Aller Idealismus ist Verlogenheit vor dem Nothwendigen.

All idealism is mendaciousness in the face of necessity.

(Friedrich Nietzsche, *Ecce Homo*, 1888)

Science is what we know and philosophy is what we don't know.

(Bertrand Russell, *Bertrand Russell Speaks His Mind*, 1959)

TABLE OF CONTENTS

A Note on the Author and the Contributors XV

Editor's Preface XIX

Assistant Editor's Preface XXXI

Part One - The Reality That Ought to Be: Problems and Critical Issues 1

Chapter 1 - A First Glance 3

1.1. The Reality That Ought to Be as Opposed to the Reality That Is 3
1.2. The Law and the Right. What Is Objectively Right and What Is Subjectively Right 5
1.3. What Is Objectively Right as the Content of Norms. Four Meanings of "Right" 9

Chapter 2 - Dualism and Interaction between the Reality That Ought to Be and the Reality That Is: Validity as a Pineal Gland 13

2.1. Constitutive Types and Valid Tokens as Independent of Norms 13
2.1.1. Validity as Congruence 13
2.1.2. Some People Speak of Types. The So-called Typicality of Law 15
2.1.3. Other People Presuppose Types 17
2.1.4. Types Are Constitutive, Rules Are Regulative 18
2.1.5. Simple and Compound Types and Tokens 20
2.1.6. Competence, or Capacity 21
2.2. The Chain of Normative Production. The So-called Typicality of Law 22
2.2.1. The Primacy of the Reality That Ought to Be 22
2.2.2. Valid and Invalid Behaviours 24
2.2.2.1. Noblesse Oblige 24
2.2.2.2. Four Possibilities 27
2.2.3. Ought-Effects Are neither Valid nor Invalid 32

Chapter 3 - Taking a Dive into the Sources of Law 35

3.1. Where to Jump in From 35
3.2. Facts, Acts, and Transactions as Valid Is-Events Which Cause Ought-Effects in What Is Subjectively Right 35
3.2.1. Generalia 35
3.2.2. Is-Facts Strictly Understood 36
3.2.3. Is-Acts Strictly Understood 37
3.2.4. Transactions, or Declarations of Will 38
3.3. Distinguishing Ought-Effects in What Is Subjectively Right from Ought-Effects in What Is Objectively Right 39
3.4. Sources of Law as Valid Is-Events (Facts, Acts, and Declarations of Will) Which Cause Ought-Effects in What Is Objectively Right 41
3.5. Sources of Law as Ought-Effects (in What Is Objectively Right) Caused by Sources of Law as Valid Is-Events 43
3.6. The Sovereign Normative Will as the Source of Positive Law in the Natural-Law School and in German Legal Positivism Alike 47
3.6.1. Two Glorious Examples 47
3.6.2. The State of Nature and the Promise 48
3.6.3. What Divides and What Unites the Natural-Law School and German Legal Positivism 51

Chapter 4 - The Problem of the Matrix 57

4.1. The Matrix of Normativeness as the Ultimate Source of What Is Right by Virtue of Human-Posited Norms 57
4.2. A Problem of Authenticity 61
4.2.1. Orthogonal Norms and Straight Rules 61
4.2.2. A Few Qualifying Remarks 64
4.2.3. Umm al-Kitāb*: The Mother of the Book, or the Matrix of the Koran* 66
4.2.4. The Great-Grandmother of Positive Human Law 69
4.3. Nature as the Matrix of Normativeness 70
4.3.1. A Traditional Starting Point 70
4.3.2. Nature as the Will of God 74
4.3.3. Nature as Biological Instinct 75
4.3.4. Nature as Divine and Human Reason 77
4.3.5. Nature as the Cosmic Order 78
4.4. The Origin of the Term *Jus Positivum* 80

Part Two - The Reality That Ought to Be: A Monistic Perspective. Norms as Beliefs and as Motives of Behaviour 83

Chapter 5 - The Motives of Human Behaviour 85

5.1. Summary of Part One and Brief Considerations on Some Legal-Philosophical Orientations 85
5.2. Encoding of Behaviour-Types: Human Personality and Culture 89
5.3. The Conditional Connection between Types of Action and Types of Circumstance. Habits and Practices 90
5.4. Needs, Interests, Values, and Norms 92

Chapter 6 - Norms as Beliefs 97

6.1. The Concepts of Norm and Custom 97
6.2. The Existence of a Norm Presupposes at Least One Believer (Doxia) 98
6.3. The Conditionality of the Content of a Norm: The Type of Action and the Type of Circumstance. More on What Is Objectively Right 101
6.4. The Referents of a Norm: Being a Duty-Holder (Deontia) or a Right-Holder (Exousia). More on What Is Subjectively Right 105
6.5. The Being-in-Force of a Norm: Being a Duty-Holder and a Believer (Nomia). The Not-Being-in-Force of a Norm: Being a Duty-Holder and a Nonbeliever (Anomia) 108
6.6. The Efficaciousness and Inefficaciousness of a Norm: Abiding and Deviant Duty-Holders. The Whited Sepulchres and the Jesuits. Efficacious Norms as a Subset of Effective Norms 109
6.7. In the Case of Anomia, a Norm Can Be either Obeyed (Conformism of Duty-Holding Nonbelievers) or Not Obeyed (Nonconformism of Duty-Holding Nonbelievers), but It Cannot Be Efficacious or Inefficacious 112
6.8. Practising Duty-Holders and Non-Practising Duty-Holders 113

Chapter 7 - How Norms Proliferate in Human Brains 115

7.1. Subsuming Valid Tokens under a Type of Circumstance and Producing Derivative Norms from the Type of Action Conditionally Connected with the Type of Circumstance 115
7.2. Proliferation from Norms of Conduct. Static Systems and Dynamic Systems 117
7.3. Proliferation from Competence Norms 123

Part Three - Family Portraits. Law as Interference in the Motives of Behaviour 129

Chapter 8 - No Law without Norms 131

8.1. Family Portraits. A Normativistic Gallery: Axel Hägerström, Karl Olivecrona, and H. L. A. Hart 1961 131
8.1.1. A Caution for All Visitors 131
8.1.2. A Critique of Voluntarism in Favour of Normativism 131
8.1.3. Norms versus Commands 133
8.1.3.1. Diversity among the Contextual Requirements 133
8.1.3.2. What Is Objectively Right: The Internal Point of View, a Point of View Internalised in the Brains of Believers, and Which Manifests Itself in Their Use of a Typically Normative Language 134
8.1.3.3. Universalisability of Norms (Catholodoxia) 135
8.1.3.4. Justified Reaction to Transgression (Dikedoxia) 136
8.1.4. In What Sense Can a Norm Be Said to Exist (Doxia) 137
8.1.5. Constitutional Norms (Hägerström and Olivecrona) and the Rule of Recognition (Hart) 139
8.1.6. Misinformation about Scandinavian Legal Realism 142
8.2. A More Targeted Reckoning with "Validity" in Legal Discourse 145
8.2.1. The Broad and the Narrow Sense of Competence Norms and Norms of Conduct 145
8.2.2. On the Function of a Valid Slap 146
8.2.3. The Metonymic Validity of Legal Directives and Texts of Law 147
8.2.4. The Slippery Slope of Validity. Norms Cannot Be Issued, or Enacted 149
8.2.5. Validity in Its Traditional Sense as a Source of Misguided Legal Normativism: Validity, Law in Force, and Normativeness 156
8.2.6. Going beyond Hart in Treating the Relationship between Validity and Normativeness in Law 158
8.2.6.1. Intra-Systemic Norms 158
8.2.6.2. The Difference between Criteria and Rules as a Difference between Types and Norms 166
8.3. Hart's *Postscript* Compared with Hart 1961: An Abjuration of Normativeness in Law 172
8.3.1. Hart's Masterpiece of 1961 172
8.3.2. Hart the Iconoclast: The Postscript*'s Destruction of the 1961 Portrait* 174
8.3.3. Summing up on Hart 1961 and on Hart's Postscript 181

Chapter 9 - But Norms Are Not Enough.
The Interaction between Language and Motives of Behaviour 187

9.1. From Norms to Propositions: The Analytical Emasculation 187
9.2. Indices, Symbols, and Conative Effects. Directives 190
9.3. Language That Bypasses the Motives of Behaviour: Suggestion and Charisma 198
9.4. Language That Overwhelms the Motives of Behaviour: Power 201
9.5. Language That Affects the Motives of Behaviour: Influence 202
9.5.1. Influence Affecting Needs, Interests, and Values 202
9.5.2. Influence Affecting Norms 203
9.6. Language That Modifies the Internalised Reality That Ought to Be: Authority (Integration between Norms and Validly Enacted Directives or Texts) 205

Chapter 10 - The Law in Force: An Ambiguous Intertwining of Normativeness and Organised Power 209

10.1. Underscoring the Role of Force in Law in order to Avoid Misunderstandings with regard to Normativism 209
10.2. The Law in Force 214
10.2.1. Orthodoxia and Catholodoxia. The Normative Social Control on Believers: Dogmas, Heterodoxia, Paradoxia, Heresy 214
10.2.2. Dikedoxia. The Normative Social Control on Duty-Holders: The Idea of Just Coercion 218
10.2.3. The Characters of the Play, the Play of Characters 222
10.2.4. Who Is to Say What Is the Law in Force: The Judges as Managers of What Is Subjectively Right (Dikaspoloi) 232
10.2.5. The Law in Force as Domination (Herrschaft) 240
10.2.6. On Authority, Autonomy, and Heteronomy 243

Part Four - In Search of Confirming Others 247

Chapter 11 - The Reality That Ought to Be as Fate 249

11.1. Consciousness of Death, Anxiety, and Self-Defensive Creation of Myth 249
11.2. *Heimarmenē* and *Moira*: To Each His Own 260
11.3. The Double Conditionality of Fate. *Huper Moron* at the Origins of Chisholm's Paradox 262
11.3.1. Kata Moiran*: In Accordance with the Norm* 262

11.3.2. The Possibility of Acting beyond the Norm: Huper Moron 263
11.3.3. The Fulfilment of the Second Condition: Huper Moron *Behaviour, the Violation of the Norm. Chisholm's Paradox* 264

Chapter 12 - What Is Right in Homeric Epic 269

12.1. Homage to Eric A. Havelock 269
12.1.1. Why Havelock? 269
12.1.2. A Heresy Unaccomplished 271
12.1.3. The Anthropology of the Homeric Poems: The Didactic Function of Epic in the Oral Civilisation of the Early Greek City-States 275
12.2. A Revisitation of Homeric *Dikē* in the Light of the Distinction among "Norms," "What Is Objectively Right," and "What Is Subjectively Right" 279
12.2.1. Premise 279
12.2.2. Norms and Society 280
12.2.3. Dikē *as What Is Objectively Right* 283
12.2.4. Dikai *as What Is Subjectively Right and Its Management, That Is,* Dikē *as the Restoration of What Is Right* 288
12.2.5. "Right" and "Wrong" as Adjectives Used to Qualify Things and People 292

Chapter 13 - What Is Right, What Is Just, *Ratio* as Type: *Sanctus Thoma Docet* 295

13.1. *Jus* in the History of the Idea of What Is Right 295
13.2. Three Senses of *Quod Est Rectum*, or What Is Right. *Jus* as What Is Right (*Quod Est Rectum*) toward Others 297
13.3. *Jus* as the Objective of Justice: *Justitia Est Rectitudo Causaliter Tantum* 299
13.4. The Justice of Human-Posited Norms (*Justitia Legalis*) Presupposes the Constant and Perpetual Just Will of the Ruler Who Has the Community in His Care 303
13.5. In What Sense Is the Justice of Human-Posited Norms (*Justitia Legalis*) General 306
13.6. Prudence and Justice in the Judgments That Judges Are to Pass 312
13.7. *Jus* (What Is Right toward Others) Is Made Right, in What Concerns Its Essence (*Essentialiter*), by the Type (*Ratio*) Contained in a *Lex* (Norm) 315

13.8. The *Redde Rationem* (the Day of Reckoning): *Ratio* as Type in the Rendition of the Fathers of the English Dominican Province 324

Chapter 14 - The Law and What Is Right. Hans Kelsen under Suspicion 333

14.1. Prologue 333
14.2. Kelsen in the 1940s 333
14.3. A Few Other Contemporary English Translations of *objektives Recht* and *subjektives Recht* 336
14.4. The "Dualism" between *objektives Recht* and *subjektives Recht*: A Further Investigation into Kelsen 340
14.5. Kelsen's Reduction of What Is Subjectively Right to What Is Objectively Right. A Textual Analysis (or Rather a Crossword Puzzle) 341
14.6. How What Is Subjectively Right, Having Been Pushed out the Front Door, Slips in through the Back Disguised as an Individualised Norm 349

Chapter 15 - Nature and Culture 355

15.1. Summing up on My Confirming Others 355
15.2. Eighteen Thousand Centuries of Culture 357
15.2.1. From Homo Habilis *to* Homo Sapiens Sapiens 357
15.2.2. Culture Encoded in Human Brains and Culture Inscribed in Documents and Artifacts 358
15.2.3. Types and Memory 362
15.2.4. What Is Mind? No Matter. What Is Matter? Never Mind. Social Construction of Reality and the Construction of Social Reality 365
15.2.5. Norms in the Formation of Individual Personality. Socialisation and Normative Revolution (Metanoia) 368
15.3. The Micro-Macro Link 371
15.3.1. Cognitive and Social Action: A Society of Minds 371
15.3.2. The Interaction between Social Structure and Character Structure 374
15.3.3. Norms and the Mental Implementation of a Social System 379
15.3.4. Internalising the Reality That Ought to Be: From Significant Others to the Generalised Other 384
15.4. The Palingenesy of the Psychological Aspects of the Internal Point of View. Overcoming the Analytical Paradigm: Willard Van Orman Quine, John R. Searle, and the Neurosciences 389

15.5. A Few Closing Remarks That Go Back to What Is Right and Law: What Is Right by Nature and What Is Right by Law as Cultural Products 406

Appendix - Elements for a Formalisation of the Theory of Norms Developed in This Volume
(by Alberto Artosi, Antonino Rotolo, Giovanni Sartor, and Silvia Vida) 413

1. Preliminaries 413
2. The Definition of "Norm" 415
3. Duty-Holder (Deontia) and Right-Holder (Exousia). The Being-in-Force and Not-Being-in-Force of a Norm. Efficaciousness and Inefficaciousness of a Norm 416
4. How Norms Proliferate in Human Minds 421

A NOTE ON THE AUTHOR AND THE CONTRIBUTORS

ENRICO PATTARO is professor of philosophy of law at the University of Bologna, president of the Italian Association for Legal and Political Philosophy, and a former president as well as an honorary president of the International Association for the Philosophy of Law and for Social Philosophy (IVR). He has some familiarity with the committees of jurists called on to draft texts of law; for example, from 1997 to 1999 he chaired the legal committee appointed by the Italian government to draft the bills of law for Italy's changeover to the euro. His scholarly interests are in general jurisprudence, the history of ideas, computer science and law, and the studies concerned with the formation of character and personality in the context of social structure. He has written fifteen books and about 200 other works; among them, "Validità o verificabilità del diritto?" in *Rivista trimestrale di diritto e procedura civile* (Milan, Giuffrè, 1966); "Il realismo giuridico come alternativa al positivismo giuridico," in *Rivista internazionale di filosofia del diritto* (Milan, Giuffrè, 1971); *Il pensiero giuridico di L. A. Muratori tra metodologia e politica* (Milan, Giuffrè, 1974); "Il positivismo giuridico italiano dalla rinascita alla crisi," in *Diritto e analisi del linguaggio* (Milan, Comunità, 1976); *Lineamenti per una teoria del diritto* (Bologna, Clueb, 1985); "Alle origini della nozione Principi generali del diritto: Profilo storico-filosofico," in *Soggetto e principi generali del diritto* (Milan, Giuffrè, 1987); and *Temi e problemi di filosofia del diritto* (Bologna, Clueb, 1994). Among the works of which he is editor are *Le fonti normative sull'euro* (Roma, Ministero del Tesoro, del Bilancio e della Programmazione Economica, 1999, 2 vols.) and *Codice di diritto dell'informatica* (Padua, Cedam, 2000).

ALBERTO ARTOSI graduated in philosophy at the University of Bologna in 1974. He became research assistant in logic and philosophy of science in 1983, and professor of logic of normative systems in 1992. He was subsequently professor of philosophy of science at Bologna University and is currently professor of legal logic and legal computer science at the Faculty of Law of the University of Bologna and a member of CIRSFID (Research Centre for History of Law, Philosophy and Sociology of Law, and Computer Science and Law). His major publications include some monographies; in particular, *Metodi tableaux per la logica classica e modale* (Bologna, Clueb, 1995), *Il paradosso di Chisholm: Un'indagine sulla logica del pensiero normativo* (Bologna, Clueb, 2000), and *Studies on Normative Reasoning: Logical and Philo-*

sophical Perspectives (Bologna, Clueb, 2000), and several essays on automated deduction in non-classical logics, deontic logic, and formal ethics. His current research topics include normative reasoning, philosophy of law, and legal computer science. He is a member of the editorial board of the journal *Discipline filosofiche* (Macerata, Quodlibet).

ANTONINO ROTOLO (PhD, Padua) is research scientist in legal philosophy at the University of Bologna Law Faculty. He is a member of CIRSFID (Research Centre for History of Law, Philosophy and Sociology of Law, and Computer Science and Law) at the University of Bologna. He published two monographic volumes: *Identità e somiglianza: Saggio sul pensiero analogico nel diritto* (Bologna, Clueb, 2001) and *Istituzioni, poteri e obblighi: Un'analisi logico-filosofica* (Bologna, Gedit, 2002). He has also written several essays on the application of formal logic for modelling legal reasoning and on the relation between law and practical reason. He is assistant editor of *Ratio Juris: An International Journal of Jurisprudence and Philosophy of Law* (Oxford, Blackwell).

