
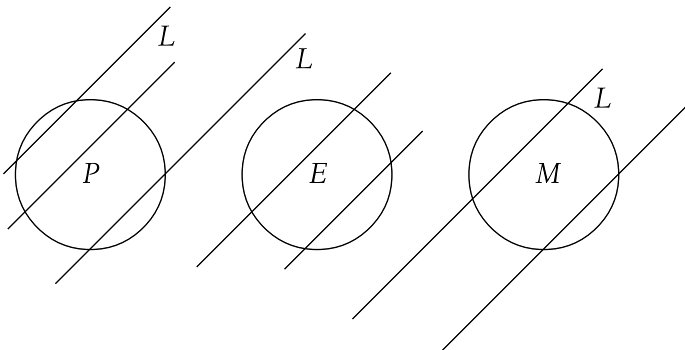
The problem of theory construction can be formulated in the following way: Is it reasonable to conceive of law as a legal system or is it more reasonable to conceive of law as a structure penetrating the whole society? Or can law—at the same time—be conceived of as both?



This is a problem in which theory construction and definition come close together since one has to make a theoretically founded decision about what to choose as *genus proximum* of law: system or structure.[4] If one decides in favor of "structure" it will be easily accepted that law, infiltrated in the other systems, has regulatory power; while if one chooses the law-as-system version (and in particular the autopoietic one, as we will see) one runs into difficulties of how to *conceptualize* the impact of a legal system on other social systems.

(2) Law is a *social* system. Luhmann distinguishes types of systems: mechanical, biological, psychic, and social systems.[5] The latter are both "meaning systems" because they refer to the possible and the negative. Psychic systems consist of consciousness (including expectations?) as its key element; therefore persons are not elements of a social system. The four system levels cannot be reduced to each other, nor is one "foundationally" based on the other. They have to be conceived of differently. (Something like a sociologically oriented psychosomatics would be impossible.[6]) The focus of Luhmann's analysis lies on social systems. They are theoretically constructed according to levels of aggregation:

– starting with communication or interaction as basic elements,
– organizations,
– social sub-systems,
– and ending with society as *the* social system (or the world society).

Law now is introduced not via psychic states (like expectations) and their "generalization," but directly on the social level, i.e., as one of the social subsystems: as the legal system.

Like Kelsen, who denied a causal nexus between law (as a normative phenomenon) and natural, psychic, economic, political, etc., conditions (as empirical phenomena), so Luhmann excludes on the basis of his quasi-ontological stratification of systems a connection between sub-social systems and so-

[4] Cf. *supra*, 26. The problem of structure and system I am pointing out is different from the criticism that Bourdieu (1987, 816) directs at Luhmann: The proposition of Luhmann's systems theory that legal structures are "self-referential" "confuses the symbolic structure, the law properly so-called, with the social system which produces it." By this Bourdieu refers to the distinction between the symbolic order of law (structure) and the order of objective relations between actors and institutions (system) that characterizes a normativist and a realist approach (cf. *supra*, sec. 2.1.).

[5] This resembles old European versions of ontology. Still, Nicolai Hartmann distinguishes four "Seinsschichten"(Hartmann 1940): material, physical, psychic, and mental (*materiell*, *physisch*, *seelisch*, and *geistig*).

[6] A sociology of law was impossible for Kelsen in his disagreement with Ehrlich over the Is-Ought question (cf. Kelsen and Ehrlich 2003 and *supra*, 139, 162).

cial systems. This invites a reconstruction of my foundationalist overview in Luhmann's terms:

Luhmann's system levels	Our "Foundations"
mechanical	natural foundations (geographical, etc.)
biological	biological, anthropological, cognitive
psychic	psychic-moral
social	mythological, religious, economic, societal, political, historical

It is only between the other social (sub)systems (the religious, the economic, the political, etc.) and the legal system that interrelationships can be meaningfully stated. But what is their connection?

The problems of theoretically designing a possible nexus between social systems—we incessantly talk about theory construction, not about "reality," whatever this might mean in Luhmann—increase almost insurmountably as soon as the notion of autopoiesis is introduced and then attributed to the legal system.

(3) Law is an *autopoietic* social system. The basic idea is, and this certainly demonstrates Luhmann's conversion into an "internalist," that the legal system reproduces itself by permanently producing its elements according to its own internal "logic." The legal system is a self-generating linkage of legal elements. Law is created by law in a circle of self-reproduction. This idea of the self-reproduction of law connects Luhmann's theory, as a sociological version, to Kelsen's immanent, pure normativism. In both the foundation of law lies in law. There is no external foundation of law. In contrast to Kelsen, however, for Luhmann the foundation of law cannot be found by tracing a hierarchy of norms to its top, to an apex norm. Rather, the legal system is founded in a paradoxical circularity. "The foundation of law is a paradox, not an idea functioning as a principle" (Luhmann 1993a, 235; my translation).[7]

The autopoietic Luhmann pays less attention to the input-output-relations of systems and gives greater weight to the internal operations of the legal system. The legal system is autopoietically closed (when did this great event actually take place??). It is not totally closed: The legal system is normatively or operationally closed but cognitively open. Thus the distinction between normative and cognitive is reintroduced, no longer attributed to *expectations*, but in the distinction between cognitively open and normatively closed *systems*.

[7] "Die Grundlage des Rechts ist nicht eine als Prinzip fungierenden Idee, sondern eine Paradoxie." Luhmann 1993b draws on examples from 17th- and 18th-century social theory to explain this alleged paradox in regard to the origin of property rights. A sober analysis of the fashionable paradoxes-flood can be found in Röhl 1998.

What makes the legal system an autopoietic one? An autopoietically closed system can be characterized by its elements or units, by a particular code and by a specific function that cannot be achieved by other systems. In the case of the legal system we find as its units legal acts or legal communications.

> The legal system [...] consists only of communicative actions which engender legal consequences [...]. It consists solely of the thematization of [...] events in a communication which treats them as legally relevant and thereby assigns itself to the legal system. (Luhmann 1988, 19)

> Every communication that processes a legal-normative expectation[8]—in the context of law enforcement, provisions for legal conflicts, legal change—is an operation internal to the law. This communication, at the same time, defines the boundaries between the legal system and its context in daily life that gives rise to the thematization of a legally relevant question. (Luhmann 1999, 6; my translation)

The operations are orientated to a particular *code*, in the case of the legal system to the binary code of legal/illegal (not: valid/invalid). Every element that passes the distinction between legally relevant and legally irrelevant (or law and non-law) will be processed according to the bifurcation of legal/illegal.

The *function* of law consists only to a certain degree in social control, or social integration, or conflict resolution (Luhmann 1993a, 156ff.). According to Luhmann the specific function of law is the deployment of conflicts, "the exploitation of conflict perspectives for the formation and reproduction of congruently (temporally/objectively/socially) generalized behavioral expectations" (Luhmann 1988, 27). It consists in stabilizing normative expectations by regulating their temporal, objective and social generalization (Luhmann 1993a, 131).

Now it becomes clear, who "generalizes congruently": It is the courts that primarily fulfil this function by applying the code of the legal/illegal to conflicting claims that are brought into the forum. Luhmann gave the impression of using a non-etatist concept of law. However, it is mainly the courts that generalize behavior expectations and thus produce law.

How can the relationship between autopoietic systems be conceptualized if one does not accept a kind of autistic closure (if this transfer from the psychic level is permitted)? The two traditional issues of the sociology of law would require clarification in the light of the theory of autopoiesis: (1) the explanation of the evolution or development of law and (2) the impact of the legal system on other social sub-systems ("effects of law"). Does law have an "independent history" or is there a nexus between law and the extra-legal world? (On legal development in general cf. Luhmann 1993a, 243, 281.) Law develops according to its own logic. External events produce at most "irritations"; they cannot determine the internal state of affairs. Environmental information must first be transformed into legally relevant information within

[8] Can expectations as *psychic* states be processed in *social* communications?

the legal system. (This is as true as it is that when you eat a potato you don't become a potato.) In order to qualify connections that might exist Luhmann invented the notion of "structural coupling" (Luhmann 1993a, 441–2) by which common elements of distinct systems can be connected (the constitution in the case of the legal and the political system; contracts in the case of the legal and the economic system). Thus, the notion of structure returns to the stage as the great social connector.

From a functional point of view with respect to the impact of the legal system on other social sub-systems, again we find a radical scepticism regarding the steering capacities of law. There is no control, influence, or determination carried out by the legal system. Law, rather, circles around itself. Thus, the construction of a theory of autopoietic law (cf. in general Teubner 1989) causes problems on a purely conceptual level that are hardly manageable within the frame of this theory's design.

All of a sudden, however, "foundations" appear in Luhmann. As one might recall, Luhmann had explicated the concept of a norm by normative, i.e., in the case of disappointments, counterfactually stabilized expectations. Now he declares as a "foundation of law" the "general disposition to normatively expect normative expectations" (Luhmann 1993a, 147; my translation).[9] Law is to be differentiated (as a legal system) on the basis of the reflexivity of its operations (ibid.). There is no longer a paradox at the foundations of law! The organizations that issue binding legal decisions (*die Entscheidungsorganisationen des Rechtssystems*) must be embedded in a motivational legal culture (*motivationale Rechtskultur*). This kind of reflexive legal culture that normatively expects normative expectations (rather, a style of normatively expecting) forms the social foundation of its own activities (ibid., 148). Are expectations and collective motivations now at the foundations of law? This sounds a bit like Durkheim and his notion of collective moral sentiments. Elsewhere in his *Das Recht der Gesellschaft* Luhmann (ibid., 81–2) describes the social preconditions of a differentiated, operatively closed legal system. If a specific legal culture can be established law will not be susceptible to being used as a pure instrument of political power, not be open to corruption. The differentiation of the legal system is based on the independence of the judiciary, *Rechtsstaatlichkeit*, civil and human rights, and democratization of the political system. These highly improbable inventions of European legal history raise the question of the moral foundations of law.

4.3. Fuller's Internal Morality of the Law

Lon Fuller (1969a; 1969b) does not locate the moral foundations of law within a collective conscience of social solidarity as Durkheim did or a "moti-

[9] "Die allgemeine Bereitschaft, normatives Erwarten normativ zu erwarten."

vational legal culture," as in Luhmann. Rather, there exists an "internal morality of law," i.e., "the morality that makes law possible" (Fuller 1969a, 4, 33ff.). By law Fuller understands "the (purposive) enterprise of subjecting human conduct to the governance of rules" (ibid., 106). Therefore, the formal quality of the governing rules is at the focus of his analysis.[10] He finds no need to refer to external moral considerations. Law, instead, has its own morality as it fulfils its function of providing fundamental social orientation patterns. In this sense law becomes itself "foundational," i.e., it forms a fundamental prerequisite for social interaction.

Fuller has noted eight ways of failing to produce rules apt for guiding the subjects of a hypothetical lawmaker "Rex." Rules should be

(1) general,
(2) made known or available to the affected party,
(3) prospective, not retroactive,
(4) clear and understandable,
(5) free from contradictions,
(6) they should not require what is impossible (*ultra posse nemo obligatur*),
(7) they should not be too frequently changed,
(8) there should be congruence between the law and official action.

These "principles of legality" that come close to the prerequisites of the "rule of law" or the "*Rechtsstaat*" follow, with the exception of (2), from a "morality of aspiration" that operates with praise and disfavor, in contrast to a "morality of duty" that is based on accusation and blame.[11] It is not a social morality on which law depends (as in Durkheim). But the question is whether this internal morality of law is only a professional morality, i.e., a morality of the legal professions, including the lawmaker, or whether a more general acceptance in a society is required. Does the rule of law depend only on a shared legalistic attitude among the legal officials or must it be backed up by general acceptance? Do the eight prerequisites hold solely for "strategic action," in the sense of Habermas (1981), or do they form an essential part of "communicative action," facilitating mutual understanding?

Hart harshly reviewed the first edition of Fuller's *Morality of Law* (Hart 1965). Firstly he criticizes the very wide notion of a rule. What constitutes the difference between legal rules, moral rules, or rules of a game? In any of these cases a rulemaker can commit one or more of the eight failures. The thrust of

[10] The idea of the formality of legal rules has been elaborated in many contributions by Robert Summers (cf., e.g., Summers 1999 and 2001).

[11] The distinction between a morality of duty and a morality of aspiration corresponds to two types of scaling: nominal and ordinal (or rank) scaling. The same methodological distinction can be applied to the distinction between norms (which one can follow or not) and principles (which one can fulfil to a greater or a lesser extent).

Hart's critique, however, aims at the misconception that the fulfilment of the eight conditions, as best as the lawmaker can, would imply a moral value as such. Hart insists that not even the best performance by a lawmaker confers intrinsic moral value on his rules. Their moral value depends on the goals a lawmaker is aiming at. From a moral point of view, even very clear rules may be neutral. By promulgating clear and understandable rules one can also pursue evil goals (Hart 1965, 351–2). It is not only extremely vague norms that lead to moral grievances.[12] Moral value is implied only if one looks at the aims of the legislator that he or she wants to achieve by promulgating legal rules. Maximizing the effectivity of the "governance of rules" is not *per se* a moral issue—otherwise one could just as well speak of a morality of (successful) poisoning. The basic moral question a lawmaker must confront is whether the rules form a "contribution to human liberty and happiness" (ibid., 357). Are we speaking here of the goals of an entire legal order? (Cf. *supra*, 163–4) In any case, the aims of a legal order that have to be subjected to moral assessment lie beyond the "internally" optimal promulgation and administration of rules. Meeting the standards of an internal morality of law might indicate a high degree of effective action orientation; however, it leaves open the question of the direction in which human action is governed. Therefore, we are dependent on a morality that is external to law—provided that we do not limit the function of law solely to efficaciously (or effectively?) subjecting human conduct to the governance of rules.

[12] Racial norms in Nazi law, for example, became quite clear as soon as the attribute "Jewish" was made administrable. In contrast, the *Polenstrafrechtsverordnung* (1941) was normatively unlimited and served terrorist aims.

Chapter 5

ANTI-FOUNDATIONALISM

Whoever is considering the foundations of law has to face the critique of foundationalism in its extreme form, namely: anti-foundationalism.

A variant of anti-foundationalism in legal theory is rooted in ethno-methodology (cf. Wilson 1970a; 1970b). It can be understood as a radical critique of norm-Platonism. According to the norm-scepticism of this theory, legal rules do not exist independently, prior and with obligating force before an act of understanding such a norm. Rather, they are constituted in the context of a concrete situation of interpretation and application. This position was already taken by the radical labelling approach in criminology, perhaps even by the free law movement ("*Freirechtsbewegung*"), and is raised by more recent authors like Stanley Fish.[1] The "objectivity" of legal norms dissolves in situations of their interpretative and performative application. Legal norms do not exist before their application. "Legal norms develop only in and through the practice of their use" (Morlok, Kölbel, and Launhardt 2000, 18). They exist only in the sphere of communications. Law consists of arguments, interpretations and judgements that are not logically deduced from norms.[2] The application of law is singular, bound to a situation, variable and flexible. Legal sociology should abandon the distinction between "law in the books" and "law in action." The sole form of existence of law is "in action." Law is a social practice. Its validity consists of its being practised (ibid., 34).

The theory of the liquidation or the dissolution of legal norms is, however, in practice not as radical as it seems. Legal norms are manifested in texts after all. There is thus something like "law in the books." These norms are the object of interpretation. As a result the dissolution of legal norms happens in the context of their interpretation. Legal norms are found in texts that can be treated like other texts. This is the core idea of the "law as literature" movement (Levinson 1982). Texts—and thus legal texts as well—are vague; their meaning depends on context. Durkheim said, following the French tradition of non-interpretation ("*sens-clair-doctrine*"): "A legal rule is what it is and there are no two ways of perceiving it" (Durkheim 1982, 82). An ethnomethodologist, in contrast, would assert: There are no legal norms as such; there are only different ways of interpreting them. Seemingly obligatory, given

[1] Cf. Fish 1989, 342ff., on foundationalism and anti-foundationalism as two kinds of epistemology.

[2] We still have, or again have, wrong conceptions of the connections between (general) legal norms and (singular) judgements. The knowledge of the properties of deduction, conclusion, subsumption, syllogism, etc., seems to have gone lost.

texts are dissolved in interpretations and situations. In consequence, the distinction between legislation and adjudication that is bound by norms becomes untenable.

T. P. Wilson endowed a variant of the traditional sociological theory of action with the label "the normative paradigm." This paradigm takes as its starting point from an agent in a situation and a position (status) equipped with dispositions and expectations. The agent internalizes stable, relatively homogenous norms and values. As others do the same, interaction in a "shared culture" is possible. The competing model of an "interpretative paradigm" assumes interactions through which the interacting people encounter the role expectations of others and reinterpret them. Norms have no fixed meaning that could serve as the basis of orientation for a single agent. The meaning of norms dissolves in interaction, is continuously fixed and reformulated in specific contexts. Norms do not have the function of directing action. Actions, e.g., those of norm application, do not "follow" from norms. They are part of a process that is both inventive and interactive.

This position leads to a couple of fundamental problems:

(1) It takes speech acts as one of the smallest units constituting society. How does it, then, deal with higher levels of aggregation like "large scale," "complex" and "macroscopic social phenomena" (Wilson 1970a, 59, 74)? Do structures, regularities and institutions still exist for those who hold this position? How do the agents produce "repetitiveness, stability, regularity, and continuity" (ibid., 79)? Regularities in interactions are supposed to be creating structures. Social structures emerge somehow (repetitively?) from interactive practises. Things proved by everyday practise are assumed to "sediment" (Morlok, Kölbel, and Launhardt 2000, 33) within an institutional framework. What does this metaphor taken from geology mean?

(2) How is one to deal with a self-understanding of the agents that is based on normative Platonism, or on a cognitive, objectifying attitude towards norms that takes norms as (seemingly) fixed entities that are binding on the applier of the norm? In principle, it is one possible position within the "interpretative paradigm" to privilege the subjective perspective of the agents (Wilson 1970a, 76–7). This perspective, however, from the standpoint of an anti-foundationalist approach, is a form of "false consciousness." The subjective understanding of being bound by given norms can only be interpreted as a useful misconception. (This has been said before by Max Weber. Cf. Weber 1978, 894.)

(3) Such an approach excludes a priori the thought of non-textual foundations of norms since everything is speech and text ("*il n'y a pas de hors-texte*"). Social reality is reduced to a communicative, rhetorical "construction." Law, manifested in language, is reduced to linguistic utter-

ances used in interaction. How is society constituted on the basis of the smallest speech units? What is the constituting role of things not said or even unspeakable? If one asserts with Gadamer that Being understood is language then one has to admit the existence of quite a bit of Being that is not understood. How does one deal with speechlessness, with non-interaction, e.g., in scientific discourse by failure to quote, by the exclusion of some authors or arguments from the "universe of discourse"? It sounds nice to take consensus as a criterion for truth but on which exclusions from interaction might it be based?

(4) There is the possibility of singular actions not involving interaction, but still based on rules.

(5) How is one to deal with texts beyond face-to-face interactions, thus especially where historical texts are concerned? Concretely: With whom do I have to communicate to explain that the assertion of a historian is wrong that the idea of *bellum iustum* is an invention of sharp minded Dominicans, who created—facing in the 16th century the barbaric suppression of natives in South-America—the distinction of just and unjust wars? If I find this figure of thought already in Thomas Aquinas, in Gratian, even earlier in Augustine or in Cicero—in their texts—do I have then to establish a consensus with the librarian of the university library that these are really texts of these authors? (Do not forget: Scientific facts are derived from social processes and that social processes are determining what is true and what false [Morlok, Kölbel, and Launhardt 2000, 21, 31]—but which social processes?) Who guarantees that the translation is correct, if I do not rely on my humanistic qualification that has been certified after years of repetitive social processes consisting of asymmetrical interactions of teacher and pupil? Do I have to enter into a spiritual conversation spanning centuries? Does this historian have to agree with me—after a situated, inventive interaction with him that is open to the context? Or is there another authority that will signal me its consensus? Generally, how can one, in historical research, distinguish between facts and fictions (*res factae/res fictae*) (cf. Evans 1997).

(6) Interactions do not merely create their own context. They are already embedded in asymmetrical and constrained contexts. Why are there in legal proceedings the compulsions to decide, to give reasons, and to interpret? Where does the judge's "definitional power" derive from? Why are in legal proceedings judicial interpretations "exclusive"? How is the "pressure" of appeals created and what are the "structurally given problems of legitimacy" (Morlok, Kölbel, and Launhardt 2000, 42, 34–5)?

(7) What can be investigated? The research domain of such a perspective is the description of microscopic "applications" of norms. The emphasis is put on a perspective that underlines the aspects of the situation, its local, contextual, interactive, everyday, and rhetorical features. The problems

outlined above repeat themselves here. How to deal with higher levels of aggregation above interactions, e.g., organizations, institutions, structures, or social systems? Is there a non-normative *social* integration; are norms only applicable to the immediate social sphere? What about the social reality beyond language? Collective data, e.g., criminal statistics are reduced to their interactive meaning. One can only transform the talk about duration of proceedings, flood of legal proceedings, fear of criminality into micro-sociological events. What about the analysis of files? Are these only sedimentary interactions? Do data about the social background of lawyers say anything beyond the talk about them? Does one not have to abandon any mode of explanation recurring on variables that are external to interactions?

Chapter 6

GENERAL TENDENCIES

The compilation of very different kinds of foundations can be structured by the exposition of some systematic movements. Such movements do not have to match the course of history.

6.1. Secularization?

There is movement away from transcendental (mythological and religious) foundations of law towards immanent (secular) foundations. The Gods, the Divine vanishes from the world in general and it does so too in the world of the law. This is well illustrated by comparing the *Antigone* to the *Oresteia*. In later literary works referring to the antique subjects, the Gods are psychic phenomena (e.g., Sartre 1996).

Religious beliefs and their institutionalization in churches are treated merely as instrumental problems of the construction of states.[1] There is, however, no clearly linear process of secularization. A secularization of myths took place already in Greek philosophy (Nestle 1940). In comparison to that, Christianity is a transcendental regression—lasting for centuries. The foundation of law and justice as early as Plato is largely immanent and in Aristotle completely so. Aristotle does not need a religious foundation for morality, justice and law. This connects him to Kant from whom he is separated by a long religious interregnum. (There are other differences between them, of course, e.g., concerning the foundation of morality.) The reception of Aristotle brings the distinction between knowledge and belief to the forefront (e.g., in Duns Scotus) until both, the reawakened science of the 17th century and religion, begin emancipating themselves from his authority. Islam, too, experienced worldly rationalizations in the heyday of the science of Islam—ranging from Ibn Sina to Ibn Khaldun, from the 10th till the 15th century. Already in the late 14th century Ibn Khaldun (1332–1406) developed in his "al Muqaddimah"—long before Montesquieu—a theory of historical development, referring only to natural conditions; Allah does not intervene in world history. Immanence is not a characteristic of "modernity." Movements of re-fundamentalization also take place all the time—not only today, but for example in the 18th century through the Wahhabits in what is today Saudi-Arabia.

[1] For example, in Hobbes 1965, book 3. On the instrumental relation towards religion and church, see also Rousseau 1941, IV, 8, on civil religion. Long before Nietzsche, he found that "Christianity preaches only servitude and dependence. Its spirit is so favourable to tyranny that it always profits by such a *régime*. True Christians are made to be slaves" (Rousseau 1941, 120).

In Western Europe, too, a renewed secularization through humanism and enlightenment does not prevent the revival of religiously fundamental doctrines like neo-Thomism since the 19th century. Modern protestant theology propagates "*Entmythologisierung*" (Bultmann) in order to unveil God's message as such (*kerygma*) from its mythological origin. Artificial re-mythologizations, a new esotericism, and the revival of religious fundamentalism can seduce the observer to speak of a "post-secular" epoch (Habermas).

The development of the law, too, illustrates that Christianity with its sacred law was a kind of regression, a regression from a state of affairs that had achieved a high level of secularization, as in the case of Roman law. However, canon law later stimulated the progress of secular law.

Carl Schmitt formulated—as often over-generalizing—the thesis that all political concepts are theological concepts secularized (Schmitt 1922). That might be true for the concept of sovereignty. The principle of the equality of all human beings and of their dignity as something unalienable can be derived from their likeness to God.[2] The love of God realizes itself in mutual acceptance among human beings. Criminal Law, too, uses worldly transformations of religious notions of evil, the devilish, of guilt and punishment.

One ought to distinguish from these kinds of concepts religious formulas employed for secular purposes. This can take a rather moderate form as in Durkheim, who proposes using religion for the purpose of social integration if the law cannot guarantee such integration. In modern times the "sacralization of politics," i.e., an instrumental use of religion presupposes the autonomy of politics. Apart from that we regularly see a radicalization of political conflicts by their sacralization.[3] There are quasi religious wars against the "evil" ones. A crusade against the "axis of evil" is announced, or a Dschihad as "holy war" against the non-believers to create a divine order in a world of non-believers. The end of profanization leads to a war beyond state and law, to religiously motivated police actions outside the bounds of the international law of war.

Secularization has beyond its connotations in philosophy and the history of ideas a clear historical basis: the separation of the profane and secular; of state and church; of law, politics, and belief; the establishment of the primacy of the sovereignty of the state, including the transformation of clerical goods into secular ones, sometimes quite materially, e.g., of cloisters into schools, prisons, barracks, etc. Religion becomes a matter of the internal, individual belief, administrated by the institutions of a church separated from the state. Secularization implies pacification, neutralization of fundamentalisms that had collided in the religious civil wars. Today, it means the acceptance of *weltanschaulichem* and cultural pluralism.

[2] Gen. 1, 27: "So God created man in his own image; in the image of God he created him; male and female he created them."

[3] The Nazis used the religious rhetoric of salvation in propaganda (Hitler, casting himself as a Messiah, set out to defeat demonic powers); cf. Burleigh 2000.

6.2. Further Secularization of Explanations and Justifications—Internalization

Explanations and justifications also are secularized and humanized. Law is, in a first step away from metaphysical explanations, thought of as being dependent on non-human, natural, e.g. geographical circumstances; then on secular, natural-human conditions (state of nature). Reason ceases to be a faculty given by God (e.g., to discern the *lex naturalis*) and becomes a part of the anthropological constitution of mankind. Finally, the law appears to be dependent on circumstances that are man-made themselves, even though not voluntarily, e.g., dependent on historical, economic, and moral conditions. G. B. Vico, in his *Scienza Nuova* (published in 1725) no longer refers to supra-natural, cosmic forces. The world, with the interplay of all its elements, is man-made. In this tradition it becomes clear that religion also is a human invention (L. Feuerbach, K. Marx). Increasing control of nature by science and technology might lead this theoretical movement away from natural, given (geographical, biological) circumstances towards environmental conditions created by man himself. In this process, however, the limits of manipulation of nature and their unforeseeable consequences become clearer as well (from changes of climate[4] to the consequences of genetic intervention).

The movement towards immanent conditions is emphasized by the fact that for the explanation and justification of law internal circumstances increasingly are used. The developed importance of law can be embodied in such a movement because it is no longer conceptualized as the passive reflex of external circumstance. The stronger emphasis on principles immanent to the law, like the rule of law and the cognitive subtleties of judicial doctrine, might inspire the idea of greater autonomy of the law. We have seen, however, discussing Kelsen, Luhmann, and Fuller, that despite tendencies towards internalization a relation to external factors necessarily persists.

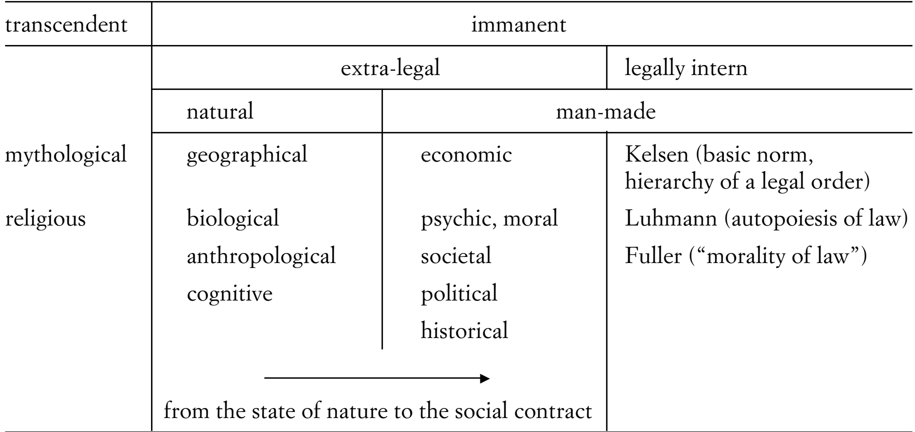
We are not able any longer to write a Hegelian history of the unfolding (“*Entfaltung*”) of reason starting from mythological and religious transcendence and leading to Kelsen’s or Luhmann’s immanence. No grand stage model would fit the real development of a world history of law and legal theories, e.g., following stages such as:

- from transcendental to immanent conditions,
- from external, natural to man-made conditions,
- from extra-legal to legally internal conditions.

None of these sequences can be shown to exist. Instead of a great developmental scheme to which the world history of foundationlisms happily con-

[4] The climate theories of the 18th century get oddly revived in the horror scenarios described by today’s science (global warming, rising ocean level, desertification).

forms I want to offer modestly a variety of “fundamentals” in a systematic (not a historical!) order:



transcendent	immanent		
	extra-legal		legally intern
	natural	man-made	
mythological	geographical	economic	Kelsen (basic norm, hierarchy of a legal order)
religious	biological	psychic, moral	Luhmann (autopoiesis of law)
	anthropological	societal	Fuller (“morality of law”)
	cognitive	political	
		historical	
	→ from the state of nature to the social contract		

Chapter 7

PROBLEMS OF EXPLANATION

Foundationalist thinking wavers between justification and explanation. They come together in myths and religion. Natural law theories of a social contract, too, deploy an only seemingly historical construction to disguise a primordial principle of normativity and legitimacy. In the 18th century, however, the distinction between facts and norms (Hume) and Montesquieu's motto—"I only give their reasons, but do not justify their customs" (cf. *supra*, 58)—becomes a scientific program. There are, however, again and again attempts to achieve justification or a critique of legal institutions on the basis of factual, e.g., biological or anthropological foundations. The ambiguity of "morality" seems to seduce one to mix empirically verifiable propositions about the origin and development of moral consciousness, about moral attitudes in the population or relevant groups, with moral postulates towards the state or legal order.

The separation of explanation and justification can be demonstrated by considering the particular methodological problems that arise by using extra-legal variables in order to *explain* the origin, development, and effects of legal norms. The problems of explanation can be systematically explicated by starting with a simple mathematical function.

(1) The fundamental decision consists in understanding law (however conceptualized in detail) as a dependent variable (y). As an independent (explaining, "founding") variable (x) any of our foundations would serve: $y = f(x)$.
(2) Given the manifold possible foundations, it is not far fetched to use a couple of independent, explaining variables. It is not only the economy, etc., that is determining the law. The enlarged, multi-variable function has then the following formula: $y = f(x_1, x_2, x_3, \ldots, x_n)$.
(3) The individual variables have to be weighted according to their explanatory power: $y = f(ax_1, bx_2, cx_3, \ldots, wx_n)$.
(4) There is always an unexplained residual factor (r), e.g., other so far unknown variables or faults in observation: $y = f(ax_1, bx_2, cx_3, \ldots, wx_n, r)$.
(5) The general problem of explanation consists in the under-determination by the various "foundations." They simply do not explain everything in law.[1]

[1] A similar problem of under-determination can be found in the innumerable attempts to draw conclusions from external human states of affairs to internal ones. Thus, there have been attempts to study specific localities to arrive at conclusions as to national character. Further examples are in astrology (conclusions are drawn from constellations to individual characters), physiology (from facial expression to personality traits), craniology (from the shape of the skull to character and intellectual traits), and recently brain research (from movement in certain regions of the brain to mental states of affairs). And finally comes the attempt to conclude from genes what makes a future genius.

One could, in addition, question the functional dependence in principle. *y* ("law") is not determined at all. It is "relatively autonomous." The development of norms—the creation of statutes, legal decisions, etc.—is not foreseeable because of the decisional or volitional character of the law. There are residuals that cannot be explained (nor justified). (This was an issue upon which *ratio* and *voluntas* were divided; cf. *supra*, 49). One can regard this as an expression of state sovereignty or autonomy in general.

(6) *y* is not only a dependent variable, *y* can operate as an independent variable: $x = f(y)$. The Marxist conception, that takes law to be principally determined, conditioned, dependent on an economic base, uses this perspective as the law is itself influencing the economic base ("*Rückwirkung*"). In the framework of an instrumental perspective this view becomes self-evident. Relevant in this context is the ubiquitous constitutive role of law in all social spheres, as well.

(7) Another problem results from this. Often *x* and *y* are apparently not distinct variables. The seemingly extra-legal "economic" foundations for example are themselves to a high degree legally determined. They are brought to the world by the correct use of legal provisions: an enterprise for example in a special legal form, a labour relation, a work council, etc. A well-known passage in Marx can be interpreted in this way. A certain state of affairs (in the sphere of the base) can be named differently: in the terms of political economy, e.g., as "relations of production," in the terms of the law "property." I dealt with this passage before (cf. *supra*, 113ff.):

> At a certain stage of development, the material productive forces of society come into conflict with the existing relation of production or—this merely expresses the same thing in legal terms—with the property relations within the framework of which they have operated hitherto. (Marx 1987, 261; cf. Marx 1969b, 9)

In consequence economic base and legal superstructure cannot be distinguished any more. There are just alternative modes of describing the world.

(8) Finally, the variable *y* ("law") is in a fact a very complex one. It contains, as we have seen (cf. *supra*, sec. 2.6), various dimensions. The theory of Donald Black, which aims at explaining the "behavior of law" on a very sophisticated level, splits the variable "law"—i.e., "governmental social control" (Black 1976, 2)—into the "quantity of law" and the "style of law." The "quantity of law" itself implies numerous elements like "the number and scope of prohibitions, obligations, and other standards to which people are subject, and [...] the rate of legislation, litigation, and adjudication. As a quantitative variable law is all of this and more" (ibid., 3). Therefore one has to decide what to explain: $y_1, y_2, y_3, \ldots, y_n$.

Chapter 8

SUMMARY

(1) There is no privileged set of variables, like *the* economy, that might be used in order to explain the various dimensions of law and the central issues of the origin, the development, and the functions and effects of this multi-dimensional law. Mono-causal models fail.

(2) There is no clear sequence of foundationalist approaches employing extra-legal factors in order to explain "law." Immanent conditions do not replace once and for all transcendent ones. We encounter secularization and re-sacralization, de- and re-mythologization. The explanatory power of extra-human and man-made conditions changes. Perhaps there is a tendency towards legally internal variables. However, the impact of legally external aspects remains.

(3) As far as the phylogenetic origin of law in general is concerned, but also the creation and change of legal norms, I have criticized on several occasions—e.g., in discussing Marx, Engels, Ehrlich, and Geiger—the idea of non- or pre-normative foundations of law, according to which there first existed a norm-free economic basis or "facts of law" or factual regularities out of which norms or rules, then legal norms emerge. Mythological as well as religious foundations are not free of norms (on the contrary: at their core are holy commandments). It is only in natural, extra-human foundations that we find a norm-free ensemble of variables (soil and climate, e.g.). However, rather than being applicable for explanatory purposes, they play the role of limiting conditions on human inventions.

(4) The general problem of the varieties of foundations lies in their explanatory under-determination. This fact can itself be explained by the basic features of a legal order, namely, according to our three dimensions, the political sovereignty of the legislator, independence (e.g., of the judiciary) and human autonomy in general. In creating law we do not establish external constraints that affect us as blind fate, as a *vis a tergo*. It is a decisive step in the enlightenment of mankind that social affairs become a matter of conscious arrangement. The idea of a social contract marks this step. We gain a reflexive attitude towards external conditions. Myths and religion become an element of tradition and culture out of which we can select or construct our collective identities. Re-mythologization or re-secularization lacks the substantive immediacy of their first appearance. It becomes transparent that they are artificial revivals. Human as well as extra-human nature no longer overwhelm us unreflectively. Instead, we face a complex of risk calculation and continuous intervention through which we can experience our limits—our technological as well as our

> moral-normative limits. Man-made conditions, like economic, moral, political ones, are no longer causal complexes that are "expressed" in legal norms and institutions. Rather, they become—from a consciously instrumental point of view—restrictive conditions for the legislator (this change of foundational conditions already could be found in Montesquieu). The core legal notion of citizenship, e.g., forms a self-constituted category the existence of which does not depend on external, natural conditions like race or "*Volk*" (as in the artificially regressive ideology of the Nazis). A nation of citizens is not the same as a "people" which is fated to share a common destiny; instead it is created in an autonomous process. This can be generalized: Law is created within its own processes (this is the truth of the "internalists"). It "depends" on its self-constitution. This comes close to Hegel's idea of law as the "realm of actualized freedom" (cf. *supra*, 66). However, how far freedom (and autonomy) really can be actualized still depends on external conditions that we must, as limiting conditions, take into account. It also depends on the normative limits that we agree upon.

What is left from our quest for foundations? The importance of limiting conditions on the efficacy of law, and the moral, constitutionally internalized foundations of law.

INDEX OF SUBJECTS

acceptance 15–6, 18–21
actor / observer 7, 12–9
administrative law 129
altruism 72, 84ff., 132
anthropology 17, 20, 70ff., 74, 89, 120–1
ape-law 17
authority 21
autonomy of law 110ff., 158–9, 182
autopoiesis 3, 164ff.

basis / superstructure 106ff., 113ff.
Begriffsjurisprudenz 57
bellum iustum 47, 175
biology 70ff.

Christian doctrine 45ff., 100
chronology 34, 42, 157
church and *imperium* 48
citizenship 135, 184
climate 62ff., 68–9, 179
code 168
coercion theory 9–10
cognition 81ff.
cognitive theory 75ff.
cognitivism 76
common law 110, 158
competence 79
concept of law 7–12
conflict resolution 29
constitutive function 29–30, 74f., 182
contract 106, 126, 130ff., 156
convention 5, 10, 21–2, 120–1, 156
courts 38, 106, 143–4, 168
crime 134
cultural foundations 157
custom 21–2, 120–1, 147–8, 151, 156
customary law 24

declarative function 28
definition of law 8ff., 12, 26, 139ff., 166
development of law (evolution of law) 3–5, 156ff., 168
dimensions of a legal order 27, 182
domination 11

Economic Analysis of Law 23, 118–9
economic foundations 57, 64, 88–119, 133, 157

efficacy 5, 60–1, 73, 152–3, 162–3, 168
etatism 24, 124
ethno-methodology 173ff.
ethical sentimentalism 77
ethics 76ff.
ethology 70
evolutionary psychology 81
expectations (cognitive / normative) 23, 30, 164
explanation 4, 161, 181ff.

fact-norm-sequence 10, 22, 70–1, 114–5, 119, 137, 151, 155–6, 183
facts of law 22, 137, 157
family law 130
feedback 112, 182
Freirechtsbewegung (free law movement) 57, 173
functions of law 2, 9, 27–30, 168, 170–1
future of the law 115ff.

Generative Grammar 80
Gewalt 145ff.
Grundnorm 2, 161–2

hermeneutical point of view 14–5, 18
historical foundations 155–9
human rights 4, 56–7, 75ff., 104, 155, 169

ideal (idea) of law 11–2
ideology 32, 57, 151
imperative theory 9–10, 26
incest taboo 70
informal / formal 24
institutional facts 29
integration (social) 121–2, 126ff., 133ff.
internal / external point of view 12–9, 119
internal foundations 161ff.
Is and Ought 23, 59, 162, 164, 181
Islam (Islamic Law) 50–7
ius talionis 42

Jewish law 43ff.
judge 24, 58, 143
justice 11–2, 45, 88, 101, 104, 117–8, 121
justification / explanation 83, 92ff., 100, 181

khadi justice 55–6

law and politics 144–5
law and power / *Gewalt* 145ff.
law and state 143–4
law in the books / law in action 7, 23, 54
law-related facts 25–6, 162
legal pluralism 24, 137, 143, 150
legal staff 21, 27
legality 57, 154, 170
legitimation / legitimacy 28, 146–7, 154–5
limitations of human rights 90
limitation of political power 28–9
living law 137–8, 157

market society 128, 135
marxist-leninist theory of law 8–9, 29
mind 79ff.
mental faculties 79
mentalism 78ff.
mentalist theory of ethics and law 78ff.
monopoly of force 3–4, 42, 154
moral faculty 81ff.
moral judgement 76ff.
morality and law 3, 20, 21–2, 79, 120ff.
morality of aspiration / morality of duty 179
myth, mythology 32–3, 100, 177, 181, 183

natural foundations 57ff.
natural law theories 100ff., 120, 181
nature 45, 82, 183–4
Nazi law 66–7, 72, 152, 178, 184
non-cognitivism 76
norm 1–2, 164
normative / cognitive, cf. expectations
normative / factual 24
normativism 7–8

obedience (norm conforming behavior, norm compliance) 3, 9–11, 18, 147–8, 163–4
Oresteia 33–39

penal law 126, 133ff.
performance 79
political foundations 143–55
power 145ff., 150ff.
primary and secondary norms 3, 23
private law 130ff.

ratio / voluntas 49, 182
rationality, stages of 48, 54–7, 120, 156
realism 7–8, 19ff., 23ff., 119
Rechtsstaat 4, 144, 169–70
Rechtstatsachen (legal facts) 137
recognition 8, 11
recognition theory 8–9, 140–1
regularities 10, 14, 17, 21, 71
religion 42ff., 63–4, 121–2, 133, 177ff., 181, 183
revenge, cf. vengeance
revolution 108, 115ff., 163
Roman law 48, 109–10
rule of law 4, 104ff., 143, 170
rule of recognition 2–3, 24
rules / regularities 10, 20ff., 71, 121

secularization 4, 48, 50–5, 57, 103, 177ff.
sharia 50ff.
slavery 61–2, 104
social contract 38, 103–4, 106, 127, 148, 181, 183
social control 28
social Darwinism 67
societal foundations 136–43
socio-biology 71ff., 81
solidarity 97ff.
sovereignty 152, 183
state of nature 23, 101–2, 148
statement of rule / statement about a rule 16
status naturalis / status civilis 38, 100ff.
structure 9, 164ff., 169
system 164ff.

theory of law 8ff., 10, 26
transformation, transition 4, 100ff., 106, 148, 154, 163
Turkey 53–4, 146, 153

Universal Grammar 80

validity 8, 23–4, 120
vengeance 34–5, 42ff., 46
violence 145ff., 148ff.
Volksgeist 66–7, 138–9

welfare state 135–6

INDEX OF NAMES

Abner 44

TABLE OF CONTENTS

A Note on the Authors IX

Preface XI

Chapter 1 - Introduction 1

Chapter 2 - Legislation 7

2.1. Introduction 7
2.2. Legislation as a Source of Law 9
2.2.1. Sources of Legislation vs. Legislation as a Source of Law 9
2.2.2. What Counts as Legislation? 10
2.2.3. Codification vs. Consolidation 10
2.2.4. Statutory Interpretation 12
2.2.5. Legislation and Common Law 14
2.2.6. Legislation vs. Adjudication 15
2.3. Legislation vs. Sovereignty 18
2.4. Taking Legislation Seriously 21
2.5. Conclusion 25

Chapter 3 - Precedent 27

3.1. A Characterization of Precedent 27
3.2. The Functioning of Precedent in Law 31
3.2.1. The Doctrine of Stare Decisis 31
3.2.2. Binding vs. Persuasive Precedent 32
3.2.3. The Ratio Decidendi *of a Precedent* 36
3.3. Precedent and Legislation 37
3.4. The Modalities of Binding Precedent 40
3.4.1. Precedent and Logical Necessity 40
3.4.2. Precedent and Rule-scepticism 41
3.4.3. Precedent and Judicial Comity 43
3.5. Precedent, Bindingness, and Ruleness 45
3.5.1. Precedent and Hart's Social Rules 45
3.5.2. Precedent, Wittgenstein and Rule-following 49
3.5.2.1. Wittgenstein and Following a Rule 49
3.5.2.2. Precedent and Following a Rule 51

3.6. The Justification of Precedent 56
3.6.1. Introduction 56
3.6.2. The Structure of Stare Decisis 57
3.6.3. The Justification of Precedent 59

Chapter 4 - Custom 63
4.1. Historical Foundations of Custom as a Source of Law 63
4.1.1. From Social Norm to Common Law 63
4.1.2. General Custom and Local Custom 65
4.2. The Conceptual Framework for Custom 66
4.3. The Common Law Rules for the Validity of Custom 69
4.4. Puzzles Concerning Custom as a Source of Law 74
4.4.1. Reasonableness 74
4.4.2. Derivation and Abrogation 77

Chapter 5 - Delegation 85
5.1. Introduction 85
5.2. Labour Arbitration 86
5.2.1. A Sketch of Labour Arbitration Law 86
5.2.2. Res Judicata *& Collateral Estoppel* 90
5.2.2.1. Statement of the Principle 90
5.2.2.2. Status Under Arbitration Jurisprudence 90
5.2.2.3. Emergence of the Principles 91
5.2.2.4. Assessment 93
5.2.3. Stare Decisis 95
5.2.3.1. Statement of Principle 95
5.2.3.2. Status Under Arbitration Jurisprudence 96
5.2.3.3. Emergence of "Quasi-stare decisis" in Arbitration Jurisprudence 97
5.2.3.4. Assessment 102
5.2.4. Conclusion 103
5.3. Mediation 103
5.3.1. Introduction 103
5.3.2. The Saskatchewan Farm Security Act 105
5.3.2.1. The Provisions of the Act 105
5.3.2.2. Assessment 107
5.3.3. The Alberta Human Rights Act 109
5.3.3.1. The Provisions of the Act 109
5.3.3.2. Assessment 110
5.3.4. Other Examples of Mediation 111
5.4. Conclusion 112

Chapter 6 - Constitutions 115

6.1. Definitional Issues 115
6.1.1. The "Thin" Sense of "Constitution" 115
6.1.2. The "Thick" Sense of "Constitution" 118
6.1.3. Constitutional Conventions 122
6.1.4. Prima Facie *Grounds for Constitutions as Sources of Law* 124
6.1.5. The Fundamental Challenge 127
6.2. The Supreme Court of Canada and "Reading in" 129
6.3. The High Court of Australia and Implied Rights 131
6.4. The Supreme Court of Canada and Unwritten Constitutional Law 132
6.4.1. Unwritten Principles as Fundamental Law 132
6.4.2. New Brunswick Broadcasting 133
6.4.3. The Provincial Judges *Case* 134
6.4.4. The Quebec Secession *Case* 136
6.5. Conclusions 138

Chapter 7 - Sources of Law in the Civil Law 143
(*by Antonino Rotolo*)

7.1. Introduction. The Theoretical Framework: Basic Concepts on the Sources of Law in Continental Legal Doctrine 143
7.2. Constitution and Legislation 153
7.2.1. The Historical Background: The Rechtsstaat *and the Paradigm of Legislation in Continental Legal Doctrine* 153
7.2.2. The Change of Paradigm: Contemporary Constitutional Democracies 159
7.3. Other Sources of Law 167
7.3.1. Some Notes on Private Autonomy and Precedent 167
7.3.1.1. Private Autonomy 168
7.3.1.2. Judicial Decision and Precedent 172
7.3.2. Custom 179
7.3.3. The Role of EC/EU Law: A Sketch 187

Chapter 8 - International Law 195

8.1. Introduction 195
8.2. Article 38 198
8.3. Treaties 201
8.4. Customary International Law 204
8.4.1. Introduction 204
8.4.2. State Practice 205
8.4.3. Opinio Juris 206

8.5. General Principles 210
8.5.1. General Principles of Municipal Law 210
8.5.2. Jus Cogens 213
8.6. Conclusion 215

Chapter 9 - Authority 219
9.1. Deeply and Contextually Justified Authority: First Thoughts 220
9.2. The Authority of Ancient Manuscripts 223
9.3. Interpretive Authority 225
9.4. Ancient Authorities Revisited 226
9.5. Legal Authorities Revisited 226
9.6. Post-post-modernist Conclusions 228

Bibliography 231

Index of Subjects 241

Index of Names 249

A NOTE ON THE AUTHORS

ROGER A. SHINER taught for thirty-five years at the University of Alberta, Canada, and is now Professor of Philosophy at Okanagan University College, British Columbia, Canada. He is a Past President of the Canadian chapter of the IVR. He has held a Canada Council Killam Senior Research Fellowship, and several research grants from the Social Sciences and Humanities Research Council of Canada. His major publications are *Freedom of Commercial Expression* (Clarendon Press, 2003), *Norm and Nature: the Movements of Legal Thought* (Clarendon Press, 1992), and *Knowledge and Reality in Plato's Philebus* (Van Gorcum, 1974). He has also co-edited several books in the areas of political and moral theory, and ancient philosophy.

ANTONINO ROTOLO (PhD, Padua) is research assistant in legal philosophy at the University of Bologna Law Faculty. He is a member of CIRSFID (Centre for Research in History of Law, Philosophy and Sociology of Law, and Computer Science and Law) at the University of Bologna. He published two monographic volumes: *Identità e somiglianza: Saggio sul pensiero analogico nel diritto* (Clueb, 2001) and *Istituzioni, poteri e obblighi: Un'analisi logico-filosofica* (Gedit, 2002). He has also written several essays on the application of formal logic for modelling legal reasoning and on the relation between law and practical reason. He is Assistant Editor at *Ratio Juris: An International Journal of Jurisprudence and Philosophy of Law* (Oxford, Blackwell).

PREFACE

Two individuals must be specifically thanked for their part in this project. I would like to thank Enrico Pattaro and Jerry Postema for the original invitation to take part in the Treatise. I have very much enjoyed the work, and have learnt a great deal from it. Enrico himself I would also like to thank, not only for his helpful comments on some of my early material, but also, and especially, for his exemplary leadership of the Treatise project, and the very hard work necessary to see it through to fruition. Jerry has read almost all of the book in draft form, and the beneficial effect of his sympathetic but critical comments cannot be underestimated. The book is much improved as a result. I must also express my gratitude to the other authors of the early volumes of the Treatise, Hubert Rottleuthner, Aleksander Peczenik and Giovanni Sartor, for many stimulating and helpful discussions of legal theory. Last, but by no means least, I must thank Antonino Rotolo for contributing to this book Chapter 7 on the sources of law in the civil law tradition. He has thereby allowed the reader to appreciate the topic of legal institutions and the sources of law from a wider perspective than I, with a background only in the common law, could provide.

The research on which the book is based has been supported by the Social Sciences and Humanities Research Council of Canada, through grant #410-98-1530, and I am grateful to the Council for their help. The grant enabled me to work some of the time in collaboration with two fine research assistants, Dale Dewhurst and David Hampton. Their combination of legal and philosophical expertise was of great value. David contributed background research to Chapter 3, and Dale to Chapter 8. Both of them worked on Chapter 5. That Chapter is an abridged version of a paper published as a jointly authored work by the three of us in *Ratio Juris* 16.1 (March 2003). The material is used here by permission of Blackwell Publishers. I am grateful to audiences at the Amintaphil meeting in Montreal in 1998 and at the American Society for Aesthetics meeting in Minneapolis in 2001 for their comments on draft versions of Chapters 6 and 9 respectively.

I am grateful to the Social Science Research Network for a fee waiver, which enabled me to subscribe to a number of their abstracts lists, and thus to keep up with recent relevant developments in the field. I am also grateful to Faith Peyton of the Inter-Library Loan section of the North Campus library at Okanagan University College, for the efficiency and friendliness with which she has in the last two years put up with an endless stream of requests.

I apologise to my children for all the time which I have spent glued to books, articles and keyboard. However, hearing one of them say proudly to a

friend, "My daddy's a philospher; he writes books" is some modest justification. My debt to my wife, Sharon Pfenning, is huge. Her support for this project been unconditional. As importantly, her unphilosophical practicality has been a constant and valuable reminder of the real world in which the law has its being, something which a person who aspires to write a work of theoretical jurisprudence like this one deeply needs.

Chapter 1
INTRODUCTION

The topic of the sources of law is a traditional one in jurisprudence. Yet, remarkably, very little attention has been paid to the topic in recent analytical jurisprudence. Much contemporary analytical legal theory does not consider the notion of a "source of law" at all. There is no entry for the term in the indices of such central contemporary texts as Alexy 1989; Beyleveld and Brownsword 1986; Dworkin 1978 and 1986; Finnis 1980; MacCormick 1978. Other theorists mention the term and pass on. Raz, for example (see Raz 1979), characterizes his theoretical position as "the sources thesis," that every law has a social source. But he gives relatively little articulation of the concept of a source. Rather, he lays out the implications of such a thesis, leaving the term "source" intuitive and primary. Raz is defending a version of legal positivism. Others too mention the term simply as part of a defence of (Hart 1994; Waluchow 1994) or a critique of (Peczenik 1983; Soper 1984) legal positivism. There is no philosophical examination of the notion of a source of law outside of its use as a piece in the wider game of general theory of law. There is too much theory and too little description, to elucidate what it is to be a source of law.

Among legal doctrinal writers in the common law tradition, the position is reversed. The typical jurisprudence text also leaves the term "source" undefined and primitive; it focuses on classifying and describing "the sources of law" with little acknowledgment that important theoretical questions are begged. The issues are complicated. Gall 1990 reproduces four different taxonomies from four different general textbooks of English law, differences that it would be impossible to reconcile into one master taxonomy. Jolowicz 1963 and Allen 1964 give the fullest treatment, and their classifications are virtually identical. The sources of English law are said to be Custom, Precedent, Equity, Legislation, and Subordinate Legislation. But already that would not apply to Canadian law, whose sources include the Charter of Rights and Freedoms, and embody both provincial and federal jurisdiction. Nor would it apply to European Community Law (see Hartley 1994), or to the United States (see Atiyah and Summers 1987). Under the civil law, doctrinal treatises—legal dogmatics—have some role as a source as well as the code.

One response to this complexity (see Paton and Derham 1972) is to seek to classify the sources of law in a quite different way. Paton and Derham suggest abandoning the single question, What is the source of law?, and they ask instead three questions: What is the secret of the validity of law? Whence comes the material from which law is fashioned? What are the historical or causal influences, which explain why the law is now as it is seen to be? These

are indeed separate enquiries. The first, as I have noted, is part of the traditional general dispute about the nature of law. The last is a question for the social psychologists, for political and social historians (see the account given by Hubert Rottleuthner in vol. 2 of this Treatise). Paton's and Derham's own answer to the middle question consists of an analysis of the public and private interests, which the law furthers and protects: They treat the question as one about the content of law. But the issue is not obviously one about content.

We need therefore to re-focus analytical concern with the sources of law. We need to look again at why it is vital for jurisprudence to be clear about the sources of law, and about the differences between different sources of law.

Let us begin with a classic statement of the idea of a source of law: "the term 'sources' is here used to connote those agencies by which rules of conduct acquire the character of law by becoming objectively definite, uniform, and, above all, compulsory" (Allen 1964, 1). Norms, or standards of behaviour, are of many kinds—maxims of manners and etiquette, statements of moral or legal duties, principles of successful horticulture, rules of sports and games, social conventions, methods of calculation, valid rules of logical inference, and so on. Legal norms are one sub-class of the class of norms. Some groups of norms are interlocking and so form systems. The rules of bridge, for example, presuppose each other; the game only makes sense if all the rules are observed. Some groups of norms exist only as the products of an institution, that is, are institutionalized—the constitution and rules of operation for a social club, for example. These two features of forming a system and being institutionalized may be combined, so that a group of norms may be said to form an *institutionalized normative system.* The term is Joseph Raz's (1975, chap. 4). The typical legal system—the Canadian legal system, for example—is a paradigm case of an institutionalized normative system. A norm counts as *a law*, rather than any other kind of norm, because it emerges from an institution—a governing legislature, example, or a court deciding a case. Laws and legal institutions also presuppose or outrank each other, and have common origins; laws form systems. Legal norms in this way differ from moral norms, even though they may have similar content. The law of contract could be abolished tomorrow by Parliament, and with it the legal obligation to keep a contract: The duty to keep promises would remain.

An enquiry, therefore, into the sources of law is an enquiry into one essential characteristic of law, into part of what makes law what it is and not another thing. Although the connection between being a law and being a norm of an institutionalized normative system is deep, and central to jurisprudence, the thought that it is in the nature of law to be a norm with an institutionalized source is analytically too simple, for two reasons. One reason is that there is an important theoretical division between what in this Treatise are called "strictly institutionalized sources of law" and "quasi-institutionalized sources of law" (see vols. 4 and 5 of this Treatise). The second reason is this. Of the

traditional common law sources, custom and equity may seem to fall outside the scope of this enquiry, as they are in the nature of the case not institutionalized. However, we can learn much about the notion of institutionalized sources of law, and *a fortiori* about the notion of a source of law itself, by considering seemingly non-institutionalized sources. It is important to ask what it is about such sources that entitles them, if they are so entitled, to be thought of as sources of law. Let me say more now about these two reasons.

This volume focuses on "*strictly* institutionalized sources of law." How should we capture the force of the "strictly," assuming for the time being that the notion of "institutionalized" is well enough understood? Here is the working definition of "strictly institutionalized source of law" for the purposes of this volume:

A law, or law-like rule, has a strictly institutionalized source just in case:
i) the existence conditions of the law, or law-like rule, are a function of the activities of a legal institution

and

ii) the contextually sufficient justification, or the systemic or local normative force, of the law, or law-like rule, derives entirely from the satisfaction of those existence conditions.

Clause (i) is intended to capture the idea of a "source" for a rule, and clause (ii) the force of the qualification "strictly." Two further comments are needed on this definition. The expression "law-like rule" is added to permit the possibility that certain forms of law less close to the paradigm of institutionalized sources of law might still qualify as strictly institutionalized sources of law.[1] It might be thought controversial whether the decisions of such sources are "laws" in some strict sense. Also, the term "contextually sufficient" is taken from Aleksander Peczenik (1983, 1; 1989, 156–7). Peczenik defines a contextually sufficient justification as one "within the framework of legal reasoning, in other words, within the established legal tradition, or paradigm." "Deep" or "fundamental" justifications, by contrast, are those from outside the framework of legal reasoning, such as justifications by moral reasoning. For Peczenik, strictly institutionalized sources would be a sub-class of contextually sufficient justifications, but not the whole class (1989, 157). I am concerned, then, in this volume with that sub-class.

Other sub-classes would include the forms of justification considered in Volumes 4 and 5 of this Treatise, as "quasi-institutionalized sources of law." Consider, example, coherentist justifications for legal claims. It might be that, within some jurisdiction, a legal claim is regarded as justified if in fact it is the one of competing claims, which coheres best with the existing body of justi-

[1] In Chapter 5, for example, I consider labour arbitration and mediation as possible strictly institutionalized sources of law. In Chapter 8, the claims of international law are examined.

fied claims within that jurisdiction. Neil MacCormick has argued for the validity of such coherence-based arguments within common law legal reasoning (MacCormick 1984, 46–7; 1978, 152–7, 233–40). Ronald Dworkin extended the idea to include coherence with principles whose postulation would make the legal system the best it could be (Dworkin 1986, 226ff.). Similarly, in most jurisdictions there are well-understood rules for the interpretation of statutes (Cross, Bell, and Engle 1995; MacCormick and Summers 1991). A distinction can be drawn between cases decided by the statutes "directly" and cases decided after the application of rules of statutory interpretation. The statute may be said to be a "strictly institutionalized source of law" in the first case, but a "quasi-institutionalized source of law" in the latter case. Both coherence and interpretation are analyzed by Aleksander Peczenik in Volume 4 of this Treatise. Similarly, there are a variety of modes of legal reasoning and argumentation. A distinction can be drawn between cases decided by the content of a legal source "directly" and cases decided after supplementation of the content of the legal source by one or more acceptable forms of legal argumentation. The source may be said to be a "strictly institutionalized source of law" in the first case, but a "quasi-institutionalized source of law" in the latter case. The analysis of forms of legal argumentation is undertaken by Giovanni Sartor in Volume 5 of this Treatise. By implication, then, my concern here is with potentially "direct" sources of law. I do not intend either now or later independently to define what is meant by "direct." The study of strictly institutionalized sources of law is the study of ostensibly "direct" sources of law.

This notion of "directness," even if it is now left merely intuitive, provides a handle on the second set of issues I distinguished above, the matter of the status of the traditional legal sources of custom and equity. Their claim to be sources of law at all rests on their capacity to decide legal cases "directly," and their claim to do so as "strictly institutionalized sources" rests on the character of their mode of functioning as sources. Custom and equity, including the special form they take in the case of international law, will turn out to be borderline examples of strictly institutionalized sources of law. But the importance of borderline cases lies in the refracted light they shed on the paradigm cases.

The decision to concentrate on contextual rather than deep justification for law limits in important ways the scope of the enquiry here into the sources of law. It is, however, consistent with, and even demanded by, the analytical approach, which I will also take. The focus of the volume will be only how sources of various kinds actually function analytically *within* legal systems. We will investigate in what way legislation, or precedent, or custom, directly generate validity for legal norms, or how it is that these sources are authoritative for legal decision-making. We are not going to investigate the ultimate sources of legal validity itself, if that is taken to be an enquiry into what moral values, or what political forces, or what historical antecedents led to a particular law being a part of the system of which it is a law.

The course of this volume will be as follows. The focus initially will be on the paradigm strictly institutionalized sources—legislation (chap. 2) and precedent (chap. 3). Then I will turn to those of the traditional sources of law, which have proved to be more controversial—custom (chap. 4) and subordinate legislation or delegation (chap. 5). In Chapter 6, the role of constitutions, especially charters and bills of rights, will be considered.

In these chapters, I will reflect my own particular legal and philosophical upbringing, as it were, in that the focus will be on the common law, and on sources of law within the common law legal tradition. The issue of the sources of law presents itself in a somewhat different guise within the civil law tradition. In the strict and formal sense of "source" that I have assumed in these chapters, not much except the enacted code counts as a source of law in the contemporary civil law. The debate over the sources of law nonetheless continues with vigour and vitality. It is important to complete the picture of strictly institutionalized sources of law by considering sources of law within the civil law. I am grateful to Dr. Antonino Rotolo for supplying a chapter (chap. 7) on this topic to this volume. The volume concludes with a chapter on the special topic of the sources of international law (chap. 8), and then a concluding chapter on the notion crucial to any analysis of legal sources of authority. It might seem strange to end, rather than begin, a discussion of strictly institutionalized sources of law with the concept of authority. However, I ask the reader to be patient, and to take Chapter 9 seriously once he or she arrives at that point.

Chapter 2
LEGISLATION

2.1. Introduction

I deal first with legislation as a source of law for a simple reason: Legislation appears intuitively as the paradigm source of law. As we shall see by the end of this chapter, this intuition needs careful handling if it is not to mislead the legal theorist. But it is an excellent starting-point. When we think of law in an ordinary, or pre-philosophical, context, we think of a set of rules controlling behaviour, which are stipulated in one place (the legislature) and applied in another (the courts). Laws presuppose law-makers. Laws tell us what to do, and so there must be some one person or body of persons who does the telling. In H. L. A. Hart's famous tale of the transition from a pre-legal to a legal world (Hart 1994, 91ff.), legislation plays a prominent part. For there to be law, we need a way of identifying which norms are legal norms; we need an agency to introduce new laws, or amend the ones that exist. Only when all this is in place, is there point to turning to the remaining issue of an agency for the settlement of disputes under these laws. The legislature is also deeply implicated in the central ways in which law differs from morality. Laws typically come into existence, are changed, or cease to exist at specific points in time, and as a result of the following of specific procedures. These are not features of moral norms, and as features of laws all typically occur as a result of legislative activity.

Legislation also, in the context of this volume, exemplifies most clearly the working definition of a strictly institutionalized source of law. The definition requires through clause (i) that the existence conditions of the law, or law-like rule, are a function of the activities of a legal institution. Exactly what it is for a norm to become enacted law is for it to the object of the appropriate activities of a specific legal institution, the legislature. Clause (ii) requires that the contextually sufficient justification, or the systemic or local normative force, of the law, or law-like rule, derive entirely from the satisfaction of those existence conditions. That condition is also clearly satisfied by legislation. Legislation is legally binding on courts and on citizens exactly because it satisfies the existence conditions to which clause (i) refers.

The term "appropriate" in the previous paragraph of course alludes to an important acknowledgment. It is not the factual existence of a certain institution, which matters, so much as the existence of a network of rules that define the institution, specify procedures for the enactment of legislation, and so forth. These rules are typically the constitutive rules of the legal order in question. They are part of what I shall call in Section 6.1.1 the "thin" sense of

"constitution." As theorists have emphasized (see for example Hart 1994, 110–7; Alexander and Sherwin 2001, 37–42), the foundation of these rules is typically agreement, whether of legal officials alone, or of officials and citizens, according to the particular theory proposed.

Subsequent chapters of this book make it clear that, even with the restriction to jurisprudential analysis and contextual justification that I have imposed on this essay, it would be a mistake not to acknowledge others sources of law than legislation. Courts—not only within the common law but also within the civil law—exercise legal-rule-making power. Customary law still has a place even in modern legal systems. Legislation as a source of law is expanded by consideration of delegation and constitutions as sources of law. As we shall see, these function as sources of law (to the degree that they do) in their own right. Theorists have been tempted then to say that courts perform a "legislative" function. While that idea obscures central differences between legislation and these other sources of law (see Fitzgerald 1966, 115–6), it does pay tribute to the paradigmatic status of legislation as a source of law.

Two qualifications, however, must be entered. First, Salmond underlines that such a privileging of legislation in the understanding of law is a modern idea: "[E]arly law is conceived as *jus* (the principles of justice), rather than as *lex* (the will of the state). The function of the state in its earlier conception is to *enforce* the law, not to *make* it" (Fitzgerald 1966, 124). Second, we must be careful about the distinction between positive law and legal positivism. The idea of "positive law" is almost as old as law itself. Classical Greece was well aware of the difference between written and unwritten law. The Greek verb used to denote law-making is the verb *tithenai*, which in its basic use means simply "to place." When later Latin writers, including and paradigmatically the medieval natural law theorists, came to develop their own vocabulary, they followed Greek practice and used to describe formal law-making the Latin verb *ponere*, whose basic meaning is also "to place," and whose past participle is *positus*. Hence the English term "positive law," which is found as long ago as the fourteenth century.[1] Positive law is simply law, which is formally enacted or laid down, as opposed to norms which may or may not properly be called "law" and which are unwritten and customary.

This brief excursus into etymology suggests, I want to say, two important things about the term "positive law." The first is that it does not belong to legal positivism; no-one becomes a legal positivist merely by acknowledging that there is such a things as positive law. Legal positivism, rather, is a jurisprudential theory, which identifies the whole of law with positive law (Shiner 1992, 5–9). The second point is that the prime function of the term "positive law," at least historically, is to mark a distinction between the norms identified as "positive law" and other norms which are believed also to deserve the

[1] See John Finnis's historical discussion in Finnis 1996, 195–6, 205–9.

name of “law”—standardly, norms of natural law, or of divine law, or of unwritten law. Legislation presents itself for that reason as the paradigm of law, since legislation is the paradigm of formally “placed” or enacted law. Still, the fact of enactment is one thing, its jurisprudential merits or demerits another, as one might put it.

In the remaining sections of the chapter, I will examine legislation more deeply, under three headings. First, I shall look more carefully into the definition of legislation itself, into concepts essentially connected with legislation, and into a brief comparison of legislation with other forms of law-making. Then I shall consider the relation between legislation as a source of law and the familiar common law doctrine of parliamentary sovereignty. Finally, I shall consider Jeremy Waldron’s complaint (Waldron 1999a) that contemporary legal philosophy does not take legislation seriously.

2.2. Legislation as a Source of Law

2.2.1. Sources of Legislation vs. Legislation as a Source of Law

One preliminary point must be made. When C. K. Allen turns to discuss legislation as a source of law, he begins first with the relationship between legislation and democracy (Allen 1964, 426ff.). He criticizes the simple idea of “sovereign and subject” that the concept of legislation seems to embody, and remarks—rightly, of course—that the relation between the state and its citizens in modern times is much more complicated. He discusses the idea of representative government, and how much leeway democratic principles seem to allow for independent action on the part of the representatives, noting that the technical minutiae of the law must assume some such independence. He considers briefly A. V. Dicey’s conundrum of whether the law creates or follows popular opinion. And so forth. Now, it is not that these are not important questions: In fact, we shall look at aspects of them in later sections of this chapter. However, from the analytic perspective, which I am adopting here, these are not questions about legislation as a source of law. They are more like questions about the sources of legislation itself. These forms of question are not reducible to one another: They must be kept distinct. Taking legislation seriously may indeed, as we shall see in Section 2.4 below, require looking at legislation in the context of democratic politics, and at the function of the legislature in a democratic political structure. But the way that legislation functions analytically within the institutionalized normative system that is a legal system is presupposed by such questions about the sources of legislation, proper or otherwise. This analytic focus must be kept in mind.

2.2.2. *What Counts as Legislation?*

"Legislation is that source of law which consists in the declaration of legal rules by a competent authority" (Fitzgerald 1966, 115). With due respect to the "competent authority" of Sir John Salmond, I find this definition of legislation to be too general to be helpful. As we shall see in Chapter 3, common law courts laying down rules of precedent "consist in the declaration of legal rules by a competent authority." Salmond goes on to say, in order to distinguish legislation from common law rules, that in legislation the rules are laid down by a legislator; this also is unhelpful. The notion of "legislation," or "statute," is in fact complex, as Enrico Pattaro has already valuably noted in this Treatise (vol. 1).

At a minimum, we have to distinguish between: i) acts of the legislature laying down rules of law, the class of which most familiar legislative acts consist; ii) acts of the legislature which do not lay down rules of law—for example, an act to ratify a treaty, or to change the appearance of the monarch on coins, or to change the interest rate on government savings bonds; iii) rules of law laid down which are not acts of the legislature, but still are enactments and not common law decisions—for example, a great deal of the apparatus of the modern regulatory state results from law-making outside of the legislature. All of these may be called "statute" or "legislation" in the broadest sense of these terms. In the context of a complex legal order such as the European Union, the general term "legislation" comprehends many different sub-categories of norm. There are regulations, laying down general rules binding both at the Union and Member State levels. Directives are binding, but only on specific Member States, and on Member States they are binding only as to the result, not the legal regime to bring about the result. (That is, legislation must be passed to achieve a certain result: But the form of the legislation or regulation fit to achieve this result is to be decided by individual member States themselves.) Decisions may bind either Member States or private parties. Recommendations and opinions are not binding at all. There are further cross-currents between these sub-categories: see Hartley 1994, 107.

2.2.3. *Codification vs. Consolidation*

"Many codifiers emphasize that one of their aims is to make the law simple and accessible, logically arranged and harmonious, certain and definite" (Paton and Derham 1972, 255). Two conflicting but deep pictures of law hold us captive. We seem to want there to be a right answer to every question of law, and so we want the written statement of the law to be such that every issue is covered in a clear and comprehensive rule. On the other hand, we value deeply the image of the judge as the person of perfect individualized judgment, who appreciates the subtle merits of the individual case independently

of the generalities of written law. Ronald Dworkin's well-known fantasy of Hercules the ideal judge taps into both these pictures, albeit (as I have argued elsewhere, Shiner 1992, chap. 7) in a confused and confusing way. The ideal of the perfectly codified law, which will generate all the right answers, is another version of these pictures. Any actual codification falls short of the ideal.

> No draftsman can altogether avoid such flaws as ambiguity, obscurity, or conflict of sections, and even if he could, new problems arise which could not possibly have been foreseen and new social philosophies become popular which are out of keeping with the basis on which the code is built. (Paton and Derham 1972, 255)

For all that, codification achieves two goals. It takes tangible steps towards the goals of simplicity, logical arrangement, certainty, and definiteness. The common law is well described as "essentially incomplete, uncertain, and unsystematic" (Fitzgerald 1966, 128).[2] Codification can take the accumulated and haphazard growth of individual statutes, individual common law decisions, and even customary law, and compose it into a "harmonious" whole. Second, codification may serve an important political purpose. As Frederick Schauer has shown (Schauer 1991, 158–62), in virtue of their necessary opacity to their background justification, rules are important devices for the allocation of power. "A decision-maker instructed to make rules according to a set of rules is thereby instructed not to consider certain facts, certain reasons, and certain arguments" (ibid., 158). A code in the nature of the case places much power in the hands of the codifier. In a context of democratic politics that might be important.

Codification, however, while pervasive in the civil law world, is rare in the common law. In Canada and elsewhere in the British Commonwealth, the criminal law is codified. In the U.S., the Uniform Commercial Code extensively regulates trade and commerce. But these are exceptions. Consolidation on the other hand is a normal legislative practice. As a body of statutory law grows, an aggregate of discrete statutes may come to resemble a body of common law in its incompleteness and uncertainty. Consolidation takes *those statutes* and makes them into a harmonious whole. Consolidation of a body of statutory law does not incorporate the existing common law; it only rationalizes existing statutes. It is also not properly regarded as an occasion for changing the law. "In cases where the meaning [of a statute] is doubtful, it is presumed, in the absence of evidence to the contrary, that the consolidation is not intended to change the law" (Paton and Derham 1972, 249). Moreover, "respect is still paid to prior [case law] decisions interpreting a section which is drawn into the consolidation" (ibid.).

As Salmond indicates (Fitzgerald 1966, 131), the on-going project of the American Law Institute to provide formal Restatements of different areas of

[2] Not that those features aren't the vices of the virtues of the common law: see chap. 3.

U.S. law is an interesting intermediate case. The several Restatements are unlike both statutes and codes in not being binding law, or rules of a formal rule-making source. On the other hand, they are treated with great respect by courts in the U.S. They are like codes and unlike consolidations, in that they aim to include existing common law as well as statute law. They are unlike both codes and consolidations, in that, especially in cases of conflict, the restaters exercise some independent judgment on what would be the preferable rule to have, separately from any degree of authority behind the rule.

2.2.4. Statutory Interpretation

I will pass here quickly over an essential aspect of legislation as a source of law, the matter of statutory interpretation. As we shall see also in Chapter 3, legislative rule-making differs from common law rule-making, in that, in the case of statutes, the exact wording of the statute is canonical. In a precedent-setting common law decision, a court may state the rule, which it finds in the case. But that wording is not in itself binding on future courts. However, when the legislature enacts a bill, exactly that wording and no other is written into law. As we have noted already, legislative draftsmen and -women are human; they cannot imagine every eventuality. Nonetheless, courts have no alternative but to confront the wording that was enacted.

There are many rules of statutory interpretation. It is not true that courts can make the wording of a statute mean anything that they want it to mean. As Waldron has noted, to the extent that law makes use of specific verbal formulations, it seeks to connect and associate itself as a social institution with another institution—the institution of natural language. In particular, the law seeks to associate itself with *whatever interpersonal determinacy there may be in natural language communication* (Waldron 1999a, 82–3). A recent standard treatise expresses the basic rules of statutory interpretation this way:

1. The judge must give effect to the ordinary or, where appropriate, the technical meaning of words in the general context of the statute; he must also determine the extent of general words with reference to that context.
2. If the judge considers that the application of the words in their ordinary sense would produce an absurd result, which cannot reasonably be supposed to have been the intention of the legislature, he may apply them in any secondary meaning, which they are capable of bearing.
3. The judge may read in words which he considers to be necessarily implied by words which are already in the statute and he has a limited power to add to, alter or ignore statutory words in order to prevent a provision from being unintelligible or absurd or totally unregulated, unworkable or totally irreconcilable with the rest of the statute. (Cross, Bell and Engle 1995, chap. 3)

In addition, the judge may resort to a variety of other aids in construction and presumptions such as preservation of meaning throughout a statute, interpretation clauses embedded in a statute, rules of language itself, historical context, (more controversially) legislative history, presumptions against unclear changes, retrospective operation, and so forth. All these aids and presumptions are discussed in detail in Cross, Bell and Engle 1995, chaps. 5–7.

Principles of statutory interpretation of this sort are very much rooted in the language of the statute, and in the intention of the legislature as revealed by the language of the statute. In the U.K. the tradition of statutory interpretation is typically conservative in the sense of adhering closely to language and interpretive principles associated with language. In the U.S., on the other hand (see Atiyah and Summers 1987, chap. 4), the intention of the legislature may play a role independently of its embodiment in the language of the statute, and, more importantly, the underlying purpose of the statute also plays a role. In Canada, unsurprisingly, both influences are felt. In the case of ordinary statutes, the tradition of interpretation is closer to the U.K. But the Supreme Court of Canada has made it clear that where interpretation of the Canadian Charter of Rights and Freedoms is concerned, interpretation will be purposive (see Hogg 2002, chap. 33, sec. 7). A more general analysis of forms of statutory interpretation in different jurisdictions may be found in MacCormick and Summers 1991.

The issue of interpretation as applied to law, especially as regards the more linguistically free forms of interpretation, falls, in all its complexity, to be discussed by Aleksander Peczenik in Volume 4 of this Treatise. I will confine myself here to mentioning one example, the only serious legal case in which I have been personally involved. One important principle of statutory interpretation is that words shall mean the same throughout a given act, and its converse is that if there is a difference in wording, something different is meant. Two different sections of the Canadian Income Tax Act concerned circumstances under which allowances paid to separated or former spouses were a legitimate pre-tax deduction from income. The two sections were very slightly different in their wording (in 1982, anyway; the wording has been cleaned up since). Revenue Canada used this difference as a ground for discontinuing to permit deductions of certain forms of allowance under one section, which would have been permitted under the other. A large number of people were affected, including myself, and the sums of money involved were considerable. One taxpayer took the issue to the Supreme Court of Canada. The Court stated in a unanimous decision that the intent of each section was obviously the same, that the government had no ground for investing a slight change of wording with such significance, and (in polite legal language, of course) that the government should stop harassing innocent taxpayers and get on with something more important (*Jean-Paul Gagnon v Her Majesty the Queen* 86 DTC 6179 (1986)). A very satisfying result—words really can't mean anything the government wants them to mean.

2.2.5. Legislation and Common Law

Important contrasts can be drawn between the operation of legislation as a source of law and the other chief contemporary source of law within the common law, precedent. "The first virtue of legislation lies in its abrogative power" (Fitzgerald 1966, 125). It is as easy (or not, as the case may be) for legislation to abolish existing law as it is for it to create new law. As we shall see in Chapter 3, a common law precedent, once set, remains indefinitely as part of the law. It can only be distinguished—its effect mitigated by a process of ever-narrowing interpretation.

Legislation easily satisfies rule of law constraints on retroactivity. A statute is passed, and promulgated. It comes into effect at a specific point in time, and from that point in time onwards. In the case of a common law decision, however, the decision is applied immediately to the litigation in the course of which the decision arises, even if the decision is in some sense a new decision. This contrast can be exaggerated. The very idea of reasoning from precedent is that the new conclusion is a natural inference from existing cases, and so in some sense should not come as a surprise. But the common law cases, which typically find their way into adjudication, are so-called "hard cases," cases where the law speaks with an unclear voice, or with many voices. Thus there still is some element of retroactivity. On the other hand (cf. here Fitzgerald 1966, 127ff.), legislation is not always free of retroactivity. Legislation often needs interpretation. That interpretation will be conducted by a court, and applied by the court to the litigation before it in a manner which involves a form of retroactivity not much different from that in common law cases. Suppose that the tax case I mentioned above had gone against the taxpayer. Those of us affected by the decision might well have felt we were being judged retroactively. We had deducted certain expenses in good faith, believing on the advice of legal professionals that such deductions were lawful. The courts appear to have changed the rules after the fact.

Legislation is also essentially anticipatory, or pro-active—it sets the rules under which future legal cases will be decided prior to those cases occurring. Common law adjudication, by contrast, can only deal with cases—fact situations—which happen actually to be litigated. The common law court may deeply desire to change the law. But it cannot act until a suitable case occurs before it. "So far as precedent is concerned, a point of law must remain unsettled, until by chance the very case arises" (Fitzgerald 1966, 128). Finally, Salmond urges, legislation differs from case law in that legislation consists of "abstract propositions," rules stated in general terms, while precedent "is merged in the concrete details of the actual cases to which it owes its origin" (ibid., 129).

2.2.6. Legislation vs. Adjudication

The points in the previous section compared legislation with common law precedent as differing sources of law. But it is also possible profitably to compare legislation with adjudication as forms of regulation of social life. Such a comparison raises a different set of issues, since adjudication as a technique of regulation extends to more than just the domain of common law precedent, even though there is some overlap to the set of distinctions and the reasoning in support of them.

Regulating an area of life by means of legislative rule-making, as opposed to leaving it to adjudicative rule-making, brings certain benefits, especially in areas of economic and social policy. Iain Ramsay gives a number of reasons to defend such a view in the specific context of consumer protection legislation, but his analysis is readily extended to other contexts (Ramsay 1989, 74–5).[3] Ramsay's reasons are these. 1) Adjudication is focused on the rights and duties of the individuals before the court, not on the broad range of policies available on some given regulatory issue. 2) Courts have limited framework of remedies, compared to a legislature or an administrative agency. 3) Adjudication is piecemeal, and development of doctrine is incremental. 4) Courts are passive and reactive; they can only await appropriate cases. Litigation is ex post facto, and cases litigated are not necessarily representative of the underlying problem which regulation might be needed to address. 5) Fact-finding in adjudication is ill-suited to broad social facts and general policy issues, and there are difficulties in assembling behavioural science data in context of any given individual lawsuit. 6) Adjudication makes no provision for policy review or monitoring of compliance, and the only available feedback mechanism is another, follow-up lawsuit.

These points can be well illustrated by recent litigation over so-called freedom of commercial expression. The granting of constitutional protection to corporate advertising has led to many cases where courts have stepped in to invalidate regulatory schemes devised by legislatures. But the results have standardly been as unhappy from the point of view of good public policy as Ramsay's analysis predicts.[4] In order:

1) The U.S. Supreme Court in *Coors* (*Rubin v Coors Brewing Company* 115 SCt 1585 (1995), 1590–1) has great fun pointing out the tension between the government's desire to prohibit providing information about the alcohol content of beer on bottle labels, and its general desire in other areas of alco-

[3] He is summarizing a more extensive argument in Horowitz 1977, 34–56. I in turn am summarizing Ramsay. These advantages would be in addition to those mentioned by Waldron 1999a and discussed in Section 2.4 below.

[4] I summarize here an argument given at greater length in Shiner 2003, chap. 13, sec. 6. For criticism of the doctrine that commercial expression merits constitutional protection under freedom of expression provisions, see Shiner 2003, passim.

hol labelling and food labelling generally for more disclosure on the part of manufacturers. But such an *ad hoc* charge of inconsistency, while arguably sufficient to decide the specific case at bar, falls well short of a serious consideration of overall food and drug labelling policy.

2) The Supreme Court of Canada in *RJR-MacDonald* (*RJR-MacDonald Inc v Attorney-General of Canada; Imperial Tobacco Ltd v Attorney-General of Canada* [Indexed as: RJR-MacDonald Inc v Canada (Attorney-General)] (1995) 127 DLR (4th) 1) struck down central provisions of federal policy expressed in the Tobacco Products Control Act, but left nothing in its place. Even though the holding was far from the endorsement of tobacco advertising that its critics feared (Shiner 1995, 8–9), the federal government was left scrambling to draft replacement legislation. Only a welcome, and uncharacteristic, degree of reticence on the part of the tobacco manufacturers themselves prevented two steps backwards in this tactic of the fight to preserve the nation's health.

3) In the case of professional advertising by lawyers the U.S. Supreme Court in fact has developed over a twenty-five year period something like a detailed regulatory scheme. Arguably, this is due entirely to the contingencies of the large number of suits brought by parties with the energy, expertise, and depth of pocket to take them to the Supreme Court. Consider, however, the state of the doctrine in the early days of its development. Although the U.S. Supreme Court tried hard in *Bates* (*Bates v State Bar of Arizona* 433 US 350 (1977)), the earliest case, to lay down some general principles, still the case had to be decided on its particular facts. The Court could not rule in advance on solicitation in pursuit of associational freedoms, or on in-person solicitation, or on regulation of advertising of area of practice, or on fee advertising, or on direct-mail solicitation, until cases introducing those issues came before them. That took until 1988. Still other issues lay ahead—on advertising areas of specialty, and statutory waiting periods before initiating direct-mail solicitation. The Court eventually took eighteen years to develop incrementally an *ersatz* regulatory scheme, which a legislature could have done, and likely done better, in, say, one.

4) The U.S. Supreme Court appears to have taken *Wileman* (*Glickman v Wileman Brothers and Elliott Inc et al* 117 SCt 2130 (1997)) largely in order to resolve a conflict between two decisions in different circuits of the U.S. Court of Appeal (ibid., 2137) concerning compelled generic advertising within the agricultural industry. In *Wileman*, the Supreme Court upheld such a scheme in the case of fruit producers, departing from its usual pattern of protecting corporate advertising. *United Foods* (*United States v United Foods, Inc* 121 SCt 2334 (2001)), heard shortly after, offered the chance for the stars to reappear in their proper places in the constellation, as two judges from the *Wileman* majority changed sides to form a majority to reject a generic advertising scheme for mushroom producers. The holding was an exercise in distinguishing without a differ-

ence. Generic advertising exists throughout the agricultural industry. The Court can achieve reform, supposing reform to be needed, only by dealing with parts of the industry one by one as producers in any given part happen to bring litigation.

5) Struggles with social science data and evidentiary standards have taken place in both the U.S. and Canada. I will mention here a Canadian example. In the trial hearing of *RJR-MacDonald* (*Re RJR-MacDonald Inc and Attorney-General of Canada; Re Imperial Tobacco Ltd v Attorney-General of Canada* (1991) 82 DLR (4th) 449 (Que SC)), large amounts of data were presented by both the government and the tobacco manufacturers concerning the relation or otherwise between consumption of tobacco products and health disorders, and between tobacco advertising and consumption of tobacco products. Nonetheless, the trial judge laid down that "the connection [...] between health protection and tobacco advertising is tenuous and speculative" (at 512), and that "the evidence of a rational connection between the restrictions and the objective sought is deficient, if not non-existent" (at 515).[5] The Supreme Court was plainly perturbed by the issue. McLachlin J. (as she then was) took this finding to stand for the proposition that there was no *scientific* evidence for a link between tobacco advertising and consumption of tobacco products, but she took advantage of precedent to deem a causal relationship to exist "on the basis of reason or logic, without insisting on direct proof" (at 97). Such an approach essentially eliminates social science data from performing any argumentative role.

The case demonstrates the problems in trying to adjudicate via social science data. If huge amounts of data are presented, neither judges nor their clerks have the professional expertise to evaluate the data, and so the data cease to be able to perform the evidentiary function for which they were introduced. If modest amounts of data are presented, it is only to easy to claim that more could have been presented, and again the evidentiary role of the data is excluded. There is no serious doubt about the propriety of basing regulatory schemes on social science data, whether economic, or sociological, or psychological. Legislatures and regulatory agencies do it all the time. The irony is that courts are in no position to assess whether a legal standard they themselves have set—the proof of a rational connection between an objective and a social policy—has in any given case actually been met. Thus the legal decision as to whether it has been met cannot be made on the only grounds, which are relevant.

6) The story of *RJR-MacDonald* provides an illustration again of the weaknesses of courts as a regulatory mechanism. Important sections of the Tobacco

[5] The second time around, *JTI MacDonald Corporation et al c La procureure générale du Canada* 500-05-031299-975 (2002) (QSC), neither side took any chances. The stack of data provided was immense, and the number of intervenor briefs permitted extraordinary. Denis J's limiting his opinion to 196 pages is a remarkable feat in itself.

Products Control Act were struck down, leaving the government no choice but to develop a new statute to replace. This they did, the Tobacco Act. That Act has now been challenged again by the tobacco manufacturers (see n.12 above). It took four years for the previous case to reach the Supreme Court of Canada for a final determination, and doubtless the time-period will not change this time. In the meantime, the Act remains in force, which is fine if you agree with it, and frustrating if you do not.

Waldron rightly points out that theorists who disparage the factionalism of legislative politics in favour of what they see as the impartial and principled adjudication of courts are just being normatively idealistic about courts. What would happen, he asks, if we were just as idealistic about legislatures (Waldron 1999a, 32)? That is an important and interesting question, and I will return to this issue again in Section 2.4 below. For now, I want to underline that my argument in this section does not turn on being idealistic or otherwise about legislatures as opposed to courts. I am simply pointing out structural features as to which legislatures and courts differ, and indicating the consequences for the design of legal institutions that follow from these differences.

2.3. Legislation vs. Sovereignty

In the common law world, legislation as a source of law is historically and doctrinally linked with the idea of parliamentary sovereignty. I want in this section to examine this historical link further. I shall argue that, whatever the strength of the link historically, there is no link conceptually. The doctrine of parliamentary sovereignty is not an implication of the very idea of legislation as a source of law. There will be two threads to my argument. First, I shall show that the reasons for finding a conceptual link are inadequate. Then I shall deconstruct the temptation to find that there is a link.

The doctrine of parliamentary sovereignty is well put in the following comment:

> What the statute itself enacts cannot be unlawful, because what the statute says and provides is itself the law, and the highest form of law that is known to this country. It is the law, which prevails over every other form of law, and it is not for the court to say that a parliamentary enactment, the highest law in this country, is illegal. (*Cheney v Conn* [1968] 1 All ER 779, at 782, per Ungoed-Thomas J; quoted by Dias 1985, 88)

As Goldsworthy has pointed out (1999, 243–4), the doctrine itself is not properly regarded as either a matter of statute law or a matter of common law. Parliament did not enact a law that it should be supreme, nor is the doctrine judge-made law like a contemporary rule of precedent. Goldsworthy quotes with approval G. C. Winterton's statement that the doctrine of parliamentary sovereignty is "*sui generis*, a unique blend of law and political fact deriving its authority from acceptance by the people and by the principal institutions of

the state, especially parliament and the judiciary" (Goldsworthy 1999, 243; see Winterton 1996, 136). If such a practice of acceptance began to change, then we would say that the constitution of the country in question would also be changing. As we shall see in Sections 6.3–6.4, there is some evidence that in Australia and Canada, such a change has taken, or is taking, place. In the U.K. also, the passing of the Human Rights Act may well involve some modification of the doctrine, although Richard Edwards at least argues that so far courts are still deferring to parliament rather than taking the opportunities for independent development of doctrine that the Act provides (Edwards 2002). It is often assumed that parliamentary sovereignty only became established as a part of U.K. law in the nineteenth century, the period of its greatest jurisprudential advocate, A. V. Dicey (Dicey 1959). Goldsworthy (1999, passim), however, mounts a detailed historical argument that acceptance of the doctrine began as long ago as the sixteenth century. Allen dates the beginning to the end of the fifteenth century (Allen 1964, 445).

My perspective here is analytical and conceptual, not historical or sociopolitical. From the analytical perspective, Julius Stone draws the crucial distinction. In discussing the work of John Austin, who famously made the commands of a sovereign with unlimited power the centrepiece of his theory of law, Stone urges that we must distinguish "the sovereignty-concept in the logical structuring of law, and sovereignty as descriptive of power relations" (Stone 1968, 71ff.). What Stone has in mind is this. Sovereignty as descriptive of power relations is exemplified in the practice of acceptance in the U.K. that we have described. As a matter of fact, courts, legislators, and citizens alike acknowledge the supreme position of parliament—the legislature—as lawmaker. Courts and citizens follow the practice of regarding the legislature as the source of supreme legal power. The concept of sovereignty as an element in a proposed analysis of the necessary structure of law is different. The question then is, Is it possible to conceive of a legal system, which lacks a strictly institutionalized source of law of the form, which the doctrine of parliamentary sovereignty attributes to legislation? Is it possible for a legal system to exist, which does not recognize the supremacy of legislation?

The answer to this question seems clearly to be, Yes we can. As I have indicated, and will discuss further later, it is beginning to look as though Australia and Canada, both common law jurisdictions, have decided they may well be able to get along without a strong doctrine of parliamentary sovereignty. Canada in fact already departed from a strong version such as that found in the quote from Ungoed-Thomas J above, when in 1982 the Charter of Rights and Freedoms became part of the supreme law of Canada. The Charter imposes in the name of human rights limitations on what legislatures in Canada can enact. Yet the Canadian legal system is uncontroversially a legal system. As I shall remark in Chapter 6, the entrenchment of a charter or bill of rights imposing limits on legislative power is increasingly common in contemporary legal systems.

Why might one be tempted to think otherwise? Two possibilities suggest themselves. Both are suggested by Goldsworthy. First, he argues that, although it is not a logical or practical necessity that Parliament should have ultimate authority to decide what the law is, "it is a practical necessity that *some* institution have ultimate authority to decide any legal question that might arise, even if it is a different institution with respect to different types of questions" (Goldsworthy 1999, 261). The last clause acknowledges that, for example, in a legal system with a constitution and judicial review, it might fall to the Supreme Court of the jurisdiction to decide with finality constitutional questions. It might fall to the legislature, on the other hand, to decide finally economic questions, in the sense that duly enacted laws as regards economic policy are not reviewable by the courts.

The second argument I extract from Goldsworthy is this. In discussing judicial review, he comments that, in any legal system, at least one institution must ultimately be trusted to adhere to whatever principles are believed to limit its authority (Goldsworthy 1999, 278). It is a mistake, he believes, to argue for a wide scope for judicial review of legislation on the grounds that such review is necessary to ensure adherence by the legal system to fundamental principles of political morality. We must at some point just trust courts, or just trust legislatures, to respect fundamental principle.

On the face of it, both arguments fail as arguments for the necessity of a sovereign legislature. Even if finality as such is necessary for law, finality may be found in more than one place in a legal system. The decisions of a supreme tribunal are final within that tribunal's jurisdiction, and the tribunal may have powers of review over legislation. Much the same applies to the necessity of trust. Trust or acceptance at some point is needed, true. But it too may as well be bestowed on a supreme tribunal as on a legislature, or on each in equal proportion. So we still lack a sound reason for the necessity of a sovereign legislature.

Let us advance on the issue from a different direction. Joseph Raz argues that any legal system must have what he calls a "primary norm-applying institution"—an institution "with powers to determine the normative situation of specified individuals, which are required to exercise those powers by applying existing norms, but whose decisions are binding even when wrong" (Raz 1975, 136). However, he rejects the view that a legal system needs a primary norm-*creating* institution. The "existing norms" which the above characterization alludes to could perfectly well be either customary or norms which the norm-applying institution has itself already recognized by application. On this view, then, a legislature as a source of law is not necessary for a normative system to qualify as a legal system. If Raz is right, not merely is a sovereign legislature not conceptually necessary for law or legal system, any legislature at all is not necessary.

Raz's argument, however, is open to one immediate objection (cf. Waldron 1999a, 35). The argument does not mention a possibility that actually exists

anywhere. In every contemporary municipal legal system there is a legislature which functions as a source of law. To what extent can it be considered the task of legal philosophy to investigate conceptual possibilities that do not reflect empirical realities? But if Waldron's scepticism about the high abstractness of Raz's argument is justified, and justified precisely because of the standard role of legislatures in contemporary municipal legal systems, then conceptual space is apparently opened up for the implementation of Goldsworthy's two proposed "necessities" to be themselves necessarily applied to legislatures. I will explain.

Goldsworthy argues, in effect, that in any legal system there must be fundamental rules for decision-making finality, whatever the institution in the legal system in which such finality resides. He argues also that there must be in any legal system acceptance or trust of legal institutions as being themselves institutions, which understand and accept their role. Specifically, legislatures must be accepted as not invariably needing their decisions reviewed by courts for content. These two points may be combined with the failure of Raz's abstract argument that a legal system can be imagined which has no legislature. All three points combined seem then to offer a powerful argument, not only for the necessity of legislation as a source of law, but for legislation with (at least in some respects) a position as a supreme source of law. From there it is a short step, although not a logically necessary one, to the analytic necessity of a sovereign in any legal system.

The impression, however, is misleading. Clearly, from the point of view of where the actual centre of power is in any given legal system, it is clear that the centre does not have to be the legislature. Thus, if it is the case that in some given legal system, the legislature is accepted as sovereign, that will be a contingent feature of that system. The point of view of actual power does not help to appreciate analytically the role of legislation as an independent source of law. The point of view of abstract possibilities does not help either; standardly contemporary municipal legal systems do have legislatures, and legislation does function as an independent source of law. However, this independent functioning, combined with the need for finality in legal decision-making, and the need for sources of law, which rest on trust and acceptance, not derived validity, seem to forge an analytical connection between legislation and sovereignty. Acknowledgment of such a link must be rejected. The fact remains that Goldsworthy's two arguments on their own do not succeed. The failure of Raz's argument shows at most that a legislature in some form is necessary for law or legal system. It does not show that a sovereign legislature is necessary.

2.4. Taking Legislation Seriously

I have alluded already to Waldron's complaint that contemporary legal philosophy does not take legislation seriously. The tendency, attributed by

Waldron to the influence of legal positivism (Waldron 1999a, 44–5), is to regard the legislature as a "black box." All that matters is the fact of enactment; whatever goes into the constitution of that fact is irrelevant to legal philosophy.[6] A standard is not part of the law until it is enacted. It is not of interest to legal philosophy until it is part of the law. So the process of enactment is not of interest to legal philosophy.

There is a truth in this argument. Although the truth does not justify legal positivism, it provides positivism with some impetus. The truth is this: A standard is indeed not part of the law until it is enacted, or until it is acknowledged by a precedent-setting decision.[7] But the challenge to positivism is this. It does not therefore follow that what it is for the standard to be part of the law can be reduced to the fact of enactment. It may be that natural law theory is correct. Enactment is intimately connected to what makes something *positive law*; but we do not understand positive law unless we conceive of it as internally related in complex ways to natural law.

I am not going to explore these issues here; I have discussed them at length in Shiner 1992. Waldron's opposition to positivism's failure to take politics seriously has a similar shape to natural law theory. I do not say, "is a natural law theory," because his theory of legislation is also in a crucial respect different from natural law theory, as I will explain. For Waldron, taking politics seriously is necessary for *legal* philosophy, because law-making or legislation, a central focus of legal philosophy, cannot be properly understand unless it is seen as taking place in "the circumstances of politics." This idea, he says, is adapted from John Rawls' discussion of "the circumstances of justice" (Rawls 1971, 126–30), itself derived from David Hume (see for example Hume 1902, sec. 3, part 1, 183–92):

> The felt need among the members of a certain society for a common framework, or decision, or course of action on some matter, even in the face of disagreement about what that framework, decision, or action should be, are *the circumstances of politics*. (Waldron 1999a, 102; his emphasis)

We live in pluralist, diverse, and multicultural societies. We disagree about many things. Most importantly, we disagree about justice, about "what count as fair terms of co-operation among people who disagree about the existence of God and the meaning of life" (Waldron 1999a, 1). We will continue to disagree about these matters, even if some conclusion as to policy or action has been

[6] One might take this further. Differences between legislation and other forms of legal source are elided also, so that legal positivism becomes the thesis that "the existence and content of every law is fully determined by social sources" (Raz 1979, 46–7), and from then on the discussion concerns what follows from this generalization. I hope that this book does enough to show that differences between sources cannot be so easily overlooked.

[7] We will see in Chapters 4 and 5 to what extent custom and delegation as sources of law force any modification of the "truth."

reached. This ever-present disagreement among people who nonetheless need to decide or take action constitutes the circumstances of politics. Law is made, legislating takes place, in the circumstances of politics. It is our response to the circumstances of politics. No theory of legislation, and *a fortiori* no theory of law, can succeed if it does not take this fact about legislation seriously.

Waldron then develops his theory of legislation by showing how so many of the familiar features of contemporary legislatures fall into place, if legislation is seen as internally related to the circumstances of politics. Legislative assemblies are standardly large, with members in the hundreds. The underlying value here is democratic legitimacy. Our preference for large legislative assemblies has to do with seeing the law as the law of the land, or the law of a people. With legislation by popular assembly, law wells up from those who are subject to it, rather than being handed down to them from on high (Waldron 1999a, 52–66). The formality of procedure in a large legislative assembly stems from the need to respect diversity (ibid., 72ff.). The focus in legislation on specific canonical wording—both on which proposal is the subject of deliberation and debate, and which version of which proposal—is a way for the law in the circumstances of politics to associate itself with whatever interpersonal determinacy there may be in natural language communication (ibid., 39, 82–3). Voting (majority decision-making) involves a "commitment to give equal weight to each person's view in the process by which one view is selected as the group's" (ibid., 114). In short, "every feature of the majority-decision method that seems arbitrary can be defended as reasonable in the circumstances of politics, and indeed as expressive of perhaps the most robust conception of respect for persons that we are entitled to work within those circumstances" (ibid., 116–7).

Waldron's theory of legislation is opposed to the typical positivistic theory, in that, like natural law theory, it looks beyond the fact of enactment to the circumstances in which enactment takes place, the circumstances of politics, and to the values that such circumstances subtend. Enactment as a process seen in the large is rooted in the need for collective decision-making in the face of fundamental disagreement about not only the answer to some political question, but also the principles on which answers to such questions should be based. However, such a focus on disagreement is also exactly what distinguishes Waldron's theory from natural law theory, in that natural law theory will assume convergence on some particular principles and answers to political questions as proof of the proper working out of the natural law. It is not that natural law theory is absolutist and leaves no room for legitimate difference of opinion. Aquinas familiarly allows for human law to be related to the natural law "by way of determination of certain generalities" (*Summa Theologica*, I–II, q.95, a.2)[8] or "like implementations of general directives," to give Finnis's transla-

[8] *Summa Theologica*, I-II Q.95 A.2, Aquinas (1988), 59.

tion of the same passage (Finnis 1980, 284).[9] Murder is invariably wrong, but local variation in the manner of punishment is possible. But the range of possible "determinations" or "implementations" is still finite. Punishing murder by a $500 fine is not a permissible determination of the natural law. There is no room for the ultimacy of political disagreement embraced by Waldron.

I have alluded several times in this chapter already to the existence in many legal systems of powers held by the courts of judicial review of legislation. The topic of judicial review and its legitimacy from the point of view of political morality is a huge one, and will be discussed only superficially here. It is vital to distinguish between judicial review of legislation—in terms of its relation to principles of individual rights and freedoms as embodied in an entrenched charter or bill of rights—and judicial review on narrower jurisdictional grounds or on constitutional grounds that are not right-based. Courts as policing agents to make sure government administrative action remains within its legislatively-determined grounds is not at first sight problematic. It may become problematic, though, if courts help themselves to a wide range of so-called common law values to assist them in this policing.[10] The debate over the undemocratic or otherwise character of judicial review focuses primarily on the former kind of review, where review takes place against a background of principles of political morality.

Judicial review in this form does not lack for defenders in contemporary legal theory, even outside the natural law tradition. The most well-known in the anglophone world is likely Ronald Dworkin (1978; 1985; 1986; 1996; see also Freeman 1990). It follows, of course, from Waldron's position of taking legislation seriously that he is deeply suspicious of court-held powers of judicial review in this sense. The nub of his objection is as follows:

> When citizens or their representatives disagree about what rights we have or what those rights entail, it seems something of an insult to say that this is not something they are permitted to sort out by majoritarian processes, but that the issue is to be assigned instead for final determination to a small group of judges. It is particularly insulting when they [sc. citizens or their representatives] discover that the judges disagree among themselves along exactly the same lines as the citizens and representatives do, and that the judges make their decisions, too, in the courtroom by majority-voting. (Waldron 1999a, 15)

Here Waldron makes common cause, although on different grounds, with contemporary versions of legal realism such as Critical Legal Studies, Critical Race Theory, and feminist legal theory, all of who have urged the essentially partial and political nature of judicial review under a disguise of judicial independence and impartiality.[11] The difference between Waldron and these po-

[9] See Finnis 1980, 281–90 for the issue of *determinatio* generally.

[10] The issue in this form has been the subject of some recent spirited debate in the U.K. For both a survey and a contribution, see Elliott 1999.

[11] For more on these approaches to law, see Volume 11 of this Treatise.

litically radical theories of law is that the radical theories are, as Hart pointed out many years ago (Hart 1983, 126ff.), frustrated idealists about adjudication. When the reality of the "political" character of judicial decision-making hits home, despair follows. Waldron, by contrast, takes the "political" character of judicial decision-making as a given, and then wonders why we then need a second, undemocratic and unrepresentative level of "political" decision-making. I put "political" in scare-quotes, for the reason that, for Waldron of course, "political" is a term with positive, not negative, connotations. Politics celebrates democracy and diversity, as it should. If issues present themselves, which are at rock bottom political issues—issues about civic and public life on which disagreement among citizens is rife and persistent—then these issues should be settled by the political process itself. The role of law in politics is exemplified for Waldron by legislation, not adjudication. Legislation, not adjudication, takes rights seriously.

It may be said that charters and bills of rights represent the moral and political ideals of a people, and therefore that courts which seek to enforce these rights as limits on legislative action are as representative of the people as legislatures themselves. If I understand Waldron aright, in his view such a claim obscures this fact. Even if there is agreement on the ideals, which is not necessarily the case, it will be agreement at a high level of abstraction. At the level of concrete application to cases, disagreement will be rife among the people. Courts, for Waldron, are not the places to resolve such disagreements. We cannot settle this theoretical (and practical) dispute here.

2.5. Conclusion

I said at the beginning of this chapter that we would in it be led to see the complex character of the intuition that legislation is the paradigm source of law. Here is how we have, if we have, succeeded. Legislation stands firmly at the interface between the legal system as a normatively autonomous system, and wider political and social life in which the legal system is embedded. To adopt legislation as the paradigm of law, as Waldron's theory of legislation has urged, thus forces the legal theorist away from the autonomy of law towards its fundamental character as a social institution. Nonetheless, legislation presents in its starkest form the moment of transformation at which a norm changes from being a moral or social norm into a legal norm. Thus legislation forces the legal theorist away from the character of law as a social institution towards law as an autonomous institutionalized normative system. If legislation is the paradigm of law, it is a deeply unstable paradigm. That may well be an advantage, however, of legislation as a paradigm of law. As I have argued elsewhere (Shiner 1992, 323–6), law itself is a deeply ambiguous institution, a fact which legal theory must confront and not seek to capture in one all-encompassing theory.

The relation of legislation to sovereignty is similarly unstable. In the strong form in which the traditional doctrine of parliamentary sovereignty is held in the U.K., there is no necessary connection between legislation and sovereignty so understood. It is entirely conceivable, and entirely empirically so, that legal systems exist which do not subscribe to such an according of power to the legislature. On the other hand, the legislature embodies two important features of legal system, the need for finality of decision-making and the need for fundamental acceptance and trust on the part of citizens. Moreover, if the foundational values of the polity are those of democracy, the legislature is the most democratic of legal institutions. Thus some measure of sovereignty for the legislature seems inevitable.

Legislation as a source of law is the lynchpin between contextual and deep justifications of law, the point at which they are most separate as well as most connected. That is the paradox of legislation, a paradox that must be embraced rather than resolved, if the role of legislation in law is to be appreciated.

Chapter 3

PRECEDENT

The second of the classical or traditional sources of law is Precedent, expressed in the maxim *stare decisis et non quieta movere*, "to stand by what has been decided, and not to disturb what is still." Many questions, however, arise concerning exactly what it is to "stand by what it is decided." Reasoning from precedent is a distinctive form of reasoning: Is it truly distinctive, or can it be reduced to some other form of reasoning? Is it peculiar to the law, or is it merely that in the law reasoning from precedent takes a special form? Why employ this form of reasoning at all? What does it mean to say that a court is "bound" by precedent? Is such talk even meaningful? In this chapter, I shall proceed as follows. In Section 3.1, I will characterize the notion of precedent in general, without special reference to the law. Then in Section 3.2 I shall examine more closely how in fact the idea of precedent functions in the typical legal context as a source of law. Section 3.3 will say something about precedent and legislation. In Sections 3.4 and 3.5 I shall discuss issues that arise when trying to understand the bindingness of precedent, in the former looking at rule-scepticism and judicial comity, and in the latter at conventional bindingness and ruleness. In Section 3.6 I shall consider the justification of precedent.

3.1. A Characterization of Precedent

Frederick Schauer has offered as the "bare skeleton" of reasoning from precedent that:

> The previous treatment of occurrence *X* in manner *Y* constitutes, *solely because of its historical pedigree*, a reason for treating *X* in manner *Y* if and when *X* again occurs. (Schauer 1987, 571; his emphasis)

Reasoning of this sort is not confined to the law (Schauer 1987, 572; Twining and Miers 1982, 268–9). Schauer gives the example of a seven-year-old child who argues that he should not have to wear short pants to school any more, because his older brother did not have to wear short pants any more when he reached seven. One might churlishly respond that the example is weak, because the child is just behaving, as we might say, "legalistically." But it would be hard to deal with every proposed non-legal example of reasoning from precedent in this way, and so Schauer's point may be acknowledged. In any case, as we shall see, the deployment of reasoning from precedent in the law is encrusted with so many special features peculiar to the law that it would not be surprising for there to be non-legal uses without such features.

The italicised phrase in the quote carries the weight of the point. In reasoning from precedent, a prior decision has weight simply from the fact of its having been taken; a hypothetical case of exactly the same profile would not have weight (Hurley 1990, 223). Suppose a court needing to decide whether the plaintiff should succeed in tort in recovering damages after being bitten by a neighbour's dog. The court has before it two arguments. One is that another court in the jurisdiction decided some years ago that, in exactly the same fact situation, the plaintiff should succeed. The other argument has the form: Suppose that the facts of the situation were thus and so; then the decision would be in favour of the plaintiff. When precedent is a source of law, the first argument is decisive; the second argument has little weight.

The point can be dramatized by the following image,[1] borrowed with thanks from Richard Bronaugh (1987, 224):

> I shall introduce the notion of what might be called *The Complete Book of the World's Legal Decisions.* This I imagine to be a book reporting all the legal decisions that there have ever been anywhere, any time.

The idea of precedent as used in characterizing precedent as a source of law is that the presence of a decision in the Complete Book is in itself of great significance. We will return again to the image of the Complete Book, as it is of expository value in more than one way.

Reasoning from precedent is thus in an important sense a content-independent mode of reasoning. By that I mean the following. Take again the case of the unfortunate person bitten by his neighbour's dog. There are good reasons for allowing him to succeed in tort—he has suffered needless harm; neighbours should look after their dogs, to prevent harm; friendly relations among neighbours is of value in itself; and so on. These reasons form a normative justification for a legal rule allowing recovery. But the reasoning which says that the person bitten should recover, because a decision allowing a person in such a situation to recover can be found in the Complete Book, is a piece of reasoning which does not pay any attention to that normative justification. The reasoning says, crudely: This was done once before, so it should be done again. Reasoning from precedent thus can be contrasted with what Schauer (1991, 77–8) calls "particularistic decision-making." In particularistic decision-making, the decision is "transparent" (Schauer 1991, 85) to the background normative principles relevant to the decision. The decision is simply a matter of applying the principles to the special facts of the particular case. In contrast, there are forms of decision-making in which decisions are not transparent to the background justifications. Rule-based decision-making is one such form (and Schauer's

[1] I am using the image for my own purposes, not for the purposes to which Bronaugh puts it in the article cited.

main concern in the book cited). In rule-based decision-making, the particular case is decided by application of the rule: In circumstances *C*, do *A*; these are circumstances *C*; so I shall do *A*. There is no reference directly to whatever the background normative justification might be for having a rule "In *C*, do *A*." It is a standing presumption of rule-based decision-making that there is some such background justification, but the justification plays no role in the actual decision to do *A*. I shall consider later whether decision-making according to precedent is just a form of rule-based decision-making. It is sufficient to note now that it shares with rule-based decision-making the feature that decisions according to precedent are not transparent to their background justifications. "Decide now fact situation *F* for *P*, because Court *C* has already decided fact situations like *F* for *P*" is not a form of reasoning that pays attention to why deciding for *P* in *F* is normatively justified.

The point may also be expressed as follows. Larry Alexander (1989, 5) identifies as one model of precedent what he calls "the natural model": Under this model the court in deciding a case gives prior judicial decisions the weight that those decisions carry independently of any formal requirement that precedent be followed. Alexander (ibid., 9) rightly goes on to point out that it is "misleading to label the method of the natural model of precedent as precedent following at all." The court simply takes what it thinks is the normatively correct decision without reference to the Complete Book, as it were.[2] For the same reasons, Schauer (1991, 83) regards supposed decision-making by rule in which exceptions to the rule can always be allowed at the point of actual decision-making not to be a form of rule-based decision-making at all.

Although as I have characterized it reasoning from precedent gives weight to the past, reasoning from precedent is not the same as reasoning from experience (Schauer 1987, 575-6). In reasoning from experience, "the facts and conclusions of the past have no significance apart from what they tell us about the present [...]. If we believe that the current case ought to be decided differently, no purely precedential residuum remains in the calculus." To rely on knowledge that a great judge decided a case a certain way, and then to decide it that way oneself, is reasoning from experience, not reasoning from precedent. In the case of reasoning from experience, the past has weight because of the substantive information it contains about how to decide in the present. In the case of reasoning from precedent, the past has weight just because it is the past. The Complete Book of legal decisions is not the Great Book of Nature.

Schauer (1987, 572–3) has also rightly emphasized that reasoning from precedent has the double aspect of being both backward-looking and forward-looking. With respect to the former, the decision looks back to what has

[2] Defenders of the natural model would include Michael Moore (1987) and Ronald Dworkin (1978, 110–5; 1986, 240–50). I have criticised Dworkin's view elsewhere (Shiner 1982, 103–15).

previously been decided and takes a cue from that. But also it is part of reasoning from precedent that each decision also sets a precedent; a decision on the basis of precedent looks forward to future decision-making. As Schauer happily puts it: "Today is not only yesterday's tomorrow: it is also tomorrow's yesterday" (ibid., 573).

Reasoning from precedent is an instance of so-called case-by-case reasoning. The person who has done most to elucidate the idiosyncratic character of case-by-case reasoning is John Wisdom (1957, 157–63; 1965, 130–8; 1991, passim). Wisdom regarded the law as the prime site for case-by-case reasoning. He described the process as follows:

> The process of argument is not a *chain* of demonstrative reasoning. It is a presenting and re-presenting of those features of the case which *severally cooperate* in favour of the conclusion [...]. The reasons are like the legs of a chair, not the links of a chain [...] it is a matter of the cumulative effect of several independent premisses, not of the repeated transformation of one or two. (Wisdom 1957, 157; his emphasis)

Wisdom (1991) argues, in fact, that case-by-case reasoning is the fundamental form of reasoning. He links this to the thought that, in case-by-case reasoning, a direct acknowledgment of similarities and differences occurs, such acknowledgment being the obverse of the "independence" of the premises alluded to in the above quotation. To see one case as the precedent for another is to see resemblances between them. While, as we shall see in the next section, the actual functioning of *stare decisis* in any given legal system involves local institutional rules, at the epistemological core of *stare decisis* is the seeing of similarities and differences.

It follows, in my view, that reasoning from precedent is therefore not the same as reasoning by analogy, at least on some standard accounts of analogical reasoning. The notion of analogy has its roots in ancient Greek mathematics, as a technical concept within mathematical reasoning. Even though contemporary writers acknowledge that analogical reasoning is not the same as deductive or inductive reasoning, still the assumption is made that in some sense a formal statement of the rules of analogical inference is possible (Alexy 1989, 281–4; Brewer 1996; Guest 1961, 190–7). The formalization may be extremely elaborate, as it is in Brewer (1996). Or it may be simply: *A* is like *B* in being *F*; *A* is *G*; so *B* is *G*—assuming that the relation between being *F* and being *G* can be appropriately underwritten. The whole point of case-by-case reasoning, however, as Wisdom understands it, is that the reasoning in principle has force independently of whether some scheme of formal rules can be constructed to rationalize it. In case by case reasoning, the reasoner by juxtaposing *B* to *A* ultimately invites the reader or hearer to see that *B* is *G*. That's all.

Of course, it is possible to interpret analogy in a wider sense, which does not include the requirement of rationalization. Postema, for example, uses

"analogy" in such an unrestricted way, emphasizing the difference between the case-by-case reasoning of the common law and formal reasoning (Postema 2002, 603–4). Then there is nothing objectionable about referring to reasoning from precedent as "analogical." The important thing is to recognize case-by-case reasoning, and therefore reasoning from precedent, for what it is, and to see how it differs from reasoning through formalities.

3.2. The Functioning of Precedent in Law

3.2.1. The Doctrine of Stare Decisis

Treating precedent as a source of law is, with good reason, held to be a distinguishing characteristic of the common law. In fact, one might be tempted to say that reasoning from precedent as a source of law is *the* distinguishing feature of the common law, were it not for the fact that even in common law jurisdictions precedent is of less importance than once it was. Not only the kind of concerns discussed in the previous chapter about the need to give primacy to legislation in a democracy, but also concerns about uniformity and codification have led to the introduction of statutory schemes to regulate areas of the law once governed only by precedent.

It is a commonplace that civil law systems do not recognize a doctrine of *stare decisis* (Merryman 1984, 22-3, 35-6, 46-7; Merryman, Clark, and Haley 1994, 937–74; Cross and Harris 1991, 10–9; Goodhart 1934). (Cf., in this volume, sec. 7.3.2.) Merryman gives as the prime reason for this lack of recognition what he calls "state positivism," the linked beliefs that law means primarily enacted law, and that the state through legislation should have a monopoly on law-making (Merryman 1984, 19–25). It is, though, almost equally a commonplace that this supposed rejection of *stare decisis* by the civil law is exaggerated (Merryman 1984, 47; Merryman, Clark, and Haley 1994, 949–51). There exists a widespread practice of in fact paying some attention to decisions in other cases, even though officially precedent is not a source of law.[3]

We will return to this matter shortly; for now, we will adhere to the official story. In common law jurisdictions, then, as distinct from civil law jurisdictions, precedent is a source of law, and the doctrine of *stare decisis* is observed. As adumbrated above, courts typically justify the decision they give in the case at bar by citing decisions taken in other cases. What, though, is a "case" in this sense?

> A case is the written memorandum of a dispute or controversy between persons, telling with varying degrees of completeness and of accuracy, what happened, what each of the parties did

[3] See also MacCormick and Summers 1997, chaps. 3–9, and Sections 5.2.3 and 8.2 of this book for other such practices.

about it, what some supposedly impartial judge or other tribunal did in the way of bringing the dispute or controversy to an end, and the avowed reason of the judge or tribunal for doing what was done. (Twining and Miers 1982, 266)

The typical common law professional library is a collection of statutes, treatises, and commentaries, and volumes of *case reports.* The centrality of the written (I include here of course, written electronically) word to the functioning of a doctrine of *stare decisis* is clear from the above characterization of a "case." To reason from cases in the law is to reason from written documents. While reference to precedent has existed for centuries in the common law, historians accept that the formal doctrine of *stare decisis* did not harden up until the latter part of the nineteenth century (Allen 1964, 187–235; Evans 1987; Postema 1987; Postema 2002, 595–7; Cross and Harris 1991, 10–9). (Cf. Lobban, vol. 9 of this Treatise.) The development and expansion of a formal system of reporting court decisions was essential to the hardening process. "Cases"—written memoranda of the kind characterized—now existed in a form which allowed them to be cited in legal argument.

By *stare decisis*, however, is not meant merely a practice of reasoning from decided cases. *Stare decisis* has evolved into a very specific practice of reasoning from decided cases, one that is in essential ways a *normative* practice. That is, *stare decisis* is a doctrine about how courts should reason, not one about how they do reason. The doctrine requires courts, when faced with a precedent of the appropriate sort in the appropriate circumstances, to decide as the precedent case requires. Understanding how precedent functions as a source of law is a matter of understanding these norms.

3.2.2. Binding vs. Persuasive Precedent

There is a central normative distinction is that between "binding" and "persuasive" precedent. If an existing case is for a court a *binding precedent*, then the decision in the precedent case is dispositive for the decision in the instant case. If an existing case is for a court a *persuasive precedent*, then the decision in the precedent case has some, maybe even considerable, weight for the decision in the instant case, but it is not as such dispositive. It is extremely natural, and in fact it is quite standard, to express the idea of binding precedent by using the modality of necessity: "Lower courts must follow the decisions of courts above them" (Cross 1977, 145); "A court must follow the precedents established by the court(s) directly above it" (Caminker 1994, 824); "The prior case [...] is one which must be followed in the subsequent case" (Goodhart 1934, 41). But it is not clear how the "necessity" here, and the metaphor of "binding," should be interpreted.

It is also clear that, with respect to the present analytical project of seeking to understand *strictly* institutionalized sources of law, that the concept of

binding precedent is the one we need. Consider again our working definition of "strictly institutionalized source of law":

A law, or law-like rule, has a strictly institutionalized source just in case
i) the existence conditions of the law, or law-like rule, are a function of the activities of a legal institution

and

ii) the contextually sufficient justification, or the systemic or local normative force, of the law, or law-like rule, derives *entirely* from the satisfaction of those existence conditions.

I have italicized the word "entirely": Here in the case of reasoning from precedent we can see it at work. With respect to persuasive precedent, what leads a court to "adopt the reasoning," as the idiom has it, of a court whose decisions it is not bound to follow will not be simply the fact that the decision is on point and was issued by the court in question. Instead, regard will be had to considerations that are fundamentally substantive, not formal—considerations of coherence, for example, or of policy. Christopher McCrudden has recently charted what he sees as a growth in the use by one national jurisdiction of case-law from another jurisdiction in the specific area of human rights law (McCrudden 2000), a matter of persuasive precedents only. McCrudden identifies (ibid., 516–27) ten different factors that seem to produce the persuasive influence of precedents from other jurisdictions. None of them have the character that the reasoning is adopted simply because of the court whose reasoning it is.

It is important to underscore that the downplaying of precedent as a source of law in civil law systems is a downplaying of *stare decisis*, the notion of *binding* precedent. Persuasive precedent plays a crucial role. Patrick Glenn has argued that persuasive precedent is especially suited, in fact, to the typical structure of a civil law system (Glenn 1987). Richard Bronaugh has argued that persuasive precedent plays an important role even in a jurisdiction which respects *stare decisis* (Bronaugh 1987). Persuasive precedents, unlike binding precedents, "cannot compel a regretted outcome"; they can only be found convincing, distinguished away, or ignored (ibid., 231). All the same, "persuasive precedents are powerful and fair instruments of invention because, when convincing, they will show ways in which—again rationally and in all fairness—the fetters of binding precedent can be slipped" (ibid., 247).[4]

I will leave the philosophical commentary on the notion of binding precedent until a later section: For the present, examples will have to suffice. It is generally acknowledged that the doctrine of *stare decisis* is strictest in the United Kingdom. Whatever the term "bound" means, as things now stand,

[4] See Sections 5.2.3 and 8.2 below for other instances of the role of persuasive precedents.

the English Court of Appeal is "bound" by decisions of the House of Lords: That is, if the House of Lords has decided a case with fact situation *F*, and decided that case for the plaintiff, say, then, if the Court of Appeal is faced with a case with fact situation *F*, it is then bound to decide for the plaintiff also. The U.K. Court of Appeal, however, is not "bound" by decisions of the Australian High Court, even if the High Court has been faced with and decided a case with the exact same fact situation. Nor is the U.K. Court of Appeal bound by decisions of the Supreme Court of Canada. The Court of Appeal may consider and take what inspiration it will from decisions of courts of another jurisdiction, but it cannot be "required" to follow those decisions. The Divisional Courts, the lowest level of courts in the U.K. hierarchy, are bound by decisions of the Court of Appeal. In Canada, a provincial Court of Appeal is bound by decisions of the Supreme Court of Canada, but not by a decision of a different provincial Court of Appeal. Courts of Queen's Bench in a given province are bound by decisions of the Court of Appeal in that province, but not by decisions of Courts of Appeal of other provinces. In the days of Empire, the Supreme Court of Canada and the High Court of Australia were bound by decisions of the House of Lords in London. But they threw off those chains in 1949 and 1978 respectively.

These examples illustrate what might be called *vertical* bindingness. This bindingness is something it only makes sense to speak of in relation to an institutional hierarchy of courts. Courts higher in the hierarchy establish by their decisions precedents for courts lower in the hierarchy. But *stare decisis* can operate "horizontally" as well. The U.K. House of Lords had said in *London Tramways* (*London Street Tramways v London County Council* [1894] AC 489) that it would always consider itself bound by its own decisions. That is, if the same fact situation came before it a second time, then the case would be decided again in exactly the same way. In 1966, however, the House of Lords issued a Practice Statement declaring itself willing to "depart from a previous decision when it appears right to do so" ([1966] 3 All ER 77). Analogously, the U.K. Court of Appeal had stated that it was bound by its own previous decisions (*Young v Bristol Aeroplane Co* [1944] KB 718). However, after the 1966 Practice Statement, Lord Denning MR made a strenuous attempt to have the Court of Appeal likewise declare that it would depart from previous decisions, an attempt which was only finally thwarted by the House of Lords in 1979 (*Davis v Johnson* [1979] AC 264). In Canada, there appears a general willingness of appellate courts to depart from their own previous decisions (Gall 1990, 281–4).

The idea of being bound to decide a case the same way is, despite what I have said, too simple. The idea of one Court being "bound" by another, or by its previous self, amounts to the more complex idea that it must *either* decide the instant case in the same way as the precedent case, or else *distinguish* the instant case from the precedent case. Distinguishing an instant case from a

precedent putatively binding upon it is an important function of common-law tribunals. Distinguishing is not to be regarded as something opposed to binding precedent but rather as part of that practice. Joseph Raz contrasts what he calls a "tame" view of distinguishing from a stronger view (Raz 1979, 185). According to the tame view, a court distinguishes a precedent case simply when it determines that the reason or rule dispositive of the precedent case does not apply to the instant case. According to the stronger view, some further conditions must be satisfied than simply a determination of non-applicability. The reason or rule said to be dispositive of the precedent case must be appropriately modified or revised so that it does not apply to the instant case. The non-applicability must be justified. As Brian Simpson puts it, "distinguishing is essentially a way of replying to arguments which are being rejected" (Simpson 1961, 150).

A further standard qualification to *stare decisis* is the notion of cases being decided *per incuriam*, "inadvertently." If the court in the instant case can show that the court in the precedent case overlooked some relevant legal material, a relevant statute or precedent, then it is relieved of the obligation to follow the previous decision. Clearly, if taken seriously, rather than used simply as a convenient escape clause, the burden of demonstrating such "inadvertence" is large. Cases of deeming a precedent to be *per incuriam* are exceedingly rare.

There is also an important legal distinction between *stare decisis* and *res judicata*. The doctrine of *res judicata* is the doctrine that, when a decision has been reached by a competent court on the merits of a case specifically as to the parties and issues in the case, those issues cannot be litigated again by those parties. Both *stare decisis* and *res judicata* have in common that, as a result of a decision in a previous case, some given decision must now be reached in the instant case. But the two doctrines are very different. Dias identifies four main differences between the two doctrines (Dias 1985, 126–7):

1) *Res judicata* applies to the decision in the dispute, while *stare decisis* applies as to the ruling of law involved.
2) *Res judicata* normally binds only the parties and their successors. *Stare decisis* [...] binds everyone, including those who come before the courts in other cases.
3) *Res judicata* applies to all courts. *Stare decisis* is brought into operation only by decisions of the High Court and higher courts.
4) *Res judicata* takes effect after the time for appealing against a decision is past. *Stare decisis* operates at once.

Lord Halsbury is generally regarded to have conflated the two doctrines when he famously stated (*Quinn v Leathem* [1901] AC 459, at 506) that "a case is only authority for what it actually decides." A precedent has force beyond the parties to the instant case.

3.2.3. The Ratio Decidendi *of a Precedent*

But how does a precedent have such a force? A lower court, when adjudicating a case, is bound by a relevant decision of a higher court in the same jurisdiction. But what makes the higher court's decision relevant to the case in the lower court? It is not just that the decision is one by the higher court. The decision has to be one by the higher court on the same issue. But how is that determined? The chief device for managing issues of relevance in the area of common law precedent is the notion of the *ratio decidendi* of a case, literally the "principle of the decision." The *ratio* (for short) is to be distinguished from an *obiter dictum*, an expression of opinion by a judge that is external to the dispositive reasoning.

The issue of what exactly it is that constitutes the *ratio* of a case is one that has been hugely debated by theorists of the common law. The debate is charted, and the different theories evaluated, most thoroughly by Cross and Harris (1991, 33–96). I will not review the debate here. Suffice it to say that the concept of *ratio decidendi* is complex and elusive. There are nonetheless some fixed points of reference.

a) The much-maligned comment of Lord Halsbury quoted above is correct to this extent: A case which functions as a binding precedent does so because of some point of law decided in the case, and not for a point not decided in the case. One typical source of *obiter dicta* in a case is comments by judges on points of law not at issue. Judges are in fact, and rightly, encouraged not to make such comments. But how is it to be ascertained what point of law is at issue?

b) Judges will frequently say what they take to be the point of law at issue in a case. But even so the *ratio decidendi* cannot be equated to any such statement. The words the judge uses do not have canonical force, unlike the words of a statute. In a case governed by statute, a court faced with a situation in which the application of the statute is unclear cannot disregard the wording of statute. They must instead seek to interpret the wording of the statute, and discern its applicability by such a process. In the case of a stated *ratio*, a later court is under no analogous obligation. It can legitimately state the *ratio* of the precedent case in different words than the judge(s) hearing the precedent case themselves used.

c) (More controversially, on my part) Despite the fact that the language of "rule" is standardly used as a characterization of the *ratio decidendi*, it can be misleading to describe the *ratio* of a case as a "rule." Neil MacCormick (1987, 179) has argued that a *ratio* is more properly speaking a "ruling." An interpretation of a statute given in a case may come to be a precedent for future interpretations; but it is not the "rule" in the case, the statute is. Moreover (and I will return to this later), it is frequently only clear after a series of future decisions that a precedent case stands for a given *ratio*. Once such a hardening

process has taken place, then talk of the "rule" in the original precedent case becomes appropriate. For all that, the case will have had a *ratio* at the time.

d) A.L. Goodhart (1931, 1–26) has famously suggested that the *ratio decidendi* of a case is constituted by the principle that derives from the *material facts* of the case. Goodhart is right to point out that, in the total fact situation of any actual case, some facts will matter from the legal point of view and some will not. That the accused was seen driving away from the bank at high speed moments after the robbery matters; that the accused was driving a Ford does not; unless matter of identification are at issue, in which case it might matter; and so on. Even if one recognizes that there will be some interdependence between the principle for which a case is thought to stand, and the facts of the case thought to be material, the advantage of Goodhart's approach—to have the concept of "material fact" drive the concept of *ratio*—is that it makes easier the preservation of the non-canonical character of the language of a common law legal opinion.

I introduced above Bronaugh's image of the Complete Book of legal decisions: As I said above, the image captures well the essential feature of precedent as a source of law that the mere fact of a decision having been taken carries weight. We can now see, though, that the operation of a system of binding precedent such as that in the United Kingdom is different from merely finding the decision in the Complete Book in several important ways. First, the mechanism of the *ratio decidendi*, however that notion is unpacked, means that the precedent case stands for—may in principle be a precedent for—more than its own peculiar facts. Thus it does not follow from a given peculiar fact situation in an instant case not being in the Complete Book that there is no legal precedent binding on the court in the instant case. Second, the bare notion of presence in the Complete Book does not yield the functionally important decision between binding and persuasive precedent. We need to supplement the Complete Book with descriptions of the institutional structure of systems of courts. Third, even within a hierarchical jurisdictional structure of the required type, the bare notion of presence in the Complete Book does not explain the role of the passage of time. It is not just that a case from the eighteenth century in England will not be a binding precedent in Canada; it will not necessarily be a binding precedent in England either. Despite these points, the image of the Complete Book captures valuable intuitions, and should not be abandoned.

3.3. Precedent and Legislation

Precedent is typically listed second after legislation as a source of law, because precedent is regarded as subordinate to legislation. Under the doctrine of parliamentary sovereignty (see sec. 2.3 above), legislation is the highest form of law. It is important, however, to be clear what "subordinate" means in this

context. It might be thought that the subordination of precedent to legislation threatened the capacity of precedent to function as an independent source of law. This is not so, and the distinctions necessary to appreciating the point have significance beyond this particular chapter. Legislation is superior also to custom and delegation. We will examine in Chapters 4 and 5 the degree to which this superiority affects the capacity of custom and delegation to function as independent sources of law.

There is an important conceptual distinction between subordination and derivation. One form of law is subordinate to another just in case, where the two conflict, one will always be regarded as superior. Precedent and custom are both subordinate to legislation in the sense that a statute can always alter the effect of a court decision and a custom can be rendered of no effect by a statute.

> Precedent is subordinate to legislation as a source of law in the sense that a statute can always abrogate the effect of a judicial decision, and the courts regard themselves as bound to give effect to legislation once they are satisfied that it was duly enacted. (Cross and Harris 1991, 173)

"Bound," they note further, means whatever it means when courts speak of being bound by a precedent, a concept we will try to elucidate in succeeding sections of this chapter.

It does not, however, follow from the fact that one form of law is subordinate in this way—subordinate due to the power of abrogation—that there is also subordination by derivation. One form of law is subordinate by derivation to another form of law—is derived from another form of law, in short—just in case the validity of the second form of law depends upon its relation to the first form of law. Delegation (the topic of chap. 5) is subordinate to legislation both by derivation and by the power of abrogation. Not only may the powers of an administrative agency be changed or abolished at any time by statute (subordination by abrogation). Until legislation is passed to create a Labour Relations Board, or an Environmental Protection Agency, there is nothing there, no body with the power to issue legally authoritative rulings (subordination by derivation). Indeed, as we shall see in Chapter 5, this feature of delegation makes it problematic as a source of law.

Precedent is clearly not subordinate by derivation to statute or legislation. The very notion, both historically and conceptually, of judicial reasoning from precedent is that it is "judge-made law." The substantive scope of judge-made law—law in the realm of common law precedent—far exceeds that of legislation. In many areas of the law, common law rules constitute all, or most, of the law that there is. The fact that precedent is subordinate by power of abrogation to legislation does not imply that it cannot function as an independent source of law: It clearly does so function in common law legal systems.

Theorists wedded to parliamentary sovereignty as a fundamental axiom of jurisprudence have heroically tried to deny this obvious fact. Famously, John Austin wrote that:

> When judges transmute a custom into a legal rule (or make a legal rule not suggested by a custom), the legal rule that they establish is established by the sovereign legislature. A subordinate or subject judge is merely a minister. [...] The rules that he makes derive their legal force from the authority given by the state: an authority which the state may confer expressly, but which it commonly imparts in the way of acquiescence. [...] Its sovereign will "that his rules shall obtain as law" is clearly evinced by its conduct, though not by its express declaration. (Austin 1954, 31–2)

Austin claims, that is to say, that precedent is subordinate to legislation by derivation, not merely by the power of abrogation. But to turn the power of abrogation into a positive grant of authority is just a mistake. As Hart (1994, 45–8) has vigorously argued, there certainly are such things as tacit orders, but the relation of the legislature to customary, including judge-made, law is not of that kind. Hart gives the example of a high-ranking officer in the military who is aware of orders being given by a sergeant, and does nothing to interfere with or countermand these orders. Then one might say that the officer has him- or herself tacitly given those orders. But two features are crucial to this case. One is that the officer is genuinely aware of the orders being given by the sergeant. That feature does not reappear in the case of precedent and legislation; the legislators are not similarly aware of all the decisions being given in the common law. Second, the officer and the sergeant are themselves in a hierarchical order, such that the officer has the authority to countermand or vary the sergeant's orders if he or she so chooses. It would beg the very question of legal theory here at stake to say that legislation and precedent are so hierarchically arranged.

There are of course complexities here: I will mention briefly three (for more detail, see Cross and Harris 1991, 173–82). First , suppose a case where a court applies a statute, not directly in that the fact situation is explicitly covered by the language of the statute, but by applying the normative import of the statute to a fact situation deemed analogous. What is the source of law here—the statute or the judicial decision? Even though the case is presented as covered by the statute, the source can more plausibly be said to be the court. Second, a judicial decision can be abrogated by a subsequent statute, while some deeper common law principle for which the case is thought to stand may survive as part of the common law. Third, while a judicial decision on the proper construal of the wording in a statute does constitute a precedent for future cases of the application of that statute, such a precedent is typically more subject to limitation or distinguishing than the normal case of common law precedents. In fact, even if the exact same wording occurs in another statute, the precedent may be rejected as authority for how to construe that other statute. These complexities, though, do not affect the fundamental point being made in this section, that, despite precedent being subordinate to legislation by the power of abrogation, still precedent is properly thought of as an independent source of law.

3.4. The Modalities of Binding Precedent

3.4.1. Precedent and Logical Necessity

Now that we have some grasp of how precedent functions as a source of law, it is time to assess some of the theoretical problems thereby raised. I shall consider first the central concept itself of "binding" precedent. The language of necessity is typical, but what kind of necessity is this? Is it indeed any kind of necessity at all, or is the language of bindingness simply illusory?

The first tempting account of the sense of "necessity" can be quickly dismissed. It is easy to show that the bindingness cannot be the necessity of logical entailment, or even of material implication. Philosophers, legal theorists, and judges have all despaired of shedding light on binding precedent by appealing to the notion of logical necessity. The reason is not hard to find. Logical rigour transports one with infallible directness from point *A* to point *B.* But in courts of law, the most interesting questions are as to whether one is at point *A* in the first place, or whether point *B is* the point at which one wishes to arrive. Thus, if it is true that pheasants are livestock if and only if they are kept and bred for the production of food (*Earl of Normanton v Giles,* [1980] 1 All ER 106), and if it is true that given pheasants were not kept and bred for the production of food, then those pheasants are not livestock. But logic alone will not settle whether the antecedents are true, and the truth-value of the antecedents, not propositional logic, will be dispositive of the case. The matter is elegantly put by Lord Diplock in commenting on the notorious creation ex nihilo by the House of Lords of the supposed common law offence of conspiracy to corrupt public morals (*R v Knuller (Publishing, Printing & Promoting) Ltd* [1973] AC 435, at 470, commenting on *Shaw v DPP* [1962] AC 220):

> My major criticism of the reasoning of the majority of this House in *Shaw's* case does not depend upon the charge having been one of conspiracy. That reasoning can be reduced to a single syllogism.
>
> Every agreement to do any act that tends to corrupt public morals is a crime at common law. *Shaw's* act of publishing advertisements for prostitutes soliciting fornication tended to corrupt public morals. Therefore *Shaw's* agreement to do that act was a crime at common law.
>
> In English law it is for the judge alone to determine whether the major premise in such a syllogism is true. The truth of the minor premise is a question for the jury, if there is any material upon which a rational being could hold it to be true. I do not criticize the jury's verdict in the instant case upon the minor premise. I deny the conclusion only because I am convinced that the major premise is false.

If the following of a precedent case is to be represented as a logical derivation, then the instant case and the precedent case must have identical legally relevant properties. The determination of the identity of this relevance must occur *prior to* determining the validity of the derivation. The derivation as such is therefore useless.

3.4.2. Precedent and Rule-scepticism

The rejection of logical necessity characteristically produces as an extreme reaction the second account of the necessity in binding precedent, that of rule-scepticism. For the sceptic, if the determination of relevant similarity comes first, then the idea of one court being bound to follow the decision of another makes no sense.[5] C. K. Allen has put this view well. He remarks that the judge is bound, not in the sense that the superior court imposes fetters on him; rather, he places the fetters in his own hand. "The humblest judicial official has to decide for himself whether he is or is not bound, in the particular circumstances, by any given decision of the House of Lords" (Allen 1964, 290). Likewise, Winston claims that any litigant can always raise the question of whether his case is an exception to a given rule (Winston 1974, 31).

The sceptical response is inadequate because it blurs significant differences between cases. I shall mention three different cases where it might seem plausible to speak of a court's "deciding for itself" or "placing the fetters in its own hand." It will be seen that even if we suppose that this language is plausible in these cases, they are very specialized cases; in this manner I will throw into relief the ordinary instances of courts using precedents so that the implausibility of describing those ordinary cases in Allen's sceptical terms is manifest.

I will present first an example from the U.K. Consider the position of Bristow J. in the High Court (a court at the lowest level in the U.K. hierarchy), hearing the case of *Miliangos* (*Miliangos v. George Frank (Textiles) Ltd* [1975] 1 QB 487). He was faced with incompatible precedents, each from a higher court and so with a claim to be binding on him. On the one hand, the House of Lords had decided fifteen years ago in *Havana Railways* (*Re United Railways of the Havana & Regla Warehouses Ltd* [1960] 2 All ER 332) that a judgment providing remedy for breach of contract must always be in sterling. On the other hand, the Court of Appeal had decided a few weeks before in *Schorsch Meier* (*Schorsch Meier GmbH v. Hennin* [1975] 1 QB 416) that judgment should be given in the creditor's currency. In the event, Bristow J. considered himself (at 492) bound to follow the House of Lords ruling independently of the merits of the case. But it could be argued by the sceptic that, since Bristow J. was also bound by the Court of Appeal's decision, his court being lower in the hierarchy than the Court of Appeal, it can truly be said that Bristow J. decided for himself to fetter himself to the House of Lords and not to the Court of Appeal. The difficulty with the skeptical reading of this example is that one could argue that the House of Lords and the Court of Appeal are not of equal authority, even though the High Court is separately bound by

[5] Such scepticism is characteristic of legal realism. For more on legal realism, see, in this Treatise, vol. 11.

each. The House of Lords outranks the Court of Appeal. Thus, arguably, the case fails as a proof of the thesis that judges fetter themselves in cases of precedent, because really Bristow J. did not have any choice—his obligation was to follow the House of Lords.

This feature vanishes in my second example, that of the position of State Supreme Courts in Australia in the late 1970's. An Australian federal statute, the Privy Council (Appeals from the High Court) Act (1975), banned further appeals from the High Court of Australia to the Privy Council in Westminster, and soon after in *Viro* (*Viro v R* [1978] 18 ALR 257) the High Court further declared itself not bound by decisions of the Privy Council. The question then arose of the position of State Supreme Courts if faced with a decision of the High Court conflicting with a decision of the Privy Council (Blackshield 1978, passim; Bale 1980, 265–71). The High Court themselves in *Viro* were not of one mind, but there was a strong tendency to say that the decision of the High Court should be preferred by the State courts. But a distinction must be drawn between the competence of the High Court to make this kind of announcement with respect to matters of federal law and with respect to matters of state law. In the latter case, it was doubtful whether the High Court could pronounce with authority. This created a situation in which, in theory, there could be conflicting decisions of two coordinate courts, the High Court and the Privy Council, and no greater formal authority from the perspective of a state court vested in one than in the other. A case before a State Supreme Court would then seem genuinely to require a choice; the court would decide for itself by which decision to be bound, if indeed one could speak of being "bound" at all (Blackshield 1978, 65). This precise situation in fact then arose, in the State Supreme Court of New South Wales. In refusing leave to appeal to the Privy Council in *NEMGA*, Moffitt P for the Court remarks that "since the High Court and the Privy Council are equal, States must make their own decision on the matter" (at 474). The Court declared that it would as a matter of principle consider itself bound by High Court decisions and not Privy Council decisions.[6]

In a case such as this, the initial appropriateness of Allen's characterization in terms of "choosing for oneself" is evident. The State court clearly feels the pressures to be bound by "law made in Australia," rather than in Westminster. But these pressures result from Australia's colonial past, and are historical; they are not a matter of the necessities of a hierarchical legal system. But then, my point is, one only has to consider how exotic and specialized these cases are. Take the normal case. Imagine a State Supreme Court, faced with a

[6] *National Employers' Mutual General Association Ltd v Waind & Hill No. 2* [1978] 1 NSWLR 466. In the Supreme Court of South Australia, likewise refusing leave, in *Australian Government Workers' Association v. Armstrong* [1980] 25 SASR 441, Mitchell J. quotes with approval Moffitt's argument in *Waind.*

case raising the issue of excessive force in self-defence. The Court is straightforwardly now bound by *Viro,* which sets the rule in Australia for that issue. *Viro* binds lower courts in Australia in the normal case in a way that cannot be appropriately described by Allen's character in terms of "choice."

My third example is again from Australia. Quite soon after *Viro*, the High Court heard *Atlas Tiles* (*Atlas Tiles Ltd v Briers* [1978] 21 ALR 129), a case which raised the issue of whether an award of damages for personal injury or wrongful dismissal should take into account the liability of the plaintiff to income tax on the lost income. The controlling case to that point had been the House of Lords' decision in *Gourley* (*British Transport Commission v Gourley* [1955] 3 All ER 796), according to which liability to taxation is to be taken into account. The High Court in *Atlas Tiles* took the opposite view. However, two years later, in *Cullen* (*Cullen v. Trappell* [1980] 29 ALR 1), the issue was re-heard by the full Court, and this time the rule in *Gourley* was upheld. Given the fact that the High Court in *Cullen* was bound neither by *Gourley* nor by *Atlas Tiles*, it having the power to overrule its own decisions, and given that either the rule in *Gourley* would be upheld or it would not, then again we seem to have a case where the Court genuinely could "decide for itself" which precedent to follow. As the highest appellate court in Australia, it would not be entirely appropriate to speak of the High Court as either donning or casting off its own fetters. But if we do wish to speak in these terms of the High Court's position in *Cullen*, such a phrasing only serves to make clearer the way in which it would not be appropriate to speak in those terms of the normal case of Allen's "humblest judicial official," or even for that matter the frequent position of less humble officials in Courts of Appeal and the like. That is, again, we can construct a very specific kind of case to which the language of free choice of alternatives is plausibly appropriate. But we have to postulate some very idiosyncratic circumstances to do that. Such language is highly inappropriate for the normal case.

I do not wish the thrust of my argument against Allen's scepticism about the bindingness of precedent to be misunderstood. I am simply offering a phenomenological description of the differences between cases. I am not claiming outright that Allen's description is straightforwardly true of the three cases cited, but not of other cases: Nothing crucial turns on that. I am simply claiming that the cases are different, and leaving alone the matter of the most philosophically perspicuous way to represent the differences.

3.4.3. Precedent and Judicial Comity

A *third* view about the bindingness of precedent would be, not that the sense of bindingess is discretionary for each judge on each occasion, but still that it is felt or subjective only, simply a matter of judicial "comity"—a matter of deference or respect, not of right or duty. The officials of common-law legal

systems simply operate the system that way. They consider themselves required to decide thus and so in such and such circumstances out of respect for other courts in the system. There is nothing else to be said about it. The bindingness of precedent is simply, in the words of Lord Scarman in *Duport Steel* (*Duport Steel Ltd et al v Sirs et al* [1980]1 All ER 529, at 551), a "self-denying ordinance," "a judicially imposed limitation." The view has been expressed academically by Dias (1985, 158–9), and also from the bench by Lord Denning (*Davis v Johnson* [1978] 1 All ER 841, at 853-7). On this view, the philosophical view to take is that there is no philosophical view to take, but only an empirical or sociological view. This view is not the same as Allen's, for it does not deny the existence of systematic rules of precedent. Rather, it offers a certain account of those systematic rules, an account that treats them as norms of courtesy, not of legal duty. All the same, the account is open to the same kind of objection as is Allen's—that is, that it does not fit the cases.

I take as my example some reasoning offered by Lord Denning. His position as Master of the Rolls made him the senior justice in the Court of Appeal. For several years after the 1966 Practice Statement by the House of Lords that it would no longer be bound by its own decisions, Lord Denning sought to bring the Court of Appeal to the same decision. He attempted to persuade his fellow judges in the Court to lay aside the rule the Court had adopted in *Young*'s case in 1944 that the Court would consider itself, with limited exceptions, to be bound by its own previous decisions. In *Davis* in 1978, Denning produced the following argument (853–7). He characterized the pre-*Young* situation as one where the Court held to rules of precedent as a matter of "judicial comity." In his view, the Court in *Young*'s case purported to make the matter one of the rule of law, not of mere comity. The 1966 Practice Statement in the House of Lords shows, Denning claimed, that this distinction between "matter of law" and "matter of comity" is in this context untenable:

> That [the 1966 Practice Statement] shows conclusively that a rule as to precedent (which any court lays down for itself) is not a rule of law at all. It is simply a practice or usage laid down by the court itself for its own guidance; and, as such, the successors of that court can alter that practice, or amend it, or set up other guidelines, just as the House of Lords did in 1966.

Therefore, Denning concludes, the Court of Appeal is in 1978 no more bound by the 1944 rule in *Young* than it was in 1944 prior to the rule in *Young* being announced by judicial comity. Before 1944, when the Court followed its own precedents, it did so simply out of respect for past colleagues. What appeared to be a change in 1944 was simply the reiteration of that pattern of respect. No new element of bindingness was introduced.

This argument is highly ingenious, but philosophically confused. To appreciate this, consider the response of the House of Lords to Denning's promotion of his point of view. In tone, it began with strident accusations of disloy-

alty (cf. Lord Diplock, *Cassell & Co Ltd v Broome* [1972] 1 All ER 801, at 874; Lord Simon of Glaisdale, *Miliangos v George Frank (Textiles) Ltd* [1975] 3 All ER 801, at 822), and subsequently modulated through affectionate despair to reluctant but sincere admiration (cf. Lord Diplock in *Davis v. Johnson*, at 1137, 1139; Lord Scarman, *Duport Steel*, at 551). Note, however, the use by members of the House of Lords of modal concepts. In the House of Lords hearing of *Davis*, Lord Dilhorne uses "conclusively" (1146), and Lord Salmon "must" (1153). Lord Hailsham *(Cassell*, at 809) talks of the "necessity" for courts to observe the rules of precedent. It does not follow from the fact that the judiciary in the United Kingdom commit themselves to operating a system of binding precedent that therefore what it is for there to be operating in the U.K. a system of binding precedent is just this commitment. Nor does it follow from the fact that the use of modal concepts cannot be analyzed in terms of logical necessity that such use cannot mean more than a self-imposed norm of courtesy and respect. The House of Lords could issue its 1966 Practice Statement changing its procedures under the doctrine of *stare decisis* because the House is at the outer limits of the system. The Court of Appeal, however, is within the system. The system of *stare decisis* may indeed afford the Court of Appeal opportunities properly termed "choices," when, for example, there is no controlling House of Lords decision, or when the case for distinguishing is as strong as the case for following a precedent. But the fact that the decision in *Young*'s case from henceforth not to overrule precedents set by the Court of Appeal was a decision of the Court of Appeal itself does not put the Court of Appeal in the same position as that of the House of Lords as regards revising such a rule. The language of modalities brings that out, and the language of comity and custom disguises it. The normativity of precedent cannot be elided in favour of patterns of respect.

3.5. Precedent, Bindingness, and Ruleness

3.5.1. Precedent and Hart's Social Rules

One way to make a somewhat more robust representation of the modalities of precedent is by moving up from "comity" to "social convention" or "social rule." H. L. A. Hart's representation of a legal system as a system of social rules is well known (see, in this Treatise, vol. 11). There are two dimensions to the view of precedent embodied in it. First, what one may call the formal rules of precedent (e.g., the rule laid down in *Young*'s case) are, in Hart's theory, secondary rules founded on the social practice among officials to accept from the internal point of view these rules as binding upon themselves (Hart 1994, 87, 231). The talk of "disloyalty" is easily interpretable as reference to what Hart refers to as the "internal" aspect of rules, for on Hart's view that aspect is manifested in criticism of oneself and others (ibid., 55–7).

However, there seems initially to be no room in Hart's social rule theory for any account of the modal qualities of a system of binding precedent. By "necessary" we do not mean merely "regarded by officials as necessary"; the internal aspect gives us a concept only of accepted normative standards, not of standards that have normative force independence of acceptance.[7] Rules of logic are normative standards; but it would be a fallacy to conclude that therefore the internal aspect gave us logical modalities. The problem raised by the Denning position discussed above remains.

Consider remarks such as that by Lord Scarman (*Duport Steel*, at 552) that "the Court of Appeal in this case [...] strayed beyond the limits set by judicial precedent." Lord Scarman's point is that the Court of Appeal is bound by the rule in *Young*, even if it does not accept that it is bound. If the Court of Appeal's being bound by the rule in *Young* meant no more than that the Court itself had the internal point of view towards the rule in *Young*, Lord Scarman's comment would lose its point. What reason would there be then to claim, as the House of Lords did, that the Court of Appeal would still be so bound *even if it no longer* had the internal point of view towards the rule in *Young.* It is at this stage that appeal to the logical modalities is made, and it is here that more is needed than merely the assertion that legal rules are conventional or social rules.

Hart rightly rejects the rule-sceptic's argument that the open-texturedness of legal rules implies that legal rules have no bindingness at all (Hart 1994, 135). If a case falls clearly under a valid rule, then it is simply an error to argue that, because the rule is fuzzy at its penumbra, the court is not determinately bound in a case that falls under the core. All the same, Hart's own account of precedent is inadequate. In his famous 1958 paper on "Positivism and the Separation of Law and Morals," he expressed the moral of his doctrine of the penumbra to legal language as "man cannot live by deduction alone" (Hart 1983, 64)—that suggests that that is how man does live at the core. Hart's account here seems to amount to attributing to precedent no more than what Ronald Dworkin has called "enactment force" (Dworkin 1978, 111), the force the *ratio* would have if it were a clause in a statute. Dworkin contrasts "enactment force" with "gravitational force," the force that a precedent exercises through its material facts as interpreted by courts, rather than through the wording of any *ratio* (Dworkin 1978, 11–2: For an account more generally of the opposition between Hart's and Dworkin's theories of law, see, in this Treatise, vol. 11). As Hart lays it out, the *ratio* of the precedent case is formulable in certain language; that language applies to the instant case; therefore the appropriate disposition of the instant case follows by logic alone. This style of analysis will only work for the established core,

[7] I have discussed the problems in Hart's notion of acceptance elsewhere; see Shiner 1992, 160–83.

only for straightforward cases of precedent. *Ex hypothesi* when a case is a hard case, a penumbral case, there exists nothing that "binds" in the sense of "yielding a decision by mechanical deduction." Hart's account of adjudication in hard cases, as is well known, is that such decisions are discretionary—that courts, as Dworkin puts it, are "simply not bound by standards set by the authority in question" (Dworkin 1978, 32). Hart talks of "choices," a "rule-producing function," "legislative" or "creative" activity, a "law-creating power," the exercise of "a creative function" (Hart 1994, 124–47). One must certainly note his disclaimers that much of the daily operation of the law is not like this (ibid., 135). Nonetheless, this non-deductive element of the law is the source of its ability to suit the human predicament, and is therefore of paramount importance.

Hart also argues that the element of discretion does not mean that adjudication in penumbral cases is arbitrary:

> A judge exercising discretion chooses to add to a line of cases a new case because of resemblances that can reasonably be defended as both legally relevant and sufficiently close. In the case of legal rules, the criteria of relevance and closeness of resemblance depend on many complex factors running through the legal system and on the aims or purpose that may be attributed to the rule. (Hart 1994, 126–7)

He continues later:

> Neither in interpreting statutes nor precedents, are judges confined to the alternatives of blind, arbitrary choice, or "mechanical" deduction from rules with predetermined meaning. [...] [Judges] often display characteristic judicial virtues [...] [including] a concern to deploy some acceptable general principle as a reasoned basis for decision. No doubt because a plurality of such principles is always possible it cannot be *demonstrated* that a decision is uniquely correct: But it may be made acceptable as the reasoned product of informed impartial choice. (Ibid., 204–5; his emphasis)

Nonetheless, Hart must think that *something* significant about penumbral adjudication is brought out by the use of terms like "discretion," "choice," "creation," etc. I can only interpret this as a denial of any constraint, bindingness, or obligation with respect to the *particular* gravitational force ultimately deemed dispositive. Consider Dworkin's paradigm example of *Spartan Steel* (*Spartan Steel & Alloys Ltd v Martin & Co (Contractors) Ltd* [1972] 3 All ER 557). The defendant contractors negligently cut a cable supplying power to the plaintiff steel alloy manufacturers. The loss of power rendered of much lesser value the melt of metal currently in the furnaces. Spartan Steel also lost time while the furnaces were restored to proper operating temperature after the power outage occurred and was remedied. Spartan Steel claimed damages not only on the loss of value on the melt in the furnaces at the time, but also the loss of profit on the four melts it would have put in the furnaces had they been operating normally. This case was a hard case, as at the time under U.K. tort law plaintiffs could recover damages for loss conse-

quent upon physical damage, but not upon so-called "pure economic loss," i.e., loss not consequent upon physical damage. The House of Lords applied the existing doctrine, which went back to a precedent a hundred years old (*Cattle v Stockton Waterworks Co* [1875] 10 QB 453). It allowed Spartan Steel damages on the melt actually in the furnace when the power cable was cut, but not on the four melts lost while waiting for power to be restored and the furnaces to warm up. Edmund Davies LJ entered a spirited dissent in which he argued that the principles that underlay recovery of damages for negligence implied that pure economic loss should be as recoverable as loss consequent upon physical damage.[8] Lawton LJ gives the most conventional opinion, doing little more than apply the precedent by which he deemed himself bound. However, given all Hart's talk about "decision" and "discretion," on his terms, there would be no sense in which Lawton LJ was *bound* in *Spartan Steel* to see the resemblance between *Cattle* and *Spartan Steel* as decisive. He exercised discretionary choice in doing so. Perhaps he was *bound* to choose impartially, judiciously, with due attention to alternative possibilities. But he was *not bound* to decide for the defendants; that he *chose* to do.

Hart thus accepts for hard cases an essentially sceptical analysis of binding precedent, an Allen-type "rule." His scepticism may not be pure rule-scepticism, or rule-scepticism "all the way down." But it is still scepticism about the genuineness of the gravitational force of precedents. The use by Hart of the label "discretion" and his emphasis on "choice" indicates that he has not freed himself from the grip of mechanical jurisprudence as much as he thinks he has. How else to construe the idea that what faces a judge in a hard case is *genuinely a choice*, except in terms of the idea that demonstration is impossible (cf. the quote from Hart 1994, 204–5 above)? If this is right, then there is something odd about the notion of "reasoned choice." For if "reasoning" means "deductive reasoning," what seems to be given with "reasoned" is taken away from us with "choice." One might say at this point that "reasoned choice" is simply one of those illuminating paradoxes in philosophy, that the deep nature of penumbral adjudication can only be brought about by such a juxtaposition of clashing ideas. In an important way, as will be seen, this is absolutely right. However, tactical questions arise about the stage in the discussion of these problems at which the deployment of the paradox will be most effective. The argument of the remainder of this section may be taken as an argument that Hart deploys it too soon. His talk of discretion and choice has caused disquiet among opponents that his disclaimers have not removed. The reason is that his understanding of the nature of logic and of the notion of rule is too shallowly rooted in background understanding of these matters. If

[8] Even now, recovery for economic loss is still tightly circumscribed in the U.K., the U.S. and Canada, although more standardly recoverable in Australia and New Zealand. For a thorough analysis, see Feldthusen 2000.

we can deepen our grasp of the background, then the notion of "choice" will be purged of its troublesome connotations, and the paradox can do its therapeutic work.

3.5.2. Precedent, Wittgenstein and Rule-following

3.5.2.1. Wittgenstein and Following a Rule

I believe that a more promising way of understanding the distinctiveness of binding precedent is to be found in Ludwig Wittgenstein's ideas about rules and necessity. There are three essential elements to Wittgenstein's account of rules: (1) that the concept of a rule is compatible with the concept of a practice; a rule is neither an untouchable piece of language nor a mere agreement in opinion; (2) a rule is still a rule, even though it is not the case that all its future applications are determined by the language in which it is phrased; (3) even given this account of a rule, a concept of necessity is available. I shall deal with these in turn.

1. *Rule and Practice.* "Obeying a rule" Wittgenstein says, is *a practice* (Wittgenstein 1958, 202). "A rule stands there like a signpost. Does the signpost leave no doubt open about the way I have to go?" (ibid., 85). "A person goes by a signpost only in so far as there exists a regular use of signposts, a custom" (ibid., 198). Wittgenstein is asking us to reflect here on what really constitutes behaviour according to a rule. It is not simply that the rule says, "Do *X*" and *A* does *X*. My following the signpost to Vancouver is not a matter of the signpost pointing to the right and reading "Vancouver" together with my turning to the right. I must recognize that *this is* a signpost, and that *that is* the way the signpost is telling me to go. Those things are not given by the existence of the signpost and my right turn. They are a matter of my taking the signpost in a certain way. But what is the foundation of *that*? It is no kind of idiosyncratic decision on my part (cf. ibid., 199). Nor is it that the signpost itself tells me (ibid., 85). Rather, this is just the way that signposts function in our society. It is part of our form of life; it is a practice, a custom for us to behave that way. "It is not a kind of *seeing* on our part; it is our *acting* which lies at the bottom of the language-game" (Wittgenstein 1974, 204; his italics). He expresses the same idea in a fundamentally important distinction between "agreement in opinion" and "agreement in judgment," the latter glossed as "agreement in form of life" (Wittegenstein 1958, 241–2). The conscious deliberation and discussion of a jury will result in agreement in opinion. But our normal application of language to the world is not like that. We do not normally deliberate before calling red things red, cars cars, and courageous acts courageous. We learn as children to apply these terms naturally, and what we all naturally learn by this process is *how things are. This* agreement is an agreement in judgment. Our *judgments* are attuned to one another by natural

development, by inheriting a language and a form of life; it is not that our opinions become attuned to one another by deliberation.

2. *Rule and Determination.* Given that rules are practices, based on agreement in judgments, how then do rules determine their applications? It is tempting to think that a rule determines in advance how it is to be applied—that this is precisely what is meant by there being *a rule* about some matter. Without this antecedent determination, how can there be a rule? We have already noted that many of the problems both in understanding the bindingness of precedent stem from the need to make a separate determination of whether the instant case is, in the appropriate sense, "like" the precedent. Wittgenstein accepts this need. "The use of the word 'rule' and the use of the word 'same' are, says Wittgenstein, 'interwoven'" (Wittgenstein 1958, 225). That is, we do not understand a rule unless we understand what the rule will countenance as identical actions performed according to it. However, Wittgenstein also warns (ibid., 215-6) against the philosophical (and, I would add, practical) uselessness of using the identity of a thing with itself as a paradigm of sameness. This is to put at a more general level the inadequate idea, born of the hopeless quest for perfectly justified decisions, that a case is only a genuinely binding precedent for another case *exactly* like it. In this context of uncertainty, the determination of what counts as "the same case" for the purposes of a given rule comes about only from a *practice* of taking the rule that way. But this means that the rule is that practice. The rule *qua* piece of language does not determine what counts as the same thing; only the rule *qua* practice does that.

3. *Rule and Necessity.* One might feel inclined now to say the following. Wittgenstein may be right in the above two points about fuzzy-edged social rules such as the rules of etiquette or of morality. But the hard rules of logic and mathematics are different. Why should not law as a rigorous discipline aspire to be like the latter? And if it does, then will not the above two points be irrelevant?

Notoriously, Wittgenstein gives this same account of mathematical rules: "But then what does the peculiar inexorability of mathematics consist in? [...]. It is usable, and, above all, *it is used*" (Wittgenstein 1956, I.4; his italics). Later he writes:

We now draw attention to the fact that the word "inexorable" is used in a variety of ways. There correspond to our laws of logic very general facts of daily experience. They are the ones that make it possible for us to keep on demonstrating those laws in a very simple way (with ink on paper for example). They are to be compared with the facts that make measurement with a yardstick easy and useful. This suggests the use of precisely these laws of inference, and now it is *we* that are inexorable in applying these laws. Because we "*measure*"; and it is part of measuring for everybody to have the same measures. Besides this, however, inexorable, i.e., *unambiguous* rules of inference can be distinguished from ones that are not unambiguous, I mean from such as leave an alternative open for us. (Wittgenstein 1956, I.118; his italics)

There are various images that the notion of "binding" can be used to express, as there are various cases of inexorability. In one sense, a law binds only when it is unambiguous. We have seen how Hart's use of "discretion" and "choice" seems to presuppose such a sense. But that notion of binding does not illustrate anything deep about the operation of precedent, any more than taking deductive inference as the paradigm of inexorability reveals anything deep about the inexorability of mathematics.

Wittgenstein's account of mathematics and logical necessity depends on relating it to fundamental human practices such as counting and so-called natural deduction. The point of this is *not* to defend rule-scepticism in mathematics and logic. Rather, it is to show in what the character of being governed by inexorable rules consists. Wittgenstein does it by the well-known device of considering what could be said about one who wishes to continue the series 996, 998, 1000, ... by 1004, 1008, ... , and how such a one may be said to be ignoring a valid rule (Wittgenstein 1958, 183ff.; Wittgenstein 1956, passim). This account of what it is to follow mathematical and logical rules makes following such rules a *special case* of what it is to follow *any* rule. What is being marked by talk of "inexorability" is simply the peculiar relation of mathematical and logical rules to social practice and to "very general facts of daily experience" (Wittgenstein 1956, I.118). In the world we live in, calculating in the way we count is *the* way to calculate, to use numbers as they should be used. In a world suitably different, where very general facts of nature were different, this would not be so. But we are not in, and cannot conceive of, such a world.

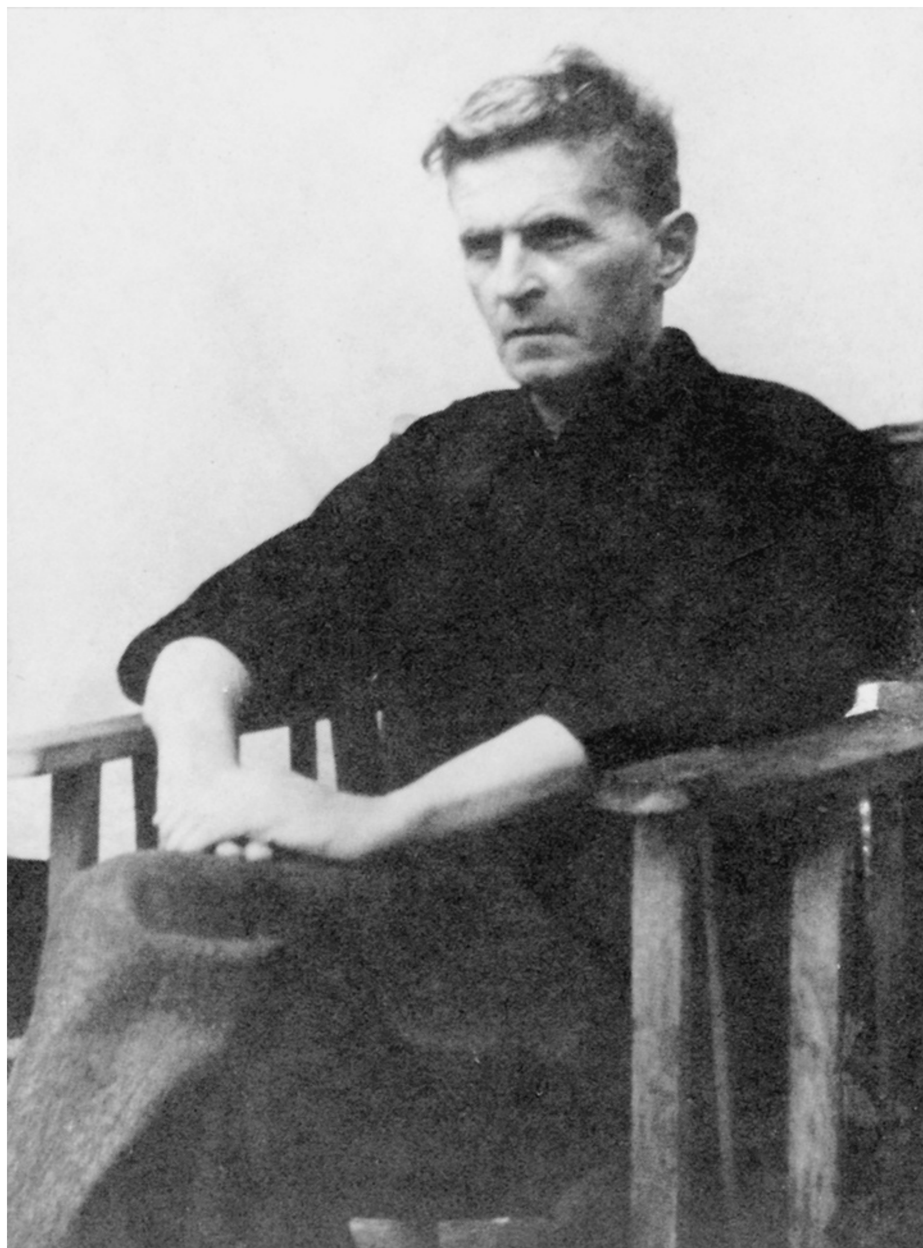
3.5.2.2. Precedent and Following a Rule

We must now apply these thoughts to a philosophical consideration of binding precedent.[9] I have three points to make. First, the purpose of introducing Wittgenstein's remarks about mathematics is this. Theorists considering binding precedent are pulled in different directions by conflicting intuitions. On the one hand, they sense the appropriateness of using modal language to characterize the requirements of *stare decisis.* On the other hand, they see clearly that legal rules are not like and do not function like the rules of mathematics or logic with respect to clarity and immutability, and moreover they see that legal inference, unlike mathematical or logical inference, is not "inexorable." In these circumstances, the second intuition generally wins the tug-of-war, and the modal language is either regarded as a naively optimistic projection or

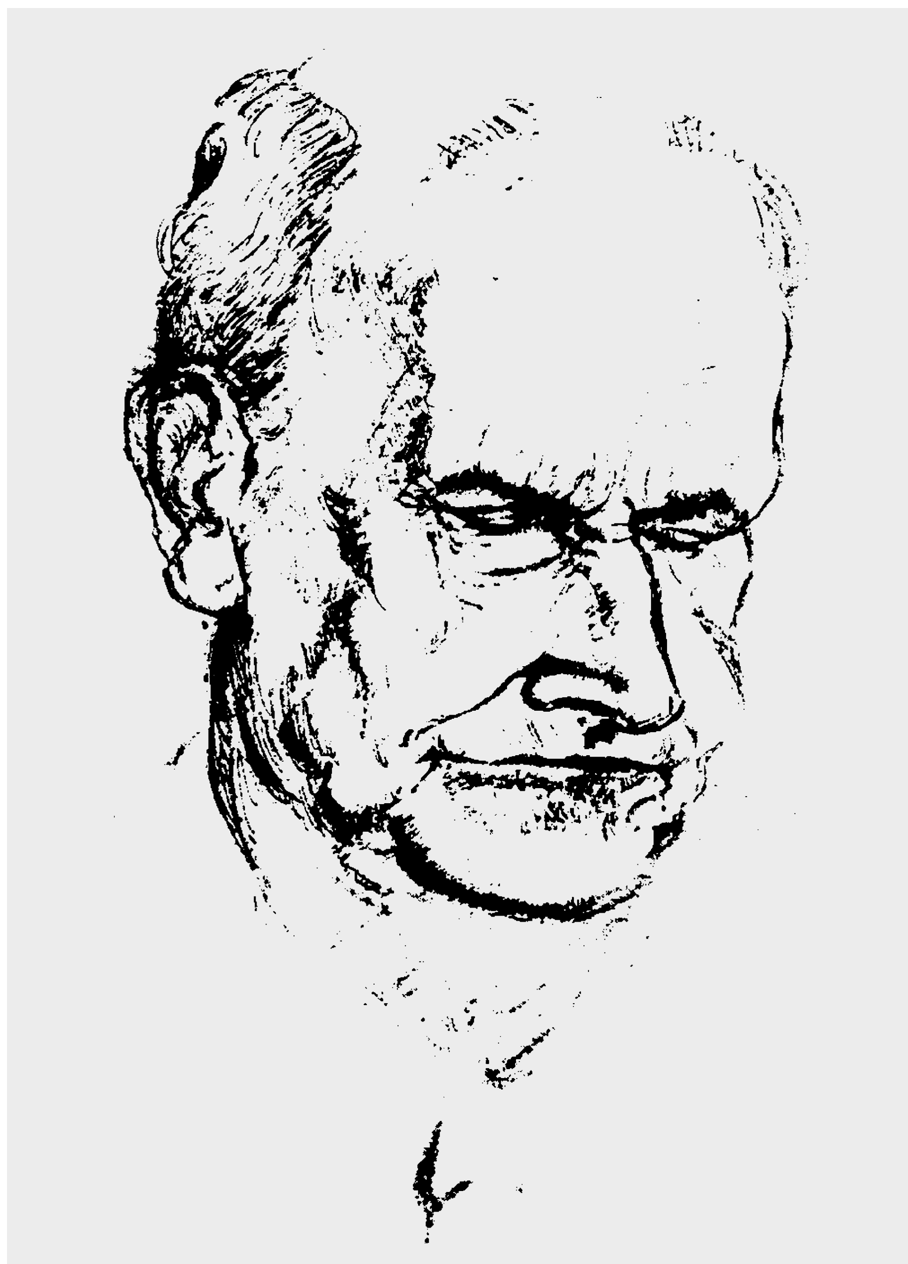
[9] The following comments are a revised version of points made some time ago (Shiner 1982). The application of Wittgenstein's ideas to law has also been explored by Brian Bix (1993) and Dennis Patterson (1999), although each says very little about precedent. See also the essays in Patterson 1992.

else the modalities are given a weak explanation in terms of "necessary to the English legal system" or judicial comity, along the lines referred to earlier. The point of introducing Wittgenstein's philosophy of mathematics and logic is to show that in fact there is *no* deep conflict between these intuitions. It is perfectly possible for modal language to be entirely appropriate even though there is also something important about a human activity brought out by calling it a practice. Only because a false picture of the inexorability of mathematics holds theorists captive are they tempted either to search for similar perfection in law or else to adopt various drastic strategies for coping with its absence.

Second, Wittgenstein's general account of rules shows that there really is no conflict either between something's being a matter of rule and a matter of practice. Yet frequently theorists discussing precedent proceed as though these notions are incompatible. Again, this is because of too abstract and idealized a picture of rules. This is quite explicit in some discussion (Rickett 1980, 144–6; Goldstein 1979, 388–9), but it also turns up in more subtle ways. Brian Simpson, for instance, stages a lengthy attack on the idea of the common law as a system of rules (Simpson 1973). I will mention two points where the wrong picture of rules influences him. He remarks (ibid., 86) that it is misleading to speak of judicial legislation. Part of his point here is very well taken—that when judges develop the common law in new ways they do not do so by conferring privileged status on a form of words, whereas that is the way that legislatures develop the law. As Charles Collier has commented, if a court decided in advance a case or question not before it, it would be accurate to call that an exercise of legislative power (Collier 1988, 774); deciding matters that are before the court is not legislating. However, Simpson then goes on to regard the non-legislative character of precedent as a reason for denying that the common law is a system of rules. Statute law is the nearest that law ever comes to being like logic or mathematics (and that is not *very* near!). The assumption underlying the thought that common law *rationes* are not like statutes, and therefore not rules, can only be that the rules of mathematics and logic are the ideal paradigms for what it is to be a rule. But that assumption is false, and so this reason for regarding the common law as a system of rules falls away. Shortly afterwards, Simpson derides the thought that the 1966 Practice Statement is a rule of precedent by saying, "one moment the House of Lords or the Court of Criminal Appeal is absolutely bound by its own decisions, the next moment it is not" (Simpson 1973, 87). Of course, the Practice Statement is absurd, if looked at in that way. However, events leading up to the Practice Statement are an essential part of the evolution of *stare decisis*, as are also events after it. The "black and white" aspect of the application of a rule is characteristic of the rules of mathematics and logic, and it is silly to imagine that legal rules have that characteristic also. But that is no reason to deny that they are rules; again, only bewitchment by the picture of logi-



Ludwig Wittgenstein (1889–1951)



Sir Rupert Cross (1912–1980)

cal and mathematical rules can make one to think that it is. As the story above (sec. 3.4.3) of Lord Denning's campaign to get the U.K. Court of Appeal to drop the rule in *Young*'s case illustrates, the practice and rules of precedent have a more powerful inertial force than can be made to deviate by one voice. It is not simply that other judges hold different opinions from Lord Denning; it is rather that the weight of the rules and the practice lie against him. They have a life independently of given particular judges, because of the values and goals the judges agree in judging them to represent.