GIOVANNI SARTOR is currently professor of computer and law at the University of Bologna, a position he took up after earning his PhD at the European University Institute (Florence), working at the Court of Justice of the European Union (Luxembourg), doing research at the Italian National Council of Research (ITTIG, Florence), and holding the chair in jurisprudence at Queen's University of Belfast (where he is now honorary professor). He is coeditor of the journal *Artificial Intelligence and Law* (Dordrecht, Springer) and has published widely in legal philosophy, computational logic, legislation technique, and computer law. Among his publications are *The Law of Electronic Agents* (Oslo, Unipubskriftserier, 2003), *Judicial Applications of Artificial Intelligence* (Dordrecht, Kluwer, 1998), *Logical Models of Legal Argumentation* (Dordrecht, Kluwer, 1996), and *Artificial Intelligence in Law* (Oslo, Tano, 1993).

SILVIA VIDA graduated in philosophy at the University of Bologna in 1994, and in 1999 earned a doctorate in philosophy of law at the University of Milan. She is currently research assistant in philosophy of law at Bologna University and member of CIRSFID (Research Centre for History of Law, Philosophy and Sociology of Law, and Computer Science and Law). She is author of two books, *Norma e condizione: Uno studio dell'implicazione normativa* (Mi-

lan, Giuffrè, 2001), on the logic of conditional norms, and *Saggi sulla filosofia morale di William David Ross* (Bologna, Gedit, 2003), on the metaethical aspects of moral intuitionism, as well as of a number of essays on logic and the philosophy of norms. Her current research topics include normative reasoning, formal ethics, and more recently philosophy of politics. She is assistant editor of *Ratio Juris: An International Journal of Jurisprudence and Philosophy of Law* (Oxford, Blackwell).

EDITOR'S PREFACE

1. The Five Theoretical Volumes

The present Treatise divides into a theoretical and a historical part. This preface introduces the theoretical part. The volumes of the historical part deserve a separate preface, which I will premise to the first of these volumes, the sixth of this Treatise: *A History of the Philosophy of Law from the Ancient Greeks to the Scholastics*, edited by Fred D. Miller, Jr., in association with Carrie-Ann Biondi Khan.

The five theoretical volumes are 1. Enrico Pattaro, *The Law and the Right: A Reappraisal of the Reality That Ought to Be*; 2. Hubert Rottleuthner, *Foundations of Law*; 3. Roger Shiner, *Legal Institutions and the Sources of Law*; 4. Aleksander Peczenik, Scientia Juris: *Legal Doctrine as Knowledge of Law and as a Source of Law*; and 5. Giovanni Sartor, *Legal Reasoning: A Cognitive Approach to the Law*. These volumes are theoretical by definition, in a stipulated sense of "theoretical" expressing the aforementioned division of the Treatise volumes into two classes, theoretical and historical.

In a second sense, the qualifier "theoretical" is conventional, rather than stipulated: It is rooted in the scholarly tradition that in continental Europe traces back to the German *allgemeine Rechtslehre*. This German expression should properly be rendered as "general doctrine of law," even though the term *Lehre* ("doctrine"), as it occurs in the expression, is often translated as "theory," and that even in the languages of civil-law countries, examples being *teoría, théorie,* and *teoria* in Castilian, French, and Italian respectively.[1] In any event, in this second, conventional sense, "theoretical" stands for "legal-theoretical" and applies properly to Volumes 3 through 5.

In a third sense we have "theoretical" as distinguished from "metatheoretical," this in the light of Alfred Tarski's (1901–1983)[2] use of the distinction between language and metalanguage (Tarski 1983).

With reference to the distinction between "theoretical" and "metatheoretical," and taking the two previous qualifications also into account, Volume 1 (which introduces the entire Treatise) can be said to be an intertwining of theory, metatheory, and history, and specifically a history of ideas; Volume 2 is

[1] But compare the Swedish *allmän rättslära*, which instead is literal to the German expression it translates, *allgemeine Rechtslehre*. On legal doctrine, legal theory, and related terms, see, in this Treatise, Peczenik, Volume 4, Chapters 1 and 2.

[2] Antonino Rotolo, in the Assistant Editor's Preface, which follows this preface, explains, among other things, the criteria used for indicating the dates of birth and death of the people mentioned in this volume as well as some of its other editorial aspects.

declaredly metatheoretical; Volume 3 is theoretical; Volume 4 is part-theoretical, part-metatheoretical; and Volume 5 is prevalently metatheoretical.

We can now give some substance to these distinctions. I will begin with Volumes 3 through 5, which I qualified as legal-theoretical (in the second of the three senses listed, the conventional sense).

Roger Shiner, in Chapter 1 of Volume 3, draws as follows the distinction between "strictly institutionalized sources of law" and "quasi-institutionalized sources of law":

A law, or law-like rule, has a strictly institutionalized source just in case:

i) the existence conditions of the law, or law-like rule, are a function of the activities of a legal institution

and

ii) the contextually sufficient justification, or the systemic or local normative force, of the law, or law-like rule, derives entirely from the satisfaction of those existence conditions.

Clause (i) is intended to capture the idea of a "source" for a rule, and clause (ii) the force of the qualification "strictly." Two further comments are needed on this definition. The expression "law-like rule" is added to permit the possibility that certain forms of law less close to the paradigm of institutionalized sources of law might still qualify as strictly institutionalized sources of law. It might be thought controversial whether the decisions of such sources are "laws" in some strict sense. Also, the term "contextually sufficient" is taken from Aleksander Peczenik (1983, 1; 1989, 156–7). Peczenik defines a contextually sufficient justification as one "within the framework of legal reasoning, in other words, within the established legal tradition, or paradigm." "Deep" or "fundamental" justifications, by contrast, are those from outside the framework of legal reasoning, such as justifications by moral reasoning. For Peczenik, strictly institutionalized sources would be a sub-class of contextually sufficient justifications, but not the whole class (1989, 157). I am concerned, then, in this volume with that sub-class.

Other sub-classes would include the forms of justification considered in Volumes 4 and 5 of this Treatise, as "quasi-institutionalized sources of law." Consider, for example, coherentist justifications for legal claims. It might be that, within some jurisdiction, a legal claim is regarded as justified if in fact it is the one of competing claims, which coheres best with the existing body of justified claims within that jurisdiction. Neil MacCormick has argued for the validity of such coherence-based arguments within common law legal reasoning (MacCormick 1984, 46–7; 1978, 152–7, 233–40). Ronald Dworkin extended the idea to include coherence with principles whose postulation would make the legal system the best it could be (Dworkin 1986, 226ff.). Similarly, in most jurisdictions there are well-understood rules for the interpretation of statutes (Cross, Bell, and Engle 1995; MacCormick and Summers 1991). [...] Both coherence and interpretation are analyzed by Aleksander Peczenik in Volume 4 of this Treatise. Similarly, there are a variety of modes of legal reasoning and argumentation. A distinction can be drawn between cases decided by the content of a legal source "directly" and cases decided after supplementation of the content of the legal source by one or more acceptable forms of legal argumentation. The source may be said to be a "strictly institutionalized source of law" in the first case, but a "quasi-institutionalized source of law" in the latter case. The analysis of forms of legal argumentation is undertaken by Giovanni Sartor in Volume 5 of this Treatise [...].

We are not going to investigate the ultimate sources of legal validity itself, if that is taken to be an enquiry into what moral values, or what political forces, or what historical antecedents led to a particular law being a part of the system of which it is a law.[3]

[3] Shiner, Volume 3 of this Treatise, Chapter 1, 3–4. Cf. ibid., 7, 19, 32–3, 85–113, 115, 140–1, 145, 150, 158, 197–8, 210, 215, 217, 221–3, 227–9.

I borrowed this passage by Shiner because—on the basis of the distinction between "strictly institutionalized sources of law" and "quasi-institutionalized sources of law"—he sets out the legal-theoretical program of Volumes 3 through 5 at the same time as he indicates, on the other hand, and by exclusion, the areas consigned, in full or in part, to the investigation undertaken in Volumes 1 and 2.

In fact, there were three distinctions that from the outset served as guiding principles at the meetings held to set out the guidelines for the various drafts of the Treatise project: In the first place, there was the mentioned distinction between the "theoretical" and the "historical" volumes; in addition, there was at work, in the theoretical volumes, the distinction between "strictly institutionalized sources of law" and "quasi-institutionalized sources of law" and, in the historical volumes, the distinction between the philosophers' philosophy of law and the jurists' philosophy of law.[4]

Thus, the legal-theoretical Volumes 3, 4, and 5 were initially and provisionally entitled as follows: Volume 3 was *Strictly Institutionalised Sources of Law* and eventually became *Legal Institutions and the Sources of Law*; Volume 4 was *Quasi-Institutionalised Sources of Law I: Legal Dogmatics* and eventually became Scientia Juris: *Legal Doctrine as Knowledge of Law and as a Source of Law*; and Volume 5 was *Quasi-Institutionalised Sources of Law II: General Legal Theory, Logic, and Legal Computer Science as Auxiliary to Legal Dogmatics* and eventually became *Legal Reasoning: A Cognitive Approach to the Law*. Analogously, Volume 6, the first of the historical volumes, was initially and provisionally entitled *The Philosophers' Philosophy of Law from Greece to the Seventeenth Century* and eventually became *A History of the Philosophy of Law from the Ancient Greeks to the Scholastics*.

In Volumes 3 through 5 there is a fourplex idea involved, as I see the matter, in speaking of "strictly institutionalized sources of law" and "quasi-institutionalized sources of law": (*a*) In a broad sense, all of social reality and culture is an institutional reality (cf. Section 15.2.4 of this Volume 1); (*b*) law is part of the institutional reality, or rather, of cultural reality, as I prefer to say; (*c*) law and the sources of law need to be analytically distinguished, even though "sources of law" is not infrequently taken to mean "kinds of law" (cf. Section 3.5 of this volume); and (*d*) once the sources of law in the sense of "kinds of law" have been distinguished within the sphere of social, cultural, and institutional reality broadly understood,[5] they will need to be further dis-

[4] It was Norberto Bobbio (1909–2004) who made the distinction between the jurists' philosophy of law and the philosophers' philosophy of law (Bobbio 1965, 43ff.): He favoured the first of these two, in the sense that he judged it to be the task of professional philosophers of law to work with the jurists, and hence to be able to carry on with them a meaningful discourse.

[5] Cf. Sections 15.2 and 15.5 of this volume and Fassò 1953 (Guido Fassò, 1915–1974).

tinguished, or at least can be further distinguished to advantage, by applying to the expression "sources of law" the qualifiers "strictly institutionalised" and "quasi-institutionalised." The sense of this last distinction is that statutory law, customary law, and judge-made law, for example, are each a strictly institutionalised kind of law, however much they are so to different degrees and in different ways; in contrast, legal dogmatics, the general theory of law, and legal logic, for example, are each a quasi-institutionalised kind of law, however much they are so to different degrees and in different ways.

The distinctions just made came to bear when we started working on the Treatise. Of course, what counts as the outcome of this process, even in what concerns the distinction between "strictly institutionalised sources of law" and "quasi-institutionalised sources of law," is the outcome fixed in the theoretical volumes in their present form. So this is how the matter was finally worked out: Shiner, in Volume 3 (*Legal Institutions and the Sources of Law*), treats of legislation, precedent, custom, delegation, constitutions, international law, general principles, and authority, and does so with explicit reference to strictly institutionalised sources of law; Peczenik, in Volume 4 (Scientia Juris: *Legal Doctrine as Knowledge of Law and as a Source of Law*), with implicit reference to quasi-institutionalised sources of law, treats from different angles, and entering into several interrelated questions, of general and particular legal doctrine, legal theory, legal interpretation, coherence, defeasibility, and reflective equilibrium in legal doctrine, and also of metatheory and ontology in legal doctrine; and Sartor, in Volume 5 (*Legal Reasoning: A Cognitive Approach to the Law*), likewise with implicit reference to quasi-institutionalised sources of law, treats from different angles, and entering into several interrelated questions, of practical rationality, basic forms of reasoning, doxification of practical reasoning, normative beliefs, various kinds of rationalisation and rationality, multi-agent practical reasoning, collective intentionality, and legal bindingness: These topics he discusses in Part I of his magnum opus (the entire volume consisting of over eight hundred pages, for an overall twenty-nine chapters and 102 sections); in Part II he treats of legal logic, covering an entire spectrum of questions.

As we can gather from Shiner's previously quoted passage, Volumes 3 through 5 are not concerned with "deep or fundamental justifications"—the justifications found "outside the framework of legal reasoning"—or with "any enquiry into what moral values, or what political forces, or what historical antecedents led to a particular law being a part of the system of which it is a law." By exclusion, these questions are consigned, in full or in part, and along with other questions, to Volumes 1 and 2 of the Treatise (and of course to the historical volumes).

In Volume 2, Rottleuthner addresses from an explicitly metatheoretical angle the question of the foundations of law, and he distinguishes seven kinds of foundations: basic, fundamental concepts; basic research; logical and episte-

mological foundations; moral or legitimacy foundations; historical, genetic foundations of law; extralegal foundations of law; and preconditions for the efficacy of law. He further distinguishes the extralegal foundations of law (Chapter 3 of Volume 2) from the internal foundations of law (Chapter 4 of Volume 2). The extralegal foundations of law can be transcendent (mythological and religious foundations of law) or immanent (natural, economic, moral, societal, political, and historical foundations of law). Examples of internal foundations of law are found in the theories of Hans Kelsen (1881–1973), Niklas Luhmann (1927–1998), and Lon Fuller (1902–1978).

Rottleuthner criticises "mono-foundationalism" in application to law, such as happens in Karl Marx (1818–1883) and Friedrich Engels (1820–1895), and welcomes instead "multi-foundationalism": "a multi-variate approach of the kind that can be found," for example, in Max Weber (1864–1920) (Volume 2 of this Treatise, xi).

***

I will turn now to the present Volume 1. Here, theory and metatheory, as well as the history of ideas, find themselves variously intertwined in a discourse devoted to unpacking the theme of the law and the right, and also in an effort to reappraise the reality that ought to be (the Ought, *das Sollen*, normativeness) from a monistic perspective.

This volume is divided into four parts: *Part One*, "The Reality That Ought to Be: Problems and Critical Issues" (Chapters 1 through 4); *Part Two*, "The Reality That Ought to Be: A Monistic Perspective. Norms as Beliefs and as Motives of Behaviour" (Chapters 5 through 7); *Part Three*, "Family Portraits. Law as Interference in the Motives of Behaviour" (Chapters 8 through 10); and *Part Four*, "In Search of Confirming Others" (Chapters 11 through 15).

In Chapter 1, I outline the Is-Ought dualism ("reality that is" versus "reality that ought to be"), a dualism proper to the tradition of legal thought in civil-law countries; and then I bring out (*i*) an underlying ambiguity that manifests itself in the use of "law" as an English equivalent for such terms as *derecho*, *diritto*, *droit*, and *Recht*, proper to the languages of civil-law countries, and (*ii*) the complex web of concepts that this ambiguity conceals. Further, the expressions "what is objectively right" and "what is subjectively right" are introduced and four senses of "right" and one of "wrong" are specified. Some of the questions dealt with in this chapter are taken up and developed in Section 2.2, Chapter 3, Section 5.1, Chapter 6, Section 10.2.4, Chapter 11, Section 12.2, and Chapters 13 and 14.

In Chapter 2 the concept of validity is introduced and connected with the distinction between types and tokens. Further, the idea of normative production (or normative causality) is taken into consideration and connected with the idea of the typicality of law. Some of the questions dealt with in this chap-

ter are taken up and developed in Chapter 3; Sections 5.2, 5.3, and 6.4; Chapter 7; and Sections 8.2, 9.6, 13.7, 13.8, and 15.2.3.

In Chapter 3 I take a dive into the sources of law, showing the parallelism between operative facts and sources of law in one sense of this expression. It is pointed out, further, that "sources of law" takes other meanings as well, notably "kinds of law" and "legal norms as Ought-effects in the reality that ought to be," between which there needs to be a clear distinction. Lastly, voluntaristic normativism is introduced and exemplified with reference to Grotius (1583–1645) and Kelsen, in which regard a continuity is underscored between the voluntaristic-normativistic conception of positive law occurring in natural-law theories (even in rationalistic ones) and the voluntaristic-normativistic conception of positive law occurring in German legal positivism. Some of the questions dealt with in this chapter are first mentioned or introduced in Chapters 1 and 2 and are taken up and developed in Sections 4.3 and 4.4, Chapter 7, and Section 9.6.

In Chapter 4, the first of the historical chapters in Volume 1, I discuss the matrix of normativeness as the ultimate source of what is right by virtue of human-posited norms: There come into play here some of the foundations that Rottleuthner treats more amply in Volume 2 and that Rotolo, in Chapter 7 of Volume 3, calls "sources of validity" in line with a long-established and venerable tradition. I also call the Koran into play in regard to the problem of the matrix; and Grotius and Kelsen are taken up anew; so, too, different classic conceptions of "nature" and the origin of the term *jus positivum* are considered. But what I am especially concerned to underline in this chapter is how the problem of the ultimate source of what is right, in all the manifestations of it described here, comes down to the problem of the authenticity of norms (Section 4.2): Cicero (106–43 B.C.) speaks of *vera lex*, and Augustine (354–430) and Aquinas (1225/1226–1274)[6] of the cases in which a *lex* is not a *lex sed legis corruptio* (it is not a norm but the forgery of a norm). And it is for this reason that I introduce (in Sections 4.1 through 4.3) the expression "matrix of normativeness." Some of the questions dealt with in Chapter 4 are first mentioned or introduced in Section 3.6 and are then taken up again in Sections 5.1, 13.7, and 15.5.

In Chapters 5 through 7 (Part Two) I present and flesh out my vision of the reality that ought to be, and do so from a monistic perspective: Norms are beliefs and motives of behaviour that acting subjects internalise in their brains and that become therein operative in different ways. I will not prefigure here in any summary fashion the contents of these chapters, and rather invite the reader to jump right in and work through them. Some of the questions dealt with in these chapters are first mentioned in Chapter 1, Section 2.1, and

[6] On Aquinas's date of birth—whether it is 1225 or 1226—see, in Volume 6 of this Treatise, Lisska, Section 12.1.

Chapter 3 and are then taken up again in Chapters 8, 9, and 10 and Sections 15.2.5, 15.3, and 15.4; the questions treated in Chapters 6 and 7 of this Part Two are also taken up again in the Appendix ("Elements for a Formalisation of the Theory of Norms Developed in This Volume").

Chapters 8 through 10 (Part Three) introduce my conception of law: realistic and normativistic but not normativistic in full. Indeed, Chapter 8 is entitled "No Law without Norms," and Chapters 9 and 10 follow through on this thought with the title "But Norms Are Not Enough" (Chapter 9) and "The Law in Force: An Ambiguous Intertwining of Normativeness and Organised Power" (Chapter 10). The same Chapter 8 begins by placing Hart 1961 (H. L. A. Hart, 1907–1993) on an ideal line that connects him to Axel Hägerström (1868–1939) and Karl Olivecrona (1897–1980), on grounds I hope will be deemed plausible. Further, there is criticised in this chapter the current concept of validity of norms (Hart's concept being a part of it), and it is argued that Hart, in his *Postscript*, presents us with an abjuration of normativeness in law (contrary to what he so excellently maintained in 1961), and that he does so to retain his staunchly defended distinction between law and morality, a distinction that staggers under the heavy blows dealt to it by Ronald Dworkin's critique. Some of the questions dealt with in Chapter 8 are first mentioned or introduced in Sections 2.2 and 5.1 and Chapters 6 and 7 and are then taken up again in Sections 9.1, 9.3, and 9.6 and Chapters 10 and 15.

In Chapter 9 some criticism is addressed to the analytical legal theory that reduces norms to propositions, or in any event to linguistic entities, and there is discussed at some length the relationship between language and the motives of behaviour; and it is also argued that language cannot bring out conative effects in an acting subject unless there concur, to this end, intra-psychical motives of action the agent has already internalised (whether these are inborn or acquired by internalisation from the social environment). Some of the questions dealt with in Chapter 9 are first mentioned or introduced in Chapter 2, Sections 3.5 and 3.6, and Chapters 5 through 8 and are then taken up again in Chapter 10 and Sections 11.3, 15.2.5, and 15.3.

In Chapter 10 I first expound Olivecrona's view of the role of force in law, a view I share with Olivecrona; I then introduce a different concept, the concept of "law in force," of which I provide my own characterisation, a characterisation intended to show the crucial importance both of the normative dimension and of organised power in the machinery of law. Some of the questions dealt with in Chapter 10 are first mentioned in Chapters 1 and 5 through 9 and are then taken up again in Sections 11.3, 15.3, and 15.5.

Chapters 11 through 15 (Part Four) are devoted to some of my confirming others.[7] Here, in Part Four, I will be especially concerned with bringing out

[7] "The image of self which a person already possesses and which he prizes leads him to

the essential traits of their thought. I do this in an extensive presentation that makes reference to the idea of the reality that ought to be, as this idea occurs in mythology and as I see it in the way that existentialism considers fate (Chapter 11), and to the idea of what is right, as this idea occurs in Homeric epic (Chapter 12), Aquinas (Chapter 13), and Kelsen (Chapter 14). Some of the questions dealt with in Chapter 11 are first mentioned in Chapter 1, Sections 5.3 and 6.3, Chapter 7, and Sections 9.6 and 10.2 and are then taken up again in Sections 12.2 and 15.2. Some of the questions dealt with in Chapter 12 are first mentioned in Chapters 1 and 6 and Sections 10.2.4 and 11.3 and are then taken up again in Chapters 13 and 14. Some of the questions dealt with in Chapter 13 are first mentioned in Chapter 1, Section 2.1, Chapter 4, and Section 12.2 and are then taken up again in Chapter 14 and Sections 15.2.2 and 15.5. Some of the questions dealt with in Chapter 14 are first mentioned in Chapter 1, Sections 3.6 and 12.2, and Chapter 13.

Chapter 15 closes the volume. Some of the questions dealt with in Chapter 15 are first mentioned in Sections 2.1, 4.3, and 4.4 and Chapters 5 through 11. I outline in this chapter my general conception of the relationship between nature (brute reality) and culture (social or institutional reality). In this chapter there are also identified, as confirming others in support of my conception of normativeness, (*i*) some contemporary scholars who study distributed artificial intelligence (DAI) and multi-agent systems (MAS)—most notably Rosaria Conte and Cristiano Castelfranchi—and (*ii*) some 20th-century sociopsychologists, most notably Hans Gerth (1908–1978) and Charles Wright Mills (1916–1962) and some of their predecessors. In this last connection, some important analogies are brought out between Gerth and Mills's concept of "generalised other" and the concept of "norm" as I understand this concept following in the wake of Hägerström, Olivecrona, and Hart 1961.

Finally, I identify in the same chapter a line of philosophical thought—an ontological and epistemological line stretching from Bertrand Russell (1872–1970) to Willard Van Orman Quine (1908–2000) and John Searle—to which I anchor my monistic and materialistic view of reality (including the reality that ought to be), a view that can be understood as non-reductionist nonetheless (despite being monistic and materialistic) in the sense that it accepts causal reductionism but rejects eliminative reductionism.[8] Also finding a rationale in

select and pay attention to those others who confirm this self-image, or who offer him a self-conception which is even more favorable and attractive than the one he possesses. [...] They treat him as he would like to be treated: they are confirming others" (Gerth and Mills 1961, 86–7; cf. Section 15.3.4). Of course, my use of "confirming others" in the title to Part Four of this volume, though it takes its cue from these two authors, makes no pretence to correspond to the technical or semi-technical use they make of the same expression.

[8] The sense in which my ontology is monistic and materialistic but not reductionist is that

the line stretching from Quine to Searle are some expectations I have in the regard to the neurosciences, and specifically in regard to the contributions the neurosciences will be able to make in enabling a satisfactory understanding of the psychological aspects of the internal dimension of human beings—of the dimension that Hart, in his account of normativeness, cautiously called "the internal point of view." Norms, as I characterise them in the course of the present volume, belong to this internal dimension of humans: They get internalised in their brains, or so I argue. For this reason I expect the neurosciences to contribute to clarifying normativeness, too.[9]

I know full well, for reasons having to do with statistics and biology, that when the neurosciences, in their progress, will verify or falsify this prediction of mine, I will have become dust again ("In the sweat of thy face shalt thou eat bread, till thou return unto the ground; for out of it wast thou taken: for dust thou art, and unto dust shalt thou return"; Genesis 3:19), and that therefore I won't be able to plume myself on my prediction or have a change of heart. But I would still like to clearly state my expectation, so that those who will witness the developments in the neurosciences which I am referring to will be able to see with certainty (without having to enter into interpretation) whether I was right or wrong.

Nor does the fact that my expectations may well be forgotten by the time these developments come to hand strike me as a good reason not to express them.

2. The Background Leading up to the Treatise

There were three ideas I was turning over in my head just about midway through the 1980s, or rather three projects I wanted to see through. The first of these was an international journal of philosophy of law based in Italy but written in English, and fashioned after the model of the most authoritative scientific journals (as in chemistry and biology), that is, a journal having a selective access based on the method of blind refereeing. And as to the English, the rationale behind it was the service it can render as a lingua franca, "just as

it substantially welcomes materialism à la Searle, who criticises eliminative reductionism at the same time as he adopts causal reductionism (cf. Section 15.4).

[9] After all, criminology, criminal psychology, and neuropsychiatry have always concerned themselves, from a sociological, psychological, and neuropsychiatric perspective, with behaviour held in violation of norms. Of course this implies that these disciplines should also study behaviours in compliance with norms and what a norm's internalisation consists in. Those who believe, as I do, that much, if not all, of psychology is destined, in the progress of scientific knowledge, to be supplanted by the neurosciences will consequently believe that the neurosciences will in the future provide important contributions to our understanding of normative phenomena, individual as well as social, as conceived and presented in the course of this volume.

had been the case with Latin until about the mid-18th century," as I was wont to remind some learned and respected colleagues of mine who would frown upon English, with a leeriness motivated in part by a patriotism rooted in their erudition, and in part by an uneasiness with the "invasion" of American culture, deemed "barbaric." But the reminder I was making did not resonate very much with them. Nor did my reminder with regard to the "invasion": I pointed out to them that *Grecia capta ferum victorem cepit* ("Greece, the captive, made her savage victor captive"; Horace, 65–8 B.C., *Epistles*, II, 1, v. 156). At any rate, from this idea was born, in 1988, *Ratio Juris: An International Journal of Jurisprudence and Philosophy of Law*, Oxford, Blackwell Publishing.

The second idea was an interdisciplinary research centre in which the history, philosophy, and sociology of law and legal computer science—and artificial intelligence and law in particular—could all communicate and, whenever possible, interact. Here, the strongest objections and resistance came from respected jurist colleagues: "We don't need any artificial intelligence," was their slogan. "We can fare well enough with our natural intelligence." At any rate, from this idea was born, in 1986, CIRSFID, a University of Bologna Centre for Interdisciplinary Research in the History, Philosophy, and Sociology of Law and in Computer Science and Law.

The third idea was a multivolume treatise in legal philosophy and general jurisprudence. This third idea did not meet any particular objections, but it remained on the back burner nonetheless, because all of my time was taken up in the first place to overcome the resistance and objections to the first two ideas, and then to develop these ideas into operative projects and consolidate these last so as not to have the facts prove right those people who had countered the same projects, not only for the reasons mentioned a moment ago, but also because, in their estimation, the projects were impracticable.

This premise may well be overly autobiographical, but it effectively conveys the reason why my first and warmest thanks for this Treatise—which finally sees the light of day—goes to Carla Faralli, despite the fact that she has not occupied herself directly with the Treatise. Indeed, for some time now, in recent years, Carla has generously accepted to take my place as editor-in-chief of *Ratio Juris* and as director of CIRSFID,[10] and has done so improving on both, enabling me to devote myself amply to research, and with great freedom of movement, such as I have not been able to enjoy for a long time. Without

[10] Granted, these two tasks may bring a nuance of distinction. But then, in the rough-and-tumble of Italian academic life, they also guarantee a personal, non-transferrable, and huge expenditure of time and energy, at the same time as they also impose a daily and forcible sharing of living quarters with bureaucratic pseudo-problems that one would never expect to encounter—this is especially true in directing CIRSFID, as it is in directing any other university institution in Italy.

such freedom and time, the Treatise project would not have found its completion.

3. Acknowledgements

The first dedication goes to the Advisory Committee: to the late Norberto Bobbio, and to Ronald Dworkin, Lawrence M. Friedman, and Knud Haakonssen, who have honoured us with their faith and prestige. So, too, Gerald Postema and Peter Stein, a new friend and a longtime friend, have contributed with their expertise to enrich and set in the right balance such scholarship as this Treatise was looking for from the moment of its original framing.

My thanks go to all the volume authors and editors, without whose essential contributions, and without whose steady collaboration, there would clearly be no multivolume Treatise that we could present to an audience of students and scholars. I am fond of recalling that I first contacted Aleksander Peczenik (Volume 4), to whom I am tied by a relationship of esteem and fellowship—a relationship begun in Lund (Sweden), as both of us were in touch with Karl Olivecrona. Hubert Rottleuthner (Volume 2) is an English gentleman born and bred in Germany: clear-minded, transparent, and headstrong. Roger Shiner (Volume 3) came in with all his wisdom, sense of life, and humour in taking part in the teamwork required by the Treatise project. Giovanni Sartor is to me the correlative of what in Volume 5 he says I am to him: He is like a little brother who keeps making trouble, opening new horizons previously undisclosed to me, and he startles me with his ingenuity and ingeniousness.

There is also a special group I am indebted to: These are the people at CIRSFID and at the university of Bologna—some of them already mentioned—who at different times, and in different ways and measures, have contributed directly to the effort and intellectual work required by the Treatise. I will first group them in alphabetical order in this list I have drawn up (I have tried to make it exhaustive, but there are many people in this group, so I hope I have not left anyone out): Alberto Artosi, Claudia Cevenini, Giovanni Costa, Emilio Franco, Matteo Galletti, Fabio Lelli, Daniela Montuschi, Sergio Niger, Andrea Padovani, Monica Palmirani, Enrico Pelino, Pierluigi Perri, Bernardo Pieri, Andrea Marco Ricci, Enrico Ronchetti, Antonino Rotolo, Corrado Roversi, Giovanni Sartor, Guido Scorza, Ughetta Tona, Francesco Tura, Filippo Valente, Annalisa Verza, Silvia Vida, Giorgio Volpe. A specific thanks goes out individually to each of these persons.

Some of the contributions from these people are now integral to the Treatise. Thus, Andrea Padovani served as coeditor, with Peter Stein, of *The Jurists' Philosophy of Law from Rome to the Seventeenth Century*—the seventh volume of this Treatise and the second of the historical volumes—and as co-

author of it with the same Peter Stein and with Andrea Errera and Kenneth Pennington; and Alberto Artosi, Nino Rotolo, Giovanni Sartor, and Silvia Vida cowrote and contributed the appendix to Volume 1, "Elements for a Formalisation of the Theory of Norms Developed in this Volume"; Rotolo also contributed to Volume 3, by Roger Shiner, Chapter 7, "Sources of Law in the Civil Law."

I am further very grateful to Giorgio Volpe and the four Bolognan scholars just mentioned, because they gave of their time to discuss amply with me some of the contents of Volume 1, and in particular my conception of norms as beliefs and as motives of behaviour: I have received from them valuable insights and suggestions. Even when we ended our discussions maintaining different views, their accurate criticisms have made it so that I should hone my formulation of the ideas I was putting forward. Of course responsibility for any error or omission rests solely with me.

Also, Giorgio Volpe joined me, in the initial phases of the project, and kept contact with the authors and volume editors—an effortful task in which he was helped out as well by Annalisa Verza. The work these two persons were doing was then taken up by Nino Rotolo, who, in addition to that, served excellently in the role of assistant editor for all the Treatise volumes, theoretical and historical, and was responsible for preparing the bibliography of Volume 1. He coordinated a fine editorial team whose members were, each in a different role, Matteo Galletti, Fabio Lelli, Daniela Montuschi, Pierluigi Perri, Andrea Marco Ricci, Corrado Roversi, Francesco Tura, and Filippo Valente.

Corrado Roversi—the youngest of those who have found themselves working in the frontline—has proved to be nothing short of irreplaceable in the task entrusted to him as assistant editor of Volume 1: He had to integrate the work of different people, and to do so in a manner I could be satisfied with (and I admit I have a reputation for being quite fastidious). Filippo Valente got me to improve my English through my effort to keep his under control: He repaid me by producing for certain literary crotchets of mine, and certain idiomatic turns of phrase in which I like to indulge in Italian, effective English equivalents I had theretofore been innocent of.

Among many libraries, a special thanks goes to those at CIRSFID and at the Antonio Cicu Department of Legal Studies, of the University of Bologna, as well as to the Bologna Library of the Italian Dominican Province.

ASSISTANT EDITOR'S PREFACE

This preface briefly introduces the reader to the editorial rules adopted in this Treatise. The conventions used here are widely established within the scholarly community, to be sure, so the acquainted reader will find much of the explanation trivial and can safely move on. But the unacquainted reader is advised to stay: The discussion will be of help in using the text to full advantage, without having to wonder what this or that notation is meant to do. The entire Treatise is styled on the basis of *The Chicago Manual of Style* (13th ed., Chicago, Ill.: The University of Chicago Press, 1982): The choices made under this guideline (and occasionally departing from it) are designed to solve the specific editorial issues involved in this Treatise and are dictated by consistency. Here are the main issues and the choices, our "house style."

Citations and quotations follow the so-called author-date system. Under this system, in wide use in the Anglo-American world, all sources are cited by indicating the author's surname (or surnames, in case of multiple authors), followed by the year the work was published and—whenever a specific passage is quoted from a source—the page number or numbers locating the quotation within the source (in third position, along with any other piece of information deemed necessary). The full citation, expanded to include the editorial details, appears as back matter in an alphabetical bibliography containing those items actually quoted in the text. This system is useful for providing information that would otherwise end up in the footnotes: Source notes are reduced to a minimum, thereby freeing up space that can be used to advantage for textual digressions (placed under the main text in discursive content notes). The sheer number of works cited in this Treatise calls for just such a solution, enabling the reader to focus on content and not be burdened with full and immediate documentation.

One problem that comes up with the standard author-date system is that it makes it difficult to specify the year of the first edition of any work that the author is citing from an edition other than the first. That is because the year shown in author-date notation must match the year shown in the bibliography, and that year identifies the edition the author is actually working from and has on hand. So if the reader finds somewhere the indication "(Hegel 1980)," this only means that the author is using the 1980 edition of Hegel's *Grundlinien der Philosophie des Rechts*, not, of course, that the work was first published in that year. One way of getting around this problem is by specifying the date of the first edition in square brackets. But this solution we felt to be cumbersome for a notation conceived for brevity—and it would have to be used consistently, requiring authors to specify the first edition of *all* their sources, rather than only of those sources whose first edition belongs to a his-

torical past or is historically significant. We thought it best to let the authors decide for themselves, on a case-by-case basis, whether this information is relevant, as when citing a classic, and when it *is* deemed relevant, to specify it in the bibliography; so, any dates indicating first editions now appear in the bibliography, at the end of the source and within parentheses.

A second issue was the way to go about citing ancient works. Here, we decided to remodel the author-date notation (as just specified) into an author-title notation. Thus, rather than indicating the author's name and the year of publication, we indicate the author's name and the title of the work cited (or its shortened form). This solution is provided for by *The Chicago Manual of Style*, and our reason for taking it up is the oddity involved in citing Plato's *Republic*, for instance, by some such label as "(Plato 1987)," 1987 being the modern reprint edition (from of the Loeb Classical Library), translated into English by Paul Shorey. Thus, ancient works whose original editions are in manuscript form are cited by author and title: in the example, "(Plato, *The Republic*)." And we have extended this rule to a tight selection of non-ancient works standardly cited by title, even if their first edition appeared in print. The other variant application this rule finds in this Treatise is with abbreviated titles; in other words, some contributors use abbreviated rather than full titles because they are working with a great many ancient works that they need to cite frequently.