Third, I submit that the Wittgensteinian account I am offering is the best way of accounting for a striking feature of the way cases actually function as precedents. The feature in question is alluded to by Lord Wilberforce in *Anns* when he remarks that the relevance of *Donoghue v Stevenson* to statutory bodies only became clear in *Dorset Yacht* (*Donoghue v Stevenson* [1932] AC 562; *Home Office v Dorset Yacht Co Ltd* [1970] 2 All ER 294; *Anns and others v London Borough of Merton* [1977] 2 All ER 492). (I feel like amending this to "it only became clear in *Anns* that it was already clear in *Dorset Yacht*," but that is by the way.) The feature remarked on is that the precise law for which a particular case is precedent will standardly only become clear after a line of subsequent cases has been decided. *Donoghue* laid down central principles of the law concerning negligence. For a long time, it was thought inappropriate to apply these principles to bodies created by statute. Later it was thought clear that in fact the principles did apply. With great decisions, such as *Donoghue*, the process of determining for what the case stands continues and continues. If we assume that "rule" and "practice" are complementary, this fact about great precedents is easy to understand and accept—for it is a direct manifestation of that complementarity. If we do not accept this view, then we get into unnecessary tangles. For instance, it is certainly true that, after *Hedley Byrne* (*Hedley Byrne & Go Ltd v Heller & Partners Ltd*, [1963] 2 All E.R. 575), a case in which a plaintiff was allowed to recover damages for economic loss consequent upon negligent misstatement, there was in U.K. law no absolute prohibition against recovery in tort for economic loss not consequent upon physical damage. But, given the wrong picture of rules, spurious questions come thick and fast. Does *Hedley Byrne* constitute simply a narrow exception to the so-called exclusory rule as regards pure economic loss, or does it show that there is no such rule? If the rule no longer exists, was it *Hedley Byrne* that put paid to it, or some later case in which the rule was further eroded? Despite the grist that these questions would seem to provide for the academic mill, they are questions that it is impossible and unnecessary to answer. The rule concerning recovery for economic loss is not reducible to any *ratio* in any one case, but is an organic practice that is still growing (Feldthusen 2000). Recognition of this fact does not require one to think therefore that speaking of rules here is a bad joke; rather, it requires sensitivity to the kind of rule we are dealing with.

Subsequent history has expanded the scope of *Donoghue*. But subsequent history can equally well reveal a precedent to stand for less than was thought. In *Stanley* (*Stanley v Georgia* 394 US 557 [1969]), Stanley was convicted under a Georgia state statute that prohibited the possession of obscene material. Striking down the statute, the U.S. Supreme Court boldly observed that the "right to receive information and ideas, regardless of their social worth, [is] fundamental to our free society" (at 564). Soon after *Stanley* was decided, it became clear that the obscenity industry could read the fine print of the decision, and lower courts followed them. As one trial judge put it, "if a person has the right to receive and possess this material, then someone must have the right to deliver it to him" (quoted in *US v Reidel* 402 US 351 [1971], at 355). *Reidel* was one of four cases in quick succession, testing various restrictions on the acquisition or importation of obscenity, in all of which the importer appealed to a supposed right to receive (*US v Thirty-seven Photographs* 402 US 363 [1971]; *US v Twelve 200' Reels of Super 8mm Film* US 413 123 [1973]; *US v Orito* 413 US 139 [1973]). The Court had to repeat time and time again that it did not mean what it said, that *Stanley* was all about (as indeed it was, bar the throwaway lines about a "right to receive") the freedom to possess the expressive material of one's choice in one's own home, and the error of government attempts to invade the home and the mind, a much more restricted issue than a grand "right to receive information."

Two further important contemporary attempts to correlate precedents and rules should be mentioned. Schauer claims that "what distinguishes reasoning from precedent from reasoning from rule [...] is the necessity in precedential reasoning of *constructing* the generalization/factual predicate that already exists in the case of a rule" (Schauer 1991, 183; his emphasis). A precedent case is never exactly the same as a case before the court. So the court has to construct the generalization about the precedent case that will bring the instant case under the precedent case. A rule just is a generalization of a certain kind, and thus will wear on its face whether the instant case falls under it. Schauer's point, if I understand him aright, is both subtly correct and subtly misleading.

A city ordinance forbids parking in front of fire hydrants; I park my car in front of a fire hydrant. A person who tries to argue that my situation is not covered by the rule, that a decision is involved in seeing that my case is covered by the rule, can only be taken to be playing some kind of philosophical game. On the other hand, consider the position of the court in *Hedley Byrne*, faced with the precedential rule ("rule," if you like) about no recovery of damages for pure economic loss. The defendant who negligently gave false information about the credit-worthiness of a client caused the plaintiff economic loss. The loss was indeed not consequent upon physical damage, since no physical interaction was at issue. The court in saying that the exclusionary rule did not apply to Hedley Byrne's situation had to construct ("construct," if you like) the generalization: "No recovery for pure economic loss not conse-

quent upon physical damage except where caused by negligent misstatement." Talk of "constructing a generalization" thus appears to have more applicability in the case of precedent than it does in the case of paradigm legal rules like statutes. It appears also to be a valid way of marking the distinction between reasoning from precedent and reasoning from rules. But that way, as we have seen, lies skepticism about the necessity of the system of precedent, and we have rejected such skepticism.

Schauer also, though, goes on to argue that there are going to be controls on the construction of generalizations. In his general discussion of rule-based decision-making earlier in the book (Schauer 1991, chaps. 3–5), Schauer has been at pains to point out how decision-making by rule depends on what he calls "entrenched generalizations." Such factors as natural kinds, culturally unbudgeable norms, classifications constitutive of language, and so forth exercise a great degree of control over how one individual can adapt language to their own pleasure. Schauer argues for analogous controls to exist in the case of reasoning by precedent. He reiterates the example, familiar from *Donoghue v Stevenson*, of the snail trapped in the ginger-beer bottle, and rightly says that we will find the assimilation of this case to others of adulterated consumer products "culturally, linguistically, and psychologically much easier" than an assimilation to a fox, say, caught in a steel trap (Schauer 1991, 186). He further comments that, although reasoning from precedent cannot be properly understood without attention to the role of weight, weight plays a role also in reasoning from rules (ibid., 187).

In a similar spirit, Barbara Levenbook introduces the concept of "exemplar force" (Levenbook 2000, 183ff.). The echo of Dworkin's notions of enactment and gravitational force is intentional. Levenbook rightly regards the use of precedent in the law as a form of example-setting which occurs outside the law as well, and, also rightly, says that exemplar force is independent of background justification (ibid. 188–98). She is aware, though, that more has to be said about how exemplar force operates, if it to be more than a label. She appeals to two notions, that of "social salience," and then, in the legal context in particular, the special role of officials and "the legal subculture" in creating and defining social salience (ibid., 211–23). Social salience functions in her theory analogously to entrenchment in Schauer's. The role of officials as distinctive contributors to social salience seems a more attractive way of explaining their role in the creation of the bindingness of precedent than an explanation in terms of comity.

In short,

> except for the fact that the lack of a canonical formulation of a factual predicate substantially increases the indeterminacy of the rule set forth in the precedent case (an indeterminacy that is compounded when multiple and extensionally divergent precedent cases are available), nothing about precedent-based constraint uniquely differentiates it from rule-based constraint. (Schauer 1991, 187)

Schauer seems to overlook how much the notion of entrenchment takes away what has apparently been given by the notion of construction. Schauer's account brings out that the difference between "mere" generalization and rule is no more, and no less, than the difference between generalizations that are constructed and generalizations that are entrenched. But if the "ruleness" of rules is properly explained by cultural entrenchment, so also is the ruleness of precedential reasoning. Precedential rules have to be "constructed," if you like, but that act is but a moment in a deeply-rooted on-going practice of rule-making, applying, and following.

At this point any residual disagreement between Schauer and myself will be a matter of seeing how both our two views are needed, to preserve a delicate theoretical balance. We are both at pains to reject the dichotomy of mechanical jurisprudence versus discretionary choice, even in hard, let alone easy, cases. Schauer, however, continues to believe that something important about reasoning from precedent is brought out by emphasis on indeterminacy and constructing generalizations, as differentiating reasoning by precedent and reasoning by rule. I prefer to emphasize what Schauer rightly calls the "ruleness" of reasoning by precedent, by arguing that some at least of the inclination to distinguish reasoning by precedent from reasoning by rule comes from an overly formalized view of what reasoning by rule is like. Ultimately, reasoning by precedent is what it is and not another thing. Its nature emerges from studying the interplay of theories, rather than from the correctness of one single theory.

3.6. The Justification of Precedent

3.6.1. Introduction

The doctrine of *stare decisis* is a fundamental feature of common law adjudication, even though it is true that the doctrine is observed less strictly elsewhere in common law jurisdictions than it is in the U.K. Established though it is, theorists have felt that the doctrine nonetheless needs principled justification. The difficulties are felt to arise from the fact that a court, when bound to adjudicate a certain way for reasons of *stare decisis*, will on occasion state that, but for the doctrine, they would have decided the case differently and that the other view seems normatively more attractive. "*Stare decisis* requires that courts conform their decisions to decisions reached by previous courts, and sometimes those previous decisions will have been unjust. *Stare decisis*, that is, sometimes requires courts to reach unjust decisions" (Peters 1996, 2033). Alexander thinks that analysis of precedent must focus on precedents that are "incorrect" in the sense of being governed by "principles of political morality" which were "misapplied" (Alexander 1989, 4). Precedent "demands that a court adhere to a prior decision that it believes to be wrong" (Kornhauser

1989, 65; see also Cross and Harris 1991, 3). As these commentators point out, *stare decisis* thus characterized seems paradoxical and greatly in need of justification—how can it be a morally justified requirement to do the morally wrong thing?

I believe that such a characterization of what is involved in *stare decisis* deeply misleads both as to the structure of reasoning from precedent itself and as to the perfectly appropriate questions about justification that do arise. I shall explain.

3.6.2. The Structure of Stare Decisis

The characterization of reasoning from precedent as paradoxical misleads as to the structure of such reasoning in the following way. Precedents through their *rationes decidendi* function as what Joseph Raz has called "exclusionary reasons" (Raz 1975, 35–48). Reasons for action that bear directly on what to do, and go into the balance of reasons, are first-order reasons. Reasons that are reasons for acting in relation to given first-order reasons are second-order reasons. These may be positive (reasons for acting on certain reasons) or negative (reasons to refrain from acting on certain reasons). Second-order reasons that function to exclude action on the basis of the first-order reasons that fall within their scope are exclusionary reasons. The reasons for action represented by the social facts of permissions or legal requirements are at least first-order reasons for action—that I promised to do *A*, or that the law requires me to do *A*, are each reasons for doing *A*. But these social facts are also second-order, exclusionary reasons, excluding from the practical reasoning reasons against doing *A*. Only so, claims Raz, can we explain the tension that arises when a person sees that performing *A* is warranted by the balance of reasons but performing *A* is forbidden by law. Conflicts between first-order ordinary reasons and second-order exclusionary reasons are resolved, not by the relative strength of the two competing reasons, but, as Raz puts it, by a general principle of practical reasoning which determines that exclusionary reasons always prevail (Raz 1975, 40). Note that Raz's view is actually less dramatic than this bald statement implies. There may be conflicts of weight between second-order reasons themselves. Moreover, exclusionary reasons have the dimension of scope; they exclude only first-order reasons within their scope. Thus by either route a given exclusionary reason may be defeated, and some action it ostensibly debarred thereby reinstated as the thing to do. The true principle is not, "Always act in accordance with exclusionary reasons," but "One ought, all things considered, always to act for an undefeated reason."

Raz's view is that in general the law functions as a system of exclusionary reasons (Raz 1975, chap. 5). I am not concerned with that broader issue here, but simply with seeing the formal rules of *stare decisis* as exclusionary reasons. The application of this account to *stare decisis* is as follows. Take a case where

a lower court is required to decide a case a certain way because of a controlling prior decision by a higher court. The effect of this requirement of *stare decisis* is that the substantive reasons which the lower court might otherwise have had to decide the case, say, in favour of the plaintiff are *excluded* from its reasoning, so that now it must decide in favour of the defendant. The effect of *stare decisis* is to change the array of reasons facing the court, rather than to add new reasons.

There is one immediate objection available to the above claim. Both Stephen Perry (Perry 1987; 1989) and Schauer (Schauer 1991, 88–93) have objected to Raz's story about legal requirements functioning as exclusionary reasons in the following way. They accept that the presence of a legal requirement—and the doctrine of *stare decisis* is in this sense a legal requirement although its norm-subjects are courts, not citizens—makes a difference to the balance of reasons. They claim, however, that it functions, not to exclude first-order reasons, but rather to alter their weight, to create a very strong presumption in favour of certain first-order reasons rather than others. As applied to the case of *stare decisis*, the thought is that the effect of a requirement to follow ("follow or properly distinguish," if you like) the precedent decision of a higher court is to add a great deal of weight to the substantive reasons embodied in the decision of the higher court, and thus alter the balance of the reasons facing the lower court. Perry refers to what he calls a "strong Burkean notion of precedent" ("Burkean," not because of any invocation of Edmund Burke's actual views, but because of a general notion of deference to the past): "A court is bound by a previous decision unless it is convinced that there is a *strong* reason for holding otherwise" (Perry 1987, 222).

The merits of the issue here are complex. I have given reasons elsewhere (Shiner 1992, 103-115) for preferring Raz's original view on this particular issue. Let me here focus on one of Perry's arguments that I have not previously addressed. One of his motivations for preferring his own "strong Burkean" account to Raz's "exclusionary reasons" account of precedents is that on his account, but not Raz's, the important feature is preserved of the lower court reasoning being to some degree, even if a very small degree, still transparent to the relevant substantive reasons. Perry's view is thus a very sophisticated version of the approach that seeks to relieve *stare decisis* of the burden of forcing courts to act immorally. Perry argues, with some plausibility, that overruling of precedent of the kind the U.K. House of Lords now permitted itself after the 1966 Practice Statement is best understood on his "strong Burkean" model (Perry 1987, 243–8). But, if that is true, then the point can be turned against the application of the "strong Burkean" account to *stare decisis* as a whole. For the House of Lords is in a different position in relation to its own past decisions from the position that lower courts are in relative to decisions of higher courts in a system of *stare decisis.* After the Practice Statement, only issues of background political morality are relevant to the deliberation of the House.

The fact that a given decision exists has weight simply out of whatever substantive weight its pastness represents, not for the formal weight of pastness itself. Other courts are in the position that the House was itself in before the Practice Statement. Perry refers to the House's former self-binding as an "extreme and somewhat aberrant" application of *stare decisis* (ibid., 247), but it is not; it is representative of the position of other courts than the House of Lords in the hierarchical U.K. jurisdiction.

Implicit in my previous remarks is the assumption that a common law *ratio* is an ordinary kind of legal rule, so that whatever may be said about ordinary kinds of legal rules may be said about *rationes*. But we have seen already that such an assumption is not entirely correct. Whereas rules embodied in statutes are given to courts to apply, common law *rationes* must to some degree be constructed. A court deciding a tort case about pure economic loss may seem, on the face of it, to be "given" the exclusionary rule, but this is not wholly so. The variation of the rule that took place in *Hedley Byrne* was regarded as quite acceptable—but no court would take it upon itself to vary the wording of a statute. Let us suppose that "indeterminacy" is the right term to use. The element of indeterminacy in reasoning from precedent, then, could be taken to weaken any claim of a common law *ratio* to function like a Razian exclusionary reason. How could a *ratio* exclude, it may be said, if it has to be confirmed by the court supposedly bound by it? Is not the "strong Burkean" account reinstated by this indeterminacy?

We have arrived again, I believe, at a point where definitive answers are elusive. I acknowledged in the previous section that it might be more appropriate to speak more loosely of the "ruleness" of common law *rationes*, rather than to speak of them directly as rules. The question is whether the "ruleness" of *rationes* is sufficient that it is more illuminating to think of them as exclusionary reasons than not so to think of them. The question cannot be definitively answered. I will, however, now go on to sketch an approach to the justification of precedent that presupposes the exclusionary reasons model. If that approach makes sense, then some further reason for the exclusionary reasons model will have been given.

3.6.3. The Justification of Precedent

There are many standard ways in the literature of seeking to justify *stare decisis*. Richard Wasserstrom, for example, lists certainty, reliance, equality, and efficiency (Wasserstrom 1961, 60–73). Fairness, in the sense of the maxim "Treat like cases alike" is regularly mentioned. More specific reasons are also adduced, such as the avoidance of delayed justice, the greater decision-making proficiency of superior courts, the desirability of uniform decision-making in the law (Caminker 1994, 843–55). Dworkin (1986, 24–6, 240–50) appeals to the value of integrity. Anthony Kronman (1990) appeals to tradition and re-

spect for the past as values in themselves. Gerald Postema (1997) neatly combines elements of both these views while rejecting each, in defending integrity as coherence with the past, but subsuming its value under justice as a characteristic of well-ordered historically extended communities. Some of these suggestions make more sense than others. For an effective critique of Kronman, for example, see David Luban (1991). For Caminker's own critique of the values mentioned above, see Caminker 1994, 856–64. For a sustained critique of consistency as a value in itself, see Peters 1996.

The issue I want to raise now is not whether these values succeed in the task of justifying *stare decisis.* Antecedently, it would seem unlikely that any single value or set of values would by itself or themselves justify *stare decisis.* It is more likely that these values contribute to the justification in complex ways with differing weights in differing contexts. The pressing question is how to understand the role that whatever values do justify precedent play in the process of justification.

Let us suppose that I have established a sufficiently robust, or even entirely robust, case for common law precedents functioning as exclusionary reasons. They then will cause, commensurate with that robustness, an opacity of the reasoning to the background reasons for having the rule in question. Consider again the rule against recovery for pure economic loss. The main reason for having such a rule is to avoid the social cost of excessive exposure to liability (Feldthusen 2000, 199–209). A lower court faced with a plaintiff whose plea amounts to seeking recovery of damages for pure economic loss does not have to consider whether the rule against recovery is a good rule; it just has to apply the rule. Let us suppose, though, that in the case in point, injustice was done to the plaintiff in question. In retrospect, to have lumped economic loss from negligent misstatement in with other cases of economic loss not consequent upon physical damage would have been unfair to plaintiffs in the position of Hedley Byrne. (And perhaps applying the rule caused unfairness to Spartan Steel as well; but that's for another time.) So the exclusionary rule prior to *Hedley Byrne* resulted in unfair treatment of some plaintiffs, and perhaps even now it also so results. How though to understand the relation between cases of specific unfairness and the exclusionary rule?

It is an inescapable feature of decision-making by rule that such decision-making is sub-optimal (Schauer 1991, 100ff.). Rules phrased in general terms will be over-inclusive, under-inclusive, or both, with respect to specific instances. We accept that, though, in order to achieve the advantages of decision-making by rules (Schauer 1991, 135–66). But if that is so, then in an important sense the plaintiff (to use a legal example) who is the victim of under- or over-inclusion is not treated "unfairly" or "wrongly." To claim that the decision was "unfair" to the plaintiff is to claim implicitly that the decision should have been taken particularistically—that is, without regard to the rule and the reasons for decision-making by rule. If you like, we can say that the

decision to disallow the plaintiff recovery was "counterfactually unfair." I mean: If the case had been decided particularistically, without reference to any antecedent rule, and decided on grounds of fairness, then the plaintiff would have recovered. But it is a mistake to think that therefore the actual decision under *stare decisis* was unfair.

I cited at the beginning Alexander's notion of the "natural model" for precedent. Alexander contrasts the natural model with what he calls the rule model of precedent (Alexander 1989, 17ff.). He suggests at the end of the article that the best model of precedent overall seems to be a two-level one. At the level of how reasoning from precedent plays itself out in the actual functioning of a common law legal system, the rule model is the best model. But still we can ask at the level of institutional design within background political morality: Should we institute, or maintain, a system of *stare decisis* as an essential mode of judicial reasoning? Here, Alexander argues, the natural model is correct. At this level, we should look at the particular system involved, and make sure that it can be justified for reasons of political morality (ibid., 48–56). It seems to me that Alexander is correct about this. The values that are arguably fostered by a system of *stare decisis* come in at the level of justifying having such a system at all. The system itself, however, insulates decision-making within the system from those values directly influencing the individual case, certainly at every level below that of the supreme tribunal of the system. To the extent that there is "indeterminacy" within the system at the lower court level—mechanisms of distinguishing precedent cases and the like—then there will be seepage of the background values into instances of decision-making in cases. But this seepage constitutes a feature of the rule model of reasoning from precedent, not its repudiation.

Chapter 4

CUSTOM

The third of the three traditionally main sources of law is Custom. The standard view of contemporary analysis is that the importance of custom historically is great, but, from the point of view of current legal practice, its importance is slight. This is so both in the common law and the civil law traditions. The only exception is in the case of international law, where customary law is still of great importance: The sources of international law will be considered separately in Section 8.4 below. Customary law is still important, of course, in communities where the mode of existence, application, and enforcement of binding social norms is primarily informal: The law, or "law," of such communities is not discussed here.

There is now not much controversy within the common law tradition concerning custom as a source of law. The reason, as we shall see below (secs. 4.2–4.3), is that, in addition to the minor importance from the point of view of legal practice, the common law rules as regards custom's functioning as a source are well established, and leave relatively little room for discussion. (But they do leave some room—see sec. 4.4 below.) As regards the civil law tradition, John Merryman comments that the amount of scholarly writing is out of all proportion to the importance of custom as a source. However, he comments also that the explanation of this phenomenon is clear—the need to justify treating as law something not created by the legislative power of the state.

> To give custom the force of law would appear to violate the dogma of state positivism (only the state can make law) and the dogma of sharp separation of powers (within the state only the legislature can make law). (Merryman 1984, 23)

I will focus in this chapter on custom within the common law. In Section 4.1, I will say something about the historical origins of custom as a source of law, and identify the prime sense of custom with which we are here concerned. In Section 4.2, I will set out the conceptual framework within which custom as a source of law is discussed. In Section 4.3, I will set out the rules according to which custom functions as a source of law. In Section 4.4, I will discuss the jurisprudential puzzles that are raised by the role of custom as a source.

4.1. Historical Foundations of Custom as a Source of Law

4.1.1. From Social Norm to Common Law

Custom is historically important, for the simple reason that "historically custom is the original form of law" (Jolowicz 1963, 198). It seems a frequently

occurring pattern of cultural diachronicity that a society, as it grows in size and complexity, proceeds from the situation where societal norms governing behaviour are acknowledged and applied by informal methods to one where the norms are created, identified, varied, and applied by formal institutions dedicated to such a purpose. H. L. A. Hart is well known for making this process of development central to his account of law (Hart 1994, 91–9). We need not, and arguably should not, join Hart in characterizing the process as one of passage from "primitive" to "developed" law. Familiarly we refer to the early stages of such a history as ones in which the norms are purely "customary." We need to remember the perspective from which contemporary legal theory uses such terminology. The law in the typical modern municipal legal system is a separate and specialized social institution, with a considerably degree of autonomy—certainly conceptual autonomy, and to a sizeable extent functional autonomy. The obverse to this fact is that we understand as "law" norms whose origin and operation occurs within this autonomous system. They are therefore not "customary."

In modern analysis, we seem to arrive at the notion of "customary law" as the designation for law that does not have status in the other, familiar institutional ways. But we should not be misled by the apparently simple idea that "custom was originally important as a source of law, but is not so now." One may put the point thus: Those who lived at the stage when their law was all customary would not have known that their law was all customary; they could not have had the notion of "customary law." It is only at a later stage of more advanced institutionalization of law that one can look back and see that once law was not so institutionalized. If we take the past history of our own society, the normative system on which phases of that society with only customary law were based performed the same task, and was of the same social significance, as our modern non-customary law. The same is true of contemporary societies that lack the familiar formal institutions of a modern municipal legal system.

In England, for example,[1] as S. F. C. Milsom observes, William the Conqueror "took over a going concern, one to which he claimed lawful title" (Milsom 1981, 11). There were already some trappings of formal legality centuries before the crucial period that most scholars have in mind when they speak of the historical importance of custom as a source of law. There were local courts, applying pre-existing rules, but the rules were not written down; they were the rules used because it was the custom to use those rules. The first significant stage in the evolution of England's common law legal system was that of the development of a tier of proceedings above the local level, that of the justice of the king. The "king's bench" travelled to different localities, and over time a level of normative discourse developed through these judges that was in common to many or all localities—the "common law," the

[1] I sketch here matters dealt with far more fully elsewhere in this Treatise: see Lobban, vol. 9.

general and not merely the local customs of the realm. "These judges did much to create a uniform common law" (Paton and Derham 1972, 195). The next stage was the centralization of the king's courts, and with centralization came specialization (Milsom 1981, 11–36, especially 25–7). With specialization came professionalization, and institutional autonomy. Custom represented a source of law, not in the sense that customary norms were directly applied by courts, but in the sense that customs were, to the extent that they were, judicially interpreted, and these independent judicial norms became the law.

Still, however, "it was long the received theory of English law that whatever was not the product of legislation had its source in custom. [...] The common law of the realm and the common custom of the realm were synonymous expressions" (Fitzgerald 1966, 189). Yet,

> it may confidently be assumed [...] that this doctrine did not at any time express the substantial truth of the matter, and that from the earliest period of English legal history the common law was in fact to a very large extent created and imposed by the decisions of the royal courts of justice, rather than received by those courts from the established customs of the community. [...] The identification of the common law with customary law remained the accepted doctrine long after it had ceased to retain any semblance of truth. (Fitzgerald 1966, 189–90)

The truth is, rather, that "the common law of England has long ceased to be customary law and become a body of case law instead" (Fitzgerald 1966, 206). "Assuredly [the Common Law] is not merely an agglomeration of spontaneous customary rules, unless we are to ignore the vital influence of judicial interpretation upon our law" (Allen 1964, 71). "[The theory that the common law was equivalent to social custom] was not really tenable even in Blackstone's day. The immensely greater part of the common law had already been elaborated by the decisions of judges—decisions which could not possibly have been mere applications of pre-existing custom" (Jolowicz 1963, 206).

4.1.2. General Custom and Local Custom

The question of historical fact when, if ever, social customs truly were sources of law in themselves we will leave to the historians. Analytically, we see at play in this (very) brief historical summary a distinction of prime importance for the topic of this chapter, that between "general custom" and "local custom." "General custom" means simply custom operative generally, across the land; "local custom" means custom operative simply locally, in a certain part of the land. For example, in the county of Kent in England, it was judicially noted as long ago as 1330 (*Sara de Richford's Case* [1330] YB 3 Ed 38 [Mich pl 12], quoted by Allen 1964, 614) that the inheritance law there differed from elsewhere in England: All sons shared equally in the case of intestate succession,

as opposed to the rule elsewhere that the eldest son inherited. As Milsom notes, this local exception survived in Kent until both rules were abolished by statute in 1925 (Milsom 1981, 11).

The historical process sketched above is essentially one of the judicially operated "common law" taking over and crowding out true "general custom of the realm." "The common law" as used now refers to the system of judge-made judicial precedents discussed in the previous chapter; it is primarily contrasted with statute law or legislation (see chap. 2 above). General custom could be a source of law only because it is equivalent to the common law and the common law is a source of law. But then in that case general custom is not a source of law; rather, the common law is. The common law is sometimes called "the custom of the courts" (Dias 1985, 187); "general custom" and "the custom of the courts" are equivalent. It follows then that "general custom is no longer at the present day a living and operative source of English law" (Fitzgerald 1966, 211), in the sense of an independent source, a source not reducible to any other kind of source, a source *proprio vigore*, by its own force or "vigour." "General custom now has no law-constitutive effect of its own" (Dias 1985, 193).

It follows further, moreover, that the issue at stake in this chapter is the extent to which, and mode in which, *local custom* continues to be a source of law *proprio vigore*. When theorists speak of custom as no longer being a significant source of law, they must be taken as making two separate points: General custom is not a source of law for the reasons cited above; local custom is not, or is not significantly, a source of law, for reasons relating solely to it. The truth of the claim about general custom can be readily conceded, and general custom will not further be discussed in this chapter. The truth of the second claim need not be conceded; it will now be investigated. Picture the form of the investigation this way. Imagine that there was a point (although whether there was, and if so when it was, is something on which historians do not agree) when there was only the written law or legislated rules, and pure social custom. Represent this state of affairs as a yellow circle with a blue band around it. Represent now the growth of judge-made, professionalized common law as the appearance and growth of a red band within the blue band. (And, if you like, expand the size appropriately of the blue band itself. Expand too the absolute size of the circle, to represent the ever-increasing role of law in our lives.) As the blue and red bands increase, the yellow contracts. The question is, Does the yellow ever disappear altogether? Or do there remain small spots of yellow still uncovered?

4.2. The Conceptual Framework for Custom

As noted, from now on by "custom" we will be referring to what has hitherto been called "local custom," as opposed to so-called "general custom." All the

same, there is room even within the category of custom so understood for further ambiguities. Here is Salmond:

> The term custom [...] has three distinct meanings of various degrees of generality:
> a) As including both legal and conventional custom;
> b) As including legal custom only, conventional custom being distinguished as usage;
> c) As including only one kind of legal custom, namely, local custom, as opposed to the general custom of the realm. (Fitzgerald 1966, 198, n. m)

By "legal custom" is meant custom that has the force of law, and thus is putatively a source of law. At this point in the analysis in this chapter, by "custom" we mean (c) in the above quotation. I will continue to use "custom" only in this sense. I will not use the term "usage" here, as it is found less frequently (a less common usage, as it were).[2] I need now to explain the difference between custom and conventional custom.

"A usage or conventional custom is [...] an established practice which is legally binding, not because of any legal authority independently possessed by it, but because it has been expressly or impliedly incorporated in a contract between the parties concerned" (Fitzgerald 1966, 193). Conventional custom "depends for its force on its acceptance and incorporation in agreements between the parties to be bound by it" (Jolowicz 1963, 214, n. 6). Conventional custom in this sense is still operative in the law of contract. As a recent textbook has it, "in some circumstances, and under rigorous conditions, a trade, business, or professional usage or custom may be incorporated by implication into a contract, and become one of its terms" (Fridman 1994, 483). The conditions are that the conventional custom be clear or certain, notorious, reasonable (including a lack of conflict with any existing legal provision), and "so generally acquiesced in by those in the particular trade, business, or profession that was involved in the contract that it may be presumed to form an ingredient of the contract" (Fridman 1994, 484; Fitzgerald 1966, 195–6; Allen 1964, 135–6). The example that established the force of conventional custom occurred at the end of the nineteenth century (Fitzgerald 1966, 217–11; Jolowicz 1963, 215–7). It concerned the law relating to negotiable instruments. A rule of common law existed that bills of exchange were negotiable by virtue of the custom of merchants, and the question then arose whether debentures payable to bearer were similarly negotiable. In 1873 the Court of Queen's Bench ruled (*Crouch v Crédit Foncier of England* [1873]LR 8 QB 374) that they could not be negotiable. Debentures were too recent an invention for there to have arisen a conventional custom concerning them; the existing presumption of the common law that they were not negotiable must therefore stand. In 1875, however, the Court of Exchequer Chamber ruled

[2] The term will reappear in Chapter 6, as part of the discussion of constitutional conventions—see 6.1.3 below. See Section 8.4.3 for usages in international law.

(*Goodwin v Robarts* [1875] LR 10 Ex 337) otherwise, and the custom of the negotiability of debentures was regarded as well established by 1902 (*Edelstein v Schuler and Co* [1902] 2 KB 144). The court in *Crédit Foncier* was applying the established rules of the common law (see sec. 4.3 below) concerning the standards for the legal force of custom. The ruling of the court in *Goodwin*, therefore, amounts to an acknowledgment that conventional custom may operate in derogation of the common law—that is, may supplant the common law. Salmond grants that this is so, with the important qualification that "the modern custom of merchants or of any other class of the community possesses [no] general authority to derogate from the common law, except so far as express agreement may derogate from it" (Fitzgerald 1966, 209). To permit conventional custom to override the common law in the absence of any formal contract or agreement would be make nonsense of the idea of common law. Conventional custom is *ex hypothesi* external to the common law. If the common law does not have enough normative force to override such external norms absent express agreement, then it would have no normative force at all.

I will not discuss further the case of conventional custom. However, we do need now to explore further the issue raised in the previous paragraph of the relation between custom and the two other prime sources of law, statute, and precedent. In Chapter 3, we have already noted the priority of statute over precedent; a common law rule cannot be applied in derogation of a statute (see sec. 3.3 above). I have also explained in Section 3.3 the important conceptual distinction between subordination by abrogation and subordination by derivation (ibid.). One form of law is subordinate to another just in case, where the two conflict, one will always be regarded as superior. Precedent and custom are both subordinate to legislation in the sense that a statute can always alter the effect of a court decision and a custom can be rendered of no effect by a statute (Cross and Harris 1991, 172). It is, however, doubtful whether a custom is subordinate to precedent in this sense. The "tests of the validity of a local custom are too deeply rooted in our law to be changed by judicial as opposed to parliamentary action" (ibid.).

It does not, however, follow from the fact that one form of law is subordinate in this way—subordinate due to the power of abrogation—that there is also subordination by derivation. Custom has some form of subordination to precedent, in the sense that the conditions under which customs are law *proprio vigore* are a matter of established rules based on precedent, even though the application of such rules in some given particular case may be such as to permit the legal force of local custom in abrogation of the common law. Cross and Harris are of the view that therefore custom cannot be an "ultimate principle" of the English legal system (ibid.). It remains to be seen (in sec. 4.4 below), however, whether they are correct here on the effect that the relationship of custom to precedent has on the claim of custom to be a source of law.

I have tried to do two things in this section. The first is to identify, among the variety of meanings of "custom," the one that concerns us here, as being the kind of custom that lays claim to being *proprio vigore* a source of law. That sense is local custom, not general custom, and not conventional custom. I have also tried to identify the constraints within which such custom operates as (subject to any qualifications resulting from our analysis in sec. 4.4) an independent source of law. These are that it so operates in its right and not only because of prior agreement, and that it operates within the constraints of i) being subordinate by the power of abrogation to statute, ii) up to but not beyond a certain point subordinate by the power of abrogation to precedent, and iii) in ways to be specified seemingly subordinate by derivation to precedent. I believe that even within these constraints a case can be made for custom as a genuine source of law, and will present such a case in Section 4.4.

4.3. The Common Law Rules for the Validity of Custom

As the previous discussion has implied, within the common law the conditions that a custom has to satisfy before it is acknowledged to be law are clearly established by precedent. Jurisprudential treatises reveal a high degree of unanimity on this topic, although there are variations in the detail of the discussion and in terminology. This section is therefore largely a matter of reporting, rather than analyzing, these conditions. The fullest account is offered by Allen (1964, 67–160, 614–32, especially 129–46). I will therefore follow his account here, noting accounts of other scholars as appropriate. Allen himself in turn largely follows the classic eighteenth-century account of Blackstone,[3] with emendations as appropriate. As Allen (1964, 129) remarks, "the primary function of modern judicial analysis is to examine the nature and reality of *existing* custom, not to invent new customs or arbitrarily to abolish those which are proved to exist in immemorial practice." "The chief purpose of these [sc. the common law rules] rules or tests is to determine whether the general and particular customs of our law are, *as a matter of established fact*, proved to be recognized social practice" (ibid.; all emphasis Allen's). The tests all "tend in one direction—proof of the actual existence and operation of the custom" (ibid., 130).[4] Allen outlines in all nine tests; let us simply follow his order of exposition.

First, he gives a pair of initial tests—that the custom be *exceptional*, an exception from the ordinary law of the land; that it be *limited*, to a particular class of persons or a particular locale. He regards these as two different ways of stating the same thing, that a custom not be in conflict with any statute or

[3] As do Jolowicz (1963, 208–13) and Paton and Derham (1972, 195).

[4] For the remainder of this expository Section 4.3 I will refer to Allen's text merely by page number, for convenience.

any fundamental principle of the Common Law (ibid., 130–1). If a custom were not exceptional, the controlling law would be the ordinary law of the land, not the custom. Custom cannot conflict with statute, in view of the supreme position of statute under the doctrine of parliamentary sovereignty. “If an Act of Parliament lays down that every pound avoirdupois throughout the kingdom shall be 16 oz., a local custom that every pound of butter sold in a particular market shall be 18 oz. is bad and unenforceable” (ibid., 131, referring to *Noble v Durrell* (1789) 3 TR 271, refusing to uphold the custom against the statute 13 & 14 Car II, c.26). Allen puts the point as regards precedent in the form of no conflict with “any fundamental principle of the Common Law,” because he accepts that, within specified tightly defined contexts, derogation of the common law is possible.

Then Allen gives six further tests, which he characterizes as “only various modes of weighing the evidence for and against the existence of alleged customs” (ibid., 133). These are:

1. *Existence from time immemorial.* This test amounts to a test of “continuous, and therefore certain, existence,” as opposed to “a mere habit, practice, or fashion that has exited for a number of years” (ibid., 133). The need for a practical operationalization of “time immemorial” is obvious: The form it takes in law is of some interest. It is defined as “from 1189 AD,” the first year of the reign of Richard I. That was the date fixed by the Statute of Westminster 1275 (Stat 3 Ed I, c. 41) for the bringing of writs of right. The writ would not lie unless the claimant or his predecessor in title had possession of the land since 1189 (Jolowicz 1963, 209).[5] This model was applied to the case of custom. Furthermore, “if a custom has existed for a long time and there is no actual disproof of it since 1189, then there is a strong presumption that it has existed from time immemorial, and unless any other objection can be made against it, it will be upheld” (Allen 1964, 134). The classic instance of this rule in operation is *Simpson*. I quote the headnote:

Appellant [Simpson] was charged under 5 & 5 Wm. 4, c.50, s.72 [a statute of the reign of William IV], with obstructing a public footway. He had put up a stall for the sale of refreshments at a statute sessions for the hiring of servants; this had been done for more than fifty years, and the statute sessions had been held before 5 Eliz., c.4 [a statute of Elizabeth I]. Appellant, thereupon, contended that he had a right by custom to erect his stall in the same way as at a fair, or, at all events, that he bona fide claimed such a right, and the justices’ [the local justices in the county of Lincoln] jurisdiction was therefore ousted.
Held [by the Court of Queen’s Bench], that the justices were right: for that, as the statute sessions were introduced by the Statutes of Labourers, the first of which was in the reign of Edward III [1327-77], there could be no such custom by immemorial usage as was claimed. (*Simpson v Wells* (1872) LR 7 QB 214)

[5] On writs of right generally, see Milsom 1981, 119–43.

2. *Continuance*. "Interruption within legal memory defeats the custom" (Allen 1964, 136). Note that the criterion applies to the claimed customary right; that is what must be continuous, not the use of the right. In *Wyld*, "a customary village right to hold a 'fair or wake' on the Friday in Whitsun week had not been exercised since 1875, but inasmuch as it had been confirmed as an 'ancient usage' by an Inclosure Act of 1799, it was held to have become a statutory right in perpetuity, which nothing short of an Act of Parliament could revoke" (*Wyld v Silver* [1963] 1 QB 169). Absent, however, such an independent confirmation of the existence of the right, if it has not been made use of for a long period of time, a presumption arises that there was no such right (*Hammerton v Honey* [1876] 24 WR 603, per Jessel MR). An open piece of land called Stockwell Green was leased in 1813, fenced in in 1816 and again in 1855 when the first fence had fallen into disrepair. The inhabitants of Stockwell thus has been excluded form the Green for a long time when in 1875 they claimed, unsuccessfully, a right by custom to use and enjoyment of the land.

3. *Peaceable enjoyment.* This is the expression used by Allen (1964, 136): so also Paton and Derham (1972, 195), Jolowicz (1963, 209–10). Others express the test as "enjoyment as of right"—cf. Dias (1985, 188), Cross and Harris (1991, 168), Salmond (Fitzgerald 1966, 200–1). The underlying idea is expressed by the maxim *nec vi nec clam nec precario*, neither by force, nor secretly, nor at will (or "by revocable licence"). A "custom" which "has only been wrested from the public by the strong hand is not a custom at all" (Allen 1964, 137). The same is true for a "custom" existing by revocable licence. An oyster fisherman was unable to get the courts to compel the City of Colchester to give him a licence to fish, even though the city had been in the habit of granting such licences for a fee since the time of Elizabeth I. There could not be any peaceable enjoyment or enjoyment as of right to such a licence, since it was solely within the discretion of the city to award such a licence (*Mills v Mayor, Aldermen, and Burgesses of Colchester* [1867] LR 2 CP 567).

4. *Obligatoriness.* The rule must be supported by the *opinio juris sive necessitatis*.[6] Those affected by the rule must regard it as obligatory; "the community in some way throws its force behind the particular rules" (Paton and Derham 1972, 193). Whether anticipating or following Hart's well-known distinction between "habit" and "rule," the latter duty-imposing and the former not (Hart 1961, 54–6; 1994, 55–7), Allen distinguishes habit and legal custom precisely in the sense of obligatoriness.

[6] For the important role of *opinio juris* in customary international law, see Section 8.4.3 below.

5. *Certainty.* "The court must be satisfied by clear proof that the custom exists as a matter of fact or legal presumption of fact" (Allen 1964, 138). This rule is "purely a rule of evidence" (ibid.). In *Wilson* (*Wilson v Willes* [1806] 7 East 121), the customary tenants of a manor who had gardens claimed a right by immemorial custom to carry away from the manorial wasteland "such turf covered with grass fit for the pasture of cattle, as hath been fit and proper so to be used and spent every year, at all times in the year, as often and in such quantity as occasion hath required" (quoting from the headnote). The claim was declared bad in law, on grounds *inter alia* of uncertainty. Lord Ellenborough CJ commented that "a custom, however ancient, must not be indefinite and uncertain: And here it is not defined what sort of improvement the custom extends to: It is not stated to be in the way of agriculture or horticulture: It may mean all sorts of fanciful improvements [...] a custom of this description ought to have some limit: But here there is no limitation to the custom, as laid, but caprice and fancy" (Allen 1964, 127–8). "When we are told that a custom must be certain—that relates to the evidence of a custom. There is no such thing as law which is uncertain—the notion of law means a certain rule of some kind" (Jessel MR, in *Hammerton*, at 603). Even though one may feel that at some level law is never "certain," still the certain existence of statute and well-founded common law rule provides a standard of certainty. There are tacitly accepted standards of evidence and of existence conditions. The purpose of this criterion is to say that such standards must be found also for the existence of customs.

6. *Consistency.* The claimed custom must be consistent with other customs. Clearly, if two customs *in pari materia*, in the same locality, and applying to the same persons, are incompatible, then one cannot be a true custom. Since the test gives no guidance as to which, Allen regards it as a test without much substance (Allen 1964, 139–40).

All the tests described so far are regarded as matters of fact for the jury (or other fact-finder) to decide. The final test that Allen considers is different. It is the important test of *reasonableness*. The test raises theoretical issues of some relevance to the present chapter, and I will discuss them in the next section. I note here simply how the test is officially supposed to go.

The rule is, not that a custom will be admitted if reasonable, but that it will be admitted unless unreasonable (Allen 1964, 140). As Allen points out, this difference matters, because "it seriously affects the onus of proof" (ibid.). The party who has proved the existence of the custom does not also have to prove its reasonableness; the party disputing the custom has to provide proof of its unreasonableness. Reasonableness is a matter of law upon which the court is to pronounce. Allen has made an extraordinarily thorough survey of the case law on reasonableness;[7] I rely on his survey here. He identifies four kinds of

[7] See the Appendix to Allen 1964, 614–32, in addition to the discussion *ad loc*, 140–6.

consideration that seem to feed into judgments on reasonableness as appropriate.

1) Sometimes "the question whether or not a custom is reasonable is indistinguishable from the question whether there is any evidence to go to the jury of its existence" (Allen 1964, 141). A rector claimed that by custom a fee of thirteen shillings was payable on the celebration of every marriage in the parish. He could show it had been so for forty-eight years, and argued that a presumption of immemorial antiquity was raised. His claim succeeded at trial. However, the Court of Exchequer Chamber (a precursor of the Court of Appeal) rejected this argument, on the grounds that, given the change in the value of money, thirteen shillings would have been a grossly unreasonable fee for such a service in the reign of Richard I (*Bryant v Foot* [1868] LR 3 QB 497). "Here it is plain that the Court was really deciding that in the reign of Richard I the alleged custom did not exist" (Allen 1964, 141).

2) Sometimes the ground for unreasonableness is that the custom is contrary to statute or to a fundamental rule of the Common Law. "Unreasonable" thus amounts to "illegal" (ibid.).

3) "A custom or usage must be notorious, and cannot avail against a party who did not know, could not be expected to know, and was under no duty to know of its existence" (Allen 1964, 142). This issue arises more frequently in the case of commercial or conventional customs, and especially where the claimed custom heavily benefits one side of the agreement only. The test appeals to an assumption of enlightened self-interest on the part of contractors; it assumes that, absent unequal bargaining power, a contractor would not agree to a bargain strongly against their self-interest. A custom which distributes benefits lopsidedly is thus presumptively a non-existent custom. Allen frames the test as based on "elementary considerations of fairness," and urges that in applying these considerations, the court is essentially saying that an unfair custom is no custom at all. With respect, I think Allen is conflating the now well understood difference between a definition of fairness which imports objective normative standards, and one which bases fairness on standards to which rationally self-interested persons may be assumed to consent. It does not follow automatically that an agreement which it is hard to suppose rationally self-interested persons making is an unfair agreement unless one simply defines "unfair" as "would not be agreed to by rationally self-interested persons."

4) "It is well settled that the time to decide the reasonableness of a custom is at the time of its origin" (Allen 1964, 143). All the same, Allen concludes that "in the great majority of cases in which an ancient custom has been held to be unreasonable in its origin, it will be found that the real reason for rejecting it is that it was originally, or is now (or both), contrary to a well-established rule of law" (ibid., 144). That is, courts should not take into account that the original reason has "died," that by contemporary standards the reason fails, except insofar as current settled law excludes such a reason.

Allen concludes from his examination of the tests for custom that "the general effect of these tests of custom in English law, however they be classified, is a strict method of proof of a custom's existence. [...] Custom, once indisputably proved, *is law*; but the courts are empowered, on sufficient reason, to change the law which it embodies" (ibid., 146; his emphasis). "Existing custom is therefore law: If it is not called in question, it operates as part of the general law of the land; If it is challenged, and is proved to exist as a local variation of the ordinary law, and further is not shown to violate an essential general legal principle, it is recognized by judicial authority as good law" (ibid., 151).

These are, in Allen's view, simply facts about how the English legal system functions—custom is, in the manner specified, a source of law in the system. I believe that Allen's conclusion can be sustained, but it is not without its objectors. I will now go on to discuss both the objections and other puzzles that are generated by the idea of custom as a source of law.

4.4. Puzzles Concerning Custom as a Source of Law

There are two main kinds of objection raised to custom as a source of law *proprio vigore.* One focuses on the role of reasonableness in the recognition of custom, and the other is grounded on the relation of custom to other sources of law. I will deal with these in turn. I will begin with the issue of reasonableness, since, even if the concerns here can be quieted, the second kind of objection will remain.

4.4.1. Reasonableness

The apparent difficulty here is pointedly put by Dias: "The introduction of reasonableness as a condition of the acceptability of local customs has virtually sapped them of vitality, for it is the courts who pronounce on what is reasonable" (Dias 1985, 189). But the difficulty is not as straightforward as Dias' bald assertion makes it seem. Dias is in fact conflating three distinguishable claims here. The *first* is the purely theoretical claim, that if courts' discretion in determining reasonableness was absolute, then custom could not be legally authoritative *proprio vigore*. The *second* is the analytical claim that the criteria courts use for reasonableness do amount to awarding courts discretion of that kind. The *third* is the empirical or institutional point that in the way that courts have applied reasonableness they have treated it as if they had complete discretion in its application. Dias's remarks imply that he would accept all three claims. However, the plausibility of each of these claims needs independent assessment.

The first can be readily conceded, and indeed is conceded even by those who disagree with Dias on the remaining two. Salmond says that reasonableness does not mean that "the courts are at liberty to disregard a custom when-

ever they are not satisfied as to its absolute rectitude or wisdom, or whenever they think that a better rule could be formulated in the exercise of their own judgment." "This," he continues, "would be to deprive custom of all authority, either absolute or conditional" (Fitzgerald 1966, 199). Cross and Harris agree: "If the courts took the view that [reasonableness] gives them a complete discretion to reject or uphold a custom according to their opinion of what is reasonable, there would be something to be said" for the view that custom cannot be a source of law (Cross and Harris 1991, 171). Custom could function as an independent source of law only if the reasonableness test for custom implied standards that constrained courts' discretion in judging the existence of legal custom.

To assess the remaining two claims, we need to invoke the important distinction elucidated by Wilfrid Waluchow (1994, 211–6) between "having discretion" and "exercising discretion." To say that a judge in some case "has discretion" is to make an analytical remark about the structural relationship between pre-existing authoritative standards and the decision that has to be taken in the instant case. Those standards do not determine the decision in the way that they would determine a decision for a case that unambiguously fell under them. The standards do not determine the decision at all once the matter has gone "beyond" their scope. Whether or not a judge has discretion in some case is therefore a structural property of a particular piece of adjudication. A judge exercises discretion when, whether entitled to or not, he or she believes that there are no standards controlling the decision, and so behaves as a judge who has discretion is entitled to behave.

A strong case can be made that, in the structural sense in play here, courts do not have discretion in applying the test of reasonableness, although there may be dispute over how it is that they do not have it. If Allen is right, and the reasonableness test amounts to a test of compatibility with fundamental principles of the common law, then those principles constrain the decision of the courts. Courts do not have discretion on what are fundamental principles of the common law. The common law itself dictates those principles. Still less do courts have discretion over reasonableness, where incompatibility with statute is a test of reasonableness. Salmond, however, objects to Allen's (in his, Salmond's, eyes) reducing reasonableness to lawfulness. Rather, he writes,

> the true rule is, or should be, that a custom, in order to be deprived of legal efficacy, must be so obviously and seriously repugnant to right and reason, that to enforce it as law would do more mischief than that which would result from the overturning of the expectations and arrangements based on its presumed continuance and legal validity. (Fitzgerald 1966, 199)

The kind of weighing of consequences Salmond recommends also would constrain application of the test of reasonableness.

Now, it may be true that judicial discretion in applying the test of reasonableness cannot be eliminated: There may well be a residual discretion that is

"weak" in Ronald Dworkin's sense (1978, 31–2). A decision may require the use of judgment by the decision-maker, where there are indeed standards relevant to the decision but it is unreasonable or impossible to express those standards in a sufficiently fine-grained way to determine the decision: Here the discretion is "weak." However, for the argument to go through that judicial application of the test of reasonableness is too discretionary for custom to be a source of law, the discretion involved has to be "strong" in Dworkin's sense. The decision-maker's discretion is "strong" where the decision is simply not controlled by standards set by the authority in whose name the decision is made (ibid.). Hart (1994, 45) comments that the tests for the fitness of a custom for legal recognition, insofar as they incorporate "such fluid notions as that of 'reasonableness' [...] provide at least some foundation for the view that in accepting or rejecting a custom courts are exercising a virtually uncontrolled discretion." The thought here is mistaken. Even if we properly substitute "have" for "are exercising," in accordance with Waluchow's distinction, the mere fact of discretion does not give any foundation for the alleged theoretical view. It is the strength of the discretion that would provide the foundation, not the fact that it is discretion.

What of the third claim, that in fact courts apply the test of reasonableness in a thoroughly discretionary way? The issue is difficult. Dias (1985, 189) and Paton and Derham (1972, 195) clearly believe that courts do apply the test in an unprincipled way. Even Allen, whose official view is, as we have seen, that the test of reasonableness is applied reasonably, comments that "customs establish themselves not because they correspond with any conscious, widespread necessity, but because they fit the economic convenience of the most powerful caste" (Allen 1964, 92). The notorious case *Johnson* (*Johnson v Clark* [1908] 1 Ch 303) is everyone's favourite example of unreasonable reasonableness. A married woman, in order to secure a debt on a promissory note, mortgaged to the creditor some property in which she had a life interest under her father's will. The conveyance was made without any separate examination of the wife—that is, as if she were an independent legal agent. The wife then sought to have the conveyance set aside, as being without separate examination void in law. The creditor in seeking enforcement of the conveyance averred a local custom under which real property held by the kind of tenure at issue here could be disposed of by a married woman without her separate examination. The court sided with the wife, on the grounds that the sort of power of independent management of property the purported custom allowed to a married woman was in itself enough to make the purported custom unreasonable. (Times have changed, but slowly: Even in the late 1960's in Canada it was not possible for a married woman to open a bank account without her husband's consent.)

I can think of two ways to proceed further, although I will leave each as an exercise to the reader. As I have noted, Allen's survey of the cases on reasona-

bleness is very thorough, and he is able to make consistent sense of the cases as supporting his view on the test of reasonableness. An opponent would have to make an equally thorough survey and show the appropriateness of a different narrative. Allen (1964, 145–6) and Salmond (Fitzgerald 1966, 199) draw attention to *Johnson* precisely because they believe it is not typical of the way that courts have applied the test of reasonableness. The challenge to opponents is to show that it is. I might say here that cases discussed by Allen hardly help him. Two days after they had decided in *Bryant* that 13 shillings would have been an unreasonable fee for conducting a marriage in the reign of Richard I, the Court of Exchequer Chamber, reversing the trial court who had now dutifully followed the lead of *Bryant*, ruled that 1 shilling would have been a reasonable fee for crossing a toll bridge in Richard I's reign, and upheld the lord of the manor's claim to exact the toll (*Lawrence v Hitch* [1868] LR 3 QB 521). On what historico-economic data the Court relied to differentiate thus, it did not explain.

The second possibility is this. As Salmond urges, justice itself has a strong interest in the principled constraint of the legal validity of custom:

> Had all manner of recent customs been recognized as having the force of local law, the establishment and maintenance of a system of common law would have been rendered impossible. Customary laws and customary rights, infinitely various and divergent, would have grown up so luxuriantly as to have choked that uniform system of law and rights which it was the purpose of the royal courts of justice to establish and administer throughout the realm. (Fitzgerald 1966, 203)

> The public interest requires that modern custom shall conform to the law, and not that the law shall conform automatically to newly established customs. (Ibid., 209)

The default position here is that the courts are acting judiciously, in accordance with the rule of law. To find that they are exercising strong discretion in their application of the reasonableness test is to find against this default position. Absent empirical proof, the default position stands.

4.4.2. Derivation and Abrogation

We return now to the distinction made above (sec. 4.2) between subordination by the power of abrogation and subordination by derivation, and the relevance of the distinction to the claim of custom to be *proprio vigore* a source of law. We can concede that, if it can be shown that custom is subordinate by derivation to other sources of law, then the case for it being a source in its own right is seriously, and possibly fatally, weakened. But I believe it can be shown, first, that the subordination of custom to other sources of law is subordination by the power of abrogation, and, second, that such a form of subordination does not affect the status of custom as a source of law.

The classic, and most radical, denial of custom as a source of law is found in John Austin. His view of laws in general, as is well known, is that laws are a

species of command, and specifically that they are general commands issued by a political superior (the sovereign) to political inferiors. The power of the sovereign is unlimited and supreme (Austin 1954, 214–5). Austin is too good a legal theorist not to see that intuitively not all laws seem to fit this blueprint, and in particular that customary law seemingly does not. The "admirers of customary laws," as he calls them, say that such laws "are not the *creatures* of the sovereign or state [...] they exist *as positive law* by the spontaneous adoption of the governed, and not by position or establishment on the part of political superiors" (ibid., 30; his emphasis). It follows, then, according to these theorists, that it would be wrong to say all laws are a species of commands. Austin mentions also the view that customary law is exclusively judge-made; as such, it would again constitute a potential counter-example to the claims that all laws are a species of command.

In responding to these objections to his Command Theory of law, Austin could go one of two ways. He has already delineated "a set of objects frequently but *improperly* termed *laws*, being rules set and enforced by *mere opinion*" (ibid., 11–2; his emphasis). He terms them rather "positive morality," and international law he allocates to this category. So one option for him, clearly, is to assign customary law also to this category—to deny, that is, that customary law is really law. The other is to find a way in which, contrary to appearance, customary law is really law because it is really commands of the sovereign. This is the route he chooses.

> Like other significations of desire, a command is express or tacit. If the desire be signified by *words* (written or spoken), the command is express. If the desire be signified by conduct (or by any signs of desire which are *not* words), the command is tacit. Now when customs are turned into legal rules by the decisions of subject judges, the legal rules that emerge from the customs are tacit commands of the sovereign legislature. The state, which is able to abolish, permits its ministers to enforce them: And it, therefore, signifies its pleasure, by that its voluntary acquiescence, "that they shall serve as a law to the governed." (Ibid., 32; his emphasis)

Austin kills two argumentative birds with one stone in this passage. He elides the difference between statute and precedent, and also the difference between subordination by the power of abrogation and subordinate by derivation. He is able to start with a premise with which no-one will disagree—that customary law is subordinate to statute by the power of abrogation—and end up with a conclusion on a matter of some dispute. Customary law is indeed, but it is not law *proprio vigore*; it is law only because it is law in the dominant sense of a command of the sovereign. "Until recognized by the courts, customs are rules of positive morality only. When sanctioned by the courts, thus indirectly becoming commands of the sovereign, there is coincidence of positive law and positive morality" (Morison 1982, 75).

If Austin is right, the claims of customary law to be a source of law are without foundation. But Austin is not right. Hart's repudiation of the theory

of law as a system of coercive orders (Hart 1994, chaps. 2–4) is an important moment in the development of twentieth-century legal positivism, and is discussed more fully elsewhere (this Treatise, vol. 11). His approach generally is to fault Austin for failing to distinguish commands from rules, and for representing laws as commands, not rules. Customary law is subsumed under this general criticism (ibid., 64).

Specifically, Hart makes two criticisms of Austin's manner of dealing with customary law (Hart 1994, 44–8). The *first* is that, though it could be an express feature of some given legal system that customs were not regarded as law until they had been enforced by the courts, such a feature does not necessarily follow simply from the idea of customary law itself. Hart's reasoning, though, is unclear. He simply asserts that it does not follow, but does not explain why. He seems to presuppose two reasons. One is that the rejection of customary law as law unless it is enforced depends on a dogmatic assumption that only statute law is truly law; it would not be hard to charge Austin with making that assumption. The second is that, if in some given legal system courts have an uncontrolled discretion whether to apply customary rules in actual cases, then customs would not be law until they are applied. He considers again whether the test of reasonableness in English law for the legal force of custom amounts to acknowledging custom cannot be a source of law. Having two pages earlier (ibid., 45; see sec. 4.4.1 above) suggested that it does, here (Hart 1994, 47), he is more cautious, and says simply that the argument needs to be made.

I will return to this first argument shortly. The *second* argument against Austin's account of customary law is this. There are paradigms for when an order may properly be said to have been tacitly given: The right kind of context and background can be supplied. But the case of a custom existing for a long time and then being acknowledged by the courts to have legal force does not conform to these paradigms (ibid., 47–8). The argument is sound, but it does not materially affect the issue in this section. I have outlined the argument as applied to precedent in Section 3.3 above; I will therefore not say more here.

Despite Hart's promise (ibid., 48) to return to the topic of the legal force of custom, in fact he does not return explicitly to it. The topic disappears into the familiar general defence of a legal system as centrally a union of primary and secondary rules, bounded by an ultimate rule of recognition (see again, in this Treatise, vol. 11). It would seem to follow, then, that, for Hart, it would be a matter of the content of the ultimate rule of recognition of any given legal system whether in that system custom functioned as a source of law. Whether it did would be a matter of the content of the secondary rules of recognition of the system. He does not actually take a stance on the analytical issue of interest here—what a secondary rule of recognition would have to be like, to be a rule which recognized custom as a source of law. By implication, Hart suggests that

the facts of the English legal system and its treatment of custom do not decide the matter; they are open to different theoretical interpretations. But I think he is wrong.

Morison argues that Austin's actual view of custom is not correct even on the assumptions of his own theory:

> What if the courts have let it be known that they will recognize customs which are established to exist in particular ways, at least under certain conditions, and the sovereign has issued no counter-command despite this? It would seem that in such circumstances a custom that can be so established, and in fact meets the conditions, is positive law [...] even before it individually comes before any court. (Morison 1982, 75–6)

Morison presumably has the English legal system in mind; at any rate, the tests for the legal force of custom described above (sec. 4.3) fit his supposition. So the claim is this. Let us grant for the sake of argument that judge-made precedential rules are tacit commands of the sovereign, and so are law in the sense of Austin's theory. Suppose now that a previously unlitigated custom comes before the courts. They assess it according to the rules they have announced that they will employ in such cases, and they deem the custom in question to be a genuine custom with the force of law. Does this not show that *already* the custom had the force of law before the courts' declaration that it has? To announce that a custom qualifies as law because it fits previously announced standards for being law is not to be anointing it to be law from the point of the court hearing onwards; it is to acknowledge the custom already to be law.

Morison says that the example assumes Austin's own theory, I take it, because the example accepts that judge-made precedential rules are commands of the sovereign. But the example essentially refutes the theory. It shows that customs are, in the circumstances described, law *proprio vigore* and not simply because they are commands of the sovereign, whether tacit or not. This claim is further strengthened by a later argument Morison brings against Austin by way of showing inconsistencies in his theory, in his discussion of precedent. Austin takes the *ratio decidendi* of a case to be tantamount to a general command proceeding from the sovereign. The *ratio*, in virtue of its assumed extension to further cases in the future whose fact-situation beings them under it, represents an intimation from the sovereign that subjects should conform their behaviour to this *ratio*. The intimation is a tacit command of the sovereign (Austin 1954, 31–2; Morison 1982, 99). "If Austin was prepared to apply this argument to judicial precedent, it is difficult to understand why he was not prepared to apply it to other alleged sources of law, the claims of which he summarily rejects" (Morison 1982, 99).

Morison's point is very densely expressed. I offer the following reconstruction; even if I am wrong in attributing the elucidation to Morison, I offer to defend it as my own. The only actual command on stage is the decision by the

court in the instant case. (Again, we grant for purposes of argument that courts' decisions can be construed as commands of the sovereign.) The subject of that command is the parties to the litigation in question. However, any plausible account of precedent has to account for the forward-looking aspect of precedent.[8] Austin aims to achieve this by saying that one case can embody a general forward-looking command. But to say that is to put a later court in the position of simply declaring that the command relevant to the case before it has already been given; the precedent case has the power of law in itself, and independently of any series of commands which might be otherwise thought needed to produce a binding precedential rule. So we have here a model for how something can be law, relative to a case controlled by it, and control that case prior to and independently of any command actually being given in that case. The model, moreover, seems extendible now to the case of custom, and to show the way in which a local custom is law, if it is, before the courts are asked to adjudicate upon it.

The point to take away from the discussion of Austin is that *mutatis mutandis* custom is in no different a position than precedent as regards its claim to be a source of law. Both have in common that they are subordinate by the power of abrogation to statute. As Allen points out (1964, 152–3), both a precedential rule and a custom may be rejected as inapplicable, and as formulated in correctly or not established respectively. When a precedential rule is adopted as applicable to the case before the court, there is an "additive" (Allen's word) element, as there is when a custom is newly recognized. I have above parsed this as so-called "weak" discretion. In short, "I do not think it is open to reasonable doubt that when a court accepts and applies a custom, it does so not in the belief that it is introducing a new rule into the law, but in the belief that it is declaring and applying the law" (Allen 1964, 153). The only relevant difference, Allen adds, is one of "adjective law": Custom is subject to its own methods of proof, distinct from methods of proof for precedential rules.

Cross and Harris (1991, 171–2), while agreeing that custom truly is a source of law, still claim that the relation of custom to precedent is one of subordination by derivation, though not one of subordination by the power of abrogation. But their view should be resisted. For one thing, as they rightly point out (ibid., 172), although the tests of the validity of custom are judge-made and not statutory, they are "too deeply rooted to be changed by judicial as opposed to parliamentary action." This fact should already make one wary of talk of the derivative status of custom to precedent. Cross and Harris have in mind when they do so talk, of course, a different twist on the judge-made character of the tests for validity. They imagine a lawyer advising a client on the possible validity of a given custom; the lawyer, on being asked why he

[8] My hope is that the rule-based account I gave in Section 3.5 meets this demand.

based his opinion that a particular custom is law on the tests laid down in the cases, replies that these tests represent English law; the tests are derived from the cases. But two different "derivations" are being conflated here. On the assumption that the tests are valid because they are properly developed common law rules, then the tests are "derived from precedent"; they are subordinate in that sense to precedent, although one would not normally, I think, speak of the relationship between a precedential rule and the precedents on which it is based as "subordination." But it does not follow that the deployment of the tests to decide on the validity of some given custom implies that the validity of the custom, if it has it, is properly said to be "derived" from the tests. We may use the idiom, perhaps, that the tests determine the validity of the custom. But just so far the idiom is philosophically uninterpreted. It could perfectly well be, and in my view is so, that the tests are determining the custom already to have validity; they are not "determining the validity" in any ascriptive way—determining the validity in the sense that before the judicial decision the custom had no validity and after the decision it has validity. Cross and Harris are transposing the derivativeness of the rules from precedent on to the custom whose validity is ascertained by the rules; but this is just a mistake. Obviously, if a custom is to have legal validity, then the tests for its validity must be legal tests—they must have some grounding in legal materials, or legal doctrine. But the fact that the need for such grounding is met does not imply that the custom passing the tests so grounded cannot then function as an independent source of law. The tests are tests for recognizing when a custom is law, has legal validity *qua custom.*

As we will see in the next two chapters, this point about the difference between a legal grounding and subordination by derivation is relevant to other claims to be sources of law beside that of custom. I will consider, and answer, two further concerns which have been raised, to try to quell any remaining doubts about custom. The first worry is this. Even such a supporter of the independent validity of custom as Allen, not merely sceptics such as Cross and Harris, speak in the idiom of courts "believing" that they are declaring a validity that already exists, or "accepting" that they are doing so, "acting as if" they are doing so, "feeling bound" to acknowledge the custom as law. Such language, it might be said, is quaint self-deception, a relic of bygone days when custom really mattered as a source of law. Now, all that is happening is the exercise of discretionary choice by the courts as to whether they decide for or against any given custom. "So gradual was the process by which [courts] came to acquire their control that at no point of time in all that development were they themselves conscious of the change" (Dias 1985, 191). "Judicial control over their [sc. customs'] admission reduc[es] their law-constitutive potentiality to vanishing point" (ibid.). Well, who knows? The argument has to go one of two ways here. Either the story about self-deception has to be taken seriously as an empirical claim, in which case we take the matter

away from the analytical legal theorists and hand it over to the legal historians, to see what evidence there in fact is about legal officials' states of mind. Psychohistory of this sort is very difficult, and very specialized, and certainly not conducted by Dias in the passage referred to. Or the story has to be taken seriously as a disguised analytical claim about the internal relationships between components of the legal system such as statute, precedent, and custom. But I have taken it seriously in that way, and argued that the law-constitutive power of custom has not vanished.

The second concern is rather different, and certainly has the right form to be an objection within analytical jurisprudence. Jolowicz (1963, 218) raises the difficulty. As noted in Section 4.3 above, it is part of the case law concerning custom that, once a court has settled the question of law that the custom is reasonable, the matter of its existence is a question of fact to be settled by the jury or other fact-finder. "But if the existence of a custom is truly a question of fact, then the court's decision provides no binding authority for the future" (Jolowicz 1963, 218). How, then, can custom be a source of law if the validity of a given custom sets no precedent, has no effect on the future development of the law? The point is this. Take another famous case where a custom was acknowledged to be valid, *Mercer* (*Mercer v Denne*, [1905] 2 Ch. 538). Fisherman in Walmer, Kent had been accustomed to drying their nets on a piece of shoreline; the area was, however, in fact private land. The landowner attempted to have the fishermen removed, but they were able to argue successfully an immemorial custom of drying nets on that land. Suppose now that some suitable period of time later (fifty years, say), in the same situation—same piece of shoreline, fishermen drying nets, landowner trying to remove them—the matter is again before the courts. The fishermen cannot simply argue: "In 1905 we won, so we should win now in 1955." The purported custom in 1955 would be *de facto* a new custom. Though the existence of the custom in 1905 could be taken as shown, proof would have to be offered of peaceable enjoyment since that time, continuance since that time, compatibility with statute at that time, and so forth. In what sense, then, is the custom of drying nets on the foreshore in 1905 a source of law?

The answer to the puzzle is this—the net-drying custom was a source of law in 1905 in the sense that its legal validity as a custom was the source for the court's decision in 1905 to find in favour of the fishermen and against the landowner. It does not count either for or against the custom being a source in 1905 either that it is or that it is not a source in 1955. It does not count against custom being a source of law that it does not behave as a source of law in the way that a legal precedent behaves. (Remember Allen's comment quoted above about the differences between custom and precedent being matters of "adjective law.") Though a true statement, it would be an inadequate answer to Jolowicz to point out that *Mercer* can be taken to be a precedent for future interpretations of the concept of "reasonableness" as applied

to custom. His point is that *Mercer* cannot be taken as a source for assessing validity of other customs seemingly like it. *Mercer* would have no bearing on, say, fisherman repairing their boats on the foreshore of a private beach, even in 1905. That would not be true of a precedent case so similar in its fact-situation. But that's just how custom operates: That's all. Jolowicz's reluctance to accept custom as a source of law because it does not behave like precedent amounts to judging custom by alien standards. The case for custom functioning as a source of law *proprio vigore* would, it seems to me, be weakened, rather than strengthened, by its functioning in the same way as precedent.

I close this chapter by recalling a point made at the very outset. All this must be kept in perspective. If centrality to current legal practice is the touchstone, then it has to be acknowledged that custom is an unimportant source of law. But a treatise of jurisprudence is not a manual of current practice. Analytically, custom qualifies to be a source of law.

Chapter 5

DELEGATION

5.1. Introduction

In this chapter, I will consider the claims of delegation, or subordinate legislation, to be a strictly institutionalized source of law. By "delegation" is meant the following. It frequently happens that a legislative body will enact a broadly phrased regulatory framework, and then leave the administration and application to cases of that framework to a subordinate tribunal or system of tribunals. The subordinate body is thus a creature of legislation; it is not the original source of the legal norms that it administers and applies. On the other hand, the legislative rules in its charge are phrased in ways which ensures that the subsidiary body has a great deal of room in which to clarify the import of the legislative norms, to produce sub-norms, to develop procedures, and ultimately to adjudicate cases. Thus prima facie there is a good case to be made for seeing the subordinate body as an independent source of law. Such a case cannot be unqualified, simply because of the dependence of the subordinate body on the legislature. The dependence is a form of subordination by derivation. But the question here is whether such a dependence still leaves room for theory to consider delegation as a source of law.

In his discussion of delegation, C. K. Allen attributes to John Austin the view that subordinate legislation is a "bastard offspring," and a source of law "as it were, on sufferance" (1964, 4–5). Allen, surely correctly, diagnoses this (in his, Allen's, view) extreme response to subordinate legislation as consequent upon Austin's views of sovereignty and of laws as commands. Allen himself strongly defends the propriety of subordinate legislation as an independent source of law (1964, chap. 7). His reasoning is empirical and "realist"—subordinate legislation, especially administrative law, is such a large and an important part of the governmental mechanism of the modern state that it would be absurd to deny it to be a source of law. However, my enquiry here is theoretical, not empirical. Is there jurisprudential warrant to consider subordinate legislation an independent source of law? Allen's empirical evidence does not, as he thinks, decide the jurisprudential question, but it is relevant to the question. If one thinks, as Austin did, that subordinate legislation derives all of its legal authority from the original legislature, then it cannot be an independent source of law. But the legislation that sets up administrative tribunals typically does so by granting to them some significant measure of discretion to judge as they see fit without review. In that case, how can such tribunals not be an independent source of law?

The determination of whether delegation qualifies as a "strictly institutionalized source of law" breaks down into two separate but connected questions. The first is whether delegation, and specifically the two kinds of delegation I shall discuss, labour arbitration, and mediation, show a sufficient degree of institutionalization. Thus, a material issue in our enquiry will be the extent to which arbitrators', or mediators', decisions have contextual justifications. (See chap. 1 above for the working definition of "strictly institutionalized source of law," and its deployment of the notion of "contextual justification.") To the extent that the delegatee body operates within the institutional legal system, and not as an independent adjunct to the legal system, one has reason to characterize the body as "strictly institutionalized." The second question has to do with the extent to which a delegatee body is a "source of law." Here, attention must be paid to the manner in which decision-making powers are devolved onto the delegatee. There is a narrow ridge for analysis to tread. If the delegatee's decision-making discretion is too tightly circumscribed by the delegating authority, then it is more plausible to treat the delegating body, rather than the delegatee body, as a source of law. On the other hand, if the decision-making discretion granted by the delegating authority is extremely wide, including the possibility of a free hand in determining principles of decision-making, a different problem presents itself. It becomes more plausible to regard the equitable principles to which the delegatee body appeals and which it deploys as being the source of law, not the body itself, and not any entity which might qualify as "strictly institutionalized."

As Allen remarks, delegation to an administrative body set up by statute is ubiquitous in the modern regulatory state. Occupational safety and health, consumer and environmental protection, food and drug safety standards, regulation of gambling, regulation of alcohol and tobacco distribution and consumption, monitoring of capital markets, organization of national defence, and so on are all typically in the hands of such authorities. Legislatures set up such authorities, and define broadly their terms of reference, then leave the actual regulating in their hands. I have selected for detailed examination here, for no better reason than that of some personal familiarity, two paradigm examples of delegated authority, labour arbitration and mediation. In the analysis which follows, I will track plausible answers to both of these crucial questions.

5.2. Labour Arbitration

5.2.1. A Sketch of Labour Arbitration Law

All jurisdictions within Canada, federal and provincial, provide legislation that aims to govern the relations between employers and collective bargaining units (unions). For convenience I shall be relying upon the Alberta *Labour Relations Code* (S.A. 1988, c. L-1.2) throughout the remainder of this initial

sketch. While there are differences between the acts of the various jurisdictions, they are broadly similar in many important respects. These acts provide for the establishment of Labour Relations Boards to hear matters of dispute between collective bargaining units and employers (see *Labour Relations Code*, S.A. 1988, c. L-1.2, sec. 11), as well as arbitration boards to hear and resolve disputes arising from the interpretation, application, and operation of collective agreements. This form of arbitration is known as grievance arbitration, as opposed to interest arbitration. The focus here is upon the former.[1]

Most labour legislation requires that collective agreements have clauses that make provision for grievance arbitration during the term of the collective agreement. For example,

> 133. Every collective agreement shall contain a method for the settlement of differences arising (a) as to the interpretation, application or operation of the collective agreement, (b) with respect to a contravention or alleged contravention of the collective agreement, and (c) as to whether a difference referred to in clause (a) or (b) can be the subject of arbitration between the parties to or persons bound by the collective agreement.[2]

Labour legislation also typically restricts the access of the parties to the Courts. For example,

> 143. (1) Subject to subsection (2), no award or proceeding of an arbitrator, arbitration board, or other body shall be questioned or reviewed in any court by application for judicial review, or otherwise, and no order shall be made or process entered or proceedings taken in any court, whether by way of injunction, declaratory judgment, prohibition, quo warranto or otherwise, to question, review, prohibit or restrain the arbitrator, arbitration board, or other body in any of his or its proceedings.
>
> (2). A decision, order, directive, declaration, ruling or proceeding of an arbitrator, arbitration board, or other body may be questioned or reviewed by way of an application for judicial review seeking an order in the nature of certiorari or mandamus if the originating notice is filed with the Court no later than 30 days after the date of the proceeding, decision, order, directive, declaration, or ruling, or reasons in respect thereof, whichever is later.
>
> (3). The Court may, in respect of an application pursuant to subsection (2), determine the issues to be resolved on the application, and limit the contents of the return from the arbitrator, or arbitration board to those materials necessary for the disposition of those issues. (*Labour Relations Code*, S.A. 1988, c. L-1.2, sec. 143)

[1] See *Labour Relations Code*, S.A. 1988, c. L-1.2, sec. 132–44, inclusive. In interest arbitration, the arbitrator(s) takes on a role in the bargaining process; in effect, making the terms, conditions and rules that the parties will abide by. Interest arbitration has more in common with mediation, which will be discussed in the next section. In grievance arbitration an agreement is already in place between the parties and the arbitrator(s) takes on an adjudicative role.

[2] See *Labour Relations Code*, S.A. 1988, c. L-1.2, sec. 133. The Alberta legislation also contains a "model arbitration clause" that shall be deemed to be part of any collective agreement that does not contain the provisions required under sec. 133. See *L.R.C., sec.* 134.

The institutional practice of labour arbitration that the foregoing legislation establishes consequently serves as a *surrogate* to the Courts for grievance matters arising from collective agreements between employers and bargaining units. That is, the issues are fully justiciable, but for independent reasons they are assigned for hearings to special tribunals, rather than to the regular court system.

To understand why labour arbitration is useful for the purposes of a jurisprudential investigation of "strictly institutionalized sources of law," it will be helpful to recite some of the typical "virtues" that are claimed for grievance arbitration. These are as follows:

(1) *Expertise of the Tribunal*. Tribunals of arbitrators, well-versed in labour issues, improve the quality of judgments.

(2) *Market Incentive.* Arbitration tribunals are agreed to and paid for by the parties (see, for example, *Labour Relations Code*, S.A. 1988, c.L-1.2, ss. 135–6). Presumably, arbitrators therefore have an incentive to work quickly, efficiently, cost effectively, and with fairness to all involved.

(3) *Speed and Cost.* Arbitration is supposed to be a faster and less expensive alternative to the Courts; largely because of (4) below.

(4) *Less Legalistic*, procedurally more informal.

(5) *Competence and Expertise of the Practitioners*. The representatives of the parties in these arbitrations (both lawyers and non-legal practitioners) tend to be knowledgeable and competent in the labour field. It should be noted that this is an area that has been very successfully "colonized" by lawyers specializing in the practice of labour law.

(6) *Settled System*. A substantial arbitration jurisprudence now exists that is (relatively) settled. Parties are now much less likely to do things that would result in grievance arbitration than they formerly were.

(7) *Law Reform*. Legislatures have shown scant interest in the reform of employment law. Arbitrators have developed a much fairer system of rules in this domain than would have been the case had such matters been left to the Courts.

I believe that some of these factors are explanatorily significant in establishing why arbitration practice constitutes a good example, first, of an "institutional source of law." I will say something about the restriction "strictly institutionalized" later.

On the one hand, *per* (3) and (4) above, we find an institutional process removed in important ways from the sources of law found in the Courts. Much of what I have to say about this will follow in the discussion below of

specific examples. For the moment though, I will simply note the following differences between arbitration tribunals and regular courts of first instance:

– Arbitrators have no plenary jurisdiction; the source of the arbitrator's power resides in the provisions of each collective agreement (expressed or implied), supplemented by relevant provisions of the appropriate labour legislation. That is, the jurisdiction of the arbitrator is limited by higher legal authority.

– Legislation is typically silent as to whether arbitrators are bound to follow common law. The Courts interpret this to mean that arbitrators are not bound to judge-made law as such, although legislation may authorize judicial review of arbitrators' decisions.[3]

– Legislation setting up arbitration tribunals typically provides for the dispensing of procedures and rules that one finds in the Courts.[4]

On the other hand, *per* (1) and (5) above, we find many legally trained and competent individuals engaged in all aspects of arbitration practice. For good or ill, labour arbitration has become legalistic. I suspect that this might explain factors (6) and (7) above. The practical upshot of this, for present purposes, is that many principles and rules that we find in the courtroom are now also emerging in arbitration jurisprudence, in some cases in spite of the assertion of independence from the courts. That is to say, the claim is not about the emergence of rules unique to arbitration tribunals. The claim is about the emergence of rules which may also be found in courts, in situations where the source of the rule cannot be the courts but can only be the arbitration tribunals themselves. The specific cases that I will go on to cite are examples of these. Since these examples have no "source" other than the practice of grievance arbitration—they are not provided for in legislation or mandated by the Courts—it seems plausible to regard them as arising from some source that is independent even if the result of delegation, and that is institutional in character.

The methodology in presenting the following case material, given the foregoing, will in each instance be the following:

(1) Identify the "emergent" principle of law visible in the arbitration:

(2) Establish that the institutional practice of arbitration has no prior commitment to the principle; e.g., adherence to the principle is not provided for in the source legislation or any other "traditional" source of law:

[3] See, *Re Manitoba Food & Commercial Workers Union, Local 832 and Canada Safeway Ltd* (1981), 120 DLR (3d) 42 (Man CA). I discuss this case further in the specific examples below.

[4] We find a good example of this in the rules of evidence (discussed in the specific examples). For an example of such statutory provisions see *Labour Relations Code*, S.A. 1988, c. L-1.2, s. 141(2).

(3) Provide examples of the principle emerging within arbitration jurisprudence:

(4) Assess whether the emergence of the principle suffices to make arbitration tribunals independent "strictly institutionalized sources of law."

I will consider two sample principles: a) *res judicata* and collateral estoppel; b) *stare decisis* or adherence to precedent.

5.2.2. Res Judicata *& Collateral Estoppel*

5.2.2.1. Statement of the Principle

Res Judicata - This is the common law principle that a final judgment rendered by a court of competent jurisdiction on the merits of a case is conclusive as to the rights of the parties and their privies. As to them, the judgment constitutes an absolute bar to a subsequent action involving the same claim, demand, or cause of action.

Collateral (or Issue) Estoppel - This is the common law principle that a prior judgment between the same parties on a different cause of action constitutes an estoppel as to those matters in issue, or points controverted, where the same issues or points emerge in the subsequent action.

5.2.2.2. Status Under Arbitration Jurisprudence

It is generally acknowledged that arbitrators are not obliged by law to heed these common law principles.[5] The 1954 decision of arbitrator Bora Laskin (as he then was), in *Re Brewers' Warehousing Co Ltd and International Union of Brewery, Flour, Cereal, Malt, Yeast, Soft Drink & Distillery Workers of America*, (*Local 278C* (1954) 5 LAC. 1797 (Laskin)) is often cited for the point that arbitrators are not obliged to adhere to *res judicata*:

> It is not good policy for one Board of Arbitration to refuse to follow the award of another Board in a similar dispute between the same parties arising out of the same Agreement where the dispute involves the interpretation of the Agreement. Nonetheless, if the second Board has

[5] There is one important aside here. Should the relevant labour legislation specify that arbitrators are so obliged, this would not be the case. This has been argued in respect of the *Canada Labour Code* in *Re Eastern Provincial Airways Ltd and International Association of Machinists and Aerospace Workers* (1984), 13 LAC (3d) 128 (Christie). In this arbitration it was argued that s.156(1) of the *C.L.C.6* mandated adherence by the arbitrator to the principle of *res judicata*. Section 156(1) states: "156(1) Every order or decision of an arbitrator or arbitration board is final and shall not be questioned or reviewed by any court."

Arbitrator Christie interpreted the section as merely "a privative clause intended to limit review by the courts" (ibid., 135). The comparable privative clause in the Alberta legislation (ibid., s.143, *supra*), in any case, provides no such ambiguity on this point.

the clear conviction that the first award is wrong, it is its duty to determine the case before it on principles that it believes are applicable. (*Re Brewers' Warehousing Co Ltd and International Union of Brewery, Flour, Cereal, Malt, Yeast, Soft Drink & Distillery Workers of America, Local 278C* (1954), 5 LAC 1797 (Laskin), 1798)[6]

The proposition that arbitrators are not required to adhere to *res judicata* and collateral estoppel has also received consideration by the Courts. In a decision of the Supreme Court of Canada (*Re Manitoba Food & Commercial Workers Union, Local 832 and Canada Safeway Ltd* (1981) 123 DLR (3d) 512 (SCC)) the Court overturned a majority judgment of the Manitoba Court of Appeal and noted substantial agreement with the dissenting opinion of Justice Monnin in the Manitoba appeal. Justice Monnin noted that there was no statutory provision for *res judicata* in the relevant labour legislation. He went on to write of the applicability of *res judicata* and issue estoppel to grievance arbitration:

Parliament and the provincial legislators have devised methods to solve labour disputes mainly in order to avoid the rigidity and the time-consuming features of the court-rooms. The legislators thought that they had pushed these disputes out of the court-rooms. How wrong were they, since I are still too frequently dealing with them. Yet it would be adding salt to the wound if I were to bring into labour arbitration, all the rigid procedures of the court-rooms and the complex judge-made laws. I do not wish to be a party to such a revival, since Parliament has clearly indicated that it wished labour disputes to be solved by boards of arbitrators not necessarily familiar with or trained in legal principles. (*Re Manitoba Food & Commercial Workers Union, Local 832 and Canada Safeway Ltd* (1981) 120 DLR (3d) 42 (Man CA), 47)

The Justice concluded that,

[*R*]*es judicata* and estoppel have no place in the settlement of labour disputes by private tribunals or by boards of arbitration. It is a principle to be reserved for the court-rooms. (Ibid., 48)

It would seem, then, that these principles do not arise within the practice of arbitration tribunals as a result of decisions by authorities delegating powers to such tribunals. The institutional source of such principles within arbitration must lie elsewhere.

5.2.2.3. Emergence of the Principles

Arbitration jurisprudence nevertheless does reveal that arbitrators are prepared to apply *res judicata* and issue estoppel. The following two cases are illustrative of this.

(i) *Re Valdi Foods and United Food & Commercial Workers, Local 175* (1991) 19 LAC (4th) 114 (Kirkwood). In this case the union argued that the

[6] Interestingly, the decision is also cited for the point that it is generally a good idea for arbitrators to adhere to *res judicata*.

matter before the present arbitrator had already been decided on a previous arbitration and that *res judicata* should prevent the company from relitigating the matter. The arbitrator considered the applicability of *res judicata* and issue estoppel to grievance arbitration:

> The principle of *res judicata* is based upon the concept that if a claim has been decided, the parties to an action cannot raise the same claim as between themselves in another action in another forum. Similarly, the principle of issue estoppel has been applied where the particular issue raised by the parties in a case was determined by an earlier decision between the same parties on the same issue. These concepts prevent relitigation of the same questions [...]. The facts of the first arbitration were agreed to by the parties in an agreed statement of facts. Although an arbitration board is not bound by the decision of an earlier board, in the same manner as the courts, in my view if the parties had agreed on the facts for one arbitration, although there may be additional facts which may be relevant to a different hearing involving different issues, there is a heavy onus on the party who wishes to dispute those facts, to show why the facts as agreed by the parties should not be accepted at the second hearing. Neither party disputed the agreed statement of facts. (*Re Valdi Foods and United Food & Commercial Workers, Local 175* (1991) 19 LAC (4th) 114 (Kirkwood), 119–20)

The arbitrator noted that the company had no further evidence to add in this arbitration. Finding that the two matters involved the same parties, the same collective agreement, the same grievor, and the same facts, the arbitrator held that *res judicata* was applicable.

In concluding his decision the arbitrator offered some insight into the rationale for introducing *res judicata* and issue estoppel into arbitration. He wrote:

> The application of *res judicata* and issue estoppel deters parties from cherry-picking arbitrators, or having the same matter adjudicated before another in the hope of obtaining a different result. It provides a guide for the consideration of the outcome of future incidents, which creates certainty and a saving of costs that would be required to bring a multitude of unnecessary grievances to boards of arbitration. Furthermore, a duplicity of hearings can, in my opinion, be a breach of natural justice and an arbitrator must be loathe [*sic*] to encourage multiple grievances in circumstances which in the civil courts would be considered *res judicata.* (Ibid., 122)

(ii) *Re Pharma Plus Drugmarts Ltd and United Food & Commercial Workers, Local 175*, 1991, 20 LAC (4th) 251 (Barton). In this case the company involved argued that the matter before the arbitrator was the same matter heard by a previous arbitrator and that owing to *res judicata* the present arbitrator did not have jurisdiction to rehear the grievance. Arbitrator Barton began by considering the applicability of *res judicata* to grievance arbitration, noting that most arbitrators seem to accept that the doctrine does, apply although they do not agree on how it should be applied (*Re Pharma Plus Drugmarts Ltd and United Food & Commercial Workers, Local 175*, (1991), 20 LAC (4th) 251 (Barton), 252). He also noted that one of the sources of difficulty in applying the doctrine was the number of differing conceptions gathered together under the principle. He isolated two “broad” notions of *res judicata* that are common within arbitration jurisprudence. Under one of these interpretations, ar-

gued in this case by the company, when *res judicata* applies the arbitrator in a subsequent case loses jurisdiction. Under the other interpretation, argued by the union, the arbitrator retains the discretion to hear a case even if *res judicata* applies; for example, if the second arbitrator believes that the previous decision was "manifestly wrong" (ibid., 254).

Arbitrator Barton noted that he felt he did have the discretion to hear a second grievance that was "similar" to an earlier one, but he rejected the two "broad" notions of *res judicata* argued by the parties in the case (ibid., 254–5). The arbitrator took a more narrow stance on *res judicata*, one that he attributed to Arbitrator Christie in *Re Eastern Provincial Airways*:

> [A]rbitrator Christie indicated that it was good policy to follow earlier awards and that he might well apply the doctrines of *res judicata* in "same grievance—same grievor" situations [...]. Essentially these arbitrators feel that if the same parties try to reopen an earlier grievance by trying to bring a subsequent one to argue the same issue based upon the same parts of the collective agreement, on new facts but facts which are essentially the same as those resolved in the previous grievance, they should not be allowed to do so. (*Re Eastern Provincial Airways Ltd and International Association of Machinists and Aerospace Workers* (1984) 13 LAC (3d) 128 (Christie), 255)

On Arbitrator Barton's account, the application of *res judicata* to bar a grievance is a discretionary power of the arbitrator. It appears that where the cases are similar—similar enough for the doctrine to apply—but different in some material way, the arbitrator may elect to rehear the matter. If, however, the grievance is simply an attempt to relitigate, then on Barton's interpretation it is proper that the arbitrator invoke *res judicata* to bar the grievance. In the present case Arbitrator Barton found that the grievance was substantially the same grievance as had earlier been argued. He exercised his discretion to bar the grievance on the basis of *res judicata*.

5.2.2.4. Assessment

It is clear that arbitration tribunals form an important working part of that institution which is a modern municipal legal system in a country such as Canada. So the focus in our assessments must be on the concepts of "strict" and "source." As remarked above, in the working definition of "strictly institutionalized source of law," the force of clause (i) is to explicate the notion of "source," and that of clause (ii) the idea of "strict." Let us consider first, then, the applicability of clause (i). Is it the case that an arbitrator who decides a case by appeal to *res judicata* or collateral estoppel is producing a rule such that its existence conditions "are a function of the activities of a legal or quasi-legal institution," to quote from the working definition of "strictly institutionalized source of law" given above?

The phrase "a function" of course is capacious. One might ask, How could it not apply? How could a decision of an arbitration tribunal *not* be "a

function of the activities of a legal, or quasi-legal, institution"? In dispelling the scent of a too easy victory, we need to recall the context for the present enquiry. I am in the large considering the claim of *subordinate legislation* or *delegation* to be independent sources of law. If the "source" for the arbitrator's ruling is ultimately not the arbitrator himself, but the authority from which his ruling derives its power, then, in the technical sense at issue here, the arbitrator would not be a source of law. I have tried to show that, even though the delegating authority aims to restrict the applicability of the principle of *res judicata*, in fact this principle has emerged as an operating principle in labour arbitration. Thus the source of the principle, and thus of decisions which rest upon it, cannot be the delegating authority. It must be the tribunal or system of tribunals itself.

A further question might be raised. It does seem as though the arbitrator applies the principle through the exercise of discretion, but not only that—discretion in a particular circumstance, when an earlier decision is thought to be manifestly unfair (see *Re Pharma Drugs*, 254). If the source of the ruling is a perception of unfairness, does this not imply that external moral norms, rather than institutional constraints, form (an essential part of) the existence conditions for the rule? This is a reasonable question, and deserves a careful answer.

As Frederick Schauer has argued, rule-based decision-making arises always within some theory of justification and exists only relative to it (Schauer 1991, 86). But rules may bear two different relationships to the justification for the rules. If they are *transparent* to the justification, then they serve simply as ways for the justification to bear on cases that fall under the rules. In the case of conflict between the rule and the justification, the rule is discarded in favour of the justification. Schauer argues that such decision-making is really "particularistic" and not decision-making by rule at all (ibid., 77–8). A rule must be in some way, to some degree, *opaque* to its justification. That is, there must be cases of conflict between the rule and the justification where the rule is adhered to at the price of a less than maximally satisfactory result from the point of view of the justification.

On this analysis, then, in general, the arbitrator's discretionary ruling would have a non-institutional source if the decision were particularistic and fully transparent to its underlying justification. But one further refinement is needed. Recall again the distinction between *contextual* or *local* and *deep* justifications. For the source to be non-institutional, the ruling must be transparent to the underlying *deep* justification, not to the underlying local justification. Arguably, in fact, if the arbitrator rejects *res judicata* for reasons of manifest unfairness, the ruling is "particularistic" and transparent to its deep justification. As I suggested above (sec. 5.2.1.), the achievement of greater fairness is one candidate reason for setting up a system of labour arbitration tribunals, and so would constitute the deep justification for any given decision within

the system. Even if, as is quite possible, the setting up of the arbitration system by the legislature is not in practice particularistic—that is, the legislature decides to let the system keep on working as it is, even though it generates from time to time an unfair decision—still, discretionary decision-making by the arbitrator for reasons of fairness would show the arbitration system to be to that degree particularistic.

Consider on the other hand the reasons embedded in the above cases for adherence to the principle of *res judicata*: certainty, cost-saving, avoidance of forum-shopping, avoidance of breaches of natural justice, avoidance of conflict with civil courts, avoidance of inconsistency between decisions, avoidance of litigation by instalments, encouragement of finality. With the exception of breaches of natural justice, all these reasons are formal or procedural,[7] not substantive, and are local or contextual with respect to the system of labour arbitration tribunals. Thus a ruling that embodies adherence to the principle of *res judicata* relies primarily on local or contextual justifications of a formal kind, and is thus quite opaque to the deep justification of fairness. Of course, in adhering to *res judicata*, an arbitrator likely believes that they will also be adhering to principles of fairness, because of a background belief in the general fairness of the system of arbitration. But that background belief is not the local or contextual reason for the ruling.

I see, then, that the emergence within labour arbitration of adherence to the principle of *res judicata*, satisfies very largely clause (i) of the working definition of "strictly institutionalized source of law." I leave further assessment of the issue of external norms as sources until the end of the discussion of arbitration. Our analysis also now enables a straightforward approach to clause (ii) of the definition. Subject to the same kind of qualification, it is clear that the local or systemic normative force of the ruling derives from its status as a ruling from that source. It is possible that adherence to *res judicata* had not emerged within the system of labour arbitration. But, given that it has, rulings which apply the principle derive their normative force from their existence as rulings of the arbitrator or arbitration board. They do not derive it from the legislature that set up the system of tribunals, nor from their content as satisfying substantive principles of justice.

5.2.3. Stare Decisis

5.2.3.1. Statement of Principle

This is the principle by which courts stand by prior decisions and decline to disturb settled points (see chap. 3 for detailed discussion). It is a doctrine

[7] And even natural justice has partly to do with procedure, partly with substance. See Jackson 1979, chap. 1.

whereby when a court has once laid down a rule of law as applicable to a certain set of facts, it will adhere to that rule and apply it to all future cases where the facts are materially the same, regardless of whether the parties and other particulars are the same. Under this doctrine a decision will be binding precedent in the same court, or in courts of equal, or lower rank in the same jurisdiction, in cases where the very point is again in controversy.[8]

5.2.3.2. Status Under Arbitration Jurisprudence

Labour legislation does not provide for the application of *stare decisis* in the arbitration process.[9] Labour legislation *does* provide that the awards of arbitrators are binding on the parties to the dispute (*Labour Relations Code*, S.A., 1988, c. L-1.2, sec. 142), and the wording of some of these clauses has been the source of occasional confusion concerning the applicability of *stare decisis* and *res judicata*.[10] *Res judicata* is applicable when the very same parties (or one of them) are proposing to reopen issues already settled between those parties; it has to do with the finality of decision-making. *Stare decisis* is not confined so narrowly; it has to do, not with the finality of decisions, but with order within an on-going system of decision-making. The confusion is illustrated by *Re United Electrical Workers, Local 512, and Standard Coil Products (Canada) Ltd.* (1971) 22 LAC 377 (Weiler, Tate, Healy). The Board considered the interpretation of a holiday pay clause and then went on to note a previous award:

> [T]his interpretation was adopted by an earlier arbitration board between the same parties, in *Re U.E.W., Local 512, and Standard Coil Products (Canada) Ltd.* (1964), 15 LAC 197 (Lane); it has not been reversed in later negotiations between these parties, and considerations of *stare decisis* require that I follow it in this case. (*Re United Electrical Workers, Local 512, and Standard Coil Products (Canada) Ltd.* (1971), 22 LAC 377 (Weiler, Tate, Healy), 381)

In a "same grievor-same grievance" situation as we find in this arbitration, the applicable principle is that of *res judicata* and not *stare decisis.* It now seems

[8] This account is something of an oversimplification, but the complications do not affect the argument here. For example, the highest court in a jurisdiction possesses the capacity to overrule its own decisions, a power typically used sparingly. And in jurisdictions within a federal state like Canada or the United States there are issues of how the decisions of one province or state bear on those of another, problems not addressed here.

[9] See, for example, the Alberta *Labour Relations Code*, S.A., 1988, c. L-1.2, Division 22, dealing with arbitration.

[10] J. Weatherill suggests that such clauses introduce *res judicata* into the arbitration process. See Weatherill 1958, 323. This is not the interpretation adopted by the Courts—as discussed above. See *Re Manitoba Food & Commercial Workers Union Local 832 and Canada Safeway Ltd* (1981), 123 DLR (3d) 512 (SCC), adopting the dissenting opinion of the Manitoba Court of Appeal in *Re Manitoba Food & Commercial Workers Union Local 832 and Canada Safeway Ltd* (1981), 120 DLR (3d) 42 (Man CA).

clear that the provisions concerning bindingness alluded to above do not invoke *stare decisis.* Numerous arbitration awards, as well as court decisions, state that the doctrine of *stare decisis* has *no application* in labour arbitration matters. Previous awards on similar matters involving different parties do not bind arbitrators.[11] Weatherill discusses the effect that previous awards have in the resolution of later cases, and notes that *stare decisis* has no application in labour arbitration cases. He provides three reasons for this (Weatherill 1958, 324):

1. There is no legislative direction that *stare decisis* should apply.
2. Arbitrations are administrative and not simply judicial processes. The purpose is not to establish general principles but rather to solve immediate problems between the parties at hand.
3. Arbitrations are less formal than the courts. The purpose of the arbitration is to relate the collective agreement to particular fact situations.

5.2.3.3. Emergence of "Quasi-stare decisis" in Arbitration Jurisprudence

It would be an exaggeration to say that the principle of *stare decisis* as understood in the courts emerges within arbitration jurisprudence. Rather, something akin to the principle exists—an established practice of adhering to previous awards, which falls short of a binding requirement to do so.[12] I need to flesh out the particular kind of force the principle has within arbitral decision-making, if I am to use the status of the principle to help understand arbitration as a form of delegation.

Consider what is ostensibly possible within arbitration, given that the doctrine of *stare decisis* does not apply. An arbitrator could enter an arbitration, ask for submissions from parties as to the facts of the grievance, and ask for interpretations of the collective agreement that make no mention of previous awards. He could render an award that makes no reference to previous awards, even if representatives discuss such awards in their submissions concerning the interpretation of the agreement. The arbitrator could even adopt a contrary position to a large body of previous awards involving similar matters. The foregoing, however, does not typically occur within arbitration practice. If it did, arbitration would be no more than, in H. L. A. Hart's words, a game of "scorer's discretion," where the only rule is, "the score is what the scorer says it is" (Hart 1994, 142). In actual practice, serious consideration is given by arbitrators to previous awards involving similar matters. Awards frequently

[11] There are many precedents here: for two recent cases, see *Halifax (City) v Halifax Firefighters Association, I.A.F.F., Local 268* (1994), 132 NSR (2d) 1 (NS SC); *Canada Post Corporation v Canadian Postmasters and Assistants Association et al* (1994), 118 Nfld & PEI R 16 (Nfld SC).

[12] For other such "established practices," see Section 3.2 (civil law), 8.2 (international law).

contain lengthy discussions of such previous "authority"—so much so that the approach taken and the form of analysis seem comparable to what one finds in written court judgments.

If arbitrators do not have to follow, or even give serious consideration to, previous awards, but in fact do so, then we should ask why. There seem to be two broad types of reason. The first is normative guidance. Previous awards function as a normative information resource; they suggest viable solutions to matters at hand. Where the issues and facts are comparable, and where the arbitrator agrees with the reasoning of the earlier award, there is no need to review the matter again from the beginning.

But guidance alone does not give us anything approaching *stare decisis*. In a fully-functioning system of *stare decisis*, there must be some normative force that attaches to previous awards simply qua settled matters. The normative force of a past decision derives simply from the fact that it exists as a past decision (see sec. 3.1 above). In a system of *stare decisis*, a hypothetical case mentioned in argument even with exactly the same fact situation would not carry precedential weight, whereas such a case could provide no more and no less normative guidance than would an actual case with the same content. In the cases discussed below we find used in the reasoning considerations emphasizing the fact of settlement such as the need to reconcile conflicting awards, deference to "well established" precedent, and the desire to create a settled body of jurisprudence. Such expressions suggest that the awards of previous arbitrators on similar matters do carry not only normative force, but also more of such force than we would find if mere guidance were all that was provided. But care must be taken. The mere fact of an award having been made, while sufficient to create a binding precedent in the courts, does not seem sufficient to attach normative force to that award within labour arbitration. What else do we need here, and what reasons are typically given for needing it?

If we are to understand the precedential value or force of previous awards in arbitral practice we should consider features of the institution itself. Three features come to mind: the adjudicative nature of labour arbitration; the purpose of labour legislation, and the nature of the participants. Labour arbitrations, notwithstanding Weatherill's characterization of the proceedings as administrative, are adjudicative. They involve disputes between parties to a collective agreement. They are adversarial. Finally, arbitrators are to resolve the dispute by finding facts and interpreting the collective agreement in a manner that is fair. There is a concern that "justice is done." If the matters at issue are sufficiently close it is therefore no surprise that arbitrators will give serious consideration to previous awards—they are the products of the same process which, *prima facie*, should be fair and well reasoned.

The goal of labour legislation is harmony within industrial relations. Adherence to previous awards directly contributes to this goal in a number of

ways. First, the development of a settled body of jurisprudence provides parties with a firm footing for the interpretation of agreement provisions during the negotiation of collective agreements. Second, the existence of a settled body of jurisprudence discourages frivolous grievances and transgressions of the collective agreement. Finally, the presence of a settled body of jurisprudence provides all with the sense that the institution will treat similar disputes in a similar manner. Wide variance in arbitral awards would suggest that the arbitration process is arbitrary.

The nature of the participants is also a consideration. Most of those that represent parties in arbitrations are legally trained. Many arbitrators are also legally trained. I suspect that the biography of the participants has much to do with how they regard their role and how they will approach the use of previous awards as precedents. One must also consider that labour legislation provides that the parties to the arbitration select and pay for the arbitrator (*Labour Relations Code*, S.A., 1988, c. L-1.2, sec. 135 and 136). Let us assume that most settled arbitration represents a fair standard of interpretation. If an arbitrator consistently ignores such settled bodies of arbitration jurisprudence, if he acquires a reputation as a "wild card," then it is unlikely that he will find much opportunity to ply his trade. In this way the institutional structure itself as a matter of social psychology promotes adherence to something like *stare decisis.*

It is important to note that this reliance within arbitration on a form of *stare decisis* does not mean that arbitration as a site for sources of law must be classified under precedent and not delegation. First, as I have indicated, the form taken by *stare decisis* in arbitration is not identical to the form taken by that doctrine in paradigm precedential adjudication in common-law courts. Second, even if it were identical, there would still be a difference between the two cases. In the case of precedent as itself a source, the authority of a decision which derives from precedent is wholly explained by the reference to precedent. In the case of a decision by a labour arbitrator, a reference to past decisions can only provide part of the explanation for the authority of that decision. The legislation which set up the arbitration tribunal is also part of the explanation, as are other local characteristics of arbitration itself. Thus the independence of arbitration as a candidate source of law—delegation—is preserved.

I will now turn to discuss three specific cases.

(a) *Re United Steelworkers, Local 6350, and Canadian Industries Ltd* (1965) 16 LAC 270 (Little, Valentine, Hicks). This arbitration concerned the scope clause of the collective agreement. The issue arose when a company foreman performed work ordinarily performed by the grievor. The union contended that the company was thereby in violation of the provisions of the agreement setting out who the employees are and the work required by their classifica-

tions. The Board noted that considerable precedent exists in respect of this sort of matter. Referring to one of these decisions the Board went on to state:

That award was written over five years ago but I know of no award expressing a contrary view since that time. It is true that no board is bound by any previous award but it is our view that where a subject has been so thoroughly considered and reviewed over the years as this one has been and a uniform result is evident in the decisions *and that most companies and unions engaged in the collective bargaining process, including these parties, know of such jurisprudence and continually act with that knowledge*, a board would have to find exceptional circumstances to warrant reaching a different conclusion. (*Re United Steelworkers, Local 6350, and Canadian Industries Ltd* (1965), 16 LAC 270 (Little, Valentine, Hicks), 274; emphasis mine.)

This statement clearly reveals that more than mere guidance informs the use of previous authority in arbitration practice. The Board in this arbitration displays a concern to preserve a settled body of jurisprudence and suggests that this is important for the collective bargaining process. Having "settled" interpretations mean that parties know what to expect concerning the meaning of agreement provisions when they negotiate those provisions. Settled interpretations also have the effect of discouraging spurious grievances and overt transgressions of the agreement. For these reasons the adherence to previous authority promotes industrial harmony—a consideration that was underlying this Board's conclusion that "exceptional circumstances" must exist to warrant an award that goes against well-established authority.

(b) *Re British Columbia Telephone Company and the Federation of Telephone Workers of British Columbia* (1990) 80 CLLC 14, 047 (BC SC). In this case the company sought judicial review of an arbitral award. Among other grounds, the company submitted that "the arbitration board misconducted itself by adopting an erroneous test of invidiousness in comparison with one prior award as the basis of its decision to reinstate" (*Re British Columbia Telephone Company*, 237–8). The company contended that the Board improperly held themselves bound to an "invidious" comparison. The Court dismissed this argument, stating:

It is clear that the board did not hold that they were bound by the Thorpe case. There is no issue of *stare decisis* here. The only question is whether or not it was proper for the Board to look to the Thorpe case for guidance in determining the appropriate penalty to be imposed. Although the results of each case must depend on the specific facts, it is not an error in law to look to other cases based on similar facts for guidance. It is not necessary to decide each case in a vacuum. The issue in the Thorpe case was the same issue as that before the Board here. The parties in the Thorpe case, except for the grievor, were the same parties as in this case. Although the comparison of the cases may be "invidious," that does not make it an error of law. (Ibid., 241)

In this case we have an excellent example of previous awards construed as guidance. The Court notes that *stare decisis* is not at issue here. The Board did

not decide as it did *because* it felt itself *bound* to follow the earlier award, but rather because it agreed with the reasoning employed within the earlier award. The clarity with which mere guidance is emphasized in this decision only throws into relief the way that other cases imply more than mere guidance.

(c) *Re Health Labour Relations Association of British Columbia (Royal Columbian Hospital) and Hospital Employees' Union, Local 180* (1986) 24 LAC (3d) 359 (Kelleher, McDonald, Fradley). The case concerns a complicated situation of conflicting authority. The dispute itself concerned the rearrangement of shift hours, work areas, and days off for a number of hospital personnel. The parties in the dispute relied upon different interpretations of the relevant collective agreement provisions stemming from conflicting earlier awards.[13] The Board noted that while *stare decisis* has no application in arbitration earlier awards do have a "special significance" (*Royal Columbian Hospital*, 379). The Board, however, observed that in this grievance there was a problem in attaching "special significance" to an earlier award precisely because the earlier awards did not result in finality concerning the issue at hand. The awards diverged in their interpretations of the agreement and created a situation of conflicting authority. This was particularly troubling because both awards concerned the interpretation of the same provisions of the same collective agreement. Both awards also based their interpretations upon the same award, *Re Int'l Nickel Co of Canada Ltd*, a decision that the present Board regarded as stating the applicable principles with respect to the matter at hand. Both awards were thus, in this Board's opinion, entitled to equal deference; a situation conflicting with the aim of industrial harmony embodied within labour legislation (ibid.).

The Board went on to speak of the *Windermere* award relied upon by the Hospital as the "tie-breaker." Noting that in the *Windermere* award both parties merely sought a ruling on the specific facts, the present Board stated that the significance of the award did not rest upon its "precedential value based upon some principle of *stare decisis*" (ibid., 380).[14] The value of the *Windermere* award for the present Board was that of guidance. Like the present Board, the *Windermere* Board had to "reconcile" the conflicting *Royal Jubilee* and *Nanaimo* awards. The present Board, in the end result, agreed with the reasoning of the *Windermere* Board.

[13] The Hospital relied upon *Re Windermere Central Park Lodge and Hospital Employees' Union* (December 7, 1984, Weiler, unreported), a decision that adopted the reasoning in *Re Royal Jubilee Hospital and Hospital Employess' Union, Local 180* (November 14, 1978, Sherlock, unreported). The union relied upon *Re Health Labour Relations Assoc. of B.C. (Nanaimo Regional Hospital) and Hospital Employees' Union* (September 7, 1979, Larson, unreported).

[14] Note that this statement implies that in some instances previous awards *will have* precedential value under something akin to *stare decisis.*

This award presents us with a number of useful insights. First, we obtain a clear statement linking the precedential value of earlier awards to the goals of labour legislation. Second, we find a situation where the concern of the Board is to reconcile or resolve a conflict within arbitration jurisprudence. It is puzzling to think that this would be a serious issue if nothing akin to *stare decisis* operated within the arbitration context. If guidance were all that mattered, that could be found in the preferred earlier case; that case's own relation to other earlier cases would be irrelevant to whether it provided guidance in the instant case. Third, the Board makes some finer distinctions between awards that carry "industry-wide" precedential value, like *Royal Jubilee* and *Nanaimo*, and awards that are more fact-specific like *Windermere*. Again, why would such a distinction matter, if the issue were simply one of the nature and extent of the guidance which the previous case supplied to those deciding the later case?

5.2.3.4. Assessment

The idea of taking previous decisions merely as "guidance" creates a situation where the arbitrator's ruling is, in the terminology proffered above, transparent to the underlying substantive justification. If it had been the case that arbitration tribunals referred to previous cases only for guidance, then the difficulty in regarding arbitration as a strictly institutionalized source of law would be insuperable. As we have seen, though, more is involved than mere guidance. Nonetheless, to the extent that guidance is prominent among the reasons why arbitrators refer to previous cases, the status of arbitration becomes somewhat looser.

If I turn to the range of reasons given for the practice of adhering to past decisions, those reasons are not uniform. The preservation of an assumed fairness in the body of past decisions, and industrial harmony, are substantive, not formal, reasons. To the extent that there is direct reference to these values in the reasoning process, again arbitrators' rulings must be seen as transparent to their underlying justifications. But it is overwhelmingly the case that the reference to these values is not direct. Rather, reference is made in context to formal and procedural values such as the need to reconcile conflicting previous decisions, the appropriateness of respect for past decisions and for decisions of higher courts, the desire to provide certainty. It may be true that those formal reasons themselves are justified by the substantive values of fairness and industrial harmony. But in the context of arbitration they serve as a barrier insulating the decision-maker in the first instance from those background values. In accord, therefore, with the line of argument laid down in dealing with *res judicata*, to the degree that the appeal is in the first instance to formal values in arbitrators' rulings, to that degree there is a case for regarding arbitration as an independent source of law, and as a strictly institutionalized source.

5.2.4. Conclusion

With respect both to the principle of *res judicata* and to that of *stare decisis*, we have seen that neither function in arbitration in exactly the way that they do in judicial courts. These differences immediately weaken the case for regarding arbitration as a strictly institutionalized source of law. On the other hand, it is clear that in each set of cases we find a well-established practice of adherence to these principles, which immediately provides a case for regarding arbitration as a strictly institutionalized source. I also introduced one further complexity into the discussion concerning the very structure of decision-making by rules. It may be that the fundamental reasons for creating a system of labour arbitration tribunals have to do with values such as fairness, efficiency, social harmony. But there is a key difference between the case where the decision-maker directly appeals to such values, and the case where the decision-maker directly appeals to formal values internal to the system of arbitration, which formal values are thought to be instrumental in the realization of the background values. The former counts as a deep justification, whereas the latter counts as a contextual justification, despite the background presence of the deeper values. This latter I believe to be the case to a considerable degree in both the sets of cases I examined. In such cases, I argued, an arbitrator's ruling will satisfy clause (i) of the working definition of "strictly institutionalized source of law," in that its existence condition will be a function of the arbitrator's activities and not of the legislature or the society which values what arbitration brings. In addition, clause (ii) will be satisfied, because the local normative force of the ruling comes from exactly the fact that it is the arbitrator's ruling, and not from any background values the ruling is supposed to instantiate.

Such a qualified analysis is all that is possible with respect to arbitration as a source of law, and it does not give a categorical answer to the question whether arbitration is a strictly institutionalized source of law. The analysis only lays down considerations for and against an affirmative answer. I shall say something more about the value of such ambivalence in the concluding section of this chapter.

5.3. Mediation

5.3.1. Introduction

I turn now to consider mediation. Mediation constitutes a subset of the large range of procedures of dispute settlement that in the last few decades have become known as Alternative Dispute Resolution, or ADR. Non-institutionalized, or purely customary, methods of dispute settlement are in themselves of great antiquity. However, ADR as an approved adjunct to the formalities and

the institutions of a modern municipal legal system is a product of the last half of the twentieth century. The term "alternative dispute resolution" covers a large range of heterogeneous activities. Virtually all writing about ADR emphasizes this heterogeneity, and the futility of trying to look for bright lines and defining characteristics. Indeed, given that one major purpose of ADR is to escape the formalities of the standard courtroom and legal system, the heterogeneity is hardly surprising. Moreover, even though some landmarks and stable ground arise from the conceptual fogs and morasses, terminology is not wholly stable. There is therefore an element of stipulation to the terms and distinctions used here, but my intent will be clear enough.

The intent of ADR is to provide a more informal process for the resolution of disputes, one which is tailored more precisely to the needs and the context of individual disputants than the conventional court adjudication. ADR ideally allows the disputants to construct and agree on resolutions which suit their particular personalities and predicaments, thus creating not merely a feeling but a reality of empowerment. The variety of forms of ADR stand at different removes from conventional court adjudication on a continuum of formality and legalization. Three categories of ADR may be distinguished: 1) *Conventional* (parties are commanded/required to participate) and *Assisted* (parties are aided and/or judged by others); 2) *Consensual* (within parties' discretion to participate) and *Assisted* (parties are aided by others); 3) *Consensual* (within parties' discretion to participate) and *Unassisted* (parties act alone).

The first category contains a variety of procedures which are themselves quasi-judicial in character, or firmly linked to judicial proceedings. The kind of arbitration discussed in the previous section is one example of this category, as also would be mandated pre-trial conferences, private courts, and forms of mediation which specifically included provisions for referring the dispute to binding arbitration.

The second category contains mediation or conciliation. As Joanne Goss has put it:

> The mediator acts as a facilitator assisting the parties in communicating and negotiating more effectively, thereby enhancing their ability to reach a settlement. It is not the mediator's role to adjudicate the issues in dispute and indeed the mediator has no authority to do so. Mediation is not a process to force compromise, although compromise is an element of the process. (Goss 1995, 5)

The success of negotiations depends upon good communication and effective techniques. Often the parties are lacking in these areas. Also the parties can find it hard to focus on what is being said and the process in which it is said. The mediator ensures the parties are communicating effectively:

> Essentially, the focus of the mediator is on the process of communication and negotiation being utilized by the parties in their interactions. The mediator will interject to ensure that the most effective negotiation approaches are being taken and that, if there is room for an agreement, that agreement is reached. (Ibid., 5–6)

The mediator attempts to identify common ground, narrows the dispute to its basic elements, helps generate possible solutions, re-focuses the parties on the needs and interests that underlie what they want, and diverts them from their position based statements that seem appropriate to them but may not achieve their aims.

The third category, usually termed "negotiation," "involves discussions directly between disputing parties or their representatives which take place on a voluntary basis. A resolution to the dispute is reached only if all parties agree" (Goss 1995, 1). The parties work out their problems primarily on their own. They may speak confidentially to others (e.g., counsellors, family, friends) who can help them clarify their own positions and brainstorm possible resolutions, etc. Alternatively, the parties may have go-betweens that help them communicate their positions to the other parties but the go-betweens bring very little if any independent input into the substance or the process.

My strategy in this section is to focus on the second category primarily, with some attention at the end to the third. I have, as noted, talked about the first category in the previous section. In the case of the second category, we still have two important features which make mediation a possible instance of delegation as a source of law: a) the referral of the matter in dispute to mediation is authorized by legislation; b) the mediation process may result in a ruling which binds the parties. The main theoretical issue I shall explore is whether these features are sufficient to identify mediation as a strictly institutionalized source of law, and, if not, why not. Three aspects of the authority delegated to a mediator are salient: a) the extent to which the mediator can produce rulings which bind the parties; b) the extent to which the mediator's role is circumscribed by legislation; c) the extent to which there is a continuing institutional structure for the mediation process. I shall present examples which gradually weaken the connection with court adjudication, so that we can see the point at which it becomes no longer plausible to talk about a "strictly institutionalized source of law." My hope is that we can look back from this point and have a clearer view of the nature of such sources.

5.3.2. The Saskatchewan Farm Security Act

5.3.2.1. The Provisions of the Act

The first example I will consider is the role of mediation in the administration of the Saskatchewan Farm Security Act (*The Saskatchewan Farm Security Act*, S.S. 1988–89 c. S-17.1). The purpose of the Act is to give some protection to

farmers from too easily losing their land in foreclosure actions (and other similar actions against farm land) commenced by the banks (sec. 4).[15] To do this the Act makes all foreclosure actions subject to the restrictions and protections of the Act. These protections include mandated requirements for mediation to occur between the bank and the farmer, as well as sanctions against the parties if they fail to participate in the mediation process in good faith. The Act is procedurally very detailed, precise and complex. The following summary necessarily glosses over many details.

Section 11 of the Act stipulates that the court must give permission for a bank to proceed with a foreclosure action against a farmer. The court will only grant this order where the court considers it to be just and equitable; *and after* the bank has taken all the necessary steps to give notice, proceeded with mediation in good faith, and met its onus to prove that the farmer has no reasonable possibility of meeting his financial obligations or is not making a sincere and reasonable effort to do so.

Once the bank gives notice of its intention to apply for a section 11 order, the Farm Land Security Board's duties and the mediator's duties become relevant. First of all, after the Farm Land Security Board receives the notice that the bank is going to seek a section 11 order, the Board completes a written review of the financial affairs of the farmer. This review is then given to the farmer, the bank, and the assigned mediator (sec. 12(2–4)). After the mediator gets the Board's initial report, mediation is set up and the attempt is made to work out a settlement between the farmer and the bank. If the mediation is successful, an agreement is drawn up between the farmer and the bank, neither the section 11 application nor any other action against the land proceeds.

While the mediation is being conducted, the Act is silent on the procedure that must be employed by the mediator. Nor does the Act give the mediator any power to make a binding decision for the parties if the parties are unable to come to a decision on their own.

If the mediator feels that one or both of the parties is acting in bad faith during the mediation sessions, then the mediator may file a bad faith certificate with the Board (sec. 12(7)). Then, when the Board makes its final report, it will take notice of the bad faith certificate, and so will the court when making its decision about the justice and equity of granting a section 11 order. When no agreement is reached through mediation, whether for bad faith reasons or just because the parties could not agree even though they tried, the Board may meet with the farmer and the bank in order to prepare its final report to the court (sec. 12(11)).The act lists several things which the final report *shall* include and several things which it *may* include (sec. 12(12)): Any bad faith certificate issued by the mediator shall be included in the report.

[15] The Act applies to all mortgagees that have an interest against farmland; I refer to all such mortgagees as "banks" for simplicity.

If there was no bad faith in mediation, the court must listen to the bank's arguments and, of course, the farmer's counter arguments. The court *shall* also give primary consideration to the final report prepared by the Board; the court *may* consider any other relevant circumstances and make further inquiries as it deems fit. However, the fact that the court *shall* give primary consideration to the Board's final report does not mean that it is bound by that report.[16] If the section 11 order is granted, the bank proceeds with its foreclosure action. If the section 11 order is rejected, the bank will have to start the whole process over again after a year has expired.

If there was a bad faith certificate included in the Board's final report then, if the *farmer* had acted in bad faith, the court may grant the section 11 application (sec. 14). If the *bank* had acted in bad faith then the court's hands are partially tied depending upon what the farmer wants to do. If the farmer wants, the bad faith certificate against the bank gives the farmer a right to request supervised mandatory mediation. If the farmer makes this request the court *shall* order supervised mandatory mediation (sec. 15). The order can require further mediation of up to 60 days. In connection with the order the court may make any additional orders that it considers necessary to effect good faith mediation. If the bank still does not proceed in good faith, then, after the supervised mandatory mediation is done, and when the matter comes back to court, the court *shall* adjourn the bank's application for a further 180 days. After the 180 days the court could grant the section 11 order or dismiss it. And, if dismissed, the bank would have to start the whole process over again after waiting one year.

5.3.2.2. Assessment

This Act is a complex piece of legislation, its elaborate protection of the farmer reflecting the importance to the culture and economy of Saskatchewan of the agriculture industry. The features that interest me are a small portion of this complexity, but some understanding of the whole is needed to put those features in context. That the mediator proceeds by way of delegation from the court is clear. Let us consider the example in terms of the three salient features noted above. These issues will help us to see whether mediation under the Act can be considered both institutionalized and an independent source of law.

The first is the extent to which the mediator can produce rulings which bind the parties. In fact the power of the mediator to bind the parties is quite limited. The mediator can only facilitate the production of an agreement by the parties themselves. Such an agreement, if reached, would be binding on

[16] In *Rosetown Credit Union v Jensen* (1990), 87 Sask R 70 (Sask CA), and in *Bank of Nova Scotia v Elsaesser et al* (1990), 87 Sask R 269 (Sask CA), the Board's reports favoured the farmer and the court still granted the bank its s. 11 order.

the parties, but only because it is a form of contract authorized by the courts and the legislature. Absent an agreement to which both parties consent, the mediation process itself cannot produce a binding result. But the mediator is not wholly without power to issue a ruling which influences the outcome of the dispute. The mediator can issue a bad faith certificate, which must be taken note of both by the Board and by the court which takes the final decision on whether foreclosure can proceed. Such a certificate issued against the farmer automatically allows the bank to claim it has met its onus of overcoming the presumption of sincerity in trying to meet financial obligations on the part of the farmer. If issued against the bank, the certificate automatically gives the farmer a right to further mediation, with severe consequences for the bank if bad faith persists. These considerations suggest that the mediator under the Act can only be considered in a limited way a source of law. Some authority is delegated to the mediator to produce rulings with local normative force. But the force is not a binding force; the legally binding ruling will be issued by the court, and the court simply has the fact of the mediator's ruling before it as relevant evidence.

The second is the extent to which the mediator's role is circumscribed by legislation. While the overall goal of the Act is clear, and mediation must observe that goal, and the legislation specifies a set of facts about the financial situation of the farmer to be provided, still there is little else in terms of legislative content which directs the mediator. If the position that I took in discussing arbitration is correct, too little legislative guidance as much weakens the claim of a forum to be a source of law as does too much. The role of the mediator under the Act is directly transparent to the principles of a just and equitable solution of bank-farmer disputes. It is true that the Board and the court will focus on the formal fact of an agreement having been reached, if it is reached; but they will also focus as much if not more on the content of the agreement, their legislative charge being ultimately to maintain justice and equity in the relations between farmers and banks.

The third concern is the extent to which there is a continuing institutional structure for the mediation process. It is clear that, as far as concerns the mediation process under the Act, there is little if anything of institutional structure internal to the mediation process itself. At the level of the court charged with making a final and binding ruling, the institutional structures of the normal court process apply (cf., e.g., *Bank of Montreal v Abbott and R & P Grain Farms Ltd* (1990), 81 Sask R 64 (QB), following *Farm Credit Corporation v Dimmock* (1989), 81 Sask R 45 (QB)). Continuity and reliability may be provided by the experience and expertise of the mediator, but these are extra-institutional features. The mediator's report is submitted to the Board, which in turns reports to the court. The mediator's report thus simply has the status of a piece of evidence; it is not analogous to the report of a court case in a formal series of court reports.

5.3.3. The Alberta Human Rights Act

5.3.3.1. The Provisions of the Act

The Alberta Human Rights Act (The Alberta *Human Rights, Citizenship and Multiculturalism Act*, S.A. 1980 c.H-11.7, as amended) is another example of mediation under legislation. The purpose of the Act is to eliminate discrimination, hatred, or contempt, at least to the extent they are based on the enumerated grounds of discrimination (sec. 2). It prevents discrimination in the offering of goods and services (sec. 3), tenancy (sec. 4), equal pay (sec. 6), employment practices (sec. 7), etc. The function of the Alberta Human Rights Commission is to promote equality, etc., (sec. 16) and to hear discrimination complaints. In order to facilitate the hearing of complaints (and carry out its other powers under the Act) the Commission may make its own bylaws (sec. 16.1). Where the Commission receives a complaint the Director of the Commission first attempts to effect a settlement by means of conciliation or, if that fails, through the appointment of an investigator (sec. 19.1). While the conciliation or investigation is proceeding, the Director retains the power to dismiss a complaint if he/she feels it is without merit, if the complainant refuses to accept a proposed settlement that the Director considers fair and reasonable, etc. (sec. 20). When the investigator is conducting his investigation he is given several legal/quasi-legal powers to search premises, demand production of documents, etc. (sec. 20.1). If the object of the investigator's search refuses to give consent to the search the investigator can get an order from a provincial court judge to enable the search. (sec. 21).

If the Director dismisses a complaint, the complainant can appeal to the Chief Commissioner (sec. 22). If the parties could not settle, or the Director dismisses a complaint that the Commissioner thinks should proceed, the matter goes to a human rights panel (sec. 23). The complainant and the party alleged to have contravened the Act become "parties" in a "proceeding" before the panel (sec. 24).The parties are entitled to appear and be represented by counsel (sec. 26). Evidence may be given in any manner that the panel deems appropriate and the panel is not bound by rules of the law of evidence (sec. 26). The panel makes a binding decision on the matters before it, unless there is a question of law which arises during the proceedings, in which case the panel can refer the question of law to the courts (sec. 26–7). In making its decision the panel has the power to dismiss the complaint, make orders to ensure the discrimination ceases, order compensation, order costs, and so on (sec. 28). The decision of the panel is final and binding on the parties subject to a party's right of judicial review of the decision (sec. 31).The panel's order can be filed with the courts and enforced as an order of the courts (sec. 32). The panel's order may be appealed to the courts, who can confirm, reverse, or vary the panel's order, or remit it back to the panel with directions (sec. 33). The courts would generally interfere only if some appealable error were dem-

onstrated.[17] Finally, if a person obstructs the Commission they are guilty of an offence under the Act and liable to a fine of up to $10,000.00 (sec. 36.2).

5.3.3.2. Assessment

Here we have a forum and a proceeding which are like labour arbitration in that the forum is specifically set up by legislation to settle a certain kind of dispute. The Commission has the authority to decide the issue by a ruling binding on the parties, but its initial goal is always to mediate a settlement to which the parties consent. The "panel" before which a human rights dispute may end up functions in many ways like an arbitration tribunal, in terms of its decision-making powers. But there are important differences between the two examples. We saw in the case of arbitration that tribunals tended, despite the freedom given them not to do so, to adhere to the typical procedural rules of the courts. Grievance arbitrations tend to follow the same sequence of steps and the presentation of evidence is quite court-like with examination-in-chief and cross-examination for both parties. The Commission on the other hand acts more independently to create its own rules of operation. Both labour arbitration boards and the Commission have powers, and enforceable powers, of independent investigation. In the case of arbitration, however, the process is much more formalized. An independent investigation (called "taking a view") by the arbitrator must be accomplished in the presence of counsel/representative (see, *R v Fine et al, ex p Sheraton Ltd* (1968), 69 DLR (2d) 625 (Ont HCJ).). After both parties have led their evidence in a grievance arbitration their case is closed and it is then in only rare instances that further evidence may be introduced—even on the arbitrators' own initiative. Again, by contrast, the Human Rights Commission collects and processes evidence in a much more informal manner. Their investigations typically proceed without counsel being present. In fact at most stages of the Commission's work, lawyers are not involved, whereas labour arbitration is notorious for starting out with the intention of some measure of independence from the legal system, but having been "colonized" by the legal profession. The case law abounds with judicial rulings that impose procedural requirements upon boards/arbitrators: I have discussed some of them above. In the case of the Human Rights Commission, there are very few court cases in which the operation of the Commission has been reviewed, despite the courts having jurisdiction to do so.

Reviewing mediation within the operation of the Human Rights Act in terms of the three salient features noted above, we find as follows. With respect to the extent to which the mediator can produce rulings which bind the

[17] It has, though, been held that the appellate courts should examine the evidence anew and, if appropriate, make their own findings of fact. *Dickason v University of Alberta* [1992] 95 DLR (4th) 439 (SCC).

parties, the mediator as such has no power. Power resides in the hands of the parties themselves who may reach a consensual settlement, or in the Commission in its various manifestations. The Commission, through the Director, the Chief Commissioner, or the panel, can issue rulings to which the parties do not consent, but by which they are nonetheless bound. Thus to that extent the Commission in the exercise of its powers is far more of an independent source of law than is the mediator under the Saskatchewan Act. On the other hand, the Commission, by virtue of the very broad terms in which its jurisdiction is granted by legislation, and the considerable informality of its proceedings, operates very largely by equitable principles. Very little in the way of formal rules stands between the Commission's decisions and the standards the Commission applies. To that extent, the Commission's claim to be a source of law is weakened. With respect to the extent to which the mediator's role is circumscribed by legislation, the direction from the legislation is stated very broadly, and the discretion of the Commission large. Even though the Commission operates within a legal framework, it does so more independently of that framework than was the case with the mediator under the Saskatchewan Farm Security Act. With respect to the extent to which there is a continuing institutional structure for the mediation process, within the broad procedural framework defined by the legislation, the Commission has extensive powers to decide on its own procedures, and to act as informally as it wishes. To the extent that the Commission is set up by legislation, has a formal structure, and follows consistently procedural rules, there is a case for attributing to it an institutional structure. But informality and institutionality are uncomfortable allies; the degree of institutionalization is limited.

5.3.4. Other Examples of Mediation

I will mention briefly here some other examples of mediation, provision for which is expressly made in legislation, but in which the mediator has no formal, legal powers at all. In Alberta, for example, under the Hospitals Act (*Hospitals Act*, S.A. 1980 c. H-11 (sec. 43)), if there is a complaint against a hospital, the Minister of Health may authorize mediation; however, if the mediation is not successful the mediator simply prepares a report to the hospital board, Minister, and the relevant persons involved. In the case of several Acts regulating the professions—the Optometry Profession Act,[18] the Nursing Profession Act (*Nursing*

[18] *Optometry Profession Act*, S.A. 1983 c. O-10 (sec. 31). S. 31(3) reads: "(3)A person designated by the Registrar as a mediator may assist in settling a complaint made to the Registrar if the complainant and the person about whose conduct the complaint was made so agree, but if within 30 days from the date of receipt of the complaint, or a longer period agreed to by those persons, settlement of the complaint between those persons does not occur, or in the mediator's opinion is not likely to occur, the complaint shall be referred forthwith by the mediator to the Registrar." The wording of the other Acts mentioned is essentially similar.

Profession Act, S.A. 1983 c. N-14.5 (sec.60)), the Veterinary Profession Act (*Veterinary Profession Act*, S.A. 1984 c. V-3.1 (sec.27)), the Certified Management Accountants Act (*Certified Management Accountants Act*, S.A. 1987 c. C-3.8 (ss. 54–5)), the Chartered Accountants Act (*Chartered Accountants Act*, S.A. 1987 c. C-5.1 (ss. 54–5)), and others—the mediator's position is even weaker; he or she does not even prepare a report. If a complaint is lodged against a professional person, a mediator may be employed to reach a settlement acceptable to both parties. But the mediator has no powers if there is no settlement to which both parties consent. The complaint simply goes forward to the Chair of the Discipline Committee or other appropriate person, or group within the professional association itself. A further example would be the role of mediation under the *Divorce Act*, 1985 S.C. 1986, c. 4. Section 9(2) of the Act states that it is the duty of every barrister, solicitor, lawyer, or advocate to inform the spouses about the mediation facilities known to the lawyer that might be able to assist the spouses in negotiating their issues. In Saskatchewan, to insure that the lawyers have done this, Form 61, Petition of Divorce, in the Saskatchewan Queens Bench Rules of Court requires the lawyers to sign a statement certifying that they have complied with their obligation under section 9(2) of the Divorce Act. Schedule B, Form 1, of the Alberta Rules of Court has a similar statement of solicitor certifying compliance with section 9 of the Divorce Act by the lawyers in Alberta. In practice, if the lawyers had recommended mediation and some settlements were reached, such a settlement simply narrows the range of issues that go to trial (providing the agreements reached are reasonable and of a type that the court would approve). If the lawyers recommend mediation and the parties choose not to attend, or cannot settle anything, the court simply proceeds as it always would have, i.e., the fact that the parties tried mediation and failed has absolutely no bearing on the court process.

In these cases, it is quite clear that mediation under these conditions does not qualify as a source of law of any kind. The mediation is a practical adjunct to the relevant legal process, and any agreement that emerges from the mediation has binding force if and only if it has the consent of the disputing parties. Absent such agreement, the dispute passes on to settlement by the court system, which would function as the source of law.

5.4. Conclusion

I began this chapter by noting that the dominant view among legal theorists was to attribute an ambivalent position to delegation or subordinate legislation as a source of law. The survey of some typical examples of delegation has indicated that there is sound reason for the dominant view. It is not necessary to go as far as John Austin and believe that all law derives its normative power from sovereign command. The issue is simply a matter of relevant points of contrast between the primary examples of sources of law—legislation and precedent—

and delegation. For a body to which legal power has been delegated to be itself a source of law, a difficult and narrow path must be trod. If such a body has too much independent law-making power, then the case scarcely presents itself as one of delegation. If such a body has too little independent law-making power, then the case scarcely presents itself as one of a source of law. The example I have discussed of labour arbitration illustrates the difficulty well. The arbitration board does operate with some degree of independence from the court system, under powers granted it by legislation. Within the whole body of arbitration tribunals, practices such as *res judicata* and *stare decisis* have developed independently; these practices mirror, but do not derive their authority from, the courts. But there are clear limits to the independence—not merely in that individual decisions may be subject to review, but also that courts may lay down rules for future arbitration tribunals to follow.

Moreover, the claim of delegation to be a source of law is threatened from another direction also. The more specifically substantive the content of the enabling legislation, the less plausible it is to claim that the body to which jurisdiction is delegated is a source of law. However, such a danger rarely materializes. Enabling legislation is typically phrased quite generally in terms of the substantive principles to be employed. That fact, however, only creates a different danger. The more the body functions as a tribunal of equity, deciding each case on its merits by seeing it as an instance of general principles, the more plausible it is to view those principles as the source of law, rather than the body itself. The more that the body has advisory, rather than conclusory, powers, the less the body can be seen as a source of law.

In the end, there is no simple and straightforward answer to the question, Is delegation or subordinate legislation a strictly institutionalized source of law? Delegation is what it is, no more and no less. An affirmative answer to the question obscures important features of delegation—the way in which the powers of a body to which jurisdiction is delegated can still be circumscribed and limited by the regular court system; the extent to which such a body acts informally and equitably; the extent to which such a body may not have any final decision-making power. A negative answer to the question also obscures important features of delegation—the way in which a body to which jurisdiction is delegated has the power to develop independently rules, practices and procedures; the way that such rules, practices and procedures may take on a degree, even a high degree, of formalization; the way such a body has the power to produce rulings binding on the parties to the dispute before it. Finally, much more so than courts and legislatures themselves, bodies to which jurisdiction is delegated are heterogeneous in kind. Some bodies, in the way that they function, have more claim to be regarded as strictly institutionalized sources of law than do others. All the theorist can hope to do is to indicate in general terms how to go about making a case one way or the other in any given particular instance. I hope that I have fulfilled that goal here.

Chapter 6
CONSTITUTIONS

Standard jurisprudential discussions of sources of law make no reference to a, or the, constitution as a source of law. From the point of view of a society's daily life with the law, this seems remarkable. What has been called "the astonishing growth of constitutionalism that has taken place around the world in the last sixty years" (Gardbaum 2001, 707), "the global hour of the constitutional state" (Walker 2002, 317), "the phenomenon of judicial enforcement of human rights [...] accepted as axiomatic" (McCrudden 2000, 500), needs no emphasis. Decisions by Supreme or High Courts concerning the constitutional validity or otherwise of rules of law, especially legislation, are a familiar focus of political debate and dispute, especially when the protection of individual or human rights is at stake. The discourse of constitutionality and constitutional rights is endemic both inside and outside the formal institutions of the law. If the existence and application of constitutions and constitutional norms is so central to legal, political, and social life, how is it then that little or no attention is paid to constitutions as sources of law?

The quickest answer, of course, is that constitutions are in fact as such not sources of law. Constitutions are law, not sources of law. We shall see that there are tempting reasons to make such a response. The purpose of this chapter, however, is to argue that, despite the force of challenges to the hypothesis, there is yet room to take seriously the claim of constitutions to be sources of law. An understanding of strictly institutionalized sources of law that omitted the role of constitutions would be incomplete.

I will begin by clarifying some definitional issues in Section 6.1. Then I will offer in Sections 6.2–6.5 examples to make the case for constitutions as sources of law. In Section 6.6 I will offer some conclusions.

6.1. Definitional Issues

6.1.1. The "Thin" Sense of "Constitution"

The notion of "constitution" has more than one meaning. The notion may be characterized in a thin or formal way: "A body of rules, conventions, and practices which describe, regulate, or qualify the organization and operation of government" (Turpin 1995, 3); "the law that establishes and regulates the main organs of government, their constitution, and powers" (Raz 1998, 153); "the body of rules which determine the final repository of law-creating power, the procedures and the limits of the content of norms in [a] legal order" (Stone 1968, 203). This sense Raz refers to as a "thin" sense, and one such

that it is tautological that every legal system includes a constitution (ibid.). Stone comments likewise that, in that sense, "every legal order has a constitution, whether so-called or not, and whether in writing or not" (ibid.). Important though the thin sense is for understanding the foundations of a legal system, it does not contribute to the issue of constitutions as sources of law. It is worth noting why.

It might seem such pessimism is unjustified. Raz writes of constitutions: "They do not derive their authority from the authority of their authors. They are self-validating. They are valid just because they are there" (Raz 1998, 173). The underlying point is structural, and has been noted in different ways by other scholars. Schauer remarks that nothing can make a constitution constitutional or unconstitutional: "constitutions establish the grounds for constitutionality and unconstitutionality [...] they simply cannot themselves be constitutional or unconstitutional" (Schauer 1995, 145). Patrick Fitzgerald acknowledges that constitutional rules differ from ordinary legal rules in that their authority does not derive from some more basic legal rule (Fitzgerald 1966, 85). Another way of making the same point is to speak, as Larry Alexander and Emily Sherwin do (Alexander and Sherwin 2001, 58ff.) of "pre-constitutional," as opposed to "constitutional," rules. Their thought is that these rules are rooted in agreement or acceptance, as opposed to constitutional rules, which are rooted in what is already in some sense law.

If a constitution is unique among (bodies of) legal rules in being thus its own source of authority and self-validating, then seemingly it must just so far be functioning as a unique and independent source of law. There are competing spatial metaphors here typically used to elucidate this point.[1] One is the metaphor of the boundary to a plane figure. When a plane figure—a circle for example—is drawn, the line is not part of the circle; it is not inside or outside the circle, but it demarcates the circle—the circle does not exist without it. One may think of the constitution in the thin or formal sense of a legal system in this way. Along with this "boundary" metaphor goes the language of "inside" and "outside," and of limits. In recent times, the idea of a constitution delimiting a legal system as the boundary of a plane figure delimits that figure has been associated with legal positivism, and especially H. L. A. Hart's doctrine of the "ultimate rule of recognition" (Hart 1994, 105ff.). (See, in this Treatise, vol. 11.) Hart himself speaks more of gaps within the law than boundaries to the law. Ronald Dworkin emphasized the commitment of legal positivism to the thesis of the limits of law in his well-known critique of positivism (Dworkin 1978, 17), and positivists seem to have accepted it as a fair characterization (see, for example Raz 1972). A different spatial metaphor is embodied in thinking of a legal system as a hierarchy of norms with one single

[1] Note, though, that I have warned about the slipperiness of these metaphors elsewhere; see Shiner 1992, 310–21.

norm at its apex. Such a picture is associated with Hans Kelsen's doctrine of the Basic Norm (see Kelsen 1967, 193–220), although Hart also uses the image of tracking back the source of validity within a hierarchy of laws (Hart 1994, 107). These two spatial images are not so different from one another, in that a logical tree can easily be seen to form the shape of a triangle, a plane figure.

The point to note is that in either case an elucidation is offered of the idea of a constitution as self-validating. The relation between the limit of the circle and the inside of the circle, or between the top norm in the hierarchy and derivative norms, gives a picture of the way in which the legal status of other norms can be derived from the constitution. We also have at the same time a picture of why it cannot make sense to speak of the constitution as possessing its legal status in the same way, and thus apparently of how a constitution can be thought of as a source of law.

The difficulty with this line of argument is as follows. From the perspective of jurisprudential analysis, a distinction has to be drawn between an enquiry into the social, historical, and political sources of law,[2] and an enquiry within legal science as to the sources of law, an enquiry into the *legal* sources of law, as it were. Kelsen's struggles with the way in which his Basic Norm is a norm of the legal system both like and unlike other norms are familiar. Hart famously describes his ultimate rule of recognition in these terms, that it "exists only as a complex, but normally concordant, practice of the courts, officials, and private persons in identifying the law by reference to certain criteria" (Hart 1994, 110). That is, the ultimate rule of recognition can only be described from the external, or socio-historical, perspective; the rule exists only as a practice. It follows, therefore, that changes in and evolution of the rule are the subject of politics, not of law, and the normative questions such changes might raise are questions of political morality and policy, not of law. Our concern here is with sources that function *legally* as sources, not with those that function politically as sources. The content of the ultimate rule of recognition for any given legal system, supposing we accept *pro tem.* that way of putting things, will tell us what are the sources of law in that legal system. It is not itself otherwise, nor can it be, one of those sources. The terminology of "self-validation" is important for drawing attention to the "boundary" character of the basic norm or ultimate rule of recognition. But it would be a mistake to think that self-validation implies a capacity to function as a source of law. The sense of "constitution" in which a constitution may function as a source of law is a different sense, and one to which I now turn.

[2] An enquiry such as that is conducted by Hubert Rottleuthner in vol. 2 of this Treatise.

6.1.2. The "Thick" Sense of "Constitution"

A quite different kind of characterization of "constitution" is substantive, not formal. Raz calls this substantive sense the "thick" sense of "constitution," and acknowledges that there will be different ways of spelling out this thick sense in different legal orders (Raz 1998). The "thick" characterization of any given constitution will involve reference, not only to the plain facts of legal structure and jurisdiction in the legal system of which it is the constitution, but also to the normative structural principles of the legal order in question. Even dictatorships, oligarchies, monarchies, military juntas, theocracies, and the like will have in some form "thick" constitutions—normative structural principles to do with the wisdom and omniscience of the Supreme Leader or Leaders, the appropriateness of deference to the same, the enduring validity and significance of the principles of belief and behaviour of a given religion, and so forth.

Raz himself suggests a combination of seven features to comprise a suitably "thick" constitution: a definition of the constitution and powers of the branches of government (the "thin" sense), long duration, a canonical formulation, legal superiority, processes of judicial review, entrenchment, principles of government generally held to express peoples' beliefs about how their society should be run (Raz 1998, 153–4). Louis Henkin lists: popular sovereignty, supreme law, political democratic theory and representative government, limited government, and separation of powers, respect for individual rights, institutions to monitor respect for constitution, self-determination (Henkin 1993, 535–6). James Tully offers a very different list, one which suggests how thing appear to the marginalized, not to the hegemonic sectors of society: the elimination of cultural diversity as a constitutive element, definition relative to a historical tradition, emphasis on legal and political uniformity, recognition of custom, identification with a specific set of European institutions, the identity of a state as a "nation," emergence at a founding moment and the support for democratic politics (Tully 1995, 62–70). Although these lists are not identical, they are familiar; even the unusual features on Tully's list are obverses of the familiar. The lists recite the content of the thick sense of "constitution" in liberal democracies. To have a constitution in this thick sense is to have a legal order that conforms to certain liberal-democratic norms of political morality, to a particular picture of a certain kind as to how legal orders *ought to be* constructed. Dictatorships, oligarchies, monarchies, military juntas, theocracies, and the like, would not have a "constitution" in this liberal-democratic thick sense, as they would lack one or more of the features in these lists.

The range of features in the previous paragraph represent a way of thinking about the design of fundamental legal and political institutions that is characteristically called "constitutionalism." The term seems to have come into existence in the form "constitutionalist" in the eighteenth century—first, descrip-

tively as a person interested in constitutions, and then normatively as a person supporting the principles of the French and U.S. Constitutions. But it evolved into a more general sense, including the form "constitutionalism," at the end of the eighteenth century and into the nineteenth as denoting a person or a theory opposed to popular democracy, a person of conservative or royalist sympathies. The term is thus rooted in the idea of opposition to the doctrine of parliamentary sovereignty, even though any connection to "royalist sympathies" is now wholly lost. The root idea survives today in the thought that the provisions of a constitution, especially one that contains a charter or bill of individual or human rights, function as a constraint on the sovereign power of the legislature. Constitutionalism is the contrary to parliamentary sovereignty, though not its contradictory, since the two do not exhaust the field.

The notion of a, or the "Constitution"—the sense in which people in the United States characteristically speak of "the Constitution," the "capital C" sense of "constitution"—is different yet again. The expression "the Constitution" here refers to a specific document, enacted or ratified at a certain time, amended at a certain time or times, and possessing a canonical written formulation. It is clear that not every legal system has a "Constitution" in this "capital letter" sense—famously, the United Kingdom does not. Canada does not either, even though there are two acts valid within the Canadian legal system with the name "Constitution Act," and sec. 52(2) of one of them essays a characterization of "the Constitution of Canada."

One further distinction needs to be drawn. The United Kingdom is famous (or notorious), not only for not having a written constitution, but also for not having a charter or bill of individual rights. (The situation has changed somewhat with the passing of the Human Rights Act (U.K., 1998, c. 42); the Act will be discussed shortly.) However, a constitution and a charter or bill of individual rights are not the same thing. Even in cases where written documents predominate in the constitution of a legal system, and even when there is one document specifically labelled "The Constitution," it may still be so that the constitution does not contain a formal charter or bill of rights. The Constitutions of New Zealand and Australia are examples; I will say something about the latter in Section 6.2.3 below. The pervasive discourse of liberal-democratic constitutionalism has made us familiar with the protection of individual rights through courts having the power to invalidate legislation by virtue of inconsistency with such charters or bills of rights. But judicial review need not take this form.

Even in the case where there is a bill of rights, courts may have different powers of judicial review with respect to such a bill. The New Zealand Bill of Rights was enacted in 1990. Sec. 4 of the Act, however, reads:

> No court shall, in relation to any enactment (whether passed or made before or after the commencement of this Bill of Rights),

(a) Hold any provision of the enactment to be impliedly repealed or revoked, or to be in any way invalid or ineffective; or
(b) Decline to apply any provision of this enactment by reason only that the provision is inconsistent with any provision of this Bill of Rights.

The force of the Act is limited to that of an interpretive principle.[3] The recent incorporation of the European Convention on Human Rights into U.K. law through the Human Rights Act arguably still protects parliamentary sovereignty from rights as constitutional trumps. The Act has, in Joanne Harrington's words, a "uniquely British structure" (Harrington 2000–2001, 107). The mechanisms for "giving further effect" (Human Rights Act, Long Title) to the European Convention are three-fold—a new rule of statutory interpretation, that legislation must be read and given effect in a way which is compatible with Convention rights; a power given to courts to declare formally that legislation is incompatible with the Convention, though such legislation remains valid and in force; a new statutory duty on the part of public authorities to comply with Convention rights. Clearly these mechanisms abridge hardly at all, if at all, the structural sovereignty of the U.K. Parliament. What long-term effect they may have on U.K. politics and judicial decision-making remains to be seen.

In Canada, the powers of courts in relation to the Canadian Bill of Rights (S.C. 1960, c.44; R.S.C. 1985, Appendix III) are quite different and much weaker from those in relation to the Charter of Rights and Freedoms (Part I of Schedule B to the Canada Act 1982, C. 11 (U.K.)). The Canadian Bill of Rights, for example, is silent on its effect on legislation deemed to be incompatible with its values, and in any case applied only to legislation of the federal government, not to that of provincial governments. It had to be decided whether the Bill was merely an instrument of statutory interpretation, or whether it embodied wider powers. In fact, the Supreme Court of Canada decided that the Bill had the effect of rendering inconsistent statutes "inoperative" (*R v Drybones* [1970] SCR 282). However, in part because of reluctance by courts to apply such apparently far-reaching powers in view of the Bill's status as just another piece of legislation, very few cases were decided under the Bill.[4] Now that the power to review and invalidate under the Canadian Charter of Rights and Freedoms is clear, Canadian courts have shown no such reluctance.

The Constitution of Canada is instructively complex and thereby instructively typical; it is therefore worth looking at some further detail. Canada as

[3] S.6: "Wherever an enactment can be given a meaning that is consistent with the rights and freedoms contained in this Bill of Rights, that meaning shall be preferred to any other meaning."

[4] The analysis of present judicial powers under the Bill is more abstract and technical than practical. For such an analysis, and a thorough one, see Hogg 2002, 32-3–32-9.

historically a Dominion of the United Kingdom was created in 1867 by the passing in the U.K. Parliament of the British North America Act (U.K., 30 & 31 Victoria, c.3). That Act created the Dominion of Canada as a federation of the then-existing provinces in British North America, and spelt out in detail the institutional structures of government and the distribution of governmental powers between the federal and provincial governments. This document was the primary formal, written source for constitutional law in Canada, although, imbued as Canada was, and still is, with the U.K. parliamentary tradition, Canada absorbed and retained many of the unwritten conventions of the U.K. constitution. In the early nineteen-eighties, the Liberal government of Pierre Elliott Trudeau strongly felt that it was no longer appropriate for the main constitutional document of Canada to be an Act of the U.K. Parliament in Westminster, with only that body capable of amending the same. Trudeau therefore set in motion the patriation of the Canadian constitution—the relocating of the power to adopt and amend a constitution for Canada from the Westminster parliament to the federal parliament in Ottawa. The U.K. parliament agreed to play its role in the patriation. Accordingly, it passed the Canada Act 1982 (U.K., 1982, c.11), which Act set out in its attached Schedule B The Constitution Act 1982 and specified that Act as having legal force in Canada (sec. 2), and declared in section 3 that no subsequent Act of the U.K. Parliament shall have force in Canada. The Constitution Act 1982 (Schedule B to Canada Act 1982 (U.K.)) contains as its first thirty-four sections the Canadian Charter of Rights and Freedoms, a statement of the fundamental rights and freedoms possessed by everyone in Canada. It also contains the procedure for constitutional amendment, and among other provisions renames the British North America Act as the Constitution Act 1867. The Act also contains these words:

> The Constitution of Canada includes (a) the Canada Act 1982, including this Act; (b) the Acts and orders referred to in the schedule; and (c) any amendment to any Act or order referred to in paragraph (a) or (b). (Sec. 52(2))

There are some thirty documents covered under (b). Note, however, the use of the term "include": According to the conventions of Canadian statutory interpretation, the enumeration is thereby non-exhaustive. What else might be "included"? The Supreme Court of Canada has already ruled (*New Brunswick Broadcasting Co v Nova Scotia* [1993] 1 SCR 319) that the unwritten doctrine of parliamentary privilege, which includes immunity from legal proceedings for things said in parliament and (at issue in the case cited) the power to exclude "strangers" (here, a television broadcasting company), is "included" in the Constitution of Canada. It is not clear whether any further written documents are "included," although, as Peter Hogg points out (Hogg 2002, 1–8), some very important, arguably constitutional, documents are not in the specified list, including the Letters Patent of 1947 constituting the office of

Governor General (R.S.C. 1985, Appendix II, no. 31) and the Act establishing the Supreme Court of Canada (Supreme Court Act, R.S.C. 1985, c. S-26).

The champion of parliamentary sovereignty, the great British legal theorist A.V. Dicey, identified three characteristics of parliamentary sovereignty:

> first, the power of the legislature to alter any law, fundamental or otherwise, as freely and in the same manner as other laws; secondly, the absence of any legal distinction between constitutional and other laws; thirdly, the non-existence of any judicial or other authority having the right to nullify as Act of Parliament, or to treat it as void or unconstitutional. (Dicey 1959, 91)

Dicey, borrowing terminology from James Bryce (Bryce 1901, vol. 1, chap. 3), infers from parliamentary sovereignty so construed maximal "flexibility" to the British constitution, as opposed to the "rigidity" of constitutions lacking these three features (ibid.). Stripped of their prejudicial rhetoric ("flexible" good, "rigid" bad), these terms do define a range on which constitutions can be located.

6.1.3. Constitutional Conventions

In Canada, then, notwithstanding a document labelled "The Constitution Act," the constitution includes far more than that document. Much the same will be true even of a legal system like the U.S. that has one single document labelled "the Constitution." For example, the Constitution requires (Art. I, sec. 7[2]) that legislation be passed in both the Senate and the House of Representatives. However, it frequently happens that the version of a given bill passed in one chamber differs to some degree large or small from the version passed in the other. Then a committee with members from both chambers is struck to iron out the differences so that the same bill can be presented for approval to both chambers. In modern times, this procedure is politically crucial. It is clearly part of the constitution of the U.S., yet it is not mentioned in the Constitution. Similarly, Art. I, sec. 1 roundly declares that "all legislative Powers herein granted shall be vested in a Congress of the United States." It is a reality of the modern regulatory state that in fact administrative agencies promulgate and administer the legal framework for a variety of aspects of life, especially commercial life. According to the letter of the Constitution, such exercise of legislative power by executive agencies is unconstitutional. Yet, "between 1937 and 1999, no federal statute was held unconstitutional by the Supreme Court because of an excessive delegation of legislative power to an executive agency" (Nowak and Rotunda 2000, 178, n.10), and the U.S. Supreme Court has recently again confirmed this approach (*Whitman v American Trucking Associations* 121 S Ct 903 (2001)). Thus a major plank of the structure of the modern U.S. is not stated in the Constitution. One could argue that it is there by interpretation of the Constitution, but it is a strange interpretation that makes a clause say the opposite of what it literally says.

These examples display the crucial distinction between what is colloquially called the "written" and the "unwritten" parts of a constitution. However, as Dicey rightly pointed out, "the true opposition [...] is between laws properly so called, whether written or unwritten, and understandings, or practices, which, though commonly observed, are not laws in any true sense of that word at all" (Dicey 1959, 420). In the same spirit, Mark Walters observes that "it is not the writing of written law that explains its normativity but its enactment by some legislative process; conversely, it is not the lack of writing of unwritten law that explains its normativity but its acknowledgment as law by some process other than enactment by legislative process" (Walters 2001, 95). Turpin notes that a "substantial part" of the U.K. constitution consists of common law rules, including the administrative law rules of *nemo judex in causa sua* and *audi alteram partem*, part of so-called natural justice (Turpin 1995, 80). Consider again the example of parliamentary privilege and the *New Brunswick Broadcasting* case. Parliamentary privilege is "unwritten," but was acknowledged by the Supreme Court of Canada to have legal force. Likewise, in the U.S. the legal force of the regulations promulgated by administrative agencies is not disputed.

On the other hand, it is a feature of parliamentary or quasi-parliamentary bodies in the common law world (down as far even as the governing Board of the school my children attend) to conduct business by Robert's Rules of Order. A breach of Robert's Rules, however, would carry no legal consequence; it would be regarded as a breach of a "maxim" or "precept" of "constitutional or political ethics" (Dicey 1959, 417). These understandings that are not law Dicey refers to as "conventions" (Dicey 1959, 418ff.), and the term is now widespread. Conventions have been usefully distinguished by Hogg from mere "usages" (Hogg 2002, 1–21); Turpin makes essentially the same distinction, but more awkwardly, between "higher-level" and "lower-level" "usages" (Turpin 1995, 87ff.). Conventions, Hogg suggests, are regarded as obligatory by the officials to whom they apply; a usage is a governmental practice that is ordinarily followed but not regarded as obligatory. He gives the example of the elevation to Chief Justice of Canada of the senior puisne judge of the Supreme Court of Canada; it is ordinarily done, but there have been exceptions. Hogg thinks, though, that from the point of view of constitutional *law* this distinction does not matter, since neither conventions nor usages are legally enforceable, in his view.

It follows that constitutional conventions cannot be sources of law in the sense of "source of law" at issue in this volume, since the transition from the convention to action is mediated by politics or ethics, not by law (Marshall 1984, 13ff.).[5] Consider again the patriation of the Canadian constitution in

[5] Constitutional conventions clearly can be "sources of law" in the historical or sociological sense alluded to above. Indeed, they are an important case of such "sources."

1982. The net effect of the proposed new constitution, especially the Canadian Charter of Rights and Freedoms in its application to provincial legislation, would have been to reduce the sovereign power of those legislatures. Nonetheless, the federal government appeared intent on going ahead with the patriation process without seeking the provinces' consent to the new constitution. The provinces challenged the federal government's power to do this. The Supreme Court was asked to rule both on whether there was a legal requirement under Canadian law for provincial consent, and whether there was a constitutional convention requiring provincial consent. The Court ruled (*Re Resolution to Amend the Constitution* [1981] 1 SCR 753: the *Patriation Reference* case) there was no *legal* requirement for provincial consent, but that there was a constitutional convention that "a substantial degree" (ibid., 905) of such consent be sought. They based this conclusion on the historical fact of provincial consent being sought in several other situations in the past when federal legislation affecting provincial powers was being proposed. Despite the Court clearly stating, however, that the convention was not a legal requirement, nonetheless, as Hogg points out, "as a matter of practical politics, the decision made it impossible for the federal government to proceed with its constitutional proposals without a 'substantial degree' of provincial consent" (Hogg 2002, 1–19), and indeed such consent was obtained. Hogg goes on to complain (ibid., 1–20) that, since the averred convention was just that, a convention with no legal force, the Court ought not to have ruled on whether such a convention existed and to have confined its rulings to matters of law. Marshall (1984, 17) by contrast thinks that a court decision recognizing a convention may be appropriately accepted as decisively settling a *political* (my emphasis) argument about the existence of a convention. This disagreement is a delicate question of the separation of powers in a democratic polity, and will not be settled here. The point is the political character of the decision by a government to act in accord with a constitutional convention; the government is not in law required so to act.

6.1.4. Prima Facie *Grounds for Constitutions as Sources of Law*

There are two kinds of consideration that seem to initial intuition to count in favour of constitutions as sources of law. One is a range of factors I shall call "institutional design"; the other is the factor of supremacy.

Institutional Design: Transnationally, constitutions are heterogeneous. It would be foolhardy to claim that everywhere and in every way constitutions function as independent sources of law. However, certain institutional arrangements favour the independent source thesis more than others.

Special Convention*:* It would seem to count strongly against a constitutional document as an independent source of law if in fact, like the Canadian or New Zealand Bills of Rights, the document is simply a bill passed in the

legislature like any other legislative enactment, with no more and no less legal status than any other such enactment. It would seem, on the other hand, to count for a constitutional document as an independent source of law if the document is approved, not in the legislature, but at some special constitutional convention, or by some special process of ratification, especially if such a convention or process involves wider social groups than members of the legislature or other political elites. I do not mean merely a referendum, for example, on a particular proposal that, if it passed, would give normative democratic legitimacy to what might otherwise be perceived simply as action taken by political elites. I mean the case where the approval of the convention, or success in the ratification vote, is essential to the subsequent legal status of the constitutional document.

Special Court: A distinction may be drawn between "centralized" and "decentralized" systems of judicial review under a constitution. A system is centralized "where a single court has the power to test the validity of legislative instruments" (Mtshaulana and Thomas 1996, 106). A system of judicial review is "decentralized," where it falls to any court to review the constitutional validity of legislation, subject to any constraints of a hierarchical jurisdiction. South Africa and Germany are "centralized" systems; the U.S. and Canada are not. It will also make a stronger case for a constitution as an independent source of law if judicial review is carried out by a court specially designated for that purpose, if judicial review is in that sense centralized. Although one might acknowledge that judicial deliberation is judicial deliberation wherever it is conducted, it is easier to differentiate deliberation to do with an independent source if the deliberative tribunal itself is differentiated.

The fact is, however, that the majority of legal systems have neither constitutions that in the present are the product of referenda, nor centralized systems of review, although entrenchment is common. It would substantially, and even fatally, weaken the argument of the chapter if the case for constitutions as sources of law had to rely on such locally restricted factors.

Supremacy: Sec. 52(1) of Canada's Constitution Act 1982 roundly declares: "The Constitution of Canada is the supreme law of Canada, and any law that is inconsistent with the provisions of the Constitution is, to the extent of the inconsistency, of no force or effect."

As Dicey's comment on the flexibility of the British constitution indicates, the provisions of a constitution need not be "supreme law," in the sense of being legally superior to legislation or rules of precedent. Legislation which is part of the U.K. constitution—the House of Commons Disqualification Act 1975, for example—is just that, a piece of legislation, not legally distinct from any other law. In the case of that Act, legislation is the relevant source. It may be urged against Dicey that aspects of the U.K. constitution are *de facto* entrenched and inflexible. Parliament will not change the defining characteristics of a parliamentary system of government, for instance. Dicey's response, I

suspect, would be to reiterate that Parliament has the legal power to effect even such a radical change as that. Whatever forces compel Parliament not to exercise this power are matters of politics, not of law. A supreme constitution, then, on the face of it, can be an independent source of law, independent of, because it is supreme over legislation and rules of precedent. If legislation can be invalidated through inconsistency with the constitution, then intuitively it would seem that the constitution must be in its own right a source of law.

The law designated as "supreme" can of course contain provisions that derogate from its supremacy. In Canada, for example, section 1 of the Canadian Charter of Rights and Freedoms states explicitly that it "guarantees the rights and freedoms set out in it subject only to such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society." The Supreme Court of Canada operationalized the "reasonable limit" test in the case of *R v Oakes*.[6] More cases litigated under the Charter are decided under section 1 than under the remaining substantive sections. It may be said that still the constitution is the source of law in a case decided under section 1, because section 1 is part of the constitution. But the rival candidate to the constitution as a source of law will be the legislation under review. If the standards of review are interpreted too deferentially, it will become difficult to insist on the constitution, rather than the legislation, to be the source of law.

These considerations apply even more forcefully in the case of section 33 of the Charter. This section gives parliaments both federal and provincial the power expressly to declare that a piece of legislation will continue in force notwithstanding a found violation of a Charter right or freedom. This "override" power has been very rarely used (Hogg 2002, chap. 36), which evidences political respect for the Charter. But its presence from the analytic point of view limits the supremacy of the Charter and thus its role as a source of law.

Both courts and commentators now in Canada have become enamoured of the metaphor of "dialogue" to characterize the relation of courts and legislatures under the regime of the Charter. The thought is that in Canada judicial review under the constitution and parliamentary sovereignty are not to be

[6] *R v Oakes* (1986) 26 DLR (4th) 200, 224–8. See also Hogg 2002, chap. 35. The test is as follows:

1) The objective of the limitation must be sufficiently important to warrant overriding a constitutionally protected right or freedom. As a minimum, it must represent a pressing and substantial concern.

2) The means employed must be reasonable and demonstrably justified. The assessment of this takes the form of a three-part test of proportionality: i) The measures employed must be rationally connected to the objective. ii) The measures should impair the freedom no more than is necessary to accomplish the objective. iii) The effects of the impugned limit must not be disproportionate to the importance of legislative objective sought.

thought of as opposites, but as complements. The true character of the Canadian legal system is law as the product of interaction between parliament and court. The metaphor, in the context of a defence of the role of the courts in reviewing and, if appropriate, invalidating legislation, goes back at least to Alexander Bickel, who speaks of a "colloquy" (Bickel 1962, 240) between the Supreme Court and Congress in the U.S.; Bickel's idea received scholarly endorsement even in the early days of the Canadian Charter (Bayefsky 1988, 157–62). The recent boost for the metaphor came from Hogg and Bushell (1997). They drew attention to the number of times that legislation invalidated by the Supreme Court of Canada was soon reintroduced in a form which attempted to respect the Court's concerns while equally pursuing the same legislative objectives. In the authors' belief, insistence on the priority of either constitution or legislation would obscure the constitutional significance of this interaction. The "dialogue" thesis of course has an empirical commitment that events properly called "a dialogue" have actually occurred, and it has been disputed on those grounds (Manfredi and Kelly 1999; Manfredi 2001, 176–81) and reiterated (Hogg and Thornton 1999). I am not concerned with the plausibility of the "dialogue" claim either empirically or normatively, but with its significance, if descriptively accurate, from the point of view of analysis. As long as it is possible for the parties to such a "dialogue" to be each independently sources of law, the derogation considered here need not foreclose the possibility that constitutions may be sources of law. The case, though, still has to, and will be, made.

6.1.5. The Fundamental Challenge

We are now in a position to appreciate the fundamental challenge to the idea of constitutions counting as in themselves an independent source of law. By "independent," I mean "analytically independent," not "doctrinally independent." By "analytically independent," I mean a source of a character that cannot be reduced by analysis to any other form of source. The challenge is essentially this: Notwithstanding what has been said in favour of constitutions as sources of law, constitutions can always be analytically so reduced.

Take again the case of Canada. Acts such as the Constitution Act 1982 and the Alberta Act (1905 (Can.), R.S.C. 1985, Appendix II, No. 21), which created the province of Alberta in 1905, were enacted as parliamentary legislation in the usual way, by the U.K. Parliament and the Canadian federal Parliament respectively. Thus, as far as concerns their status analytically as sources of law, arguably they belong to the genre of legislation. Legislation as a source of law has been discussed in Chapter 2 above; that the statute in question is an element of the constitution of some given legal system does not affect its analytical status as legislation. Likewise, with respect to those "unwritten" constitutional laws that fall into Dicey's category of "law properly so called,"

they can seemingly be regarded as common law rules of an unproblematic kind, operating through the mechanism of precedent. Precedent as a source of law has been discussed in Chapter 3 above. That the common law rule in question is an element of the constitution of some given legal system does not affect its analytical status a rule of precedent.[7] Conventions which are not "law properly so called" will not fall even within the scope of custom as a source of law, since conventions cannot be sources of law. The question may then be fairly raised: If, in considering constitutions as sources of law, we eliminate any element of a constitution which can be correctly parsed analytically as legislation, or as precedent, or as pure ethics, or politics, is there any residue? Only if there were in some plausible way such residue would it be possible to make a case for constitutions as analytically independent sources of law.

That there is, if there is, such a residue would only fulfil the just-stated necessary condition; it remains to be seen whether it is also sufficient. We can turn to Walters for a guide to the requirement of sufficiency. He talks of

> a challenge for judges [...] [of] identifying for the legal system a theory of fundamental law that somehow fits within the matrix of doctrinal, instrumental, and traditional assumptions that together define the character of the legal system; indeed, without this framework in law, the notion of fundamental law is liable to be consumed by its moral-political content, and any claim to its application as legal norm, as opposed to political sentiment, may collapse. (Walters 2001, 93)

Walters distinguishes between "fundamental law" and "foundational law" (ibid.). His notion of the "foundational law" for any given legal system is essentially the same as Hart's "ultimate rule of recognition," of "constitution" in the "thin" sense. Fundamental law, by contrast, is the law that provides the substantive basis for the legal system. In the present context, "fundamental law" will be the sum of all the sources of law for the system. The traditional sources of law possess the requisite kind of legal character. The task here will be to enquire whether the "residue," if "residue" there be, also possesses this character, also fits within the "matrix of doctrinal, instrumental, and traditional assumptions that together define the character of the legal system" so that the "notion of fundamental law" is not "consumed by its moral-political content."

I will now present several examples from recent developments in constitutional law in Australia and Canada. I believe these examples demonstrate ways that constitutions can be sources of law. I do not present these examples

[7] By using the term "rule" here and the term "principle" later, I do not mean to be either prejudging or taking a side in the strenuous debate in recent legal theory as to whether a maxim like *nemo judex in causa sua* is a legal "rule" or a legal "principle." I use "rule" here and "principle" later in a generic, pre-analytic sense. For my own views on the theoretical debate, see Shiner 1992, chaps. 1.6, 2.5, 7. (See, in this Treatise, vol. 11.)

solely in order to provide information about the institutional history of two specific legal systems. I present them in order to demarcate possibilities in analytic jurisprudential space.

6.2. The Supreme Court of Canada and "Reading in"

Mtshaulana and Thomas (1996, 107) distinguish between "preventive" and "repressive" review powers. A constitutional court has "preventive" powers if it can pass on the (in)validity of proposed legislation before it actually passes into law. A constitutional court has "repressive" powers if it can only (in)validate legislation after it has become law. The constitutional courts in France and S. Africa have "preventive" powers in this sense. The courts in Canada and the U.S. do not; their powers as regards constitutionality are simply "repressive."

The "repressive" power of a constitutional court is a blunt instrument. The court deliberates and declares a piece of legislation constitutionally infirm. That's it. Where there was once a law, there is now a legal gap. The gap may, of course, be more or less deep, and more or less consequential. In the famous case in which the Supreme Court of Canada struck down the section of the Canadian Criminal Code criminalizing abortion (*R v Morgentaler* [1988] 1 SCR 30), the "gap" left was filled by an array of existing provincial administrative regulations concerning the provision and funding of abortions, health as such being within provincial jurisdiction. This array is still the controlling legal regulation of abortion within Canada. The situation in the (equally famous, within Canada anyway) decision on the statutes of the province of Manitoba (*Re Manitoba Language Rights* [1985] 1 SCR 721) was different. The Act creating the province of Manitoba (Manitoba Act 1870, 33 Vict., c.3 (Canada)) stipulated that the acts of the Manitoba legislature be published in both English and French, but since 1890 this had very largely not in fact been done. The Supreme Court of Canada had no choice but to rule that all unilingual acts of the legislature were constitutionally invalid—a large and deep gap indeed. Out of respect for the rule of law, the Court suspended the operation of their decision for a year, to give Manitoba time to carry out the necessary translation.

The contrast between these cases shows the way in which a decision on constitutional validity takes place in a context, and the reviewing court must take that context into account. The device of "reading in" allows the Supreme Court of Canada to do that. I will explain. In the relatively early days of the Canadian Charter of Rights and Freedoms, the Court began to follow up on determinations of invalidity by "severing" the section(s) deemed invalid, so that the rest of the legislation would survive. The Court was willing, moreover, not merely to sever sections, but also to sever phrases—to edit, in effect, the language of the legislation, to correct putative failures of parliamentary

draughtsmanship. Once, however, the propriety of such "editing" became accepted as a remedial device for constitutional infirmity, "reading in" appeared to be the next logical step. Constitutional underinclusiveness could be cured in more ways than by excising language.

The case that launched reading in was *Schachter* (*Schachter v The Queen* 93 DLR (4th) 1 (1992)). Canada's unemployment insurance provisions allowed adoptive parents to assign parental benefits between father and mother as they wished after placement of the adopted child, but in the case of natural parents only the mother could claim parental benefits after the birth of a child. Schachter claimed that he as a natural father was discriminated against by these provisions, in violation of the equality guarantees in Section 15 of the Charter. Section 15 names certain specific grounds for discrimination that will result in invalidity, and the wording makes it clear that the list is non-exhaustive. So the Court had no difficulty in finding that unconstitutional discrimination had occurred. However, the issue then became one of a remedy. To strike down the section would then leave everyone without parental benefits, natural and adoptive parents alike. Lamer CJC for the Court noted the difference between a statute that gives a benefit or right to one group and one that gives a benefit or right to everyone except a certain group. It would be, he said, "an arbitrary distinction" to treat the former and the latter differently (ibid., 13). Reading in to compensate for wrong exclusion is therefore as reasonable as severing in the case of wrong inclusion, the latter being a fully accepted form of remedy granted by courts.

Had the Court actually in *Schachter* applied the remedy of reading in, the unemployment insurance regulations would have been deemed to grant equal parental benefits to both natural and adoptive parents. In the event, the federal parliament had already changed the regulations, equalizing them by reducing the level of benefits to both. The Court therefore declined to interfere further by actually granting in that case the remedy of reading in whose legitimacy it had established earlier in the decision. However, the Court did apply this remedy in later cases. In *Miron* (*Miron v Trudel* [1995] 2 SCR 418), the Court read in to Ontario automobile insurance regulations that accident benefits were payable to common-law spouses as well as legally married spouses, the former being unconstitutionally discriminated against by wording in the regulations which limited benefits to legally married spouses. More controversially, in *Vriend* (*Vriend v The Queen in Right of Alberta* 156 DLR (4th) 385), the Court read in sexual orientation as a ground for unconstitutional discrimination into the Alberta Human Rights Act,[8] an ordinary act of the Alberta legislature protecting citizens against discrimination by private parties. Delwin Vriend was a lab instructor at a Christian college in Edmonton; the college fired him as soon as he revealed he was gay. It is quite clear that sexual orien-

[8] Alberta Individual Rights Protection Act (R.S.A. 1980, c.1-2).

tation was consciously omitted by the Alberta legislature from the listed grounds of discrimination in conflict with the Act; Alberta is not known for openness to diversity. The Supreme Court declared the Act to be in conflict with the guarantee of equality in Section 15 of the Charter, and read in the words "sexual orientation" to the list of prohibited grounds for discrimination under the Act.

The *Vriend* case presents reading in as a source of law. Vriend had no legal ground for complaint under the Alberta Human Rights Act about his dismissal as the Act stood the time he was fired. The Alberta Human Rights Commission in fact dismissed his complaint on just those grounds. However, after the Supreme Court decision to read in sexual orientation, he did have legal grounds for complaint. His normative position under the law was changed; he had legal rights he did not previously have. My point here is not the political propriety (or otherwise) of the Supreme Court's adoption of reading in as a remedy for Charter violations. My point is simply the analytic one that adoption of such a remedy produces a new source of law, the constitution. It might be argued that "reading in" is simply a technique of statutory interpretation, and that the source of Vriend's equality right, for example, remains the statute. Such an objection does not account for the fact that Vriend's equality right was actually created by the Supreme Court of Canada decision. The Court was not interpreting the statute: It was changing it—a fact on which both the supporters and the opponents of the decision agreed! At some point in the future, perhaps, when reading in becomes as commonplace and as established as an interpretive canon such as *expressio unius exclusio alterius* ("the mention of one thing is the exclusion of another"), then there may be reason to say that reading in is a technique of statutory construction. As things now stand, I suggest, the practice is best construed as embodying a source of law.

6.3. The High Court of Australia and Implied Rights

Australia's constitution lacks any charter or bill of rights. A few specific rights are guaranteed in different sections; but the protection of the standard individual rights of liberal constitutionalism is left to Parliament and the common law. Nonetheless, in two cases decided at the same time (*Australian Capital Television Pty Ltd v Commonwealth of Australia* 108 ALR 577 (1992); *Nationwide News Pty Ltd v Wills* 108 ALR 681 (1992)), the High Court of Australia deemed that laws limiting political expression were constitutionally invalid in virtue of an implied guarantee of freedom of expression, at least in political matters. The Court pointed to the entrenchment via the Constitution of a system of representative government, and argued further that representative government could not function properly without freedom of political communication. Freedom of political communication could therefore be properly in-

ferred to be a constitutional right in Australia, and therefore legislation that interfered with that right properly invalidated.

These rulings provoked a huge storm of controversy, though it is true that "the scope and implications of the implied rights decisions were much exaggerated by proponents and critics alike" (Galligan 1997, 36). Although Gaudron J suggested that a wide range of rights might be inferable from representative government (*ACTV*, 652), and Toohey J seemed in a conference presentation soon after to dangle the prospect of a judicially-created "bill of rights" (Lee 1993, 614–5), it is quite clear in the opinions as a whole that only freedom of political communication was contemplated. This was confirmed two years later in *Theophanous* (*Theophanous v Herald & Weekly Times Ltd* 68 ALJR 713 (1994)). The right is even more restricted, in that it covers political communication only in relation to the specific structure of representative government embodied in the Australian Constitution, and does so in a negative fashion, creating a space for the exercise of freedom of expression rather than granting positive rights. Nor does the protection of free political expression necessarily apply if the law restricting it has other purposes (*Langer v The Commonwealth* (1996) 186 CLR 302; *Lange v Australian Broadcasting Corporation* (1997) 71 AJLR 818).