The Treatise is written in English and is addressed to an English-speaking audience. Quotations are generally reproduced in English. If the quoted matter is a translation, and the author has thought it useful to provide the original quotation (in the source language), that text will appear in a footnote. And if the translation is the author's own, that fact is indicated by "my translation." Any omission of quoted matter or any addition to it is indicated by square brackets: Ellipsis points within square brackets indicate omitted text matter; anything other than ellipsis points, added matter. Any square brackets in the original are labelled as such (as "square brackets in original," which points out omissions or additions made by the author being quoted, rather than by the author who is doing the quoting). Italicised text, instead, is labelled only when it is *not* in the original, as "italics added" (all unlabelled italics are therefore to be understood as occurring that way in the original). Both practices ("square brackets in original," "italics added") are standard. Exceptions to the italics rule occur when a Treatise contributor has felt it necessary to make a point by stating that certain italicised text matter is not his own doing.

Another issue was how to go about quoting original text not based on the Latin alphabet, such as ancient Greek. Here, too, each author was free to reproduce the original in a footnote. But in quoting or using short strings or single words, we chose to transliterate into the Latin alphabet, as *The Chicago Manual of Style* suggests doing in secs. 9.85ff. In some cases we quote words that may take two different transliterations: Here we chose to quote the word as transliterated in the text being quoted, without making any changes to it.

A few final remarks are necessary that apply specifically to Volume 1, by Enrico Pattaro.

All quoted translations provided in this volume have, with a few exceptions, their corresponding original in a footnote, this on the principle that the reader ought to be able to see for himself or herself whether the English translation is faithful to the original. In the same spirit, many of these quoted translations are also provided with alternative renditions of terms and strings relating to crucial concepts: These renditions occur in square brackets (in line with the editorial guidelines just described) and are inserted because deemed better able to convey the concepts involved.

Another specific point concerns Aquinas's *Summa Theologiae*: This title is spelled as such in the run of text (rather than as *Summa Theologica*), as it is in Volume 6, Chapter 12, by Anthony J. Lisska, among other places. To be sure, the editions used in writing Volume 1 are entitled *Summa Theologica*, and would have to be so spelled in the run of text, but here philological reasons in favour the spelling *Summa Theologiae* override the editorial criterion. Of course, the bibliographic reference to this text specifies both variants of the title, in keeping with the editorial rule governing citations.

There is also the question of the spelling for such Latin terms as *ius*, *iustitia*, and *obiectum*. The Treatise authors were free to adopt either of two solutions: the *i* spelling (as just exemplified) or the *j* spelling (*jus*, *justitia*, *objectum*). The letter *j* does not figure in the alphabet of classical Latin: The graphic sign *j* appeared only later, in the Middle Ages. Here, too, the decision was made in Volume 1 to spell these words as they occur in the texts from which they are being quoted, despite a preference of taste that would lean toward *jus*, *justitia*, *objectum*, and so on. The reader of Volume 1 will find *jus* or *ius* depending on who is actually writing; thus, if the word is being quoted it could be *jus* or *jus*, depending on how the author being quoted has spelled it; if it's *not* being quoted (but simply used or discussed), it will *jus*. The other volume authors were left free to chose their own rules in this regard; thus, Volume 4 is titled *Scientia Juris* (not *Scientia Iuris*), and in Volumes 6 and 7 the *i* spelling is retained throughout.

Finally, Volume 1 provides the dates of birth and death (only where both apply) for all the scholars, thinkers, and philosophers it mentions. These dates are specified only on first occurrence, the first time the author's name is mentioned anywhere in the text: Readers coming across an author's name on any occurrence other than the first can find out the corresponding dates of birth and death by using the index of names at the end of the volume.

The Reality That Ought to Be: Problems and Critical Issues

Mir ist wohl bewußt, daß eine monistische Weltanschauung weder den Dualismus von Sein und Sollen, noch jenen von Inhalt und Form als einen endgültigen anerkennt und auch nicht anerkennen darf. Wenn ich hier dennoch prinzipielle Gegensätze erblicke und auf Verbindung von Sein und Sollen, von Inhalt und Form zu einer höheren Einheit, die beide einander ausschließende Begriffe umfaßt, verzichten zu müssen glaube, so finde ich als Rechtfertigung dieses meines Standpunktes im Grunde keine andere ehrliche Antwort als die: Ich bin nicht Monist. So unbefriedigend ich auch eine dualistische Konstruktion des Weltbildes empfinde*, in meinem* Denken *sehe ich keinen Weg, der über den unleidlichen Zwiespalt hinwegführt zwischen Ich und Welt, Seele und Leib, Subjekt und Objekt, Form und Inhalt—oder in welche Worte sonst sich die ewige Zweiheit verbergen mag.*

I am fully aware that a monistic vision of the world does not recognise and is not allowed to recognise as definitive the dualism between Is and Ought or that between content and form. But here, if I descry principled oppositions, and believe I have to renounce the bond of the Is with the Ought, of content with form, into a higher unity embracing the two mutually exclusive concepts, then I fundamentally find as a justification for this standpoint of mine no other honest answer than this: I am not a monist. So, I too *perceive* as unsatisfactory a dualistic construction of the image of the world, but in my *thought* I see no path that will lead beyond the unbearable inner clash between self and world, soul and body, subject and object, form and content, or whatever other words this eternal duality may instead conceal itself under.

(Hans Kelsen, *Hauptprobleme der Staatsrechtslehre entwickelt aus der Lehre vom Rechtssatze*, 1911)

Die Norm als solche, nicht zu verwechseln mit dem Akt,
in dem sie gesetzt wird, steht—
da sie keine natürliche Tatsache ist—
nicht in Raum und Zeit.

The norm—not to be confused with the act by which it is posited—
does not as such reside in space and time, since it is not a natural fact.

(Hans Kelsen, *Reine Rechtslehre.*
Einleitung in die rechtswissenschaftliche Problematik, 1934)

So wie, solange es eine Religion gibt, es eine dogmatische Theologie geben muß,
die durch keine Religions-Psychologie oder -Soziologie zu ersetzen ist,
so wird es—solange es ein Recht gibt—eine normative Rechtslehre geben.
Deren Rang im Gesamtsystem der Wissenschaften ist eine andere,
eine untergeordnete Frage. Was not tut, ist nicht: diese Rechtswissenschaft zugleich
mit der Kategorie des Sollens oder der Norm aufzuheben,
sondern sie auf ihren Gegenstand einzuschränken
und ihre Methode kritisch zu klären.

So long as there is a religion, there must be a dogmatic theology, not to be substituted
with any psychology or sociology of religion. In the same way, so long as there is a legal order,
there will be a normative legal doctrine. Its rank in the overall system of the sciences
is a different and subordinate question. What is necessary is not that this legal science be dismissed,
along with the category of the Ought, or of norm, but rather that
it be circumscribed to its object and its method critically clarified.

(Hans Kelsen, *Reine Rechtslehre.*
Einleitung in die rechtswissenschaftliche Problematik, 1934)

Chapter 1

A FIRST GLANCE

1.1. The Reality That Ought to Be as Opposed to the Reality That Is

In the tradition of continental legal literature, the Ought is usually contrasted with the Is.

The Is is broadly understood to mean nature, namely, the physical (mineral, plant, and animal) world. Its makeup is the way it is and cannot change except according to laws characterised as necessary.[1] In German, the native language of scholars often turned to in dealing with these matters, the Is is referred to as *das Sein*, a reality pervaded by necessity (*das Müssen*).

I will call this reality "the reality that is."

Unlike mineral, plant, and animal behaviour, human behaviour is somehow believed to fall outside the reach of natural necessity: Human beings share physical, biological, and kindred necessary laws with other earthly beings. But unlike these other beings, human beings are believed to be endowed with a free will. Free will is subject to laws peculiar to it, which, unlike physical and biological laws, are not necessary, and hence can as a matter of fact be broken. Nevertheless, these laws are binding, that is, they ought to be adhered to despite their de facto violability. They are a normative must: the Ought (*das Sollen*) (Kelsen 1911, 3–33).

I will call the Ought "the reality that ought to be."

The reality that ought to be is a world of norms and of other kindred entities. It presents two aspects that are in a sense complementary: what is objectively right and what is subjectively right. I will take these up beginning in Section 1.2.

It is rarely the case, at least in civil-law countries, that a jurist should dwell on explaining what "ought" means. Jurists are rather more inclined to pointing out why one "ought" to do something, taking the notion of ought for granted. They will say that people ought to behave in certain ways, for this is "called for" or "commanded" by law, or by the lawmaker, the sovereign, the state, the legal system, and so on. However, by saying that a certain item of behaviour is to be engaged in because this is what the law or the sovereign "calls for" or "commands," a jurist will fail on two accounts: (*a*) in explaining what "ought" means and (*b*) in providing reasons why anyone should behave in the manner specified by the Ought.

As for point (*a*), until we limit ourselves to saying that norms pertain to the world of Ought, we will not explicitly have said what norms are, what they are made of, what entities they are.

[1] According to an established usage, we might refer to the physical world as "brute reality" and to its necessary laws as "exceptionless."

As for point (*b*), assuming the behaviour at issue is called for or commanded by law or by the sovereign, we are still left to ask why we should comply with the law and obey the sovereign. There is at play here what in Chapter 4 I call "the problem of the matrix."

In any event, civil-law jurists are together in assuming that a norm is not at one with the behaviour of the people it refers to, meaning that the existence of a norm does not depend on whether the obligation to comply with it is fulfilled, or on whether the rights it confers are exercised. Let us look at two examples.

First. The norm requiring people not to smoke in public places continues to be a norm even when no one is gathering in these places, so that no actual obligation properly subsists and no fulfilment or non-fulfilment of the norm is possible. Further, this norm continues to be a norm even when people are gathering in public places and not refraining from smoking, so that actual obligations do subsist but are routinely violated.

Second. Imagine you own a boa constrictor and that the reptile coils around you, effectively getting you into a stranglehold: You are in the boa's power, at its complete mercy. Nevertheless—cheer up!—in the realm of Ought you have full and exclusive power over that boa (you even have a right of life and death over it), while the boa has none over you. Given the situation you find yourself in, you may in practice succeed in exercising your right over the boa or fail to do so; either way, neither the norm on property nor your right of ownership over the boa stands affected. This is so even if the boa strangles and eats you, in which case your right of ownership over the boa will simply transfer from you to your heirs.[2]

Does this warrant the view that norms, rights, and obligations[3] belong to an ideal reality—the reality that ought to be—which persists over time even if the facts in the reality that is point to the contrary?

A legal-philosophical current of thought—natural-law theory, which is actually a variegated cluster of theories—has always upheld this view.[4]

German legal positivism—traditionally opposed to natural-law theories, and whose concepts at least in continental Europe still work their way into the

[2] If we want to drive this story to extremes, we will have to conclude that even what is left of you—your mortal remains in the boa's stomach—will become your heirs' property along with the boa. The boa constrictor example is taken from Leon Petrażycky (1867–1931); here I made it a bit more gruesome and adapted it to Article 832 of the Italian Civil Code, on property rights.

[3] "Rights and obligations" is not exhaustive. I should add "duties" (in distinction to "obligations") as well as "(legal) relations" and "normative subjective positions." But for ease of exposition I will often use "obligation" and "duty" interchangeably, assuming all other normative subjective positions to be understood.

[4] Views similar to these, though less sophisticated, recur as well in other contexts of legal thought: In Volume 7 of this Treatise, Sections 2.2.4 through 2.2.6, Padovani shows that Accursius (1182–1260), for example, placed *jura*—among which rights (like usufruct, understood as *jus utendi*, "right of use") and obligations (*juris vincula*)—within the group of incorporeal things (*res incorporales*).

reasoning of jurists—is loath to be likened to natural-law theories, but it nevertheless uses notions of norm, right, and obligation that cannot be understood to be anything but ideal entities.[5]

Another current of thought, Scandinavian legal realism, holds that norms, rights, and obligations exist only as psychical phenomena in people's minds: These normative psychical phenomena are powerful motives behind human action, and they will be greatly effective in social life to the extent that people come to convince themselves (whether on reflection or not) that norms, rights, and obligations are entities possessing a reality "of their own," for example, a spiritual reality that is nobler and longer-lasting than the reality that is (where the latter, depending on various theories, may include, besides physical and biological reality, the reality of psychical and social phenomena) (cf. Pattaro 1974).[6]

The vague notions of Ought, norm, right, and obligation constantly thwart efforts to make the concept of law clear and unequivocal, and yet they are useful to law in buttressing its function of guidance to, and social control of, human conduct. The law would be weaker and less effective if legal literature and the common conscience were not freighted with these notions, often taken up as scientific notions referring to nonfactual entities: to a reality that ought to be.

1.2. The Law and the Right. What Is Objectively Right and What Is Subjectively Right

If we consider the civil-law countries, like France, Germany, Italy, and Spain, we will find that in their languages the equivalents of the English noun "law" are *droit*, *Recht*, *diritto*, and *derecho*. These nouns can mean "law" or "the right," or both, depending on context, whereas English "law" bears no linguistic kinship with "the right": It comes from Old English *lağu*, from Old Icelandic *lag*, meaning "something laid down."[7]

[5] I am referring specifically to German legal positivism because speaking of legal positivism in general (including the analytical jurisprudence of Jeremy Bentham, 1748–1832, John Austin, 1790–1859, and their followers) can be misleading in several respects, especially with regard to the concepts of "norm" and "binding force of law." On legal positivism in common-law countries, see, in Volume 9 of this Treatise, Lobban, Chapter 6, devoted to the age of Bentham and Austin.

[6] The Scandinavian realists' recurrent claim that rights and obligations are imaginary entities has occasioned clamour among some sensitive scholars, such as Julius Binder (1870–1939), Gerhard Beseler (1878–1947), Emilio Betti (1890–1968), and Wolfgang Kunkel (1902–1981): On them see Faralli 1987, 71ff. And yet—as Padovani shows in Volume 7, Section 2.2.5, of this Treatise—Bartolus of Sassoferrato (1313/1314–1357), among others, had already written that obligations *sunt simplices imaginationes* (are simple imaginings).

[7] In the languages of the civil-law countries just mentioned, the terms *loi*, *Gesetz*, *legge*, and *ley* translate the English "law," but this mostly in the sense of "a law," that is, in the sense that "law" takes in expressions like "the tax law enacted by Parliament" and "the law on illegal immigration."

Moreover, students in civil-law countries meet from the beginning of their legal education the distinction between *droit objectif* and *droit subjectif*, *objektives Recht* and *subjektives Recht*, *diritto oggettivo* and *diritto soggettivo*, *derecho objectivo* and *derecho subjectivo*.

Translating these terms and rendering into English the distinction they express is a tricky job. The difficulty is usually dodged by taking a kind of shortcut: by saying that the distinction does not hold in common-law systems, and by proceeding to suggest that the noun "law" be used for *objektives Recht* (and for its equivalents, like *droit objectif*) and "right" for *subjektives Recht* (and for its equivalents, like *droit subjectif*) (cf. de Franchis 1996, vol. 2, s.v. "Diritto (I) oggettivo" and "Diritto/i (II) soggettivo in genere," 658–9 and 680–1).

We cannot follow this way to tackle or, rather, work our way around the problem, because by so doing we would miss both points: (*a*) In civil-law literature one and the same word, for example, *das Recht* in German, can mean either "the law" or "the right"; and (*b*) this word, *das Recht*, in expressions like *objektives Recht* and *subjektives Recht*, is used regularly to mean that the thing referred to, the right, is in some sense either objective or subjective.

To be sure, the noun "right" has been used to translate the noun *Recht* into philosophical English—thus, G. W. F. Hegel's (1770–1831) *Philosophie des Rechts* has been translated to *Philosophy of Right* (cf. Hegel 1955 and 1980).[8]

But in *legal* English the noun "right" typically translates *subjektives Recht*, and does so in only one of its senses (namely, "a power, faculty, or legitimate claim," in short "a right"), so that we would have a misleading legal English if we used "right" as a noun to translate both *subjektives Recht* and *objektives Recht*.

If we accept the shortcut solution by which "law" translates *objektives Recht* and "right" *subjektives Recht*, we will fail to see that there is a reason why the noun *Recht* occurs in both expressions, namely: These expressions refer to one and the same reality. And we will obscure as well the distinction between what in this reality is qualified as objective and what is therein qualified as subjective, or the sense in which that is so.

The question is not only linguistic, but also conceptual and ontological.

As previously announced, I will call the reality presupposed by the ontology at issue "the reality that ought to be," meaning "the Ought" as opposed to "the Is": in German, *das Sollen* as opposed to *das Sein*. The reality that ought to be is the world of norms, rights, and obligations. Law, when assumed to belong to this reality, can be viewed as a set of rules that are binding per se or as a set of rights and obligations, the ones conferred and the others im-

[8] It is common in moral and political Anglophone philosophy to draw a distinction between "the right" and "the good," as is the case with the classic work by W. D. Ross (1877–1971), *The Right and the Good* (Ross 1930).

posed on certain subjects and possibly not on others, or it can be viewed in both of these ways.[9]

I see no better solution, in the effort to make the previously outlined ontological clot understandable and manageable, than to use "right" as an adjective and set it into an expression which gives it a nominal (substantival) form and function, and which is not open to the ambiguities the noun "right" is open to. I will translate *objektives Recht* to "what is objectively right" and *subjektives Recht* to "what is subjectively right." Let me point out again that translating *objektives Recht* to "law" and *subjektives Recht* to "right" would prove misleading to common-law and civil-law jurisprudents and jurists: It would not help toward improving their reciprocal understanding of those issues that are peculiar to each other's legal culture. The distinction between "what is objectively right" and "what is subjectively right" is not a distinction pertaining to the concept expressed by "law." It rather pertains to the concept expressed by "what is right" or "the right."[10]

What is *objectively* right is the content of norms, where norms are per se binding rules. The question of what is objectively right understood as the content of norms I will come back to in Section 1.3 and in the chapters to come.

What is *subjectively* right bears an inherent connection with what is objectively right: It is the content of norms insofar as it refers to actual persons, or subjects, who are in the reality that is. Hence, "subjectively" is not the opposite of "objectively" here, just as in the equivalent German context *subjektives* is not the opposite of *objektives*. "Subjectively" is used to mean that actual persons, or subjects, are involved because they are referred to by the content of a norm that is applicable to them.[11]

[9] It may be better to say that law can be viewed as a set of standards rather than as a set of rules. This is because Ronald Dworkin has made the distinction between rules and principles so popular that using "rule" in a broad sense (as inclusive of principles and other possible kinds of standards) may prove to be misleading. See Dworkin 1996. Nevertheless, I still prefer to use "norm" in a broad sense and specify, when context requires it, whether I am using this term to refer to rules exclusively or to refer to any legal standard. The distinction between rules and principles is dealt with in this Treatise, Volume 4, Section 5.1.4, by Peczenik, apropos of the distinction between decisive and defeasible reasons.

[10] As is known, there is an effort underway in the European Union to make everything uniform among member states, even the size of zucchini and tomatoes. And now the names designating university faculties. Even so, since this uniformity of names is not yet complete, you can still create an ideal legal curriculum in Europe like so. You might start out at Oxford University, attending the faculty of law ("the faculty of *what is laid down*," which see the beginning of this section), and then move on to the University of Paris 5, at the *faculté de droit* ("the faculty of *what is right*"), and then, up a notch, to the University of Bielefeld, at the *Fakultät für Rechtswissenschaft* ("the faculty of *the science of what is right*"), and finish up nicely at the University of Bologna—in Italy, which styles itself as "the cradle of law"—at the *facoltà di giurisprudenza* ("the faculty of *the wisdom of what is right*," from the Latin *juris-prudentia*).

[11] Clearly, "what is subjectively right" does not mean "what one or more subjects believe to be (objectively) right" (see Section 6.2).

What is subjectively right with respect to a *duty-holder* is an obligation ascribed to him or her, because a duty-holder is an actual person referred to by the content of a norm as being under an obligation.

What is subjectively right with respect to a *right-holder* is a right ascribed to him or her, because a right-holder is an actual person referred to by the content of a norm as being endowed with a right: with a legitimate power, faculty, or claim.

Some subtler expressions have been used to underscore the implication that holds between what is objectively right and what is subjectively right in the reality that ought to be: *Recht in einem objektiven Sinn* and *Recht in einem subjektiven Sinn.* The English translation of these expressions should therefore be "what is right in an objective sense" and "what is right in a subjective sense." It is Hans Kelsen, among others, who uses the German expressions just mentioned: He uses them to criticise German legal positivism for failing to work out all the consequences entailed by its revision of the conceptual apparatus it inherited from natural-law theories. Kelsen clarifies that according to German legal positivism, "what is right in a subjective sense" (*Recht in einem subjektiven Sinn*) includes obligations: German legal positivism in the 19th and early 20th centuries considered *die Rechtspflicht* (legal duty, or obligation) to be *die zweite Form des subjektiven Rechts* (the second form of what is subjectively right), the first form (of what is subjectively right) being a legal right (*Berechtigung*, literally "authorisation, permission, or power granted by an authority")[12] (Kelsen 1934, 40, 46; more on this in Chapter 14). This is so, recall, because what is subjectively right is understood to be what is objectively right insofar as the latter refers to actual persons, or subjects, in the reality that is.

So conceived, what is objectively right (the content of norms) and what is subjectively right (the rights and obligations ascribed to the actual subjects referred to by the content of norms) are not heterogeneous; rather, they imply each other. A long-established historical connection between them warrants their distinction as a distinction between two aspects of the reality that ought to be: "What is objectively right" and "what is subjectively right" are both entailed by "what ought to be."

A comment is in order here.

Some scholars seem to assume that what is subjectively right lies in the content of norms. This is only partially true. What is subjectively right depends on what is objectively right (on the content of norms), to be sure, and it likewise belongs to the reality that ought to be, but that is not enough: What

[12] Note here that the word *Be*recht*igung* contains *recht* ("right"), and that *berechtigen* means "authorise" in the sense of "to give a right." Compare "licence," from Latin *licere* ("be allowed"), and "permit," in the sense of "to allow to do something," "to grant permission," "to afford opportunity."

is subjectively right requires as well certain subjects (people) to exist and certain events to occur in the reality that is. Hence the content of a norm is a necessary but not a sufficient condition of what is subjectively right. Again: "Subjectively" is used to say that actual persons, or subjects, are involved because they are referred to by the content of a norm applicable to them.

Felice Battaglia (1902–1977), a professor of mine when I was an undergraduate law student, would use a geometric metaphor to illustrate the connection between what is objectively right and what is subjectively right: What is objectively right (norms) is likened to the circumference of a circle, and what is subjectively right (rights and obligations) to the circle closed in by the circumference. Just as there can be no circumference without a circle to be enclosed in, or a circle without a circumference to enclose it, so there can neither be what is objectively right without what is subjectively right nor what is subjectively right without what is objectively right. What is objectively right cannot but establish and delimit what is subjectively right, and what is subjectively right is necessarily settled and delimited by what is objectively right. Each entails the other, so that, according to Battaglia, there is no "logical priority" of one over the other; rather, a "logical simultaneity," coexistence, and complementarity holds between them (cf. Battaglia 1962, 145).

Battaglia and others seem to miss the distinction between the content and the referent of a norm: What is objectively right is the content of a norm *independently of* any person, or subject, being actually referred to by the norm; what is subjectively right is the content of a norm *insofar as* the norm refers and applies to actual people, or subjects, in the reality that is. What is objectively right makes up, as it were, the top layer of the reality that ought to be; what is subjectively right, its bottom layer. I discuss this distinction in Sections 1.3 and 3.3, and in Chapter 14, as well as in Sections 6.3 and 6.4 in connection with my characterisation of norms.

1.3. What Is Objectively Right as the Content of Norms. Four Meanings of "Right"

As we may readily observe, the legal-dogmatic language of civil-law scholars requires us to detect shades of meaning that are not always made explicit in this language. The expressions "what is objectively right" and "what is subjectively right" designate distinct entities in the reality that ought to be: The former expression designates norms and types of behaviour as set forth in the content of norms *and therein qualified as obligatory, permitted, or forbidden* (Section 2.1); the latter expression designates obligations and rights that people actually hold under a norm. The different meanings that "right" acquires in these two expressions should have come through in the clarifications made in Section 1.2. Still, we will need to distinguish at least four meanings of "right," the first three of which make reference to the reality that ought to be

(to what is objectively right and what is subjectively right) and the fourth to the reality that is (to actual behaviours held by people under a norm).

(*i*) "Right," in the expression "what is objectively right," designates what is objectively right in the reality that ought to be, and that thing—what is objectively right in the reality that ought to be—is norms and their content.

What makes objectively right the content of a norm is the norm itself insofar as the deontic modalities contained in a norm are assumed (believed) to be normative (see Section 4.2.1 and Chapter 6). Here are three types of behaviour: "paying taxes," "making a purchase," and "committing theft." They all exemplify what is objectively right insofar as they are set forth in norms and are therein qualified as obligatory, permitted, and forbidden respectively. Notice that the three examples would be no less probatory if we changed them to accommodate norms under which "making a purchase" is obligatory, "committing theft" is permitted, and "paying taxes" is forbidden. If the familiar deontic modalities—O*p*, P*p*, F*p* (obligatory *p*, permitted *p*, forbidden *p*)—are understood to be contained in norms, then (on this understanding) they determine what is objectively right independently of the type of behaviour referred to by the variable *p* (and whatever the definition of the modalities, since in the standard system of deontic logic, it is known, O, P, and F are interdefinable).

In the light of these remarks, and in order to avert possible misunderstandings, I will *not* use "objectively wrong" in opposition to "objectively right"; thus, I will avoid using the expression "what is objectively wrong." Indeed the content of a norm is *always* what is objectively right, because what makes up the content of a norm is a type of behaviour *in combination with* the deontic modality that *in the norm* qualifies that type.

(*ii*) "Right," in the expression "what is subjectively right," designates what is subjectively right in the reality that ought to be, and that thing—what is subjectively right in the reality that ought to be—consists of obligations and rights and of other normative subjective positions that people actually hold under a norm.

So "right," in the expression "what is subjectively right," stands not only for "rights," but also for "obligations" and "duties" and other normative subjective positions. These entities, though they belong to the reality that ought to be, get necessarily ascribed to actual *subjects* (people) in the reality that is, and for this reason are called what is *subjectively* right.

Here, too, in order to avert possible misunderstandings, I will *not* use "subjectively wrong" in opposition to "subjectively right"; thus, I will avoid using the expression "what is subjectively wrong."

(*iii*) The words "obligations" and "rights" designate obligations (bonds, duties) and rights (powers or claims) respectively, meaning different entities in what is subjectively right in the reality that ought to be.

So we have here, with "rights," a third sense of "right" meaning "a right" or "rights," but not "obligation" or "obligations." If we stipulate that obliga-

tions are proper to passive normative positions in what is subjectively right, then rights are proper to active normative positions in what is subjectively right.[13]

(*iv*) Lastly, the term "right," in expressions like "a right behaviour," qualifies an actual behaviour held in the reality that is: It qualifies an actual behaviour as being in accordance with the reality that ought to be, and in particular with the content of a norm, namely, with the type of behaviour set forth in this norm and therein qualified as obligatory, permitted, or forbidden. An actual right behaviour complies with the deontic modality that in a norm qualifies the corresponding type of behaviour.

An actual right behaviour may be one held by a duty-holder or by a right-holder. One consequence to follow from this is that a duty-holder's and a right-holder's behaviours will be different even if they are both right. A duty-holder's actual behaviour will be said to be right when the duty-holder fulfils an obligation in accordance with the content of the norm under which he or she is a duty-holder. A right-holder's actual behaviour will be said to be right when the right-holder uses a right in accordance with the norm under which he or she is a right-holder.

In this sense of "right"—and in this sense only: with regard to actual behaviours in the reality that is—I will use the term "wrong" in opposition to "right." In the reality that is—and only in this reality (in our imperfect and human reality)—we will see both right and wrong behaviours. In the ideal reality that ought to be we won't see anything but what is right.

We will see in Section 12.2 that these four meanings of "right"—the four meanings here distinguished and constructed drawing upon the tradition of civil-law dogmatics—can also be detected in the ancient Greek term *dikē*, and in derivatives of it like *dikaios*, in several contexts of Homeric epic. In Chapter 13 I will consider the concept of what is right, *jus*, in Aquinas. Lastly, in Chapter 14 I will distinguish, with regard to Kelsen, nine concepts relative to "law," "what is right," and the "reality that ought to be"—a distinction that proves necessary if we are to make any headway in working through the meanders of Kelsen's normativistic reductionism.

[13] This is the reason for my stipulation. There is a distinction in Italian legal language, with regard to legal relations, between *soggetto attivo* (literally, "active subject") and *soggetto passivo* (literally, "passive subject") under the law: between active and passive normative subjective positions, we might say. A right-holder is a *soggetto attivo*, and a duty-holder a *soggetto passivo*, in the legal relation that holds between them.

Chapter 2

DUALISM AND INTERACTION BETWEEN THE REALITY THAT OUGHT TO BE AND THE REALITY THAT IS: VALIDITY AS A PINEAL GLAND

2.1. Constitutive Types and Valid Tokens as Independent of Norms

2.1.1. Validity as Congruence

I will adopt and adapt a current distinction terminologically traceable to Peirce (1839–1914), among others—that between "type" and "token"—and use it to render into English the German distinction between *Tatbestand* and *Tatsache* (or *Sachverhalt*; cf. Kaufmann 1982—Arthur Kaufmann, 1923–2001).

I will say that actual states of affairs and events are tokens, meaning instances, of certain states of affairs or event types. Thus, for example, every actual commission of theft is a token of the type "committing theft," and every actual celebration of a matrimony is a token of the type "celebrating a matrimony."[1]

Types may be represented or described in sentences: either in truth-apt sentences (I will call these "apophantic sentences") or in non-truth-apt sentences (such as deontic sentences and directives). Types may also be set forth in norms in the sense of "norm" specified in Chapter 6 (norms in brains, or normative beliefs). I will call "deontic" the sentences that qualify states of affairs or events as obligatory, permitted, or forbidden.[2]

A type is only a component—a component within the descriptive or representative component—of the content of a sentence (apophantic or deontic) or

[1] For the purposes of the present volume, I distinguish two kinds of entities: (*a*) states of affairs, which may consist in the possession of a property by an object (a thing or a person) or in the existence of a relation between two or more objects, and (*b*) events, among which people's actions are a special concern here. However, it should be emphasised that nothing of any special importance hinges on the adoption of this metaphysical stance, since the arguments developed in the present volume may easily be recast in the terms of many competing metaphysical positions. Similarly, G. H. von Wright (1916–2003), in "Deontic Logic" (1967, 59), distinguishes between "act-qualifying properties, e.g., theft" (approximately my type) and "act-individuals," that is, the "individual cases which fall under these properties, e.g., the individual thefts" (approximatively my tokens). The same distinction appears in G. H. von Wright (1963, 36) as a distinction between "generic acts or act-categories" (corresponding to the "act-qualifying properties" and ultimately to my types), e.g., murder, and "individual acts or act-individuals," e.g., the murder of Caesar.

[2] A deontic sentence may either express or not express a norm, and whether it does will depend on the characterisation of norms one adopts. In this volume, a norm is such when it satisfies the requisites described in Chapter 6. See also, in this volume, Artosi, Rotolo, Sartor, and Vida, Appendix, Section 2.

of a norm: It cannot by itself be the full content of a sentence or of a norm. A type by itself is part of the phrastic, to use R. M. Hare's (1919–2002) terminology: There is also needed at least a neustic (in the same terminology)[3] if an apophantic sentence, a deontic sentence, or a norm is to have its full content.

In an apophantic sentence the neustic states, affirms, or denies the phrastic and hence the types therein described.

In a deontic sentence the neustic qualifies as obligatory, permitted, or forbidden the type of behaviour described in the phrastic (and the same holds true of the type of behaviour set forth in a norm in the sense of "norm" specified in Chapter 6).

On my own characterisation, validity is the congruence, and invalidity the incongruence, of a token with a type. I will understand "validity" as "a token's congruence with a type," whether the type in question is set forth in the phrastic of an apophantic or a deontic sentence or in the phrastic of a norm not expressed in any sentence. My characterisation of validity therefore parts ways with the current legal-linguistic use of this term.

If a type gets described in an apophantic sentence, validity will be a token's congruence, and invalidity its incongruence, with the type described in the phrastic of the sentence, whatever neustic this sentence takes, that is, whether the apophantic sentence affirms or denies the type in question.

Consider the two sentences (*a*) "Peter sleeping [phrastic], is [neustic]" and (*b*) "Peter sleeping [phrastic], is not [neustic]." An actual nap that Peter should take will be a valid token of the type described in the phrastic of (*a*) and (*b*) alike, even if it will make only sentence (*a*) true, and sentence (*b*) false.

Likewise, if a type is described in a deontic sentence, validity will be a token's congruence, and invalidity its incongruence, with the type represented in the phrastic of the deontic sentence, whatever neustic this sentence takes, that is, whether the deontic sentence makes the type obligatory, permitted, or forbidden. Finally, if a type is set forth and qualified in a norm in the sense of "norm" specified in Chapter 6, but is not expressed in any sentence, validity with regard to that type will be a token's congruence with the type, and invalidity its incongruence, whether this norm makes the type obligatory, permitted, or forbidden.

Let us consider, with regard to the last two cases, the three deontic sentences or norms (*c*) "Peter sleeping [phrastic], is obligatory [neustic]," (*d*) "Peter sleeping [phrastic], is permitted [neustic]," and (*e*) "Peter sleeping [phrastic], is forbidden [neustic]." An actual nap that Peter should take will

[3] Hare's terminology I take up here without claiming any philological faithfulness to his text or any interpretive faithfulness to his thought. The phrastic, or descriptive (representative) part of a sentence, can describe either a type or a token. The neustic, in contrast, is the part by reason of which a sentence is apophantic (indicative, in Hare's terminology) or deontic (imperative, in Hare's terminology). I will use Hare's syntactic expedients to bring the phrastic into relief with respect to the neustic (see Hare 1952, 17–28, 37, 188–90).

be a valid token of the type set forth in the phrastic not only of (*a*) and (*b*), but also of (*c*), (*d*), and (*e*), even if Peter's nap complies only with (*c*) and (*d*), while it violates (*e*). Instead, any actual non-sleeping on Peter's part will not be a valid token of any of the types set forth in the phrastics of (*a*) through (*e*); but at the same time it will make (*a*) false and (*b*) true and will comply with (*c*) and (*d*) and violate (*e*).[4]

What is beginning to come through from the examples just made is that an actual token's validity (congruence) or invalidity (incongruence) with respect to a type must be kept separate from the truth or falsity of the apophantic sentence the type is set forth in as well as from compliance or noncompliance with the deontic sentence, or with the norm (in the sense of "norm" specified in Chapter 6) the type is set forth in. We will see in Section 2.2.2 what the connections are that—with this distinction in place—can be made between valid tokens and tokens whose occurrence is obligatory, permitted, or forbidden.