Despite the implied right of freedom of political communication being therefore a lot less dramatic than it originally appeared to be, the example is relevant to my analytic purposes here. The implied constitutional right is novel in the following way (cf. Lee 1993, 624–5). Two modes of making law by implication from the Constitution are unproblematic—to imply using established techniques of statutory interpretation, and, in the Australian context, to draw implications based on the federal structure of the Constitution. As Mason CJ put it, such implications "must be logically or practically necessary for the preservation of the integrity of that structure" (*ACTV*, 591). But the mode of implication under analysis is a third one, that certain citizen rights, although not in the language of the Constitution, are presupposed by features of the Constitution, such that those rights may be deployed to assess the validity of legislation. The Constitution then is a source of law in virtue of the features on which the implication is based. The written document as such is not the source of law. The structural constitutional principles of the legal order described in the document are the source.

6.4. The Supreme Court of Canada and Unwritten Constitutional Law

6.4.1. Unwritten Principles as Fundamental Law

The Supreme Court of Canada in three recent cases has spoken approvingly of the constitution of Canada as including "unwritten" principles. In itself, this thought is not controversial or interesting, as it would, for example, cover

the case of constitutional conventions, which I have already acknowledged to be irrelevant to our present concerns. The Court has, however, said of certain unwritten principles that they are part of Canada's "fundamental law" (*New Brunswick Broadcasting*, 384), and that is a more robust claim. As Walters analyzes it, the claim that *lex non scripta* is fundamental law involves three separate propositions.

The first is that there are certain legal norms properly regarded as *unwritten*. The second is the assertion that certain of these unwritten norms are, within the hierarchy of legal norms in a system, *supreme*. The third is the notion that the supremacy of unwritten law is *justiciable*, and that, therefore, judges may declare statutes repugnant to this unwritten law to be void and unenforceable (Walters 2001, 96).

As he points out, it is possible to accept the first of these propositions but not the second and third, or the first and second but not the third. The unproblematic acknowledgment of constitutional conventions amounts to assent to the first. More important is the matter of supremacy and justiciability. If unwritten constitutional principles are not supreme, and if they are not justiciable, then they cannot in any real sense be characterized as sources of law.[9] The three Supreme Court cases are all subtly different, and I will say something about them in turn.

6.4.2. New Brunswick Broadcasting

The *first* case is *New Brunswick Broadcasting*. I have already mentioned that it declares the unwritten principle of parliamentary privilege to be part of the fundamental law of Canada. McLachlin J (as she then was) accepts for the Court (at 374ff.) the argument that the privilege is part of the Canadian constitution, because the preamble to the Constitution Act, 1867 (the Act which founded Canada as an independent state) contains the claim that the then-existing provinces "have expressed their desire to be federally united" with a "Constitution similar in Principle to that of the United Kingdom." As McLachlin J comments, it is thereby implied that legislatures in Canada, including provincial legislatures, have the privileges which the U.K. Constitution acknowledges the Parliament in Westminster to have (at 375). While she warns that such unwritten principles should not be "freely imported" (at 376), she feels that the preamble, together with the restriction of such principles to those necessary for the proper functioning of a legislature, provide grounding for recognition of parliamentary privileges as part of "fundamental law." She also highlights the point already noted above (sec. 6.1.2), that sec. 52(2) of the Constitution Act, 1982 merely says that the Canadian Constitu-

[9] For the possibility of principles supreme but not justiciable, see the discussion of the *Quebec Secession* case below.

tion "includes" named documents, and thus that room is left for it also to "include" unwritten constitutional principles (ibid., 378).

Note that the argument here is not that the preamble is a supremely authoritative justiciable text: The Court had already denied to the preamble any enacting force or any role as a source of law (*Patriation Reference*, 805). The argument is that the preamble is not merely an aid to interpretation, but a sound legal basis for the assertion that, *in Canada*, the unwritten principle of parliamentary privilege is fundamental law. The unwritten principle is a source of law, and its legal status secured.

Note too that the broadcasting company's challenge to their being banned from the Nova Scotia House of Assembly was based in part on constitutional protection for freedom of expression under sec. 2(b) of the Canadian Charter of Rights and Freedoms. Janet Hiebert has characterized courts conducting judicial review under the Charter as "at the apex of an institutional rights hierarchy" (Hiebert 2001, 162). Yet, as James Kelly has argued (Kelly 2001, 340ff.), the Supreme Court has several times used the federal character of Canada as a "gatekeeper" (his expression) to turn aside Charter claims. So the Charter as such is not in itself supreme law in Canada. The novel twist in *New Brunswick Broadcasting* is that the Supreme Court ruled that the scope of the unwritten and "exterior" constitutional principle of parliamentary privilege is wider than the scope of the Charter: Charter rights under certain circumstances are overridden by it. The Court, in short, attributes to the principle of parliamentary privilege both supremacy and justiciability.

6.4.3. *The* Provincial Judges *Case*

The *second case*, the *Provincial Judges* case (*Manitoba Provincial Judges Association v Manitoba (Minister of Justice)* [1997] 3 SCR 3), concerned the status of the principle of judicial independence as applied to provincial court judges. These latter officials adjudicate in the lowest tier of Canadian courts, and are employees of the provincial government. They come nearest in Canada's common law system to the position of civil law judge, "a civil servant who performs important but essentially uncreative functions" (Merryman 1984, 37). However, they are still legal officials who preside over trials and apply the law to the parties before them. In the early 1990s, when cost-cutting was all the fashion, a number of provinces froze, or even rolled back, the salaries of their provincial court judges, and in a variety of other ways worsened their conditions of work. The judges in several provinces, and some defendants who considered themselves negatively affected by these changes, challenged these impositions by provincial governments as incompatible with the necessary independence of the judiciary from the government.

The Supreme Court thought it appropriate to settle all of these cases in one determination. Lamer CJC for the Court noted that, although the cases

raise a range of issues relating to the independence of provincial courts, [they] are united by a single issue: Whether and how the guarantee of judicial independence in sec. 11(*d*) of the *Canadian Charter of Rights and Freedoms* restricts the manner by and the extent to which provincial governments and legislatures can reduce the salaries of provincial court judges. Moreover, [...] they implicate the broader question of whether the constitutional home of judicial independence lies in the express provisions of the *Constitution Acts*, *1867 to 1982*, or exterior to the sections of those documents. (Ibid., 30)

Sec. 11(d) of the Charter grants to persons charged with an offence the right to a trial "by an independent and impartial tribunal," and the other Acts referred to make a variety of separate provisions concerning the appointment and working conditions of judges. However, provincial judges are not named explicitly in the non-Charter material, and the Charter would apply to them by implication only insofar as they adjudicated criminal cases. It would have been an enormous project, and probably not an achievable one, to try to settle each of the separate points raised in terms of simply the written sources. The Court decided that it was time to present a more deep-rooted and rational framework for dealing with the fundamental constitutional issue of judicial independence. The Court saw that, in order to develop such a framework, it had to look elsewhere than the patchwork of existing written provisions, and it did so, to sources "exterior" to those documents.

The Court's argument again relied heavily on the preamble to the Constitution Act, 1867, with its reference to a "Constitution similar in Principle to that of the United Kingdom." The Court saw that such an expression could be taken more broadly than simply an allusion to the doctrine of parliamentary privilege. In his opinion, Lamer CJC memorably (if floridly) referred to the preamble as "the grand entrance hall to the castle of the Constitution" (ibid., 78), through which unwritten principles which could be grounded in the preamble's commitment to parliamentary democracy would pass. They would so pass, because they are "recognized and affirmed" (ibid., 64, 77–8) by the preamble. The preamble "invites the use of those organizing principles to fill out gaps in the express terms of the constitutional scheme. It is the means by which the underlying logic of the [Constitution] Act can be given the force of law" (ibid., 69). The preamble "identifies the organizing principles of the *Constitution Act, 1867*, and invites the courts to turn those principles into the premises of a constitutional argument that culminates in the filling of gaps in the express terms of the constitutional text" (ibid., 75). The principle of judicial independence, of course, meets the standard, and Lamer CJC goes on to lay out a complex scheme for adjudication in which judicial independence is at issue.

Lamer CJC also by implication takes up McLachlin J's challenge in *New Brunswick Broadcasting* that principles that are held to pass through the "grand entrance" of the preamble be not "freely imported." He spends a lot of time (ibid., 70–5)— time which McLachlin J in *New Brunswick Broadcast-*

ing did not spend—in showing how, in ordinary cases of constitutional and statutory interpretation, the kind of principle he has in mind has been deployed. He also acknowledges the force of the fact that judicial independence is embedded in statutory and constitutional materials (ibid., 75–7): His point as regards the matters at issue is that they are not covered by the existing written materials. It is therefore manifest that analytically he is pointing to the unwritten principle of judicial independence as itself the source for the various concrete determinations made in the case as to the challenges brought to the impugned provincial legislation.

It is true that Lamer CJC acknowledges the importance of considerations of legitimacy:

> There are many important reasons for the preference for a written constitution over an unwritten one, not the least of which is the promotion of legal certainty and through it the legitimacy of constitutional judicial review. Given these concerns, which go to the heart of the project of constitutionalism, it is of the utmost importance to articulate what the *source* of those unwritten norms is. (Ibid., 68; my emphasis)

I do not believe, however, that from the appropriateness of his remarks it follows that analytically the true source for the decisions in *Provincial Judges* is legislation and common law precedents. I take this passage to be of a piece with McLachlin J's concerns about "freely imported" principles. The term "source" at the end of the above quote is not being used in the technical sense of "ground of legal validity," but in the more diffuse sense of "ground for purposes of democratic legitimacy." The talk about "the premises of a constitutional argument" implies that the unwritten principles are the source, and I am defending here the correctness of such a view.

6.4.4. The Quebec Secession *Case*

The *third* case is the *Quebec Secession* reference case (*Reference re Secession of Quebec* [1998] 2 SCR 217). The government of the province of Quebec, a political party committed to the goal of a sovereign and independent Quebec, held a referendum in 1995 on whether to proceed to attempt to negotiate the secession of Quebec from Canada, and if negotiations failed, to declare independence anyway. The electorate in Quebec rejected the path of sovereignty by only a very narrow margin. The federal government had been trying to pretend that nothing of interest or importance was happening, but the narrowness of the margin woke them up to political realities. Accepting that the political aspirations of (at least a considerable number of) Quebecers for independence needed to be taken seriously, the federal government referred the matter of the legality of Quebec secession to the Supreme Court of Canada. The Court was asked (essentially: see 228 of the case report for the exact, and more elaborate, wording): (i) Can the government or legislature of Quebec ef-

fect the secession of Quebec from Canada unilaterally under Canadian law? (ii) Can the government or legislature of Quebec effect secession unilaterally under international law? (iii) If Canadian and international law conflict on this point, which prevails? The Court answered in the negative to (i) and (ii), and did therefore not address (iii).

The Court's decision talks again, and often, of the role of unwritten constitutional principles in the determination of issues like the ones before the Court. In view of the unquestionably political, and unquestionably politically charged and contested, character of possible Quebec secession and independence, the Court took great care both to identify certain matters as strictly legal, rather than political, and to emphasize that these matters were within its jurisdiction (at 228–39; see also Walters 1999, 377–9). The Court sought to define, as a matter of constitutional law, the legal framework for the possible secession of a province from the Canadian federation. The Court identified four principles as comprising this framework— federalism, democracy, constitutionalism and the rule of law, and respect for minorities (at 240)—and also spelt out some of the more specific steps that such principles subtended, especially a *legal* duty on the part of Quebec to negotiate secession, rather than declare independence unilaterally, and a *legal* duty on the part of the federal government and the other provinces also to negotiate if the people of Quebec clearly desired to leave Canada.

The Court speaks about these unwritten principles in (by now, in this chapter) familiar terms: "these principles inform and sustain the constitutional text: they are the vital unstated assumptions upon which the text is based" (at 247); they "infuse our Constitution and breathe life into it" (at 248).

> Although these underlying principles are not explicitly made part of the Constitution by any written provision, other than in some respects by the oblique reference in the preamble to the *Constitution Act, 1867*, it would be impossible to conceive of our constitutional structure without them. The principles dictate major elements of the architecture of the Constitution itself and are as such its lifeblood. (Ibid.)

And so forth. The remarks in this case, however, differ in one important respect from those in the two previous cases. Although the Court stresses that the application of these principles results in legal duties on the federal and provincial governments of Canada, the Court also adds a cautionary element. Having distinguished "the law of the Constitution, which, generally speaking, will be enforced by the courts, and other constitutional rules, such as the conventions of the Constitution, which carry only political sanctions," the Court then comments that "judicial intervention, even in relation to the *law* of the Constitution, is subject to the Court's appreciation of its proper role in the constitutional scheme" (ibid., 270; the Court's emphasis). The Court stands for the place of constitutionalism and the rule of law in the mix of relevant constitutional principles; however, the democratic principle also has a role,

exemplified in the political character of the issues. The Court concludes that, in pursuit of the rule of law, it must develop the proper legal constitutional framework for possible secession, but then defer to the democratic principle:

> The role of the Court in this Reference is limited to the identification of the relevant aspects of the Constitution in their broadest sense. We have interpreted the questions as relating to the constitutional framework within which political decisions may ultimately be made. Within that framework, the workings of the political process are complex and can only be resolved by means of political judgments and evaluations. The Court has no supervisory role over the political aspects of constitutional negotiations. (Ibid., 271).

As Walters points out (Walters 2001, 100), this is tantamount to saying that, with respect to justiciability, some unwritten constitutional principles are fully legal, supreme, and justiciable; others are fully legal and supreme, but not justiciable. The Court, as noted, speaks of the constitutional framework it develops as imposing duties (a "binding status"; ibid., 272), as having "serious legal repercussions" (ibid.) if ignored. The example the Court gives is that the international community may be slow to recognize a new regime that has not seceded within the framework specified (ibid., 272–3).

6.5. Conclusions

The message of the cases discussed above is that constitutions may function as sources of law, in the sense that legal rights and duties may follow from aspects of a constitution, such that their source cannot be reduced to other kinds of sources of law but must be the constitution. Unwritten constitutional principles function as sources of law—such principles are genuinely legal, are supreme, and, in some cases, are justiciable. The principles are unwritten, and so as a source are not reducible to written legislation; nor are they merely rules of precedent. The connection to legal materials that is required for the principles to be genuinely legal principles does not imply that those materials are the true source of law in the decision applying the unwritten principles.

Walters says of the principles in *Quebec Secession* that "although perhaps not common law in the pure sense, these unwritten constitutional rules may be called *common law constitutional* rules" (Walters 1999, 383). He does not explain what he means by "perhaps not common law in the pure sense," but an explanation may be offered. The principles are not "pure" common law principles, since they would not figure in any inventory of such principles. They are not principles with an existing pattern of observance by courts. It may be true to say that they are latent in the institutional history of Canadian constitutional law, but they lie well below the hitherto conscious surface of such law-making and law-applying. The Supreme Court of Canada brings them into consciousness. If terms like "common law" or "customary" are used in a wide sense, such that anything that is not a written enactment is

"common law" or "customary," then the unwritten constitutional principles we have been discussing of course qualify as "common law principles" or "customary principles." However, I have already shown in Chapter 4 above the disutility of such a wide meaning for the purposes of the present analytical project.

Even the idea of "common law constitutional rules" is misleading in the following way. A "common law rule" is one that is in actual use by officials of the system; the administrative law rules mentioned above (sec. 6.1.3) are examples. But, as I have noted, there is an important sense in which the constitutional principles the Supreme Court of Canada deploys in *Quebec Secession* to decide the case are not currently in use; they are the substrate of legal materials currently in use. To that degree, the ruling has a prospective dimension. If important constitutional cases continue to arise in which these principles will be wholly or partly dispositive, their novelty will wear off and they will then become genuinely "common law constitutional rules." Walters' characterization is predictive, rather than currently descriptive. The reduction of these principles to the same kind of source as rules of precedent fails.

How do such principles avoid the notion of fundamental law being "consumed by its moral-political content" (Walters 2001, 93; see sec. 6.1.5 above)? Walters himself suggests that the unwritten principles fall into two classes, "text-emergent" unwritten constitutional norms and "free-standing" unwritten constitutional norms (Walters 2001, 98). With respect, this does not seem to me correct. The idea of "text-emergent" principles Walters draws from the Court's reference to the need for constitutional principles to "emerge from an understanding of the constitutional text itself, the historical context, and previous judicial interpretations of constitutional meaning" (*Quebec Secession*, 240). The idea of "free-standing" comes from the Court's reference to principles deriving from somewhere "exterior" (*Provincial Judges*, 64) to the written texts. However, the literal idea of "text-emergent" principles fits best with the process of implying a right from a specific constitutional document, as conducted by the High Court of Australia in the case of freedom of political expression (see sec. 6.3 above). Stephen Donaghue has argued, even, that the implications drawn by the High Court can be underwritten by applying well-understood rules for valid contextual implications in language (Donaghue 1996). Rather, the distinction the Supreme Court of Canada implicitly draws is between, on the one hand, unwritten constitutional principles to be derived from the U.K. constitutional tradition, in themselves "exterior" to Canadian law and entering Canadian law through the "grand entrance way" of the preamble to the Constitution Act, 1867, and, on the other hand, unwritten constitutional principles to be derived entirely from within the domestic Canadian constitutional tradition—which includes "the constitutional text itself, the historical context, and previous judicial interpretations of constitutional meaning." The terminology of "text-emergent" and "free-standing" obscures

the success of the Court's endeavour to link the supreme and justiciable unwritten constitutional norms it deploys to written law sufficiently closely that it can with a straight face speak of these norms as "legal," and not merely norms of political morality.

The underlying point is the same as that made in Chapter 4 (see 4.4 above) concerning the status of custom. As with custom, it does not follow that the rootedness of unwritten constitutional principles in statutory and precedential materials implies that the validity of the principles is properly said to be "derived" from these materials in the technical sense of subordination by derivation. Obviously, if unwritten constitutional principles are to have legal validity, then they must have some grounding in legal materials. Perhaps also, if the nature of the Canadian polity radically and sufficiently changed, governing bodies would abrogate the principles. In that sense the principles could be said to be at the present time subordinate by the power of abrogation to the legislature. But the fact that the need for such grounding in legal materials is met does not imply that the principles so grounded cannot then function as an independent source of law.

It remains to be seen how closely the constitutional sources I have identified fit the working definition of "strictly institutionalized source of law" being used in this volume. That definition is, recall:

A law, or law-like rule, has a strictly institutionalized source just in case
i) the existence conditions of the law, or law-like rule, are a function of the activities of a legal institution

and
ii) the contextually sufficient justification, or the systemic or local normative force, of the law, or law-like rule, derives entirely from the satisfaction of those existence conditions.

The rooting in legal materials that I have described satisfies the first part of this condition. The second is somewhat less straightforward; the amount of looseness will depend on the account given of the term "entirely" in this context. The Supreme Court of Canada in *Quebec Secession* at one point comments that "our law's claim to legitimacy also rests on an appeal to *moral* values, many of which are imbedded in our constitutional structure" (at 256, my emphasis). In the case of a true "strictly institutionalized source," it may be said, the normative force that is transferred from the source to the norms it endorses is not in any way mediated by the content of the source, but only by its satisfying formal conditions for being a source of that kind. It seems hard to represent unwritten constitutional principles in such a way. The values and principles enshrining them which we have discussed here—freedom of political expression, individual equality, democracy, respect for minorities, and so on—are principles to which the persons whose principles they are have as citizens made a

commitment. The prominence of those principles in the constitutional discourse—domination of the discourse, even—displays that commitment. The commitment itself, though, is not legal, but moral and political. It seems then to follow that this substantive commitment is the true source of law.

In assessing the force of this argument, it is important to grasp the following point. As I have argued at greater length elsewhere (Shiner 1992, 5–9), there is something in the world independently of legal theory that legal theory is the theory of, namely, *law*. Pre-philosophically, or pre-analytically, there are in the world laws, legal rules, legal doctrines, legal institutions, and legal systems. We would not be able to differentiate the entities the legal theorist is concerned to understand from other social institutions and practices unless they possessed certain observable features, nor would the term "law" have empirical reference, unless this were so. The salient features of this familiar social institution may be picked out by a recitation that simply gives them their standard ordinary names. A different level of discourse altogether is that of legal theory itself, which arranges, or orders, those features in a manner that to the theorist seems best to represent the institution of law. It is important to realize that the conflict between theories like legal positivism and natural law theory occurs at this second level, not at the first. Positivism can be represented as saying that an accurate recitation of the formal features of a legal system is all that one needs to do, in order to complete an adequate theoretical account of law. The natural law theorist can be represented as saying that an adequate theoretical account of law cannot be completed without understanding that there is an internal relation between law and the principles of political morality which lie behind it.

T. R. S. Allan has rightly commented that "in matters of constitutional significance, legal doctrine and political principle are inevitably interdependent and intertwined" (Allan 1993, 253). How should this comment be taken? It could be taken as a theoretical claim denying the exclusive right of either positive law or background political morality to be the determining source of law in constitutional matters, but there is little to substantiate such an interpretation. The comment functions best as a pre-analytic, or pre-philosophical, claim about just how it is at the outer limits of constitutional law. So taken, the constitutional cases I have discussed illustrate the force of the claim. The "existence conditions" to which we refer in clauses (i) and (ii) of the working definition of "strictly institutionalized source of law," when the character of constitutional law is at issue, are ones in which "legal doctrine and political principle are inevitably interdependent and intertwined." That is the result of our enquiry into constitutions as sources of law. To try further to differentiate and rank the part played by doctrine or by principle will be to move from pre-analytic description to theoretical contention.

To participate in such contention is not my aim here; my aim is rather to present what the contending parties are contending about.

Chapter 7

SOURCES OF LAW IN THE CIVIL LAW

by Antonino Rotolo [1]

7.1. Introduction. The Theoretical Framework: Basic Concepts on the Sources of Law in Continental Legal Doctrine

Despite the great many works which jurists devote to the sources of law—and which, as Roger Shiner observes in Section 1.1 of this volume, are cast in a legal-dogmatic perspective—recent analytical jurisprudence seems to largely ignore the theoretical relevance of this topic. And, with some exceptions, the same applies to the tradition of civil law. Other questions come to the centre of legal-theoretical investigation: the ontology and nature of law, the theory of normativity, law and morality, law and politics, legal epistemology, legal reasoning, and so on. This does not mean that the sources of law are completely disregarded, but perhaps that legal philosophers tend to treat this question from specific perspectives. To see this, we will take a quick look, by way of example, at three classic contributions to the general theory of sources: those of Hans Kelsen, H. L. A. Hart, and Alf Ross.

At some risk of being too schematic, we can say of the continental doctrine of the sources of law that it seeks to attain at least one of the following ultimate goals (cf. Guastini 1998):

(a) to identify the foundation of the binding nature of law;
(b) to state the criteria for the recognition of what is valid law;
(c) to define the conditions for norms to belong to the legal system and so the grounds for its unity;
(d) to provide formal and substantial criteria for changing legal systems, regulating such changes, and solving normative conflicts.

These aspects exhibit possible mutual connections, depending mainly on the philosophical approach adopted. Points (a) and (b) are closely linked if it is

[1] First of all, I am grateful to Roger Shiner for his methodological advices on how to frame this chapter with regard to the rest of this volume. I would like to thank Giorgio Bongiovanni for his helpful suggestions, especially in regard to Section 7.2. His works on the relation between constitutionalism and legal theory have been of great help to me in sketching out in a brief space the thorny question of the sources of law in contemporary constitutional systems. A note of thanks is also due to Mario Luberto: Much of what is said in Section 7.3 on private autonomy draws inspiration from his recent contributions on the matter. Last but not least, I would like to thank Silvia Vida, Andrea Morrone, Enrico Pattaro, Giovanni Sartor and Filippo Valente for having read an earlier version of this chapter. Of course, the author himself is solely responsible for any opinion or mistake contained in it.

argued that we must look at the effective grounds on which legal systems stand. This is to say that we cannot recognise what is law or arrive at its foundation unless we refer to social practices or to the conventions among officials which the law emerges from; at the same time, we must avoid reference to moral criteria and suchlike (in a broad sense, this can be understood to be the so-called Sources Thesis; Raz 1979). On the other hand, (a) and (b) may provide substantial grounds for the unity of legal systems, as well as determine patterns of change in the law and possible criteria—points (c) and (d)—for preferring certain norms to others. Thus, any sound theory under which the law ought to be entrenched in morality or justice (e.g., natural-law theory) should consider the implicit or explicit ways of choosing between conflicting norms and identifying the basic values that shape the law. Working in the opposite direction, (c) and (d) can also substantiate point (b) at least. Thus, a positivistic account of the law will typically define the notion of legal validity on the basis of criteria internal to the legal system, highlighting the normative procedures set forth within the system for changing the system. And so on.

As has been noted (e.g., in Pattaro 1994; cf. Guastini 1998), the notion of the sources of law is, on the face of it, ambiguous because it assumes what the law is and does not specify the meaning of the term "source." [2] My preliminary remarks accord with this conclusion. It is quite usual for continental legal doctrine to attempt to put some order into this variety of possible perspectives by distinguishing among at least three sources as follows (ibid.; cf. Bobbio 1994):

(1) sources for the validity of law;
(2) sources of lawmaking;
(3) sources for the cognition of law.

The first kind of source is meant to capture all those approaches that address the problem of the validity of legal norms and of the law in general. This view corresponds roughly to points (a) and (b) above. "Sources," or perhaps "source," means in essence "foundations," or "foundation" (which see Rottleuthner, vol. 2 of this Treatise; see, also, Pattaro, vol. 1). The second perspective is concerned with defining the procedures through which lawmaking proceeds. Here, the meaning of "sources" is connected with the types of act and fact that produce legal norms. The third and last approach listed focuses on the types of legal materials (mainly legal texts) resulting from any lawmaking process and through which (i) this process unfolds, and (ii) we can recognise what is valid law. As noted by Guastini (1998; see also Luberto 2001, 135) the distinction between (2) and (3) is of some theoretical use, but is often

[2] But this, for various reasons, is also acknowledged in such classic accounts of the sources of law as Kelsen's and Ross's. Cf. Kelsen 1967, chap. 5, sec. e; Ross 1958, chap. 3.

not so clear in concrete cases. This is because, in some legal positivistic views, for example, all lawmaking procedures need to be regulated or, at least recognised, by positive law—by posited legal norms—such that for any procedure there should exist a corresponding norm that can be "extracted" from a certain legal text. In this specific perspective, this conclusion seems to hold even if we apply to *any* system of statutory law the definition which Shiner provides of "strictly institutionalised sources of law" (see, in this volume, chap. 1), and which is adopted in this chapter: If the focus is made to fall on the systematic meaning of the sources—by referring to such "contextual and sufficient" criteria for the recognition of law as are provided by the legal system—then the distinction between sources for the recognition of law and sources of lawmaking will tend to be fuzzy.[3]

We will return this general distinction shortly. But let us first look at the way it works in three accounts of the sources of law that have now become classic and yet are still influential in continental legal doctrine: Kelsen's, Hart's, and Ross's. Their general theories of law are of course "universally" known, and for a survey of them the reader is referred to Volume 11 of this Treatise. That way we can focus here on those aspects of them that are directly relevant to the topic at hand. Indeed it will be seen presently how these theorists tend to associate the system of sources with the notion of source of validity, despite the fact that they all provide some analytical criteria for describing each legal source.

Hans Kelsen (1967, 221) argues that the "peculiarity of the law is that it regulates its own creation." This is central to Kelsen, who further observes that such regulation "can be done by a norm determining merely the procedure by which another norm is to be created […] [and] also by a norm determining, to a certain extent, the content of the norm to be created" (ibid.). Again,

> The relationship between the norm that regulates the creation of another norm and the norm created in conformity with the former can be metaphorically presented as a relationship of super- and subordination. […] The legal order is […] a *hierarchy of different levels of legal norms*. Its *unity* is brought about by the connection that results from the fact that the *validity* of a norm, created according to another norm, rests on that other norm, whose creation in turn, is determined by a third one. This is a regression that ultimately ends up in the presupposed basic norm. (Ibid., 221–2; italics added)

As noted by Zagrebelsky (1987, chap. 2), among others, if the law is analysed strictly in these terms, then any doctrine of legal sources will be doomed to play only a marginal role in describing the lawmaking process. Thus, it will no

[3] Note that Guastini 1998, in a slightly different perspective, proposes a different distinction, wherein, given points (2) and (3) above, the idea of a "source of validity" gets replaced with the notion of "normative authority," meaning by this the subjects empowered to create legal norms.

longer be so important in this case to establish in which sense legislation as such, for example, is a source. There is no sharp distinction in Kelsen's approach (1967, 233ff.) between the creation and the application of law: A norm is created by virtue of the application of a superior norm. What really matters, on this conception, is that a legal norm, whatever it is, be produced in accord with the hierarchical structure of the legal system. Any act or fact by which a norm gets created is a legal source if that norm is recognised by a valid norm in the system's hierarchy. Without such recognition, this act or fact will still be found to be a legal source on the *presupposition* that it produces objectively binding norms—as sometimes happens when courts apply customary law. Zagrebelsky's criticism is basically correct. But something must be added to it. In national legal systems, constitutions correspond in general to the "highest level of positive law" (ibid., 222). Kelsen, however, famously distinguishes between the "material" and the "formal" constitution. The material constitution consists of all norms that "regulate the creation of general legal norms." It concerns the constitutional matter of "law-making" and is intended in its broadest sense, since it "may be created by custom or by a specific act performed by one or several individuals" (ibid.). The formal constitution is a legal document which in turn can include norms regulating the lawmaking process (legislation), "but also norms concerning other important political subjects [and] regulations according to which the norms contained in this document may be abolished or amended [...] by a special procedure." The sense of these norms of constitutional revision, and perhaps of the formal constitution in general, is then that they "stabilize the norms designated [...] as 'material constitution'" (ibid.). It is *normal* on this perspective that "in the modern legal order" the creation of general legal norms "has the character of legislation," in the sense that the legal order institutes a special legislative organ: "Only in a democratic legislation are regulations required that determine the legislative procedure" (ibid., 225). In a similar vein, formal constitutions may confer a lawmaking power on administrative organs, too, or on the government "in the event of exceptional circumstances" (ibid., 229). Lawmaking, materially intended as the creation of general legal norms, can take specific forms of statutory law, such as ordinary statutes and ordinances. In Kelsen's terms, this is law in its formal sense, where the doctrine of sources does not necessarily get conflated with the notion of legal validity. Zagrebelsky's remark is still correct, however, in the sense that it falls in with Kelsen's following conclusions:

(a) "Legislation and custom are often referred to as the two 'sources' of [national] 'law'"; but
(b) "If international law is considered, then only custom and treaty can be considered to be the 'sources' of this law." On the other hand,
(c) "by 'source of law' may also be meant the [ultimate] reason for the validity of a law, [...] the basic norm of a legal order." But,

(d) if it is considered only the "the positive reason for the validity of a legal norm, [...] the constitution is the source of the general legal norms created by legislation and custom" (ibid., 232–3).

In other words, "according to a positivistic theory of law, the source of law can only be law" (ibid., 233). The conclusion is that the true meaning of the idea of legal sources is closely related with that of legal validity.

The notion of legal validity seems to enter as the key concept also in Hart's approach to the sources of law. Perhaps "it is not incidental that *The Concept of Law* should lack a chapter explicitly devoted the system of sources (a question treated in chapter 6 along with the *rule of recognition*)" (Luberto 2001, 148; my translation). The rule of recognition,[4] it is widely known, consists of a special kind of secondary rule: You can tell one by the fact that

> some feature or features possession of which by a suggested rule is taken as a conclusive affirmative indication that it is a rule of the group to be supported by the social pressure it exerts. (Hart 1994, 94; cf. MacCormick 1981, 22)

The role that this rule plays in establishing what, from the "internal point of view," is valid law ties in with this feature of it, that this rule "must be effectively accepted as a common public [standard] of official behaviour by its officials" (Hart 1994, 113). There is encoded in the rule of recognition the variety of formal conditions characterising the sources of law, such that this rule can, in combination with "rules of change" and "rules of adjudication" (ibid., 95–7), account for the lawmaking process. What on this conception comes to be the system of sources is in principle quite flexible because open to any recognised social practice by which binding law is found. Valid law can be retrieved "wherever such a rule of recognition is accepted," so that

> both private persons and officials are provided with authoritative criteria for identifying primary rules of obligation. The criteria so provided [...] may take any one or more varieties of forms: These include reference to an authoritative text; to legislative enactment; to customary practice; to general declarations of specified persons; or to past judicial decisions in particular cases. (Hart 1994, 100)

Unlike what we have in Kelsen's theory, the hierarchy of legal sources is not exclusively upward moving, dependent on a superiority relation deriving from the mechanism of empowerment (cf. Luberto 2001, 149). The rule of recognition must contain criteria for solving a conflict between two rules, r_1 and r_2;

[4] The theoretical meaning of the rule of recognition is among the most debated questions of Hart's theory of law and cannot be treated here. The definition of its scope, especially in regard to the relation between law and morality, has recently set against each other what have come to be called the inclusive view (cf. Waluchow 1994) and the exclusive view (Raz 1979) of legal positivism.

and the norm that will prevail in this conflict, say r_1, may be recognised as superior to r_2 even if the validity of r_2 does not derive from r_1. As Hart observes, what is decisive here is the distinction between subordination and derivation in accounting for the hierarchy of sources (see, in this volume, chap. 3):

> Yet they [custom and precedent] owe their status of law, precarious as this may be, not to a "tacit" exercise of legislative power but to the acceptance of a rule of recognition which accords them this independent though subordinate place. (Ibid., 101)

This fact shows that the legal status of sources does not depend entirely on our recognition of them through a purely formal criterion in the manner of Kelsen. This conclusion does not, however, entail that the sources of legal validity are only a marginal element in Hart's approach. The trivial reason why this is so is that Hart's idea of validity is simply not that of Kelsen. In fact, Hart finds that

> in the simple operation of identifying a given rule as possessing the required feature of being an item on an authoritative list of rules we have the germ of the idea of legal validity. (Ibid., 95)

In addition,

> the rule of recognition providing the criteria by which the validity of other rules of the system is assessed is in an important sense, which we shall try to clarify, an *ultimate* rule. (Ibid., 105)

To Alf Ross now. There does not seem to be in Ross any linking of the theory of sources to the *ultimate* problem of legal validity. As Gavazzi observes (1965, xii), Ross argued consistently, from the very first time he turned to the sources of law, that his problem should not be confused with that of identifying the social grounds of law, or with that of determining the foundation of its bindingness. What matters is that "the source of law is, *according to a formal definition*, the reason for recognising something as law" (Ross 1929, 292; my translation, italics added).[5] Let us look, for example, at Ross's definition of legislation:

> Statute law is enacted law, that is, it has been created by a resolution made by certain human beings and therefore presupposes norms of competence which indicate the conditions under which this may take place. [...] All enactments by virtue of a competence is known by the common name of legislation. Taken in a broad sense legislation comprises not only the constitution (if written) and Acts of Parliament, but also all kinds of subordinate and autonomic enactments [...]: orders in council, statutory rules and orders, by-laws by local authorities, autonomic corporations, churches, etc. (Ross 1958, 79)

This definition, articulated by specifying the notions of procedural and material competence (ibid., 79ff.), accords with the requirement of a formal ap-

[5] "Rechtsquelle in formaler Definition bedeutet Erkenntnisgrund für etwas als Recht."

proach to sources. Ross, too, acknowledges, in Kelsen's lead, that the mechanism of empowerment—based on the role of competence norms in producing other norms—determines a regression along the normative degrees of the legal system. But, he argues, the way to go about identifying the ultimate norm that grounds the legislative process is not a question internal to the law; it is rather a subject of psychological or sociological investigation (ibid., chap. 3, sec. 16).

So far, so good. On closer analysis, however, it turns out that Ross's approach to sources is not independent from his view of the ultimate problem of legal validity. As is well known, his notion of validity tends to merge with that of effectiveness, insofar as the identification of what is valid law is made to depend, in Ross, on the possibility of predicting that such law will be the actual ground for the future decisions of judges (ibid., chap. 2). In line with his realistic approach, Ross maintains that

> "Sources of law" [...] are understood to mean the aggregate of factors which exercise on the judge's formulation of the rules on which he bases his decision. (Ibid., 77)

In this sense, Ross classifies sources as follows:

> By [the degree of objectification of the various types of source] I mean the degree to which [the sources] present the judge with a ready formulated rule; or conversely, the degree to which they present him only with material which is fashioned into a rule only after an active contribution of labour on his part. Accordingly, the scheme of classification will be:
>
> (a) the completely objectivated type of source: the authoritative formulations (legislation in the widest sense);
> (b) the partly objectivated type of source: custom and precedent; and
> (c) the non-objectivated, "free" type of source: "reason." (Ibid., 78)

This view does not in theory seem too "dangerous." Even if the sources of law are objective (psychological) factors of a kind, still we can articulate them analytically. But this conclusion, compatible with Ross's account of legislation, seems to be jeopardised by what, in line with his idea of validity, he says about precedent and custom:

> One cannot take it for granted that the doctrine of *stare decisis* reflects an actual situation to the effect that Anglo-American judges *feel* themselves bound to a higher degree by precedent than do their Continental colleagues. On the contrary, one might surmise that the Continental judge does not to the same extent as his Anglo-American colleague feel himself responsible for the development of the law, but will be inclined to leave to legislation any attempts at reform [...]. And the result might be that, as against the official ideology, he will *in fact* be less inclined to depart from precedent. (Ibid., 90; italics added)
>
> [The doctrine of custom]—as the doctrine of precedent—is an ideology, whose function it is to conceal the judge's freedom and law-creative activity. (Ibid., 97)

Ross's overall criterion for characterising the system of sources is based on his general view of sources as effective "causes" of the judge's decisions. Whence

the final impression that one gets: If the criterion for identifying the sources of law is based on their influence on the future decisions of judges, then any analytical characterisation of them—any way of determining the systemic or contextually sufficient conditions for their existence—will have only a marginal importance. In fact, any factor that, prima facie, looks legal will be good enough to be considered a source of law. No clear, definitive, or systemic criterion of recognition is provided in general, other than that this criterion must be a part of the "ideology of judges." Again, the ultimate notion of legal validity plays a determinant role in this regard.

These comments on Kelsen, Hart, and Ross—which parallel some of Shiner's preliminary remarks—may perhaps explain why continental legal theory has recently fallen short of providing a comprehensive and analytical account of the sources of law. Of course this falling short cannot be ascribed solely to the influence that leading theorists have exerted on subsequent approaches. There is something else involved. It is often the implicit or explicit claim of systems of civil law that they can establish by themselves what are to count as authoritative sources of law. The Italian civil code, for example, makes a statement to the effect that we are to regard as sources of law (roughly speaking) legislative statutes, regulations and ordinances, and customs.

This explicit enumeration is one way in which our legal system attacks the problem of sources (we will see that something of this kind is true of the constitution as well). In this sense, the system operates in such a way that the sources of law are institutionally authoritative when they are recognised as such within the legal system. On the other hand, it is clear that the bindingness of these explicit classifications of the sources has only a prima facie status (cf. Peczenik, vol. 4 of this Treatise). As has been pointed out (e.g., Guastini 1998), most "legal classifications" of the sources of law are quite often far from being comprehensive.

Given this contingent incompleteness of all (internal) legal classifications of sources, legal interpretation, whatever its normative level, seems to be among the decisive routes through which such classifications can be tested. The ultimate identification of the binding sources of law within continental legal systems requires interpretation, not least because the application of law makes it necessary to check if and why a certain norm is valid law (MacCormick 1978, chap. 3; cf. Wróblewski 1992). More generally, when we look at the sources of lawmaking, the recognition and subsequent systemic categorisation of the law often seems based on the interpretation and application of at least some basic norms that shape the legal system structurally. The alternative to this method is that of setting out criteria of recognition that are, in a way, external to the law. Of course, this question falls outside the scope of this chapter, since it concerns the so-called quasi-institutionalised sources of law and their relation to those sources that in this volume are identified as "strictly institutionalised" (see, in this Treatise, vols. 4 and 5).

As Shiner argues, the point is not to commit ourselves too strongly to any specific philosophical stance with regard to the continental theory of the sources of law. This open-ended approach is in principle very much a possibility since sources can be construed as the sources of lawmaking by which something is recognised prima facie as law or is codified in different ways within the legal system. In Shiner's words, it is a matter of looking "first [...] at how legal systems actually operate with the notion of authoritative source" (this volume, chap. 9), meaning that we will have to explain how sources work within the institution of a legal system.

Proceeding upon this basic assumption, I will block out, in what follows and in the remainder of this chapter, as neutral an account as possible of the notion of sources of law. The analysis will thus be focused on (i) the facts or events that are *typically* recognised as law-productive, and (ii) the systematic relations that hold between norms deriving from such facts or events—see points (c) and (d) above. In this perspective, the conceptual apparatus comes from a comparative approach to continental legal dogmatics (cf. Pegoraro and Rinella 2000, 2ff.). Notice that all the questions taken up here are given a treatment which may be viewed as problematic. A wider philosophical discussion would therefore be in order but would have to be rather involved, so I will confine myself to illustrating some basic concepts that give the "flavour" of the continental approach to the sources of law.

The doctrine of the sources of law is meant generally to describe the kinds of effect that result from creating, changing, or abrogating legal norms, these activities being the so-called sources of lawmaking. More precisely, there seem to result immediately normative provisions from sources that consist in issuing normative acts. The sources that in turn exhibit prima facie the structure of normative facts also provide a basis on which to identify normative types of behaviour (for a general account of this question with reference to customary law, see chap. 4; see also Pizzorusso 1999; Guastini 1998; for an overall perspective, see Pattaro, vol. 1 of this Treatise). The way the system of sources is articulated typically reflects the degree of complexity of the corresponding legal system, and ultimately the social contexts which this system is situated in (for an example of this thesis, see sec. 7.2 below). Even so—despite such dependence on context—we can still set out some basic distinctions with which to identify some kinds of sources.

Thus, when legal systems are not sufficiently stable—and their structure not yet consolidated—the lawmaking process sometimes gets shaped on the basis of rules that do not, strictly speaking, fall within the "legal" scope of the creation of law (cf. Guastini 1998; Modugno 2002). This makes it possible to single out, in distinction to the "legal" sources of law, what are called *extra ordinem* sources. These last are recognised as productive of legal norms on the basis of the effective role they play—especially at the decision-making level—in creating, changing, or abrogating existing legal norms.

A second element peculiar to continental doctrine is the distinction often drawn between act-based and fact-based sources (cf. Guastini 1998; Sorrentino 1997). This dichotomy looks at the qualifying circumstances under which legal norms are created. The main point is to establish whether or not these circumstances are such that lawmaking is the effect of an activity specifically designed to create, change, or abrogate legal norms (an activity that can be viewed as intentional, at least prima facie). This criterion does not of course apply to custom, and in the civil-law tradition it does not officially apply to precedent, either. The systemic meaning of act-based sources, on the other hand, is that they usually regard the effects of such lawmaking as is performed by organs empowered to create legal provisions. Constitutions, ordinary legislative statutes, regulations, and ordinances are all, in this sense, examples of act-based sources of law.

Another key approach by which we can gain an insight into the continental system of the sources of law is that which requires us to specify the "force" of legal norms—points (c) and (d) above. This approach basically connects up with the doctrine of the hierarchy of sources, which comes of use in solving normative conflicts within a legal system and, more generally, in identifying criteria of subordination or derivation among sources (which see chap. 2). A typical way to accomplish this task is by taking the superiority of one source over another to mean that the higher-order norm justifies the legal character of the lower norm and sometimes sets the limits of its normative content. Conversely, the subordinated source is found to be such in the sense that it implements sources superior to it in the hierarchy. As was noted with regard to Kelsen's doctrine, this is a formal characterisation of the notion of hierarchy based on the mechanism of legal empowerment and on the role of the so-called competence norms[6] (for a recent overview, see Spaak 2003).

This characterisation of the hierarchy of sources captures only one aspect of the question, however. As has recently been pointed out (Guastini 1998, 121ff.), there are other criteria of normative hierarchy that can be brought to bear. Thus, the hierarchical relation between two conflicting norms, n_1 and n_2, can be specified on the basis of a "material" criterion according to which n_1, for instance, should prevail by effect of a third norm n_3 that establishes the superiority of n_1 over n_2. Notice that this material superiority will usually find its counterpart in a formal superiority relation, since n_1 and n_2 can in theory be

[6] As observed by Guastini (1994, 213ff.), the rules that regulate the production of rules are classified under the general type "power-conferring rules." However, these last—which ascribe to a subject a normative rule-creating power—must be prima facie distinguished from: procedural rules—regulating the exercise of a certain normative power—, rules of competence—referring to the scope of a normative power—, rules about the content of rules, about the application of rules, and about conflicts of rules. In general, cf. Spaak 1994. On the constitutive character of power-conferring rules, cf. Ruiter 1993, and, in a logico-philosophical perspective, Rotolo 2002.

formally subordinated to n_3 (ibid., 122, 126–7). Looking at national legal systems, the combination of formal and material criteria often makes it possible to draw a distinction among constitutional sources; primary sources, such as standard legislation; and secondary sources, such as administrative regulations, ordinances, and so on (Sorrentino 1997). As we will see in Section 7.2, this distinction will not be so sharp in the event of a constitution that is "flexible." Flexible constitutions can be modified by standard legislation, so there is no decisive distinction here between constitutional and primary sources. This blurring of distinctions seems to be the natural consequence of the general thesis under which a source can be changed only by another source occurring on at least the same normative level, or—as Ross famously argued (1969)—only by a source superior to it in the hierarchy of the legal system.

There may also be criteria of hierarchy like the two that follow (Guastini 1998, chap. 11, sec. 1):

(a) Logical hierarchies. These proceed, in a broad sense, upon a metalinguistic basis to establish the superiority of one norm over another. Thus, a norm in which something is stated to be obligatory will be found logically inferior to the corresponding norm in which a sanction is established for violating the norm that sets the obligation. Similarly, an abrogating norm is superior to the norms abrogated by it. Notice that Guastini also brings into this category hierarchies based on the substantial competence established by different sources of law. Here, normative conflicts are solved on the following basis: Sources are found to sit higher in the hierarchy—in the formal or the material sense—when they fix in advance some substantial constraints upon the lawmaking process, such that other sources, whatever formal status they have relative to one another, are confined to regulating specific legal matters only. We will return briefly to this point in the next section.

(b) Axiological hierarchies. These are based on the substantial and constitutive value assigned to the content of those norms that stand highest in the legal system. This value assessment is mainly a matter of legal interpretation, to be sure, but some cases are structurally encoded in modern legal systems, in the so-called constitutional principles, for example. This too is a point we will return to in the next section.

7.2. Constitution and Legislation

7.2.1. The Historical Background: The Rechsstaat *and the Paradigm of Legislation in Continental Legal Doctrine*

The difference between the systems of common law and civil law is sometimes overemphasised, or perhaps taken for granted. One hears it said quite often that in the civil-law tradition the law is viewed as basically a codified and

statutory system of legal rules, and the sources of law as mainly written. And this perspective, it is widely known, seems to be very far from the idea of the law that has developed in Anglo-American legal culture. The analysis advanced by Roger Shiner in this volume shows that this distinction is still a useful conceptualisation when it comes to accounting for these different traditions and legal families (cf. Vanderlinden 1995; Zweigert and Kötz 1998).

At the same time, some of Shiner's arguments point out how these two kinds of legal system have now acquired a number of points of contact and similarities. As was noted only a moment ago, it is commonplace to say that continental law is based on the codification of the rules, whereas Anglo-American law is not: Codified law has not played in Great Britain or the United States the decisive role it played in continental Europe. In addition, there is quite a difference in the way the judiciary has been structured in the two contexts. Despite this, it is indisputable that both may be traced back to the basic political family of liberalism.[7] An analysis of this common philosophical root falls outside the scope of this chapter. In regard to the doctrine of the sources of law, it suffices to note here that legislation has been playing an increasingly important role in common-law systems (cf. Pegoraro and Rinella 2000, 16ff., 95ff.; but see Waldron 1999b). Not incidentally, as Shiner has pointed out, legislation has been considered a paradigm of the sources of law in the Anglo-American doctrine as well. Just to mention an example, the courts in the common-law judiciary are often required to use and interpret precedents also in the light of legislation (cf. Stein 1984, 92ff.).

So far, so good. But if the actual legal practices in common-law and civil-law countries sometimes seem to overlap, the respective systems of sources of law still diverge in the analysis provided of them by legal doctrine. The reason for this lies of course in the different traditions and diverse histories of legal institutions. In what follows I will provide the reader with a short outline of the historical roots of the idea that legislation is the paradigm of the sources of law in modern continental doctrine, especially as this idea results from 19th-century legal dogmatics. Many important changes have since occurred, but some concepts are still present today, perhaps in different forms, at least in parts of contemporary doctrine and especially in the practice of judges (Zagrebelsky 1992, 38).

A turning point in continental legal thought is the European process of codification and constitutionalisation that began in the late 18th century. It is a thorny enterprise to focus in so short a space on the reasons of this radical change (see Tarello 1976). This is due not only to the complexity of the philosophical and cultural grounds that have contributed to this process, but also on account of two historical facts. First, codification and constitutionalisation

[7] For a discussion of this kind, the reader can refer to the comprehensive analysis provided by the historical volumes of this Treatise.

did not take place in the European countries at the same time. Second, the constitutional codifications did not necessarily run parallel with a systematisation of other areas of law, such as civil and penal law (ibid.).[8] Even so, there is at least a strong conceptual key with which to account for the entire process.

It is indisputable that the 19th-century codes in Europe are strongly rooted in the great traditions of Roman law and *jus commune* (cf. Watson 1981). This is perhaps one of the main aspects that distinguishes the civil-law tradition from the tradition of common law. However, if the codifications may be traced back to these roots, they also made a step forward. The reaction was against the so-called legal particularism, namely, the lack of unity and coherence of the law (Tarello 1976, 28ff.): The system of civil and penal law was plural and fragmented relative to the unity the political authority. The ideals of the certainty and uniqueness of the law may be viewed as the underlying principles of the process of codification. In a nutshell, the paradigm of law was the code, meaning by this

> a book of legal rules organised by matters in a system, in force for [...] the entire state, binding for all subjects to the political authority of the state, issued and published by such an authority to abrogate the previous laws on those matters [...] and with the intent to persist for a long time. (Pegoraro and Rinella 2000, 50, my translation; see Tarello 1976)

This idea of the law seems to be compatible with at least two of the main features that characterise the notion of legal system as maintained by Raz (1979, 150ff.). According to Raz the legal system claims (a) "the authority to regulate every kind of behaviour," and (b) the "authority to regulate the setting up and application of other institutionalized systems by its subject-community" (ibid., 151). As we will see shortly, some remarks have to be made about the first of these general theses, especially as applied, for example, to the historical case of the doctrine of *Rechtsstaat*. But uniqueness and certainty are definitely central to understanding how the doctrine of the sources of law took shape in the 19th-century tradition of civil law. In general terms, this is the perspective that led to consider legislation as the paradigmatic source of law.

As I have alluded to, there are substantial differences with regard to how each country produced its systems of codes and how their respective legal schools viewed this process. French legal doctrine was perhaps the prototypical example of an approach embodying the paradigm of legislation, with its emphasis on the centrality of the democratic deliberative process and of the abstractness and generality of legal rules as the main institutional mechanism with which to protect the basic rights of the citizens. German codifications were not as smooth as in France. The Historical School of Savigny, Puchta,

[8] In France, for example, the emergence of civil and penal codes proceeded in close connection with the process of constitutionalisation. The same is not true, for example, of Austria and Italy.

and Hugo reacted against the French model and the unification of the laws of the *Länder*: Their claim is well known to be that the law should be the "organic" product of the *Volksgeist*, and hence should be customary and "scientific" at the same time (Wieacker 1967). Even so, a tribute to legislative positivism was later paid in Germany as well, though the BGB, for example, was mainly a product of the doctrine of *Pandektenrecht*, with a cautious scepticism towards the ideas of the rationality and abstractness of the law (Pegoraro and Rinella 2000, 52; cf. Sacco 1992).

Coherently with this historical background, the continental process of constitutionalisation unfolded in parallel with, and subsequently to, the development of a peculiar general theory of the state. Such a doctrine provided the conceptual framework within which legislation could play its role as paradigm of law. Again, France and Germany are worthy of special attention in this specific perspective. As is well known, French constitutionalism set the stage for subsequent constitutional experiences across much of continental Europe. The following points fix some of the characterising features of French constitutionalism (cf. Barbera 1998):

(a) Understanding the social body as a whole, the parts of which are made to work together; the whole is raised to its highest power according to the true idea of democracy; sovereignty of the people as represented by the *Assemblée legislative*;
(b) The doctrine of the separation of powers;
(c) The principle of legality "lex facit regem";
(d) Legislation as the prevailing source of law insofar as it produces written laws that are abstract and general; the judge as a mere "bouche de la loi."

This general view was later reframed and worked into the German *Allgemeine Staatslehre* at the end of the 19th century (Barbera 1998, 9–10). According to Gerber, Laband, and Jellinek, the state is nothing but a legal person whose will is expressed through legislation and whose power is limited by its own laws. As Zagrebelsky rightly points out (1992, 24ff.), the idea of *Rechtsstaat* was a reaction against the absolutism of the monarchy, and replaced it with another kind of absolutism: that of the state and of legislation. But if the French "empire of legislation" was strongly grounded on the sovereignty of the social body, the main role of the legislative process in Germany was to reach an equilibrium between the authorities of monarchy and of parliament (Böckenförde 1983). Despite the fact the *Rechtsstat* has been considered an open and formal notion—perhaps compatible with non-liberal perspectives (cf. Schmitt 1935)—it was rooted in a true liberal perspective. According to Zagrebelsky (1992), O. Mayer (1895) notes that the *Rechtsstat* was based on the centrality of legislation, and the statutes were the product of the deliberation of the representative parliament, with a clear emphasis on:

(a) the subordination of the administration to legislative power; (c) the subordination of basic rights to legislation only, and the prohibition incumbent on the administration against interfering with the exercise of such rights; (d) the role of independent judges to apply statutes in settling disputes between citizens and between citizens and the administration. (Zagrebelski 1992, 23; my translation)

At any rate, the French and the German models both embedded a clear subordination to legislation of all other sources of law. To understand this fact it may be helpful to also have a quick look at the corresponding notion of the rule of law in England. As is well known, the rule of law proceeded from a similar idea of limitation of political authority. Parliament was accordingly meant to protect liberties from any arbitrary claims of the monarchy. But the role of legislation in the English system of the sources of law was initially quite different. Parliament was a deliberative organ carrying much political weight, but it also played the role of a kind of supreme court of justice: The function of legislation was in a sense to complete existing law, meaning the common law.[9] This applied in particular to all cases in which the common law was not able to provide a just and satisfactory treatment of concrete cases. The existing law, in turn, was connected with the practice of the judiciary (Zagrebelsky 1992, chap. 2, sec. 2; cf. Kriele 1975; Ten 1993). Thus, although the entire English legal system was inspired by roughly the same core of liberal political values that obtained in continental Europe, it was designed differently with regard to the role of legislation and its relations with the other sources of law.

In continental legal doctrine the principle of legality, on the one hand, and the protection of liberties, on the other, have come together under the umbrella of the indisputable supremacy of legislation. As is known, legislative power was meant to regulate any conflicts between liberties and political authority. What resulted from this primacy—with regard to the structure of legal systems—was the uniqueness and systematic nature of law. It is also worth noticing that written constitutions, unilaterally conceded (*octroyées*) by the monarchies, did not affect this unifying criterion of the legal system since they were basically "flexible"—open to modification by ordinary legislative process.

The supremacy of legislation with regard to the opposition between administration and liberties has been articulated differently in France and in Germany. The French "monistic" model of parliamentarism—the *Assemblée legislative* as the unique organ representative of the nation (cf. Carré de Malberg 1931)—viewed all other political authorities as derivative of the legislative assembly. Any powers of the administration thus came by way of explicit acts of empowerment issued by the parliament. In this sense, the only true source of law was legislation. Things were slightly more complicated in

[9] For example, the parliamentary legislative process was constrained by the principle of due process as well as by the judiciary.

Germany, where, as mentioned, the constitutional order emerged from a compromise between the claims of the monarchy and the protection of the autonomy of citizens. In this perspective, administrative power did not follow directly from legislation but was limited by it (cf. Eichenberger 1982). This may lead one to think that German legal doctrine assumed the supremacy and not the uniqueness of legislation in the system of the sources of law, since legislation was meant to prevail only in the event of conflict with the administration. This is true but is not the whole story. A very influential doctrine by Laband (1911) and Jellinek (1887), among others, maintained that only the *Rechtssatz* is true law. In other words, they argued that the law should consist of rules whose main goal was to regulate the legal relationships between individuals as legal subjects within the legal system. The normative effect of such rules was therefore to create for people rights and corresponding duties, and so to create or modify these subjects' legal capacities. If that is the case, the scope of the law was to protect and regulate through legislation the domain of the private autonomy of citizens. The legal system claimed to regulate, not every kind of behaviour—as Raz maintains in his theory—but only the interpersonal dimension of human actions. To sum up, even in Germany the doctrine of the supremacy of legislation sometimes took the form of a theory in which legislation was understood as the unique "primitive" source of law (cf. Zagrebelsky 1987).

The foregoing account thus lines out briefly the constitutional setting that developed in parallel with the development of continental legal positivism—the philosophical perspective that essentially equates the law with positive law. This is a well-known aspect of the history of legal thought (see the historical volumes of this Treatise). Apart from that, there is a question that still requires at least a short comment. As Shiner acknowledges (see chap. 2), the paradigmatic character of legislation as a source of law can also be found in common-law doctrine. Despite the historical roots of the English concept of the rule of law, this concept, too, came to be associated in the 20th century with the idea of the sovereignty of Parliament (cf. Dicey 1959). But the supremacy of legislation never applied to common-law countries. Thus precedent, for example, though it may be subordinated to legislation, cannot be conceived of as a source of law deriving therefrom. Perhaps this historical fact is nothing but the counterpart of the theoretical conclusion advanced by Shiner in Chapter 2 about the unstable nature of legislation as a paradigm of the sources of law. Shiner is quite right in pointing out that legislation as a "strictly institutionalised source of law" makes sense even without appealing to the "sovereignty of the parliament": There is no necessary and stable conceptual relationship between the two claims. Legislation can be conceived formally by relating it to the idea of "enactment of statutes through a deliberative process." But this thesis has some historical exceptions in civil-law doctrine. As briefly outlined, the law has long been essentially equated with the statutes

enacted by a sovereign parliament, and this has been the theoretical perspective that provided a first liberal solution to the problem of the protection of the basic liberties of the citizens and of the limits of political authority.

7.2.2. The Change of Paradigm: Contemporary Constitutional Democracies

As adumbrated in the previous overview, the 19th-century system of the sources of law would often set up a hierarchical structure as follows (Pegoraro and Rinella 2000, 58): legislation, ordinances and administrative regulations, and custom. The criterion of hierarchy *lex superior derogat inferiori*—legislation prevails over regulations and regulations over custom—was mirrored in this simple makeup of the system of the sources of law.[10]

European legal systems changed radically during the 20th century. It may be useful, by way of an introduction to this change of paradigm, to focus roughly on the new legal status assigned to the basic rights. The *Rechtsstaat* adopted a perspective as follows:

(a) Rights exist insofar as the legislative power recognises and protects them;
(b) Rights are the consequence of the state's self-limitation; all citizens contribute democratically to political will-formation;
(c) The state's sovereignty is grounded on the idea of democracy.

In contrast, constitutional democracies in the 20th century are basically founded on the following statements or assumptions (cf. Zolo 2002):

(a) The people are sovereign;
(b) The fundamental rights are functionally independent of the control of standard legislative processes; accordingly, the protection of these rights is implemented by the constitutional review of legislation;
(c) There must be a dualism and equilibrium between democracy and rights; legislation should be so framed as to deal with public interests in a way that is compatible with, or neutral with regard to, the normative content of the fundamental rights.

With the regard to the system of the sources of law, this new perspective connects up closely with the different legal status acquired by constitutions: These are no longer "flexible" but "rigid." As is well known, the rigidity of the constitution means in essence that (Guastini 1998, 321ff.; Sorrentino 1997, 129ff.; Paladin 1996):

[10] This fact is still present in the Italian civil code (Preliminary Provisions, sec. 1), for example, where the authoritative sources of law are stated to be statutes, regulations, and customs. On this, see Paladin 1996.

(a) The constitution cannot be modified by means of standard legislation;
(b) The validity of statutory laws is subordinated to their conformity to the constitution.

The notion of conformity, as indicated at point (2) above, can be specified in two directions. Conformity means that statutory laws, on the one hand, ought to be issued and enacted in accordance with certain procedures set forth in constitutional (competence) rules, and, on the other hand, that they must exhibit a substantial compatibility with the basic values embedded in the constitution.[11]

Of course, the fact that "formal" (written) constitutions enjoy features (1) and (2) above places them, prima facie, on top of the hierarchy of sources of law. However, as Guastini rightly points out (ibid., 122; cf. Modugno 2002, 5), it is not entirely true that flexible constitutions do not exhibit any kind of superiority over other sources. As was noted earlier, hierarchical superiority can be characterised with respect to different criteria. If we invoke a formal criterion—a (secondary) rule setting forth the lawmaking process, e.g., a power-conferring norm, is superior to a rule issued in accordance with this procedural rule—then, quite obviously, constitutional rules, though included in flexible constitutions, can be superior to legislative statutes. In other words, constitutional rules may be the source (foundation) of validity of other legal rules. This point has a certain analytical interest, but it is marginal if applied to legal systems with rigid constitutions. In general, the formal character of the notion of superiority can play a decisive role only in approaches like that which we have with Kelsen's pure theory of law. It is argued in Section 7.1 that on this approach the system of the sources of law tends to vanish in favour of the idea that the superiority of norms depends on the dynamic aspect of legal systems, i.e., on the mechanism of empowerment that grounds the notion of legal validity. In fact, a legal system with a flexible constitution empowers the parliament to change any legal rule, including constitutional rules.

The change of paradigm in 20th-century Europe was determined by a number of reasons that, of course, are specific to the context of each country. It is outside the scope of this chapter to account for this historical development. But still, two aspects will have to be mentioned very roughly here. The first is World War II. As is well known, the experience of the Nazi and the Fascist regimes and their horrors marked a turning point in European history, forcing countries like Italy and Germany to rethink their own institutional structures. Framing "rigid" constitutions that include a core of basic values and affirm the inviolability of human rights was found to be the "legal answer" with which to ward off the risk of *Gesetzliches Unrecht* (Radbruch 1973; cf. Gozzi 1999,

[11] It can be argued here that the "rigidity" of constitutions is a matter of degree. The limits and procedures of constitutional revision in fact vary with each legal system. Cf. Guastini 1998, 325ff.

119ff.).[12] The second aspect, which can be traced back to the late 19th and early 20th centuries, corresponds to a complex combination of social factors. These may be summarised by focusing on the progressive emergence of a plurality of interests coming from classes and groups other than the middle class, whose interests had hitherto been expressed by the *Rechtsstaat* (cf. Irti 1979). The legal codes revealed their inability to deal with this pluralism of interests: Thus, in the effort to regulate labour and other social matters, legal measures were adopted whose nature was inherently contingent and far from the rational ideals of the abstractness and generality of law (Pegoraro and Rinella 2000, 56ff.).[13] This process has been argued to correspond to new trend towards the "decodification" of continental legal systems (Irti 1979).

This evolution of continental legal systems strongly affects the system of the sources of law. Despite a certain reluctance of legal doctrine to recognise the fragmentation of legislation, and more generally of the system of sources (cf. De Otto 1988), most constitutions during the 20th century make allowance for the needs of pluralism and distinguish accordingly a number of different kinds of statutory law (for a classification, see Guastini 1998). The system of the sources of law is thus enriched by nonstandard laws that cannot be abrogated by the standard legislative process, for example, even if they are not enacted following a standard procedure.[14] For these sources of law—which are often "atypical" since deviate from standard procedures of legislation (cf. Zagrebelsky 1987, 62-66; Modugno 2002)—, but perhaps for the entire system of the sources of law, any clear criterion of hierarchy seems be insufficient. The "segmentation" of statutory law, then, gets regulated by the constitutions by stating—explicitly, or by constitutional interpretation, or again through legislative integrations—criteria of substantial competence, specifying which source ought to be devoted to which matter needing legal treatment (cf. Sorrentino 1997; Paladin 1996). As Modugno has observed (2002, 103ff.), the proliferation of sources, each having its own competences and specific enactment procedures, makes less clear the classical relation of (hierarchical)

[12] It is also well known that this "legal answer" came parallel to a new discussion on the nature and the concept of law and on the law's relations with the idea of justice. An analysis of this question with regard to the role of constitutions is provided by Alexy 1992, among others.

[13] These are the beginnings of the process that would later lead to the continental model of the Welfare State (cf. Zagrebelsky 1992, 45ff.). Notice that in Europe the basic principles of the Welfare State had already been codified in the German constitution of 1919. However, the full realisation of this model would be had after World War II. Cf. Forsthoff 1964.

[14] Not to mention the development and growing importance of regional law. There is one recent reform worth mentioning in this specific perspective, a reform made by a constitutional revision (no. 3 of 18 Oct. 2001) of Title 5 of the Italian Constitution (cf. Rescigno 2003). A subsequent decision of the Italian Constitutional Court on this revision (no. 303/2003) emphasises the importance of the principle of subsidiarity, a principle that would make it possible to reach a flexible allocation of the legislative competences of national, regional, and local bodies (on which see Morrone 2003).

subordination between the so-called primary sources—essentially based on legislative power—and secondary-level sources, such as regulations—which come from other political and legal authorities. It is hard to say that the standard statutory law of the parliaments carries with it a general competence in regard to any legal matter. The competences of standard statutory law are very often defined only indirectly, that is, by way of a residual normative space not assigned to other sources of law (cf. Pegoraro and Reposo 1993; Pegoraro and Rinella 2000).[15] This does not mean that hierarchical criteria do not play any role in settling potential normative conflicts, but simply that such conflicts can be solved by combining different strategies. This scenario therefore consists of various types of conflicts where the principle of hierarchy sometimes applies, sometimes holds for only a certain legal matter, sometimes gets replaced by the criterion of material competence, and less often is neutral with respect to different sources competing to regulate the same matter.

As Zagrebelsky has observed (1992, 47f.), the scenario depicted a moment ago does not illustrate a temporary and merely contingent tendency of the law, but seems to be a structural consequence of the pluralism that is shaping contemporary legal systems. In this sense, the fragmentation of the system of the sources of law is not only a fact of some interest for legal historians, but is of great importance for legal theorists, too. Legal systems in the 20th century sometimes look like clusters of subsystems within which—this perhaps can be viewed as a bizarre consequence—the formal criterion of hierarchy comes again to be the main tool for solving normative conflicts (see Pegoraro and Rinella 2000, 60). The uniqueness of the legal system can no longer be taken for granted by referring to legislation. The supremacy of the constitution is hence the unifying principle to which legal systems tend and from which they come. This holds true in at least two perspectives (Guastini 1998, 312ff.). First, as the supreme source of law, the constitution includes norms on lawmaking and, more generally, power-conferring norms that (a) define constitutively the main organs of the state and (b) regulate and identify the main subordinate sources of law.[16] Second, there are embedded in the constitution basic principles assumed to make up a minimal and untouchable core of common values, rights, and general policies.

Of course none of this is to say that constitutions cannot be changed. Rigid constitutions do admit of revision (contrary to what happens with an entirely unchangeable constitution), even if they do so only in accordance with special

[15] This does not necessarily imply that parliamentary statutes are "residual" in terms of importance. Perhaps, the contrary is true, insofar as the other sources of law are confined to regulating specific legal matters. A notable exception of this indirect way of specifying legislation's competences is the French constitution, where the criterion of competence is applied directly to standard legislation.

[16] As argued in Guastini 1998, however, constitutions only rarely regulate all relevant constitutional matters; this means that they sometimes are lacking in providing a sufficient regulation for all sources that are functionally part of the legal system.

procedures (cf. Guastini 1998; Zagrebelsky 1987). But then, on the other hand, most continental constitutions recognise a core of basic principles. Let us look at Italy. The Italian constitution is not only rigid in the sense that standard legislation cannot change it. Some parts of the constitution cannot be changed even by the special procedures the constitution sets forth for its revision. This holds explicitly, for example, for the political makeup of the state, since article 139 makes it a prohibition to deviate from its republican (and democratic) form. Again, article 2 qualifies some basic rights as "inviolable," even if no explicit reference is made to the legal impossibility of constitutional revisions. Following some decisions pronounced by the Constitutional Court (e.g., no. 18/1982 and no. 1146/1988), Italian doctrine has identified in these rights a "strong core" of constitutional values. In this sense, the constitutional interpretation of the notion of "inviolability" implies a prohibition to effect any kind of revision (cf. Guastini 1998, 345ff.).[17] This second perspective, concerned with the basic values built into constitutions, shows how the change of paradigm in legal systems has been mirrored in the need to rethink as well the concept of law advanced by legal positivism. The contributions in this direction, by Dworkin (1978; 1986) and Alexy (1986; 1992), among others, lay stress on the role of legal principles as "constitutive" factors of legal systems and on the consequent relation between law and morality—and in this they have been found to provide a "neoconstitutionalistic" approach to the law (Bongiovanni 2001).

In summary, the constitutional level gets its supremacy both in unifying the system of sources of law and in providing a substantial foundation for the unity of legal systems. Constitutions seem to be a sort of meta-source of law.[18] But something needs to be added about this characteristic. As Zagrebelsky has noted (1992, 49–50), the supremacy of constitutions cannot be compared to the authority of legislation (better yet, to the sovereignty of the parliament)

[17] As observed in Guastini 1998, the character of these prohibitions is quite different from the "logical" impossibility of revision that applies, for example, to the constitutional revision of norms that regulate constitutional revision itself (cf. Ross 1969), or to constitutional changes that modify the "spirit" of the entire constitution (cf. Zagrebelsky 1987, 100ff.). The second argument, based on the "logical" prohibition that the power of constitutional revision be transformed into the power of framing a new constitution (constituent power), is strictly related to a systematic and "holistic" reading of the constitution, which seems to be a matter of degree. On the other hand, this second argument falls in line with the mentioned decisions of the Italian Constitutional Court on a "strong core" of values. Of course, the theoretical aspects of this question cannot be explored in this chapter.

[18] But, as previously noted, in regard to the former aspect, it must be noticed that constitutions only rarely provide a satisfactory and comprehensive regulation of all other sources of law (cf. Guastini 1998). This applies in particular for the so-called atypical sources (Pegoraro and Rinella 2000, 60ff.). Such regulations are sometimes referred to legislation. This poses the problem of the applicability of these legislative regulations when they regard sources of the same hierarchical level or, a fortiori, when they make more precise the normative content of the constitution. For example, questions like these are solved in Germany by appealing to the role of the Constitutional Court (*Grundgesetze*, art. 93).

in the *Rechtsstaat*. It would misleading to apply a schema that follows a linear top-down approach and simply replaces legislation with the constitution at the apex of the sources of law.[19]

What is the essential meaning assigned to the principle of the supremacy of the constitution, with regard to legislation, for example? Continental constitutional theory has provided a number of different answers to this question. Let me focus on Italy (cf. Bongiovanni 1997). We have here some suggestions that can be extended to other legal systems in continental Europe. It was mentioned earlier that constitutions consist at least of three kinds of legal norms: (a) norms regulating constitutively the organisation of the state and the formal structure of the legal system; (b) norms that recognise and confer fundamental rights, and that identify some basic values which ought to shape the legal system as a whole; and (c) "programmatic" norms that entrust the legislator and the public administration with working out and pursuing social and economic policies (Guastini 1998, 312ff.; cf. Kelsen 1945, 260ff.).[20] This classification of norms applies to the Italian constitution, in force since 1948. Italian legal doctrine has focused its attention on how the legal system, and especially legislation, can implement the programs set out in the constitution. The first leading opinion on this question came from P. Barile (1957; 1958; cf. Bongiovanni 1997, 75ff.). Barile recognised two basic directions through which constitutional programs should be realised. The first concerns the institutional role of the President of the Republic (and of the Constitutional Court), which is that of guaranteeing that the core of stable and permanent goals set out in the constitution be attained to the greatest extent possible. The second concerns majority's democratic exercise of its power to create laws which can implement constitutional programs, albeit only partially and contingently, and which may also be directed at goals not specified in the constitution (this also in virtue of the discretional character in principle assigned to the legislative power). On the other hand, the President and the Constitutional Court are viewed as the "guardians" of the constitution—they have to exercise their control over legislation. This does not only mean that the legislative lawmaking process must be compatible with constitutional goals (in addition to respecting fundamental rights): There can also be said to exist a core

[19] A counterexample of this supposed linearity of hierarchy is confirmed, for instance, by what is remarked in the previous footnote. In general, the hierarchical relation between constitutions and other sources of law is a basic principle stated by the constitutions themselves. However, as argued by Guastini 1998, it is a matter of fact that constitutions rarely provide a complete regulation for all the sources they recognise.

[20] The kinds of norms listed at points (b) and (c) above seem to be roughly in line with Dworkin's 1978 well-known distinction between principles and policies (cf. Bongiovanni 2001). However, this is a theoretical matter that cannot be explored here. See, in this Treatise, vol. 11. See also, Alexy 1986, where legal principles are defined as optimization commands (*Optimierungsgebote*), namely, "norms commanding that something be realised to the highest degree that is actually and legally possible" (Alexy 2000, 295).

of political goals that are "binding" upon all the constitutional organs of state. In other words, there should be a homogeneous line of policies with which to effect the development of the law. This approach is grounded on the theoretical distinction between "formal" and "material" constitution, well known in legal theory thanks to Kelsen's contribution (cf. Kelsen 1967, 221ff.). But Barile is referring here to Mortati's (1940) characterisation of this distinction, where the material constitution is understood to be the social and political order, the underlying foundation of the written (formal) constitution, which confers legal validity on the latter: The legal character of the formal constitution derives from "social forces which express a predominance over other forces and which share a core of interests and political values that hold authoritatively as the basis of the state" (Mortati 1967, 31, my translation; cf. Bongiovanni 1997, 77; Fioravanti 1990). This is the social and theoretical premise that justifies the assumption of the unity and homogeneity of the constitutional system with respect to its implementation through legislation.[21]

The foregoing is a roundabout way of arguing that the ideal of the "monism" of legislation—which is typical of the *Recthsstaat* and can be reframed within a monistic conception of the constitution—can survive only if social pluralism is going to play a limited role in shaping institutional dynamics directly. Only on this perspective can legislation be viewed as the main source of law, subordinate to the constitution and to its power of implementing supreme constitutional goals. This has been one classical reading of the Italian constitution, which in fact has been framed (and interpreted) bringing out the supremacy of legislation (Fioravanti 1995), such that (a) the judiciary is bound by the interpretation of legislative statutory law and (b) the tasks of the Constitutional Court were originally meant to be confined to the pathologies of the legal system (Mezzanotte 1979).

But, as previously noted, this top-down approach is misleading when it comes to understanding contemporary legal systems, for it still proceeds upon the assumption of the unity of the sovereignty of political power. The crisis of this model, along with recent approaches and the new reading given to constitutions in continental law, has had a strong effect on the doctrine of the sources of law. Constitutions are not viewed any longer as basic laws providing a dimension of "super-legality." In some cases, the focus of legal doctrine is on the "deconstruction" of all formal criteria for the hierarchy of sources and on the "deconstitutionalisation" of constitutional matters, in favour of an approach that systematises sources on the basis of their political weight and the "axiological relevance" of their content (Mezzanotte 1991, 51; Bongiovanni 1997, 88).[22]

[21] As noted in this regard (Bongiovanni 1997; Fioravanti 1995), political parties were meant to play a decisive role in the process of the unification of social and political interests.

[22] See Guastini 1998, on the distinction between the "constitution" and "constitutional matter."

Similarly, Zagrebelsky (1987) argues that the criteria of recognition and hierarchy of the sources of law be based on their political weight with regard to the process of integration of the pluralistic forces of contemporary societies. Even those hierarchies based on criteria of the substantial competence of sources are not so decisive as had been previously argued. A number of examples may be adduced here in Italy. I will only mention two cases briefly. The first is that some acts of government—though they are not act-based sources of law in the strict sense—exert all the same a substantial influence on primary sources of law, such as the legislative acts of regional and autonomous organs, whose supremacy is recognised on the basis of a criterion of competence. The second example has to do with the relation between the national legal system and EU law. Article 11 of the Italian constitution—which states, among other things, that international controversies cannot be resolved by recourse to war, and recognises the authority of international authorities and accordingly some limitations to the national sovereignty to ensure peace and justice among the states—has been made exception to by standard legislative acts aimed at implementing what has been established by international treaties. The rationale at work in both cases makes no reference to any criterion of hierarchy (even if a criterion of this kind could be applied to the second example at least), but is rather related to political arguments. But the picture is even more complicated than that. The character of the Constitutional Court's review of legislation is changing. Some of the court's recent decisions are framed, not to set down exclusively legal rules whose application is confined to the specific case at hand, but to advance legal principles as well as criteria for their subsequent application (Bongiovanni 1997, 90ff.; cf., in general, Bin 1992). This looks like a sort of revenge which, by judicial means, the constitution is taking on the discretional power of legislation.

What is, on balance, the upshot of this excursus? A first and obvious answer is that we have to acknowledge the definitive crisis of the monism of constitutions, and more generally of legal systems. The relevant questions are not "Where is the sovereign power?" "What is the supreme source of law?" but rather is "How can we make compatible a plurality of powers (and sources) and reach an equilibrium in the face of the pluralism of values and interests?" (cf. Fioravanti 1995). To put it briefly, continental constitutionalism is edging closer to the American concept of a pluralistic and balanced constitution, taking onboard its classical ideas of a plurality of institutional organs that attain an equilibrium through the mechanism of checks and balances. But it has been observed (Castiglione 1996; Preuss 1995; cf. Bongiovanni 2004, chap. 1), in line with what was previously argued, that this conclusion does not entail a focus only on the "negative limit imposed by constitution" (Castiglione 1996, 417). Constitutions embed enabling as well as disabling rules, the ones limiting political authority, the others opening new dimensions for political action (Holmes 1988). This basic assumption makes it possible to emphasise four

main tasks of contemporary constitutions (Preuss 1995; cf. Bongiovanni 2004, chap. 1): (a) limiting power, (b) authorising constitutional powers by defining dimensions of action (lawmaking process), (c) legitimising the political and the legal order, (d) attaining a social integration of pluralism.[23] These factors do not proceed in parallel but integrate one another to shape the entire legal system. If that is the case, Bongiovanni observes (2004), two dimensions coexist within contemporary constitutional systems: that of democratic (political) decision on which interests should contingently prevail, and that of the control of constitutional jurisdiction, whose starting point is the pluralism of values recognised in the constitution (cf. Gozzi 1999). This, therefore, is the "spirit" of contemporary constitutional democracies. There is search underway for a rational, but not a definitive, equilibrium between two opposing and constitutive aspects of legal systems—namely, the constitution, with its basic values, and legislation—such that democracy gets framed by the constitution as well. Maybe the intricate web of the sources of law sketched here is nothing but the natural consequence of this tension. The system of the sources of law looks metaphorically like one of the battlefields in which constitutional values confront the current plurality of interests. The weight of each source is now measured by substantial and political criteria, and perhaps even by axiological ones. The end of the story seems to be that the project of formally defining general hierarchies by which to rank the sources of law cannot succeed, at least if we take for granted the unity of the legal system.

7.3. Other Sources of Law

7.3.1. Some Notes on Private Autonomy and Precedent

As was briefly shown in Section 7.1, Kelsen's stance on the theory of the sources of law is quite peculiar. His basic assumption is that there is no clear difference between creating and applying law. In this sense, each law-applying act is also creative of law, in a development that proceeds from the apex of the legal system to its lowest level. It was previously noted how Kelsen's pure theory of law, because of this peculiarity of it, cannot really give us a significant account of the system of the sources of law. Still, a discussion of the approach gives us a chance to focus on important questions that go beyond Kelsen. In particular, his theory enables us to have a different take on some elements of legal dynamics that in continental legal doctrine are often not recognised as legal sources: We can conceive of these elements as ways through which the law shapes itself in the lawmaking process. Two examples, it is well known, are legal transactions and judicial decisions: Both are argued to pro-

[23] For a nicely crafted account of this fourth aspect, in relation to the nature of legislation, see Habermas 2003.

duce, in the law, individual norms conceptually distinct from the general and abstract norms that usually pertain to legislation and custom (Kelsen 1967, 233ff., 253ff.).

7.3.1.1. Private Autonomy

Let us consider the first of the two elements mentioned: legal transactions. The concept of a legal transaction (*Rechtsgeschäft*) comes to us by way of the 19th-century German doctrine of civil law, which makes it correspond to the notion of a "declaration of will" (*Willenserklärung*) roughly as follows: The law recognises the legal effects of specific capacities that are properly qualified as belonging to the sphere of "private autonomy" (cf. Windscheid 1900; Zitelmann 1879; Manigk 1907). This notion of a (declarative) power provides a general facility through which autonomous individuals can shape their own normative environment. If individuals are to be autonomous, they must go beyond the possibility of activating institutional connections between predetermined actions and predetermined results: They must be empowered to state what normative relations they want between them, and to produce these effects by virtue of this statement. The way to do this is by a declaration of will: The interested subjects state in an appropriate form the results they want to have, and the institution within which they are operating makes it so that exactly those results are had (usually on the assumption that certain conditions are met) (cf. Zweigert and Kötz 1998). Such an empowerment of individuals answers as well the needs of a complex self-organising society, where it is not possible to establish in advance all the normative relations that are to obtain between agents. In a society of this kind it must be left to agents themselves to decide what normative relations are appropriate to their needs or are required for the fulfilment of their tasks. As has been pointed out—notably, by Galgano (cf. Galgano 1999, chap. 2)—the notion of a legal transaction is in general quite debatable: It is a theoretical construction of 19th-century German legal dogmatics that finds no close counterpart in most present-day continental legal systems, since its aim was originally to unify within a single legal category different acts, such as contracts, wills, and marriage. Our focus will therefore be on the most typical of the forms by which the self-regulation of private autonomy occurs, that is, by contract. A contract is, roughly speaking, declarative act jointly made by two or more parties whose status will change by effect of the declaration they are making (for a comparative analysis, see Zweigert and Kötz 1998). Thus, the Italian civil code, article 1321, describes a contract as an agreement that two or more parties enter to create, regulate, or extinguish an economic jural relation between them. The parties can therefore bring forth new legal positions (creating new duties, powers, or rights); and they can extinguish these positions as well as transfer them from one party to another (as is the case with property rights). Note that the law does not estab-

lish what changes a contract will bring to the parties' legal positions: It is up to the parties themselves to establish such changes, and the law will in principle recognise their will, producing exactly those results which the parties state in their contractual terms. (The law can integrate and modify some of the results, however.) This also explains why single contracts cannot usually be classified as pertaining exclusively to the types of act (such as commissives and commands) typically singled out in theories of institutional acts. A single contract usually establishes at once new duties (for example, an obligation to pay a price), new rights (a right to be paid in the amount agreed upon, or to receive the goods paid for), a transfer of existing rights (to the property of the goods in question), and so forth. In fact, contracts put into focus a new dimension of autonomy—private or contractual autonomy—by which is meant the possibility of bringing into effect the legal effects the parties are seeking to bring into effect, simply by stating those effects. It must be observed in this regard that contracts are similar to legislation (as Kelsen 1992 observes, among others): The legal effects of an act of Parliament legislation are those effects which are stated in the act. We need not refer to a preexistent convention to determine what rules and legal positions an act of Parliament has brought into effect, since it is not any convention that establishes these effects, but the act itself. We need to look at the act's content—at what was declared by Parliament (there may be interpretative conventions, but these connect the words used in the act to certain meanings rather than directly to certain institutional results). This is the reason why Kelsen (ibid., 69ff.) assigns to private autonomy a special role between that of legislation—whose general norms are not suitable for bringing concrete legal relations directly into effect—and judicial decisions, which are conditioned by the violation of the legal norms that derive from a mutual agreement between parties (Luberto 2001, 167; Luberto 2000).

Despite this finding, the role of private autonomy as a source of law is often viewed as problematic in continental doctrine (cf. Luberto 2001, 2000). In truth, Kelsen, too, finds that the norms and normative contents the parties create by entering into legal transactions "are not independent legal norms," since the "ought" deriving from the act "is the subjective meaning of the legal transaction": Its objective meaning is given "if and so far as the legal order bestows this quality upon the fact; and the legal order [mainly legislation and custom] does this by making the establishment of the fact of the legal transaction, together with the behavior that is opposed to the terms of the legal transaction, the condition for a civil sanction" (Kelsen 1967, 256–7). The centrality and independence of legal transactions in lawmaking resulted from the "scientific" construction of the German Historical School and the doctrine of *Pandektensrecht*. In this perspective, the inherent and "natural" normative force of declarations of will ties in closely with the idea that legal categories should be abstracted from the law spontaneously shaped by the *Volksgeist*

(Savigny 1840). This would later find a rejection with the continental codifications and the subsequent state dimension assigned to the system of legal sources (cf. Galgano 1999, chap. 3).

Contemporary dogmatics often tends to be sceptical about private autonomy as a source of law. Much of Italian legal doctrine, for example, assumes that private autonomy is not properly a legal source. At least four reasons have been advanced in this regard (cf. Guastini 1998; Paladin 1996; Zagrebelsky 1987; Betti 1994; Scognamiglio 1969; for a different perspective, cf. Pegoraro and Rinella 2000). Acts of private autonomy are such that

(a) they are confined to producing individual and concrete norms *exclusively*;
(b) they create norms whose legal status consists simply in their autonomy, and whose prima facie bindingness—in contracts, for example—derives from the agreement of the parties; in this sense, they have no heteronomy, meaning by this the characteristic whereby a norm's addressors (or makers) are other than its addressees;
(c) they create norms whose bindingness does not apply *erga omnes*, but is confined *exclusively* to the parties involved in the transaction—legal transactions are a kind of legislation *inter partes*;
(d) the ultimate bindingness of their legal effects is grounded on authorising norms through which such effects are recognised, or else on norms wherein sanctions are set forth in the event of the parties' noncompliance with the terms of a transaction (this feature of acts of private autonomy accords with Kelsen's remark on the subjective and objective meaning of legal transactions).

We cannot explore here the variety of theoretical questions involved in the points just introduced, nor can we survey, even in part, the immense literature on these questions. Therefore, only a few short comments will be made. Arguments (a) through (d) above, closely connected, are basically in accord with the legal-positivistic view of the sources of law. Argument (a) does not generally provide a sufficient basis to argue against private autonomy as a source of law: If a norm *n* is individual and concrete but the act *A* that produces it is not legally derivable—i.e., the (material or formal) bindingness of *n* cannot be derived entirely from other sources as such—then *A* may be considered prima facie a true source of lawmaking. In fact, the assumption that the law must consist only of general and abstract rules is a positivistic thesis that seems to be confuted by at least some recent trends in legislation (see Zagrebelsky 1992), which of course is a source of law. The other arguments are more difficult to confute because, implicitly or explicitly, they regard the problem of the ultimate ground of the bindingness of norms as pertaining to the sphere of private autonomy. Points (b) through (d) seem to assume, perhaps to different

extents, a system of act-based sources whose prototypical model continues to be legislation, in the widest sense of this term. In addition, (b) and (d) proceed on the idea that we can define any formal criteria of hierarchy among sources: We can have a system in which the mechanism of empowerment is still central. One question, I believe, is the innovative character of act-based sources and their discretionary power in determining the content of the norms they produce. We can see this with legislation relative to the constitution: On the one hand, legislation proceeds formally under constitutional meta-rules of lawmaking; on the other, it can hardly be said to be entirely bound by the substantial content of these constitutional rules. The same is true of private autonomy relative to the norms that regulate it, and this feature of private autonomy makes it look like a legal source. Let us go further into this. Zagrebelsky (1987) was seen earlier to view sources as playing a new role in lawmaking in the process of political integration and pluralism. It has been acknowledged that acts of private autonomy, and contracts in particular, represent a typical form of bottom-up integration of social interests (ibid., 16). The way the argument goes, however, the legal sphere of these acts

> does not correspond to "political and legal dimensions" with a general scope (state, regional, local), but it is confined to the sphere of subjects who perform such acts. Therefore, for the act-based sources it is correct to say that there is no "third party" within the [normative] dimension assigned to them, insofar as no individual has the power to invoke her subjective position of non-inclusion or contrast with respect to the rules of these act-based sources. (Ibid., 16–7; my translation)

This being so, the basic aspect to be considered with regard to legal transactions is that they are binding only *inter partes*—which see point (c) above. This is a structural difference between legal transactions and the other act-based sources: Legislation, for example, is *formally* a source that, *as such*, holds *erga omnes*, while a contract is not structurally so. But this does not yet seem reason enough to exclude contractual autonomy from a classification of act-based sources of law, for this last is based on a stipulative definition.[24]

The positions briefly illustrated above are quite debatable. And if we come down to a more empirical level, we will find an exception to the standard view of contractual autonomy in the so-called collective contracts and agreements. This form of contract—typically concerned with labour relations and industrial law, and suitable as a legal tool in the welfare state—results from a collective bargaining that usually involves trade unions and employers' associations.

[24] The legal idea of private autonomy can be accounted for as well, from a very general perspective, in the light of a liberal (Kantian) idea of private autonomy, that is, by taking as foundational to it the basic value of individual choice and the fulfilment of a personal conception of the good, one of the underlying principles of modern constitutionalism. But a discussion on how this principle can affect the legal status of private autonomy falls outside the scope of this chapter.

The general goal of these agreements is ultimately to achieve (a) industrial peace over a given area and period of time and (b) to set up working standards, as for the distribution of work and rewards, as well as to provide guarantees on the stability of employment (cf. Daintith 1979; 1997, chap. 10). In Italy, these contracts often get formally constructed as acts of private autonomy whose bindingness is not *erga omnes* (cf. Luberto 2001, 169). But then, from a wider perspective, collective contracts have been argued to "acquire their general bindingness thanks to suitable norms that regulate lawmaking, or to the effective political weight of trade unions; in this second case, such contracts are to be considered sources *extra ordinem*" (Pegoraro and Rinella 2000, 15; cf. Daintith 1979). Italian legal doctrine has thus recognised this change of paradigm with regard to the legal nature of some forms of contractual autonomy. This is due in part to some decisions pronounced by the Italian Constitutional Court, which, on the basis of articles 36 and 39 of the Italian Constitution, has found that the terms of collective contracts are the main criterion by which to assess the fairness of the salaries paid to employees (cf. Pizzorusso 1977, 557). In this sense, the scope of these contracts goes beyond the bindingness of the parties involved, and takes on a clear *erga omnes* character (Zagrebelsky 1987, 247ff; cf. Paladin 1996).

7.3.1.2. Judicial Decision and Precedent

Kelsen was seen earlier to argue that there is no sharp distinction between creating and applying the law. Now, this argument can be brought to bear on the legal status of judicial decisions as well. In other words, even the judges' decisions—or rather, their provisions—are, in the light of the hierarchical mechanism of empowerment, nothing but individual and concrete norms that belong to the legal system:

> The creation of individual norms by the courts represents a transitional stage of the process that begins with the establishment of the constitution, continues via legislation or custom to the judicial decision, and leads to the execution of the sanction. (Kelsen 1967, 237)

Notice that Kelsen's remark about the objective meaning of the "ought" implied by individual norms applies to judicial decisions as well, since, ultimately, the judiciary is regulated by higher competence norms:

> This means that the *subjective* meaning of the act of such a decision need not yet be accepted definitely as its *objective* meaning. The subjective meaning of the act will become definitely its objective meaning only when the judicial decision has acquired the force of a final judgement: When it cannot be cancelled by a further procedure. (Ibid., 240)

Even so, as for the legal transaction, even judicial decision may be viewed as a lawmaking process, since it is productive of legal norms within the legal system. This idea is widely known to find support in, and run parallel to, the the-

sis by which judicial decisions have a constitutive character, despite the approaches that assume their declarative nature (ibid., 236ff.; cf. Kelsen 1991). In fact, "the court does not merely 'find' [...] the law whose creation had been previously entirely completed"; this is because the court "must decide the question whether the norm to be applied is constitutional," for example; further, given a fact submitted to court's decision, "it only by [the court's] ascertainment that the fact reaches the realm of law; only then does a natural fact become a legal fact" (Kelsen 1967, 237, 239). This Kelsenian tenet is at base epistemological: "Judicial decisions are constitutive because of the decisional, not cognitive, features characterizing judicial reasoning throughout all the differing phases of the judicial activity [...], and because of the decisional, not cognitive, features of the very result judicial activity yields: The norm of the case" (Mazzarese 1999, 256; for a critical discussion of this thesis, see also Bulygin 1995).

So framed, this question reformulates in broader terms the classical question of jurisprudence, Do judges create law? We cannot enter here into a full discussion of this question as such without also discussing the structure of judicial reasoning (which see Sartor, vol. 5 of this Treatise). But Kelsen's approach is still an excellent point to start from when looking to put some order among the variety of meanings assigned to the question whether judicial decisions are sources of law. The following outline is based on Guastini (1998, 100ff.):[25]

(a) Judges create law, and this activity is justified by theoretical considerations on the general structure of judicial reasoning;
(b) Judges create law only in certain circumstances, for example, in presence of gaps in the legal system;
(c) Some judges in the judiciary create law, or they do so only with regard to specific kinds of decisions;
(d) Some judges create law because this activity is recognised within the legal system (by an explicit meta-norm on lawmaking, for example).

Points (i) and (ii) require an investigation into the creative role of judicial interpretation. Point (iv) is surely central in discussing, from a legal-dogmatic perspective, the role of judicial decisions in the system of sources of law. Point (iii) is also relevant (even if this goes beyond the scope of Guastini's treatment of it) insofar the focus is on the basic analysis of continental legal systems and the way they actually work.

I will close this section with a brief note on Kelsen and on the role of judicial decision in continental legal dogmatics. Kelsen is well aware that, even if

[25] The enumeration that follows summarises a classification provided by Guastini. A few cases have been omitted for the sake of simplicity.

judicial decisions produce individual norms, this acknowledgment does not necessarily commit us to viewing such decisions as sources of law, at least not in the standard sense of sources. On this conception, judicial provisions are to be treated classically as binding precedents (for an overview of the concept, see, in this volume, chap. 3). But then Kelsen argues as follows (Kelsen 1967, 250ff.):

(a) "A court [...] may be authorized to create not only an individual norm [...], but a general norm"; "this happens when the judicial decision becomes a so-called precedent";
(b) "the formulation of the general norm may be done by the court that created the precedent; but can also be left to other courts bound by the precedential decision";
(c) at any rate, the similarity of two cases can be established "only on the basis of a general norm that defines the fact by determining its essential elements";
(d) "If the courts have to apply usually customary law, as in the sphere of the Anglo-American law, and if they, besides, have the authority to create precedents, a theory can [...] develop in such an area that all law is court-made law; that no law exists before the judge's decision: that a norm becomes a legal norm only because it is applied by the court";
(e) But the above conclusion is incorrect, since it does not distinguish "between the 'sources' of law that are legally binding and those that are not";
(f) The conclusion is that "a 'source' of law can be 'law' only because it is a peculiarity of the law to regulate its own creation," and so "the judicial decision is the continuation, not the beginning of the law-creating process."

On this reasoning, precedent acquires this peculiar feature, that looks like a decision whose bindingness holds *erga omnes*. But this understanding of precedent leads Kelsen to emphasise the centrality of the top-down process of specification of the legal system (law application as law creation), and hence to focus on the general structure of judicial reasoning.

In standard legal dogmatics, on the other hand, the nature of judicial decisions as legal sources is investigated by focusing primarily, not on the general structure of judicial reasoning, but on the recognised function that judges serve within the legal system.

Systems of civil law are commonly distinguished from systems of common law by noting that civil law has no rule of precedent, in that judicial decisions are not legally binding. This feature of civil law is accounted in large part by pointing out the general prohibition, in civil law, of what are called *arrêts de règlement*, meaning that the acts of the judiciary must focus exclusively on the merits of cases they are called to settle. This requirement is understood to

flow naturally from the doctrine of the separation of powers and is designed to materially subordinate judicial decisions to legislation (Marinelli 2002, 878; cf. David and Jauffret-Spinosi 1992; Merryman 1984). Judicial decisions turn out, in consequence, to be binding only *inter partes*, and not *erga omnes* (cf. Guastini 1998, 474–5).

This claim is well known, and true in principle, and yet precedents are now used widely in continental legal systems, too, with perhaps the exception of France (this volume, sec. 3.1; cf. Summers and Taruffo 1991; Kriele 1988; Sartor 1996; MacCormick and Summers 1997). This thesis is based on a comparative analysis of the practice by which judges justify and motivate their decisions, even if the emphasis falls on the appeal to previous judicial decisions as persuasive precedents (on the general distinction between binding and persuasive precedent, see, in this volume, chap. 3). Even so, precedents are acknowledged to play an *effective* role in lawmaking, a circumstance by which continental legal doctrine is sometimes prompted to revise the classical system of sources, by bringing into it precedent as a source that is "merely effective," *extra ordinem*, or "supplementary" with respect to legislation (Pizzorusso 1977, 534ff.; Taruffo 1999, 248).

This analysis is based on "empirical" considerations, and indeed we do find legal systems in continental Europe that seem to formally recognise some specific uses of binding precedent. German law, for example, provides for the possibility of submitting, to joint or higher courts, cases for which different interpretations of the same law have been adopted by the same or by different courts (cf. Marinelli 2002, 879). Similarly, the Italian legal system prescribes a uniform interpretation of the law, and the task of ensuring such uniformity is conferred upon the Corte di Cassazione, the highest court of appeals in ordinary jurisdiction (art. 65, I c., Ord. Giud.; Gorla 1990; see Guastini 1998, chap. 19). These examples are chiefly concerned with the formal bindingness of precedents in their interpretation by the courts. And I will return to this question presently. A significant example of true binding precedent is to be found in Spain, where the judicial practice of the Supreme Court (*Tribunal Supremo*) may result in true binding precedents if at least two equal decisions are pronounced on a similar matter (Coca Payeras 1980). The bindingness of these decisions pertains to their normative and material content and is unconnected with the task of guaranteeing a formal unity, meaning a uniform interpretation of the positive law.

The conceptions of "sources of law" thus far examined have been taken into account in different criticisms concerned with the qualification of judicial decisions as sources of law. Marinelli (2002, 905ff.), for example, considers the following points. First, many continental legal systems expressly prohibit using judicial decisions as precedents, and we often find it stated in these systems what are to count as binding sources within the system. But—it was previously observed—this prohibition does not prevent judicial decisions from

playing an effective role as precedents in the practices of the courts. And it was also seen how classifications of legal sources often prove to be far from complete. On a second level, the criticism proceeds on the assumption that the use of precedents in continental legal system is mostly persuasive. If it is, one can hardly confer upon judicial decision the status of a legal source. In fact, the appeal to precedents, though frequent, is "legally contingent," and its presupposed bindingness cannot be qualified within the hierarchical system of sources. In particular, persuasive precedents often draw their efficacy from other sources from which they get their normative force (in general, see Larenz 1979). We see this, for example, with precedents designed to secure a uniform interpretation of legislative statutes. Here, the decisions of the Italian Corte di Cassazione cannot be made out to be true precedents, since the function of harmonising the interpretation of legislative statutes suggests that the judges of this supreme court should be subordinate to legislation when it comes to deciding cases on their merits.[26] Marinelli concludes that the practices of looking to precedents generally takes different forms. Thus, we may see "a more or less hidden, or an explicit reference" being made to precedents, or a hint of discussion on them in judicial motivation, or again we may see them become "the entire basis of judicial justification" (ibid., 906). These objections are serious, to be sure, but they are not decisive. Of course, a widespread use of persuasive precedents is, at least prima facie, a contingent practice of legal systems. But the resulting difficulty encountered in placing precedents within the formal hierarchy of continental sources is sometimes overestimated, on the assumption that such insertion cannot be made without a *clear* hierarchy among legal sources. The need for a clear hierarchy (it was argued in Section 7.2) cannot be taken for granted: Sources are identified as well on the basis of their political weight in integrating plural interests, and the effective emergence of new authorities in lawmaking complicates matters in an unexpected way.

But there are other aspects to be considered. One element that seems to make a difference in civil-law versus common-law systems is this: In civil law, previous judicial decisions are rarely invoked by reference to specific leading precedents. The courts will rather often recall a series of judgements generically, since the "precedent takes the form of a *line* or *series* of cited judge-

[26] This question is still widely debated in Italian legal doctrine and cannot be taken up here. One point of discussion is article 101 of the Italian Constitution, where it is stated that the judges ought to be subordinated to legislation only. Reference is made here as well to article 111 of the Constitution, which provides, among the other things, for the possibility of appealing to the Corte di Cassazione in cases where the lower courts should "violate" the law. In this sense, the argument against finding the decisions of the Corte di Cassazione to be true precedent, is also presented as the argument that they are not binding *erga omnes*. See Marinelli 2002; Guastini 1998; Gorla 1990; Galgano 1994 as well as Pizzorusso 1990, and the literature cited there.

ments" (Summers and Taruffo 1991, 489). Here, the force of previous judgments is made to depend directly on the possibility that these judgments should fall within a certain line of judicial interpretation. Such is not necessarily the case at common law, where the precedential value of decisions can in theory rely on single and unique leading precedents (cf. Taruffo 1999, 250–1). This, of course, in not simply a matter of different styles of citing: The difference reflects the fact that the doctrine of *stare decisis* is not generally recognised in continental law. Accordingly, even the force and persuasive function of precedents connects with the degree of agreement among the courts in deciding on certain matters. On the other hand, binding and persuasive precedent gives us patterns of infinite nuances. For example, Sartor (1996) observes that the notion of binding precedent—as contrasted with persuasive precedent—is quite vague. In fact, the bindingness of precedents can be characterised according to different degrees of force. Precedents may be (cf. ibid., sec. 3; cf. Taruffo 1999)

(a) strongly binding: They ought to be applied without exception;
(b) formally binding: They ought to be applied, unless specific exceptions occur;
(c) defeasibly binding: They ought to be applied, unless substantial reasons may occur to argue against their application;
(d) not binding but supportive: They may be applied in arguing that certain cases have to be settled in conformity with past decisions;
(e) merely "illustrative": They provide some heuristic reasons to settle future cases, but such reasons must be balanced with contrary arguments.

The crucial type of precedents is that mentioned at point (c). In this regard, Sartor argues (ibid.), defeasible bindingness in turn can be articulated into a strong or a weak version. In the first case, a precedent ought to be applied unless the balancing of relevant reasons leads to conclude that the precedent is definitely unjust or inadequate. In the second, substantial reasons can make the precedent inapplicable, but such reasons "slightly" prevail over contrary arguments. This second case perhaps corresponds to the threshold beyond which past judicial decisions cannot be considered any more as true precedents. In fact, the bindingness of a precedent is such that the burden of proof is on those who argue to derogate from it. To do so, it is required to motivate this derogation. In this theoretical perspective, it is hard to say that the notion of (defeasibly) binding precedent, at least prima facie, is not adequate to account for some judicial practices in the civil law.[27]

[27] Similarly, the "infinite" number of degrees of force assigned to previous decisions leads also Taruffo (1999, 256ff.) to be sceptical about the sharp distinction between binding and persuasive precedent. The question cannot be simplified by establishing whether judicial

A second question is the retroactive character of precedents, since "the decision is applied immediately to the litigation in the course of which the decision arises, even if the decision is in some sense a new decision" (this volume, sec. 2.5). This retroactivity is taken to be a reason why we should reject precedent as a source of law, since there is integral to the legal tradition of continental Europe the principle that the law (usually, legislation) cannot be retroactive: Violating this principle makes the law more uncertain. Leaving aside all political arguments on the primacy of legal certainty over the flexibility of decisions, I agree with Shiner (ibid.) that this contrast is sometimes overstated: "The legislation is not always free of retroactivity," because it "needs interpretation." But then we should not fail to acknowledge that the question carries some weight in European law. There have been attempts to introduce in continental countries the Anglo-American practice of "prospective overruling," where judges—even if they are convinced that a certain line of precedent is best abandoned—still follow the same line for the sake of legal certainty, and rather declare in *obiter dicto* that it will be changed (Roselli 1999, 282ff.).

To conclude this section, I will say something on the way the role and practice of constitutional courts in civil-law countries affects the system of sources of law. My focus will be exclusively on Italy.[28] The function of the Constitutional Court's review of legislation may lead to judgments in which the court (a) accepts the request for judicial review and acknowledges the constitutional illegitimacy of some legal provisions (*sentenze di accoglimento*) or (b) rejects this request, finding that there is no violation of the constitution (*sentenze di rigetto*) (see Zagrebelsky 1988; Sorrentino 1997; Paladin 1991). The first kind of judgment ultimately determines the invalidity of the legal provisions submitted to the court's review. Some arguments may be developed here to qualify these decisions as sources of law (Pizzorusso 1977). Following Guastini (1998, 496ff.), we can say that *sentenze di accoglimento* are sources in that

(a) they are a sort of "negative legislation": Their effect is basically to "cancel" some legal provisions from the legal system;
(b) they may reinstate the validity of previously abrogated legal provisions;
(c) they are binding *erga omnes*.

decisions are binding, and hence whether they set a precedent. From a wider perspective, binding precedent is opposite to "examples," which do not exhibit any clear normative force, but are based on such factors as relevancy and utility. Examples are not "exemplary": They are not bound by criteria of vertical or horizontal bindingness among the courts, and they may also be used when they do not apply specifically to the matter at hand. In other words, the function of examples is mainly heuristic; they sometimes take the form of justifying reasons. On the different kinds of precedents in civil law, see also Wróblewski 1983.

[28] But similar remarks can be made to apply to other civil-law systems, since the question, as we will see, pertains as well to the general character of the constitutional review of legislation. See Pegoraro and Rinella 2000.

These remarks apply to all kinds of *sentenze di accoglimento*. But some of them, called *sentenze manipolatrici*, exhibit additional features. Indeed, they constitute a sort of positive legislation as well. One type of *sentenza manipolatrice* finds that legal provisions are constitutionally illegitimate when something is missing from them, and then declares positively what this "something" is (by way of a *sentenza additiva*). Other judgements declare the illegitimacy of a legal provision by stating that something in the provision needs to change, and by specifying what this "something" is (these judgements are called *sentenze sostitutive*) (Guastini 1998, 504ff.). In either case the judgement is, prima facie, law-creative. As Guastini observes (ibid.), much of Italian doctrine still does not view these judgements as sources of law, because they do not in theory produce law but are confined to ascertaining the normative content implicit in the constitution. On the other hand, it can be argued that since *sentenze manipolatrici* introduce new norms at the legislative level, and are binding *erga omnes*: They are true act-based sources.

Again, the impression is that it is all-important to investigate the creative character of legal interpretation and the nature of legal reasoning. For example, this is the general perspective adopted by Alexy (1989) and Kriele (1988; cf. Sartor 1996, sec. 6.2). Alexy argues that the foundation of the rule of precedent instantiates the discursive principle of universalisability. The rule of precedent states that similar cases must be dealt with in similar ways (treat like cases alike; unlike cases not alike): If so, the rationality of legal reasoning prescribes that burden of proof is on those who argue to derogate from past decisions. Similar theoretical remarks are developed by Kriele, who also maintains that binding precedents contribute to the certainty and coherence of legal systems. In both approaches, the emphasis is made on the value of the equality of judicial application of law, which is the necessary counterpart of the formal equality before the law. And, of course, this claim is crucial also in the civil-law systems.

7.3.2. Custom

Custom is traditionally viewed as the prototype of fact-based sources of law (cf. Paladin 1996; Sorrentino 1997; Guastini 1998; Modugno 2002; Pegoraro and Rinella 2000; in general, see Kelsen, 1967; Ross 1958; Aarnio 1987; Peczenik 1989). Following Kelsen (1945, 126ff.), legal customs can be said to exhibit some points of contact with private autonomy, since, as has been observed (Guastini 1998, 649; Celano 1995; cf. Pizzorusso 1977), they express a form of autonomous and decentralised lawmaking. In addition customs arise, at least in some cases, and to a certain extent, from the practice of those subjects who are at the same time the addresses of customary rules.

The problem, in very general terms, is to understand which factors are required for a custom to be considered true law. In other words, it is a question

of resting on some kind of basis for the normative (but also the legal) qualification of some social regularities and stabilised patterns of behaviour, since "consistent behavior in accordance with particular implicit rules does not indicate that people should so behave": "The principal issue is that one cannot derive an *ought* from an *is*" (Watson 1984, 561).

Here, a significant part of continental legal doctrine, though with different nuances and interpretations, still tends to adopt the traditional view by which the requirements for custom to be law are *usus* and *opinio juris seu necessitatis* (see, for Italy, Sorrentino 1997; Modugno 2002). As is well known, the historical roots of this view can be traced back to Roman law, in the *Justiniani Institutiones*, for example (I, 2, 9; translated in Watson 1984, 562): "Unwritten law is that which usage has approved. For long-practiced customs, endorsed by the consent of the users, take on the appearance of statute."[29] In this sense, we can distinguish between quantitative (material) and qualitative (psychological) elements in the formation of legal custom. The first requirement is that custom should exhibit the general, uniform, constant, and public reiteration of a certain social practice. The second requirement is the widespread and mutual belief (or conviction) that this practice is legally binding, and such that the effective compliance with this pattern of behaviour is accompanied by the "sense of fulfilling a norm" (Watson 1984, 563; cf. Larenz 1979).[30] I will return shortly on this specific view. For a better understanding of the theory of *opinio juris*, we will focus first on other conceptions of the legal character of custom.

With his usual lucidity, Bobbio (1994) has provided a comprehensive classification of the doctrines of customary law in continental legal tradition. We can distinguish among doctrines that ground customary law on the following

(a) the authority of the subject which such a law comes from;
(b) the qualification of the behaviour of the users, meaning by this the addresses of customary rules, even if it may be argued in general that the group of users includes as well those people who practise this behaviour;
(c) the legal character of the matters regulated by custom;
(d) the effective recognition of custom by judges;
(e) whether customary law is a part of the legal system as a whole.

The first kind of doctrine derives from the Roman tradition and says that custom is legal since it is the product of the people—the ultimate authoritative

[29] "Ex non scripto ius venit, quod usus comprobavit. Nam diuturni mores consensus utentium comprobati legem imitantur."

[30] As is well-known, this view is articulated in Allen 1964 by specifying that custom must be immemorial, reasonable, continuously observed, and, of course, believed obligatory. On this specific analysis, see, in this volume, chap. 4.

source of lawmaking. In this sense, the elements of *usus* and *opinio* must be integrated by also focusing on other aspects of the Roman legal tradition—where custom is defined as "tacit convention among citizens" (*tacit civium conventio*) or a "tacit will of the people" (*tacit voluntas populi*)—in the argument that customary law has the same legal dignity as written law (ibid., 23). This view gets reframed by the German Historical School, for example. Savigny (1840) opposes the view that custom becomes legally binding through voluntary acts by the people: Rather, such binding force comes naturally from the *Volksgeist*, which exists before any individual act accordant with custom. In this sense, the idea of *opinio juris* is closely related with the collective and spiritual dimension of the people. But "the validity of Savigny's view of custom [...] depends on the plausibility of his general theory of law, which current legal philosophers universally reject" (Watson 1984, 566; cf. Friedman 1973).

The second approach is, according to Bobbio (1994, 25ff.) the common meaning assigned the theory of *opinio juris seu necessitatis*. Here, it was mentioned earlier, the legal character of custom depends on the psychological attitude that people take towards a practice, which thus comes to be regarded as legally binding. This way of viewing the question is chiefly meant to confine the scope of custom to recognised and socially desirable practices, and to distinguish them from mere usage. But this theory has been widely criticised on account of its circularity: "On the one hand, it is argued that a legal norm of custom does not exist in absence of *opinio*; on the other, *opinio* presupposes that the legal norm already exists" (ibid., 27; cf. D'Amato 1971). Two solutions are possible on Bobbio's reconstruction. The first is that *opinio* is based on an error, on the false belief that a legal norm exists even if it does not (cf. Kelsen 1945). The second argument reduces the importance of *opinio* as not constitutive of the legal character of custom, but simply as evidence of its legal effectiveness *ex post* (but see Modugno 2002, 142). This general criticism of the doctrine of *opinio juris* has a variant. Watson (1984, 564ff.) argues that the problem of circularity becomes crucial in dealing with the notion of desuetude:

> A principal failing is that *opinio necessitatis* provides no mechanism to incorporate changing customs or to delete law which ceases to mirror common practice. One might try to resolve this inadequacy by postulating that the doctrine of desuetude is inherent in customary law. The doctrine of desuetude states that when a practice [...] ceases to be followed or recognized as law, it ceases to be law. At that stage, but not before, the road becomes clear for the creation of new customary law. Adherence to the new custom before the old customary legal rule becomes obsolete is a factor in making the old rule obsolete. However, under the doctrine of *opinio necessitatis*, overlapping practice does not create a new legal rule because the new practice was not followed in the "the general conviction of law." Thus, at the precise moment of desuetude, there is no law on the point at all. (Ibid., 563–4)

It has been observed that the problem of desuetude cannot be solved by applying the criteria with which to account for the abrogation of act-based sources. The key concept is not the formal validity of custom, but its effective-

ness. It is incorrect, on this view, to argue that a practice gets replaced by another, but, more realistically, that the same practice gradually transforms (cf. Sorrentino 1997, 200). This argument is reasonable and seems to weaken Watson's criticism. On the other hand, the burden of the proof is on those who maintain that desuetude derives from a gradual evolution of customs, since they have to describe analytically how this evolution takes place. At any rate, even if this general approach affects Watson's remark on the problematic nature of desuetude, it obviously does not overcome the circularity of the doctrine of *opinio juris*.

Another option is available in the face of this difficulty (Bobbio 1994, 27ff.): The legal character of custom depends on the specific kind of behaviour to which custom refers, a behaviour materially susceptible of legal regulation. It is crucial, from this perspective, to provide criteria for assessing the legal relevance of social practices. For example, as was seen in Section 7.2.1, we can extend the requirement, identified by 19th-century German legal doctrine with regard to legislation, that the law be focused on the interpersonal dimension of human actions. But this approach is as comprehensive as it is vague. In fact, as Bobbio observes, it does not enable us to understand why certain social rules are *effectively* legally binding, while others are not, despite the fact that the latter may concern the same dimension of human action as the former. It can be argued that the identification of relevant legal matters requires a systematic reading of the legal system as a whole. If we have general principles of positive law saying that some sphere of social action ought to be regulated, we then have a rational criterion by which to understand when a certain social practice may generate customary law. This variant seems acceptable because it goes beyond the generic identification of supreme and "external" goals assigned to the law. But even this view is not sufficiently precise (cf. Bobbio 1994, 29). The crucial point, from this general perspective, is to determine the essential character that turns into customary law *each social rule* that is recognised *ex post* as legal, a requirement that seems to go back to the general criteria previously looked at.

As Bobbio reminds us (ibid.), Alf Ross seems to go with the approach that identifies the specific legal character of certain practices in their susceptibility of legal regulation. Ross maintains that "a legal custom is simply a custom in a sphere of living which is (or which becomes) subject to regulation by law": *Opinio juris*, in particular, will not suffice, because "every custom, even the one which leads me to appear in suitable clothing, is felt as such to be binding" (Ross 1958, 93–4). But this is just one side of Ross's view. In fact, in line with what was said in Section 7.1, what he has in mind when he speaks of a custom becoming law is "that a sphere of living hitherto outside the field of law is subjected through the practice of the courts to regulation by law" (ibid., 93, note 5). The material relevance of a social matter is reflected in the *opinio juris*, which is nothing but the "expectation [...] that legal sanctions

are expected if the matter is brought before the courts" (ibid., 94). This being so, the role of courts is crucial, since it is admissible that, for practices that no one follows for a long time, "custom as source of law [...] leads to situations where the judge is motivated by a changed legal conception in the community" (ibid., 96). The necessary contribution of judicial recognition in recognising legal custom is typical of legal realism, for example (see Pattaro 1994, chap. 9). As is well-known, there are many variants of this approach, but all of them, each to a different extent perhaps, tend to focus on the constitutive function of judges in establishing whether a custom is a legal fact. On the other hand, and for different reasons, some kinds of legal positivism also seem to adopt a similar attitude. Bobbio (1994, 31) mentions Austin's theory of legal custom: On this theory, legal custom is considered in itself a process of law-formation that operates, indirectly, through the direct function judicial decisions. As Shiner points out, however, this mechanism does not tell the whole story, since Austin assumes the customary rules recognised by judges to be "tacit commands of the sovereign legislature" (see, in this volume, sec. 4.4). Watson (1984) likewise emphasises the crucial role of judges. Watson brings sociopsychological factors into the view that customary law, as law, is ultimately made by judicial decision. He, too, believes that *opinio juris* fails to provide sufficient criteria. In fact, "court decisions declare customary law even when (a) custom is uncertain (and there is no *opinio necessitatis*) and (b) there is no custom." On the other hand, and despite this last remark, it is usual to find that that "in societies where decision-makers treat customary behavior as law, there is also an attribution to the people of the power to make law by their tacit behavior," but "this law is created only when decision-makers officially recognize or accept it" (ibid., 571–2).

There is a number of possible criticisms against this view. The first is merely empirical and consists in noting that, in international law, the absence of a central and sometimes universally recognised authority places custom next to treaties as a primary source of law (cf., in this volume, chap. 8). Here, "some arguments have been made in support of emerging practices that conflict with obsolete provisions of public international law" (Parisi 2000, 4; cf. Kontou 1994). A second argument comes from Bobbio (1994, 31–2). He notes that some customary rules emerge from the practice of constitutional organs invested with a legal authority of their own (on this, see below). In addition, if judicial decisions are made out to be a necessary and sufficient condition for declaring a rule to be customary law (or rather for constituting a rule as such), then we won't be able to provide a ground for the obligatoriness of that rule: Judges are not obliged to apply custom for the trivial reason that custom is not a *legal* source. In general, as Peczenik observes,

> It is [...] important not to adopt a terminology which encourages one to ignore the spontaneous norm-creating activity of people. Only weak moral reasons support the conclusion that the

> courts and authorities have monopoly of creation of legally binding norms. […] Much stronger reasons support the contrary conclusion. […] [T]he custom of people may be relatively fixed, perhaps more so than the practice of the authorities. […] [A]n indirect democratic legitimacy of judicial and administrative practice is hardly superior to democratic legitimacy of popular consensus. (Peczenik 1989, 331)

Moreover,

> A more important complication results from the fact that one may regard the very source-norms, determining the legal status of *all* the sources of law, as a kind of custom. Existence of the source-norms involves a complex of human actions or dispositions to act whose description *strongly* supports them. (Ibid.)

This being so, it is self-evident that judges, and other officials with them, trivially serve the *declaratory* function of recognising customary law. Much more demanding is the task of arguing that judges truly create customary law (cf. Zagrebelsky 1987, 269, 280).

On the last of the approaches examined by Bobbio (1994, 33ff.), custom becomes law if it becomes a part of the legal system as a whole. Bobbio's analysis develops as follows. The first assumption is that custom consists of social rules that emerge, as always, from the general, uniform, constant, and public reiteration of certain social practices. There are, then, two main ways through which a rule becomes part of the legal system: "(1) by helping to constitute, or making possible, the function by which certain powers set up a sanctioning mechanism and (2) by providing these powers with criteria with which to settle conflicts of interest between group members (or between them and legal organs)" (ibid., 34; my translation). On this assumption, customary rules become legal when "(1) they contribute directly or indirectly to the formation of organs constitutive of the legal system and (2) they get used by these organs to settle social conflicts of interest" (ibid.; my translation). This approach does not seem to me to be much less vague than the previous ones. But then it does have its merits. As I understand it, its main purpose is to widen as much as possible the range of criteria with which to identify legal customs: In fact, we can adopt a unique and specific conception of customary law since, as Peczenik observes (1989), customary law also serves the function of providing the very source-norms of the system as a whole. Kelsen's view can be made to fall within this general approach, I believe, even if, as is well known, he does not qualify custom as the ultimate ground on which a legal system stands. It was noted in Section 7.1 that the generic activity of lawmaking corresponds to what is regulated by the material constitution, which in turn may have a customary or written form. In this second case, law creation is codified in the so-called formal constitution. Kelsen thus seems to admit the possibility that custom grounds the process of lawmaking. But the purity of his doctrine does not allow him to come to this conclusion. The following quotation summarises perfectly the way Kelsen's approach to custom locks in with his pure theory:

> Customary law may be applied by the law-applying organs only if they can be regarded as authorized thereto. If this authorization is not conferred by the constitution in the positive-legal sense […], then it must be *presupposed* that custom as a law creating fact is already instituted in the basic norm as the "constitution" in the transcendental-logical sense. This means: A basic norm must be presupposed which institutes not only the fact of the creation of a constitution, but also the fact of a qualified custom as law-creating fact. This is also so if the constitution of the legal community is not created by a legislative act but by custom, and if the law-applying organs are considered authorized to apply customary law. (Kelsen 1967, 226)

As expected, the basic norm is the key concept with which to also admit custom as a legal source (cf. Pattaro 1994, chap. 9). But it is still correct to say that Kelsen's view falls within the last approach considered by Bobbio, since the legal character of custom depends on its being effectively a part of the legal system.

What is the role of custom in continental legal systems? Customary law is widely recognised to play a crucial in a decentralised system such as international law (this volume, chap. 8; see Pegoraro and Rinella 2000; D'Amato 1971; Brownlie 1998; Janis 1993; Kontou 1994), but its weight within national legal systems is viewed as marginal (cf. Zagrebelsky 1987; Bobbio 1994; Paladin 1996; Guastini 1998; Pegoraro and Rinella 2000). Continental legal systems are mainly statutory, and legal dogmatics, often influenced by legal positivism, states the general principle that custom ought to be subordinated to legislation.

The distinction is often made, based on this principle, between the following (Pizzorusso 1988; for a different classification, see also Sorrentino 1997, 198–9):

(a) custom *secundum legem*, when positive legal provisions (typically legislative statutes) refer explicitly to customary rules;
(b) custom *praeter legem*, which applies to matters not regulated by any positive legal provisions;
(c) custom *contra legem*, which provides legal rules in explicit conflict with positive legal provisions (typically legislative statutes).

Modern systems of continental law recognise such custom as emerges within the scope of positive law—point (a) above. When custom regulates areas not regulated by statutes—point (b) above—its effective bindingness will depend on the different solutions and policies adopted in each legal system with regard to what is regulated. If a custom is in conflict with positive law—point (c) above—the law ought usually to prevail (cf. Pegoraro and Rinella 2000, 13). But it is quite possible for a custom *contra legem* may be effectively recognised as binding within a legal system. This may happen when, for example, a customary rule is used by a judge in settling a dispute. Here, the custom cannot be considered a "legal" source of law, but its effectiveness makes it a source *extra ordinem* (cf. Kelsen 1945, 119ff.; see also Guastini 1998, 650; Pizzorusso 1988; Paladin 1996, 391ff.).

Let us consider the legal status of customary law in the Italian legal system. The Italian Constitution does not provide any explicit regulation of customary law, with the exception of article 10, which finds that the legal system ought to be in accordance with such norms of international law as are universally (*generalmente*) recognised. This article is generally interpreted by the Constitutional Court as referring specifically to sufficiently stable and general custom at the international level. It is also viewed as prescribing the permanent implementation of international customary law in the internal system, though in keeping with the constitution's fundamental principles (cf. Paladin 1996, 396ff.). This constitutional provision pertains only to international law; the main regulation of internal customary law is set forth instead in the so-called Preliminary Provisions to the Italian Civil Code. Article 1 recognises custom as a legal source. From a strictly formal perspective—which may in theory take exceptions—basing the legal character of custom on this provision implies that customary law is subordinated to legislation, since its legal character is formally provided by a statute (Guastini 1998, 650). On the other hand, it is at least debatable that custom is legal only insofar as it is so recognised by positive law, for the simple reason that any legal classification of sources does not provide an ultimate ground for the existence or absence of a legal source. This holds in principle only in strongly centralised legal systems, where the independent status of customary law cannot be taken for granted. Aside from this question, it seems clear that custom *contra legem* is in principle rejected because article 15 allows legislative provisions to be abrogated only by subsequent provisions at the same legal level. In addition, article 8 states, with regard to matters covered by statutes and regulations, that here customs are binding *only* when reference is made to them (in the same statutes and regulations). This may be an argument in favour of the legality of custom *secundum legem*, of course. But there is also room for accepting custom *praeter legem* (ibid.; Paladin 1996). Custom *praeter legem* can play the important role of filling in the gaps of positive law. Article 12 of the Preliminary Provisions, it is true, indicates that legal gaps ought to be filled by analogy or by recourse to the general principles implicit in the system. But then, this article does not mention custom, and so can be made out to require that we refer to written sources only, or, where custom is not helpul, that we proceed by analogy or by reference to legal principles (Paladin 1996, 393): It is quite hard to defend the ideal of the completeness of legal systems.

The foregoing considerations suggest that written sources operate opposite to custom by a relation of mutual exclusion. The normative space left to customary law appears residual. But the relation between positive and material law is far from being so clear (Zagrebelsky 1987, 282ff.). Formal law is surely affected and influenced by the spontaneous formation of material law. This applies, for example, to the so-called constitutional customs—customs emerging from the practice of certain constitutional organs. In fact, the activity of

these organs is regulated mainly by power-conferring rules, which are often discretional in character and allow a number of possible material implementations (Esposito 1961; cf. Modugno 2002, 144ff.; Sorrentino 1997, 199f.; Guastini 1998, chap. 31). In general, material law should not be viewed as necessarily in contrast with formal law. Quite the contrary: Custom integrates positive law, for its interpretation is open to different outcomes. In addition, it is evident how custom shapes the normative content of the legal system: "Many of the constitutional transformations are performed by way of interpretation," or under the pressure of conventional usages (Zagrebelsky 1987, 283; my translation).

This conclusion perhaps indicates the general philosophical path to an understanding the role that social practices play in institutionalised systems. As has been said, the notion of custom seems able to capture the dynamic role that social action has in shaping the legal system. Here the ultimate problem is not explaining why custom has a normative nature. Social practices are in general rule-based activities, and in fact are inherently normative (on this general thesis, see Brandom 1994). The first thing, even in regard to the relation between formal law and social custom, is that we need to focus on how "principles of justice can emerge spontaneously through the voluntary interaction and exchange of individual members of the group." This being so, "relevance must be given to the statements and expressions of belief […] of the various players [...] individuals and states articulate desirable norms as a way to signal that they intend to follow and be bound by such rules" (Parisi 2000, 17, 18). In other words, we need to investigate how the normative coordination of individuals can become a basis for the spontaneous and uncoerced behaviour of the members of the group. The theoretical problem is to see whether these mechanisms can account as well for more-complex contexts where external (formal) contraints, such as legal institutions, influence, as well as are influenced by, these social dynamics (on this, see Sartor, vol. 5 of this Treatise). But, of course, these questions fall outside the scope of this chapter.

7.3.3. The Role of EC/EU Law: A Sketch

EC/EU law is a crucial factor in the recent evolution of European legal systems. As such, it plays an important role as well in the theory of the sources of law. This last issue is twofold, since it may be analysed with regard to the specific nature of EC/EU legal sources—for these are part of a distinct legal system—but also with regard to the peculiar relationship between European sources and national legal systems. The main purpose of this section is to account briefly for some well-known problems that concern this second aspect of the question.

The enactment and ratification of the institutive Treaties of Paris and Rome—and of subsequent Treaties, notably the Single European Act, the

Treaty of Maastricht, the Treaty of Amsterdam, and the Treaty of Nice—have affected the entire lawmaking process within member states. In fact, the development of European law has given increasing weight to the supranational legal order, thereby raising serious problems in the coordination of different levels of law-creation and legal decision-making (for an overview of the history of EC/EU institutions, see George and Bache 2001). In particular, several member states have been forced to promote initiatives of constitutional revision to align the principles of their constitutional orders with the normative and effective claims to the limitation of sovereignty stated in the treaties. This process has been made more urgent especially after the Treaty of the European Union (Treaty of Maastricht). This treaty marked a turning point in the process of European integration, since it was meant to go beyond the initial economic goals of the community by opening new dimensions of *political* integration. Thus, the German legal system, for example, subsequently recognised in explicit form some limitation to sovereignty, "though subordinating this limitation to the principles of democracy and the rule of law [...], subsidiarity and protection of fundamental rights," as likewise codified in the "strong core" of German Constitution (Pegoraro and Rinella 2000, 84; see *Grundgesetze*, art. 23). Similarly, the French Constitution requires the republic to contribute to exercising common competences within the framework of European Treaties (art. 88–1), authorises the transfer of legislative competences to EU institutions (art. 88–2), and prescribes that any legislative initiative inspired by EU acts is to be submitted to the parliament (art. 88–4) (Pegoraro and Rinella 2000, 84–5). Italy has long recognised the force and bindingness of European legislation by reference to article 11 of its constitution (cf. Zagrebelsky 1987; Sorrentino 1997; Guastini 1998; Modugno 2002). As noted earlier, this article states that Italy, "under equal conditions relative to the other states, authorises such limitations of its own sovereignty as are necessary to establish a legal order with which to ensure peace and justice among nations." The new article 117, reframed by a recent provision of constitutional revision (18 Oct. 2001, no. 3), codifies the specificity of EU law in this regard. Article 117 is thus meant to complete and integrate article 11, still viewed as the main constitutional ground for the force and bindingness of EU law within the Italian legal system (cf. Modugno 2002, 129–30).

The structure and functioning of the EU system is quite intricate. Even a brief account of it cannot be attempted here (cf. Kapteyn et al. 1998; Craig and De Búrca 1998; Shaw 2000; Vincenzi and Fairhust 2002; Peterson and Shackleton 2002; Nugent 2003). I will only provide the reader with a few basic notions necessary to put in focus the relationship between the EU and national legal systems. The main European institutions are the Council of Ministers, a legislative body composed by the heads of state and the foreign ministers of member states; the Commission, an executive body chiefly responsible for drafting legislation; the Parliament, consisting of directly elected repre-

sentatives of member states; and the European Court of Justice, entrusted with settling disputes on the interpretation and application of supranational legislation. In the system of EC/EU legal sources, the primary level of legislation is represented by the treaties. These provide European institutions with the power of generating secondary legislation, which consists mainly of regulations, directives, decisions, and recommendations. The structure of secondary EC/EU legislation is quite complicated. In general, the legislative process involves Commission, Parliament, and Council (see Kapteyn et al. 1998; Craig and De Búrca 1998). In particular, ever since the Treaties of Maastricht and Amsterdam, EU legislation has frequently adopted the so-called procedure of co-decision. Roughly speaking, this procedure requires the Parliament and the Council to contribute jointly to the deliberation, such that a provision is approved only when it obtains the agreement of the two bodies (cf. Crombez 1997; Crombez 2000; Laruelle 2002). This trend in EU lawmaking bears out the thesis that there exists no actual European legislator: One should properly speak of a European legislative process (cf. Wyatt and Dashwood 1993, 37). This remark—true in principle—seems based on the implicit adoption of a monistic view of legislation. But this approach cannot be applied any longer to national legal systems (see Section 7.2.2).

European legislation presents a general framework within which one can assess how EC/EU law affects the national systems of legal sources. So we have two levels: the general framework and the national systems. The question, then, is How can EC/EU law be qualified with regard to the legal status and force of treaties and secondary legislation within member-state systems?

Let us again take Italy as a case study with which to attack this question. It has been argued by Italian doctrine that EC/EU treaties properly constitute a legal system in principle distinct from the legal orders of the single member states (cf. Paladin 1996, 422ff.; Guastini 1998, 671ff.; Tesauro 1995). This apparently obvious statement carries with it a number of theoretical consequences if considered through the process by which European law gets implemented in member states. In theory, and despite some recently reiterated judgements by the European Court of Justice, EC/EU law, and its treaties in particular, can hardly be said to be in general self-executing. A self-executing treaty is such that it is binding (creating obligations and rights) upon all individual citizens or upon the subjects of the High Contracting Parties. EC/EU law, or part of it at least, is commonly thought to require execution by way of a specific lawmaking process that pertains to member states (Sorrentino 1997, 206–8). In this sense, specific internal legislative acts are aimed at making supranational provisions more precise and directly applicable. These acts have to implement EC/EU law within each national legal system. By contrast, as noticed a moment ago, the European Court of Justice has maintained that the treaties, though primarily addressed to the states, may carry legal effects for the citizens, too, either directly—by provisions specially framed to this end—

or indirectly (cf. Gaja 1995, 438ff.). On this view, EC/EU sources are provided with their own legal bindingness within national systems, too. Even so, the formal legitimacy and force of EC/EU law continues to find its main basis in articles 11 and 117 of the Italian Constitution, and in indirectly in the reference that national implementation acts make to the European treaties (Modugno 2002, 129–30; Sorrentino 1997, 205ff.; Guastini 1998, 673).

This being so, the question comes up, What is the hierarchical relation between supranational and internal legal sources? In theory, the hierarchy can be articulated by enumerating the competences that pertain to EC/EU law in accordance with the treaties (cf. Sorrentino 1996). Here, the limitation of national sovereignty stated article 11 of the Italian Constitution, for example, does not require that the sovereignty be fully given over to EC/EU institutions: Such limitation corresponds to the transfer of some material competences, with the additional constraint that supranational legislation must be compatible with the strong core of principles recognised by the constitution (Sorrentino 1997, 206). But this general view carries a number of exceptions. First, the specification of competences found in the treatises is often quite vague, thus allowing for a certain flexibility of interpretation. Second, the treaties often contain clauses that authorise a unilateral expansion of European competences. Such an expansion has been generalised with the Treatise of Maastricht, by writing into it the principle of subsidiarity, meaning by this that EU law may go beyond its formal powers when the action of member states is not sufficient to attain certain goals (Modugno 2002, 131; Sorrentino 1997, 207). All these things make the hierarchy based on competence quite unstable and fluid.

A close analysis of the legal character of national legislative implementation of EU law provides further evidence of the peculiar influence of EU law on the internal system of sources. Implementation laws are formally provisions of standard legislation. But they are also something else: They compete with standard legislation, sometimes derogating from the constitution as well (Sorrentino 1997, 208ff.; Guastini 1998, 675ff.). In keeping with the judgements of the Constitutional Court, Italian legal doctrine has recognised that such special provisions may be "stronger" than ordinary legislative statutes, since they implement treaties as well as articles 11 and 117 of the Italian Constitution. In other words, implementation provisions, though enacted as ordinary legislation, can be a reason for declaring the constitutional illegitimacy of other ordinary laws: When these last come in conflict with the implementation provisions, they violate EC/EU treaties directly, and the Italian Constitution indirectly (articles 11 and 117 of it). The treaties are thus external sources of law, and in becoming effective by taking the form of ordinary legislation, they are superior to other standard legislative statutes. But the matter is more intricate. Implementation provisions may be subject as well to the Constitutional Court's review, and hence can, in theory at least, be declared unconsti-

tutional if in violation of the basic principles of the system (Modugno 2002; cf. Zagrebelsky 1987).[31]

A full understanding of how EU law affects national systems of legal sources makes it necessary to focus as well on the secondary level of European legislation. In this regard, directives and regulations are, strictly speaking, the main legislative provisions to be considered in assessing the direct influence of EC/EU law on national systems (Tesauro 1995, 91; cf. Sorrentino 1997; Guastini 1998; Modugno 2002). The formal status of these legal sources was originally framed by the institutive treaties of the community, but subsequent integrations, amendments, and specifications were formulated at the level of primary legislation as well as by decisions of the European Court of Justice. In general terms, and as established by the institutive treaties, regulations have a general scope, and are binding and self-executing, so they do not formally need any national implementation to be enforced within member states. In this sense, in light of article 11 of the Italian Constitution, regulations are in all respects sources of primary-level legislation in the Italian legal system, since they are authorised to derogate from standard legislation (cf. Gaja 1995, 439ff.; Guastini 1998, 681). By contrast, directives are defined as programmatic provisions: They state general goals to be achieved, but do not specify how these goals are to be met or create direct obligations and rights in this regard. Directives, too, require formal implementation through national legislation insofar as they are primarily addressed to the states' constitutional bodies (cf. Prechal 1995). But the character of directives was later reframed. As noted earlier, ever since the Treaty of Maastricht was ratified, the European Court of Justice began to argue more and more often that EU law in general, and directives in particular, may carry a direct effect within national legal systems. This will be true to the extent that some directives may contain obligatory provisions formulated in clear and unconditional terms (cf. De Búrca 1992; Guastini 1998, 677ff.; Modugno 2002, 130f.). But on this principle, it must be noticed, EU regulations, too, though formally justifiable, are ultimately and concretely self-executing when likewise clearly and unconditionally formulated (Sorrentino 1996; Sorrentino 1997). The distinction between regulations and directives is therefore not so sharp: On the one hand, some directives are claimed to be self-executing if provided with clear terms of application; on the other, regulations are found to be specifically self-executing only if considered from a formal perspective (Sorrentino 1997, 207; Modugno 2002, 131; Pegoraro and Rinella 2000, 85).

We now have sufficient elements to go on with which to understand the legal complexities of the relation between EC/EU law and national systems.

[31] Here is may be argued, as Guastini does (1998, 675), that all implementing provisions are in theory illegitimate insofar as they violate the basic principle of the sovereignty of the people. This argument, if accepted, would undermine the internal legitimacy of all EU sources of law.

Our focus, again, will be on the Italian system. Here, we need to take a look more closely at how the Italian Constitutional Court changed attitude as the guidelines issued by the European Court of Justice kept coming out. The following illustration is from the lucid analysis of Modugno (2002, 132–36; see also Sorrentino 1997, 208–10). In a first stage, the Constitutional Court recognised the limitations of Italian sovereignty by applying article 11 of the constitution. But article 11, it is argued, cannot provide implementing provisions with any force additional to that of other legislative acts (decision no. 14/1964). Here, the criterion *lex posterior derogat priori* may be safely applied to solve conflicts between European and national provisions. This approach is recognised as unacceptable by the Court of Justice (case 6/64, 25/07/1964). In subsequent decisions (nos. 183/1973, 232/1975), the Constitutional Court states that any internal statute in contrast with European law violates article 11 indirectly; the court thereby ascribes a special legal force to European provisions. In particular, a national statute—if subsequent to a European provision with which it is in conflict—will have to be rejected through a constitutional review of legislation. This last opinion was later criticised by the Court of Justice: All ordinary judges must refrain from applying any national provision incompatible with European law, even without any official declaration of illegitimacy from the Constitutional Court (case 106/77, 09/03/78). Which court accepts this approach by recognising that European provisions have to take precedence over national statutes, even if constitutional review ought still to take its course whenever a basic constitutional principle has been violated, or when a national provision constitutes a permanent obstacle to implementing the treaties (no. 170/1984). A turning point came with decision no. 168/1991, with which the Constitutional Court explained in what sense European law takes precedence over national provisions. Prevailing supranational statutes do not really abrogate internal provisions but make them inapplicable. In other words, national laws incompatible with supranational laws are not invalid because a norm cannot be abrogated by another norm that does not properly belong to the legal system (Modugno 2002, 134; cf. Guastini 1998, 683–6). But the force of EU law is not of course unlimited. As noted, these limits—corresponding to the fundamental rights safeguarded by national constitutions—are still inviolable. Cognisant of this fact, the European Court of Justice has been working since the 1970s to define an “autonomous system of fundamental rights” that reflects what is already codified in the treaties and recognised by all national constitutions (Sorrentino 1997, 211). This process has led to the EU Charter of Fundamental Rights, adopted by the European institutions and endorsed by member states at the European Council held in Nice in December of 2000. On the face of it, the charter is nothing but a political declaration reaffirming a minimal core of rights that result from constitutions as well as from treaties and other supranational sources (but on this, see Castiglione and Bellamy 2002, 526–7). Clearly, a framework of this kind

will not suffice to eliminate structural and potential tensions between the national and the supranational levels (as noted, before the Charter of Fundamental Rights, in Sorrentino 1997). But then, initiatives like the one launched with the charter may contribute to an effective process by which the system of fundamental rights gets constitutionalised in the European Union. This fact can perhaps help us understand as well the future development and reading of the European constitution, currently in its drafting and discussion stage.

The legal force of supranational sources is thus closely related to the very possibility of a democratic legitimisation of the European Community and Union and of framing new constitutional assets for Europe. As MacCormick observes (1999, 126ff.), the starting point is the theoretical distinction between internal and external sovereignty: The former is traditionally based on identifying the core of internal sovereign power; the latter usually focuses on a state's authority to exercise autonomous control over its territory, independently of any other state or organisation. In both these respects, Europe is beyond the notion of a sovereign state. In theory, the EC/EU constitution is essentially complementary to that of member states: It is polycentric, "directed to its permanent self-transformation," and hence open to multilevel dimensions of legitimisation (Preuss 1999, 420–3). Massimo La Torre, among others, has recently provided an account of the major approaches in the literature to the problem of legitimising the European political and legal order (La Torre 2002). The first approach takes up what is called the functionalist view, which "avoids any centrality of the political agencies and of the role of the state," this by emphasising the functionally "intrinsic rationality and evolutionary force of societal and economic processes" (ibid., 67–8). A second alternative is intergovernmentalism, in which the European integration "is entirely relying on the traditional system of states' foreign policy in which each state aims at reaching its greatest possible profit and power and can incline to some sort of compromise and agreement if these are seen instrumental to the power interest" (ibid., 68). These two approaches are sometimes combined, as when functionalism is centred around welfare functions of "redistributive mechanisms driven by a thick concept of social justice": Since "citizenship is [still] strongly connected to the state, […] welfarism is hardly to be distinguished from intergovernmentalism" (ibid., 70). A third approach is "privatism," by which spontaneous "private law […] is the real constitution of a supranational integration process": The "integration here does not need a direct explicit intervention of governments and/or political agencies" (ibid.). A final option is the so-called regulatory model. It is "the result of a double strategy": On the one hand it gives us "a way out from the opposition between a classical concept of the liberal state, a night watchman with minimal competencies, […] and the welfare state taking the initiatives in the shaping of economic policies." In this sense, constitutionalism is considered the neutral "implementation of rational control over the emotional deliberation of

majoritarian assemblies and organs" (ibid, 71–2). Independent agencies are thus the efficiency-based counterpart of democracy as majority rule. All these models have a number of drawbacks (cf. ibid. 78ff.). Thus, some try to reformulate the regulatory model by combining the neutral efficiency of its procedures with the principles of justice derived from a discursive principle of universalisability (as La Torre himself seems to argue). From this ideal perspective, procedures instantiate—and ideally guarantee—the basic principle of democracy as well as the protection of the equal dignity of human beings. Others recognise the importance of the deliberative process but reframe it within the perspective of neo-republicanism (these approaches are illustrated in Bellamy and Castiglione 2002, 519ff., among others). The polycentrism of the European asset and the lack of a unitary centre of powers need to be shaped by a bottom-up participation of individuals and groups directly involved in the questions at hand. The main goal is then to reach an institutional equilibrium in the presence of a pluralistic setting. This equilibrium takes the form of political compromises and, when questions of principle are considered, must result from a true deliberative process.

The fluid, multilevel dimension of the European asset mirrors the complexities of EC/EU law and its relation with the national systems of sources of law. The polycentrism of law discussed in Section 7.2 may be argued to have some points of contact with the unstable nature of European law. Preuss (1999, 421) recognises this similarity, even if "the fragmentation and diffusion of power characteristic of the Community goes considerably beyond [...] contemporary statehood." Perhaps—considering pluralism and the challenge it poses—this difference can be made out to be in essence one of degree.

Chapter 8

INTERNATIONAL LAW

8.1. Introduction

International law suffers from what D. J. Harris wittily calls "the Austinian handicap":

> "Is international law 'law'?" is a standard sherry party question. Its sometimes irritating persistence is very largely the responsibility of John Austin. (Harris 1998, 6)

For Austin, familiarly, to qualify as law in the proper sense, a norm must be a command from a political superior—a sovereign—to a political inferior, and backed by a threat of evil in the even of non-compliance. What is "usually styled *the law of nations* or *international law* [...] consists of opinions or sentiments current among nations generally. It therefore is not law properly so called" (Austin 1954, 141–2). Austin is fundamentally correct in saying that international law does not qualify as law by his test for law. But Austin's test takes as a paradigm for law a system of municipal law.[1] On the face of it, therefore, there is no special reason why we should expect international law to satisfy the test. But then a different question arises: If international law is not law by Austin's test, and Austin's test is inappropriate, by what other, appropriate test for law might international law qualify?

At the end of *The Concept of Law* (Hart 1994, chap. 9), H. L. A. Hart examines international law as a test case for the theory of law as a system of social rules that he has developed in the rest of the book. Hart acknowledges international law to be different in form from municipal law. Municipal law is in the central cases characterized by a legislature, courts with compulsory jurisdiction and law-making powers, officially organized sanctions. International law lacks a legislature: Although there are fora where issues of international legality are discussed, such as the United Nations or the World Trade Organization, these fora do not have law-making powers. There are courts of international law, the International Court of Justice and the new International Criminal Court, but these courts do not have compulsory jurisdiction. The absence of coercive legal sanctions in international law (though not of the sanctions of brute power in international relations) is a commonplace. Hart concludes that international law is not law because it has analogies of *form* with municipal law. Rather, in his view, international law shares with municipal law analogies of function and content. International law performs in inter-

[1] Much has been written in analytical jurisprudence about whether even municipal legal systems satisfy Austin's test, but that is a topic for another time.

national relations the function of providing certainty and predictability in the normative framework, of resolving problems of coordinating action, often by rules that are in themselves morally indifferent. International law, like much of municipal law, performs a facilitating function, in constituting a network of norms by which states can conduct their affairs to their mutual benefit. International law has a similar repertoire of precisions and technicalities to achieve this goal as does municipal law, and as typically making distinctions and drawing lines where morality would not draw them. The key training for an international lawyer is training in municipal law. There is, Hart says, a "range of principles, concepts and methods which are common to both municipal law and international law, and make the lawyer's technique freely transferable from one to the other" (ibid., 237).

Hart wrote these words over forty years ago, and in the meantime the amount of formal legal apparatus operating at the level of international relations has considerably increased. Not the least interesting and relevant development are regional organizations of states, especially of the European Union, which has now in its own right a significant body of law, and has more the appearance of a distinct legal system than anything previous international body. It has also recently been argued that the World Trade Organization functions as a distinct legal system (Palmeter and Mavroidis 1998). There is now among the nations of the world a level of cultural, economic and practical interdependence that is unparalleled. Socio-legal scholars Ryan Goodman and Derek Jinks have argued that this interdependence amounts, if one uses standard sociological definitions of "institution," to an institutional "world polity," and that, so far from individual nation states being primitive and international organizations derivative, the sovereignty of individual states only makes sense as something carved out of this "world polity" (Goodman and Jinks 2003, 106–9).

Even if such a case for an international legal system is persuasive, we still cannot move from there immediately and quickly to an investigation of the sources of international law comparable to the above investigations of the sources of municipal law. We must confront the so-called

> voluntarist or consensual theory of the nature of international law, by which states are bound only by that to which they consent. [This theory] remains the one to which the International Court of Justice adheres and one from which, not surprisingly, states do not appear to dissent in their practice. (Harris 1998, 44)

States act as though they can relieve themselves of the burdens of an international agreement simply by declaring themselves no longer bound, and much time is spent negotiating and securing ratification for international agreements. It is said that voluntarism cannot be the whole story, for a newly created state would be regarded as immediately bounds by norms of international law even before explicit consent could be confirmed. As Michael Byers

explains (Byers 1999, 8), there is a truth to the idea that the origin of international law is in consent, even if consent is not enough to explain entirely the normative force that international law once created comes to have. Nonetheless, voluntarism has an intuitive appeal as a theory of the normativity of international law, which it would not have as a theory of the normativity of municipal law.

Ironically, what has seemed to many the most attractive up-to-date version of voluntarism shows the need for a precise understanding of voluntarism. In this theory, states are pictured as acting in the international realm wholly out of self-interest, and game theory is thought to provide the best modelling of such self-interested behaviour (see for example Goldsmith and Posner 1999, 2000). However, as Byers points out, the outcome of such an emphasis on states' action out of self-interest is the failure of voluntarism (Byers 1999, 6). It is very often in states' interest to act, even to apply power, within the framework of an institution or legal system. The very facilitating functions of legal norms that we alluded to above create a reason based on self-interest for developing legal structures, "because these structures create expectations of behaviour which reduce the risks of escalation and facilitate efficiency of action [...] [they] promote stability" (ibid.).

The contrast between municipal law and international law may be put succinctly (and therefore of course too simply) thus: In the case of municipal law, consent counts towards legitimacy; in the case of international law, consent counts towards validity. My thought is this. The working assumption of the project in this book has been that we can identify and analyze in a formal way the sources of law, and in particular the strictly institutionalized sources of law, in some tradition of municipal law independently of the material content of those sources (cf. Brownlie 1998, 1–2). We can determine whether a norm is a contextually justified or valid norm of a municipal legal system by determining whether it has a "source" in one of the senses discussed in the previous chapters of this book. We are enabled to do that in good part because we can identify what I referred to in Chapter 6 as the "thin" sense of the constitution for any given municipal legal system, the rule of recognition that gives formally the sources of law for that system. In the case of municipal law, then, consent is given, not to each legal norm taken individually, but to a political system in general that includes a legal system as a large part. That consent secures the legitimacy of the system; the validity of the individual norms of the system is secured by the sources of law.

That model cannot be applied in the case of international law, since the world legal order, in whatever sense that term is applicable, lacks a rule of recognition of that kind. Up to a point (and I shall elucidate further what point in secs. 8.4.3 and 8.5.2 below), the validity of individual norms of international law is given by states' consent to those very norms. We will see below how this thought plays out in the case of the two major sources of interna-

tional law, treaties and customary international law. There is nothing in the case of municipal law that corresponds to the rights of the persistent objector in customary international law (see sec. 8.4.2 below). It is possible for a state that persistently objects in the appropriate way to a norm of customary international law to be acknowledged not to be bound by the norm. But, however much I persistently object to the valid norm that requires me to wear a seatbelt when driving a vehicle, if I am caught ignoring the law, I have to face the consequences.

The project of this chapter, then, does suffer from an "Austinian handicap"—not that there is no sovereign to international law, but that there is no rule of recognition that will generate the sources of international law. The alternative might seem that we have to give up on the idea of strictly institutionalized sources of international law altogether. But it is too soon to conclude that the sources of international law can only be defined by their material content, whether we call that "morality," "natural law," or *realpolitik.* While we have to waver on how far the sources of international law are "strictly institutionalized sources" in the sense in play in this book, it will be clear in the end that one can validly speak in a formal way of the sources of international law. The "Austinian handicap" can be overcome.

8.2. Article 38

Discussions by legal scholars of the sources of international law invariably begin, as indeed they should, with Article 38 of the Statute of the International Court of Justice. It reads as follows:

1. The Court, whose function is to decide in accordance with international law such disputes as are submitted to it, shall apply:
   (a) international conventions, whether general or particular, establishing rules expressly recognized by the contesting States;
   (b) international custom, as evidence of a general practice accepted as law;
   (c) the general principles of law recognized by civilized nations;
   (d) subject to the provisions of Article 59, judicial decisions and the teachings of the most highly qualified publicists of the various nations, as subsidiary means for the determination of rules of law.
2. This provision shall not prejudice the power of the Court to decide a case *ex aequo et bono*, if the parties agree thereto.

Article 59 reads:

The decision of the Court has no binding force except between the parties and in respect of that particular case.

An analysis of the sources of international law in the end amounts to an analysis of the meaning and import of Article 38, and the next three sections of this

chapter, subject to the qualifications noted in the next two paragraphs, constitute just such an analysis.

I am not going to discuss further Article 38(1)(d). Historically, jurisprudential writings by scholars such as Grotius and Suárez played a central role in the initial development of international law (see, in vol. 6 of this Treatise, Stone, chap. 14; Riley, vol. 8 of this Treatise). However, the current project is not historical, but analytical. As the amount of more (in some sense) institutional material grows—treaties, international conventions, rulings by the International Court of Justice, acknowledgment of rules of customary international law, and so forth—the relevance of informal subsidiary sources such as the writings of "publicists" falls away. While most scholars still assert that the importance of the writings of publicists should not be underestimated (a not wholly disinterested remark, since such persons would themselves typically be "publicists"), there is a general acknowledgment that these writings function only minimally as a source. A further point is that, to the extent that opinions of writers have force as a source of law, it is because their ideas get taken up into the general customary process of the formation of norms in international law. The writings do not function as an independent direct source.

As for judicial decisions, Article 59 declares that there is no rule of precedent in the International Court of Justice itself. The Court pats some attention to consistency as a value, but in its formal practice it follows the civil law, not the common law, approach to precedent (see secs. 3.2.1 and 7.3.1.2 above). However, Article 38(1)(d) covers more judicial decisions than just those of the Court. Brownlie (1998, 19–24) offers a detailed account of the variety of judicial decisions from municipal law and other international courts such as the European Court of Justice, and how these might bear on the matter of the sources of international law. While he designates a number of them as "important," still the importance of these as a source is indirect, and lies again primarily in their contribution to customary international law. Palmeter and Mavroidis have argued (1998, 400–7) that, within the WTO, even though the body officially follows Articles 38 and 59 of the ICJ Statute and has no formal doctrine of precedent, still the Appellate Body of the WTO treats both adopted reports of dispute settlement panels and its own prior decisions as *de facto* binding precedents.

Before proceeding to the analysis of Article 38(1)(a) to (c), I must still consider some preliminary questions about Article 38. The first question (cf. Brownlie 1998, 3; Hillier 1998, 64) is that Article 38 does not describe itself as a list of the *sources* of international law; it talks about the material that the Court shall bring to bear in the settlement of disputes. But why should the absence of the term "source" cause us to have concerns about whether what Article 38 lists are "sources"? In the earlier chapters of this book, nothing that we have examined as a source of law is labelled in some canonical document as a source of law. Hillier may be correct to say that "law is not necessarily

simply defined in terms of how courts decide disputes" (Hillier 1998, 64). His point, I take it, is that what it is for a norm to be a law is not necessarily for it to be a norm used by courts in deciding disputes. So, for example, a bill passed in parliament is a law, even if it is never applied in the settlement of a dispute by a court. But it is simply a mistake to infer from the fact that the sources of law sometimes produce norms that are not applied in courts that a list of norms that are to be applied by courts is not a list of sources of law. Brownlie's caution is based again on the fact that there is for international law no rule of recognition specifying sources, which, he assumes, we would need to have in order to be confident that Article 38 was a list of sources. Maybe so, but this point can be made. The practice of the International Court of Justice is to treat the materials identified by Article 38 as sources; the practice of scholars of international law when not in jurisprudential mode is to treat the materials identified by Article 38 as sources. Provided we are clear (and I hope that by the end of the chapter we will be) about the idiosyncratic character of the sources of international law, whether to use the term "sources" or not ceases to be an interesting question.

Second, it may be argued that Article 38 is not exhaustive as a list of supposed "sources" of international law (Hillier 1998, 64). Hillier, for example, is willing to consider as sources of international law not mentioned in Article 38 resolutions of international organizations, especially resolutions of the United Nations General Assembly; resolutions of regional organizations such as the Organization of American States or the European Union; the codifications of the International Law Commission; and finally so-called "soft law," "international instruments which, while not binding on states in the manner of treaty provisions, nonetheless constitute normative claims and provide standards or aspirations of behaviour" (Hillier 1998, 99). The difficulty with such a more capacious interpretation of the sources of international law seems to me this. As we will see in the analysis of customary international law in Section 8.4, an examination of the practice and attitudes of states is central to the project of proving this or that norm to be a norm of customary international law. Items in Hillier's list of non-Article 38 sources play an important role as evidence in such an examination. So the question reasonably arises, how would one distinguish between being a source of law and being (simply) material evidence for the existence of a norm of customary international law? After all, the "sources" listed in Article 38 also function as evidence in such an examination. The most straightforward answer to the question is, we mark the distinction thus—what is listed in Article 38 is a source of international law; what is not listed is not.

The third question about Article 38 is whether the listing of sources is intended to be hierarchical—after all, it is given a lexical numbering (Hillier 1998, 64; Brownlie 1998, 3–4). If we make normal assumptions about the contribution of *travaux préparatoires* in legal interpretation, the answer is defini-

tively negative. There is clear evidence (cf. Harris 1998, 23) that when the Statute was being drafted, the possibility of making the list hierarchical was explicitly considered and rejected. There is no analogue here to the priority of legislation over custom and precedent in common law sources.

More detailed examination of the meaning of Article 38(1)(a) through (c) will be deferred to the next three sections of this chapter. I shall close this section with a comment on Article 38(2). The reference to decisions *ex aequo et bono* might seem, and to some has seemed, as though it is an explicit declaration that principles of equity form part of the sources of international law. Brownlie argues persuasively that such would be a misinterpretation. In his view the "power of decision *ex aequo et bono* involves elements of compromise and conciliation" (Brownlie 1998, 26). That is, section (2) authorizes the Court, if invited to do so by the parties to a dispute, to function more as a mediator or arbitrator than as a court. That is, the Court has some discretion to form novel and unique solutions to disputes before it if asked to do so, rather than being required invariably to base its decisions on legal sources *stricto sensu*. As Brownlie also points out (1998, 25–6), it is not that equity in the familiar sense of fairness and reasonableness plays no role in international law decision-making:

> In the *North Sea Continental Shelf Cases*[2] the Court had to resort to the formulation of equitable principles concerning the lateral delimitation of adjacent areas of the continental shelf, as a consequence of its opinion that no rule of customary or treaty law bound the states parties to the dispute over the seabed of the North Sea. (Brownlie 1998, 26)

Article 38(1) (c) of the International Court of Justice Statute, however, in Brownlie's view authorizes the use of equitable principles in such circumstances, as such principles are prime examples of "general principles of law recognized by civilized nations." The use of equitable principles to decide cases in the absence of binding written law has been a feature of law since its beginnings (cf. Shiner 1994).

8.3. Treaties

A treaty has been provisionally defined by the International Law Commission as "any international agreement in written form, whether embodies in a single instrument or one or more related instruments and whatever its particular designation [...] concluded between two or more States or other subjects of international law and governed by international law" (quoted at Brownlie 1998, 608–9). Treaties are perhaps the source of law most familiar to the non-professional in the field. However, to the legal theorist, the propriety of regarding treaties as sources of law is more controversial. A treaty of the famil-

[2] ICJ Reports (1969) 3, 46–52.

iar kind—the North American Free Trade Agreement, for example, or the various foundational treaties of the European Union, or a particular lease-lend agreement signed between two States—are seemingly best interpreted on the model of a contract in municipal law. The contract/the treaty creates rights and duties for the signatory parties and only the signatory parties, and only to the extent specified in the contract/treaty itself. These rights and duties persist as long as, but only as long as, the contract/treaty remains in force. But it does not follow that to be a source of rights and duties—a source of legal obligation—is to be a source of law. A treaty as much as a contract binds only within a framework of legal norms that define the procedures for concluding and the properties of a binding contract. Those legal norms, rather than the treaty itself, constitute the applicable source of law (cf. Harris 1998, 45–6).

The force of this sceptical argument is in the first instance blunted by the fact that theorists distinguish between law-making treaties (*traité-loi*) and treaty contracts (*traité contracts*) (Brownlie 1998, 11–2; Degan 1997, 489; Hillier 1998, 64). The strongest candidates for being sources of law are the so-called law-making contracts; we shall consider them further shortly. But is it clear that, once these two classes of treaty have been distinguished, the sceptical view of treaty contracts is justified? Appeal is made to the well-known principle of international law *pacta sunt servanda*, agreements must be kept. The thought is that, unless the parties to a treaty subscribed to this principle, a treaty contract would be without normative force. This is not clear. Brownlie describes the principle as containing "a presumption as to the validity and continuance in force of a treaty" (Brownlie 1998, 620). Consider though the difference between (to return to my examples above) a lease-lend agreement and the North American Free Trade Agreement. Canada, let's say, agrees to lend South Korea $50m. on condition that in return Korea, apart from repaying the loan, uses the money to purchase two CAN-DU nuclear reactors as developed by Canadian government scientists for the nuclear power industry. Here we have the best case for a treaty with no status as a source of law. The treaty specifies concrete actions the performance of which fulfils the contract; these and no other actions the parties to the contract are bound to perform. NAFTA is different. It includes commitments to perform actions, but these are of a more diffuse and long-term kind—to admit goods of given kinds to cross borders without tariffs, to abstain from granting subsidies of certain kinds to industries of certain kinds, and so forth.

Suppose now that, under NAFTA, all is well for a while, but then some years down the road Canada, or the U.S., or Mexico decides to impose import tariffs or subsidize industries in violation of the Agreement. Now, it might make some sense to say that the principle of *pacta sunt servanda* comes into play to remind the State in question that they are a party to an agreement. But I use "remind" advisedly. When the U.S. Congress, for instance, passes a bill

giving subsidies of over $1bn. to the U.S. agricultural industries, what is the source of the norm “Give no subsidies” that, in the opinion of Canada and Mexico, the U.S. has failed to honour? Is it the principle *pacta sunt servanda*, or is it the North American Free Trade Agreement? It is plausible to say that it is the Agreement.

Moreover, what is the position of Canada, the U.S. and Mexico immediately after the signing of the Agreement? Are they right then bound by the norm, “Give no subsidies”? Surely they are. But if the function of *pacta sunt servanda* is to explain why years down the road States are continue to be bound, then it does not explain why they are immediately bound at the moment of signing. Brownlie implies by his use of “validity” in the above quote that, without the principle of *pacta sunt servanda*, an agreement like NAFTA would not be a valid treaty. That seems to me implausible. Even if, more plausibly, a framework of norms is needed for the creation of binding treaties, the rights and duties created by the treaties are in the first instance validated by norms internal to those treaties. To the extent, then that the sceptical argument against treaties contract as sources of law has force, it does so only with respect to certain kinds of treaties contract.

The idea of a law-making treaty is this. “Law-making treaties create *general* norms for the future conduct of the parties in terms of legal propositions, and the obligations are basically the same for all parties” (Brownlie 1998, 12; his emphasis). In Degan’s words, law-making treaties create “objective rights”; treaties contract create only “subjective rights” (Degan 1997, 489). Brownlie gives as examples the Hague Conventions of 1899 and 1907 on the law of war and neutrality, the Geneva Protocol of 1925 on prohibited weapons, and the Genocide Convention of 1948, as well as non-constitutional aspects of the United Nations Charter. The prohibition on genocide arising from the Convention is normatively binding generally. The prohibition is itself a norm that is constituted as law by the Convention.

The question can be raised, in what sense if any would non-parties to the Convention be bound by it? That question would require an answer in terms of the relation of the Convention to customary international law (to be explored in detail in the next section). In the *North Sea Continental Shelf Cases*, the International Court of Justice itself identified three such relations. It may be declaratory of custom at the time the treaty is adopted; it may crystallize custom through the agreement of States to the treaty; or States may signal their acceptance of it as custom by their practice after the treaty’s adoption. By any of these three routes, non-parties may come to be bound by the treaty, and only by one of these three routes. However, it does not follow as a result that parties to the law-making treaty are bound if and only if *they* see the treaty as so related to customary international law. What it is for the treaty to be law making is that parties to it are as such bound by its norms. It makes law for those parties.

We see already in the discussion of treaties what will be pervasive in this chapter—that the question of whether this or that instrument or practice or principle is genuinely a "source" for international law is not one that admits of a simple and straightforward answer. In the case of treaties, the best we can say is that three points emerge. In the case of treaties contract, those that conform most closely to a contract in municipal law have the least claim to be as such sources of law. Those that are agreements to perform or forbear certain actions, or to observe or forswear certain principles of action, over the long term have the best claim to be regarded as sources of law. In the case of law-making treaties, there is little reason to doubt that they function as sources of law, although insofar concerns their capacity to bind non-parties to the treaty, that will be because and only because of some appropriate relation to customary law.

8.4. Customary International Law

8.4.1. Introduction

This section will be the longest section of the chapter. The analysis to be given of custom as a source of international law is central to any discussion of the sources of international law, and the topic of customary international law is extremely complex. In this subsection, I shall deal with some preliminary matters.

First, what I called above the sceptical argument appears again, in an appropriately modified form. Whatever specification is given for the kind of "custom" that is a candidate for a source of law, it will be a specification of a pattern of behaviour (in some general sense), for that is just what a custom is. But then is that pattern, that custom, itself what makes some norm a norm of customary international law? Or is it just evidence that the norm is a norm of customary international law, and the acknowledgment by a court, say, what makes the norm a norm of customary international law? The dominant view among international law scholars is certainly that the sceptical account is wrong: Customary international law is so called because the custom is what makes some candidate norm into a norm of customary international law. I will assume the correctness of the dominant view here. One argument in its favour seems to me this. Scholars are able to lay out in some detail the *evidence* that international law itself regards as proof of the existence of the kind of custom that generates norms of customary international law (see, for example Brownlie 1998, 4ff.). To count the custom proved by such evidence to exist as now itself only evidence from which a norm of customary international law must be inferred, rather than as satisfying the criterion for the legality of such a norm, is to be guilty of confusion. This is one way in which customary international law stands to be compared with custom as a source of law in respect

of municipal law. As I said of custom in Section 4.4.2 above, "to announce that a custom qualifies as law because it fits previously announced standards for being law is not to be anointing it to be law from the point of the court hearing onwards; it is to acknowledge the custom already to be law."

Second, there are some important differences between custom in international law and custom in municipal law. One difference between custom in municipal law and customary international law I have already noted (sec. 8.2 above). Unlike custom in municipal law, customary international law is not related hierarchically to other sources of international law. A treaty does not automatically abrogate a norm of customary international law if they conflict. In fact (Byers 1999, 172ff.), it is possible for customary international law to constitute a reason for modifying the content of a treaty. Another difference is that there is no requirement in the case of a custom in international law that it exist "from time immemorial." A custom needs to be shown to exist only for so long as is necessary to prove the existence of the custom, whatever that time is (Harris 1998, 36).

8.4.2. State Practice

In the *North Sea Continental Shelf Cases*, the International Court of Justice specified the criteria for the existence of a customary rule of international law:

> Two conditions must be fulfilled. Not only must the acts concerned amount to a settled practice, but they must also be such, or be carried out in such a way, as to be evidence of a belief that this practice is rendered obligatory by the existence of a rule of law requiring it. (ICJ Reports (1969), 44)

These two conditions are known as the State practice condition and the *opinio juris* condition. The two conditions closely echo in spirit H. L. A. Hart's well-known account distinguishing (in his terms) habits and social rules (Hart 1994, 55–9). For Hart, a habit is merely a convergent pattern of behaviour; there is no question of any normative push towards conformity with the habit. In the case of social rules, there is such pressure. Social rules consist therefore of two elements: In addition to a convergent pattern of behaviour, there must also be what Hart called the "internal aspect," the stance towards the convergent pattern of those whose rule it is, which makes for there being a rule and not merely a habit. In this subsection we consider the former.

We can distinguish two issues in the analysis of State practice: What kind of practice, and in what way must it be "settled"? As for the first, there are no hard and fast rules, but clear examples can be given. Degan, for example, lists actions and attitudes of a State's organs within the limits of their competence; any national legislation or in a ministry of a ruling; a legislative act that is applied by competent State organs through their positive actions; a State's participation in bilateral and multilateral treaties; conventions on codification

and progressive development of a branch of international law; resolutions adopted by political organs of international organizations, such as the U.N. General Assembly; abstract and verbal statements of State representatives, their diplomatic correspondence if accessible, and their voting in international organizations, although governments in States change and the political objectives of a State change over time (Degan 1997, 156–61).

As for how settled a general practice needs to be, it is generally acknowledged that States' practice needs only to be general, not universal (Degan 1997, 182; Hillier 1998, 73; see also *North Sea*, par. 77). Moreover, more weight is to be given to the practice of States that would be materially affected by the candidate customary rule (*North Sea*, ibid.; Hillier 1998, 73; Harris 1998, 40). One important constraint on settledness is the acknowledgment of the rights of the persistent objector. It is possible for a State to escape being bound by a rule of customary international law, if they have publicly dissented from it in an appropriate way. The State must have objected from the early stages of the formation of the rule onwards, up to its formation and beyond. Also, the objections must have been made consistently. A would-be objector who picks and chooses when to object loses their objector's position. The burden of proof is firmly on the State who seeks to secure persistent objector status (Hillier 1998, 74, paraphrasing a decision of the International Court of Justice).

8.4.3. Opinio Juris

The second of the two criteria for the existence of a rule of customary international law is referred to as *opinio juris sive necessitatis*, or *opinio juris* standardly and for short. This factor is the analogue of Hart's "internal aspect" deployed to distinguish mere habits from social rules. In the current context, the factor is crucial for marking the distinction with respect to customary international law between a "custom" with normative implications and a mere "usage." This distinction repeats the similar distinction in municipal law (see sec. 4.1, sec. 6.1.3 above). "Usage" is comprised of "acts done out of courtesy, friendship or convenience," rather than out of a sense of obligation (Hillier 1998, 66), or acts carefully observed but not considered to be obligatory legal rules (e.g., ceremonial actions and actions of protocol) (Degan 1997, 162). The *opinio juris* is exactly this sense of obligation, the sense that action is accordance with a rule. It serves equally well, as Byers has pointed out (Byers 1999, 18, 130), to distinguish action guided by a rule from action in response to the exercise of power.

There are two questions that need to be explored further as regards *opinio juris*. First, what kind of material evidence shows that a state has the *opinio juris* towards some given norm? Second, scholars typically speak about the *opinio juris* as a "psychological" (Degan 1997, 163; Brownlie 1998, 7) or a

"subjective" (Byers 1999, 130; Hillier 1998, 75ff.) element. How are we to understand these terms?

With respect to the first question, the initial answer is straightforward. We are looking for a recurring and consistent pattern of behaviour, the kind of behaviour that would show acceptance of the obligatoriness of the candidate norm, rather than an understanding of the norm as simply a matter of "usage." But what kind of pattern? Now, there is no straightforward answer. For one thing, there are typically many different people at many different levels of government of each State that can have different and conflicting convictions. Also, there is a problem when the political systems in a country go under a profound change (e.g., the changes in Eastern Europe and Russia) (Degan 1997, 163). Action against self-interest is a clear instance of behaviour of the relevant sort (Hillier 1998, 71). It would seem plausible to suppose that there are equivalents at the level of international relations to the constituents of Hart's "internal aspect": Deviations from the supposed norm are regarded as open to criticism, and threatened deviations meet with pressure for conformity; deviation from norm acknowledged as a good reason for criticism; criticism of deviation acknowledged to apply properly to oneself (Hart 1994, 55–6). Action against self-interest has much to do with this third constituent.

A difficult aspect of the empirical proof of *opinio juris* has to do with acquiescence.[3] To what extent can a failure to act or speak count towards proof of *opinio juris*? Acquiescence is not equivalent to consent, but is "one of ways in which States may participate in the development, maintenance or change of rules of customary international law" (Byers 1999, 144). Harris claims that acquiescence is in fact the most frequent ground for determining states' acceptance of a norm (Harris 1998, 43). Acquiescence in international law is defined as "silence or absence of protest in circumstances which generally call for a positive reaction signifying an objection" (Degan 1997, 348–9; Harris 1998, 43). Included in these "circumstances" is the important principle that "the party to which implied consent is imputed must first of all be in knowledge of facts in regard to which it abstained from protest" (Degan 1997, 353). The *Anglo-Norwegian Fisheries* case (*U.K. v Norway* ICJ Reports (1951) 116; see also Harris 1998, 375–81) provides an example. Norway used a distinctive method for defining its exclusive fishery zone, taking into account the ubiquity of fjords and sounds along the Norwegian coastline. Instead of the zone tracking the low-water mark all along the coast (the usual method), Norway drew straight lines across from outermost points of land, thus (in the case of larger fjords and sounds) including waters that would otherwise be outside the zone by the traditional method. Norway formally promulgated this "straight-line" method in a decree of 1935, which the U.K. later challenged.

[3] For a discussion of Hart's own struggles with acquiescence in relation to his concept of the internal aspect of law, see Shiner 1992, 160–82.

Norway presented evidence that it has in fact used this method since the middle of the nineteenth century without any international opposition. France had once questioned the decree, but accepted without demur Norway's assurance that the decree was lawful. The U.K. had not protested the practice for more than sixty years. The Court roundly rejected the U.K.'s claim that it did not protest the practice because it did not know about it. Since the U.K. had a material interest in its fishing fleet being able to fish in these waters, and in fact the fleet had never done so, the case also illustrates the significance of inaction against self-interest.

All the same, the general view of scholars seems to be that there are no hard and fast rules as to the material evidence required for proof of the "subjective" element of *opinio juris*. The International Court of Justice will look at each case on its merits and determine the kind of evidence appropriate for that case.

My second concern in this section is the interpretation of the terms "subjective" or "psychological" that are typically used to characterize *opinio juris*. Pictures infused with philosophical dualism of the mind as distinct from the body cast a long shadow here. Hillier, for example (1998, 81), argues that it is important to construe *opinio juris* as "subjective," not "psychological." It is for him not a matter of anyone's *beliefs*; rather, we should look at the *positions* taken by the organs of states. But why would "position" be thought to be an improvement over "belief"? Presumably, because positions are things that can be readily determined publicly, by looking at documents, speeches, and the like. Why, however, are not a state's beliefs open to inspection in the same kind of way? Don't we find out what the Canadian government "believes" about something by looking at documents, speeches, and the like? Similarly, Degan in the passage quoted about (1997, 163) comments that, since states do not have their own minds, we have to rely on what is said and done by the states' policy-makers. But is not such evidence equally evidence of a state's mind?[4]

In fact, I think Hillier's intuition that "subjective" is preferably to "psychological" as a term to describe *opinio juris* is correct, but not for the reason that "psychological" diverts one in the direction of hidden or non-existent minds. The *opinio juris* is "subjective," because it has in the end to do with how things are interpreted by states taken individually. That some given candidate norm of customary international law is the beneficiary of the *opinio juris* is not "objective," in the sense that the independent normative merits of the rule make it an obligatory rule. Rather, it is "subjective" in the sense that it is the independent acceptances of the rule as obligatory by individual states that makes it an obligatory rule—independent beliefs that the rule is obligatory, even, if you like.

[4] For more on how to think of the mentality of collective bodies such as states and organizations, see Ouyang and Shiner 1995.

However, it would be a mistake to suppose that these independent beliefs arise in a vacuum. As Byers cogently argues, the "subjective" element that is a crucial element in the determination of customary international law is best thought of as a matter of "shared understandings" among states:

> *opinio juris* itself represents a diffuse consensus, a general set of shared understandings among States as to the "legal relevance" of different kinds of behaviour in different situations. Only that behaviour which is considered legally relevant is regarded as capable of contributing to the process of customary international law. (Byers 1997, 19)[5]

The correct picture here is not of a number of independent states pressing voting buttons in secret to arrive at an aggregated vote. Rather, we have a continuous and evolving interchange of ideas and positions, which at some point stabilizes enough to constitute *opinio juris*.

It is true that, if such a view is correct, it will then be difficult to determine exactly when a mere usage has taken on through the development of the *opinio juris* the character of law. Again, though, Byers' account is insightful and persuasive. He argues that there are essentially two aspects to these "shared understandings." First, there is the shared understanding that develops with respect to some given candidate norm of customary international law. But underlying any such individual instance of *opinio juris* is a more important, because basic and enduring, shared understanding, the shared understanding, the *opinio juris*, as to the customary process itself (1997, 19; for the full account, 129–203). What holds international law together as a system, in Byers' view, is a shared commitment among states to developing international law by a customary process. Byers interprets the concrete norms of customary international law as beneficiaries of the *opinio juris* not so much in themselves taken individually, but because these are the norms that emerge from the customary process, which process itself is the prime beneficiary of the *opinio juris*.

Byers' view has the advantage of explaining what is otherwise somewhat distrusted by scholars. Brownlie suggests (1998, 7) that the International Court of Justice demands proof of *opinio juris* as a specific element separate from proof of states' converging practice only in a minority (albeit a "significant minority") of cases. It would then be easy to charge the Court with eliding the difference between customary norm and mere usage, and appropriating to itself a unilateral discretionary power to deem norms to be norms of customary international law. If Byers is correct, such a practice by the Court is defensible, in that states have by their shared understanding concerning the customary process precommitted themselves to the obligatoriness of norms that have widespread acknowledgment and are respected by the Court.