2.1.2. Some People Speak of Types. The So-called Typicality of Law

Let us in the meantime return to *Tatbestand*. This German legal term means "the constitution of a fact or an act"; in Italian the same concept is named "fattispecie astratta," literally, "abstract fact-type." As far as I know, there is no established equivalent for these legal terms in the common-law tradition. I have called *Tatbestand* and *fattispecie astratta* into play to show that my use of the term "type" is not accidental: It rather belongs to the Western tradition of legal thinking (at least in civil-law countries) and of philosophy. As to "token," I will task this term with rendering into English the German legal term *Tatsache* (or *Sachverhalt*) and the Italian legal term *fattispecie concreta*.

Consider that the Italian legal term *fattispecie* derives from the Latin expression *facti species*, which is not necessarily a legal term and refers to the *species*, form, or type of *factum*—to the specificity or difference that distinguishes one state of affairs or event from another, marking out its "otherness," even when two types belong to the same genus: for instance, the types "spaghetti" and "tagliatelle" under the genus "Italian pasta," or, in law, the types "theft" and "robbery" under the genus "crimes against property."

In one of its main senses, the Latin word *species* means "the set of characteristics whereby something is recognisable"—this is tantamount to "form" or "type"—and the Latin word *specimen* (derivative of *species*) means "example" or "sample": This is tantamount to "token."

[4] Recall, too, that logical connectives, including negation, can as a rule be inserted in the phrastic (rather than in the neustic) if that proves expedient. We could do that with (*b*) in the examples just made; but we can also do it with (*c*) and (*e*) by changing the deontic modality (O to F and F to O) and introducing a negation into the phrastic.

The neoplatonist Porphyry (233–309), who was not a jurist but a philosopher, remarked that differences are *constitutive* of species (*sustatikai tōn eidōn*; *constitutivae specierum* in the Latin translation of Boethius, ca. 480–525) and *divisive* of genera (*diairetikai tōn genōn*; *divisivae generum* in Boethius's Latin translation) (Porphyry, *Isagoge*, 10, 9–10; Boethius, *Porphyrii Isagoge Translatio*, 10, 9–10). This view is traceable to Plato's dialectical-divisive method.[5]

In modern times, the psychology of form (*Gestaltpsychologie*) and the philosophical doctrines of schema (witness I. Kant, 1724–1804, and F. W. J. Schelling, 1775–1854) provide an account—each in a way distinctive to it—of how we frame our cognitive and practical activities within forms, or schemata.[6] *Si parva licet*, the legal notion of *Tatbestand*, which I am rendering with the English "type," makes it possible to interpret these activities as valid or invalid tokens of given types, and that without making any reference to law, norm, rule, or the like.

We have here an interesting concept—it is, indeed, one of the concepts of "concept," and it has been variously construed and rendered under different terms in both philosophy and law: in philosophy, from Plato and Aristotle (384–322 B.C.) to Kant and then Peirce, among others; in law, under *Tatbestand* and *fattispecie astratta*, as previously introduced.[7]

Notice that in German and Italian legal literature the use of *Tatbestand* and *fattispecie astratta* is limited to the types to which legal norms attach normative legal consequences, or Ought-effects (see Lazzaro 1967, 40ff.—Giorgio Lazzaro, 1938–2002; Hassemer 1968, 11ff., 109ff.). I will not follow this limitation here, and will give a broader scope to *Tatbestand* and *fattispecie astratta* and to their English rendition as "type."[8]

[5] In Volume 6 of this Treatise, Chapter 3, Section 1, footnotes 3 through 5, Stalley provides a short bibliography on Plato's (Plato, 427–347 B.C.) theory of forms. Plato's forms are the source to which Porphyry's forms (*eiden*) are to be traced. Boethius, in his Latin translation of *Isagoge*, renders *eidos* with *species*.

[6] In what follows I will use "scheme" in distinction to "schema" (pl. "schemata"), a term currently associated with Kantian epistemology, which marks a turning point in the history of the concept of "type," or "form." So in using "scheme" I am not ascribing to Immanuel Kant the concept of "type" I have adopted.

[7] One of the terms used is of course "form" (*eidos*). On the use of this term (*forma* in Latin) found in the medieval jurists, such as Martinus (ca. 1100–ca. 1166) and Baldus (1320–1400), as well as in Placentinus (ca. 1135–1192), though he uses *genera* and *species*, see, in Volume 7 of this Treatise, Padovani, Sections 2.2.1 through 2.2.4: The sources these jurists drew from are Porphyry and Boethius. In Sections 13.7 and 13.8 of this volume I will discuss Aquinas's use of *ratio* as signifying "type," "form," and the like.

[8] Instead, the sense in which *Tatbestand* and *fattispecie astratta* are used in German and Italian legal literature I will express using "type of circumstance." Specifically, I will use "type of circumstance" in a strict sense to designate a type to which a norm attaches normative consequences, or Ought-effects (see Section 6.3 and Chapter 7), and in a broad sense to designate any type with which a type of action is conditionally connected, independently of whether any norms are involved (see Section 5.3).

It bears recalling here—since I am speaking of "types"—that in the tradition of civil-law literature, typicality (along with abstractness and generality) is listed among the so-called distinguishing traits of law, and hence of legal norms (see Larenz 1992, 349ff.—Karl Larenz, 1903–1993). But these traits are not distinctive to law in particular, for in any field we have to do with both sides of the coin: with tokens (concreteness, and individuality) as well as with types (typicality, abstractness, and generality). Typicality is a feature not only of law but of all the domains of culture (and the same holds for concreteness, at least to some extent). Even so, there is a specific import that attaches to the abstractness and generality of legal norms, that is, to the fact that legal norms contain types (which by definition are general and abstract). Some aspects of this specific import we will look at in Section 2.2.1.

2.1.3. Other People Presuppose Types

Let us return to "type" in the more general sense of this word and adapt to it Porphyry's previously recalled remark: As the genus is constitutive of the possibility of types—of the possibility of divisions that distinguish species, or types, within the genus itself (and do so by proper or specific differences: *idion*, *proprium*)—so every type is constitutive of the possibility of tokens, of the possibility of instances that concretely exemplify the type understood as a form.

It will be noted in passing, because relevant from the standpoint of legal theory, that there are types for verbal behaviours as well, and these types, too, may get instantiated—by tokens of verbal behaviour, of course. Thus, actual verbal actions (like uttering certain words) can, given the proper circumstances, perform the type "making a promise" or "celebrating a matrimony," for example. It is no accident that verbal behaviours of this kind have been called "performative," notably by J. L. Austin (1911–1960) (Austin 1962): "To perform" means, literally, "to *fill* a form by going exactly through it"; what goes through a form fits this form; it is congruent with the form, it is valid with respect to it.

Because types are constitutive of the possibility of their being instantiated, they are also the schemes which make it possible to understand and "interpret" actual events or states of affairs as the tokens that validly instantiate (or do not validly instantiate) the types in question.

There is no reason to link the idea of something being an interpretive scheme with the idea of law, norm, rule, or the like. An interpretive scheme is not a norm or a rule, but a type. As such, it can be set forth in the content of norms or of rules, and therein possibly qualified as obligatory, permitted, or forbidden, but it can also be represented in apophantic sentences and questions, for example. Types are schemes, or forms, by which we interpret and classify actual states of affairs or events, whether these types are set forth in the content of

a norm or in the content of a directive, or whether they are represented in an apophantic sentence, a question, and suchlike. Thus, Hans Kelsen and Alf Ross (1899–1979), among others, are too narrow in the way they maintain that norms are "schemes of interpretation": German *Deutungsschema* in Kelsen (1934, 4; compare the English translation: Kelsen 1992, 10); Danish *tydningsskema* in Ross (1971, 52; compare the English translation: Ross 1958, 39).

2.1.4. Types Are Constitutive, Rules Are Regulative

Let us go one step further.

The debate is well known on the difference between constitutive rules and regulative rules. The distinction traces at least to John R. Searle. He writes:

> I want to clarify a distinction between two different sorts of rules, which I shall call *regulative* and *constitutive* rules [...]. As a start, we might say that regulative rules regulate antecedently or independently *existing forms* of behaviour; for example, many rules of etiquette regulate interpersonal relationships which exist independently of the rules. But constitutive rules *do not merely regulate*, they create or define *new forms* of behaviour. The rules of football or chess, for example, *do not merely regulate* playing football or chess, but as it were they create the very possibility of playing such games. (Searle 1969, 33; italics in original on first and second occurrence, added on all other occurrences)

My concept of "constitutiveness" is not the same as Searle's. Nor is this the place to discuss Searle's concept or anyone else's (that of Amedeo G. Conte, for example).[9] From the standpoint of my concept of "constitutiveness," it is misleading to link the fact of "being constitutive" with "rule" or "norm." Indeed what in my view is constitutive is not a rule but a form, or type, and types may be the content not only of a rule, deontic sentence, or norm, but also of an apophantic sentence, among other things. Types are constitutive of the possibility of being instantiated by actual tokens, and it does not matter to this end where a type is set forth: It could be in a rule, a deontic sentence, a norm, an apophantic sentence, or a question, or anywhere else.

Consider, for example, Shakespeare's *Romeo and Juliet*. We can all agree that the play is made up of sentences that are not rules, much less deontic sentences. Let us imagine a company of actors performing this play by having Juliet kill Romeo because moved by hate, by the rivalry that had traditionally been pitting the Montecchi and the Capuleti families against each other. This company of actors cannot be said to be acting out Shakespeare's *Romeo and Juliet*, but some other play, if any—in much the same way as, in a chess match, any two players who should move the rook diagonally and the bishop along ranks and files will be said to play not chess, but some other game, if any. What happens in these two cases is a failure to instantiate certain types de-

[9] A. G. Conte has devoted himself profusely to the question of constitutive rules. See his collected essays: Conte 1989, 1995, and 2001.

scribed in Shakespeare's *Romeo and Juliet* and in the game of chess respectively. Hence, what is played in one case is not Shakespeare's *Romeo and Juliet*, and what is played in the other is not the game of chess. It is a mere accident, on my concept of "constitutiveness," that the types in chess are described in rules and that the types in the play are described in a literary text not made up of rules. What matters in either case is that the actions performed (Juliet killing Romeo and a chess player moving the rook diagonally, and the bishop along rank and files) are not valid tokens of the types described in *Romeo and Juliet* and in the game of chess respectively, at least not in my sense of the word "valid": These actions are not congruent instantiations of any type described in *Romeo and Juliet* or in the rules of chess.

The token Juliet killing Romeo can also be said not to have a corresponding type, or form, in Shakespeare's *Romeo and Juliet*, and the token moving the rook diagonally and the bishop along ranks and files can be said not to have a corresponding type in the game of chess; or again, the first token can be said to be invalid with respect to all the types described in Shakespeare's *Romeo and Juliet*, and the second token invalid with respect to all the types described in the rules of chess.[10]

I am not objecting here to Searle's thesis. On the contrary, I quoted the 1969 Searle excerpt, and italicised some of Searle's words, because this excerpt, at least when taken in isolation, makes me comfortable with my preferred concept of "constitutiveness," that is, the concept of "constitutiveness" as independent of "norm" or "rule." Indeed, in the excerpt, Searle speaks of *forms of behaviour* in connection with regulative and constitutive rules alike, and does not exclude that constitutive rules are also regulative: Instead, he says that *they are not merely regulative*. So extracted, Searle's statement does not contradict, but in a way supports, my thesis.

Indeed, on my understanding of "constitutiveness," the point is not so much that some rules and not others are constitutive. All types or forms are constitutive. Therefore, any rule—insofar as its phrastic includes forms (or types), however much these forms (types) may never have been thought of before appearing in the rule that creates or defines them—can be said to be constitutive not qua rule, but insofar as its content includes a type (as of behaviour), however much this may be a new type, a type never before conceived of.

Instead, independently of the type described in the phrastic, all rules may be said to be regulative qua rules; that is, they may be said to be regulative because of their neustic. Rules are regulative because they qualify through deontic modalities (the modality obligatory, permitted, or forbidden as set forth in their neustic) the types they themselves set forth in their phrastic, and

[10] But these tokens will be valid with respect to other types (extraneous to *Romeo and Juliet* and to the rules of chess) because, in a sense, every token presupposes a type with respect to which it is valid—a type of which it is a congruent instantiation (cf. Section 15.2).

also—if they are normative rules—because they attach normative consequences (Ought-effects: see Chapter 3) to the valid instances of such types (see Section 2.2.2).[11]

2.1.5. *Simple and Compound Types and Tokens*

On my characterisation, "valid" and "invalid" mean congruent and incongruent with a type, form, or scheme. In geometry, "congruent" means "coinciding at all points when superimposed"—such is, for example, the meaning of "congruent triangles." Just as a triangle, *a*, can be incongruent with triangle *b* but congruent with triangle *c*, so a token, *t*, can be incongruent with type *U*, and hence invalid with respect to it, but congruent with type *V*, and hence valid with respect to it.

It may be that my characterisation will cause validity to appear as only a vestige of validity as this word is so often used to credit what is believed to be the binding force of law. Still, I feel confident that the characterisation of validity resulting from my approach will prove useful in simplifying the way this term is variously, and not always consistently, used in legal literature. Besides, my main purpose for characterising validity as a concept bound up with the concept of "type," but not with those of "norm" and "rule," is precisely to free it from all contamination with the concepts expressed by "binding force of law" and the like. In sum, I maintain that an actual token is valid if it counts as a happy token: as a congruent realisation, or happy performance, of a given type, form, or scheme.

It is possible, as well as useful, to draw a distinction between compound types and simple types.

A compound type is made up of two or more types, and these in turn can be compound or simple. A simple type is not made up of types: It is not susceptible of further subdivision.

An actual state of affairs or event will be a valid token with respect to a compound type if, and only if, its components congruently instantiate all the simple types making up the compound type. A valid token of a compound type is itself compound: It is made up of two or more tokens, compound or simple. Moreover, an actual compound state of affairs or event will be a valid token of a compound type only if it reproduces in its structure whatever relevant order is found in that type.

It might be argued that the realisations, instances, or tokens of a given type are by definition congruent, happy, or valid—for otherwise they would not be

[11] On my conception of norm (cf. Chapter 6), a rule is normative only for those who believe it to be so. But then all rules are regulative independently of their being believed to be normative. Rules, if they meet the requisites specified in Section 9.2, will in any event be a variety of directive.

realisations, instances, tokens, or performances of the type in question. And we could add that, given an actual state of affairs or event and a type, we ought properly to speak of realisations and instances that *prima facie* are realisations and instances of that type. For my present purposes, however, it suffices that I speak of tokens that are valid or invalid, congruent or incongruent, happy or unhappy with respect to a given type.

2.1.6. Competence, or Capacity

From the idea that types are constitutive of the possibility of their instantiation by tokens we get a characterisation not only of validity, but also of competence, or capacity.

The Latin verb *competere* means to "meet," "match," "correspond," or "fit together." Every type constitutes the possibility that a state of affairs or an event will meet or match this type, or correspond to it, or fit together (be congruent) with it: Every type is constitutive of the possibility of its valid (and invalid) instantiations, and, when these involve the action of one or more agents, it will be constitutive as well of the competence, or capacity, of the actual persons who instantiate it validly. Competence, or capacity, is the validity of acting persons: It is the validity or congruency of actual agents (tokens) with respect to an abstract agent (an agent-type).

It is not always the case that a type should include an agent-type and then constitute the possibility that certain actual agents (agent-tokens) have the competence to act a certain way or be in the capacity of doing so. Consider, for instance, the types "wildfire," "earthquake," and the like: They constitute the possibility of their valid instantiation, but they do not constitute the possibility of any competence, or capacity, unless we assume that the type "wildfire" or "earthquake" requires human agency.

At any rate, a relevant distinction with regard to validity and competence, or capacity, is that between "action" and "acting person," or "agent." Consider the type "the well-off aiding the needy." With respect to this type, the actually well-off are competent to aid the actually needy (they are in the capacity of aiding them), and the actually needy are competent to be aided (or in the capacity of being aided) by the actually well-off, whereas the converse is not true. The actually needy are not competent to aid the actually well-off, and the actually well-off are not competent to be aided by the actually needy. Of course nothing prevents the needy from helping the well-off. This, however, would not be a valid token of the type "the well-off aiding the needy." It would rather be a congruent, or valid, instantiation of the type "the needy aiding the well-off."

Just as "validity" need not involve "law," "norm," "rule," and the like, so "competence," or "capacity," need not involve these concepts, either. My characterisations of validity and competence, or capacity, presuppose only the

terms "type," "token," and the like, whether the type at issue is set forth in a norm, rule, or deontic sentence or in an apophantic sentence, or elsewhere. For example, the types "the well-off aiding the needy" and "the needy aiding the well-off" can occur in true or false sentences (apophantic sentences) like the following: "In my country the well-off aid the needy" and "In your country the needy aid the well-off." These sentences describe types which do not involve any reference to law, norms, or rules, and which, despite this feature, are constitutive of the possible validity or invalidity (congruence or incongruence) of behaviour-tokens with respect to the behaviour-type "aiding" and of the possible capacity or incapacity of agent-tokens with respect to the agent-types "the well-off" and "the needy."

The ideas of validity and of competence, or capacity, stem from the idea of constitutive types or forms: If and where a type or a form is described, or set forth, is not relevant to understanding that the core meaning of "validity" and "competence," or "capacity," is "congruency with a type (or form)."

2.2. The Chain of Normative Production. The So-called Typicality of Law

2.2.1. The Primacy of the Reality That Ought to Be

Despite the Is-Ought dualism, more or less consciously presupposed by the legal doctrine of civil-law countries, any event in the reality that ought to be is conditioned, according to the same legal doctrine, by events occurring in the reality that is: There is no event in the reality that ought to be which is not the normative consequence of events occurring in the reality that is. I will call the former events "Ought-events," "Ought-effects," "Ought-changes," or "normative consequences," and the latter "Is-events," "Is-causes," or "Is-changes."

Ought-effects, caused in the reality that ought to be, consist in the birth, modification, or extinction of rights or obligations ascribed to subjects under the law, or they consist in the birth, modification, or extinction of norms: In the former case the Ought-effects are caused in what is subjectively right; in the latter case they are caused in what is objectively right. In both cases the Ought-effects regard normative entities: They regard either rights and obligations in what is subjectively right or norms and their content in what is objectively right.