[5] See also Byers 1997, 148. For a more formal and thorough discussion of law as based on shared understandings, albeit focusing primarily on municipal law, see Shapiro 2002; Bratman 2002.

Byers' theory of customary international law as rooted in shared understandings among states as to the customary process is, in my view, valid as an articulation of the truth in voluntarism as a theory of international law (see sec. 8.1). Voluntarism demands too much if it requires specific consent, or even specific acquiescence, to each and every norm by which a state is bound. But voluntarism is correct to base the international legal order on subjectivity—subjectivity construed as a shared understanding of the kind described.

8.5. General Principles

8.5.1. General Principles of Municipal Law

Article 38(1)(c) talks about "general principles of law recognized by civilized nations" as a source for international law. To those who have a predilection of the appropriate kind, it is easy to see this subsection as licensing the legal deployment of principles of natural law. I do not intend to confront directly here such a reading, but neither do I intend to assume it. The natural law reading of subsection (c) derives impetus from the fact that, whatever such "general principles" are, they must be different from treaties and customary rules, for those are named as sources of law in subsections (a) and (b). So what else could they be but principles of natural law? Well, that question is not merely rhetorical. Even though the constraint is valid that "general principles" must be construed as naming a new source of law, other views on the meaning of the phrase are possible. In the majority of instances, justiciable disputes will be resolved by the application of treaties and norms of customary international law. Despite the grand wording of subsection (c), such "general principles" play a relatively minor role in actual international adjudication. We should still, though, investigate their nature.

Let me begin with one general and preliminary jurisprudential point. There has been much discussion in recent legal theory of the concept of a legal principle, stemming from Ronald Dworkin's claim[6] that legal positivism fails as a legal theory because it has no satisfactory explanation of what Dworkin called "legal principles." Defenders of legal positivism pointed out (cf. Shiner 1992, 76–80) that there were a number of ways that the idea of a "legal principle" could be appropriately filled out consistent with legal positivism's basic commitment to institutional sources of law. As we will see in the next paragraphs, many theories of the interpretation of subsection (c) of Article 38(1) are "positivistic" in such a sense. Although I am not going to defend positivism by picking one or more of these theories as correct, it is important to locate their commitments on the jurisprudential landscape.

[6] Dworkin 1978, passim and other writings: see also Volume 11 of this Treatise.

The most common "positivist" interpretation of subsection (c) is to take it as authorizing an international court to employ in adjudication general principles of a fundamental character of municipal law (Harris 1998, 49; Hillier 1998, 84; Brownlie 1998, 16). This is described as the "prevailing view" (Hillier 1998, 84). Instances of such principles that have been applied include the doctrine of *res judicata*, the natural justice principle of *nemo iudex in causa sua*, the principle that any breach of an engagement involves an obligation to make reparation, the right to bring class actions, the doctrine of corporate personality. The English principle of statutory interpretation *expressio unius est exclusio alterius* was held to be a "general principle" within the meaning of subsection (c), while the English rule that grants by a sovereign should be construed against the grantee was rejected as too peculiarly English (The *Abu Dhabi Arbitration* (1952) 1 ICLQ, 247; see Harris 1998, 50). In general, principles of evidence, procedure and jurisdiction are the strongest candidates for "general principles" in this sense of principles of municipal law that can be applied in international law (Brownlie 1998, 16).

As soon as we try to expand the interpretation of subsection (c) beyond this "prevailing view," difficulties arise. The first difficulty is this. Take the case of the doctrine of *res judicata*. There are complex issues in relation to the doctrine of whether a hearing in a municipal court between the same parties on the same issue counts as *res judicata* for the same issue and the same parties in an international court, and vice versa (see Brownlie 1998, 52–4). But the content of the doctrine itself is the same in international law as it is in municipal law. The municipal law doctrine of *res judicata* does not need to be massaged in order to be applicable in international law. On the other hand, take the principle of estoppel (*préclusion*), that a party is prevented by his own acts from claiming a right to detriment of another party who was entitled to rely on such conduct and has acted accordingly. Estoppel is a familiar principle of municipal law, with considerable case law or doctrinal exposition backing it. The case of international law is different. Brownlie confidently asserts that "the principle of estoppel undoubtedly has a place in international law" (Brownlie 1998, 158). He considers its application in the areas of territorial sovereignty (ibid., 158–9), nationality (ibid., 407–9), and agency (ibid., 645–7). However, it is clear from his analysis that, in the first place, the principle is far less developed than it is in municipal law, and, second, the principle operates at a high level of generality. "The 'principle' has no particular coherence in international law, its incidence and effects not being uniform" (ibid., 646). It would be wise not to overstate the "coherence" of the principle of estoppel in municipal law; even so, such scepticism about the principle would not be appropriate for municipal law.

It follows, then, that, to the extent that the principle of estoppel applies in international law, its judicial application is not going to be straightforward as would be that of the principle of *res judicata*. To the extent that it is not, it is

misleading to say that the "general principle" of estoppel in international law is just the principle of estoppel in municipal law in a different context. The principle undergoes some transformation when moved over from municipal law to international law. In what sense, then, is estoppel a "principle" of international law? Not simply in the sense that it is a principle of municipal law applied in a different context.

Theory is now in a quandary. Take a different example. One of Byers' recurrent themes is that customary international law contains four dominant principles—those of jurisdiction, personality, reciprocity and legitimate expectation (Byers 1999, 10 and elsewhere). "Legitimate expectation" is very close to being estoppel under a different name. Yet these "principles" Byers thinks are governing principles of customary international law with the backing of the "shared understandings" he talks about as the basis for customary international law. That is, these principles are sources of international law under the rubric of Article 38(1)(*b*), not (c). How could one make out the case that Byers is wrong, and that estoppel is a principle of international law in the manner of subsection (c), not subsection (b)? It is not clear.

One suggestion is that subsection (c) authorizes the application of "general principles" of municipal law not merely directly, as in the case of *res judicata* and the other examples above, but by *analogy*. Subsection (c) does not say that, of course; but can it be interpreted that way? Degan discusses this suggestion at some length (Degan 1997, 99–104). He is very dubious about the suggestion. He takes argument by analogy to be a specific and (relatively) rigorous form of argument. But so interpreted his view is that it would be hard to apply in the transfer from municipal law to international law. The two forms of law are sufficiently different that, even if the proposed norm is well established in municipal law, its "source and application in international law can be different," with in the end different meanings attached to the same term (ibid., 104). He mentions estoppel as an example. The more that one tries to compensate for these differences by appealing to the principle in a wide range of forms of law, the harder it will be to claim that application of the principle is justified under subsection (c). The reason why all this matters, of course, is that the application of a principle under subsection (c) is not constrained by the *opinio juris*. To authorize without the constraint of the *opinio juris* the use of a principle that to all intents and purposes is a principle of customary international law is to vitiate the *opinio juris* requirement, and thus to depart from the voluntariness constraint on the validity of norms of international law, however that constraint is to be interpreted.

Degan's own approach to subsection (c) is no less controversial. He argues that the subsection refers to "fundamental legal precepts that are a prerequisite for the existence and operation of legal order and are therefore common to all branches of law" (Degan 1997, 99). His list is very different from Brownlie's: (i) the right to existence, or preservation, i.e., survival; (ii) the

right to independence or sovereignty; (iii) the right to juridical equality, i.e., equality in law; (iv) the right to be respected; and (v) the right to international communications (Degan 1997, 84). He tries to insist later that "general principles of law must not be confused with the *rules of legal logic*" nor with equitable principles; "the general principles of law should not be entirely assimilated with the *use of analogy* in international law." The principles must be sought in the positive rules of municipal, international, transnational and supranational law—"the general principles of law thus derived, have little in common with *natural law*, except their very remote origin." "The general principles of law must therefore be considered to be *rules of positive law*. Their legal force ultimately rests on *implication*. We designated some of them as logical prerequisites for the existence of a legal order". "The general principles are, so to say, of *eternal character*. We must not be afraid of this conclusion, although it looks outrageous for a dogmatic positivist" (Degan 1997, 36–8; his italics).

It is not clear that Degan offers us here a jurisprudentially stable position. Degan's account of the institutional roots of "general principles" in municipal law and other settled law is so generous and capacious that it outstrips the kind of positivistic account of legal principle I alluded to above, in terms of, say, principles that are needed to bring coherence to settled law, or principles that are short-hand summaries of settled law. The reference to "precepts which are a prerequisite for the existence and operation of legal order" reminds us of nothing so much as Lon Fuller's doctrine of the inner morality of law (Fuller 1969, 33–41), the presuppositions of legal order. Fuller's view is generally interpreted, and was so intended by Fuller himself, as incompatible with legal positivism, and a form of secular natural law theory.

The moral of our analysis so far is that it is very difficult to interpret "general principles" as it occurs in subsection (c) more generously than as a reference to those general principles of municipal law that can be transferred over readily and without change of meaning to international law. More generous interpretations run the risk of authorizing principles that will lack the necessary voluntaristic backing to be available as principles of international law, however close or otherwise the connection to settled law.

8.5.2. Jus Cogens

The issue of voluntarism becomes more acute when we turn to the international law concept of *jus cogens*. The 1969 Vienna Convention on the Law of Treaties contains these provisions:

Article 53: A treaty is void, if, at the time of its conclusion, it conflicts with a peremptory norm of general international law. For the purposes of the present Convention, a peremptory norm of general international law is a norm accepted and recognized by the international community of

States as a norm from which no derogation is permitted and which can be modified only by a subsequent norm of general international law having the same character.

Article 64: If a new peremptory norm of general international law emerges, any existing treaty that is on conflict with that norm becomes void and terminates.

Such norms form the category of *jus cogens* (Brownlie 1998, 515–7; Harris 1998, 835–7; Byers 1999, 183ff.; Degan 1997, 216–34). Such norms as prohibitions on aggression, genocide, apartheid, slavery, and crimes against humanity are standardly given as paradigm examples of such norms. The essence of *jus cogens* is the inability to derogate. As we have seen, in the case of ordinary norms of treaty law or customary international law, derogation is permitted under defined circumstances. However, South Africa during the apartheid period achieved no success in persuading the rest of the world that it could legitimately position itself as an opponent of the norm against apartheid.

There is a jurisprudential puzzle, however, as to the source of such norms. Brownlie, Degan and Harris all regard *jus cogens* norms as simply instances of norms of customary international law, notwithstanding their peremptory character. A custom of the international legal order not only creates these norms as norms of customary international law, but also adds to them the special qualification of the status of peremptory norms. However, as Byers plausibly argues (Byers 1999, 187ff.), things cannot be so straightforward. Recall the claim that consent in some form must lie at the basis of all international law. Even if we interpret voluntarism in terms of a notion like Byers' of "shared understandings," still the truth in voluntarism must be respected. But then in that case how can the prohibition on derogation central to *jus cogens* be explained? If a norm has status of a norm of customary international law only through States' consent, how can it be binding on States independently of their consent? It is implausible to claim treaties as the source of *jus cogens*, since treaties do not bind universally, and treaties can be readily varied by their parties. General principles within the meaning of Article 38(1)(c) also seem an implausible candidate. However, the relatively minor role played by general principles within the meaning of subsection (c) in the actual practice of international law clashes with the powerful normative status of *jus cogens.*

Again, theorists with a predilection for natural law theory will quickly claim the source of *jus cogens* to be natural law. But it is worth considering whether a "positivistic" account may still be offered. Byers' own solution to the conundrum he has constructed concerning the sources of *jus cogens* relies on his "process" account of the consensual basis for customary international law. He accepts (1999, 190ff.) that in the end *jus cogens* should be seen as part of customary international law, but a distinctive part. In the case of a regular (i.e., derogable) norm of customary international law, the existence conditions for the norm (State practice and the *opinio juris*) are focussed primarily on the substantive content of the norm, rather than on its imperative character. In

the case of *jus cogens*, the substantive content and the imperative character must kept more firmly distinct. The special imperative character of *jus cogens* as peremptory and non-derogable can itself in its own right be the beneficiary of the customary process that Byers has identified as the voluntaristic basis of customary international law. His original puzzle concerning *jus cogens* as part of customary international law depended on not differentiating enough between substantive content and imperative character. If I understand Byers aright, his thought is this. There is nothing in the *process* by which norms of customary international law emerge to prevent the development of a States' practice and the *opinio juris* towards the status of being peremptory and non-derogable in the case of one or more norms of some given content. The status of being peremptory and non-derogable, as it begins to emerge (if it does, and it has), is the beneficiary of States' endorsement and consent. States will, if it is in their self-interest to do so, consent to, or acquiescence in, this distinctive imperative status for customary norms as it emerges. This is an instance of the customary process at work in essence no different from that that happens to the ordinary instances of norms of customary international law. If Byers is right, then, the source of *jus cogens* is properly to be subsumed under Article 38(1) subsection (b), not subsection (c).

8.6. Conclusion

It is clear from the above discussion that it is very difficult to give in the case of international law the kind of systematic account of the sources of law that is possible for municipal law. There may be good reasons, as we saw in Section 8.1, for thinking holistically of an international legal order. But the sources listed in Article 38 of the Statute of the International Court of Justice arguably do not function as sources in the same way as the sources of municipal law. Moreover, there is the further complicated issue of the role of the consent of States. While there are good reasons for suggesting, as theorists have done (see for example Hart 1994; Alexander and Sherwin 2001), that even municipal law must rest on a bedrock of acceptance, still consent has a functional role in international law that it does not have in municipal law. We should expect, then, that the issue of whether the Article 38 sources of international law are "strictly institutionalized sources" of law in the sense of this book will be a delicate matter.

Here is a reminder of the working definition of "strictly institutionalized source of law":

A law, or law-like rule, has a strictly institutionalized source just in case
i) the existence conditions of the law, or law-like rule, are a function of the activities of a legal institution

and

ii) the contextually sufficient justification, or the systemic or local normative force, of the law, or law-like rule, derives entirely from the satisfaction of those existence conditions.

The first clause requires that the existence-conditions of the norms of international law are a function of the activities of a legal institution. There are two ways to approach the possible satisfaction of this requirement. One is to examine the role of given particular institutions within the international legal order as a whole. The other is to consider whether the international legal order as a whole itself may be an "institution" of the appropriate kind.

The previous chapters of this book have shown that, in the case of municipal law, the first approach is the appropriate, and the successful one. However, the discussion in this chapter has revealed the difficulty of taking the same approach to international law. As I indicated in Section 8.1, decisions of the International Court of Justice do not have in themselves any rule-making force. Treaties impose rights and duties, but it is unclear whether a treaty itself counts as an "institution" in any relevant sense. There are many other institutions in the international legal order—The United Nations, the World Trade Organization, the International Labour Organization, and so forth—but these also have no rule-making power in the sense that any norms they promulgate are not directly and in themselves binding. They bind, if and when they do, because they are to all intents and purposes norms of customary international law.

In the case of the second approach, however, there is some prospect of success. Byers argues that the international legal order meets typical sociological standards for being an institution. It would, for instance, especially in its customary aspects, qualify as "an identifiable social convention which results from the convergence of patterned behaviour and actor expectation, and to which States conform without making elaborate calculations on a case by case basis" (Byers 1999, 147). Goodman and Jinks characterize institutions as "the normative, cognitive, and regulative environments in which organizations (and other actors) operate. Institutions thus structure the field of possible action and the ways in which organizations meet specific expectations" (Goodman and Jinks 2003, 107–8). They too are in no doubt that by such a criterion the international legal order qualifies as an institution.

Suppose, then, that we consider the international legal order as an institution, such that its norms exist as a function of its activities. Is it the case that clause (ii) of the working definition is also satisfied? The case would not be easy to make out. Take customary international law, and that element in it characterized above as a committed shared understanding of the customary process as a source of law. In one sense—a very abstract sense—a norm of customary international law is one simply because of the operation of the customary process as a source of law. It is not one because of its content. If we

could be content with such abstraction, then we could claim that customary international law functions as a strictly institutionalized source of law. But if we seek understanding of the way in which international custom functions as a source of law, we need to look far beyond such an abstraction. As Byers argues, at the level of customary international law the traditional distinction between international law as an autonomous science and international relations as a subdivision of political or social science disappears. The customary process at the foundation of international law is a point where international law and international politics merge. But if that is so, then it will be hard to claim that the systemic normative force of a law, or law-like rule, derives entirely from the satisfaction of institutional existence conditions. The "constitution" in the "thin" sense of the international legal order, in short, is a process, not an institution, even there is reason to say it is a process operated by an institution.

As with other chapters in this book, I will refrain from offering a final bottom-line judgment on whether the sources of international law are strictly institutionalized sources of law. They are as they are, and I have tried to show them as they are.

Chapter 9

AUTHORITY

I have to this point in this book used the term "authority" and cognate terms, but I have said nothing about how to understand the concept of authority in the context of an enquiry into legal institutions and the sources of law. That might seem extraordinary, and even perverse, for the following reason. Legal counsel pleading a case or advising a client, judges and other legal officials holding judicial hearings and issuing opinions and verdicts, legal scholars commenting on and analyzing legal decisions—all habitually talk about relevant legislation, or relevant case law, as being the "authorities" for the substantive legal claims that they make. It is of the essence of law as an institutionalized normative system[1] that legal decision-making be based on grounds that are *authoritative* within the normative system. An account of the sources of law, which made no reference to the concept of authority, would seem therefore bizarrely incomplete.

I do not aspire to such incompleteness, and will accordingly discuss the concept of authority in this chapter. However, there is an important methodological reason for leaving the discussion of authority until this point in the book. I shall explain.

The concept of authority in law may be considered in two quite distinct ways, ways which correspond closely to the distinction drawn by Aleksander Peczenik between "contextual" and "deep" justifications for legal decisions (Peczenik 1983, 1; Peczenik 1989, 156–7). I introduced this distinction in the first chapter, and will reintroduce it here. Peczenik defines a contextually sufficient justification as one "within the framework of legal reasoning, in other words, within the established legal tradition, or paradigm." "Deep" or "fundamental" justifications, by contrast, are those from outside the framework of legal reasoning, such as justifications by moral reasoning.

The distinction between contextual and deep justifications subtends a distinction between two different paths to establishing the authority of law, and specifically the authority of the sources of law. The first path would regard law as authoritative, if it is, because law meets the criteria (whatever they are) for being *deeply* justified. The second path would regard law, or a law, or a legal decision, as authoritative, if it is, because law, or that law, or that decision, meets the criteria (whatever they are) for being *contextually* justified. The working assumption of this book is the following. Given that its topic is within general jurisprudence, and is that of legal institutions and the sources of law, then the book must take the second of the two paths outlined above.

[1] For a legal system as an institutionalized normative system, see Raz 1975, chap. 4.

That is, our concern here is with authoritative sources of law in the sense of contextually justified sources of law. It is not with authoritative sources of law in the sense of deeply justified sources of law.

If, however, that is so, then an important issue of methodology arises. Should the articulation of the notion of authority so specified come before or after the detailed account of how different sources of law actually function within the on-going operation of legal systems? It is my fundamental belief, and one on which I have acted here, that the latter is the correct methodological choice. The content of the notion of authority at play in examining legal institutions and the sources of law from the perspective of establishing rules of contextual justification must be given by a detailed account of the way in which legal systems actually treat various sources of law as authoritative. The content of the notion can neither precede, nor regulate nor confine such an account. If you like, a satisfactory theoretical story about the contextual authority of legal sources must be "bottom up," not "top down." We cannot presume first legal positivism, or natural law theory, or legal realism, or any general theory of law, and then apply to legal institutions and the sources of law that theory. We have to lay high-level theory of that kind aside, and first look at how legal systems actually operate with the notion of authoritative sources. That examination then gives us our notion of authoritative source. We can use that notion, if suitable, then to test high-level jurisprudential theories, although I will not undertake that project here.[2]

In one sense, then, this chapter is redundant, for I have already shown how it is that sources of law have authority, how and why legal officials speak of the sources they employ as authoritative. I have done that, even though I have not used the term. But in another sense, this chapter is not redundant. For more can be said about how it is that the first two sentences in this paragraph say what is true, and that is the task I shall actually undertake in this chapter. My view is that contextual authority, if I may call it that, is a distinctive kind of authority. I will proceed to display it as such, and so give the account that this book needs of the authority of institutional legal sources, by comparing and contrasting contextual authority with other examples of authority both inside and outside the law. Contextual authority can only be displayed in context, and can only be philosophically illuminated by comparing and contrasting that context with other contexts.

9.1. Deeply and Contextually Justified Authority: First Thoughts

Discussions of the notion of authority in legal and political philosophy typically begin with the distinction between epistemic and normative authorities, or, in Joseph Raz's terminology, theoretical and practical authorities (Raz

[2] I have undertaken it elsewhere in Shiner 1992.

1986, 29, 52–3). Theoretical authorities are those who should guide belief, and practical authorities those who should guide action. The most commonly discussed kind of practical authority is political authority, the authority of the state. The most commonly discussed issue here is that of the justification of, or the legitimacy of, the authority of the state. The thought is that the state exercises coercive power over our lives—it makes certain kinds of conduct no longer optional, in H. L. A. Hart's famous phrase (Hart 1994, 6). Such coercive power needs to be justified. As Raz's "normal justification thesis" for political authority has it, it must be shown that

> the alleged subject is likely better to comply with reasons which apply to him (other than the alleged authoritative directives) if he accepts the directives of the alleged authority as authoritatively binding and tries to follow them, rather than by trying to follow the reasons which apply to him directly. (Raz 1986, 53)

The authority of a state, which meets this "normal justification" condition, is legitimate authority. It would be deeply justified authority. Legitimate authority is also sometimes called "de jure authority," as opposed to "de facto authority." De facto authority is possessed by a state, which simply as a matter of fact is able to use its coercive power effectively. An unjust state may possess de facto authority even if does not possess de jure authority.

But take now this concept of "de jure authority." "Jure" comes from the Latin word "jus," which is typically translated "right." It does not come from the Latin word "lex," which is typically translated "law." The idea of a difference between "jus" and "lex" is somewhat analogous to the difference between de jure authority and de facto authority. "Lex" signifies simply written law, law that has been enacted, law that is "on the books"—or, to use a more technical term, "positive law."[3] "Jus," however, signifies law that embodies some proper standard of political morality, which is why it is typically translated "right"; "jus" is a value-loaded concept. The notion of positive law is value-neutral; it is just a fact, if it is, that there is a law of a given content on the books in a given legal system.

Let me now continue by focussing on this notion of positive law. (In so doing, I am not adopting the legal theory known as legal positivism. The difference between legal positivism and its natural law opponents is not that one asserts and the other denies the existence of positive law. Rather, it is that, for the legal positivist, positive law constitutes the whole of law, while for natural law theory positive law is only part of law, natural law, and even divine law, being other parts.) Positive law is bound to have a prominent place in any theoretical account of law,[4] just because a legal system is an institutionalized normative system. Legal standards are normative—they impose duties or facilitate action. Legal norms form a system—they interlock and cohere in vari-

[3] "Positive" is derived from the Latin word used to mean, of laws, "enact."

[4] For more on the prominence of positivism, see Shiner 1992, 5–12.

ous ways, and are bounded in various ways. The system that legal norms form is an institutionalized system. That is, the origin, interpretation, and application of the norms occur—at least in the modern municipal legal systems with which readers of this book will be familiar—in a formal social institution created for such a purpose, and standardly are in the hands of officials formally entrusted with such tasks. Legislatures, courts, judges, counsel, and so on are all familiar aspects of a modern legal system. As I have argued elsewhere (Shiner 1998, 137), there is an important difference between art and law when it comes to institutional theories. An institutional theory of art is a revealingly paradoxical theory, foregrounding the externality of aesthetic standards to the work of art itself. An institutional theory of law, by contrast, states platitudes, and could be of value in philosophical disputes only to remind people of the familiar and obvious. Of course, since philosophical puzzlement is frequently engendered by over-elaborating and over-interpreting the obvious, reminders of the obvious have an important place. (For more on these issues of methodology, see Wisdom 1957, 16–101, 112–48; Wisdom 1965, chaps. 1, 6, 9, 11.)

The institutional and the systematic character of legal norms form the background to the notion of contextual legal authority in which we are interested here. Two separate points need to be made. *First*, the institutional character of a legal system means that there can be internal standards of acceptability or validity for legal norms. These internal standards may very well be, and typically are, standards which are "content-independent" in the sense of leaving open questions of the deep justification (if any) for those standards. The resulting validity of such norms is then to that degree arguably a matter of fact, not of value. If a norm gains legal validity as a result of institutional behaviour—say, enactment according to a certain procedure by Congress or Parliament—then that such behaviour occurred is a matter of fact. The kind of fact at issue has been called "institutional";[5] that the norm has been validated also, in the same way and to the same degree, a matter of (institutional) fact. *Second*, the systematic character of a legal system allows for sub-institutions within the legal system to be arranged in hierarchies. In Canada (roughly speaking), within each province there are Superior Courts and Courts of Queens Bench, both subject to the provincial Court of Appeal; each provincial Court of Appeal is subject to the Supreme Court of Canada. In the U.S. (*very* roughly), there are state Superior and Supreme Courts and federal District courts within states, all subject to the U.S. Courts of Appeal in the different circuits; these Courts of Appeal are subject to the U.S. Supreme Court. The effect of these hierarchies is that decisions in cases in lower courts are controlled in various ways by decisions on the same point in higher courts.[6]

[5] Cf. MacCormick and Weinberger 1986, chaps. 1–4, and the earlier philosophical literature to which they refer.

[6] The issue of binding precedent has been discussed in detail in Chapter 3.

The concept of an authoritative source then arises from these two features combined. Judges giving opinions in lower courts standardly refer to the decision of the higher court as "authority" for the case. "Authority" in this specific sense, then, means a source of controlling normative power within an institutionalized normative system, such that the existence of the power is a content-independent matter of institutional fact. By "legal authority" is meant further that the institutionalized normative system in question is a legal system. This is the concept of contextual legal authority that we have been assuming, and that the preceding chapters have been elucidating. It is just a plain matter of fact about how legal systems, as examples of institutionalized normative systems, operate, that this controlling normative power exists. It is a plain matter of fact about the typical municipal legal system that the institutional fact of contextual legal authority exists, and tales the form specified.

9.2. The Authority of Ancient Manuscripts

Let us leave for a while the idea of legal authority, and turn to look at some examples taken from literary studies. The first kind of example I want to discuss is taken from classical studies, though analogous examples could be found in the study of more modern literature.

Everybody knows that the familiar sentences and paragraphs in English (or other native language) that we get our undergraduate students to read when we assign Plato and Aristotle, are translations into English. Plato and Aristotle wrote in Greek, not English. But, they are translations of what? One would think, presumably, it is Plato's and Aristotle's own Greek. But things are not that simple. Some ancient papyrus books survive, and have been discovered in fact to contain segments of the writing of familiar ancient authors. In fact, though, the bases for our present knowledge of ancient texts are manuscript copies (the word is derived from *manus*, hand, and *scriptus*, written), made long ago from still earlier copies. The copying of copies clearly at some point would reach back to the original books, but the material is lost. Take Aristotle's *Physics*, for example. In his classic edition, Sir David Ross lists as leading sources for the text of the *Physics* seven different manuscripts ranging from the tenth to the fourteenth century in age, a translation into Arabic from the tenth century, a paraphrase from the fourth century, and commentators from the third and sixth centuries (Ross 1936, 102–3).[7] Out of these sources comes a text in the form dealt with by contemporary scholars.

Ross refers to these different manuscripts and so forth as "authorities" (ibid.). What is this use of "authority," and how does an ancient manuscript become an authority? The process of establishing a manuscript, or more frequently a manuscript tradition, as authoritative relies heavily on an editing

[7] All these dates are A.D.

process known as collation, a bringing together. Two manuscripts are systematically compared, letter by letter, and the differences between them carefully logged. From such a logging, it is possible to make inferences as to the relations between the manuscripts. Any given manuscript that survives today was created by being copied by hand from some existing manuscript. The copying process of course is not foolproof; that is why even now publishers send out proofs. Among the most common mistakes these copyists made (and we still do) are dittographies (writing a letter or word twice which is written only once in the original) and haplographies (writing a letter or word only once which is written twice in the original), and the well-known error of leaving out one of two lines which start or end with the same word. Now, if in collating two manuscripts, an error appears in one that is not in the other, the presumption is that the error-free manuscript is the earlier, and therefore more likely to be more authoritative as to what the original writer actually wrote. If two manuscripts contain pretty much the same set of errors, then the later one does not provide any independent support for the authority of the earlier. Ross refers to ancient commentaries on Aristotle's *Physics* as "sources." These provide some external control on later manuscripts in case where they quote Aristotle's own words. Since they were writing much closer to Aristotle's own time, the presumption is that they are more reliable as to what he originally wrote, even if they were themselves working from copies.

By this kind of collating, a picture can be built up of the independence or dependence of surviving manuscripts on each other. The more a given wording is attested to by manuscripts reasonably believed to be independent of one another, the more likely it is that such a wording is authentic. For whole stretches of text, there is unanimity or near-unanimity on the wording; without that, it would be hard to imagine our being able to say that we had the text of Aristotle at all. Such unanimity is at the core of the notion of an authoritative text of an ancient work.

The ground begins to soften where there are differences among manuscripts, which cannot be explained through collation as copyists' errors. The softening has two main aspects to it. The first is the copyists themselves. Some were copying-machines, as it were; but many were learned scholars in their own right not above introducing their own ideas as to what Aristotle must have been trying to say and their own choices among then-existing variant readings. The second is the contemporary editor him- or herself, in two ways—in that they too make choices among variant manuscript readings as to the one they think most likely to be authentic, and in that they too introduce their own emendations if they are convinced that no surviving manuscript can possibly be representing the original aright. Choice among variants and emendation clearly rely heavily on the editor bringing an interpretation to the text, whereas the other ways of establishing textual authority are interpretation-neutral. The conscientious editor, of course, and most of them are, will dis-

play in footnotes the main alternate readings to the ones chosen, and defend any original emendations. But still a process of interpretive choice is at work.

9.3. Interpretive Authority

Although my focus here is on the idea of textual sources as authoritative, let us continue for a moment with the notion of an authoritative interpretation. The notion is familiarly in play in the arts when we think of a performer interpreting a piece of music, or of a director interpreting a play or a legend. There are uninteresting parsings of the expression "authoritative interpretation." A musical performance may be termed "authoritative" when it is delivered with great confidence and panache, or when it happens to coincide with how the critic thinks the piece should be played. A more interesting parsing for our purposes is when the expression is used to assert that a particular performer's interpretation sets a new and high standard—a precedent, even—as to how the piece ought to be played, or when a director's interpretation sets a new and high standard for how a play ought to be staged.

The logic of interpretive judgments in art criticism, of course, is a huge and contested topic. In my view, which of course I cannot now defend,[8] is that, whatever degree of subjectivity there is in interpretive judgments, it is not complete. Such judgments are to a degree rationally answerable to features of the artwork being interpreted, and debate about the most preferable, or the most authoritative, interpretation is to that degree rational debate. When a critic backs up a claim of authoritative interpretation by pointing to the score, playing extracts from this performance and that performance, referring perhaps to the history books, and so on, they are providing logically appropriate support for the judgment of authoritativeness. True, such judgments do not attain the cogency of judgments of logical validity, or of plain empirical fact. There is still room for talk of interpretive choice, for determined maintenance of one's own view, and like supposed indicia of subjectivity. Nonetheless, many features of interpretive judgments, and a fortiori of judgments of interpretive authority, would have to be papered over and ignored before such judgments could be plausibly said to be wholly subjective and not rational.

It is important not to let go of this interim conclusion. We are going to begin shortly working back from claims of interpretive authority towards legal authorities and the authority of legal texts. The point from which the return journey starts is well inside any perimeter to rationality, which may be marked by claims that are wholly subjective. We shall want to use claims of interpretive authority as a contrasting case, but the point of the contrast does not rely

[8] Some indication of how I would defend the view may be found in Shiner 1978; 1988; 1996; 1997.

on the thought that these claims are not rational. Rather, it relies on identification of the kind of rationality they really do have.

9.4. Ancient Authorities Revisited

At the end of Section 9.2, I talked about two ways in which an element of interpretive choice entered in to an editorial decision about what wording is to be regarded as authoritative. Let us now lay aside those cases, and concentrate on the core notion of authority in play. Let us return to Ross and the *Physics*, and look at the more general picture of the manuscript tradition. Ross points out (Ross 1936, 105–7) that, unlike most cases, collation of the *Physics* manuscripts does not reveal clear family-trees. Rather, while there are "main branches" (he identifies three), the copyists of the extant manuscripts must have had others available to them at the time, and made use of them to introduce variants at the time of copying, leading to "constant criss-crossing between the main branches." No single manuscript or family, then, is the authoritative manuscript throughout. Different manuscripts must be considered authoritative for different stretches of the work; agreement between two or more of the main branches is crucial (Ross 1936, 115).

I want to emphasize two things about this notion of authority. First, note how grounded the notion is. Notwithstanding the role of copyist or editorial choice, there are stable criteria, applied through the operation of the process of collation between manuscripts themselves and between manuscripts and ancient commentators, for when a particular manuscript is authoritative as to the correct wording of the text of the *Physics*. The criteria are internal to the world of classical scholarship, and institutionalized to the extent that that world is institutionalized. There is a well-understood normative practice in place to ground the determinations of authoritativeness and authority.

Second, notice that the manuscript itself, the text itself, is the authority. In the case of the ancient commentators, scholars do speak of the commentator himself—Simplicius, or Themistius—as the authority for a given reading of the text. In the case of manuscript, the manuscript itself, usually either named after the place where it is preserved—the Vatican museum, for example—or given an arbitrary name of a single letter by the scholarly tradition, is the authority. No doubt, if in fact the names of copyists were known, and if there had been reasons for individuating particular copyists, things might have been different. But we have no such information and no such reasons, and scholars are quite comfortable with referring to manuscripts, or sentences in manuscripts, as authoritative.

9.5. Legal Authorities Revisited

How similar or different, now, is the notion of an authoritative legal text, or a court decision as an authority? First, note that there is a comparable kind of

anonymity with respect to legal authorities, an anonymity that leads to either the text of the statute or the text of the majority opinion in the case being regarded as authoritative. In the case of statutes, it is true that courts may refer to "Parliament" or to "Congress" as the source of the authoritative text. But the reference is never made more specific than that; there is no talk in courts of law of "the Liberal majority in 1996," or "the 1996 Chrétien government" being the source. Courts speak this way because of underlying constitutional conventions about the relation of the legislature to the courts in a democratic system of government. But those conventions are not part of the practice of acknowledging the authority of statutes. In the case of written legal opinions, again, if the opinion is a majority opinion, the opinion is considered the opinion of the court; its author is not named. In the case of minority or dissenting opinions, the author may be more often named, but by no means invariably.

Socio-legal studies, particularly of a Critical Legal Studies or legal realist orientation, has made much of this anonymity. The argument is made that such anonymity is a convenient fiction which allows individual judges to ward off responsibility for, and give the semblance of neutrality to, what is purely political decision-making. Moreover, it is argued, it is clear that certain judges' opinions matter more than others; it's the judge, not the judgment, that cuts the ice. I do not think, though, that the notion of authority in play here in the legal context can be so readily reduced to a version of personal authority. Take a case where it is clear that any authority belongs to the individual making the judgment, not the text of the judgment itself. Take art criticism. It's clearly the critic him—or herself—Arthur Danto, Linda Nochlin, F. R. Leavis, Pauline Kael, Deryck Cooke—who is the authority, not the text of their writings. Those texts become authoritative only derivatively. And even so, in art criticism at least, the notion of "authority" in play is much weaker in any case. But the court's opinion in a controlling case does not possess only a shadow authoritativeness derived from the stature of the judges who wrote it and signed on to it. The opinion is given its authoritativeness by the institutionalized normative system of which it is a part.

The authority of legal texts is different in this way even from the authority of ancient manuscripts. We could well imagine that, were the appropriate sort of information available to underwrite the change, it did happen that ancient copyists themselves became authorities, rather than their manuscripts. Not a great deal otherwise would change in how contemporary editors go about establishing what is the most authoritative text for an ancient work. But, if the legal system were to be run on such an individualized system of authoritativeness, it would be a radically different institution, and have to have radically different goals, than as presently understood. It is true that certain judges may acquire an especial reputation for jurisprudential sagacity, and so their word may become authoritative in something like the sense in which we speak of Albert Einstein as an authority on physics, or J. G. A. Pocock an authority on

the eighteenth century. But these are exceptional cases, and only serve to highlight the way in which the notion of authority in the legal context normally functions in a quite different way.

Second, the rules, whether written or conventional, of the institutionalized normative system which is the legal system provide a grounding for the authority of authoritative legal texts which is stronger even than that provided by the conventions of classical scholarship for the notion of manuscript authority. Consider the relation of courts to legislatures in the familiar kind of democratic system of government. While an entrenched constitution may give courts some power to invalidate legislation, fundamentally courts are bound by legislation. They can, and do, interpret the wording of statutes; but they cannot change the wording. Likewise, within a given jurisdiction, lower courts will be bound by precedent decisions of higher courts on the material point of law. Courts standardly distinguish between "authoritative" or "binding" precedent and "persuasive" precedent (see sec. 3.2.2 above). As things now stand the British Columbia Court of Appeal is "bound" by decisions of the Supreme Court of Canada, whereas it is not "bound" by decisions of the U.S. Supreme Court or the House of Lords, or by decisions of the Alberta Court of Appeal, for that matter. It may consider and take what it will from decisions of courts of another jurisdiction, but it cannot be "required" to follow those decisions. It is required to follow decisions of the Supreme Court of Canada.

Those are just plain facts about how the Canadian legal system operates, stated in the language the system itself uses. These facts give us the notion of legal authority, and the bindingness of legal authority. Now, of course, it is possible (and in the end perhaps even necessary) to ask theoretical questions about exactly what "binding" means in the expression "binding authority." I undertook that project in Chapter 3. My point now is that, whatever it means, the idea of legal authority is grounded in the rules of the legal system as institutionalized normative system. Those rules give a formal bite to the notion of authority that is lacking in any other of the instances of authoritative texts we have considered.

9.6. Post-post-modernist Conclusions

Much—most, even—of what I have been saying may be making some people very uneasy. I have been talking about the institutions of law, classical scholarship and art criticism. I have been talking about them as if they and their properties were plain facts in the world, and as if talking about them is a matter of giving their descriptions. Where have I been in the last twenty years, it might be asked? Hasn't it been shown without a doubt that "facts" such as these—facts about social institutions—are socially constructed facts, not facts in the world, and discourse about them just that, discourse and not description?

There is, I confess, a background agenda to this chapter. It would suit me fine to achieve some deconstructing, as it were, of talk about social constructions. Of course, language is a social construction: What else could it be? But this truth does not license sceptical inferences to the effect that any description of the world using language must be epistemologically or otherwise suspect. Different cases are different, even if we need to use language to draw attention to the differences. Talk of "social construction" is worthwhile, when it serves to bring out unnoticed, or under-noticed, features of cases. There is an arguable point to referring to taste in art as socially constructed. The difference between the appeal of a twentieth-century Abstract Expressionist painting and the appeal of a seventeenth-century Baroque painting is not at all like the difference between something sweet and something sour. But we lose the capacity to state that difference in a meaningful way, if we insist that the difference between a sweet taste and a sour taste is "socially constructed."

Likewise with respect to the cases discussed here. There is considerable point to showing how cultural differences affect artistic interpretation, and thus to remarking how the authoritativeness of artistic interpretation is socially constructed. But the potential role of cultural factors is considerably reduced in the case of authoritative manuscript texts of ancient works, because of the mechanical character of the process of manuscript collation and the durability of the results based upon it. In the case of authoritative legal texts, claims of authority are even more grounded in well-understood and well-accepted institutional norms, the existence of which is a matter of fact.

It is possible to argue that, because the norms governing the authoritativeness of legal texts are the norms of a social institution, these norms are "social constructions." Such a claim might serve to mark a difference between the authority of a legal text and the hardness of a rock or the softness of a melting ice cream. But the remark would simultaneously obscure the equally important difference between the authority of a legal text and the authority of a manuscript reading or of an artistic interpretation.

The authority of a legal text is an idiosyncratic form of authority, internal to the legal system of which it is a part. It is in important ways both like and unlike the two forms of literary authority with which I have compared it in this chapter. It is a form of political authority, because a legal system is an important element of the political system of which it is a part. But legal authority is not reducible to political authority either. It is the kind of authority, which exists, in an institutionalized normative system between different parts of the system, with whatever differentiating characteristics flow from the system in question being a legal system. Contextual legal justification is a form of justification, and contextual legal authority a form of authority, both in their own right, and not simply as bastard or derivative versions of deep justification and political authority.

INDEX OF SUBJECTS

abrogative power of legislation 14, 37–9, 68–9, 77–81, 140
Abu Dhabi Arbitration (International) 211
acceptance of law 46, 116, 208–9, 215
acquiescence, in international law 207–8, 215
act-based sources of law 152
ACTV v Australia (Australia) 131–2
AGWA v Armstrong (Australia) 42
Alberta Act (Canada) 127
Alberta Human Rights Act (Alberta, Canada) 130
  mediation under the Act 109–11
    distinguished from labour arbitration 110–11
    power of mediator 110
  provisions summarized 109–10
Alberta Human Rights Commission 131
  powers under Alberta Human Rights Act 109–10
Allgemeine Staatslehre 156–7
Alternative Dispute Resolution
  forms distinguished 104–5
analogy
  in international law 212–13
  in municipal law 30–1
Anglo-Norwegian Fisheries Case (International) 207–8
Anns v Merton (U.K.) 53
Arbitration 86–103
  in international law 201
arrêts de règlement 174–5
art
  institutional theory of 222
  interpretation of 225–6, 229
    not subjective 225
atypical sources of law 161
Atlas Tiles v Briers (Australia) 43
audi alteram partem 123
Austin, J.
  on parliamentary sovereignty 19, 38–9
  theory of custom 77–81, 183
  theory of delegation 85, 112
  theory of international law 195
authority 5, 10, 12, 18, 20, 35, 39, 41–2, 47, 67–8, 74, 76, 83, 85–6, 89, 94, 98–101, 104–5, 110, 113, 116, 122, 193, 219–29
  "contextual" 219–23, 228–9
    distinguished from "deep" 219–20, 229
  de jure and *de facto* distinguished 221
  epistemic and normative distinguished 220
  interpretive 225–6
  legal 225–9
  normal justification thesis 221
  of ancient manuscripts 223–5, 226–7, 229
  personal 227
  political 221, 229

Bank of Montreal v Abbott (Canada) 108
Bank of Nova Scotia v Elsaesser (Canada) 107
Bates v Arizona (U.S.) 16
bindingness, of legal sources
  erga omnes 170–2, 174, 175, 178–9
  inter partes 170–2, 175
British North America Act (Canada) 121, 133, 135
  preamble to 135–9
Bryant v Foot (U.K.) 73, 77
BTC v Gourley (U.K.) 43

Canada Act (U.K.) 121
Canada Post v CPAA (Canada) 96
Canadian Bill of Rights 120, 124
case (legal), defined 31–2
Cassell v Broome (U.K.) 45
Cattle v Stockton (U.K.) 48
certainty, legal 10–11, 15, 59, 61, 67, 70, 72, 92, 95, 102, 136, 195
Charter of Rights and Freedoms (Canada) 1, 13, 19, 120, 124, 126, 129–31, 134–5
charter or bill of rights 5, 25
  distinguished from constitution 119–20
Cheney v Conn (U.K.) 18
civil law tradition 5, 63, 153–5
codification 9–10
  in civil law 155–9
coherence 4
collation, of manuscripts 224, 226
comity, judicial 27, 43–5, 52, 55
common law 31, 138

common law tradition 63
Complete Book (of legal decisions) 28–9, 37
consolidation 10–12
consent
  in international law 197–8, 208–9, 214–15
  in municipal law 8, 20
constitution
  as foundational law 128
  as fundamental law 128
  as meta-source of law 162–3
  as self-validating 115–17
  as supreme law 125–7, 132–8
  conventions of 122–4, 133, 137
  distinguished from charter or bill of rights 119–20
  flexible and rigid distinguished 122, 125, 159–61
  in civil law 159–67
  institutional design of 124–7
  material and formal distinguished 146, 165
  octroyée 157
  of Australia 119, 131–2
  of Canada 119–22, 125
    patriation of 121, 123–4
    unwritten principles of 132–8
      as fundamental law 132–8
      "text-emergent" and "free-standing" distinguished 139
  of France 156–7, 162, 188
  of Germany 125, 160–1, 163, 188
  of Italy 160, 163, 164–5, 166
  of New Zealand 119
  of South Africa 125, 129, 214
  of United Kingdom 119, 125, 132–9
  of United States 119, 122, 125
  "reading in" provisions of 129–31
  "thick" sense of 117
  "thin" sense of 7, 19, 115–17, 128
    applied to international law 197–8, 217
  unwritten and written contrasted 123, 135–6
  usages of 123, 206
Constitution Act 1867 (Canada) *see British North America Act*
Constitution Act 1982 (Canada) 119, 121–2, 125, 127, 133, 135
Constitutional Court
  in France 129
  in Italy 163, 165
    sentenze additive and *sentenze sostitutive* 178–9
  in Germany 163
  in South Africa 129
constitutional revision 160, 162–3
constitutionalism 118–19
  in Canada 136–8
  in France 156
  in Germany 156–7, 160–1
  in Italy 164–6
  in USA 166–7
constitutionalisation 154–8
contextually sufficient justification 3–4, 7, 26, 94, 103, 197, 219, 229
contracts
  as source of law 168–72
  collective 171–2
Corte di Cassazione, Italian 175, 176
Criminal Code (Canada) 129
Critical Legal Studies 24, 227
Critical Race Theory 24
Crouch v Crédit Foncier (U.K.) 67
Cullen v Trappell (Australia) 43
custom 1, 3–5, 22, 38, 63–84, 127, 138, 140, 201
  as a part of the legal system 8, 184–5
  as continuous 71
  as derived from the authority of the people 180–1
  as exceptional 69–70
  as from time immemorial 70, 205
  as limited 69–70
  as recognised by judges 80–1, 183–4
  as requiring *opinio juris* 71, 181–2
  as susceptible of legal regulation 182–3
  Austin's theory of 77–8
    criticized 78–81
  certainty of 72
  consistency of 72
  constitutional custom 122–4, 186–7
  conventional custom 67–8, 187
  general custom 65–6
  history of 63–5
  in civil law 179–87
    secundum legem 185–6
    praeter legem 185–6
    contra legem 185–6
  in municipal and international law contrasted 204–6
  local custom 64–67
  peaceable enjoyment of 71
  reasonableness of 72–7, 79, 83
  relation to legislation 39, 68–9, 77–8, 81
  relation to precedent 68–9, 77–8, 80–4
  validity of 77–84

customary international law 63, 198–201, 204–10, 212, 216
customary process of 209–10, 216
distinguished from norms of 209–10, 214–15
usages in 206

Davis v Johnson (CA, U.K.) 44
Davis v Johnson (HL, U.K.) 34, 45
decodification 161
deconstitutionalisation 165–6
deep justification 3–4, 26, 94, 103, 219, 229
delegation 1, 5, 8, 22, 38, 85–113
as subordinate to legislation 85–6
defined 85
labour arbitration as source of law 86–103
mediation as source of law 103–12
status as source of law ambiguous 112–13
democracy, democratic politics 9, 11, 22–5, 118–19, 137–8, 140
derivation 38, 68–9, 77–8, 85–6
distinguished from abrogation 38, 78
determinatio 23–4
dialogue
between legislature and courts 126–7
Dickason v U of Alberta (Canada) 111
direct source of law 4
discretion 46–8, 51, 56, 71, 74–7, 79, 81–2, 85–6, 104, 210, 209
having and exercising distinguished 75–6
of human rights mediator 110–11
of labour arbitrator 93–7
strong and weak distinguished 75–6
distinguishing (a precedent) 34–5
tame and strong view contrasted 35
dogmatics, legal 1
Donoghue v Stevenson (U.K.) 53–5
Duport Steel v Sirs (U.K.) 44–6
Dworkin, R.
defender of judicial review 24
Hercules the judge 11
on integrity as legal value 4, 60
on legal principles 28, 164, 210
on precedent 29
enactment vs. gravitational force 46–7, 55
on strong and weak discretion 47, 75–6
on the limits of law 116

economic loss (pure) 47–8, 53–4, 59–60
Edelstein v Schuler (U.K.) 67
equity, equitable principles 1, 3–5, 86, 108, 111, 139, 201, 213
estoppel
in international law 211–12
in labour arbitration 90–5
EC/EU law 188–9
competences of 188, 190
decisions 189
directives 189, 191
national implementation of 189–93
recommendations 189
regulations 189, 191

TABLE OF CONTENTS

A Note on the Author XI

Preface XIII

Chapter 1 - Legal Doctrine and Legal Theory 1

1.1. Introduction 1
1.1.1. The Purpose, Method, and Materials of This Volume 1
1.1.2. Legal Doctrine and Legal Dogmatics 1
1.1.3. Particular and General Doctrine 3
1.1.4. Justification, Description, Explanation 3
1.1.5. Influence of Legal Doctrine 6
1.1.6. Kinds of Legal Research 8
1.2. General Legal Doctrine 11
1.2.1. General Legal Doctrine and Normative Legal Theory 11
1.2.2. Defeasible Norms of General Legal Doctrine 13
1.3. The Sources of Law 14
1.3.1. Causal Factors, Legal Justification, and Sources of Law 14
1.3.2. Classification of the Sources of Law 15
1.3.3. Legal Doctrine as a Source of Law 17
1.4. Statutory Interpretation 17
1.4.1. Types of Argument in Statutory Interpretation 17
1.4.2. Systemic Arguments 19
1.4.3. Restricting and Extending a Norm's Area of Application 20
1.4.4. Analogy 20
1.4.5. Teleological Construction of Statutes 24
1.5. Interpreting Precedents 25
1.5.1. What Is Binding in a Precedent? 25
1.5.2. The Binding Force of Precedent 26
1.5.3. Justification of Precedent 27
1.6. The Doctrine of Fact-Finding 28

Chapter 2 - Particular Legal Doctrine 31

2.1. Preliminary Remarks 31
2.1.1. Juristic Theories 31
2.1.2. The Distinction between Public and Private Law 34
2.1.3. Inner and Outer System in Private Law 34
2.1.4. Principles of Private Law 35

2.2. Philosophical and Juristic Theories of Property 38
2.2.1. Philosophical Theories of Property 38
2.2.2. Juristic Theories—Transfer of the Right of Ownership 39
2.2.3. Benson's Formalistic Analysis of Property 41
2.2.4. Philosophy as a Tool of the Doctrine of Property 42
2.3. Juristic Theories in Contracts 43
2.3.1. What Justice? What Freedom? 43
2.3.2. The Binding Force of Contracts 45
2.3.3. Moral Philosophy, Economics, Legal Research 45
2.3.4. Good Faith 46
2.3.5. The Theory of Assumptions 47
2.4. Juristic Theories in Torts 48
2.4.1. Philosophical Theories of Justification in Tort Law 48
2.4.2. Ernest Weinrib's Theory of Corrective Justice in Torts 49
2.4.3. The Pro Tanto *Locality of Corrective Justice in Torts* 50
2.4.4. Three Intellectual Moves of Legal Doctrine 51
2.4.5. Theories of Negligence 52
2.4.6. Theories on Adequacy in Torts 53
2.5. Some Theories of Criminal Law 55
2.5.1. Philosophical Justification of Punishment 55
2.5.2. Some Juristic Questions 57
2.5.3. Dolus *Crimes and* Culpa *Crimes* 58
2.5.4. Causation in Criminal Law 59
2.6. Law and Economics as the Main Juristic Theory? 61

Chapter 3 - Criticism and Defence of Legal Doctrine 65

3.1. Criticism 65
3.1.1. Reform Movements and the Alleged Deficiencies of Legal Doctrine 65
3.1.2. The Alleged Irrationality of All Normative Theories 68
3.1.3. Indeterminacy and Façade Legitimation 69
3.1.4. Ontological Obscurity 71
3.1.5. Unjustified Normative Claims 72
3.1.6. The Risk of Fragmentation 73
3.1.7. Unscientific Character 73
3.1.8. Philosophical Background of the Criticism 75
3.2. Defence of Legal Doctrine 76
3.2.1. The Copernican Turn: Philosophy Tailored to Legal Doctrine 76
3.2.2. Saying and Doing in Legal Doctrine 77
3.2.3. The Philosophical Background of Anti-Critique 78

3.2.4. Contextually Sufficient Justification and Preference for Weak Theories 79

Chapter 4 - Law and Morality 81

4.1. Links between Morality and Law 81
4.2. Natural Law 83
4.2.1. Strong Natural Law 83
4.2.2. A Recent Development: Weak Theories of Natural Law 85
4.2.3. The Claim to Correctness 86
4.3. Exclusive Legal Positivism 87
4.3.1. Exclusive Legal Positivism—The Normative-Meaning Component 87
4.3.2. Defeasible Grundnorm*, Conditional* Grundnorm*, and Transformation into Law* 90
4.3.3. Positivist and Non-Positivist Criteria of Valid Law 92
4.3.4. Progressing Sophistication 94
4.3.5. Political Legitimacy instead of Philosophical Justification 95
4.4. Inclusive Positivism and Propositions *de Lege Lata* 95
4.4.1. Legal Positivism Inherent in Legal Doctrine? 95
4.4.2. Inclusive Legal Positivism and Tuori's Critical Legal Positivism 96
4.4.3. Criteria of Validity and Hypothetical Imperatives 99
4.4.4. The Fused Descriptive and Normative Modality of Propositions de Lege Lata 100
4.5. The Justification of Morality 102
4.5.1. Positivism, Natural Law, and Moral Theory 102
4.5.2. The Controversialism of Strong Moral Theories 102
4.5.3. Strong Contractarianism 102
4.5.4. Weak Contractarianism 104
4.5.5. Society-Centred Moral Normativity 105
4.6. Pluralism and Common Ground in the Law 107
4.6.1. The One-Right-Answer Ideal and Moral Relativism 107
4.6.2. Plurality of Cultures 109
4.6.3. The Plurality of Objective Values in General and the Common Core 111
4.7. Social Normativity, Morality, and the Law 112

Chapter 5 - Coherence in Legal Doctrine 115

5.1. Weighing and Defeasibility 115
5.1.1. Space for Defeasibility and Weighing in Legal Justification 115
5.1.2. General Theories of Weighing 118

5.1.3. Extending the Domain of Reason 119
5.1.4. Decisive Reasons, Defeasible Reasons, Rules, Principles 121
5.1.5. Defeasibility, Not Indeterminacy 123
5.1.6. Logic and Rhetoric in Legal Argumentation 125
5.2. Reflective Equilibrium in Legal Doctrine 127
5.2.1. Wide, Constrained, and Segmented Reflective Equilibrium in Legal Doctrine 127
5.2.2. Equilibrium around Platitudes—Philosophical Background 129
5.2.3. The Philosophy of Platitudes for Legal Doctrine 133
5.2.4. Reflective Equilibrium and Society-Centred Morality 136
5.3. The Coherence of Legal Knowledge 137
5.3.1. Aspects of Coherence in Legal Doctrine 137
5.3.2. Foundationalism, Scepticism, and Coherentism 139
5.3.3. Conceptions of Coherence 140
5.3.4. A Complex Web of Big Circles 143
5.3.5. Epistemic Coherence, Truth, Knowledge, and Segmented Coherence 144
5.3.6. Criteria of Coherence in Legal Doctrine 146
5.3.7. Coherence over Time 147
5.4. Coherence and Justice in Law 149
5.4.1. Coherence in Practices and Norms, Not Only in Knowledge 149
5.4.2. Justice as the Weighing of All Considerations 151
5.4.3. Different Justice in Different Contexts? 152
5.4.4. Procedural Justice? 153
5.4.5. Justice, Coherence, Law, and Morality 154
5.4.6. The Importance of Justice for Judges, Legal Scholars, and Politicians 156
5.5. Coherence and Concepts in Legal Doctrine 158
5.5.1. Value-Open Legal Concepts and the Nature of Things 158
5.5.2. Intermediate Concepts 160
5.5.3. Concepts and System 162
5.6. Is Coherence Contrary to Facts? 163

Chapter 6 - Metatheory and Ontology for Legal Doctrine 167

6.1. The Question of Cognitivism 167
6.1.1. The Controversy over the Truth of Normative and Evaluative Statements 167
6.1.2. Normative and Descriptive Meaning 167
6.1.3. Four Possibilities 169
6.2. Ontology for Legal Doctrine 170
6.2.1. The Problem of the Ontology of Law 170

6.2.2. Law as a Dependent Entity 174
6.2.3. A Theory of Legal Conventions and Institutions 176
6.2.4. The Law as a Product of Convention and Morality 177

Chapter 7 - Conclusions 179

Bibliography 181

Index of Subjects 193

Index of Names 197

A NOTE ON THE AUTHOR

Aleksander Peczenik—born in Kraków (Poland) in 1937—studied law in Kraków and later in Stockholm (Sweden) and received a doctoral degree in law in Kraków and a doctoral degree in philosophy in Lund (Sweden). He has served as professor of jurisprudence in Lund since 1978 and as Samuel Pufendorf Research Professor in Lund since 2003. He is president of the International Association for the Philosophy of Law and for Social Philosophy (IVR). Peczenik's focus of research is the theory of legal argumentation and epistemology, and especially the coherence theory in law and justice. He has published nine books, among which *On Law and Reason* (Kluwer, 1989). One of his roughly 150 scholarly papers is entitled "The Passion for Reason" (in Luc Wintgens, ed., *The Law in Philosophical Perspectives*, Kluwer, 1999), which summarizes his scientific views. In another article, "A Theory of Legal Doctrine" (*Ratio Juris* 14, 2001), there is set out an earlier version of the theory developed more fully in this *Treatise of Legal Philosophy and General Jurisprudence*.

PREFACE

One cannot write a volume of this kind without the help of many people. At the formative stage, my theory of legal doctrine was influenced once and for all by the late Professor Kazimierz Opałek of Jagiellonian University in Kraków. Later on, I had the privilege of closely cooperating with Aulis Aarnio and Robert Alexy. Lars Lindahl helped me to see things in a more profound manner than I otherwise would have been able to do.

Zenon Bańkowski, Christian Dahlman, Svein Eng, Jaap Hage, Kaarlo Tuori, and Jan Woleński commented the manuscript of this volume in a very helpful and constructive manner. My intention was to adjust the text to all the comments. Only in exceptional cases, was that impossible because it would lead to complex and profound philosophical discussion, exceeding the limits of this volume. It is needless to say that I bear the sole responsibility for all the shortcomings of this volume.

Giovanni Sartor and those who took part in the seminar in jurisprudence at the Lund University, especially Uta Bindreiter, Christian Dahlman and David Reidhav, made important comments. At decisive moments, I received inspiration from Wlodek Rabinowicz and Johannes Persson of the Philosophical Institution in Lund, and from Matti Sintonen of Tampere. The Faculty of Law in Lund has created in recent years excellent working conditions. Enrico Pattaro made the whole project of this *Treatise in Philosophy of Law* possible.

I cannot mention here all the people I should thank for their support and inspiration. I know that this volume delivers more questions than answers. Some answers are certainly imperfect. Better ones may come later on when the new generation takes over.

Lund University
Law Faculty

If we will disbelieve everything, because we cannot certainly know all things,
we shall do much what as wisely as he who would not use his legs,
but sit still and perish, because he had no wings to fly.

(John Locke)

Chapter 1

LEGAL DOCTRINE AND LEGAL THEORY

1.1. Introduction

1.1.1. The Purpose, Method, and Materials of This Volume

The primary aim of the present volume is a rational reconstruction of legal doctrine.

By "rational reconstruction" is meant the activity of explaining fragmentary and potentially conflicting data by reference to theoretical objects in the light of which the data is seen as relatively coherent, because presented as part of a complex, well-ordered whole (MacCormick and Summers 1991, 19; cf. Eng 1998, passim).

This volume is based on the following materials:

- published writings of legal scholars;
- the practice of teaching of law;
- *travaux préparatoires* and other documents originating from lawmakers;
- the published written opinions of higher courts;
- writings in legal history; and
- writings in philosophy.

Because of my European background, the present volume will deal mainly with continental European legal doctrine. But legal doctrine in common-law countries is not essentially different from European doctrine.

1.1.2. Legal Doctrine and Legal Dogmatics

There is one kind of legal research prominent in professional legal writings, such as handbooks, monographs, commentaries, and textbooks of law, that implements a specific legal method consisting in the systematic, analytically evaluative exposition of the substance of private law, criminal law, public law, etc. Although an exposition of this kind may contain historical, sociological, philosophical, and other considerations, its core consists in the interpretation and systematization of valid law. More precisely, it consists in a description of the literal sense of statutes, precedents, etc., intertwined with many moral and other substantive reasons. One may call this kind of exposition of the law "legal doctrine."

Terminology is not uniform. Legal doctrine may be called, for example, "analytical study of law" or "doctrinal study of law." The word "legal science" (*scientia juris*, *Rechtswissenschaft*), frequently used in many European coun-

tries, is ambiguous. It may refer to legal doctrine, either pure or containing elements of legal sociology, history, etc. It may also refer to any kind of legal research. Another term is "constructive legal science" (cf. Agell 2002, 246ff.).

Legal doctrine is often called "legal dogmatics" (*Rechtsdogmatik*). The term has an established meaning well known among continental law theorists. Indeed, this volume deals with legal dogmatics on the understanding of this discipline that has obtained among these theorists. In Anglo-American legal theory the term "legal dogmatics" is not so well known, however. It also produces misunderstandings among legal researchers who dislike the word "dogmatic" because it calls up the idea of "narrow-mindedness," or something like it. For these reasons, I will avoid using this term in the present volume. I do this with regret and in the hope that the situation will change in the future and that the term "legal dogmatics" will be used consistently in all jurisprudential contexts.

The term "legal doctrine" refers in this volume to the activity of scholars as well as to the products of this activity, that is, to the content of books and research. My original intention was to write about the products rather than about the activity. But an understanding of the products very often requires reference to the activity.

Legal doctrine picks up questions from legal practice and discusses them in a more general and profound manner. But the perspective of the legal scholar differs in some respects from the perspective of a judge.

- A legal scholar has no power to make binding decisions. Scholars choose their subject matter freely. The claims, demands, and motions of the parties, on the other hand, bind the judge.
- Judicial argumentation pays attention only to information that, at most, is indirectly relevant to the case under consideration. In contrast, scholars express themselves in a more abstract manner and are less oriented towards actual cases and facts. The scholar uses many examples of actual as well as hypothetical situations.
- Scholars seek out problems, whereas judges confine themselves to the problems that are necessary for the case in adjudication.
- The scholar may freely make recommendations *de lege ferenda* and even boldly propose new juristic methods, whereas the judge must make correct decisions in the light of the prevailing legal method.

Scholars must argue explicitly. Judges, in contrast, may rightly feel that the decision is justifiable and yet find themselves in a position where they are unable to formulate a satisfactory justification. Moreover, in many cases, the judge has no time to prepare a general and extensive justification. Finally, when a number of judges decide a case jointly, they must often find an acceptable compromise. In some cases, only a less extensive and less general justification can satisfy this demand.

1.1.3. Particular and General Doctrine

Particular legal doctrine describes the structure of the law (the so-called outer legal system) and develops justificatory standpoints for various parts of this structure (the so-called inner legal system).

There also exists a general legal doctrine. It is a discipline in itself rather than fragments used within particular legal doctrine. Traditionally, this part contains the theory of the sources of law and the theory of legal argumentation. These two theories are central in legal doctrine in this sense: Almost all other theories belonging to legal doctrine include theoretical assumptions about the sources of law and about statutory interpretation.

There is an interplay between general and particular legal doctrine: Particular theories use arguments justifiable in general doctrine; general theories, for their part, generalize results obtained from different particular theories.

Moreover, general legal doctrine derives its best examples, inspiring theory construction, from various parts of particular legal doctrine. This must be so, because particular legal doctrine in various parts of the law gets integrated with a tacit knowledge in the respective legal disciplines. Lawyers often know how to perform legal reasoning without being able to tell why they do what they do. Theories of particular legal doctrine express verbally a part of this tacit knowledge, thus converting it into explicit legal knowledge, in turn funnelled into general legal doctrine.

This dynamic of legal doctrine explains the never-ending quarrel between scholars in general legal theory and scholars in particular legal disciplines, such as private law and criminal law. The former tend to forget that their roots are in particular legal doctrine, thus sliding more and more into philosophy. They risk becoming second-class philosophers, no longer jurists at all, doing work that is trivial and sterile. The latter, on the other hand, risk losing the self-reflective insight that can only come to hand at a higher level of abstraction. Moreover, they tend to do unnecessary work, since the basic problems of legal doctrine are the same in most particular disciplines.

1.1.4. Justification, Description, Explanation

Legal doctrine is committed to justifying its statements. Karl Popper's famous contrast between the context of discovery and context of justification thus applies to it (cf. Anderson 1996, 11–6, quoting widely known works of Wasserstrom and MacCormick; cf. Bergholtz 1997, 69ff.). But it is not entirely clear what exactly the word "justification" means in the context of legal doctrine.

All kinds of legal doctrine claim to be justified in a stronger sense than that of lay description and judgment. Claims to justification sometimes mean the same as claims to objectivity. Legal scholars are expected to be more objective than attorneys, for example. It is acceptable for an attorney to interpret the

same law differently in different trials, depending on the client's interest. By contrast, it is not acceptable for a scholar to advocate opposing views in different legislative committees, etc.

Legal scholars with scientific ambitions sometimes present legal doctrine as an explanatory enterprise. Were this description accurate, legal doctrine would be a branch of the sociology of law. However, the word "explanation" often conceals the normative aspect of legal doctrine. Thus, Jan Hellner (2001, 38ff.) writes about many kinds of explanation. Hellner's typology is descriptive, and based on interesting examples. Reprocessed in a more analytical manner, it boils down to this: "Explanations" in Hellner's meaning can be the same as conceptual analysis of legal concepts and rules, especially through clarification of their connections with other concepts and rules.

Explanations can also be causal. Historical explanations describe the causal links that legal rules have with their background history, with the history of legal institutions, with the history of society as a whole, or with the history of political, philosophical, and other ideas. Sociological explanations of legal rules are of a similar kind, but they emphasize the present state of society, not its history.

However, such legal scholars as Hellner also write about justificatory, or normative, "explanations," that is, justifications of legal rules through the legal evaluations of the members of society, through considerations of justice, or through rational will, interest, etc. Some justificatory "explanations" give certain legal rules their legitimacy. Functional, final, and teleological "explanations," mentioned by Hellner, also have a normative character.

One may wonder how an outstanding scholar can confuse justification with explanation. One reason for this confusion can be the unconscious self-defence of a scholar who intends to effect a "science of law" in an objective, value-free manner and so tends to conceal justification behind the façade of explanation.[1] Another reason is deeper. Such terminology reveals a tension in legal doctrine between doing and saying. Scholars do both description and valuation; they speak mostly about description and are almost ashamed to do valuation. Indeed, the work of legal doctrine is usually value-laden. To be sure, jurists draw a distinction between conducting a cognitive inquiry into the law as it is (*de lege lata*) and making justified recommendations for the lawgiver (*de lege ferenda*). But as every legal scholar knows, the distinction between *de lege lata* and *de lege ferenda* is not clear-cut. Legal doctrine pursues a

[1] This "scientist" attitude in legal doctrine follows a similar attitude in the social sciences in the first half of the 20th century, when causal and functional explanation was often perceived to be less problematic than intentional explanation. But this view was facing serious criticism so early as the 1970s and 80s. Thus, Jon Elster (1983, 1989, and 1999) criticized functional, institutional, and other sociological explanations of action; in his opinion, action can only be explained intentionally, in the light of rational-choice theory. But this theory, too, is overly formalistic for legal doctrine.

knowledge of existing law, yet in many cases it leads to a change of the law (Peczenik 1995, 312ff.). Thus, legal doctrine appears to be descriptive and normative at the same time. Dreier (1981, 90ff.) makes the following example. Consider two competing theories in contracts, the will theory and the declaration (reliance, trust) theory. According to the first, a party is in principle not bound by declared contract terms that unintentionally end up conflicting with the real will expressed when concluding the contract. According to the second, the declared will takes precedence over factual will, because the other party must go by what was stated. How does one test which theory is right? If the theories are descriptive, the test is in their coherence with the words of the statute and with factual judicial practice. If the theories are normative, the ultimate test lies in the justice and reasonableness of their consequences. In practice, both kinds of testing take place.

Svein Eng has put forward a more general theory on the descriptive and the normative element in legal language and argumentation (Eng 1998, chap. 2, Sec. F; Eng 2000, passim; Eng 2003, chap. 2, Sec. F). According to Eng, statements *de lege lata* have a "fused descriptive and normative modality." They are neither purely descriptive nor purely normative. If a discrepancy emerges between one lawyer's statement de *lege lata* and the opinion of other lawyers in that same regard, the lawyer who made the statement may either align it with the other lawyers' opinion or uphold the statement despite the other lawyers' differing opinion. In the first case, statements *de lege lata* appear to be descriptive; in the second, normative. But there are no rules at the level of legal language or of legal methodology that may help us determine usual kinds of *de lege lata* statements by lawyers as either descriptive or normative. We will return to this theory later on.

This tension between description and change in legal research *de lege lata* has a parallel in the tension between the maximalist goal of classical natural-law doctrine—i.e., arriving at necessary substantive principles—and the more modest goal of the historical school, that is, finding only a general legal method by which to interpret and systematize positive law. According to Savigny (1993, 197), legal doctrine does not create settled rules, but a method that continually changes the rules (cf. Sandström 1989 and 1993; Peterson 1997).

This mixture of description and recommendation becomes apparent when one asks the question, Who profits from legal doctrine? An attorney, it is true, may profit from legal doctrine using doctrinal writings to make predictions about future judicial decisions. Such predictions are possible because legal doctrine describes the law. But high-court judges, too, can use legal doctrine, not to predict their own decisions, of course, but to learn what decisions would be normatively correct. These two clients of legal doctrine, attorney and judge, correspond ideally to its two aspects, description and recommendation.

Legal doctrine is Janus-faced: It aims to attain a knowledge of the law. At the same time, it is a part of the law in the broadest sense, for it participates in developing the norms of society.

1.1.5. Influence of Legal Doctrine

Once the normative aspect of legal doctrine is recognized, one may ask about its influence on the law and legal practice. In studying legal research, we find explicit and implicit reasons to think that legal doctrine produces beneficial effects, such as:

- giving the law precision, coherence, and a transparent structure;
- promoting justice and morality, as by interpreting old law in a new way;
- promoting trust in the law;
- promoting the globalization of law, considering, inter alia, that scholars maintain international contacts; and
- promoting stability in a world dominated by political dynamics.

One may even call these effects the functions of legal doctrine but this may drag us into a functional sociology with all its attendant problems.[2]

The importance of legal doctrine varies in different countries and historical periods. In Rome, Augustus granted to certain prominent jurists the right to answer questions of law by authority of the Emperor: *Ius publicae respondendi ex auctoritate principis*. The so-called citation-statute of A.D. 426 accorded a binding force to the books of Papinian, Paulus, Ulpian, Gaius, and Modestinus and regulated in detail these jurists' authority. Medieval Europe was under the dominating influence of the legal *communis opinio doctorum*, based on Roman sources and embraced by the majority of celebrated legal writers, mostly French and Italian. In a monumental work, Lars Björne summarizes the subsequent evolution as follows. In 18th-century aristocratic society, the role of legal doctrine was confined to description and to piecemeal, technical refinement of the law. In the 19th century, its role expanded to include innovative claims and pioneering work, exerting a great influence on the law. In the 20th century, its influence ebbed again. The democratic establishment of the present time needs jurists as little as did the aristocratic establishment of the 18th century. Moreover, human rights now overshadow the normative work of legal doctrine, just as 18th-century natural law did.[3]

It is not easy to map out the factors that make legal doctrine important. Let me only mention two facts coinciding with the emergence of the grand

[2] We may also list the following functions of law, and so of legal doctrine: (1) governing the conduct of people, (2) contributing to the distribution of goods, (3) fulfilling expectations, (4) solving conflicts, and (5) propagating ideals and values (cf. Aubert 1975).

[3] Björne 2002a, 241–2, referring to Björne 1995, 1998, and 2002b.

style of legal doctrine in Germany in the early 19th century. The first was political dynamics and crisis: the atrocities of the French revolution, the Napoleonic wars, the emergence of the new system of German states after the Congress of Vienna. The second was philosophical dynamics and crisis: Natural-law philosophy lost ground in favour of Hegelianism and the historical school. In a world of unsure politics and equally unsure philosophy, lawyers attempted to attain intellectual certainty by shaping legal doctrine for coherence. Both factors exist even today, after the two world wars, the collapse of ideologies, the outcry of post-modernism, etc. No one knows whether this situation will promote a revival of legal doctrine. Too many other factors are involved to make possible any sensible prediction. Let me make one example. One would have expected legal doctrine to play a big role in the process of unifying European law. But this role is proving to be lesser than expected.

The role of legal doctrine varies as well in different parts of the law. For example, it is often weaker in environmental law than in other areas of regulation. One reason for this may be that experts in environmental law are frequently involved in political controversy. Moreover, the principles of traditional, public, criminal, and civil law are old, as opposed to the now emergent environmental law. Finally, it is difficult to achieve coherence between traditional private law—highly informed by the idea of individual autonomy—and environmental law, by definition concerned with common values shared by all.

In general, legal doctrine exerts a significant influence in creating law. For example, in many countries legal researchers join legislative committees. Moreover, in international relations, model law (a kind of soft law) is often made by bodies of professors, sometimes having a tenuous authorization (as from the U.N.) and recognized as authoritative.

An important question in this context is whether legal experts exert a real influence on political solutions or only on political rhetoric. Politicians often use legal doctrine as a drunkard uses a lamppost: To get support rather than to get light. But whatever intentions they have, they need to be alert to the possibility of criticism from jurists and—more important—from voters, who often demand consistency, coherence, legal certainty, predictability, and, not least, justice and objectivity.

The influence of legal researchers is great on the courts as well. In many countries, law professors are appointed to serve as members of the courts, especially supreme courts and constitutional tribunals. It is a known fact that judges read books written by legal scholars, sometimes quoting them and sometimes not, depending on the tradition of the country, but it is unreasonable to assume that they ignore them.

Among the institutions and channels of influence open to legal doctrine, one may mention, too, legislative councils (*conseil constitutionel* in France, *lagrådet* in Sweden, etc.), advisory committees of constitutional tribunals (as in Poland) and the opinions delivered by faculties of law.

An interesting problem is the relation of legal doctrine to politics.

Legal doctrine can be used in the service of politics: Politicians establish goals and values; legal scholars help convert these into draft law.[4] This is the only option when juristic theories are weakly developed and do not lead to any extensive *communis opinio doctorum*. This may also be justifiable in the face of strong social pressure for change. But there is also a limit. If the pressure for change conflicts too much with the moral expectations of the members of society, legal doctrine should rather act in a reactionary manner, aiming to slow down the pace of change.

On the other hand, politics is conducted within the frame of the law: Politicians initiate legislation within the framework constructed by legal scholars. Thus, legal doctrine may produce exceptions to statutory rules. A more interesting phenomenon is that it may produce "subsidiary" general norms (principles and rules) to which the statutory rules are exceptions. For example, scholars of civil law have developed such norms as the negligence principle and *pacta sunt servanda*. They also have developed clusters of norms specific to such general theories as the theory of adequate causation in torts and the theory of assumptions in contracts (which see Chapter 2 below). Particular legislation has introduced specific rules that may be regarded as exceptions to such norms.

1.1.6. Kinds of Legal Research

Legal argumentation is not uniform. There exist various legal roles and corresponding types of argumentation. Judicial argumentation cannot ignore the judge's duty to make binding decisions, regardless of whether the reasoning employed is conclusive or not. Moreover, the procedural framework binds the decider and the parties.

Argumentation in legal scholarship varies with each kind of legal research. For example, one can distinguish the following kinds of legal research:

- particular legal doctrine;
- general legal doctrine, coupled with normative legal theory;
- general description of the law and conceptual analysis;
- sociology of law;
- descriptive meta-theory;
- critical legal theory and applied normative philosophy.

Of course, each kind is an ideal type, legal research being a mixture of any number of these types.

[4] The Swedish MP Lars Erik Lövdén once said that law is nothing but an instrument of politics.

A jurist may attempt to elaborate a "scientific" legal theory—one that is value-neutral. For example, she can present a general account of legal method. She may thus describe the sources of law (statutes, precedent, *travaux préparatoires*, etc.) and modes of legal reasoning (by analogy, teleological, systematic, etc.). Using Hart's somewhat strange term, one can call such description a descriptive sociology. It often employs conceptual analysis. Hart is again a good example, since he succeeded to integrate the analysis of fundamental legal concepts with the general description of the legal system.

The genesis of such description is complex. A big part of it developed out of legal research, purified of normative components; another part originated from philosophy and the sociology of law.

The general description of law can morph into a professional sociology of law. The sociology of law studies causal, structural, and functional connections between legislation, legal practice, legal research, and a number of social factors. In particular, a sociologist of law can inquire into the psychological motivations behind the legislative process, as well as behind judicial decision and scholarly texts. The sociology of law can provide useful information for legal practice and legal doctrine alike.

Going deeper, the legal theorist may realize that describing the law must be philosophically problematic. For instance, this cannot be done in the language of strict empirical science. To make any such description meaningful to a lawyer, the theorist must speak of valid statutes, precedents, interpretations, etc., as if these were physical objects, even though they obviously are not. Moreover, one can suspect that the concept of law is not a given, but is rather an outflow of analytical, descriptive, normative, and metaphysical reflections on the law.

The legal theorist will then realize that legal method makes sense when a certain philosophical position (or theory) is assumed, and will make no sense at all when another is assumed. She can even note that different fragments of legal method make sense under different philosophical theories.

If she is a philosophical relativist, she will stop there. Jerzy Wróblewski, for instance, consciously adopted this way of working (cf. Wróblewski 1992; Peczenik 1975b). He thus formulated theories about the ideologies of statutory interpretation. His project can be characterized as follows: Its philosophical basis—meta-theoretical relativism—is not philosophically neutral; it has its background philosophy, namely, relativism; it is totally devoid of normative components; it assumes—at least tacitly—that science must be non-normative. The lack of normative components will savour of sterility to lawyers seeking advice on how to answer normative questions, about statutory interpretation, for example.

Critical legal theory and applied normative philosophy are normative. The borderline between legal doctrine and critical legal theory is unclear. All legal doctrine includes normative components. But legal scholars usually play down

their genuine normative standpoints and harmonize them with values implicit in the law itself. If a scholar exceeds the limit of contextually acceptable valuation, she will either conceal it or enter the realm of critical legal theory.

Critical legal theory always has a philosophical background. It therefore deserves the name "applied normative philosophy." But applied normative philosophy is not always critical. It may also be aimed at understanding the law and at a profound justification of it.

When working in applied normative philosophy, a theorist makes some basic normative assumptions, preferably taken from the rich tradition of moral philosophy, and applies them to the law. A normative theory can take any number of philosophical theories as its basis. I will mention only some of the more influential ones, namely, Aristotle's rhetoric and theory of practices, Kant's philosophy of practical reason, utilitarian moral philosophy, and communitarian or Hegelian philosophy, in which normativity is made to arise from society.

Gerald Postema has elaborated a radical version of the view that jurisprudence is a practical philosophy. He states what follows:

> Philosophical jurisprudence [...] is in the first instance a practical, not a theoretical study. It is a branch of practical philosophy. (Postema 1998, 330)

> The recognition of a practice as normative arises from observation of a people engaging in a living, functioning practice, not of participant's beliefs about it. (Ibid., 355–6)

In general, we need to be conscious of the following problems:

- Some (though hardly all) legal theorists believe that a "scientific" theory of law cannot be normative.
- Normative issues in philosophy are notably controversial. Different philosophical views can carry incompatible normative consequences.
- There is no neutral criterion of choice between them.
- Each such philosophy can be paraphrased in numerous ways.
- There is also the possibility of combining them with one another.

For example, Åke Frändberg (2000, 654ff.) advocates a value-free, scientific legal theory. This view must, however, be interpreted restrictively. We can ask some rhetorical questions in this regard. What is to count as a "scientific" theory? Only natural science or also what are called the social sciences? For example, isn't sociology normative? Maybe it is normative but not scientific. Is the philosophy of science scientific? Popper's philosophy of science, for example, assumes some methodological rules. Does this fact make it unscientific? Some epistemologists (e.g., Pollock 1986, 123ff.) write of epistemic norms: Does that make epistemology unscientific? The concept of justification is normative: Should science then evade justification? Even logic is normative in a sense, since it formulates rules of logic. Frändberg is no doubt

aware of these problems. What he finds objectionable in a theory of law, then, is not that it includes norms, but more specifically that it includes moral norms.

The Anglo-American discussion about the descriptive versus normative character of legal theory includes increasingly sophisticated interpretations of few standard-setting authors, such as Hart and Dworkin (see recently Coleman 2002, 311–51).

1.2. General Legal Doctrine

1.2.1. General Legal Doctrine and Normative Legal Theory

Classical German *Juristische Methodenlehre* (e.g., Larenz 1983) delivers the best examples of general legal doctrine. General legal doctrine describes and systematizes legal sources and legal arguments. It therefore codifies the legal method used in particular legal doctrine and in judicial practice. As part of legal doctrine, it is also a part of the law in the broadest sense.

Not only is general legal doctrine general in its content, but large tracts of it remain relatively uniform as we pass from one modern legal order to another. This is certainly the case when it comes to interpreting statutes. In a study on the operative interpretation of statutes by courts of law in nine very different countries—a study undertaken from the point of view of legal doctrine (MacCormick and Summers 1991, 462)—important similarities have been discovered to exist between the major types of arguments that figure in the opinions. There were also found to exist similarities in the materials incorporated into the content of such arguments, as well as in the main patterns of justification involved, in the ways of resolving conflicts between types of argument, and in the role of precedent in interpreting statutes. There are differences, too (ibid., 463ff.), for example, between conceptual frameworks and justificatory structures. Thus, in continental systems, justification is often presented as deductive, explicit, or enthymematic; in the United States and the United Kingdom, the basic model is an alternative discursive justification (cf. ibid., 492ff.). The overall impression is that of a large crowd of crisscrossing and difficult-to-explain differences: Certainly, not all of them follow the distinction between continental and common law. All fall within the same legal culture. Though the study is directly concerned with statutory interpretation by the courts, its findings are applicable to statutory interpretation by legal doctrine as well.

General legal doctrine is a cluster of theories that differ by their age, geography, and generality.

- Some are traditionally juristic; others are more abstract and philosophically oriented.

- Some have attained greater sophistication in the common-law environment; others are more sophisticated in continental law.
- Some have developed relatively uniformly across different parts of the law and across various legal systems; others are rather local and fragmentary.

There is also, at law schools, a tradition of legal theory that the English-speaking world often refers to as jurisprudence. But what is legal theory?

> It has many names: general theory of law, theory of state and law, *allgemeine Rechtslehre*, jurisprudence. Its content is a mixture of legal philosophy, methodology of law, sociology of law, logical analysis of normative concepts, some comparative law and some study of national positive law. The didactic value of legal theory is great. It can give students of law elementary information about philosophy and social doctrines. I believe that such information can facilitate the work of lawyers. The scientific value of legal theory is, however, problematic. Nobody can be competent in philosophical, logical, sociological and legal disciplines at once. The progress of doctrine is rapid. A lawyer, even if working in legal theory, needs greater effort to become an expert in some *part* of logic *or* philosophy *or* sociology. In order to do any creative work of value, he must rather find a topic whose discussion requires a combination of his *legal* qualification with his general knowledge of the mentioned extra-legal disciplines [...]. But if such a topic cannot be found at all, a specialist in legal theory would soon only be a teacher while his scientific position would recall that of a hero in A. Bester's science fiction: Education: none. Skills: none. Merits: none. Recommendations: none. (Peczenik 1971b, 17)[5]

The normative theory of legal doctrine is just such a research topic (cf. Peczenik 1966 and 1967). It is similar to the theory of science (cf. Peczenik 1974, 9ff.), a product of self-reflection by legal scholars. Its primary aim is the rational reconstruction of legal doctrine. It provides standards of rationality for legal doctrine. It is—again—Janus-faced: It studies legal doctrine (its object of study), but at the same time has much in common with traditional methods of legal doctrine. It optimizes legal doctrine by generalization. In fact, legal doctrine is itself a kind of rational reconstruction of the law. The main difference is that normative legal theory operates on a more fundamental level of inquiry, thus pushing rational reconstruction a step further.

Normative legal theory is the continuation of a research program that in the mid-19th century culminated with the German juristic encyclopaedias (see Brockmöller 1997, 137ff.). These encyclopaedias, framed to attain the most general knowledge of the law, border between general legal doctrine, analysis of legal concepts, and sociology of law.

Normative legal theory is a theory about legal doctrine at the same time as it makes up the most general part of legal doctrine. This normative theory should properly take the somewhat strange name "general part of general legal doctrine." One can also call it "legal doctrine driven to the extreme."

The law theorist is identified as one who acts as a liaison between law and philosophy, providing philosophical tools and philosophical insight for jurists

[5] Quoted by van Hoecke 1985, 7. Van Hoecke 1985 has a different conception of legal theory, but this is another story.

and juristic data for philosophers. Normative legal theory needs bridges to normative, moral, and political, philosophy. Its most general theories, such as conceptual jurisprudence (e.g., Puchta) or the jurisprudence of interests (e.g., Jhering; Heck 1968) come quite close to the philosophical level of abstraction. And yet it is a juristic discipline, relatively stable and relatively resistant to the moods of philosophical fashion—albeit only *relatively* so. Thus, the success of analytical philosophy in the first half of the 20th century doubtless affected general legal doctrine. Even if doctrine never fully adjusted to analytical philosophy.

1.2.2. Defeasible Norms of General Legal Doctrine

Some norms that have developed in legal doctrine—source norms—determine the hierarchy and importance that various sources of law, such as statutes, precedents, and *travaux préparatoires*, have in the legal system.

Other norms of legal doctrine—reasoning norms—regulate legal reasoning; in particular, they indicate how one should construe statutes.

Reasoning norms and source norms come into existence by effect of the interplay between legal practice and legal doctrine, but legal doctrine formulates them in a more explicit manner. Thus we have, among other things, treaties and textbooks on legal method.

Reasoning norms and source norms are defeasible. Much of this volume deals with defeasible theories, defeasible norms (rules and principles), and defeasible beliefs. It is not only a rule's validity that makes the rule applicable to the case considered; what is equally important is that no defeating reason intervene which, if added to the rule, makes it inapplicable (see Section 5.1, *infra*, on defeasibility).

Reasons are often defeated by weighing. In a concrete situation, sufficiently strong reasons may outweigh each reasoning norm and each source norm. In other words, such norms have a *pro tanto* character. One may also say that these norms are outweighable.

In some earlier writings (e.g., Peczenik 1989), I characterized them as *prima facie* rules. But the term *pro tanto* is better (Rabinowicz 1998, 21; cf. Kagan 1989, 17; Peczenik 1998b, 57). In particular, the idea of weighing reasons seems natural for *pro tanto* reasons but inappropriate for *prima facie* reasons. Certain considerations may appear *prima facie*—at first sight—to be reasons for a decision or a judgment, only to prove irrelevant when one takes into account other aspects of the situation. A *prima facie* reason can be *undercut* by other aspects of the situation and then drop out of sight altogether. To put it differently, *prima facie* reasons are not a special kind of reason. They are ordinary reasons that come to bear in the light of what we presently know or take into consideration. If new knowledge intervenes that changes what we know, they may turn out not to be reasons at all. Not so with *pro tanto* rea-

sons. These reasons normally prevail but may be outweighed if the situation strays from normal. In other words, they can never be undercut but only outweighed in some cases by reasons to the contrary, if the latter are stronger. Since they can be outweighed, they are contributive, not decisive reasons.

Source norms and reasoning norms have an analytic dimension, too: They are bound up with the concept of legal reasoning. One may disregard any one of these norms singly, but it would be strange to simultaneously reject a significant part of the set comprising the same norms and still try to engage in legal reasoning.

One may inquire whether a source norm or a reasoning norm is justifiable. This question presupposes some normative standards other than the source norm itself. Such standards are thinkable in the realm of profound—ultimately moral—justification, as when it is said that some source norms are more just or more democratic than others.

One may also inquire to what extent such norms are dependent on the written and unwritten norms of the state's constitution. This relationship is quite complex.

- Obviously, the constitution can defeat norms formulated in legal doctrine; it can establish exceptions to such norms.
- On the other hand, the constitution is open to interpretation in view of these norms.
- Moreover, these norms are common to many legal orders, whereas a constitution is always linked to a particular state.
- The basis of legitimacy for these norms is, at least *prima facie*, independent from the constitution: Legitimacy is a matter of legal culture, not of enacted law.

1.3. The Sources of Law

1.3.1. Causal Factors, Legal Justification, and Sources of Law

There are several kinds of non-legal factors that influence legal decision-making causally; among these we have:

- the media;
- the views expressed by private organizations;
- the intentions of the government and other political agents, often expressed in a formal manner, especially when these intentions reflect influential political values;
- influential values in civil society, political ideologies, standards of political correctness, etc., expressed in the media, in political lobbying, etc.; and
- viewpoints formulated by international organizations, influential though lacking the formal authorization of international law.

Some of these factors may increase the legitimacy and authority of decisions. This is a complex problem, considering that legitimacy and authority are particularly complex concepts (cf. Biernat 1999). Documents affecting decision-making causally sometimes gain so much authority that decision-making courts or authorities may openly quote them. One may say, then, using a more or less established Scandinavian terminology, that causal factors convert into sources of law.

Sources of law are one kind of authority reasons. One proffers an authority reason when supporting a certain legislative, judicial, or other decision by circumstances other than its content.[6] All texts, practices, etc., that a lawyer must, should, or may proffer as authority reasons are sources of law in the sense adopted in this volume.[7]

The list of sources of law changes over time. Thus, statutes and custom had a special position in the 19th century in the classical continental doctrine of the sources of law. They created legal rights and duties for private persons, and also determined the limits of legal argumentation (cf. Malt 1992, 55ff.). Classical doctrine recognized as well a number of secondary sources of law (argumentative auxiliary tools) such as "the nature of things," legal practice, *travaux préparatoires*, and foreign law (ibid., 52). Scandinavian legal realists, notably Torstein Eckhoff (cf. Eckhoff 1993, 17ff.), replaced this doctrine with a more extensive list of "source factors" influencing legal decisions. Thus, Eckhoff listed administrative practice, among other things, and also accepted valuations as one such factor.[8] In time, the realists presented a more sophisticated view, including in the list of sources of law only such factors as precedents and *travaux préparatoires* (cf. Schmidt 1957).

Enrico Pattaro in Volume 1 and Roger Shiner in Volume 3 of this Treatise provide an extensive analysis of the sources of law.

1.3.2. Classification of the Sources of Law

Legal doctrine often assumes that the sources of law are hierarchically ordered. Thus, the following can be said of Sweden, and indeed of many other states (Peczenik 1989, 319ff.; MacCormick and Summers 1991, 422ff.).

All courts and authorities must use applicable statutes and other regulations in the justification of their decisions.[9] The expression "other regula-

[6] The term "authority reason" has been introduced by Summers (1978, 707ff.). Cf. Peczenik 1989.

[7] I do not discuss other senses of the term "source of law" (cf. Ross 1929, 291, and Raz 1979, 45ff.).

[8] In an extreme form, this approach has led to an absurd "breakfast jurisprudence." In the 1960s, Ivar Agge of Stockholm argued the sources of law to consist of all factors having a conscious or unconscious effect on legal decision-making. It may be may asked, then, whether this list of factors might include a bad breakfast that should cause a judge to be grumpy.

[9] The problem of the direct effect of EU law is left out of account here.

tions" refers to general rules issued by the government as well as by subordinate authorities and municipalities.

When performing legal reasoning, one should use precedents as authority reasons, and in some countries, legislative preparatory materials if any are applicable.[10] When doing legal reasoning, one may use the following materials, among others:

- custom (but only where it does not constitute a must-source or a should-source of law);
- writings in legal doctrine;
- foreign law, unless incompatible with any overriding reasons, such as the so-called *ordre public*.

Of course, this enumeration is anything but exhaustive (see Peczenik 1989, 319ff.).

The classification discussed is an idealization. We can work out increasingly complex classifications of the sources of law. Moreover, only vague definitions of "must-sources," "should-sources," and "may-sources" of law are universally acceptable. The precise interpretation of these concepts varies from one legal order to another, from one part of a legal order to another, and from one period to another. Different people will suggest different precise interpretations serving different purposes.

The following comments elucidate the complex meaning of "must," "should," and "may."

- "Must-sources" are formally binding *de jure*; "should-sources" are not.
- The consequences of disregarding "should-sources" are usually milder than the consequences of disregarding "must-sources."
- "Must-sources" are more important than "should-sources," which in turn are more important than "may-sources."

Thus, reasons strong enough to justify disregarding a less important source may be weaker than those required to justify disregarding a more important one. If a collision occurs between a more important source and a less important one, the former has priority, provided no overweighing reasons reverse the order of priority. If we assign priority to a less important legal source over a more important one, we will have the burden of arguing this priority. Overweighing reasons are thus required if we are to follow a precedent contrary to the plain meaning of a statute. A more important *pro tanto* legal source can, however, have a lesser weight than a number of less important ones combined. A number of precedents can thus jointly weigh more than the

[10] One should also use international conventions underlying applicable to national legislation, together with preparatory materials and other interpretational data relative to these conventions.

literal meaning of a statute. A counterargument that "wins" against a stronger source of law must be stronger than a counterargument sufficient to win against a weaker one. In sum, the hierarchy of legal sources is defeasible.

The doctrine of the sources of law faces the problem of globalization, however. There appear new sources of law that are not always precise in character and status. The grounds of their binding force are reason, pedigree, and practice—any combination of them. Let me make some examples:

- UN resolutions;
- human rights;
- commercial custom;
- foreign precedents;
- arbitration;
- recommendations of more or less authoritative organizations;
- other soft law; and
- more or less globalized doctrine.

1.3.3. Legal Doctrine as a Source of Law

Legal doctrine is a source of law that a jurist may take into account as an authority reason. In other words, one may pay attention to theses developed in legal writing not only because of the quality of the reasons proffered therein, but also due to the authoritative position that legal writers occupy. It is a well-known phenomenon that a doctoral dissertation gains in authority the moment its author becomes a professor of law.

Legal doctrine has been a source of law of varying importance in the course of history. But legal doctrine is more than merely a source of law. It is a rational description and refining of the law, and it claims (at least occasionally) to tell us what the law actually is. In other words, legal doctrine has a twofold nature: It is, on the one hand, a relatively subordinated source of law and, on the other, the best presentation of the law itself.

Why is legal doctrine authoritative? The answer is, because of the quality of argumentation it typically produces. Legal doctrine delivers rational arguments; hence the presumption that it should be regarded as authoritative. A more profound answer is that it gains authority because *pro tanto* well informed, coherent, and just.

Thus, legal doctrine converts reason into authority.

1.4. Statutory Interpretation

1.4.1. Types of Argument in Statutory Interpretation

Argumentation in law applies to many things: evidence at trial, the interpretation of contracts, the establishment of a *ratio decidendi* at common law, and so

on. Here, I deal only with the arguments used in statutory interpretation. Statutory interpretation lies at the core of legal method. It has a long history (see Raisch 1995). Friedrich Carl von Savigny (1840, 206ff.) put forward the most influential classification of the elements of statutory interpretation in Germany, and indeed in the whole of continental Europe. There are four such elements: logical, grammatical, historical, and systemic. Statutory interpretation is an organic coming together of all four. The subsequent evolution of legal method brought in one more element: goal interpretation. The most complete and sophisticated treatise on statutory interpretation is Jerzy Wróblewski's (1959), unfortunately accessible only in Polish. Wróblewski describes interpretive directives in three contexts. In the linguistic context we have syntactic and semantic directives; in the systemic context, directives on consistency, completeness, and hierarchy within the legal system; in the social-political context, directives on the goals of law. There are also second-order directives for choosing from among interpretive directives. Normative theories of interpretation are either static or dynamic. Static theories emphasize stability; dynamic ones, the adaptation of law to the needs of life.

The following argument types are used in statutory interpretation:

Linguistic Arguments
1. The argument from ordinary meaning […]
2. The argument from technical meaning […]

Systemic Arguments
3. The argument from contextual-harmonization: The governing idea here is that, if a statutory provision belongs within a larger scheme, whether a single statute or a set of related statutes, it ought to be interpreted in the light of the whole statute in which it appears […]
4. The argument from precedent […]
5. The argument from analogy […]
6. Logical-conceptual argument: The governing idea here is that, if any recognized and doctrinally elaborated general legal concept is used in the formulation of a statutory provision, it ought to be interpreted so as to maintain a consistent use of the concept throughout the system as a whole, or relevant branch or branches of it.
7. The argument from relevant principles of law […]
8. The argument from history […]

Teleological/Evaluative Arguments
9. The argument from purpose
10. The argument from substantive reasons

Transcategorical
11. The argument from intention. (MacCormick and Summers 1991, 512ff.)[11]

The argument from intention is "trans-categorical" in the sense that there are different ways to discover legislative intentions: by using linguistic, systemic, or teleological arguments (ibid., 522ff.).

[11] The list summarizes a comparative project carried through with the participation of scholars from nine countries. Nota bene: Wróblewski took part in the project and noticeably influenced its theoretical framework.

The following comparative remarks deserve attention (ibid., 518): The French system gives special weight to arguments from general principle. In Germany, logical-conceptual arguments are regarded with more favour than elsewhere, especially in comparison with the United States.

1.4.2. Systemic Arguments

Systemic arguments lie at the core of legal doctrine. Thus, when interpreting a statutory provision, we must pay attention to other provisions that contribute to understanding the provision in question. When interpreting a statutory provision, we may pay attention to its title and to its specific placement within the legal system or within a certain statute. This kind of interpretation assumes that coherence within any one part of the law is greater than coherence across different parts of it.

Important systemic arguments seek to solve logical, empirical, or evaluative collisions among legal rules.[12] The following guidelines help jurists work out collisions among legal norms. Whenever we discover a collision between legal rules, we should work it out either by reinterpreting (and thus reconciling, or harmonizing) these norms or by setting up an order of priority among them. When reinterpreting or ranking rules in collision, we should always do so using a method that can be applied equally to similar collisions among other rules. If possible, different sources of law should be so interpreted that they prove compatible. The interpretation of statutes, precedents, legislative preparatory materials, and the like should thus affect one another. When a higher norm is incompatible with a norm of lower standing, the higher norm must be applied.[13] Where an older norm is incompatible with a more recent one, the more recent one must be applied.[14] We may apply a more general norm only in cases not covered by a less general norm incompatible with it.[15] If a more recent general norm is incompatible with an older but less general norm, the more recent and less general norm must be applied.[16] If possible, we must harmonize the results obtained from the use of different methods of statutory interpretation. Whenever the use of different methods of statutory interpretation in a given situation results in an incompatibility, the incompatibility should be worked out by reinterpreting the provision in question.[17]

[12] Collision among principles is another matter (cf. Alexy 1985, 78ff.) because principles are contributive, not decisive reasons.

[13] *Lex superior derogat legi inferiori.* A special question concerns the courts' competence to declare that statutes incompatible with the constitution are invalid.

[14] *Lex posterior derogat legi priori.*

[15] *Lex specialis derogat legi generali.*

[16] *Lex posterior generalis non derogat legi priori speciali.*

[17] Cf. Savigny 1993, 140–1: "Thus, the interpretation consists of 4 elements: logical […], grammatical […], historical […], systematic […]. That is, not several interpretations but

In systemic interpretation, we should avoid *ad hoc* solutions, perhaps reasonable in the case under consideration or in a limited number of cases but foreign to the rest of the system. For example, German jurists opposed the idea of using accident insurance terms to justify introducing a certain speed limit on the highway. This solution would have been foreign to the system.

1.4.3. Restricting and Extending a Norm's Area of Application

A norm's area of application as established in legal reasoning often differs from the area established by most non-juristic readings of the norm based on natural-language analysis. Statutory interpretation may thus extend or restrict a statute's *pro tanto* meaning. Extensive interpretation embraces not only the core but also the "periphery" of a rule's area of application. Restrictive interpretation restricts the *pro tanto* core of a rule's area of application. This kind of extension and restriction is perhaps somewhat strange, but it is linguistically possible. The choice will depend on the weighing and balancing of various substantive reasons and authority reasons, and is of course defeasible.

So-called "reduction" is a radical restriction of this meaning. Reduction eliminates not only the "periphery" of a rule's area of application, but also part of its linguistically uncontroversial core. Such radical restriction contradicts ordinary language. In some cases, one goes beyond reduction and eliminates the entire rule, in what is called *desuetudo derogatoria*.

One may also extend radically a rule's area of application, sometimes beyond its linguistically possible "periphery." The most frequent method of doing so is reasoning by analogy.

1.4.4. Analogy

What is meant by "statutory analogy" is that one applies a statutory rule to a "target" case which, from the viewpoint of ordinary language, cannot be made to fall within either the core or the periphery of the statute's area of application, but which in a relevant way resembles the cases covered by this statute in some essential respects. This definition is based on the result of interpretation—effecting a radical extension of the rule's area of application—as well as on the method applied to obtain the result, namely, proffering a relevant similarity of cases.

Some writers (e.g., Ross 1958, 149) reject the distinction between extensive interpretation and statutory analogy. In judicial practice and in legal writ-

always only one interpretation always composed of these 4 elements." ("Also ist die Interpretation zusammengesetzt aus 4 Elementen: Logisches [...], Grammatisches [...], Historisches [...], Systematisches [...]. Also nicht vielerlei Interpretationen, sondern immer nur Eine Interpretation, immer componiert aus diesen 4 Elementen.")

ing, however, we can find several examples of new norms created by analogy, generally considered more radical than mere extensive interpretation. Moreover, in penal law, for example, courts may reason from analogy to a much lesser extent than is possible by extensive interpretation. A court that should disregard the difference between these two forms of reasoning may unjustifiably begin to use analogy in cases where extensive interpretation is allowed (cf. Peczenik 1971a, 334ff.).

A use of the similarity argument, which does not extend a statute's linguistically possible area of application, is sometimes also regarded as analogy (cf., Kaufmann 1982).

Neither statutory analogy nor *analogia intra legem* is transitive: One case, *C1*, can be analogous to another, *C2*, in its turn analogous to a third, *C3*, and yet *C3* need not be analogous to *C1*. In this sense, analogy is like distance: *C1* may be close to *C2* and *C2* to *C3*, and this without *C3* being close to *C1*. Moreover, the relation of statutory analogy is not reflexive, since the set of cases regulated by a norm is not analogous to itself. The relation of statutory analogy can be symmetrical or not: When *C1* is analogous to *C2*, the latter can—but need not—be analogous to the former.[18]

One may also employ "law-analogy" or "legal induction." With some simplification, we can regard these two terms as synonymous. Law-analogy means that a general norm is postulated on the basis of a resemblance among a number of established (most often statutory) rules, thereby regarded as special cases of that norm.

Let us make an example. The so-called Scandinavian doctrine of wrongfulness (literally, "unlawfulness"; cf. Hellner 1995, 64–5) gave us the following general norm: One should not be held criminally responsible or liable in torts—or at least responsibility should be restricted—if one's action was not wrongful; that is, if the action's positive results were more important than the risks it caused. This general norm is justifiable on the basis of such defences as duty, emergency, authorization, contributory negligence or consent on the part of the victim, or the fact of the victim taking particular risks—all of which restrict or eliminate liability. These defences are merely special cases of the lack of wrongfulness. Assume, for example, that *A* violently threw *B* out of the meeting that *B* disturbed. The court found that *B*'s provocative behaviour justified the conclusion that *A* should not be held criminally responsible (cf. the Swedish case NJA 1915, 511).

Finally, an important form of analogy in the law is institute analogy: A legal institute, such as "instalment payment," can serve as a model for another, as for "financial leasing." Old legal institutes inspire new ones (cf. Peczenik 1995, 341ff.).

[18] Cf. Frändberg (1973, 150–1), though the author discusses analogy among norms, not cases.

When deciding not to reason by analogy, one can follow another legal mode of reasoning, the so-called *argumentum e contrario*. Assume that a statutory provision or other legal norm regulates some cases in a certain way. By virtue of strong *argumentum e contrario*,[19] (similar) cases not covered by either the core or the periphery of this norm's linguistically acceptable area of application should not be treated in the way stipulated by the norm: *Qui dicit de uno negat de altero*.

The following reasoning norms, established by the tradition of *scientia juris*, help us choose between analogy and *argumentum e contrario*: We should not construe by analogy provisions that establish time limits. Nor should we construe such provisions by extension unless particularly strong reasons exist for making an assumption to the contrary. Only very strong reasons can justify using analogy to conclude that an error exists in the text of a statute. We should not construe by extension or by analogy provisions that make exceptions to a general norm unless we have strong reasons for assuming the opposite.[20] We should not construe by extension or by statutory analogy provisions imposing burdens or restrictions on a person unless very strong reasons exist for making an assumption to the contrary.[21]

When making a choice between different analogies, we need to take into account considerations similar to those that come to bear in choosing between analogy and *argumentum e contrario*.

Legal doctrine plays a crucial role in developing such reasoning norms. It also gives them a more precise content in particular legal contexts. The argumentation leading to the development and refinement of such reasoning norms bases itself on a coherent system of propositions and preferences developed in the history of *scientia juris*.

Law-analogy and statutory analogy are both justifiable by the principle "Like cases should be treated alike," and hence by considerations of justice and coherence. This kind of justification is widely open to philosophical argumentation. In consequence, it is both profound and controversial.

The key problem is what similarities between cases are relevant enough to justify juristic reasoning by analogy. The estimate of relevance is holistic. Attention must be paid to the following elements:

- criteria of relevance that follow explicitly or implicitly from statutes and other sources of law;

[19] A distinction is necessary between a weak *argumentum e contrario* and a strong one. By virtue of weak *argumentum e contrario*, the norm in question is not a sufficient reason to conclude that a similar case not covered by either the core or the periphery of the norm's linguistically acceptable area of application should be treated this way.

[20] *Exceptiones non sunt extendendae*: A well-known but contested tenet in juristic literature (cf., Engisch 1968, 147ff.).

[21] *Odia sunt restringenda*.

- normative moral theories regarded as relevant to the legal problem in question; and
- theories of particular legal doctrine regarded as relevant to the legal problem in question.

An interesting general philosophical question is whether all rational use of analogy in the law assumes the formulation of a general rule.

In continental law, the answer is often in the affirmative. The proper explication of an analogical argument that assumes a general rule is said to have the following form: (i) First, a general rule that covers the "target" case is induced (or "abduced," using a more technical term) on the basis of a previously established legal rule; (ii) this general rule is then confirmed or disconfirmed; (iii) if confirmed, finally, the general rule warrants an inference to the target case. Analogical inference must therefore rest on an assumed general rule, for otherwise the step from the premises to the "target" case would not be logically correct.

In common law, on the other hand, the classical answer to the question whether analogy assumes a general rule is in the negative. Gerald Postema has provided a good characterization:

> Unlike deductive argument, this form of reasoning does not involve applying a general rule to a particular case. Rather, it proceeds in accord with Aristotle's characterization of argument by example (paradigm) [...], that is, "from part to part, like to like"—a similibus ad similia, as Bracton put it. Thus, while sometimes a general rule can be articulated linking the two cases, this rule is, on this classical understanding, a product of the identified analogy, not its precondition. And, in the order of intellection, identification of the "likeness" precedes and provides the basis for the articulation of the rule. (Postema 2001)

This understanding of analogy has been a target of deductivist criticism (cf. Brewer 1996, 926–7). The first stage of analogy is, according to Brewer, "abduction in a context of doubt." Having found the relevant cases, the judge discovers a rule—the analogy-warranting rule—that explains the examples. The second step is to test this rule against a set of external criteria called analogy-warranting rationales. Each analogy must be explained by reference to these rationales. Finally, the reasoner applies the confirmed analogy-warranting rule to the case under consideration.

In answer to Brewer, I will again quote Postema:

> Keep in mind, however, that since the premise of the classical account, on our reformulation, is that ultimately analogical inference rests on norms implicit in practice, not on explicit rules, any account of the kind of intellection involved cannot, on pain of inconsistency, take the form of a codified set of rules. We can only, and should only, seek to characterize the process, its structure and its constraints, in order to show why we may reasonably treat it as a form of reasoning. (Postema 2001)

In other words, the idea of logical rationality forces us to formulate a general rule from which the solution of the "target" case follows logically. To justify

analogical inference, we must be able to imagine a general rule from which the solution of the target case follows deductively. This general rule must be in principle acceptable. But, at the same time, the very idea of analogical inference forces us to the insight that this general rule must be contestable. There is an uncodifiable moment in analogical reasoning. Cognitive scientists and artificial intelligence hope to explain it further (cf. Hunter 2002).

Last, but not least, "it is within the context of [...] legal tradition [...] with its interlocking network of principles, rules, etc., that we find the conditions for making valid assertions of analogy and disanalogy" (Bańkowski 1991, 208).

1.4.5. Teleological Construction of Statutes

The teleological construction of a statute is its interpretation in view of its purpose. Sometimes—though not often—a statutory provision states precisely or implies logically a certain goal. But this is not usually the case. The provision in question is more likely to support a certain goal only defeasibly.

A distinction can be made between subjective and objective teleological construction of statutes: The former follows the will of those who take part in lawmaking, in bringing out the *travaux préparatoires*; the latter follows other juristic substantive and authority reasons.

In Sweden, one often finds the goals of the statute in its *travaux préparatoires*. But an influential minority of Swedish lawyers, led by Per Olof Ekelöf (1958, 79ff.), protest against the great role of preparatory materials. Ekelöf's theory is a product of the evolution of legal method in the late 19th and early 20th centuries under the influence of Scandinavian legal realism. On Ekelöf's view, judges and jurists should, in ordinary cases, follow the meaning the statute has in ordinary linguistic usage. In "special" (uncertain, untypical, hard) cases, the interpreter ought not to go into a linguistic analysis of the statute, or feel bound by the *travaux préparatoires*. Instead, she should establish the purpose of the statute by analogy with the effects ("total result," "actual function," or "practical function") the statute has in ordinary cases (cf. Ekelöf 1958, 84ff., 105ff.). It is not clear to what extent Ekelöf's views affected the courts, but it certainly shaped a generation of legal researchers at the faculty of law in Uppsala. This success was only local but intense enough to urge an explanation. One can regard Ekelöf's method as a special case of reasoning by analogy, that is, a statutory analogy based upon relevant similarities of results. This emphasis upon results represents an effort to recommend consequentialist reasons while maintaining loyalty to the authority of the statute.

Another version of teleological interpretation, dominant in EU law, follows general formulations found in a treaty together with common knowledge of the EU's integrationist dynamics.

Sometimes, a statute's goals follow from "the nature of things," that is, they follow from background knowledge of social institutions, values, etc. Each

method of establishing the goal makes it necessary to weigh and balance reasons, as does a choice between competing methods (cf. Peczenik 1995, 375).

The jurisprudence of interests and related movements attempted a reform of legal doctrine. Have they succeeded in changing its deep structure? In my opinion, they have not. They proposed to consider "interests" exclusively, and not also "concepts" and "system," but this they did only in word; indeed, the older conceptual jurisprudence and the newer jurisprudence of interests alike looked at the system of concepts and at interests, both. The shift was mainly in emphasis. Legal doctrine has become more pragmatic and somewhat less systematic. It has also lost its self-trust, conceiving of itself more and more as a servant of politics (Jerusalem 1968; cf. Larenz 1983, 67ff.).

The mixed success of the reform movements is a good example of the tension between juristic tradition and philosophical fashion. The new philosophy led to some changes in legal method, but these changes were smaller than many philosophers had expected.

1.5. Interpreting Precedents

1.5.1. What Is Binding in a Precedent?

Precedent now plays a significant role in legal decision-making and in the development of the law in common law and continental law alike (MacCormick and Summers 1997, 531–2). All students of comparative law know that a big part of common law consists of precedents, whereas continental (or "civil") law is mostly statutory. They also know that, in common-law countries, precedents are legally ("formally") binding on all courts below the highest courts. In other words, it is a legal error not to follow the precedents of higher courts, and such failure will ordinarily be reversed on appeal. The precedents set by the highest courts carry a strong normative force, too, even though there is no possibility of reversal on appeal. The doctrines of binding precedent are particularly strong in the British systems (ibid., 518). In the countries of the European continent, precedent is not formally binding but is regularly followed by the courts in practice. This fact explains why some jurists say that precedents in continental law are binding *de facto* but not *de jure*.[22]

The arguments used to interpret precedents are similar to those used in statutory interpretation. But there are some problems specific to precedent, one of these being the question what is binding in a precedent (cf. ibid.,

[22] Only very special kinds of precedent are binding *de jure* in continental systems. Thus, in Germany, precedents established by the Federal Constitutional Court are formally binding on the courts below. Ordinary precedents established by the Federal Court of Justice are not formally binding, but they have to be followed except where special reasons can be shown to the contrary. Cf. MacCormick and Summers 1997, 461ff.

503ff.). The binding element is the so-called *ratio decidendi.* The theory of *ratio decidendi* has evolved in common-law countries and has influenced continental jurisdictions more or less consistently.

A *ratio decidendi* might be:

1. a rule of law or a ruling in the light of material facts that a prior court explicitly declares or believes itself to be laying down or following; or
2. a ruling in the light of material facts that a prior court (when the decision is analysed) is, as a matter of fact, laying down or following; or
3. a ruling in the light of material facts that a prior court ought to properly (in view of the existing law, facts and precedents) to be laying down or following. (Ibid., 506)

This is easy to state. On reflection, however, common-law history shows confusion in the definitions of *ratio decidendi* (ibid., 510ff.): "The *ratio* is perhaps to be considered an essentially contested concept, because it is not purely descriptive but also evaluative or normative in force" (ibid., 512–3).

In spite of such problems, the general doctrine of precedent is more sophisticated in the common law than in continental systems (cf. ibid., 536ff.). In particular, the common-law tradition developed a methodology called distinguishing the precedent, designed to show why a precedent is not binding in the case under consideration. No such methodology has developed in any of the civil-law countries (ibid., 538). This fact contrasts with statutory interpretation. The doctrine of statutory interpretation is at least as developed in continental-law countries as in common-law countries.

In some countries, like Sweden, the weakness of methodological considerations is offset by precedents having very strong authority. Justice Johan Lind (1996–1997, 362) derived the ultimate consequence: It makes no sense at all for a legal scholar to regard Supreme Court decisions as wrong. They are right by definition, so to say. Such views have been criticized (cf. Nergelius 1997, 437ff.), to be sure. But their existence is in itself worth noticing.

1.5.2. The Binding Force of Precedent

While the question, What is binding in a precedent? is technically juristic, and can be developed in an advanced manner without recourse to a philosophically oriented legal theory, the question of the binding force of precedent requires a deep theoretical investigation.

Without theoretical reflection, one may simply state that some precedents in common law are binding *de jure*, while precedents in continental law are binding *de facto*. But this is not satisfactory. The expression "binding *de facto*" seems to imply that precedents lack normative force even if usually followed. A view of this kind may be theoretically naive, or it may be accompanied by some sophisticated theories. For example, a law theorist may adopt an external point of view with regard to legal practice. A theorist may thus interpret

the expression "*de facto* bindingness" as referring to a statistical regularity, supposing the expression to express the empirically established fact that judges regularly follow certain (types of) precedent. A theorist may also understand the "*de facto* force" of precedents to mean that precedent is (a part of) the judge's motivational basis. This was, for instance, Alf Ross's idea in his theory about the normative ideology of the judge. Thus, Ross's theory was an external description of the judges' internal point of view. On this conception, precedent exerts a "psychological force" in decision-making.

This was the mainstream theoretical solution some fifty years ago. But the solution is highly objectionable. Any non-normative interpretation of "binding *de facto*" is contrary to the lawyers' internal understanding of legal practice in most countries. The word "binding" carries a normative connotation and cannot be reduced to non-normative facts. The theory of *de facto* bindingness is thus self-contradictory and not particularly interesting (cf. MacCormick and Summers 1997, 465ff.).

A better way to express the various kinds of normativity involved in bindingness and normative force is as follows: Precedents that are formally binding, or binding *de jure*, *must* be regarded as authority reasons in legal argumentation. Precedents which are not formally binding, but which have normative force, *should* be used as authority reasons in legal argumentation. This "should" is legal in character, though not in the strict sense of being binding *de jure*. The normative force of all precedents—even those that are not binding *de jure*—is a legal, authoritative force.

All this has interesting consequences for the structure of legal systems in general. One may say that a legal system consists of two layers: norms that *must* be regarded as authority reasons in legal argumentation—as formally binding or binding *de jure*—and norms that merely *should* be regarded as authority reasons in legal argumentation.

The terms "must," "should," and "may" deserve further theoretical analysis, in much the same way as they do in the context of statutory interpretation. As we have seen, this analysis involves a theory of defeasible rules. A theory of this kind exceeds the compass of everyday legal doctrine and requires that we go deep into philosophical analysis.

1.5.3. Justification of Precedent

The question how to justify the binding force of precedents is highly philosophical and yet is a subject of frequent discussion in Anglo-American jurisprudence. Roger Shiner (vol. 3 of this Treatise, 59–60; see also Shiner 1982) states the following.

> There are many standard ways in the literature of seeking to justify *stare decisis*. Richard Wasserstrom, for example, lists certainty, reliance, equality, and efficiency […]. Fairness, in the

sense of the maxim "Treat like cases alike" is regularly mentioned. More specific reasons are also adduced, such as the avoidance of delayed justice, the greater decision-making proficiency of superior courts, the desirability of uniform decision-making in the law [...]. Dworkin [...] appeals to the value of integrity [...]. Anthony Kronman [...] appeals to tradition and respect for the past as values in themselves [...]. Gerald Postema [...] neatly combines elements of both these views while rejecting each, in defending integrity as coherence with the past, but subsuming its value under justice as a characteristic of well-ordered historically extended communities. [...] Antecedently, it would seem unlikely that any single value or set of values would by itself or themselves justify *stare decisis*.

The plurality of values involved in the system of precedents provokes the question whether the system does not suffer inevitably of indeterminacy. Shiner put it this way:

It is an inescapable feature of decision-making by rule that such decision-making is sub-optimal (Schauer 1991, 100ff.). Rules phrased in general terms will be over-inclusive, under-inclusive, or both, with respect to specific instances. We accept that, though, in order to achieve the advantages of decision-making by rules (Schauer 1991, 135–66). [...] But it is a mistake to think that therefore the actual decision under *stare decisis* was unfair. [...] The values that are arguably fostered by a system of *stare decisis* come in at the level of justifying having such a system at all. The system itself, however, insulates decision-making within the system from those values directly influencing the individual case, certainly at every level below that of the supreme tribunal of the system. To the extent that there is "indeterminacy" within the system at the lower court level—mechanisms of distinguishing precedent cases and the like—then there will be seepage of the background values into instances of decision-making in cases. But this seepage constitutes a feature of the rule model of reasoning from precedent, not its repudiation. (Shiner, vol. 3 of this Treatise, 60–1)

1.6. The Doctrine of Fact-Finding

Though general legal doctrine focuses on interpreting statutes and precedents, it has also developed other argumentative contexts. One of these is fact-finding in the law and interpreting legal facts. In some countries, these problems are discussed under the umbrella of legal doctrine; in others, in the context of procedural law. The problems are exceptionally difficult because they require technical juristic sophistication as well as a knowledge of general epistemology. One can mention the following problems.[23]

- How should we set out the difference between a statement of fact and a statement of opinion?
- How can we arrive at shared criteria of what counts as a fact or as a factual statement?

[23] The same group of scholars that published *Interpreting Statutes* and *Interpreting Precedents* (cf. MacCormick and Summers 1991 and 1997) discussed the examples below in 1999.

- Can we work out typologies of facts, such as negative versus positive, institutional versus brute, primary versus secondary, and fact in issue versus evidentiary fact?
- How can we distinguish particular facts from generalizations about facts?
- How can we define the relationship between scientific facts, historical facts, and legal facts?
- Are there domain-specific differences in reasoning about facts, for example, differences between criminal law, administrative law, and commercial law?
- How far do fictions, presumptions, burdens of proof, and standards of proof contribute to or result from domain-specific differences?
- Should we seek truth as an intrinsic value even in law, and should we likewise value the rule of law, *raison d'état*, due process, and human rights.
- How should we treat domain-specific differences in preferred proofs (for example, what requirements of writing ought to be set down)?

I will not characterize here fact-finding juristic arguments in any detail. Suffice it to say that this part of general legal doctrine is less uniform in time and space and across particular domains than are the doctrines of statutory interpretation and of precedents.

Chapter 2

PARTICULAR LEGAL DOCTRINE

2.1. Preliminary Remarks

2.1.1. Juristic Theories

Legal doctrine claims to produce theories, which I shall call "juristic theories." Though one can hardly work out a general definition of theorizing, equally applicable to science in the strict sense and to legal doctrine, the word "theory" in the present context indicates the following:

- theory is stable, in opposition to experience, which is fluid;
- theory is justifiable, in opposition to metaphysics, which are controversial;
- theory is a system of statements that displays consistency, clarity, and fruitfulness (cf. Dreier 1981, 79ff.).[1]

Legal theories can have different levels of abstraction. For example, a theory may simply indicate that some cases resemble other cases. The theory provides, then, a description of particular cases, mapping out possible ways by which to follow the law and possible violations of the law, listing possible interpretations of a statute, developing technical solutions that may facilitate obedience of the law and prevent its violation, and developing relevant distinctions between types of cases.

But a juristic theory may also systematize the law under abstract concepts and principles which have been formulated by international instruments (such as the European Convention on Human Rights) or by national legislatures or courts, or which have been worked out by legal doctrine itself. So, too, juristic theory may use historical and comparative studies, or auxiliary sciences, such as psychology and sociology. Finally, it may use all the basic kinds of philosophical study underlying jurisprudence, that is, moral theory, political theory, language theory, logic, epistemology, the theory of science, and metaphysics. In the following chapters, I will deal with the relationship between juristic theories and philosophical theories.

Dreier (1981, 73ff., 93) has proposed the following classification of juristic theories.

Singular theories deal with relatively concrete norms. There are three kinds of such theories. Interpretive theories constitute the first kind. Thus, the German theory of the essential content (*Wesensgehalt*) of a basic right fo-

[1] Dreier states as well that theory is rather descriptive than related to action. This reflects the ancient distinction between *vita contemplativa* and *vita activa*.

cuses on Section 19 II *Grundgesetz*. Norm-proposing theories constitute the second kind. They deal with unwritten norms regarded as part of the law. One example is *culpa in contrahendo* in German civil law. The third kind consists of midlevel theories, which can be classified as follows.

- Constructive or qualification theories integrate certain social phenomena into the system of basic legal concepts. Among several examples, Dreier mentions the theory by which the legal position of an administrator of property (*Vermögensverwalter*) is made out to be that of an official or of a representative.
- Institute theories deal with complexes of norms regulating some typical social relationships, such as sale-and-purchase, property, marriage, and school.
- Principle theories deal with content and legal character and with the function of abstract (written or unwritten) norms, like the norms setting out the goals of the German state in Section 20 I *Grundgesetz*.
- Other theories deal with basic concepts, that is, with explicit or implicit abstract elements found in many norms. Among several examples, Dreier mentions the theories of subjective rights, of legal persons, of declarations of intention, of administrative acts, and of crime and punishment.
- Finally, some theories deal with large tracts of the law, such as civil law, criminal law, and administrative law. Each branch (or fragment) of the law contains specific principles[2] and concepts. This role of the internal systematic setup of the law makes sense of such questions as, Does it matter in legal practice that the law of torts should fall under private law, not under public law? Does it matter whether commercial law is or is not a part of civil law?[3]

Let me add more examples. The following juristic theories in private law may be mentioned:

- theories of property in private law; for example, the theory of public trust and the theory based on property rights;
- theories on the transfer of property; among these we have the traditional theory by which all aspects of property transfer simultaneously, and the "analytical" theory by which different aspects of property may be transferred in different moments;
- the will theory, the trust theory, and the theory of assumptions in contract law;

[2] See the typology of principles in Peczenik 1995, 446ff.

[3] Legal orders differ in this respect. Thus, these questions matter a lot in Slovakia (see Bröstl 2000, 51ff.) and much less in Sweden.

- the so-called loyalty principle in contract law;[4]
- theories of intent, negligence, and adequate causation in the law of torts; and
- theories of authorization and theories of the bill of exchange (cf. Aarnio 1997, 256ff.).

Among the theories of criminal law we have

- again theories of intent, negligence, and adequate causation;
- theories stating the goals of punishment (treatment, deterrence, retribution, etc.);
- theories of criminal action, instigation, and complicity; and
- the theory of omission as a kind of action.

In constitutional law, some juristic theories draw on political philosophy; such is the case with theories of democracy (see Peczenik 1995, 63ff.) and the rule of law (ibid., 50ff.; Fuller 1964; Hayek 1960). An important theory of German constitutional law deals with weighing principles and with proportionality (see Alexy 2001, 2003, and Section 5.1 below). Another important German theory deals with the essential content of basic rights (see Nergelius 1996, 245ff.). There are also corresponding theories in other legal orders (see ibid., 155ff.). Other theories of constitutional law are closely related to general legal doctrine, as is the case with theories determining the relative importance of different sources of law.

The doctrine of human rights contains a wide spectrum of problems, ranging from basic political philosophy to technical juristic problems such as interpreting laws on the freedom of demonstration.[5]

In administrative law, one can mention the overarching theory contrasting public and private law and the theories on the state's tort liability for damage caused by state employees, and we also have some more-specific theories, such as the theory of compelling danger (*Notstand*) facing a police officer (cf. Maurer 2000, 495).

An important part of the doctrine of procedural law concerns principles, often having ancient or medieval history on their side, such as *nemo iudex in res sua*, *audiatur et altera pars*, *ne bis in idem*, the legality principle (*nullum crimen sine lege*), presumption of innocence, *in dubio pro reo*, and *in dubio mitius*. These principles help legal practice find the proper balance between the main goals of the legal process, as between efficiency and protection of the parties (cf. Nowak 2003, chap. 4).

[4] In Sweden, see Nicander 1995–1996, 49.

[5] There is extensive bibliographical work on the subject; see, for example, the bibliographies published by The Human Rights Center, Institute of International Studies, University of California at Berkeley, at http://globetrotter.berkeley.edu/humanrights/bibliographies/.

There are also some principles in tax law, such as the principle making taxation proportional to the taxpayer's economic capacity, the legality principle (no tax without law), and *in dubio contra fiscum*.

2.1.2. The Distinction between Public and Private Law

Most domain-specific theories of legal doctrine have evolved in private law and criminal law. Theories of public law are more dependent on political philosophy.

Private law deals traditionally with relationships between persons (witness family law and inheritance law); with property, contracts, and torts; with associations, bonds, and instruments of value; etc. Its precise scope varies from one state to another. A general definition of private law is neither interesting nor possible; but one may discuss the distinction between private and public law on the basis of the following criteria (Maurer 2000, 44ff.):

- Private law protects private interests; public law protects public interests.
- Private law regulates horizontal relations between equal parties; public law regulates vertical relations of subordination.
- Private law regulates relations ascribed to the citizenry at large; public law regulates relations ascribed to the state and other authorities.

Though much discussed some years ago, the distinction is no longer very popular. But it might be coming back in a more philosophical form. Thus, Benjamin Zipursky uses the framework derived from Blackstone and Locke and then states what follows: "At the basis of our system of private law is a principle that, under a variety of different circumstances, individuals are *entitled* to act against other private parties in a variety of ways" (Zipursky 2002, 643).

Moreover:

> A fundamental difference between public and private litigation is that public litigation—most obviously, criminal prosecution—involves a state's effort to exercise its power to act against a defendant, whereas in private litigation, it is a private party who attempts to exercise her power against the defendant [...]. The state is acting, but responsively; it is not initiating action. (Ibid., 649–50)

2.1.3. Inner and Outer System in Private Law

The doctrine of private law makes sense only in the structural and systematic context of this domain. Thus, we have to deal with the general part of private law: with persons, transactions, contracts, torts, family law, inheritance law, etc.

One can distinguish between the outer and the inner system of law. The inner system presupposes the outer (cf. Bydlinski 1996, 5). The "outer system" of private law is a readable and accessible ordering of legal materials.

Legal concepts linked to one another within the single parts of private law (contracts, torts, etc.) as well as across different parts—e.g., obligation law and law *in rem*. One cannot understand private law without understanding its systematization.

The inner system of private law is a system of justificatory relations. Some norms, when coupled with external data, justify other norms (ibid., 16). Each part of private law has its own principles, but these are justifiable in relation to general principles. This is possible because extensive normative phenomena are more stable than singular rules (ibid., 22). Normatively specific fragments of the law display specific combinations of principles (ibid., 23). The inner system unifies private law into a coherent whole (ibid., 74).

Concepts in private law are framed to describe the outer system as well as to provide justifications for the inner system. These concepts hang together and presuppose one another. The doctrine of private law pays close attention to the concepts used in statutes and legal practice, but it also creates new concepts by generalizing logically possible cases. Secondarily, it may pay attention to social relationships whose connection with the statute and with legal practice is more indirect.

The inner system of private law as a whole is not a deductively axiomatic system (Bydlinski 1996, 27), even if one can reconstruct some of its parts deductively (ibid., 31ff.). Complete justification in private law must involve all the higher levels of justification (ibid., 44).

The system of justificatory relations includes end-means relations. A good example is the teleological theory of Per Olof Ekelöf, still dominant at the Uppsala Law Faculty. Thus, Bert Lehrberg uses Ekelöf's teleological theory to outline the structure of contract law.

2.1.4. Principles of Private Law

There is a vast literature on principles and policies in private law, among other kinds. And this literature is full of theoretical controversy. So it may be safer here to provide examples of principles in private law, refraining at this stage from theoretical analysis. The point of exemplification is to show that there are many such principles, and that their scope depends on the systematization of the law. Bydlinski sets out the following fundamental principles of all law, including private law:

- protecting basic goods (such as life and dignity);
- maximizing equal freedom;
- ensuring distributive justice;
- providing minimum subsistence;
- protecting the weak;
- providing corrective justice;

- guaranteeing security and peace under the law;
- protecting acquired rights;
- using state organization to guarantee security under the law;
- purposefulness as adequacy of reflective goals;
- purposefulness as utility; and
- purposefulness as economic efficiency.

He lists the following as principles of private law (Bydlinski 1996, 92ff.):

- the principle of relative (bilateral) justification;
- the subsidiarity principle (property shall stay by the lowest effective unit);
- the principle of self-responsibility.

There are also many more-specific principles. I will cite some of them, following Bydlinski. The point here is not to accept his systematization of private law, but merely to show that such systematization is possible. This is an interesting exercise even if there may be many competing ways to systematize private law.

The general part of private law includes the following principles with regard to persons:

- recognizing individual subjective rights as individual legal powers;
- according priority to public protection over individual self-defence;
- prohibiting the abuse of rights;
- ensuring equal legal capacity;
- ensuring equal protection of personal rights;
- ensuring equal capacity of legal action, or a capacity of legal action graded to individual handicap;
- ensuring freedom of association;
- ensuring the freedom to set up associations;
- securing, in principle, the equal position of legal persons (such as corporations) and physical persons (individuals);
- requiring corporate organization as a precondition of the legal capacity of associations;
- protecting minority groups; and
- exercising state control over the right to institute associations.

The general part of private law includes the following principles with regard to transactions:

- ensuring private autonomy in transactions;
- the consensus principle;
- protecting transactions, and especially trust;

- permitting and enabling transactions;
- assuming responsibility for promises and declarations of intention; and
- loss of rights in consequence of long passivity.

The following principles, among others, concern contracts and torts:

- personal liability;
- loyalty;
- limited obligation to conclude contracts;
- causation of damage as a ground of liability;
- compensation for damages;
- the negligence principle;
- prevention of damages;
- joint liability of a victim who is partly at fault; and
- maximum of compensation.

The principles of property law include the following:

- exhaustive enumeration of types of rights *in rem* (*numerus clausus*);
- publicity;
- fixed order of priority among rights *in rem*;
- protection of good-faith acquisition;
- freedom of property; and
- limitations of property in the public interest.

The principles of family law include:

- the permanent character of family relations;
- transparency of family relations;
- enforcement of institutional, non-individual purposes (the goals of a family);
- equal rights of the sexes;
- monogamy; and
- acting in the best interest of the child.

The principles of inheritance law include:

- freedom of testaments; and
- universal succession.

Bydlinski also enumerates principles for special parts of private law: for commercial law, association law, value-papers law, immaterial law, labour law, competition law, and insurance law.

Bydlinski thus lists a great many principles. The list begs several questions.

- Do the principles carry normative consequences, or are they empty formulas, forms of argument, platitudes?
- Is only one such listing of principles thinkable, or are there many possible lists?
- If there are many lists, what system of principles is best and why?
- What criterion should be used for what is best? Morally best or best as what is most fitting for the positive law? In the latter case, what exactly does "fitting" mean?
- Which principles express human rights? Which ones have a less central position? In particular, do all the fifty principles formulated in the European Union Charter of Fundamental Rights express human rights? Can one speak of fifty human rights? Or should we rather speak of fifty principles elucidating the six main values: dignity, freedoms, equality, solidarity, citizen rights, and justice?
- Are such principles universal? Or are they rather bound up with certain periods in history? Are the principles valid for the whole of modern law, for the whole of modern Western law, or for the whole of law in the 21st century? How should one discuss these questions?
- Are these principles valid despite value pluralism in modern society?

2.2. Philosophical and Juristic Theories of Property

2.2.1. Philosophical Theories of Property

Philosophical theories of property use conceptual analysis, ontological distinctions, epistemological reflection, and general normative philosophies in the effort to solve normative problems. Let me make an example: "The ontological differences between material chattels, land, and intellectual property can have an important bearing on questions of justification" (Waldron 1996, 4).

The author takes into account a number of philosophers who produced justificatory theories (ibid., 11ff.): Plato, Aristotle, Grotius, Pufendorf, Hobbes, Locke, Hume, Adam Smith, Rousseau, Hegel, Marx, Bentham, Mill, Nozick, and Rawls.

Of course, debates of this kind involve professional philosophical reflection, mostly in the spirit of individualism and liberalism, but also in the spirit of communitarianism, Hegelianism, and other society-centred views. Thus Alan Brudner, a Hegelian philosopher, states the following: "The law of property (and indeed the common law as a whole) may thus be a system of doctrinal systems" (Brudner 1995, 24). And:

> The principles that are opposed in property law—the negative freedom of the atomistic self and the positive freedom of the socially constituted self—are not Manichean extremes having

no connection with each other. Rather, each contains the other within itself. The common good is *individual* autonomy; and the individual self's objective worth […] presupposes community. (Brudner 1995, 78)

The philosophy of property is valuable because the thinkers who work at it make an earnest attempt to arrange the existing laws under a justificatory first principle. Thus, they introduce a degree of coherence into property law. To be sure, a first principle of this kind can scarcely serve as an axiom from which the actually existing or the best property law follows logically. But it can serve as a basic model for understanding property law. Some parts of property law will follow from this first principle; others will be conceived as justified departures from it. "Justified" means here that they have the support of other principles and rules derived from various philosophies, authorities, and practices.

Even if philosophers fail to find a unique and uncontroversial principle for this role, they might produce a number of possible principles of this kind. But a critic may find that this assessment is curiously distant from the real life of the law. A philosophical first principle for property law may be useful to politicians looking to buttress their political manoeuvrings and agendas with philosophical rhetoric, but it cannot really determine political decisions, because those advocating various political views disagree with one another and use philosophical arguments to support their positions in particular and practical matters. As an example, one can mention the American debate on the standing of television: Is television a public trust or is it private property? The doctrine of public trust, having its roots in Roman law and in English common law, underscored the legal right of the public to use certain lands and waters. This right may be concurrent with private ownership. Some political reformers have enthusiastically applied this doctrine to television.[6] The critics of this doctrine advocated private property. The proper delimitation between the doctrine based on property rights and the public-trust doctrine will depend on a weighing and balancing of considerations. Such balancing provides ample space for political manipulation.

2.2.2. Juristic Theories—Transfer of the Right of Ownership

Upon crossing the Atlantic, one lands in another planet. In particular, Scandinavian jurists take on tasks that are much less dramatic. They describe statutes and cases—the outer system of property law. They may even express some normative standpoints but seldom arrange them under philosophical first principles.

If they ascend to a higher level of abstraction, it is not to seek normative advice but to discover analytical truths. Then, in looking to systematize the

[6] Beginning in 1991, the Government Law Center of Albany Law School sponsored conferences on Public Trust Doctrine. See http://stella.als.edu/glc/ptd-home.html.

complex content of positive law, they may use some of the analytical tools worked out in philosophy.

For example, Aulis Aarnio (1997, 265ff.) has discussed theories of the legal position of heirs and the right of ownership. He did not mention classical philosophers, but discussed instead the structure of property in the particular context, that is, in the transfer of the right of ownership. Legal doctrine has long used the traditional theory (*T1*) by which the right of ownership constitutes in principle an owner's unlimited power over the object. At any one moment, all the aspects of ownership can only belong to one, and only one, physical or juridical person. Even if several persons own the same thing jointly, each of them will enjoy all the aspects of ownership, but only as regards one part of that thing, a part identified either physically or in abstract terms, for example, percentage-wise. A sale will thus result in an instantaneous and total transfer of ownership: Initially the seller is a full owner, and then the buyer is. But this traditional view has met with difficulties in exceptional situations, e.g., when the assignment of chattels is supplemented with a suspensive condition or clause by which the ownership rights will not transfer to the assignee fully until the subsequent occurrence of a given act or event. In this interim period, the assigner no longer has full rights of ownership, and the assignee will not have received full rights, either. For this reason, certain auxiliary theories have been developed in addition to the traditional theory of ownership. Thus, the situation in the interim period has been characterized as a potential right, an expectative right, or a conditional right of ownership.

According to the newer "analytic" theory of ownership—*T2*, formulated by Alf Ross, among others (Ross 1958, 170ff.; Wedberg 1951, 246ff.)[7]—"ownership" is an "intermediate" concept connected with two clusters of norms, the first determining the conditions for becoming an owner, the second setting out the legal consequences of becoming one. If *A* buys or inherits a property, or receives it as a gift, she will then own the property. If she owns the property she may then use or sell it or bring a legal action against anyone who should interfere with such use or sale. Now, contrary to what theory *T1* says, the change of ownership is understood, not as an instantaneous event affecting all ownership rights, but as a series of events in many stages. One can now interpret the transfer of ownership as a process by which one person gradually acquires over time more and more aspects of ownership (cf. Ross 1958; Zitting 1959, 227ff.).[8] Aarnio's comment is that

> the conceptual equipment of *T2* makes it possible to achieve a more detailed analysis of relevant problems than the corresponding equipment of *T1*. This means, more detailed questions, and further, more detailed and richer answers. On the basis of this fact, it seems also to be well-

[7] See also Lindahl's and Odelstad's formalization, Section 5.5 below.

[8] The idea can be traced to a Finnish court ruling issued in the 1880s and to the Finnish jurist Torp. (This I learned from Lars Björne.)

founded to claim that the change from *T1* to *T2* has been an expression of scientific progress. (Aarnio 1997, 272–3)

An interesting application of the theories of ownership concerns the heir's legal position. In the legal orders based on Germanic law, the inheritance transfers to the heirs immediately after the decedent's death. If there are two or more co-heirs, they acquire joint ownership of the property that belonged to the decedent. Two theories of the co-heirs' right of joint ownership have been developed. The theory of indivisible ownership (*T1*) argues that all co-heirs, upon the decedent's death, will jointly own the property in the estate, even if an individual heir does have a right to a portion of the estate as such. On the theory of divisible joint ownership *T2*, each heir will have an imagined, ideal portion (or share) of each individual object in the estate. Correspondingly, the heir's rights will consist of a conglomeration of the imagined portions belonging to her, and there are as many imagined portions as there are objects. The two theories entail similar consequences: The individual heir may not dispose of the objects in the estate.

These two theories would later lose ground to a third theory (*T3*) by which ownership rights are best viewed as composed of component parts, each susceptible to change in a variety of ways in a variety of situations. Aarnio regards it as a paradigm shift: "If *T1* and *T2* are considered articulations of a conceptualist legal dogmatic paradigm, then, in accordance with the above, *T3* is clearly an articulation of an analytical paradigm" (Aarnio 1997, 267).

T1 and *T2* differ from each other only in a very abstract—almost philosophical—way. *T3* differs from both *T1* and *T2* in a philosophical way, too, since it no longer regards ownership as indivisible. But it also differs from them in another respect, namely, it allows for normative solutions that would appear conceptually impossible in the light of *T1* and *T2*. This is all right according to Aarnio, because the idea of ownership as an indivisible whole was too inexact to solve complex legal conflicts in a dynamic society.

2.2.3. Benson's Formalistic Analysis of Property

The idea of ownership as a single unit having aspects linked to one another—though almost abandoned by the analytically minded jurists—is making its way back.[9] Thus Peter Benson has developed a distinct, juristic conception of rights characterized as follows:

A defendant is subject only to a prohibition against injuring what already comes under the plaintiff's right of ownership: in the formulation of the common law, there is no liability for nonfeasance. [...] Secondly, the juridical conception supposes that this protected ownership in-

[9] See also Simmonds 1998, 195ff., on the reemergence of the will and interest theory after Hohfeld.

terest, and hence the plaintiff's right, is of such kind that the only way it can be injured is just through external interaction between the parties. […] Thirdly and finally, the juridical conception of rights [does not deal with] assessing what the general welfare or common good may require. In so restricting its purview, the law purports to articulate terms that are fair and reasonable as between the parties, in the light of their particular interaction. (Benson 2002, 755–6)

Benson distances himself from such ideas as that expressed in the analytical theory of ownership by which the incidents of property are construed as a "bundle" of rights, liberties, powers, immunities, and so forth (ibid., 771).

The three incidents […] of the right of property under first occupancy—namely, the right to possess, the right to use, and the right to alienate—are fully integrated and mutually interconnected, albeit distinct, expression of the very same conception of property. (Ibid.)

Moreover:

The equality of individuals consists in their absolute identity as self-authenticating sources of claims.
This conceptually basic view of individuals as free and equal is the juridical conception of the person ("juridical personality") and is reflected in the right of property. (Ibid., 813)

2.2.4. Philosophy as a Tool of the Doctrine of Property

When jurists discuss property, they often turn to philosophy as a tool. Whereas some American jurists attacking political problems use classical moral philosophy as a tool, some European jurists use logical analysis as a tool. My use of the word "tool" is meant to suggest that the deepest ground for juristic theories does not lie in general philosophy. Thus, for example, one notices the following about Benson's argumentation: A part of the argument consists in a conceptual analysis of juridical property rights in relation to several other juridical concepts, such as possession, use, alienation, compensation, and thing. But there is also a normative side to the argument, which consists in assuming that when property law is organized around these concepts, it carries an inner normativity of its own. This normativity can then be reinforced from the outside by philosophical considerations of freedom, equality, and so on.

Aarnio's argument deserves a similar comment. He presents this development as an attainment of greater theoretical sophistication. The analytical theory is indeed much more precise than the old theories.[10] Moreover, it is clearer in its avoidance of complex metaphysics. According to the older theo-

[10] Aarnio's theory, and the European theories in general, is—on the face of it—"less philosophical" than the American theories in its use of philosophy to frame property law. But this is not entirely accurate. There is behind the European theories, and the Scandinavian theory in particular, a lot of work done by professional logicians, such as Stig Kanger and Lars Lindahl, who refined the analysis originating with Hohfeld.

ries, ownership was an indivisible unity, not unlike a substance. The analytical theory, on the other hand, did not recognize these controversial entities. But there is another part of the argument whose main concern is power rather than clarity. The analytical theory dissociated itself from any thought that the concept of ownership may have normative consequences. The lawgiver, rather than the conceptual speculations undertaken in legal doctrine, should regulate the normative content of law. Thus, the analytical theory encourages creating (in legislation or in legal practice) legal situations where the rights traditionally accorded to the owner exclusively are spread among many subjects. This is a flexible tool that enables the legislature and judiciary to conceive combinations of Hohfeldian legal positions previously not conceived. Analytical sophistication of this kind makes more logical space for legislation and statutory interpretation: It frees the politicians and the judiciary from constraints previously imposed by traditional conceptual jurisprudence, in effect taking some power away from legal scholars and handing it over to politicians and judges. The state may use this tool to take over some aspects of ownership and thus to interfere in private economy.

These questions lead to the following assessment. Though the analytical theory of ownership appears to be more sophisticated than the older theories, this is no reason reduce ownership to its simple Hohfeldian components. The components and the totality are both useful in normative debate. Once this political context of analysis is recognized, one also acquires a tool for further political debate. It will make sense, for instance, to ask whether certain legislative restrictions on the right to dispose of real-estate property are just in one respect only if compensated with generosity in another respect. Should not a homeowner subject to tough restrictions on her right to rebuild or rent a house at least retain an unrestricted power to sell the house? This debate can also prompt a conceptual question: Can an ownership that is restricted in one way also be restricted in another way and yet still preserve its nature as ownership? For example, can a person still be said to own a house who may not rebuild or sell the house at will?

2.3. Juristic Theories in Contracts

2.3.1. What Justice? What Freedom?

The big moral questions in contracts are justice and freedom. Philosophers disagree: Some emphasize freedom, others emphasize justice. There are also intermediate positions (e.g., Richardson 1990, 258).

Moral theory enters contract law through considerations of justice, among others. The traditional view rests upon the concept of commutative justice, holding that adjudication must follow considerations relevant to the parties and must avoid such broader moral and political issues as distributive justice.

Some writers, however, emphasize distributive justice. Thus, Anthony Kronman (1980, 472) suggests, contrary to the ideology of welfare-state liberals and libertarians, that the rules of contract law should be utilized to implement distributional goals whenever alternative ways of doing so are likely to be more costly or intrusive.

Kronman emphasizes groups, not individuals. What is decisive is that "the welfare of most people who are taken advantage of in a particular way be increased by the kind of advantage-taking in question" (ibid., 483).

Unsurprisingly, there are also more complex normative theories. For example:

> Building on his interpretation of Aristotle, Thomas Aquinas, and the Spanish natural law school, Gordley proposes that the virtues of liberality and commutative (or corrective) justice constitute the two main ends of contracting. A party's obligation should depend on which virtue he has exercised. (Benson 1996, 43)

The overall impression is that philosophers are quite helpless when facing the real life of contracts. They employ sophisticated conceptual analysis, yet each of them arrives at her own preferred political position.

The same applies to freedom. The legal concept of freedom of contract emerged in the late 18th and early 20th centuries under the impact of liberal political theory (cf. Gordley 1991). There is a natural link between liberalism and the concept of freedom of contract (cf. Kimel 2001, 473ff.). But there are also controversies about what liberalism requires as well as about what "freedom of contract" should mean. Should one be free to make contracts and have them enforced, despite the fact that there may be moral, economic, social, or political reasons that would indicate restrictions to this freedom?

There is no single correct definition of freedom, but a cluster of overlapping definitions. Only complex definitions capture the central intuitions concerning freedom. For example, according to G. C. MacCallum (1967, 312ff.), freedom has both a positive and a negative aspect. Freedom is a threefold relation, expressed in the scheme:

X is free from *Y* to do *Z*.

Christine Swanton (1992) has developed a coherence theory of freedom based on a wide reflective equilibrium among defeasible considerations of "endoxa," meaning opinions accepted by many or the wise. Ola Svensson (2001) has added to this the idea of complex real freedom, which means two things:

- *Ceteris paribus*, with every new possibility of action, a person is that much freer.
- *Ceteris paribus*, the greater the importance of these possibilities, the freer this person is.

Freedom of contract has economic consequences, too. Thus, formal freedom of contract leads to Pareto optimality: A change in the distribution of resources is optimum and desirable if at least one person considers herself to be better off while no one becomes worse off (see Coleman 1988, 95ff.). A perfect market would lead to Pareto optimality. No market is perfectly competitive, however. Theorists thus discuss the "morality of market failures" (see Collins 1995; Trebilcock 1993). Another economic concept is the Kaldor-Hicks criterion: A change in the distribution of resources is optimum if either Pareto optimality is achieved or those who have gained by the resource reallocation can compensate those who have lost out by it (see Coleman 1988, 98ff.). The Kaldor-Hicks criterion is conceptually independent from freedom of contract. In effect, theorists disagree whether the allocation of resources should follow Pareto optimality, the Kaldor-Hicks criterion, or other moral considerations. The best solution may depend on the degree of market failure and of freedom of contract.

2.3.2. The Binding Force of Contracts

There is a complex controversy on the binding force of contracts. Sophisticated theories differ from one another at a high level of abstraction. Thus, the promise theory derives normative consequences from the principle that contractual obligation is a self-imposed obligation. In the European context, a similar theory is Windscheid's will theory. One philosophical justification of the promise theory is this:

> There exists a convention that defines the practice of promising and its entailments. This convention provides a way that a person may create expectations in others. By virtue of the basic Kantian principles of trust and respect, it is wrong to invoke the convention in order to make a promise and then to break it. (Fried 1981, 17)

Another theory is the reliance theory.

> According to a reliance theory, a contractual obligation is essentially an obligation not to let someone down whom you have induced to rely upon you. It is, in other words, an obligation to ensure the reliability of induced assumptions. (Smith 2000, 115)

What, then, does the binding force of contracts rest on? On invoking a convention, on inducing reliance, or on valid transfer? What is the criterion for choosing a theory?

2.3.3. Moral Philosophy, Economics, Legal Research

Perhaps each theory has something important to say. There is behind contract law a much broader set of values. One must consider the relationship among three different kinds of research: moral philosophy, economics, and legal re-

search. Jurists provide a map of situations in which one needs to rely on evaluations. Moral theorists tell us something about the justification of evaluations. It can happen that one moral theory is intuitively more convincing in one such situation and another in another situation. Economics delivers concepts and distinctions useful to moral theory and other concepts and distinctions useful to legal research. Intuitionist moral theorists can profit from economics because it gives them a map of situations that trigger moral intuitions. Legal research profits from various kinds of moral and economic considerations weighed and balanced depending on the situation.

This plurality of considerations explains why some influential jurists, especially in Scandinavia, present themselves as value pluralists. Thus, Jan Hellner (2001, 93) mentions the following ultimate goals for the law of contracts:

- to make sure that a party who concluded a contract in order to profit from it actually gets that profit;
- to protect the weaker party in a contractual relation;
- to protect the promisor from unexpected consequences of the promise made; and
- to protect the promisee who has placed her trust in another party's promise.

Juristic theories may force the big moral questions into the background. The theories then become less general and less vulnerable to basic philosophical controversies. I will mention two such theories in contracts: the theory of good faith and the theory of assumptions.

2.3.4. Good Faith

American contract scholars in the 1950s and 60s rejected so-called "conceptualist" or "formalist" approaches in favour of supposedly "realist" inquiries. Any effort to reduce the vast complexity of the real world of commercial practice to a general principle was dismissed. Thus, Robert S. Summers (1968) explicitly denied that a general conception of good faith is helpful and proposed instead a series of six categories of bad-faith performance: (a) evasion of the spirit of the deal, (b) lack of diligence and slacking off, (c) wilfully rendering a "substantial performance" only, (d) abuse of a power to specify contract terms, (e) abuse of a power to determine compliance, and (f) interfering with or failing to cooperate in the other party's performance (cf. Barnett 1999).

This attitude toward scholarship began to change in the 1970s and 80s. An example is the theory of good-faith performance developed by Steven Burton (1980). He rejects the list-of-factors approach and holds that legal scholarship must again produce unifying theories. Randy E. Barnett (1999, 1413ff.) would later survey the "core concerns of contract law"—will, reliance, efficiency,

fairness, and bargain—proposing the criterion of manifested intention as a "framework that specifies when one of these concerns should give way to another."

But Summers's categories are much clearer and less controversial than the proposed philosophical super-criterion.

2.3.5. The Theory of Assumptions

Another example is the theory of assumptions in contracts. Originally developed by Bernhard Windscheid (1850; cf. Lehrberg 1989, 34ff.), it presented a tacit assumption of a contract as an undeveloped condition. The plaintiff is not bound by the contract if certain facts take place and

- she had not considered the possibility that these facts could occur and
- had implicitly made it clear that she would not have entered the contract had she known about this possibility.

The contract is void if the defendant knew or ought to have known that the plaintiff would set this condition. The theory is thus based on the hypothetical will of the parties. For this reason, it has been called subjective.

An "objective" version soon appeared that was based on visible assumption and just and equitable risk distribution.[11]

A teleological version of the theory of assumptions—elaborated by Bert Lehrberg (1989)—found success in Sweden. The theory is "a conglomerate of different principles with different levels of precision and unclear relation to each other" (Lehrberg 1989, 277).

The principles provide a classification of various generic cases and of the problems these pose. The solutions are teleological, following Ekelöf's general doctrine by which the consequences of applying the statute in atypical ("hard," or difficult) cases should be the same as in routine cases. According to Lehrberg, one should pay great attention to the consequences of detailed, particular legal provisions. This way, a detailed legislation gains action-guiding importance at the expense of general principles of law.

Lehrberg formulated the following "principles of purpose":

- Trust: The defendant has relied normally upon the validity of the contract; this reliance should be protected.
- Will: Yet the plaintiff is not bound by the contract in opposition to her clearly visible will.
- Protecting good faith: The plaintiff deserves protection if her ignorance of facts is not due to negligence.

[11] Möller and Ussing; cf. Lehrberg 1989, 42ff.

- Fulfilment of the contract: It is easier for the plaintiff to void the contract on the basis of a mistaken assumption if the contract, for any reason, has not been fulfilled.
- Reasonableness: The possible loss of both parties must be considered.
- Profit: The defendant is not in the same need of protection if she stands to lose only the profit to be had from the contract.
- Prevention: The parties must be deterred from making contracts that can be voided.

Much of the theory describes actual or hypothetical generic cases and applies these principles to them. The author presents twelve separate model cases (ibid., 286ff.). He also states that the requirements of good faith vary between different types of assumptions.

The problem is how these principles are to be justified. One may ask, in particular, whether the principles rest on standards of justice. But any such standards are going to be philosophically controversial. The general impression is that the systematization of generic cases and their commonsense solutions is more reliable than any philosophical grounding of these solutions.

2.4. Juristic Theories in Torts

2.4.1. Philosophical Theories of Justification in Tort Law

Why should one be held liable for causing harm or injuring another person? What degree of liability is justified? How extensive should the compensation be? Philosophers disagree. There are various economic theories and various justice-based theories (cf. Perry 1996, 57ff.).

The first economic theory (propounded by Pigou and Calabresi in their earlier writings, cf. Perry 1996, 59ff.) holds that "externalities"—costs that initially fall on *A* because the activity of *B* has caused *A* harm—should be "internalized": The costs weighing on *A* should be transferred to *B*, the causally responsible party.

Another economic theory, introduced by Calabresi in his later writings and developed by Richard Posner, is a deterrence theory. Thus, according to Posner and his followers, the defendant's conduct shall be deemed negligent only if the burden (cost) of precautions was less than the probability of the accident multiplied by the gravity (cost) of the accident ("Learned Hand's formula").[12] In

[12] Judge Learned Hand developed the formula by which one is negligent where the burden (*B*) of avoiding a risk, or package of risks, is less than the probability of that risk occurring (*P*) multiplied by the gravity or severity of the anticipated risk should it materialize (*L*). Expressed algebraically, one is negligent if $B < P \times L$ (United States vs. Carroll Towing Co., 159 F.2d 169 (2nd Cir. 1947). The formula is now commonly accepted in the law-and-economics movement. Richard Posner is the leading personality of the movement.

other words, the supreme goal of tort law is, and ought to be, total cost minimization (cf. Perry 1996, 61).

The third type of economic theory assumes that the supreme goal of tort law is to spread losses throughout society as thinly and as widely as possible (cf. ibid., 68ff.).

Some economic theories appear to us to be unjust, for example, because they pay too little attention to the economic situation of the person required to pay compensation. Thus, various justice-based theories have evolved. One such type centres around distributive justice. On this theory, the supreme goal of the law of torts is to achieve a just distribution of resources (cf. ibid., 71ff.).

All these theories have been criticized for failing to consider that compensation in torts is a local (person-to-person) problem between parties, and not a global problem of creating an economically efficient or just distribution of resources throughout the community.

2.4.2. Ernest Weinrib's Theory of Corrective Justice in Torts

Ernest J. Weinrib interprets as corrective justice the justice between plaintiff and defendant in the law of torts.

Whereas distributive justice concerns the overall distribution of benefits among a group of people, corrective justice concerns only the relation between two parties, as between the wrongdoer and the plaintiff in the law of torts, without regard to the overall scheme of distribution.

Weinrib develops this idea as follows. First, a system of private law should pursue a coherent end or set of ends. Second, it should follow the Aristotelian perspective of correlative rights and duties based on corrective justice.

> For it makes no difference whether a good man has defrauded a bad man or a bad man a good one, nor whether it is a good or a bad man that has committed adultery; the law looks only to the distinctive character of the injury, and treats the parties as equal, if one is in the wrong and the other is being wronged, and if one inflicted injury and the other has received it. (Aristotle, *Nicomachean Ethics*, v, 1132a)

Third, it should base corrective justice on the Kantian norm of protecting individual autonomy. His conclusion:

> On this view, unreasonable risk is the idea that integrates the defendant's wrongdoing and the plaintiff's injury. The defendant's wrongdoing consists in creating the potentiality of a certain set of harmful consequences; the plaintiff recovers only if the injury is within that set. The consequences for which the defendant is liable are restricted to those within the risks that render the act wrongful in the first place. (Weinrib 1995, 158–9)

The theory has practical consequences. Consider, for example, the famous case Palsgraf vs. Long Island Railroad (162 N.E. 99, N.Y. 1928): A train-station attendant had moved a package while assisting a passenger who was rac-

ing to board a train just then departing. Unbeknownst to the attendant, the package contained fireworks, which exploded just as the package was moved. The plaintiff, a passenger who was standing on the station platform at some distance from the site of the explosion, suffered an injury when struck by a weighing scale. In denying damages, Judge Cardozo insisted that the central tort concept of duty must be defined relationally between a particular defendant's risk-creating conduct and a foreseeable endangerment of the plaintiff. By defining duty in relational terms, Cardozo's opinion faithfully reflects the bipolarity of Weinrib's formalist perspective on rights and duties. By contrast, the idea of tort duties owed to the world at large—an idea articulated in Judge Andrews's dissenting opinion in Palsgraf—deviates from the bipolar perspective and is consequently, on Weinrib's view, erroneous.

Weinrib supports his views with the following considerations of coherence. He insists that the legal positions of the plaintiff and the wrongdoer need to be conceptually connected (Weinrib 1995, 30) and that they must possess a single integrated justification (ibid., 35). Consequently:

> Corrective and distributive justice provide the most abstract representations of unity of justificatory considerations […]. Because corrective and distributive justice are the categorically different and mutually irreducible patterns of justificatory coherence, it follows that a single external relationship cannot coherently partake of both. […] When a corrective justification is mixed with a distributive one, each necessarily undermines the justificatory force of the other, and the relationship cannot manifest either unifying structure. (Ibid., 73)

2.4.3. The Pro Tanto *Locality of Corrective Justice in Torts*

Weinrib's theory has been criticized as artificially isolated from social considerations (cf. Rabin 1996). No doubt, one can ask many questions in this vein: Does Weinrib's theory entail normatively reasonable solutions of cases with strict liability? Does it entail reasonable solutions in cases presenting a so-called *casus mixtus*, as when a thief has bad luck and the stolen property perishes in an accident? Similar questions are possible with regard to all the rich details of the law of torts.

Next problem concerns coherence. Weinrib insists that the legal positions of the plaintiff and the wrongdoer are conceptually connected, that they possess a single integrated justification, and that this justification must rest on one conception of justice, namely, corrective justice. Failing which, these positions are not coherent with one another. But this conception of coherence is too restricted. He thinks that internal coherence in private law must prevail for the sake of individual autonomy, even if this decreases the coherence of private law with the rest of the legal system. It is unclear why this must be so.

It is no wonder that Jules Coleman developed a "mixed" conception that combines the principle of corrective justice, requiring that wrongful losses be annulled, with a "relational principle" that lays this duty of annulment on the

person responsible for the loss. The mixed conception postulates that if the conditions of wrongful loss and responsibility are met, then the wrongdoer must compensate the victim's loss, unless an alternative compensation is in place, such as a social insurance (cf. Coleman 1992, 326). In other words, corrective justice justifies compensating wrongs in general, but does not require laying on the wrongdoer the duty to pay compensation. When deciding whether the burden of payment should fall to the wrongdoer—as against, say, the state or an insurance company—we may justifiably rely rather on distributive justice than on corrective justice.

At a higher level of abstraction, we may introduce openly Hegelian considerations. The following quotation is interesting:

> Neither strict liability nor fault seeks to engulf the law of torts, nor does social insurance seek to displace the law of negligence. Rather, each rules within limits consistent with the preservation of the others' distinctive existence—limits made coherent by the primacy of the whole with respect to its constituent parts. […] This means that while the right to a tort action cannot be extinguished by social insurance, that right must nonetheless yield to the extent necessary to insure a basic level of welfare for all members of the community. (Brudner 1995, 209)

Moreover, private law is not an isolated segment of law. Legal practice—with its use of reasoning by analogy, apportionment of damages, and other legal technicalities to solve the complex problem of causal over- and under-determination—departs in point of fact from Weinrib's ideal. Each deviation has its own justification, which links up with the totality of legal knowledge. Weinrib's coherence is too narrow to grasp this relation. He has a coherent theory of the relation between the parties. This is a good start. But a lawyer needs also a coherent theory of "everything," in which the relation between parties is taken into account together with considerations of interests, deserts, needs, and utilities, both individual and social. A theory of this kind must pay attention, among other things, to restitution, fair risk distribution, and the general deterrence of wrongs (Hellner 1995, 37ff.). It must include a "local" theory of negligence and adequate causation, but it may do so only within a frame to be completed with and corrected by other considerations. This frame must be open to exceptions, defeasible, and *pro tanto*.

A coherent theory so construed must pay attention to both corrective and distributive justice.[13]

2.4.4. Three Intellectual Moves of Legal Doctrine

The overall impression is that philosophers have failed to provide a commonly accepted formula for the justification of liability in torts. How does legal doc-

[13] Cf. Perry 2000, 237ff., on the relationship between the concepts of corrective and distributive justice.

trine handle the disagreement? By making three intellectual moves: relativizing moral theory, localizing problems within parts of the law, and localizing problems in terms of the requirements of liability.

Let me start with relativizing. Jan Hellner (1990, 162ff.; 2001, 92) mentions the following ultimate goals of the law of torts: to compensate the person who suffered an injury or a loss, to assure commutative justice in the sense that whoever pays for additional protection should be considered entitled to this protection, to distribute risks according to economic efficiency, to spread loss among many persons, etc. Such jurists as Hellner usually deny that compensation has a single ultimate goal.

The second move of legal doctrine is to discuss the problems separately for each part of the law. In torts, one must balance such considerations as corrective justice, general deterrence, just distribution of risks, and the victim's needs. Similar factors certainly play an important role in criminal law. A lot can also be said about the retributive, social-utilitarian, and reformative theories of punishment. In contracts, the principle *pacta sunt servanda* has obvious underpinnings in Kantian autonomy, yet social considerations of needs may dominate consumer protection, for example. Labour law must treat desert seriously. But, in some cases, localizing problems in legal doctrine affords only *prima facie* solutions and opens the way to discoveries of a hidden coherence in the legal system. The same problems, principles, and systematizations develop in different parts of the law. For example, tort law and criminal law must both deal with negligence and adequate causation. There is an ongoing process of importing some principles from one part of the law to another.

The third move is to split the discussion on liability into several problems. For example, the jurist distinguishes various requirements of liability, each typically an independently necessary requirement. The sufficient condition of liability is then the joint fulfilment of all these requirements. Which are the requirement of negligence (except in cases of strict liability), the requirement of adequate causation, the requirement of the purpose of legal protection, the requirement of proof, the requirement of strong evidence, and so on (cf. Peczenik 1979a, 283ff.).

2.4.5. Theories of Negligence

Negligence is an important precondition of liability and responsibility in vast areas of the law, not least in torts, contracts, and criminal law. Since time immemorial, jurists have proposed several principles, maxims, and theories in order to draw a demarcation line between what one is and is not liable for. In part, the demarcation is based on negligence, even if there can also be strict liability without negligence and negligence without liability (on this, see the next section). In general, negligence is a mental attitude for which one is blamed. For example, knowing that your action may have brought about

harm and not caring, or not knowing when you should have known. The classical standards of negligence have something to do with normality: One is blamed for carelessness because a normal person, a *bonus paterfamilias*, would take more precautions. The estimate of normality is in turn based either on frequency—what most people do in a certain context is not negligent—or on social expectations. The latter are complex, yet it makes sense to say that one acted negligently even if many other people in that situation have acted similarly. For example, an organizer of a fashionable but extremely risky mountain-climbing tour in the Alps may be found negligent despite the fact that other organizers have done likewise.

Two other theories in competition with the normality standard have appeared just recently: They are Richard Posner's law-and-economics theory and the theory of liability as an element of the welfare-state politics of security. On the law-and-economics theory, the defendant's conduct shall be deemed negligent only if the burden (cost) of precautions was less than the probability of the accident multiplied by the gravity (cost) of the accident ("Learned Hand's formula," which see above). On the other theory, recently presented as an interpretation of some Swedish cases (Dahlman 2000, 58ff.), the defendant is negligent if found to have created an unacceptable uncertainty for the accident victim. The relation between the three theories follows from the metarule (ibid., 106ff., especially 137) by which the main ground for liability is deviation from normality; the law-and-economics criterion is suited for organized activity and the unacceptable uncertainty criterion is suited for organized activity that causes a personal injury.

But this situation opens the question whether we still need the umbrella-term "negligence" to cover all these cases. If we do need this term, what do we need it for? Another problem is how these theories are to be justified. It may be asked, in particular, whether they follow from any standards of justice.

2.4.6. Theories on Adequacy in Torts

Considerations of negligence will not suffice, however. About 1880 a German philosopher, J. von Kries, worked out a theory by which one is not liable when the causation was not "adequate." The theory drew a big following among jurists. Consider the following example: A negligent coachman falls asleep; the horse takes a wrong turn, is struck by lightning, and the lightning kills a passenger. The coachman's negligence is a cause of the passenger's death, but the cause is not adequate. It would, however, be adequate in another case, as when the chain of causation from falling asleep to the passenger's death ends up, not in lightning, but in driving into a ditch. Thus, an unwritten principle of the law of torts was discovered that stipulates that one has to compensate for damage only if the damage is found to be an "adequate" result of the action for which one is held liable. But when is the causal connection "adequate"? Von Kries

came up with two ideas: first, an adequate cause is generally apt to bring about a given kind of a harm and, second, an adequate cause increases significantly the probability of a given kind of a harm.

The relation between negligence and adequacy can be characterized as follows (Peczenik 1979a, 286–90): Negligence depends upon whether a normally careful person—a *bonus paterfamilias*—would not have acted as the wrongdoer did, because she would have foreseen a risk of harm. Adequacy depends upon whether an especially competent person (a cautious expert, a *vir optimus*) would have foreseen a relevant risk of harm of the peculiar type in question. The legal system often requires that both conditions, negligence and adequacy, be satisfied if the wrongdoer is to be held liable.

Different theories of "adequacy" have evolved in legal doctrine (cf. ibid., 153ff.); among them the following: The causal connection between an action and the damage that follows is adequate if, and only if, any action of this kind is apt to bring about (or relevantly increases probability of) a damage of this type. The causal connection between an action and the damage that follows is adequate if, and only if, a very cautious and well-informed person (a cautious expert, a *vir optimus*) can foresee the type of damage in question. The causal connection between an action and the damage that follows is adequate if, and only if, this action is a not-too-remote cause of the damage. The causal connection between an action and the damage that follows is adequate if, and only if, this action is a substantial (important) factor producing the damage.

Each theory claims to be the general theory of adequacy, but each, while reasonable, is contestable. Such theories must be brought into equilibrium with considerations of corrective and distributive justice. Thus, to some extent, moral reasons can be proffered to justify the choice between thinkable criteria of adequacy. And moral reasons can be found for the conclusion that a person shall not compensate for damage even if she had adequately caused it. On the theory of the "purpose of protection" (*Schutzzweck*), the wrongdoer is thus liable only for the damage against which the norm in question is intended to afford protection. *Schutzzweck* is then an extra condition of liability apart from adequacy (see references in Peczenik 1979a, 153ff.; see also Stoll 1968; Andersson 1993). But the new formulations are likewise controversial. Moreover, several authors have tried to replace the theories of adequacy with the purpose of protection or with the law-and-economics theory (see Landes and Posner 1987, chap. 8, and the following footnote, in Posner 1995): "This is not to deny causality: [I]t is to deny that the law requires a concept, definition or doctrine of causation" (Posner 1995, 185, n. 38).

In practice, one must find an equilibrium between abstract considerations and less abstract normative intuitions on the proper solutions to generic cases. A large part of each doctrinal theory describes actual or hypothetical generic cases and applies the chosen principle of liability for adequately caused damage to them. There are many such cases. Special problems come up, for example, in

connection with multiple "competing" causes of the harm (see Peczenik 1979a, 63–100). Using a more up-to-date terminology, one can speak of problems in the cases of over-determination-cum-preemption. Thus, if a certain type of damage *D* is generally consequent upon causes of the types *X* and *Y*, then, given an antecedent *X*-action, a *Y*-action will not necessarily raise in any significant way the probability of a *D*-damage (while the antecedent *X*-action does significantly raise the probability of *D*). Even so, it may still be that the resulting damage *D* is ascribed to *Y* as its (adequate) cause, rather than to *X*, if the intervening *Y*-action preempts the causal connection between *X* and *D*.

We must also distinguish property damage from personal injury, and initial harm from consequential harm. Legal doctrine surveys these cases systematically. The following kinds of cases occur in the context of adequate causation in torts (cf. Peczenik 1979a, 38ff., 206ff.):

- Multiple sufficient causes of a divisible harm.
- Simultaneous, independently sufficient causes of indivisible harm.
- Non-simultaneous, independently sufficient causes of indivisible harm.
- An "overtaken" cause consisting in the plaintiff's illness or vulnerability.
- Is *A* liable when another person's fault hastens the harm?
- Is *A* liable when an accidental event hastens the harm?
- Liability for redundant causal factors.
- Cumulative causes to which fault can be ascribed.
- Cases involving the victim's intervening fault.
- Cumulative causes, one of them consisting in an unusual accidental event.
- Cumulative causes of an injury, one of them consisting in the victim's illness or vulnerability.

And so on (cf. ibid.).

2.5. Some Theories of Criminal Law

2.5.1. Philosophical Justification of Punishment

Criminal law, too, has its philosophical underpinnings. Duff (2002b) lists the following basic questions with regard to the justification of punishment:

> As Hart famously pointed out [...], we must distinguish at least three justificatory issues. First, what is the "general justifying aim" of a system of punishment: What justifies the creation and maintenance of such a system—what good does it achieve, what duty does it fulfil? Second, who may properly be punished: What principles or aims should determine the allocations of punishments to individuals? Third, how should the appropriate amount of punishment be determined: How should sentencers go about deciding how severe a sentence they should impose? We can add a fourth issue, which is insufficiently discussed by philosophers: What concrete modes of punishment are appropriate, in general or for particular crimes? (Duff 2002b)

We can trace in criminal law a tension—similar to that which we have in torts—between justice-based responsibility and social considerations. Theories of punishment depend to a considerable extent on considerations of justice (as is the case with retributive theories) and of utility (as is the case with consequentialist theories stating for punishment such goals as treatment and general and particular deterrence).

A consequentialist must justify punishment (if she is to justify it at all) as a cost-effective means to certain independently identifiable goods. But this punishment can be unjust, and hence wrong. For this reason, retributivism assumes a different position: Penal desert constitutes a necessary and a sufficient reason for punishment (cf. Duff 2002b). Retributivism has normative consequences. Consider, for example, the following quotation: "I believe that these three culpable mental states—purpose, knowledge, and recklessness—all exhibit the single moral failing of insufficient concern for the interests of others" (Alexander 2002, 828ff.). Moreover, "negligence and strict liability, which are not culpable mental states and do not evidence negative desert, cannot themselves provide justifications for punishment" (Alexander 2002, 830).

One can also discuss whether Mill's Harm Principle specifies the only kind of good reason for criminalization (cf. Duff 2002a) or whether there also exists harmless wrongdoing.

The dependence of criminal law on philosophy shows itself in a trend towards abstraction. As in torts, we can observe here the high sophistication and great controversiality of abstract philosophical issues. Let me quote Duff again:

> It is, to put it mildly, unlikely that our normative theory of justified punishment will justify our existing penal institutions and practices: it is far more likely that such a theory will show our existing practices to be radically imperfect—that legal punishment as it is now imposed is far from meaning or achieving what it should mean or achieve if it is to be adequately justified. (Duff 2002b)

It is thus plausible that some scholars should advocate a relational conception based on a plurality of considerations. For example:

> Attributions of responsibility occur not in a juridical vacuum, but in specific interpersonal and circumstantial contexts. Such attributions are fundamentally *relational*: They depend upon the character of moral, legal and social relations among the actor, the victim, and the evaluator. (Kutz 2002, 550)

This insight into the complexity involved in the justification of punishment has Hegelian antecedents. Thus, Brudner (1995), in an explicit endorsement of Hegel's philosophy, states what follows:

> Because each system is a part of a whole, each must be actualized by judges and legislators with a moderation that reflects this constituent status. [...] Hence it is a mistake to make negligence

the basis of liability for crimes against personality or to weaken the strict retributivist understanding of desert for such offences. Subjectivist orthodoxy is appropriate for true crimes. However, it is also a mistake to make subjective fault the standard of blameworthiness for welfare offences or to assess the justice of penalties for such offences from the standpoint of desert. Because the welfare laws are justified instrumentally, the concept of desert strictly understood has […] not intelligible application within this sphere. (Brudner 1995, 255–6)

2.5.2. Some Juristic Questions

Jurists are sometimes sceptical about philosophy, yet they may ask questions similar to those that philosophers ask. A lot can be said here about retributive, social-utilitarian, and reformative theories of punishment. One may also consider Nils Jareborg's (1992, 98ff.) classification of crime ideologies. The primitive ideology and the collectivist ideology base punishment on the wrongdoer's attitude. The primitive theory bases punishment on the wrongdoer's disobedience to the ruler; the collectivist theory, on her disobedience to the authority of the law as linked to morality, community, or natural law. The radical theory does not deal with the wrongdoer's attitude at all, but merely with circumstances that make the action worth punishing, that is, for the most part, with the harm caused by the wrongdoer. Jareborg (ibid., 106ff.) concludes that the radical theory has great practical consequences; for example, it implies that punishment for larceny should be milder than punishment for inflicting mental suffering, and that criminal law should efficiently protect the interests of the victims.

Since the primitive and the collectivist ideologies are based on attitudes, they give rise to problems similar to those arising in connection with retributive theories. The radical theory, on the other hand, echoes consequentialism. The interrelations are complex because the two ideologies are purely legal, not moral (Jareborg 1992, 105). Jareborg's scepticism towards the moral justification of the law is quite controversial but deserves attention, not least because his sceptical approach to moral normativity in the law does not imply a value nihilism. Jareborg (1975), in contrast, has criticized value nihilism.

The most important achievement of the doctrine of criminal law is systematization. Criminal law consists of a general part and a special part. The general part differs from one jurisdiction to another but is typically concerned with the concept of crime, as well as with punishment, legality, the requirements of voluntary action, action and omission, criminal culpability, the individuation of crime, exculpatory circumstances and excuses, completed attempt, and so on. The special part deals with particular crimes.

According to Jareborg (1988, 106ff.), the structure of the penal system consists of three levels: criminalization and threatened punishment, adjudication in connection with punishment, and the execution of punishment. On the level of criminalization, the following questions matter most importantly: What types of action should be criminalized? Who should the legal threat be directed against? Should the threat be differentiated, and if so, how?

Decreasing slightly the degree of abstraction, we may turn to the juristic system of concepts and distinctions. Juristic theories in criminal law, for example, deal with what counts as criminal action. They discuss whether a person who instigates another to commit a crime, or a person who helps commit the crime, is to be regarded as having committed the crime in the first person. One may mention the following theories (Jescheck and Weigend 1996, 645ff.). The so-called unified concept of criminal action, adopted in Austria, for example, classes as wrongdoers all persons who in any form contributed causally to the criminal result. Another conception, adopted in Germany, differentiates between various forms of participation. Direct criminal action (restrictively or extensively defined) is contrasted with indirect criminal action, which includes complicity and instigation.

Sophisticated theories deal with such questions as, Should the accomplice's responsibility depend on whether the primary action was intentional or negligent? Should it depend on whether the primary action is inexcusable? Other theories deal with the indirect criminal action that *A* commits using another person's action as a tool. Interesting questions in this context are, for example, whether the fact of the "tool" acting legally should relieve the indirect wrongdoer of responsibility. This is the case, for instance, when someone deceives a police officer and thus makes her arrest a person on illegal grounds.

2.5.3. Dolus *Crimes and* Culpa *Crimes*

Some crimes require intention (*dolus*); others require carelessness or negligence (*culpa*). There are different kinds of *dolus* (cf. Jescheck and Weigend 1996, 297ff.):

- Intent (*Absicht*): The accused person *A* wants to achieve the criminal result.
- Direct *dolus*: *A* knows for sure that the result will take place.
- *Dolus eventualis*: *A* takes the result into account and accepts that it may take place.

Unsurprisingly, different theories of "dolus eventualis" have evolved; among these:

- *Dolus eventualis 1*: *A* takes into account a certain probability of the result coming to be.
- *Dolus eventualis 2*: *A* takes into account the concrete possibility of the result.
- *Dolus eventualis 3*: *A* would have acted in the same way had she known with certainty that the result would take place.

Each theory of this kind, though reasonable, is contestable. Unsurprisingly again, there are also some critical strands of legal doctrine that call into question the sense of such theories, advocating either

- a reconstruction of *dolus* in terms of probability; or
- a non-theoretical description of judicial practice.

There are also various theories of *culpa* in criminal law. Thus, Jareborg (1988) makes the following distinction:

> Carelessness: *culpa* as fault, act-orientated *culpa*, *culpa* making an action or omission wrong, not allowed, not justified. Negligence: *culpa* as guilt, actor-orientated *culpa*, *culpa* making a person performing an unjustified action or blameworthy omission, not excused. (Ibid., 29)

2.5.4. Causation in Criminal Law

There is also the problem of causation, even though theories of adequate causation play a lesser role in criminal law than in torts (cf. Jescheck and Weigend 1996, 285ff.).

There are radical controversies on the philosophical level. Thus, Larry Alexander proclaims that we should be "rejecting the equation of attempts and success and the problem of proximate causation" (Alexander 2002, 840), but adds the following interesting footnote:

> Moore [...] believes that successes increase negative desert relative to the underlying attempts. Causation, therefore, is a puzzle that he, unlike me, must resolve. (Ibid., n. 52)

Michael Moore's theory (1999, 1ff.) is complex indeed. It deals with the following questions, among others:

- distinguishing causation from mere correlation;
- the cause/condition distinction;
- over-determining causes;
- the scalar nature of legal causation;
- the limited transitivity of the causal relation;
- the sudden breaking of causal chains by (apparently) fresh causal starts; and
- limited liability for omissions.

Moore thus lists ten requirements which the legal concept of causation must fulfil (ibid., 43–5), states that Hume's theory of causation does not meet them (ibid., 50), and concludes what follows:

> It has been recently suggested that we look to singularist, not generalist, theories of causation. A singularist theory rejects Hume's reductionist fourth tenet sketched above. A singularist, that is, refuses to analyze the singular causal statement, "*x* caused *y*," in terms of causal laws. Such a theory will thus be committed to the existence of singular causal relations (and not, as are generalist theories, only committed to the existence of universal or probabilistic uniformities, or of universal or probabilistic relations between universals). (Ibid., 51)

These considerations are metaphysical more so than they are juristic. They are also highly controversial.

On the other hand, when we bring down the level of abstraction, we meet midlevel principles and paradigm cases of greater stability than general philosophical considerations. Consider, for example, the doctrine of objective liability conditions (*Lehre von der objektiven Zurechnung*) in German criminal law. The theory covers a certain number of cases which constitute a crime according to the letter of the law, but whose punishment the majority opinion of law scholars finds unjust. German legal doctrine has made a systematic survey of such cases. Following are some of the ones that have been most discussed (see Jescheck and Weigend 1996, 286ff.; Koriath 1994; Roxin 1989 and 1993):

- A person wants to kill another by infection with a cold, and so shakes hands with that person, thereby infecting her. The "victim" dies (case group: normal risks).
- A person wants to kill another with the help of a thunderstorm and sends the "victim" to a forest. The thunderstorm kills the "victim" (case group: force majeure).
- A person wants to hit another. A third person tries to kill the second by hitting her on the head with a stone. The first person intervenes just in time, and the stone hits the victim's shoulder rather than her head. The victim survives (case group: risk decreased).
- A driver runs a red light and, 200 meters past the light, has an accident in which a person is killed (case group: the purpose of protection).
- A person hits another. The victim refuses medical care and dies (case group: contributory negligence of the victim).
- A person fires at someone with intent to kill. The victim falls into the river, swims to an island and dies there, not from the gunshot but due to lack of food (case group: untypical chain of events).
- A person poisons another with intent to kill. A third person shoots and kills the victim before the poison can take effect (case group: action of a third party).

A special problem is whether omission is a cause of the criminal result. Here, too, we meet competing theories (cf. Jescheck and Weigend 1996, 617ff.).

The doctrine of objective liability is thus much less abstract and much more useful than philosophical theories. To be sure, its origin is partly in philosophy, for it has evolved from Hegel's philosophy of law as modified by the influential professor of law Karl Larenz. But its present use is distinctly different from what Hegel had in mind (cf. Toepel 1992, 137).

In summary: Jurists provide a map of situations in which one needs to rely on evaluations. Moral theorists tell us something about the justification of evaluations. The map is more stable and less controversial than the justifications.

2.6. Law and Economics as the Main Juristic Theory?

There is an important division between humanities-inspired soft juristic theories and mathematics-inspired calculus theories: The former lie at the core of legal doctrine; the latter express the modernistic ideal of precision. Many such theories have been attempted, but only few have succeeded. The most mature theory of this kind is "law and economics."

Richard Posner (cf. Posner 1990)[14] argues that the function of the law is to maximize wealth within the marketplace:

> The "wealth" in "wealth maximization" refers to the sum of all tangible and intangible goods and services, weighted by prices of two sorts: offer prices (what people are willing to pay for goods they do not already own); and asking prices (what people demand to sell what they do own). (Posner 1990, 356)

An entitlement should be conferred on the party who would have purchased it had the transaction costs not made it irrational for her to do so (Spector 1997, 360). The theory claims to be applicable to all parts of the law. It also advises the lawgiver and the courts as to the choice between different kinds of legal regulation. For example, the lawgiver can deter a factory from polluting a river by establishing a punishment, by making the polluter pay damages, by assigning a price for "rights to pollute," etc. The choice is right if it maximizes wealth.

Posner changed his mind twice with regard to moral justification in his theory. From an initial utilitarian defence of wealth-maximizing policies, he turned to a consent-based approach, and then to a pragmatist position (ibid., 359).[15]

The utilitarian justification is obvious but insufficient. Utilitarians think that the main moral principle is to maximize utility; Posner thinks that the main principle for the law is to maximize wealth. Is not wealth utility? Alas, the converse does not hold: There are some utilities different from wealth in Posner's sense. Friendship and family, for instance, make up an important utility for any normal person: It makes her happy and fulfils her preferences. But friendship and other similar kinds of utility elude Posner, since one cannot sell one's friends on the marketplace.

The consent justification of the theory is the following: All individuals will, in choices involving uncertainty, attempt to maximize their expected wealth. Thus, wealth ought to be maximized. However,

> if we grant that it seems plausible that some individuals prior to the enforcement of a judicial principle can identify themselves as losers by the enforcement of the principle, then it is impossible to assume unanimous consent. (Reidhav 1998, 112ff.)

[14] Posner drew inspiration from the Nobel prize winner Ronald H. Coase.

[15] Posner used a utilitarian (consequentialist) strategy to justify the instrumental value of wealth in 1979 (Posner 1979). He turned to a consent-based (Kantian) approach in 1980 (Posner 1980).

Consequently:

> It has been suggested that Posner's theory is contractarian as well as utilitarian but as we have seen in this chapter and in the light of previous chapters it is neither. (Ibid., 115)

Simply put, the losers will not agree to a social contract binding them to Posner's theory. Hence the pragmatic turn of Posner's theory:

> We look around the world and see that in general people who live in societies in which markets are allowed to function more or less freely not only are wealthier than people in other societies but have moral political rights, more liberty and dignity, are more content (as evidenced, for example, by their being less prone to emigrate)—so that wealth maximization may be the most direct route to a variety of moral ends. (Posner 1990, 382)

Posner calls maximization this pragmatic justification of wealth (cf. Posner 1995, 1–25). It is not easy to understand what exactly the term "pragmatic" means in this context. Let me present here Horacio Spector's interpretation:

> Suppose Posner claims that market institutions and human rights are now favored by people in modern societies, and that this is the reason why they are worth of support. In a preference-satisfaction normative theory, market institutions and human rights are justifiable insofar as they can satisfy human preferences [...]. By the same token, market institutions would be justifiable as institutional settings where human preferences are maximally satisfied. [...] I am not sure whether this view can be attributed to Posner. But if it can, his entire position is no different from preference-based utilitarianism. (Spector 1997, 368)

If that is the case, Posner's theory can no longer proclaim itself universally applicable, but only applicable to goods that are traded in the market (Spector 1997, 369). Furthermore, it is a pragmatic matter what is in the market and what is not. The task of sorting out which problems Posner's theory is rightly applicable to will therefore have to be undertaken by drawing upon a complex melange of consequentialist, non-consequentialist, and majoritarian considerations. Thus, the scope of the wealth-maximizing principle must be confined to those areas of the law where basic values, such as autonomy, life, health, and physical integrity, are not directly involved. By contrast, if the good in question is not in the market, it is incommensurable with the theory.

Moreover, Posner's theory faces problems even with regard to those goods that we do find in the market. He understands the maximization of wealth to consist in the satisfaction of those preferences that are backed up by a willingness to pay. But wealth in this sense does not always correspond to utility. For example, a poor man can desire bread more than a rich one, but will not want to pay for it as much as the rich man. On the wealth-maximization principle, the rich man shall get the bread, whereas the utility-maximization principle requires that it should go to the poor and hungry one.

Posner's theory, despite its ambitious claims, is perhaps just one of many juristic theories: It helps us understand and normatively improve some parts

of the law, but not the whole of it. But then, again, it is extremely successful in filling the vacuum created by the legal-realist destruction of the classical “soft” juristic theories (see Chapter 3 below). It leads to unjust effects in many cases, to be sure. But it may serve as the main juristic theory of modern times. One can perhaps argue that the simplest and most politically realistic way of balancing moral considerations is through a wealth-maximization approach, modified when necessary by other considerations. One may accept it defeasibly, that is, unless moral considerations justify a departure from it. Such considerations may express themselves in other juristic theories, which may come closer to commonsense moral intuitions than can the wealth-maximization theory.

Chapter 3

CRITICISM AND DEFENCE OF LEGAL DOCTRINE

3.1. Criticism

3.1.1. Reform Movements and the Alleged Deficiencies of Legal Doctrine

Let me now turn to a critical assessment. Legal doctrine is a product of premodern evolution, for it developed in a line that spans from Greek philosophy and Roman law to medieval *jus commune* and the reaction against natural law effected in the spirit of Hegel and Savigny. Modern philosophy made a linguistic turn and left this tradition behind. The new philosophy—more or less analytic—led to an erosion of legal doctrine. At the same time, radical reformers perceived legal doctrine as an unnecessary ballast. Indeed, criticism affected all legal argumentation, in legal practice and doctrine alike.

Classical legal doctrine achieved its peak with conceptual jurisprudence (cf. Hellner 2001, 138ff., and Peczenik 1974, 144ff.), which

- discussed legal rules in relation to the systematic structure of the law;
- attempted to present legal rules in a unified way;
- put particular legal rules under more abstract concepts; and
- elaborated increasingly abstract principles, deriving normative consequences from them.

Conceptual jurisprudence had its period of greatness in 19th-century Germany. Its foremost representative was Georg Friedrich Puchta.

Later on, conceptual jurisprudence faced criticism because it overestimated the role of deductive inferences in legal reasoning and because some of its concepts lacked practical importance. According to Rudolf von Jhering's jurisprudence of interests, formulated in conscious opposition to conceptual jurisprudence, the content of the legal system reflects the individual and common interests of the people. Statutory interpretation should be teleological, i.e., it should pay regard to legally protected interests—not only material goods, but also honour, love, liberty, education, religion, art, and science. But Jhering saw limitations in the teleological method. He thus refused to use the term "purpose of law" in defining juridical concepts, in systematizing the penal code, and in categorizing rights under private law.

The tension between these two schools survives to the present day, albeit in a modified (and more cautious) form. For example, Hart's choice theory and Raz's interest theory of rights (cf. Kamm 2002, 481ff.) echo the famous dispute in the 19th century between Windscheid's and Jhering's theories.

The criticism against conceptual jurisprudence grew more radical in the writings of François Gény, Eugen Ehrlich (the "free-law school"), and Hermann Kantorowicz. The version of jurisprudence of interests developed by Philipp von Heck was—again—more cautious. Karl Larenz (1983, 117ff.) would later develop the *Wertungsjurisprudenz*, which in substance is a continuation of *Interessenjurisprudenz*.

	Formalist (New Criticism)	Psychological	Structuralist (semiotics)
Academic cross-reference	Organic-form analogies (from biology, painting?)	Psychology (Freudian, Jungian, Lacanian, etc.)	Linguistics, anthropology
Assumptions	Everything you need is in the text; great works resolve tensions into unity; reading is apolitical; ideal readers will all read a given text the same way.	Because literature works on both a conscious and an unconscious level, it is useful to investigate how the unconscious contributes to our understanding of authors, texts, and readers.	The language comprises everything, i.e., a sign system of codes with rules and conventions and patterns of differentiation; the critic should be able to decipher these structures systematically.
Buzzwords	Elements (plot, character, theme, point of view, tone, symbols, setting, etc.), ambiguity, irony, autonomy of the work	Repression, projection, displacement, denial, sublimation, rationalization, castration, id-ego-superego, the unconscious, Oedipus complex, libido, wish fulfilment, archetypes	Codes, signs (signifier/signified), grammar, binary oppositions, synchronic vs. diachronic, systems of differentiation
Tricks/guiding questions	Avoid fallacies: (intentional, affective, mimetic, paraphrase); identify tensions of form and content and find how they get fashioned into organic unity.	Look for rivalries and signs of repressed desire (especially sexual and aggressive drives) in literary forms, characters, authors, and readers.	To decode a text or group of texts, bring out analogies between language structures and the system established within that text or group of texts.

In the United States, Roscoe Pound developed a related theory. The function of the legal order consists in social engineering, that is, in acknowledging certain individual, public, and social interests; determining the limits within which the law should protect these interests; and protecting recognized interests within the limits so determined. In this connection, Pound developed a number of rules for interpreting private law. Property law and most rules of

Post-Structuralist (deconstruction, new historicism)	Marxist	Feminist	Reader response
Structuralism, rhetoric, continental philosophy	Economics, political science, sociology	Any and all other schools, sociology, women's studies	Psychology, subjectivism; [reader : text : performer : musical score]
Meaning is textual and so unravels itself; systematic closure and determinate meaning is impossible	Culture reproduces (but may sometimes also produce) economic relations; class matters (for it affects our understanding of characters, authors, and readers).	Gender matters (for it affects our understanding of characters, authors, and readers); the personal is always political.	The reader plays a vital role in shaping literary experience.
Derridaen: binary oppositions, *differance*, *arche* (origin), free play, margin, privileged term, supplement, presence/absence. Foucauldian: archeology, discourse, power, rupture. New Historicists: thick description	Alienation, ideology, class conflict, base/superstructure, means of production, materialism, bourgeois	Sex (biological) vs. gender (cultural); patriarchal, revision, subversion, resisting reader, patriarchal authority of language, canon, tradition, culture, meaning, "writing the body"	Subjective; implied reader; "interpretative communities"; "fusion of the horizons" of expectation
Isolate hierarchies and show how the supposedly superior term is dependent on the supposedly derivative term; re-destabilize established New Critique or structuralist readings.	Watch for attitudes about labour: Does the text challenge or reinforce dominant ideologies?	Pay attention to what characters say and do in relation to gender; borrow freely from other approaches; get personal.	Examine your own expectations and reactions and contributions to the text (and perhaps compare these expectations with those of other people).

commercial law should be interpreted with the use of precise arguments based on the sources of law, this to protect the rule of law, an important social interest. On the other hand, indemnity rules require free interpretation according to the interpreter's evaluation of colliding interests.

In time, many jurists accepted—though often superficially—the worldview of analytical philosophy, in essence incompatible with legal doctrine. Many jurists adopted as well a critical approach directed against legal doctrine and the law in general. The arts of criticism are many. Legal scholars may provide a political evaluation of particular cases and institutions. Ideological criticism of the law at a higher level of abstraction is more interesting. One can mention here Marxism, critical legal studies, deconstructivism, and feminism. The taxonomy at pages 66–7 provides a general orientation in this complex matter (Steinwand 2003).

In sum, legal doctrine has faced repeated criticism focussed on the following points. Juristic theories have important normative components, despite their frequent claims that they deal with the law only as posited (*lex lata*). Further, legal doctrine allegedly suffers from the following deficiencies: ontological obscurity, indeterminacy, unjustified normative claims, philosophical fragmentation, unclear relation to political pluralism, territorial locality, and unscientific character.

3.1.2. The Alleged Irrationality of All Normative Theories

The normative content of juristic doctrines is a sufficiently strong ground for various value sceptics and rule sceptics to declare such theories non-rational *par excellence*. In other words, these sceptics assume that there is no such thing as normative reason. One may ascribe this position to David Hume. Let me quote his famous fragment:

> Take any action allow'd to be vicious: Wilful murder, for instance. Examine it in all lights, and see if you can find that matter of fact, or real existence, which you call vice. [...] The vice entirely escapes you, as long as you consider the object. You never can find it, till you turn your reflection into your own breast, and find a sentiment of disapprobation, which arises in you, towards this action. Here is a matter of fact; but 'tis the object of feeling, not of reason. It lies in yourself, not in the object. (Hume 1985, 520)

According to Hume, there are two main kinds of psychological state. The first consists of beliefs—states that purport to represent the way the world is. The second includes desires—states that represent how the world should be. Desires do not even purport to represent the way the world is (see Smith 1994, 7). This Humean psychology is the psychological equivalent of the logical gap between Is and Ought. Just as the Is and the Ought are assumed to be logically independent, so are belief and motivation. But this belief-desire psychology is highly controversial in moral theory (cf. McNaughton 1988, 20–3, 47–50, 108–13; cf. Hage and Peczenik 2001). Moreover, the

Humean criticism is general, not restricted to the law. Whoever uses Hume to criticize juristic doctrines must be committed to be equally critical of all normative moral theory.

Later on, philosophers like A. J. Ayer would suggest that moral statements simply express the moral sentiments or attitudes of the individual and that philosophy has no way of evaluating which set of moral statements is best.

Hägerström's philosophy was more complex, but he, too, vehemently denied the possibility of rational theorizing in morality, as opposed to theorizing about morality. (See *infra* on ontological problems.)

3.1.3. Indeterminacy and Façade Legitimation

Another problem of juristic doctrines is that they are excessively vague. Here are some examples:

- The theory of statutory interpretation states that the plain meaning of the statute normally, though not always, takes precedence over established judicial practice, but the theory cannot identify precisely the exceptional circumstances under which established judicial practice takes priority over the wording of the statute.
- The normality theory of negligence states that negligence normally involves a deviation from normal practice, but it does not tell us precisely what counts as normal.
- The foreseeability theory of "adequate" causation states that a negligent person is not liable for the consequences of her action if even an expert could not have predicted them. But it fails to tell us which consequences the expert can foresee and which she cannot.

Unsurprisingly, some theorists claim that our interpretation of the law is both unavoidable and necessarily indeterminate. In concentrating on legal rules and other published materials in law, legal doctrine and the written justification of judicial decisions address only what one might call a "façade legitimation" (cf. Ross 1958, 151ff.). In particular, such maxims of interpretation as analogy and *argumentum e contrario*

> are not actual rules, but implements of a technique which—within certain limits—enables the judge to reach the conclusion he finds desirable in the circumstances, and at the same time to uphold the fiction that he is only adhering to the statute and objective principles of interpretation. (Ibid., 154)

Ralf Dreier (1991, 120ff.) calls such criticism irrationalist, discusses methodological and ontological irrationalism in general, and then says the following about irrationalist theories of judicial decisions:

- Judicial decisions are in fact irrational, i.e., dependent on a number of psychological, sociological, and ideological factors.
- The justification of judicial decisions is merely a façade concealing the real motives behind the decision.
- Judicial decisions should depend on irrational factors. Only personal wisdom counts, not argumentation.

The American legal realists and the advocates of critical legal studies claim that the class of available legal materials is insufficient to logically entail a unique legal outcome in most cases, and that judicial decisions in indeterminate cases are influenced by the judge's political and moral convictions—not by legal considerations. The criticism often occurs in the shape of "anti-formalism," making a straw man out of "the formalist" and going through an entire list of more or less exaggerated positions so set up as to be refuted (cf. Himma 2002c).

The idea of indeterminacy also takes more-sophisticated versions. Thus, Joseph Raz claims that legal interpretation has innovative, forward-looking aspects. Innovation defies generalization. Hence, it is futile to attempt to construct a general theory that differentiates good interpretations from the bad (cf. Raz 1996a and 1996b; Dickson 2001; in moral philosophy, see also Williams 1985; Dancy 1993). Moreover, Sunstein (1996, 36) advocates a special role for "incompletely theorized agreements" in judicial decision-making. Judges may agree on the outcomes of individual cases even though they disagree on which general theory accounts best for those outcomes. They also may agree on a general principle, but not on what that principle requires in particular cases, or they may agree on a "midlevel" principle but disagree on the general theory underlying the principle as well as on what particular cases fall under its purview. In German legal theory, Friedrich Müller (1997) has claimed that the meaning of a norm is not a pre-interpretive standard, and that it therefore cannot limit interpretation.

One may find the basis of such scepticism in Wittgenstein's remarks on rule-following (Wittgenstein 1958, §198):

> Whatever I do is, on some interpretation, in accord with the rule,

and we can

> give one interpretation after another; as if each one contented us at least for a moment, until we thought of yet another standing behind it. (Ibid., §201)

One particular indeterminacy argument is this: Does not legal doctrine introduce overly complex theories that diminish the usefulness of legal rules? The very point of making rules is simplicity; Luhmann (1993, 54, 62, and elsewhere) speaks of a "reduction of complexity." Is it not a deficiency when legal doctrine makes the legal system more complex (cf. Noll 2000, 58ff.)?

3.1.4. Ontological Obscurity

Whereas the Anglo-American critics focus on indeterminacy, Scandinavian critics focus on ontology.

A big objection to juristic theories is that one cannot state precisely what they deal with. Since the details of legislation and judicial practice can be a product of political compromise, arbitrary evaluation, and at worst corruption, and since these details are nevertheless binding and so affect the basis of juristic theories, jurists who develop a coherent theory must answer that they are not simply describing statutes and decisions, but rather revealing something more profound underlying these statutes and decisions. But what can they reveal if not factual practice or the similarly split attitudes of politicians, judges, and the public? In other words, whereas neat calculi in natural science seem to reveal the very order of the world, neat juristic doctrines cannot reveal any such order, because there is none.

An even more radical doubt is, Do legal rules exist at all? Legal practitioners obviously believe that there is a legal system and that some rules belong to this system. It would be a strange theory, indeed, which holds that all these people are wrong. Yet the question whether legal rules exist is philosophically interesting. A powerful ontological critique has come from so-called Scandinavian legal realism, a theory that places legal doctrine into an ontological vacuum.

The founder of the so-called Uppsala School, Axel Hägerström, built up his theory on the following theses on reality (cf. Hägerström 1929, 111ff.). All knowledge concerns something real. Only one reality exists and it comprises the objects located in time and space. Human beings are thus real because each human being exists in a certain period during which she always occupies a position in space. Mental processes exist because people, who exist in space, experience them as existing in time. Time and space are objective. What cannot be placed in time and space does not exist.

Let me add a terminological caveat. Scandinavian "legal realism" has nothing to do with metaphysical realism, a theory that stipulates the existence of complex entities to which complex concepts refer. Metaphysical realists thus affirm the existence of valid law, that is, of the entity corresponding to the concept "valid law." Their adversaries are the nominalists, who deny the existence of such entities. Legal realists make the opposite point here: They say that no such entity can belong to material reality. Legal realists therefore stand closer to nominalists than to metaphysical realists.

According to Hägerström, value concepts like "good" and "beautiful" are self-contradictory. They apparently say something about objects (e.g., "This picture is beautiful") but in fact do nothing of the kind and merely express feelings (such as one's admiration of the picture). Moreover, value statements lack truth-values, since they "describe" things that fall outside time and space. The value "existing" in an object—e.g., the goodness "existing" in it—does

not exist in any definite sense at all. Thus, on Hägerström's view, the state and the law, among other things, are merely products of our imagination.[1]

Hägerström's ideas gained influence among lawyers when these ideas were taken up by outstanding legal scholars, such as Karl Olivecrona and Alf Ross. Olivecrona held unswervingly with Hägerström's thesis that valid law is merely a product of imagination, but he paid a high price for it: We cannot study valid law in any scientific way; we can only study people's beliefs about what is valid law. In Olivecrona's opinion, legal rules are not imperatives in a literal sense, yet they are independent imperatives in the sense that their addressees regard them that way (as imperatives). Beliefs about what is valid law do not designate any fact. But they do serve social functions—directing human conduct, facilitating the concise writing of statutes, and even conveying vague pieces of information, such as that in the usual course of events the "owner" of an estate exercises a kind control over the estate.

Alf Ross, too, accepted Hägerström's philosophy. Yet he proposed a new definition of valid law. According to Ross, the scientific assertion that a certain rule is valid is, according to its real content, a prediction that the rule will form an integral part of justification in future legal decisions. The philosophical background of this theory consists in the conviction that scientific propositions must have verifiable consequences on the physical conduct and mental experiences of the persons who monopolize the use of physical force in society.

3.1.5. Unjustified Normative Claims

Whereas the "legal realist" criticism focuses on indeterminacy and ontology, the liberal criticism focuses on normativity.

This kind of criticism assumes a dichotomy between genuine normativity and quote-unquote normativity. Legal doctrine is in error when it purports to assert propositions with a claim to normativity. When properly analysed, the propositions of legal doctrine allegedly prove to be, not "genuine legal statements," but "spurious" ones. They do not express any genuine normativity but merely report the content of institutionally established law (cf. Hedenius 1963, 58).

There is behind this criticism a rationalist, contractarian (or Kantian) theory of normativity based on the rational will of individuals. How can there be any legal normativity at all—and in particular any normativity established by doctrine—when all normativity allegedly arises from the rational will of individuals, not from social facts (as is legal practice)?

Moreover, juristic doctrines evolve in the context of specific national legal systems. For example, the German theory of adequate causation in torts is not

[1] Yet Hägerström apparently favoured the autonomous "morality of self-realization" (cf. Bjarup 1997, 106ff.) at the same time as he postulated "the law as substitute for social morality" (ibid., 108).

at all similar to the Anglo-American theory of proximate cause. Nor is it similar to the French theory of *cause étrangère*, though all three theories have similar effects in their respective legal systems. In this sense, juristic doctrines are essentially positivistic. Their content depends not only on principles with a claim to universal validity, but also on the contingencies of particular legal systems. How can any such content be normatively binding?

3.1.6. The Risk of Fragmentation

Another kind of criticism emphasizes internal tension in legal doctrine. Juristic theories show a curious ambiguity vis-à-vis basic theories of practical reason and morality. They are often explicitly or implicitly based on such theories. Philosophical theories are notoriously controversial, however. To deal with this controversialism, legal researchers can split legal doctrine into fragments, some following one philosophical theory, others following another one. Also a way to avoid philosophical fragmentation is by isolating legal doctrine from philosophy. Venture into a daring generalization, one can say that whereas isolation is the main threat in the legal doctrine of continental Europe, philosophical fragmentation is what threatens American doctrine. Disputes between utilitarians, rights theorists, moral particularists, and other moral philosophers thus affect European legal scholars only slightly, if at all. The Americans are more interested in philosophy, but then legal research often follows one or another philosophical fashion and thus faces philosophical fragmentation. The tension between philosophical fragmentation and isolation creates a problem when it comes to providing a deep foundation for the normative force of juristic doctrines.

The philosophical fragmentation of legal doctrine increases in parallel with the increasing complexity of the modern world. For example, Mark van Hoecke and François Ost have written about legal doctrine in crisis, pointing out such factors of crisis as acceleration of the law, specialization, the proliferation of factors in legal doctrine, pluralization of legal systems, and information chaos. Their conclusion is that there is a growing need for a (European) re-systematization of the law (van Hoecke and Ost 1997, 189ff.).

3.1.7. Unscientific Character

Another form of criticism originates from the idea of science. The objection that legal doctrine is unscientific is not new. Julius von Kirchmann's attack of 1848 (Kirchmann 1990) finds its supporters even today: Three words by the lawgiver are enough to convert juristic libraries into garbage.

The objection that legal doctrine is unscientific can even be more sophisticated. Thus, Enrico Pattaro has characterized legal doctrine, as follows:

Law and legal science, only in part divergent, belong to the great realm of ethics, ethics construed in the broad sense as the whole of all discourses (moral, political, legal, etc.) whose prescriptions are aimed at practice, that is, behaviour. To attain their practical ends, law and legal science can make use of logical instruments without becoming scientific discourses by so doing, but rather making such logical instruments contribute to the practical perceptive function of law. (Pattaro 1997, 109–10)

These views are characteristic of many versions of legal realism. For example, an important version—psychological legal realism—has exerted a great influence upon Polish legal theory. Leon Petrażycki (1959b, 1959a, 1960, and 1955; see Peczenik 1975a for a bibliography) created an original theoretical system covering moral and legal philosophy, the theory of science, psychology, and sociology. According to Petrażycki, legal doctrine makes the law uniform and adapts it to its social function to create peace. It uses analogy, induction, conceptual analysis, and deduction in as precise a way as possible. Thus, Petrażycki did not share the American realist views about the indeterminacy of the law and of legal doctrine. Yet he insisted that legal doctrine is not a science, because it is not an adequate theory. In Petrażycki's opinion, scientific theories must be adequate, meaning by this that they must be neither "jumping" theories nor "lame" ones. A "jumping" theory is too wide: What is true of only a part of a class is (erroneously) said of the whole. A "lame" theory is too narrow: What is true of the whole class is said of only a part of it. According to Petrażycki, an adequate theory of law must be a psychological theory of legal emotions. Legal doctrine, because it deals with positive legal norms, and indirectly with the emotions underlying these norms, cannot be adequate, given that emotions similar to these underlie as well the rules of games, of various social conventions, etc. Petrażycki proposed a new classification of psychical phenomena. Not only feeling, knowing, and willing exist, but also impulsions ("emotions"). These are passive/active; thus one feels hunger and at the same time goes looking for food. Moral impulsions consist in "feeling" a duty in combination with an active readiness to act from that duty. Legal impulsions are the only legal phenomena upon which an adequate theory is possible. A correct legal theory must therefore be psychological, and the law is thus made to consist in legal impulsions. These impulsions are imperatively attributive, i.e., they are directed at our own duties in such a way as to lock in with other people's rights, and vice versa. Introspection is the proper method to study our own legal impulsions. The legal impulsions of others are accessible only by way of an analogy with ours. The uniformity of the law is explained in terms of evolution in the manner of natural selection in Darwin's sense. A person whose rights are violated will want to retaliate. The legal psyche is thus aggressive (while the moral psyche is peaceful, for it lacks the element of rights). Therefore, legal rules and legal concepts get brilliantly, though unconsciously, adapted to the need to unify the legal impulsions of different people. Positive law—i.e., official law (the law in a juristic sense), the

law of illegal organizations, the law of children's games, etc.—must be studied within the same adequate theory. With positive law in the sense of "official law," such as legislation and custom, the underlying impulsions are attached to inter-subjectively cognizable "normative facts." Legal rules are mere "impulsive phantasms," projections of shared legal impulsions.

3.1.8. Philosophical Background of the Criticism

The criticism of legal doctrine reflects in part the exaggerated minimalism of the period between the two world wars, and in part the mainstream of late 20th-century intellectual culture. Greater information about different cultures and the advent of pluralistic democracy suggest that

- moral opinions are of necessity relative;
- the interpretation of the law must also be relative if it uses moral valuations;
- the law is nothing more than an instrument of politics; and
- the law needs to be morally neutral in order not to be oppressive.

Indeed, moral relativism, relativism in legal argumentation, and, not least, the separation of law and morals have been quite influential in modern culture. In this context, legal doctrine appears strange. It collides with the mainstream of intellectual culture in the late 20th century, all focussed on the following basic positions:

- foundationalism in epistemology;
- minimalism in ontology;
- deductivism and scepticism in judgment and weighing in the theory of argumentation;
- individualism and dogmatism in moral theory, especially in the sense of reducing normativity to individual, contractarian, or Kantian reflections about first principles; and
- individualism in social theory.

On the other hand, criticism in legal doctrine is often connected with general doubt about the powers of reason, especially practical reason, in the spirit of postmodernism. Only small "narrations" were left intact; among them, formal logical calculi and local legal doctrine.

Consequently, some legal scholars are often victims of hastily accepted fashionable philosophical theories, often too analytical and too critical to be compatible with legal doctrine, and often understood in a superficial manner.[2]

[2] Cf. Moore 2000, 193ff., on the superficial character of "pragmatic instrumentalism."

3.2. Defence of Legal Doctrine

3.2.1. The Copernican Turn: Philosophy Tailored to Legal Doctrine

Now, despite the hostile environment, legal doctrine—and this is a true miracle—fared pretty well: It weathered the criticism and continued to display the central characteristics of conceptual jurisprudence, though often in a diluted form. It had to pay a high price, though: Faculties of law are full of so-called technical jurists who simply continue to deal in legal doctrine on a low level of abstraction—devoid of all reflection.

To some extent they are right. A reflection made by mainstream philosophers about 1950 would irreparably destroy legal doctrine. But philosophical fashion changes and legal doctrine persists.

More to the point, I propose a "Copernican inversion" of the relation of legal theory to moral theory. Instead of adjusting legal theory to one of the notoriously controversial moral theories, we can try to adjust moral theory to legal theory. The same holds for standards of rationality. We can aim at a rational reconstruction of legal doctrine, but this reconstruction is not intended to adjust legal doctrine to strong preexistent standards of rationality. Rather, the reconstruction adjusts the standards of rationality to legal doctrine; that is, it makes a pro-doctrine selection of recognized patterns of rationality, mostly weak ones. The point is to adapt philosophical choices to the practices engaged in at law and under the law. This is all right if philosophy is nothing more than a generalization of knowledge about various segments of the world (cf. Castañeda 1980, passim). Legal practices are an important segment of the world.

Thus, to understand juristic doctrines, a theorist must argue that they are justifiable despite their normativity, ontological obscurity, vagueness, philosophical fragmentation, and territorial locality. In particular, if we wish to make sense of juristic theories, we will have to call into doubt, for example, Hägerström's reductionist ontology along with his radicalism with regard to practical reason. For legal doctrine would make no sense at all if there were no valid law. Nor would it make sense if evaluative statements were not justifiable. At the same time, an advocate of legal doctrine can accept much of Hägerström's criticism, and that of his successors, against rationalist natural law and against rationalist claims to derive precise norms from conceptual reflections. Legal doctrine can make sense even if reason gives us only forms of argument, claims of coherence, and platitudes—not precise norms. Indeed, legal doctrine would face more, rather than less, problems if rationalist natural-law philosophy were true. For in this case a rational reconstruction of legal doctrine would face the difficult—and in my opinion impossible—task of showing how each single evaluative statement of legal doctrine can be traced back to abstract principles of natural law.

This defensive strategy must be contrasted with a trend in analytical philosophy that accepts reductionist ontologies, in the spirit of Hägerström, but ignores the criticism of rationalist natural-law philosophy advanced by Olivecrona and other legal realists. This trend presents a conundrum: How can one talk about rights as if they existed, using pure reason behind the veil of ignorance to logically derive normative consequences, and still embrace ontological reductionism? This is possible only for a mind seized by the dream of precision. Advocates of this trend need a precise and minimalist ontology together with a precise normativity based on a single first principle. They achieve precision but only in segments, and these are inconsistent with one another. They have no way of understanding legal doctrine.

3.2.2. Saying and Doing in Legal Doctrine

In our defence of legal doctrine, we shall pay more attention to what legal scholars do than to what they say they do. When spelled out, the philosophical assumptions may differ from those that scholars actually use in their work. In particular:

- Jurists often pay lip service to the view that moral opinions are necessarily subjective; but in practice they continue to express moral opinions, especially on justice, as if these were objective.
- Jurists often pay lip service to the view that the interpretation of the law must also be subjective if it uses moral valuations; but in practice they continue to express interpretive standpoints as if these were objective.
- Jurists often pay lip service to the view that the law is no more than an instrument of politics; but in practice they continue to contrast the law with politics.
- Jurists often pay lip service to the view that the law, in order not to be oppressive, should be morally neutral; but in practice they continue to treat the central principles of law as if they had objective moral force.
- Jurists often pay lip service to foundationalism in epistemology, and especially to empiricism; yet they fail to reduce juristic theories to empirical data.
- Jurists often pay lip service to minimalism in ontology, and especially to materialism, yet they fail to reduce valid law to material phenomena.
- Jurists are often ontological realists in theory, and so go looking for (and often fail to find) such entities as valid law; yet they are instrumentalists in practice, doing what they always have done, without much philosophical reflection.
- Some jurists often pay lip service to deductivism and scepticism with regard to non-deductive argumentation; yet they fail to present legal reasoning as entirely deductive.

- Jurists often pay lip service to individualism in moral theory, and especially to the reduction of normativity to individual, contractarian, or Kantian reflection on first principles; yet they often keep talking about collective and transpersonal values, difficult to reduce this way.

What is more, self-reflection on the part of legal scholars often results in a philosophical melange. Some philosophical positions are suited for one fragment of juristic work; others are suited for another fragment. Thus, the philosophical assumptions of legal doctrine are often presented as descriptive and even as self-evident.

3.2.3. The Philosophical Background of Anti-Critique

The philosophical background of our anti-critique can be summarized briefly in three statements as follows:

- global reason is possible;
- reason is systematic;
- all philosophy is controversial.

Much of our reasoning is local. But we cannot say without self-refutation that *all* reasoning is local. If this were true, then we could not claim anything at all about "all reasoning" (cf. Suber 1997, 21ff.).

Moreover, there has been no universally accepted metatheory or philosophy of science since the downfall of logical positivism. It is agreed that all of the ingredients of the so-called received view are on shaky ground: The deductive notion of theory structure, the hypothetical-deductive view of theory formation and theory testing, the deductive-nomological model of explanation and its covering-law cousins, all these elements have lost their credibility. They have suffered the fate of many empirical theories: The emergence of anomalies forced them to evasive manoeuvres in which the basic idea lost its initial simplicity—and with it, its appeal (Sintonen 1998).

Nicholas Rescher's (2001) theory of philosophical reasoning leads to similar conclusions. His estimate of modern philosophy is the following. Nineteenth-century philosophizing consisted in the articulation of ambitious systems (Rescher 2001, 257). Many philosophers of the post-WWI era maintained that philosophical systematization of the traditional kind must be abandoned (ibid., 259). After World War II, there was a revival of philosophy, but a rather particularist one, without great systems (ibid., 261ff.). Today, philosophers are again producing complex systems, even if they do so multilaterally and collectively, proceeding by disaggregated and unplanned collaboration (ibid., 268). In other words, philosophy has once again taken an interest in global reason.

At the same time, all philosophical theories are deeply problematic.

> Any given philosophical position, and any particular stage in its development, will, if developed further, encounter inconsistencies. […] As we deploy our distinctions we simply deflect difficulties from one point to another. A sort of entropy principle is at issue: The dissonance or conceptual friction that we remove at one point recurs no less extensively at another. (Rescher 2001, 212)

> It emerges on this perspective that the first principles that are basic to philosophical understanding are "first" (and ultimate questions "ultimate") only in the first instance or in the first analysis and not in the final instance and the final analysis. Their firstness represents but a single "moment" in the larger picture of the dialectic of legitimation. […] The question "Why these principles rather than something else?" is certainly not illegitimate here. (Ibid., 243)

In other words, one can compare a philosopher to Sisyphus (Peczenik 1999, 209). Moreover:

> The conscientious philosopher has no alternative but to proceed systematically. […] The fully adequate development of any philosophical position has to take into view the holistic issue of how its own deliberations fit into the larger scheme of things. (Rescher 2001, 43)

> The better (the more smoothly and coherently) an interpretation fits a text into its wider context, the better it is as an interpretation. (Ibid., 69)

> Recourse to the idea of best *systematization* offers a distinctly more promising alternative to that of best explanation. […] For systematization requires *both* coherence *and* a maximum of achievable comprehensiveness. (Ibid., 138, 139)

3.2.4. Contextually Sufficient Justification and Preference for Weak Theories

Legal doctrine seems to embrace almost all the big philosophical questions at the same time. Yet it does so only indirectly. To elucidate the sense of the word "indirectly" in this context, I have proposed the distinction between two levels of justification: One I call contextually sufficient and the other profound (Peczenik 1983, 1; 1989, 156–7). Contextually sufficient justification stays within the framework of legal reasoning, that is, within established legal tradition, or paradigm, or within the lawyer's horizon. Contextually sufficient legal justification is, so to say, philosophically neutral. Profound ("deep" or "fundamental") justification, by contrast, connects up with things that lie outside the framework of legal reasoning, such as moral reasoning.

But the hope of doing philosophically profound justification and the hope of making justification philosophically neutral are mutually defeating. It appears to be that the optimal strategy of legal doctrine will have to be something along these lines:

- create a list of possible links between legal doctrine and philosophy;
- pick up clusters of philosophies that can make sense of legal doctrine;
- avoid commitment to strong philosophical theories and prefer weak philosophical theories instead.

Obviously, a legal scholar must avoid strong theories that are simplistic and disregard the complexity of the real world. All-encompassing (comprehensive) theories that aim to explain "everything" might be okay, too, were it not that the history of analytical philosophy and jurisprudence teaches us two things.

First, comprehensive theories are weak in the sense that they forgo precision. In particular, legal doctrine will reconcile smoothly with the following weak theories:

- Weak theories on the binding force of law: Jurists may assume that the law is binding and normative without committing themselves to any particular theory of normativity.
- Weak moral theories, such as weak contractarianism, in which the idea of contract as the source of normativity is nothing more than a formal scheme of justification (as in Scanlon 1998)—the exact content of normativity must come from society.
- Weak logical theories, such as nonmonotonic logic and fuzzy logic, for example (Hage 1997b).
- Weak ontological theories (as in Searle 1995).
- Weak epistemological theories, such as the coherentism of BonJour (1985), Lehrer (1997), and Thagard (2000).
- Weak theories in the philosophy of science (as in Cartwright 1999 and Haack 1998).

We will see below that all these theories are comprehensive but must pay a price for it: They are less precise than most analytical philosophers would have demanded some fifty years ago.

Secondly, even these comprehensive theories tend to be controversial. In my opinion, legal theory should fight shy of controversial philosophical problems as much as possible: Legal theory had best go with weak theories, since this is necessary to avoid controversy. A big question is what the term "weak theory" means in this context. Here are two possibilities:

- A weak theory is the common core of a cluster of strong theories, each comprehensive but controversial. For example, BonJour, Lehrer, Thagard, and other coherentists (see below) share the view that knowledge is a coherent whole. The problem is, however, that this common core is difficult to describe and may be trivial.
- A weak theory is an alternative to one such comprehensive theory. A jurist who endorses coherentism would then have to pick out essentials from the theories of BonJour, Lehrer, Thagard, and a few other coherentists, without specifying any common core. For such a jurist, an understanding of coherence amounts to an understanding of the fact that there are alternative conceptions of coherence, and to an understanding of the differences there are between these conceptions.

Chapter 4

LAW AND MORALITY

4.1. Links between Morality and Law

Let us deal now with the problem of the normativity of legal doctrine. As stated above, legal doctrine includes "fused" statements *de lege lata*. The meaning of these statements has a normative component. But is this normativity justifiable? If so, is it a species of moral normativity? Ought the courts to follow the views of legal doctrine, among others? Do the courts act immorally when they ignore such views?

When confronted with such questions, a modern jurist will quite often instinctively say no. But on reflection the questions prove complex. To answer them, we must first discuss the deeper question of the connection between law and morality. Unfortunately, the question is notoriously ambiguous, and in fact makes it necessary to deal with many questions.

Some of them have easy answers.

- The moral minimum as a question of fact: Is the content of law influenced by morality? Do all legal orders actually protect basic moral values? Most jurists would reply to these questions in the affirmative, though many would say that there also exist morally neutral legal rules, such as the rule stipulating left-side or right-side traffic on public roadways.
- The question of the moral criticism of law: All but a handful of jurists would deny that valid law can be made subject to moral criticism.
- The question of justification: Should morality influence the content of law? All but a handful of jurists would deny that it should, though many would say that there are also non-moral reasons the law should pay attention to.

Other questions are more difficult to answer.

- The moral minimum as an analytical question: Is there a "necessary connection" between law and morality? More specifically: Can collision with morality convert valid law into something less than valid law?
- Do we have a legal obligation to interpret the law morally? Most jurists would admit that citizens often expect the law to be interpreted in a just and fair manner. But there is some confusion. Though justice and fairness are moral concepts, some jurists would deny that we have a general legal obligation to interpret the law morally. They may also say that everything depends on the content of the (positive) law of the land.

- The positivistic assumption of legal doctrine: Does legal doctrine necessarily assume a separation of law and morality?
- Does the law create a genuinely normative motivation, one different from moral motivation?
- Profound moral justification of the law: Are there moral reasons to follow the law? Do we have a general moral obligation to follow the law?
- Moral force of legal doctrine: Does legal doctrine create norms that ought to be observed from the moral point of view?

Can collision with morality convert valid law into something less than valid law? This question lies at the core of the dispute between the natural-law school and legal positivism. A classical question is whether there is a necessary connection between law and morality and whether this necessity is conceptual.[1] A more fashionable question is whether this connection follows from the "nature" of the law.

But the question is complex. "Valid law" in the descriptive sense is "law in force." Its existence is a matter of social facts. However, the concept of valid law has a normative aspect as well. To say that a norm is valid is to say that it ought to be observed.

One may emphasize the descriptive question. From this perspective, legal positivism asserts, while natural law denies, that the conditions of legal validity are purely a matter of social facts. The famous dictum of legal positivism—The existence of law is one thing; its merit or demerit is another—is perhaps the most frequently quoted sentence in legal theory (John Austin, quoted by Bjarup 1995–1996, 1179, among others).

This kind of legal positivism ignores the normative meaning of "valid law." It has been quite popular in the Anglo-American world; one may mention here Jeremy Bentham, John Austin, and Herbert Hart. Even today it is quite popular in Scandinavia, too.[2]

These legal positivists tend to dismiss the binding force of the law and state that the law merely possesses a quote-unquote normativity. This species of positivism simply states that the law proclaims itself as binding in fact, but not binding in any deeper sense, whatever this deeper sense may be. This brand of legal positivism comes close to legal realism.

From the normative point of view, valid law is the law which we ought to follow. For the sake of clarity, I will adopt a weak normative theory of legal validity, thereby pushing the problem of the deep justification of legal normativity into a further level of analysis. Thus, Giovanni Sartor[3] states the following:

[1] The very idea of conceptual necessity leads to some problems, noticed by Wittgenstein, Sellars, Quine, Davidson, Rorty, and Brandom, among others.

[2] For example, Frändberg 2000, 657, understands the question "What is valid law" as merely descriptive.

[3] A similar conception has been developed by Wiesław Lang (1962).

> The statement "x is legally valid" is purely normative, it only means "x should be accepted in legal reasoning." Being enacted by the legislator, being included in a sacred book, being accepted by most judges, being accepted by most citizen, being included in the best construction of the political morality of the community, corresponding to the will of God, etc., are different preconditions to which the normative characterisation of being legally valid has been linked in validity debates. It may be more reasonable to give more importance to one or another of those grounds, to exclude some of them, to consider other facts, but this pertains to a substantive theory of the grounds of validity, not to definitional stipulation. (Sartor 2001, 585ff.)

But this is only the first part of a complex research program. Sartor's theory is not intended to facilitate the choice between fundamental philosophical positions on legal normativity. It intentionally cuts off ontology, epistemology, and normativity and leaves a fragmentary clarification to be completed with a deeper reflection.

The different views of the grounds of legal validity can be classed into three categories: natural law, legal positivism, and legal nihilism. Natural law tends to find the super-norm for the law in morality; legal positivism, in the law itself; legal nihilism (often but deceptively called legal realism) regards the whole problem as falling outside the scope of rational reflection (cf. Peczenik 1989, 216ff.). Thus, coherent legal positivism tends to accept the assumption that valid law is binding, in a sense normative, meaning that it ought to be obeyed. At the same time, all the positivists reject any analytic connection between law and morality. They claim that the legal system can be thoroughly immoral and yet valid. From the legal point of view, one ought to comply even with norms that belong to such a systematically immoral system.

4.2. Natural Law

4.2.1. Strong Natural Law

Natural-law theorists claim that the conditions of legal validity are not exhausted by social facts; the moral content of norms, too, bears on their legal validity. The famous dictum of Saint Augustine is *Lex iniusta non est lex* (Unjust law is not law).

Many advocates of natural law have distinguished between "positive" law, created by the authorities, and truly valid or binding law, that which conforms to natural law. Though the term "natural law" is vague, one can assume that it refers to especially important moral norms.

Strong theories of natural law derive a rich set of material consequences from first principles of natural law. Such first principles may be religious, anthropological, or analytical.

Classical natural law often had religious components, but one can advocate it on secularized grounds as well. Classical natural law (in Aristotle, Cicero, Augustine, Aquinas, and others)

> has a clear understanding that one cannot reasonably affirm the equality of human beings, or the universality and binding force of human rights, unless one acknowledges that there is something about persons which distinguishes them radically from subrational creatures, and which [...] is intrinsic to the factual reality of every human being. (Finnis 2002, 4)

Thus, classical natural-law theories were based on anthropological insights.

A natural-law theory is rationalist if the most important parts of it are supported by statements which in one way or another are given by reason. Such statements can be analytic (reporting the sense of some concepts) or otherwise obvious, acceptable to anyone who possesses a coherent world picture, etc. The theory can have empirical support, too, but no important parts of it require the support of religious assumptions.

The modern natural-law tradition of the 17th and 18th centuries takes up "the strategy of assimilating the norms of natural law (morality) with those of logic" (Finnis 2002, 7).

This was chiefly done by assuming that certain norms, if denied, would entail self-contradiction. Thus, Hobbes assumed that it would be self-contradictory not to keep promises (ibid., 6). Grotius and Pufendorf focused on lists of obligations to which we are all duty-bound through laws of nature based on reason, whereas Locke focused on rights which all people naturally have, and which the rest of us are obligated to acknowledge. Almost all such thinkers assumed that human beings have a natural right to the *suum*, that is, to their own or to what is due to them, including a right to life, limb, thought, dignity, reputation, honour, and freedom of action (cf. Olivecrona 1971, 278ff.). The idea of the *suum* justified the binding force of promises, including among these the social contract. The content of law was regarded as justifiable by recourse to such a contract.

Rationalist natural law replaced the omniscience of God with a purportedly logical analysis of the social contract and of other basic concepts. The analysis typically proceeded a priori, that is, independently of data about actual societies. But, paradoxically, claims to derive natural law from logical necessity led to a proliferation of conflicting theories. We have here the notorious controversiality of the hunt for certainty. How many "states of nature" are there in competition with one another?

Kant's moral philosophy, too, is rationalist, though his a priori theories were not analytic. Influenced by Grotius and Pufendorf, Kant agreed that we have moral duties to ourselves and to others, such as developing our skills and keeping our promises to others. But all such duties depended on a single categorical imperative. We as rational beings can judge whether an action is moral by asking if the action is consistent with the categorical imperative. One formulation of the categorical imperative is "Act only on that maxim (intention) whereby at the same time you can will that it shall become a universal law." Another formulation is "Always act to treat humanity, whether in yourself or in others, as an end in itself, never merely as a means."

The problem is, of course, whether such abstractions as the social contract and the categorical imperative entail any particular duties or rights. Hegel provided what has since become a classic point of criticism: Such abstractions are formal and empty. If they are to entail anything, they must be supplemented with historically and socially determined data. Thus, the social contract cannot be thought of simply as derived from natural wants or from the parties' calculative rationality. Rather, it must be treated holistically as a culturally shaped form of social life within which the actual wants of individuals as well as their reasoning powers are made determinate.

One can criticize strong natural-law theories for attempting to derive too much content from formal, "logical" assumptions about social contracts and categorical imperatives. One can also criticize some of them for attempting to derive normative or evaluative conclusions from descriptive propositions about human nature and the like. Natural-law theories face as well some empirical problems. It is not easy to list the invariable elements of human nature, the elements necessary for the law.

Justifiable or not, strong natural law cannot make sense of legal doctrine. Legal doctrine is too complex and diversified to fit into a limited set of first principles. To be sure, one may adjust it to classical, rationalist, or even religious natural law, but then some components of the doctrine become controversial or obscure. For example, Weinrib's effort to base the law of torts on Kant and Aristotle is far from convincing.

It is true that rationalist natural law, because it bases the normativity of law on the social contract, still fascinates some legal theorists. Their trick is to make a distinction between the legality and legitimacy of law. Thus, a theorist can say that the validity of the law is a matter of fact—such as the fact that Parliament has enacted a statute or that the courts are implementing it—and yet proceed at the same time to smuggle in rationalist natural law as a criterion for the legitimacy of legislation and judicial practice. For example, one can study whether legislation and judicial practice is legitimate in view of Locke's or Hobbes's theories.[4] But this use of the heritage of natural law is no longer a theory of law. It is rather a political doctrine designed to criticize existing law.

4.2.2. A Recent Development: Weak Theories of Natural Law

Natural law is not very influential today. But it has survived because it is now typically much weaker than in older times. Such thinkers as Finnis and Moore have given us profound insights into the nature of law, but they would not even dream of developing detailed "codes" of natural law in the spirit of, say, Pufendorf.

[4] For example, Zetterquist 2002 discussed the legitimacy of EC law in the light of Hobbes and Locke.

Thus, Fuller has drawn up a list of minimal requirements for the internal morality of law: Its rules must be general, promulgated, not retroactive, understandable, not contradictory, possible to obey, and relatively constant; there should also be congruence between the rules as announced and as applied. John Finnis works in the tradition of Thomas Aquinas, emphasizing its moderate and commonsense side. Thus,

> the idea that law must pass, as it were, a kind of moral filter in order to count as law strikes most jurists as incompatible with the legal world as we know it. Therefore, contemporary Natural Lawyers have suggested different and more subtle interpretations of the main tenets of Natural Law. For example, John Finnis views Natural Law (in its Thomist version) not as a constraint on the legal validity of positive laws, but mainly as an elucidation of an ideal of law in its fullest, or highest sense, concentrating on the ways in which law necessarily promotes the common good. (Marmor 2002b; cf. Finnis 2002)

Michael Moore expresses a robust belief in the existence and accessibility of moral truth, in a metaphysically realist sense. This is a strong theory, and yet its normative implications are weak and commonsensical, because he also prefers a coherence-theory approach to knowledge (cf. Moore 1992, passim, and Bix 2002, 89ff.).

In Austria, Alfred Verdross (1971, 92ff.) elaborated a moderate theory, returning to the anthropological roots of classical natural law. The theory contains four parts. The first part is based on the thesis that all normal human beings feel certain basic needs and exhibit some primary wants. They all want to live. Though circumstances can force one to suicide, the disposition to self-preservation is natural. All normal people want to avoid being exposed to physical injury, defamation, and economic loss. Though only some people have a disposition to follow a leader, all normal human beings want to have some freedom to fulfil their intentions and not be forced to act. Eternal social morality expresses these needs and wants. Primary natural law consists of norms which belong to social morality and regulate legal problems. Primary natural law is eternal. Secondary natural law indicates how the aims for the legal system that have been derived from primary natural law can best be realized in the given social conditions. Secondary natural law changes continually, since it must take account of changing social facts. Positive law, given in statutes, precedents, etc., and enforced by sanctions, is valid only when in accord with secondary natural law.

Legal doctrine can profit from such theories because they legitimize its normative components without forcing it into the Procrustean bed of rationalist-liberal orthodoxy.

4.2.3. The Claim to Correctness

Another kind of sophisticated theory turns on the idea of practical rationality. The best example is Robert Alexy's idea that the law—i.e., legal norms singly

as well as the legal system as a whole—necessarily makes a claim to correctness. This correctness has a moral character. Alexy does not characterize correct morality in all its details but insists that it would survive in a free process of argumentation. An important thesis is this:

> Legal systems do not lose their legal character if some individual norms or decisions do not raise the claim to correctness. This would only be the case if such a large number of norms or decisions goes without the claim to correctness that one can say that the system as a whole abandons this claim. (Alexy 2000b, 142)

Unless any such catastrophe occurs, a legal system continues to be legal but may be faulty if some of its norms are immoral.

Eugenio Bulygin has pointed out the weakness of Alexy's theory. Bulygin mention Genghis Khan, Philip II of Spain, England's Henry VII, Khomeini, and Pinochet and concludes what follows:

> Probably they understood quite different things by justice or moral correctness. Now, the thesis of the necessary connection between law and morality implies that there is a conceptual link between any legal system, on the one hand, and one and the same morality, not just any moral system, on the other. In the case of Alexy it is the universalistic morality, based on procedural discourse ethics. The alleged fact that all norm-issuing acts performatively imply a claim to justice does not prove that there is a necessary connection between all legal systems and this specific morality. In order to sustain this last thesis Alexy must not only prove that there is one objective morality; he must also prove that this morality is shared by all law-makers. (Bulygin 2000, 134)

Unsurprisingly, Alexy does not heed this advice. Instead, he writes this:

> A necessary connection between law and morality does not presuppose a morality actually shared by all. It is compatible with moral dispute [...]. In order to obtain a necessary relation between law and morality one does not need—as Bulygin assumes—an objective morality actually shared by all law-makers. The idea of a correct morality, the practice of rational argumentation about what morality is correct, and the possibility of constructing, on this basis, practical rationality, suffice. (Alexy 2000b, 143–4)

This dispute is quite characteristic. Bulygin demands explicitness and precision. He is not satisfied with abstract ideals, such as the possibility of practical rationality. His philosophical language has no room for such ideals. This is a respectable position. However, the recent development of legal theory seems to indicate another direction, towards weak and not always explicit theories.

4.3. Exclusive Legal Positivism

4.3.1. Exclusive Legal Positivism—The Normative-Meaning Component

It is no wonder that modern jurists are often attracted to legal positivism. The name "legal positivism" is modern, but the core idea of it is old. The law is what pleases the ruler: *Quod principi placuit, legis habet vigorem* (Dig. 1, 4, 1

pr., Ulpianus). Natural-law theories have been fiercely challenged by the legal-positivist tradition since the early 19th century.

Modern positivism is quite sophisticated.[5] An important distinction is that between inclusive and exclusive positivism. Exclusive positivists deny that a legal system can incorporate moral constraints on legal validity; inclusive legal positivists maintain that the social conventions on whose basis we identify the law may, but need not, make reference to moral content as a condition of legality.

Exclusive legal positivists face problems when they attempt to justify the authority of the law. They need two strong and controversial theories: the theory of exclusionary reasons and the theory of detached legal statements.

The first theory states that legal rules are exclusionary reasons. An exclusionary reason "never justifies abandoning one's autonomy, that is, one's right and duty to act on one's judgment of what ought to be done, all things considered." But it may justify in some cases "not doing what ought to be done on the balance of first-order reasons." An exclusionary reason "is immune from the claim that it should be reexamined with a view to possible revision on every occasion to which it applies" (Raz 1979, 18, 27, and 33).

Stephen Perry (1987) and Frederick Schauer (1991, 88–93) have objected to Raz and claimed that the function of the law is not to exclude first-order reasons, but rather to alter their weight, to create a very strong presumption in favour of certain first-order reasons rather than others. Roger Shiner (1992, 103–15) prefers Raz's view. The key to his argument is a three-part pattern of thinking: Thoughtful people are disposed to have representations of the law; they are disposed to regard the law as a reason for action; they have a desire to follow the law. See also Shiner in Volume 3 of this Treatise.

The merit of exclusive positivism is that it exposes the defeasibility of first-order reasons. Legal rules can defeat these reasons, establishing exceptions to them. But then the exclusive positivists fail to see the other side of the coin. They do not notice that legal rules are themselves defeasible by a process of weighing. We will return to weighing and defeasibility in a while.

The second theory is that the normativity of the law is not genuine. An exclusive legal positivist can dismiss the binding force of the law and state that the law merely possesses a quote-unquote normativity. This kind of positivism simply states that the law proclaims itself to be binding in fact, but that it is not binding in a deeper sense, whatever this deeper sense may be. Such legal positivism comes close to legal realism.

According to Joseph Raz, jurists utter detached legal statements (see Raz 1981, 441ff.). Detached legal statements are categorical statements made from a point of view which is not the jurist's personal point of view, but

[5] See Hart 1961 and 1983; see also George 1996 (a collection of essays) and the works by Himma and Marmor quoted in this volume.

rather that of the (fictitious) legal man. The jurist pretends, as it were, to embrace the view of the legal man. In other words, the law does not create genuine normative motivation. Raz claims that "a detached legal statement [...] does not commit the speaker to the normative view it expresses" (Raz 1979, 153–4).

The view is accompanied with a denial of the general obligation to obey the law (Raz 1979, 233ff.). This denial makes sense if we consider that Raz assumes (and argues against) a very strong theory of obligation to follow the law, rather than the mere *pro tanto* obligation I assume (ibid., 234). Still, Raz admits exceptions for some special persons, like bishops (ibid., 237).

I will not enter at this point into the very sophisticated problem whether the theory of exclusionary reasons is compatible with the theory of detached legal statements. Suffice it to say here that the latter does not tally with the tradition of legal doctrine. No doubt, it is possible to make detached legal statements, about old and foreign legal systems as well as about one's own system. But there are also internal statements by legal researchers that imply a commitment to what the law says. A Swedish jurist who says "Swedish law demands that I pay income taxes" will normally be motivated to pay such taxes.

An advocate of traditional legal doctrine would argue that this motivation reveals a genuine normativity of the law as well as something about the general normativity of doctrinal statements *de lege lata*. The critic would retort, however, that the genuine normativity of social facts, such as the law and legal research, cannot exist. We will return to this problem, too.

The German legal doctrine of the 19th century and the first half of the 20th century differed from this Anglo-Saxon view, because it often affirmed a kind of inherent normativity of the law. One of the most sophisticated positivist doctrines of the genuine normativity of law is Hans Kelsen's pure theory of law. According to Kelsen, legal norms constitute a hierarchy of a peculiar kind. A norm is legally valid if it has been created in accordance with valid norms of higher standing which determine who is authorized to make the norm and how this norm-making is to proceed. The higher norm itself is valid if it has been made in a way prescribed by a still higher valid norm, and so on. But the highest legal norms, set out in the constitution, cannot derive their validity from the validity of still higher legal norms, since no such norms are valid in the legal system. Instead, the highest legal norms must derive their validity from the *Grundnorm*, the basic or apex norm. One formulation of this norm is: The constitution ought to be observed. More precisely:

> Acts of force ought to be performed under the conditions and in the manner which have been stipulated by the historically first constitution of the state and by the norms enacted in agreement with it. (In an abbreviated form: One ought to behave as the constitution prescribes.) (Kelsen 1960, 203–4)

The apex norm is legally invalid because it has not come into existence in any legally prescribed way. It merely gets presupposed conceptually by anyone engaged in legal reasoning on valid law (cf. Bindreiter 2002, especially part 2, chap. 3). And yet it is, according to Kelsen (1960, 202), a "ground" of legal validity.

But can a mere presupposition constitute a ground for legal validity? Kelsen did not solve the problem of the profound justification of law. He did not even attempt to answer the question whether there are moral reasons to follow the law, but merely pointed out that the problem is not a legal one. He did not succeed to explain the legal, non-moral normativity of the law. Indeed,

> nothing remotely like an argument for rejecting natural law theory—for rejecting, that is to say, the morality thesis—has been offered by Kelsen. On the contrary, on this front he offers only a crass and vulgar relativism. (Paulson 2000, 292)

The debate on exclusive legal positivism is far from over. But one thing is certain. Exclusive legal positivists can

> assert that all jurists are unconsciously employing Kelsen's basic norm all the time and in two different ways—on the one hand, in taking for granted that the law is considered valid and binding by the other members of their legal audience, and, on the other, in being committed to this view themselves. (Bindreiter 2002, 127)

However, these positivists have no way of justifying this assumption deeply. They cannot tell us why the jurists ought to be committed thus. In particular, they cannot say why the scholars who produce juristic theories ought to feel bound by their own products. Nor can they tell us why the judges and the public should feel bound by the results of legal doctrine. They may perhaps say that binding law is what pleases the rulers, but certainly not that binding law is what pleases professors of law.

This explains why we must look for a reasonable middle way between legal positivism and natural-law theories. A jurist needs to combine weak legal positivism, and its contextually sufficient legal justification, with a moral basis in profound justification.

4.3.2. Defeasible Grundnorm*, Conditional* Grundnorm*, and Transformation into Law*

Going deeper into this question, one can imagine a distinction between a defeasible *Grundnorm* and a conditional *Grundnorm*.

Exclusive legal positivists stay within the horizon of the everyday jurist. They assume unconditionally that the constitution ought to be followed. Hence, they accept the *Grundnorm* in Kelsen's sense.

Law theorists state that this *Grundnorm* is defeasible. In other words, they realize that there may be exceptions to the *Grundnorm*; they indicate the possibility of transcending the horizon of the everyday jurist. Jurists accept the *Grundnorm*, but they may stop doing so if sufficiently many criteria of law are no longer fulfilled. For instance, they would stop regarding a system as valid law if it were no longer efficient. And some lawyers at least (we might call them anti-positivists) would stop regarding it as valid law if it were extremely immoral or unjust.

Jurists who are not exclusive positivists do in fact transcend the horizon of the everyday jurist. They may reformulate the *Grundnorm* as a conditional norm (cf. Peczenik 1981 and 1982, passim, and 1989, 293ff.). In other words, they work the exceptions into the *Grundnorm*.

An epistemologist may add that the *Grundnorm* exemplifies a leap or "jump" (cf. Peczenik 1989, 116) and a "transformation" in legal thinking. A leap from a set of premises *S* to a conclusion *q* exists if, and only if,

- *q* does not follow deductively from *S*; and
- *S* cannot be expanded or changed to obtain a set of premises *S1* from which the same conclusion follows and which consists solely of certain premises, namely, premises presupposed in the culture under consideration and premises proven to be true.

Leaps occur at many places in the system of legal argumentation (cf. Peczenik 1979b, 47ff.). The most difficult problems concern the leap into the law, that is, from the criteria of law to legal validity.[6] This leap ends up transforming something into law. The legal mind transforms our knowledge of simpler facts into a knowledge of valid law. Metaphorically speaking, it transforms these facts into valid law.

This language of leaps is fruitful because it points out a number of philosophical problems. Some problems are logical. Thus we have

- the problem of informal logic, where the question is asked whether a leap can be a correct or valid mode of reasoning[7]; and

[6] A leap within the law, on the other hand, occurs when we derive conclusions about valid law from a set of premises containing at least one statement mentioning or expressing valid law. A leap of this kind results in a transformation within the law (cf. Aarnio, Alexy, and Peczenik 1981, 149–50, and Peczenik 1983, 33ff.). Here I should make a distinction between legal source-establishing leaps and legal interpretive leaps (cf. Peczenik 1989, 299ff.). An interpretive leap ends up transforming the wording of the sources of law into a knowledge of interpreted law.

[7] For an overview of this problem, see the *Journal Informal Logic: Reasoning in Argumentation and Practice*, published by the department of philosophy of the University of Windsor (Windsor, Ontario, Canada).

- the problem—discussed in artificial intelligence and law—of modelling legal argumentation; to this end, several systems of defeasible logic and nonmonotonic logic have been developed as well as argumentation theories and dialogical models (see below).

Other problems are epistemological; that is the case with

- the problem of defeasible rules and defeasible knowledge; and
- the problem whether we can leap from a description of such facts as that of a parliament enacting certain laws, courts making certain decisions, and legal scholars publishing certain books to the conclusion whereby the norms expressed in these sources of law ought to be observed.

Finally, we have ontological problems:

- What is law? Is it the rules enacted by a parliament? Is it court decisions? Or the opinions of legal scholars justified by way of a leap? Or is it something else?

A law theorist may safely state that we jurists need leaps if we are to speak our language and act the way we do. Philosophers must give us more-accurate theories of the logic, justification, epistemology, and ontology of law. Alas, many philosophical theories are either too reductionist or too metaphorical. The point of the theory of leaps is that it includes a series of questions posed by a jurist and addressed to philosophers.

4.3.3. Positivist and Non-Positivist Criteria of Valid Law

Let us now leave behind the normativity of the law and pass to the descriptive question, What is law? That is, What are the criteria of law?

There is no doubt that, from a psychological standpoint, lawyers can recognize a given country's legal provisions, precedents, etc., spontaneously, that is, without having to reason things out and without recourse to any general definition of law. This information is more bibliographical than theoretical (cf. Wedberg 1951, 254). The information is acquired by entering into a certain socially established practice. Law students often begin their studies by acquainting themselves with this "bibliography." Among other things, they learn a list of the sources of law, such as statutes and precedents, that one must, should, or may pay attention to. Lawyers, too, learn from their practice how to perform legal reasoning.

But many law theorists think that one also needs a more abstract theory, one indicating the criteria of law. Thus, law is a complex of interrelated components (cf. Peczenik 1989, 268). Two kinds of component occupy a central

position in this complex: norms and actions (cf. Peczenik 1984, 97ff.). There are also secondary components, that is, on the one hand, the legal values that justify and explain the norms and, on the other, the mental processes connected with our actions. Legal norms make up a system, and much theoretical literature deals with its structure: That is the case with Hans Kelsen, H. L. A. Hart, and Eugenio Bulygin.

One may also formulate criteria with which to decide when the normative system as a whole is law. I will pay attention here only to criteria for discovering the content of norms and the relationships among norms, leaving aside, for example, the question of their social results. These criteria make up a "big crowd." Here is a sampling:

- The law includes a "dynamic" hierarchy of norms in which higher norms determine the proper method for creating lower norms (cf. Kelsen 1960, 228ff.).
- The law includes, not only norms of conduct, but also constitutive rules enabling us to speak of institutional facts, such as contracts, promises, marriage, and citizenship.
- The law includes norms claiming that the legal order possesses authority to regulate any type of behaviour and constitutes the supreme system of norms in society (cf. Raz 1979, 116ff.).
- The law includes as well some norms claiming that the legal order has the sole right to authorize the physical use of force in its territory (cf. Ross 1958, 34; Olivecrona 1971, 271; Kelsen 1960, 34ff.).
- The law has a high degree of effectiveness (or efficacy: cf. Kelsen 1960, 10ff.). Efficacy means two things. First, we shall find, in any given territory, that its legal norms are observed by far more people in a far greater number of situations than the norms of its non-legal organizations. Second, legal norms are enforced by legally authorized officials, such as judges, prosecutors, police, and executive officers.
- The law is often published and applied openly; it is also frequently interpreted by professional lawyers using established and noticeably advanced methods and doctrines.

These criteria answer the question What is law? leaving moral considerations out of account. If they proved sufficient for identifying the law, legal positivism would pull off a major victory. But the victory is contested by non-positivists, who add another criterion:

- A normative system is the law only if it does not contain or generate too many grossly immoral norms and practices. Moral reasoning decides what is "grossly immoral" and what is "too many."

The extreme immorality of such "law" as some parts of Hitler's or Pol Pot's legislation makes it impossible for a lawyer to use the legal method to reduce

the injustice of a legal practice. Assume now that the "legal" system in question contains very many extremely immoral or extremely unjust provisions. It is plausible to assume that this "legal" system is not law: *Lex iniustissima non est lex.* This thesis may be compared to, but is less radical than, the central tradition of natural law, by which unjust laws are not law (cf. Lucas 1980, 123).

Since the democratic process of legislation is not perfect, unjust laws can be enacted not only in a totalitarian state but also in a democratic society. One may criticize these laws even while approving of the legal system as such. The legal systems of oppressive regimes deserve a more comprehensive criticism, but one must recognize their character of valid law. Only the extreme immorality of a normative system as a whole supports the conclusion that the system is not valid law.

4.3.4. Progressing Sophistication

A possible way to keep the criteria of law free from morality is to move these problems into another "box," namely, into the applicability of legal norms. In this connection, several sophisticated distinctions may prove useful. For example, one may define legal validity by some more or less uncontroversial facts, such as legislative or judiciary practice, together with likewise uncontroversial data concerning language and formal logic; moral deliberation will then decide on the applicability or inapplicability of valid law in specific cases.

Increasing the level sophistication even further, one may attempt a value-free definition of applicability. Thus, Pablo Navarro (2001, 251ff.) has developed the following theory on the applicability of legal norms.

- A distinction is drawn between the internal and external applicability of norms to legal cases.
- Internal applicability refers to the scope of a legal norm; external applicability, to its force.
- The relation between internally applicable norms and their cases is internal (conceptual), but the relation between externally applicable norms and their cases is external (extrinsic).
- Defeasibility affects the external applicability (or force) of legal norms, not their internal applicability (or scope).

Navarro believes that the scope of a norm includes its logical consequences, in accordance with classical logic. For example, the norm "No vehicles may enter the park" prohibits cars, ambulances, and so on from entering the park. But in cases of emergency, the force of this norm is not conclusive, and this could mean that an institutional decision granting admittance to an ambulance may be legally justified. The norm just mentioned applies internally to (or regulates) the case of ambulances, but its force is not conclusive. The

force, not the scope, is defeasible, that is, open to exceptions that may depend on moral valuations. To answer the question of force, one may need moral valuations, but the question of scope is answerable in a non-moral way.

The choice between different conceptualizations of validity, applicability, and defeasibility in the law depends on many factors, and these are difficult to list and even more difficult to evaluate. But whatever conceptualization one may choose, there remains a space for moral valuations in the law. It does not matter very much whether the chosen terminology suggests that these valuations decide what is valid law, or merely what is the applicable law, or perhaps the externally applicable law.

4.3.5. Political Legitimacy instead of Philosophical Justification

Can one ground the profound justification of the law in political philosophy? The presently dominating philosophers of law—such as Dworkin, Habermas, and Raz—shift the discussion from the problem of legal normativity to the problem of the legitimacy of the law. This contrasts with the older continental tradition, in which much of legal theory was concerned with ontological and epistemological questions about the existence of law and of moral values, and so with moral and legal knowledge. Legal theory effected a shift away from comprehensive and transcendental thought towards political and post-metaphysical thought.[8] The concept of legitimacy has political associations. In this spirit, legal doctrine faces criticism because of its alleged lack of political legitimacy. Thus, a well-known criticism of legal doctrine consists in pointing out the controversial political implications of normative statements made by legal researchers (e.g., Wilhelm 1989, 86ff., and Wagner 1985, passim).

But political legitimacy is an unsafe ground for such criticism. "Legitimacy" is an extremely complex phenomenon (cf. Berger and Luckmann 1971, 110ff.), as such not particularly useful as the last step in a complex analysis of legal normativity. One can argue that theories of political legitimacy must hover in the air if they are not accompanied with ontology and epistemology.

Last but not least, the discussion of political legitimacy is not the most promising way of making sense of legal doctrine. A respectable legal scholar aims rather at truth than at political correctness.

4.4. Inclusive Positivism and Propositions *de Lege Lata*

4.4.1. Legal Positivism Inherent in Legal Doctrine?

Despite such difficulties, one may wonder whether legal positivism is not presupposed by all legal doctrine. Aulis Aarnio put this idea in the following way:

[8] Natural-law thinkers like Moore and Finnis are a notable exception to this trend.

> The matrix of legal doctrine […] would seem to consist (at least) of the following elements […] (1) A set of legal philosophical background assumptions and/or commitments, normally implicit, very seldom explicitly expressed. As examples can be mentioned ideas of (a) the origin of law, (b) the validity of legal norms (problem of the rule of recognition), (c) the concept of norm and normativity, (d) the idea of rational discourse. The basic assumption concerning the origin of law seems to accept an idea of the societal sovereign. The bindingness of legal norms does not need any natural-law backing assumption about some kinds of "superior" legal principles behind the positive principles. In this sense, the basic matrix of legal doctrine seems to contain a decisive legal positivist basic standpoint. (Aarnio 1997, 82)

Must the doctrinal jurists subscribe to legal positivism, on pain of self-contradiction? The right *prima facie* answer is yes. Assume first, *arguendo*, that Joseph Raz is right and that jurists merely utter detached legal statements (see Raz 1981, 441ff.), not genuine normative statements. A legal doctrine of this kind is by definition positivist, logically separated from genuine moral statements. Assume now—in accordance with our analysis *supra*—that legal doctrine also includes genuine normative statements. Assume, at the same time, that the normative force of these statements is restricted to a given legal system, limited in time and space, simply because legal doctrine is thus restricted. Assume, finally, that this legal doctrine is endorsed by almost all competent legal scholars, independently of their views in moral theory. These assumptions make it plausible that the normative force of the statements of legal doctrine is separated from universal morality, and so is in this sense positivist.

4.4.2. Inclusive Legal Positivism and Tuori's Critical Legal Positivism

The legal positivism inherent in legal doctrine cannot be exclusive, however: It must be inclusive, that is, it must assume that the social conventions on the basis of which we identify the law may, but need not, make reference to moral content as a condition of legality.[9] Only this kind of legal positivism can make sense of that legal doctrine which purports to stay within the limits of the law and yet includes normative criticism of statutes and precedents on the basis of socially established values, principles, and policies. In other words, an important deficiency of exclusive legal positivism is that it tends to disregard the variety of legal norms (cf. Atienza and Manero 2002). A theory of law, if it is to be useful in legal doctrine, must pay attention to different categories of legal norm, namely:

- regulative norms (norms that command, prohibit, and permit);
- constitutive norms, and especially power-conferring norms; and
- norms, such as principles and policies, that do require deliberation.

[9] A summary of the discussion between exclusive and inclusive positivism may be found in Marmor 2002a, Himma 2002a and 2002b. See also Shapiro 2002.

In this context, one must also discuss Kaarlo Tuori's theory (2002) by which the basis of legal normativity resides in the deep structure of the law, not in morality.

Tuori draws into his theory philosophical reflection, mostly based on Michel Foucault, François Ewald, and Jürgen Habermas. But he also reflects directly on the law as it is, on its creation and application in modern society, as well as on its tradition: Savigny, Puchta, Laband, etc. He tries to integrate these two lines of reasoning. The second line is central. The first is auxiliary and—in the manner of all strong philosophical theories—more vulnerable to criticism, the kind directed at each of the philosophers mentioned and the kind questioning the compatibility of their theories.

Tuori's theory is very useful for our project of making sense of legal doctrine. This is so independently of the future fate of Foucault, Ewald, and Habermas. It may happen that these philosophers will go out of fashion. But even then, Tuori's theory will survive simply because it is a first-rate legal theory. Tuori distinguishes three layers of law:

> "Mature" modern law does not consist merely of regulations that can be read in the book of statutes or court decisions to be found in published collections. It also includes deeper layers, which both create preconditions for and impose limitations on the material at the surface level. I call these sub-surface levels the legal culture and the deep structure of the law.
> […]
> The general doctrines of different fields of law combine conceptual and normative elements of the legal culture. The fields of law receive their identity from their general doctrines: the formation of general doctrines can, in the development of a new aspirant field of law—like, say, labour law or social law—be seen as a sign of independence.
> […]
> If divergent types of law can be discerned in legal history and if these types differ in their respective deep structures, then even the deep structure must be conceived of as historical, as transient. In the deep structure, at the level of the fundamentals of the law, though, the pace of change is at its slowest; the deep structure represents the *longue durée* of the law. (Tuori 2002, 147, 169, and 184)

The deep structure contains elements that are old or global, or both. It is more stable in time and space than the legal culture, and legal culture is more stable than the surface level. Finally, Tuori (2002, 199ff.) develops a classification of the relationships between layers:

- the relation of sedimentation;
- the relation of constitution;
- the relation of specification;
- the relation of limitation;
- the relation of justification; and
- the relation of criticism.

Through the relation of sedimentation, the deep structure—in other respects resembling morality—receives a kind of "positivization" derived from the le-

gal culture and from the surface of the law. How can the law be positive, in the sense of being based on decisions, and yet have a deep structure, a structure obviously independent of the same decisions? The answer is: The deep structure constrains decisions via a tacit knowledge of the deciders. Legal doctrine is the only agent consciously pushing the deep structure to the surface.

I agree with all this in principle. In particular, I fully agree that mature law cannot work without the deeper layers. But then why are the legal culture and the deep structure layers of the law itself? Why not regard them as layers of morality or ethics, perhaps positive morality or ethics?[10] The terminology is convenient because it is consistent with moral pluralism ingrained in our culture since the time of the Enlightenment. Tuori—following Habermas—uses the term "(post-conventional) morality" for universal principles, contrasted with the plurality of ethical convictions competing with each other in the same society. Universal moral principles are too abstract to justify an efficient criticism of legal rules. Particular ethical convictions are too controversial to make such criticism acceptable to all members of society. In contrast with abstract principles of universal morality, the legal culture and the deep structure of the law are historical and connected to a certain society. At the same time, they are the same for the whole of society, thus coming in contrast with particular ethical convictions.

In my opinion, however, the distinction between universal morality and socially centred ethics is an illusion. The reason is that there is no non-social morality. All morality is socially centred. In part, social morality is controversial: There are many competing values. In part, it is firmly established in society—and across societies. But no morality is a priori, universal, and necessary in all possible worlds. This problem will be addressed in the next chapter.

Regardless of this doubt, the most important question is how Tuori's theory would work in legal practice. It would legitimize the perspective of a progressive lawyer, who thinks like a lawyer, thus exhibiting his legal culture which is necessarily historical and in this sense conservative, and yet is capable of absorbing rapid succession of modern or post-modern ideologies.

An interesting aspect of Tuori's theory is its ontological turn. The profound answers to the methodological and epistemological problems of legal doctrine are ontological, for they are expressed in terms of what the law *is.* Thus, the law is complex: Not only does it have a surface structure; it also consists of legal culture and a deep structure. Legal doctrine is a part of this complex law. We will return to ontology later on.

[10] Another question is, What criteria should we use to separate from each other the level of legal culture and that of the deep structure?

4.4.3. Criteria of Validity and Hypothetical Imperatives

Another form of inclusive legal positivism focuses on criteria of validity and hypothetical imperatives. According to Christian Dahlman (2002, 119–22), every legal system governed to some extent by the rule of law applies a number of conditions of legal validity, requiring, for example, that a norm be held invalid if it conflicts with the constitution or with the law of the European Union. When Kelsen observed that a norm is invalid if it conflicts with a higher-order norm, he observed a condition of legal validity being upheld. Other familiar conditions of legal validity are that a norm be invalid if incoherent with the binding decisions of the supreme court, that the interpretation of a statutory rule be invalid if it conflicts with the purpose of the statute, that a rule be invalid if it does not treat like cases alike, etc. In the statement that "it would be wrong for a court not to recognize Jones's right to be compensated by Smith," Professor *X* normally intends to give a learned opinion about the law, i.e., about the consequences of a certain condition of legal validity in the present case. The professor rarely intends to voice a mere personal opinion on the verdict she prefers from a moral point of view. According to Dahlman, legal propositions of this kind are not predictions or prescriptions, but recommendations.

The interesting point here is the following. When Professor *X* states something along these lines, the statement can be construed as a conjunction of two things: First, she utters a descriptive proposition that a certain legal-validity condition has been fulfilled in the present case. Let me add to this that, most often, the professor has a class of cases in mind rather than a particular case. Such propositions remind us of Joseph Raz's theory of detached legal statements. Second, *X* submits to a rule that is valid in accordance with this condition of validity. The act of submission is justifiable in moral terms, but the professor is wise enough not to enter into a discussion about this justification.

Dahlman's story continues like this: Consequently, if someone submits to the meta-norm that the rule which fulfils this condition of validity ought to be obeyed, because she believes that the reasons for obeying the law outweigh the reasons for not doing so, she has not created a moral reason to obey the law, which is independent of the reasons to obey the law in specific cases. She has merely devised a way to avoid the time-consuming enterprise of weighing, in every single case, the reasons for obeying the law against reasons for not doing so.

What, then, are the ultimate and tacit reasons that make our professor submit to the rule? In part, they are economic reasons, such as the prospect of avoiding time-consuming enterprises. But in part they must also be moral reasons, such as the prospect of promoting justice under the rule of law. Can we ignore these moral reasons entirely? I doubt that. If indeed we cannot, then inclusive legal positivism has failed to achieve a definitive separation of law

and morals, merely pushing morality out of the jurist's horizon. And for good reasons, surely—for good (ultimately and partly) *moral* reasons.

4.4.4. The Fused Descriptive and Normative Modality of Propositions de Lege Lata

This reflection makes it possible to understand Svein Eng's theory, previously mentioned, by which propositions *de lege lata* exhibit a "fused descriptive and normative modality" (Eng 1998, chap. 2, sec. F; Eng 2000, passim; Eng 2003, chap. 2, sec. F). They are neither purely descriptive nor purely normative. If a discrepancy is discovered between a lawyer's statement *de lege lata* and the opinion of other lawyers—for example, on the provision of a law-enforcement body—the lawyer making the statement may either modify it in accordance with the opinion held by the other lawyers, or she may uphold the statement despite the opinion held by these other lawyers. In the first case, statements *de lege lata* appear to be descriptive; in the second, normative. But there are no rules at the level of legal language or of legal methodology that may help us determine the usual kinds of *de lege lata* statements by lawyers as either descriptive or normative. The level of objective meaning does not present us with any criteria that may serve as the basis for such determinations. Further, if one asks the lawyer whether she can sort the descriptive from the normative in her statement *de lege lata*, the answer will most often be no: In making her proposition *de lege lata* she did not adopt any view as to what should be adjusted in the event of a subsequent discrepancy. She will often add that she does not think it right or possible to take this view. In other words, the level of subjective meaning presents us with a fusion of the descriptive and the normative. The general descriptive component in lawyers' statements *de lege lata*—it is always considered relevant to ask and to take into account "what opinion other lawyers will probably hold"—corresponds with what Eng terms "the perspective of the generalized lawyer," i.e., a perspective of fundamental consciousness, on the part of the individual lawyer, which builds on and generalizes from the opinions and actions of other lawyers. This perspective represents a condition of the possibility of fusion (Eng 1998, chap. 2, sec. F 2.3; Eng 2000, chap. 2.3; Eng 2003, chap. 2, sec. F 2.3). The concrete context of the general descriptive component and its corresponding perspective of consciousness is the legal-institutional context consisting, on the one hand, of bodies competent to make final and binding decisions as to how to interpret and subsume cases under legal norms and, on the other, of the lawyers' corresponding interest in what these bodies will conclude. The general descriptive component, its perspective of corresponding consciousness, and their concrete context distinguish law from language in general, and from morals and the relationship between parents and children, and explain why we do not find fusion in these last domains (Eng 1998, chap. 2, sec. F 3.2.6; Eng 2000, chap. 3.2; Eng 2003, chap. 2, sec. F 3.2.6).

One can contrast this view with Hedenius's (1963, 58) distinction between genuine and spurious legal statements, the former purely normative, the latter purely descriptive. The distinction held sway as the "sacred cow" of Scandinavian analytical jurisprudence and for fifty years mired all serious research on legal method.

Dahlman criticizes Eng and accuses him of advocating a "confused modality." But he also criticizes Hedenius for having overlooked the fact that legal argumentation includes recommendations. The problem is, however, that Professor *X*, previously introduced, does two things at once: She utters the recommendation—pointing out a criterion of validity in a detached manner—and in addition submits to the rule that fulfils the same criterion. She utters the recommendation in a fused manner, just as Eng says. She could have analysed the statement as a conjunction of a hypothetical imperative—a recommendation in the light of criteria of validity—and a categorical act of submitting to this imperative. Had she performed this analysis, she would have been doing philosophy of law. As a jurist, however, she refrains from the analysis, staying in a "fused" box, the box of propositions *de lege lata*. This box is a reality. Eng demands that we recognize its existence. Dahlman does not deny the existence of it; he only wants jurists to make the philosophical analysis. I doubt very much that jurists are prepared to do this consistently, a time-consuming and perhaps unwise undertaking. I am using the word "time-consuming" here for the second time to underscore the practical character of legal argumentation. Jurists do some conceptual analyses but refuse to do others, not because of any inability on their part but because it is time-consuming or impractical in other respects.

Eng advocates philosophical neutrality on the level of the "generalized lawyer." He claims (Eng 1998, 582–84, 361–5) that there exist areas in current argumentation and language that (a) are relatively well delimited and (b) enjoy a degree of independence from basic ontological and epistemological positions. The independence might be of various kinds and must be demonstrated in particular contexts. For example, Eng claims that legal argumentation *de lege lata* is one such relatively independent segment, characterized by the fact that the lawyers do not have any criterion by which to decide whether their utterances are normative or descriptive. But, let me add with Eng, we also need to bring out the philosophical linkups between these areas and the rest of the worldview. To put it in a provocative manner, we need a separation of law and philosophy, but a contextual separation, not an ultimate one. For practical reasons, it is fine to separate law from philosophy in some contexts but not in others.

The same contextuality exists in the problem of legal positivism. Positivists advocate the separation of law and morals, but this separation, too, is only contextual, not ultimate, fruitful in some contexts but not in others.

4.5. The Justification of Morality

4.5.1. Positivism, Natural Law, and Moral Theory

The relationships between legal positivism and natural-law theories, on the one hand, and moral theories, on the other, are complex.

Natural-law theorists tend to seek objective moral foundations for natural law. But a position is logically possible which regards the law as objectively justified in the light of some social needs, and the like, and which, at the same time, calls objective morality into doubt.

Legal positivism is independent from moral theory. The moral objectivist and the moral relativist can both be legal positivists. Thus, Jeremy Bentham was a moral objectivist, namely, a utilitarian, whereas Hans Kelsen was a moral relativist.

Let me focus now on legal theories that seek to set the law on moral foundations. These theories derive the normativity of the law from the normativity of morality. Legal positivists regard such derivations as problematic. The basis from which normativity is derived—objective morality—is also regarded as problematic.

4.5.2. The Controversialism of Strong Moral Theories

Strong theories of natural law are notoriously controversial. One reason why this is so is that they are based on strong and controversial moral theories. Not only in legal theory, but also in moral philosophy there are three kinds of theories: sceptical (or nihilist), rationalist, and society-centred. Nihilistic moral theories are obviously unable to justify legal doctrine. They cannot normatively justify anything at all, since they reject the very idea of normative justification. On the other hand, one may provide a deep justification of the law on the basis of one of the competing non-nihilist moral theories: utilitarian, Kantian, Aristotelian, Hegelian, etc. Sceptics disagree with objectivists. Rights theorists disagree with utilitarians. Natural-law theorists disagree with various kinds of historicists. Rule utilitarians disagree with action utilitarians. One can give reasons not only in favour of each major moral theory, but also against it. The problem is that this profound justification is controversial. A philosopher is like Sisyphus—always attempting to arrive at non-controversial answers to questions that often admit of no answer at all.

4.5.3. Strong Contractarianism

The core idea of rationalist theories of natural law—the idea of the contract—has regained its influence in moral theory (with Rawls, Nozick, etc.). The idea is much weaker here than in 17th-century theories of natural law. For example, it avoids categorical statements about the invalidity of positive law that

contradict natural law. It also avoids strong metaphysical assumptions about such things as the mode by which values are said to exist objectively.

But contractarianism faces many problems.[11] One can attempt to base morality and natural law on a factual and explicit social contract, but this is sheer science fiction. There simply never has been a time when "everybody" got together and agreed to some set of arrangements. A more promising way is to list facts that are evidence of a tacit (implicit) social contract. Dworkin's "constructive model" implies a social contract in this spirit: The citizens implicitly promise one another that the law will speak with one voice. Dworkin (1977, 162) advocates a "constructive model," not a "natural model." Whereas the natural model deals with moral and legal values and knowledge, the constructive model focuses on responsibility:

> The constructive model [...] demands that we act of principle rather than on faith. Its engine is a theory of responsibility that requires men to integrate their intuitions and subordinate some of these, when necessary, to that responsibility. (Ibid.)

Responsibility thus requires people to integrate their normative intuitions, but why? The question is not easy to answer, because Dworkin presents a model without an ontology and perhaps even without an epistemology. A big weakness of Dworkin's theory is that he refuses to discuss metatheoretical questions (cf. Dworkin 1986, 78ff. and 266ff.). Moreover, it is unclear exactly which behaviours indicate a tacit agreement to go with this or that arrangement.

Ideal hypothetical-consent theories are more popular. They typically operate with a version of or surrogate for a "veil of ignorance" (cf. Rawls 1971, 12) designed to ensure objectivity. But then, why should a person who was never actually in this ideal choice situation, and who never actually agreed to any terms therein, consider herself bound by what she would have agreed to if she had been there? (cf. Dworkin 1977, 150ff.). In brief, how can a hypothetical contract create an actual obligation? One may also wonder whether we can make a rational choice between competing versions of the veil of ignorance. How can a contractarian justify meta-level propositions about how thick the "veil" should be—that is, what knowledge it must exclude—if not by recourse to the contract behind the very same veil of ignorance? Stated otherwise, there is no way to be sure that a rational person behind the veil of ignorance would choose Rawls's maximin criterion or Harsanyi's average utilitarianism (cf. Reidhav 1998 and Harsanyi 1953), or even a form of gambling. Everything depends on genetic dispositions together with the social roots of

[11] Cf. Cudd 2002 and the Scandinavian legal-realist criticism of contractarian natural law (e.g., Olivecrona 1971, 12ff.; Strömberg 1989, 23–43). Even one who doubts the ontological basis of this criticism can agree with the realists that social-contract theories make philosophically controversial assumptions and may lead to whatever result one wish may wish to arrive at.

the person in question. One can so define the veil of ignorance as to support one philosophy or another, to be sure, but such definitions are ad hoc and hover in the air.

Strong contractarianism is controversial—and too strong to make sense of legal doctrine. For example, it is not easy at all to explain and justify all the intricacies of legal doctrine on the basis of Rawls's or Nozick's theories.

4.5.4. Weak Contractarianism

Ideal hypothetical-consent theories do an important philosophical service, however. They elucidate the meaning of the idea of what is morally right and wrong. Thus, Scanlon's contractarianism

> holds that an action is wrong if its performance under the circumstances would be disallowed by any set of principles for the general regulation of behaviour that no one could reasonably reject as a basis for informed, unforced general agreement. (Scanlon 1998, 153)

Scanlon bases his theory on the theory of human motivation.[12] All human motivation is based on reasons, and moral reasons are only one kind of reason.

Scanlon's basic idea—leading to contractarianism—is that moral obligation must be justifiable to people (cf. Scanlon 1998, 154),[13] not *in abstracto*. It follows from this idea, according to Scanlon, that the addressee of such a justification should enter as a party to a contract.[14]

Scanlon's theory is philosophically strong because its content is weak. At the end of the day, Scanlon admits that the circumstances of social life may affect the content of moral right and wrong. He thus asks, "How many valid moral principles are there, then? An indefinite number, I would say" (ibid., 201).

Finally, "what people have reason to want depends on the conditions in which they are placed, and among these conditions are facts about what most people around them want, believe, and expect" (ibid., 341).

Consequently, Scanlon (1998, 228) restricts the validity of Rawls's principles to a particular context.

The key concept in Scanlon's theory is reasonableness. "Reasonable" is a primitive concept: It may include any consideration that people have reason

[12] This element distinguishes Scanlon's theory from Hare's, based on the analysis of moral language; cf. Hare 1981.

[13] It may be added here that there is a parallel between Scanlon's justification to others and Aulis Aarnio's idea of justification before an "audience" (Aarnio 1987, 221ff.). See also Perelman 1963; Perelman and Olbrechts-Tyteca 1969, 13ff.

[14] Scanlon compares his theory to Gauthier's, Hare's, Kant's, and Rawls's, and (Scanlon 1998, 393, nn. 2–4) to Habermas's. He admits a close resemblance to Habermas. The difference between the two is, according to Scanlon, that "reaching a conclusion about right and wrong requires making a judgment about what others could or could not reasonably reject. This is a judgment that each of us must make for him- or herself. The agreement of others […] does not settle the matter" (Scanlon 1998, 190).

to regard as morally significant (ibid., 216ff.), and it is, too, "an idea with moral content" (ibid., 194). "In contrast to utilitarianism and other views which make well-being the only fundamental moral notion" (ibid., 216), Scanlon's theory "can account for the significance of different moral notions, within a unified moral framework, without reducing all of them to a single idea" (ibid., 216).

But even weak contractarianism is not immune to criticism, since it

> will have to pivot on what the society would, if rational, consent to contracting for. But in this case we might as well short-cut the social contract and ask what is rational directly. So in this case the "social contract" idea becomes redundant and dispensable. (Rescher 2002, 7)

Moreover, weak contractarianism cannot provide a set of first principles from which one might derive the content of legal doctrine. It cannot answer the question which laws are normatively binding and which laws are not. This question cannot, I believe, be answered on the basis of rationalist quasi-logical speculation, but only on the basis of our knowledge of the social facts.

4.5.5. Society-Centred Moral Normativity

An advocate of a society-centred moral theory would prefer another terminology. She would say that all norms are social and historical. She would be sceptical about universal norms. She would state that the moral theory most suited to the needs of legal doctrine is society-centred and coherentist (Hegelian, Aristotelian, communitarian, or perhaps another kind). The so-called communitarians have contributed to the theory of society-centred morality. Communitarians argue against Kantians and contractarians, and especially against Rawls. Rawls appeared to present his theory of justice, at least initially, as universally true, and communitarians argued against this stance that the standards of justice must be found in forms of life and in the traditions of particular societies.[15] In another philosophical tradition, one may take up the Hegelian idea of the state as an ethical community. We have here a triad, with *Sittlichkeit*—rationalist morality—and the law. Society-centred morality (*Sittlichkeit*) is the common denominator. Individualist moral theories are meaningful only against the backdrop of society. The law inherits its normativity from this society-centred morality.[16]

[15] See Bell 2001; cf. Mulhall and Swift 1992, 155ff. Rawls later sought to eliminate the universalist presuppositions from his theory: See Rawls 1993 and 1999.

[16] To put it otherwise: "That law's foundation is the totality we call dialogic community implies that the principles of formal right and equity are valid only within definite and rational limits. Because formal right and equity are both instantiations of the genuine ground of law, each must be actualized with a moderation that reflects this subordinate status and that preserves the distinctive identity of the other" (Brudner 1995, 150).

Let me now introduce briefly Copp's (1995) views on morality, normativity, and society. He developed two mutually independent theories: the standard-based theory and the society-centred theory.

> Standard-based theory provides a general account of the truth conditions of normative propositions [...]. Standards are norms or rules, expressible by imperatives [...]. According to the theory, normative claims express propositions which entail, nontrivially, that relevant standards have appropriate status. The nature of this status depends on the kind of normative claim in question. In the case of moral claims, the status is itself normative; moral propositions are true only if corresponding moral standards are appropriately justified. (Copp 1995, 3)

The second theory, the society-centred theory, "is intended to explain conditions under which a moral standard would be relevantly justified" (ibid., 4). Namely, "the moral code that would best serve the needs of a society is the code that the society would be most rational to choose, and it is the moral code justified for the society" (ibid., 7).

Much of Copp's book is devoted to explaining such things as society's needs, what best serves society, the choosing of a society, and more. It is open to doubt whether these—often quite daring—explanations need to be accepted to make sense of legal doctrine. But one thing seems to be a *conditio sine qua non*: a kind of social theory of morality that can account for such problems as the we-attitude and the questions of shared knowledge, common knowledge, and shared values. Thus, Copp's theory comes of service to jurists. A jurist who endorses this theory can say: Law can be morally binding and social at the same time because a binding morality must itself be society-centred.

These observations answer the known objection against juristic doctrines that they are local and thus cannot be genuinely normative. They seem to account for the peculiarities of the law of a certain state in a certain period. A critic would emphasize that this kind of territorial locality differs from universality, inherent in both science and morality. But the universality of morality—as opposed to the social, and hence local, character of the law—is itself very much open to question. Moreover, the territorial locality of juristic theories is relative. These theories are often used outside their country of origin. For example, Roman legal doctrine, and German legal doctrine after that, exerted their influence on different European countries. Doctrinal concepts such as "tort," "contract," "property," and "ownership" may have different extensions in different countries even as they have the same core in these countries.

Copp's theory, though society-centred, has the resources to deal with overlaps between different societies: "If a justified moral code is one that best contributes to making society possible then the justified code for a society would not conflict with the justified code for another society that overlaps with it" (ibid., 212).

But there remains the more basic question (ibid., 242–3): "It can be the case that a person would *not* be justified in subscribing [...] to the moral code

that *is* justified relative to her society [...]. Why should one *comply* with the moral code that is justified relative to one's society?"

Copp considers these questions irrelevant because based on the mistaken assumption that action-guidingness or normativity must be explained in terms of rationality (ibid., 244). The questions cannot be easily dismissed, however: They call for a comprehensive study that may leave Copp's theory behind and go into such problems as (Pettit 1993, Editorial Reviews—Book Description)

- What makes human beings intentional and thinking subjects?
- How does their intentionality and thought connect with their social nature and communal experience?
- How do the answers to these questions shape the assumptions which it is legitimate to make in social explanation and political evaluation?

There are, too, in this context, the questions

- What is the source of the normativity of society-centred standards?
- How are the right reasons to be determined in new situations?

Giovanni Sartor, in Volume 5 of this Treatise, has analysed multi-agent practical reasoning and collective intentionality as follows.

First of all an agent has what we may call *self-directed concerns*. [...] One may also have what we may call *other-directed concerns*. These consist in focusing on other agents, and in using practical reasoning to enhance the conditions of them. [...] Finally, an agent may have what we may call *collective-directed concerns*. These consist in focusing on the condition of a group of agents one belongs to (a collective). When one takes a collective-concerned perspective, one views oneself just as a member of the collective one refers to, so that one's identity becomes irrelevant, though one's traits and actions may matter (as they would if they belonged to any other member of the collective), according to the criteria one adopts with regard to the collective. An agent having such concerns will have collective-concerned likings: Consider for example, how one may like the country to which one belongs to have a booming economy, its culture and science are flourishing, its citizens participate in government, they do not suffer poverty, and so on. (Sartor, vol. 5 of this Treatise, sec. 9.1.1)

Society-centred theories face the risk of dissolving in post-modernist rhetoric and deconstructionism. But the risk can be avoided (cf. Pettit 1993, xiii).

4.6. Pluralism and Common Ground in the Law

4.6.1. The One-Right-Answer Ideal and Moral Relativism

Legal doctrine cannot do without the idea that its theories are right or wrong. It would be pointless to give up this idea and yet go on producing such theories.

Ronald Dworkin (1977, 81ff.), focusing on judges rather than on legal scholars, assumes that there must be a single right answer to any legal ques-

tion. This is the case notwithstanding the fact that present-day jurists have abandoned the pursuit of deductive certainty based on irrefutable premises.[17]

An early response to his theory was as follows (cf. Mackie 1977, 9). Dworkin sees only three possibilities:

- The reasons for a conclusion weigh more than its counterarguments;
- The counterarguments weigh more than the reasons in support of that conclusion;
- The reasons and the counterarguments weigh equally.

He overlooks the fourth possibility, that is:

The reasons for a conclusion and its counterarguments are incommensurable.

Indeed judges, and even more so doctrinal researchers, argue for the best solutions, thereby assuming that arguing makes sense. It makes sense only if they explicitly or implicitly accept the ideal of the one best answer to legal interpretive questions.

Mackie's reply to Dworkin brings us to the question of relativism. One may wonder whether there is a single right answer to any moral question. Sophisticated distinctions are possible, too, for example, supposing that there is a single right answer to any question of justice, at the same time denying that there is a single right answer to any moral or ethical question unconnected with justice. These distinctions presuppose controversial philosophical positions. Without subscribing to any of these, one may ask two general questions:

- Are genuinely normative views—and moral views in particular—necessarily relative?
- Do genuinely normative views—and moral views in particular—necessarily conflict with one another?

The first question is the question of relativism, the second the question of pluralism.

Moral relativity—the first question—is answered by several competing philosophical theories. But for all their sophistication, they produce more questions than answers. We have a good example in the dialogue between Harman and Thomson. Harman's position is this:

For the purpose of assigning truth conditions, a judgment of the form, *it would be morally wrong for P to D*, has to be understood as elliptical for a judgment of the form, *in relation to*

[17] Let us agree with the following (Dworkin 1986, 412): "I have not devised an algorithm for the courtroom. No electronic magician could design from my arguments a computer program that would supply a verdict everyone would accept once the facts of the case and the text of all past statutes and judicial decisions were put at the computer's disposal."

> *moral framework M, it would be morally wrong for P to D.* Similarly for other moral judgments. (Harman and Thomson 1996, 4)

Thomson, for his part (ibid., 68), presents the "Thesis of Moral Objectivity: It is possible to find about some moral sentences that they are true." But she argues (ibid., 154) that "Moral Objectivity is compatible with there being issues about which no undisputable conclusion is reached: it is compatible even with there being issues about which no undisputable conclusion is reachable."

There is also the following complication:

> I have been arguing that the truth of a normative reason claim requires a convergence in the desires of fully rational agents. However note that the convergence required is not at the level of desires about how each such agent is to organize her own life in her own world. In their own worlds fully rational agents will find themselves in quite different circumstances from each other, circumstances that are conditioned by their different embodiments, talents, environment and attachment in their respective worlds. Their desires about how to organize their own lives in their own worlds will therefore reflect these differences in their circumstances. The convergence required is rather at the level of their hypothetical desires about what is to be done in the various circumstances in which they might find themselves. (Smith 1994, 173)

Simply put, if I am in Jones's situation, and if we are both rational, my standards will be the same as Jones's.

In a similar spirit, Copp admitted that "the combination of the society-centred theory and the standard-based theory implies a form of moral relativism" (Copp 1995, 7); yet he made the following additions: "There is nothing in […] the society-centred theory to rule out the possibility that there is some moral code that is justified relatively to every society" (ibid., 222–3).

A further complication is that the so-called quasi-realism, developed by Simon Blackburn, apparently couches a profound relativist theory in objectivist language.

The overall impression is that the debate on moral relativity is overly sophisticated and inconclusive. Is a doctrinal jurist committed to taking a position on such matters? Perhaps not. It seems that all the recently proposed views are moderate enough to permit a normative legal doctrine. A jurist may join the camp of objectivists, relativists, or quasi-realists (cf. Dahlman 2002, 105ff.), but she must always opt for a weak and moderate position within the camp she sides with.

4.6.2. Plurality of Cultures

Philosophical uncertainty in such matters justifies bringing down the level of abstraction. The considerably abstract methodological disputes over universalism versus particularism had become less prominent by the 1990s, and the debate now centres on universal human rights (cf. Bell 2001).

Another way of bringing down the level of abstraction is to pass from the philosophy of relativism to less ambitious reflections on pluralism. Pluralism is a close relative of relativism. A pluralist accepts the relativist thesis that there is no single Herculean rationality that universally determines optimal moral opinions and legal interpretation. At the same time, she concedes that moral agreement and agreement in legal interpretation are feasible within a single moral or legal culture. Each culture has its own moral standards and its own standards of rationality. And each—no matter how delimited—will harbour within it a single right answer specific to all its moral and legal questions. But there is no single right answer that holds up across all the cultures.

On the other hand, members of various cultures can communicate with one another. Let me quote Isaiah Berlin:

> I came to the conclusion that there is a plurality of ideals, as there is a plurality of cultures and of temperaments. I am not a relativist; I do not say "I like my coffee with milk and you like it without; I am in favor of kindness and you prefer concentration camps"—each of us with his own values, which cannot be overcome or integrated. This I believe to be false. But I do believe that there is a plurality of values which men can and do seek, and that these values differ. There is not an infinity of them: the number of human values, of values that I can pursue while maintaining my human semblance, my human character, is finite—let us say 74, or perhaps 122, or 26, but finite, whatever it may be. And the difference it makes is that if a man pursues one of these values, I, who do not, am able to understand why he pursues it or what it would be like, in his circumstances, for me to be induced to pursue it. Hence the possibility of human understanding. (Berlin 1998)

Charles Taylor (1999) envisaged a cross-cultural dialogue between the representatives of different traditions. Rather than arguing for the universal validity of their views, however, he suggests that the participants allow for the possibility that their own beliefs may be mistaken. This way, each participant can learn of another's "moral universe." Here I should bring in a theory that Aulis Aarnio developed with me. The following quotation explains it briefly.

> Any value statement belongs to a certain value code shared, to a certain degree, by a number of people. Is the value code itself relative or not? To solve this problem, one must assume that universal value-statements and principles have always a *prima-facie* character. *Prima-facie* value propositions not only claim universality but also can be understood as universally valid in the following sense. First, their validity does not depend on an individual's free preferences. Second, although they are culture-bound, there is something all cultures must have in common. But such *prima-facie* propositions do not logically imply a moral judgement in any particular case. They are merely a starting point of an evaluation procedure, i.e., of weighing and balancing, nothing more. On the other hand, the final (contextual, all things considered) evaluations are necessarily relative to a certain culture and, indeed, to individual preferences. When claiming universality of values, people see the first side of the problem. When endorsing relativism, they see only the second one. (Aarnio and Peczenik 1996, abstract)

4.6.3. The Plurality of Objective Values in General and the Common Core

In general, such thinkers as Isaiah Berlin (1969, 160ff.) claim that there are many values, all of them objective but incommensurable with one another and not reducible to a single ideal. If they come in conflict, then we will have to choose.

> We are doomed to choose, and every choice may entail an irreparable loss. The world we encounter in ordinary experience is one in which we are faced with choices between ends equally ultimate and claims equally absolute, the realization of some of which must inevitably involve the sacrifice of others [...]. If, as I believe, the ends of men are many, and not all of them are in principle compatible with each other, then the possibility of conflict—and of tragedy—can never be wholly eliminated from human life, either personal or social. The necessity of choosing between absolute claims is then an inescapable characteristic of the human condition. (Berlin 1998)

This value pluralism is very much plausible. But pluralism should not be overstressed.

> The morally pluralistic societies with which we are familiar are not deeply and pervasively pluralistic. Their members tend to share moral attitudes towards the central features of the criminal law, for example, and they share moral attitudes toward the central political features of their society, such as its democratic constitution. (Copp 1995, 197)

Moreover:

> There is no guarantee of reaching acceptable results, but the pressures towards objectivity and a right answer, even on the base of conflicting pluralistic values, are very strong wherever values come into practical conflict. [...] We should think of ourselves as responding to the multiplicity of values that historical traditions have presented us with, and should try to take the next step under the pressure of the search for coherence. (Nagel 2001, 110–1)

Moreover, we must deal with overlaps of cultures—in the law, among other things, as well as in commerce, the media, and the World Wide Web. The idea of a society-centred morality is compatible with this possibility.

When speaking of pluralism and overlapping cultures, one may be referring to cultural pluralism within a society or to the cultures characterizing different societies (cf. Rawls 1993 and 1999).

In Rawls's works, this idea of an overlapping consensus gets integrated with the Kantian philosophy of the priority of the right over the good. Rawls discusses the depth and breadth required of the overlap precisely in view of this philosophy (1993, 149ff.). The core idea of an overlapping consensus has a strong intuitive appeal. Its Kantian underpinnings are, however, philosophically controversial. Not all philosophers are Kantians. And, what is more important for us here, not all jurists are. Justifying the normativity of a legal theory in strict dependence on Kantian philosophy makes it unlikely that this theory will keep within an overlapping consensus among jurists.

Yet jurists obviously need a theory of overlapping consensus. Legal doctrine would be pointless absent a community of jurists in principle willing to agree on juristic theories. Aulis Aarnio noticed this in his theory of audiences. What matters for rationality is acceptability (cf. Aarnio 1987, 185ff.) within a relevant group of people, that is, within an "audience" (cf. Aarnio 1987, 221ff.) of colleagues, peers, etc. These persons accept *p* or at least agree that *p* is acceptable according to the standards they accept; *p* is acceptable to a person, *A*, if she finds it legitimate (or permitted) for another person, *B*, to accept and assert *p* even if *A* herself prefers not to accept and assert *p*.

The common core is the main point of this volume. Legal doctrine deals with the common core of values in society. The problem is, however, that while legal doctrine must seek out a common core, it need not commit itself to any specific and strong philosophical theory of common core. Over-sophistication in the debates on moral relativism and pluralism makes it understandable that jurists should often react in the manner of Aulis Aarnio's well-known *bon mote*: Everything is relative, but this relativity is itself relative.

According to Jaap Hage (2004), each theory has its own standards for what is a good theory. There is no way to criticize a complete theory except by means provided by a theory the critic uses; and it is not objectively true that the critic's standards are better than the standards of the theory she criticizes. But the insight that all theories are relative to one's own standards for a good theory does not prevent us from using an objectivistic language. This leads to the following default strategy of relativism. By default, jurists will use an objectivist language for

- the normative bindingness of law;
- moral normativity;
- legal knowledge—genuine though evaluative;
- the genuine existence of law, not identical with subjective convictions about the law;
- the validity of legal reasoning, even if not deductive.

But if a jurist has any reason to doubt an objectivist standpoint, let her attempt a relativization of the language, of culture, of the legal profession, and so on.

4.7. Social Normativity, Morality, and the Law

To sum up, legal doctrine is committed to

- regarding social values as its genuinely normative basis;
- regarding valid law as genuinely binding;
- assuming there is a common core of values in society; and
- assuming that a big part of the law reflects this common core.

At the same time, legal doctrine may retain its neutrality with regard to such questions as

- whether there may also exist a universal normativity, derived from Reason alone, or perhaps originating from God;
- whether there is a common moral core among divergent cultures;
- whether human rights are universal; and
- what is the proper sense and essence of such concepts as "validity," "applicability," and "binding force."

The last item is perhaps crucial. Neither conceptual analysis nor any kind of philosophical insight into the essence of things can yield precise normative conclusions. In fact nothing can—if one understands the word "precise" literally. Approximate conclusions about what one ought to do can be reached, but the best way to justify them is through a coherent weighing and balancing of the moral considerations embedded in the tradition of our society.

Chapter 5

COHERENCE IN LEGAL DOCTRINE

5.1. Weighing and Defeasibility

5.1.1. Space for Defeasibility and Weighing in Legal Justification

Social normativity is an important keyword in our project of making sense of legal doctrine. Other keywords are defeasibility, weighing, and equilibrium. Theories of the defeasibility of legal reasoning have a strange history. In the mid-20th century, H. L. A. Hart wrote what follows:

> Claims upon which law courts adjudicate can usually be challenged or opposed in two ways. First, by a denial of the facts upon which they are based [...] and secondly by something quite different, namely a plea that although all the circumstances on which a claim could succeed are present, yet in the particular case, the claim [...] should not succeed because other circumstances are present, which brings the case under some recognized head of exception, the effect of which is either to defeat the claim [...] altogether, or to "reduce" it. (Hart 1952, 147–8)

The curious thing is that Hart did not return to defeasibility in his later writings. This stance was perhaps incompatible with his legal positivism (see Chapter 4, *infra*). And yet defeasibility is crucial in legal doctrine. Defeasibility affects all legal norms, and hence all

- legal claims;
- legal principles; and
- legal rules.

In particular, it affects, among other things,

- legal-source and reasoning norms and
- precedents.

Defeasibility is importantly connected with outweighability. The relation between the concepts of "outweighable" and "defeasible" is as follows.

A given norm may be both outweighable and defeasible. It is defeasible in the sense that it can be defeated, meaning that we can set it aside in exceptional cases. It outweighable in the sense that the justification of these exceptions requires a weighing and balancing of reasons.

From the logical point of view, a norm may be defeasible but not outweighable. That is, it may be set aside by a process other than weighing, for example, by the arbitrary fiat of a sovereign lawgiver.

In modern legal culture in the West, such fiat is perceived as illegitimate if the lawgiver's authority cannot be justified by any weighing and balancing of

reasons; it is also perceived as objectionable if the lawgiver cannot support the fiat by any weighing and balancing of reasons.

Weighing is relevant in all juristic contexts, such as

- statutory interpretation;
- interpretation of precedents;
- construction of juristic theories; and
- establishing the validity of legal norms, albeit only marginally so.

In all these contexts, weighing is used in

- profound justification of the law, linked to moral theory and to other branches of philosophy; and
- contextually sufficient legal justification.

From another point of view, weighing is used to

- establish an exception to a legal rule, or an extension of it; and
- to balance contributing reasons (including principles) against one another.

Profound normativity in the law—not merely its quote-unquote normativity, that is, the trivial fact of the law proclaiming itself to be binding—must be inherited from society-centred morality (or, in Tuori's terminology, from the deep structure of the law). On the other hand, contextually sufficient justification abstracts from the profound basis of legal normativity. But the abstraction is never complete. When in doubt, the jurist may ask more-and-more fundamental questions, imperceptibly entering the realm of profound justification. This way, contextually sufficient justification changes into profound justification, but not all the time, only when there are reasons for it.

Taking account of legal practice—not merely of what officials and jurists say they do—it is plausible to say that established legal rules, such as statutory provisions, have a defeasible (and thus outweighable) character. More specifically, if a legal provision allows for hard cases, it is defeasible not only from the point of view of morality, but also within the law itself. This is so because

- the provision's application to hard cases may be outweighed by moral considerations; and
- the provision may be applied to the case under consideration in a legally correct way, even if this is contrary to its wording (*contra legem*).

The reasons to be weighed are mostly values and principles. But I think that any rule can be weighed against other reasons (cf. Peczenik 1989, 80ff., and Verheij 1996, 48ff.). Moreover, almost all regal rules can encounter hard cases,

and these are solvable only by a weighing and balancing of reasons. No doubt, the application of some legal provisions involves routine cases only, or almost so. Provisions imposing clear time limits can serve as a good example. But provisions of this kind are very few, and they are not interesting for legal doctrine.

Some concepts used in the theory of legal argumentation, such as "statutory analogy" and "the purpose of the statute," presuppose weighing. For example, only important similarities between cases constitute a sufficient reason for conclusion by analogy. Judgments on importance are justifiable by weighing and balancing various reasons, often principles. Another important problem in statutory interpretation that involves weighing concerns the purpose of the statute. The weighing and balancing of all the circumstances of the case decides what data has priority in deciding what the goal of the statute is.

> In general, various reasons and methods, such as literal interpretation, analogy, systemic interpretation, historical interpretation and goal interpretation support statutory interpretation in hard cases. The choice between the alternatives depends on weighing and balancing of various legal arguments. (Peczenik 1995, 376)

Weighing is important in particular legal doctrine, too.

In property law, the delimitation between the proper realm of the doctrine based on property rights, on the one hand, and the public-trust doctrine, on the other, depends on a weighing and balancing of considerations.

In contracts, one must weigh and balance different theories of freedom of contract and different kinds of justice (commutative and distributive). One must also use weighing to solve problems that are more particular, concerning good faith, implied contract terms, conscionability, and the assumptions built into a contract.

In torts, we again meet a weighing of different kinds of justice. We also meet weighing in more specific, juristic contexts. For example, theories of adequate causation need weighing to elucidate the sense of such terms as "a damage of this type," *vir optimus*, a "too remote cause of the damage," or a "sufficiently important factor in producing the damage." Weighing is also necessary to balance theories of adequacy with competing theories, like the purpose of protection.

In criminal law, one must weigh various kinds of reasons when attempting a philosophical justification of punishment and constructing theories on the purpose of criminal law. In more specific, juristic contexts, one must rely upon weighing when recommending theories of *dolus*, *culpa*, harm, wrongfulness, action, omission, causation, defence, etc. Weighing is indispensable as well when discussing punishment in a concrete, actual, or hypothetical case.

What also needs mentioning here is the German doctrine of weighing in constitutional law (see Alexy 1985, 143ff.).

5.1.2. General Theories of Weighing

In general, there is no algorithm for weighing in legal doctrine (cf. Peczenik 1989, 58–96). Moreover, "ultimately balancing is an act that cannot be captured by criteria, it is an act of the imagination (Bańkowski 2001, 184).

Weighing is defeasible. One weighing is dependent on other weighings. A given factor may make very different contributions to the value of the whole depending on what other factors it combines with (cf. Rabinowicz 1998, 22). In other words, weighing is holistic. This holistic conception of weighing reminds us of ethical particularism. For if weighing in general depends on all accessible reasons together, it follows that weighing in a concrete case depends on all the circumstances connected with the case. Like justice, weighing takes in all considerations. The so-called ethical particularists, such as Jonathan Dancy, seem to suggest that any reason can be undercut, or at least made to weight less, when it appears in new configurations in combination with other factors (cf. Rabinowicz 1998, 22).

One can conceptualize weighing as an aggregation of arguments and a construction of chains of arguments. As soon as one states that one thing weighs more than another, the question comes up, "Why?" At this point one needs another argument and another act of weighing. Briefly stated, x may weigh more than y in isolation, but in a certain situation z can occur and reverse the order, such that x weighs less than $y + z$; $x + q$ may then weigh more than $y + z$. This way, weights can be aggregated. Not all reasons may be cumulated, to be sure. But reasons proffered in legal argumentation cumulate often enough to make cumulation an interesting rule of thumb: *Ceteris paribus*, two reasons pointing in the same direction are stronger jointly than they are singly.

In other words, human beings have a faculty of judgment, and weighing is a product of this faculty. The philosophical question, What faculty of judgment is used in a profound perspective? is not a question for legal theory to address. Perhaps this faculty is the passion for reason, or it may be several kinds of passion for reason. Or maybe something more fundamental, more Kantian, so to speak. A law theorist is well advised to leave all three options open.

One way that has been attempted out of this intellectual labyrinth is to construct a mathematical theory of importance, but a theory of this kind will tend to be complex (cf. Lindahl 1997, 111ff., and Odelstad 2002). Moreover, it will leave philosophical questions without anwers.

Another way is to assume a simple model of weighing where each weighed value or principle is susceptible of three degrees of violation: slight, medium, and serious. When principles collide, a slight violation of one principle is always to be preferred to the medium violation of another, and a medium violation is to be preferred to a serious one (see Alexy 2001 and 2003). In particular, Alexy (2001, 69ff. and 2003) points out what follows. Weighing and balancing can be analyzed in three steps. We must establish (1) the intensity of interference with

the principle, (2) the weight of the principle in the abstract, and (3) the reliability of the empirical assumptions concerning what the measure in question means for the non-realization of the principle. Intensity, weight, and reliability can be measured on the triadic scale slight, medium, serious. Though in some cases the measuring can be questioned, and a "draw" may occur, weighing is most often conclusive. A finer scale, admitting of more than three degrees, is of course logically possible, but it would be impossible to apply in practice.

The formula for weighing and balancing two principles *Pi* and *Pj* in the case under consideration is

$$Wi,j = \frac{Ii \cdot Wi \cdot Ri}{Ij \cdot Wj \cdot Rj}$$

where *I* designates the intensity of interference with the principle in the particular case, *W* the abstract weight of the principle, and *R* the reliability of the empirical assumptions.

In my opinion, Alexy's theory is the best juristic approximation of weighing. It is especially well suited to attacking problems in constitutional law; the triadic scale of *W* corresponds to the fact that some basic rights are privileged, some are normal, and others (such as social rights) are more contestable.[1] The most profound philosophical theory of weighing is the holistic one, but it is difficult to operationalize for the immediate use of lawyers.

5.1.3. Extending the Domain of Reason

Despite its holistic and defeasible character, weighing is a rational activity. Legal doctrine uses weighing but aims at a rational reconstruction of the law. Rationality cannot be reduced to formal logic. Nor should we set up a contrast between rationality and a weaker reasonableness. Thus, according to Gardner and Macklem (2002, 474) "rationality is […] the same as reasonableness. As we have argued, it is simply the capacity and propensity to act (think, feel, etc.) only and always for undefeated reasons."

The concept of a "reason" may be defined in many ways. What is important is that a reason is a fact, or else a belief in a fact. The following definition appeals to the psychological relation of holding one belief on the basis of another:

> A belief *P* is a reason for a person *S* to believe *Q* if and only if it is logically possible for *S* to become justified in believing *Q* by believing it on the basis of *P*. (Pollock 1986, 36)

[1] In this respect, Alexy's theory of weighing is a juristic theory: It belongs to legal doctrine. But when one considers its sophistication, it falls within the reach of legal theory and legal philosophy.

To be sure, some readers may think that logical deduction is the only method of correct reasoning. Yet arguments may be evaluated by several standards. One such standard—deductive logic—is very severe. Arguments that satisfy this standard guarantee the truth of their conclusions on the basis of the truth of their premises. However, since the standard of deductive logic is very severe, many real-life arguments that are useful do not satisfy it. The distinction between good and bad arguments can be brought outside the range of deductively valid argument by developing other standards, standards for defeasible reasoning. The concept of rationality is applicable to vastly different areas. One speaks of logical rationality (deductive and inductive), discursive rationality, supportive rationality, scientific rationality in general, the rationality of actions, goal rationality, norm rationality, system rationality, etc. (cf. Peczenik 1989, 55ff.; Aarnio 1987, 189; Agell 2002, 246).

The narrower the conception of reason, the wider the space for the irrational to creep in (cf. Dreier 1991, 134).

Thinkers who restrict the domain of reason to deductive logic and to empirical observations of brute facts may provide for law theorists useful logical calculi. But they have no chance whatsoever of making sense of legal doctrine. Its subject (valid law) and its reasoning patterns (obviously not only deductive) appear fictitious and irrational to a logical-empirical theorist. Early Scandinavian legal realists, such as Karl Olivecrona and Alf Ross, can serve as an example. Ross's project of legal science as predictions of future judicial practice has proven to be hopeless. It was deemed such from the very beginning by Olivecrona, and it is easy to criticize (see Peczenik 1989, 262ff.; Peczenik 1995, 103ff.).

Thinkers who restrict the domain of reason to deductive logic, empirical observations of brute facts, and goal-means calculi may inspire legal theory by providing additional logical tools. But they still face the same problems when it comes to the object of legal doctrine and its way of reasoning.

Thinkers who restrict the domain of reason to deductive logic, goal-means calculi, Kantian practical reason, and empirical observations of brute facts have a slightly better chance, but they will inevitably distort legal doctrine beyond recognition. Their trick is to split the domain of reason in two hermetically isolated parts: theoretical reason on the one hand and practical reason on the other. Theoretical reason is the realm of deductive logic and brute facts only. Practical reason is a province of deductive logic that takes in Kantian categorical imperatives together with various derivates and social contractarianism more or less linked to Kant. A prominent example is the early Rawls, with countless epigones. The problem is that most of the existing juristic theories have thus far evaded such a reconstruction.

There remains to enlarge the domain of reason by including deductive logic, defeasible logic, goal-means calculi, postulates of practical reason, sociocultural patterns of reasoning, and observations of facts—brute and social alike.

5.1.4. Decisive Reasons, Defeasible Reasons, Rules, Principles

We have seen that defeasible reasoning is common in the context of juristic interpretation and juristic theorizing. Let me add to this that this kind of reasoning is common in many contexts. People often think in terms of what is normally the case and provide plenty of leeway for exceptions. It is thus common for them to utter defeasible statements, justified unless suspended or cancelled by newly presented information.

The artificial-intelligence-and-law community has developed logical tools for modelling defeasible legal arguments that can deal with undercutting arguments, rebuttals, weighing information, reasoning on weighing information, reasoning on rules, lines of argumentation and dialogues, procedural rules, commitment rules, and burden of proof.

In Volume 5 of this Treatise, Giovanni Sartor provides the following definitions.

> [W]e distinguished two kinds of collisions:
>
> 1. *rebutting collision*, where two reasons support incompatible conclusions;
> 2. *undercutting collision*, where one reason leads to the conclusion that another reason is unable to support its own conclusion.
>
> We have also observed that in rebutting collisions the stronger reason prevails, while in undercutting collisions the undercutter prevails, regardless of its comparative strength. (Sartor, vol. 5 of this Treatise, sec. 26.3.1)

> In the normative domain *undercutting* is usually based upon the *inapplicability* of a general rule to certain entities. By saying that a rule is inapplicable to certain entities, we precisely claim that we are not authorised to infer the instances of that rule which concern these entities. (Ibid., sec. 26.3.3)

Let us now make the distinction between decisive and contributing reasons. Decisive reasons determine the conclusions they lead to. If a decisive reason for a conclusion obtains, the conclusion must also obtain.

Some decisive reasons determine their conclusion without any possibility of an exception. Other decisive reasons are, however, defeasible. A decisive reason is defeasible if, and only if,

- the reason is decisive on the basis of the information possessed; and
- new information may become available that was initially not there and converts the reason to a non-decisive one.

In other words, decisive and defeasible reasons determine their consequences in normal circumstances, but do not determine such consequences if the circumstances are not normal. Contributing reasons, on the contrary, never determine consequences by themselves. There can be contributing reasons that plead for and against a particular conclusion. It is the set of *all* reasons (pro and con) contributing to a particular conclusion that determine whether the

conclusion holds (cf. Hage and Peczenik 2000, 306ff.). One can also say that contributive reasons are *pro tanto* reasons.

Rules are decisive reasons, but they often are defeasible. *Principles* are contributing reasons.

Rules apply in an all-or-nothing fashion, in the sense that if a rule is applied to a case, the ruler's conclusion yields the legal consequence for that case. Principles, on the contrary, generate only reasons that plead for actions contributing as much as possible to goal states. Once we know that a certain provision is a principle, or that a certain practice or deliberation expresses a principle, we know that it is a contributing reason, not a decisive one. This definition is closely related to the opinions of both Dworkin and Alexy.

Dworkin's formulation is as follows:

> Rules are applicable in an all-or-nothing fashion. If the facts a rule stipulates are given, then either the rule is valid, in which case the answer it supplies must be accepted, or it is not, in which case it contributes nothing to the decision. [...] A principle [...] states a reason that argues in one direction, but does not necessitate a particular decision. (Dworkin 1977, 24, 26)

According to Alexy (2000b, 295; cf. Alexy 1985, 75ff.), "principles are norms commanding that something must be realized to the highest degree that is actually and legally possible. Principles are therefore optimization commands."

There is an extensive analytical literature on rules versus principles. I will provide only one other conceptualization (Atienza and Manero 1998). These authors define principles in the strict sense in terms of a norm's range of application. This principle defines the cases to which it is applicable "in an open manner, while the rules do so in a close manner" (ibid., 9). Thus, the authors reject Alexy's assumption that principles are optimization commands:

> the principles in the strict sense are optimization commands only in the sense that, as their conditions of application are formed in an open manner [...], but once it is determined that in that case the principle prevails, it demands complete fulfilment. (Ibid., 12, 13)

The merit of this conceptualization is that it avoids the problem of contributing reasons and the attendant problem of weighing. In Atienza and Manero's theory, principles are like rules: They must be followed when applicable. But the problem of weighing does not thereby disappear. It only moves from one "box" to another: from an analysis of the content of rules/principles to an analysis of their applicability.

Legal doctrine is not committed to making a final choice from among the analytical conceptualizations of Dworkin, Alexy, and Atienza and Manero, or from among other such conceptualizations. But it is committed to recognizing the importance of defeasibility for legal reasoning, regardless of the conception of defeasibility that is chosen.

In the real world, the use of legal provisions varies. In most cases, legal provisions are applied if their conditions are met and they generate decisive

reasons. In hindsight, these cases may be called routine (or "easy"). Once a case is identified as routine, no values and no choices are necessary to solve it. A decision in this case follows from an established legal rule in combination with the description of the case. Sometimes, however, there are major objections against treating legal provisions as "hard" rules. One will then be prepared to make an exception. In hindsight, such cases are called "hard." There are also hard cases resulting from problems of interpretation.

Some legal realists correctly realized that one cannot draw a clear demarcation line between hard cases and routine cases. Thus, Per Olof Ekelöf made a similar distinction between ordinary and special cases and added what follows. Special cases comprise not only what falls outside of the letter of the law, but also what is clearly covered by this "letter" and yet seldom occurs or is connected with "such special circumstances that a mechanical application of the statute can be regarded as militating against its purpose" (Ekelöf 1958, 84). Ordinary cases, on the other hand, are those cases which are of great importance or are for some other reason so conspicuous that the drafters of the statute could not have avoided taking note of them. Moreover, social change occurring after a statute has been enacted may cause some cases to become ordinary even though the drafters hadn't thought of them. Consequently, when making the distinction between ordinary and special cases, one must rely on an evaluative weighing of various criteria.

Each legal role—for instance, the role of a judge, of an attorney, or of a legal scholar—determines its own delimitation between routine cases, in which the law ought to be followed without deliberation, and hard cases, which require a weighing and balancing of the law against moral considerations. Delimiting routine cases requires a valuation. This valuation is implicit in the legal role assumed and is not justifiable within this role. But it certainly is justifiable within another role, perhaps within the role of a philosopher. A lawyer performs this delimitation intuitively, and that is the way she must and ought to proceed.

5.1.5. Defeasibility, Not Indeterminacy

The idea of defeasibility enables one to criticize sceptics who argue that legal doctrine is a mere façade put up to conceal the real reasons for judicial decision and is hopelessly indeterminate—unable to formulate precise rules for choosing from among conflicting legal arguments.

This criticism could not go unchallenged. A great American legal realist thus concluded with resignation, "A right man cannot be a man and feel himself a trickster or a charlatan" (Llewellyn 1960, 4).[2]

[2] Should probably read "a man cannot be a right man," but the observation is patently true.

One way of challenging the indeterminacy of theories is to argue that legal doctrine formulates general rules for interpreting the law. These rules are defeasible but not fully indeterminate. In particular, argumentation by analogy and *argumentum e* contrario are defeasible but reasonable. The choice between them is justifiable if coherent with the system of already accepted propositions and preferences of both legal and moral character.

These defeasible rules are honestly endorsed by both judges and doctrinal jurists. Even when such rules are a façade concealing other reasons, they may still be correct.

> The alleged façade is in fact worthy of study itself, since at the very least it represents an effort at self-conscious public justification. Thus it enables us to understand what are regarded as satisfactory and publicly acknowledgeable grounds for legal drafting and decision making. (MacCormick and Summers 1991, 17)

Indeed,

> if the reasons given are well-founded and valid it does not matter whether they are judge's "real" reasons. If, again, the reasons are not well-founded or not legally valid it equally does not matter whether they are judge's "real" reasons. In either case, the reasons actually given will be judged on their own merits. (Bergholtz 1987, 441; cf. ibid., 421ff.)

Moreover, disagreement about precise rules of interpretation and about solutions to cases does not imply disagreement about forms of argument. Statutory analogy and *argumentum e contrario*, for example, are not rules but forms of argument (Alexy 1978, 341ff.; Alexy 1989, 279ff.), each supported by a different set of reasoning norms and other principles that a judge has to weigh and balance. They enable the judge to reach the conclusion that is justifiable in the given circumstances and within the limits of the established reasoning norms. In some cases all judges, or all legal researchers, would reach a consensus if they reasoned perfectly; in other cases they would not. But the forms of argument and their argumentative underpinnings restrict the area of disagreement.

In particular, the juristic use of statutory analogy and *argumentum e contrario* "relies upon the principle that the judge should never create norms which are altogether new but should seek his guidance in rules which have already been recognised for other situations" (Schmidt 1957, 195).

Legal doctrine constantly puts out more or less abstract examples of justifiable uses of analogy, such as justifiable examples of *argumentum e contrario*. One can regard these abstract examples as rules of interpretation. These rules are defeasible. Consequently, they are not fully precise. Yet they do say something—they are not fully indeterminate.

Anglo-American philosophers are engaged in sophisticated discussion on the interpretive character of legal theories. Thus, Joseph Raz claims that legal interpretation has innovative, forward-looking aspects. Innovation defies gen-

eralization. Hence it is futile to attempt to construct a general theory that differentiates good interpretations from the bad (cf. Raz 1996a; Dickson 2001). Raz has been influenced by the theory of sceptical philosophers, like Williams (1985) and Dancy (1993).

To avoid scepticism, some scholars question whether legal doctrine can have any interpretive character at all. The question is a special case of the much more general question whether meaning in general is explicable as interpretation. Thus, Marmor (1992) and Stone (1995) reject interpretation as the fundamental determinant of meaning. The key to these views is the following passage from Wittgenstein:

> It can be seen that there is a misunderstanding here from the mere fact that in the course of our argument we give one interpretation after another; as if each one contented us at least for a moment, until we thought of yet another standing behind it. What this shows is that there is a way of grasping a rule which is not an interpretation, but which is exhibited in what we call "obeying the rule" and "going against it" in actual cases. (Wittgenstein 1958, § 201)

This passage suggests that rule-following is something other than interpretation. But what is it then? Perhaps a sincere disposition of judges to use rules in certain ways, a disposition acquired through the training they have received and the practice they engage in Postema (1998, 329ff.) thus asks the following question: If the goal of theorizing about the law is to master a practice, can one at the same time state that the goal is to interpret the law?

Still, judges and jurists obviously assume that there are some rules for interpretation. But then they stop reflecting. Typically, they do not ask for rules of the second order, but rely instead on a tacit knowledge acquired through training and practice.

Philosophers inspired by Wittgenstein have not proved that interpretation is irrelevant for legal doctrine. Nor have they shown that interpretation does not diminish the law's margin of indeterminacy: They have not shown that the law is fully indeterminate, but merely that it is not fully determinate.

5.1.6. Logic and Rhetoric in Legal Argumentation

One may need new analytical tools to deal with defeasibility and weighing. Researchers doing artificial intelligence and law have developed tools for modelling legal argumentation (cf. Gordon 1995; Prakken and Sartor 1996; Hage 1997b and Verheij 1996). They have built a theory of defeasible reasoning on top of monotonic logic. The "nonmonotonicity of a logic means that the addition of a new information to a theory can make sentences underivable which used to be derivable on the basis of the smaller theory" (Hage 1997a, 199).

Notice that none of the old information is removed: It stays in the theory. This is important for jurists because congruent with the practice of statutory

interpretation. A jurist may radically reinterpret the statutory provision in question, but the provisions stay within the legal system. Only in extremely hard cases does weighing and balancing lead to the removal of a norm from the legal system (*desuetudo derogatoria*).

In a nonmonotonic logic, an extension of the set of premises can lead to a contraction of the set of conclusions. The essential point is that the premises are defeasible.

Nonmonotonicity, or defeasibility, arises from the fact that arguments can be defeated by stronger counterarguments. The new arguments defeat some of the old ones. In a monotonic logic this would mean that the new set of premises is inconsistent, and hence that one can derive anything from it (*ex falso quodlibet*). But all default argumentation means that *ex falso quodlibet* is no longer regarded as a logical rule. Moreover, nonmonotonic logic makes it possible to extend a theory in such a way that it becomes possible to derive more reasons for a conclusion as well as against it.

Special predicates are used to say that rules are valid, that rules apply, and so on. Rules of derivation establish, for example, that a rule—if applied—gives rise to a reason, that a conclusion holds if the reasons for it outweigh the reasons against it, and so on.

These models can be relatively simple, but they also can embrace formal dialectics that introduce speech acts, burden of proof, etc. (cf. Freeman and Farley 1997). Thus, Arno Lodder (1999) has proposed a model specifying

- the participants;
- the moves of the game;
- the burden of proof;
- the role of commitment;
- the rules of dialogue; and
- levels in the dialogue.

The rules of dialogue determine how to play the game. They define:

- which player's turn it is;
- whether a move is allowed; and
- the consequences of valid moves in terms of commitment.

Rhetoric and logic get combined in this approach to argumentation. Logically compelling arguments are allowed, as are psychological arguments designed to convince.

A general strategy for legal doctrine might be the following. Try first with strict rational models, starting with deduction. If these lead to trivial or counterintuitive results, extend the set of tools to some kind of nonmonotonic logic. If this does not suffice to cross the threshold of trivial-

ity and resistance to intuition, then try dialogue games. If even this is not enough to satisfy a lawyer, switch over to humanistic discourse and metaphysics. Intellectual tools are just tools. They do not eliminate the indeterminacy of legal doctrine. They reduce it, though, because they increase the likelihood of a stable consensus.

Since all these models rely on non-conclusive rules, none can completely eliminate the indeterminacy of legal argumentation. They make it possible to model the law as rules and exceptions. But the model's author, and in some cases its user, must decide what new information generates an exception. This decision is not always determined in the law, meaning established by statute or precedent. The models merely channel the indeterminacy, pointing out the "places" that need to be judged intuitively. Still, the probability of a consensus on such "places" is high enough to secure for such modelling a high rhetorical value. That is, it promotes a stable consensus among legal scholars, lawyers, and the public.

In this context, one may also reflect on the epistemological value of rhetoric, for example, following Stephen Toulmin, along with Chaim Perelman and Louise Olbrechts-Tyteca. But whatever the outcome of such philosophical disputes, it is undeniable that legal doctrine has the space to accommodate both logic and rhetoric.

5.2. Reflective Equilibrium in Legal Doctrine

5.2.1. Wide, Constrained, and Segmented Reflective Equilibrium in Legal Doctrine

No algorithm indicates when an exception enters into a defeasible system of rules. Nor is there an algorithm for juristic weighing. To establish exceptions and perform juristic weighing, one must rely on a web of reasons in a kind of reflective equilibrium.

The idea of reflective equilibrium is well known in political and moral theory. John Rawls characterized reflective equilibrium in the particular context of his theory as follows:

> By going back and forth, sometimes altering the conditions of the contractual circumstances, at others withdrawing our judgments [...]. I assume that eventually we shall find a description of the initial situation that both expresses reasonable conditions and yields principles which match our considered judgments duly pruned and adjusted. (Rawls 1971, 20)

The idea of reflective equilibrium in legal justification requires some modifications. The idea originated in the context of a rather orthodox strand of liberal theory. A liberal moral thinker aims at equilibrium, freely modifying principles and judgments alike. Legal doctrine aims at equilibrium, too, but this equilibrium is not free. It is an equilibrium of a peculiar kind:

- wide;
- constrained;
- segmented; and
- centred around platitudes (truisms or commonplaces).

Simple reflective equilibrium is too narrow for legal doctrine. We need a wider equilibrium. On wide reflective equilibrium in morality:

> A wide reflective equilibrium is a coherent triple of sets of beliefs held by a particular person; namely, (a) a set of particular moral judgments; (b) a set of moral principles; and (c) a set of relevant background theories, which may include both moral and nonmoral theories. […] The agent may work back and forth, revising his initial considered judgments, moral principles, and background theories, to arrive at an equilibrium point that consists of the triple (a), (b), and (c). (Daniels 1985, 121; cf. Swanton 1992, 11ff.)

By working competing moral theories into reflective equilibrium, the jurist takes the first step away from simple reflective equilibrium. Such thinkers as Rawls can modify and adjust principles and judgments, but they have not thought of a free adjustment among moral theories. On the contrary, they hold firmly to a certain kind of liberal moral theory: They are not philosophically neutral but are liberal moral philosophers. Legal doctrine, in contrast, is philosophically neutral, in the sense that it is not committed to a specific moral theory.

Another deviation of legal doctrine from the liberal idea of reflective equilibrium is this. A legal scholar is not entirely free to adjust principles and judgments to each other. A search for reflective equilibrium can be undertaken only when the legal culture makes it possible. That is,

- when it is proper to enter into profound justification;
- when interpreting the law in hard cases; or
- when using value-open concepts.

Thus, wide reflective equilibrium in legal doctrine must be constrained by must—and should—sources of law, that is, mainly by statutes, judicial decisions, and *travaux préparatoires*. The wording of these is immune to revision. Legal doctrine may only revise their interpretation within the limits allowed by legal language and legal culture. The threshold of revision will obviously vary, from relatively low with *travaux préparatoires* to extremely high with the system of enacted legal rules considered as a whole.

Wide and constrained reflective equilibriums in legal doctrine are segmented. Each juristic theory should be coherent with itself, internally, according to its own standards. But different theories have different scopes. Some are relatively narrow, as is the theory of adequate causation in the law of torts. Others cover a whole branch of law, such as private law. At the same time, there exists a total unifying structure for legal doctrine as a whole, and ulti-

mately for the total system of acceptances, reasonings, and preferences relevant for the law. The fragments are like islands and archipelagos rather than like a continent. They are linked by way of "bridges" and "boats" that change direction in line with changes in culture. In other words, legal doctrine aims not only at the internal equilibrium of the legal system, but also at an equilibrium that takes into account our background knowledge of society and philosophy. The law is linked normatively to morality and politics. Indeed:

> The upshot is that the common law is (inherently, though more or less imperfectly in fact) a unity of not only diverse doctrines but also of doctrinal systems. The unity of subunities constitutes the good order and justice of the common law and reveals injustice as the hypertrophic extension of some constituent principle, such as formal liberty, the general happiness, or positive freedom. (Brudner 1995, 261)

5.2.2. Equilibrium around Platitudes—Philosophical Background

Reflective equilibrium in legal doctrine is arranged around platitudes, not around precise ideas. The importance of platitudes for human thinking cannot be overestimated. It is obvious both in science and in morality. Let me start from the evolution of the philosophy of science.

The older philosophy of science was dominated by so-called inductivism. Thus, some philosophers of science have argued that if order rules the universe, induction is the only method of predicting that order; they have also claimed that induction is sufficient to reconstruct all scientific reasonings (Reichenbach 1949, 429ff.) and have brought statistical reasoning into play.

Karl Popper (cf. 1959, 28ff.) criticized inductivism and claimed that the proper method of scientific research consists in creating bold hypotheses. One should try to falsify the hypotheses made. These should be accepted conditionally, that is, so long as they are not falsified (ibid., 40ff.). The growth of knowledge is the result of a process closely resembling what Darwin called natural selection: We have here a natural selection of hypotheses (ibid., 108 and 1972, 261). But Popper's falsificationism faces some difficulties. Pierre Duhem noticed, even before Popper's time, that one may criticize and eliminate the observations that seem to falsify a hypothesis. How should one go about choosing when to contest the theory and when to contest the observation? Popper formulated some methodological rules with which to solve this problem (Popper 1959, 83).[3] The most important of these is the rule that ad

[3] Some philosophers of science have tried to extend the list of methodological rules. Thus, Knut Erik Tranöy (1976, 131ff., and 1980, 191ff.) discusses "norms of inquiry" that not only have a methodological character, but also express distinct traditions, each centred around a different value: self-realization, public welfare, value-neutrality, testability, intersubjective controllability, honesty, sincerity, exactitude, completeness, simplicity, order, coherence, system, academic freedom. To some extent, these norms of inquiry are similar to material inference rules in Toulmin's sense (cf. 1964, 109).

hoc auxiliary hypotheses, introduced to save the theory and not explicative of anything else, are forbidden.

According to Thomas Kuhn (1970, 23ff.), each scientific theory should be judged as part of a broader totality called a paradigm. Each paradigm includes, among other things, (1) examples of concrete scientific achievements (e.g., Einstein's) imitated by scientists in subsequent research; (2) value judgments, norms, and basic beliefs shared by scientists, e.g., criteria for the correctness of physical experiments; and (3) so-called symbolic generalizations about the sense of scientific terms, such as "mass" and "energy."[4] If a scientist cannot solve a problem within a paradigm, this failure does not falsify the entire paradigm or any of the theories essential to it: What is "falsified" is rather the scientist's skill. Paradigms are incommensurable. In the transition from one paradigm to another, words change their meaning or their conditions of application. Each paradigm then satisfies the criteria it dictates for itself and falls short of satisfying some of the criteria dictated by its opponent (ibid., 109–10). In his later works, Kuhn introduced the concept of "disciplinary matrix" (cf. Kuhn 1979, 293ff.), each matrix defining a scientific discipline.

According to Imre Lakatos (1970, 132ff.), a given research program (or group of theories) contains a hard core that includes some central propositions, e.g., the main points of the theory of relativity. This core is protected by auxiliary hypotheses. One thus ought to direct counterexamples against the auxiliary hypotheses, never against the hard core. The research program is fruitful ("progressive") if it continues to produce theories with greater and greater empirical content explaining more and more observations. Failing which, the research program becomes degenerative, often giving way to another program with another hard core. Classical physics thus stagnated in the late 19th century. All questions were apparently solved and no new theories appeared. Some time later it gave way to the new physics based on relativity. In Lakatos's theory, cores thus play a role similar to that of paradigms in Kuhn's system. But Lakatos's theory is philosophically more interesting than Kuhn's. A paradigm shift in Kuhn's theory is nothing more than a changing scientific convention. It simply happens, even for no rational reason. In Lakatos's sense, a change from one research program to another is more like Popper's falsification: It is brought about by the inner dynamics of science.

Despite having enormous success, the philosophy of science from Popper to Lakatos came up against fundamental problems due to its conventionalism and relativism. If all previous theories have been falsified, if the new theories

[4] Popper (1959, 13) was close to this idea: "A structure of scientific doctrines is already in existence; [...] This is why (a scientist) may leave it to others to fit his contribution into the framework of scientific knowledge" (cf. Popper 1972, 51ff.).

are incommensurable with the old ones, how then can one believe in the truth of present-day theories? They, too, are doomed, are they not? Present-day philosophy of science has no clear answer to this question. It only delivers some hints. For example, Nancy Cartwright (1999, 37ff.) claims that we learn the truth about the world not only from physics, but also from the morals of fables, such as the moral, "It is dangerous to choose the wrong time for doing something" or "The weaker always fall prey to the stronger." The point is "that laws of physics are general claims, like morals of fables" (ibid., 47), and that "the laws of physics are true only about what we make" (ibid.).

The truth can be found on the low and midlevel of abstraction, not only in the most abstract and logically prior laws of nature. Eventually, a new abstract theory will replace an old one, and the new theory may use very different concepts. But the morals of fables survive, and they give us insight into the natures of things (Cartwright 1999, 77ff.). The new theory keeps most of the low-level and midlevel content of the old one.

An outsider may regard such views as almost defeatist. But they suggest the following question: If philosophers of natural science tend to play down the scientific claim to precision, shouldn't law theorists, too, learn to accept the profound but not precise "morals of parables"?

To expand on this point, I will change source of inspiration and pass from the philosophy of science to moral philosophy. One cause of moral relativism and pluralism is in the eternal quarrel among the big moral theories. But these moral theories—though incompatible when developed in general, precise, and content-rich fashion—lead to very similar consequences once their level of abstraction, precision, and informational content is brought down. The more abstract, precise, and content-rich a theory is, the more controversial it becomes.

Each of the big moral theories is built up on a platitude. Thus, Kantians emphasize autonomy of the person, utilitarians utility, Aristotelians practices, and—let me add—coherentists coherence. All these platitudes have obvious moral importance, since no one would totally ignore autonomy, utility, moral practices, or coherence. One need not be Kantian, Aristotelian, or coherentist to recognize the importance of the corresponding platitude. All morally sensitive persons seem to accept the platitudes, even if they may disagree when it comes to sophisticated conceptions of morality.

Thus, one may argue that platitudes define morality. In particular, Michael Smith (1994, 39ff.) has stated that there are different kinds of platitude "surrounding our moral concepts." Some indicate that moral judgement is above all practical. There are platitudes that give support to our idea of the objectivity of moral judgement. Others tell us about the supervenience of the moral on the natural. Others still deal with the substance of morality, as by urging a concern and respect for the person. And then there are platitudes that deal with procedure, such as reflective equilibrium. In sum:

> There is in fact a rich set of platitudes about rightness that those who want simply to fix the reference of rightness by some minimal reference-fixing description simply fail to take into account. (Ibid., 32)

Controversies among moral theories first surface when one tries to convert the platitudes into abstract, precise, and content-rich intellectual structures. Let me add that consensus on the precise consequences of platitudes is defeasible. I have previously called this a *prima facie* consensus. It may also be called a *pro tanto* consensus (cf. Peczenik 1998b, 55.2).

There are vague platitudes that define morality in general. Others, slightly less vague, define our morality in Western society; among these we have the platitudes about human rights. The core of human rights is perhaps universal but at the same time allows for historically evolving modifications. A good question is whether the universal core amounts to something more than platitudes.

In law, one can perceive platitudes behind moral theories as "normative patterns" competing with one another. This, I think, is the only way to understand the theory of normative patterns, a theory recently set out by Anna Christensen (2000, 285ff.). She discusses three such patterns, namely, established position, justice, and the "market-functional" pattern. It is easy to see that the established-position pattern echoes theories of entitlement (such as Nozick's) and that the "market-functional" pattern echoes the law-and-economics theory. What is interesting is that Christensen, a professor of law, does not bother very much to go into the intellectual subtleties of these theories, but simply uses the platitudes. Jurists obviously need these platitudes to understand what is going on in the law.

There exists a considerable consensus among people on moral platitudes and perhaps also on some cases. This consensus is clear within Western culture, but one may suspect that it also exists in other mature cultures. Thus, *A* may be more or less widely considered a morally good person if she has a disposition

- not to harm others;
- to help others;
- to tell the truth;
- to keep promises;
- to work efficiently; and
- to show courage (cf. Peczenik 1989, 58).

Such platitudes are in a sense obvious. But they may also be supported by reasons. We can argue for them by giving particular examples of good actions as well as by using big moral theories. For instance, when arguing in favour of the first two criteria (not harming others and helping them), we can adduce examples of saints, but we can also use a utilitarian moral theory. When argu-

ing for the next two (telling the truth and keeping promises), we can adduce examples of particularly honest persons, but we can also use a Kantian moral theory. When arguing for the last two criteria (working efficiently and showing courage), we can adduce examples of great scientists and heroes, but we can also invoke a perfectionist moral theory.[5] One can also envisage cultural progress as the main principle of justification in the law (cf. Peczenik 1983, 116ff.).

In sum, platitudes are more stable than particular judgments and big theories alike. And their stability becomes even greater when one can link them to particular judgments and big theories. A web of platitudes is more stable than the same platitudes considered singly. In other words, a reflective equilibrium among platitudes is more stable than any one platitude alone.

5.2.3. The Philosophy of Platitudes for Legal Doctrine

Inductivism is too rigid for legal doctrine. To be sure, legal doctrine is rife with examples of statutory provisions and other norms of established law generalized by way of the so-called "legal induction." But while "regular" induction leads to theories or hypotheses on preexistent facts, legal induction (and legal reasoning *ex analogia*) often leads from one norm to the creation of a new norm. Juristic theories do not merely reflect enacted statutes and past decisions passively. Rather, there is a mutual influence going on between juristic theories and specific legal rules in a reflective equilibrium centred on legal sources and on some platitudes.

It is also doubtful whether legal doctrine consists of testing falsifiable hypotheses in Popper's spirit, since it is not clear what observational data these hypotheses would explain. Nor is it clear what the term "falsify" means in legal doctrine. Especially so when one considers that legal doctrine contains normative and fused statements. No doubt, honest researchers in legal doctrine are Popper-minded, in the sense that they try to adjust their theories to social realities, not least to statutes and legal practice. But the adjustment is

[5] On perfectionism, see Hurka 1993. Legal doctrine is not committed to Hurka's strong philosophical statements, such as his idea that perfection is connected with human essence (cf. ibid., 23ff.). It suffices to state that humans have a passion for perfection, a component of the human passion for reason. But some of Hurka's statements fall in with the commonsense ideas mirrored in legal doctrine. For example (ibid., 55): "Perhaps perfectionist ideas will serve best in a pluralist morality, where they are weighed against claims about utility or rights." Hurka's main problem is reconciling perfectionism—which on the "maximax" principle apparently privileges the elite—with the egalitarianism of Rawls' maximin criterion (cf. ibid., 75, 83ff.). "The egalitarian tendency of diminishing marginal utility competes against the fact of (somewhat) differing abilities and the support it gives to (some) inequality. To reach a final perfectionist position, we must somehow balance these opposing claims" (ibid., 173). Thus, Hurka hopes to defend "perfectionism with strong but defeasible tendency to favour material equality" (ibid., 189).

often a matter of subtle reinterpretation rather than replacing one theory with another to account for a crucial counterexample.

The most important lesson a law theorist receives from Kuhn's theory of paradigms is the insight that normative and conventional components are by no means specific to legal research. This is important because many critics of legal research have claimed that these components make it unscientific. One can thus find analogies between matrices (and between paradigms) in natural science and legal research. According to Aulis Aarnio (e.g., 1984, 25ff.), the matrix of legal doctrine, in a modified Kuhnian sense, consists of four components as follows:

- a set of philosophical background presuppositions, among which the assumption that legal reasoning is based on valid law;
- presuppositions on the sources of law (one assumes here that some of these presuppositions are either binding or at least that they constitute authority reasons);
- presuppositions on legal method (one assumes here that legal reasoning is and should be governed by methodological norms); and
- a set of values, most importantly in what concerns the certainty of the law (legal certainty) and justice.

Each paradigm of legal doctrine contains a particular interpretation of the matrix.[6] Legal doctrine in different historical periods and societies is underpinned by different sets of assumptions on valid law, legal sources, legal method, legal certainty, etc. But all legal reasoning is based on presuppositions of the kind just mentioned.

"Paradigms" sometimes tend to coexist in legal doctrine, in contrast to the paradigms of natural science, each replacing the previous sequentially in time. Some of the achievements of legal doctrine have been imitated by almost all jurists, but their content is rather limited, by no means comparable to the leading theories of natural science. By way of example, one may cite Savigny's theory of the four methods of statutory interpretation. This theory stands in the background of all writings of this kind in continental Europe, and perhaps even beyond that. But the theory is not followed in all respects. On the contrary, subsequent scholars have paraphrased Savigny freely, sometimes putting in more arguments, directives, and methods than Savigny, and sometimes weighing the methods differently, for example (cf. Wróblewski 1959, 143ff.; McCormick and Summers 1991, 464ff.).

One can also view legal doctrine in the light of a properly adjusted theory of research programs. To achieve this adaptation, I will assume that observa-

[6] On the description of various paradigms in legal research, see Dalberg-Larsen 1977, 513ff.

tional data has its analogue in the following kinds of entities relevant for legal research:

- legal rules—as set forth in statutes and other sources of law—authoritatively recognized in the legal system;
- moral norms (mostly principles) and value statements commonly endorsed within the community;
- sociological and other data about the community; etc.

A scientist tries to interpret observational data as mutually consistent and coherent with the "hard core" of the assumed theory. Analogously, a legal researcher tries to interpret established legal norms and *pro tanto* moral statements as mutually consistent and coherent with the core assumptions of legal doctrine of her time. These core assumptions determine the research program advanced in legal doctrine. A research program is fruitful ("progressive") if it continues to produce coherent theories accounting for increasingly established legal norms and moral statements. It is also progressive if the subsequent theory in the series explains and does away with more anomalies than its predecessor. An anomaly is either a logical inconsistency within a cluster of legal data or another kind of incoherence within this cluster, such as pointless norms not justifiable by general principles. A degenerative legal research program is no longer able to produce such new theories or to eliminate the anomalies.

Last but not least, the idea that the "morals of parables" can be true and epistemically stable is quite useful for our project of making sense of legal doctrine. Legal doctrine consists of midlevel theories, and these appear to be more stable than all-inclusive principles and moral theories. Midlevel theories of legal doctrine are seldom fully accurate. Yet they lie at the core of legal justification. They may be conceived of as "background theories" brought into a wide equilibrium along with inclusive moral theories and particular moral and legal intuitions. They are justifiable downwards by particular intuitions and upwards by inclusive moral theories. At the same time, by virtue of the same reflective equilibrium, midlevel theories take an active role, justifying (in addition to being justified by) particular intuitions and inclusive theories alike. Midlevel theories are such in several respects: Their extension is lesser than that of philosophical theories and their level of abstraction lower, as is their position in the logical hierarchy of theories. Hence they may very well follow from one of the comprehensive and abstract philosophies. They are, however, less controversial than these philosophies.

Each such theory is centred on some platitudes.

Consider the example of negligence. The wrongdoer should be liable for negligent acts; negligence is blameworthy; the wrongdoer is blamed for carelessness because a normally careful person—a bonus *paterfamilias*, for exam-

ple—would take more precautions. The estimate of what is normal is in turn based on frequency, social expectations, and moral intuitions. But on the law-and-economics theory, the defendant's conduct shall be deemed negligent if this judgment generally promotes economic efficiency. On another theory, the defendant will be deemed negligent if found to have created an unacceptable uncertainty for the accident victim (Dahlman 2000, 58ff.). According to a meta-rule recently presented to interpret some Swedish cases, each of these theories prevails in a certain area of the law (ibid., 106ff., especially 137). The problem is that this conception is controversial, as are all such conceptions. The theorists quarrel, and yet there is something stable behind their disagreement. Thus, what is stable in the doctrine of torts is the platitude, "The wrongdoer should be liable for negligent acts." This platitude seems to be an object of overlapping consensus among jurists.

The *bonus paterfamilias* standard of normality is somewhat more precise than this platitude, but it certainly is not very precise. It is stable and has been repeated in the course of two thousand years by the advocates of moral views quite different from one another. It also has been criticized, to be sure: Generation after generation, critically minded jurists have quipped about a *prima ballerina* who should be required to dance like a *bonus paterfamilias*, for example. Yet there is after all something reasonable in this standard, regardless of the moral theory from which one advances the criticism.

The law-and-economics theory is much more precise but much less stable. Its main advocate, Richard Posner, has drawn a following, it is true, but found nothing like an uncontested acceptance. I would venture to guess that the theory will be modified, completed with a number of exceptions and more or less ad hoc supplements. It is destined to be replaced by another theory. This seems to be the destiny of all scientific theories. Indeed, any competing theory whose precision is comparable to the law-and-economics theory would be equally unstable. What, then, is stable? The answer in general is "platitudes." Tuori (2002) would perhaps say that platitudes are part of the deep structure of law.

5.2.4. Reflective Equilibrium and Society-Centred Morality

Finally, there is the problem whether this theory of reflective equilibrium in legal doctrine coheres with the theory of society-centred morality set out in Section 4.5. In his society-centred theory of morality, Copp (1995, 56ff.) disagrees with the theory of wide reflective equilibrium. His main argument is that equilibrium may depend on an individual's "psychological contingencies." One can wonder whether this is a fatal objection. An individual seeking to bring her beliefs, preferences, and modes of reasoning into a wide reflective equilibrium has—within this equilibrium—the means with which to eliminate some of her psychological contingencies. The main purpose of re-

flecting on one's views is just this. My original views are perhaps partly irrational, but reflection may reduce this irrationality. Some of my original views are perhaps in conflict with the moral code in place in my society. Reflection will help me understand that this is the case; my initial interpretation of my society's moral code may then appear irrational to me; reflection will help me adjust my interpretation of this code to my views of rationality. I am both rational and social. All my views are revisable on the basis of social codes as well as on the basis of rationality.

The theory of society-centred morality and the theory of wide reflective equilibrium are both intuitively convincing. They should be reconciled. One way to do this is by understanding the theory of society-centred morality as an ontological theory that says what morality is. At the same time, one can understand the theory of wide reflective equilibrium as an epistemological theory telling us how one can obtain knowledge of society's moral code. Can philosophers work out such reconciliation in detail? Let us hope so.

5.3. The Coherence of Legal Knowledge

5.3.1. Aspects of Coherence in Legal Doctrine

Unfortunately, the term "reflective equilibrium" is going to need some clarification.

> The term "reflective equilibrium" is used to describe a state in which a thinker has achieved a mutually coherent set of ethical principles, particular moral judgments, and background beliefs. But how people do and should reach reflective equilibrium has remained poorly specified. (Thagard 2000, 126)

That is the specification the coherence theory proceeds upon. Legal doctrine produces coherence in the law in several ways. At a high level of abstraction, one may say that argumentation in legal doctrine is a compound of knowledge, morality, and justice. Legal doctrine aims at coherence among all these aspects. At a lower level of abstraction, one may add the following.

- First, legal doctrine uses such traditional means as argumentation *per analogiam*, *e contrario*, and *a fortiori*, and the analysis of the purpose of law. Using these tools typically increases coherence in the law. In modern society there are also some more-particular reasons for having a coherent justification of legal decisions and opinions (cf. Bergholtz 1987, 352ff.). Parties in litigation and citizens in general do not have blind faith in the lawgiver or in decision-makers: They want to know why the decisions are as they are. Moreover, a coherent justification of legal norms and interpretation facilitates social control over lawmaking and law-implementing institutions, and this is an important requirement of democracy.

- Second, legal doctrine uses interrelated concepts, such that the meaning of a concept is often dependent on the meaning of other legal concepts.
- Third, legal doctrine presents the law as a systematic whole; the order of presentation of the parts of the law is predetermined by the relations that hold between such concepts.
- Fourth, legal doctrine presents legal rules under the umbrella of principles and goals that explain and justify legal rules.
- The fifth aspect is unity over time. Legal doctrine presents the law as evolving piecemeal: All parts of the law may change, but not all of them at once.
- Finally, there is the unity of legal validity (this unity reaches considerable sophistication in Kelsen's pure theory of law).

The third aspect is systematization. Savigny stated that legal doctrine is historical and philosophical (Savigny 1993, 30). It is philosophical due to its use of the concept of system (ibid., 32). It integrates exegetical and systematic elements (ibid., 35). As to systematic elements, Savigny stated what follows:

> I place the essence of the systematic method in the recognition and presentation of the inner connection or resemblance, by which the particular legal concepts and legal rules are unified into a big whole. Such resemblances are originally often concealed and their discovery will enrich our insight. (Savigny 1840, xxxvi; my translation)[7]

The fourth aspect of coherence in legal doctrine is that of the overarching principles of law. Thus, on Neil MacCormick's conception of normative coherence in the law, some principles support a number of legal rules, and hence make them coherent (MacCormick 1984, 235ff.; cf. MacCormick 1978, 152ff.). Ronald Dworkin's theory of the "integrity" (or coherence) of law includes an idea similar to MacCormick's idea that principles make rules coherent. Dworkin (1977, 87) thus

> condemns the practice of making decisions that seem right in isolation, but cannot be brought within some comprehensive theory of general principles and policies that is consistent with other decisions also thought right.

The fifth aspect is unity over time. This is one of Dworkin's points. He compares a lawyer to a novelist writing a "chain novel" seriatim. Each novelist, and each lawyer, aims to make her additions coherent not only with general principles but also with all the material she has been given, with the predictions of what her successors will want to or will be able to add, and with her substantive

[7] "Ich setze das Wesen der systematischen Methode in die Erkenntnis und Darstellung des inneren Zusammenhangs oder der Verwandtschaft, wodurch die einzelnen Rechtsbegriffe und Rechtsregeln zu einer großen Einheit verbunden werden. Solche Verwandtschaften nun sind erstlich oft verborgen, und ihre Entdeckung wird dann unsre Einsicht bereichern."

value judgments (Dworkin 1986, 225ff.). In Dworkin's opinion, judges should apply the "constructive model"; that is, they must accept precedents "as specifications for a principle that he must construct, out of a sense of responsibility for consistency with what has gone before" (Dworkin 1977, 161).

Another aspect is the unity of legal validity. Kelsen's view is that lawyers presuppose the *Grundnorm*: Laws inherit validity from the legally valid constitution. Lawyers, then, take for granted, on the basis of the *Grundnorm*, that the constitution is valid—that it ought to be obeyed (cf. Kelsen 1960, 203ff.). This *Grundnorm* brings into unity a variety of norms, thereby making determinate all the norms that belong to this legal order (cf. Kelsen 1960, 197). The *Grundnorm* is open to many interpretations, it is true, but the simple point here is that the postulate of the unity of the law is important to lawyers.

In sum, legal doctrine aims at presenting the law as a web of theories, principles, rules, meta-rules, and exceptions exhibiting different levels of abstraction and connected by means of support relations. Legal doctrine typically aims at obtaining a coherent totality, one that is relatively stable over time.

Let it be noted, too, that Robert Summers (in several works: cf. Summers 1995) has worked out a theory of the formality of the law that seems to have much in common with coherence. Law is formal because it is a functional unit. Form is its purposive systematization. The law is formal in several senses. In particular, it has its own structure, procedure, and methodology. The law as a functional unit requires rules but goes beyond rules. It gives us means, but it also determines some of our goals. The rule of law is one such goal.

5.3.2. Foundationalism, Scepticism, and Coherentism

As stated previously, the main topic of this volume is the question of legal knowledge. Legal doctrine contains normative elements and yet advances a claim to knowledge of the law. Let me now enter into more-abstract problems where coherence and knowledge intersect.

Epistemology has developed three competing views of knowledge: foundationalism, scepticism, and coherentism. Foundationalism holds that all knowledge ultimately rests on evident and basic beliefs (cf. Chisholm 1966, 30ff.). These basic beliefs can be of several types. Empiricists hold that basic beliefs exhibit knowledge initially gained through the senses or by introspection. Rationalists hold that at least some basic beliefs are the result of rational intuition. But foundationalism has been called into question. The alleged foundations are not certain. Each alleged basic belief may be defeated by contrary evidence.

Another alternative is scepticism. A sceptic would thus doubt all knowledge. A nihilist is an extreme sceptic who simply says that there is no knowledge at all. Nihilism is not an attractive project.

Most present-day epistemology is centred on the controversy between foundationalism and coherentism. In contrast to foundationalism, coherentism claims that every belief derives some of its justification from other beliefs. Beliefs are mutually reinforcing. Coherentism is linked to defeasibility. We can call each belief into question, but not all beliefs at once.

Coherentism is inescapable in moral theory, at least at the meta-level. It is possible that the best moral theory is foundationalist in its internal structure, as utilitarianism seems to be. But in choosing a moral theory—for example, utilitarianism as against a Kantian or an Aristotelian position—we must be coherentist. As soon as this choice is questioned, we must list and weigh pros and cons. There is no foundationalist meta-theory for this weighing. A choice of theory can be justified only by recourse to the chooser's total system of beliefs, preferences, and reasonings.

The main problem for coherence theory is how to explain the special status of data—of empirical observations in the first place. Difficulties with data lead to intermediate positions between foundationalism and coherentism, such as Susan Haack's foundherentism (cf. Haack 1993, 19ff. and 203ff).

> Unlike foundationalism, it should not make relations of evidential support exclusively one-directional, but should allow for pervasive mutual support; unlike coherentism, it should allow the relevance of the subject's experience for the justification of his empirical beliefs. (Haack 1998, 85)

Just as a possible filling-in of a blank space in a crossword puzzle can be supported by its consonance with the clues to it as well as by its agreement with other, already filled-in spaces, so a belief can be supported either by its consonance with experiential evidence or by its agreement with other beliefs.

Experiential evidence consists, not of propositions, but of perceptual interactions. It contributes to knowledge, not in virtue of logical relations among propositions, but in virtue of connections between words and world set up in language-learning. In other words, Haack's theory assumes a leap from (non-propositional) experiential evidence to coherent system of propositions.

5.3.3. Conceptions of Coherence

Philosophers usually tell us that coherence is a triad of logical consistency, cohesion, and comprehensiveness (Alexy 1998, 41).

Among the general conceptions of coherence there is Laurence BonJour's, which can be summarized as follows (Bender 1989, 5, referring to BonJour 1985, 9, 10, 92, 102–3, 106, 116, 123–4, 141, 151–4, 170, 191).[8] A system of beliefs is a justification-conferring coherent system iff:

[8] BonJour's theory of coherence is very attractive but somewhat unclear, since he writes of a unified system with unexplained anomalies.

(i) It is logically consistent;
(ii) it exhibits a high degree of probabilistic consistency;
(iii) it exhibits a significant number of relatively strong inferential connections among component beliefs;
(iv) it is relatively unified, i.e., it does not split into relatively unconnected subsystems;
(v) it contains few unexplained anomalies;
(vi) it sets out a relatively stable worldview that remains coherent—satisfying (i) through (v)—in the long run; and
(vii) it satisfies the observation requirement, meaning it must contain laws attributing a high degree of reliability to a reasonable variety of cognitively spontaneous beliefs, including introspective beliefs.

Requirements (i) through (ii) concern consistency, requirements (iii) through (v) cohesiveness, and requirement (vi) diachronic coherence.

Consistency is a logical concept. There also exist convincing logical theories of comprehensiveness (see Hage 2004). But the concept of cohesion is not entirely clarified. It has something to do with the idea that statements belonging to a coherent totality must have the support of other statements within this totality. Some philosophers have attempted a general theory of support or cohesiveness. Others (e.g., Hage 2004) are sceptical about these general ideas and regard cohesiveness as domain-dependent. In other words, they state that each coherent theory has its own standards of cohesiveness.

Though the basic idea of coherence is plausible, philosophers quarrel when attempting a precise theory of coherence. One can thus equate coherence with:

- the consistency of a system, plus the fact that every judgment in the system is entailed by the rest of the system (Bracker 2000, 28, 31; Blanshard 1939, 270–1; Ewing 1934, 229ff.);
- the simplicity of a system, meaning short, conservative leaps and no unexplained cases (Bracker 2000, 49ff.; Quine 1960, 17ff.);
- inferability from maximal consistent subsets within the system (e.g., Rescher 1973, 78ff.);
- the reasonableness of the total system of beliefs, preferences, and reasonings (Lehrer 1990, 115ff.);
- reflective equilibrium among reasons, plus comprehensiveness and simplicity of the system (Bracker 2000, 82ff.; Rawls 1971, 19ff.);
- narrative coherence, on any interpretation of it (e.g., Jackson 1988, 58ff.; Bracker 2000, 128ff.); or
- constraints-satisfaction (Thagard 2000, 15ff.).

Paul Thagard has developed a theory of coherence as constraints-satisfaction. Two statements, *p* and *q*, cohere with each other when one explains the other;

when they jointly explain a third statement; or when they display an analogy in their explanatory power. Coherence relations include explanation, deduction, similarity, and association. He thus takes up at least six different kinds of coherence—explanatory, analogical, deductive, perceptual, conceptual, and deliberative—each requiring different kinds of elements and constraints. If two elements cohere, there is a positive constraint between them. A positive constraint between two elements can be satisfied by either accepting or rejecting both elements. Epistemic coherence is a composite of five kinds of coherence, each with its own kinds of elements and constraints. Thagard's theory of explanatory coherence is informally stated in the following principles:

Principle E1. Symmetry. Explanatory coherence is a symmetric relation, unlike, say, conditional probability. That is, two propositions *p* and *q* cohere with each other equally.
Principle E2. Explanation. (a) A hypothesis coheres with what it explains, which can either be evidence or another hypothesis. (b) Hypotheses that together explain some other proposition cohere with each other. (c) The more hypotheses it takes to explain something, the lower the degree of coherence.
Principle E3. Analogy. Similar hypotheses that explain similar pieces of evidence cohere.
Principle E4. Data Priority. Propositions that describe the results of observations have a degree of acceptability on their own.
Principle E5. Contradiction. Contradictory propositions are incoherent with each other.
Principle E6. Competition. If *p* and *q* both explain a proposition, and if *p* and *q* are not explanatorily connected, then *p* and *q* are incoherent with each other (*p* and *q* are explanatorily connected if one explains the other or if together they explain something.)
Principle E7. Acceptance. The acceptability of a proposition in a system of propositions depends on its coherence with them. (Thagard 2000, 43)

Despite Principle E4, Thagard faces the "isolation objection." Haack's theory is more convincing because it links theories to non-propositional experiential evidence.

The idea of coherence leads to epistemic conservatism. Wlodek Rabinowicz (1998, 17) puts it as follows:

Suppose we discover that our system of beliefs is internally incoherent; or suppose we acquire a new belief that does not cohere with what we have believed before. It is here that the principle of conservatism comes in: A smaller modification is to be preferred to a larger one. Thus, conservatism is a principle of minimal change.