The reality that ought to be enjoys a primacy over the reality that is, for Is-causes (in the reality that is) will have to be valid tokens of types *set forth in norms* if they are to produce Ought-effects (in the reality that ought to be)—and they will produce *only* those effects that the same norms attach to those Is-causes. Is-events will produce Ought-effects if, and only if, they are valid (congruent) tokens of the types to which norms attribute a capacity to produce Ought-effects.

We can grasp here the true sense of so-called typicality, understood (as noted in Section 2.1.2) to be a distinguishing trait of law. As such, as a distin-

guishing trait of law, typicality does not consist merely in the fact that the law sets forth types of behaviour, for even a literary text sets forth types of behaviour. As has been observed already, typicality is, in this sense, a feature common to all the domains of culture: It is not a specificity of law.

The deep sense of typicality as a distinguishing trait of law lies elsewhere: It lies in the fact that no normative consequence will flow from valid tokens of types that are not set forth in legal norms. Only norms can produce normative consequences, either in what is subjectively right (rights and obligations) or in what is objectively right (norms and their content). True, norms use types and their valid tokens to govern and control the production of Ought-effects and so, more generally, to govern and control change and development in the reality that ought to be. *But they do so through types they themselves contain*, and that without exception. The valid tokens of types not contained in norms do not, cannot, and must not produce any Ought-effects.

There is here a chain of normative production like so: norm → valid token of a type set forth in this norm → new norm (or modification or extinction of norms already existing in what is objectively right) or new rights or obligations (or modification or extinction of rights or obligations already existing in what is subjectively right).[12] There will not be any chain of normative production with types not set forth in norms, for in this case we are left without the prime mover. So *herein* lies the true sense of so-called typicality as a distinguishing trait of law: It lies not in the fact that there are types only in the law (since they are found elsewhere, too), or in the fact that there is no law without types (since, more in general, no branch of science or the humanities is devoid of types), but in the fact that there is no law without norms (see Chapter 8), and that only the types contained in norms make possible the proliferation of norms in human brains and so also of legal norms (see Chapters 7 and 8 and Section 9.6).

It is misconceived to equate or connect validity with norms (Ought-effects). Validity depends not on norms but on types. And in fact a token's validity with respect to types not contained in norms has nothing to do with the production of Ought-effects. Obviously, the types and typicality that jurists and jurisprudents are concerned with are the types and typicality set forth in legal norms, and the valid tokens they are interested in are the tokens that are valid with respect to types set forth in legal norms. Perhaps the misconception in equating or connecting validity with norms is rooted in part in this (understandably) specific concern of the jurist and the jurisprudent with types as found in norms and with the tokens that are valid with respect to such types. This does not avert the misconception but perhaps explains it.

[12] Of course, the arrows in this sentence are not to be understood as logical connectives. They rather simply represent a sequence.

2.2.2. *Valid and Invalid Behaviours*

2.2.2.1. Noblesse Oblige

The concepts of "type" and of "valid token" are the device which, in civil-law dogmatics, explains the interaction between the reality that ought to be and the reality that is. This device is a sort of pineal gland in that it is meant to connect heterogeneous realities: the reality that ought to be, on the one hand, and the reality that is, on the other (in something like the manner in which the Cartesian pineal gland had this function with respect to soul and body: *res cogitans* and *res extensa*).

The way I characterise validity and competence, or capacity (Section 2.1), does not make them any less essential as components of the Cartesian pineal gland of sorts devised in legal doctrine to account for the interaction between the reality that ought to be and the reality that is (and for the primacy of the former over the latter).

We will consider in detail in Chapter 3 the role played by validity—by an Is-event's congruence with the types set forth in the reality that ought to be—within the chain of normative production. We will see how continental legal doctrine and general jurisprudence commonly (though not always consciously) understand the functioning of the legal pineal gland with regard to the Ought-effects produced by Is-causes in both of the aspects of the reality that ought to be: what is subjectively right and what is objectively right. The question of the Ought-effects in what is subjectively right is treated within the continental legal theory of "facts, acts, and transactions (or declarations of will)" (see Section 3.2). The question of the Ought-effects in what is objectively right is treated within the theory of the "sources of law" (see Sections 3.4 and 3.5).

But now I will comment instead on the peculiar way in which the concept of "valid state of affairs, valid event, or valid behaviour" is used, at least implicitly, in continental legal dogmatics. There is a body of legal literature concerned with the so-called interpretation of facts, states of affairs, events, and behaviours, namely, with the way in which to understand these things (as valid or invalid tokens, I would comment) with respect to the types set forth in the law.[13] But this last statement, to be more accurate, should rather read as follows: There is a body of legal literature concerned with the so-called interpretation of facts (of actual states of affairs, events, or behaviours), namely, with the way in which to understand these things (as valid or invalid tokens, I would comment) with respect to the types set forth in *and not forbidden by* the law.

[13] Cf. Engisch 1960, 19—Karl Engisch, 1899–1990; Kaufmann 1982, 37ff.; Larenz 1992, 166ff.; Guastini 2004, 99ff. In Volume 4 of this Treatise, Section 1.6, Peczenik refers to this topic under the heading "the doctrine of fact-finding."

The crucial point here is "not forbidden by the law." Thus, "paying your taxes" and "making a purchase" are types set forth in *and not forbidden by* the law, whereas "committing theft" is a type set forth in *and forbidden by* the law.[14]

Jurists will speak of a valid or an invalid actual payment of taxes or purchase depending on whether an actual event they are considering in the light of the type "paying your taxes" or "making a purchase" is or is not a congruent token of this type. But the same jurists, at least in civil-law countries, will not speak of a valid or an invalid actual theft despite the fact that an actual event they are considering in the light of the type "committing theft" is going to be either a congruent or an incongruent token of this type.

Jurists reserve the qualification "valid" or "invalid" for the congruence or incongruence of actual states of affairs or events (tokens) considered in the light of types set forth in the law and therein qualified as obligatory or permitted, but not in the light of types set forth in the law and therein qualified as forbidden: "Committing theft" is a type of behaviour set forth in the law *and therein qualified as forbidden*. To a jurist, "valid or invalid token" means not simply "congruent or incongruent token of just any type set forth in the law," but "congruent or incongruent token of a type whose instantiation is obligatory, or at least permitted, under the law," as is the case with the tokens of the types "paying your taxes" (obligatory) and "making a purchase" (permitted).

Jurists never assume "valid or invalid token" to mean "congruent or incongruent token of a type whose instantiation is forbidden under the law," as in the case of the type "committing theft." The use of "valid" and "invalid" is thereby circumscribed to only such tokens of behaviour as are right, in that these tokens do not violate any legal norm and so are not wrong (Section 1.3 under point (*iv*)).

Further, as was previously pointed out, jurists are not interested in tokens of types not set forth in law, and therefore never assume "valid or invalid" to mean "congruent or incongruent token of a type not set forth in any legal norm."

Maybe the reason why jurists do not say "valid" or "invalid" of wrong behaviours (actual behaviours instantiating types set forth in a legal norm *and*

[14] Clearly, since in the standard system of deontic logic the concepts of obligation, permission, and forbiddance are interdefinable, the expression "It is obligatory to pay your taxes" is equivalent to (i) "It is forbidden not to pay your taxes" and to (ii) "It is not permitted not to pay your taxes." Analogously, the expression "It is permitted to make a purchase" is equivalent to (iii) "It is not obligatory not to make a purchase," and to (iv) "It is not forbidden to make a purchase," whereas the expression "It is forbidden to commit theft" is equivalent to (v) "It is obligatory not to commit theft" and to (vi) "It is not permitted to commit theft." In fact, it may be said that the conceptual sense of expressions such as (i) and (ii) corresponds to the general idea of obligation, the conceptual sense of expressions such as (iii) and (iv) corresponds to the general idea of permission, and the conceptual sense of expressions such as (v) and (vi) refers to the general idea of forbiddance.

therein forbidden) is that this use is held back by an unconscious voluntaristic prejudice on their part: An agent who commits a wrong does not will the Ought-effects the legal normative system "wills" for the wrongdoer. I am referring here to the doctrine of legal transactions (Section 3.2.4). Underlying this doctrine is the idea that the persons who stipulate a valid and right transaction are aiming to produce legal Ought-effects as these are willed by the normative legal system.

So, too, the reason why jurists do not say "valid" or "invalid" of behaviours that instantiate types *not* set forth in law may be that this use is held back by an unconscious professional bias: The tokens of types not set forth in law are irrelevant; they deserve no attention.

Or maybe what in both cases holds back the jurists is a sort of Platonic noblesse oblige, which legal dogmatics is still influenced by. "Valid" and "invalid" are terms too noble to apply to actual wrong behaviours, because wrong behaviours appear to carry derogatory connotations, or to apply to the tokens of types not set forth in law, because these tokens appear to be of little importance (*de minimis non curat praetor*). Plato, it is known, did not admit that there should be forms or types for such things as seem undignified or ridiculous:

> "And what about these, Socrates? Things that might seem absurd [*geloia*, better translated as "ridiculous"], like hair and mud and dirt, or anything else totally undignified and worthless? Are you doubtful whether or not you should say that a form [*eidos*] is separate for each of these, too, which in turn is other than anything we touch with our hands?" "Not at all," Socrates answered. "On the contrary, these things are in fact just what we see. Surely it's too outlandish to think there is a form [*eidos*] for them." (Plato, *Parmenides* (b), 130c)[15]

On my characterisation of validity, in contrast, a token will be valid or invalid when congruent or incongruent with a given type, independently of whether the type in question is set forth in a norm or in an apophantic sentence, for example, and—if the type *is* set forth in a norm—independently of whether the norm makes this type obligatory, permitted, or forbidden.

Hence, a behaviour-token that is valid with respect to a given type set forth in a norm will be right, in addition to being valid, if it complies with the modality that in a norm qualifies that type as obligatory or permitted; and it will be wrong, in addition to being valid, if it does not comply with the modality that in a norm qualifies that type as forbidden. Given, for example, the type "crossing the street," my actual congruent, and hence valid, crossing the street will be right (in addition to being valid) if the type "crossing the street"

[15] The Greek original: "Ἦ καὶ περὶ τῶνδε, ὦ Σώκρατες, ἃ καὶ γελοῖα δόξειεν ἂν εἶναι, οἷον θρὶξ καὶ πηλὸς καὶ ῥύπος ἢ ἄλλο τι ἀτιμότατόν τε καὶ φαυλότατον, ἀπορεῖς εἴτε χρὴ φάναι καὶ τούτων ἑκάστου εἶδος εἶναι χωρίς, ὂν ἄλλο αὖ | ὧν ἡμεῖς μεταχειριζόμεθα, εἴτε καὶ μή;' 'οὐδαμῶς,' φάναι τὸν Σωκράτη, 'ἀλλὰ ταῦτα μέν γε, ἅπερ ὁρῶμεν, ταῦτα καὶ εἶναι· εἶδος δέ τι αὐτῶν οἰηθῆναι εἶναι μὴ λίαν ᾖ ἄτοπον" (Plato, *Parmenides* (a), 130c).

is qualified by a norm as obligatory or permitted; instead, my actual congruent, and hence valid, crossing the street will be wrong (in addition to being valid) if the type "crossing the street" is qualified by a norm as forbidden. And my actual crossing the street will be valid or invalid even with respect to apophantic sentences such as "It is lethal to cross the street" or "It is not lethal to cross the street." (Only a valid token of the type "crossing the street" can make these apophantic sentences true or false.)

The jurists, by limiting the application of "valid" and "invalid" to the tokens of obligatory and permitted types, endow these terms with a normative valence: A valid token of an obligatory or permitted type is fully right; an invalid token of the same type is, so to speak, a defectively right behaviour-token, a behaviour-token inadequate or unfit to serve the function of producing the normative consequences (Ought-effects) that legal norms attach to the valid instances of the type in question. Let us illustrate the point with two examples as follows.

(*a*) Anyone who validly pays taxes or validly makes a purchase holds a right behaviour-token (obligatory in the first case, permitted in the second) and does so without defect, such that this actual behaviour is not only right but also fit to produce Ought-effects, such as extinguishing someone's actual obligation to pay taxes and acquiring a right to property of the thing purchased.

(*b*) Instead, anyone who invalidly pays taxes or invalidly makes a purchase (as by overlooking to place a signature or stamp a seal) holds defectively a right behaviour-token. This actual—perhaps right but defective—behaviour is unfit to produce the Ought-effects that legal norms attach to the payment of taxes and to sales contracts respectively. It is inadequate because not fully congruent with the type set forth in a norm; it is inadequate precisely because invalid, an invalid (imperfect) token of an obligatory or permitted type. This is how, consciously or not, a jurist who deals in continental legal dogmatics will reason: The valid instances of an obligatory or permitted type are fully right; the invalid instances of an obligatory or permitted type are imperfectly right; the instances of a forbidden type are unworthy of the qualification "valid" or "invalid"—they are simply wrong.

I find it preferable not to ascribe any normative valence to the terms "valid" and "invalid," because it is on account of this valence, or partly on account of it, that these terms have come to be a source of misunderstanding.

2.2.2.2. Four Possibilities

One can well understand the jurists' concern with constructing theories that answer practical rather than theoretical needs, and with developing an equally practical terminology. Jurists use the terms "valid" and "invalid" to qualify only the tokens of obligatory or permitted types, and hence to establish whether or not these tokens produce the Ought-effects the normative legal

system connects with the instances of the types considered: The valid tokens of obligatory or permitted types produce the Ought-effects the normative legal system connects with those types; invalid ones do not, or they produce different Ought-effects.

But this need of the jurists can equally be answered by a use of "valid" and "invalid" that is devoid of normative connotations because based exclusively on the concept of type.

Ça va sans dire that only the valid (congruent) tokens of types set forth in norms produce the Ought-effects the normative legal system connects with the valid instances of such types. And in fact, the way I see the matter, this happens not only with the valid tokens of obligatory or permitted types, such as "paying your taxes" or "making a purchase," but also with the valid tokens of forbidden types, such as the type "committing theft."

It likewise goes without saying that the invalid (incongruent) tokens of the types set forth in legal norms do not produce the Ought-effects that legal norms connect with the valid instances of such types. I believe this happens not only with the invalid tokens of obligatory or permitted types, but also with invalid tokens of forbidden types, such as the type "committing theft": An incongruent (invalid) token of a forbidden type does not produce the legal Ought-effects the legal system connects with the congruent (valid) tokens of the same type.

But whether the invalid tokens of a given obligatory or permitted type, or even a forbidden one, produce other Ought-effects (Ought-effects other than those that legal norms connect with the valid tokens of those types) is a different question. Let us formulate this question as follows.

A type set forth and qualified in a legal norm as obligatory, permitted, or forbidden is thereby regulated by the legal norm. The valid tokens of a type normatively qualified as obligatory or permitted are right; the valid tokens of a type normatively qualified as forbidden are wrong: We will have *validly right* tokens in the first case and *validly wrong* tokens in the second. Also, the valid tokens of a type set forth in a legal norm will be assumed (believed) to produce Ought-effects in the reality that ought to be (in what is subjectively right or in what is objectively right: see Chapters 3, 6, and 7). And the Ought-effects of valid tokens will be the effects the normative[16] legal system attributes to validly right tokens (to valid instances of obligatory or permitted types) and to validly wrong tokens (to valid instances of forbidden types) respectively.

[16] The qualifier "normative" is meant to signal that there is at play here the so-called internal point of view: Section 8.1.3.2. But it is not necessarily the case that all those subject to a legal system should always adopt this point of view (cf. Sections 8.2.6.1 and 10.2.3). In short: Not all legal rules are norms, and those legal rules that *are* norms are not necessarily so for everyone who is subject to the legal system. And not all norms are legal norms (but this much is, I believe, an established fact).

With this said, we have in all two possibilities—or rather four, since each of the two branches turn into two further possibilities. And this all has to do with the so-called typicality of law.

Possibility one: valid tokens. A token is *valid and right* or it is *valid and wrong* with respect to the types set forth in given legal norms. It is valid and right with respect to types therein qualified as obligatory or permitted; it is valid and wrong with respect to types therein qualified as forbidden.

If the tokens of an *obligatory* or *permitted* type are *valid*, they will necessarily be right and will necessarily produce the Ought-effects that under a legal norm are to be caused by the valid tokens of this obligatory or permitted type. The Ought-effects in question will get produced either only in what is subjectively right (and hence will only affect obligations and rights; such will be the case if the valid, right tokens in question are facts, acts, or transactions: see Section 3.2), or they will get produced in what is objectively right (and hence will affect legal norms and their content; such will be the case if the valid, right tokens in question are sources of law: see Section 3.4) and then—indirectly—they will affect also what is subjectively right (where they will affect obligations and rights), but this only on condition that certain further events (facts, acts, or transactions) also occur in the reality that is.

If the tokens of a *forbidden* type are *valid*, they will necessarily be wrong and will necessarily produce the Ought-effects that, under a legal norm, are to be caused by the valid tokens of this forbidden type. The Ought-effects of a valid, wrong behaviour will get produced only in what is subjectively right (and hence will affect only obligations and rights).

Possibility two: invalid tokens. A token is *invalid* with respect to the types set forth in given legal norms but is valid with respect to the types set forth in other legal norms in the legal system; or a token is *invalid* with respect to all the types set forth in the norms making up the legal system (even if it is valid with respect to a type not set forth in any norm in the legal system).

If the tokens of an *obligatory* or *permitted* type are *invalid*, they will *not* produce the Ought-effects that, under a legal norm, are to be caused by the valid tokens of this permitted or obligatory type. And whether other normative consequences (Ought-effects) will follow from such invalid tokens, and if so what kind they will be, will depend on the normative legal system as a whole: It will depend on whether the same tokens, though invalid with respect to the permitted or obligatory type in question, are valid with respect to other types, meaning types described elsewhere—by one or more other norms in the normative legal system and therein qualified as obligatory, permitted, or forbidden.