One can wonder why it is so. A simple explanation is that we prefer a smaller modification of the original beliefs to a larger one simply because ex ante these are our beliefs; rejecting them would mean rejecting what we ex ante consider to be true.

This philosophy may appear too conservative but is not. It tells us nothing at all about the extent of the modifications needed to adjust the belief system to new data. This depends solely on how extensive the input of new data is. Moreover, the principle of minimal change may be so adjusted as to allow us to prefer a bigger modification of the belief system to a smaller one if we hope by this means (with the system so modified) to explain more data than we ex-

pect to gather in the future. In this case, a bigger modification of the present belief system is reasonable because it leads to a smaller modification of what is expected to be the future belief system. Scientists often expect that a more coherent theory will thus explain more future data than a less coherent theory. This problem is well known in the philosophy of science, especially in the context of Popper's, Kuhn's, and Lakatos's theories.

From a "consumer's" standpoint, I think there should be some common core for all these theories. Law theorists would like to have such a core theory. But none have so far been forthcoming in any explicit form.

5.3.4. A Complex Web of Big Circles

The biggest problem of coherentist justification is its circularity. If nothing stands as an unshakable foundation of knowledge and everything is open to doubt, I will need reasons to back up my reasons, and so on ad infinitum. A coherentist cannot avoid this infinite regress without accepting circularity.

The problem of the circularity of justification—though formulated at its most general in the theory of coherence—is well known in other contexts as well, for instance, in the theory of science and in hermeneutics.

In the philosophy of science one meets the idea of a "theory circle": A theory is judged in view of data, and data in view of a theory. Perhaps "circle" is not the best word choice for what goes on in this moving back and forth. People do not literally justify *p* with *q* and *q* with *p*. At least they do not do so at the same time, but rather in the course of a justificatory "spiral": $Data_1$ justifies $Theory_1$, which justifies $Data_2$; $Data_2$ in turn justifies $Theory_2$, which justifies $Data_3$; and so on. The description of $Data_2$ thus presupposes theoretical terms with regard to $Theory_1$ but not with regard to $Theory_2$ (cf. Kutschera 1972, vol. 1, 258).

An important problem is that of classifying elements within the theory circle. In natural science, we can always make the conceptual distinction between data and theory. In many humanistic theories, we cannot say clearly which propositions report observational data and which express theories. Stegmüller (1975, 84–5; cf. Aarnio 1979, 154–5) regards this property as an explication of the so-called hermeneutical circle, typically characterized as follows:

> The whole of a cultural product (be it literary or philosophical opus, or the entire work of a thinker or a period) can be only understood if one understands its component parts, while these parts in their turn can be understood only by understanding the whole.

Hermeneutical philosophy has attracted many jurists. Some have even regarded hermeneutics as an alternative to the "positivistic criterion of science" (cf. Berndt and Doublet 1998, 161ff.). I will merely note here, without going into the discussion, the parallel between the idea of reflective equilibrium and that of hermeneutical circle.

In general, a coherent system of acceptances, preferences, and reasonings is like a network of argumentative circles, most of them quite big. A chain of arguments will sooner or later bite its own tail, metaphorically speaking, and hence may be represented as a circle. In a chain of this kind, p_1 supports p_2, p_2 supports p_3, and so on, and p_n supports p_1. "Support" is explicable only as reasonable support: p_2 follows from p_1 only in conjunction with another premise, say r_1. This premise r_1 is reasonable, which implies that it is a member of another such circle.

Circularity is acceptable because the circles are integrated in webs. What is important is the complexity of the web's structure: "Higher complexity of an appropriate kind gives extra safety, makes the circle more robust, less vulnerable to destruction […]. To put it metaphorically: Nets are safer than chains" (Rabinowicz 1998, 18ff.).

5.3.5. Epistemic Coherence, Truth, Knowledge, and Segmented Coherence

One can regard coherence as the main criterion of truth. But this is no reason to speak of truth and coherence as necessarily one and the same thing. A more convincing theory incorporates the idea of coherence into the so-called classical definition of knowledge:

> According to this definition, knowledge consists in true justified belief. More explicitly, the phrase "*X* knows that *A*" […] is equivalent to the conjunction of the three following conditions (a) *X* believes that *A*, (b) *A* is true, and (c) *X*'s belief is (correctly) justified […]. Where can coherence enter into the classical definition of knowledge? The condition (c) is the only suitable place. Thus, we can combine the classical theory of knowledge with a coherence theory of justification. (Wolenski 1998, 25)

We can say that all statements—and hence all normative statements—are justifiable, and that their justification is the same as their membership in a coherent system (cf. Peczenik 1998a and 1998b). More precisely, what is justifiable coheres with the background system of acceptances, reasonings, and preferences (Lehrer 1997, 3).

The background system of beliefs, reasonings, and preferences can be conceived of as an all-embracing theory (cf. Alexy 1998, 42). Coherentism is a kind of holism. Holism has been represented, among others, by Hegel (1999, 19)—"Das Wahre ist das Ganze" (The true is the whole)—and Quine (1953, 42; cf. Quine 1960, 40ff.), "The unit of empirical significance is the whole of science." Davidson's philosophy of language, too, is holistic and assumes that people are mostly right.

But can't a coherent system of acceptances and preferences be false, "isolated from the world"? To understand coherentism, we must keep in mind that neither scepticism in general nor this isolation objection in particular enjoys a privileged status against other beliefs. Coherentism is merely one of sev-

Friedrich Carl von Savigny (1779–1861)

Leon Petrażycki (1867–1931)

Hans Kelsen (1881–1973)

eral competing beliefs. If someone says that my personally justified coherent system of acceptances and preferences is not "objectively" justified, this person will have to outperform the competition provided by my system (cf. Lehrer 1990, 176ff.). Consequently, if I want to argue that I am justified in accepting or preferring *x*, I must appeal to the system of acceptances and preferences I hold to at that time. And if the sceptic wants to convince me that I am wrong, an appeal to the acceptance system I hold with at that time is again all she can make. If what the sceptic accepts is less reasonable than the objection, she loses. The loss means that the acceptance in question is defeated.[9]

But only a Hercules, an Archangel, or another perfect entity could have a coherent theory of everything, and that only if a perfect language were possible. We humans must accept constraints. Segmented reflective equilibrium (which see above) has its counterpart in segmented coherence. It is plausible, within the deep coherentist super-theory, to attempt foundationalist (or quasi-foundationalist) approximative theories. Science in all disciplines is a collection of such theories: These last are fragments, whereas the totality is coherentist rather than foundationalist. A scientific theory claims to be coherent with a certain branch of science. Generally, each fragment of knowledge claims to be coherent with another branch of knowledge. These branches are like islands, they do not form a single continent. The metaphor of bridges echoes "bridging implications." But a better metaphor is ferryboats, not bridges.[10] For a bridge is fixed, it stands where it is. A boat, on the other hand, can find different routes to connect to another island, depending on the (intellectual) weather. Islands are knowledge, boats are philosophy. Philosophy is not fixed. Philosophy has no paradigms. But philosophy links the different parts of knowledge into a coherent whole. It provides the total unifying structure for all of knowledge. It includes many levels: legal, moral, metaethical, epistemological, metaphysical, etc. To have more on this, one can refer to the "multicoherence" theory developed by Paul Thagard (which see above).

In this context, the reader should also consult Giovanni Sartor's analysis in Volume 5 of this Treatise:

> The notion of the status of arguments will be the central element of our argument logic. We shall divide all arguments in certain *discourse* (by a discourse we mean in general any set of arguments) into three classes, according to their status in the discourse, the justified, the defensible, and the overruled ones:
>
> 1. *Justified arguments* have no viable attackers in the discourse.
> 2. *Overruled arguments* are attacked by justified arguments and therefore are deprived of any relevance in the discourse.
> 3. *Defensible arguments* are undecided, since there is an undecided conflict between themselves and their attackers.

[9] Lehrer assumes reasonableness as a primitive concept (Lehrer 1990, 127).

[10] I am grateful to Håkan Gustafsson for this profound insight.

> From our point of view, the status of an argument in a discourse does not depend on the intrinsic qualities of the argument. It rather depends on whether other arguments in the discourse attack the argument [...], and in particular on whether these attackers succeed in defeating that argument. This implies that arguments are defeasible, in a double sense.
>
> First there is *internal defeasibility*, or defeasibility *in a discourse*, that is, relatively to a given set of arguments. An argument $\mathcal{A}$ is defeated in a discourse, when other arguments in the discourse defeat $\mathcal{A}$, relatively to the discourse, and no further arguments in the discourse provide for $\mathcal{A}$'s reinstatement. [...] However, besides internal defeasibility, we also need to consider *external defeasibility*, that is, defeasibility *of a discourse*. What is justified in a discourse D_1 may not be justified in a larger discourse D_2, which is obtained by adding further arguments to D_1: Those further arguments may defeat discourse D_1, in the sense that they undermine some arguments which were justified in D_1. External defeasibility prevents the possibility of ever obtaining safe conclusions. (Sartor, vol. 5 of this Treatise, sec. 27.1.2)

The pursuit of a global coherence of acceptances, preferences, and reasonings is a Sisyphean task—doomed to failure yet inevitable. In this pursuit, a thinker arrives at a conglomerate of interlinked pockets of locally coherent segments. There is nothing in this that is specific to moral or legal thinking. Indeed, that is how humans think in general.

5.3.6. Criteria of Coherence in Legal Doctrine

An interesting research project is to relate Thagard-style constraints to criteria of coherence. Alexy and Peczenik have developed a number of such criteria (cf. Alexy and Peczenik 1990).[11] The more the statements belonging to a given theory approximate a perfect supportive structure, the more the theory will be coherent. Logical consistency—though a necessary condition of perfect coherence at any moment—is not a sufficient condition of coherence. There are additional criteria of coherence. *Ceteris paribus*, a theory's degree of coherence will depend on such factors as

- how many supported statements belong to the theory;
- how complex the webs of supportive reasons are that belong to it;
- how many universal statements belong to it;
- how many general concepts belong to it and how high a degree of generality they exhibit; and
- how many cases and fields of human endeavour the theory covers.

The degree of coherence is determined by a weighing and balancing of these criteria of coherence. But then, How is this weighing and balancing to proceed? The idea of weighing used here is not formal or logic: Weighing is holistic (which see Section 5.1 above). Let me note the following objection:

[11] The presentation here is modified in some respects.

> Such an approach raises many questions, such as how these various criteria of coherence are to be weighed and balanced against each other, and whether it is always the case that the weighing operation will result in a complete ranking of given sets of propositions as either more or less coherent than each other, so that when faced with competing such sets, it is always possible to find the most coherent set of propositions according to the ten criteria. Alexy and Peczenik recognise that weighing and balancing the criteria of coherence will be a complex matter, but appear to assume that it will always be possible to establish which is the most coherent of rival sets of propositions. (Dickson 2001)

Will that always be possible? I do not venture to answer the question. But we human beings must try to establish the most coherent theory. This may be a Sisyphean task, to be sure, but there is no alternative. Human thinking is a quest for coherence.

The criteria of coherence are general, applicable to all coherent theories. This is possible only because these criteria are not precise. They are platitudes of a kind similar to that found in moral theory. Once stated with precision, they dissolve into endless clusters of domain-specific criteria, each cluster applicable to some but not all coherent theories.

As Hage (2004) points out, each coherent theory has its own support standards. A coherent set is in accordance with constraints that are themselves part of the set. The support relations between the elements making up an acceptance set are not defined outside the set, but are part of it. Outside the acceptance set there is only the minimal standard that a good acceptance set satisfy its own standards. Integrated coherentism does specify what mutual support means as a standard of coherence. What counts as mutual support, and also the extent to which such mutual support increases the quality of an acceptance set—these questions the acceptance set will have to work out for itself.

In this perspective, Alexy–Peczenik coherence criteria appear to be a part of the acceptance set of a juristic theory of law rather than a general philosophy of coherence.

5.3.7. Coherence over Time

The law's coherence does not exclude change. It only implies that change must be constrained by certain preexistent and fundamental views, rules, principles, and values.

A legal order, a juristic theory, a moral system, etc., can be justified as coherent in the light of a legitimate tradition. A tradition shows a certain degree of "narrative coherence," which is something like a story. Its present components display many kinds of connections with the past as well as with the expected future.

One can also regard as a tradition the legal culture and the deep structure of the law in Tuori's sense (which see above).

Something of the kind can be found in the theory of science. Kuhn's and

Lakatos's theories of paradigms and research programs elucidate the idea of a stable core that makes the changing science coherent. Paradigms and research programs are scientific traditions.

A tradition can be understood as a transmission of a pattern of thought or action (cf. Rolf 1991, 147). The well-known philosopher of science Michael Polanyi (1962, 54) regards the common law as a classical example of tradition. Any tradition comprises some basic values and patterns of rationality which are taken for granted within the tradition, and which may never (or almost never) be criticized. A tradition is rooted in certain social and political institutions. It determines its own standards of rational argumentation and problem-solving. A living tradition is not static, however—it evolves. Old questions thus find new answers that give rise to new questions. The bearers of a tradition have a latent receptivity to new questions and can develop a new, more profound perspective regarded as closer to the truth.

On *legal* tradition, one can quote the following conclusion by Bańkowski (1991):

> The law is a tradition. Like all traditions law is comprised of beliefs [and] practices [...] which are, or are believed to be, transmitted from the past and which retain authoritative significance in people's current beliefs, practices, etc. (Krygier 1991, 68; cf. Krygier 1986, 237ff.)

Logical consistency is in principle a necessary but insufficient condition of synchronic coherence, but not a necessary condition of *diachronic* coherence. Science, law, culture, etc., change continually. The new may very well be logically inconsistent with the old. The new and the old can still constitute a coherent totality. The cultural heritage can sow the seeds of its own change.

To provide a justification in the light of a tradition is the same as to show that

- we all have already accepted, through our way of life, the core of a certain cultural tradition;
- this tradition carries within it "second-order traditions" able to support their own change as well as the change of other components in the tradition; and
- there has been an optimization in the sense that diachronic coherence has been maximized.

A coherentist justification can thus be based on a tradition, theory, or system of norms in process, that is, subject to continuing change. The following examples elucidate this idea.

Theses about valid law can almost always be supported by a legal norm that has been valid for some time. This kind of support creates an inner coherence for the legal system. This is so even if the previously valid norm has already lost its validity. An old constitution can, for example, decide how the new constitu-

tion, perhaps a radically different one, may be enacted. Secondary legal rules, as analysed by Herbert Hart (cf. Hart 1961, 92ff.), are a good example. While primary rules determine the actions that individuals shall or may perform, secondary rules decide how primary rules come into existence and how they change (see also Luhmann 1993, 109–10). In contrast, Luhmann (ibid.) argues that a "temporal theory of validity" should be adopted instead of the classical, hierarchical theories of validity. He proposes that legal theory "switch from hierarchy to time." Luhmann's proposal may be fruitful in his sociological theory of law, but not in a legal theory that adopts the lawyers' internal point of view. Hierarchical theories of validity should not be rejected, but made complete with a theory of defeasibility and with a temporal theory. The defeasible hierarchical structure of law is an empirically stated institutional fact.

Legal source rules, argumentation rules, and collision rules, too, are an example of coherence-creating norms. A reinterpretation of valid law and creative judicial decision-making are thus based on established rules and methodological principles.

Improvement (*Weiterentwicklung*) of the law by analogy and precedent is based on essential similarities between (actual or hypothetical) cases. The judgment of essentiality must be rooted in the legal tradition of the society concerned. At the same time, however, the improvement may lead to a change in the legal tradition.

5.4. Coherence and Justice in Law

5.4.1. Coherence in Practices and Norms, Not Only in Knowledge

On the face of it, the structure of justice calls to mind the structure of explanation: Both require coherence. This parallelism between cognitive explanation and normative justice is the key idea in Peczenik 1966.

Juristic theories have explanatory force, that is, they promote the coherent understanding of the law. At the same time, they promote justice. This explanatory and justificatory force is possible because these theories reveal various—often overlapping—resemblances among cases. Also, Thagard's idea of multicoherence is applicable to coherence in ethical thinking (Thagard 2000, 161–2). Thus, ethical conclusions are reached by roughly maximizing the satisfaction of the deductive, explanatory, deliberative, and analogical constraints that make it possible to handle the complexity of moral reasoning. Thagard's normative conclusion is that there are "three reasons for considering emotional coherence as being prescriptive as well as descriptive of trust" (ibid., 214). First, the standard models of rationality have little application to real life. Second, emotions cannot—psychologically—be removed from decisions. Third, people do not want to cut "their analytical decision making off from crucial emotional information about what really matters" to them.

But does this surface similarity of justice and coherence bespeak a profound similarity? The basic question here is, If coherence is the key notion of epistemology, how well does it fit in with the normative component of legal interpretation? In other words, Why should practices and norms, too, rather than just knowledge, be coherent? There is a lot that needs to be said to answer this question. Here I will make only the following remarks.

- There is a normative dimension to coherence.
- Coherence has greater affinity with goodness than with evil (Fuller 1986, 91).
- Human practices are open to criticism. We can ask for a justification of practices, asking for reasons that support them. But once we have these reasons, we are faced with the problem of reasons for reasons—we get trapped into the epistemological problem of coherent webs of reasons.
- In particular, a people's respect for the rule of law can be expressed by the postulate that a legal system must exhibit, and be interpreted as exhibiting, a relatively high degree of coherence as a normative system (MacCormick and Summers 1991, 535).
- The law should be just. This is a platitude around which theorists have developed various analytical and normative theories, for example, the theory that the connection between law and justice is a priori.

The role of coherence in considerations of justice is a special case of the problem of coherence in practical reasoning. Let me quote Giovanni Sartor:

> By using reasoning in the ways we have described, rational agents may build what we may call *practical theories*. By a *practical theory* we mean a set of cognitive states that the agent uses to guide its behaviour. Such a theory can include conative states (likings, desires, intentions, and wants), their doxified reformulation, and the epistemic beliefs that are relevant to the adoption of conative states (beliefs concerning, for example, causal connections between one's actions and the realisation of what one likes, conditions for applying a plan's instructions, and so on).
>
> A practical theory is a dynamical construct, which may change when new perceptual inputs are provided to the reasoner. It may also change when new inputs are provided by the agent's conative dispositions. Finally, changes may also be prompted by reasoning (and in particular, as we have seen, by the process of rationalisation).
>
> This leads us to a further issue: How can one choose among different alternative ways of changing the practical theory one is endorsing? For making this choice one needs to consider that each element in one's theory may interfere in various ways with other elements. The function of each element needs to be appreciated from a holistic perspective: It depends on the global cognitive functionality of a theory containing that element as compared to the functionality of a theory not comprising it. (Sartor, vol. 5 of this Treatise, sec. 4.1.4)

5.4.2. Justice as the Weighing of All Considerations

All lawyers would accept the maxim that like cases should be treated alike. But there are many criteria of likeness. Chaim Perelman (1963, 6–7) defined abstract or formal justice as a principle of action by which everyone belonging to the same essential category should be treated alike. There are many essential categories. Thus, one may think it just to distribute goods equally to everyone, or according to each person's merits (or desert), work, needs, rank, or legal entitlement.

Perelman's theory has since been supplemented with more-detailed classifications (cf. Lucas 1980, 164–5). Thus, a distinction can be made between merit and desert. Merit is bound up with a person's qualities; desert, with her action. More specifically, desert is bound up with one's contribution or effort, or to the costs incurred (see Lamont 2002). A comment is necessary here on desert. There is an ancient tradition whereby justice consists in giving people what they deserve. Desert has recently been undermined or completely dismissed by liberal orthodoxy, to be sure, but it still is central to the sense of justice of ordinary people[12] and—I will add—to the tradition of legal doctrine.

Justice weighs all considerations. Thus, Nils Jansen (1998, 161) has worked out the following "formal conception of justice": "Just is the result of right weighing of all principles of justice relevant in a situation."[13]

Justice is a complex web of reasons weighed and balanced. Justice seeks to achieve as coherent a system of valuations on deserts, needs, and relations among parties as is possible in a given context.

Complexity and controversiality are inevitable in justice, yet we keep seeking an absolute and certain justice based on reason. This creates a tension. We call justice into doubt as soon as we seek rational grounds for it, yet we invoke these very grounds as soon as someone stresses the relativity of justice (Lucas 1980, 35ff., criticizing Alf Ross).

There are many considerations of justice, and the system of considerations of justice is complex. In brief: *x* and *y* should be treated equally from point of view *a* but unequally from point of view *b*. What, then, are we to do? We need to find a reason, *c*, with which to establish the priority of *a* over *b*. But *c* may itself be called into question, and hence will need the support of *d*. In the end, we will need a complex web of reasons on deserts and needs, on the relations among the parties involved, etc., weighed and balanced. The identification and weighing of reasons of justice may depend on many factors.

[12] Among the theorists who argue against desert are John Rawls, Ronald Dworkin, Thomas Nagel, Brian Barry, Robert Goodin, and Derek Parfit. Pojman (1999, 283ff.) thinks it absurd to disregard desert.

[13] "Gerecht ist das Ergebnis der richtigen Abwägung aller in einer Situation einschlägigen Gerechtigkeitsprinzipien" (my translation).

5.4.3. Different Justice in Different Contexts?

The relative weight of deserts, needs, and corrective justice is different in different parts of the law. Thus, in torts, one must balance such considerations as corrective justice, general deterrence, fair distribution of risks, and the victim's needs. Similar factors certainly play a big role in criminal law. A lot can be said here about the retributive, social-utilitarian, and reformative theories of punishment. In contracts, the principle *pacta sunt servanda* has obvious underpinnings in Kantian autonomy, but then social considerations of needs—such as consumer protection—may dominate. Labour law must treat desert seriously.

But these differences are differences of mixture or assembly, not differences of category. We can trace the same components of justice in all parts of the law, but each time in a different mixture or grouping.

Some authors, noting the complexity of justice, have tried to construct theories assigning categorically different kinds of justice to different, sharply defined types of goods or societies. A sharp demarcation line of this kind is, I believe, an illusion.

Michael Walzer maintains what follows: "Every social good or set of goods constitutes, as it were, a distributive sphere within which only certain criteria and arrangements are appropriate" (Walzer 1983, 10).

There are different spheres of justice, and the principles of justice are each internal to one such distributive sphere. Walzer thus discusses three modes of human relationship and corresponding justice, namely, solidaristic community (justice according to needs), instrumental association (justice according to desert), and citizenship (justice as equality) (cf. Miller 1976, 339ff.; 1999, 21ff.).

But we must also pay attention to "justice across the spheres" (Gutmann 1995, 102–3). Although various material principles of justice can be justified only within a certain circle of people circumscribed by a social framework (community, culture, subculture), someone belonging to one circle may understand and respect viewpoints advanced from within another circle. We can all be in agreement on certain general values, but not on the their relative weight (Aarnio and Peczenik 1996).

Another author who underscores the complexity of justice is Nicholas Rescher. The complexity is great even if we look at distributive fairness only:

> Strongly normative concepts like fairness, justice, and even rationality resist being captured by single uniformly construed model, because it lies in the nature of things that so extensive a concept has to accommodate itself to a great variety of particular situations so that a "one pattern fits all" is not a workable prospect. (Rescher 2002, 43)

The overall situation is deeply pragmatic. Fairness in division itself becomes a process that reflects the aims and purposes that are at issue in the context within which that division is made.

An interesting tension becomes manifest between justice all things considered, on the one hand, and formal justice, on the other. As stated above, formal justice requires that persons belonging to the same essential category be treated alike. Jurists have always hoped that treating like cases alike would make the law predictable and thus fulfil the ideal of the rule of the law. The hope is realistic as long as the criteria of likeness are imposed by the legislator and by precedent-making courts. No sooner does legal doctrine devise its own criteria of likeness—as it must do to make the law coherent—than it faces the problem of multiple criteria. (Ibid., 120)

5.4.4. Procedural Justice?

We cannot fail to mention procedural justice. Jürgen Habermas seeks to ground ethics (and hence justice) on procedure and on discourse conditions. Universally valid norms may emerge from discourse with the participation and acceptance of all those who stand affected by such norms.[14] Thus, according to Habermas's discourse principle, norms of conduct are valid if, and only if, the people who may stand affected by these norms can accept them as the basis on which to take part in an ideal rational discourse. Rational discourse on public matters can only be achieved within the framework of the law. In this framework, the principle of rational discourse becomes the principle of democracy. On this principle, legal norms may lay a claim to legitimate validity only if all consociates under the law would accept them in a perfect discursive lawmaking procedure (see Habermas 1994, 135ff.).[15] In Habermas's "postmetaphysical thinking" (ibid., 83, 87, 127), the same applies to basic rights. These are no longer grounded in religion or metaphysics, but in the political process as such, and ultimately in rational discourse.[16] Habermas thus believes that a perfectly rational procedure of deliberation must return substantively correct and just results.

John Rawls's theory of justice is also based on a procedure. More to the point, we can reach moral conclusions in general, and principles of justice in particular, without abandoning the standpoint of prudential calculus—and so without positing a moral outlook—merely by having each of us singly pursue our own prudential reasoning under certain procedural bargaining and knowledge constraints.

But Habermas's procedural theory is "a total idealization" (Alexy 1994, 232). As such, it is almost empty. Even if it could tell us that the results of perfect discourse must be correct, we do not—and cannot—know the final content the conclusions of perfect debate would have. In brief, a purely proce-

[14] It will be noted in passing that Robert Alexy (cf. 1978, 1985, 1989, 1994) has worked out a much more careful list of discourse rules and principles.

[15] For criticism of Habermas's principle of democracy, see Alexy 1994, 227–38; cf. Peczenik 1995, 69–71, 523.

[16] It follows that Habermas's catalogue of rights accords a priority to basic political rights (those that guarantee the democratic process), ibid., 155, 320, 529.

dural theory can at best give us an unreachable ideal to approximate, but not a standard against which to judge actual differences of opinion.

In contrast, Rawls claims that his theory yields substantive principles of justice, but his claim is notoriously controversial.

Amy Gutmann and Dennis Thompson have thus developed a theory of deliberative democracy (applicable to justice as well) in which procedural principles are supplemented with substantive ones. The principles are "provisional":

> The principles of deliberative democracy are distinctive in two significant respects: They are morally provisional (subject to change through further moral argument); and they are politically provisional (subject to change through further political argument). (Gutmann and Thompson 2000, 167)

All these principles express, in various forms, the idea of reciprocity:

> Reciprocity suggests the aim of seeking agreement on the basis of principles that can be justifiable to others who share the aim of reaching reasonable agreement. (Ibid., 167)

But

> reciprocity is not a principle from which justice is derived, but rather one that governs the ongoing process by which the conditions and content of justice are determined in specific cases. (Ibid., 167)

According to Gutmann and Thompson, a full theory of deliberative democracy includes substantive as well as procedural principles; it denies that either kind is morally neutral, and it judges both kinds from a second-order perspective (ibid., 163).

5.4.5. Justice, Coherence, Law, and Morality

Justice bears a connection with coherence and is ultimately holistic. The idea of coherence is likewise holistic. But there are differences. Weighing is more important when making considerations of justice than when doing coherent theory-construction in other domains. For example, empirical theories, though they must fit into a coherent system of acceptances, preferences, and reasonings, are often expressed in mathematical language. A theory of this kind is foundationalist in its internal structure. In contrast, justice is always a matter of judgment, never a matter of algorithm. Some theories of justice, such as Rawls's, display sophistication and precision, to be sure. But they are clearly less precise and more controversial than mature empirical theories of science.

An even more important difference is this: While one can have an ideal of global coherence or an ideal of a society's law or morality all things consid-

ered, neither a global justice nor even a simultaneous justice for all the members of that society seems to be conceptually possible. What in a society is legal or moral all things considered may prove unjust for an individual.

In this context, I should like to recall and modify the inclusion theses I have presented elsewhere (Peczenik 1989, 238ff.). The socially established law, set out in such sources as statutes, precedents, and *travaux préparatoires*, has a *pro tanto* character. If a *pro tanto* law explicitly contains, implies, or otherwise supports the conclusion that a person has a certain legal duty or right, then this person is bound by a *pro tanto* moral duty or right having the same content. Even deeply immoral provisions belonging to the socially established law are meaningful *pro tanto* moral reasons which are, of course, easy to override by means other than *pro tanto* moral reasons. This is so because the law is morally binding *pro tanto* unless one denies that the whole system of immoral "law" makes up a legal system. In accordance with the classical tradition of natural law, one may make this denial for moral reasons, and in particular for reasons of justice (*lex iniusta non est lex*), but in my opinion the immorality at issue must then be extreme and must systematically underlie the entire system, including its technical provision of private law.

Moreover, all-things-considered law results from interpreting *pro tanto* law in the light of social standards of justice and morality. If someone has an all-things-considered legal right or duty, then she will also have an all-things-considered moral right or duty of the same content. To be sure, this view may be criticized for bringing about a strange, and even an absurd, inversion of natural law, to the effect that illegal morality is not morality. But the flavour of absurdity disappears if one starts reflecting on the expression "all things considered." If an action is all-things-considered illegal, it cannot be all-things-considered moral. "All-things-considered illegal" means that the action is disallowed in the light of a law that (1) crosses the threshold of extreme injustice (for otherwise it is not law) and (2) has been interpreted morally to the extent required by the tradition of legal interpretation. If the action appears moral in the light of some other foundationalist moral theory, that is a problem for this theory to work out. All-things-considered law, that is, optimally interpreted law, is thus a part of all-things-considered morality.

Like morality and the moral interpretation of law, justice requires us to consider "all things," but this always from the standpoint of an individual or at least from that of a certain group. For example, when a Swedish law of 1980 imposed a 102 percent income tax for certain rare situations, an injustice was certainly done to the persons affected, and yet the law was all-things-considered legal and thus all-thing-considered moral, even if paradoxically so. What is unjust to the person affected by the 102 percent tax may arguably be just (or at least fair) from a radically redistributive perspective. To call the legal provision moral was simply to say that a judge was morally more reasonable to apply it than to refuse to do so, for that would undermine the rule of

law. This makes justice local in a sense and implies that there cannot be a universal system of justice. But then, on the other hand, society-centred morality and law are total within the boundaries of a state.

Justice therefore enters into a tension with society-centred morality and law. There is also a tension between commutative/corrective justice and distributive justice (see Chapter 2 above).

Another tension we have is that between equality and perfection: Whereas egalitarians tend to endorse Rawls's maximin principle, perfectionists are fascinated by the maximax principle.

> According to maximax, each agent's overriding goal should be not a sum or average of lifetime value, but the greatest lifetime value of the single most perfect individual or, if perfections are not fully comparable, of the few most perfect individuals. (Hurka 1993, 75)

In our egalitarian culture, perfectionists hesitate to endorse maximax (Hurka does not; ibid., 75ff.). But "there is a constraint on any attempt to reconcile perfectionism with distributive equality" (ibid., 79).

This tension between equality and perfection connects up with the tension between justice and morality. Equality is more important in the context of justice than in other moral contexts.

5.4.6. The Importance of Justice for Judges, Legal Scholars, and Politicians

It follows from this tension that justice is not the supreme value of society and so must in some cases yield to other values. The question now comes up, What is the optimal position of the judge and of legal doctrine with respect to the tension between justice and morality? Should legal scholars ultimately aim at a just interpretation of the law, or should they aim at a moral interpretation of it? And which should the judge ultimately aim at?

Legal scholars must ultimately aim at interpreting the law in light of the common core of society's morality. Legal doctrine cannot retain its identity if it assumes a priority of (what is necessarily a local) justice over the common core of morality. If reversed, this priority would split legal doctrine in two segments. One segment would be a quasi-sociological description of practice; the other, a cluster of mutually inconsistent conclusions as to what is just from the viewpoint of different individuals or groups.

As to judges, a tempting hypothesis is that they should always administer justice within the limits of the law. But then the method of adjudication and the method of legal research would have to be quite different, the former committed to a local coherence of values and the latter to social morality, and hence to a global coherence of values. This difference between the role of justice in juristic doctrine and the role of justice in the courts explains the following difference.

> While the goal of the kind of doctrinal interpretation undertaken by legal scholars is to establish the unity of an entire legal system, the judicial interpretation undertaken by judges is of a far more local variety, as it is concerned merely with the norms applicable to the case in question, and because a coherent interpretation of those norms may decrease their coherence with other legal norms.[17]

But if this is so, how then can legal doctrine come of service in providing guidance to judges in hard cases? The answer to this question is that legal doctrine can give the judge good advice in normal situations; but when a situation deviates from normality, the judge must set aside broad considerations of coherence—delivered by legal doctrine—and pass to local considerations relevant to the case at hand.

A competing hypothesis is that the judge is legally as well as morally obliged to commit injustice in those cases in which justice conflicts with society's global morality. She may thus have to arrive at a decision that discriminates against someone. In a civilized society, the content of established law and of legal method is such that cases of this kind will be quite unlikely. But if the circumstance does arise, the judge has an overriding duty to make that discriminatory decision—a decision deemed unjust to the person concerned. She also has an overriding duty as a citizen to urge the lawgiver to change the law. These two duties do not collide, because they come to bear on two different roles: the role of judge, on the one hand, and that of citizen, on the other. It is perfectly consistent to make a legal decision as a judge and then recommend that the same law be changed.

The most sensible division of labour between the lawgiver, the judge, and the legal scholar may perhaps be something along the following lines. The lawgiver sets down rules for normal cases, but due to changes in society, and to her human imperfection, she must permit *contra legem* interpretation in hard cases. The legal scholar should try to interpret the products of legislation in the most coherent way possible, paying as much attention as possible to the inner coherence of the law as well as to the coherence between law and morality. From her perspective, enacted law is defeasible in that it must be defeated by legal doctrine if found to be incoherent. The hard cases in which enacted law is thus defeated are not normal from the lawgiver's standpoint, but they are normal enough to make such coherent doctrinal interpretation possible. When a particularly hard case comes up, the judge should deviate—in the service of justice—from the normality imposed by the lawgiver as well as from the normality developed in legal doctrine. To sum up, we have three ideals:

- Legal doctrine must strive for an encompassing coherence, within the law as well as between law and morality.
- Adjudication must seek to do justice to the parties within the limits of the

[17] Dickson 2001, setting out accurately the view I myself defend.

law. Judges should aim at coherence, even if this may be a local coherence restricted to narrow parts of the law.
- Political thinking must strive for a flexible adjustment of decision-making to changing public opinion. Politicians need to acknowledge the plurality of moral opinions in society and the plurality of sources of law. When legislating, they must aim at coherence, even if this may be a local coherence restricted to narrow parts of the law.

Can legal doctrine serve judges and politicians? Yes, it can, by delivering the ideal of coherent law, to be taken into account and balanced against the just demands of the parties and against the demands of public opinion.

True enough, our assumption that the law should be coherent for the sake of knowledge and justice can be challenged. A radical jurist may even require that a juristic theory be legitimate in the sense of finding the acceptance of some (not necessarily everyone) in our pluralist society. Since different people accept different things, the most legitimate juristic theory may well be incoherent (cf. Dahlman 2000, 159ff.). This way of thinking makes political legitimacy, not legal knowledge or justice, the ultimate basis of argument. To pursue this path, one must have a normative theory of legitimacy that is normatively as well as epistemologically testable. But no such theory can pass this test unless it is coherent. Thus coherence, thrown out the front door, comes in from the back.

5.5. Coherence and Concepts in Legal Doctrine

5.5.1. Value-Open Legal Concepts and the Nature of Things

The law itself invites considerations of coherence when it uses value-open concepts (cf. Alexy 1980, 190ff.).[18] Legal scholars have value-open concepts of their own that they invent and use. These concepts are essentially contestable (cf. Gallie 1956, 167ff.) and can be accessed via a wide reflective equilibrium between what "the many or the wise" think (cf. Swanton 1992, 7 and 22ff.). Indicated in these concepts are questions that require weighing. Juristic weighing indicates answers.

The value-open concepts of legal doctrine can be characterized as follows:

- They may have a core, but part of their reference lies at the periphery and can be defined only by family resemblance.
- They link legal rules with their social background.
- They make it possible to identify objects by recourse to weighing.

[18] Shifting emphasis, Larenz (1983, 463ff.) uses the term "function-determined concept." The content of such concepts reflects the principles underpinning the legal rules in question.

When interpreting these concepts, a jurist must aim at a reflective equilibrium among various reasons. But, in this, she is less free than a Rawlsian liberal. She may change the tradition of legal interpretation, but only "piecemeal," never radically.

Value-open concepts indicate "family resemblances" (cf. Wittgenstein 1958, § 67): *x* resembles *y* in several respects, *y* resembles *z* in several respects, and so on, and yet it is logically possible that these objects should share no properties.

There is an interesting parallel between these clusters of resemblance, on the one hand, and what Hegel called "concrete concepts" and Larenz "types," on the other.[19] But there is the following shift of emphasis. Whereas all the members of a family *à la* Wittgenstein may have nothing in common, most objects within a "concrete concept" share most of their properties. For example, the concept "human being" is concrete in the sense that there is no single definiens of a human being. What is decisive for being a human is a cluster of different properties, such as sentience, language, and tool-making, and perhaps moral sensitivity. Every human being possesses many such properties.

There are types and subtypes that come together into clusters of types (*Typenreihen*), thus mapping out resemblances and differences between cases. It is important to understand that these resemblances are not always indicated by statutes or decisions. They are often observed in social relations and taken for granted in legal reasoning.[20] Savigny thus conceived the legal system as a sum of legal institutes that are legal and technical as well as factual. Feedback from old institutes within the system gives rise to new institutes.

With an old word used by Savigny, among others, one can call the system of resemblances "organic." Juristic theories thus explore three kinds of unity in the law: the unity of legal rules, the unity of legal institutes, and the unity of the social relations regulated by law. The metaphor of the organism makes sense in view of the fact that social relations evolve continually. The Organic and practical coherence of legal institutes is holistic because each element not only determines the totality, but is determined by it (cf. Brockmöller 1997, 102ff.).

Savigny thus attributed four traits to the legal "organism":

- its unity, as a natural whole;
- the reciprocal connection of its elements;

[19] Larenz and Canaris (1995, 287), say that if we characterize the type "human" as the whole of human possibilities, then humans can be viewed as corporal, mental, and spiritual entities (all three combined) that fulfil themselves in these three dimensions in many ways and acquire new possibilities. ("Typus 'Mensch' in der Fülle aller seiner Möglichkeiten, dann sieht man ihn zugleich als ein leibliches, seelisches und geistiges Wesen, das sich in diesen drei Dimensionen auf mannigfache Weise verwirklicht und sich neue Möglichkeiten erschließt.")

[20] According to Stahl, the law is thus a juristically formed reality. Cf. Wilhelm 1989, 32ff.

- an immanently evolving structure that is part natural, part moral (*sittlich-geistig*);
- an ability to "live its own life" (whatever this metaphor is taken to mean).

Each juristic theory is linked (explicitly or implicitly) to a background knowledge of society. In some theories, this information about social facts cannot be acquired without a systematic and comprehensive view of society, whereas in others the background often consists of particular nuggets of information. Given this context, we can understand why jurists keep going back to the "nature of things."

The idea of the nature of things is coherent with the teleological world picture of Aristotle and Aquinas, among others. In this perspective, the nature of things is the natural purpose of, inter alia, social relationships and legal norms (cf. Dreier 1965, 11ff. and 14ff.). The teleological nature of things resurfaces with Hegel's philosophy, albeit in a new metaphysical context (cf. ibid., 31ff.). In a different way, the idea is coherent with Kant's theory of a priori, where the nature of things becomes what one must assume a priori about social and legal questions, among others (cf. ibid., 25ff.). The nature of things can also be understood by reference to such social facts as elicit in people evaluative responses expressed in normative and evaluative statements (Radbruch 1950, 99).

When jurists refer to the "nature of the things," what they have in mind is the background knowledge of society, without which the knowledge of law would amount to no more than an empty formalism. This background knowledge is contestable and in part tacit. Any effort to make it explicit will lead to controversy. Juristic statements about the nature of things are always unclear, and yet inevitable.[21] The jurist is free to interpret the nature of things in one way or another. But—again—she is less free in this than a Rawlsian liberal.

5.5.2. Intermediate Concepts

Many legal concepts are intermediate concepts that link a set of conditions with a set of consequences. The point of this theory is to couple normative conclusions with descriptive conditions, thereby reconstructing legal material in a concise way.[22] Alf Ross used the following scheme:

[21] Cf. Dreier 1984, 480ff; earlier, Dreier 1965, 125ff. Dreier had his doubts about the expression "the nature of things."

[22] Cf. Ekelöf 1945 and Ross 1951. Wedberg (1951, 246) refers to a lecture entitled "On the Fundamental Notions of Jurisprudence" that he himself delivered at the Uppsala Law Club in 1944. It makes for an interesting research topic to relate such propositions to fused propositions in Svein Eng's sense.

$$\left.\begin{array}{l} F_1 \rightarrow \\ F_2 \rightarrow \\ F_3 \rightarrow \\ \vdots \\ F_p \rightarrow \end{array}\right\} \quad O \rightarrow \quad \left\{\begin{array}{l} C_1 \\ C_2 \\ C_3 \\ \vdots \\ C_n \end{array}\right.$$

Each F_i expresses a possible legal ground on which x can claim ownership of y. Each C_j expresses one of the consequences of x's ownership of y. O (for ownership) merely stands for the systematic connection by which F_1, F_2, F_3, ..., F_p entail the totality of legal consequences C_1, C_2, C_3, ..., C_n. This is expressed by stating, in one series of rules, the facts that create ownership and, in another series, the legal consequences that ownership entails (Ross 1956–1957, 820; English translation of Ross 1951).

Lars Lindahl and Jan Odelstad (2000) have presented an analysis of intermediate concepts that uses an algebraic framework. An important point of their study is that, in many cases, the imperceptible shifting between descriptive and normative speech

> observed by Hume might result from the use of intermediate terms. For example, it might plausibly be held that "to be in the public interest" is an intermediate term within ethics, in a way analogous to the way in which "owner" is an intermediate term in the law. It is not clear that the sentence "the action *A* is in the public interest" is wholly descriptive neither that it is wholly normative. Rather "to be in the public interest" seems to be descriptive in part and normative in part. (Lindahl and Odelstad 2000, 273)

Though the idea of intermediate concepts was first developed a considerably positivist environment, it is useful in other contexts, too. The conditions need not be factual in a positivist sense. They may very well be described in terms of wide and constrained reflective equilibriums, a procedure that requires some weighing. The consequences need not be legal; they can very well be moral. They are often defeasible, and the defeat may be based on a jurist's good judgment, a spontaneous judgment not derivable from the momentary state of the legal system. Accurately defined conditions and consequences are an ideal, something that 19th-century conceptual jurisprudence sought after, for example. But generations of jurists have perceived this ideal to be overly demanding. Thus, the ranking of principles is not completely pre-programmed (Larenz and Canaris 1995, 304). Moreover, principles are indeterminate and need to be "concretized" by way of less-abstract sub-principles (ibid. 305ff.). Finally, the "inner system" of law is "open and fragmentary" (ibid., 314ff.). The jurist is therefore free to some extent to adjust the conditions and consequences indicated by intermediate legal concepts. But the other side of the coin is—once again—that she is not entirely free.

5.5.3. Concepts and System

Value-open concepts in the law are linked to one another. They make up a web and can be understood fully only within this web. Juristic theories develop these concepts and weigh them against one another within the limits the same concepts indicate.

Juristic theories provide (explicit or implicit) definitions of their basic concepts, principles, and systematization. Each theory consists of several parts, much like a treatise consists of chapters. In each such part, the theory enumerates factual or hypothetical legal cases and recommended solutions.

The concepts of criminal law are interrelated, and it may be discussed in criminal law, for example, what order of presentation will bring out these interrelations most effectively. We might consider the following order: What is crime? What is punishment? What is the justification of punishment? What are the sources of criminal law? How can national criminal law be marked off from international questions? Then we will discuss the concept of a criminal act. And then the concepts of *dolus* and *culpa*. And then the art and conditions of punishment. The order of presentation will depend in part on national laws and in part on "the nature of things."

Another example is the law of contracts (cf. Lehrberg 2003). A presentation of contract law will have to start with three questions: How does a contract come into existence? When is a contract invalid? What is the content of a contract? Then we will introduce the distinction between interpreting a contract and filling it in (or completing it). Then we will analyze the binding force of the contract, list the different conceptions in this regard, and make the distinction between the promise principle (an offer is binding) and the trust model (binding force by effect of a justified trust in the counter party). Then we will analyze the concept of declaration of intention and its main elements. Then we will move on to such problems as contract by various means of communication, subsequent bindingness, liability for breach of contract, liability before the contract is completed (*culpa in contrahendo*), liability in torts, the scope of compensation, power of attorney, abuse of trust, invalidity, the doctrine of assumptions, the grounds of relevance, and general clauses.

The most important word in this brief presentation is *then*. This order of presentation can be rephrased, to be sure. But all possible rephrasings are going to have a lot in common. It would make no sense, for example, to start out with the concepts of abuse and invalidity first and then discuss offer and acceptance.

This way—by setting up a sequence of this sort—the system of law constrains the reflective equilibrium of juristic reasons.

One can link the systemic context of legal concepts with contemporary philosophy of language. Philosophy of language after Wittgenstein has parted into pragmatic theories concerned with the use of language in various con-

texts, on the one hand, and semantic theories concerned with reference, on the other. The first are anti-rationalist; the second, artificial. Robert B. Brandom (1998) has put out a theory that combines normative pragmatics and inferential semantics, thus showing us the middle way between exaggerated scepticism and unrealistic Platonism. Brandom's complex theory is beyond the compass of this volume. But the theory has ideas that a law theorist must surely find sympathetic.

First, it is pragmatic:

It offers an account of knowing (or believing, or saying) *that* such and such is the case in terms of knowing *how* (being able) to *do* something. (Brandom 1998, 4)

Second, it is inferentialist:

Grasping the *concept* [...] is mastering its *inferential* use: Knowing [...] what else one would be committing oneself to do by applying the concept, what would entitle one to do so, and what would preclude such entitlement. (Ibid., 11)

Third, it is holistic:

On an inferentialist account of conceptual content, one cannot have *any* concepts unless one has *many* concepts. (Ibid., 15)

In sum, Brandom is

putting forward a view that is opposed to many (if not most) of the large theoretical, explanatory, and strategic commitments that have shaped and motivated Anglo-American philosophy in the twentieth Century: empiricism, naturalism, representationalism, semantic atomism, formalism about logic, and instrumentalism about the norms of practical rationality. (Ibid., 31)

Further discussion on the way Brandom's theory applies to law is accessible in Klatt 2002.

5.6. Is Coherence Contrary to Facts?

The coherence orientation of legal doctrine has provoked criticism, sometimes based on what is called the polycentricity of law.

Joseph Raz (1994, 289) claims that perfection—and coherence, I would add—should not be "purchased at the cost of losing contact with reality." The law's coherence competes with such other values as subsidiarity, meaning by this decision-making at the lowest efficient level. Moreover, some incoherence in the law may be justifiable if it promotes the efficient working of the market economy and a conflict-free cooperation among people. Raz's negative conclusion is:

Given multiplicity of criteria, it is possible that sometimes coherence has to be sacrificed for some other good and there is no way of deciding which mix of coherence and other values is best [...], because there is no general method of rationality. (Raz 1994, 303–5)

Moreover, Raz claims

> that because the law is meant to be taken as a system based on authority its content is to determined by reference to the intention of legal authorities and their reasons, and, therefore, that, given the vagaries of politics, including [...] judicial involvement in politics, there is no reason to expect the law to be coherent. (Ibid., 300)

In other words, there is no reason, on Raz's view, why the test of coherence should matter in establishing the validity of law. But this test may matter when it comes to interpreting the law. Raz's position has been characterized as follows:

> if we are to apply a coherence account in order to determine how judges ought to decide cases according to law […], then we should assume a coherence-independent test to identify the settled law of a jurisdiction first, and then bring in considerations of coherence at a later stage, and hold that courts ought to adopt that outcome to a case which is favoured by the most coherent set of propositions which, were the settled rules of the system justified, would justify them. (Dickson 2001)

Similar problems come up in the context of the law's "polycentricity," especially as discussed in Scandinavian legal theory. Thus, we have a polycentric theory of the sources of law with Henrik Zahle (1986, 752ff.). Different sources of law carry a different weight in different parts of the law. Moreover, different sources of law reflect different opinions about normative questions. This is to be expected, considering that these different theories originate from different persons at different times (Zahle 1992, 456). In the same spirit, Hans Peter Graver (1992, 132–51) has noticed that the courts' reasoning patterns do not guide other decision-makers, nor is it normatively expected that this should happen (ibid. 139). Rather, there are many competing centres of power, conceptual schemes, patterns of argument, and theories on the sources of law (ibid., 140ff.). In this sense, the legal system breaks down and converts into several independent subsystems (ibid., 151). Håkan Gustafsson (2002, 105ff.) has refined this kind of criticism thus. Polycentricity occurs on the level of legal norms. Legal pluralism occurs on the level of background principles of society analysed from an external, sociological perspective. "Polyvalence" is the plurality of values behind law. Only a local coherence of the law is possible (ibid., 426ff.).

It is not my intention here to ascertain the truth of the empirical findings on factual polycentricity and incoherent fragments of law. I will assume that they are accurate, comparing them with the tradition of legal doctrine. This tradition is also a fact. What we need is a theory able to accommodate some sets of data and conditions as follows:

- law as a product of authority is sometimes incoherent;
- the law should nonetheless be coherent;

- increased coherence is an important objective in the interpretation and application of law;
- coherence plays a role in establishing legal validity;
- legal doctrine aims and should be aimed at attaining legal knowledge, and hence coherence; and, not least,
- legal doctrine aims and should be aimed at attaining justice, and hence coherence again.

Chapter 6

METATHEORY AND ONTOLOGY FOR LEGAL DOCTRINE

6.1. The Question of Cognitivism

6.1.1. The Controversy over the Truth of Normative and Evaluative Statements

A theory of legal doctrine was previously outlined based on a wide reflective equilibrium centred on platitudes. But a critic may ask whether a doctrine of this kind—containing normative components—can lay a claim to truth. For example, can a legal interpretive statement—supported by a weighing of moral arguments—be true even if it can be justified only by a set of premises containing evaluations? Here we will turn to a more abstract problem than that discussed between relativists and objectivists in moral theory. Relativists and objectivists can both be cognitivists. Relativists can claim truth but this is a relative truth, the truth within a framework. Objectivists can claim the truth which is independent of a framework (if any such thing is possible). Obviously, a relativist can also be a non-cognitivist. A non-cognitivist can be an objectivist only in a rather odd sense, which is by assuming that there are objective values, even if no one can ever utter a truth-evaluated sentence about them.

The question whether valuations and norms have truth values is notoriously controversial (see von Wright 2000 and Artosi 2000). Moreover, What is truth? Minimalists (like Horwich) work in Tarski's paradigm: "Snow is white" is true if, and only if, snow is white. Quotation marks make all the difference between talking about words and talking about snow. The truth predicate is a device for unquoting. But then we are still left with metaphysical questions to be asked about snow and whiteness. A minimalist expels metaphysics from the theory of truth but does not thereby destroy metaphysics. She merely sets out a minimalist theory that requires a complement in the form of competing and controversial conceptions about the furniture of the world.

6.1.2. Normative and Descriptive Meaning

Before entering further into this discussion, I need to emphasize a point with regard to the meaning of normative and evaluative statements. There is an important difference between descriptive and evaluative statements: The former have a descriptive meaning only while the latter have a descriptive meaning *and* a normative meaning on top of that.[1]

[1] Cf. Peczenik 1989, 51ff., on the *practical* and *theoretical* meaning of a norm-expressive statements and value statements.

The normative meaning of norm-expressive statements can be grasped by way of their normative qualification. These statements qualify human actions and events as prescribed, permitted, prohibited, and so on. I will not consider here the more complex types of normative qualification. "Prohibited," "prescribed," and "permitted" express a qualification (even if this does not exhaust their meaning). In general, a norm qualifies actions and events as conforming to or violating the norm in question. One can regard normative qualification as an inverted truth, so to speak. This is so because "true" and "false" are also qualifying words. A descriptive proposition *p* will be qualified as true if the facts are in accord with the way *p* describes them; the proposition will be false, then, if it does not correspond to the facts (cf. Peczenik 1967, 133; 1968, 119). Svein Eng subsequently expressed a similar view discussing what happens in case an utterance should fail to correspond with reality. When the speaker modifies the utterance for alignment, this fact will indicate that what she intended to utter was a descriptive statement; when she tries to correct reality, this fact will indicate that what she intended to utter was a normative statement (cf. Eng 1998, 310–50).

At the same time, however, normative and evaluative concepts have a descriptive meaning. This descriptive meaning is expressed by criteria that set forth the meaningful use of the same concepts. Normative and evaluative statements may thus be justified. Justifiability implies that a person confronted with a norm-expressive statement or a value statement can ask, "Why?" and hence request reasons in support of the statement. On our part, pointing out that the action in question is good, or that it ought to be performed, will suffice to show that the same action fulfils at least one of the established criteria of evaluation (cf. Peczenik and Spector 1987, 467ff.).

The basis of this theory is intuitionist. There obviously exist moral intuitions of (morally sensible) individuals. These intuitions—often concerned with particular cases, but also with general principles—are expressed in evaluative as well as normative sentences that tell us about the reasons behind the intuitions. These reasons include other intuitions of the same kind. Finally, we also have the general intuition that moral intuitions ought to be justified. We have a passion for reason or, more precisely, a preference for coherence (Peczenik 1999, 210).

These simple observations come close to David Copp's philosophical theory of realist-expressivism. The core of this theory is this:

> It holds that our moral beliefs and judgments represent moral states of affairs and can be accurate or inaccurate to these states of affairs, which is the central realist thesis, but it also holds that, in making moral assertions, we express certain characteristic conative attitudes or motivational stances, which is central positive view of expressivism. (Copp 2001, 1)

Further:

> The truth conditions of basic moral propositions are given by propositions about what is called by relevantly justified or authoritative moral standards. (Ibid., 27)

These standards are decided by society, and the theory is thus society-centred (ibid., 28). The expressivist side of the theory means that Copp has

> been arguing for the plausibility of the conventional-implicature view for cases in which a speaker asserts basic moral propositions by using moral terms. In such cases [...] the speaker conventionally implicates, other things being equal, that she subscribes to a corresponding standard. In other cases [...] a speaker who expresses a moral belief conversationally implicates that she subscribes to a corresponding standard, other things being equal. (Ibid., 34ff.)

6.1.3. Four Possibilities

The questions just introduced are highly controversial. Let me outline four possible positions.

The first position is non-cognitivist. Jurists are often well disposed towards non-cognitivism. They consequently tend to regard norms as expressive and qualifying statements, not as propositions qualified as true or false. This was my own position in the 1960s and 70s. The theory combines a kind of expressive theory of norms with the following justification of logical rationality in normative contexts. The logic of descriptive propositions deals with the relationships that hold between the truth-values of these propositions. Conversely, one may use normative qualification as a foundation for the logic of norms. Assume, for example, that the meaning of two norm-expressive statements, n_1 and n_2, is such that each action qualified in a given way by n_2 is necessarily qualified in the same way by n_1. It is then plausible to assume that n_1 entails n_2 (cf. Peczenik 1967, 133; 1968, 119; 1969, 46ff.; reprinted in 1970, 31, 11, and 60ff.). Thus, in the realm of norms, the logical connective "if ... then" may generally be defined by way of normative qualification. The same applies to other logical connectives, such as "and" and "not." Thus, a rational non-cognitivist, *A*, follows her *passion for reason* and can have a rational discussion with another rational non-cognitivist, *B*. What *A* does, then, is to show *B* that *B*'s system of beliefs, preferences, and reasonings supports the conclusion that *A* proposes.

The problem is, however, that this very passion for reason requires of us, not only to construct coherent normative theories in morality and in law, but also to state what kind of reality these theories are about.

The second position is a mixed one. In 1989 and 1995 I expressed a theory that is cognitivist relative to *prima facie* (better yet, *pro tanto*) norm-and-value statements and non-cognitivist relative to all-things-considered norm-and-value statements: The former are true if they correspond with the cultural heritage of society; the latter may be more or less reasonable in the light of an individual's acceptance-and-preference system, but are not true in any ontological sense. On this theory, knowledge of *pro tanto* values is possible, whereas a well-argued belief about an all-things-considered value merely expresses something essentially similar to knowledge, but not knowledge in the

literal sense. The rationale here is that we are not thereby committed to the view that there is only one right answer to all moral questions (cf. Peczenik 1989, 309ff.; 1995, 670ff.).

This theory is open to criticism because it is a hybrid theory. It splits up the apparently homogenous category of norm-and-value statements into two radically different categories, one of which is truth-assessable and the other is not. Moreover, non-cognitivism does not give us any profound basis on which to require coherence of all-thing-considered value judgments (cf. Rabinowicz 1998, 17ff. and 23; Peczenik 1998b, 62ff.).

The third position is cognitivist. A cognitivist metatheory may be thought to provide a better account of *pro tanto* norm-and-value statements and all-things-considered norm-and-value statements, both. But a theory of this kind will have to avoid the dogmatism that we are all too familiar with from classical natural law: We must preserve the intuition that it is easier to contest weighing in particular cases than to frontally attack such values as human life. But this cognitivist turn is very difficult for me to take, since my roots are in the legal realism of Petrażycki, Wróblewski, Ross, and Olivecrona.[2]

The fourth position is metatheoretical relativism. The best way out is perhaps to endorse Jaap Hage's idea that there is no fixed demarcation line between the objective and the relative (cf. Peczenik and Hage 2000, 337). Presupposing the concepts and standards of moral-cum-legal practice commits us to viewing our knowledge of these concepts and standards as objective knowledge about the world. Thus, the dependence of judgments on concepts and standards does not rule out the objectivity of these judgments. Only when we start doubting the knowledge we allegedly have of the same concepts and standards do we switch over to a relativist language and add such clauses as "I think that," "in my opinion," and so on. Now, it is particularly odd to doubt basic moral values and easier to doubt judicial decisions. But, as previously stated, the difference is not sharply determined in basic philosophy. The borderline is fluid and contingent. What this means for us in this context is that juristic doctrines may be regarded as affording a kind of juristic knowledge only so long as theorists do not begin to have doubts as to what they "really" do.

6.2. Ontology for Legal Doctrine

6.2.1. The Problem of the Ontology of Law

Lurking behind epistemology and metatheory is ontology. In Volume 1 of this Treatise, Enrico Pattaro presents an analytical and explanatory theory that

[2] Jes Bjarup has an insightful point in this regard: "AP's [...] theory can be regarded as a union of utilitarianism with communitarianism emphasizing that the good legal order is characterized by protecting human preferences. The ground for it is in the non-cognitivist view" (Bjarup 1995–1996, 1186).

shows how complex entities get constructed from simpler components. The following quotations are particularly illuminating.

Despite the Is-Ought dualism, more or less consciously presupposed by the legal doctrine of the civil-law countries, any event in the reality that ought to be is conditioned, according to the same legal doctrine, by events occurring in the reality that is: There is no event in the reality that ought to be which is not the normative consequence of events occurring in the reality that is. I will call the former events "Ought-events," "Ought-effects," "Ought-changes," or "normative consequences," and the latter "Is-events," "Is-causes," or "Is-changes." (Pattaro, vol. 1 of this Treatise, sec. 2.2.1)

As has been anticipated, a norm is, on my view, a motive of behaviour [...]: It is the belief (*opinio vinculi*) that a certain type of action must be performed, in the normative sense of this word, anytime a relevant type of circumstance gets validly instantiated. This must unconditionally be so, that is, regardless of any good or bad consequences that may stem from the performance in question. My concept of norm is *deontologically* oriented. (Ibid., sec. 6.1)

In conclusion, Is-facts, acts, and transactions are events in the reality that is which cause Ought-effects in what is subjectively right in the reality that ought to be: They will bring about, modify, or extinguish rights and obligations among subjects under the law (provided they are valid tokens of a type of Is-event set forth in, and not forbidden by, what is objectively right in the reality that ought to be: Section 2.2.2.1). (Ibid., sec. 3.2.4)

This analysis gives us a good insight into the complexity of the law. It also shows that each time a jurist notices a change in the legal "reality that ought to be," there is a corresponding and underlying change in physical and mental reality. In a similar spirit, Laurent Mommers provides

a framework in which different ontological views can be accommodated. In this framework, there are three basic layers. The first layer consists of non-legal entities that are legally-relevant. The second layer consists of potentially legal entities whose existence status (*qua* legal entity) is not yet established. The third layer consists of legal entities. Transitions between these three layers are possible through varying sets of criteria. A potentially legal entity, such as a judge's decision, becomes a legal entity by checking whether the status layers required do indeed apply. Thus, for instance, an immoral decision is not classified as a legal entity in a natural-law view, whereas it is classified as such in a legal-positivist view. Entities on these three different levels are connected to each other through two different relations. These are the count-as relation [...] and the causation relation. (Mommers 2002, 100)

A metaphysically oriented philosopher of law may, however, ask the embarrassing question, What entities do actually do exist? What entities belong to the "furniture of the world"? Is it not the case that only simple entities, such as beliefs, exist literally, whereas the rest of the above-mentioned entities are reducible to the content of beliefs? Or do laws, rights, transactions, etc., exist in a peculiar manner other than that by which beliefs are said to exist? Generations of philosophers have attempted to dissolve such metaphysical questions. But the questions come back persistently.

No sooner is the metaphysical question set out, than confusion begins to abound limitless. This is because we have to do with two deeply rooted conflicting intuitions.

Intuition (1): The law is a social fact; it is created by power-holders (such as legislators and judges) or by the customs that obtain among people.

Intuition (2): Judges and legal researchers obtain knowledge of the law by way of evaluative operations, that is, by interpreting statutes, precedents, and other sources of law; this interpretation is necessarily connected with justice, such that an unjust interpretation is an incorrect interpretation.

Intuition (1) will result in legal research giving up its claim to knowledge. Or it will result in radical proposals for changing legal research into something like a hardcore, value-free science.

Intuition (2) will result in theories by which the law is an ontologically complex entity. This explains the possibility of legal knowledge obtained by evaluative interpretation, to be sure. But success here comes at a price. It common among ordinary lawyers to gainsay the complex ontology of law, for they are practical minded and loathe metaphysics.

What, then, are we to do?

One possibility is to simply trace out in full the collision course these two intuitions are on and give up on the idea of an ontology of law. This will imply that ontological questions are beyond the jurist's reach. From this perspective, we are led to ask whether our normative beliefs are justified within the jurist's horizon. We will set metaphysical questions aside—not as wrong, but as unpractical—and go on thinking in the manner of a lawyer. This is an option I am strongly inclined towards.

Another possibility is to spell out the complex ontology resulting from Intuition (2) and make it understandable. There are, on reflection, at least eight alternatives in answer to the question what the law is.

The first of these is to explain the law as consisting of legally binding norms, mostly statutory in Europe. This alternative is obviously attractive, not least because it corresponds to the terminology of constitutional law. But even here there are some embarrassing questions that can be asked. There is no doubt that statutes are law, but something else is apparently also a part of the law—judicial practice and unwritten legal principles, for instance.

On to the second alternative, then: The law is a social practice; in a famous slogan, it is what the courts do in fact, and nothing more pretentious than that. This second alternative is attractive to some legal realists precisely because social practices appear to be reality. But this alternative, too, is confusing because it obviously contradicts the basic intuitions of lawyers, who would otherwise say that statutes, not judicial practice, lie at the core of law. No doubt, judicial practice is a kind of law in action (another famous slogan)—but is *all* law judicial practice? What about statutes not yet applied by the courts? What about customary law? What about Dworkinian preexisting principles of law? What about the products of juristic theories?

To modernist philosophers, the first alternative, and even more so the second, looks attractive because it is simple, and philosophers assume that sim-

plicity is the basic merit of ontological theories. Alas, both alternatives are destructive because they run counter to the basic intuition that legal doctrine produces a knowledge of the law rather than arbitrary constructions. The problem may be circumvented by introducing some terminological distinctions. For example, we can split the idea of law in two main components: law in force and binding law. Law in force would fit in with Intuition (1): It would be a social fact, perhaps ultimately reducible to the conventions shared by those in power. Binding law would follow Intuition (2): It would be ontologically complex. Having got into this business of distinction-making, one can also take up Tuori's distinction between the law's surface structure, its deep structure, and its culture. These theories are certainly interesting. But they leave open the metaphysical question, What is the ontologically complex manner of existence of "binding law," "deep structure," "legal entities," and so on?

The third alternative: Everything that legal doctrine produces, using established methods of legal reasoning, is law. But this alternative savours of desperation. Jurists seem to play a strange game with time. They tell us that they are describing the law in force and that this law is a social fact. And yet, all the while, doctrinal jurists reconstruct the law in an effort to make it more coherent and just than it was before. Thus, if doctrine reconstructs the law, it is not describing anything preexistent, but rather making it anew: It is making "law" and deceiving the public by creating the illusion that what is being offered is a description of the law. Description assumes a time sequence: There is first the object described and then the description. But in legal doctrine the order appears to be reversed. Moreover, is this doctrine-made "law" legitimate? And, if so, why?

The fourth alternative: The law is an idealized paraphrasing of legal practice: It is not what the courts do in fact, but what they would have done if they had performed perfectly rational, Herculean thinking (cf. Dworkin 1977).

The fifth alternative echoes the fourth by carrying it over from the courts to the universities. The law is an idealized paraphrasing of legal doctrine: It is not what doctrine produces in fact, but what it would have produced if legal scholars had performed perfectly rational thinking.

The sixth alternative: There are two kinds of law, namely, input-law and output-law. Input-law consists of all legally relevant normative materials and texts, meaning statutes, judicial practice, *travaux préparatoires*, evidence of established custom, evidence of social morality, etc. Output-law is that which legal doctrine produces. In a previous work (Peczenik 1989, 268ff.), I took up this sixth alternative.

The seventh alternative says that legal doctrine is engaged in narration, self-description, self-reference, etc. (cf. Jackson 1988). But this view is controversial.

The eighth alternative: The law is what we in our society ought to obey. Legal reasoning based on statutes, judicial practice, and suchlike is the only

way to discover what this law is. Legal doctrine is the best form of legal reasoning. For it reconstructs the input of statutes, practices, and cultural patterns, all the while describing a "deeper" and preexistent legal ought.

It may be said, to avoid confusion, that all ontology is relative. There are many views of reality, each corresponding to a different background theory that defines the concept "real" (cf. Quine 1969, 53ff.) and indicates what we are to regard as individual objects, and as their parts, kinds, and so on (cf. Goodman 1978, 7ff.). There may be many metaphysical systems, "all such systems being wholly comprehensive and mutually incompatible, but all equally valid descriptions of one's reality" (Castañeda 1980, 19). One can plausibly insist that there is only one world, to be sure—only we see it in different ways because, among other reasons, we have different ways of understanding certain utterances (cf. Searle 1995, 195).

In view of this fact, we must make a choice between two alternatives as follows: We can accept perspectivalism as our meta-philosophy—law as a complex entity exists in the perspective that makes legal doctrine coherent, but not in a profound, metaphysical perspective—or we can opt for the profound ontological perspective.

6.2.2. Law as a Dependent Entity

The property common to the fourth and fifth alternatives is that the truth of statements about such things as valid law and correct interpretation supervenes on the rationality of the corresponding activity, such as adjudication and legal research. Giovanni Sartor suggested to me in conversation a more general formulation as follows: The truth of statements about such things as valid law and correct interpretation supervenes on the rationality of the conative state by which the corresponding practical information is acquired. This view is quite attractive. Let me go a little further into the fifth alternative.

The law exists because people believe in it, but the law is not identical with beliefs. Using a philosophical expression now in vogue, one can say that the law supervenes on human beliefs, preferences, actions, dispositions, and artefacts. Thus, a series of actions by persons acting in their capacity as members of parliament can cause the fact of a text being produced and counting as a legal statute. This way, legal statutes are ontologically dependent on these actions. Dependence is determined by the count-as relation and by the causation relation. We cannot state that these relations obtain without effecting jumps (leaps) in the sense outlined in Section 4.3.2.

Instead of speaking of dependence, leaps, and transformations, we might try a more technical term and speak of supervenience. A preliminary analysis of the law's mode of existence may thus proceed by pointing out that there are non-legal entities (e.g., beliefs, preferences, actions, dispositions, and artefacts) on which the law supervenes. When we engage in legal practices we use

a conceptual scheme in conjunction with which the law—and not just our belief in the law—is enabled to exist. This conceptual scheme determines the criteria for the existence and persistence of the law that we acquire in our social practice. The law exists relative to our conceptual scheme, not by virtue of it. Simply stated, the way we talk about the law in ordinary life, and even more so the way lawyers talk about the law, reveals something about what the law is.

A supervenience theory of the law suffers from the drawback that it seems to introduce a number of entities with an ontological foundation that is less firm than that of purely physical entities (cf. Sosa 1998). Sosa points out nicely the problems with supervenience theories:

> Suppose a world with just three individuals $x1$, $x2$, $x3$. Such a world is held by some "mereologists" to have in it a total of seven things or entities or objects, namely, $x1$, $x2$, $x3$, $x1 + x2$, $x1 + x3$, $x2 + x3$, $x1 + x2 + x3$. Antimereologists by contrast prefer the more austere ontology that recognizes only the three individuals as objects that really exist in that world. (Sosa 1998, 399)

One way to avoid such problems is to make the controversy relative to a choice of language. It will be convenient to use antimereological language on some occasions and mereological language on others. However,

> existence relative to a conceptual scheme is not equivalent to existence in virtue of that conceptual scheme [...]. Each of us acquires and develops a view of things that includes criteria of existence and perdurance for categories of objects. When we consider whether an object of a certain sort exists, the specification of the sort will entail the relevant criteria of existence and perdurance. And when we correctly recognize that an object of that sort does exist, our claim is elliptical for "exists relative to our conceptual scheme." (Sosa 1998, 404)

The law can therefore exist as a supervening entity. But does it do so as a matter of fact? Is there sufficient reason to conclude that the law exists *objectively*? Or is the law a product of the imagination; is it parasitic on human behaviour and mental processes? This question ties in with the debate on reductionism, a complex debate far from finding a solution. In the first half of the 20th century, science was generally of a mind to reduce complex systems to less-complicated components, and ultimately to logical "atoms." Thus, there was a drive to reduce biological laws to chemistry and chemistry to physics. So, too, there was a drive to reduce legal concepts to scientific, ultimately physical concepts. The so-called Vienna Circle (especially with Rudolf Carnap and Otto Neurath) tried to base complex theories in the natural sciences on "protocol sentences" that report observations. Quine (1953, 38ff.) thus critically dubbed "radical reductionism" the belief that each meaningful statement is equivalent to a logical construct upon terms referring to immediate experience. The reductionist program proved to be extremely difficult to fulfil. Thus, Fodor and Putnam initiated an anti-reductionist consensus thirty

years ago by noting the analogy between computational states and mental states (cf. Block 1997). Therefore, the following—cautious—approach is taken in this volume. We will not take any position at all with regard to whether the reductionist program is logically possible. We will only state that any presentation of legal problems in general, and legal doctrine in particular, is going to be extremely complex if carried out in the reductionist way.

6.2.3. A Theory of Legal Conventions and Institutions

Having chosen a "rich" ontology as a practical possibility (without ruling out reductionism as an ideal)—that is, having chosen a language allowing for the existence of legal entities next to the "brute" entities these are dependent on—we can introduce Eerik Lagerspetz's theory of conventional facts and rules.[3] Thus:

R is a regulative rule in *S* if

- the members of *S* generally comply with *R*;
- there is a mutual belief in *S* that *R* is a regulative rule in *S*; and
- this mutual belief is at least in part a reason for this compliance (cf. Lagerspetz 1999, 211).

Rules that exist by way of mutual beliefs are conventional facts. But a single constituent rule within a rule-system need not exist by virtue of mutual beliefs about the rule's existence—witness some of the more esoteric parts of law known only to a small circle of legal specialists. It suffices if a rule belongs to a chain or web of rules that ultimately can be traced to rules existing in the relevant community by way of mutual beliefs (cf. ibid. 209ff). Lagerspetz regards his theory as an improvement on Searle's well-known theory of institutional facts. According to Searle, rules create institutional facts. Lagerspetz asks:

> But what kind of fact, then, is the fact that these rules do exist in relevant communities? Obviously, a fact about the existence of a rule cannot be a brute fact in Searle's sense: it is not a fact on the furniture of the physical world, neither are the statements expressing it subjects of direct perceptual control. If Searle's classification is meant to be an exhaustive one, facts about rules must themselves be institutional facts. Therefore, they are inherently dependent on the existence of further rules: something is a rule only if there is a rule with the effect that it is counted as a rule. We are in an infinite regress. This might be called as the logical regress of rules. (Ibid. 199)

Lagerspetz's

solution to these problems is to develop a notion of non-brute fact which is not inherently rule-dependent. The basic idea behind the solution is the following: There are things which exist and facts which hold only if the relevant individuals believe that they exist or hold and act ac-

[3] Lagerspetz 1999; see also Lagerspetz 1995. Incidentally, a generation earlier, Tore Strömberg regarded beliefs in valid law as a social convention (cf. Strömberg 1981, 39ff.).

cording to these beliefs. What we call as institutions and institutional facts fall under this description. Descriptions of these things and facts are implicitly circular or self-referential, but the circle in question is not a vicious one. In the descriptions, institutional terms reappear only in the scopes of propositional operators describing the attitudes of relevant individuals. Moreover, the existence of the related beliefs is only a necessary condition for the things being there. […] The self-referential nature of conventional facts is not an anomaly, for there are things in the world which are capable for self-reference and for cross-reference. Propositional attitudes—believing, knowing, hoping, fearing, etc.,—have this capability. We can have beliefs about other people's beliefs, while they have at the same time beliefs about our beliefs. This gives rise to the phenomenon called mutual, or shared belief, or common, or mutual knowledge. (Ibid. 199–200)

A more detailed discussion of this topic is found in Peczenik and Hage 2000, on which this and the following sections are based.

6.2.4. The Law as a Product of Convention and Morality

The law is not merely a convention, however. It is a product of convention and morality. Granted that the point of legal doctrine is to present the law as coherent and morally binding, we will have two competing philosophies to choose from. On the first of these, legal doctrine provides us with a knowledge of the coherent and morally binding law that was already in existence before the theories were constructed, even if legislative-cum-judicial practice was neither coherent nor moral. The second philosophy is that legal doctrine changes the law, making it more moral and coherent. Assume for a moment that we accept the claim to knowledge advanced by legal doctrine. We will then have to admit that the law was in a deep sense already coherent and moral before legal doctrine told us so. In other words, a legal scholar can discover a preexisting law by setting out a convincing argument for it. Morally binding law therefore depends on a conjunction of two elements: people's knowledge of legal institutions and moral deliberation. The first element depends in turn on mutual beliefs; the second, on the motivations and dispositions of whoever is doing the interpreting. This coupling of elements approximates morally binding law, provided that the people involved are morally sensitive and rational (cf. Peczenik and Hage 2000, 343ff.).

In sum, someone's personal interpretation of the law converts into morally binding law if

- the interpretation achieves an optimal coherence of the law itself; and
- this construction is coherently linked to an optimally coherent moral theory.

This ideal is of course unreachable. But legal doctrine must try to approximate it in the effort to live up to the ideal of a descriptive-cum-normative *Rechtswissenschaft*.

If accepted, the previously outlined cognitivism and complex ontology of law will make it necessary to add the following about the relation between the law and human motivations (cf. Hage and Peczenik 2001, 141ff., repeated in Peczenik 2001, 92ff.). The law exists—it does so as a fact. But to discover this fact, a jurist must rely on social conventions as well as on personal morality. This morality is dependent on the jurist's motivation. Thus, in seeking to make sense of the claim to knowledge advanced by juristic doctrines, we can attempt to leave Humean philosophy behind and consider the possibility that there are facts whose existence depends inherently on the motivation, or at least on the reasonable motivation, of the knowing subject.

To a modern reader, this is blasphemy. But the present section should be understood as a thought experiment, not as an article of faith. What I present here is a way to achieve a result, that is, making sense of legal doctrine. The price we have to pay for this is a non-Humean theory of knowledge and motivation. Nothing prevents us from looking for a cheaper way to get this result.

Let me assume, therefore, that the law is just such a motivating fact. On this conception, we can easily understand why so many lawyers (at least pre-modern and post-Nazi lawyers) have reasoned as follows: This "law" cannot reasonably motivate me; hence it is not law. Or, more specifically: This "law" is extremely unjust; hence it is not law. This is the point of Radbruch's famous formula (1950, 354; cf. Alexy 1992, 53ff.). When legal doctrine makes enacted law more coherent, it gives us knowledge of the deeper law—of the law as a rationally motivating fact.

All this stuff is highly metaphysical. But the point is that such metaphysics makes sense of descriptive-cum-normative legal doctrine. And legal doctrine is (or at least was) a fact. Personally, I would rather have a simpler metaphysics doing the same service. But I cannot find it. This is perhaps a challenge that philosophers can take up.

Chapter 7

CONCLUSIONS

Legal doctrine faces philosophical criticism. It was pointed out in the foregoing chapters how one can reply to these objections.

- Juristic theories have important normative components and these are allegedly arbitrary. But normative statements are rationally justifiable.
- Legal doctrine allegedly refers to ontologically obscure entities. But legal doctrine can work without complex ontological assumptions. Moreover, a complex ontology admitting of conventional and moral objects is possible.
- Legal doctrine is criticized for its indeterminacy. The answer to this objection is "defeasibility, not indeterminacy."
- Legal doctrine faces the objection that it wrongly presumes a common moral core in a pluralist society. But a core of this kind does actually exist and should not be ignored.
- Legal doctrine faces the objection that it is not universal, but territorially local and hence unscientific. But this locality has been exaggerated. There are considerably global and long-lived components of legal doctrine. Moreover, a precise normative statement cannot be truly universal, because all morality is society-centred.

The most important objection is that the normative claims of legal doctrine are unjustified. But legal doctrine produces a relatively stable normativity. This normativity is based on coherence, which applies to

- legal knowledge;
- justice under the law; and
- legal concepts.

In all three respects, legal doctrine produces midlevel theories with platitudes at the centre. Justification in legal doctrine proceeds through constrained, wide, and segmented reflective equilibriums between legal theories, on the one hand, and particular judgments and moral principles, on the other. The platitudes and the justifications are debated among officials and members of the community. The equilibrium is society-centred, for it results from discussion among many participants. It consists in an overlapping consensus among people seeking coherence.

The platitudes involved are of four kinds at least:

- platitudes in coherence theory itself, which consist of criteria of coherence;

- platitudes in society-centred morality;
- platitudes in general legal doctrine (these are concerned with legal sources and arguments); and
- platitudes in particular legal doctrine.

All these platitudes enter into a single equilibrium. Not one of them is by itself a super criterion. Platitudes are fuzzy, but by bringing them together we can diminish the degree of fuzziness. To "diminish" is not to "eliminate." No theoretical reconstruction of legal doctrine can convert such fuzziness into a calculus of conclusive rules.

Consequently, a legal decision is justified (normatively) if, and only if, it coheres (to a greater extent than any other decision) with the sources of law, which for the most part consist of

- legal statutes;
- past decisions (precedent);
- *travaux préparatoires*; and
- legal doctrine.

Thus, legal doctrine is rationally justifiable. Does this point to a great future for legal doctrine? No one knows for sure. Jurists are good at keeping things stable and reasonable. But the political system pushes for dynamic change and may look upon jurists as an obstacle. The economic system, well-adjusted to the needs of big businesses, demands simple and rapid decisions, not slow juristic debate. "Post-metaphysical" modernism, well-adjusted to the needs of technology, demands clarity at all costs and manifests its revulsion at the traditional talk of truth, justice, and morality. The exponentially growing complexity of the information society exerts pressure on jurists and in many cases makes the juristic dream of a coherent law exactly that, a dream. Last but not least, in this complex and dynamic world, there is a post-religious need for security, if not real at least imaginative. Legal doctrine is too complex and too sophisticated to answer this need. People feel more comfortable with the illusions of strict social science and with politically correct recitations of longer and longer catalogues of the rights we all have.

Are we then looking at the end of legal doctrine? Perhaps so, if we do nothing. But problems are challenges. They can and must be solved.

INDEX OF SUBJECTS

Abstraction 1–2, 3, 11–3, 31–4, 39–41, 45, 49–50, 50–1, 53–5, 55–7, 57–8, 59–60, 65–8, 76–7, 79–80, 83–5, 109–10, 115–7, 118–9, 123–5, 129–33, 133–6, 137–9, 139–40, 151–2, 160–2, 167
Administrative law 28–9, **31–4**
All-things-considered 87–90, 109–10, 152–3, **154–6**, 169–70, 170–8
Analogy 8–11, 17–9, 20, **20–4**, 24–5, 50–1, 65–8, 69–70, 73–5, 115–7, 123–5, **140–3**, 147–9, 174–6
Analytical 1–2, 3–6, 8–11, 11–3, 13–4, 31–4, 39–41, 41–2, 42–3, 59–60, 65–8, 75, 76–7, 79–80, 81–3, 83–5, 100–1, 121–3, 125–7, 149–51, 170–4
Apex norm, *see Grundnorm*
Application area of a rule 20, 20–4
Applicability of a rule 94–5, 95, 112–3, 121–3
Assumptions in contracts 6–8, 31–4, 45–6, **47–8,** 115–7, 162–3
Authority, authority reasons 6–8, 14–5, 15–7, 17, 20, 24–5, 25–6, 26–7, 57–8, 87–90, 92–4, 115–7, 133–6, 163–5

Balancing, *see weighing*

Causation 6–8, 31–4, 34, 35–8, 50–1, 51–2, **53–5**, 59–60, 69–70, 72–3, 115–7, 127–9
Circular **143–4**, 170–4, 174–6, 176–7
Cognitivism 167**, 169–70,** 177–8
Coherent, coherence 1, 3–6, 6–8, 17, 19–20, 20–4, 27–8, 34–5, 38–9, 43–5, 49–50, **50–1,** 51–2, 71–2, 76–7, 78–9, 79–80, 81–3, 83–5, 85–6, 99–100, 105–7, 111–2, 112–3, **115–65,** 167–9, 169–70, 170–4, 177–8, 179–80
Coherentism 79–80, **139–40,** 144–6
Communitarian 8–11, 38–9, 105–7
Concepts 3–6, 8–11, 11–3, 14–5, 15–7, 24–5, 31–4, 34–5, 42–3, 45–6, 57–8, 65–8, 71–2, 73–5, 81–3, 83–5, 105–7, 112–3, 115–7, 127–9, 129–33, 137–9, 146–7, 152–3, **158–63,** 167–9, 169–70, 174–6, 179–80
  intermediate 39–41, **160–2**
  value open 127–9, **158–60**
  and system **162–3**
Conceptual 3–6, 8–11, 11–3, 17–9, 24–5, 26–7, 38–9, 39–41, 41–2, 42–3, 43–5, 49–50, 50–1, 65–8, 73–5, 76–7, 78–9, 81–3, 86–7, 87–90, 94–5, 96–8, 100–1, 112–3, 140–3, 143–4, 154–6, 156–8, 162–3, 163–5, 174–6
  jurisprudence 11–3, 24–5, 42–3, **65–8,** 76–7, 160–2
  scheme 163–5, **174–6**
Constraint satisfaction 140–3
"Constructive legal science" 1–2
Contractarianism 61–3, 72–3, 75, 77–8, 79–80, **102–4, 104–5,** 105–7, 119–20
Contracts 3–6, 6–8, 17–9, 34, 34–5, 35–8, **43–8**, 51–2, 52–3, 92–4, 115–7, 152–3, 162–3
Controversial 8–11, 20–4, 31–4, 42–3, 46–7, 47–8, 53–5, 55–7, 57–8, 59–60, 68–9, 73, 76–7, 78–9, **79–80**, 83–5, 87–90, 95, 96–8, **102**, 102–4, 107–9, 111–2, 129–33, 133–6, 151–2, 153–4, 167, 169–70, 170–4
Convention, social 45, 73–5, 87–90, 96–8, 129–33, 133–6, 167–9, 170–4, **176–7**, 177–8, 179–80
Correctness, claim to 86–7
Criteria of law 90–2, 92–4, 94–5
Critical legal theory 8–11, 65–8, 69–70
Critical positivism 96–8
Culpa, *see negligence*

Deductivism 20–4, 75, 77–8
Deep structure 24–5, **96–8,** 115–7, 133–6, 147–9, 170–4
Defeasible 11–3, **13–4**, 15–7, 20, 24–5, 26–7, 43–5, 50–1, 61–3, 87–90, 90–2, 94–5, **115–27,** 127–9, 129–33, 139–40, **144–6**, 147–9, 156–8, 160–2, 179–80
Democracy 6–8, 31–4, 75, 92–4, 111–2, 137–9, 153–4
Desuetudo 20, 125–7
Detached legal statements **87–90**, 95–6, 99–100, 100–1

Economics, *see law and economics*
Emotion 73–5, 149–51
Environmental law 6–8

Epistemic norms 8–11
Equilibrium (reflective) 43–5, 53–5, 115–7, **127–37,** 137–9, 140–3, 143–4, 144–6, 158–60, 160–2, 162–3, 167, 179–80
Everything 50–1, 79–80, 143–4, 144–6
Expert 6–8, 8–11, 53–5, 69–70
Exceptions 6–8, 13–4, 20–4, 38–9, 39–41, 50–1, 69–70, 87–90, 90–2, 94–5, 115–7, 121–3, 125–7, 127–9, 133–6, 137–9
Exclusionary reasons 87–90
Explanation 3–6, 24–5, 78–9, 105–7, 140–3, 149–51

Fables 129–3
Façade 3–6, 69–70, 123–5
Falsification 129–3, 133–6
Fashion 11–3, 24–5, 52–3, 73, 75, 76–7, 81–3, 96–8, 174–6
Formalism in the law 41–2, 46–7, 49–50, 69–70, 137–9, 158–60
Foundationalism, foundationalist 75, 77–8, **139–40,** 144–6, 154–6
Foundherentism 139–40
Framework 6–8, 8–11, 11–3, 34, 46–7, 79–80, 104–5, 107–9, 152–3, 153–4, 160–2, 167, 170–4
Fused statements *de lege lata* 3–6, 81–3, **100–1,** 133–6

Global reason 78–9
Grundnorm 87–90, **90–2,** 137–9

Holistic 20–4, 78–9, 83–5, 118–9, 119–20, 144–6, 146–7, 149–51, 154–6, 158–60, 162–3
Human rights 6–8, 15–7, 28–9, 31–4, 35–8, 61–3, 83–5, 109–10, 112–3, 129–33

Ideal, idealization 3–6, 8–11, 15–7, 50–1, 61–3, 85–6, 86–7, 102–4, 104–5, 107–9, 109–10, 111–2, 152–3, 153–4, 154–6, 156–8, 160–2, 170–4, 176–7, 177–8
Indeterminacy 27–8, 65–8, **69–70**, 72–3, 73–5, **123–5**, 125–7, 160–2, 179–80
Individualism 38–9, 75, 77–8, 105–7
Influence of juristic theories **6–8**, 53–5, 71–2, 73–5, 105–7
Interest, jurisprudence of 11–3, 24–5, 65–8
Intuitions 43–5, 45–6, 53–5, 61–3, 102–4, 133–6, **167–9**, 170–4
Irrationality, irrationalism 68–9, 69–70, 136–7

Janus's face of legal doctrine 3–6, 11–3
Judgment, faculty of 118–9
Jurisprudence, *see legal theory*
Juristic encyclopaedias 11–3
Justice 3–6, 6–8, 20–4, 27–8, 35–8, 43–5, 47–8, 48–9, 49–50, 50–1, 51–2, 52–3, 53–5, 55–7, 77–8, 81–3, 86–7, 92–4, 96–8, 99–100, 105–7, 107–9, 115–7, 118–9, 127–9, 129–33, 133–6, 137–9, **149–58,** 163–5, 170–4, 179–80
  commutative 43–5, 51–2
  corrective 35–8, 43–5, 49–50, 50–1, 53–5
  distributive 43–5, 53–5
  in different legal roles 156–8
Justification 3, 3–6, 6–8, 8–11, 13–4, 14–5, 15–7, 20–4, 27–8, 31–4, 34–5, 35–8, 38–9, 45, 45–6, 48–9, 49–50, 50–1, 51–2, 52–3, 53–5, 55–7, 57–8, 59–60, 61–3, 69–70, 71–2, 79–80, 81–3, 87–90, 90–2, 95, 96–8, 99–100, 102, 104–5, 115–7, 123–5, 127–9, 133–6, **137–49,** 149–51, 162–3, 167, 167–9, 169–70, 170–4, 179–80
  contextually sufficient **79–80,** 87–90, 115–7
  context of 3–6
  profound, deep 8–11, 13–4, 42–3, **79–80,** 81–3, 87–90, 95, 96–8, 102, 107–9, 115–7, 127–9

Kaldor-Hicks criterion 43–5
Knowledge 3, 3–6, 11–3, 13–4, 24–5, 28–9, 50–1, 55–7, 71–2, 76–7, 79–80, 85–6, 90–2, 95, 96–8, 102–4, 104–5, 105–7, 111–2, 123–5, 127–9, 129–33, 136–7, **137–49**, 149–51, 153–4, 156–8, 158–60, 163–5, 169–70, 170–4, 176–7, 179–80

Law and economics 45–6, **61–3**
Layers of law 26–7, 96–8, 170–4
Leap (and transformation) 90–2, 174–6
Legal culture 13–4, **96–8,** 109–10, 115–7, 127–9, 147–9, 170–4
"Legal dogmatics" 1–2
Legal Positivism 81–3, **87–95, 95–101,** 102, 115–7, 160–2, 170–4
Legal Realism 14–5, 24–5, 46–7, 61–3, 69–70, 71–2, 73–5, 76–7, 81–3, 83–5, 85–6, 87–90, 90–2, 115–7, 169–70, 170–4
Legal roles 8–11, 156–8
Legal theory, Jurisprudence 1–2, 3, **8–11, 11–3**, 26–7, 27–8, 31–4, 69–70, 73–5, 76–7, 79–80, 81–3, 86–7, 95, 96–8, 100–1, 102, 111–2, 118–9, 119–20, 147–9, 163–5

Legitimacy, legitimate, legitimation 3–6, 13–4, 14–5, 50–1, 69–70, 78–9, 83–5, 95, 105–7, 111–2, 115–7, 147–9, 153–4, 156–8, 170–4
Liberal 38–9, 43–5, 72–3, 85–6, 127–9, 151–2, 158–60
Linguistic turn 65–8
Local 11–3, 24–5, 48–9, 50–1, 51–2, 65–8, 75, 76–7, 78–9, 105–7, 144–6, 154–6, 156–8, 163–5, 179–80

Meta-theory 8–11, 78–9, 102–4, 139–40, 144–6, 167–9, 169–70, 170–4
Middle level 31–4, 59–60, 69–70, 129–33, **133–6**, 179–80
Modern, modernist 6–8, 11–3, 35–8, 61–3, 65–8, 73, 75, 78–9, 81–3, 83–5, 87–90, 96–8, 105–7, 115–7, 137–9, 170–4, 174–6, 177–8, 179–80
Motivation 8–11, 26–7, 76–7, 81–3, **87–90**, 104–5, 170–4, 177–8
Multicoherence 144–6, 149–51

Narration, narrative 75, 140–3, 147–9, 170–4
Natural law 3–6, 6–8, 8–11, 43–5, 57–8, 65–8, 76–7, 81–3, **83–7,** 87–90, 92–4, 96–8, 102, 102–4, 154–6, 169–70, 170–4
Nature of things 24–5, 152–3, 162–3
Necessary connection 81–3, 83–5, 85–6, 86–7
Negligence 6–8, 20–4, 31–4, 35–8, 47–8, 48–9, 50–1, 51–2, **52–3**, 53–5, 55–7, 57–8, 58–9, 59–60, 69–70, 79–80, **133–6**
Nonmonotonic 79–80, 90–2, **125–7**

TABLE OF CONTENTS

A Note on the Author XXI

Preface XXIII

Introduction XXV

Part I Legal Reasoning and Practical Rationality 1

Chapter 1 - Practical Rationality 3

1.1. Implicit Cognition 3
1.1.1. Fixed Reflexes 4
1.1.2. Conditioned Reflexes 5
1.2. Explicit Cognition 7
1.2.1. Cognitive Functions and Cognitive Organs 8
1.2.2. Reason As a Mental Organ 10
1.2.3. Epistemic Reasoning 11
1.2.4. Practical Reasoning 14
1.2.5. The Foundations of Rationality 15
1.3. The Nature of Practical Cognition 16
1.3.1. Basic Conative States 17
1.3.2. Adoption and Withdrawal of Conative States 18
1.3.3. Abstract Plans and Subplanning 21
1.3.4. The Structure of Plans 23
1.3.5. The Evaluation of Plans 23
1.3.6. Epistemic Desires: Knowledge and Interest 27
1.3.7. Strategies, Standing Plans, and Instructions 29
1.4. The Function of Intentions 31
1.4.1. Intentions and Instructions 31
1.4.2. Reasoning with Intentions 32
1.4.3. Behavioural and Cognitive Instructions 34
1.4.4. Other-Directed Intentions and Commands 35
1.4.5. General and Collective Intentions 38
1.4.6. May-Instructions and Intentions 39
1.5. Reasoning and Cognition 41

1.5.1. Failures of Reasoning 41
1.5.2. Reasoning's Dependency on Implicit Cognition 42
1.5.3. Reasoning's Contribution to Cognition 44

Chapter 2 - Basic Forms of Reasoning 47

2.1. Ratiocination 47
2.1.1. Mental States, Noemata, Sentences, and Speech Acts 47
2.1.2. Reasoning Schemata and Instances 49
2.1.3. The Adoption of a Reasoning Schema 53
2.2. Conclusive and Defeasible Reasoning 55
2.2.1. Validity and Truth-Preservation 56
2.2.2. Monotonic and Nonmononic Reasoning 57
2.2.3. The Rationale of Defeasibility 59
2.2.4. The Logical Function of Defeasible Reasoning Schemata 61
2.2.5. Collision and Defeat 62
2.2.6. Collisions and Incompatibility 64
2.2.7. Undercutting Collisions 65
2.2.8. Preference-Based Reasoning 66
2.2.9. Reinstatement 68
2.2.10. Undercutting in Practical Reasoning 72
2.2.11. Defeasible Reasoning and Probability 73
2.3. Some Notes on Defeasibility in Law and Morality 75
2.3.1. The Idea of Defeasibility in the Practical Domain 75
2.3.2. Defeasibility in Legal Language 77
2.3.3. The Defeasibility of Legal Concepts and Principles 78
2.3.4. Defeasibility and Legal Procedures 79
2.3.5. Overcoming Legal Defeasibility? 80
2.4. Heuresis and Coherence Evaluation 81
2.4.1. The Construction of Conjectures 81
2.4.2. Functions of Heuresis 82
2.4.3. Heuresis and Ratiocination: An Overview 83

Chapter 3 - The Doxification of Practical Reasoning 87

3.1. Doxification 87
3.1.1. Adoption-Worthiness and Bindingness 88
3.1.2. The Notion of Doxification 89
3.1.3. The Rationale for Doxification 90
3.1.4. The Doxification of Conative States 92
3.1.5. The Idea of Cognitive Bindingness 93
3.1.6. The Doxification of Cognitive Instructions 96
3.2. The Projection of Practical Beliefs 99

3.2.1. Doxified Shall-Intentions 100
3.2.2. Doxifying May-Intentions 101
3.3. Normative Beliefs and Normative States of Affairs 102
3.3.1. Normative States of Affairs and Current Cognitive States 103
3.3.2. Normative States of Affairs and Optimal Cognitive States 106
3.3.3. Cognitive Optimality and Collective Inquiry 109
3.3.4. Cognitive Optimality and Dialogues 111
3.3.5. The Supervenience of Normative States of Affairs 114
3.3.6. The Relativisation of Practical Cognition 117
3.3.7. Practical Cognition and the Existence of Normative States of Affairs 118

Chapter 4 - Rationalisation, Reflexivity, Universality 121

4.1. Rationalisation 121
4.1.1. Upwards Practical Reasoning 121
4.1.2. Rationalisation and Critical Thinking 123
4.1.3. Rationalisation in Legal Reasoning 124
4.1.4. Practical Theories and Their Coherence 125
4.2. Reflexive Reasoning and Universality 127
4.2.1. Planar and Reflexive Reasoning 127
4.2.2. Reasoning and Meta-Reasoning 128
4.2.3. Descriptive and Ideal Rationality 131
4.2.4. Particularised and Universal Rationality 131
4.2.5. Limits of Rationality 133
4.3. An Example in Practical Reasoning 136
4.3.1. Creon's Reasoning 136
4.3.2. Antigone's Reasoning 141
4.3.3. Comparison of the Two Reasonings 142

Chapter 5 - Bounded Rationality: Cognitive Delegation 145

5.1. The Notion of Bounded Rationality 145
5.1.1. The Limitations of Human Rationality 146
5.1.2. Substantive and Procedural Rationality 147
5.2. Bounded Rationality and Teleology 150
5.2.1. Failure to Achieve Teleological Optimality 151
5.2.2. The Evaluation of Outcomes 153
5.2.3. Pareto Efficiency 155
5.2.4. Weighing Alternatives 156
5.2.5. Simplifying Evaluations 158
5.3. Cognitive Delegation and Authority 161

5.3.1. The Concept of Delegation 162
5.3.2. Types of Cognitive Delegation 163
5.3.3. Authority and Normative Power 165
5.3.4. Rules and Teleology 166
5.3.5. The Notion of an Exclusionary Reason 167
5.3.6. Exclusionary Reasons and Normative Delegation 170
5.3.7. Authorities as Exclusionary or Independent Reasons 171
5.3.8. Commands and Reasons 172
5.3.9. The Independence of Normative Syllogism from Teleological Reasoning 173

Chapter 6 - Bounded Rationality: Factors 177

6.1. Propensities 177
6.1.1. Propensities and Intentions 177
6.1.2. Factors and Teleology 178
6.1.3. Logical Function of Propensities 180
6.2. Factors 181
6.2.1. Binary Factors and Dimensions 182
6.2.2. Factors and Principles 183
6.2.3. Factors, Dimensions and Standards 186
6.2.4. Factors in Legislation 187
6.2.5. Factors in Case-Based Reasoning 189
6.2.6. The Role of Factors in Practical Inference 190
6.2.7. Factors, Dimensions, and Prototypes 191

Chapter 7 - Preference-Based Reasoning: Rules 195

7.1. Rules and Preferences 195
7.1.1. Undecided Conflicts 195
7.1.2. Priority Beliefs 197
7.2. Kinds of Rule Preferences 199
7.2.1. Source-Based Priority 199
7.2.2. Time-Based Priority 200
7.2.3. Specificity-Based Priority 202
7.2.4. Checking Specificity 205
7.2.5. Priority of Exceptions 207
7.2.6. Value-Based Priorities 208
7.2.7. Factor-Based Priorities 211
7.3. Reasoning with Rule-Priorities 212
7.3.1. Multiple Priorities and Their Ordering 212
7.3.2. General Priority-Rules 214
7.3.3. Meta-Priorities 215
7.3.4. Reasoning with Priorities and Belief Revision 217

Chapter 8 - Preference-Based Reasoning: Factors 221

8.1. Reasoning with Factors 221

8.1.1. An Example in Factor-Based Reasoning 221

8.1.2. Factor-Based A-Fortiori *Reasoning* 222

8.1.3. Factor-Based Inference 224

8.1.4. From Binary Factors to Dimensions 225

8.1.5. Dimension-Based Inference 231

8.1.6. Dimensional A-Fortiori *Reasoning* 233

8.2. The Accrual of Reasons 233

8.2.1. The Accrual Thesis 234

8.2.2. The Negation of the Accrual Thesis 234

8.2.3. A Terminological Clarification 235

8.2.4. Merging and Adding Reasons 236

Chapter 9 - Multi-Agent Practical Reasoning 241

9.1. The Concerns of an Agent 241

9.1.1. Three Types of Concerns 241

9.1.2. The Construction of Collective-Directed Concerns 242

9.1.3. Reasoning and Collective-Directed Concerns 244

9.2. Acting in a Social Context 247

9.2.1. External Motivation and Threats 248

9.2.2. Double Contingency 251

9.3. Strategic Dilemmas 252

9.3.1. Prisoner's dilemmas 253

9.3.2. Prisoner-Dilemma Structured Situations 256

9.3.3. The Tragedy of the Commons 258

9.3.4. Strategic Dilemmas and Collective Concerns 258

9.3.5. Coordination Dilemmas 260

9.3.6. Salience 261

9.3.7. Assurance Dilemmas 264

Chapter 10 - Collective Intentionality 267

10.1. Coordination and Collective Intentionality 267

10.1.1. Collective Cognitive States 268

10.1.2. Collective Rationality and Collective Cognitive States 270

10.1.3. Rational Adoption of a Collective Cognitive State 274

10.1.4. Collective and Plural Optimality 277

10.1.5. The Gamble of Participation 279

10.2. Participation as a Coordination Game 281

10.2.1. Salience as a Guide to Success 281

10.2.2. Rational Participation and Consent 282

10.2.3. Rational Participation in a Future Collective State of Mind 284
10.2.4. The Intrinsic Value of Participation 285
10.2.5. The Process of Collective Reasoning 286
10.2.6. Collective Practical Theories 288
10.2.7. Collective Adoption of Multi-Agent Plans 289
10.2.8. Collective Adoption of Acceptance Policies 291
10.2.9. Collective Normative Beliefs 292
10.3. Sanctions and Assurance 294
10.3.1. The Possibility of Non-Compliance 294
10.3.2. The Role of Sanctions 295
10.4. Plural Legal Intentionality 298
10.4.1. Collective Reasoning and Authoritarianism 299
10.4.2. Collective Values 300

Chapter 11 - Collective Cognition and Dialogues 303

11.1. Dialogues and Cognition 303
11.1.1. Dialogues and Dialectical Systems 304
11.1.2. How to Characterise Dialectical Systems 307
11.1.3. The Structure of Dialectical Systems 308
11.1.4. The Persuasion Dialogue: The Structure 310
11.1.5. The Persuasion Dialogue: The Position of the Parties 312
11.1.6. Other Kinds of Dialogue: Information Seeking, Negotiation, and Reconciliation 313
11.1.7. Combination of Dialogues, Dialogue Shifts, and Inversion of the Burden of Proof 315
11.2. Dialogues and Procedures 317
11.2.1. What Dialogues for What Procedures 318
11.2.2. Dialogue and Collective Choices 320
11.2.3. Deliberation, Democracy and Cognition 323
11.2.4. Adversarial Models of Legal Argumentation 326
11.2.5. Formal Analyses of Legal Disputation 327

Chapter 12 - Cognitive and Legal Bindingness 331

12.1. The Paradox of Legal Validity 331
12.2. A Legal Example 333
12.2.1. Prima-Facie *Reasoning* 334
12.2.2. The Adoption (Endorsement) of a Legal Rule 335
12.2.3. Substantive Adoption Policies 336
12.3. Validity, Bindingness, Adoptability 338
12.3.1. The Social Impact of Legal Reasoning 339
12.3.2. Legal Reasoning as a Contribution to the Legal Process 340

12.3.3. Participation in Legal Beliefs 342
12.3.4. Reasoning about Legal Bindingness 343
12.4. Bindingness and Rationality 344
12.4.1. Convergence as a Ground for Bindingness 345
12.4.2. Why Share Legal Rules and Meta-Rules 346
12.4.3. Participation in Currently Shared Rules 348
12.4.4. Participation in Future Rules 352
12.4.5. Coordination and Prioritisation 353

Chapter 13 - The Foundation of Legal Bindingness 357
13.1. Definitional and Substantive Issues 358
13.1.1. Definitions of Legal Bindingness 358
13.1.2. Grounds for Bindingness 359
13.1.3. Terminological Disputes and Substantive Disagreement: The Stance of the Enactment Positivist 362
13.1.4. Terminological Disputes and Substantive Disagreement: The Stance of the Practice Positivist 364
13.1.5. Terminological Disputes and Substantive Disagreement: The Stance of the Inclusive Positivist 365
13.1.6. The Normativity of Legal Bindingness (Validity) 366
13.2. Political Conflicts and Legal Bindingness 368
13.2.1. Legal Bindingness and Optimal Law 368
13.2.2. Unacceptability on Substantive Grounds 371
13.2.3. Constitutions and Constitutionalism 374
13.2.4. Law, Power, Sovereignty 377
13.2.5. Legal Bindingness and Moral Bindingness 378
13.2.6. Bindingness Propositions 380
13.2.7. Legal Reasoning and Detachment 381
13.2.8. Legal Reasoning and Shared Legal Opinions 383
13.2.9. Overcoming the Paradox of Legal Validity 385

Part II Legal Logic 387

Chapter 14 - Law and Logic 389
14.1. Introduction: Logic and Legal Reasoning 389
14.1.1. The Attraction between Law and Logic 389
14.1.2. The Conflict between Law and Logic 389
14.2. Deduction and Formal Logic in Legal Reasoning 393
14.2.1. The Deductive Model of Legal Reasoning 394
14.2.2. Deduction and Anticipation 395
14.2.3. The Tension between Legal Logic and Legal Practice 397

14.2.4. The Anti-Deductive Critiques 398
14.2.5. Defences of the Axiomatic-Deductive Model 401
14.2.6. Legal Logic Beyond Deduction 403

Chapter 15 - Classical Logic and the Law 405

15.1. Propositional Logic 405
15.1.1. Propositional Formalisation 406
15.1.2. Propositional Connectives 407
15.1.3. Normalisation 409
15.1.4. Inference Rules for Propositional Logic 413
15.2. The Application of Propositional Logic to the Law 418
15.2.1. Material Conditional and Hypothetical Propositions 418
15.2.2. Ex Falso Sequitur Quodlibet *in Legal Reasoning* 419
15.2.3. Logical Inference and Truth-Preservation 420
15.3. Predicate Logic and the Law 421
15.3.1. Predicates and Terms 422
15.3.2. Quantifiers 423
15.3.3. Inference Rules for Predicate Logic 424
15.3.4. Normative Syllogism 425
15.4. Time in Predicate Logic 430
15.4.1. Propositions and Fluents 432
15.4.2. From Fluents to Propositions 433
15.4.3. Representing Temporally-General Rules 435
15.5. Conclusions on Predicate Logic in the Law 436

Chapter 16 - Actions 439

16.1. The Characterisation of Actions 439
16.2. Logical Analysis of Action 440
16.2.1. Two Action-Operators 440
16.2.2. The Logic of Action 442
16.2.3. Actions-Descriptions as Propositions and as Terms 445
16.2.4. Connections Between Behavioural and Productive Actions 447
16.3. Omission 447
16.3.1. The Notion of an Omission 448
16.3.2. Logical Analysis of Omission 449
16.3.3. Some Abbreviations for Representing Actions 450

Chapter 17 - Deontic Notions 453

17.1. Obligation 454
17.1.1. The Representation of Obligations 454
17.1.2. Positive and Negative Obligations 455

17.2. Prohibition 456
17.2.1. The Representation of Prohibitions 456
17.2.2. Connections between Obligation and Prohibition 457
17.3. Permission 458
17.3.1. The Representation of Permissions 458
17.3.2. Positive and Negative Permission 459
17.3.3. Connections between Obligations, Prohibitions, and Permissions 459
17.3.4. A Fourth Deontic Status: Facultativeness 462
17.3.5. Commands and Deontic Statuses 464
17.4. An Axiomatisation for Deontic Reasoning 465
17.4.1. Relationships between Obligations and Permissions 466
17.4.2. Reasoning Schemata for Action Logic and Deontic Logic 466
17.5. Negative Corollaries on Permission 467
17.5.1. Permission Does Not Entail Facultativeness 468
17.5.2. Permission Does not Entail Prohibition to Prevent 468
17.5.3. Permission Does Not Presuppose Prohibition 470
17.6. General Deontic Propositions 471
17.6.1. The Representation of Categorical Deontic Propositions 472
17.6.2. Personally-General and Specific Deontic Propositions 473
17.7. Standard Deontic Logic and Deontic Paradoxes 473
17.7.1. Standard Deontic Logic 474
17.7.2. Paradoxes of Standard Deontic Logic 475
17.7.3. How to Avoid Deontic Paradoxes 478

Chapter 18 - Negation, Permission, and Completeness 479

18.1. Permission, Ignorance, Non-Derivability 479
18.1.1. Being Permitted and Not Being Prohibited 479
18.1.2. Permission as Ignorance 481
18.1.3. The Case of Socrates, the Judge Who Knows That He Does not Know 483
18.1.4. Permission as Non-Derivability 484
18.2. Completeness of the Law 488
18.2.1. The Completeness of Legal Cognition: A Noble Dream? 488
18.2.2. Completeness of Sections of the Law 491
18.2.3. Closure Meta-Rules 492
18.2.4. Strong Permission and Weak Permission 493
18.2.5. Closure Rules and Bounded Legal Cognition 494
18.2.6. Ignorance and Autoepistemic Inferences 496

18.2.7. Some Conclusions on Negation, Permission, and Completeness 497

Chapter 19 - Obligational Concepts 499

19.1. Teleology of Normative Propositions 499
19.1.1. The Teleological Stance toward Normative Propositions 499
19.1.2. A Notation for Normative Teleology 501
19.2. Directed Obligations 503
19.2.1. Other-Directed Obligations 503
19.2.2. The Representation of Other-Directed Obligations 504
19.2.3. Other-Directed Permissions 505
19.2.4. Reasoning with Directed Obligations 506
19.3. Obligational Rights 507
19.3.1. Representation of Obligational Rights 507
19.3.2. The Benefit Theory of Rights 508
19.4. A Formalisation the Hohfeldian Obligational Set 510
19.4.1. The Hohfeldian Obligational Set: Original Formulation 510
19.4.2. The Hohfeldian Obligational Set: Logical Reformulation 511
19.5. Further Kinds of Rights 513
19.5.1. Permissive Rights 513
19.5.2. Absolute and Relative Rights 514
19.5.3. Exclusionary Rights 516
19.6. Rights and Norms 517
19.6.1. Rights in Authoritarian Legal Systems 517
19.6.2. The Supposed Conflict between Rights and "Norms" 518

Chapter 20 - Normative Conditionals and Legal Inference 521

20.1. The Cognitive Function of Normative Conditionals 521
20.1.1. Conditional Instructions and Propositions 521
20.1.2. Kinds of Normative Conditionals 522
20.2. Specific and General Normative Conditionals 523
20.2.1. Specific Normative Conditionals 523
20.2.2. Normative Conditionals and Causality 524
20.2.3. General Normative Conditionals 526
20.2.4. Operative Facts, Precondition-Types and Tokens 527
20.2.5. Must and Relative Necessity 529
20.3. The Negation of Normative Conditionals 532
20.4. Inferences for Normative Conditionals 534
20.4.1. Detachment 534

20.4.2. Specification and Universal Conditionals 534
20.4.3. Normative Syllogism 535
20.4.4. Chaining Syllogisms 536
20.4.5. Syllogism and Subsumption 537
20.4.6. Subsumption Rules 540
20.4.7. Subsumption and Learning 542
20.5. Inapplicable Inferences 544
20.5.1. Inferring a Conditional from a Falsity 544
20.5.2. Normative Conditionals and Contraposition 546

Chapter 21 - Varieties of Normative Conditionals 549

21.1. Types of Normative Conditionals 549
21.1.1. Different Kinds of Normative Determination 549
21.1.2. Counts-as Connections and Constitutive Rules 551
21.2. Intermediate Legal Concepts 553
21.2.1. Alf Ross's Theory of Legal Concepts 553
21.2.2. The Inferential Meaning of Intermediate Legal Concepts 558
21.2.3. Cognitive Function of Non-Deontic Legal Concepts 559
21.3. Kelsen's View of Legal Conditionality 563
21.3.1. Causality and Imputation 564
21.3.2. Problems with the Kelsenian Conditionality 564
21.4. Normative Conditionals and Time 566
21.4.1. Temporal Predicates 567
21.4.2. Temporally Specific Normative Initiation 567
21.4.3. Temporal Generality and Normative Initiation 568
21.4.4. Temporal Persistence 569
21.4.5. Temporalised Normative Syllogism 571
21.4.6. Time and Normative Emergence 572
21.4.7. Temporalised Counts-As 574

Chapter 22 - Potestative Concepts 577

22.1. Powers and Potestative Rights 577
22.1.1. Generic Power 577
22.1.2. Action-Power 579
22.1.3. Abstract Action-Power 581
22.1.4. Enabling Power 581
22.1.5. Potestative Right 583
22.1.6. Powers and Permissions 583
22.2. A Formalisation of the Hohfeldian Potestative Set 585
22.2.1. The Hohfeldian Potestative Set: Original Formulation 585
22.2.2. The Hohfeldian Potestative Set: Logical Reformulation 585

Chapter 23 - Proclamations 589

23.1. The Intentional Production of Legal Results 589
23.1.1. Rechtsgeschäft *and Contract* 589
23.1.2. Contracts and Autonomy 591
23.2. The Notion of a Proclamation 593
23.2.1. The Definition of a Proclamation 593
23.2.2. Proclamations and Intentions 594
23.2.3. Proclamations as Attempts 595
23.2.4. Proclamation Rules 596
23.3. The Logic of Proclamation-Based Inference 597
23.3.1. The Naive Formulation 597
23.3.2. The Problem of Substitutional Quantification 598
23.3.3. How to Climb Ramsey's Ladder 601
23.3.4. Our Representation of Meta-Syllogism 604
23.4. The Analysis of Proclamations 606
23.4.1. The Content of Proclamations 607
23.4.2. Effective and Void Proclamations 608
23.4.3. Multi-lateral Proclamations (Agreements) 609
23.4.4. The Logic of Proclamations 610

Chapter 24 - Proclamative Power 613

24.1. The Notion and the Inferential Role of Proclamative Powers 613
24.1.1. Proclamative Power and Legal Inference 614
24.1.2. Proclamative Power and General Inferences 616
24.2. Kinds of Proclamative Power 617
24.2.1. The Power to Create and Terminate Obligations 617
24.2.2. The Power to Confer Permissions 618
24.2.3. Empowerment to Command 619
24.2.4. Empowerment to Renounce a Power 620
24.2.5. Power to Transfer Property 620
24.3. Empowerment to Empower 621
24.3.1. Conferring Powers 621
24.3.2. Representation 623
24.3.3. Limitations to Individual Legal Autonomy 626
24.4. Public Powers as Proclamative Powers 627
24.4.1. Proclamations and the Dynamics of the Law 628
24.4.2. Legal Dynamics and the Applicability of Logic to the Law 630
24.4.3. Judicial Powers and Logic in the Law 633

Chapter 25 - Normative Texts and Sources of Law 637

25.1. Proclamations and Their Interpretation 637

25.1.1. The Efficacy of Proclamations 637
25.1.2. The Double Effect of Proclamations 638
25.1.3. Proclaimed Sentences 640
25.1.4. The Bindingness of Proclaimed Sentences 641
25.1.5. The Interpretation of Proclamations 646
25.1.6. Problems in Legal Interpretation 647
25.1.7. Criteria for Interpretation 651
25.2. Sources of Law 653
25.2.1. Custom 653
25.2.2. Precedent 655
25.2.3. Legal Doctrine as a Source of the Law 656
25.2.4. The General Idea of a Source of Law 657
25.3. A Logic for Legal Pluralism 659
25.3.1. The Need for a Pluralist Legal Logic 659
25.3.2. An Example in Pluralist Normative Reasoning 661
25.3.3. An Analysis of Pluralist Normative Reasoning 662

Chapter 26 - Argumentation Frameworks 669

26.1. From Inference Steps to Arguments 670
26.1.1. The Notion of an Argument 670
26.1.2. Some Notational Devices 671
26.1.3. The Lebach Example 672
26.1.4. Arguments and Premise Sets 674
26.1.5. Subarguments 676
26.2. Meta-Level Arguments 677
26.2.1. A Meta-Level Argument 678
26.2.2. Synthetic and Analytic Arguments 679
26.2.3. Another Meta-Level Argument 679
26.3. Collisions between Arguments 679
26.3.1. The Idea of a Collision between Arguments 679
26.3.2. Rebutting Collisions 682
26.3.3. Undercutting Collisions 682
26.3.4. Locating Undercutting Attacks 684
26.4. Argument Defeat 685
26.4.1. The Notion of Argument Defeat 686
26.4.2. Decisive Subreasons and the Evaluation of Colliding Reasons 689
26.4.3. The Preference Relation over Reasons 691
26.4.4. The Reinstatement of Defeated Arguments 692

Chapter 27 - Argument Logic 695

27.1. The Status of Arguments 695

27.1.1. Requirements of an Argument Logic 695
27.1.2. Justified, Defensible, and Overruled Arguments 696
27.1.3. Semantics and Proof Theory 697
27.2. The Semantics of Inferential Justifiability 698
27.2.1. Prima-facie *defeat* 698
27.2.2. Acceptability of Arguments 699
27.2.3. Admissibility of Sets of Arguments 701
27.2.4. Justified Arguments 702
27.2.5. A Formal Characterisation of Inferential Justifiability 703
27.3. A Proof-Theory for Inferential Justifiability 704
27.3.1. Proof Trees 705
27.3.2. The Proof of an Argument 706
27.3.3. Applications of the Proof-Method 709
27.3.4. Ross's Paradox of the Self-Amending Constitution 713
27.3.5. A Solution to the Self-Amendment Paradox: Non-Retroactivity 722
27.3.6. A Second Solution to the Self-Amendment Paradox: An Interpretative Assumption 725
27.4. Extensions of the Basic Model 727
27.4.1. Representing Non-Provability 727
27.4.2. Non-Provability and Burden of Proof 729
27.4.3. Combining Defeasible and Conclusive Inferences 732

Chapter 28 - Cases and Theory Construction 735

28.1. Case-Based Reasoning as Theory Construction 735
28.1.1. Cases and Theories 735
28.1.2. Levels of Explanation and Justification 738
28.2. The Construction of a Theory 740
28.2.1. The Example 741
28.2.2. The Background of Theory Construction 741
28.2.3. The Components of a Theory 744
28.2.4. Including Cases and Factors 744
28.2.5. Constructing Rules 745
28.2.6. Constructing Preferences 746

Chapter 29 - Theory-Based Dialectics 751

29.1. The Basic Model 751
29.1.1. Constructing Theories and Explaining Cases 752
29.1.2. A Simple Theory 753
29.1.3. The Introduction of a New Case 754
29.1.4. Theory-Based Distinguishing 755
29.1.5. Arbitrary and Value-Based Preferences 756

29.1.6. Evaluating Theories 758
29.2. Argument Moves and Theory Construction 760
29.2.1. Citing a Case 761
29.2.2. Counterexamples and Distinctions 762
29.2.3. Emphasising Strengths and Showing Weaknesses not Fatal 765
29.3. Dimensions in Theory Constructions 765
29.3.1. Dimensions and the Representation of Cases 765
29.3.2. Dimensions and Values 767
29.3.3. The Extraction of Factors 768
29.3.4. Additional Reasoning Moves 771
29.4. Stratified Legal Theories 773
29.4.1. Hierarchies of Factors 774
29.4.2. Downplaying a Distinction 775
29.4.3. Distinguishing, Downplaying, and Distinguishing Again 778
29.5. Further Extensions of Our Model 783
29.5.1. Metrics for Theory Coherence 783
29.5.2. Comparison of Values 785
29.5.3. Changes in the Social Context 785
29.5.4. Links to Case-History 787
29.5.5. Other Ways of Analogising 788

A NOTE ON THE AUTHOR

Giovanni Sartor is currently professor of Computer and Law at the University of Bologna, after obtaining the PhD at the European University Institute (Florence), working at the Court of Justice of the European Union (Luxembourg), being a researcher at the Italian National Council of Research (ITTIG, Florence), and holding the chair in Jurisprudence at Queen's University of Belfast (where he now is honorary professor). He is co-editor of the *Artificial Intelligence and Law* Journal and has published widely in legal philosophy, computational logic, legislation technique, and computer law. Among his publications are *The Law of Electronic Agents* (Oslo: Unipubskriftserier, 2003), *Judicial Applications of Artificial Intelligence* (Dordrecht: Kluwer, 1998), *Logical Models of Legal Argumentation* (Dordrecht: Kluwer, 1996), and *Artificial Intelligence in Law* (Oslo: Tano, 1993).

PREFACE

First of all, I thank Enrico Pattaro, with whose help and guidance I have been able to develop my research so far, starting from my undergraduate studies, and who has given me the chance of participating in the Treatise project. Also on this occasion, as on many previous ones, his support and his advice have been invaluable to me. I am very grateful to the participants in the Treatise project, and in particular Aleksander Peczenik, Gerald Postema, Nino Rotolo, Hubert Rottleuthner, and Roger Shiner. I have learned a lot discussing with them, and they have provided me with many useful comments on my manuscript and with a lot of helpful suggestions.

I have also had the opportunity of discussing my volume with many other colleagues and friends, all of whom have been very helpful. In particular, Alberto Artosi, Tom Gordon, Jaap Hage, and Henry Prakken have read parts of the manuscript, making a number of cogent remarks. This book would have been much worse without their help in identifying shortcomings and problems, and in suggesting appropriate remedies. I am equally grateful to Claudia Cevenini and Jonathan Gelati for taking the trouble to proofread the whole manuscript, and for helping me to correct many mistakes, both in linguistic expression and in content.

Since the project of the Treatise has started, I have been working first at the Queen's University of Belfast (at the Law School) and then at the University of Bologna (at the Law Faculty). I am thankful to both Universities for offering me a stimulating environment and the opportunity of reconciling research and teaching. I am also thankful to CIRSFID (the Research Centre of History of Law, Philosophy and Sociology of Law and Computer Science of Law, of the University of Bologna) for supporting my research in many ways, and most of all through the friendly help and advice of its director, Carla Faralli.

Last but not least, my thanks and also an apology are due to my family, my wife Lia and my children Giovanna, Chiara, Galileo, Aldo and Benedetta, in order of appearance. They have put up with me during the preparation of this book, and have been supportive, though I was unable to dedicate to them all the attention they deserve, especially in the last months, when time constraints were pressing.

Giovanni Sartor
University of Bologna
CIRSFID and Law Faculty

INTRODUCTION

The study of legal reasoning not only is one of the main areas of legal theory, probably the one which has been more extensively cultivated during the last decades; it is also the battleground of apparently incompatible methods and approaches. Consider, for instance, the eternal opposition of natural law and legal positivism, the 19th century debate between conceptualist and sociological jurisprudence, the 20th century conflict between legal formalism and legal realism, in all their variants.

We shall here try to elaborate a viewpoint from which it may be possible to combine and integrate such diverse models of legal thinking into one comprehensive perspective. This viewpoint is constituted by the assumption that legal reasoning can be viewed as an application of a broader human competence, that is, *practical cognition* or *practical rationality*, namely, the ability of processing information in order to come to appropriate determinations. Epistemologist Susan Haack has rightly said that science "is a thoroughly human enterprise, messy, fallible and fumbling; rather than using a uniquely rational method unavailable to other inquirers, it is continuous with the most ordinary of empirical inquiry, 'nothing more than a refinement of our everyday thinking,' as Einstein put it" (Haack 2003a, 9–10). We take a parallel stand with regard to legal reasoning: It is, and should be, nothing more than a refinement of our everyday practical thinking. This stand will have two implications.

First of all, it will enable us to bring to bear on the analysis of legal reasoning the rich variety of studies which address the phenomenon of practical cognition: not only logic and philosophy, but also psychology, cognitive science, artificial intelligence, game theory and decision theory.

Secondly, it will lead us to view various jurisprudential ideas (for instance, reference to rules, goals, intentions, factors, principles, values, coherence, dialectics) as different aspects of a unique cognitive process—each having a specific function to play, and each being able to contribute, within its proper bounds, to the project of legal rationality—rather than as pointers to incompatible alternative approaches to legal problem-solving.

Our work is divided into two parts. The first is dedicated to embedding legal reasoning within practical cognition, and to fitting the various aspects of legal reasoning in this broad picture. After considering the nature of practical cognition, we shall focus on practical reasoning, and we shall discuss in particular the following aspects: reasoning with rules, goals, preferences, factors, and values; bounded, strategical and dialectical rationality; collective reasoning and

the participation in collective intentionality; the rational endorsement of legally binding normative propositions.

The second part is aimed at providing, with the help of logical analysis, a more precise and accurate account of the fundamental forms of legal reasoning. Among such forms, we shall consider deontic modalities, Hohfeldian concepts, normative conditionals, legal acts and powers, legal sources, argumentation, and theory construction.

Notwithstanding the considerable length of this volume, we shall not be able to review all approaches to legal reasoning, and particularly we shall not be able to consider many of the most recent studies. This depends on the limitations of our knowledge, but also on the fact that our domain of inquiry is so large that a selection is inevitable, and it needs to be made with regard to relevance for the particular perspective we intend to develop.

Part I

Legal Reasoning and Practical Rationality

Chapter 1

PRACTICAL RATIONALITY

In this chapter we shall sketch a general account of practical reasoning, in order to provide the basis for our model of legal reasoning. This reflects the idea that legal reasoning can be viewed as an application of a more general human competence, which we call *practical rationality*. Practical rationality is a fundamental aspect of *rationality*, by which we mean the appropriate way of processing information through reasoning. As we shall see, practical rationality complements *theoretical rationality*, the other fundamental aspect of rationality.

The account of practical and legal reasoning in Part I of this volume is going to be informal. In Part II, some of the notions introduced will be made more precise, and will be characterised with the help of a (moderate) logical formalism.

1.1. Implicit Cognition

Rationality is a capacity that cannot be appreciated in isolation, as a feature of a disembodied pure intelligence: It is a function that is performed by real agents and it is grafted on the top of other cognitive capacities of such agents.

As we shall see, rationality is a significant addition to these other cognitive capacities, since it provides a flexible way of extending, controlling and refining their output, but it would be a useless symbol grinding mechanism if it were separated from them. Therefore, to appreciate the role of rationality, we need first to analyse other forms of information processing, which we group under the heading of *implicit cognition*. These forms of cognition include those ways of information processing that take place within an agent, but are inaccessible to the consciousness of the agent itself,[1] though the agent may have access to their outcome. We shall distinguish two basic types of implicit cognition:

- *fixed reflexes*, which are hard-wired into the agent, and
- *conditioned reflexes*, which are dynamically adapted to the environment.

[1] We use the term *agent* in a very general sense, namely, to refer to any entity capable of autonomous action. This includes not only humans, but also animals and even some artificial entities, like physical robots and virtual ones (the so-called software agents). On the agency of autonomous automata, cf., among the others, Pollock 1989; Pollock 1995; Wooldridge 2000, 1ff.; for a legal discussion, Bing and Sartor 2003. On rule-governed interaction of software agents, see Artikis et al. 2002.

We shall then consider those more complex cognitive functions that are provided by specialised cognitive organs.

1.1.1. Fixed Reflexes

Fixed reflexes connect certain environmental inputs (impacting on the agent's sensors) to certain behavioural responses. These reflexes never change during the agent's life. An agent having only fixed reflexes is incapable of learning, since its behavioural responses are completely determined by the input-output function that is implemented into its physical make-up: Every time the agent receives a certain type of input, it will reply with the same kind of action.

For such agents, learning may take place only with regard to the species, thanks to *evolution*. If the reproduction mechanism of a species is capable of producing variations, then those variations will preferentially survive and reproduce, which have reflexes that are best fit to the environment. Therefore, the species will "learn" (become more adapted to its environment), as the generations pass one unto another, even if the behaviour of each individual is unchangeably defined by its input-output functions. As Popper (1976, sec. 37, 179ff.) observes:

> Life as we know it consists of physical "bodies" (more precisely, structures) which are problem solving. This the various species have "learned" by natural selection, that is, to say by the method of reproduction plus variation, which itself has been learned by the same method.

Agents having fixed reflexes can be biological ones, such as viruses, bacteria, plants, animals, but also artificial ones, such as certain robots and computer programs. In the latter case, the reproduction mechanism is usually the process of fabrication, rather than self-replication, while variation and selection will be operated by experiments and choices of designers, rather than by natural selection (though the development of new artificial agents through self-replication is increasingly popular, as in genetic approaches to computing). In humans, fixed reflexes provide for all basic bodily functions, from processing food, to preserving blood pressure and bodily temperature, to the first phases of processing sensory inputs.

It is important to remark that, even if evolution (or the project of the agent's creator) has given an agent reflexes which are adapted to the agent's environment (i.e., reflexes which provide for survival of the agent and persistence of its species), an agent having fixed reflexes is not reacting directly to its chances of survival and reproduction. There is no teleology at work, as far as the individual is concerned. The individual agent is only blindly reacting to certain features of its environment, as its sensors perceive them.

Teleology, in a sense, works at the level of the species, through selective evolution: The species may change so as to meet the requirements of the environ-

ment (thanks to the higher reproductive success of agents having better-adapted reflexes). Consider for example, how viruses tend to evolve into forms that are not attackable by the available drugs. More generally, Darwinian evolution will tend to endow species with biological solutions that are appropriate to their survival problems: In this sense we may say that evolution engages in a kind of design work, if this is generally understood as "the work of discovering good solutions for problems that arise" (Dennett 1996, 133).

1.1.2. Conditioned Reflexes

A more complex type of implicit cognition is provided by *conditioned reflexes*, that is, by the mechanism of *operant conditioning*, the key idea of behaviourist psychology (Skinner 1953). Agents endowed with conditioned reflexes have the capacity or *learning*, by acquiring and modifying their reflexes. Let us consider briefly what architecture may underlie such capacity.

First, there are certain states of the agent that act as *positive reinforcers* for its reflexes. This means that when an action, triggered by a certain input, produces a reinforcing state, the agent will increase its tendency to replicate this action in the future, in response to the same type of input: The activation of the positive reinforcer will start or strengthen the activating reflex. Similarly, there are other internal states that act as *negative reinforcers*. This means that when an action, triggered by a certain input, activates a negative reinforcer, the agent will tend to refrain from responding to that input with that action: The activation of the negative reinforcer will weaken or even cancel the activating reflex.

Conditioned reflexes are not rigidly fixed: They can change, according to the impact of practising each reflex on positive or negative reinforcers. Reinforcers, on the contrary, are usually embedded in the agent's architecture, and they are linked to physiological states that usually favour the survival of the agent (though they may be reinforced according to the impact of their satisfaction on further, higher level, reinforcers).

Secondly, to be capable of acquiring new conditioned reflexes (of learning them) an agent also needs a mechanism for generating some variations in its behavioural responses to external stimuli. The variations that activate a positive reinforcement will then tend to be transformed into new reflexes.

Such a learning mechanism can even lead to the modification of the reflexes, that is, to their *generalisation* (extension to further inputs) or to their *specialisation* (restriction to a reduced set of inputs). On the one hand, when a behavioural response, originally linked to a certain class of inputs, results in positive reinforcement after being practised with regard to a new input, that response can be linked also to the new input (generalisation). On the other hand, when a behavioural response, originally linked to a certain class of inputs, results in negative reinforcement after being practised with regard to a particular instance of that class, the corresponding reflex can be specialised (the class of

inputs which activate the reflex is restricted), so that the response is no longer triggered by that particular input (specification). For example, animals may expand the range of the foods they tend to approach, after enjoying new foods, or may restrict it after bad gastronomic experiences.

Finally, conditioned reflexes provide an unconscious form of analogy, being susceptible of being activated also by inputs that that are only similar to those which were experienced by the agents in the past.

We cannot consider here the type of mechanisms that provide an agent with conditioned reflexes. In fact it seems that conditioned reflexes can be implemented in similar ways into different types of structures, from biological ones, as in neuronal connections in brains, to electronic ones, as in electronic neural networks.[2] In any case, an agent endowed with conditioned reflexes is characterised by the disposition to react to certain situations with the activation of a reinforcer, and by the capacity of strengthening the reflexes that are followed by (the production of such situations and therefore by) the activation of a positive reinforcer.

Consider, for example, a robot that moves in an environment where plugholes with different shapes are available, each type of plughole being susceptible of providing the robot with a different amount of electricity. Let the resulting increase (decrease) in the electrical charge of the robot be the positive (negative) reinforcer for the act of plugging into different kinds of plugholes. We can expect that such a robot, after exploring the available holes, will tend to (will have "learned to") plug into those holes-shapes that provide it with more electricity, and to avoid those holes-shapes that provide less or no energy.

We have spoken loosely of positive and negative reinforcers, meaning those internal states that determine a positive or a negative reinforcement. We may want to give a bio-psychological interpretation of this notion, assimilating positive reinforcers with pleasure and negative reinforcers with pain. However, this way of speaking may be sensible only with regard to humans and more sophisticated animals, while being inappropriate for computer devices and probably also for simpler types of animals.

It is also necessary to avoid viewing an individual agent endowed with conditioned reflexes as necessarily aiming to achieve its own survival and reproduction. A reinforcer is activated by certain situations (more exactly, by the sensorial input available in such situations) and not directly by the prospects of survival and reproduction characterising those situations.

It is true that selective evolution tends to ensure a correspondence between the situations activating a positive (negative) reinforcer and the situations con-

[2] On neural networks the classical reference is Rumelhart and McClelland 1986; on the use of neural networks to model legal cognition, see Philipps 1989, Philipps and Sartor 1999a and the contributions in Philipps and Sartor 1999b. On neural network and legal reasoning, see also: Zeleznikow and Stranieri 1995; Hunter 1999; Bourcier and Clergue 1999; Merkl et al. 1999.

tributing to (detracting from) the survival and reproduction of the agent. However, this happens only in the long term: In rare or new circumstances, it may happen that the agent's reinforcers (its drives) make it subject to damage or death.

Consider again the conative robot of the example above. What if new plugholes are introduced with a voltage exceeding the capacity of the robot? The robot (driven by its craving for holes providing more electricity) will insist in plugging into the high voltage holes, until it burns its circuitry. Similarly, let us assume that the favourite food of an animal becomes polluted, so that continuing to eat it will cause the animal's death, without producing any pain in the animal (or at least without producing any pain immediately after consuming the food). Then, eating the food, although not activating any negative reinforcer (or even being accompanied by pleasure) will cause the animal's death. Something similar may happen also to humans. Consider, for example, how our tendency to feed ourselves as much as we can (reinforced by the pleasure of eating) has been a powerful help to survival in times of scarcity, but may nowadays put at risk our health.

The mechanism of conditioned reflexes is a very important way of learning also for humans. It allows humans to get very complex forms of implicit knowledge, which may drive them to the right responses (on the basis of past pleasurable experiences, and of satisfaction associated with success or reward) even when they are not aware of the reasons why such responses were right. This is the kind of knowledge to which Hayek (1977, 41) refers, when he observes that:

> what we call knowledge is primarily a system of rules of action assisted and modified by rules indicating equivalences or differences of various combinations of stimuli.

In connection with our tendency to *imitation*, conditional reflexes provide an important mechanism for *social learning*. Individuals tend to imitate the behaviour of other people, especially when those people are successful or approved in their community, and tend to replicate their own behaviour when it is successful or approved.

1.2. Explicit Cognition

In some sense, a *reactive agent*—which has inherited a set of fixed reflexes and has developed or fine-tuned a set of conditioned reflexes—possesses some *implicit knowledge*: The agent's functioning is adapted to its environment, since its reflexes provide appropriate solutions to the survival and reproduction problems that the agent is likely to meet. In fact the mechanism of inborn and conditioned reflexes is a very powerful one, and many experiments have shown that reactive agents can perform impressively well in various tasks, from recognising

forms and shapes (as in scanning devices), to playing football (as in robot tournaments), to making business decisions (like investments in the stock market).

However this mechanism only provides us with a partial account of the operation of cognition. When considering reflexes, we only focus on *implicit knowledge*, namely, on knowledge that is inherent to the way an agent is built (fixed reflexes), or to the way it developed, interacting with its environment (conditioned reflexes). With regard to implicit knowledge, there is no internal state of the agent, which is specifically intended to represent this knowledge in such a way that the agent may use it as a basis for its further internal processes or external behaviour. This distinguishes implicit knowledge from *explicit knowledge*, namely, knowledge which is represented inside the agent, in such a way that it can be accessed by the agent itself. The use of explicit knowledge (through appropriate cognitive organs) characterises what may be called a *cognitive agent* in a proper sense.

In considering a developed cognitive agent, we need to move beyond the mechanism of reflexes, and thus, beyond *behaviourism*, the approach to psychology which focuses on the connection between external inputs and observable behaviour, disregarding the internal cognitive processes of the agent. We need rather to focus on the specific processes that characterise cognition: According to the approach of *cognitive psychology* we need to analyse the ways in which information is internally processed. This leads us to distinguish different cognitive functions, which are performed by different cognitive organs, both in epistemic and in practical cognition.

1.2.1. Cognitive Functions and Cognitive Organs

We cannot here consider the many theories of various cognitive functions. Just to give an idea of the approach of cognitive psychology, let us recall Marr's (1982) theory of *perception*. According to this theory, the functioning of perception can be explained by distinguishing four modules, which work in sequence, providing the following outputs:

- a representation of the image in the retina (of the intensity of light at each point of the retina);
- a primal sketch, which identifies potentially relevant areas of the image, and their geometrical connections;
- a $2\frac{1}{2}$-D sketch, which makes explicit the orientation and depth of visible surfaces, relative to the observer;
- a 3-D representation, where shapes and their spatial organisation belong to specific objects, independently of the observer's position.

Marr's approach shows how, according to cognitive psychology, one cannot approach the mind as a black box, the behaviour of which is fully determined by

environmental inputs, as in operant conditioning.[3] On the contrary, one can understand a complex cognitive function only by distinguishing the cognitive modules that realise this function, and by specifying the ways in which these modules operate and interact.

Similarly, Chomsky famously argued that our *language* faculty, like other human cognitive faculties, does not reflect the circumstances of our environment: It is rather a complex *mental organ*, which develops, like physical organs do, according to its own (genetically determined, that is, innate) structure:[4]

> The capacity to deal with the number system or with abstract properties of space—capacities that lie at the core of what we might call the human "science forming faculty"—are no doubt unlearned in their essentials, deriving from our biological endowment. [...] These systems have many of the relevant properties of physical organs. We might think of them as mental organs. Thus the human language faculty might well be regarded on the analogy of the heart or the visual system. It develops in the individual under the triggering effect of experience, but the mature systems that grows in the mind [...] does not mirror the contingencies of experience, but vastly transcends that experience. (Chomsky 1987, 420)

According to this author, only some linguistic parameters are provided by the environment (in particular, by the examples given by other speakers), and these parameters provide for the differences between different natural languages, all of which are applications of the same basic mechanism.

From this perspective, the production and the comprehension of linguistic expressions are no adaptations to external stimuli, and in particular are not learned through conditioning. They result from the speaker's possession of a *grammar*, that is, from the fact that the speaker's language organ has been parameterised in such a way as to be able to cope with (produce and decode) the sort of linguistic tokens that the speaker finds in the environment.

The grammar that the speaker has adopted defines the speaker's *linguistic competence*, and can be expressed through a set of rules. One is usually not aware of the grammar one follows, but one applies it unconsciously, when one engages in linguistic performance, namely, when speaking or listening.

The idea that the mind is to be viewed as a set of connected mental organs, whose working is genetically determined, is expressed in general terms by Pinker (1999, 21):

> The mind is what the brain does; specifically the brain processes information, and thinking is a kind of computation. The mind is organised into modules or mental organs, each with a specialised

[3] For a synthetic account of the psychology of perception, and some references, see, for example: Gross 1996, 201ff.; Gregory 1987; van Leeuwen 1998.

[4] Among the many publications in which Chomsky provided and refined his model of our language organ, identifying the common structures of the grammars which enable us to generate correct linguistic expressions (generative grammars), let us just mention Chomsky 1957, which started a revolution in modern linguistic. On the idea that language is genetically determined faculty, see also Pinker 1994.

design that makes it an expert in one arena of interaction with the world. The modules' basic logic is specified by our genetic program.

1.2.2. Reason As a Mental Organ

Here we shall not discuss any longer the cognitive models of various mental faculties, nor shall we address the controversies concerning the extent in which they are innate (determined by human DNA) rather than resulting from environmental inputs (for an interesting introduction to this issue, see Ridley 1999). We shall just focus on *reason* or *reasoning*, which we tend to view as a *mental organ*, like Marr's perception modules or Chomsky's language faculty.

Let us just observe that for Chomsky linguistic competence is an individual possession, rather than a social entity. Here is how he criticises the view that language is a social fact:

> This "externalized language" that Jones and Smith share must be an abstract object of some sort, a property of the community, perhaps [. . .]. Suppose that Smith and Jones have more or less the same shape; we do not conclude that there is a shape that they partially share, and the interactions between Smith and Jones give us no more grounds to suppose that there is a language that they share. (Chomsky 1993, 39–40)

We largely share Chomsky's focus on individual linguistic competence (I-language) and the rejection of social hypostases. In the following, we shall tend to present *rationality* in a similar way, namely, as a "mental organ" that belongs to the individual mind, to the individual psychology. According to this psychological approach the inputs of rationality—its reasons—will be constituted by certain mental or *cognitive* states of the individual reasoner.

Our focus on individual minds (our methodological individualism), as we shall see in the following, does not exclude the communal aspects of human cognition: We accept that, both for language and for reason, individuals use (or, better, "parameterise") their natural organs in such a way as to reproduce those schemata that are practised in their societies (as observed by Millikan 2002), and that they may use such organs to engage in collective cognitive enterprises, and submit to the rules and constraints which are appropriate to such enterprises.

However, we believe that our distinctively cognitive approach, rather than renouncing to capture the social aspects of legal reasoning, provides—compared to purely behavioural accounts—a deeper understanding of such aspects and has higher explanatory power.[5]

[5] This way we hope to be able to overcome criticisms like those that Patterson 2003 raises against cognitive approaches to the law (in particular, Patterson addresses the psychological models of categorisation in Winter 2001, and Amsterdam and Bruner 2000).

In fact, we can understand and forecast people's action in every-day life only by moving beyond observable behaviour and attributing to people cognitive states: We need to try to "understand people's behaviour by coming up with explanatory hypotheses about their beliefs, goals, etc." (Haack 2003a, 166).

Moreover, we can attribute such cognitive states—when no direct evidence is available—only by assuming that people engage in reasoning, i.e., that they often move from possessed cognitive states into new ones according to rationality. We need to adopt this perspective (to view people as carriers of cognitive states, which they often process rationally) in order to understand many social phenomena, and in particular the law.[6]

Our particular perspective—approaching reason as a mental organ, coupled which viewing reasons as mental states—allows us to set aside the distinction between *guiding reasons* and *explanatory reasons*, the first being intended as the facts that justify performing certain actions, the second as the facts that explain why certain actions were performed (on this distinction, see Raz 1975, and Hage 1997, 35).

Since we are interested in the working of reason as a mental faculty or organ, the mental states that lead rationality to draw certain conclusions, according to its correct way of working are necessarily *both* (1) guiding and (2) explanatory:

1. they should lead us (our reason-organ) to such conclusion, since this is what reason does when it is properly working, and at the same time
2. they do lead us to such conclusions, when we properly apply our rationality.

Clearly, the use of rationality as an explanatory hypothesis requires that humans have, as a matter of fact, the faculty of rationality and use it, at least in some occasions.[7]

1.2.3. Epistemic Reasoning

In examining a cognitive agent we need to distinguish two types of cognition: *epistemic cognition* and *practical cognition*.

[6] For a defence of the specific explanatory function of mental states, though inclining towards a dispositional account of them, see Haack 1993, 170ff. The idea of *Verstehen* (understanding), intended as the attribution of mental states to social actors, plays a central role in German historicism (see, for instance, Dilthey 1991) and in Max Weber's sociology (see Weber 1947, 87ff.). On understanding, see also von Wright 1971.

[7] Though there are various social mechanisms (like imitation, or selective evolution) that make humans behave as if they were rational, even when they are not using their rationality. We cannot here discuss this issue, which is related to the well-known and much discussed problems of the explanatory value of economic theories, which typically embed rationality assumptions. This is an issue that has also been discussed with regard to using economic models in the law (Posner 1983, 2ff.), or in politics (Pettit 1993, chap. 5).

Epistemic cognition consists in the agent's capacity of forming internal (mental) states that have the function of representing aspects of the agent's world. We call such states *epistemic states*. We distinguish two types of epistemic states, percepts and beliefs.

Percepts are mental states that are caused by the various mechanisms of perception, which are activated when some input is provided to the agent's sensors (on the distinct cognitive function of percepts and beliefs, see Pollock and Cruz 1999, 84ff.). Perception may concern the external environment (heteroception: sight, hearing, touch, smell, and taste) but also the state of the agent's body (proprioception: the perception of the position and movements of one's limbs).

A *belief* consists in the endorsement of a proposition. To believe a proposition means:

> to adopt it as a basis for further attitudes, choices and behaviour, i.e., to consider the information expressed by it as correct and proceed accordingly in thoughts, and actions. (Lehrer 1990, 36)

In other words, to believe a proposition means to adopt it as a premise of one's reasoning and acting, that is, as something one is ready to think and act upon. We shall put a very low threshold in the "quantity" of endorsement required for belief (on a gradual approach to belief, cf. Haack 1993, 90). So we shall say that one believes a proposition, not only when one is absolutely certain about that proposition, but also when one is aware that one's evidence for that proposition may be overridden by evidence to the contrary (when the belief is defeasible, see Section 2.2 on page 55). We also speak of a belief in a proposition when one only adopts the propositions as a *hypothesis*, i.e., as a premise for one's further epistemic inquiries, but not (yet) for one's action.

An agent endowed with the faculty of epistemic cognition processes external inputs and obtain epistemic states. Then the agent reasons, producing new mental states on the basis of the epistemic states the agent already has. *Epistemic reasoning* is indeed the process through with one builds new epistemic states moving from the epistemic states one already possesses.

Consider, for example, my mental process when I see my youngest child with a broken knee. First my brain will process the visual input provided to my eyes in such a way to provide a perception of the body of the child. My having this mental state (this perception) will start my reasoning. On the basis of this perception I will form the belief that indeed the child has a bodily lesion having certain features. On the basis of the latter belief (and the knowledge I already possess) I will form further beliefs, concerning possible consequences of the injury, the appropriate medication, the time required for the injured child to recover, the type of event that caused the injury, and so on.

Obviously, the same kind of mental process may also take place in a legal framework. Consider for example, how a judge—having to decide a case where compensation is requested for an injury resulting from a traffic accident—will

approach the cognitive task of establishing the features of the injury, its causes, its likely effects. Though the cognitive process of the judge will be also governed by various procedural constraints, within those constraints the judge's cognition will be governed by (and criticisable according to) epistemic rationality.

The reasoning process we have just exemplified, namely, the process of epistemic reasoning, does not proceed randomly: It tends to follows certain schemata, it implements certain procedures. Those schemata and procedures, as we shall see, constitute what we may call *epistemic rationality*.[8]

Assume for example, that I believe that ⌈if the injured knee is dirty, then it may develop an infection⌉[9] and that I also believe that indeed ⌈the injured knee is dirty⌉. This would lead me to believe that the injured knee of the child may develop an infection. Such inference would happen according to a pattern, or *reasoning schema*, which we call *detachment*,[10] and which has the following structure:

Reasoning schema: *Detachment*

(1) believing that A; AND
(2) believing that ⌈if A then B⌉
———— IS A REASON FOR
(3) believing that B

As we shall see in Chapter 2, by a *reasoning schema* we mean in general a transition schema between mental states: A certain combination of certain mental states of the agent, which we call the *precondition* or the *reason* for the application of the schema, leads the agent to having certain other mental states, which we call the *postcondition* or the *conclusion* of the schema.

When the reason is composed of distinct mental states, we say that each one of those mental states is a *subreason* of the schema, and when the conclusion is composed of distinct of mental states we say that each one of those mental states is a *subconclusion* of the schema.

When one reasons, one tends to produce instances of one's reasoning schemata. For example, the schema *detachment* above may be instantiated as follows.

[8] We prefer to use the term *epistemic rationality* when specifically referring to the use of reasoning for getting to factual (epistemic) conclusions, rather than the term *theoretical rationality*, since we shall extend the notion of a theory also to the practical domain (see Section 4.1.4 on page 125).

[9] We use symbols "⌈" and "⌉" to enclose propositions, in particular when we need to specify the scope of an operator which applies to propositions (such as "believing that" or "knowing that"). We shall omit these symbols when the concerned proposition can be immediately and unambiguously detected.

[10] Another name for this reasoning schema is the medieval locution *modus ponens*, or more exactly *modus ponendo ponens*, meaning "the proposing (affirming) method."

Reasoning instance: *Detachment*

(1) believing that the injured knee is dirty; AND
(2) believing that ⌈if the injured knee is dirty, then it (the injured knee) may develop an infection⌉
——— IS A REASON FOR
(3) believing that it (the injured knee) may develop an infection

1.2.4. Practical Reasoning

The practical side an agent endowed with epistemic cognition can still correspond to the model of built-in or conditioned reflexes: These reflexes will be activated by the agent's epistemic states, rather than directly by sensorial input. For example, my believing that food is coming (rather than directly my smelling the food) may start salivation; my believing that something dangerous is happening may determine a state of alert (muscular tension, accelerated cardiac palpitation, and so on).

However, the benefits of epistemic cognition will be mostly significant to agents who can also engage in *practical cognition*. Like theoretical cognition, practical cognition consists in the capacity of forming internal (mental) states. The difference is that these states are not intended to represent the agent's environment: Their function is rather that of guiding the deliberative process of the agent, of playing a role in the process that leads the agent to determine its behaviour.

We call all such mental states (like desires, goals, intentions, and wants) *conative states*. An agent endowed with the faculty of practical cognition possesses conative states, and has the ability of forming new conative states on the basis of its current epistemic and conative states. Practical reasoning is indeed the process through with an agent builds new conative states on the basis of the epistemic and conative states it possesses.

For example, assume that I like ice creams. If I also believe that it is possible for me to get ice creams, then practical reasoning will lead me to have a desire to have one. This desire—together with my beliefs about where ice cream shops are located (there is one near the corner, and another a little further away), their quality (the shop further away is a little better than the nearby one), the money I have in my pocket, etc.—will lead me to make plans on how to satisfy this desire and to inquire on the relative merit of such plans (should I go to the nearby shop, or to the further away, but better one?).

Then, practical reasoning will lead me to adopt one of those plans, in consideration of its advantages (how much I will like my ice cream) and its costs (going there, spending some money, etc.), and also of how it interferes with plans for achieving alternative goals (for example, I may have a plan to keep on working without interruptions to respect a deadline).

Once I have adopted a plan and I have formed further beliefs concerning the circumstances of its implementation, practical cognition will lead me to intend to implement the various steps of my plan. This will lead me to want to implement each one of these steps (getting dressed, getting out of my house, going to the ice cream shop, and so on) when the right time comes. Finally, I will behave correspondingly.

We believe that the processes we have just described—through they lead to practical determinations rather than to epistemic ones—pertain to *reasoning* and *rationality*. Like theoretical reasoning, also *practical reasoning* is a sequence of transitions between mental states. Like theoretical reasoning, also practical reasoning does not take place randomly: It takes place according to certain patterns or standards. These standards constitute the correct way of reasoning with conative states, that is, they constitute *practical rationality*.

1.2.5. The Foundations of Rationality

Our description of (epistemic and practical) rationality as the correct way of reasoning leads us to the philosophical issue of the foundation of rationality (for a discussion, cf. Pollock and Cruz 1999). Why should we consider certain reasoning schemata, and not certain others, as being correct ways of reasoning? For instance, why should we accept *detachment* and reject *wishful thinking* (moving from desiring that a state of affair holds to the belief that this state of affair indeed holds)? We may consider here two possible foundations.

The first is an *internalistic foundation*. We, being rational agents, know how to reason and can tell when we reason correctly and when we do it wrongly. In other words, even when we cannot make our own reasoning schemata explicit, we can monitor our own reasoning, and establish whether it is proceeding correctly or wrongly (though the monitoring process is fallible too). Thus, there is a judge for reasoning, which is reasoning itself (or the rational agent): Our rationality consists in reasoning according to schemata that our reasoning certifies as being correct. This Kantian foundation (reason is the ultimate judge and therefore it is the only one who can engage the critical task of establishing reason's standards of correctness[11] unfortunately looks circular, and violates the basic legal principle that one should not judge one's own case (*nemo judex in causa sua*).

Thus, we may want to explore an *externalistic foundation*. From this perspective, reasoning schemata are rational when they enable us (better than other possible reasoning schemata, given out biological constitution and the nature

[11] "It is a call to reason to undertake anew the most difficult of all its tasks, namely, that of self-knowledge, and to institute a tribunal which will assure to reason its lawful claims, and dismiss all groundless pretensions, not by despotic decrees, but in accordance with its own eternal and unalterable laws" (Kant 1999, Axi–xii).

of our environment) to know our environment, and to act appropriately. Accordingly, practical reasoning can be viewed as a specific technique that enables (certain type of) agents to intervene in the world, and adapt it to their considered likings. This statement indirectly concerns theoretical reasoning too, which by providing appropriate epistemic inputs to practical rationality improves the performance of the latter.

If the agent's considered likings concern states of affair that enhance the agent's chances of survival and reproduction, then rationality also contributes to enhance those chances. Therefore, externalist analyses of reasoning can provide an explanation of the existence of rationality, of why reasoning agents exists in the world: Rationality increases fitness, and thus rationality leads to the preservation and replication of rational agents (and thus of rationality itself), according to the mechanism of selective evolution.[12] Another explanation would, obviously, consist in rational agency resulting from the action of a creator who intended to create embodiments of rationality.[13]

For our purposes we do not need to make a choice between internalist and externalist approaches. We may leave to professional epistemologists the discussion of their comparative merit (on the opportunity not to make unnecessary theoretical commitments in legal theory, see Peczenik, Volume 4 of this Treatise, sec. 3.2). We just need to remark that both foundations of reasoning may be equally applied to epistemic and practical reasoning.

1.3. The Nature of Practical Cognition

We have just said that practical cognition consists in adopting new conative states on the basis of one's current conative and epistemic states. Let us now consider what these conative states may be and when it is rational to adopt or withdraw them.

[12] The opposite thesis—that is, the idea that reason has negative survival value—was advanced by Kant in order to detach reason from any empirical aim, and put aside Hume's view that reason is only instrumental to the satisfaction of passions (Hume 1978, 413ff). Kant argues that reason cannot have the function of providing self-preservation, welfare, or happiness, since these aims can be much better maintained by instinct alone, without reason "meddling incompetently with the purposes of nature" (Kant 1972, 61). More generally, he affirms that "the more a cultivated reason concerns itself with the aim of enjoying life and happiness, the further does man get away from true contentment" (ibid.). We agree indeed with Kant that reason alone is much inferior to instinct alone, as a guide to survival. However we disagree with his view that reason has a negative survival value, since a combination of reason and instinct (a combination that characterises human practical cognition, as we shall see in Section 1.5.3 on page 44), where each faculty plays its proper role, is likely to outperform instinct alone.

[13] Both evolution and creation are rejected by Nagel (1986, 78ff.), who, however, admits that he has no alternative explanatory hypothesis. For a discussion of the relation between faith and science, and in particular, between creationism and evolutionism, see Haack 2003a.

1.3.1. Basic Conative States

We may distinguish four basic conative states.

The first conative attitude consists in having *likings* or *preferences* (we use those expressions as synonymous). The agent likes or dislikes certain situations (present of future) or certain features of them. By a liking (or a disliking), we mean a generic *pro* (or *con*) attitude (Pollock 1995, 12ff.). These notions should be distinguished from pleasure and pain: They are more abstract positive or negative stances. Usually, there is a connection between likings and pleasures, and between dislikings and pains, but it is possible that an agent dislikes pleasurable situations or likes painful ones. For example, I would certainly dislike the situation when my brain is taken out of my head and wired into a pleasure machine, even if the machine will provide me with the most exquisite and varied experiences (see Nozick 1974, 42–45).[14] Other people may even have an ascetic attitude, and dislike pleasurable sensations; or they may have a masochistic attitude, and like situations where they are feeling pain.

The second conative attitude consists in having *desires* or *goals*. A desire is more specific and focused than a liking. Consider for example, the difference between liking ice creams, and desiring to have one. It seems to us that desire involves the selection of a specific goal, and has the psychological (cognitive) function of prompting the agent to make plans to achieve that goal. Therefore, by a goal, we mean the content of a desire: We shall equivalently say that one has goal G or that one desires G.

The third conative attitude consists in having *intentions*. By an intention we mean in general the state of mind of an agent who has determined that a certain action is to be executed, possibly under certain conditions. As we shall see in the following, by an *instruction* we mean a specification of an action to be performed, under given conditions. Therefore we may also say that an intention is the adoption or the endorsement of an instruction.

We use the word *intention* to refer both to *self-directed intentions*, namely, one's determination concerning one's own behaviour, and to refer to *other-directed intentions*, namely, one's determinations concerning other people's behaviour. However, we shall now exemplify the notion of an intention by considering self-directed intentions (other directed intentions will be discussed in Section 1.4.4 on page 35).

When one has the self-directed intention to perform a certain action (or combination of actions), one has made up one's mind with regard to whether one will perform that action, under the appropriate conditions, and is ready to execute the action, as soon as these conditions are satisfied.

Adopting intentions is the way in which we shall store the plans we have adopted, and keep ready for executing them: Instructions contained in chosen plans provide the content to our intentions.

[14] For a different view, according to which one may accept to trade reality for dreams and artificial memories, see Dick 2002.

Thus, an agent having formed an intention is *committed* to implement the corresponding instruction, since this is required by the way in which practical rationality works: One may rationally withdraw one's intention, but it would be irrational for one not to implement one's intention, while having it. For example, when I select the plan of going to the ice cream shop round the corner (rather than to a better shop, further away), I adopt the intentions to go there and buy an ice cream. I may withdraw this intention (since there is something more important I must do), but it would be irrational for me both to keep the intention and not to implement it (at least when there is no conflict with stronger intentions).

The fourth conative attitude, of which we shall provide a very concise account, consists in having *wants*. A want is an impulse towards performing an action, which the agent feels when the action needs to be performed. For instance, when I look at my watch and I see that the time has come for getting my ice cream (according to my intention), I feel the impulse (want) to get up and go out.

1.3.2. Adoption and Withdrawal of Conative States

Let us now examine how reasoning schemata lead us to adopt new conative states when having certain other conative and epistemic states.

The first typical reasoning step concerns moving from likings to desires. This step presupposes that one believes that the object of one's liking is achievable. We may express the reasoning schema for desire formation as follows:

Reasoning schema: *Desire adoption*
(1) liking A; AND
(2) believing that A can be achieved
——— IS A REASON FOR
(3) desiring A

Having a desire leads one to start making plans on how to satisfy the desire. A *plan*, is a combination of instructions for achieving a certain goal (the content of the desire). In the simplest case, a plan prescribes making a single action. For instance, in order to have some fresh air, I can make the plan of opening the window, and implement it. In more complex cases, a plan includes various combinations of actions to be performed under various conditions. For example, my plan to get an ice cream consists of the following sequence of instructions, to be executed in the sequential combination, that is, one after the other:

1. I shall go to the shop round the corner,
2. if it is open, I shall buy an ice cream there,

3. if it is closed, I shall look for another ice-cream shop.

One should withdraw a mental state, adopted according to a reasoning schema, whenever one withdraws the states of mind that provided the reason for applying that schema (in some cases the situation is more complex, since a mental state can have been derived according to more than one reasoning schema, as we shall see later). Correspondingly, when one withdraws the belief that a liking can be fulfilled (there are no ice creams accessible to me, since all shops are closed today) one should abandon the corresponding desire. This is rational since having a desire activates planning, and it is a waste of time to make plans for something that cannot be achieved.

A second typical transition concerns moving from having a goal and believing that a certain plan provides a sufficiently good way to achieve the goal (better than any other option the agent is aware of, after making an adequate inquiry), into adopting this plan. The adoption of the plan consists in adopting the intention to achieve the goal of the plan, and also in adopting the intention to execute each of the instructions in the plan (in the appropriate sequence). This would happen accordingly to the following schema, which we call *intention-adoption* or also *teleological inference*:

Reasoning schema: *Teleological inference*
(1) desiring A; AND
(2) believing that plan B is a sufficiently good way of achieving A
——— IS A REASON FOR
(3) intending to achieve A; AND
(4) intending to perform all instructions in B in the appropriate combination

By a *sufficiently good* way of achieving a result we mean a way that—though not necessarily being optimal, nor necessarily being believed to be optimal—is better than inactivity, and better that any other plan we have been able to conceive so far. On the other hand, believing that a better incompatible plan is available (there is a better cheaper new ice-cream shop quite near) is a reason for abandoning the previously adopted plan (to go to the shop round the corner). This is also rational since sticking to the old plan would imply failure to achieve a superior result.

Note that this feature of practical rationality combines the idea of *bounded rationality* (see Chapter 5) with the idea of *critical cognition*: On the basis of the awareness of the limitations of one's own cognitive processes, one can revise their outcomes.

According to the first idea (bounded rationality), one should act also on the basis of a suboptimal plan, and even when one knows that the plan is subopti-

mal: A suboptimal solution may be adequate with regard to one's needs. However, according to the second idea (critical cognition), if one comes across a better solution, then one should abandon the inferior one.

Assume for example, that I have some money I want to put in a bank. Assume that the offer of bank b_1 provides for the best conditions, among the offers I have collected so far. Assume also than a financial expert, whom I consider to be both competent and sincere, tells me that he knows of a bank offering better conditions, but he is not going to tell me the name of this bank. Clearly, under such conditions, rationality commands me to chose bank b_1, though I know that my choice is suboptimal. However, if I succeed, before making the contract, in coming to know which bank is providing better rates, I should not make the contract with b_1, but I should rather go for the more profitable deal.

Similarly, assume that I am a prosecutor, and I am convinced that the man in front of me has murdered a child, but the evidence I have only allows me to require his conviction for a minor offence. Clearly, under such conditions, I should try to get him condemned for the minor offence. However, if I come, before the end of the trial, to access further evidence, which supports his conviction for murder, I should indict him for this.

A third typical transition concerns moving from the intention of executing an instruction in a plan, to the actual (present time) *want* of doing what this instruction establishes, when time for execution comes. For instance, if I have the intention of having an ice cream at 5 o' clock, when this moment comes, practical rationality requires me to want to go to get the ice cream.

Reasoning schema: *Want adoption*

(1) having the intention that ⌈now, I shall do A⌉

——— IS A REASON FOR

(2) wanting to do A

When we get to the level of wants, rationality must abandon the scene. There is no time for reasoning now, and one should just let one's wants be transformed into actions. A want may conflict with other wants, emerging from different plans (the agent has not noticed the conflict at planning time) or emerging from the agent's instinctive reflexes (fixed or conditioned ones).

Consider for example the situation when there is the conflict between my impulse to put the plug into the plughole, which derives from my plan to operate the computer, and the impulse to bring back my hand, which derives from the instinctive reaction to an electric shock. Pollock (1995) assumes that such conflicts are to be solved by a non-rational mechanism, which gives priority to the stronger impulse. However, according to Pollock's account, rationality—though not being able to change the working of this mechanism—may influence its output by providing appropriate inputs: Rationality provides each impulse to action with a strength which is proportional to the value of the instruction and

the plan implemented by the impulse. This would ensure that the most valuable plans tend to be implemented first.

By combining in a sequence the reasoning schemata we have considered we obtain a downward-going chain:

- from likings into desires,
- from desires into intentions,
- from intentions into wants.

The chain terminates with the agent's attempt to execute actions. If all reasoning steps have functioned properly, one will act in such a way as to be successful, at least in most cases (failure is always possible, in a complex and unpredictable world, even when one has used one's cognitive functions as well as one can). This means that one will

- realise one's wants, and so
- implement one's intentions, and so
- fulfil one's desires, and so
- make the world more likable to oneself.

From our perspective, practical rationality appears to be a technique for enabling a reasoner to reach the target of higher-level conative states, by achieving the target of lower level conative states: By realising one's wants, one implements one's intentions; by implementing one's intentions one achieves one's goals; by achieving one's goals one satisfies one's desires, and by satisfying one's desires one adapts the world to one's likings. This explains why the function of each conative state consists in producing, under appropriate conditions, corresponding lower level conative states.

1.3.3. Abstract Plans and Subplanning

We have considered above how the adoption of a goal leads to devising a plan. However, when one is planning, one rarely has the time and the information required for specifying in full details all actions to be performed. To a certain extent, this may be remedied by including *conditional instructions* in one's plan. For instance, to get an ice cream I can make a plan establishing that ⌈if the shop round the corner is open, I shall go there⌉, and ⌈if it is closed, I shall go to the shop in the town square⌉.

However, there are many contingencies that one cannot anticipate, not even conditionally, at the time when one starts planning. Moreover, at that time one may have more important things to do, rather than keep refining one's plan.

Therefore, one would usually devise at first only an *abstract plan*, providing for *abstract actions*. This provides the precondition for later *subplanning*: One will translate each abstract action into a combination of more specific actions, only when one has the time, the information, and the opportunity to do it.

The development of a plan, therefore, proceeds top-down, by progressive refinements. One fills the details progressively, by reducing each abstract action indicated in the high level plan into a combination of more concrete actions required for the performance of the abstract action. The process continues until the plan only consists in a combination of elementary instructions directly available to the agent (by that time, usually the execution of the plan will have started).

To exemplify the process of subplanning, let us consider a goal that is more complex that the ice cream goal we considered above. Assume that I have the goal of attending a conference that takes place in the city of Barcelona. At first, I can make a very schematic plan, including the following actions: I shall fly to Barcelona, I shall then attend the conference, I shall fly back when it is finished. However, performing each of those abstract actions requires further planning from my side, since I do not know yet how to perform each of actions, and there may be different ways of doing them, having different costs and advantages. For example, flying to Barcelona requires me to devise a subplan consisting in buying a ticket, getting a taxi to the airport, and jumping on the right plane. In turn, to buy a ticket I must devise and implement a sub-subplan which includes getting to a travel agency, browsing through the Barcelona flights available on the 27th of next month, choosing the most convenient one, writing a cheque, and so on.

This progressive top-down specification of plans, through the mechanism of subplanning, is ensured by the formation of *instrumental desires* and goals (Pollock 1995, 29). Let us consider this important aspect of practical rationality.

Selecting a plan produces, as we have seen, the intention of performing, in the appropriate order, all actions of the plan. But the agent may be unable to immediately execute the abstract action: In order to perform a non-elementary action (like flying to Barcelona) one must have a plan on how to do it, according to the context in which the action is to take place. Thus, the intention to perform an abstract action does not produce a want, but rather an instrumental desire to execute the action. This means that the agent will adopt the goal that the action is executed. To satisfy this goal the agent needs to start planning again, this time with the goal of making the abstract action.

Thus, we may say that instrumental desires (and goals) have the functional role of activating subplanning. In fact, the idea that intending to do something leads to having a corresponding goal is generally accepted in the logics of intention: These logics usually include axioms or inference rules according to which the intention to execute action A entails having the goal that A is executed (see, among others, Wooldridge 2000, 100ff.). However, it seems that such a transition, though being generally acceptable, is to take place only with regard to non-elementary action, namely, the actions one cannot execute directly, through an available routine. This is reflected in the following schema:

Reasoning schema: *Instrumental desire*

(1) having the intention to execute non elementary action A

——— IS A REASON FOR

(2) desiring to execute A

The way in which instrumental desires are processed corresponds to the general way of processing desires. The instrumental desire to execute A will prompt the agent to search for plans for achieving A, and to adopt one such plan, according to *teleological inference*.

Consider again my plan to fly to Barcelona, attend the conference and fly back. Once I have adopted this plan, I will have the intention to fly to Barcelona. This would lead me to desire to fly to Barcelona, to adopt this as my goal, and so start subplanning again. Assume now that I build a subplan including: buying a ticket, getting a taxi to the airport, and jumping on the right plane. I will then form a desire to buy a ticket to Barcelona, adopt this as my goal, and start subplanning, and so on.

Subplanning ends when one's plan only contains actions which one already knows how to execute (like the action of walking along a certain street) or which one knows one will be able to specify at the time of their performance (like the action of buying a ticket at the travel agency).

1.3.4. The Structure of Plans

As we have seen, planning consists in devising plans or programs (combinations of instructions) the execution of which would achieve certain goals of the planner. In the simplest case, a plan would involve just a sequence of instructions, to be executed sequentially (Pollock 1995, 177), like the following plan for getting a flight to Barcelona.

1. I shall phone the travel agency,
2. I shall make a reservation,
3. I shall go to the airport,
4. I shall jump on the plane.

Plans frequently have a more detailed and articulated structure than a straightforward sequence. They may involve conditional forks (if the telephone is engaged, I shall walk to the travel agency), loops (I shall repeat phoning the travel agency, until there is an answer), and other control structures, similar to those we can find in computer programs.

1.3.5. The Evaluation of Plans

We cannot go here into a discussion of how planning is performed (for a detailed analysis, see in particular: Bratman 1987, and Pollock 1995, 175ff.).This

would require us to consider possible heuristic strategies for generating plans, which would be a formidable task. Thus, we shall not even approach the issue of plan-generation: We assume that a rational agent has a cognitive module for performing end-means reasoning and devise appropriate plans (as is true for humans), but we shall not try to examine how this module functions. We shall rather focus on the simpler (but still very difficult) task of evaluating a constructed plan, to decide whether to adopt it. This decision may require a comparison with alternative plans.

The most popular model for evaluating and comparing decisional alternatives is provided by *decision theory* (see, for all, Jeffrey 1983). Decision theorists usually assume that the value of an outcome consists in a numeric measure, which is called the *expected utility* of that outcome.

Rationality (as it is understood in decision theory) recommends choosing the plan that provides the highest utility, and we may certainly agree on that. Unfortunately the difficult issue is that of computing utilities.

Let us consider first the simplest case, to wit, the case of a plan that is completely *deterministic*: The plan has just one possible outcome, of which the planner is absolutely certain. Then, the merit of the plan is to be determined by the expected utility of its outcome.

As an example, consider the following circumstances: A judge is charged with the task of deciding whether a convicted criminal may leave prison in advance, and he is absolutely certain that the convict has now changed and will not commit any serious crime. Therefore the judge believes that the only relevant outcome of his decision will be a very positive one: The convicted person will enjoy her freedom again, she will probably get a job and contribute to supporting her family in need. The alternative decision (letting the convict in jail) will achieve, with equal certainty, a negative outcome: The convict is likely to get into drug-abuse and to be introduced into serious forms of criminality, her chances of getting a job will diminish and her family is likely to collapse.

When one is so lucky to find so simple a decisional context, the decision is easy, even when one has not been able of assigning numerical utilities: One knows for certain that one decisional alternative is better than all the others.

The situation is more complex when the plan is non-deterministic, that is, when the plan may have different outcomes having different utilities. Consider, for example, the situation of another judge: She has to decide whether to free in advance a paedophile convict. Assume that the judge believes that there are good chances that the paedophile will now be able to control his impulses, but she is also aware that there are some chances that he will repeat his criminal behaviour. According to decision theory, she needs to evaluate each action she may take by considering the utility of each possible outcome of that action, multiplying this value by the chance of that outcome, and summing up all results she

obtains for the different possible outcomes.[15] For example, suppose that the judge makes the following utility assignments: utility 1 to the situation where the paedophile leads a peaceful live, and utility -6 to the situation where he repeats his crimes. If there were only 10% chances that the convict repeats his crimes, then a decision to let him free would have a positive value, namely, the expected utility 0.3, according to the following calculation:

$$(1 * 0.90) + (-6 * 0.10) = 0.30$$

Even if, for the sake of simplicity, we discount the problem that a plan may have multiple possible outcomes, depending on unknown circumstances, we still have to face a very hard problem when applying decision theory in practical cases: It is very difficult, in many practical domains, to assign a numerical utility to the outcomes of possible plans, so that one can establish their comparative merit.

In fact, to "rationally" compare alternative plans (choices, decisions), it seems that one needs first to analyse the expected outcomes of each one of those plans, by identifying the desired (valuable) features that characterise each outcome and establishing to what degree each feature will be satisfied (promoted) by that outcome. Then one needs to assess the total value of each plan, by considering the plan's combined impact on all those features. Finally, on the basis of such evaluation, one needs to compare the different alternative plans that one has been able to devise.

For example, when considering the plan of going to a restaurant r, I may consider to what degrees I expect that a dinner at r would exemplify the desired features of the quality of the food, the quality of the wines, the quality of the service, the price, and so on. Then I would need to compute the whole expected value of the experience of going to restaurant r, as being characterised by the fact that the desired features are satisfied to such degrees. Having done that, I would be able to compare plans to go to different restaurants, each of which provides a different combination of levels of quality for food, wines, service and price.

Similarly, a judge, when considering different alternative ways of deciding a case, may examine how each possible choice will impact on legally relevant values. For example, a decision that permits putting video cameras in public spaces, and keeping recordings for a year would impact both on the values of privacy and security. To evaluate this decision, and compare it with possible decisional alternatives (prohibiting cameras altogether, or allowing them only

[15] In general, when a plan α may lead to n mutually-exclusive outcomes $\omega_1, \ldots, \omega_n$—each outcome ω_i having probabilities P_i and utility $u(\omega_i)$—then α's expected utility $EU(\alpha)$ is given by the following formula:

$$EU(\alpha) = \sum_{1}^{n} u(\omega_i) * P_i$$

if recordings are deleted after a very short time), one needs to assess how the decision impacts on each value and to provide, on the basis of such assessment, a comprehensive evaluation.

According to the procedure that is usually suggested by decision theory, making the evaluations we have just described requires a mathematical characterisation of both:

- the information on the basis of which a plan is to be evaluated, and
- the procedure that computes, on the basis of that information, the merit of whole plan.

In the simplest case, this is done by:

1. assigning a (positive or negative) weight to every relevant feature of the outcome,
2. quantifying the degree to which every feature will be satisfied by the expected outcome of a certain choice,
3. multiplying the degree of satisfaction of each relevant feature by its weight, and
4. summing up the results that are obtained in step (3).

Note that weights are negative for those features which impact negatively on the outcome: the higher the quantity of this feature, the worse the outcome (all the rest being equal). So, for example, assume that I assign weight $\mathbf{4}$ to food, $\mathbf{2}$ to wines, $\mathbf{1}$ to service and $-\mathbf{3}$ to price, and that I expect that restaurant r will score 3 for food, 2 for wines, 1 for service, 2 for price (0 indicates average, so that 2 describes a fairly high price). Then expected value of the choice of going to r will be:

$$(3 * \mathbf{4}) + (2 * \mathbf{2}) + (1 * \mathbf{1}) + (2 * (-\mathbf{3})) = 11$$

Similarly, assume that a judge gives weights $\mathbf{3}$ to security and $\mathbf{2}$ to privacy, and expects that a situation where recording are taken and are kept for a year will satisfy security to level 3 and privacy to level -2. Then the expected value of such a choice would be:

$$(3 * \mathbf{3}) + ((-2) * \mathbf{2}) = 5$$

Such a numerical procedure appears intuitively correct, and even upon reflection it appear to be free from apparent flaws. The issue we need to address is then why humans rarely perform such numerical calculations, especially when taking important decisions: Few people use arithmetic when selecting their partner, their house or even their new car. We may conjecture that the reason for this apparent "irrationality" is that our natural (implicit) cognitive capacities include

more powerful unconscious mechanisms for plan evaluation. It is not clear at all how such mechanisms may work, but they are certainly there.[16]

This fact does not imply that explicit plan evaluation (and even the assignment of weights and numbers) is useless, since our unconscious processes, though far better than any approach decision-theorists have yet been able to provide, are far from infallible. We would rather say that explicit evaluation of plans (according to the indications of decision theory) should be used to check the intuitive results that are provided by our implicit cognition. It would be improper, in most cases, to use it on its own, as an independent procedure for decision making.

1.3.6. Epistemic Desires: Knowledge and Interest

As we have seen, the reasoning steps that are commanded by practical rationality are conditioned to the agent's having or not having certain beliefs (besides having or not having certain conative states). And one will have appropriate beliefs only when one has made appropriate inquiries.

Therefore, when one has a conative state one should start making inquiries to see if one can obtain beliefs that enable one to move into subsequent conative states. When I like something, I should check whether my liking can be realised, in order to transform my liking into a goal (desire). When I have a goal, I should try to find a sufficiently good plan to achieve it, in order to obtain the intention to realise the goal and to implement its instructions. When I have the intention to perform a conditional instruction in a plan, I should check whether the precondition of the instruction holds, so that I can form the unconditioned intention to make the conditioned action (which will prompt a corresponding want).

Inquiry is an activity and, like any other activity, it will not take place unless it is prompted by appropriate conative states. This is particularly clear when an inquiry requires external behaviour: For instance, to form a reliable belief concerning the telephone number of a travel agency, I need to leaf through the phone book. However, also mental activities require a conative stimulus. This is provided by the *desire to know*: Whenever one's progression in practical reasoning depends upon possessing a belief on a certain issue, one will form the desire to know the solution of that issue.

In particular, when one has a desire and one does not know how to satisfy it, rationality requires that one adopts a new desire, namely, the desire to find a plan that satisfies one's original desire. This epistemic desire prompts the operation of epistemic cognitions (unless there is something more urgent to do). As soon as epistemic cognition finds such plans, and gives an indication on their merits,

[16] There is a vast philosophical tradition, from Aristotle to Pascal, which has remarked the intuitive nature of practical reasoning; for a discussion, see Pattaro 1988.

practical cognition will select the most convenient plan. As soon as one adopts a plan, one forms the intention of performing the actions in the plan. If one does not know how to perform an action, one will form the desire to realise that action, which will produce the epistemic desire to know how to realise the action. This would activate again epistemic cognition. The following reasoning schema captures the link between desire and desire to know.

Reasoning schema: *Instrumental desire to know*
(1) desiring A; AND
(2) not knowing how to realise A
——— IS A REASON FOR
(3) desiring to know how to realise A

According to schema *instrumental desire to know*, my desire to go to the Barcelona conference would produce my epistemic desire to know how to go there. The latter desire would lead me to search for appropriate plans, and possibly to find one that includes flying to Barcelona, attending the conference, and coming back. My intention to implement this plan would produce my desire of performing its single abstract steps. This again prompts the epistemic desire of knowing, for example, how to fly to Barcelona. Satisfying this desire—that is, constructing a sufficiently good plan which specifies how to achieve the goal of flying to Barcelona (I shall buy a plane ticket, take the plane, and so forth)—might engender further epistemic desires, for example, the desire to know how to buy a ticket. Finding a plan for that (I shall go to the nearest travel agency, ask for the ticket, . . .), might prompt further epistemic desires, for example, the desire of knowing where the nearest travel agency is located.

Similarly, a public administrator, who has the goal of reducing pollution, will have the desire to know how such a goal may be achieved. This would lead him to identify a set of remedies, the combination of which is likely to reduce pollution, such as limiting traffic and recycling waste. The goal of limiting traffic will again start the desire to know how to do it, which would lead the administrator to identify possible strategies for restricting the circulation of vehicles.

Reasoning may be sufficient for satisfying epistemic desires. For example, I may already know where travel agencies are located, so that to find the nearest one I just need to reason (to compute and compare their distances from my house).

When on the contrary reasoning is insufficient, physical action is required. For instance, establishing which travel agency is the nearest one, may require the following actions: finding the telephone directory, leafing through it, writing down the names of the travel agencies and their addresses, getting a map, locating the addresses, checking distances with a ruler. Similarly, the public administrator who is interested in reducing pollution needs to have samples of air and water taken and examined, to make contracts with experts, and so forth.

According to the model we have just presented, epistemic rationality does not consist in randomly extending one's beliefs with further beliefs, but is rather driven by conative states: desires (included epistemic desires), intentions, wants. This means that epistemic cognition is in principle instrumental, that is, subordinated to practical cognition, and therefore to the conative states that guide practical cognition and are produced by it.

However, this does not imply that all epistemic interests are only instrumental to specific "material" goals of the agent. We seem to have an inborn conative disposition for knowing (curiosity), regardless of the uses of this knowledge, and a corresponding liking for the discovery and possession of knowledge.[17]

1.3.7. Strategies, Standing Plans, and Instructions

The description of practical cognition provided so far has the defect of depicting an ideal that is difficult to realise in a complex environment, given the resource limitations that constrain any real cogniser.

The problem is that the model so far presented relies too much on *teleological inference*, and in particular puts an excessive emphasis on planning. Unfortunately, planning is a very difficult task: For getting sufficiently good results it requires processing a lot of information, in complex ways. If every action required new planning, then one would be condemned to inactivity (or to random action) in most cases, since one would not be able to find sufficiently good plans in time.

Thus, any rational agent endowed with bounded resources needs additional, quicker and simpler ways of processing information. Some ways may be provided by one's in-built and conditioned reflexes and more generally by the working of one's unconscious cognitive organs, but also reasoning may contribute.

A very helpful approach consists in permanently storing a set of ready-made plans on how to satisfy those desires that the agent will most frequently have. Those abstract plans may be called *strategies*, or *know-how*. Usually, strategies concern instrumental desires, which can be activated by different higher level desires, and which are sufficiently simple that a standard plan can be appropriate in most situations where the instrumental desire might arise.

The language of *technical* or *hypothetical imperatives* (⌈if I want A, I must do B⌉, or ⌈if you want A, do B⌉) has probably the function of expressing standing plans or strategies (A expresses the possible goal, and B the plan for achieving it). Technical imperatives, together with the corresponding desire, provide the input for the following reasoning schema.

[17] According to the opening words of Aristotle's *Metaphysics*, 980a, "all men by nature desire to know."

Reasoning schema: *Technical imperative*

(1) desiring A; AND
(2) adopting the technical imperative ⌈if I desire A, I must do B⌉

——— IS A REASON FOR

(3) intending to do B

For example, the first time I wanted to go to my new office, I had to make plans on how to get there. After studying maps and time-tables, I came to adopt a plan that included the following: taking bus number 8, getting off at the third stop, getting on bus number 12, and jumping off at the fourth stop. After my first successful trip to my office, I have no need of studying maps and timetables again. Every morning, as soon as I adopt the goal of going to my office, I retrieve the standing plan that tells me ⌈If I desire to go to work, I must take bus number 8, get off at the first stop, and so on⌉. The retrieval of the standing plan is activated by the fact that I adopt the corresponding goal (I desire to go to work).

Processing is even simpler when the agent has a permanent goal, which can be achieved by performing actions of the same type whenever a certain condition holds. Note that in such a case only the repetition of a certain action (under the appropriate circumstances) will achieve the goal (a one time behaviour will not do), and this repetition is the content of the plan.

For example, let us assume that, to keep my shape, I adopt the plan of running every morning at least for half an hour. In other terms, I adopt a plan which includes an iterative instruction: ⌈I shall repeat the following: When morning comes, I shall run for half one hour⌉. Every morning, I would run, to execute this instruction, according to my persistent intention to implement my original plan, without the need of devising a new plan.

Assume that one morning I have the desire to sleep longer, and consequently consider the plan ⌈today I shall stay in bed⌉. This plan will conflict with my original plan to run every morning, and endanger its objective (my fitness). Thus, when I wonder whether to get up or not, I put into question my whole original plan and its goal (getting fit), not just the immediate results of today's running. I can obviously devise an alternative (and possibly better) plan which does not contemplate my running today, and still enables me to get fit, but until I have done that, if my desire for fitness counts more than my desire for sleeping, the rational thing to is to stick to the original plan.

Something similar happens when one knows that one is going to have a desire of a certain type whenever a certain situation occurs. In such cases, one can use the same plan for satisfying any of such desires. So, for example, assume that when I am at work I usually desire to have my laptop computer, in order to satisfy various goals of mine (writing papers and letters, sending e-mails, accessing the www, etc.). Then, I can adopt the *standing instruction* of bringing the computer with me whenever I go to the university. Every morning then I simply

retrieve and execute this instruction, without considering what my goals are and how best I could satisfy them. However, should I fail to execute the standing instruction today, I would just impair my achievement of today's goals and no encompassing plan.

Standing instructions are very similar to conditioned reflexes, and it may be difficult to discriminate between the two. For example, when I start leafing through a book as soon as I get it in my hands, am I implementing the standing instruction ⌈I shall leaf through a book whenever I get hold of it⌉ or am I reacting according to a conditioned reflex (I enjoyed leafing through books so much in previous times, that I developed the tendency to do it)?

A further connection between standing plans and conditioned reflexes results from the fact that plans which have been successfully executed many times tend to transform into conditioned reflexes, or routines, which can be applied without recourse to reasoning. On the other hand, conditioned reflexes, when the agent can find a rationale for them (as hopefully it should frequently be the case), may be transformed into standing plans.

1.4. The Function of Intentions

Intentions play a fundamental role in practical reasoning, by linking teleology and action: They provide the link between teleological reasoning (the formation and evaluation of plans) and the implementation of wants through actions, enabling us both to distinguish and to connect these two dimensions. The cognitive function of intention is not exhausted by establishing this connection: Often we need to process our intentions through reasoning, and acquire new intentions on the basis of the intentions we already have.

Thus, reasoning with intentions represents an important aspect of practical reasoning, as we shall see in the next sections, an aspect that is often overlooked by accounts that are only centred upon teleological reasoning.

1.4.1. Intentions and Instructions

Our notion of an intention comes close to the notion of *commitment*, as used by computer scientists (like Cohen and Levesque 1990) and cognitive psychologists (like Castelfranchi 1995) when analysing rational action. As we said above, by forming intentions an agent gets *committed* to performing certain actions. This is the way in which one stores the deliberative outcomes one has achieved, so that one can move into further deliberative tasks, even before executing such outcomes. If one were unable to commit oneself to the (provisional) outcome of one's deliberation, one would be incapable of focussing one's mind upon new practical issues, while keeping ready to use the results of one's previous deliberations, at the appropriate occasion. Therefore practical rationality, intended as

the correct way of going about in dealing with practical issues, requires the ability to form intentions, in agents facing multiple problems with limited resources.

Commitment is a practical attitude, consisting in the tendency to appropriately use intentions in reasoning and in acting. One's commitment to an intention consists in one's persistence in the intention (it would be irrational to abandon the intention without a reason, before it is implemented) and in one's pull to deliberate and act according to the intention (it would be irrational not to reason and act according to the intentions one is having).[18]

We use the term *instruction* to denote the content of an intention. By an *instruction*, we mean a cognitive structure, which is characterised by the function of specifying the content of an intention: The instruction indicates what needs to be done, by whom and in what circumstances, to fulfil the corresponding intention.

We might also say that instructions are *imperatives*, to emphasises that they are meant to direct action, but it must be clear that here as an "imperative" we do not mean a speech act (the act of commanding), but rather the content of a mental state (the intention).

1.4.2. Reasoning with Intentions

As we have seen above, when one adopts a plan, one forms both the *intention* to achieve the goal of the plan and the intention to execute every instruction in the plan. The instructions in the plan concern a combination of more specific actions, the performance of which enables the agent to execute the abstract action of realising the plan's goal (I shall first walk to the nearer ice cream shop, if it closed I shall go to the shop round the corner, and so forth).

However, the adoption of the plan does not terminate the planner's practical reasoning: What cognitive activities are required for executing the instructions in a plan depends on the content of these instructions.

The simplest kind of instruction concerns the immediate execution of an action by an individual: The instruction says that individual x shall perform action A. For example, consider the instruction requiring that John buys an ice cream, which we express as: ⌈John shall buy an ice cream⌉.

Thus, when John has the intention of buying an ice cream we say that John has the intention that ⌈John shall buy an ice cream⌉.

Some instructions include a temporal reference. For instance, they can require that an action is accomplished at a certain time: ⌈I shall buy an ice cream at 5pm⌉. Executing such instructions requires doing the action when the time comes (neither sooner, nor later).

Other temporalised instructions specify that an action is to be performed before or after a certain time (I shall go to work before 9am) or before or after a

[18] For a discussion of commitment, cf. Wooldridge 2000, 23ff.

certain event has taken place (I shall go home before my wife arrives), or while a certain condition obtains (I shall work while the children are away).

Many instructions have a conditional structure: They specify the conditions under which the indicated action needs to be accomplished. Consider, for example, the following instructions (concerning the reasoner's own behaviour): ⌈if my wife has gone to work, I shall pick up the children⌉, ⌈if there are no policemen around, I shall drive through the lane reserved for public transportation⌉.

Besides simple instruction we may have, as in programming languages, complex instructions, such as those requiring that a certain action is repeated until a certain condition is satisfied: ⌈I shall repeat the action of circling around, until I have found a parking place⌉.

We may also have *general instructions*, namely, instruction requiring that an action is performed whenever a certain type of event is instantiated: ⌈whenever I finish eating, I shall brush my teeth⌉.

Intentions may be transformed into wants, so that their treatment is passed to a non-rational module of the agent, or they may be processed through reasoning, leading one to forming new intentions on the basis of the intentions one currently has.

We shall not provide here a structural account (nor a formalisation) of different ways of reasoning with intentions. We shall just mention some reasoning steps one may perform for moving from the intention to perform a complex instruction (plus the appropriate beliefs) to the intention to perform a combination of simpler instructions.

First of all, the intention of executing a conditional instruction, plus the belief that the corresponding condition obtains, leads one to intend to perform an unconditional instruction, according to the schema *intention detachment*.

Reasoning schema: *Intention detachment*

(1) intending to execute instruction ⌈if *Precondition* then I shall accomplish *Action*⌉; AND
(2) believing that *Precondition* is satisfied
——— IS A REASON FOR
(3) intending that I shall accomplish *Action*

For example, my intention to execute the instruction ⌈if my wife has gone to work, I shall pick up the children⌉, plus my belief that ⌈my wife has gone to work⌉ leads me to adopt the intention that ⌈I shall pick up the children⌉.

Similarly, one's intention to perform a general instruction, leads one to perform any specific instruction that instantiates the general instruction, as indicated by the schema *intention specification*.

Reasoning schema: *Intention specification*

(1) intending to execute the instruction ⌈whenever *Precondition* is satisfied then I shall accomplish *Action*⌉

——— IS A REASON FOR

(2) intending to execute the instruction ⌈if in occasion o, *Precondition* is satisfied, then I shall accomplish *Action* in occasion o⌉

For example, my intention to implement the general instruction ⌈whenever I finish eating, I shall have a nap⌉, will lead me to the specific conditional instruction ⌈today, when I finish eating lunch, I shall have a nap⌉.

1.4.3. Behavioural and Cognitive Instructions

We need to distinguish two types of instructions: *behavioural instructions* and *cognitive instructions*.

Definition 1.4.1 *Behavioural instruction. A* behavioural instruction *requires that an agent holds a certain external behaviour.*

Definition 1.4.2 *Cognitive instruction. A* cognitive instruction *requires that an agent forms a certain mental state.*

We may say that the first type of instruction expresses a *behavioural policy*, while the second type express a *mental policy*. Thus, in the second type of instruction, the required action consists in the adoption, or in the acceptance, of a mental state. As a common-sense example of a cognitive instruction, consider the following policy, adopted by a nurse in a kindergarten who has decided not to give uncooked foods to the children, to prevent the spreading of an infection: ⌈If food has not been heated above 150° C, then I shall adopt the belief that it is uncooked (I shall consider it to be uncooked)⌉.

As a legal example, consider the following instruction, adopted by a judge for the purpose of deciding a case: ⌈If Mark has committed a crime in the last 5 years, then I shall consider him to be a recidivist⌉.

The interesting peculiarity of cognitive instructions is that they can be executed by reasoning alone. Rationality, therefore, does not stop at their adoption, but also includes their execution. Thus, if one comes to have the intention that one shall adopt mental state M, rationality requires one to adopt M (unless one abandons that intention). In other words, in the execution of cognitive instructions two steps are involved:

1. one forms the intention that one shall adopt the required mental state,
2. this leads one to adopt that mental state.

This idea is expressed by the following reasoning schema:

Reasoning schema: *Executing cognitive intention*

(1) having the intention that⌈I shall adopt mental state A⌉

——— IS A REASON FOR

(2) adopting mental state A

For instance, assume that the I have the following mental states:

a. the intention that ⌈If Mark has committed a crime in the last 5 years, I shall believe that he is a recidivist⌉,

b. the belief that ⌈Mark is a recidivist⌉.

From this mental states, according to schema *intention detachment*, I will first form the intention that ⌈I shall believe that Mark is a recidivist⌉. Then, by implementing this cognitive intention (according so schema *executing cognitive intention*) I will adopt the belief that ⌈Mark is a recidivist⌉.

1.4.4. Other-Directed Intentions and Commands

Besides distinguishing between behavioural and cognitive instructions, we need to consider the following kinds of intentions:

- intentions concerning one's own behaviour, which we call *self-directed intentions*, and
- intentions concerning other people's behaviour, which we call *other-directed intentions*.

When agent j has the intention that agent k performs a certain action (an other-directed intention), not only j desires or has the goal that k does that action, but j *directly intends* that k shall do it.

To clarify the notion of an other-directed intention, we need therefore to distinguish the case when one has an intention concerning the behaviour of another, from the case where one only has the expectation or the goal that another behaves in a certain way (see Grosz and Kraus 1996).

One first clue is that when one has the other-directed intention that some people behave in a certain way, one relies upon the behaviour of those people, one puts one's trust on their action. In fact, the formation of other-directed intentions is related to the phenomenon of *multi-agent planning*. This concerns the fact that often for one it is not possible or opportune to achieve one's goal through one's action alone: One needs to build plans which also include the action of other agents (consider a manager that is deploying her collaborators to achieve her goals).

In such cases one needs to engage in multi-agent planning, and rely for the achievement of one's aims on the behaviour of the other agents participating in

this plan.[19] From our perspective, however, simple reliance on the behaviour of others is not sufficient for having an intention concerning their behaviour. The key element for the existence of an other-directed intention is that one views one's own intention (as perceived by one's partner) as a reason that should lead one's partner towards executing the intended instruction.

For example, for my wife to intend that I wash the dishes there is no need of an agreement between us, she just needs to assume that my awareness of her intentions should contribute to my washing the dishes. This is the so-called *reflexivity of intentions*, which is common to self-directed intentions and other-directed intentions: When one has the intention that an instruction is implemented, one also has the intention that the implementation of the instruction is determined by the very fact that one has that intention.

Our choice of using the word *intention* also to refer to attitudes towards the behaviour of other people, though corresponding to linguistic usage, is different from the terminological and conceptual choices of some authors. For example, Castañeda (1975) uses the word *practition* to refer to what we call an instruction, and distinguishes two possible practitions, *intentions* (practitions concerning one's own actions) and *mandates* (practitions concerning actions of other people).

Our use of a broader notion of an intention is justified by the idea that "intentions" concerning the behaviour of other people are mental states having a cognitive function which is similar to that of intentions concerning one's own behaviour, at least as far as reasoning is concerned.

Also with regard to intentions concerning the action of other people, we should not mistake the state of having an intention for the speech act that presupposes (and possibly originates) the possession of an intention by the speaker. Issuing a request, a command, or making an agreement are no mental states: They are actions (speech acts), though actions which include or presuppose the formation of mental states.

Consider, for example, the situation of a coach who is telling his players what are to do in the next match. When giving player Peter the command: ⌈if an adversary hits you, you shall hit back⌉, the coach will form the intention that ⌈if an adversary hits Peter, Peter shall hit back⌉. This intention will usually persist in the mind of the speaker after the performance of the speech act, and will be used in subsequent reasoning. For instance, the intention of the coach, when added to the belief that ⌈an adversary hits Peter⌉ will lead him to have the intention that ⌈Peter shall hit back⌉. Such an inference will take place according to the inference schema that we called *intention detachment*.

[19] According to Castelfranchi and Falcone (1998) one's intention that another performs a certain action is psychologically grounded on the fact that one relies upon the other's action, and views this action as a component of one's plan.

Thus, we need to distinguish carefully the mental state of the commander from the action of commanding (or agreeing): The latter includes a behavioural performance, though such a performance is accompanied by mental states. We follow here the mentalistic model of meaning and speech acts proposed by Grice (1989), and consequently view the semantics of speech acts as being grounded on mental attitudes.[20] Here is how Grice (1997, 65) defines the concept of meaning:

that U meant something by uttering x is true iff, for some audience A, U uttered x intending:
1. A to produce a particular response r;
2. A to think (recognise) that U intends (1);
3. A to fulfil (1) on the basis of his fulfilment of (2).

Accordingly, we view the speech act of prescribing or commanding, as consisting in a *declaration of intention* (a *declaration of will*). More precisely, a command consists in an utterance by the commander, expressing the following complex intentions:

1. that the commandee shall execute a certain instruction,
2. that the commandee recognises that the commander has intention (1),
3. that the commandee fulfils commander's intention (1) on the basis of the fulfilment of commander's intention (2), that is, on the basis of the recognition that the commander has intention (1).

Usually the commander's intention comes to existence at the time when the command is expressed. More precisely, when executing the act of commanding, usually the commander also performs the following mental transition: She moves from (*a*) having the intention of making so that the commandee does something (by ordering him to do it), into (*b*) having the intention that he does it.

For instance, before telling my child to wash his hands, I have the desire that he washes his hands, but I do not have yet the intention that he does it. I adopt this intention when performing the act of commanding him to wash his hands, since this act expresses the combination of the following intentions:

1. that he washes his hands;
2. that he recognises that I intend that he washes his hands;
3. that he does (1) on the basis of the fact that he recognises that I intend (want) him to do that.

[20] We cannot provide here a general discussion of speech acts, though we shall address the intentional production of normative effects in Chapter 23. The classical references, beside Grice 1989, are Austin 1962 and Searle 1969. Italian legal theory has recently dedicated a particular attention to the legal application of the theory of speech acts, see among others: Di Lucia 1997; Azzoni 1998; Conte 2002.

The idea that commands are related to intentions (or volitions), concerning somebody else's behaviour, is very common also in legal theory. For instance, Bentham (1970, chap. 1, sec. 1) views a law as:

> an assemblage of signs declarative of a volition conceived or adopted by the sovereign in a state, concerning the conduct to be observed [...] by [...] persons, who [...] are or are supposed to be subject to his power; such volition trusting for its accomplishment to the expectation of certain events [...] the prospect of which it is intended should act as a motive upon those whose conduct is in question.

Similarly, Kelsen (1960, 4–5) speaks of *acts of will* (*Willensakte*) to refer to those contexts where "a person through an act expresses the will that another person behaves in a certain way."

Here, we shall not say more about commands, since we are not interested in the speech act of commanding, but rather in the psychological attitude of the person who has (seriously) issued a command, an attitude that consists in the intention that the addressee of the command behaves in a certain way (plus the related higher-level intentions we described above). This attitude—though starting at the time when the act of commanding is performed—continues after that act is completed. Therefore we do not need to worry about a logic of commands, but we must rather focus on the logic of intentions. This has also the advantage of allowing us to treat in the same way, that is, as intentions, both the volition which concerns one's own behaviour and the volition that concerns other people's behaviour.

In Chapter 23 we shall view the action of commanding in a different (though equivalent way), that is, as the action through which the commander proclaims to create an obligation of the commandee, exactly with the intention of creating such an obligation.

1.4.5. General and Collective Intentions

An agent may have *general intentions*, concerning the implementation of certain instructions by all members of a group. Consider for example, a captain's intention that all members of his squad march in the same direction, namely, his intention that ⌈Every soldier shall turn to the left⌉. After issuing the command "All of you, turn to the left!," the commander shall indeed have the intention that every one of his soldiers shall turn to the left, from which he will infer his intention than a specific soldier, say Mark, shall turn to the left. The captain's reasoning corresponds to the following schema:

Reasoning schema: *Intention individualisation*

(1) intending that ⌈any x, who is P, shall execute action A⌉

——— IS A REASON FOR

(2) intending that j, who is P, shall execute action A

where j is any particular individual, and P is any predicate which specifies the kinds of agents one is referring to. This would be instantiated into inferences like the following:

Reasoning instance: *Intention individualisation*

(1) having the intention that ⌈any x, who is under my command, shall turn to the left⌉

——— IS A REASON FOR

(2) having the intention that ⌈$Mark$, who is under my command, shall turn to the left⌉

Agents may also adopt *collective intentions*, namely, intentions which they ascribe to a group to which they belong (see Section 9.2 on page 247). Such intentions may concern the group as a whole, or individual members of it. In the first case the collective intention concerns a joint action, to be performed through a combination of actions of all members of the group. In the second case, the collective intention only concerns the behaviour of one or some members of the group. Note that, for one to have a collective intention, it is not necessary that one assumes that one's own individual state of mind has a decisive impact on the behaviour of the addressee of the instruction: It is sufficient that one assumes that the collective intention of the group may determine that behaviour.

1.4.6. May-Instructions and Intentions

We have so far considered the shall-intention, concerning the instruction that one shall do something under certain circumstances. However, we also need to examine the *may-intention*, concerning the instruction that one may act in a certain way, under certain conditions.

When one forms the intention that one may do certain actions (tomorrow I may go to the sea, I may also stay at home, but definitely I shall not go to the mountains), one accepts the possibility that one (if one wishes to do so) behaves accordingly. The practical function of adopting a may-instruction seems to consist in storing a pre-selection of candidate shall-intentions. Firstly one screens some actions or plans that are likely to be sufficiently good choices (though not necessarily the best ones), and memorises them as the content of may-intentions. Then, when the time comes for making a choice, one retrieves the may-instructions one has adopted, and one has some possible choices at one's disposal.

When one has the may-intention to execute a certain action, one is not committed to choose that action, but one puts this action in a particular evidence, in comparison to other possible actions.

May-intentions are particularly important with regard to the actions of other people. One's intention that another may do something concerns one's accep-

tance that the latter behaves this way. Consider for example, what it means for me to intend that my daughter may go out tonight, or for a captain to intend that his soldiers may take half a day off, or for a coach to intend that her players may finish the training session in advance if they wish so.

An agent j's intention that agent k may do action A is not viewed by k an autonomous reason for doing A (my daughter's awareness that I intend that she may go out is not a reason for her to go out, unless she wishes to do so). Rather, j's may-intention enables k to decide whether do A without considering that j can have a contrary intention (the intention that k shall not do it). This is because having a may-intention that action A is done is incompatible with having the shall-intention that A is omitted. One may also say that an agent having a may-intention that action A is done is committed not to have the intention that action A is omitted, has excluded to adopt the instruction that A is omitted.

It is important to remark that having a may-intention that A is done cannot be assimilated to not having the shall-intention that A is omitted. For instance, it is not the same to say that I have the may-intention that my daughter goes out, and to say that I do not have the intention that she shall not to go out (I do not that the intention that she shall stay at home).

My not having the intention that my daughter shall not go out is a purely negative condition, which also exists when I have not yet considered the matter. It just means that my mind does not contain the intention that my daughter shall not go out. Therefore, my subsequent adoption of the latter intention does not require a retraction of any of my previous (conative) states of mind. This transition (from not having the intention to having it) only consists in acquiring an additional state of mind.

For instance, assume that I start my cogitations without having any idea about what my daughter shall or may do tonight: I am having neither the intention that she shall not go out, nor the intention that she may go out. However, after having considered the matter, I come to the conclusion that is it is better that she does not go out, and form the corresponding intention, which I communicate to her. Clearly this transition only consists in adding this new determination to the states of mind I had before, without changing any of my previous states of mind.

On the contrary, my having the intention that my daughter may go out is a positive state of mind. It means that I have made up my mind with regard to her going out (at least in the sense that I decided not to interfere with her choice to go out).

Assume that I start my cogitations having the intention that she may go out. However, reconsidering the matter (I come to know that she has a school test tomorrow), I form the intention that she shall not go out. This is no simple addition to my previous cognitive states: Adopting this new attitude requires, to preserve consistency, that I abandon my previous may-intention.

1.5. Reasoning and Cognition

Our special attention for reasoning, though fully justified (being reasoning the subject of this book), should not lead us to overemphasise the importance of reasoning among mechanisms of cognition. In fact reasoning is only one of such mechanisms, though a very important one. We could not survive without our implicit cognition, while many cognitive animals prosper without engaging in reasoning.

It has been convincingly argued that many failures of Artificial Intelligence can be traced to *intellectualism*, namely, to the idea that cognition can be reduced to reasoning. For example, Brooks (1985; 1991) argues that motoric, perceptive and reactive skills are the difficult parts of intelligence, while reasoning is trivial, once these skills are available. He observes that it took evolution billions of years to produce beings that could move and perceive, while reasoning could be quickly achieved, on the top of these abilities, in less that one million years. According to his view, a purely ratiocinating entity cannot achieve intelligence, if intelligence consists in the ability to successfully engage in autonomous problem-solving, in a real environment. This ability, on the contrary requires a strict connection between perception and action: An intelligent agent is situated in the environment, the agent is stimulated by the environment and is active in it, engaging in its exploration and its modification (see Brooks 2002, 3ff.).

1.5.1. Failures of Reasoning

There is empirical evidence that reasoning and calculation alone are often insufficient to make good judgments (cf. Thagard 2000).

For example Damasio (2000) describes people with injuries that have disconnected the parts of their brains that perform verbal reasoning and numerical calculation from emotional centres such as the amygdala. One would expect that these people, having no emotion, should be perfect decision-makers: They should embody the Aristotelian ideal of an "intelligence without passion" (*Politics*, 1297a). On the contrary, it appears that they tend to make poor decisions, especially when others are involved. Damasio conjectures that this deficiency arises because the brain damage prevents the patients from making emotional evaluations that involve somatic markers (bodily states that indicate the positive or negative emotional value of different possibilities). Consequently, such patients do not know what they care about.

As Thagard (2000) observes there is also research showing that there are domains where people's intuitive judgments may be more effective than their more systematic, deliberative judgements. For example Wilson and Schooler (1991) studied college students' preferences for brands of strawberry jams and for college courses, and found that students who were asked to analyse the reasons for their preferences ended up with choices that corresponded less with expert

opinion than did the choices of less analytical students. Wilson and Schooler conjectured that this happens because analysing reasons can focus people's attention on relatively unimportant criteria. More generally, Liebermann (2000) argues that intuitions are often based on unconscious learning processes that can be interfered with by attempts at explicit learning: Not only intuition can do better than reasoning, but reasoning can impair intuitive cognition.

Our view is that an appropriate and critical use of reasoning is able to succeed in building upon the outcomes of intuition, by checking and refining them, as we shall see when discussing rationalisation (see Section 4.1 on page 121). On the contrary, when reasoning is the only or dominant form of cognition, results are likely to be extremely poor.

1.5.2. Reasoning's Dependency on Implicit Cognition

It is easy to see that epistemic reasoning is fully dependent upon implicit cognition.

First of all, we need *perception*, which processes sensorial data and provides the necessary input for epistemic reasoning. Consider for example the mechanism of vision: Given a certain external input (the rays of light hitting the sensors in our retina), there is a mechanism in our brain (which we largely share with other animals, such as reptiles, birds and mammals) which reacts to those inputs, processes them, and provides us with percepts. Our introspection gives us no idea of what is going on inside our brain, from the moment when the input stimuli are received to the moment when the corresponding cognitive states are formed (the moment when we have certain percepts). However, this mechanism works fairly well, as far as we can judge, providing us with a view of our environment that is adequate for most of our needs.

Moreover, our brain has inbuilt mechanisms for a vast array of cognitive tasks: recognising faces, measuring and comparing areas, identifying solid shapes, synthesising linguistic expressions, forecasting trajectories, finding analogies in objects and events, finding symmetries, making and evaluating plans of actions, and so on. We come intuitively to having beliefs on all these matters without engaging in any reasoning, without performing any transition (accessible to consciousness) from one belief to another. We just need to listen to our intuition, that is, to collect the results which are provided by a non-rational module of our mind.

This is good for us since we have no time for reasoning in all these matters, and in most cases, we have no idea of how to do that. Consider, for example, the task of developing an explicit inference which (*a*) starts with the belief that millions of cells in the retina of your eye are being stimulated in certain ways by waves of light having different lengths, and (*b*) concludes with the belief that an object is in front of you, having certain dimensions, shape, colours, and position. We have no idea of how to do that, and even if we knew how to do it,

we would never find the time for it. Only our implicit cognition can provide us with adequate perceptual knowledge.

This raises the question of why we should trust our implicit cognition, though we have no way of controlling its processes. One answer is that implicit cognition results from the fine tuning of cognitive mechanisms in the millions of years since life started in our planet, through the mechanism of selective evolution (for a discussion of the links between evolution and cognition, see Dennett 1996).

As implicit theoretical cognition provides us with percepts and beliefs, implicit practical cognition provides us with a vast array of conative states. Consider for example how nature provides us with desires related to food, sex, and environmental conditions (for instance, avoiding too much hot or cold) or even with a desire for knowledge (curiosity). Consider also how one has certain attitudes concerning one's children and relatives, how one feels attraction or repulsion towards certain foods, animals, or people, how one has instinctive reactions under certain circumstances (from the basic impulse to withdraw one's hand when it touches a hot object, to the tendency to run away in a situation of danger).

We cannot here consider the way in which humans come to have "instinctive" conative states. As Damasio (2000) observes, to do that one would have to examine the chain of reciprocal interactions connecting basic life regulation (simple, standardised schemata of bodily response), emotions (more complex schemata of bodily response), feelings (perceptions of pleasure, pain and emotions), and reason. This would be a very difficult inquiry, which goes much beyond the object of this volume and the competence of its author.

Let us just say that our knowledge of inbuilt cognitive modules of natural agents (humans and animals) is still very scanty. Only in the recent years has neurology started to identify the areas of the brains that are involved in cognitive tasks and some of the chemical-physical processes that are required by these tasks. Until further progress is made, we can approach the non-rational cognitive models operating in humans and animals only conjecturally: From observing the results provided by these modules we can try to figure out their functioning.

Recently, some insights have been obtained by Artificial Intelligence, which has attempted to model cognitive processes and is achieving a few substantial results.

In opposition to the "neatness" of the reasoning-based approaches to cognition, methods for processing implicit cognition have sometimes been called "dirty" or "scruffy." Pollock (1995) proposes to call them instead "quick and inflexible" (Q&I). By this he means that those methods are efficient: They provide us with quick cognitive answers, which usually present the required grade of accuracy (consider, again, vision, or face recognition). However, they are also inflexible in the sense that the agent cannot deliberately change them, adapting

them to new circumstances. Therefore, implicit cognitive faculties represent a good solution for the types of problems they were "made for" (to which they represent evolutionary responses). However they may provide inadequate answers in new or unusual circumstances.

1.5.3. Reasoning's Contribution to Cognition

The limitations of implicit cognition do not imply that reasoning is always superior to it, so that one should abandon implicit forms of knowledge as soon as reasoning becomes available. Exactly the contrary is true: In most cases implicit cognition is much better than reasoning, and reasoning can be grafted only on an agent already possessing implicit cognition.

The latter is in fact (at least for natural agents) both the evolutionary antecedent, and the functional prerequisite for the possession of reason. First of all, the efficiency of intuitive cognition is necessary in a dynamic environment. Secondly, the fine-tuning of the agent's behaviour and the incremental acquisition of behavioural schemata on the basis of experience, which is provided by the mechanism of conditioned reflexes is still required in reasoning agents. Finally, we do not know how we would achieve through reasoning or through computations the results that we obtain by using our unconscious mental organs in tasks like perception, analogy, or language understanding.

Correspondingly, a rational agent cannot be an agent all of whose behaviour is determined by reasoning, but rather an agent that adds a reasoning capability on the top of the faculties for implicit cognition. Relying on reason alone would produce death or madness, and thus a complete failure both in practice and theory, rather than the triumph of rationality. Reasoning (reason), rather than substituting all other cognitive faculties, should monitor and control their working, and process their outcomes.

Consider, for example the situation when I have drawn two closed areas on a sheet of paper, and want to establish which one is bigger. My intuition (my specialised cognitive module for measuring areas) tells me that area A is bigger than area B. Let us assume that I have no time to use mathematical calculus to compute the two areas, or that I do not know how to do it (my knowledge of geometry is very elementary), or that the importance of the result does not justify that effort. Then the belief produced by my intuition will be all I have to rely on, and reasoning would only intervene to draw further inferences from this belief, or even to confirm it, on the basis of my knowledge of the reliability of my intuitive module for comparing areas.

Let us assume that on the contrary I have time to apply mathematical integration to compute the two areas, and that I find out that B is bigger then A. Then, if I am fully rational, I would apply reasoning to adjudicate the conflict, but I should not automatically decide in favour of the result provided by reasoning. It may be that I am aware that my knowledge of the integration calculus

is quite limited, so that it is quite likely that my calculations were mistaken. In such a situation, my correct reasoning (my rationality) should lead me to believe the results provided by intuition, rather than those provided by my mathematical reasoning. There is no contradiction in this: A rational agent should not be a fanatical rationalist (following only reasoning, or giving always priority to it), but rather a critical rationalist (on this notion, see Popper 1976, sec. 24; Hayek 1973), capable of taking into account, in its reasoning processes, also the limits of reasoning itself and the advantages of other mechanisms for cognition.

A similar situation may occur in practical reasoning. Also here, when there is a conflict between what is suggested by reasoning and what is proposed by intuition, reason itself may command following the latter. Thus, for example, when reasoning leads me to actions for which I feel a sincere repulsion, possibly the most rational conclusion is believing that my reasoning may have gone wrong. Consider the predicament that Dostoyevsky depicted so well in "Crime and Punishment" (Dostoyevsky 1997) and generally the situation where one's favourite moral theory leads one to conclude that one should kill innocent people (for example, since this would increase average happiness, or produce more equality). The idea of implicit cognition (and of instinctual reaction as resulting from implicit cognition) allows one to reconcile a rationalistic perspective with giving some credit to irrationality. Thus, a person committed to rational cognition may even agree with Nietzsche (1966, 191) on the following idea: "One has to see to it that they [the instincts] as well as reason receive their due—one must follow the instincts but persuade reason to follow them with good reasons."

Chapter 2

BASIC FORMS OF REASONING

After distinguishing the broad domains of epistemic and practical reasoning, we can now look more closely into their basic structures.

In the following sections we shall first focus of the ways of reasoning which may be collected under the idea of *ratiocination*, the thinking process that follows established patterns, which both guide and justify its progression.

In the last section we shall introduce the idea of *heuresis*, the creative formation of new ideas or hypotheses.

2.1. Ratiocination

Ratiocination consists in moving from possessed cognitive states into new cognitive states, according to established patterns. These patterns are usually accessible to introspection, though their application does not require a deliberate choice. When such patterns directly apply to existing cognitive states, and provide the information one is interested in, ratiocination is the appropriate problem-solving method.

2.1.1. Mental States, Noemata, Sentences, and Speech Acts

Before moving into the analysis of ratiocination, we need to put some order in our psychological and linguistic terminology.

First of all, we need two psychological notions:

- *mental state*, namely, the psychological situation in which a cognitive agent may be at a certain time (having a liking, a desire, a belief, an intention, a want);
- *noema* (plural *noemata*), namely, the contents or objects of such mental states.[1]

To specifically refer to the noemata corresponding to the mental states we mentioned in Chapter 1, we shall use the following terms:

- *proposition*, for the content of a belief;

[1] We borrow the term *noema* from Castañeda (1975, 7), who uses it to mean "what is *thought* or *conceived*, *planned* or *purposed*, to refer both to propositions and to the similar counterpart units of content of practical reasoning."

- *goal*, for the content of a desire;
- *instruction*, for the content of an intention or a want.

For example, my believing that ⌈today is Wednesday⌉ is a mental state (a belief), like my intending that ⌈I shall keep working until 1 pm⌉ (an intention). The contents I have in mind while having these mental states are two noemata, and precisely ⌈today is Wednesday⌉ is a proposition, while ⌈I shall keep working until 1 pm⌉ is an instruction.

Besides the psychological notions we just introduced (mental states and noemata), we also need two linguistic notions:

- *sentence*, namely, the sequence of words that expresses a noema;
- *speech act*, namely, the communicative action that is performed through uttering sentences.

For example, the sequences of words "today is Wednesday" and "I shall keep working until 1 pm" are sentences. On the other hand, my action of asserting that today is Wednesday (when replying to my wife's question "What date is it today?") is a speech act. More exactly, the speech act is constituted by the fact that I uttered the words "today is Wednesday, October 23th" with the intention of making so that my wife understood this message.

The same holds for my action of saying at the phone the words "I shall work until 1 pm!" with the intention of committing myself to do that, and of conveying to my hearer this intention of mine (I did this when I was requested to complete this morning my paper for a conference).

We have characterised noemata as psychological entities. However, they can be detached from their psychological carriers (the particular individuals who are currently having states of mind concerning the noemata) and they can be seen as contents of possible mental states. This leads us to viewing noemata as linguistic components, namely, as *meanings*, that are associated to sentences or utterances, where such associations are determined by the cognitive operations of speakers, hearers, or third parties, or by what cognitive operations they should perform according to the semantic rules of their language. We do not need to go into the difficult discussion of the connection between meanings and mental states of individuals. For our purpose it suffices that we focus on noemata as psychological entities, to wit, as the contents of real or possible state of minds, contents that can be associated to linguistic entities.

We speak of *cognitive states* to mean all mental states that occur in theoretical or practical cognition: beliefs, desires, intentions, and so on. These states are frequently referred to also as *intentional states*, using the word *intentional* in its philosophical meaning, which concerns the relationship (also called *aboutness*) between mental states and the things they refer to (on intentionality, cf. Dennett and Haugeland 1987). To avoid confusion between this technical sense of "intentional" and the commonsense (and legal) meaning of "intentional" as being

deliberate, or on purpose, we shall use the term *cognitive state* rather than the term *intentional state*. We shall however, occasionally use the term *intentionality* in the sense just indicated, namely, to refer to the adoption of (or to the ability to adopt) a cognitive state (see Section 9 on page 241).

We hope that the reader will forgive us for not even trying to provide a deeper analysis of the notions we have just introduced, addressing the vast literature on the matter. Unfortunately this would require us to move into philosophy of language—one of the most complex and controversial domains of philosophical inquiry—-, which we cannot do in the few lines we can dedicate here to this matter.[2]

2.1.2. Reasoning Schemata and Instances

As we have seen in Section 1.2.3 on page 11, a ratiocinating agent proceeds through discrete reasoning steps. Each step is characterised by its preconditions (some mental states already possessed by the reasoner) and its post-conditions (some new mental states, to be acquired through performing the reasoning step). The transition from pre-conditions into post-conditions takes place according to certain patterns, which we have called *reasoning schemata* (see Pollock 1995, whose theory of reasoning provides the basic inspiration for our model). In general, such schemata have the following form:

Reasoning schema: *Name*
A_1; ...; AND A_n
———— IS A REASON FOR
B_1; ...; AND B_m

where *Name* is the name of the schema, $A_1, \ldots, A_n$ are the pre-conditions of the schema, and $B_1, \ldots, B_n$ are its post-conditions. We say that the set of all the pre-conditions in a schema constitutes its *reason*, and the set of all its post-conditions forms its *conclusion*. We also speak respectively of a *subreason* or of a *subconclusion* to refer to a single pre-condition or to a single postcondition, that is, to refer to a single mental state contained in the reason or in the conclusion.

We maintain a certain ambiguity, by using the same expressions (reason and conclusion) to refer on the one hand to the mental states a reasoner has before and after applying a schema, and on the other hand to the contents of such mental states, that is, to the corresponding *noemata* (see Section 2.1.1 on page 47). When we want to refer specifically to noemata rather than to the corresponding mental states, we shall explicitly indicate it.

Reasoning schemata are *formal*, in the sense that they apply to all mental states having a certain structure or *logical form*, though natural language can

[2] For a collection of contributions on the philosophy of language, see, for example, Ludlow 1997.

express such states (or noemata) in different ways.[3] Any specific instance of a reasoning schema—that is, any combination of mental states matching the reasoning schema—constitutes a *reasoning instance*. For example, consider the following reasoning schema, which we call *syllogism*:[4]

Reasoning schema: *Syllogism*
(1) believing that all P's are Q's; AND
(2) believing that a is P
——— IS A REASON FOR
(3) believing that a is Q

Note that the reason of this schema includes two components or *subreasons*:

- the belief in a general proposition, which is usually called the *major premise* of the syllogism, and
- the belief in a particular (individual or concrete) proposition, which is usually called the *minor premise* premise of the syllogism.

The major and the minor premise are connected by the fact that a predicate (P) occurs in both of them.

The reasoning schema *syllogism* is instantiated by following reasoning instance, which embodies its pattern:

Reasoning instance: *Syllogism*
(1) believing that all Mondays are days on which there is a flight to Barcelona; AND
(2) believing that today is Monday
——— IS A REASON FOR
(3) believing that today is a day on which there is a flight to Barcelona

When opportune, we abbreviate reasoning instances as follows:

$$\frac{Reason}{Conclusion}$$

[3] One may even wonder whether there is a universal *language of thought* (Fodor 1983) in which each cognitive content may be uniquely expressed.

[4] We use the expression *syllogism*, since this pattern of reasoning corresponds, in the legal domain, to what is usually called *judicial syllogism* (Wróblewski 1974). However, we need to remind the reader that the Aristotelian theory of syllogism was not concerned with propositions referring to specific individuals, like proposition (2) and (3) in our schema. The syllogistic figure which comes closest to our *syllogism* would be the Barbara mood, according to which the couple of (universal) premises (1) ⌈all P's are Q's⌉ and (2) ⌈all Q's are R's⌉ leads to the (universal) conclusion that (3) ⌈all P's are R's⌉. A more precise account of syllogisms and of normative syllogisms in particular will be provided in Chapter 15 and in Chapter 20.

Therefore, we may represent the above instance of the *syllogism* schema as follows.

(1) believing that all Mondays are days on which there is a flight to Barcelona;
(2) believing that today is Monday

---

(3) believing that today is a day on which there is a flight to Barcelona

When *syllogism* is applied in practical reasoning, it provides what we call *practical syllogism*. This is the kind of reasoning which seems to corresponds to the model of the *Aristotelian practical syllogism* (*Nicomachean Ehics*, 1477a), namely, the reasoning which terminates with the performance of an action (in the example of *Nicomachean Ehics*, 1477a, tasting this cake), on the basis of a general rule (the rule that one should taste sweet foods).

We can translate the Aristotelian practical syllogism into an inference step whose reason is constituted by a general intentions (in the example, a content-general intention, namely, the intention that ⌈if a food is sweet I shall taste it⌉) and by the belief that the antecedent of the intention is satisfied in a particular case (the belief that ⌈this cake is sweet⌈), and whose conclusion is constituted by a specific intention (the intention that ⌈I shall taste this cake⌉).

(1) intending that if something is sweet I shall taste it;
(2) believing that this cake is sweet

---

(3) intending that I shall taste this cake

Note that in our example, practical reasoning does not lead directly to action, as in the Aristotelian practical syllogism: It only leads to a further cognitive state, an intention (the intention that I shall taste this cake). This cognitive state requires a further inference to be transformed into a want (the want to eat it the cake), which finally leads to action through a non-ratiocinative process, unless external factors prevent the action from taking place or from being completed.

Substituting intentions with normative beliefs—according to the process of doxification, which we shall extensively describe in Chapter 3—we obtain the *normative syllogism*, that is, a syllogism whose preconditions are a general normative conditional and a specific instance of the conditional's antecedent, and whose postcondition is a specific instance of the conditional's consequent.

(1) believing that if something is sweet I ought to taste it;
(2) believing that this cake is sweet

---

(3) believing that I ought to taste this cake

Here are two legal examples of normative syllogisms. The first corresponds to the so-called *judicial syllogism*:

Reasoning instance: *Syllogism*
(1) believing that all thieves ought to be punished; AND
(2) believing that John is a thief
——— IS A REASON FOR
(3) believing that John ought to be punished

The second concerns the type of reasoning which is involved in referring to authoritative sources of law (as we shall in chapter 25), which we call *meta-syllogism*.

Reasoning instance: *Meta-syllogism*
(1) believing that all rules issued by the head of the law school are binding; AND
(2) believing that rule ⌈it is forbidden to smoke in the premises of the law school⌉ was issued by the head of the law school
——— IS A REASON FOR
(3) believing that the rule ⌈it is forbidden to smoke in the premises of the law school⌉ is binding

While in ordinary syllogisms we use a rule for deriving normative qualifications of people or objects, in meta-syllogism we use a meta-rule (a rule about rules) for inferring properties of rules (more generally, of normative propositions) or relations between rules. It is not strictly necessary to introduce a specific reasoning schema for meta-syllogisms, since meta-syllogisms are no different from other syllogisms, as far as their inferential properties are concerned. However, we shall do it anyway, since we need to refer frequently to this kind of inferences:

Reasoning schema: *Meta-syllogism*
(1) believing that all rules being P's are Q's; AND
(2) believing that rule r is P
——— IS A REASON FOR
(3) believing that rule r is Q

Though reasoning-schemata primarily concern mental states, for simplicity we shall often represent a schema by indicating just the corresponding noemata (in particular, when only beliefs are concerned, we shall often indicate the believed propositions). For example, we can express the schema *syllogism* as follows:

Reasoning schema: *Syllogism*
(1) all P's are Q's; AND
(2) a is a P
——— IS A REASON FOR
(3) a is a Q

and, in abbreviated form

(1) all P's are Q's;
(2) a is a P
———
(3) a is a Q

2.1.3. *The Adoption of a Reasoning Schema*

Let us specify what it means for a reasoner to *adopt a reasoning schema*. When saying that a reasoner j adopts a reasoning schema, we mean that j has a particular inclination: Whenever j instantiates all preconditions of the schema, then j will also tend to instantiate the schema's post-conditions. For instance, when saying that j adopts schema *detachment*, we mean that j has the following inclination: Whenever j believes both A and ⌈if A then B⌉, j will also tend to believe B. We need however to clarify what we mean by j having such an inclination.

Let us observe that one cannot perform all inferences that are required by every reasoning schemata one adopts: This would lead one to acquire an infinite number of useless mental states, and therefore to fill one's head with useless contents. The simplest inference rules of propositional logic[5] are sufficient to lead an overzealous reasoner into such a hopeless condition. Consider, for example, the following schema:

Reasoning schema: *Disjunction introduction*
(1) A
——— IS A CONCLUSIVE REASON FOR
(2) A OR B

[5] Propositional logic is the most basic section of logic, which is based just upon the meaning of propositional connectives, like AND and OR, as we shall see in Section 15.1 on page 405.

The inferences that are enabled by schema *disjunction introduction* look obvious: Any proposition entails its disjunction. For instance, a reasoner believing that ⌈today is Tuesday⌉ can safely come to believe that ⌈today is Tuesday OR today is Thursday⌉. This process unfortunately may continue: As from proposition A one infers proposition ⌈A OR B⌉, from the latter proposition one can infer ⌈A OR B OR C⌉, and so on infinitely.

This issue is linked to the so-called problem of *logical omniscience*: One cannot derive (and endorse) all implications of one's beliefs. This *cannot*, however, can be read in two different senses.

In a first sense, it points to a serious limitation of our cognitive powers: We cannot (are unable to) infer many important truths that follow from what we already know (discovering these truths is the difficult task of mathematicians and logicians).

In a second sense, which is the one we are now considering, the assertion that we cannot be logically omniscient rather refers to the futility of a misguided cognitive effort: We cannot (we should not, since it would be silly or unreasonable) derive all useless or trivial implications of our current beliefs.

The way out of the latter problem consists in limiting oneself to performing only those inferences that may be relevant for one's epistemic interests, according to the priorities determined by these interests (and according to the available time and energy). Therefore we cannot view reason-schemata neither as absolute necessities, forcing one to draw whatever irrelevant conclusions they indicate, nor as pure possibilities, which one can randomly implement or disregard. Reasoning schemata rather express a *necessity* that is *conditioned* to the utility or relevance of their use. Thus, one believing both P and ⌈if P then Q⌉ should acquire belief in Q only if one has some interest in establishing whether Q holds (and one has nothing more important to do). Otherwise a rational reasoner should refrain from making the inference.[6]

Note also that the same reasoning schemata, such as *syllogism*, are so ubiquitous that sometimes they are expressed elliptically. For instance, when saying that:

⌈a is a P⌉ IS A REASON FOR ⌈a is a Q⌉,

we often mean that:

⌈a is a P AND all P's are Q's⌉ IS A REASON FOR ⌈a is a Q⌉.

Such ellipses are usually harmless, and even useful in some circumstances. In particular, they are useful when one wants to hint that there is a way of completing one's reasoning, but one does not want yet to commit oneself to a specific way of doing this (or one does not know yet how to do it). However, for clar-

[6] On the connection between reasoning and interest, see Pollock (1995), who proposes an architecture for interest-driven reasoning.

ity's sake we prefer to express all reasoning schemata by specifying all of their subreasons.

2.2. Conclusive and Defeasible Reasoning

We shall distinguish two types of reasoning schemata: conclusive and defeasible ones. The basic difference between the two kinds of reasoning schemata can be summarised as follows.

A *conclusive* reasoning schema indicates a transition that can operate regardless of any further information the agent possesses, as long as the reasoner instantiates the pre-conditions in the schema: Whenever one endorses the reason of the schema, one may safely endorse its conclusion.

Definition 2.2.1 *Conclusive reasoning schema. A reasoning schema R is* conclusive *if one can always adopt R's conclusions while endorsing R's premises (and one should never reject R's conclusions while endorsing R's premises).*

When a reason A supports a conclusion B according to conclusive reasoning, we also say that R *entails* C and write:

$$A \vdash B$$

When both A entails B and B entails A, we say that A *is equivalent to* B and we write:

$$A \equiv B$$

The distinctive feature of a *defeasible* reasoning schema is that it may be defeated by further information to the contrary: The schema indicates a transition that only operates when one has no prevailing beliefs (or, more generally, mental states) against applying the schema or against adopting its conclusions. When one endorses the premises of a defeasible schema but has such prevailing beliefs, one should:

- refrain from adopting the conclusion of the schema, and even
- withdraw the adoption of that conclusion.

Definition 2.2.2 *Defeasible reasoning schema. A reasoning schema is* defeasible *if one should, under certain conditions, refrain from adopting its conclusions though endorsing its premises.*

In the following sections we shall consider some important aspects of conclusive and defeasible reasoning, analysing their commonalities and differences.

2.2.1. Validity and Truth-Preservation

The strong connection between reason and conclusion that characterises conclusive reasoning schemata can be linked to the idea of *truth-preservation*. Conclusive inference schemata (in the epistemic domain) are truth preserving: Whenever (in any possible situation where) the premises of a conclusive schema are true, then also the conclusions of the schema are true. Said otherwise, it is impossible that the premises of a conclusive schema are true and its conclusions are false.

Definition 2.2.3 *Truth preservation. A reasoning instance R is* truth preserving *if necessarily, whenever R's premises are true, then also R's conclusions are true. Similarly, a reasoning schema R is* truth-preserving *if all R's instances are truth preserving.*

Truth-preservation is a very useful and important property, but it does not characterise all rational reasoning patterns. Therefore, it does not delimit the scope of logical reasoning, if by *logic* we mean rational reasoning, or rational ratiocination.

It is true that many authors tend to limit logic to truth-preserving reasoning: They view logic as having the specific function of providing truth-preserving ways of reasoning. Moreover, many logicians refer to truth-preservation by using the word *valid*. For instance, it is said "an argument is VALID if it is logically impossible for all the premises to be true, yet the conclusion false" (Sainsbury 2001), or, just to take another citation, that "an argument is called *valid* when its premises entail it conclusion, in other words, if the premises can't be true without the conclusion also being true" (Hodges 1983, 1). Correspondingly, it is also said that logic is the study of valid reasoning.

Obviously, there is nothing wrong in using the word *valid* in this specific sense (for which there is a long and very respectable tradition), nor in defining the word *logic* so that it only concerns truth-preserving reasoning. However, these definitions lead people (especially when they are not familiar with formal reasoning and with the technical meaning of logical notions) to the idea that any form of reasoning that is not truth-preserving is "invalid," in the generic sense of being wrong, arbitrary, or unreasonable.

To avoid this connotation sneaking into our discourse (and to avoid confusion with the sense in which the word *valid* is used in the law, for example when discussing legal sources), we shall refrain from using *valid* in the sense of "truth preserving" (and *invalid* in the sense of "non truth-preserving").

This allows us to avoid qualifying all defeasible inferences as being "invalid": Though they are not truth-preserving (it may happen that their preconditions hold, but their conclusions fail to be true), defeasible reasoning schemata are indeed "valid" or "sound" forms of reasoning, in the sense of being appropriate ways of approaching certain cognitive tasks.

Reasoning schema: *Conclusive syllogism*

(1) all Y's are Z's; AND
(2) x is Y
——— IS A CONCLUSIVE REASON FOR
(3) x is Z

Reasoning schema: *Defeasible syllogism*

(1) all Y's are normally Z's; AND
(2) x is Y
——— IS A DEFEASIBLE REASON FOR
(3) x is Z

Table 2.1: *Conclusive and defeasible syllogism: reasoning schemata*

2.2.2. Monotonic and Nonmononic Reasoning

Conclusive reasoning schemata provide for *monotonic reasoning*: The conclusions that can be derived by a reasoner that only uses conclusive reasoning always grow, as long as the reasoner is provided with further input information.

More exactly, if a conclusion A can be conclusively derived from a set of premises S_1, then A can also be derived from whatever set S_2 resulting from the addition of further premises to S_1 (from whatever set S_2 such that $S_1 \subset S_2$).

On the contrary, when one draws defeasible inferences from a set of premises S_1, it may happen that, by adding further premises to S_1, one obtains a set S_2 which does not entail some conclusions one could derive from S_1 alone. Defeasible reasoning schemata license *non-monotonic* reasoning: Their conclusions may need to be abandoned when new information is available.[7]

In Table 2.1 you can see the reasoning schemata for defeasible and conclusive syllogism, which are applied in the reasoning instances of Table 2.2 on the next page. According to the first reasoning instance, when one believes that ⌈all bachelors are unmarried⌉ and that ⌈John is a bachelor⌉, one can conclusively conclude that ⌈John is unmarried⌉. According to the second instance, when one believes that ⌈Pet dogs are normally unaggressive⌉ and that ⌈Fido is a pet dog⌉ one can defeasibly conclude that ⌈Fido is unaggressive⌉.

The difference between conclusive and defeasible reasoning emerges most clearly when one acquires beliefs that contradict the conclusions of one's previous inferences.

Let as assume, for example, that Mary—who knows that ⌈bachelors are

[7] On non-monotonic reasoning, see Ginzberg 1987, which collects the contributions which have originated research in this domain. For an introduction, see also Brewka 1991.

Reasoning instance: *Conclusive syllogism*

(1) all bachelors are unmarried; AND
(2) John is a bachelor
——— IS A CONCLUSIVE REASON FOR
(3) John is unmarried

Reasoning instance: *Defeasible syllogism*

(1) pet dogs are normally unaggressive; AND
(2) Fido is a pet dog
——— IS A DEFEASIBLE REASON FOR
(3) Fido is unaggressive

Table 2.2: *Conclusive and defeasible syllogism: reasoning instances*

unmarried⌉ and ⌈husbands are married⌉—after meeting John at a dinner party comes to believe, according to John's statements, that ⌈John is a bachelor⌉. This leads Mary to believe, according to schema *conclusive syllogism*, that ⌈John is unmarried⌉. However, the day after a friend tells Mary that ⌈John is Lisa's husband⌉. This should lead her to conclude, still according to *conclusive syllogism*, that ⌈John is married⌉, which contradicts her belief that ⌈John is unmarried⌉.

At this stage, Mary has no choice but to abandon the premises of one of these inferences. If she sticks to the idea that John is a bachelor, she needs to withdraw the belief that John is Lisa's husband, while if she accepts the idea that John is Lisa's husband, she needs to withdraw the belief that John is a bachelor.

In defeasible reasoning, a different approach is required. Let us assume, for instance, that one endorses all of the following propositions: ⌈Fido is a pet dog⌉, ⌈pet dogs are normally unaggressive⌉, ⌈Fido is a Doberman⌉, ⌈Dobermans are normally aggressive⌉. According to schema *defeasible syllogism*, this set of premises licences both of the defeasible inferences in Table 2.3 on the facing page.

Let us assume that the second inference in Table 2.3 on the next page is stronger (more reliable) then the first one. In such a situation, we are not required to withdraw any of the premises of the weaker inference (withdraw the belief that pet dogs are normally unaggressive, or that Fido is a pet dog). We can maintain the premises of both inferences, that is, we can keep on believing both of the following reasons (sets of premises): {Fido is a Doberman; Dobermans are normally aggressive}, {Fido is a pet dog; Pet dogs are normally not aggressive}. However, we shall refrain from deriving the conclusion that ⌈Fido is aggressive⌉.

(1) Fido is a pet dog;
(2) pet dogs are normally unaggressive

---

(3) Fido is unaggressive

(1) Fido is a Doberman;
(2) Dobermans are normally aggressive

---

(3) Fido is aggressive

Table 2.3: *Two defeasible inferences*

2.2.3. *The Rationale of Defeasibility*

Defeasible reasoning schemata, as we have observed in Section 2.2 on page 55, are not truth-preserving. They license what Peczenik (1989, 114ff.) calls *jumps* or *leaps*: When believing the premises of a defeasible schema, we are lead to endorse the conclusions of the schema, though these conclusions are not truth-preservingly implied by our premises (and they may indeed turn out to be false, even when the premises hold true). However, failure to satisfy truth preservation does not entail logical faultiness. On the contrary, epistemology has come to identify various kinds of sound defeasible inference (Pollock 1995, 52ff.). Here we list a few of them:

1. *Perceptual inference*. Having certain perceptual contents is a defeasible reason to believe in the existence of corresponding external objects. More generally, having a percept with content φ is a defeasible reason to believe φ. For instance, having an image of a red book at the centre of my visual field is a defeasible reason to believe that there is a red book in front of me.
2. *Memory inference*. Recalling φ is a defeasible reason to believe φ. For instance, my memory that yesterday I had a faculty meeting is a defeasible reason for me to believe that indeed there was such meeting.
3. *Enumerative induction*. Observing a sample of F's all of which are G's is a defeasible reason to believe that all F's are G's. For instance, believing that all crows I have ever seen are black is a defeasible reason to believe that all crows are black.
4. *Statistical syllogism*. Believing that ⌈most F's are G's AND a is an F⌉ is a defeasible reason to believe that a is a G. For instance my beliefs that ⌈most printed books have even-numbered pages on their left side⌉ and

that ⌈the volume on the top of my table is a printed book⌉ are defeasible reason for me to believe that this volume has even-numbered pages on its left side.

5. *Temporal persistence.* Believing that φ is the case at time t_1 is a defeasible reason to believe that φ is still the case at a later time t_2. For instance, my belief that my computer was on the top of my table yesterday evening (when I last saw it) is a defeasible reason for me to believe that my computer is still there (on temporal persistence, see Section 21.4.4 on page 569).

In general, there is nothing strange or pathological in defeasible reasoning. On the contrary, defeasibility is the natural way in which an agent can cope with a complex and changing environment.

We do not even need to view defeasibility only in cognitive agents: An agent only endowed with fixed or conditioned reflexes may exhibit what may be viewed as a form, or at least as an evolutionary antecedent, of defeasible reasoning. Consider a reactive agent having two reflexes r_1 and r_2 such that:

- according to r_1, stimulus s_1 (tasting good) triggers action a_1 (eat it!);
- according to r_2, stimulus s_2 (feeling hot) triggers action a_2 (get rid!);
- r_2 is stronger then r_1.

Assuming that the strength or each reflex is proportional to its importance for an agent's survival or reproduction, the most useful thing to do (with regard to survival and reproduction) when incompatible reflexes are triggered would be to implement the stronger of the two reflexes. Accordingly, when confronted with stimuli s_1 and s_2 (a tasty, but burning bite of food), a well-adapted reactive agent, rather than staying inactive or choosing randomly, will execute r_2 and do a_2 (get rid of the food). Therefore we may conclude that, in a certain sense, reflex r_2 defeats r_1: Given only stimulus s_1, the agent would react with a_1, but given the combination of s_1 and s_2, the agent will react with a_2.

Though one may correctly speak of defeasible reflexes, defeasibility acquires its fullest meaning for cognitive agents: For such agents defeasibility consists in having certain cognitive states and withdrawing them when further cognitive results become available. In particular, we shall focus on *defeasible ratiocination*: The agent acquires through reasoning certain provisional cognitive states, and later may retract them, as a result of further reasoning.

To refer to the provisional conclusions of defeasible reasoning, usually the qualification *prima facie* is used. However, qualifying all defeasible conclusions as being *prima facie* suggests that all results of defeasible reasoning are obtained on the basis of the only information that is immediately available to the reasoner. This suggestion is misleading, since a defeasible conclusion may also be adopted after an accurate inquiry.

Possibly a better terminological choice (suggested by Peczenik, Volume 4 of this Treatise, sec. 5.1.3) consists in qualifying the outcomes of defeasible

reasoning as *pro-tanto* conclusions, namely, conclusions which, through being justified on the basis of the information so far considered, may be withdrawn on the basis of further information.

Note that a defeasible belief is not necessarily so strong as to justify acting accordingly. One may be aware that further inquiry may provide reasons against maintaining that belief. In such a case, one may resist acting on the basis of a *pro-tanto* conclusion. It will depend on the circumstances of the case, and mainly on the depth of the inquiry so far performed and on the need of providing a quick answer, whether rationality requires jumping from *pro-tanto* acceptance into action, or rather deferring action until the issue has been better examined. The important idea of *rational deferment* goes back to Buridan (1968), who was unjustly ridiculed with the famous story of the Buridan's ass (see Section 7.1.1 on page 195).

Consider for example the case of a person who asks his tax lawyer whether he should pay taxes on money he earned abroad. Assume that the lawyer finds a rule stating that also money earned abroad should be taxed. However, the lawyer is aware that a number of exemptions exist, concerning different countries and different types of revenue (though she is not aware of the content and the preconditions of such exceptions). Therefore she should tell the client that she only *pro-tanto* (namely, on the basis of the information she has so far considered) believes that the money he earned abroad is not taxed. She needs to look further into tax law for providing a sufficiently reliable answer.

2.2.4. The Logical Function of Defeasible Reasoning Schemata

According to the analysis we developed in the previous section, defeasible inference schemata seem to have a twofold function.

The first function is that of providing the reasoner with provisional thoughts, on the basis of which one may reason and if necessary act, until one has new information to the contrary. In this spirit, Pollock (1995; 1998) relates defeasible reasoning to a general feature of human cognition. He argues that normally one starts with perceptual inputs and goes on inferring beliefs from one's current cognitive states (one's percepts plus the beliefs which one has previously inferred). Such a belief-formation process must satisfy apparently incompatible desiderata:

- One must be able to form beliefs on the basis of a partial perceptual input (one cannot wait until one has a complete representation of one's environment).
- One must be able to take into account an unlimited set of perceptual inputs.

Defeasibility is the way to reconcile such requirements:

> The only obvious way to achieve these desiderata simultaneously is to enable the agent to adopt beliefs on the basis of small sets of perceptual inputs but then retract them in the face of additional perceptual inputs if those additional inputs conflict in various ways with the original basis for the beliefs. This is a description of *defeasible reasoning*. Beliefs are adopted on the basis of arguments that appeal to small sets of previously held information, but the beliefs can later be retracted in the face of new information. (Pollock 1995, 40)

The second function for defeasible reasoning is that of activating a structured process of inquiry, based upon drawing *pro-tanto* conclusions, looking for their defeaters, for defeaters of defeaters, and so on, until stable results can be obtained. This process has two main advantages: (1) it focuses the inquiry on relevant knowledge, and (2) it continues to deliver provisional results while inquiry goes on.

2.2.5. Collision and Defeat

In order to have a first look into the working of defeasible reasoning, let us consider an example that is frequently referred to by epistemologists.

Assume that I believe that swans are normally white, and that I am told that there is a swan in the park. This enables the following defeasible inference (an instance of the schema *statistical syllogism*):

(1) most swans are white;
(2) the bird in the park is a swan

---

(3) the bird in the park is white

However, when I look out of the window, I see that the bird in the park, although being unmistakably a swan, looks kind of pinkish. This prompts the following perceptual inference:

(1) I am having a pink image of the bird in the park

---

(2) the bird in the park is pink

Thus, I am pushed towards conflicting conclusions, supported by competing defeasible inferences (according to the first inference, the bird is white, according to the second one it is pink). Assume that, being a moderate empiricist, I consider the perceptual inference to be stronger than the statistical one. Therefore, I should abandon my *pro-tanto* belief that the swan is white and accept (though provisionally) that it is pink. In such a case, we say that the inference concluding that the swan is white is defeated by the perceptual inference according to which it is pink.

Inference $\mathcal{A}$	Inference $\mathcal{B}$
(1) Most swans are white	(1) I perceive the image of a pink bird in the park
(2) The bird in the park is a swan	
(3) The bird in the park is white	(2) The bird in the park is pink

Table 2.4: *Rebutting collision: Inference $\mathcal{A}$ collides with inference $\mathcal{B}$*

Cognitive processes like the one we have just considered can be explained by introducing two notions, collision and defeat.

Definition 2.2.4 *Collision. Let mental state M be a reason for adopting mental state Q and mental state M^* be a reason for adopting mental state Q^*. We say that that there is a* collision *between M and M^*, when the combined mental state which consists in endorsing both of M and M^* does not support adopting both of Q and Q^*.*

When one finds oneself in a collision, one is prevented from performing both colliding inferences. One may be prevented from performing just one of them, or one may be prevented from performing both. Those inferences which are prevented by the collision, are said to be *defeated*, while the reason that prevents deriving a conclusion is said to be a *defeater* (see Pollock and Cruz 1999, 195ff.):

Definition 2.2.5 *Defeat. Let mental state M be a reason for adopting state Q. Mental state M^** defeats *(is a* defeater *for) M, iff the combined state consisting in endorsing both of M and M^* does not support adopting Q.*

In the example above, mental state m (believing that most swans are white and that the bird in the park is a swan) collides with mental state m^* (the percept that that the bird in the park is pink). State m alone was a reason for adopting a mental state q (believing that the bird in the park is white), according to *statistical syllogism*. However, the combined state consisting in having both m and the additional mental state m^* is no reason for adopting q: Because of the defeater m^*, the inference from m to q is blocked or defeated. The conflict between the two inferences $\mathcal{A}$ and $\mathcal{B}$ originated by the two colliding mental states m and m^* is reproduced in Table 2.4.[8]

[8] Here and in the following, we shall refer to sequences of propositions—and in particular to inferences and arguments—by using symbols $\mathcal{A}$, $\mathcal{B}$, ...

2.2.6. Collisions and Incompatibility

The type of collision we exemplified at the end of previous paragraph (conflict of inferences leading to incompatible conclusion) will be called *rebutting collision*. As a first approximation, we may define rebutting collision as follows:

Definition 2.2.6 *Rebutting collision. There is a* rebutting collision *between reasons M and M* when*

1. *M is a reason to adopt mental state Q,*
2. *M^* is a reason to adopt mental state Q^*, and*
3. *Q is incompatible with Q^*.*

This definition needs to be integrated with a specification of what it means for two mental states to be incompatible:

- When beliefs are at issue, incompatibility consists in the fact that Q and Q^* concern propositions that cannot jointly be true (either the swan is pink or it is white).
- When shall-intentions are at issue, incompatibility consists in the fact that Q and Q^* concern instructions that cannot be jointly implemented (either I shall make a donation or I shall spend my money).[9]

However, only in some cases can incompatibility be assessed by looking only at the directly concerned mental states: These are the cases when these mental states contain noemata that are incompatible in all logically possible situations. For instance, it cannot be that case that Tom both stole a car and did not steal it; or that Mary both is obliged to repair some damage and is not obliged to do so.

In many other cases, to assess the incompatibility of two mental states one needs to consider further information, concerning meaning connections, causal links, or further facts. For example, to assess that being pink and being white are incompatible states of one same object (our swan) one must know that an object cannot have two colours at the same time. Similarly, to know that there is a conflict between the fact that others detain and process one's personal data and one's free self-determination (as affirmed by privacy supporters), much psychological and sociological background-knowledge is to be assumed. Finally, to know that low inflation and full occupation are incompatible (in a certain economic context) one must have a lot of economical information.

Therefore, very often the incompatibility of two conclusions cannot be immediately detected by the reasoner, but is rather the result of finding relevant

[9] By "implementing an instruction," we mean performing the indicated action under corresponding circumstances. The problem of compatibility becomes more complex when may-intentions are also considered. We shall address this issue in Chapter 17, when dealing with permissions.

	Inference $\mathcal{A}$		Inference $\mathcal{B}$
(1)	I perceive a pink bird in the park	(1)	There is red light outside
		(2)	Perceiving a pink object under red light does not warrant that it is pink
(2)	The bird in the park is pink	(3)	My perceiving a pink bird does not warrant that it is pink

Table 2.5: *Undercutting collision: Inference $\mathcal{A}$ collides with inference $\mathcal{B}$*

information and of bringing it to bear through reasoning processes (for an illuminating discussion, see Perelman and Olbrechts-Tyteca 1988, sec. 46).

2.2.7. Undercutting Collisions

Besides rebutting collisions, there is another way in which reasons can collide. This happens when the reasoner has a reason to believe that, in the present circumstances, a reasoning schema does not apply, since under those circumstances the reason of the schema provides no reliable support to its conclusions.

Let us consider a variation of the ornithological example we introduced in Section 2.2.5 on page 62. Assume that I am seeing (or rather having the vision of) a pink bird, and that I come to believe, according to a perceptual inference, that the bird is indeed pink. I notice, however, that there is beautiful sunset now, throwing red light over all things. I know that red light makes white objects look pink. Therefore, I conclude that it would be unreasonable for me to believe that the swan is pink on the basis of the only fact that it looks pink to me (under the present conditions the pink-looking swan might as well be white).

Note that this reasoning does not tell me that the swan is white, since pink objects would still look pink under red light: It only undermines the previous inference, without providing a different conclusion (Table 2.5).

This type of collision (collision between a reason M, and a reason M^*, indicating that M is unreliable) shall be called *undercutting collision*. More exactly, according to Pollock and Cruz (1999, 196), we define undercutting collisions as follows.

Definition 2.2.7 *Undercutting collision. There is an* undercutting collision *between reasons M and M^* when*

1. *M is a reason for adopting mental state Q,*

2. *M^* is a reason for believing that M does not support Q.*

Under these conditions we also say that M^* undercuts *M.*

For instance, my awareness that there is red light is a reason for believing that the fact that the bird looks pink does not support concluding that it is pink. Such awareness *collides with*, and more exactly *undercuts*, my considering the pink appearance of the bird as a reason for concluding that it is pink.

2.2.8. Preference-Based Reasoning

When one endorses two colliding reasons, one cannot derive the conclusions of both of them: At least one of these reasons is defeated.

We may thus distinguish the following two cases:

1. If one reason, assume R_1, prevails over the other, R_2, we may reject R_2 and endorse R_1 (so that only R_2 is defeated).
2. If, on the contrary, none of the two reasons prevails, both reasons are defeated.

Thus, it appears that a reason R_1 *defeats* a reason R_2, whenever R_1 collides R_2, and R_2 does not prevail over R_1. When, additionally, R_1 prevails over R_2 (item 1 above) then R_1 *strictly defeats* R_2 (defeats R_2, but is not defeated by it).[10]

In considering what reason prevails, there is a difference between rebutting and undercutting collisions:

- In rebutting collisions there is a perfect symmetry between the two reasons: One reasons prevails over the other exactly when it is stronger, that is, when it outweighs the other.
- In undercutting collisions, the undercutter is favoured: It always prevails.

Thus, in case of rebutting collision the stronger reason outweighs and strictly defeats its competitor. Consider for example, a recent case that had to be addressed by the Italian privacy authority. It concerned the case of a woman who requested for health reasons to access data concerning the DNA of her father (the data was stored in the database of a hospital), who did not give his consent. Therefore, the authority needed to balance the privacy-based inference (the father's data could not be provided since sensitive data cannot be communicated without the consent of the data subject) and the inference based upon the right to health (one has a right to obtain what is needed for one's health, such as, for

[10] Note that the propositions that (*a*) $\lceil R_2$ does prevail over $R_1\rceil$ and that (*b*) $\lceil R_1$ prevails over $R_2\rceil$ are not equivalent: The first also holds when the outcome of the conflict of the two reasons is a draw (is undetermined), while the second requires that the conflict is positively decided in favour of R_1 (we assume that the prevailing-over relation is antisymmetric).

that woman, access to the father's DNA). In such a case the health-based inference was considered to be preferable to the privacy-based inference, so that the latter was viewed as being strictly defeated, and the former inference dictated the outcome of the case.

In case of undercutting collisions, the undercutter prevails: It strictly defeats the attacked reason. This seems indeed the most reasonable way of approaching undercutting. If I just have a reason R_1 to believe that the bird in the park is pink, and a reason R_2 to conclude that R_1 is unreliable, I should not conclude that the bird is pink (on the basis of the unreliable reasons R_1). Similarly, assume that I find in a law text two rules: a rule r_1, and a rule r_2 saying that r_1 is inapplicable under certain circumstances. If these circumstances are satisfied in the present case I should conclude that r_1 is indeed inapplicable, and refrain from deriving its conclusion.

Though our approach to undercutting seems generally acceptable, we need to apply it with some caution in order to avoid absurd conclusions. Assume for instance that r_2 is a Constitutional rule, while r_1 is a statutory rule saying that r_2 is inapplicable. It seems that, according to the mechanism of undercutting, r_1 should prevail, so that r_2 would be inapplicable (though that Constitutional provisions prevail over statutory rules). However, this absurd conclusion can be avoided if we specifically assume the principle that legislative provisions curtailing a constitutional rule—by declaring it to be inapplicable—are to be rejected. The rejection of such provisions (the view that they are not binding, i.e., that they are invalid) can be justified on teleological grounds (since admitting their bindingness would impair the limiting function of the Constitution with regard to legislation).[11]

In conclusion, when facing a collision, we should reason as follows:

- in rebutting collisions, we should compare the strength of the conflicting reasons, and assume that any reason that is not stronger than its competitor is defeated (only stronger reasons prevail);
- in undercutting collisions, we should assume that the undercutter always prevails.

Let us consider a further example on undercutting. Assume that I have heard two different accounts of the same event, from two friends, John and Mary:

- John tells me A,

[11] We shall not consider here how to assess the comparative strength of competing reasons (the outweighing relation), an issue that will be extensively discussed in Chapter 7. By now we just need to observe that our treatment of undercutting corresponds to Prakken and Sartor 1997. The logical treatment of undercutters is a very difficult and controversial matter. Even John Pollock, who introduced the notion of undercutting in the logical debate, changed his mind in this regard. While he had at first assumed that undercutters always prevail (as we also assume), he later affirmed that an undercutter only succeeds if it is at least as strong as the undercut reason (Pollock 1995, 103–4).

- Mary tells me NON A (A is not the case), and
- I consider both of them to be sufficiently reliable, under normal circumstances (so that I would have believed each one of them, if the other had kept silent).

It seems that I should view the statements of Mary and John as defeating one another, and refrain from forming any belief on the matter (neither A nor NON A), unless I can assume that one of the two conclusions more reliable then the other. In the latter case, I should provisionally (defeasibly or *pro-tanto*) believe the content of the more reliable statement, and reject the other.

Similarly, assume that I come to know both of the following facts:

- Tom intentionally caused harm to Mary's property, driving into her fence, and
- he acted in a state of necessity, to avoid hitting a child who was crossing the street.

Under such conditions, I should conclude that Tom has no duty to compensate Mary's damage, since the conclusion that he is not liable (having acted for the necessity of saving another's life) prevails over the conclusion that he is liable (having intentionally damaged another's property).

This way of reasoning assumes, however, that one has a way of determining what conclusion (if any) is more strongly supported. In some cases, one may do that by adopting mathematical methods. For example, one may use probability calculus, and assume that the strength of each conclusions corresponds to its probability, which can be computed by combining the probabilities of its preconditions. Other numerical calculations of the comparative strength of beliefs have also been proposed, which diverge under some respects from standard probability (see, for example, Pollock 1995).

We cannot here discuss the merit of numerical methods for assessing credibility, which would require us to address the technicalities of probability and statistics. Let us just observe, in general, that there are certain specific legal issues (in particular in the domain of evidence) where numerical calculi can provide appropriate answers. However, these calculi do not provide a generally applicable solution for dealing with incompatible conclusions in moral and legal reasoning. In the law, it is rather the case that one needs to engage in priority reasoning, that is, one needs to bring to bear further information, and to decide accordingly which inference is to prevail (this idea will be extensively examined in Chapter 7). Though this information rarely is numerical, it enables in most cases a sufficiently precise assessment.

2.2.9. Reinstatement

We need to introduce a further idea that explains the characteristic procedure of defeasible reasoning: the notion of *reinstatement*. When a defeater is strictly

Inference $\mathcal{B}$ is preferable to inference $\mathcal{A}$

Inference $\mathcal{A}$		*Inference $\mathcal{B}$*	
(1)	Mary loved John	(1)	Mary's clothes were stained with John's blood
(2)	people normally do not kill their loved ones	(2)	if one's clothes are stained with the victim's blood, then normally one has killed the victim
(3)	Mary has not killed John	(3)	Mary has killed John

Table 2.6: *Defeat by rebutting*

defeated by a further inference, then the inference originally attacked by the defeat may recover its capacity to establish its conclusion.

Let us develop further the pink-swan example. As before, assume that the bird of which I am having a pink vision is a swan, so that I would conclude for its whiteness, unless this conclusion was defeated by my perception of its pinkness. Assume also that I realise that the sun is setting, and that its light makes all white things look pink. My awareness of this undercuts the conclusion that the bird is pink (see Table 2.6). As a consequence of the perceptual inference being undercut, the inference for whiteness is reinstated: I again *pro-tanto* believe that the bird is white (being a swan).

Let us consider another example, concerning the difference between rebutting and undercutting. Let as assume that a detective is investigating the violent death of John, of which Mary, John's inconsolable girlfriend, is accused. The detective believes that Mary loved John, but has evidence that her clothes were stained with John's blood. The information he has allows him to build two inferences, which rebut one another: the inference according to which Mary did not kill John, since she loved him (inference $\mathcal{A}$), and the inference that she killed him, since her clothes were stained with John's blood (inference $\mathcal{B}$).

Assume that the detective also believes that inference $\mathcal{B}$ is preferable to inference $\mathcal{A}$ (he gives more credit to chemistry then to psychology). This allows the detective to endorse the conclusion of inference $\mathcal{B}$: At this stage of the inquiry he forms the belief that Mary killed John (inference $\mathcal{B}$ defeats inference $\mathcal{A}$, but inference $\mathcal{A}$ does not defeat $\mathcal{B}$).

However, assume that the detective discovers that Lisa (John's previous girlfriend) tried to frame Mary, by staining Mary's dress with John's blood. Again, this alone would not be a reason to believe that Mary did not kill John, but rather a reason for considering that the inference $\mathcal{B}$ (from Mary's having blood-stained clothes to her being the murderer) is unreliable, and therefore to view this inference as being undercut.

Inference $\mathcal{B}$ is preferable to inference $\mathcal{A}$

Inference $\mathcal{A}$	*Inference $\mathcal{B}$*	*Inference $\mathcal{C}$*
(1) Mary loved John	(1) Mary's clothes were stained with John's blood	(1) Lisa stained John's clothes with blood
(2) people normally do not kill their loved ones	(2) if one's clothes are stained with the victim's blood, then normally one has killed the victim	
(3) Mary has not killed John	(3) Mary has killed John	(2) Mary's clothes being stained with John's blood does not warrant that Mary killed John

Table 2.7: *Reinstatement through undercutting*

The latter inference, let us call it $\mathcal{C}$, by undermining inference $\mathcal{B}$ results in reinstating inference $\mathcal{A}$. Thus, we pass from the following situation (we use a smaller character for defeated inferences):

where inference $\mathcal{A}$ is strictly defeated by inference $\mathcal{B}$, into the situation:

where inference $\mathcal{B}$ is strictly defeated by inference $\mathcal{C}$, and consequently $\mathcal{A}$ is reinstated. Thus given all of $\mathcal{A}$, $\mathcal{B}$, and $\mathcal{C}$, the detective would conclude, according to $\mathcal{A}$, that Mary did not kill John (since she loved him).

A further type of undercutting collision is provided by inferences presupposing that one does not have a certain mental state: These inferences collide exactly with one's adoption of that mental state. Such inferences are made when one assumes that, if a certain proposition A were true, one would have come to believe A, or at least one would possess the information that enables one to infer A.[12] Therefore, when failing to form the belief that A, one may conclude that A does not hold and reason accordingly. However, when one positively finds

[12] This seems to be the rationale of the so-called autoepistemic logic (Moore 1987), and of the use of negation by failure in logic programs (Clark 1987).

Inference $\mathcal{A}$	Inference $\mathcal{B}$
(1) If I do not believe that one is guilty, then I presume that one is innocent	(1) I have evidence proving that Mary is guilty
(2) I do not believe that Mary is guilty	
(3) Mary is innocent	(2) Mary is guilty

Table 2.8: *Undercutting presupposition*

that A holds, one should abandon inferences based upon the assumption that A does not hold.

For example, why do I believe that my children are in the garden? The answer is the following: I believe that they have come back from school, and I believe that they are not in the house (and that the garden is the only other place where they may be). But why do I believe that they are not in the house? The reason is the following:

- I do not have the belief that the children are in the house, and
- I expect that if they were in the house I would have this belief (since I would have heard them entering the door, which would have lead me to believe that they were in the house).

Since my conclusion that the children are in the garden is based upon my non-believing that the children are in the house, as soon as I can positively conclude that the children are in (for example, because I hear them screaming), I will withdraw the inference.

A similar mechanism may also be used in legal contexts, and may even be mandated by legal rules. For example, when a judge does not believe that a person is guilty, he should base his verdict upon the thesis that the person is innocent (*in dubio pro reo*), as shown in Table 2.8.

It may be argued that this kind of situation takes place more generally in the law, whenever a rule makes a certain legal effect dependent upon the fact that certain facts are not shown to hold (see Sartor 1995). This is indeed the typical way of reasoning with legal *presumptions*. Consider for example the rule in the Italian civil code, which says that one is presumed to have received a message when the message arrived at one's address, unless one proves that one had no possibility of accessing the message. The judge, according to this rule, will be able to conclude that one has received a message on the basis of the sole fact that the message arrived at one's address, under the assumption that the addressee could read the message. However, if there is evidence showing

that the addressee was under the impossibility of accessing the message, this conclusion will be defeated.

2.2.10. Undercutting in Practical Reasoning

Undercutting also applies to practical reasoning. The need to act on the basis of defeasible conclusions is particularly apparent when one—pressed by many goals and commitments—needs to quickly find plans for achieving each of these goals, and adopt those plans without further ado (even when one is aware that there may be better plans which one could find, having additional time at one's disposal). However, as we observed above, if a better plan becomes available before action takes place, one should abandon one's previous intention, and adopt the new plan.

Consider, for example, the inference leading me to adopt the intention of leaving on Monday for Barcelona, since this plan is sufficiently good: It is better than staying at home (the inactivity option), and is better than any plan I have so far considered. This inference gets defeated when I build a plan for leaving on the Sunday before, which allows me to get a cheaper ticket and to make a short visit to the main monuments of the city.

In general, as we have seen above, in teleological reasoning one moves from (1) having a goal G and (2) believing that plan (instruction) P_1 is a satisfactory way of achieving G, into (3) intending to realize P_1. However, this inference can be undercut when the reasoner comes to believe that a different plan, let us call it P_2, is better than P_1, as a way of achieving G. The defeat schema seems therefore to be the following:

Defeating schema: *Teleological defeat*

(1) believing that plan P_2 is a better way of achieving goal G than plan P_1

———— IS AN UNDERCUTTING DEFEATER AGAINST

(2) using *teleological inference*, for adopting P_1 as a way of achieving G

Assume for example that a judge has so far decided cases on product liability by requiring that customers prove the producers' fault. Assume that the judge adopted this policy since she believed that this was a satisfactory way to induce producers to take care in order to avoid releasing faulty products. Assume, however, that the same judge comes now across some law-and-economics literature that shows that strict liability provides a stronger incentive to preventing damage to the customer. The judge should then be induced to abandon the fault liability approach in favour of strict liability (we discount consideration concerning the need that the judge co-ordinates her action with the action of her colleagues, of legislators and of the citizens, on which see Chapter 9).

Inference $\mathcal{A}$	*Inference $\mathcal{B}$*
(1) I have the goal of getting the new book of my friend Henry Prakken	(1) Plan p_2 (getting a free author's copy) is a more convenient way of getting Henry's book
(1) Plan p_1 (buying it on line) is sufficiently good way of achieving this goal	
(1) I intend to implement plan p_1	(1) the convenience of plan p_1 does not support its adoption

Table 2.9: *Teleological defeat*

Here is the corresponding defeat instance:

Defeating instance: *Teleological defeat*
(1) believing that strict liability is a better way of preventing damage to the customers than fault liability
——— IS AN UNDERCUTTING DEFEATER AGAINST
(2) using *teleology*, for adopting fault liability as a way of preventing damage to the customers

Another example of this type of defeat is represented in Table 2.9.

2.2.11. Defeasible Reasoning and Probability

We may wonder whether defeasible reasoning is the only, or the best, way to deal with incomplete information. In particular, we need to consider the main alternative to it, that is, *probability calculus*, and in particular the versions of probability calculus that are based upon the idea of *subjective probability*. In fact, probability calculus has more solid scientific credentials than any defeasible logic, and a rich history of successful applications in many domains of science and practice.

Following the probability approach, the reasoner—rather than facing incompatible beliefs (like the belief that John was driving the car, when the car run over Tom, and the belief Mary was driving the car, in the same occasion), and then having to make a choice—would come to the consistent conclusion that incompatible hypothesis have different probabilities (for instance, on would reach the conclusion that there is a 40% chance that John run over Tom, and a 60% chance that Mary did it). Probabilistic inference, as it is well known, determines the probability of an event on the basis of the probability of other events, ac-

cording to the mechanism of probability calculus: If there is a 80% chance that Tom will have walking problems because of having been run over, there is a 32% chance (40% ∗ 80%) that Tom will have such problems having been run over by John, and 48% chance (60% ∗ 80%) that he will have such problems having been run over by Mary.

Here we cannot introduce probability calculus, nor discuss the many difficult issues which are related to it (especially when ideas of probability and causation are combined). Let us just point at a few issues concerning the normative application of probability calculus, which make it inadequate as a general solution for normative reasoning.

The first issue concerns practicability: Often we do not have enough information for assigning numerical probabilities in a sensible way. For instance, how do I know that there is a 40% probability that John was driving and 60% probability the Mary was driving? In such a case, it seems that either we arbitrarily attribute probabilities, or, with equal arbitrariness, we assume that all alternative ways in which things may have gone have the same probability.

The second issue is a conceptual one: Though it makes sense to ascribe probabilities to epistemic propositions, it makes little sense to assign it to practical information. What does it mean that a certain desire (goal) or intention (instruction) has a certain probability?

The third issue relates to psychology: Humans tend to face situations of uncertainty by choosing to endorse hypothetically one of the available epistemic or practical alternatives (while keeping open the chance that the other options may turn out to be preferable), and applying their reasoning to this hypothesis (while possibly, at the same time, exploring would be the case, if things turned out to be different). We do not usually assign probabilities, and then compute what further probabilities follow from such an assignment.

This cognitive behaviour corresponds to the reasoning skills of which we are naturally endowed. Humans, once they have definite beliefs or hypotheses, are able to develop inference chains, store them in their minds (keeping them unconscious until needed), and then retract any of such chains when one of its steps is defeated. On the contrary, humans are bad at assigning numerical probabilities, and even worse in deriving further probabilities and in revising a probability assignment in the light of further information.

Our incapacity of working with numerical probabilities certainly is one of the many failures of human cognition (like our incapability of quickly executing big arithmetical calculations). In fact, computer systems exist which, using complex nets of probabilities (these are called *belief networks* or *probability networks*), perform very well in certain domains by manipulating numerical probabilities much quicker and more accurately than a normal person (see, for a short introduction, Russell and Norvig 1995, chap. 14, and for a collection of important contributions, Shafer and Pearl 1990).

However, our bias toward adopting a binary, rather than a probabilistic ap-

proach (endorsing one alternative, rather than assigning probabilities to all of them), in face of uncertainty has some advantages: It focuses cognition on the implication of most likely situation, it makes it easier to make long reasoning chains, it facilitates building scenarios (or stories) which then may be evaluated according to their coherence, it enables linking epistemic cognition with binary decision-making (it may be established that one has to adopt decision B if A is the case, and NON B if A is not the case). There is indeed psychological evidence that humans develop theories even under situations of extreme uncertainty, when no reasonable probability assignment can be made.

In a social context a binary approach makes it easier to replicate the reasoning and thinking of other people: One can forecast more easily a binary choice by another than the ascription of probabilities, and such a binary choice can become the focus of social expectations, an aspect is particularly emphasised by Luhmann (1974, chap. 6, sec. 1).

The limited applicability of probability calculus in the practical domains does not exclude that there are various practical and legal issues where statistics and probability provide decisive clues, as when scientific evidence is at issue (on scientific evidence, see Haack 2003b, and Haack 2003a, 233ff.).

2.3. Some Notes on Defeasibility in Law and Morality

The notion of defeasibility, before becoming the focus of much AI research (for a collection of seminal contributions, see Ginzberg 1987) was deployed by some epistemologists (in particular, see Pollock 1974, and Chisholm 1977). Even before that, however, the idea of defeasibility was frequently applied and sometimes studied in the domain of practical (moral and legal) reasoning.

2.3.1. The Idea of Defeasibility in the Practical Domain

The word *defeasible* is a traditional legal term, indicating the possibility that a legal instrument is voided in special circumstances. In fact, it is a typical feature of law and morality that they can only offer standards appropriate for normal situations. When exceptional circumstances occur, these standards may need to be put aside (on defeasibility in the law, cf. among others: Gordon 1988; Sartor 1995; MacCormick 1995; Alchourrón et al. 1985). This is well expressed in a famous Aristotelian citation, where defeasibility is considered not a fault, but a natural feature of legal rules:

> All law is universal, and there are some things about which it is not possible to pronounce rightly in general terms; therefore in cases where it is necessary to make a general pronouncement, but impossible to do so rightly, the law takes account of the majority of cases, though not unaware that in this way errors are made. And the law is none the less right; because the error lies not in the law nor in the legislator, but in the nature of the case, for the raw material of human behaviour is essentially of this kind. So, when the law states a general rule, and a case arises under this that is

exceptional, then it is right, where the legislator, owing to the generality of his language, has erred in not covering that case, to correct the omission by a ruling such as the legislator himself would have given if he had been present there, and as he would have enacted if he had been aware of the circumstances. (Aristotle, *Nicomachean Ehics*, 1137b)

Similarly, Aquinas makes the following precise observation:

[I]t is right and true for all to act according to reason: And from this principle it follows as a proper conclusion, that goods entrusted to another should be restored to their owner. Now this is true for the majority of cases: But it may happen in a particular case that it would be injurious, and therefore unreasonable, to restore goods held in trust; for instance, if they are claimed for the purpose of fighting against one's country. And this principle will be found to fail the more, according as we descend further into detail, e.g., if one were to say that goods held in trust should be restored with such and such a guarantee, or in such and such a way; because the greater the number of conditions added, the greater the number of ways in which the principle may fail, so that it be not right to restore or not to restore. (Aquinas, *Summa Theologiae*, I-II, q. 94, a. 4)

The very notion of defeasibility is at the centre of the work of David Ross, an outstanding Aristotelian scholar and moral philosopher, who developed a famous theory of *prima-facie* moral obligations (Ross 1930; 1939). Ross, who adopted a pluralist form of moral intuitionism, relates defeasibility to the possibility that moral principles are overridden by other moral principles in concrete cases:

Moral intuitions are not principles by the immediate application of which our duty in particular circumstances can be deduced. They state [...] *prima facie* obligations. [...] [We] are not obliged to do that which is only *prima facie* obligatory. We are only bound to do that act whose *prima facie* obligatoriness in those respects in which it is *prima facie* obligatory most outweighs its *prima facie* disobligatoriness in those aspects in which it is prima facie disobligatory. (Ross 1939, 84–5)

The notion of defeasibility, quite usual in legal practice and in doctrinal work, was brought to the attention of legal theorists by Hart (1951, 152), whose observations anticipate the current debate on the topic:

When the student has learnt that in English law there are positive conditions required for the existence of a valid contract, [. . .] he has still to learn what can defeat a claim that there is a valid contract, even though all these conditions are satisfied. The student has still to learn what can follow on the word "unless," which should accompany the statement of these conditions. This characteristic of legal concepts is one for which no word exists in ordinary English. [. . .] [T]he law has a word which with some hesitation I borrow and extend: This is the word "defeasible," used of a legal interest in property which is subject to termination of "defeat" in a number of different contingencies but remains intact if no such contingencies mature.

In legal defeasibility two aspects must be distinguished:

1. the inventive, heuristic reasoning required for understanding the inadequacy of a general rule in a particular context and for stating a corresponding exception or rebuttal;

2. the structure of the reasoning that takes into account exceptions, rebuttals, and presumptions in order to reach conclusions justified by all available knowledge.

The second aspect does not fall outside logic, although it does not consist in deduction, since it can be reproduced in formal models of defeasible reasoning, along the line we indicated above, and as we shall specify in Chapters 26 and 27. Legal defeasibility implies that for justifying a legal conclusion it is normally, but not always, sufficient to select from the available pool of premises a subset supporting that conclusion. In fact, the inference of that conclusion may be defeated, if an exception or an "unless" clause is satisfied, or if a relevant presumption is found to be contradicted.

2.3.2. Defeasibility in Legal Language

The legislator often explicitly foresees the defeasibility of legal rules, by using different linguistic structures. For example, to establish that tort liability is excluded by self-defence or state of necessity, the legislator may use any of the following formulations:

- *Unless clause*. One is liable if one voluntarily causes damage, unless one acts in self-defence or in a state of necessity.
- *Explicit exception*. One is liable if one voluntarily causes damage. One is not liable for damages if one acts in self-defence or in a state of necessity.
- *Presumption*. One is liable if one voluntarily causes damage and one does not act out of self-defence or state of necessity. The absence of self-defence and of a state of necessity is presumed.

According to all these formulations, for concluding that one must make good a certain damage it is normally sufficient to ascertain that one voluntarily caused that damage, but this inference is defeated if the person turns out to have acted either in a state of necessity or in self-defence.

By distinguishing circumstances that have to be positively established to derive a certain conclusion from circumstances susceptible to blocking this derivation, the law divides the *burden of proof* between the parties. The plaintiff, who is interested in establishing a certain legal conclusion, has the burden of establishing the supporting circumstances. The defendant, once the plaintiff has succeeded, has the burden of establishing the impeding circumstances. Though defeasibility may not fully explain the dialectics of legal procedures, it provides their logical background.[13]

[13] The link between defeasibility and procedures will be addressed in Section 27.4.1 on page 727.

2.3.3. The Defeasibility of Legal Concepts and Principles

Defeasibility is also an essential feature of *conceptual constructions* in the law. Legal concepts have to be applied to such a diverse domain of instances that they can at best offer a tentative and generic characterisation of the objects to which they apply, which has to be supplemented with exceptions. General legal concepts presuppose defeasibility: The requirement of absolute rigour in defining and applying concepts—the demand that all features which are included in, or entailed by, a concept apply to each one of its instances—would paradoxically run against the very possibility of being "logical" in the sense of using general concepts.

In fact, even the definitions of the legal concepts that can be found in statutes and codes reflect the stepwise defeasible process of establishing legal qualifications. First a general discipline is established for a certain legal genus (for example, contract), then special exceptions are introduced for species of this genus (like the sale contract), and finally further exceptions may be introduced for specific subspecies (like the sale of real estates). Consequently, when using conceptual hierarchies we must apply to a certain object the rules concerning the category in which it is included only in so far as no exceptions emerge concerning a subcategory in which that object is also included.

Defeasibility can be consciously established by the legislator, but it may also result from the evolution of legal knowledge: After a general rule has been established, exceptions are often provided for those cases where the rule appears to be inadequate. This is typically the evolution of judge-made law, where general *rationes decidendi* are often limited by means of *distinctions*, namely, by means of exceptions introduced for specific contexts.

General attitudes of legal reasoning can also be explained and justified as *defeasible presumptions*. For example, interpretation standards and even judicial precedents (*rationes decidendi*) bind judges only defeasibly, in the sense that they should be followed only in so far as they are not overridden by (strong) reasons to the contrary (Alexy 1989, 274, 279). Even the obligation to apply legislation is considered to be defeasible by many authors, who believe that statutory texts are not legally binding when completely unacceptable from a moral standpoint (Peczenik 1989; Alexy 1992).

Similarly, the due consideration for widespread social attitudes, legal traditions, socially accepted common-sense rules (so much stressed by theorists of argumentation) can be distinguished from blind conservatism only when those factors are given the statute of defeasible presumption. This was, by the way, also the spirit of the principle of inertia advocated by Perelman and Olbrechts-Tyteca (1969, 142), according to which any opinion adopted in the past should only be abandoned when having sufficient reasons to do that. More generally, defeasible endorsement is the appropriate cognitive attitude with regard to what Aristotle calls *endoxa*, meaning, any "opinion held by everyone or by the major-

ity or by the wise—either all of the wise or the majority or the most famous of them—and which is not paradoxical" (Aristotle, *Topics*, 104a8-13).

2.3.4. Defeasibility and Legal Procedures

Finally, also the procedural aspect of defeasibility needs to be considered. This aspect concerns the fact that, as we have observed above, defeasible reasoning activates a structured process of inquiry—based upon drawing *prima facie* conclusions, looking for their (*prima facie*) defeaters, looking for defeaters of defeaters, and so on—until stable results can be obtained. Such a process reflects the natural way in which legal reasoning proceeds. This is particularly the case in the application of the law to particular situations, when one has to bring to bear on particular situations the different, and possibly conflicting legal rules that apply to them, and adjudicate the conflicts between these rules.

Günther (1993; 1989) has affirmed that the application of the law is characterised by a *sense of appropriateness*, intended as the ability of impartially taking into consideration all different features of the considered situation, according to all valid rules which may apply to it. We believe that defeasible reasoning can indeed be viewed as a formalisation of Günther's sense of appropriateness. The model of defeasible reasoning is indeed based on the distinction between on the one hand the adoption of general defeasible rules, each of which only takes into account a few aspects of possible situations, and on the other hand the application of this rules to concrete situations, where one needs to take into account all aspects that are relevant according to all applicable rules.

In fact in the law, as in "any subject on which difference of opinion is possible, the truth depends on a balance to be struck between two sets of conflicting reasons" (Mill 1991a, 41), the point by which "truths have reached the point of being uncontested" (ibid., 51) is far from being attained. Therefore, in legal reasoning the use of *positive logic*, which relates a thesis to its supporting grounds, must be supplemented with critical discussion of the opinion to the contrary, that is, by that *negative logic* which "points out weaknesses in theory or errors in practice, without establishing positive truths" (ibid, 109). It seems to us that theories of defeasible reasoning have the merit of unravelling exactly the basic structure of Mill's negative logic.

Defeasibility of legal reasoning also reflects the dialectics of judicial proceedings where each party provides arguments supporting its position, which conflict with the arguments of the other party. This debate may also be transferred into the judicial opinion that resumes the results of the dispute and determines its output. To convincingly justify a judicial decision in a case involving serious issues, it is not sufficient to produce a single argument, but it is necessary to establish that the winning argument prevails over arguments to the contrary, especially those that have been presented by the losing party.

Also doctrinal work cannot avoid being contaminated by the dialectics of le-

gal proceedings, since its main function consists in providing general arguments and points of view to be used in judicial debates. In this perspective, doctrinal reasoning may be viewed as consisting in an exercise of *unilateral dialectics*, intended as a disputational model of inquiry in which “one develops a thesis against its rivals, with the aim of refining its formulation, uncovering its basis of rational support, and assessing its relative weight” (Rescher 1977, 47).

2.3.5. Overcoming Legal Defeasibility?

Some authors have suggested that the law ought to be recast in a set of consistent axioms, which would lead to compatible outcomes, according to deductive inference, in any possible factual situation. This reformulation of the law would eliminate normative conflicts, and therefore would allow us to avoid legal defeasibility (at least of the rebutting type).

We need to observe, however, that it is very doubtful that such reformulation of the law is really possible (feasible). Moreover, even if it were possible, it is doubtful that it would be useful.

Against the possibility of a consistent axiomatisation of the law, we note that incompatibility between normative propositions can often only be established on the basis of further information, as observed in Section 2.2.6 on page 64. Not all this information can be obtained in advance, at the time when the law is being axiomatised.

Against its utility, we remark that it is doubtful that such axiomatisation would really make the law easier to understand and apply. Legal prescriptions would need to become more complex, since every rule would have to incorporate all its exceptions.

In addition, such a representation of the law would not be able to model the dynamic adjustment that takes place—without modifying the wording of existing rules—whenever new information concerning the conflicting rules and the criteria for adjudicating their conflicts is taken into consideration. Finally, by rejecting defeasible reasoning, one would lose its capacity of providing provisional outcomes while the inquiry goes on.

Our observations concerning the need of representing the law in ways which facilitate defeasible reasoning do not imply that the current way of expressing legal regulations in statutes and regulatory instruments cannot be improved. Large improvements in legislation techniques on the contrary are required to cope with the many tasks that need to be carried out by modern legal systems. However such improvements should not aim at producing a consistent set of legal rules, just for the sake of logical consistency. They should rather aim at producing legal texts that can be more easily understood and applied (Gordon 1988).

This objective requires a skilful use of the very knowledge structures (such as conceptual hierarchies, speciality, or the combination of rules and exceptions)

that enable defeasible reasoning. In this regard, we need to observe that such structures are largely used also outside the law, in situations when one has to express precisely ways of dealing with complex and changing situations, as in difficult applications of computing.

For example, conceptual hierarchies (enabling defeasible inheritance) have become a standard programming technique in object-oriented programming (the mainstream programming methodology nowadays), while defeasible reasoning (in the form of negation by failure, see Section 27.4.1 on page 727) represents the core of logic programming.

2.4. Heuresis and Coherence Evaluation

Using the term *heuresis* we refer in general to all cognitive processes through which a reasoner generates new hypotheses or conjectures and evaluates their merit, without applying precise reasoning schemata.

2.4.1. The Construction of Conjectures

Heuresis is concerned in the first place with the construction of *conjectures*, namely, sets of general propositions that explain the specific beliefs that one has obtained via perceptions, and more generally through experience. We say that in general a set of propositions S explains a proposition Q, when:

1. Q may be derived from S by using ratiocination,
2. S does not contain Q, and
3. Q's derivation requires using general statements or laws.[14]

Some authors have emphasised the ratiocinative process that leads from individual propositions to general laws (inductive logic). We agree that inductive logic can be a very useful tool in many inquiries (aspects of inductive logic may be seen at work in various algorithms for machine learning, though these also include heuristic elements). However, it does not exhaust the process of making conjectures: Hypotheses are usually formed on the basis of a very limited set of individual instances, and they contains predicates that would not have been used to describe these individual instances, unless the agent already had the hypotheses in mind (the classical critique of inductivist approaches to theory formation is provided by Popper 1959).

Let us consider a famous example of a theoretical conjecture, analysed by Hempel (1966, 3ff.). A large number of women who delivered their babies at the First Maternity division of Vienna General Hospital died of an illness know as puerperal fever. The death rate for this illness was much higher in the First division than in other hospitals, and in particular higher than in other

[14] For a more refined characterisation, cf. Hempel 1966.

divisions of the same hospital. The solution to this puzzle was provided by a Dr. Semmelweis, who developed and tested various hypotheses (the deaths were due to overcrowding, to rough examinations by students, to the visits of a priest, to the position in which the women were delivering, and so on). Finally, after having discarded various explanations, Semmelweis came up with the right one: Doctors and students frequently examined women in labour just after having performed autopsies, and their hands carried infectious material from the dead bodies to the delivering women. He tested the hypothesis by having doctors clean their hands with antiseptic liquid before examining the women, and saw that the death rate fell dramatically.

Clearly Semmelweis's conjecture cannot be viewed as the application of ratiocination to the evidence possessed by him. To use the words of Hempel (1966, 15):

> There are, then, no generally applicable "rules of induction," by which hypotheses or theories can be mechanically derived or inferred from empirical data. The transition from data to theory requires creative imagination. Scientific hypotheses are not *derived* from observed facts, but *invented* in order to account for them. They constitute guesses at the connection that might obtain between the phenomena under study, at uniformities and schemata that may underlie their occurrence.

However, ratiocination is not useless in heuresis: Rather than in the process of finding the best hypotheses it may be applied to the process of testing the hypotheses (as emphasised by Carnap 1950), and by considering their implications for past events and new experiments.

Also in the legal domain, the construction of hypotheses plays an important role, and also in the legal domain it cannot be reduced to ratiocination. As a simple example of legal heuresis, consider the invention of the well-known Learned Hand formula for allocating liability for damage: Liability falls upon the party who could most cheaply prevent the damage. This is a conjecture that was not included in the previously available beliefs, but which allows us to explain (and justify) many decisions and regulations in the tort domain, and to anticipate or justify the outcomes of future disputes.

A similar role may be recognised to other broader (and much less plausible) hypotheses advanced by legal theorists. Consider for example the theory that judges tend (and should tend) to maximise economic efficiency (Posner 1983, 11ff.), or the theory that on the contrary, they exclusively aim (and should aim) at securing rights (Dworkin 1977c, 81ff.), regardless of efficiency (Dworkin 1985c).

2.4.2. Functions of Heuresis

Besides being required for the construction of new hypotheses, heuresis also comes into play when competing theories have been conjectured, and thus are

to be comparatively evaluated. Here ratiocination provides the input: It tells us what are the logical relations among the statements included in these theories, and what are their links to the evidence which is accessible to the reasoner. However, as we shall see in Chapters 28 and 29, it is up to non-ratiocinative processes to establish what theory has to be rejected for its inferior coherence (though some standards, applicable via ratiocination, may constrain and direct this judgement).

Moreover, heuresis must come to the help of ratiocination by providing it with objectives: Before engaging in ratiocination, one needs to establish what proposition, among the infinite ones he may derive from the available knowledge, may be relevant for the problems one has to solve.

Finally, heuresis must come to help when there are too many possibilities of applying the available reasoning schemata to one's premises. In fact, one may be unable to proceed only via ratiocination since one does not know what reasoning schema to apply to what premises in order to solve the issues one is addressing. One approach could consist in applying all applicable reasoning schemata to the available premises, and then again all applicable reasoning schemata to the conclusions which have been obtained, and so on. This approach, however, would often lead to the so-called *combinatorial explosion*: The number of reasoning steps to be performed would soon exceed the capacity of the reasoner. Therefore one needs to make heuristic guesses concerning what directions one should take, in order to restrain the space for one's search through ratiocination.

2.4.3. Heuresis and Ratiocination: An Overview

The distinction between heuresis and ratiocination is not a clear-cut one. Also heuresis may correspond to certain schemata: This is the case for some classical schemata of analogical reasoning, such as the *a fortiori* reasoning, which we shall discuss in Chapter 8.1. And also the use of ratiocination—at least by a human being, who cannot serially process symbols as quickly as a computer can—requires some guessing skills.

We may try to clarify the differences between ratiocination and heuresis by saying that the first is *deterministic*, and the second is *non-deterministic*. Ratiocination is deterministic since, when a reasoning schema allows us to directly derive from our mental states a conclusion we are interested in, we just need to apply the appropriate reasoning schema to find the answer. If more than one such schemata provide interesting conclusions, then we may follow any fixed order (for example the alphabetical order of our reason schemata) for inferring these conclusions.

On the other hand, heuresis is not deterministic. We are not able to specify a fixed procedure that ensures a successful heuresis. Firstly, we do not have the full knowledge of all heuristic methods and techniques our mind uses. Secondly, we do not know how to apply all of them according to a fixed procedure.

Thirdly, even if we had this knowledge, the resulting procedure would be so complex that no agent (at least no human agent) would be able to understand and follow it.

The fact is that our brain is not primarily a tool for ratiocination: It is primarily a selective rather than a ratiocinating organ (cf. Edelman and Tononi 2000). The (changing and adaptable) ways in which our brains processes its inputs are provided by the enormous complexity of the neural connections in the brain, the interactions and reciprocal adaptation of different networks of connections, the interaction between signals interchanged in those networks and the chemical messages produced by the body. Ratiocination is a later acquisition, built on top of this machinery. It certainly represents a huge evolutionary advance and gives our species an indisputable primacy over other animals, but can be usefully employed only in connection with those more ancient, complex and deeper functionalities. Those functionalities, besides providing for perception and conditioned learning, also support the process of heuresis.

A second difference between ratiocination and heuresis concerns their connection to justification. The fact that a conclusion was obtained via ratiocination provides the reasoner with a reason for believing that conclusion: One's awareness that one obtained a certain outcome through ratiocination provides one with a justification for endorsing this outcome. For instance, my belief that Jones killed Martin, and that killers ought to be punished leads me to the belief that Jones ought to be punished. If I were asked why I have this belief, I would reply by indicating the reasoning step I have just performed.

This is not the case for heuresis. The process of heuresis produces beliefs, but indicates no explicit ground why these beliefs should be maintained. This is because one is generally not aware of the process of heuresis (one does not know from what previous beliefs a new idea comes from). Moreover, even if one knew the input beliefs of one's heuristic processes, one would not know on the basis of what kind of connections one has come up with a specific idea. The grounds for believing a proposition obtained through heuresis are to be found elsewhere, and in particular, as we shall see, in the ratiocinative connections with other beliefs one currently has, and more generally in the function played by the new idea in one's belief set. Thus, in the case of heuresis there is dissociation between the process through which one obtains certain beliefs, and the grounds on the basis of which one should maintain these beliefs.

The latter observation seems to lead us to the traditional distinction between *context of discovery* and *context of justification* (see: Reichenbach 1938, 6–7; Popper 1959, chap. 1, sec. 2). However, we believe that also ratiocination is a genuine, though limited, source of knowledge, and therefore, a technique for discovery. It is true, however, that it leads us to fairly obvious discoveries, and that, as we said, it provides a justification for them (for a criticism of drawing too sharp a distinction between discovery and justification, see Haack 2003b, 116ff.).

Heuresis undoubtedly plays a fundamental role in legal reasoning, and there is much of it that stays outside the boundaries of legal logic, even if such boundaries are as inclusive as possible. With regard to heuresis, logic can be of little help, since "there is no such thing as a logical method of having new ideas, or a logical reconstruction of this process" (Popper 1959, 32). More generally, explicit methodological prescriptions play a limited role in the search for legal solutions (though many lawyers find them useful) given the way in which heuresis works, even if we do not accept the contention of Haft (1986, 27), that the current "mythical mystical descriptions of legal method can be explained by the fact that a legal method does not exist." We believe that methodological indications can be useful, though their prescription cannot substitute learning by example, as Friedrich von Savigny, the great 19th century German jurist, affirmed, saying that: "One can only learn true legal method, by reading inside the law of the classical Romans and learning from them their approach" (quoted by Haft 1986). More generally methodology can assist and stimulate, but cannot substitute trained intuition.

Finally, legal heuresis can coexist with ratiocination, not only complementing it, but also interacting with it. As we shall see in Chapter 28 it is possible to control, check and validate the outcomes of heuresis, resorting to analytical inference and coherence evaluations. Moreover, heuresis provides a stimulating challenge for the student of legal thinking, who can extract some aspects of legal heuresis, submit them to a precise analysis, and possibly also transfer them into computer systems.

Chapter 3

THE DOXIFICATION OF PRACTICAL REASONING

In the previous chapters, we have viewed practical reasoning as being a procedure for acquiring (or abandoning) conative states: While theoretical reasoning consists in moving from one's current beliefs and perceptual states into new beliefs, practical reasoning consists in moving from one's beliefs and conative states into new conative states. We have also seen that practical reasoning can be as rational as theoretical reasoning can be.

We shall now consider an important option that is available to an agent possessing both types of cognition. One can perform practical reasoning by using some of the resources one has for theoretical reasoning. This happens by reformulating conative states as if they were epistemic states, and in transferring into epistemic reasoning the reasoning schemata available for practical reasoning. We call this process the *doxification* of practical reasoning.[1]

3.1. Doxification

Consider, for example, the inference that leads us to adopt the intention of executing a plan, according to schema *teleological inference*. As we have seen above, when one (*a*) has a goal, and (*b*) believes that the plan is a satisfactory way of achieving the goal (the plan satisfies one's likings sufficiently well, and better than any alternative plan one has found through an adequate inquiry), then (*c*) one may adopt the intention to execute the plan. On the other hand, one abandons such an intention as soon as one believes that a better plan is available.

The same result can also be obtained in an indirect way. One may ask oneself the apparently theoretical question "What plan is such that I should adopt it?," a question that may be viewed as an abbreviation for "What plan is such that I should have the intention of executing it?" In replying to this question, as we shall see, one will be led to recast one's conative states in the form of normative beliefs.

[1] We take the basic idea of doxification from Pollock (1995, 277ff.), who speaks in this sense of *doxastification*: "Rather than requiring separate computational modules for defeasible epistemic reasoning and defeasible practical reasoning, human cognition makes do with a single module dedicated to epistemic reasoning and then integrates practical reasoning into that module using a technical trick. The trick involves 'doxastifying' normative judgement." We have reduced *doxastification* to *doxification* just to provide a shorter term to express this idea.

3.1.1. Adoption-Worthiness and Bindingness

We need to introduce some terminology, to avoid the awkwardness of the expressions like "this plan is such that I should have the intention of executing it."

Note that English, as other modern languages, has no synthetically unambiguous way of expressing the idea of *necessity* or *optimality* (as distinct from the idea of possibility). The suffix *able* (or *ible*), is sometimes used to convey also this idea: We speak of applicable rules, desirable objectives, pleasurable sensations, preferable choices and so on. However, this suffix is likely to engender ambiguities, having the idea of possibility as its primary meaning. For instance, one may wonder whether an applicable rule is a prescription that one may or may not apply, or rather a prescription that one is required to apply. Similarly, one may wonder whether a desirable goal is an objective that one may or may not desire to attain, or whether one is required to aim at its achievement. To cite a famous example, when John Stuart Mill said that happiness is desirable (Mill 1991b, 168), was he meaning that there is the possibility that people desire it, or that they are bound to do that?[2]

To avoid such ambiguities, we say that a mental state (or its content) is *adoption-worthy*, to express *cognitive optimality*. In other words, by saying that a mental state is adoption-worthy, we mean that this mental state is worthy of, deserves or requires being adopted, i.e., that we should adopt it. Said otherwise, adopting this mental state is necessary to fulfil our cognitive duty, that is, to proceed correctly in our cognitive effort, according to the requirements of rationality.[3] For the sake of conciseness, we shall also use the word *binding*, to convey this idea (we shall comment on the use of the term *binding* in Section 3.1.5 on page 93).

Definition 3.1.1 *Adoption-worthiness (bindingness). A mental state (or a noema) is* adoption-worthy*, or more simply,* binding*, when it (or its content) deserves to be adopted.*

Therefore, when one says that a mental state—a belief, a liking, a desire, or an intention—is adoption-worthy (binding), one means one should have that belief, liking, desire, or intention. The same ideas are expressed by saying that the corresponding noema—proposition, preference, goal, or instruction—is adoption-worthy (binding).

[2] Note that the ideas of necessity (or obligation) and possibility (permissibility) would be expressed differently, for example, in Latin, where one would be able to distinguish *amabilis* (that may be liked) from *amandus* (that should be liked).

[3] We cannot develop here the idea of a cognitive duty, and analyse its commonalities with and differences from other kinds of duties, like prudential, ethical or legal ones. Let us just observe that this idea can be linked to the attempts to build a deontologic notion of justification, like those advanced, among others, by Chisholm 1977, BonJour 1985, and Pollock and Cruz 1999.

3.1.2. The Notion of Doxification

We shall not try to define a semantics for the notion of *adoption-worthiness* by appealing to other, more primitive notions: This idea needs rather to be clarified by making explicit the conceptual role it plays in reasoning. We shall do that by analysing the reasoning processes that we call *doxification* and *de-doxification*, by which we mean respectively, the transformation of a conative state into a belief and vice versa.

Let us consider, for example, how doxified planning may mimic the direct adoption of a plan:

- Direct plan-adoption. According to schema *plan adoption* (see Section 1.3.2 on page 18), when one has a goal (one desires something) and one believes that a plan is a sufficiently good way of achieving that goal, one will form the intention to execute the plan.
- Doxified plan-adoption. When one believes that a certain goal is adoption-worthy and one believes that a plan is a sufficiently good way of achieving that goal, one will form the belief that the plan is adoption-worthy.

The same happens for the retraction of plans:

- Direct plan-retraction. According to schema *teleological defeat* one will abandon one's intention to execute a plan as soon as one believes that a different plan provides a better way of achieving the goal of the earlier plan.
- Doxified plan-retraction. One will abandon one's belief that a plan is adoption-worthy as soon as one believes that a different plan provides a better way of achieving the goal of the earlier plan.

In general, doxification appears to be a reasoning technique that allows one to store one's conative states in the form of beliefs and manipulate them accordingly, in order to achieve rational determinations: Rather than memorising the intention to implement a plan, one memorises one's belief that the plan is adoption-worthy (binding); rather than memorising the desire for something, one memorises the belief that something is desirable (it is a valid object for desire). However, the condition under which it is rational to have such beliefs remain the same conditions under which it is rational to have the corresponding conative states (no progress is done in this regard).

Let us use again our ice cream example. Assume that, moved by my desire for ice cream, rather than working on my book I spend my time in devising plans for getting ice creams, and I come to believe that the plan ⌈At 5 pm I shall go to the ice cream shop round the corner, and then I shall buy an ice cream⌉ is a sufficiently good one. Since I am a doxifying agent, this would lead me to the belief that ⌈this plan is adoption-worthy⌉ (rather than directly to the adoption

of this plan). Then I would move from having this belief to the adoption of the plan, so that I will form the intention ⌈At 5 pm I shall go to the ice cream shop round the corner, and I shall buy an ice cream⌉.

Retraction of a plan would take a similar route. Assume that I form the belief that another plan is better (there is a new shop, not too far away, where I can get better ice creams). This would lead me to retract the belief on the adoption-worthiness of the plan of going to the nearest ice cream shop and buy there an ice cream. Correspondingly I will retract my adoption of this plan.

Note that doxified practical reasoning leads to the same outcomes I would have obtained by direct practical reasoning, with regard to both the formation and the retraction of intentions. Only the reasoning process is different: Direct practical reasoning immediately infers the intention to adopt the plan, doxified practical reasoning takes the detour of forming the belief that the plan is adoption-worthy.

The kind of reasoning we have just seen in relation to whole plans also applies to single instructions. So, rather than forming the intention to execute an instruction—for instance, the intention to execute the instruction ⌈when I finish eating lunch, I shall take a nap⌉—I will form the belief that the intention to execute this instruction is adoption-worthy.

As we have just seen, *doxified practical reasoning* mimics direct practical reasoning on the basis of the following ideas:

1. The conditions for (rationally) believing that a mental state is adoption-worthy are the same as the conditions for (rationally) adopting it.
2. The conditions for believing that a mental state is not adoption-worthy are the same as the conditions for abandoning it.
3. When one believes that a mental state is adoption-worthy one is justified in endorsing that conative state.

The third idea leads to the reasoning schema we call *de-doxification*:

Reasoning schema: *De-doxification*

(1) believing that mental state (or noema) M is adoption-worthy

——— IS A REASON FOR

(2) endorsing M

3.1.3. The Rationale for Doxification

Doxification makes techniques for treating and expressing beliefs available to practical reasoning. Moreover, it allows one to distinguish clearly the conative states one currently has (one's current having a certain liking, desire, intention, etc.), from the states that may emerge from a fresh cognitive process.

In other words, it allows one to distinguish:

- the (epistemic) question ⌈What desires (intentions, wants, etc.) am I currently having?⌉, and
- the (practical) question ⌈What desires (intention, wants, etc.) should I have (are adoption-worthy to me)?⌉.

These two questions play a different role in one's cognition.

The first stimulates a report on one's current conative states, on the basis of the introspective examination of one's own current state of mind. The second, on the contrary, activates a fresh reasoning process that may lead one to form new conative states, or to revise one's current conative states. This process may fail to provide belief, but an attempt seems required to answer seriously to the second query.

The first question is similar to asking oneself for a report on one's own current epistemic condition ("Do I believe that the ice cream shop near the corner is open?"), which may be answered on the basis of an introspective analysis. The second question is similar to asking oneself how things are in the world ("Is it the case that the ice cream shop near the corner is open"), which stimulates a process of inquiry, intended to form a fresh belief on the matter.

The distinction between asking what conative states one has and asking what conative states one should have enables us to differentiate our approach from emotivistic conceptions of normative reasoning and normative language. We are not saying that true normative propositions are dependent upon the contingent conative states of the reasoner: We are not saying that the proposition ⌈something is good (for me)⌉ is true whenever I like it, or similarly that the proposition ⌈something is obligatory (for me)⌉ is true whenever I feel committed to do it. We are rather saying the following:

- one should (rationally) believe that something is good exactly when one should (rationally) like it, and similarly
- one should (rationally) believe that something is obligatory, exactly when one should (rationally) intend to do it.

Rational (or true, if you prefer) normative beliefs only accompany rational conative states, namely, the outcomes of correct practical cognition.

The process of doxification, by putting a further step between reasoning and action, provides us with a finer approach to practical decision-making, which is particularly required when we need to balance our different interests, roles and capacities. Consider, for example, how, before deciding what to do this morning, I may consider what I should do out of my concern for my health (do some physical exercise), for my family (take my children to the park), for my job (sit down and prepare my lectures), and so on.

Note that one has different concerns—as we shall see, one may be concerned for oneself, for one's fellows, or for the various communities in which one participates—and reason in different roles (as an individual, as a member

of a social group, as having a special role in that group, and so forth). Before effectively forming a definitive want to act in a certain way, one needs to consider what conative states would correspond to each of the concerns one is having and the roles in which one is acting. This is done by forming a belief that a certain conative state is binding (adoption-worthy) with regard to a certain concern one has, or to a particular role one is playing, or to a particular perspective one is adopting. This belief may not be sufficient to determine one's behaviour, since one may need to consider one's other concerns and roles.

3.1.4. The Doxification of Conative States

Doxification may operate with regard to different conative states.

Let us first consider *likings*: A doxifying reasoner, rather than simply having preferences, would form beliefs concerning what he or she should like, that is, about what preferences are adoption-worthy, or said otherwise, about what is *good* or what represents a *value*. For example, I may wonder whether I should like having ice creams (whether is it good that I have ice-creams), or whether I should be indifferent to them, as I should be with regard to every sensual pleasure, according to stoical philosophy.

For a legal example, consider how a judge may ask herself what are the values proper to her legal system, and may conclude, for instance, that individual liberty, work, health, communication, culture, happiness, participation are such values. These are the things that are valuable from the legal point of view, the goods that should orient legal reasoning. Consequently, the judge, at least when acting in her official position, will adopt these likings and reason accordingly.

The process of doxification equally concerns *desires*. A doxifying reasoner, rather than simply forming and withdrawing desires (according to his or her likings and other mental states), forms and withdraw beliefs concerning what he or she should desire, that is, beliefs concerning the adoptions-worthiness of certain goals (under certain conditions). For instance, I may wonder whether I should desire having ice creams, or whether I should refrain from having this goal, given that by now all such shops have closed down.

As a legal application of this reasoning schema, consider how the above judge, who believes that her community has certain legal values, may form the belief that one of these values, being realisable in the case at hand, deserves being adopted as a goal to be implemented. For instance, believing that human health is one of the legal values at issue in that case, she may conclude for the adoption-worthiness of the goal of realising this value.

Finally, also *intentions* can be doxified. One, rather than adopting or abandoning the intention of executing certain instructions (plans), will form or abandon beliefs concerning whether one should adopt those instructions, that is, concerning whether those instructions deserve being adopted. This is a belief that one should form—as we said in Section 1.3.2 on page 18 when introducing

schema *teleological inference*—as soon as one believes that a plan is sufficiently good, while not having in mind a better plan.

As a legal application of this reasoning schema, consider how our judge, who has adopted in her legal reasoning the goal of contributing to the realisation of the value of health, may consider that for this purpose the best solution is to adopt (in the name of her community) the instruction ⌈one shall fully compensate the damages one causes to the physical and mental health of others⌉. As a matter of fact, the endorsement of such a rule by Italian judges in the '70s marked a significant evolution in Italian tort law (previously, only damage causing a reduction of one person's future earnings would be legally relevant with regard to tort liability).

Obviously, when considering whether this rule should be adopted as legally binding, the judge needs to consider not only how implementing this rule would contribute to the goal of protecting health, but also how it will impact on other legal values (the efficient functioning of the judicial process, individual freedom in social relations, and so on). Moreover, she needs to consider, as we shall see in Chapter 12, the chance she has of contributing, through her decision, to the general (or a sufficiently generalised) adoption of this rule by the judiciary and the citizens, and how this choice fits with her role in the legal process.

The notion of doxification allows us to introduce two concepts we shall frequently use in the following pages, *normative belief* and *normative proposition*.

Definition 3.1.2 *Normative beliefs and normative propositions. A* normative belief *is a belief that doxifies a conative state. A* normative proposition *is the content of a normative belief.*

As we shall see in the following, our notion of a normative belief includes believing that something is a value to be appreciated, a goal to be pursued, a factor promoting an outcome, or a binding rule, and also believing that, under appropriate circumstances, certain actions are obligatory or permitted, certain persons have certain rights or other entitlements, various legal or moral qualifications hold. The diverse contents of all such beliefs constitute what we call *normative propositions*.[4]

3.1.5. The Idea of Cognitive Bindingness

Reasoning agents have various ways of expressing the concepts we have so far introduced, with various nuances. We have suggested that, rather than saying that a certain practical content (value, goal, instruction) is adoption-worthy, we may

[4] Note that our idea of a normative proposition is different from the notion of a normative proposition that is provided by Alchourrón and Bulygin 1971, sec. 7.2, 121ff. These authors use the term *normative proposition* to refer to those epistemic assertions one may express about a normative system (a set of normative statements), like the assertion that such a system contains of entails certain statements (see also Alchourrón 1969).

also say that this content is *binding* (such that one is bound or constrained, according to rationality, to adopt it). According to our terminological stipulation, belief in the adoption-worthiness of an instruction and belief in the bindingness of this instruction are the same mental state. This mental state represents the doxification of the intention of implementing the instruction, and it is to be adopted and retracted exactly in the case when one would (rationally) adopt and withdraw this intention.

However, in the practical domain one tends to speak of bindingness only when there may be a conflict between one's determination to adopt a certain content and other psychological tendencies one has or may have. This is the case when the adoption-worthiness of a certain content results from a perspective that is different or broader than one's self-interest (such as when one is reasoning out of the concern for one's fellows, for a community, or for a certain institution).

For instance, it may seem strange for me to say that my intention of going to restaurant r is binding to me, since r provides me with the best value-for-money ratio. It would seem less strange to say that the instruction ⌈I shall go to the gym⌉ is binding to me: I need to exercise to get fit, but my laziness would lead me not to go to the gym. It would seem even more appropriate to say that the goal of keeping my travel expenses within the limits of the travel budget that has been allocated to me is binding to me, in my role of a civil servant: I need to adopt this goal out of the concerns that are linked to my role, though I would like to spend much more. Accordingly, though we assume a perfect logical equivalence between adoption-worthiness and bindingness, we shall speak of bindingness only when self-interest is not at issue.

Doxification also concerns the inference schemata for intentions (see Section 1.4 on page 31): When one believes that conditional or general instructions are binding, one is lead to believe (under appropriate conditions) that the corresponding unconditional, or specific instructions are binding.

For instance, when a judge believes in the bindingness of the instruction ⌈one shall compensate any damages one causes to the physical and psychical health of other people⌉, he will conclude for the bindingness of the instruction ⌈Jones shall compensate any damage he caused to the physical and psychical health of Brown⌉. This conclusion, and the belief that ⌈Jones caused damage worth € 1,000 to the health of Brown⌉, will lead the judge to believe in the bindingness of the instruction ⌈Jones shall pay Brown € 1,000⌉.

In conclusion, the idea of cognitive bindingness leads us to connect psychological and normative notions:

- believing that something is a *value* amounts to believing that this is a *binding preference* (that it should be liked);
- believing that something is a valid *goal* amounts to believing that this is a *binding goal* (that it should be pursued);
- believing that an *instruction* is valid amounts to believing that it is a *bind-*

ing instruction (an instruction that one should have the intention of executing).

Though the terms *value* and *valid* can also be understood in different senses, this appears to be an important way in which they are frequently used, as we shall see in Chapters 12 and 13.

Note that our notion of *cognitive bindingness* needs to be carefully distinguished from the notion of *obligatoriness*. The most common and proper use of the predicate *obligatory* consists in applying it to action-descriptions: This predicate expresses that an action ought to be done by an agent (see Section 17 on page 453).[5] On the contrary, we apply the predicate *binding* to a noema (a cognitive content), to express that rationality requires that this content is adopted by the agent. So we may apply this predicate to any kind of noema, both to propositions describing states of affairs, and to practical contents (preferences, goals, instructions).

We shall later comment on the specific cognitive function that is played by the idea of bindingness. By now let us just observe that from our perspective, saying that ⌈proposition A is binding⌉ does not coincide with saying that ⌈it is obligatory that A⌉, as the following example will show.

Consider, the following bindingness-proposition: ⌈the proposition that ⌈Mary copies her exam papers⌉ is binding⌉. This bindingness-proposition expresses the idea that we are bound to accept (believe) that ⌈Mary copies her exam papers⌉. We can reasonably endorse this idea whenever our evidence sufficiently supports the conclusion that Mary does indeed copy her papers.

Consider, on the other hand the absurd deontic proposition: ⌈it is obligatory that ⌈Mary copies her exam papers⌉⌉. This deontic proposition expresses a very different idea: Mary is under the obligation to copy her exam papers.

A connection between bindingness-propositions and deontic propositions exists when the content of a bindingness proposition is provided exactly by a deontic proposition: According to schema *de-doxification* the belief that ⌈it is binding that ⌈A is obligatory⌉⌉ leads to the belief that ⌈A is obligatory⌉. However, this schema holds for the belief in the bindingness of any proposition and not just for the belief in bindingness propositions expressing the obligatoriness of an action (for any proposition A, believing that ⌈A is binding⌉ leads to believing that A). Exactly in the same way, from ⌈it is binding that A is permitted⌉ one may conclude ⌈A is permitted⌉.

A specific logical connection between bindingness-propositions and deontic propositions only exists between one's belief in the bindingness of the instruc-

[5] There are cases in which the predicate *obligatory* is applied to propositions describing states of affairs (other than the accomplishment of an action), but it seems that these are just elliptic formulations, where the agent is left implicit, and the action is specified by indicating the state of affairs resulting from its accomplishment. Consider, for example, the proposition ⌈In this street it is obligatory that the cars' speed is lower than 50 kilometres per hour⌉.

tion that ⌈j shall accomplish A⌉, and one's belief that ⌈it is obligatory that j accomplishes A⌉. As we shall see in Section 3.2.1 on page 100, this connection depends of the fact that the second belief represents the doxification of the first one: The proposition ⌈it obligatory that ⌈j accomplishes A⌉⌉ can be seen as another way of saying that ⌈the intention that ⌈j shall accomplish A⌉ is binding⌉.

Similarly, as we shall see in Section 3.2.2 on page 101, the proposition ⌈it permitted that ⌈j accomplishes A⌉⌉ can be seen as another way of saying that ⌈the intention that ⌈j may accomplish A⌉ is binding⌉.

3.1.6. The Doxification of Cognitive Instructions

In the previous section we have seen how doxification may work for behavioural instructions, concerning the performance of external actions (see definition 1.4.1). However, we can doxify also *cognitive instructions*, concerned with mental activity (see definition 1.4.2).

Let us first consider how a legal reasoner moves from believing in the bindingness of a cognitive instruction into applying that instruction. Assume that a judge believes the following bindingness-proposition:

> It is binding that ⌈everyone shall accept that ⌈the amount of compensation due to a person for causing permanent impediment to walking is the result obtained by multiplying € 1,000 for the years of the expected life of the damaged person⌉⌉.

This belief will lead the judge, according to schema *de-doxification*, to endorse the following conclusion:

> Everyone shall accept that ⌈the amount of compensation due to a person for causing permanent impediment to walking is the result obtained by multiplying € 1,000 for the years of the expected life of the damaged person⌉.

The latter belief, according to schema *specification*, will lead to:

> I shall accept that ⌈the amount of the compensation due to a person for causing permanent impediment to walking is the result obtained by multiplying € 1,000 for the years of the expected life of the damaged person⌉.

Endorsing this cognitive instruction will finally lead the judge to execute it (according to schema *executing cognitive intention*, see Section 1.4.3 on page 34), and to acquire the following belief:

> The amount of compensation due to a person for causing permanent impediment to walking is the result obtained by multiplying € 1,000 for the years of the expected life of the damaged person.

The latter belief—combined with the belief that Brown's accident caused him a permanent impediment to walking, and that his expected life span is 30 years (and that $30 * 1{,}000 = 30{,}000$)—will lead the judge to syllogistically conclude that:

> The amount of compensation due to Brown is € 30,000.

We shall now consider specifically the link between cognitive and behavioural instructions, as it appears to a doxifying reasoner.

For instance, assume that Mary, a cook in a kindergarten, has to face an epidemic that is related to food infection. She asks herself: What instructions (determinations) shall I adopt, out of my concern for the health of the children, to prevent the spread of the epidemic? Assume that she concludes that she should adopt the behavioural instruction that she shall never give the children any uncooked food. This practical belief is supported by her belief that cooking the food will kill the germs causing the infection.

Her belief in the adoption-worthiness (bindingness) of this policy leads her to adopt that policy, that is, to form the intention that she shall never give uncooked food to the children. Mary is happy with the choice of this plan of action, which allows her to pursue her mission of feeding the children, while being sure that she is not harming them.

To be able to apply her policy, however, Mary has to solve an apparently theoretical question: "When is a food uncooked?" To answer this question she may refer to linguistic knowledge and consult a dictionary to find out the meaning of "uncooked." More ambitiously, she may investigate non-empirical realities and look for uncookedness in a dimension inhabited by conceptual realities: When does a food count as being uncooked? When is it endowed with the non-empiric property of uncookedness? When does it partake to the idea of uncookedness?

However, being a practically minded woman, Mary does not care about such inquires, but only about the health of her children: Since she views cooking as a way of killing germs through heat, and since she believes that all germs will be killed at 150 degrees Celsius, she concludes that the following cognitive instruction is adoption-worthy to her: ⌈I shall accept that food is uncooked, whenever it has not been heated above 150° Celsius⌉.

Let us now see how Mary will apply this instruction. Faced with a food that has not been heated up to that temperature, she will conclude that she shall accept that it is uncooked. This belief, according to reasoning schema *executing cognitive intention* will lead her to believe that the food is uncooked, as you can see in Table 3.1 on the following page. Note that the cook's reasoning in Table 3.1 on the next page can be shortcut, if she translates the proposition

> I shall accept that food is uncooked, whenever it has not been heated above 150° Celsius

into the following form:

(1) I shall accept that food is uncooked whenever it has not been heated above 150° Celsius;
(2) this dish has not been heated above 150° Celsius

---

(3) I shall accept that this dish is uncooked

---

(4) this dish is uncooked

Table 3.1: *Inference with cognitive intentions*

(1) food is uncooked whenever it has not been heated above 150° Celsius;
(2) this dish has not been heated above 150° Celsius

---

(3) this dish is uncooked

Table 3.2: *Doxification of the inference with cognitive intentions*

> food is uncooked whenever it has not been heated above 150° Celsius

and stores the latter proposition in her mind. This allows her to reduce the inference in Table 3.1 above to the inference in Table 3.2, which looks like an epistemic inference.

Observe that the epistemic-like inference of Table 3.2 leads the cook exactly to the same result (her belief that the food is uncooked) she could achieve by using the corresponding cognitive instruction (first inferring the intention to believe that the food is uncooked, and then forming that belief).

One may want to make a step forward and say that the fact that Mary has adopted (or should adopt) the belief ⌈if a food has not been heated above 150° Celsius, it is uncooked⌉ constitutes a new reality (a rule, or a rule-based connection), according to which the fact that a food has not been heated above 150° constitutes its uncookedness.

We shall consider in Section 3.2 on the next page how, and in what sense, a normative reality may be constituted by one's beliefs. By now, let us just observe that the propositional doxification of cognitive instructions may be viewed as a psychological foundation of the phenomenon of the so-called *constitutive rules*, which have kept busy so many philosophers of law and of morality.

Such rules are usually said to be essentially different from *regulative rules*, or better *deontic rules*, namely, those rules which express the obligation or the per-

mission of performing an action. While deontic rules directly govern behaviour, constitutive rules are affirmed to create (to constitute) new states of affairs(see Searle 1995, 9ff.), such as the following facts:

- the fact that a food is uncooked , as distinguished from, but supervening upon, the fact that it has not been heated above 150° Celsius),
- the fact that one has a certain nationality, as distinguished from, but supervening upon, the fact that one was born in a certain place or from certain parents, or
- the fact that one committed a crime or made a contract, as distinguished from, but supervening upon, the fact that one has killed somebody or has made an agreement.

From our perspective, constitutive rules, or better *non-deontic rules*—in the sense of rules establishing non-deontic qualifications—are indeed derivative upon cognitive instructions. They basically are reasoning shortcuts: Their application leads, through a simpler computation mimicking epistemic reasoning, to the same conclusion one would obtain by applying cognitive instructions. This is the case both when one is reasoning individually and when one is reasoning as a member of a group (this issue will be examined in Chapter 9).

Such a cognitive simplification unfortunately produces philosophical complications. We believe that such complications can be at least partly overcome, when one focuses on the function of constitutive rules in reasoning, rather than on their "ontological status," and considers their functional equivalence to *cognitive instructions*.

3.2. The Projection of Practical Beliefs

As we have seen above, for rationally forming the belief that a conative state is adoption-worthy, one does not need to assume that there is an external state of affairs corresponding to the content (the noema) of that conative state. One simply needs to correctly derive this belief on the basis of the (doxastic counterpart of the) reasoning ways that, in direct practical reasoning, would enable one to rationally form that conative state. For instance, the cook of the example above when concluding that the instruction ⌈I shall never give uncooked food to my children⌉ is binding (adoption-worthy) to her does not need to assume that there is an external reality which corresponds to this instruction, and makes it true.

However, when one believes that one should adopt certain conative attitudes, one tends to assume that states of affairs exist corresponding to these attitudes, to wit, that there are *normative states of affairs*. This takes doxification one step further, as we shall see in the following section.

3.2.1. Doxified Shall-Intentions

When I believe that the instruction ⌈I shall make action *A*⌉ is *binding* (adoption-worthy), I tend to project this instruction into the world, assuming that action *A* has a property, namely, the property of being *obligatory*. Similarly, we project *conditional instructions* we believe to be binding into *causal-like connections* holding between factual preconditions and normative effects.

For instance, assume that I believe that I should adopt the instruction ⌈I shall help my brother, when he is in need⌉. According to this assumption, I shall form the belief that there exists a link between my brother's being in need and my obligation to help. In other words, I shall view this instruction being paralleled by a causal-like connection between my brother's state of need and my obligation to help him, a connection that can be described by apparently epistemic propositions such as the following:

> if my brother is in need, then I ought to help him

or even:

> the fact that my brother is in need determines (causes) my obligation to help him

A similar type of projection also holds for legal beliefs. So, my belief that I should adopt (in legal reasoning) the instruction:

> one shall compensate people whom one has damaged

will be paralleled by my belief in the existence of a *legal connection*, namely, a causal-like connection existing as a legal ought-to-be, as Kelsen (1960, sec. 4.b) would say (see also Kelsen 1992, sec. 11).[6] According to such a connection, producing damage causes an obligation to repair:

> if one damages another, then one ought to compensate the damage

or even

> one's damaging another determines one's obligation to repair the damage.

Thus, to doxifying reasoners the fabric of the world appears to be enriched with a new dimension: the practical state of affairs corresponding to their practical beliefs. In particular, these states of affairs include the obligations and the permissions corresponding to shall- and may-instructions that the "doxifiers" believe to be binding (out of any of their particular concerns or roles).

[6] For a discussion of the Kelsenian idea of ought-to-be, see Pattaro, Volume 1 of this Treatise, sec. 1.1 and chap. 14; for our criticism of it, see Section 21.3 on page 563.

Normative beliefs are critically discussed in Pattaro (2003, 136ff.) in connection with the idea of *duty sentences in the form of judgements* originally proposed by Axel Hägerström, the founder of Scandinavian legal realism (see Hägerström 1953, 127–32), that is, the idea that such beliefs are practical attitudes in disguise.

We agree with the realist tradition in considering that normative beliefs are functional to practice, and are conducive to conative states. However, our cognitive perspective leads us to emphasise the rational aspects (the opportunities for practical cognition) that are offered by doxification: Having such beliefs—though it may seem ontologically suspect—is useful, and indeed rational, for a practical reasoner. Reasoning with practical beliefs is an appropriate way to deal with many practical issues, and thus it is a sound way of reasoning, if one remains within the cognitive purposes that doxification is intended to satisfy.

Consider for example, the instruction adopted by Mary, the kindergarten cook: ⌈whenever a food has not been heated above 150° Celsius, I shall believe that it is uncooked⌉. Her belief that she should adopt this instruction leads her to assume a non-deontic connection: ⌈the fact that a food has not been heated above 150° Celsius determines its uncookedness⌉. She will indeed believe that ⌈not having been heated causes a food to be uncooked⌉.

Similarly, a judge's conclusion that her community should adopt, for the purpose of legal reasoning, the instruction ⌈anybody who damages one's health shall pay compensation⌉—this being the best available way to promote the value of health—leads the judge not only to intend that this instruction is executed, but also to project a corresponding connection into the world, that is, to believe that, according to the law, ⌈damaging one's health determines the obligation to pay compensation⌉ (on normative determination, see Section 20.2 on page 523).

3.2.2. Doxifying May-Intentions

The idea of a projection also extends to may-intentions. A may-intention is doxified into the belief that an action is allowed or *permitted*.

For example, my intention that I may have a drink tonight gets doxified into the belief that I am permitted to have a drink. Similarly, my intention that my daughter may go out tonight is projected into the fact that she is permitted to do that.

As a legal example, consider how a judge, when forming the intention (from the perspective of his community) that women may take off their bras at the sea, may conclude adopting the belief that topless is permitted on public beaches (this happened in Italy at the end of the 1970s).

There is another way to express the doxification of the may-intention that action A is performed: Rather than saying that A is permitted, we may say that A's omission is not obligatory, i.e., that A is not forbidden. As we shall in

see in Chapter 17, saying that A is not forbidden amounts to saying that A is permitted.

In fact, a may-intention to do an action A can be seen as a negative intention to omit A: When one intends that A may be performed, one excludes that one shall intend that A is omitted (the idea of permission as exclusion is developed by Hernandez Marín 1998, chap. 16). Excluding the intention that A is omitted is no purely negative state of mind, it does not merely consist in not having the intention that A is omitted. Nor is this state of mind obtained through introspection: It is not the case that ⌈I can conclude excluding the intention that A is omitted, whenever introspection tells me that my current mental states do not comprise the intention that A is omitted⌉. To reach this conclusion a specific inquiry is called for.

This seems to correspond to what we generally do when we have to establish whether a negative state of affairs holds. To establish that the negative proposition ⌈NON A⌉ holds it is not sufficient that one fails to find A among one's beliefs, or even that one fails to derive A from one's beliefs. It is rather necessary that one finds an incompatibility between one's beliefs and A, so that one can exclude that A is true. For example, for me to establish that my son Aldo is not in his room, it is not sufficient that I fail to retrieve in my mind the belief that Aldo is in his room, nor that I fail to conclude that Aldo is in his room from my current beliefs (I may have no information about where he is, so that neither I can conclude that he is in, nor I can conclude that he is out). Only when I get some information that is incompatible with his being in his room (I hear a noise in the kitchen, and I know that he is the only person in the house besides me), I can conclude that Aldo is not in his room.

Similarly, my exclusion of the possibility that I adopt a certain intention gets doxified into the belief that it is not the case that the state of affairs doxifying the excluded intention holds. Correspondingly, my exclusion of the intention that I shall do A gets doxified into my belief that it is not obligatory that I do A, i.e., into my belief that I am permitted to omit A. Correspondingly, my exclusion of the intention that I shall omit A gets doxified into my belief:

- that it is not obligatory that I omit A, or equivalently,
- that I am not forbidden to do A, or equivalently,
- that I am permitted to do A.

This leads to the equivalence between the negation of a prohibition and a permission, an equivalence that we shall discuss in Section 18 on page 479.

3.3. Normative Beliefs and Normative States of Affairs

In Chapter 3 we approached doxified practical reasoning at a purely epistemic or cognitive level, that is, we considered what function normative beliefs play

in cognition. Seen at this level, doxified practical reasoning gives us no specific problem: It is a cognitive tool that facilitates us in reaching the same conclusions we would achieve through direct practical reasoning.

From a purely functional perspective, there is no problem is projecting our conative states into the external world, assuming the existence of normative properties and states of affairs, and adopting corresponding beliefs: Doxification is a useful trick, which provides us with a further chance to use our epistemic skills in the practical domain, and so enhances our ability in practical reasoning. This is the position that is taken by Pollock (1995, 275):

> [A doxified practical] judgement is epistemic in name only. It requires no "objective fact" to anchor it or give it truth conditions. It is merely a computational device whose sole purpose is to allow us to use defeasible epistemic reasoning to accomplish defeasible practical reasoning.

A reflective practical reasoner, however, may transfer this issue at the ontological level, asking "What are the state of affairs that correspond to practical beliefs?" or "What states of affairs make practical beliefs true?" We cannot here provide a thorough discussion of such a fundamental philosophical question, but we shall not refrain from addressing it within the limits in which it is relevant for our purposes.[7]

3.3.1. Normative States of Affairs and Current Cognitive States

It is a fact that when one forms normative beliefs by doxifying one's conative states, one also tends to couple such beliefs with states of affairs, which are projected into the external words. This also concerns those normative beliefs that have been obtained through reasoning. For instance, assume that the kindergarten cook, besides believing that that she ought not to serve uncooked food to her children, also believes that a particular dish is uncooked. These premises lead her to conclude that she ought not to serve that dish, i.e., that she is under the obligation not to serve that dish, this obligation having been determined by the dish's uncookedness.

The fate of the projections of (doxified) conative states is obviously linked to the fate of the conative states to which they correspond. If the cook abandons her belief on the bindingness of the instruction ⌈I shall not serve uncooked food⌉ (because she has come o know that the infection was not caused by food, but by the contact with infected children), she would stop projecting that instruction onto the external world, i.e., she would stop believing that a food's uncookedness determines the obligation not to eat it.

[7] This issue has been extensively discussed in the literature. For a series of sceptical considerations on the matter, cf. Mackie 1977, and with specific regard to the law see Patterson 1999 and Pintore 2000. For vindication of the existence or moral and legal entities, properties and relations, see Moore 2003. For a discussion of legal ontology see also Pavlakos 2003.

It is not easy to establish an appropriate semantics from normative beliefs, and a corresponding ontology for normative states of affairs.

An answer—unfortunately, an untenable one, as we shall see—is that normative propositions are made true by the fact that the agent has the corresponding conative state. From this perspective, Mary's intention not to serve uncooked food verifies the proposition that she ought not to eat uncooked food as well as its implications (like the proposition that she ought not to serve the children a particular dish of vegetables). The proposition that she ought not to serve uncooked food remains true as long as she continues having the intention not to serve such food. As soon as she stops having this intention, the propositions become false (and she no longer has the obligation).

Similarly, this perspective leads us to say that the proposition that some things (for instance, freedom, welfare, peace, etc.) are values holds true as long as one continues to like those things (to have a preference for them). For instance, as long as Mary cares for the health of the children, it holds true that children's health is a value. Were she to become cynical, indifferent, or completely egoist, the proposition that the health of the children is a value would become false (at least as far as Mary is concerned).

In general, the approach we have just described expresses the view that practical states of affair supervene upon the fact that one adopts the corresponding conative state: My liking something makes it likable (valuable or good), my desiring something makes it desirable, my intention to implement an instruction makes it binding.

Unfortunately, this view cannot be maintained. Consider again the case of Mary, the kindergarten cook, who has the intention to avoid serving uncooked food to the children (and believes that she should have this intention), on the basis of her belief that such food would be dangerous for their health. Assume that she comes later to know that there is no danger in eating uncooked food (the germs causing the infection were transmitted through contact with infected children, and not through the food). At the cognitive level, the situation is quite clear. Her belief that there is no danger related to uncooked food leads her to withdrawing all of the following:

1. the intention to avoid serving uncooked food,
2. her belief that this intention is binding, and
3. her belief that she ought not to serve such food.

However, what happened to the state of affairs corresponding to the proposition ⌈Mary ought to avoid serving uncooked food⌉? Was it really true that she had the obligation to avoid serving uncooked food while she was having that intention (the intention to avoid serving uncooked food), though, as a matter of fact, there was no risk of any infection?

It seems to us that she had no obligation to avoid serving uncooked food (since there was no risk of an infection, and on the contrary it would have been good for the children to have some fruit and vegetables) even when she had that intention. Then it is clear that the state of affairs that she ought to avoid serving uncooked food did not supervene on her having that intention.

Consider also the position of a parent of a child, who works as a doctor and has come to know that the children's disease has nothing to do with uncooked food. Should the parent too conclude that Mary ought not to serve uncooked food, just because he knows that Mary has that that intention? It seems that we must give a negative answer to this question. This implies that Mary's obligation neither supervened upon her intention not to serve the food nor upon her belief that she was under the corresponding obligation.

The same considerations also apply to legal reasoning. Assume that a judge knows that most of her colleagues and fellow citizens adopt the instruction ⌈no compensation shall be given for damage to health (beyond the economic loss which was suffered by the victims)⌉. Is this sufficient for her to conclude that ⌈if one damages one's health one has no right to compensation⌉, since this normative connection supervenes on the intention of her fellows and colleagues? Is the judge justified in drawing this conclusion even when she knows that allowing compensation for health damages would much better serve the values of the legal system, that most of her colleagues would share her argument for adopting a rule to that effect and follow her example, that her adoption of such rule would be consistent with her role, that any rational cognisers who intended to implement shared legal values in the current social conditions would agree with her?

If we must give a negative answer to this question, then it is clear that a legal obligation does not directly supervene upon people's belief that there is such an obligation (though people's current opinions have an important role to play, as we shall see in Chapter 12).

Consider also the following hypothetical case. Assume that I believe the following: (1) damage to health ought to be compensated, and (2) Mark damaged John's health in a traffic accident. Yesterday these beliefs led me to conclude that Mark ought to compensate John. Assume however that this morning I come to know that Mark did not damage John's health (John's medical problem pre-existed to the accident). Under such epistemic conditions, today I can conclude that it is not the case that Mark ought to compensate John.

This conclusion does not concern only the present, but also the past. Once I know the facts of the case, I become convinced that even yesterday there was no obligation for Mark to compensate John, though I wrongly believed that he had this obligation. This shows that Mark's obligation did not supervene on my belief that he had that obligation.

3.3.2. Normative States of Affairs and Optimal Cognitive States

It seems that the conclusions of Section 3.3.1 on page 103 (normative properties do not supervene on people's belief that such properties exist) lead us to a dilemma: Either we assume that there are in the world normative properties and states of affairs, which exist independently of people's mental states, or we have to admit that there are no such properties and states of affairs, so that reasoning about them is plain nonsense.

In the latter case, we may admit that, though normative beliefs have great social importance, they remain irrational or even absurd. We would end up adopting the thesis of the Scandinavian realists: Normative beliefs are both necessary to the social fabric and senseless.[8]

This view puts at potential risk the mental health of lawyers (at least those who cannot avoid pursuing rationality and coherence): They need to face the cognitive dissonance between having normative beliefs and acting upon them (as required in order to contribute to the social function of the law), and viewing such beliefs as irrational or absurd.

We believe that there is a way out, so that the existence of a normative state of affairs can be distinguished from people's current beliefs, without assuming that normative states of affairs have an existence similar to that of physical states of affairs. This is the idea that what constitutes a practical state of affairs is the *cognitive optimality* of the adoption of the corresponding conative state—or, which is the same, the cognitive optimality of the belief that this conative state is adoption-worthy.

Before moving on, we need to specify the idea of cognitive optimality. In particular, we need here to distinguish different ways in which a mental state may be cognitively optimal, or which is the same, *justifiable* (we use synonymously the expression "cognitively optimal" and "justifiable"). All of these ways must be counterfactual: They do not concern the mental state that the one has as a matter of fact, but they rather concern the mental states that one would have if one had perfectly applied various cognitive tools at one's disposal, where by perfectly applying a cognitive tool, we mean using it correctly, whenever it is relevant.

This leads us to defining different notions of justifiability. The first, *inferential justifiability*, is limited to ratiocination, as applied the current mental states of the reasoner.

Definition 3.3.1 *Inferential justifiability. A mental state M is* inferentially justifiable *to agent j, if j would maintain M after applying perfect ratiocination to j's current mental states.*

[8] See, in particular, Hägerström 1953 and Olivecrona 1971. For a related discussion, see also Pattaro 2000. As is well known, Scandinavian realists linked legal conceptions with magical beliefs or other irrational attitudes (see Faralli 1987).

Assume, for example, that I have come to the conclusion that I need to pay € 1,000 to fly to Barcelona. However, when reasoning about the cost of my ticket I failed to consider that a € 10 fee has to be paid to the travel agency for booking an international flight. I knew that there was this condition, but I failed take it into account. If I had perfectly applied my ratiocinative powers to all my beliefs (included the condition concerning the fee), I would have concluded that I have to pay a € 1,010 rather than € 1,000. Thus, my belief that I have to pay only € 1,000 is not inferentially justifiable.

The second notion of justifiability, *rational justifiability*, is still confined to the current mental states of the reasoner, but concerns any kind of reasoning process.

Definition 3.3.2 *Rational justifiability. A mental state M is* rationally justifiable *relative to agent j, if j would maintain M after applying perfect reasoning to j's current mental states (with the exclusion of any external cognitive input, but including not only ratiocination, but also heuresis and coherence evaluation).*

Assume, for example, that when forming the belief that I had to pay € 1,010 to go to Barcelona, I failed to consider my knowledge that in various previous cases when I travelled on Monday, I paid a 10% lower price than when I travelled on other days of the week. This should have led me (through heuresis) to form the hypothesis that there may be a Monday discount also for travelling to Barcelona. Adopting this hypothesis should have prevented me from adopting the belief that when travelling to Barcelona on Monday the ordinary € 1,010 price is to be paid, and should have led me to the belief that I may possibly need to pay only € 910. Thus the belief that I have to pay € 1,010 price, though being inferentially justifiable, is not rationally justifiable.

The third notion of justifiability, *cognitive justifiability*, besides reasoning, also includes actions that may lead one to get new external inputs (typing at a computer keyboard, looking at objects, walking to places, asking people, etc.).

Definition 3.3.3 *Cognitive justifiability. A mental state M is* cognitively justifiable *to agent j, when j would maintain M after a perfect inquiry starting from j's current mental states.*

Assume for example, that a new 20% discount on tickets to Barcelona has just been decided by the airplane company, and typed into the computer system that manages the issue of flight tickets. I have now the rationally justifiable belief that the price is € 910, but this belief is not cognitively justifiable, since there is a true fact (which would be accessible through a perfect inquiry) that would lead me to withdraw that belief. Knowledge of the new discount would indeed lead me to conclude that the price of the ticket is € 730, which is the result I obtain by applying to the pre-discount price (900), the 20% discount and adding the fee for the travel agency (since $900 * 0.80) + 10 = 730$). Note that reasoning (and even conversation) would not suffice for me to reach that conclusion. I

also need to query the computer system (and before that, I need to switch it on, activate the Internet connection, and so forth).

Therefore, a mental state is *cognitively justifiable* for a certain reasoner, if that reasoner would have that mental state, and remain in it, after having been provided with all relevant perceptual input, and having processed that input (plus the current mental states of the reasoner) according to all resources of perfect, or *optimal rationality* (there included ratiocination, heuresis, and coherence evaluation).

Since optimal rationality may be assumed to be the same for all reasoners, we can make this idea independent of the identity of the reasoner.[9] This leads us to rephrase Definition 3.3.3 on the page before as follows.

Definition 3.3.4 *Cognitive justifiability. A mental state M is* cognitively justifiable *when any rational agent would maintain M after an optimal inquiry.*

We can also introduce into this notion the idea of truth for theoretical knowledge. We can say that a conative state (liking, desire, intention, want) is cognitively justifiable, if a reasoner would have that mental state, and would remain in it, after having been provided with all relevant true theoretical propositions, and having processed that input according to all resources of optimal rationality (there included conclusive reasoning, defeasible reasoning, heuresis, and coherence evaluation).

When a conative state is cognitively justifiable, we may say that the content of that cognitive state is *adoption-worthy* or *cognitively binding*.

For instance, according to the ideal of optimal cognition (cognitive justifiability), we may say that it was not the case that Mary (the kindergarten cook) ought to avoid serving uncooked food: There was a true belief (the belief that the uncooked food was safe) that would have led her to abandon her endorsement of this obligation. Said otherwise, the instruction ⌈I shall not serve uncooked food⌉ was not cognitively binding to her (though she believed it was).

Similarly, I may say that it was not the case that Mark ought to compensate John, since there is a true belief (the belief that he did not damage John) that, according to reason, would have lead me to abandon the belief that Mark ought to compensate John.

Finally, imagine that a judge believes that Internet providers are to be considered liable for any damage caused by contents stored and published on their servers, whenever they had some control over such contents—this seems to be the *ratio decidendi* of case *Stratton Oakmont vs Prodigy Services Co.* (Supreme Court of New York Country, 1995). Assume that the judge has not considered that this rule restricts the providers' choice (if they want to avoid liability) to the

[9] Though one may argue that even optimal cognition cannot discount different starting points: When reasoners j and k have different starting points (different current mental states) even perfect cognition would sometimes lead them to different outcomes (we shall address the issue of relativising cognitive states in Section 4.2.5 on page 133).

following alternatives, both having prejudicial implications: Either providers omit every control (so that any illegal material can go on line) or they refuse to publish any contentious information (so engendering freedom of expression).

If the judge had considered these implications of his ruling, he would not have adopted it and reasoned accordingly. Under such conditions—though the judge believed that the provider was liable, and condemned it to pay damages—we may say that the provider was not liable for defamation. This does not exclude that now, according to the decision of the judge, the provider is obliged to pay damages. However, this happens because of the wrong decision of the judge in the individual case, and not because of the law pre-existing that decision.

3.3.3. Cognitive Optimality and Collective Inquiry

Our notion of a proposition being cognitively justifiable may be connected to the idea of truth as the ultimate outcome of inquiry, according to the famous definition of Charles S. Peirce:

> "Truth" is that concordance of an abstract statement with the ideal limit towards which endless investigation would tend to bring scientific belief. (Peirce 1966, vol. 5, par. 565)

With reference to Peirce, however, we must discuss the idea that such an outcome needs to be agreed by the community of the researchers:

> The opinion which is fated to be ultimately agreed to by all who investigate, is what we mean by the truth, and the object represented in this opinion is the realty. (Peirce 1966, vol. 5, par. 408)

We need in this regard to distinguish *unbounded* or *optimal cognisers*, having unbounded cognitive resources, and *bounded* or *suboptimal cognisers*, having limited cognitive resources.

If we are referring to *unbounded cognisers*, having unlimited cognitive capacities (in the perceptual, ratiocinative and heuristic domains) and unbounded time at their disposal, it is not clear why many such cognisers (being able to communicate) would perform better than only one of them. In fact, an unbounded cogniser could perform in parallel all cognitive processes that may be separately performed by a set of cognisers, and access the outcomes of all such processes. No advantage (except in efficiency, which is no problem for an optimal cogniser) could be obtained by distributing cognition over a set of communicating agents. So, if we take the idea of an optimal cogniser as the standard for cognitive justifiability, one such cogniser seems to be enough.

Things look very different if we refer to *bounded cognisers* as humans are. With regard to bounded cognisers, we may certainly assert that usually a set of communicating inquirers functions better than an isolated enquirer, and a larger

set of enquirers, when interactions are properly managed, often is more effective than a smaller set.

However, a community, no matter how large, of bounded cognisers cannot provide us with a definition of cognitive optimality (justifiability). In particular, the limitations of each cogniser also impacts on his or her ability to process messages coming from other cognisers: When a community of interacting cognisers grows above a certain limit, its cognitive performance starts to deteriorate (since most of energies will be spent in communication), unless interactions are restricted.

Moreover, it may be better that the single cognisers (or separate groups of them) work to a certain extent in parallel, independently one of the others, each one focusing on his or her own ideas: Too much interaction at an early stage can lead the cognisers to converge into what appears to be most promising at the initial stage, disregarding the individual exploration of ideas that, though initially less appealing, given a sufficient time and effort could turn out to be the right ones. In other words, an excess in interaction can favour exploitation of other people's ideas over the exploration of new ideas (as observed by Axelrod and Cohen 2000, chaps. 2 and 3), and thus degrade the heuristic performance of the whole conversational community.[10]

In conclusion, increasing the number of interacting bounded cognisers and the intensity of their communication does not necessarily lead to cognitive optimality. To define this notion we need to refer to the performance of optimal cognisers, endowed with a perfect cognitive capacity, but then, as we observed, one such cognisers is enough. Moreover, assume that we really idealise the cognitive and communicative competence of each individual belonging to a community of optimal cognisers, assuming that each such member in the following conditions:

1. he or she has immediate access to all cognitive results that are obtained by any other cognisers,
2. he or she takes such results into account as if they were provided by his or her own cognition,
3. he or she processes such results immediately through his or her reasoning (the outcomes of which, according to item (1) are accessible to all other cognisers).

It is easy to see that such a community would function as a single mind, processing information in parallel (which is what our brain does, though far from perfectly) and having access to the outcomes of all its parallel processes: Distributed

[10] As an extreme example of successful closure to interaction during inquiry, consider the case of Andrew Wiles, the English mathematician who succeeded in proving Fermat's last theorem (the conjecture that for whenever $n > 2$, for no x, y and z, $x^n + y^n = z^n$). Wyle achieved this extraordinary result, solving a problem on which mathematicians have been struggling 300 year, by working almost in complete isolation for seven years (only his wife knew he had this research objective). On Wyle's story, see Singh 1997.

information-processing, once all resource bounds are removed, is brought back to monological information-processing.

3.3.4. Cognitive Optimality and Dialogues

These considerations take us away from the idea that cognition and truth can be defined as the outcome resulting from unrestrained dialogues, as Habermas (1971) famously claimed (see also Habermas 1999, 34ff., 1981), an approach that was transferred into the law by Alexy (1989). Here is Habermas's original formulation:

> I may predicate something of an object, if and only if every individual who could enter into conversation with me would predicate the same thing of the named object. In order to distinguish true from false statements, I refer to the judgement of others—indeed the judgement of all others with whom I might ever engage in conversation (here I include, counterfactually, all speech-partners whom I might encounter if my life history were co-extensive with humankind). The condition for the truth of statement is the potential agreement of *everyone* else. (Habermas 1971, 124; translation by R. Adler and N. MacCormick in Alexy 1989, 102)

With regard to Habermas's theory, we agree with the following critical comment of Tugendhat (1980, 6):[11]

> Every foundation [. . .] is not essentially communicative, since it can also be accomplished by one single reasoner for him or herself, that is, in this sense, monologically.

It is true that Habermas insists that what matters in not whatever factually reached consensus, but only a *rational* consensus, which is produced following the principles of rationality. However, in this case, as Rescher (1993, 13–14) observes: "[W]e might then as well have started from a concern for rationality as such and left consensus out of it", since "it will only be a rationally engendered consensus that is significant; and what is significant about it is not its consensuality but its rationality."

From our perspective, only optimal cognition—for which there seems to be no difference between dialogue and monologue—can take the burden of constituting normative truth.

Different dialectical procedures can be devised (and have been devised) by social evolution or by conscious design, as ways to enhance the cognitive performance of bounded individual cognisers through interactions with others. Such procedures, however, rather than the fixed transcendental-pragmatic paradigm

[11] See the discussion in Alexy 1991, 399ff. The possibility of founding normative conclusions monologically, though within a contractarian approach, is affirmed by Scanlon 1998, as observed by Peczenik, Volume 4 of this Treatise, sec. 4.5, to which we refer for some critical considerations, concerning more generally contractarian foundations to normativity. A monological foundation of normativity is also developed, for instance, by Gewirth 1978.

of rationality (Habermas 1981), are more modestly to be viewed as methods aimed at enabling bounded cognisers to achieve certain cognitive and other goals, by co-operating with their fellows. Thus procedures for cognitive interaction need to be justified instrumentally, according to teleological reasoning, as we shall argue in Chapter 11.

Note that our approach is based on a mentalistic, rather than on a linguistic approach. In fact Habermas (1999, 10ff.) rightly locates the basis of his approach in the "linguistic turn," which at the end of the XIX century tried to distinguish sharply logic and epistemology from psychology, viewing public language as the only medium of cognition, repository of knowledge and siege of thought.[12]

Here we shall move away from this paradigm, and locate our work within the "psychological" or "mentalistic turn" which seems to characterise the last decades of the XX century, thanks to the advances in linguistic psychology, philosophy of mind, and cognitive science.[13] Correspondingly, we view cognition as a (mental and practical) activity of the cognising individual (interacting in various ways, linguistic and non linguistic, with others), and see language and in particular its public use, as being subsidiary upon, and derivative from, a psychological foundation.[14]

In particular, with regard to the connection between dialogues and research, we believe that researching together is usually an opportune choice, given the limits of the cognitive capacities of each single researcher. Obviously, the research group must have the right size (according to the nature of the research which is being performed), and there must be the appropriate frequency of exchanges of information (not too few exchanges, since we need the contribution of others, and not too many, since this will not allow us the time for processing autonomously the information that is provided to us).

[12] For a criticism of the very idea of a public language, see Chomsky 1993. For an extreme criticism of reducing cognition to language, see Churchland (2000, 508), who observes that language use "is mastered by a brain that evolution has shaped for a great many function, language use being only the very latest and perhaps the least of them." Thus Churchland views language use as a "superficial" and "extremely peripheral" activity, which cannot provide standards of intellectual virtue: It only uses a very elementary portion of the available neural machinery and cannot match the complexity required for organising and processing perceptual knowledge. The idea that heuresis cannot be limited to linguistic performance is well expressed by following often cited words of Einstein 1981, 398: "The words of the language as they are written or spoken, do not seem to play any role in my mechanism of thought. The physical entities which seem to serve as elements in thought are certain signs and more or less clear images which can be 'voluntarily' reproduced and combined. [. . .] [T]his combinatorial play seems to be the essential feature in productive thought —before there is any connection with logical construction in words or other kinds of signs which can be communicated to others."

[13] For a collection of important contributions to cognitive science, see Cummins and Dellarosa-Cummins 2000.

[14] On viewing rationality as a psychological feature, and epistemology as kind of psychological inquiry, cf. Pollock and Cruz 1999, 170ff.. For a psychological approach to normativity, see Conte and Castelfranchi 1995.

However, we also maintain that for gaining cognition, perception and experiment (and therefore action, and not only of the communicative type) is required. This idea was powerfully expressed by Galilei (1960, sec. 44), who opposes the outcome of experiments to the general opinion:

> Adducing such witnesses serves no purposes [. . .], since we have never denied that many people have written and believed such things. We did indeed say that the thing is false, but as to authority yours alone is as cogent as that of a hundred men in making the effect true or false. You take your stand upon the authority of many poets, and against the experiments which we produce. I reply by saying that if those poets were to be present at our experiment, they would change their opinion, and without any revulsion whatever they might say that they had written hyperbolically or might confess themselves to have erred.

We view dialogues as ways of collectively processing information: They offer to individual cognisers the chance of overcoming (to some extent) their cognitive limitations, by pooling their premises and outcomes, and, especially, their heuristic findings: Though conversation does not constitute rationality—nor does it exhaust the ways in which rational enquiry can be carried out—dialogues are a fundamental addition to bounded individual rationality.

In the practical domain, a special limitation of individual cognition is the fact that—though we may reason adopting a communal or impartial point of view (see Chapter 9)—we are usually incapable of properly assessing the needs of others, or the communal needs, giving them an appropriate weight (though we may assume that an optimal cogniser also has this capacity).

We shall see in Chapter 11 how dialectical interaction can facilitate bounded cognisers in approximating optimal rationality. This will lead us to reaffirm the value of public deliberation, especially in the political domain, and the hope that ways of interaction can be found where cognition and participation can go hand in hand.

Finally the idea of cognitive justifiability as being constitutive of normative "truths" and states of affairs, could also be linked to the model of judge Hercules, the perfect legal cogniser, according to Dworkin (1977a, 105ff.). However, we shall try to be less personal, by translating Dworkin's personal ideal of epistemological virtue into a set of cognitive moves and skills.

The idea of cognitive justifiability can also be connected to the version of Peircean approach recently proposed by Coleman and Leiter (1995), which makes legal truths dependant upon ideal cognition, through we emphasise the way in which ideal practical cognition is constitutive of practical truths: Ideal practical cognition can reach practical truths because it constitutes the very states of affairs that (doxified) practical propositions describe. If one accepts this dependency of normative states of affairs upon practical cognition, one may consider our approach to be consistent also with realistic approaches to law and morality (see for instance Moore 2002).

3.3.5. The Supervenience of Normative States of Affairs

The dependency of normative states of affair on optimal practical cognition (rather than on possessed mental states) explains why we view normative states of affairs as having an independent reality and tend to assimilate them to physical situations. This dependency corresponds to the traditional rationalistic approach to morality and natural law, that is, to the idea that reason (cognition) constitutes normative state of affairs. To repeat the famous words of Grotius (1925, sec. 1.10.1):

> The law of nature is a dictate of right reason, which points out that an act, according as it is or is not in conformity with rational nature, has in it a quality of moral baseness or moral necessity.

Our contribution will consist in an attempt to provide cognitive foundations not only for conclusions pertaining to natural law, but also, as we shall show in the following pages, for conclusions concerning positive law. For this idea too, one may find illustrious predecessors, like Aquinas, who famously said that human reason

> from the precepts of the natural law [. . .] needs to proceed to the more particular determination of certain matters. These particular determinations, devised by human reason, are called human laws. (Aquinas, *Summa Theologiae*, I-II, q. 91 a. 3, c)

Note that the idea that practical cognition constitutes normative states of affairs does not depend on what solution one gives to the problem of the origin of practical cognition. This idea is consistent both with the view that practical cognition is an "imprint on us of the Divine light [. . .] nothing else than the rational creature's participation of the eternal law" (Aquinas, *Summa Theologiae*, I-II, q. 91 a. 2, c),[15] and with the view that it rather is an outcome of selective evolution, a produce of the "blind watchmaker" (Dawkins 1986) to which neo-Darwinians attribute the ability of designing intelligence and consciousness.[16] The assumption that practical cognition can constitute normative state of affairs only depends (*a*) on the possibility of applying reason also in the practical domain, and (*b*) on the possibility of providing a sufficiently precise account of reasons's functioning in this domain.

The idea that it is possible to give a cognitive foundation to legal conclusions seems to be contradicted by the contingency of positive law, and especially by the contingency of legislative statements. These statements are undoubtedly created by the decisions of the legislator, in the sense that the legisla-

[15] For recent discussions on the theological foundations of practical and legal cognition, see for instance Cotta 1995, 8ff and D'Agostino 1997.

[16] For an introduction to neo-Darwinian thinking, see, among the others, Dawkins 1989 and Dennett 1996. On Darwinian approaches to law and society, see also Rottleuthner, Volume 2 of this Treatise, sec. 3.2.1.2.

tor's choice, expressed through the appropriate procedures, makes them legally binding. However, we need to consider that when trying to figure out what intentions one should have according to reason—and particularly what shall- or may-instructions are cognitively binding, i.e., what is obligatory or permitted—one needs to consider all relevant information. This information also includes the fact that certain actions have been performed, by the reasoner or by others, that certain events have taken place, and in particular they include the fact that other people have issued certain directives, and have certain mental attitudes.

When I, as a rational cogniser, inquire what mental attitudes I should have, I may cancel (revise or abandon) some of my current mental states: This is what I should do as soon as I become convinced that they are wrong. However, I cannot cancel the actions that I (possibly together with other people) have accomplished on the basis of wrong mental states, and obviously I cannot cancel what other people have done and what they now believe. The actions which have been taken (even if wrongly) and the attitudes and opinions of others (even if mistaken) contribute to forming the factual context within which I must now make up my mind: They are part of the input which is available to my practical cognition, and on the basis of which I must come to a rational determination. Cancelling wrong acts or mistaken attitudes by an act of will does not pertain to rationality, but to wishful thinking.

For instance, assume that yesterday my wife and I adopted the intention to go to the sea today, on the basis of our shared belief that the weather would be sunny. This morning we discover that we were wrong: The sky is cloudy. However we are now ready to leave, we have made the bookings, have loaded our car with stuff and children, etc. If we had known that it would be cloudy, we would not have decided to go to the sea. If yesterday we had had optimal cognition (there included a perfect weather forecast), we would not have had the intention to go to the sea, but we would have planned to go elsewhere. However, as a matter of fact, this very decision led us to further actions and initiatives, which created a new state of affair, in which the best thing to do (according to practical cognition) is now definitely to go to the sea. So, what we intend (and should intend) to do today, is something that we wrongly intended to do yesterday.

Similarly, assume that my community (its legislators) has wrongly decided to abolish a certain tax (for example the inheritance tax, as happened in Italy a few years ago). I believe that we should have kept this tax: The money was needed and there is much social and economic evidence that inheritance tax corresponds to the interest of our community.

However, people who have inherited after the abolition of the tax have the expectation not to pay such tax and they have arranged their business correspondingly, and tax offices are no longer organised for taxation. Moreover, reintroducing the tax is a collective decision that is to be taken by the appropriate legislative organs. Also from the point of view of one who sincerely wants to

contribute to the welfare of one's community, it would be irrational to try to pay the tax after it has been abolished (though it was rational to pay it before it was cancelled): One would only cause trouble to the tax offices and would appear silly to one's fellows. It would even be more irrational to try to coerce other people into paying this tax without a legislative backing (assume that the reasoner is a judge or a prosecutor working in the tax domain), which would cause disruption and endanger the proper functioning of legal institutions.

In conclusion, when assessing what cognitive states one would optimally have, one should be ready to revise one's own current cognitive states, and consider what outcomes one would obtain through a fresh optimal cognitive effort (including access to all relevant inputs). However, one cannot revise away:

1. all actions that one and one's fellows have accomplished (even when they were irrationally motivated);
2. those mental states that other agents currently have (even when those agents wrongly came to having those mental states).

Points (1) and (2) indicate part of the context in which one's rationality is to be deployed.

For example, assume that I am the judge in a case, and have to establish whether causing health damage produces the obligation to restore it. Clearly, I cannot assume that this obligation just supervenes on my current belief that it exists, nor on my belief that I should adopt the corresponding instruction, since I know that my beliefs may be wrong. The obligation only supervenes on the fact that optimal cognition, under perfect knowledge of all relevant circumstances (there included the existing beliefs of the judiciary and citizens, but also legislation and precedents, existing causal connections, and so on) would lead us to adopting that rule.

Among the factors I need to consider, according to reason, there may also be the wrong opinions which my fellows have concerning what rules they should adopt in such a case (this issue will be considered at length in Chapter 9).

From our point of view, there is no contradiction in assuming that a wrong belief may determine a decision that makes this belief true (with regard to future occasions): The very fact that an agent adopts a certain decision creates a new situation, where it may become rational (for the agent itself and for others) to adopt the mental state that the agent wrongly adopted at the time of the decision. Consider, for example, the case of a judge who, by deciding a case wrongly (according to a rule she should not have adopted in deciding that case) creates a binding precedent. Now reason commands that, in subsequent cases (unless conditions occur for overruling or distinguishing the precedent) the judge should adopt the same ruling that she wrongly adopted in the past, though she is now aware that she made a mistake.

3.3.6. The Relativisation of Practical Cognition

We need to consider a possible criticism of our idea that normative states of affairs supervene on optimal practical cognition. Though ratiocination seems to proceed according to schemata that are shared by all cognisers (see Section 4.2.4 on page 131), cognition may fail to lead everyone to the same outcomes. The problem is that different individuals may have different inputs to their reasoning, through their different "intuitions" (the outcomes of non-ratiocinative modules), their different experiences and previous beliefs. Shall we admit that there can be different (and possibly incompatible) optimal answers to the same practical question? In this case, our idea that the existence of a practical state of affairs is constituted by the cognitive optimality of the corresponding belief, will force us to admit that incompatible practical states of affairs may exist (that a rule can be both binding and not binding, that an action can be both forbidden and permitted, and so on), thus violating the Aristotelian principle of non-contradiction, stating that "the same attribute cannot at the same time belong and not belong to the same subject and in the same respect" (Aristotle, *Metaphysics*, 1005b12).

Our solution to this difficult issue will have two strands.

Firstly, we shall provide a *sceptical* model of defeasible reasoning: Mutually incompatible conclusions, supported by equally good reasons, cannot be endorsed by a rational reasoner.[17]

Secondly, we shall assume that when different reasoners have different cognitive inputs, shared answers can be obtained by relativising practical reasoning to the different non-rational inputs: Rather that concluding that one should adopt unconditionally a certain mental state, we can conclude that one should adopt a certain mental state relative to a particular position or point of view one is taking. We can consequently affirm that also the existence of the corresponding practical states of affairs is relative to those assumptions.

This is the attitude we normally adopt even when we are reasoning on our own, but we are uncertain on what starting points to take. For example, before deciding whether to give priority to family or work, I may wonder what I should do under each one of those perspectives. Assume I conclude that, out of my concern for my children, I ought to take them to the park. However, it is also true that today I have important work to do, so that, out of my concern for my work commitments I should stay at home. After having explored what I should to under each one of these two regards, I can make a decision.

Similarly, a judge may consider that:

- to promote a reduction in litigation, he should adopt the instruction

[17] We use the word *sceptical* in the sense in which it is employed in describing reasoning systems. Sceptical systems. which refrain from deriving incompatible conclusions supported by equally good reasons, are opposed to *credulous* systems, which derive such conclusions (see Horty et al. 1990).

⌈health damages should not be compensated⌉, while
- according to the value of health, he should adopt the instruction ⌈health damages should be compensated⌉.

Correspondingly the judge may say that giving priority to the value of reducing litigation, it is the case that health damages should to be compensated, while, giving priority to the value of health this is not the case. This seems to be true, not only before the judge chooses whether giving priority to reducing litigation or to promoting health, but even after he has made that choice.

Finally, one may adopt normative judgements relativised to a particular point of view, that is, to a whole set of values, beliefs, instructions (those proper to one particular religion, moral or legal system, etc.), to the exclusion of other points of view. This means that one will separately apply one's cognition to the inputs provided by each point of view, getting to beliefs that are relativised to that point of view. By projecting these relativised beliefs and mental states unto the reality one sees the world as being populated by different types of relativised obligations (legal, moral, religious, professional, and so on) corresponding to those different points of view. When one projects relativised normative connections, one reasons out of the particular concern one is adopting: A normative state of affairs exists (out of a particular concern) when optimal cognition, as constrained by that concern (to the exclusion of other concerns), would lead the agent to adopt the corresponding conative state. The same happens when one is considering various normative systems (moral, religious, legal ones), each one projecting possibly incompatible normative relations over the same physical reality.

3.3.7. Practical Cognition and the Existence of Normative States of Affairs

Let us conclude our attempt to provide a cognitive foundation for the semantics of normative beliefs, by observing that the issue of whether practical rationality (practical cognition) is possible does not depend upon the assumption of the independent existence of normative states of affairs. Practical rationality (like theoretical rationality) is an information processing competence that, as a matter of fact, humans happen to possess. The opposite is true: Normative states of affairs exist as a reflex of practical cognition.

The issue of the ontology of normative states of affairs has little importance to a reasoner who wants to discover what conative states he or she should adopt. The task of establishing what normative states exist coincides with the task of establishing what conative states one should rationally adopt, according to one's own reasoning and one's further cognitive faculties (as applied to the available cognitive inputs, and to the results of previous theoretical and practical inquiries). Since normative states of affairs are not perceptible entities, one cannot take the opposite route and start by observing what normative states exist in

the world and then infer what conative states one should adopt (since normative states are not accessible to perception).

However, the difficulty of providing an ontology for normative beliefs does not question the legitimacy of adopting such beliefs. For the legitimacy of having practical beliefs, it is not necessary to assume that a reality exists that corresponds to these beliefs. It is sufficient that one can establish a mapping between doxified practical reasoning and direct practical reasoning: Whenever the first way of reasoning leads an agent to adopt or reject the belief in the projection of a conative state, the second way of reasoning should enable the same agent to adopt or reject that state. Therefore, doxified practical reasoning—though depending upon direct practical reasoning, and being, in a sense, a shadow of the latter—does not necessarily belong to the domain of magic and illusion. Not only has it an important social function, but it also has a significant cognitive function, and is a significant and useful complement to direct practical rationality (on the utility of practical reasoning in an assertive form, even from the of view of an emotivistic theory of ethics, see Blackburn 1998).

Even those who do not find very palatable the idea of that our world is inhabited by extra-empirical entities such as rights, duties, norms and values, may indulge in doxified practical reasoning, without falling into superstition, ideology or self-deceit.

Finally, we believe that the assumption that these extra-empirical entities exist, though not being necessary for engaging in doxified practical cognition, is admissible. When one employs one's epistemic resources in practical reasoning, one is free to assume that the world is populated by the entities and the properties corresponding to justified practical determinations, those entities being constituted exactly by the fact that they match the conclusions of practical knowledge. Using the terminology of Searle and Vandervecken (1985), we may say that, from this perspective, ideal practical knowledge has a *word-to-world* direction of fit: It constitutes (it makes existent) the referents of its justified conclusions.[18]

[18] Our definition of cognitive justifiability appeals to epistemic idealisation, rather than to factual consensus. Thus it leads to the view that the law is *modestly objective*, in the sense of Leiter (2002, sec. 5), i.e., to the assumption that the existence of legal facts depends upon ideal legal cognition (see also Coleman and Leiter 1995).

Chapter 4

RATIONALISATION, REFLEXIVITY, UNIVERSALITY

Doxified practical reasoning, as we have seen in Chapter 3, is a reproduction of practical reasoning through epistemic reasoning: It leads to justified conclusions exactly when such conclusions would also be obtainable through direct practical cognition. However, it has some interesting advantages, which allow for significant enhancements in practical rationality. In particular, it facilitates practical reasoning to move in an upward direction, according to the idea of rationalisation, and to focus on itself, according to the idea of reflexivity.

In this chapter we shall first focus on *rationalisation* and then we will shall examine *reflexivity*. This will lead us to some considerations concerning the power and the limitations of practical reasoning, and in particular its ability to implement universal standards of rationality. Finally we shall provide an extensive example that combines various reasoning patterns we have introduced.

4.1. Rationalisation

While usual practical thinking moves downward, from likings to desires, to goals, to intentions, to wants, *rationalisation* consists in taking the opposite direction, going from lower level conative states to higher level ones.

In rationalisation, one moves from the conclusions of a reasoning schemata to possible premises that may license these conclusions. Since different sets of premises may licence the same conclusions, schemata for ratiocination, when used backwards, only provide clues for heuresis: They open a space of possible justifications or explanations, so that heuristic search is required to find and select, within that space, what hypotheses one should endorse.

4.1.1. Upwards Practical Reasoning

When one feels a want to do something, rather than immediately letting one's want be transformed into action, one may asks oneself: "Should I really do this?" This question starts an inquiry aimed at finding whether one really has the intention to do that action. Failure to form such an intention, would lead one to question one's want.

Similarly, when having the intention of executing a certain instruction, one may ask oneself: "Is this instruction really binding?" This would lead to searching for a sufficiently good plan (or a higher level intention) including that in-

struction. Failure to find such a plan would lead one to question the adoption of the instruction (one's belief that it is binding). It is possible that failure only concerns reasoning (there is a possible plan which may include this instruction, but one has failed to construct it), but it may rather be that one's intention is irrational (rationality would recommend not to execute that instruction, since it is useless or obnoxious).

In the same way, one may question one's current desires, wondering: "Should I really have such desire?" This query would start an inquiry intended to find whether one would really like the situation where one' desire is satisfied.

Finally also one's likings may be questioned in the same way ("Should I like this thing?"), according to one's other likings and meta-likings.

To clarify the idea of rationalisation, consider for example the situation of a researcher who feels the want to make a disparaging comment on a recent work by a colleague of his, generally considered to be a much more brilliant academic. He may then stop and wonder: "Should I really make this derogatory comment?"

Assume that the researcher obtains, through introspection, the awareness that he really has the intention of making such comment (he was not just misinterpreting his own intentions). Then he asks himself: "Why should I intend to disparage my colleague?" Assume that the researcher has to admit that the work of his colleague, as a matter of fact, is quite good. So, the only possible goal, which may be served by the derogatory comment, is to belittle his colleague, to take away from her a bit of her academic glamour.

Then the researcher may wonder why he should desire to realise this goal: "Why should I have the goal to belittle my colleague?" First he checks whether this may be an instrumental desire. This would lead him to wonder whether the satisfaction of this desire (belittling his colleague) may be seen as a way of realising a higher-level plan, serving a higher-level goal. Assume that he finds no such plans.

Having failed to attribute an acceptable instrumental function to his desire, the researcher considers whether belittling his colleague should be a top-level desire. To do that, he must move from desires to likings. The researcher asks himself: "Do I really like the situation where my colleague is belittled?"

Assume that the answer is positive: Our researcher would really like this to happen. Then the researcher may wonder: "But why should I like the situation where somebody's position is impaired, though no advantage comes to me or to others?" Envy is the only ground he can find, and he must admit that he has this feeling toward his colleague. However, the researcher has no particular liking for the fact that he is envious. He feels rather a dislike for the idea of being motivated by envy, and he believes that his dislike for envy is appropriate.

Thus, rationalisation has failed: In the light of the considered likings of the researcher, and of the reasoning steps we described, our researcher could not complete a full piece of rational reasoning leading him to the action he wants to take.

On the contrary, his dislike for the idea of being motivated by envy, as his practical reasoning moves down, leads him to believe that he should have the desire of not being motivated by envy. This leads him to adopt the plan not to act out of invidious grounds, and in particular, to the intention not to disparage his colleague's work for reasons of envy. In this particular case, his awareness that envy is his only motivation for disparaging her work, leads him to intend not to behave in this way

In this example, rationalisation has changed the psychological state of the agent: Now he is aware that his rationality could not support his intuitive want to hurt his more successful colleague, and he has indeed to face a clash between this intuitive want to disparage his colleague, and the new intention of not doing it, which has resulted from his failed rationalisation.

4.1.2. Rationalisation and Critical Thinking

The process of rationalisation is therefore a process through which one submits one's own intuitions to the tribunal of reason, by linking intuitive determinations to explicit knowledge. This ability is a very important skill: It allows one to test, develop and refine one's ways of thinking and behaving, and particularly to adapt them to new situations. Consider that the basic human inborn reflexes were already established in the Stone Age, in hunting and gathering communities, after which little change seems to have happened with regard to the biological constitution of our species. Nowadays, technologic and economic changes provide a new social context, continuously changing, in which some traditional or even inborn behavioural schemata may be inadequate. An overhauling of such dispositions, using the flexibility of reasoning, may indeed be required.

A critical reasoner, however, should not expect too much from reason's verdicts, and should be very careful before translating them into actions. In fact, reasoning can also be wrong, and, in some cases, it can be terribly wrong. This is specially linked to the fact that rationalisation does not consist only in the mechanical use of given reasoning schemata. It requires discovery, or heuresis.

For instance, to conclude that certain instinctive or traditional forms of behaviour do not contribute to the achievement of any value, I need to find out that there is no sufficiently good plan that may prescribe such forms of behaviour. However, my failure to find any such plan is more likely to depend on the limitation of my intellectual resources, rather than on the fact that those forms of behaviour are really worthless. Similarly, my reason's endorsement of certain plans of action, when it is incompatible with what intuition suggests to me, may decisively depend on my insufficient knowledge of the obnoxious effects of implementing such plans.

A rational agent, as we said above, is not one who always and only follows the outcome of one's reasoning, but rather one who uses reasoning to test, refine and

verify the working of the various cognitive instruments one has at one's disposal (including reasoning itself, though not in any privileged position).

From this perspective, we may also see why the higher-level conative states of the agent are corroborated by their capacity to rationalise lower level conative states. Assume that my impulses result from reliable non-rational modules for practical cognition, and that I can rationalise my impulses according to my higher-level conative states (likings, desires and plans). This successful rationalisation not only indicates that my impulses are likely to be correct; it equally indicates that my higher level conative states are likely to be correct.

We hope that this discussion may show how the attainment of coherence between lower and higher level cognitive states, as well as between epistemic and practical cognition, though not offering any certainty concerning the correctness of one's determinations (and *a fortiori*, not constituting such correctness) has a relevance that is not only psychological, but also epistemological. The achievement of a *reflective equilibrium* (see Rawls 1999c, 18–9, 42–5) may indeed be a good indicator that one is on the right track.

4.1.3. Rationalisation in Legal Reasoning

The process of rationalisation is very important in legal reasoning. Usually a judge does not start with top-level legal values: He or she rather starts by considering specific decisional alternatives for the case at hand. From these decisional alternatives (Has this child the right to compensation for the health damage he suffered as the consequence of a car accident or should such right be denied?), the legal reasoner moves up to the possible rules which may support the alternative conclusions, from the rules to the values supporting them, and so on. This process would have to continue until one reaches a result one considers to be sufficiently reliable.

Various legal theorists have provided models of legal reasoning where justification plays an important role. For instance, this aspect is addressed by MacCormick (1978), who adopts the view that legal decisions must be deductively justified from premises including general norms, but rejects the thesis that the legal system already includes all such norms. He accepts that the interpretation of valid sources may offer alternative incompatible rules, or may be unable to provide any relevant rule, and claims that under these circumstances formal justice (equal treatment of equal cases) requires the judge to make a choice among the alternative rules or for a new one. Such a choice must be justified on the basis of its consequential acceptability and its legal coherence.

In our framework we would say that the aspects of judicial reasoning that are presented in MacCormick (1978) pertain in particular to the rationalisation of legal decision-making. We will show in the following, how teleological reasoning and coherence evaluation are indeed the basic ways in which rationalisation can be performed (beyond the point where rules and meta-rules take us).

We disagree, however, with MacCormick in considering that a deductive justification is always required in the legal domain. On the contrary, we believe that a defeasible justification, according to the patterns of defeasible reasoning suffices (and it is indeed viewed as perfectly sound by legal decision makers). Moreover, when there are alternative justifications leading to the same outcome, there is no need for choosing among them. For instance, if the plaintiff will be liable both by adopting fault liability and strict liability, and the judge can think of no other possible theory of liability with may apply to the case, there is no need for the judge to commit to any of the two theories (the idea that judges should not overcommit is discussed by Sunstein 1996a).

In conclusion, we agree with the idea that usually, as Judge Holmes puts it: "It is the merit of the common law that it decides the case first, and determines the principle afterwards" (Holmes 1995, 212). However, determining a principle and, more generally, a theory that rationalises a decision is not a useless embellishment, nor an act of deceit (or self-defeat). It can be (and hopefully it is usually) a serious attempt to make sense of one's decision, an attempt whose failure may lead to withdrawing or revising that very decision, or to departing from it in subsequent cases.[1]

Note also that a successful rationalisation of the adoption of a legal rule does not necessarily presuppose that one views the rule as a way to achieve or honour the values which the legislators had in mind when issuing that rule: It is sufficient (and indeed necessary) that the rule achieves or honours the legal values one presently recognises, as pertaining to the legal system of one's community. It may well happen that a rule "adapts itself to the new reasons which have been found for it, and enters on a new career" (Holmes 1881, 5).

4.1.4. Practical Theories and Their Coherence

By using reasoning in the ways we have described, rational agents may build what we may call *practical theories*. By a *practical theory* we mean a set of cognitive states that the agent uses to guide its behaviour. Such a theory can include conative states (likings, desires, intentions, and wants), their doxified reformulation, and the epistemic beliefs that are relevant to the adoption of conative states (beliefs concerning, for example, causal connections between one's actions and the realisation of what one likes, conditions for applying a plan's instructions, and so on).

A practical theory is a dynamical construct, which may change when new perceptual inputs are provided to the reasoner. It may also change when new inputs are provided by the agent's conative dispositions. Finally, changes may also be prompted by reasoning (and in particular, as we have seen, by the process of rationalisation).

[1] The opposite view, as it is well known, was held by realists, see for example Llewellyn 1931.

This leads us to a further issue: How can one choose among different alternative ways of changing the practical theory one is endorsing? For making this choice one needs to consider that each element in one's theory may interfere in various ways with other elements. The function of each element needs to be appreciated from a holistic perspective: It depends on the global cognitive functionality of a theory containing that element as compared to the functionality of a theory not comprising it.

Various features of the competing ways to change one's theory can govern this choice. In particular we can mention the following:

- A theory must be an efficient reasoning tool: It must be usable with a limited effort, it must be controllable, and easily updateable.
- There should be a certain degree of support among the components of a theory. Lower elements should be inferable from higher elements, and the latter should be rationalisable according to the former.
- The theory should have the capacity to assimilate (to explain) the inputs provided by non-rational cognition (such as perception or the agent's conative dispositions). Those cognitive modules have a degree of reliability of their own (which does not depend on reasoning), and provide independent supports to a theory able of explaining their outcomes.

To sum up all these requirements, we may use the idea of *coherence*, an idea that plays a central role in legal reasoning. When one engages in legal reasoning, one needs to be aware that one's choices contribute to the production of a legal theory that is going to be used also by other people and in other circumstances. It should contain integrated epistemic and practical beliefs, and it should match feelings and intuitions concerning justice. The requirement that one's theory matches one's feelings and intuitions does not necessarily require that only the theory is modified to meet to the pre-existing attitudes of the reasoner: One may well be induced to modify one's attitudes on the basis of one's endorsement of the tenets of a practical theory. Matching may thus result from a process of reciprocal adaptation, leading to a state of mind which we may call *reflective equilibrium*.

Legal theorists have often appealed to the idea that a lawyer's work needs to be inspired by coherence, though rarely making this idea sufficiently precise. One step in this direction is provided by Alexy and Peczenik (1990) who affirm that the coherence of a theory is to be judged according to a number of standards, besides logical consistency: the number of its supported statements, the length of its supportive chains, the number of its general statements, the number of cases and fields of life it covers, and so on (see also Peczenik 1996, 160).[2]

[2] A further development of the idea of coherence, including a formal analysis, is provided by Hage (2000b). The characterisation of the notion of legal coherence also depends on how the legal

In Chapter 28 we shall come back to the idea of coherence, and consider some significant aspects of it.[3]

4.2. Reflexive Reasoning and Universality

Let us conclude our basic analysis of rationality by casting a superficial glance at some deep philosophical issues.

4.2.1. Planar and Reflexive Reasoning

We may distinguish two types of reasoners: *planar* reasoners and *reflexive* reasoners.

Planar reasoners lack the ability to observe themselves: They move from one mental state to another mental state, without being aware that this is happening.

Reflexive reasoners, on the contrary, are capable of observing themselves, of having mental states about their mental states. First of all reflexivity consists in one's capacity of being aware of one's own mental states, according to the reasoning schema *introspection*.

> **Reasoning schema**: *Introspection (self-awareness)*
> (1) having mental state M
> ——— IS A CONCLUSIVE REASON FOR
> (2) believing to have mental state M

Note that inferences from mental states to beliefs about them need to take place only when introspective beliefs are useful to the reasoner, since otherwise one's head will soon be cluttered with useless meta-beliefs (and meta-meta-beliefs, and so on).[4]

system is characterised (on the notion of a legal system, see Losano 2002), for instance on whether one also includes in it social values and attitudes and on whether one also considers the social effects of the practice of legal rules. We believe, however, that our cognitive perspective, which requires us to include in our coherence evaluation all contents that are relevant for approaching legal issues, can provide an adequate framework.

[3] For a broader discussion of coherence, which links legal science and epistemology, we need to refer the reader to Peczenik, Volume 4 of this Treatise, chap. 5. For two recent accounts of the notion of coherence, see Thagard 2001 and Haack, forthcoming.

[4] This distinguishes our reasoning schema *introspection* from the ideas of *positive* and *negative introspection*, as they are usually introduced in epistemic logic, that is, from the idea that agents are aware of what they believe (when one believes A, then one also believes to believe A) and of what they do not believe (when an agent does not believe A then the agent also believes not to believe A). Similarly, introspective practical reasoners are assumed to be aware of what they intend (when one intends to do A, then one also believes that one intends to do A) or desire. On introspection see Konolige 1986, chap. 5, and with regard to intentions, Rao and Georgeff 1991.

Reflexive agents, besides having beliefs about their mental states, may come to have conative states about their mental states (one may like, desire, intend, want to have certain mental states).

Finally, reflexive agents may also have the capacity of observing the properties of their mental processes (one may try to establish how quick, reliable, fatiguing one's cognitive activities are). In particular, reflexive agents can monitor their reasoning processes, and correct those processes when they depart from rationality.

Pollock and Cruz (1999) observe that rationality, in this regard, is similar to linguistic competence, as described by Chomsky (1965, 3ff.). Possessing a competence means to experience a form of normativity. An agent endowed with a competence possesses and applies a know-how, a kind of procedural knowledge: One tends to follow certain schemata—which Pollock and Cruz (1999) call *epistemic norms*—and, though one is not aware of the very schemata one follows, one can recognise when one has failed to apply them.

Consider linguistic competence: When one is proficient in a language, one (usually) applies the patterns characterising that language, though occasionally failing to do so. In addition, one can recognise that one is making a mistake, even when one has no explicit knowledge of the grammar of one's language. Remember that according to Chomsky the way language works is fully defined by our inborn linguistic competence, and learning a particular language only consists in providing our language organ with the parameters proper to that particular language (see Section 1.2.1 on page 8).

Correspondingly, we may assume that our basic epistemic know-how (our basic reasoning schemata) forms part of the natural endowment of human beings (of our natural reason), and in this sense it is universal and inborn. However, this know-how just is our starting point: One may come to adopt further ways of processing information, as a consequence of training or of culture, or of choices which one has made according to one's aims and needs. One then views also those acquired ways of reasoning as appropriate, and one learns to apply them also in one's reasoning (they become part of one's know-how, or reasoning competence).

4.2.2. Reasoning and Meta-Reasoning

So far, we have considered *planar reasoning*, that is, the unreflective functioning of rationality, its spontaneous way of approaching the issues that it needs to address, according to the know-how of the reasoner (see Section 4.2.1 on the preceding page).

However, as we can monitor and govern our locutions (though linguistic performance is usually spontaneous), so we can also monitor and govern our own reasoning. This is rationally done through *reasoning about reasoning*, that is, through *meta-reasoning*. Meta-reasoning has a theoretical side (becoming

aware of how we are reasoning), but also has a practical side (deciding how we shall reason).

We have seen some examples of meta-reasoning in Section 3.1.6 on page 96 when we considered cognitive instructions, namely, instructions requiring an agent to adopt certain mental states under certain conditions.

However, practical meta-reasoning can take a more general shape, as when one decides to adopt certain reasoning schemata rather than certain others, or to focus on certain sub-reasons while disregarding certain others. From this perspective the cognitive instructions can be viewed as a subtype of a more general class of instructions that prescribe a certain cognitive (mental) behaviour.

Meta-reasoning raises various difficult issues. The first deals with the interaction between the natural ways of reasoning—which represent our original endowment, and that we apply "automatically," without any special deliberation about them—and the ways of reasoning that one consciously decides to adopt. The adoption of new ways of reasoning must be the result of a choice that one performs on the basis of one's original reasoning: In this sense, new reasoning ways are dependent upon one's natural reasoning. However, there can also be a conflict, since this choice may lead one to outcomes that are different from the outcomes that one would have achieved by using one's original ways of processing information.

A bridge between meta-reasoning and planar reasoning may be provided, in the practical domain, by a general undercutter, which we call *meta-undercut*. It concerns how a meta-level practical conclusion, and specifically one's intention to reject an inference, leads to undercutting the latter inference:

Defeating schema: *Meta-undercut*
(1) intending to reject reasoning instance R
——— IS A UNDERCUTTING DEFEATER AGAINST
(2) reasoning instance R

Thus, when I have made up my mind (formed the intention) that I should not accept the outcomes of reasoning instance R, I shall view R as being undercut. Note that by the intention to reject a reasoning instance, we mean neither the intention not to perform it, nor the belief that it is unreliable: We rather mean the practical attitude of refusing to view the conclusion of that reasoning instance as being supported by its reason. Note also that this intention can be doxified, so that one's intention to reject reasoning instance R can be accompanied by one's belief that this reasoning instance should be rejected.

Assume, for example, that I am convinced that I should not rely on wishful thinking, and that I have formed indeed the intention not to accept any instance of such way of thinking. Assume also that I come to believe, while still half asleep in my bed, that the train will be half an hour late this morning. However, I am aware that I could only obtain such belief through wishful thinking: I moved from desiring that the train be late (so that I do not have to get up now), to

believing that the train is indeed late. This should lead me to intend to reject this inference, an intention that will undercut it, and thus prevent me from endorsing its conclusion.

Here is the corresponding reasoning instance:

Reasoning instance: *Syllogism*

(1) intending to reject instances of wishful thinking; AND
(2) believing that reasoning instance ⌈I desire that the train is late, therefore I believe that it is late⌉ is an instance of wishful thinking

——— IS A REASON FOR

(3) intending to reject reasoning instance ⌈I desire that the train is late, therefore I believe that it is so⌉

The conclusion of this piece of reasoning is a premise of the following instance of schema *meta-undercut*, which undercuts the instance of wishful thinking.

Defeating instance: *Meta-undercut*

(1) intending to reject reasoning instance ⌈I desire that the train is late, therefore I believe that it is so ⌉

——— IS AN UNDERCUTTING DEFEATER AGAINST

(2) reasoning instance ⌈I desire that the train is late, therefore to believe that it is so⌉

A doxified version of the schema *meta-undercut* can be obtained by substituting the intention to reject with the belief that one ought to reject:

Defeating schema: *Doxastic meta-undercut*

(1) believing that reasoning instance r ought to be rejected

——— IS A UNDERCUTTING DEFEATER AGAINST

(2) reasoning instance r

Wishful thinking can also have legal applications, both with regard to issues of fact and issues of law. Consider for instance how a judge may be induced to believe that an accused person did not commit the crime of which she is accused, by the fact the judge would like that she had not committed the crime so that he could acquit her without violating the law (assume that the judge has a personal sympathy for the accused, or has political reasons for preferring that she is not declared guilty).

Similarly, a judge may be induced to believe that a certain legal interpretation is legally correct, simply by the fact that he would prefer that this was the case (since this would correspond to his personal goals or political convictions).

4.2.3. Descriptive and Ideal Rationality

According to a *descriptive view of rationality*, one's rationality includes whatever reasoning schemata one applies in one's own reasoning processes. Correspondingly, from the perspective of a particular agent, a conclusion is rational if it has been reached adopting the reasoning standards of this agent, whatever they are.

A purely descriptive view of rationality is clearly inadequate, and would lead to absurd implications. Assume that one is reasoning according to wishful thinking: Whenever one desires something to be true, one comes to believe that it is true. According to a purely descriptive view of rationality, we would have to conclude that for such an agent it is rational to conclude that something is true whenever he or she would like it to be true.

A purely descriptive approach to rationality is untenable also because the reasoning schemata one is adopting are under the reflexive scrutiny of rationality: One (a rational agent) needs to abandon any of one's reasoning schemata, as soon as one ceases to view this schema as being an appropriate guide to one's reasoning (according to rationality itself). Thus, rationality is a self-correcting faculty, though it is fallibly so. For instance, as soon as one verifies that many conclusions one has derived through wishful thinking happen to be false, one's rationality will suggest abandoning this way of reasoning. Thus, it seems that rationality may be its own judge: Its verdicts are going to be applied by rationality itself, by revising the processes it certifies as being incorrect.

This leads us to a second view of rationality, a *normative* or *ideal* view: Rationality consists in applying methods that are appropriate (conducive to cognition), according to rationality itself. This may be called the *idea of reason*, or *ideal rationality*. Approaching ideal rationality is the task of reflexive reasoning, which monitors the reasoning of the agent, and adapts it to the requirements of rationality.

The notion of ideal rationality leads to an idea of *objectivity*: Standards of rationality are followed because of their correctness, certified by the agent's rationality, not because the reasoner adopting these standards has certain individual idiosyncrasies. As a matter of fact, the reasoning schemata that constitute an agent's rationality do not condition the acquisition of a new mental state to the identity of the agent, but only to the agent's cognitive states: They equally apply to any other agents having the same cognitive states. So ideal rationality includes a pull toward *universality*, which depends both on the universality of the basic ingredient of rationality, namely, natural reason, and on rationality's capacity of critically revising itself according to standards it views as being correct.

4.2.4. Particularised and Universal Rationality

This pull toward universality contrasts with the fact that on the basis of different experiences, and of the different cognitive states that result from having had

such experiences (or on the basis of different psychological constitutions) different agents may have come to adopt different reasoning patterns, and these patterns may lead them to different reflexive judgements concerning the very reasoning patterns they are using.

Assume, for instance, that I adopt reasoning patterns $\{s_1, s_2\}$, while you adopt $\{s_3, s_4\}$. Assume also that patterns $\{s_1, s_2\}$ support one another, and the same for patterns $\{s_3, s_4\}$. Under these conditions, reflexivity does not lead us to converge: It pushes me towards sticking to $\{s_1, s_2\}$ and it pushes you towards sticking to $\{s_3, s_4\}$: What is rational to different people (including the very reasoning patterns they use) is relative to the reasoning patterns they start with.

This situation is logically possible, but fortunately not likely to happen. At least with regard to the differences that may emerge between humans, natural (innate) reason seems powerful enough to adjudicate such conflicts, by establishing what ways of reasoning are right and what ways are wrong, or by accepting that different ways of reasoning are appropriate to the different circumstances in which the different reasoning agents are using their cognitive competence.

Our sharing the fundamental schemata of rational thinking does not imply that everyone is equally good at cognising. Cognitive performance varies dramatically in different individuals. However, as Pollock and Cruz (1999, 156) observe, there is empirical evidence that, insofar as people make cognitive mistakes, they can generally be brought to recognise these mistakes. This suggests that their underlying procedural knowledge (the basic constitution of their rationality) is the same.

We may certainly wonder to what extent an alien intelligence (as may be found on other planets) or an artificial intelligence (which has gone through an autonomous evolutionary process, as in genetic computing) may correspond to human rationality but, with regard to the latter, we may agree with the following statement by Rescher (1990, 3):

> Rationality has two distinguishable, although inseparable aspects: the one personal, private, and particular; the other impersonal, public and universal. The private (particularised) aspect turns of what it is advisable *for the agent*, duly considering his or her personal situation and circumstances—the agent's idiosyncratic information, experience, opportunities, capabilities, talents, objectives, aspirations, needs and wants. [...] The universal aspect of rationality turns in its being advisable by standards that are person indifferent and objectively cogent for *anyone in those circumstances* to proceed in a "rationally appropriate" way in the matters at issue. The standards of rationality are unrestricted an general, in the sense that what is rational for one person will also be rational for anyone else who is in the same condition.

Thus, we may conclude by affirming our faith in the *objectivity* of rationality.

This does not imply that rational reasoners will always come to the same conclusions, nor even that they will always adopt the same reasoning schemata.

What conclusions one rationally achieves (also concerning what reasoning schemata one should use) depends on what cognitive inputs one receives (first of all through perception, but also through other forms of implicit cognition) and on the particular role or perspective one is adopting. Individual rationality is a limited and fallible cognitive faculty, operating along with other cognitive faculties.

However, one's individual rationality, being bootstrapped by our shared natural reasoning competence, and reflexively monitoring itself and the working of other cognitive faculties, may still lead one towards universality and objectivity.

4.2.5. Limits of Rationality

The objectivity of rationality is a problematic idea since rationality appears to be characterised by an intrinsic duplicity. On the one hand, rationality processes the inputs it happens to find in the reasoner's mind, according to the schemata that happen to be endorsed by that reasoner at the time when reasoning takes place. On the other hand rationality itself may be applied to validating these inputs and reasoning schemata. However, such validation has to be performed on the basis of whatever criteria are adopted by the reasoner at the validation time.

Thus, it is no wonder that different authors appreciate in different ways the chances of success of the pull towards universality and objectivity we just considered. Simon (1983, 5) provides a very clear and strict statement as to the limits of reason:

> Reasoning processes take symbolic inputs and deliver symbolic outputs. The initial inputs are axioms, themselves not derived by logic but simply induced from empirical observations, or even more simply posited. Moreover, the processes that produce the transformation of inputs to outputs (rules of inference) are also introduced by *fiat* and are not the products of reason. Axioms and inference rules together constitute the fulcrum on which the lever of reasoning rests, but the particular structure of that fulcrum cannot be justified by the methods of reasoning. This ineradicable element of arbitrariness—this Original Sin that corrupts the reasoning process and therefore also its products—has two important consequences. [...] First it puts forever beyond reach an unassailable principle of induction [...]. Second, the principle of "no conclusion without premises."

This second principle is so described by the same author:

> Reason [...] goes to work only after it has been supplied with a suitable set of inputs, or premises. If reason is to be applied to discovering and choosing courses of action, then those inputs include, at the least, a set of *should*'s, or values to be achieved, and a set of *is*'s, or facts about the world in which the action is to be taken. Any attempt to justify these *should*'s and *is*'s by logic will simply lead to a regress to new *should*'s and *is*'s that are similarly postulated. (Simon 1983, 5)

Simon's observations are so compelling that one may wonder how faith in reason may survive such severe limitations. Our idea is that the limitation of reason's with regard to *is*'s can possibly be overcome by expanding the appeal to reason

into an appeal to cognition, including, beside reasoning, also perception and more generally what we have called implicit cognition: The combination of implicit cognition and reasoning (there included coherence evaluation and heuresis) may be assumed to lead optimal cognisers to convergent outcomes. This is likely to happen when cognisers share the same perceptive functions (or at least when they are able to figure out why their perceptive apparatuses respond to the same stimuli with different outcomes), and they are able to communicate and appreciate the results of their heuresis.

With regard to *should*'s the situation is more difficult, and scepticism has a long tradition, which finds its most authoritative statement in David Hume's assertion that "reason is and ought only to be the slave of passions, and can never pretend to any other office than to serve and obey them" (Hume 1978, 415, vol. 2, sec. 3.3).

Recently the issue has been tackled by Nozick (1993, 139ff.), who identifies 16 rationality conditions concerning preferences and goals. These conditions do not only include the usual rationality constraints on preferences, such as transitivity (If I like x more than y and I like y more than z, then I should like x more than z). They also include the conative attitudes that promote and facilitate the use of rationality: preference for satisfying rationality, desire for the means to achieve it, preference for being able to exercise rationality, and so forth.

Nozick assumes that also these conative attitudes are intrinsic to rationality: Rationality itself requires and motivates the realisation of the pre-conditions for its fullest exercise, that is, it includes what Peczenik (1997) calls the "passion for reason."

Another interesting perspective consists in updating the old project of moral intuitionism (Ross 1930; 1939) and in assuming that the results which are provided by our inborn non-inferential cognitive competence—at least when they can stand the challenge of rationalisation—may be viewed as properly justified elements of practical knowledge. This seems to be the thesis that is developed by Audi (1999, 282), who views intuition as a non-inferential cognitive capacity, which can provide us with appropriate cognitive responses. Similar to this idea is the hypothesis that humans have an inborn moral competence, similar to their linguistic competence, an idea developed by Mahlmann (Volume 2 of this Treatise, sec. 3.2.1.3).

We believe that intuition—to which we may also refer, in the normative domain, by using the more solemn word *conscience*—has indeed a fundamental role to play also in legal cognition.[5]

Some German authors—in particular Philip Heck, one of the leading repre-

[5] See for instance, with reference to constitutional issues, Bobbitt 1991, 183–6. The notion of *legal conscience* (*Rechtsbewußtsein* or *Rechtsgewissen*) was used by some German jurists, like Jung and M. Rümelin, in the first decades of the 19th century (for some references, see Lombardi Vallauri 1967, 342–3).

sentatives of the so-called jurisprudence of interests (*Interessenjurisprudenz*)—have referred to legal intuition by using the term *Rechtsgefühl* (which we may translate as *legal feeling* or also as *sense of rightness*)[6] , but have understood this notion in a way which is fully compatible with legal rationality, and even provides an integration of it. While viewing *Rechtsgefühl* as an independent important aspect or organ of legal cognition, Heck connects it to reasoning and subjects it to the control of rationalisation:

> [The] *Rechtsgefühl* can provide the very decision of the case, but also major premises and value judgements that then lead to the decision of the case by way of the normative reflection. [...] This intuitive acquisition of legal results (*intuitive Rechtsgewinnung*) is based upon the unaware combination of all pieces of knowledge and all experiences, not only with regard to the content of the laws, but also with regard to the extension, the direction and the meaning of the concerned life-interests. [...] The certainty of the appropriateness [of the *Rechtsgefühl*] depends upon the presence of these pre-conditions. Also the intuitive legal feeling can make mistakes and under the influence of reflection be recognised as misleading, so that it disappears completely. (Heck 1968b, sec. 16.3; my translation)

Here we shall not consider to what extent the approaches we have just mentioned can take us beyond the idea that rational agents use reasoning to adapt the world to their likings, whatever such likings are, as Pollock (1995) seems to assume.[7] By now we may content ourselves with the conclusion that the idea of optimal cognition enables us to assert that certain conative states are *cognitively optimal*, and therefore to assert (if we wish to do so) that corresponding normative states of affairs exist.

As we observed above, the cognitive optimality of those conative states—and therefore the existence of corresponding normative states of affairs—may be relative to certain basic mental attitudes of the cognising agent, including preferences between fundamental values (Peczenik 1989, 47ff.). Such a relativisation may concern social roles, audiences (Aarnio 1987, 221ff.), ideologies, individual idiosyncrasies. However, at least within one of such relativised perspectives, it seems possible to reach, through practical cognition, outcomes one may consider to deserve acceptance, and therefore (if one wishes to project one's practical conclusions into a normative reality) to be constitutive of normative states of affairs (on relativising normative judgements, see in particular Wróblewski 1992).

[6] Since the German word *Recht* means both "law" and "correct" (see Pattaro, Volume 1 of this Treatise, sec. 1.3).

[7] For an attempt to capture the impartiality of morality from this perspective, see Pollock 1986.

4.3. An Example in Practical Reasoning

It is now time that we try to provide the reader with an example in normative reasoning, which may illustrate the reasoning schemata we have so far described. We shall approach a very classical paradigm, the story of Antigone, a mythological tale that in the mid fifth century B.C. became the subject matter of the homonymous tragedy by Sophocles, an undisputed masterpiece of world literature (on Antigone and the law, see Rottleuthner, Volume 2 of this Treatise, sec. 3.1.).

The prologue to the tragedy is provided by the fight for the kingdom of Thebes between two twin sons of the unlucky king Oedipus, Polynices and Eteocles. Polynices, who had been expelled from Thebes by Eteocles returns with an army to conquer the city. In front of the walls of Thebes the two brothers kill each other in a duel.

After the duel, the attackers are defeated and Creon, the maternal uncle of the brothers, becomes the new king. Creon forbids upon the death penalty that Polynices be buried (and so, according to the religious beliefs of the Greeks, prevents him from finding repose in the after life).

Antigone, a sister of the two dead brothers, violates Creon's command by burying Polynices's body, and is therefore put to death.

4.3.1. Creon's Reasoning

Let us first consider Creon's reasoning, which he expresses with the following words (Sophocles, *Antigone*, 131):

As God above is my witness, who sees all,
when I see any danger threatening my people,
whatever it may be, I shall declare it.
No man who is his country's enemy,
Shall call himself my friend. Of this I am sure –
Our country is our life; only when she
Rides safely, have we any friends at all.
Such is my policy for our common weal.
In pursuance of this, I have made a proclamation

[. . .] Polynices,
Who came back from exile intending to burn and destroy
His fatherland and the gods of his fatherland,
To drink the blood of his kin, to make them slaves –
He is to have no grave, no burial,
No mourning from anyone: It is forbidden.
He is to be left unburied, left to be eaten
by dogs and vultures, a horror for all to see.

We can recast (quite roughly) Creon's reasoning as a sequence of inference steps according to the reasoning schemata we described above.

(1) believing that the safety of Thebes is a valuable goal;
(2) believing that punishing (treating as my enemies) the enemies of Thebes is a sufficiently good way of contributing to that goal

---

(3) believing that I ought to punish the enemies of Thebes

Table 4.1: *Creon's inference: Creon ought to punish the enemies of Thebes*

(1) believing that Polynices tried to destroy Thebes;
(2) believing that if one tries to destroy Thebes, then one is an enemy of Thebes

---

(3) believing that Polynices is an enemy of Thebes

Table 4.2: *Creon's inference: Polynices is an enemy of Thebes*

The first one is a doxified instance of schema *teleological inference*, whose value-premise is provided by the belief that the safety of Thebes is a valuable goal,[8] and whose conclusion is the obligation to punish the enemies of Thebes (see Table 4.1).[9]

The second inference by Creon consists in applying schema *syllogism*: given that Polynices tried to destroy Thebes, he concludes Polynices is an enemy of Thebes (see Table 4.2).

The conclusion of the latter inference provides Creon with the minor premises of a *normative syllogism*, and enables his to conclude that he ought to punish Polynices (see Table 4.3 on the next page).

To fulfil the obligation to punish Polynices, Creon adopts this as a goal (as an instrumental value) and then finds a way to achieve this goal, that is, to ensure that Polynices remains unburied (see Table 4.4 on the following page). This can be viewed as an instance of schema *teleological inference*, and in particular an instance of subplanning (expressed in a doxified form).

Fulfilling this obligation (implementing this intention) requires a further step into sub-planning (teleological reasoning). Creon adopts the instrumental goal

[8] By a *valuable goal*, we mean a goal that should be adopted (that is adoption-worthy), namely, an intrinsic or instrumental value.

[9] Note that we are adopting the doxified perspective. We could as well perform our inferences in their direct form, reasoning on the basis of conative states (rather than on corresponding beliefs). In such a case the inference in Table 4.1 would be recast as follows: (1) having the goal to ensure the safety of Thebes and (2) believing that punishing the enemies of Thebes is a sufficiently good way of realising this goal, is a reason for (3) intending to punish the enemies of Thebes.

(1) believing that I ought to punish the enemies of Thebes;
(2) believing that Polynices is an enemy of Thebes

---

(3) believing that I ought to punish Polynices

Table 4.3: *Creon's inference: Creon ought to punish Polynices*

(1) believing that ⌈punishing Polynices⌉ is a valuable goal;
(2) believing that ⌈ensuring that Polynices remains unburied is a sufficiently good way for punishing him⌉

---

(3) believing that ⌈I ought to ensure that Polynices remain unburied⌉

Table 4.4: *Creon's inference: Creon ought to ensure that Polynices remains unburied*

(1) believing ⌈ensuring that Polynices remains unburied⌉ is a valuable goal;
(2) believing that ⌈my ordering that nobody ought to bury Polynices is a sufficiently good way to ensure that he remains unburied⌉

---

(3) believing that ⌈I ought to order that nobody ought to bury Polynices⌉

Table 4.5: *Creon's inference: Creon ought to order that nobody ought to bury Polynices*

of ensuring that Polynices remain unburied, and to device a way (a plan) for achieving this goal. This leads Creon to conclude that he should order that nobody shall bury Polynices (see Table 4.5).

From the conclusion of the inference in Table 4.5, according to schema *dedoxification*, Creon infers his intention of issuing that order (see Table 4.6 on the next page).

This concludes a first phase of Creon's reasoning (we assume that issuing this order does not require further subplanning). Note that he may have performed these reasoning steps backwards, in order to rationalise a pre-existing intuitive intention to issue such order, or he may have come through reasoning to this result.

(1) believing that ⌈I ought to order that nobody ought to bury Polynices⌉

---

(2) intending that ⌈I shall order that nobody ought to bury Polynices⌉

Table 4.6: *Creon's inference: Creon shall order that nobody ought to bury Polynices*

(1) believing that ⌈Creon has issued the order that nobody ought to bury Polynices⌉;
(2) believing that ⌈if Creon issues an order then its content is binding⌉

---

(3) believing that ⌈the proposition ⌈nobody ought to bury Polynices⌉ is binding⌉

Table 4.7: *Creon's inference: the order not to bury Polynices is binding*

(1) believing that the proposition ⌈nobody ought to bury Polynices⌉ is binding

---

(2) believing that ⌈nobody ought to bury Polynices⌉

Table 4.8: *Creon's inference: nobody ought to bury Polynices*

At this stage Creon acts according to his intention: He issues the order.

The fact the he has issued the order changes the cognitive context in which Creon and his fellows are acting. Now Creon (as his soldiers and his fellow Thebans in general) can infer, according to *syllogism*, that what Creon has ordered is binding (see Table 4.7). This allows his to conclude, according to *dedoxification*, that nobody ought to bury Polynices (see Table 4.7). The type of reasoning we have just described also applies to Creon's decision to punish with "stoning before all the folk" those who disobey his order, as we learn from Antigone's words. The starting point consists in applying schema *teleological inference*: given the importance of implementing his order, Creon concludes that he ought to ensure that the violators are punished with stoning (see Table 4.9 on the following page).

A further teleological inference leads Creon to the intention to establish the sanction (stoning the violators) by ordering it (see Table 4.10 on the next page).

(1) believing that ⌈ensuring that my order not to bury Polynices is implemented⌉ is a valuable goal;
(2) believing that ⌈punishing with stoning those who disobey my order is a satisfactory way for ensuring the implementation of my order⌉

---

(3) believing that ⌈I ought to ensure that those who disobey my order not to bury Polynices are punished with stoning⌉

Table 4.9: *Creon's inference: Creon ought to ensure that violators are punished with stoning*

(1) believing that ⌈ensuring that those who disobey my order not to bury Polynices are punished with stoning⌉ is a valuable goal;
(2) believing that ⌈ordering such punishment is a sufficiently good way to ensure that it is carried out⌉

---

(3) believing that ⌈I ought to order that those who disobey my order not to bury Polynices are punished with stoning⌉

Table 4.10: *Creon's inference: Creon ought to order the punishment*

Once Creon has issued the order concerning the sanction, his soldiers (and Creon himself) can apply schemata *normative syllogism* and then *de-doxification*, to conclude that those who bury Polynices ought to be stoned (see Table 4.11 on the facing page).

Creon later provides, when talking to his son Haemon, a rationalisation of his goal that his order not to bury Polynices is implemented. This goal follows from a higher goal he has. This is the goal of ensuring obedience (Sophocles, *Antigone*, 144):

He whom the State appoints must be obeyed
To the smallest matters, be it right or wrong
And he that rules his household without a doubt
Will make the wisest king or, for that matter,
The staunchest subject. [...]
There is no more deadly peril then disobedience;
States are devoured by it, homes laid in ruins,
Armies defeated, victory turned to rout.
While simple obedience saves the life of hundreds
Of honest folk. Therefore I hold to the law
And will never betray it —least of all for a woman.

(1) Creon has stated that ⌈those who bury Polynices ought to be stoned⌉;
(2) if Creon issues a statement then its content is binding

---

(3) the proposition that ⌈those who bury Polynices ought to be stoned⌉ is binding

---

(4) those who bury Polynices ought to be stoned

Table 4.11: *Creon's inference: those who bury Polynices ought to be stoned*

(1) believing that ⌈saving the city of Thebes from ruin⌉ is a valuable goal;
(2) believing that ⌈ensuring obedience to the orders of ruler of Thebes is a satisfactory way to contribute to saving that city⌉

---

(3) believing that ⌈I ought to ensure obedience to the orders of the ruler of Thebes⌉

Table 4.12: *Creon's inference: Creon ought to ensure obedience to the orders of the ruler of Thebes*

With a further abuse of Sophocles's poetry, we may recast Creon's reasoning as a combination of schemata *teleological inference* and *syllogism*. First *teleological inference* leads Creon to conclude that he ought to ensure that the orders of the rulers of Thebes are obeyed (see Table 4.12).

Then, according to *syllogism*, the premises that he is indeed a ruler of Thebes and that he has ordered that nobody ought to bury Polynices lead Creon to conclude that he ought to ensure the implementation of this specific order (see Table 4.13 on the following page).

4.3.2. Antigone's Reasoning

Let us now move to Antigone's reasoning. Let us reconstruct it from the following reply she gives to Creon (Sophocles, *Antigone*, 138):

That order did not come from God. Justice,
That dwells with the gods below knows no such law.
I did not think your edict strong enough
To overrule the unwritten unalterable laws

(1) believing that I am the ruler of Thebes;
(2) believing that I have ordered that ⌈nobody ought to bury Polynices⌉;
(3) believing I ought to ensure obedience to the orders of the ruler of Thebes

---

(4) believing that I ought to ensure obedience to the order that ⌈nobody ought to bury Polynices⌉

Table 4.13: *Creon's inference: Creon ought to ensure obedience to the order not to bury Polynices*

(1) believing that ⌈propositions stated by the gods are binding⌉;
(2) believing that ⌈the gods have stated that ⌈every one ought to bury one's own relatives⌉⌉

---

(3) believing that ⌈the proposition that ⌈every one ought to bury one's own relatives⌉ is binding⌉

---

(4) believing that ⌈every one ought to bury one's own relatives⌉

Table 4.14: *Antigone's inference: we ought to bury our relatives*

Of God and heaven, you being only a man.
They are not of yesterday or to-day but everlasting,
Though where they came from, none of us can tell.

With further violence to Sophocles, we shall rephrase Antigone's reasoning through a sequence of syllogisms. The first of them is followed by a dedoxification step, as you can see in Table 4.14. After concluding for that one ought to bury one's relatives, Antigone adopts, through one further syllogism, her fatal determination: she ought indeed to bury her brother Polynices (see Table 4.15 on the facing page).

However, Antigone also believes that she Creon's orders are binding, which would lead here to the opposed conclusion (see Table 4.16 on the next page).

4.3.3. Comparison of the Two Reasonings

Thus Antigone has to face a (tragic indeed) contradiction: One inference concludes that she ought to bury Polynices, the other, that she ought not to do that.

(1) every one ought to bury one's own relatives;
(2) Polynices is my relative

---

(3) I ought to bury Polynices

Table 4.15: *Antigone's inference: Antigone ought to bury Polynices*

(1) Creon has issued the order that ⌈nobody ought to bury Polynices⌉;
(2) if Creon issues an order then its content is binding

---

(3) the proposition ⌈nobody ought to bury Polynices⌉ is binding

---

(4) nobody ought to bury Polynices

---

(5) I ought not to bury Polynices

Table 4.16: *Antigone's inference: Antigone ought not to bury Polynices*

What is Antigone to do?

To get out of her predicament, she needs to compare the reasons leading her to conflicting conclusions.[10]

First, through schema *meta-syllogism* she infers that the rule that obliges people to bury their relatives is stronger then the prohibition to do so. This result leads her to conclude that she has an outweighing reason supporting her obligation to bury her brother (see Table 4.17 on the following page). According to this preference, as we shall see more precisely in Chapter 26, Antigone endorses the argument leading her to conclude that she ought to bury Polynices, which leads her to behave correspondingly.

On the other hand, Creon does not take seriously this conflict until it is too late. When he decides to follow the advice of Teiresias, the soothsayer, and free Antigone, she will already be dead. This will cause further losses, since Creon's son and wife will kill themselves.

We shall not consider further the tragic problems of Creon and Thebes, but we hope that this example may show how our approach covers significant aspects of practical and normative reasoning.

[10] We shall extensively consider preference-based reasoning in Chapter 7. Here we shall only provide an exemplification, without analysing it.

(1) rules stated by the Gods are stronger then those stated by a state-rulers;
(2) the rule ⌈people ought to bury their relatives⌉ was stated by the Gods, while the rule ⌈people ought not to bury their relatives⌉ was stated by a state-ruler

---

(3) the rule ⌈people ought to bury their relatives⌉ is stronger than the rule ⌈citizens ought not to bury their relatives⌉

---

(4) reason: ⌈Antigone is Polynices's relative; people ought to bury their relatives⌉ for ⌈Antigone ought to bury Polynices⌉
outweighs
reason: ⌈nobody ought to bury Polynices⌉ for ⌈Antigone ought not to bury Polynices⌉

Table 4.17: *Antigone's inference: the reason for burying Polynices outweighs the reason for not doing that*

Chapter 5

BOUNDED RATIONALITY: COGNITIVE DELEGATION

Our idea that normative states of affairs supervene upon optimal (though possibly relativised) practical cognition needs to stand a further challenge. This is provided by the idea of *bounded rationality*, namely, the idea that human rationality is a limited faculty, for which optimal cognition is often out of reach.

Therefore, rather than considering what one would think and do if one could get perfect cognition, we should focus on how one can use well-enough one's own bounded cognitive resources.

The idea of bounded rationality has found many important applications in a number of different domains, from economics, to politics, to computing. Here, in Chapters 5 and 6, we shall focus on its application to aspects of cognition that are especially important for the law.

In this chapter, after introducing the notion of bounded rationality, we shall explore the limitations of rational teleological reasoning, and we shall discuss whether and to what extent these limitations can be overcome by delegating teleological reasoning to others, and in particular, by relying on the judgement of authorities.

5.1. The Notion of Bounded Rationality

For characterising the idea of bounded rationality, we will refer to the fundamental contribution by Herbert Simon, who deserved the Nobel Prize in economics for his elaboration of this idea (Simon 1979), but also used it to provide ground-breaking contributions to political science and artificial intelligence.[1]

Simon developed a model of human reason as a limited and fallible competence, and consequently investigated how individuals and institutions can use such competence appropriately, providing it with attainable tasks, favourable contexts and practicable methods.

[1] For an informal introduction to the many ideas developed by Simon, we refer the reader to his autobiography (Simon 1996).

5.1.1. The Limitations of Human Rationality

Simon's starting point is that human rationality has restricted powers, when compared to the magnitude of the problems which humans have to face:

> The capacity of the human mind for formulating and solving complex problems is very small compared with the size of the problems whose solution is required for objectively rational behaviour in the real world or even for a practicable approximation to such objective rationality. (Simon 1957, 198)

The limitations of the human mind (in memory, attention, perception, reasoning, etc.) have two connected implications: the impossibility of examining all options and the impossibility of considering all information.

The first implication concerns practical reasoning. Optimal practical rationality (by which Simon means *maximisation*, namely, the choice of the plan that maximises the satisfaction of the objectives of the decision maker) is usually out of reach. Rather than aiming at optimality, that is, at making the best choice among all possible alternative plans, one (rational realistic decision-maker) should aim at *satisficing*, as Simon says, that is, at finding "a course of action that is satisfactory" or "good enough" (Simon 1965, xxv), and stop one's inquiries when one has got to that point.

> We cannot within practicable computational limits generate all the admissible alternatives and compare their respective merits. Nor can we recognize the best alternative, even if we are fortunate enough to generate it early, until we have seen all of them. We satisfice by looking for alternatives in such a way that we can generally find an acceptable one after only moderate search. (Simon 1981, 139)

The second implication concerns theoretical reasoning (when functional to practical choices). Also in theoretical reasoning, bounded rationality should not aim at complete cognition. One should "recognize that the world as he perceives it is a drastically simplified model of the buzzing, blooming, confusion that constitutes the real world." One should therefore aim at building a "simplified picture of the situation that takes into account just a few of the factors that he regards as most relevant and crucial" (ibid.).

A further implication of bounded rationality is the role that *institutions* play in providing us a context where a useful deployment of rationality is possible. Institutional arrangements, by limiting uncertainty (reducing complexity), enable us to use our limited cognitive faculties:

> Our institutional environment, like our natural environment, surrounds us with a reliable and perceivable schema of events. [...] The stabilities and predictabilities of our environment, social and natural, allow us to cope with it within the limits set by our knowledge and our computational capacities. (Simon 1983, 78–9)

Consider, for example, how we would approach a world where we would not have the expectation that shops will be open, that traffic will be regulated, that debts will be paid, and so on.[2]

On the other hand, institutions need to be arranged in such a way as to promote the effective use of bounded rationality. Among the institutional arrangements that enable the use of limited rationality, Simon mentions the following:

- organisations, where individuals can specialise in specific tasks and take routine decisions competently,
- markets, which synthesise through prices all information concerning production costs,
- adversarial settings, such as legal proceedings, where each party, by only focusing on its own interest and point of view, and only providing the information which advances its interest and expresses its views, contributes to producing a pool of information which tends to reflect all interests and views.

5.1.2. Substantive and Procedural Rationality

The idea of making the best use of the limited capacities of the human mind contributes to explaining many feature of legal decision-making: its adversarial nature, its restricted time-frame, the need to appeal to legal authorities, the procedural restrictions on usable information (for example, judges may be bounded to take into consideration only evidence that has been provided by the parties, in legally appropriate ways).

We shall here focus on how the idea of bounded rationality—the fact that humans are fallible and should be content with suboptimal choices—may impact on our view that normative states of affairs are constituted by optimal practical cognition.

This requires us to address a further distinction between forms of rationality, which also has much importance in the legal domain. This is the distinction between *substantive rationality* and *procedural rationality*. This distinction was originally introduced by Simon (1976), and is expressed as follows by Rubinstein (1998, 21), citing the words of Simon:

> On the one hand substantive rationality refers to behaviour that "is appropriate to the achievement of given goals within the limits imposed by given conditions and constraints"; on the other hand "behaviour is procedurally rational when it is the outcome of appropriate deliberation."

We may also express this distinction by saying more generally that the substantive rationality of a cognitive state consists in the fact that it would result from

[2] The role of institutions in "reducing complexity" has been stressed in legal sociology, in particular, by Luhmann 1985.

optimal cognition, while its procedural rationality consists in the fact that it would result from a cognitive effort that is appropriate to the conditions of the cogniser.

Clearly the two ideas of rationality can lead us to different results: It may be that substantive rationality would require choice a, but that application of reason to information I have (including the information I could obtain through a reasonable cognitive effort) leads me instead to choice b. For instance, if I had all information concerning the stock market, I should buy stock a but, on the basis of the information I have, it is rational for me to buy stock b (I do not know, nor have any way of knowing, that there is an attempt to buy over company a, so that the price of its stock is going to rise).

Similarly, in a legal case the following situation may obtain: If the judge knew what really happened he would condemn the defendant, but given that the judge does not have sufficient information (the defendant succeeded in destroying all evidence), he must acquit the defendant.

Moreover, it may be rational that one does not even try to get further information, even when one knows that this would enable one to improve the substantive rationality of one's beliefs and decisions, since the cost of the inquiry is higher then the advantage one may obtain through a better decision. For example, assume all of the following:

- I want to fly to Barcelona;
- I believe that there exists a cheaper ticket for Barcelona than the ones I could find so far (I was told by a person whom I trust, but whom I am unable to contact today);
- I currently do not know how to get the cheaper ticket;
- I could find it out through an appropriate inquiry (just phone all travel agencies) which requires a lot of time and effort.

Under such conditions is may be rational for me not to make the costly inquiry, but rather buy the cheapest ticket among those I have already found, though I am aware that this choice is suboptimal.

Similarly, when deciding a minor legal case, it may be rational for a prosecutor or an administrator to stop inquiring when further search is only going to make little difference, which would not compensate the costs of the inquiry.

The distinction between procedural and substantive rationality is also relevant to the law. Consider for example how one may want to differentiate the procedural correctness of a judicial or administrative decision (including both the respect of procedural rules and the soundness of reasoning) and its substantive correctness: Procedural correctness does not ensure substantive correctness, whenever the decision-maker is unable to obtain sufficient information on some decisive aspect of the case. For instance, assume that though pollutants from j's factory caused k's cancer (and j was aware of this risk, on the basis of some secret research), scientific knowledge publicly available at the time of the

process does not allow to substantiate any connection between pollution and cancer: The procedurally correct decision consists in denying compensation to k, though this is substantially wrong.

Let us consider whether normative states of affairs are constituted by substantive or by procedural rationality. For instance, for the obligation to do A to exist, is it required that *optimal* (substantive) cognition would lead one to have the intention that A is done or is it sufficient that *bounded* (though procedurally correct) cognition leads one to intend that A is done? It seems that only unbounded substantive rationality can do the job. This is particularly clear when we consider the cognition of an observer, rather than the cognition of the author of the action. It does not make sense to assume that the normative qualification of an action depends on the knowledge state of a bounded observer, or on the particular procedure that the latter used.

For instance, assume that the correct exercise of her bounded cognitive resources enables Mary to conclude that the decorator who was working in her house badly damaged a painting (this is the conclusion she can obtain by processing all clues she could access, through a reasonable cognitive effort). This leads her to conclude then the decorator is under the duty of paying damages to her.

However, this is not the outcome that a perfect cogniser would have achieved: By looking into the past, or more modestly, by processing DNA traces left on the brush, such a cogniser would have concluded that the decorator did not damage the painting (this was done by a malicious neighbour of Mary, with whom she had a dispute, and which profited of the open door to take revenge).

It seems that we need to affirm, under such conditions, that the decorator has no obligation to pay damages to Mary, though she justifiedly believes that he does, and though also any judge (unless having super-human cognitive capacities) would come to the same conclusion. The decorator may become obliged after the wrong decision of the judge, but has no obligation before that decision is taken.

The idea that only cognitive optimality constitutes normative states of affairs is consistent with the fact that the law often gives normative relevance to suboptimal cognitive states. For instance, negligence may determine liability, irrationality of an administrative decision may lead to its annulment, one's ignorance of the effects of one's action may reduce or prevent one's criminal liability. However, this only means that to establish the appropriate normative qualification of an action, optimal cognition may needs to consider some suboptimal mental states of the agent: Also these mental states are among the circumstances to be taken into account, in order to establish what is normatively the case.

It is true that sometimes one's progress in knowledge impacts on one's knowledge state, and therefore produces a relevant change in the very situation to be evaluated. For example, assume that a civil servant, after an adequate inquiry, has made up his mind for a certain course of action, which appears satisfactory

according to the available information. Adopting that course of action under that knowledge state would be procedurally rational, and would not be legally challengeable. However, assume that the civil servant subsequently comes upon further information, which shows that there is a clearly better solution than the one he had envisaged. After obtaining the new information the civil servant is in a new knowledge state, in which it would be irrational (and legally challengeable) to accomplish what he rationally intended to do in his previous knowledge state. Also such considerations, however, do not impact on our idea that only optimal cognition constitutes normative states of affairs, once such cognition is allowed to refer to the agent's cognitive states: In our example there has been a change in the knowledge state of the civil servant (which is one of the circumstances to be considered), that explains why optimal cognition would judge differently his choice before and after having the obtained additional information.

The idea that optimal practical cognition constitutes normativity is also consistent with the fact that one needs to take into account past mistaken decisions. In fact, though substantive rationality requires me to ideally take into account every relevant circumstance, it cannot require me to undo past mistakes. For instance, assume that I have bought an expensive flight to Barcelona, wrongly believing that no cheaper flight was be available. After I have completed the purchase (getting a non refundable ticket), it becomes rational for me to take that flight (though this choice was irrational before buying that ticket). Similarly, optimal cognition may require a judge to act according to an enacted law or a precedent, even when the law should never have been enacted and the precedent should never have been decided that way.

Finally, Simon's idea of *satisficing* (rather than optimising) is included to some extent in our model of teleological reasoning. A rationally chosen plan (according to schema *teleology*) is not required to be optimal: It rather must be satisficing (good enough) and must appear as the best one only among the plans that the agent has so far considered.

5.2. Bounded Rationality and Teleology

The description of practical reasoning we provided in Section 1.3 on page 16 emphasises the role of teleology: The formation of intentions relies upon adopting plans in order to achieve goals. This emphasis duly reflects the importance of means-end analysis in practical reasoning, as providing the pivotal link between epistemic and practical reasoning: (1) practical reasoning provides epistemic reasoning with goals, (2) epistemic reasoning finds and evaluates plans, according to one's likings and beliefs, and (3) practical reasoning endorses the most satisfactory plans.

However, we should also give due consideration to the practicability of teleological reasoning: Teleological reasoning requires an enormous amount of

knowledge, which often is not available. This is required not only for approaching the tremendous problem of planning (constructing plans), but also for comparing and evaluating the constructed plans. The latter task is undoubtedly more tractable, but nevertheless seems to exceed human powers in many contexts.

Any boundedly-rational agent needs to find some ways to limit his or her commitment to teleological reasoning. Moreover, the outcomes of teleological reasoning of other agents are very unpredictable, since they strongly depend on the particular circumstances of the individual reasoner (on the information and experience which is available to him or her). When predictability and coordination are a primary requirement, teleological reasoning may need to be constrained.

In the following pages we shall first try to identify the limitations of teleological reasoning, and then we shall see how we can overcome these limitations, or at least live with them.

5.2.1. Failure to Achieve Teleological Optimality

As we observed above, plans of actions do not exist in nature, as perceivable objects: One must *construct* them. Constructing a plan requires that one anticipates the effects of possible actions, and combines them in such a way as to achieve one's goal. Since different plans can be obtained, one may need make a choice. Therefore, identifying the best plan involves two aspects:

1. constructing a set of candidate plans that includes the best one, and then
2. making the right choice among the constructed plans (choosing the best among them).

In both regards, optimisation is often out of reach for a bounded decision maker.

Firstly, we cannot consider all possible strategies for achieving certain objectives, and therefore we may fail to construct the best strategy, and consequently miss it. For example, when planning for a dinner in a foreign city, I may miss the restaurant that is better suited to my tastes, since I am not aware of its existence.

Similarly, consider how a legislature may fail to discover what solution would be most advantageous for achieving the highest economic growth (for example, cutting taxes too much may cause a recession and a huge deficit, rather than favouring economic development, as expected), or how judges or legal scholars may fail to discover optimal solutions to the problems they are considering (for example, making Internet providers liable for publishing illegal contents whenever they exercise some control over their sites, may lead them to omit any control, rather than to be more careful).

Secondly, even when we have constructed the best plan (together with other candidate plans), we may not be able to realise that it is the best one, and choose

an inferior option. Failure to rank the available options according to their merit may depend in particular on the following:

- we have very little knowledge of the factual consequences of many of our choices;
- we have very confused ideas about what values should inspire our evaluations, and about their relative importance, in various possible situations.

Simon (1965, 63) depicts as follows the latter limitation of human rationality:

> The fact that goals may be dependent for their force on other more distant ends leads to the arrangement of these goals in a hierarchy—each level to be considered as an end relative to the levels below it and as a means relative to the levels above it. Through the hierarchical structure of ends, behavior attains integration and consistency, for each member of a set of behavior alternatives is then weighed in terms of a comprehensive scale of values—the "ultimate" ends. In actual behavior, a high degree of conscious integration is seldom attained. Instead of a single branching hierarchy, the structure of conscious motives is usually a tangled web, or more precisely, a disconnected collection of elements only weakly and incompletely tied together; and the integration of these elements becomes progressively weaker as the higher levels of the hierarchy—the more final ends—are reached.

This problem concerns individual psychology, but also the functioning of organisations. It frequently happens that

> the connection between organisation activities and ultimate object is obscure, and these ultimate objectives are incompletely formulated, or there are internal conflicts and contradictions among the ultimate objectives, or the means selected to achieve them. (Simon 1965, 64)

Obviously, such problems are particularly serious in political and legal decision-making, which should ideally take into consideration all values that are relevant to a community, according to the preferences of all its members.

This makes it very difficult to assess the rationality of decisions impacting on different values, according to a combined assessment of resulting gains or losses with regard to the relevant values. Consider for example, how it is difficult to assess the rationality of decisions in issues of Internet law, where one has to balance such diverse values as privacy, freedom of information, individual liberty, democracy, economic growth, technological and scientific development.

Various views have been taken in this regard. Some authors seem to believe that we can understand and justify decision-making by moving beyond teleological rationality, and focusing rather on *systemic rationality*: We should look at how certain forms and styles of decision-making contribute to the functioning of the social systems in which they take place, regardless of how they match the goals pursued by the decision-makers (this is the view famously advanced by Luhmann 1973). Others, such as Habermas (1999, 259) have rejected the

idea that rational decision-making involves assessing and comparing impacts on relevant values, affirming that:

> weighing takes place either arbitrarily or unreflectingly, according to customary standards and hierarchies.

To overcome such dismissive views, while addressing seriously the issue of the limitations of teleological reasoning, we need to go back to the analysis of teleology which we developed in Section 1.3.6 on page 27, and consider the problem of the evaluation of outcomes and plans.

5.2.2. The Evaluation of Outcomes

In evaluating a plan one needs to identify its outcome (the results it will produce), distinguish the relevant desirable or undesirable features that are involved by that outcome, consider to what degree these features are advanced or impaired by the plan, and finally establish what value is to be accordingly attributed to the plan.

For instance, when considering the plan of going to a restaurant r (see Section 1.3.6 on page 27), one may consider to what degrees one expects a dinner at r would exemplify the following features: quality of the food, quality of the wines, quality of the service and amount of the price. Then one would move from the level of realisation of each feature into the evaluation of their combination.

The most delicate step is the last one, namely, moving from single features to their joint evaluation. Analytical reasoning (ratiocination) is in general not very capable of capturing and assessing interconnected sets of features: This is a task that seems to be performed by a kind of holistic understanding, similar to pattern recognition in perception (as affirmed by Thagard 2000). However, under certain conditions analysis may help.

The analytical evaluation of multi-featured decisional outcomes is facilitated when all of the following conditions hold:

- there is a numerical measure for the realisation of each relevant feature,
- the value (the likeability) of each feature grows linearly (always in the same proportion or weight) according to the measure of the realisation of this feature,
- all desired features are independent.

Under these conditions, to obtain the evaluation of an outcome, we just needs to multiply the measure of the realisation of each feature in that outcome for the weight of the feature, and sum up the results we obtain.[3] This provides an easy

[3] The evaluation EV of outcome ω—where ω realises features $f_1, \ldots, f_n$, to the degrees

	food	*wine*	*service*	*price*	*totalvalue*
r_1	$4 * \mathbf{3}$	$2 * \mathbf{2}$	$2 * \mathbf{1}$	$(6) * -\mathbf{2}$	6
r_2	$3 * \mathbf{3}$	$2 * \mathbf{2}$	$1 * \mathbf{1}$	$(2) * -\mathbf{2}$	10

Table 5.1: *The expected value of two restaurant-experiences*

way for computing the value of plans of action and consequently for comparing them.

For instance, assume that I assign weights **3** to food, **2** to wines, **1** to service and $-\mathbf{2}$ to price. Moreover, I expect that in restaurant r_1, food will score 5, wines 2, service 1, and price 6 (€ 60), while in restaurant r_2 food will score 3, wines 2, service 1, and price 2 (€ 20). This allows me to assign points 6 to restaurant r_1 and points 10 to r_2, as Table 5.1 shows. Thus, if the input data are correct, and if all assumptions above hold, rationality commands me to go to the cheaper restaurant r_2, even though it offers an inferior food and service quality than r_1.

This example shows how this way of evaluating choices gives questionable results, when no precise and objective way is available for quantifying degrees of satisfaction and weights, or when different features interfere. One may rightly challenge my choice for restaurant r_2 (or anyway my procedure for reaching that choice) by pointing to the arbitrariness of assigning degrees of satisfaction and weights (how do I know that the level of food quality of r_1 is 4, rather than 5 or 3, how do I know that food quality has weight **3**, rather than **4** or **2**?), to their contingency (for example, the importance of the quality of service depends on how much time I have and on how irritable I am, on that particular day), to their interdependence (having bad service would likely spoil my enjoyment of the food).

However, it may still be possible to compare the degrees of satisfaction of a certain desired feature in different situations. Combining this assumption with the idea of monotonic growth of desires as the degree of the desired feature grows, one gets some clues on how to develop one's preferences.

$d_1(\omega), \ldots, d_n(\omega)$, and each feature f_i has weight $\mathbf{w}_i$—is given by the simple formula:

$$EV(\omega) = \sum_{i=1}^{n}(d_i(\omega) * \mathbf{w}_i) \quad (5.1)$$

5.2.3. Pareto Efficiency

If outcome δ, in comparison to outcome γ, presents at least one feature at a more desirable degree and no feature at a less desirable degree, then it seems that a rational agent should prefer δ to γ (and thus, that it would be irrational to prefer γ to δ).

Let us try to state this idea more precisely. Let us write $x \succ y$ to mean that x is preferable to y.[4] Thus, when x and y are degrees of a positive feature (like the quality of the food), namely a feature of which it is desirable to have a higher degree, then $x \succ y$ whenever $x > y$ (x is greater then y). On the contrary, when x and y are degrees of negative feature (like the price of the food), namely a feature of which it is desirable to have a lower degree, then $x \succ y$ whenever $x < y$ (x is smaller then y). Accordingly, we can say that a rational agent should prefer outcome δ to outcome γ under the following conditions:

(a) δ and γ share the same desirable features $f_1, \ldots, f_n$, and
(b) δ presents these features at degrees $d_1, \ldots, d_n$ and γ at degrees $g_1, \ldots, g_n$.
(c) there is an i such that $d_i \succ g_i$, while for no j, $g_j \succ d_j$.

For instance, if a restaurant r_1 provides better food than a restaurant r_2, and equal or better wines and service, then a rational agent should prefer r_1 to r_2 ($r_1 \succ r_2$).

This is the idea of what we may call *Pareto efficiency*,[5] which, can be viewed as a modest but general feature of rational choice: When a choice is required between alternative decisions δ and γ, and the two decisions impact on the same values (desirable features), but δ advances some of these values to a higher degree than γ does, the impact on all other values being equal, then δ is to be preferred.

Consider for example, the choice between these two ways of treating videos taken through cameras located in a street having a high crime rate:

- cancelling data after a week, or
- keeping data for one year.

Let us assume that cancelling data after a week allows a greater achievement of the value of privacy, while there is no difference with regard to the attainment

[4] More generally, in the following we shall write $a \succ b$ to mean that entity a is preferable to entity b, that is, whenever we want to express the comparative merit of certain objects, like values, rules, and so on.

[5] The idea of Pareto efficiency is used by game theorists to denote a situation where no one's position can be improved unless somebody else's position is worsened. More exactly, a Pareto-efficient outcome has the following property: There is no other outcome that makes every player at least as well-off and at least one player strictly better-off. Here, following Alexy 2003, 135, we extend this notion to impacts on different values, rather than on different individuals.

of the value of security (one week being sufficient to check video recordings, in relation to all serious claims). Under such conditions, the decision to keep the videos for a year would be irrational, according to the idea of Pareto efficiency (assuming the only relevant values are privacy and security).

Thus, we can say that a decision is irrational when the decision-maker knows (or should know, through an appropriate cognitive effort) that an alternative choice provides a higher satisfaction of some values, without diminishing the level of satisfaction of any other value.

Though it may seem quite trivial, the idea of Pareto-efficiency is a useful minimum standard for evaluating decisions. For instance it seems to subsume some of the standard of *reasonableness* which are used in constitutional and administrative review. For instance, a decision which impairs certain values without contributing to increasing the realisation of any other values is certainly inefficient, and in this sense it is more then just unreasonable, it is irrational. Similarly, a choice (*a*) would be irrational on grounds of its Pareto-inefficiency when it achieves certain values by impairing certain other values, but there is an alternative choice (*b*) that would realise the same values to the same extent without impairing any other values (or impairing them to a lesser degree): Choice (*a*) is unreasonable since it determines a value-prejudice which is unnecessary to achieve its beneficial outcomes.

5.2.4. Weighing Alternatives

The idea of Pareto efficiency, however, does not help us in making choices in those situations where there are alternatives δ and γ, such that δ advances more than γ certain values, and γ advances more that δ certain other values. Consider for example, the problem of making a choice between two restaurants r_1 and r_2, such that r_1 provides better food, r_2 provides better service, and all other relevant features are satisfied to the same degrees. Similarly, consider the problem of choosing whether to cancel video recordings after one day or after seven days, assuming that cancellation after one day gives a higher level of privacy while cancellation after seven days provides a higher level of security.

One may say that such issues can be solved through a comparative analysis that takes into account (a) the degree at which the values are satisfied by the different choices, and (b) the importance of the values. Choice α is better than choice δ if the comparative gains concerning the values that are better promoted by α, outweighs the comparative loss concerning the values that are better promoted by δ. For instance, rationality requires me to go to restaurant r_1 rather than to restaurant r_2 if the comparative advantage in food quality outweighs the disadvantage in service quality. Similarly, one may say that rationality requires cancelling videos after seven days rather than after one day, if the gain in security outweighs the loss in privacy.

The difficulty, however, consists in finding a sufficiently precise character-

isation of how one should rationally "weigh" such alternatives. One may say that the weighing judgement depends both on the quantities that are gained or lost, and on the importance of what is gained and lost, but this gives very little help to the decision-maker, for whom the problem is exactly that of establishing quantities and relative importance.

Moreover, the importance of a gain or a loss with regard to a certain value, does not only depends on the "quantity" that is gained or lost (whatever one means by quantity) and on the importance of the value at issue. It also depends on the level of satisfaction with regard to which we measure gain or loss.

For instance, in relation to the value of wealth (or of nutrition), a small quantity of money (of food) can have great importance to a poor (starving) person, and very little importance to someone who is rich (well fed). In other words, the importance of a certain feature does not grow linearly in relation to the quantity of its realisation (that usually marginal utilities tend to decrease is a fact well-known to economists). Thus, a fixed proportion (a weight) cannot always capture the connection between the quantity of a feature and its value: A more complex functional correlation might need to be specified.

The difficulties we have just considered should lead us to be careful and critical (maybe even sceptical) with regard to pretended "objective" or "scientific" evaluations of decisional alternatives. However, they should not lead us to conclude that the rational comparison of alternative is impossible, that the tools of decision theory are useless, that every choice puts us in front of the incommensurable or the "absurd," as existentialists used to say, and calls for (or at least presupposes) an arbitrary commitment (cf. Sartre 1993).

In fact, we need to approach the problem of weighing and balancing on the basis of our awareness, not only of our failures, but also of our cognitive powers, and in particular, of the power of our implicit cognition. As a matter of fact, we know how to take decisions which impact on different values and objectives, and we can approach this task in a way that, though far from perfect, is sufficiently good for most of our purposes.

Humans seem to possess an adequate cognitive faculty (organ) for evaluating and comparing, under conditions of uncertainty, alternative plans of actions, though we cannot tell precisely how this faculty works, nor can we fully replicate its functioning through explicit reasoning. It is no chance that even decision theorists, when they have to make choices involving multiple aspects in complex domains (choosing a partner, a profession, buying a house or even a car), rely more on their intuitive judgement then on the conceptual tools provided by their discipline.

Thus, the fact that our comparative evaluations usually result from an unconscious process does not imply that they are random or absurd. On the contrary, our implicit cognition usually also takes into account data that are explicitly provided and processes these data unconsciously, along with information which remains implicit, and that we do not have the ability and the time to express

and consciously evaluate. For instance, my choice to buy a certain car may be influenced by the information I find in car journals, or in suggestions by friends, along with various other things I know, though I can only partially articulate this data.

Moreover, one can (and should, in important cases) articulate, at least in part, this implicit knowledge at the stage where one critically analyses one's choices, trying to rationalise them, as being based upon good grounds. For instance, before writing a check to the car dealer, I may try to consider if my intuitive preference is really based upon good grounds, by explicitly listing the pros and cons of a certain particular choice, as compared to the available alternatives. I should stop only at the stage where I have found a reflective equilibrium, that is, when intuitive assessment and explicit reasoning lead me to the same result.

The situation is no different with regard to legal decision-making. Consider for instance a judge who has to decide, in the absence of a precise rule, whether a certain way of processing data taken through street-cameras is admissible, or whether an employer is allowed to have access to the e-mails an employee has sent and received using the account provided by the company. One can take a stand on such issues only with reference on the one hand to the legal values at stake (security, privacy, economic efficiency, and so forth) and on the other hand to the technological and social knowledge concerning the ways in which different arrangements are going to impact on these values. All of this knowledge is brought to bear, usually unconsciously, on one's evaluation of whether a certain choice unduly impairs the value of privacy, with regard to other possible arrangements. This intuitive judgement needs, however, to be rationalised by articulating grounds for it, a rationalisation that should lead the decision maker to find a satisfactory reflective equilibrium.

We may thus say that in the domain of value-based comparison explicit reasoning, rather than substituting intuition (implicit cognition) should process and rationalise its outcomes. This implies the possibility of revision, since failure to provide a satisfactory rationalisation is an important symptom that the intuitive decision was wrong, as we observed in Section 4.1 on page 121.

Therefore, we can draw two conclusions. The first is that cognition and rationality can (and should) also govern comparative evaluations. The second is that the quantitative methods proposed by decision theory, in most contexts, should be used to control intuitive choices, analyse their compatibility with similar choices, and fit them into a theoretical background, rather than to provide a self-sufficient alternative to human intuition (to implicit cognition).

5.2.5. Simplifying Evaluations

For some purposes, and under certain conditions, some simplifications may help, providing us with useful and workable ways of analysing relevant aspects of important decisions, and of checking their consistence.

For example, Alexy (2002) proposes a simple method of characterising numerically the impact of legal decisions on relevant values.

He observes that the German Constitutional Court frequently justifies its judgments on the legitimacy of certain laws by examining the impacts of such laws on legal values, and by characterising such impacts as *light*, *medium*, or *serious*. For example, the duty to place health information (regarding the dangers of smoking) on tobacco products was considered to be legitimate since such duty implied a *light* interference on freedom of occupation (economic freedom), which was outweighed by the need to protect customer's health, *heavily* endangered by smoking.

Correspondingly, Alexy recommends the following:

- we should qualify legal values according to their low, medium or high importance, and link this qualification to numerical weights (for instance, **1** for values having low importance, **2** for medium importance, and **4** for high importance);
- we should also qualify gains and losses in the achievement of legal values (gains being positive and losses being negative) as light, moderate, or serious, and link such qualifications to simple numerical quantities (for instance, 1 for light, 2 for medium and 4 for serious),

The value-impact of a decisional alternative on a single value is then to be computed by multiplying the significance of the impact on that value by the importance the same value. For example, if freedom of occupation is a value having a medium importance, a decision implying a light violation of it would get score $(-1) * \mathbf{2}$, that is, -2.

The total value-impact of the decision is calculated by summing up its impacts on all values. For instance, a decisional alternative implying both a light violation of the medium value of freedom of occupation and a medium enhancement of the very important value of health would get the following positive score:

$$(-1) * \mathbf{2} + 2 * \mathbf{4} = 6.$$

We shall not discuss here the merits of Alexy's proposal, nor the circumstances in which it may be applied. We believe that it may be very useful in some contexts—when decisions can be conceptualised and compared according to the proposed grid—but not in others (for example, in choosing restaurants the light-medium-serious grid sometimes is sensible, but sometimes is not). This method, however, exemplifies why and how reasoning can be used to check intuitive evaluations.

Such controls, though being superficial when compared to the complexity of the decisional problems (and to the way in which implicit cognition can take into account such complexity) can be very useful. More generally, mathematical computations are particularly important when economic impacts need to be

examined, so that one can use the tools of economic analysis (as is done by the economic analysis of law; cf. Posner 1983). However, when such tools are used outside their proper domains, they may lead to questionable, if not misleading, results.

A rougher simplification than that proposed by Alexy is provided by assuming that that there is a so-called *lexicographic order* over values. This is the view that values (or sets of them) can be listed in order of importance, and that no gain, however big, in a lower level values can outweigh a loss, however small, in a higher level value. For example, it is frequently said that personality rights always prevail over economic rights.

Clearly, such an extreme view cannot be taken literally, or rather can only be maintained by sensible persons at the price of hypocrisy and self-deceit (masquerading economic rights as personality rights whenever one feels that they ought to prevail, and vice versa). For instance, it seems undeniable that the modest loss in privacy that is involved in the fact that a seller keeps a record of the sale, for a limited time, is outweighed by the chance of monitoring the performance of the contract. On the other hand, the idea that personality rights normally (defeasibly) prevail over economic rights, and that this defeasible presumption can only be defeated when there is a clear and specific reason to the contrary, seems quite sensible.

A lawyer may use further techniques to simplify teleological evaluation. First one may limit oneself to considering "the types of decision which should have to be given in hypothetical cases which might occur and which would come within the terms of the ruling," and one may evaluate those consequences by asking about "the acceptability of such consequences" (MacCormick 1978). This means that rather than examining the social and economic consequences that follow from certain legal decisions (or from the adoption of certain legal rules), one may simply consider what legal decisions would be taken in certain classes of cases if certain rules were adopted (for a discussion of this idea, cf. also Luhmann 1974, chap. 4, sec. 5).

A different way of simplifying teleological reasoning is provided by reasoning *per-absurdum*. This consists in focusing on just one negative implication of a certain choice, and on the values that are impaired by such an implication. This very crude way of cutting away the complexity of teleological reasoning is appropriate when a single consequence of a decision is so detrimental that very unlikely it will be outweighed by the advantageous effects of the same decision. Often, for getting a vivid impression of the negative impact of a certain choice, it is not even necessary to specify what values are going to be impaired. Here is how Lord MacMillan refuted the thesis that producers own no duty of care to customers:

Suppose that a baker through carelessness allows a large quantity of arsenic to be mixed with a batch of his bread, with the result that those who subsequently eat it are poisoned. Could he be

heard to say that he owed no duty to the consumers of his bread to take care that it was free from poison, and that, as he did not know that any poison had fallen into it, his only liability was for the breach of warranty under his contract of sale to those who actually bought the poisoned bread from him? (House of Lords [1932] A.C. at 620)

Some usual criteria of reasonableness, used in constitutional or administrative review, can also provide useful clues for detecting irrationality. For instance, the choice of allocating a certain advantage or burden to certain individuals, while not allocating it to other persons that are in an equal situation (with regard to all relevant features), besides violating the principle of equality, is also an index of irrationality. In fact, with regard to such a choice, usually there must be a better alternative, which may consist either in putting the same advantage or burden also upon these other persons (in case that this advantage or burden has a positive value-impact), or in eliminating it completely for everybody (in case that it has a negative value-impact).[6]

Similarly, the fact that a certain choice completely disregards certain values is an index of its likely irrationality: Since the importance of the compression of a value increases more than proportionally when the value is satisfied to a little extent, it is very unlikely that the complete non-realisation of a certain value can be outweighed by an increase in the satisfaction of other values. For instance, an increase in security, though justifying a reduction of freedom, cannot justify the complete elimination of freedom, and the less freedom we have, the higher the increase in security must be to justify additional restrictions.

5.3. Cognitive Delegation and Authority

An important way of overcoming one's cognitive limitation is to rely on others, that is, to delegate to others certain cognitive tasks. This is what we call *cognitive delegation*. In this section, after considering the notion of *delegation*, we shall distinguish different types of it, and then analyse its connection with the idea of *authority*.

[6] The decision of whether to extend or to eliminate an advantage (or a burden) is a difficult one, but one which must be addressed by a rational decision maker. Refusing to address it may lead to very negative consequences. For instance the Italian Constitutional judges for a long time have avoided to face this problem by adopting the policy of extending every benefit (for instance, with regard to salary or pension) to every person being in the same situation as those already enjoying the benefit (even when the benefit appeared to be an unjustifiable privilege), in the name of the principle of equality. This policy had a very bad impact on public finances, so that recently the judges had to reconsider it: They now do not exclude that a privilege may have to be eliminated rather then extended (and usually prefer to stimulate a legislative adjustment, rather than act directly). For a discussion of reasonableness in the decisions of the Italian Constitutional Court, see Morrone 2001.

5.3.1. The Concept of Delegation

We shall understand the notion of delegation not in the legal sense (concerning the delegation of power, and especially of normative power, an aspect we shall explore in Chapter 24), but in the broader sense in which this idea is used in social and cognitive sciences. For instance, Castelfranchi and Falcone (1997) view delegation as consisting in one's expectation that another will contribute to realising one's own plans:

> In delegation the delegating agent (x) needs or likes an action of the delegated agent (y) and includes it in her own plan: x relies on y, x plans to achieve g through y. So, she is constructing a multi-agent plan and y has a share in this plan: y's delegated task is either a state-goal or an action goal.

In this very broad sense, delegation covers any case in which one views other people as contributors to one's aims. It covers such diverse contexts as the relation between employers and employees (the first delegating various productive and administrative tasks), the relation between students and teachers (the first delegating the task of providing them with certain information and training), the relation between citizens and public officers (the first delegating the performance of public tasks). According to Castelfranchi and Falcone (forthcoming) the psychological attitude of the delegator may be called *trust*, and consists of two components, *core trust* and *reliance*. Core trust includes the following:

1. The truster has a certain goal, that is, he is interested in the production of a certain result.
2. The truster believes that the trustee is able to bring about that goal (competence belief).
3. The truster believes that the trustee is willing to bring about the goal (disposition belief).

Reliance includes the following:

4. The truster believes that he needs to rely on the trustee for the achievement of the goal, since it would be impossible or inconvenient for him to achieve the goal directly (dependence belief).

5. The truster believes that the goal will really be achieved, thanks to the action of the trustee.

We cannot here consider to any larger extent the theory of trust,[7] though it has various significant implications for the law (for some preliminary notes, see

[7] For some significant contributions to the theory of trust, see Gambetta 1990. For a general introduction to the social and political aspects of trust, see Fukuyama 1995.

Memmo, Sartor, and Quadri 2003). Let us just borrow the general ideas of delegation and trust and apply them to the domain of practical cognition. In particular, we speak of *cognitive delegation* to refer in general to situations where, rather than performing directly a cognitive task, one prefers to rely upon the cognitive performance of someone or something else.

For instance, consider how I may delegate to my lawyer the task of establishing how I shall behave in a dispute, to my doctor the determination of how I shall take care of my health, or to my electronic calculator the task of performing mathematical operations.

In the following we shall try to identify the rationale of cognitive delegation, and to consider whether this notion may be useful for approaching legal reasoning.

5.3.2. Types of Cognitive Delegation

When one decides to delegate a cognitive task to another, one forms the intention that one shall not form the appropriate mental state on the delegated issue through one's own cognition, but one will rather adopt the results that will be provided by the delegatee. Note that cognitive delegation may depend upon at least three quite different reasons (which may, though not necessarily, concur):

- *effort-based delegation*, which is determined by the belief that it is too costly to use one's own energies in performing the delegated task;
- *qualification-based delegation*, which is determined by the belief that the delegatee is better qualified than oneself in performing the delegated task;
- *coordination-based delegation*, which is determined by the belief that one should use the outcome provided by the delegatee (rather than the outcome provided by one's own cognition), since in this way one will coordinate one's action with the action of other people.

For instance, if I have decided to delegate to my secretary the booking of a hotel, this is because I have more urgent things to do. I could perform that task myself, possibly better than her (since I know my preferences better), but this would imply spending my time doing this, and not being able to use it for other purposes.

On the other hand, I have decided to delegate to the doctor the task of establishing what medication I should take, since I think that she is better than me in doing that. I rely on her judgement more than I rely on mine.

Finally, I have delegated to my wife the task of establishing how to furnish our house, since we need to take one decision on the matter, and she would not listen to my objections (and I want to avoid having discussions or fights).

It is easy to see that the delegator takes a different attitude in the three cases.

In effort-based delegation, the delegator forms the intention not to employ his cognitive activity for the delegated task, but to rely on the delegatee. However, this is not, for the delegator, a reason against thinking and acting on the basis of the outcome of his cognition. Assume that I have forgotten that I had told the secretary to look for a hotel, and that I succeed in finding a good one. The fact that the secretary has found another hotel is no reason why I should refrain from choosing the one I found myself, if I believe that I am better than her in choosing hotels for me (though I believe that I should not spend my time looking for hotels). So, in efficiency-based delegation, one has the expectation that somebody or something else will provide one with sufficiently good cognitive answers, and one has the intention not to use one's own cognition for that purpose. However, one trusts the outcomes of one's own inquiries on the matter (one does not have the intention of not using those outcomes, when they are available).

In qualification-based delegation, the delegator forms the intention to adopt the cognitive outcomes provided by the delegatee, and prefers these outcomes to those provided by his own cognition. However, he does not necessarily have the intention not to apply his own cognitive powers to the delegated task. For example, I do not behave irrationally if, after the doctor has given me her diagnosis and therapy, I read the medical encyclopaedia trying to understand by myself what is happening to me, and what remedies are available in my circumstances. However, the result of my cognition will have a limited use to me, since I will stick to what the doctor says, and I will not form any intention on the basis of the outcomes of my own inquiries. When such outcomes conflict with the doctor's, I will view them not only as being rebutted by the doctor's indications to the contrary, but also as being undercut: The very fact that there is such conflict would lead me to think that my cognitive effort must have gone wrong, to view it as being unreliable.

Finally, in coordination-based delegation the delegator intends to adopt cognitive outcomes provided by the delegatee, since he is sharing this attitude with the members of a certain community, and this may lead them to the possibility of collective behaviour and coordination. This does not imply any judgement on the merit of his cognitive efforts as compared to the results provided by the delegatee. Therefore, though I may consider the conclusions I would on my own (concerning how to furnish the house) as being defeated by the incompatible indications I get from my wife (for the sake of coordination), I would not see my reasoning as being undercut by such conflict: The grounds that would lead me to endorse a certain conclusion (had the coordinator not intervened) still favour that conclusion.[8]

[8] Our idea of coordination-based delegation may possibly be viewed as a case of what Soper (2002) calls *deference*.

5.3.3. Authority and Normative Power

The idea of a cognitive instruction offers us a way of representing cognitive delegation. This takes place when one endorses the *meta-instruction* that one shall adopt instructions that are issued by a certain person or according to a certain procedure. When this is the case, we may say that one delegates to that person or to that procedure the formation of one's intentions (or the determination of one's obligation), and this may be explained by the fact that one trusts that person or procedure for providing appropriate practical (normative) determinations.

This seems to be the case when one recognises a competence (a normative authority) to a certain person or institution. For example, on the basis of grounds pertaining to qualification (my wife is better endowed then I am in aesthetic taste) or coordination (I do not want to have fights concerning how to arrange our house) or to both, I may adopt meta-instruction mi_1:

> mi_1: Whatever instructions my wife issues concerning the arrangement of our house, I shall adopt it[9]

Assume also that I had doxified meta-instruction mi_1 into meta-proposition mp_1:

> mp_1: Whatever normative proposition my wife states concerning the arrangement of our house, it is binding upon me

The intention to implement meta-instruction mi_1 will make so that whenever my wife issues an instruction, I will have the intention to implement it. Similarly, my belief in meta-proposition mp_1, will lead me to believe that any normative proposition she states is binding to me and, therefore, to endorse any normative proposition she states (or, more exactly, proclaims; see Chapter 23).

Accordingly, when my wife tells me "You shall move the sofa to the opposite side of the room," I shall form the intention to do that. Similarly, when she tells me "You are obliged to move the sofa to the opposite side of the room," I shall believe that I am under this obligation.

The same attitudes seem to exist when one endorses a rule attributing a legal competence. For example, when one is ready to endorse whatever instruction is issued by the Parliament, we may say that one is adopting the meta-instruction:

> mi_2: Whatever instruction is issued by the Parliament, I shall adopt it

[9] By "adopting an instruction," we mean forming the intention to execute it.

Assume that the concerned person has doxified meta-rule mi_2 into the meta-proposition mp_2:

> mp_2: Whatever normative proposition is stated by the Parliament, it is binding upon me

When one believes meta-proposition mp_2 and one knows that the Parliament has stated a certain normative proposition, one is led to endorse that proposition. For example, if one, besides endorsing mp_2, believes that Parliament has stated proposition,

> p_1: It is forbidden to smoke in working places

one will be led to endorse the proposition p_1.

Finally, if one also believes that one's office is a working place, one shall infer the specific proposition p_2:

> p_2: I am forbidden to smoke in my office

5.3.4. Rules and Teleology

Cognitive delegation can lead to outcomes that conflict with the outcomes one obtains through other ways of reasoning, and in particular by teleologically deriving a specific determination from one's own goals and values. Assume, for example, that on the basis of the values characterising my legal system, such as liberty and self-determination, I would be led to adopt the rule that one is allowed to smoke in working places when no non-smoker is around, as it is the case now. Thus I would conclude that I am allowed to smoke now in my office.

What is the connection between this inference and the inference we examined in the previous section, which led me to conclude, that I am forbidden to smoke in my office, by appealing to the competence meta-rule mp_2, and to the rule p_1 I consequently adopted?

It seems that this issue does not only concern the application of meta-rules, but it more generally concerns the relation between *normative syllogism* and *teleological inference*. An adequate discussion of this matter would require us to consider some fundamental questions of the theory of practical reasoning, such as the controversial issue of the connection between act-utilitarianism and rule-utilitarianism, which we cannot address here (see, among others, Hare 1981, secs. 2.4 and 2.5). However, we shall not refrain from briefly considering some aspects that are relevant for the logic of normative reasoning.

In fact, we can reduce the burden of means-end reasoning by adopting the following strategy: We endorse rules according to teleological reasoning, and

then we adopt specific determinations following from these rules according to syllogistic reasoning. This strategy allows us to distinguish the level of *ordinary practical thinking*, where one straightforwardly applies the rules one has adopted, and the level of *critical thinking*, where one chooses teleologically what rules to follow.

This strategy can be extended to meta-level reasoning: We endorse meta-rules according to teleological reasoning, and then we adopt rules according to syllogistic reasoning, based upon these meta-rules. Consider, for instance the meta-rule according to which rules issued by the Parliament are binding for the citizens, a meta-rule that leads citizens to conclude syllogistically that a particular rule, having been issued by the Parliament, is binding for them. Consider also the meta-rule according to which rules issued by the guru of a certain religious sect are binding for the members of the sect, a meta-rule that leads members of the sect to conclude syllogistically that a particular rule, having been issued by the guru of the sect, is binding for them. This kind of cognitive delegation—we delegate to meta-rules, and thus to the rule-production mechanism to which they refer, the task of determining what rules we should follows—leads us to turn into a matter of ordinary practical thinking also the choice of what rules we should adopt: These are the rules that somebody else has produced, according to the meta-rules we critically endorse.

The rule-based picture of practical reasoning depicts an attitude that is undoubtedly sensible in some contexts, though it may lead to a rigid and insensible behaviour, and particularly to underestimate the cognitive significance of one's feelings and experiences.

However, from the perspective here developed, this is just one possible strategy for coping with the complexities of practical thinking, and other strategies are also available. Among these strategies, the following are worth mentioning: considering the teleological merits of specific choices, making analogies out of such choices, experiencing one's involvement in caring relationships, rationalising the attitudes and feelings emerging from one' s involvement in individual cases, and so forth.[10] Only the combination of rule-based reasoning with these different strategies can provide a comprehensive approach to practical thinking.

5.3.5. The Notion of an Exclusionary Reason

Raz (1975; 1978) has developed an analysis of normative reasoning based upon the idea that norms (rules) are exclusionary reasons: They are reasons for not considering certain other reasons. We shall now examine and evaluate this

[10] The idea that there are acceptable alternatives or at least complements to a rule-based approach to practical reasoning has been particularly explored by some feminist researchers, and most famously by Gilligan (1982). For a recent statement of the importance of the ethics of care, see also Held 2003.

highly influential jurisprudential theory, connecting it to our idea of cognitive delegation.

In Raz's analysis the basic notion is that of a *reason*, which he views as a fact, namely, a fact which is a ground for an action by a certain person. Our perspective is different in that we consider reasons to be mental states, rather than facts. This however is not a major difference, since we admit that one may assume that there are "normative" states of affairs, corresponding to those conative states which would result from perfect practical cognition (see Section 3.3.2 on page 106).

Therefore, rather than focusing on the distinction between reasons as facts and as mental states, we shall focus on what is generally viewed as the most significant contribution of Raz to practical reasoning, namely, his idea of an *exclusionary reason*. First we shall try to express this idea in our framework. Then we shall consider whether the idea of an exclusionary reason provides us with an understanding of the notion of a rule and of the power to issue rules.

In Raz (1975, 35ff.), the idea of an exclusionary reason is introduced by discussing the case of Ann, who refuses to make an investment choice, since she does not rely on her judgement, being too tired. Raz describes the situation by saying that Ann's tiredness is not a first-level reason for not making the investment, to be balanced against reasons for making the investment. It rather is a higher-level reason, and in particular a reason for not acting on the balance of the first-level reasons for and against making the investment choice, that is, an exclusionary reason that precludes Ann from taking all such reasons into account.

We describe Ann's situation in a different way: she has the cognitive intention not to rely on (to reject) any reasoning which might lead her to form the intention of making the investment. Such a cognitive intention is rational if it is adopted (or rationalised) according to some of the reasoning schemata we described above.

Let us assume, for instance, that Ann reaches this conclusion by using *teleology*, as you can see in the top left part of Table 5.2 on the next page.

Let us also assume that Ann possesses cognitive states that would lead her to form the intention of making the investment her friend suggests (she desires to earn money, and she believes that making the investment would be a satisfactory way of making money): she has a reason for intending to make the investment.

However, this reason is excluded by her cognitive intention to reject the inference leading to the investment decision, in the sense that this cognitive intention prevents her from endorsing the conclusion of that inference, namely, the intention to make the investment.

Let us consider why she should not form that intention. Through a syllogism, she first acquires the intention to reject the inference leading her to make the suggested investment (since this is a reasoning leading her to an investment decision), as you can see in the bottom part of Table 5.2 on the facing page.

(1) having the goal of preventing losses (2) believing that a satisfactory way of preventing losses consists in ⌈rejecting any reasoning for or against investment-decisions, when I am too tired⌉	
(3) intending that ⌈I shall reject any reasoning for or against investment-decisions, when I am too tired⌉	(4) Believing that ⌈now I am too tired⌉
(5) intending that ⌈I shall now reject my reasoning for or against this investment decision⌉	

Table 5.2: *Exclusionary inference*

The latter intention undercuts that inference, according to the reasoning schema *meta-undercut* (see Section 4.2.2 on page 128), thus preventing the endorsement of the intention to make the investment.

Defeating instance: *Meta-undercut*

(1) intending to reject reasoning instance ⌈I shall make the investment suggested by my friend since this is a satisfactory way of reaching my goal of making money⌉

IS AN UNDERCUTTING DEFEATER AGAINST

(2) reasoning instance: ⌈I shall make the investment suggested by my friend since this is a satisfactory way of reaching my goal of making money⌉

In another example, Raz considers the case of a father who has promised his wife that, in choosing a school for their child, he would only consider the child's interests (for a similar legal example, consider a young attorney who is told by her boss that, in choosing a strategy, she should only consider the interests of their client).

In our framework, we can model this case by assuming that the father has the intention to reject all teleological reasoning concluding with the intention of sending his child to a school, where such decision is finalised to, or evaluated according to, any value which does not pertain to his child's well-being. This intention would also lead the father to view all corresponding inferences as being undercut, according to the reasoning schema *meta-undercut*.

5.3.6. Exclusionary Reasons and Normative Delegation

After introducing the idea of an exclusionary reason and expressing it in our framework, we need to consider whether this idea is helpful in understanding the phenomenon of legal authority, viewed as a kind of cognitive delegation. The idea of exclusionary reasons is in fact applied by Raz (1979) to characterise the notions of authority or normative power, which he views as the ability to "change protected reasons":

> [A]n act is the exercise of a normative power if there is sufficient reason for regarding it either as a protected reason or as a cancelling protected reasons and if the reason for so regarding it is that it desirable to enable people to change protected reasons by such acts, if they wish to do so. (Raz 1979, 18)

By a protected reason Raz means "a fact that both is a reason for an action and an (exclusionary) reason for disregarding reasons against it."

By applying Raz's notions to our example of no-smoking legislation, it appears that from the viewpoint of one who recognises the normative power of the Parliament, the fact that the Parliament issued the prohibition to smoke, on the one hand should provide a reason for not smoking, and on the other hand should exclude that liberty and self-determination are reasons for not smoking.

We have some doubts that this is the most plausible analysis of the most common attitude towards normative powers. In fact one's endorsement of a competence rule usually involves coordination-based delegation, rather than qualification-based delegation: One's readiness to endorse the decisions of the legislator, even when it expresses a political view one strongly opposes, does not result from one's belief that the legislator is more likely to be right than oneself, but rather from one's recognition that coordination requires that one accepts legislation even when the legislator is wrong (we shall address the issue of the limits of such acceptance in Section 13.2.1 on page 368). Therefore such an attitude does not exclude (undercut) but rather rebuts what grounds one may have for a different determination.

For instance, the fact that I endorse the conclusion that I ought not to smoke, even if nobody is around who could be damaged by my smoke, does not stop me from believing that freedom and self-determination are important legal values, so that their consideration would lead me to conclude that I am permitted to smoke under such circumstances. This is consistent with the fact that the conclusion I would derive from this reason, according to teleological reasoning, is rebutted (and defeated) by the inference I can draw, according to syllogism, from the Parliamentary rule prohibiting smoke.

Therefore, the rule against smoking does not seem to be an exclusionary reason, but rather an independent (sub)-reason, which operates without appealing directly to teleological reasoning (it is to be applied through the schema *normative syllogism* and not through the schema *teleology*), and which may indeed

clash against the conclusions which are derivable according to teleological reasoning.

This type of analysis applies in general to the recognition that certain persons or institutions are legal authorities: The fact that I view the instructions of such persons or institutions as binding on me (in the sense that I am committed to endorse them) does not stop me from recognising that an attempt to directly implement the goals of the legal system would lead me to different determinations.

5.3.7. Authorities as Exclusionary or Independent Reasons

It seem that by viewing authoritative statements as exclusionary reasons, Raz aims at preserving the independence of normative syllogisms from direct teleological reasoning, However, one needs to do that only when one views practical reasoning as a single one-step transition from an all-comprehensive set of reasons into the determination to perform an action, where such a set contains whatever elements may contribute to supporting or attacking that determination, according to whatever kind of inference. When one takes this view, one needs to exclude explicitly from the comprehensive reason-set whatever reasons may wrongly interfere with other reasons in the set: In particular when one reaches a conclusion by applying rules, one must exclude, when applying the rule, any considerations pertaining to the value-impact of that conclusion.

Our perspective, on the contrary, is based on the analytical distinction of different reasoning schemata, each concerning specific types of reasons (we shall discuss this aspect in Section 8.2.4 on page 236). Thus, for recognising the independence of normative syllogism from teleological considerations we do not need to view the syllogism's premises (and in particular, the rule) as excluding anything.

From our perspective, on the contrary, one's adoption of a rule would even be compatible with the fact that one views the rule's conclusion as being defeated by teleological reasoning, when the rule leads to teleologically unacceptable results (i.e., there are cases where I give priority to the outcome of my teleological reasoning over rule-based syllogism). At most we may say that in such situations ideal rationality requires a theory-construction effort: Future conflicts between rule-based and teleological reasoning should be prevented by framing and endorsing a general exception to the defeated rule.

Therefore, it does not seem that one may view rules, and in particular power-conferring rules, as exclusionary reasons, at least in cases when purely coordination-based delegation is involved.

Things would look differently if one's attitude towards a ruler consisted in what we have called *qualification-based delegation*. In this case not only one would endorse the ruler's indication for the sake of coordination, but one would do this since one believes that the ruler is a better practical cogniser then oneself. The dissonance with the prescription of such an enlightened ruler would lead

one to view one's reasoning as being unreliable and therefore as being undercut. Consider for example, my attitude toward certain sanitary precautions which have been stated by the Ministry of Health, and which are in conflict with what I may have done otherwise. Not only will I follow those precautions since I am committed to adopt whatever prescription is stated by the Ministry, but I would view the conflict with the Ministry's prescriptions as a decisive proof that my independent sanitary views are flawed (and possibly extend my doubt to the premises that have led me to such conclusions).

Thus, it seems to us that in most cases, the citizens' attitude towards legal authorities can be viewed as a case of coordination-based delegation, rather than as a case of qualification-based delegation. Correspondingly, one should view's one's commitment to legal meta-rules and rules (when combined with appropriate factual knowledge) as a reason for adopting what follows from them via syllogism. This does not exclude that one has reasons for adopting different determinations according to legally relevant values (and teleological reasoning), though such determinations are rebutted by the conclusions of rule-based syllogisms (which usually prevail, for the sake of coordination).

5.3.8. Commands and Reasons

Wallenstein, the protagonist of the homonymous trilogy by Friedrich Schiller, represents paradigmatically the tragic conflict between the orders of an authority and one's substantive reasons.[11]

Wallenstein was the general of the imperial forces during the Thirty Years War, opposing Protestants (also supported by Catholic France, for political reasons) and Catholics, led by the Austrian emperor Ferdinand the Second. After twelve years of fighting, Wallenstein became aware that war was only producing atrocities and the reciprocal destruction of the opposed parties. Therefore, he tried to make peace with the Protestants and, in particular, with the Swedes, who had the strongest army in the Protestant side. This initiative went against the will of his fanatical emperor, who allegedly said to prefer a desert to a land full of heretics. Unfortunately, Wallenstein was discovered, betrayed and killed by emissaries of the emperor. This led to eighteen additional years of war, which caused the complete devastation of central Europe.

Let us consider Wallenstein's attitude toward his emperor, according to Schiller's interpretation. His hierarchical subordination to the emperor does not exclude what cares and values he has. On the contrary, when deciding to disobey he affirms (Schiller 1800, scene 16) that:

[11] Schiller's trilogy on Wallenstein includes the plays: *Wallenstein's Camp* (1798), The *Piccolomini* (1799), and *Wallenstein's Death* (1799). For the whole trilogy, see Schiller 1980. In the following citations we use the translation of *Wallenstein's Death* by S. Coleridge (Schiller 1800), who only translated the last two plays of the trilogy. A similar literary example of disobedience for the common good (though not on such noble grounds as Wallenstein's) is provided by von Kleist 2002 .

My cares are only for the whole: I have
A heart—it bleeds within me for the miseries
And piteous groanings of my fellow-Germans.

Thus, his submission to the emperor's authority does not prevent him from engaging in teleological reasoning. He is rather in a situation where (scene 2):

[...] Like enemies, the roads
Start from each other. Duties strive with duties

It does not seem that the emperor's order to continue the war is seen by Wallenstein as an exclusionary reason, which makes irrelevant his teleological reason for trying to make peace with the enemy (his goal to stop war, and the belief that acting autonomously to making peace is the only way to achieve this goal). On the contrary, Wallenstein views the emperor's order to continue war as an independent subreason, that according to *syllogism* leads himself to a conclusion that is incompatible with the conclusion he can reach by using *teleological inference*, as you can see in Table 5.3 on the following page. Thus, Wallenstein has to compare the strengths of these two inferences (of the corresponding reasons): Up to a certain time he values argument $\mathcal{A}$ as being preferable, but when the costs of war become unbearable, he considers that argument $\mathcal{B}$ is to be preferred.

It seems to us that Wallenstein's attitude well exemplifies the way in which a rational agent should approach political authority. The statements of political authorities do not exclude what (valuable) reasons one may have for behaving differently, but rather lead to inferences that have a certain strength, according to the values which support the recognition of authority (and in particular, the need for political coordination). Authority-based inferences may thus usually prevail over incompatible inferences (and in particular over the teleological considerations based upon the needs and values of one's community), but they do not exclude what reasons provide the basis for these teleological inferences, which may prevail under appropriate circumstances.

5.3.9. The Independence of Normative Syllogism from Teleological Reasoning

Our analysis does not entail that the conflict between commitment to an authority (one's intention to obey the authority) and teleological reasoning can be reduced to teleological reasoning alone, by incorporating into one's cost-benefit analysis also the costs of disobedience.

On the contrary, we need to consider the conflict between a general intention (the intention to behave in a certain way in all situations of a certain kind), and the teleological inference that leads one to conclude that under the present circumstances one should behave in a different way. As we observed in Section 1.3.7 on page 29, one's general commitments (general intentions or beliefs

	Inference $\mathcal{A}$		Inference $\mathcal{B}$
(1)	the emperor has ordered that I shall continue war until all heretics are eliminated;	(1)	stopping atrocities and destruction is a valuable goal;
(2)	I shall endorse any order of the emperor	(2)	making peace with the Swedes is a satisfactory way of reaching that goal
(3)	I shall continue war until all heretics are eliminated	(3)	I shall make peace with the Swedes

Table 5.3: *Wallenstein's dilemma*

in general rules) serve goals that are larger than those that are involved in a single choice.

Consider for instance the conflict between my commitment to jog half an hour every day and my teleological inference that today I had better stay at work, since this would enable me to achieve results that are more important that the outcome of my jogging today. The problem is that the second inference—based upon the comparative evaluation of the single actions of running or not running today (according to their impact on my goals and values)—is not the only relevant consideration. In fact my commitment to jog every day responds to considerations (my health and fitness would be favoured by a consistent jogging practice) that are broader that those involved in my choice between running and working today (had I not taken that commitment), and this commitment is challenged by my decision not to run today. Similarly, consider the conflict between my commitment not to smoke and the teleological conclusion that I may now smoke, a conclusion I obtained according by balancing positive and negative effects of a single act of smoking.

It seems that exactly in the same way the importance of one's general commitment to accept the instructions of an authority (under certain circumstances) is to be weighed against one's teleological evaluations leading to disobedience. In our framework such conflicts can be viewed as instances of rebutting collisions between reasons leading to incompatible conclusions.

Similarly, the adoption of a legal rule, like for instance the rule that makes hotel owners liable for certain injuries and losses of their guests, may lead us to conclusions that may be different from the results we would reach if we just balanced the consequences of alternative decisions on a specific individual case, regardless of the benefits arising from the shared adoption and consistent implementation of this rule in all cases falling under its scope. It is exactly the benefit arising from a consistent application of the rule that we are to balance against our assessment of the specific impact of our decisions on the interests at

stake in the individual case (on this issue, see for instance Fletcher 1996, 189ff.). The benefit of a rule-based practice may be very low (or even negative), like when we are dealing with a domain where decision-makers can obtain enough information on the specific cases, these present complex combinations of interdependent features, and there is little need to coordinate decisions and generate consistent expectations (as for instance in certain non-economic areas in family law). Or, on the contrary, the benefit may be high, like when decision-makers have little information concerning the individual cases, and need to generate consistent expectation.

It may be argued that the analysis in term of exclusionary reasons, though not fitting defeasible rules, provides an account of the working of indefeasible rules. As long as one who keeps one's commitment to such rules, one needs to reject any inference leading to incompatible outcomes: When one has superior reasons for not complying with the rule's conclusion (for example, one has superior reasons for smoking), one needs to withdraw one's commitment to the rule. Thus, one's commitment to indefeasible rules—as long as it is maintained—excludes (the relevance of) incompatible premises.

Our reply to this argument is the following. We agree with this analysis as to the determination of the results that can be obtained by a reasoner who is committed to indefeasible rules. However, we believe that these results are not obtained because an indefeasible rule aims at excluding incompatible reasons, but simply because it conflicts with them, and re-establishing consistency requires (when dealing with conclusive reasons) retracting the weaker reasons.

As a matter of fact, epistemic generalisations seem to behave no differently from normative generalisations in this regard. When one endorses a defeasible epistemic generalisation (for example, Mary usually tells the truth), evidence to the contrary (she was lying to me yesterday) may lead one to reject an instance of the generalisation (she was telling the truth yesterday), while maintaining belief in the generalisation. On the contrary, when one endorses an indefeasible generalisation (for example, Mary never has told a lie), one needs to reject evidence to the contrary (the evidence that she yesterday told a lie), as long as one keeps one's endorsement: One may accept this evidence only by abandoning one's endorsement of the indefeasible generalisation.

Thus, our conclusions seem to diverge from the ideas expressed by Shiner (Volume 3 of this Treatise, sec. 3.6.2), who relies upon the notion of an exclusionary reason in his theory of legal sources, and who defends this idea against the critiques of Schauer (1991) and Perry (1989).[12]

However, we believe that this divergence depends on the particular framework we have developed for practical reasoning, which takes into account "automatically" what we view as the main aim of the doctrine of exclusionary rea-

[12] Exclusionary reasons also play a fundamental role in the account of legal reasoning provided by Hage (1997).

sons: avoiding that spurious considerations enter into sound reasoning patterns (this issue will be discussed in Section 8.2 on page 233). As a matter of fact, our model of practical reasoning implicitly embeds a kind of "exclusion." This concerns the fact that any instance of a reasoning schema does not admit, within the its preconditions, sub-reasons that are incompatible with or irrelevant to, the functioning of the schema, namely, sub-reasons that so do not contribute to forming the reason of the schema. In this sense, any instance of the syllogistic inference excludes from itself goals and values, as Raz's view correctly implies (since the schema *syllogism* only allows for a general conditional plus an instance of the conditional's antecedent).

However, from our perspective this exclusion only concerns appealing to goals and values within the syllogistic inference. It does not expel such goal and values from the deliberation of the agent, where they still provide grounds for different inferences, possibly defeating the rule-based syllogism.

In conclusion, we believe that Raz's notions of an exclusionary reason does not provide a general notion of authority and an understanding of the psychological functioning of authoritative statements or rules. Nevertheless, it can be profitably used for analysing more specific contexts, such as when one is prohibited from taking a certain reason in account in making a certain kind of decision. Consider, for example, how an employer is prohibited, in many legal systems, from taking decisions on appointments or promotions according to the race or the sex of the applicant (on exclusionary rights, see Section 19.5.3 on page 516). Moreover, as we have observed, the idea of an exclusionary reason can capture the essence of what we called qualification-based delegation (see Section 5.3 on page 161).

Finally, note that we have only considered conflicts between legal rules and teleological reasoning as applied to legal values. A different issue concerns adopting legal decisions on the basis of one's private interests and goals. Those interests and goals (or rules, like ⌈I shall always favour my friends⌉) should not enter into legal decision-making, since they are not appropriate to the particular point of view that is proper to the legal process. But this is not linked to the existence of particular legal rules, operating as exclusionary reasons against such interests and values, but to the nature of legal decision-making as being oriented to the "common good," rather than to the individual interests of a particular decision-maker (see Section 9.1 on page 241).

Chapter 6

BOUNDED RATIONALITY: FACTORS

In Section 5.3 on page 161 we considered how we can sometimes unburden ourselves from the fatigue of reasoning—and particularly of teleological reasoning—by delegating it to others. However, this is not always possible, nor always advisable, since others may not be available or may not be sufficiently honest or competent, and relying too much on them would compromise our individual autonomy. Fortunately, when teleological reasoning is not practicable or opportune, a viable shortcut may still be available to a bounded cogniser, as we shall see in the next sections: This consists in relying on what we shall call *propensities*, the cognitive attitudes which can be doxified in the form of *factor/outcome-links*.

6.1. Propensities

Having a *propensity* consists in experiencing certain circumstances as factors prompting our physical or mental behaviour in a certain direction, that is, as favouring certain outcomes.

Consider for instance how one may have at the same time two propensities: to go out when it is sunny, and stay inside when the whether is dull. Similarly consider how one may have a propensity to help people in need, but also a propensity to stay away from distressful situations.

We may describe such attitudes by saying that when one has a propensity, one experiences certain types of situations as *factors* favouring certain *outcomes* (staying at home, going out, helping a person, avoiding him or her, and so on), but one does not commit oneself to implement these outcomes whenever the factors are present.

The conative attitude which is constituted by a propensity can be doxified in the belief in a *factor/outcome-link*, to wit, in one's belief that the factor *favours* or promotes the outcome—that the factor indicates that the outcome may be profitable or appropriate—though not necessarily committing one to endorsing the outcome.

6.1.1. Propensities and Intentions

It appears that there is a fundamental difference between a conditional intention and a propensity. When one endorses a conditional intention (the intention to

adopt a conditional instruction) one has made up one's mind about what to do in case the condition holds. This is particularly clear in the case of intentions concerning a specific action, like the following: ⌈If this afternoon the whether is fine, I shall go out⌉. A rational agent having that intention should perform the action (unless the agent withdraws the intention).

In case of general intentions, which allow for defeasible reasoning, one may keep the general intention, though not implementing it in certain individual cases. However, this requires either having a stronger intention to perform an incompatible action (so that reasoning based upon the general intention is rebutted) or rejecting the corresponding reasoning (so that it is undercut). Consider for example how I may keep my general intention ⌈I shall do some jogging every morning⌉, though I may allow an exception for one day when I am ill, or when I have to join an important meeting. Unless there are prevailing reasons to the contrary, rationality prevents us from having a general intention and not implementing it.

On the contrary, when having a propensity to act in a certain way in a given situation, one has not yet made up one's mind about how one shall behave in that situation, i.e., one is not committed (even only towards oneself) to act in the suggested way when the situation obtains. The rational way of processing a propensity does not consist in immediately intending (or wanting) to act accordingly. One is rather supposed to view one's propensity as an input to a further decisional phase that will eventually lead to forming an intention.

Continuing the example above, assume that when I wake up in the morning, I see that the weather is nice and I retrieve my propensity of going out when this is the case. Under these circumstances, I should not feel an immediate urge to jump out my door, nor should I immediately get ready to go out. I rather need to consider all my active propensities—or if you prefer all factors which favour or disfavour that outcome (it is a nice day, but not all children are well and I have some work to do)—to weigh or balance all these factors and reach a corresponding determination to go out or to stay at home.

6.1.2. Factors and Teleology

Propensities, as they need to be distinguished from intentions, need also to be distinguished from goals and values. A factor promoting a certain outcome is no goal to be achieved in the future: It is rather a feature of the pre-existing context that favours a certain future choice. For example, the fact that my children are sick is a factor favouring my decision to stay at home, but it is not something I want to achieve through my decision.

Though propensities and goals are to be distinguished, there is a connection between these two cognitive structures. Propensities, like intentions, may arise out of teleological reasoning: A propensity may originate from the fact that one has a certain goal and believes that acting in a certain way under certain condi-

tions is a way of promoting that goal. This corresponds to the application of the reasoning schema *propensity formation*.

Reasoning schema: *Propensity formation*

(1) having goal G; AND
(2) believing that doing action A, under pre-condition C, promotes G

——— IS A REASON FOR

(3) having the propensity to do action A under pre-condition C (viewing pre-condition C as a *factor* favouring action A)

The goal is not promoted by the mere existence of the factor (the pre-condition): What matters is the performance of the action when the factor obtains. Assume for example that I have the goals of getting suntanned and of keeping fit (while keeping in good health), and that I believe that this is likely to happen if ⌈when the weather is good I go the sea⌉ (where I can lie in the sun and swim). This may lead me to the following instance of propensity formation.

Reasoning instance: *Propensity formation*

(1) having goals of⌈getting suntanned and keeping fit⌉; AND
(2) believing that ⌈going to the sea, when the weather is good contributes to producing the result of ⌈getting suntanned and keeping fit⌉⌉

——— IS A REASON FOR

(3) having the propensity ⌈to do action going to the sea, when the weather is good⌉ (regarding condition ⌈the weather is good⌉ as a factor favouring action ⌈going to the sea⌉)

Note that my goals (tan and fitness) will not be achieved by the simple fact that the factor (good weather) holds, but by performing the action (going to the sea) when the factor holds (when there the weather is good).

Similarly, my having the goal that the children are in good health, plus my belief that keeping the children at home when they are sick contributes to their good health, allows me to infer that the children being sick is a factor that favours keeping them at home.

When the pre-condition (the factor) of a propensity is satisfied, one does not obtain an intention, but rather an unconditional propensity. This unconditional propensity can be formed according to the schema *propensity detachment*.

Reasoning instance: *Propensity detachment*

(1) having the propensity ⌈to go to the sea, when the weather is good⌉; AND
(2) believing that ⌈the weather is good⌉
——— IS A REASON FOR
(3) having the propensity ⌈to go to the sea⌉

The unconditional propensity to go to the sea is not yet an intention. To form an intention on the basis of one's propensities one needs to collect and balance them, in order to evaluate whether those favouring a certain action outweigh those against such action.

6.1.3. Logical Function of Propensities

There are strong similarities, but also significant differences between intentions and propensities. Compare, for example, the reasoning schemata *propensity formation* and *teleology*. Both of them take into account goals: Having certain goals (or values) is a pre-condition leading to the formation of both intentions and propensities. However, the teleological formation of an intention is much more demanding, as a cognitive task, than the teleological formation of a propensity.

For adopting the intention to execute a certain instruction, one needs to take into consideration—when assessing whether the instruction provides for a satisfactory way of achieving one's goal—all relevant values on which the execution of the instruction may impact.

On the contrary, for adopting a propensity, it may be sufficient to consider just the goal one is focusing on. In such a case, the consideration of other values is delayed to a subsequent phase, that is, to the time when one needs to engage in action: Only at that time does one weigh and balance this propensity along with all other relevant propensities one may have.

Thus, propensities provide a way of simplifying teleological reasoning: One does not analyse anew, whenever one has to undertake a specific action, the impact of that action on all values one is pursuing (as it happens when one teleologically decides what to do in a single case), nor does one anticipate how a certain type of action is going to impact on all values in all possible circumstances one may anticipate (as it happens when one teleologically adopts a general intention). When reasoning with propensities, one rather factorises the process: First one forms the view that when certain conditions are satisfied, it may be good to act in certain ways (since this may positively impact on some interests or values) and then, when these conditions (along with others) are satisfied, one weighs conditions for acting in these ways against conditions for acting differently.

This appears to be quite a rough way of deciding, since it cannot take well into account the way in which different values and different factors interact, nor can it ensure that all relevant values are taken into consideration (only the values

which already have led to forming propensities will contribute to the decision). However, this reasoning strategy seems to be adequate to a bounded agent living in a world like ours, an agent who is usually justified in taking the attitude which Simon (1965, xxv–vi) describes as follows:

> [He] is content with this gross simplification because he believes that the real world is almost empty —that most of the facts of the real world have no great relevance to any particular situation he is facing, and that most significant chains of causes and consequences are short and simple. Hence he is content to leave out of account those aspects of reality—and that means most aspects—that are substantially irrelevant at a given time.

Note that developing a propensity does not necessarily presuppose that one has a conscious picture of the goals that support the propensity. The propensity-formation process is largely unconscious: The goals supporting propensities can usually be precisely identified only through a process of rationalisation.

Consider my propensity for taking a walk when the weather is good, or, if you prefer, my belief that good weather favours taking a walk. I have no clear idea of the goals that such propensity serves: To identify them I need to engage in rationalisation (maybe the goal is keeping fit, or just enjoying the view, or . . .).

Finally, we need to consider that propensities seem to operate like force-vectors, which add their effect when going the same direction: Factors favouring the same action can be viewed as a combined factor providing a more solid support to that action (the analogy between reasons and forces is defended by Hage 1997). This is a feature that has also been described by Wisdom (1944, 187) using the following furniture-based metaphor (see also Twining and Miers 1991, 268):

> In such cases we notice that the process of argument is not a chain of demonstrative reasoning. It is a presenting and re-presenting of those features of the case which severally cooperate in favour of the conclusion, in favour of saying what the reasoner wishes said, in favour of calling the situation by the name which he wishes to call it. The reasons are like the legs of a chair, not the links of a chain.

For example, if the children being sick is a factor for staying at home, and so is the fact that I have some work to do, the combination of the two is a stronger factor for staying at home. This, as we shall see in Section 8.1 on page 221 may be seen as the foundation of some typical forms of analogy (the so-called *a fortiori* reasoning), that are particularly important in case-based legal reasoning.

6.2. Factors

As conditional intentions are doxified into rules, so propensities are doxified into what we call *factor/outcome-links*, or simply *factor-links*, that is, in the con-

nection between a certain factor and a certain legal outcome (a deontic or other qualification) which the factor favours.

As we shall see in the following sections factors may have different logical structures and they licence peculiar kinds of inferences.

6.2.1. Binary Factors and Dimensions

Some factors are *binary*. A *binary factor* either is fully present in a case (and the factor's outcome is favoured) or is fully absent: It does not make sense (or it is anyway irrelevant) to view the binary factor as being present to a higher or lower degree. For instance either today is a school holiday (this being a factor which favours taking the children to the sea) or it is not so. Similarly, either one is a woman (a man), this being a factor with favours one's appointment in an area where women (men) are underrepresented, or one is not.

Some other factors appear to be *scalable*: The more intensely they are present, the more they favour a certain action. For example, my children being sick is a factor for staying at home, but as the degree of sickness increases, so increases the strength with which this factor favours staying at home. Similarly, the malice of the author of a crime is a factor that increasingly favours his or her punishment: The more malice one has exhibited in committing a crime, the more the punishment should increase.

We shall call a scalable factors a *dimensional factor*, or simpler, a *dimension*, using the terminology proposed by K. Ashley and E. Rissland (Ashley 1990; Rissland and Ashley 1987), who introduced the use of dimensions in the analysis of legal knowledge.[1]

Some dimensions appear to have a *double direction*: Up to a certain degree they favour a certain outcome, above that degree they favour the opposite outcome. Consider for example the clearness of the sky. Having very little clearness (the sky is fully clouded) favours staying at home, but, as the sky becomes clearer, there is a point where the dimension changes direction and favours going out rather than staying at home.

Similarly, the goodness of the motives for which a crime has been committed provides a ground for diminishing punishment (and to diminish it more, the better being the motives), while the badness of such motives provides a ground for augmenting it (and for increasing it more, the worse being the motives): We may see the quality of the motives of a crime as being a continuous dimension (ranging from the noblest and worthiest motives, to the most abject and vile ones), having a tendency to influence the amount of the penalty towards a progressive increase.

As we shall see in Section 8.1.4 on page 225, transforming a continuous di-

[1] See also, for a recent discussion of the idea of a dimensions, Bench-Capon and Rissland 2001. On dimensions as scalable factors, see Bench-Capon and Sartor 2003.

mension into a binary factor (either motives are good or are bad, and there is a corresponding fixed increase or decrease of the sanction), is an additional strategy of bounded rationality for simplifying one's decisions, for making them easier and more foreseeable, though at the price of a reduced capacity of apportioning one's conclusions to the specific features of individual cases.

6.2.2. Factors and Principles

Factor-based reasoning plays a central role in moral and legal reasoning, though it is rarely specifically discussed under this heading[2] being rather approached in connection with the idea of a *principle*. For instance, the two paradigmatic examples of principles that are to be found in Dworkin 1977b, a contribution that originated a vast debate on the notion of a principle, seem to be properly classifiable as factor/outcome-links. The first principle is taken from case *Riggs vs Palmer*, a decision of a New York court (in 1889) that denied the inheritance to a person named in the will of his grandfather, who had killed the grandfather in order to inherit from him. The ground of this decision is idea that:

> No one shall be permitted to profit by his own fraud, or to take advantage of his own wrong, or to found any claim upon his own iniquity, or to acquire property by his own crime.

The second principle is taken from case *Henningsen vs Bloomfield Motors Inc.*, a decision from a New Jersey's Court (in 1960). In this case the judges recognised the liability of the manufacturer of a faulty car for the damages suffered by the buyer, though the contract between the manufacturer and the buyer included a limitation of liability. Their conclusion is supported by the idea that:

> The courts generally refuse to lend themselves to the enforcement of a bargain in which one party has unjustly taken advantage of the economic necessities of the other.

Both principles can easily be rephrased into factor/outcome-links: The first says that the fact than one has obtained a profit (advantage or property) through fraud (wrong or iniquity) favours the conclusion of not allowing one to keep that profit; the second says that the fact that one party in a contract has unjustly taken advantage of the economic necessities of the other party favours the conclusion that the contract should not enforced.

This interpretation is confirmed by Dworkin's description of the way in which principles work:

> [A principle] states a reason that argues in one direction, but does not necessitate a particular decision. If a man is or is about to receive something, as a direct result of something illegal he

[2] Reasoning with factors, is specifically addressed by Sunstein (1996a).

> did to get it, then that is a reason which the law will take into account in deciding whether he should keep it. There may be other principles or policies arguing in the other direction—the policy of securing title, for example, or a principle limiting punishment to what the legislature has stipulated. If so, our principle may not prevail, but this does not mean that it is not a principle of our legal system, because in the next case, when these competing considerations are absent or less weighty, the principle may be decisive. (Dworkin 1977b, 26)

Also other examples of principles indicated by Dworkin could be rephrased as factor links: An act being formally regular favours the conclusion that the act is enforceable, a punishment not having been explicitly established by the legislator favours the conclusion that the courts should not order that punishment, and so on.

To express the connection between a factor and the outcome it favours, one may use the word *reason*, saying that the factor is a reason for its outcome. However, we should pay attention that in this connection the word "reason" may refer to different objects and play different functions: In particular, when by speaking of a reason, sometimes we mean a *complete reason*, autonomously supporting a conclusion, sometimes we only mean a *subreason*, which only works as a component of a larger reason. For instance, we may say all of the following:

- The factor ⌈having obtained a profit though fraud⌉ is a subreason for the outcome it favours, that is, for ⌈not being allowed to keep the profit⌉: When one both believes that an instance of the factor is present (one person has obtained a profit through fraud) and endorses the factor link, one will be pushed towards the corresponding outcome (that person is not allowed to keep the profit).
- The factor link ⌈having obtained a profit though fraud favours not being allowed to keep the profit⌉ also is a subreason, for being pushed towards that same outcome.
- Any goal or value which is going to be promoted through the recognition of this factor/outcome-link (for example, the goal of reducing frauds, or of enhancing mutual trust) is a subreason for recognising the factor link, together with the belief that recognising the link will contribute to achieving this goal. Therefore the promoted goal lends an indirect support to any conclusion that can be obtained thanks to that link.

Our analytical apparatus allows us to distinguish all of these elements and to give each of them the appropriate place in reasoning.

It is particularly important to distinguish the notion of a factor/outcome-link from the notions of a value, as both values and factors are frequently merged under the heading of principles.[3]

[3] An assimilation of principles to values (or goals) is proposed by Alexy 1985, 75–7, who views principles as *commands to optimize*, which prescribe to reach a certain outcome as much as

On the contrary, we believe that the cognitive role of values is different from that of factors. Values (together with goals) find their proper role within teleological reasoning (which may support the adoption of both intentions and propensities), while factor-based reasoning has a different cognitive function, namely, providing an alternative to teleological reasoning.

Similarly, we need to distinguish factors and defeasible rules, which (or at least some of which) also are frequently called "principles."[4] While a factor (combined with the factor/outcome-link) only is a contributory reason for the favoured result, the antecedent of a defeasible rule (combined with the rule itself) is a defeasibly sufficient reason for the rule's effect. In other words, when believing that a certain factor exists in the current situation, I am not committed to assume that, in the absence of reasons to the contrary, the favoured result obtains. On the contrary, when believing that the antecedent of a defeasible rule is satisfied, I am committed to assume that in the absence of reasons to the contrary, the rule's consequent obtains.

We will not provide a precise characterisation of the notion of a *principle*. It seems to us that it is better to use term *principle* in a generic way, namely, as expression or the importance of a certain legal noema (a piece of normative information), and of the fact that this noema is the premise from which further significant noemata (like legal rules, instrumental legal values, specific factors) can be inferred. In fact, it seems to us that qualifying a legal noema as a principle usually entails no commitment to a specific logical function or form, or to a specific origin.[5]

With regard to the logical form and function of legal noemata we believe that the four classes we have so far identified—indefeasible rules, defeasible rules, values, and factors—may be viewed as providing an adequate classification. One can find instances of "principles" (important premises of legal reasoning) within all such classes. We can correctly speak of a principle with regard

possible. From our perspective, this can only be accepted as a synthetic characterisation of what needs to be analytically specified: A value is to be maximised in the sense that, everything else being equal, it is better to achieve more of it rather than less; defeasible rules are to be maximised in the sense that they have to applied whenever there are no prevailing reasons to the contrary; factors-links have to be maximised in the sense that factors determine the outcomes they favour, whenever they have a sufficient strength (combined with other factors) and are not overridden by contrary factors.

[4] Principles are characterised in a rule-like way in Nozick 1991. The assimilation of principles to defeasible rules is assumed by Atienza and Ruiz Manero (1998), who view principles as rules having open conditions of applications. If openness consists in the fact that a "principle" is not to be applied when there are prevailing reasons against doing that, then principles are indeed defeasible rules.

[5] This seems to correspond to the way in which the term "principle" is currently used by jurists (Alpa 1993, see, among the others) and has been used along legal history (see Pattaro 1988). In a similar sense, also the term *general clause* (in German, *Generalklause*; in Italian, *clausola generale*) is often used (see for instance Rodotà 1987). The notion of a principle is downplayed by Raz 1972, while the opposition of rules and principles is affirmed by Sieckmann 1990.

to all of the following: a legal value, like ⌈human dignity is a fundamental legal value, to be protected and advanced⌉; an indefeasible rule, like ⌈nobody shall ever be tortured⌉; a defeasible rule, like ⌈workers have a right to strike⌉; a factor/outcome-link, like ⌈the fact that an interpretation corresponds to the textual meaning of a statute favours its endorsement⌉.

As we can use the term *principle* to denote legal contents having different logical structures, we can use it to refer to contents having different origins. In particular, we can correctly speak of a principle non only with regard to ideas pertaining to legal tradition or political morality, but also with regard to contents that are expressed in positive sources of the law: in a constitution (like the principle that workers have a right to strike, included in the Italian Constitution), in ordinary legislation (like the principle of vicarious liability of employers, stated in the Italian Civil code), in case law (like the principle that health damages are to be compensated, introduced by Italian judges some years ago).

6.2.3. Factors, Dimensions and Standards

The notion of a factor, and in particular of a *dimension*, can be connected to a further kind of legal information, *legal standards*, that is, those legal models of behaviour which, according to Pound (1954), have the following characteristics:

> (1) They all involve a certain moral judgment upon conduct. It is to be "fair," or "conscientious," or "reasonable," or "prudent," or "diligent." (2) They do not call for exact legal knowledge exactly applied, but for common sense about common things or trained intuition about things outside of everyone's experience. (3) They are not formulated absolutely and given an exact content, either by legislation or by judicial decision, but are relative to times and places and circumstances and are to be applied with reference to the facts of the case in hand.

From our perspective, a standard (fairness, good faith, reasonableness, care) appears to be a *dimension*, and in particular a property which increasingly favours a positive evaluation of the activities to which it applies (the more one is fair, conscientious, reasonable, prudent, the more praiseworthy one's behaviour is).

However, the application of the standard involves also other kinds of legal information. The standard is combined with a one or more *rules*, legally requiring that a certain level of the standard is maintained in certain domains (for instance different rules of law may require different levels of care in different activities and with regard to different professions). These rules can be cast as an obligational rules: ⌈Producers have a duty of care to their customers⌉, ⌈Contractual parties must be fair toward one another⌉, and so forth.

Determining the required dimensional levels may require teleological considerations: Given the goals of facilitating the formation of contracts, promoting mutual trust, and preventing litigation, but also of ensuring the liberty of contractors and limiting the cost of contracting, what minimum level or fairness

and consciousness should be legally required from the parties? The required level of the standard can also be determined with reference to an exemplar or prototype: the normal person, the good father of a family (*bonus pater familias*), the good medical doctor, lawyer, accountant, and so on (on prototypes, see Section 6.2.7 on page 191).

Establishing whether this level has been achieved requires extralegal knowledge, proper to the domain of activity that is being considered. For instance, to establish whether a doctor has behaved with the required level of medical care, one needs to consider what medical information was accessible to him or her, whether this information was used correctly understood and applied in his or her work, whether a sufficient degree of attention was maintained, and so on.

6.2.4. Factors in Legislation

In his famous characterisation of principles, Dworkin (1977b) identifies further characters of them (besides the fact that they operate as factors): Principles are dependent on morality (rather than on expediency), they have the function of protecting individual rights (rather than advancing social goals), they are included in legal culture (rather than having been expressly stated by a legislator). Not all such characters apply to all factors.

In particular, the relevance of certain factors may depend upon legislative choice: The legislator may state explicitly what factors are, or are not, to be considered when taking a particular decision.

For example, the Italian criminal code specifies what factors may lead to an aggravation of a crime (like the fact that it was committed with cruelty), and what factors may lead to its attenuation (like the circumstance that the author of the crime acted in a state of wrath, caused by the behaviour of the victim), and requires the judge to balance those factors to establish whether the aggravation or the attenuation prevail, and consequently increase or decrease punishment.

Though there are some rules that constrain the evaluation of aggravating circumstances, this evaluation seems to correspond to the model of factor-based thinking we have just described. In fact this is the way in which the Norwegian legal theorist Torstein Eckhoff describes the evaluations involved in sentencing (see Twining and Miers 1991, 269), though he refers to the criteria governing such evaluations by using the term *guiding standards*.

> To know the relevant reasons is not the same as having reached a solution. The weighing of reasons still remains. This weighing is, of course, very easy when all relevant reasons pull in the same direction. But still it is a different process from that of subsuming a set of facts under a rule. And a weighing of reasons which pull in different directions can give rise to considerable doubt and scruples. [. . .] Take for instance, principles of sentencing, which I conceive of as typical examples of guiding standards. They supply answers to the question of what must be taken into account when deciding whether an offender should be sentenced and what the sentence should be. They tell us, for instance, that the gravity of the offence and the age and record of the offender must

be considered. But they do not determine whether a particular offender should be discharged or imprisoned, or what the length of his prison sentence should be. These questions are left to the judge who has to base his decision on a weighing of the relevant factors. (Eckhoff 1976, 217)

As another example of legislative factors, consider for example the US Copyright Act, which mandates, at section 107, that:

In determining whether the use made of a work in any particular case is a fair use the factors to be considered shall include:

- the purpose and character of the use, including whether such use is of a commercial nature or is for non-profit educational purposes;
- the nature of the copyrighted work;
- the amount and substantiality of the portion used in relation to the copyrighted work as a whole, and
- the effect of the use upon the potential market for or value of the work.

The factors in section 107 are bi-directional dimensions:

- the more the use is no-profit the more fair use is favoured, the less it is so the more copyright protection is favoured;
- the more the content is factual the more fair use is favoured, the less the content is factual (the more the content is fictional) the more copyright is favoured;
- the smaller the used portion the more fair use is favoured, the bigger the portion the more copyright is favoured;
- the smaller the impact upon the market value of the work, the more fair use is favoured, the larger the impact the more copyright is favoured.

This example clarifies the difference between factors on the one hand and values on the other hand. Factors are not results one should aim at achieving as much as possible in the future (through a specific action or through the general practice of a rule). They are rather features of the existing (or pre-existing) situation favouring a certain normative conclusion: While values are forward-looking, factors are backward-looking.

The relationship between factors and values is not identity but *teleology*: The reason why a factor is recognised as promoting a certain outcome consists in the fact that through recognising this factor/outcome connection (by giving the factor a certain weight when taking a decision) one promotes certain values.

For example, by giving relevance to the factual nature of a work as favouring its fair use, one promotes the values of knowledge and information, while by giving relevance to its fictional nature as a factor for copyright protection one promotes creativity.

However, when one reasons with factors, one does not need to refer to the connection between factors and the underlying values, and one does not even

need to be aware of such connections. This simplifies the reasoning of the agent, who can find "satisficing" solutions (as Simon would say, see Section 5.1.1 on page 146) without engaging in the complexities of teleological reasoning. One needs to move up to values only when factor-based reasoning leads to absurd or meaningless outcomes, or when one has to adjudicate a conflict of competing factors. Under such circumstances, one needs to engage in rationalisation, trying to secure the doubtful or contested factor/outcome-links by anchoring them to values.

A failure to provide this anchorage signals that a factor/outcome-link may have to be abandoned, since it does not play any acceptable function. For example, up to a certain time, in Italian criminal law, the fact of acting out of sense of honour was considered to be a factor favouring a considerable reduction in criminal punishment (especially in cases of homicide between partners or relatives, in particular when extramarital relations were at issue). However, at a certain time this factor started to have less and less importance, as people started to look in a different way at family relationships.

6.2.5. Factors in Case-Based Reasoning

Factor-based thinking is an essential aspect of case law. For a clear reference to factors and factor-based reasoning, we will refer to the case *Playboy Enterprises Inc. vs George Frena* (1993). In this case the judges had to decide whether the publication of some Playboy photos on a subscription-based bulletin board, maintained by George Frena, implied a infringement under 15 U.S.C. Section 1114.

One of the central points to be established concerned the likelihood that confusion was caused by the fact that Frena used the word "Playboy," a registered mark, in presenting those photos. Here is how the judges describe how this evaluation needs to be performed:

> The following factors are highly relevant in deciding whether there is a likelihood of confusion: "(1) the type of mark at issue; (2) similarity of marks; (3) similarity of product or services; (4) identity of purchasers and similarity of retail outlets; [. . .] (6) the defendant's intent; and (7) actual confusion." Ice Cold Auto Air, 828 F.Supp. at 935 (citing Freedom Sav. and Loan Ass'n, 757 F.2d at 1182-83). The Court, however, is not required to specifically mention each of these factors in making its decision. See Univ. of Georgia Athletic Ass'n v. Laite, 756 F.2d 1535, 1542 (11th Cir.1985) (analyzing the factors in the context of a claim of unfair competition). Rather than simply determining whether a majority of these factors indicate a likelihood of confusion, a court must "evaluate the weight to be accorded the individual factors and then make its ultimate decision." [. . .] An analysis of fewer than all seven factors may support a finding of likelihood of confusion. See Univ. of Georgia Athletic Ass'n, 756 F.2d at 1543. In the Eleventh Circuit, the type of mark and evidence of actual confusion are the most important factors.

Thus, according to the judges, the conclusion that there is a likelihood of confusion (a conclusion that may lead, in its turn, to establish that there was a trade-

mark infringement) depends upon a number of scalable factors. These factors are to be weighed together, in their variable combinations, to see whether they are sufficient to support that conclusion in a particular case.

6.2.6. The Role of Factors in Practical Inference

Practical inference based on conditional intentions is quite different from practical inference based upon propensities. In the first case, one just needs to check whether the intention's pre-condition is satisfied, and then perform the action, unless exceptions emerge. The agent having a propensity, on the contrary, needs to do the following:

- first collect factors favouring or disfavouring a certain outcome, both pros and cons;
- then compare the combined strength of the two sets of factors, and
- finally, according to this evaluation, form an intention (or refrain from forming it).

We may distinguish two ways in which such an intention is formed.

The first way consists in reasoning directly with factors, without forming general intentions or endorsing rules. The presence of a certain combination of factors directly leads the agent to form the specific intention to perform a particular action.

The second way consists in moving from the recognition that a certain combination of factors supports a certain conclusion to the adoption of a general commitment: One shall endorse the conclusion whenever that combination of factors is present. This means that this set of factors becomes the antecedent of a conditional instruction, to which one gets committed. As usual, such instruction can be doxified into a conditional normative proposition.

For example, after my child falls seriously ill, having being taken to the sea while she was sick, I may commit myself to the intention of never taking my child to the sea when she is sick. This means that I commit myself to viewing the fact that my child is sick no longer only as a (contributory) factor favouring staying at home but rather as the antecedent of an abstract instruction I am committed to. I can still assume that prevailing counterreasons may impede the application of the instruction, but unless I am satisfied that such counterreasons exist, I intend to implement the instruction.

As a legal example, assume that in a certain legal system, the educational nature of a certain use of a copyrighted work favours the conclusion that it is a fair use. A lawyer could argue that the value of education is so overwhelming that this factor/outcome-link should originate a conditional rule: The law should be viewed as including a rule to the effect that any educational use is fair.

The opposite passage can also take place, to wit, one may transform a conditional instruction into a factor/outcome-link: Rather than rigidly committing

oneself to that instruction, one may choose to view the instruction's antecedent as a factor which needs to be balanced in the concrete case with factors to the contrary.

For example, one may argue that under the conditions of the Internet society, where circulation of information has become ubiquitous and costless (so that one cannot limit the unwanted uses of one's work, once it has been made accessible), a rule to the effect any educational use is fair would involve an inadmissible compression of the rights of the authors: Rather than as a rule, the connection between educational and fair use it to be viewed as a factor/outcome-link, the relevance of which has to be evaluated case by case, according to the ways and circumstances of the educational use.

We will not provide reasoning schemata for the transformation of factors into rules (and vice versa), since such ways of reasoning do not appear to pertain to ratiocination, but rather to heuresis and theory construction, namely, to the processes through which one attempts to improve one's practical theory, either by making it more rigid, or more flexible. We will consider these processes in some detail in Chapters 28 and 29.

6.2.7. Factors, Dimensions, and Prototypes

Factors and dimensions are connected to another very important notion—which is applicable in different fields, like linguistic, artificial intelligence, and legal theory—the notion of a *prototype*.

It has been frequently observed that many legal concepts are not characterised through a set of necessary and jointly sufficient conditions, but rather through a prototype, or through a set of prototypes, connected by *family resemblances*.[6] Prototypical meanings are not limited to legal language: It seems that the concept we are most familiar with (the notions of a table, a plate, a chair, a fruit, a game) are not understood through precise definitions, but rather through prototypes or exemplars. These concepts elicit a set of typical cases to which we compare the objects of our experience: We conclude that a concept applies to an object when the similarities between the concept's prototypes and the object outweigh their differences (and no alternative concepts gives a better match).

In general, to check whether a certain entity is an instance of a prototypical notion one has to consider: (*a*) to what degree and in what combination the features characterising the prototype are present in that entity, and (*b*) whether the entity has additional features, which are absent in the prototype, and which would hinder the present prototypical features from playing their normal function.

[6] On family resemblances, see Wittgenstein 1974, secs. 67ff., who introduced this idea, Rosch and Mervis 1975, who developed it within cognitive psychology, and Hart 1983c, 174–275, who applied it to the law.

In artificial intelligence and law, the idea of prototypical reasoning has been advanced in particular by McCarty (1982), in particular with regard to company law. In his model, indeterminate legal concepts are represented by three elements: (*a*) an optional invariant, indicating necessary, but not sufficient, conditions for the concept (for example, in the domain of corporate positions, holding a share of a certain object); (*b*) a set of paradigms or prototypes (for examples the prototypes of stockholding, bondholding, etc., each of those being characterized by a bundle of rights and obligations); (*c*) a set of transformations (or deformations), allowing one prototype to be mapped (transformed) into other prototypes (for example, to map stockholding into bondholding), or concrete cases to be related to a prototype.

Also German legal theorists have dedicated much effort to the idea of a legal prototype, assuming that a *Typus* is "characterised by features that do not need always to be present together, or that can be present to different extents in the concrete instances" (Larenz 1992, 131; my translation). As examples of prototypically characterised notions, Larenz (1992) indicates the notion of the "essential component of an object" (*wesentliche Bestandteil einer Sache*), which depends on the measure in which the component contributes to the normal functions of the object, or the notion of the guardian of an animal (*Tierhalter*), a qualification which is dependent on the extent to which one has control over the animal in one's own interest. He also argues that for establishing whether a certain entity is an instance of a *Typus* one has to refer to values, that is, one has to consider whether—with regard to the relevant values—it would be appropriate that the entity produces the legal effects that are connected to the *Typus* (on *Typen*, see also Kaufmann 1965, and Hassemer 1968).

We cannot hope to provide here a precise analytical understanding of the notion of a prototype (which would be a substantive achievement for legally theory) and of its connections with related ideas such the sociological notion of a pure or *ideal type* (see Weber 1947, chap. 1, sec. 1.a.10). We shall just consider whether our notions of a factor and a dimension can provide an insight into prototypical thinking.

Let us assume that the variable and exchangeable features that characterise legal prototypes are viewed as factors and dimensions. Correspondingly, we characterise a prototypical qualification as being favoured by certain factors or along certain dimensions, and we view prototypes as consisting in the optimal combinations of such factors and dimensions.

For example, assume that the law grants particular warranties to employees (protection against unjustified dismissals, against mobbing and discrimination, health insurance, and so on), warranties which are not available, or not to the same extent, to independent workers. Assume also that the qualification of a worker as an employee would be favoured to the extent that the worker is dedicating a larger proportion of his working time to one work-giver, is following the directions of the work-giver, is working within the premises of the work-giver or using the work-giver's tools.

With regard to such dimensions, not only can we build the notion of a prototypical employee (a person who is working full time for a single employer, under detailed directions, within the employer's premises and using the employers' tools), but we get a multi-dimensional space were we can locate different real or hypothetical cases. For instance, assume that we locate within this dimensional space case c_1 where a judge concluded for the existence of an employment relationship between a_1 and b_1, where a_1 is a woman who was working in her house, but was dedicating 80% of her working time to the work-giver b_1, and following b_1's detailed instruction, and mostly using b_1's tools.

Once that we have characterised the dimensional space, and have located within this space the known positive or negative examples at our disposal, we can reason analogically, in order to establish whether a certain hypothetical or real case can be characterised as an instance of the prototypical concept. This would be done by considering what factors and dimensions apply to the new case, and comparing the new case to the known instances of the prototypical notion (according to *a fortiori* reasoning or other ways of analogising).

For instance, consider case c_2 where a_2 is a man dedicating 90% of his time to work-giver b_2, and a_2 is following b_2's directions and using b_2's tools to the same extent in which a_1 was following b_1's directions, used b_1's tools, and so on. Under these circumstances, *a fortiori* reasoning allows us to conclude that indeed also the relation between a_2 and b_2 is an employment relationship. Consequently, we can conclude that also b_2, like b_1, has rights to health insurance, to a certain degree of stability in his job, and so on (on *a fortiori* reasoning, see Section 8.1 on page 221, in particular Section 8.1.2 on page 222 and Section 8.1.6 on page 233).

When *a fortiori* reasoning cannot be used (or when one wants to challenge past classifications), one needs to resort to values. The assignment to a prototype involves reference to values since values explain why factors and dimensions promote the classification under a certain prototype: Such classification determines certain legal effects, and connecting these legal effect to the relevant factors and dimensions (by means of the intermediate prototypical concept) contributes to some values.

For instance, when we cannot or do not want to rely on analogies from past exemplars of relationships between workers and work-givers, which have already been qualified as instantiating or not instantiating the employment relationship, we need to engage in teleological reasoning: We need to examine to what extent the existence of an employment relation under certain conditions (when certain factors are present) would contribute to realise the values that underlie a stable employment relationship (mutual trust, security, freedom from arbitrary power, the chance to develop long term life projects, and so on), and weigh these values against the values that may be satisfied by a more flexible arrangements (economic freedom, efficiency, increased access to work, and so forth).

This evaluation may lead us to restructure the dimensional space, adding certain exemplars or even changing the qualifications of previously classified exemplars (for example, seeing instances of employment relationships where we previously saw independent work, or vice versa).

By appealing to the idea of a dimension (or to the interchange of equivalent factors), we may explain McCarty's idea of a transformational matching between a prototype and its candidate instances. By increasing or decreasing the level to which a dimension is satisfied, or by cancelling, adding, and exchanging factors, we can move from an hypothetical exemplar or real case to other exemplars or cases within the same dimensional space.

Finally, the possibility of passing from factors and dimensions to rules, and vice versa, through theory-construction processes (as we shall see in Chapter 28), explains the dialectical movement of legal thinking between the prototypical characterisation of legal notions and the attempt to capture these notions through precise definitions.

Chapter 7

PREFERENCE-BASED REASONING: RULES

In Chapters 7 and 8 we shall examine an aspect of legal cognition that integrates the main forms of reasoning we have so far considered: rule-based defeasible reasoning, teleological reasoning, and factor-based reasoning. This is *preference-based reasoning*, by which we mean addressing conflicts of reasons by taking into account the relative importance of such reasons, on the basis of the weight of the elements they include: rules, values, and factors. We have already considered how to take into account the relative importance of values in Section 5.2 on page 150. Therefore, we shall now focus on rules, and address factors in the next chapter.

7.1. Rules and Preferences

When a rule[1] leads us to a conclusion that is incompatible with what can be inferred through another rule, we must make a choice, and accordingly endorse only one of the two inferences (unless we reject both of them). The rational way to approach such conflicts, which legal reasoning shares which common-sense reasoning, consists in moving into *preference-based reasoning*.

7.1.1. Undecided Conflicts

As an example of a conflict between two incompatible rules, consider the case of Tom, who endorses both the rule that one is forbidden to drive at a speed higher that 80 km per hour on suburban roads, and the rule that he is obliged to be at work at 8 o' clock every morning. Unfortunately, it is now 7.30, and he knows that there are still 50 km to go, so that he has no chance to be at work in time while respecting the speed limit. Under these circumstances (see Table 7.1 on the next page), he needs to decide which one of the two inferences $\mathcal{A}$ and $\mathcal{B}$ to perform, and consequently, which conclusion to endorse.

According to the two inferences, Tom could derive the following conclusions: ⌈I am obliged to get to my office by 8 o' clock⌉ and ⌈I am forbidden to go at a speed higher than 80 km per hour⌉. These conclusions are not contradictory (they are mutually consistent), when seen in isolation from the back-

[1] By a *rule* we mean any general instruction or normative proposition. Remember that we speak of an *instruction* to refer to the content of an intention, and we view *normative propositions* as being the doxification of instructions.

Inference $\mathcal{A}$		Inference $\mathcal{B}$	
(1)	I am now driving on a suburban road;	(1)	today it is a working day;
(2)	when one is driving on a suburban road, one is forbidden to go at a speed higher that 80 km per hour	(2)	every working day, I am obliged to get to my office by 8 o' clock
(3)	I am forbidden to go at a speed higher than 80 km	(3)	I am obliged to get to my office by 8 o' clock

Table 7.1: *Conflicting inferences*

ground knowledge. However, these propositions are incompatible in Tom's case, since Tom gets a contradiction when he combines them with further information (which he has no reason for questioning), such as the information that now it is 7.30, and that his office is 50 km away.

The situation we have just considered is particularly perplexing since it seems that Tom has no way out. He will be faulty in any way, either for violating the speed limit, or for being late at work. Until he has decided which fault is lighter than the other, he is left in a state of perplexity: Both propositions ⌈I ought to slow down⌉ and ⌈I have to speed up⌉ seem equally appealing to him, or at least he has no reason for preferring the one to the other. Choosing arbitrarily one of the two seems to be irrational.

A more serious kind of undecided practical clash is provided by Sartre's story concerning a young man who has to decide whether to join the partisan war or to stay by his old mother (this case is discussed in Sartre 1988). Not to speak of Hamlet's famous dilemma: "To be or not to be: that is the question/ Whether 'this nobler in the mind to suffer/ The slings and arrows of outrageous fortune,/ Or to take arms against a sea of troubles, And by opposing end them?" (Shakespeare 1981, sec. 3.1, 64–8)

For a similar situation in the epistemic domain, consider Laura's state of mind when she finds her house flooded, and (*a*) Laura's daughter Mary tells her that she (Mary) did not leave the tap on (it must have been her brother Anthony), while (*b*) Laura's son Anthony tells her that he did not do it (it must have been his sister Mary). Assume also the following: (*c*) Laura is certain that one of her children did it (she knows that only her daughter and her son were in the house), and she is usually ready to believe her children. Under such conditions, she is incapable of forming an opinion on the matter, and making an arbitrary choice seems to be irrational.

In the framework for defeasible reasoning we sketched in Chapter 2.2, we are in front of a case of *reciprocal* defeat (reciprocal rebutting): The reasoner is incapable of forming a definite opinion on the matter at hand since two in-

compatible conclusions elide each other. The reason for adopting one such conclusion would provide a sufficient stimulus for endorsing that conclusion, unless the reason for adopting the incompatible conclusion was present. However, given that both reasons are jointly present in the reasoner's mind, neither of them is decisive (yet).

Here one may suggest, with Pollock (1995, 64), that there is a fundamental difference between practical and epistemic reasoning:

- epistemic rationality requires that one refrains from adopting any one of two equally strong incompatible conclusions;
- practical rationality, instead, may require that one selects randomly one of the two conclusions.

The practical necessity of making a choice would be required for avoiding the fate of the famous *Buridan's ass*, which starved to death standing between two haystacks that were indistinguishable in accessibility and delectability. However, as we shall see in the following, the need to choose at random (whatever one may say on the rationality or the morality of lotteries, see Elster 1989) may be avoided if one comes to believe that one inference prevails over the other.

7.1.2. Priority Beliefs

The importance of conflicts of reasons in legal thinking has been recognised and emphasised especially by the realist movement and, more recently, by the critical legal studies. Both approaches view such conflicts as a confirmation of their scepticism towards legal reasoning (as opposed to power and interest): Conflicts of legal reasons can only be decided by the "sovereign prerogative of choice" of the judge (Holmes 1897). On the contrary, we believe that practical cognition, can also approach conflicts of reasons, and identify preferable choices (with the possible exception of "Buridan's ass cases"), or at least rationalise intuitive evaluations.

To find a rational way out of perplexity, the reasoner must come to believe that the reason supporting a conclusion is stronger or preferable to the reason supporting the other. If one comes to have such belief, then one should view only the weaker inference (the inference based upon the weaker reason) as being defeated (rebutted), and should adopt the conclusion of the stronger inference.[2]

[2] An additional approach to cope with uncertainty consists in probabilistic inference, which in the law can be profitably used to evaluate factual evidence, when appropriate input data are available. We cannot address here the many legal and epistemological issues linked to the assessment of evidence, on which see, among the others, Anderson and Twining 1991, with regard to the common law, and Taruffo 1992, with regard to civil law jurisdictions. On the doctrine of fact-finding, see Peczenik, Volume 4 of this Treatise, sec. 1.6. For an introduction to the philosophy of probabilistic inference, see Cohen 1989. For an attempt to apply defeasible reasoning in examining evidence, see Prakken 2001b.

In Section 2.2.6 on page 64 we observed that when there is a collision between reasons R_1 and R_2, at least one of the two colliding reasons is defeated and possibly both of them. We have also observed that when R_1 prevails over R_2, we should endorse the conclusion of R_1, and refrain from accepting the conclusion of R_2: In this case R_2 is defeated by R_1 but R_1 is not defeated by R_2.

This leads us to specify the notion of defeat through the following definition.

Definition 7.1.1 *Defeat. Reason* R_2 defeats *reason* R_1 *when*

1. R_1 *collides with* R_2*, and*
2. *it is not believed that* R_1 *prevails over* R_2

According to this definition, one's belief that a reason R_1 prevails over its competitor R_2 prevents the defeat of R_1. Consequently, one may endorse the conclusion of R_1 (one may perform the corresponding inference) even while continuing to endorse the R_2 (but one will not endorse R_2's conclusion). In this case, we also say that the prevailing reason *strictly defeats* the weaker one.

Definition 7.1.2 *Strict Defeat. If* R_1 *defeats* R_2*, but* R_2 *does not defeat* R_1*, then* R_1 strictly defeats R_2*.*

With regard to establishing what reasons prevail, we have to distinguish rebutting collisions and undercutting collisions:

- in rebutting collisions, the stronger reason prevails;
- in undercutting collisions, the undercutter prevails.

With regard to rebutting collisions, the decisive issue now becomes that of establishing when one reason is stronger then its competitor. We shall assume that the decisive element—in establishing the comparative strength of two competing syllogisms–is indeed the comparative strength or *priority* of their rules. Thus the decisive issue would be that of establishing when a rule is preferable to another rule.

For this purpose, we shall restrict ourselves to a specific type of inference, that is, *normative syllogism*, and in particular to what we have called *rule-syllogism*. As we have seen in Section 2.1.2 on page 49, this is the inference that makes it possible to infer properties of rules or relationships between rules according to a meta-rule. In particular, in our case we shall infer that a rule r_1 is stronger then another rule r_2, given a reason including (beliefs in):

- the fact that the concerned rules r_1 and r_2 are in a certain relation;
- the meta-rule saying that whenever a couple of rules (like r_1 and r_2) are in these relation then the one of them is stronger then the other.

7.2. Kinds of Rule Preferences

In the following sections we shall see how different priority criteria allows us to infer priorities between the concerned rules, and thus adjudicate their conflicts.

7.2.1. Source-Based Priority

The comparative importance of competing rules frequently depends on the fact that they have been issued by different agents, endowed with a different levels of normative power (see Chapter 25). Under such conditions, the reasoner should adopt the normative conclusion following from the normative proposition that was stated by the agent endowed with greater normative power. This applies more generally whenever a certain comparative level of strength (a certain priority) is associated with a certain source of law (see Section 25.2 on page 653), according to the traditional saying that *lex superior derogat legi inferiori* (a superior law derogates an inferior one).

This way of reasoning is not limited to legal contexts. As a common-sense example, consider the plight of Mark, a nice little boy who is ready to obey to both his mother and his older sister. The problem for him is what to do when he gets conflicting indications. What if mother told him that he is forbidden to watch television after 9 pm, and his older sister, who is in charge of him today but does not want to be bothered, tells him that today he is allowed to watch television as much as he likes? It seems that under such conditions Mark should give priority to the prescription of his mother, and conclude that he is still forbidden from watching television.

A similar situation is that of a law-abiding civil servant, who in post-war Italy had to decide whether to go on strike: The Italian Constitution gives every worker the right to strike, but statutory rules issued under the Fascist regime (included in the criminal code) prohibited striking, and one such rule especially referred to civil servants, punishing their strikes with a severe penalty. Under such conditions, it seems that the civil servant would be right in giving priority to the Constitution, and consequently in concluding he was permitted to strike.

Assume that our civil servant was considering the two inferences in Table 7.2 on the next page. To establish which inference to endorse, the civil servant needs to establish which inference is based upon a stronger reason. This requires that he establishes the comparative strength (preferability) of the premises in those reasons, and in particular of the constitutional rule ⌈Workers have the right to strike⌉ and the statutory rule ⌈Civil servants are forbidden to strike⌉. This comparison also requires reasoning, and in particular a syllogistic step, as shown in Table 7.3 on the following page. Having come to the conclusion that the constitutional rule prevails, the civil servant will adopt the belief that the inference based upon the constitutional rule (inference $\mathcal{A}$) is stronger

Inference $\mathcal{A}$	Inference $\mathcal{B}$
(1) I am a worker;	(1) I am a civil servant;
(2) workers have the right to strike	(2) civil servants are forbidden to strike
(3) I have the right to strike	(3) I am forbidden to strike

Table 7.2: *Conflict of syllogisms: right or prohibition to strike*

(1) ⌈workers have the right to strike⌉ is a constitutional rule;
(2) ⌈civil servants are forbidden to strike⌉ is a statutory rule;
(3) constitutional rules are preferable to statutory rules

---

(4) rule ⌈Workers have the right to strike⌉ is preferable to rule ⌈civil servants are forbidden to strike⌉

Table 7.3: *Preference inference*

than the inference based upon the statutory rule (inference $\mathcal{B}$). Accordingly, he will view the latter inference as being defeated, but not the former, and he will endorse the conclusion of the former inference (he has the right to strike).

In certain legal systems (such as the Italian one), a Constitutional Court has the power of striking out statutory rules violating the Constitution. However, before the statute is voided legal reasoners need to relate constitutional and statutory prescriptions, performing the kind of reasoning we have just presented.

7.2.2. Time-Based Priority

In other cases, the clue for adjudicating the clash of competing inferences is given by temporal priority, according to the traditional saying that *lex posterior derogat legi priori* (a subsequent law derogates the previous one).

Also this kind of prioritisation is not limited to the law. For a common sense example, assume that Lisa asks her parents whether she is allowed to go out tonight with her friends. Her parents at first give a negative answer to her request: She is forbidden to go out, since she must complete her homework. However, at 8 o' clock, seeing that she accepts their verdict, but that she feels very unhappy and distressed about having to stay at home while all her friends are going out (she is crying in her room), her parents change their mind, and tell her that she is permitted to go out, if she really wants to do so. Under such

Inference $\mathcal{A}$	Inference $\mathcal{B}$
(1) Tom is a legitimate owner of his copy of "The Concept of Law," by H.L.A. Hart;	(1) "The Concept of Law," by H.L.A. Hart, is a copyrighted work;
(2) legitimate owners of a copyrighted work are permitted to duplicate it for personal use	(2) anyone is forbidden to photocopy more than 1/3 of a copyrighted work
(3) Tom is permitted to duplicate his copy of "The Concept of Law," by H.L.A. Hart	(3) Tom is forbidden to photocopy more than 1/3 of "The Concept of Law," by H.L.A. Hart

Table 7.4: *Conflict of syllogisms in intellectual property law*

conditions it seems that Lisa may safely conclude that she may disregard the previously expressed normative proposition, and conclude that she may go out.

A similar conflict results from the fact that a legislator issues a new normative statement that is incompatible with a previously issued one. Consider, for instance, how various countries have issued laws restricting fair use of copyrighted work (for example, by limiting the number of pages one is allowed to photocopy, or by requiring that a fee is paid). Clearly, a judge deciding a copyright case after one such law has been enacted will consider that the rules of the new law prevail over the previous, more liberal, legislation. Accordingly the judge will conclude, for instance, that Tom is now forbidden from photocopying a whole book for personal use, though this was allowed by pre-existing laws.

For instance, assume that Tom would like to make a copy of all pages of "The Concept of Law," the well-known jurisprudential contribution of H.L.A. Hart. Being a law student, before performing this operation, Tom considers the legal aspects involved: Is copying this book permitted or forbidden? (see Table 7.4). The answer to this question is provided by the principle of temporality, or of *priority by posteriority*, as is shown in Table 7.5 on the following page.

The idea that subsequent laws take precedence over previous ones is quite a reasonable assumption: This is necessary to adapt the law to new social needs and political ideas, it is required to implement the intention of the norm issuers, it is a shared uncontroversial thesis of our legal culture. Note, however, that also the opposite idea, namely, the idea that older laws prevail over newer ones may be appealing under some situations. This idea—though difficult to be realised in practice—may be appropriate to cultures that view history as progressive deterioration, also with regard to practical cognition.

Inference $\mathcal{C}$

(1) the rule ⌈anyone is forbidden to photocopy more than 1/3 of a copyrighted work⌉ was issued subsequently to the rule ⌈legitimate owners of a copyrighted work are permitted to duplicate it for personal use⌉;
(2) subsequently issued rules are preferable to anterior ones

---

(3) the rule ⌈anyone is forbidden to photocopy more than 1/3 of a copyrighted work⌉ is preferable to the rule ⌈legitimate owners of a copyrighted work are permitted to duplicate it for personal use⌉

Table 7.5: *Preference inference*

Inference $\mathcal{A}$		Inference $\mathcal{B}$	
(1)	Tweety is a bird;	(1)	Tweety is a penguin;
(2)	birds fly	(2)	penguins do not fly;
(3)	Tweety flies	(3)	Tweety does not fly

Table 7.6: *Specificity in epistemic syllogisms*

7.2.3. Specificity-Based Priority

A further clue for adjudicating normative conflicts is given by the idea that more specific rules prevail over more general ones, according to the traditional saying that *lex specialis derogat legi generali* (a special law prevails over a general one).

This way of reasoning is very frequently adopted in common-sense reasoning both in practical and in epistemic domains. In Table 7.6 you can see an epistemic example that is often mentioned in the literature on defeasible reasoning, to show that it makes sense to prefer more specific inferences. Given that Tweety is both a bird and a penguin, we would be led to conclude both that he flies and that he does not: The latter conclusion prevails since it is based upon a more specific property (penguins are a specific type of birds).

As a more significant example of a common-sense situation involving a conflict of rules, consider the case of a pregnant woman, Mary, who is reading the instructions for taking certain pills (assume that she trusts these instructions, and is ready to endorse all of them). She first reads that an adult person may take up to three pills a day and then, at the bottom of the instructions, she reads that pregnant women should not take more than two pills a day. The former instruction entails that Mary (who is undoubtedly an adult) may take three pills a day, but the latter, more specific, instruction entails that she should not take more than two.

Inference $\mathcal{A}$	Inference $\mathcal{B}$
(1) I am an adult;	(1) I am pregnant;
(2) if one is an adult, then one may take up to three pills a day	(2) if one is pregnant, then one ought not to take more than two pills a day
(3) I may take up to three pills a day	(3) I ought not to take more than two pills a day

Table 7.7: *Specificity in practical syllogisms*

It appears that in such a case, the rational way to process this information is to conclude that she should not take more than two pills. Thus, she should prefer and endorse the second of the inferences represented in Table 7.7 (inference $\mathcal{B}$).

The reason why she should prefer the second inference is that it is based upon more specific information, since pregnant women are a strict subset of adults (at least if we assume that all pregnant women are adults). This seems to correspond to a rational reasoning-pattern: If we know that something normally holds for a certain set of entities, but that something incompatible holds for a subset of such entities (which includes the case we are interested in), we had better focus on the features of the subset.[3] In general, if we can reach a certain conclusion, on the basis of having certain pieces of information about an entity (the fact that it is a human being), and we can reach a different conclusion on the basis of having more information about that entity (the fact that it is a pregnant human being of feminine sex), then the conclusion we obtain on the basis of our having more information is to be preferred (this can be linked to the idea of subproperty defeat, see Pollock 1995, 69).

In case of rules that have been voluntarily issued (see Chapter 23), and thus may be assumed to result from an intelligent effort, the idea of specificity defeat emerges from the likely intention of the rule issuer (at least when we may assume that the issuer is proceeding sensibly): We need to conclude that more specific rules are intended to prevail over more general ones, unless we assume that the rule-issuer wanted to generate an undecided conflict or to produce a useless rule (as the more specific rule would be, if all inferences including it were always strictly defeated by inferences based on more general rules).

Moreover, the very fact that people (and in particular lawyers) reason according to specificity-defeat is a ground while one should adopt this principle,