Likewise, if the tokens of a *forbidden* type are *invalid*, they will *not* produce the Ought-effects that, under a legal norm, are to be caused by the valid tokens of this forbidden type. And whether other normative consequences (Ought-effects) will follow from such invalid tokens, and if so what kind they will be, will depend on the normative legal system as a whole: It will depend

on whether the same tokens, though invalid with respect to the type in question, are valid with respect to other types, meaning types described elsewhere—by one or more other norms in the normative legal system and therein qualified as obligatory, permitted, or forbidden.

I will make two examples: one of an invalid token of a permitted type, the other of an invalid token of a forbidden type.

(*i*) Article 1367 of the Italian Civil Code, on the interpretation of contracts, reads thus:

> In case of doubt, the contract or the individual clauses shall be interpreted in the sense in which they can have *some effect*, rather than in that according to which they would have none. (*The Italian Civil Code*, art. 1367; italics added)[17]

We can gather from this article that under the Italian Civil Code, behaviour-tokens that are invalid with respect to one type of contract can nonetheless be valid with respect to other types of contract. In particular, under the article in question, a behaviour-token (such as drawing up a contract) that invalidly instantiates one type of contract (as for a sale of goods) can nonetheless validly instantiate a different type of contract (as for renting this same good); in fact the interpreter, when in doubt, will be required to interpret the contract not in the sense by which the token of the two parties' drawing up of this text is invalid with respect to *all* types of contract (and hence carries no Ought-effects in what is subjectively right in the reality that ought to be), but rather in a sense by which the two parties' behaviour-token (their drawing up the contract) is valid with respect to some type of contract under the law (and hence can carry some Ought-effect in what is subjectively right in the reality that ought to be).

(*ii*) Article 56 of the Italian Penal Code, on attempted crime, reads thus:

> Anyone who does acts aptly directed in an unequivocal manner towards commission of a crime shall be liable for an attempted crime if the action is *not completed* or the event does not take place.
>
> A person guilty of an attempted crime shall be punished: [with imprisonment of from twenty-four to thirty years, if the law prescribes the penalty of death for the crime];[18] with imprisonment for not less than twelve years, if the punishment prescribed is life imprisonment; and, in other cases, with the punishment prescribed for the crime, reduced by one-third to two-thirds.
>
> If the offender voluntarily desists from action, he shall be subject to punishment only for acts *completed*, where these constitute in themselves [count as, I would say, meaning they are valid instances] a *different offence*.
>
> If he voluntarily prevents the event, he shall be subject to the punishment prescribed for the attempted crime, reduced by from one-third to one-half. (*The Italian Penal Code*, art. 56; italics and footnote added)[19]

[17] Clearly, "effect" here means "Ought-effect," that is, a normative effect. The Italian original: "Nel dubbio, il contratto e le singole clausole devono interpretarsi nel senso in cui possono avere qualche effetto, anziché in quello secondo cui non ne avrebbero alcuno."

[18] The death penalty has been abrogated in Italy for all crimes.

[19] The Italian original: "Chi compie atti idonei, diretti in modo non equivoco a commettere un delitto risponde di delitto tentato, se l'azione *non si compie* o l'evento non si verifica.

We can see from this article that, under the express statement of the Italian Penal Code, behaviour-tokens that are invalid with respect to one type of crime (invalid because not completed), and hence are not wrong under the legal norm wherein this type of crime is set forth, are instead valid with respect to other types of crime, and hence are wrong under the legal norms wherein these other types of crime (in particular, the type "attempted crime") are set forth.

In Paragraphs 3 and 1 of this Article 56 of the Italian Penal Code we find a clear distinction between "completed act" and "uncompleted act." A token's completeness with respect to a type, and especially with respect to a compound type (on compound types, see Section 2.1.5) is a requisite of the token's validity with respect to that type. It bears repeating here what was observed in Section 2.1.5, namely:

> A compound type is made up of two or more types, and these in turn can be compound or simple. A simple type is not made up of types: It is not susceptible of further subdivision.
>
> An actual state of affairs or event will be a valid token with respect to a compound type if, and only if, its components congruently instantiate all the simple types making up the compound type. A valid token of a compound type is itself compound: It is made up of two or more tokens, compound or simple. Moreover, an actual compound state of affairs or event will be a valid token of a compound type only if it reproduces in its structure whatever relevant order is found in that type.

There are two things we may appreciate in the light of the distinctions made in the foregoing passage: (*a*) a token's completeness with respect to a compound type stands as a requisite of the token's validity with respect to the same compound type, and (*b*) if the tokens of a type that is a component of a compound type are complete with respect to the component type, they can be valid with respect to this component type (cf. Section 6.4 on the referents of a norm).[20]

Il colpevole di delitto tentato è punito: [con la reclusione da ventiquattro a trenta anni, se dalla legge è stabilita per il delitto la pena di morte;] con la reclusione non inferiore a dodici anni, se la pena stabilita è l'ergastolo; e, negli altri casi con la pena stabilita per il delitto, diminuita da un terzo a due terzi.

Se il colpevole volontariamente desiste dall'azione, soggiace soltanto alla pena per gli atti *compiuti*, qualora questi costituiscano per sè un *reato diverso*.

Se volontariamente impedisce l'evento, soggiace alla pena stabilita per il delitto tentato, diminuita da un terzo alla metà" (italics added).

[20] For example, suppose subject *x* decides to kill subject *y*. If *x* succeeds, *x*'s acts will be completed with respect to the compound type "murder": The token will be valid with respect to this compound type. If *x*'s acts are aptly directed in an unequivocal manner toward killing *y*, but *x* does not succeed, *x*'s acts will not be completed with respect to the compound type "murder": *x*'s acts, that is, the token, will be only *partially* completed and *partially* valid with respect to this compound type; at the same time, *x*'s acts, that is, the token, will be *fully* completed and *fully* valid with respect to the type "attempted murder." Finally, if *x* voluntarily desists from killing *y*, some of *x*'s acts may be completed and valid with respect to a different type, such as the type "personal injury"; or else, none of *x*'s acts will be completed and valid with respect to any type set forth in the Italian Penal Code.

Indeed, we can gather from the same Paragraph 3 of Article 56, as exemplified a moment ago in footnote 20, that a completed act which is invalid with respect to a compound type as set forth in a penal law can validly instantiate a *different offence*, meaning a different type of crime, a crime set forth elsewhere in the Italian Penal Code, or it can validly instantiate a type that is not set forth by the same code or therein prohibited. A completed act that does not constitute a different offence is clearly a valid token of a type of behaviour not prohibited in the Italian Penal Code, and which may even be absent from the entire Italian legal system.

As has been observed already, all of what I have been describing thus far concerns the true sense of the so-called typicality of law.

2.2.3. Ought-Effects Are neither Valid nor Invalid

A further and important qualification is called for here.

Ought-effects are neither valid nor invalid. They simply happen to get produced or not get produced in the reality that ought to be. Their production is regulated by norms. Which means that norms establish (*a*) what Ought-effects must be and will be produced and (*b*) what type of Is-event the production of Ought-effects is conditionally connected with.

If the type with which a norm connects Ought-effects gets validly instantiated in the reality that is, then these Ought-effects will be produced in the reality that ought to be. Otherwise, they will not be produced.

It may not be inaccurate (even if it may be misleading) to say that the production of Ought-effects is an Ought-effect. But it will be inaccurate, as well as misleading (from my standpoint), to say that the non-production of Ought-effects is an Ought-effect. Even so, it is not regarded as an oddity to say that Ought-effects are valid, when what we mean is that they should be produced (or have been produced), or that Ought-effects are invalid, when what we mean is that they should not be produced (or have not been produced).

Indeed, it is standard practice in common parlance and in legal doctrine to say that the invalidity of a certain Is-event (in the reality that is) produces the invalidity of certain Ought-effects (in the reality that ought to be): It is usual to say that the Ought-effects that "should have been valid" (meaning that "they should have been produced if the causing Is-event had been valid") "are not valid" (meaning that "they have not been produced because the causing Is-event was not valid").

Thus, in reference to the game of soccer, people will commonly say of a goal (Ought-effect) that it is valid if the shot on goal (Is-event) was valid, and that the goal (Ought-effect) is invalid if the shot on goal (Is-event) was invalid (as when the ball is kicked from offsides). "Valid goal" is used here to mean "a goal has taken place in the reality that ought to be, i.e., a normative consequence, or

Ought-effect, has been produced which is a goal," and "invalid goal" is used to mean "no goal has taken place in the reality that ought to be, i.e., no normative consequence, or Ought-effect, has been produced which is a goal." The soccer norm here involved is that if a shot is executed validly with respect to a certain type (not from offsides, among other things) and the ball goes through one team's goalposts, then the other team must normatively earn one point (in the reality that ought to be which makes up the game of soccer).[21]

What in the common parlance of soccer is referred to as a question of "valid goal" or "invalid goal" is not a question of validity. It is rather a question of normativeness:[22] It is a normative question, a question concerning the reality that ought to be, meaning by this that a certain Ought-effect—scoring a point—must normatively take place in the reality that ought to be (if a certain type of Is-event has been validly instantiated), while it must not and will not take place in the reality that ought to be (if the same type of Is-event has been invalidly instantiated). (More on this in Section 8.2.4.)

Let it be emphasised that the production and non-production of Ought-effects depends on norms qua norms. It does not depend on any constitutiveness of norms, because no norm is constitutive qua norm. All norms are regulative and normative qua norms: They are regulative insofar as they qualify as obligatory, permitted, or forbidden certain types of behaviour; and they are normative insofar as they conditionally connect certain Ought-effects with certain types of Is-events (though not necessarily and so not always; cf. Chapters 6 and 7).

By contrast, validity and invalidity—a token's congruence or incongruence with a given type—depends on the type qua type that a token is brought under. It is types that are constitutive, not the norms, or rules, they are set forth in. A type, recall, may be set forth anywhere, even in an apophantic sentence. Types, wherever they are set forth, even in the reality that ought to be, are constitutive of the possibility that tokens (occurring in the reality that is, the only reality they can occur in) instantiate them validly (congruently) or invalidly (incongruently) in that same reality (the reality that is).

Hence Ought-effects are not themselves valid or invalid, despite the fact that norms make the production or non-production of Ought-effects in the reality that ought to be (in what is subjectively right and what is objectively

[21] Similarly, a legal norm on voting activities will say that if the vote is validly effected with respect to a certain type (with respect to a certain type of voting procedure), and if a candidate obtains a majority of votes, then this candidate must (normatively) become, say, mayor of New York.

[22] "Normativeness" does not seem to enjoy as much currency as "normativity" in legal-philosophical literature. And it is precisely for this reason that I have chosen to use "normativeness" to express the concept of norm adopted in this volume (cf. Chapters 6 and 7). For similar reasons I have chosen "efficaciousness" (rather than "efficacy" or "effectivity") for the specific efficaciousness of motives of behaviour, and in particular to designate the efficaciousness of a norm as a motive of behaviour as this concept is presented in this volume (cf. Section 6.6). On some uses of "normativity," see Paulson and Litschewski Paulson 1998.

right) dependent on the validity in the reality that is of the tokens of certain types of Is-events set forth in the same norms.

The production we are discussing here is of a peculiar kind: It is a *normative* production. So, unless stated in a norm (through the types with which Ought-effects are therein conditionally connected), this normative production cannot take place in the reality that ought to be (the only place where Ought-effects can take place).

Chapter 3

TAKING A DIVE INTO THE SOURCES OF LAW

3.1. Where to Jump in From

The distinction was introduced in Chapter 1 between the reality that ought to be and the reality that is. In the reality that ought to be a further distinction was made between what is objectively right (norms and their content) and what is subjectively right, meaning rights and obligations. What is subjectively right depends on the content of norms as well as on what this content refers to in the reality that is—to actual subjects (people), states of affairs, and events.

It was pointed out that the reality that ought to be and law, though they often get mixed up in the thought of various scholars, do not necessarily coincide.

In Chapter 2 we considered validity and presented it as a sort of "legal pineal gland" designed to guarantee the interaction between two heterogeneous realities: the reality that ought to be and the reality that is. By this connection I introduced my concept of "validity," a concept entirely severed from the concept of "norm" and based instead on that of "type."

In this chapter I will go into the details of the interaction between the reality that is and the reality that ought to be with regard to what is subjectively and what is objectively right respectively. In the former connection, I will present a reconstruction of the legal-dogmatic theory of facts, acts, and transactions (declarations of will) as valid Is-events which cause Ought-effects in what is subjectively right (Section 3.2). In the latter connection, I will comment on the theory of the sources of law as valid Is-events (facts, acts, and especially declarations of will by the sovereign) which cause Ought-effects in what is objectively right (Sections 3.4 through 3.6).

3.2. Facts, Acts, and Transactions as Valid Is-Events Which Cause Ought-Effects in What Is Subjectively Right

3.2.1. Generalia

The Is-events that cause Ought-effects in what is subjectively right are distinguished into facts, acts, and transactions (*Geschäfte* in German) or declarations of will. The idea is that these events are valid tokens of types described in, and not forbidden by, legal norms: They are valid and right tokens of these types, and norms attach to them Ought-effects, namely, the birth, modification, or extinction of rights and obligations among subjects under the law (normative production and typicality of law: Section 2.2).

The distinction between facts, acts, and transactions has long been received in civil-law legal literature. In particular, the theory of *Rechtsgeschäft* developed within 19th-century German legal dogmatics and was then received into a number of civil-law countries, but not in common-law countries. Various English renditions of the term *Rechtsgeschäft* have been attempted, among which some using the term "transaction" and others the expression "declaration of will." I adopt here "transaction" even if the term is not fully satisfactory. And we will see, further, that the expression "declaration of will" traditionally appears in the *definiens* of *Rechtsgeschäft*: It therefore cannot be used to also translate the *definiendum*.

All events occurring in the reality that is, and which are valid and right tokens (valid with respect to types qualified in the normative legal system as obligatory or permitted), are Is-facts broadly understood, provided the normative legal system attaches to them Ought-effects that take place in what is subjectively right.

In the tradition of civil-law legal literature, Is-facts broadly understood are distinguished into Is-facts strictly understood and Is-acts broadly understood. Further, Is-acts broadly understood divide into Is-acts strictly understood, on the one hand, and transactions, on the other. Following is a diagram laying out the distinctions just made.

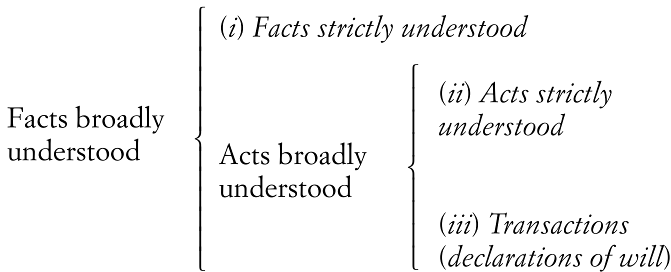

Figure 1: *Facts, acts, and transactions, or declarations of will*

You may like or dislike this redundant distinction: I happen to dislike it. But still, it is a component of the legal dogmatics of civil law.

3.2.2. Is-Facts Strictly Understood

Is-facts strictly understood (item (*i*) in Figure 1 above) are events in the reality that is to which the reality that ought to be (norms) attaches Ought-effects (which effects take place in what is subjectively right in the reality that ought to be), whether or not these events are voluntary human actions. In other words, if human will bears no relevance to the validity of the Is-events to

which a norm attaches the production of Ought-effects, then—from the standpoint of legal dogmatics—an Is-fact will be an Is-fact strictly understood whether or not it is a voluntary human action.

An example of an Is-fact strictly understood that causes Ought-effects in what is subjectively right is a person's death.

A person's death is an event in the reality that is, wherein it can occur through human will (deliberate killing or suicide or killing by voluntary action not intended to kill) or independently of human will (as the result of failing health, for instance, or of a fatal accident). In either case, whether human will is involved or not, the death-token validly instantiates the type "death" and carries several Ought-effects in what is subjectively right in the reality that ought to be: Some of the deceased person's rights and obligations will become extinct and some will transfer to other people; the deceased person's right to life will become extinct, for example, whereas the property rights (unless otherwise specified in a valid will) will transfer to relatives.

3.2.3. Is-Acts Strictly Understood

Let us turn to item (*ii*) of Figure 1 (introduced in Section 3.2.1): valid Is-acts strictly understood.

In the tradition of civil-law literature, Is-acts broadly understood are those events in the reality that is which are voluntary human actions.

From the standpoint of civil-law dogmatics, a human action can be voluntary in two senses: a general sense, in which "voluntary action" means "conscious action," and a specific sense, in which "voluntary action" means "conscious action carried out with the conscious intention of producing certain Ought-effects."

Is-acts strictly understood are voluntary human actions to which the reality that ought to be (norms) attaches Ought-effects (which effects take place in what is subjectively right in the reality that ought to be) whether these acts are voluntary human actions in the general or the specific sense of this expression. In other words, whether an act is voluntary in one or the other of the two senses just specified bears no relevance to the validity of the Is-acts to which a norm attaches the production of Ought-effects; hence, from the standpoint of legal dogmatics, an Is-act will be an Is-act strictly understood (not a transaction or a declaration of will) whether it is voluntary in the general or the specific of the two senses of "voluntary."

An example of an Is-act strictly understood causing Ought-effects in what is subjectively right is the finding of a treasure, a treasure being "any movable thing of value, hidden or buried, of which no one can prove he is owner" (*The Italian Civil Code* art. 932, par. 1).[1]

[1] The Italian original: "Qualunque cosa mobile di pregio, nascosta o sotterata, di cui nessuno può provare d'essere proprietario."

The finding of a treasure is an event belonging to the reality that is, where it can take place through human will in the general or the specific of the two senses specified above, i.e., finding a treasure without any intention of becoming its rightful owner, or finding the same treasure intently, in the effort to become its rightful owner.

In either case (and this is the reason why, from a legal-dogmatic standpoint, the act in question is an Is-act strictly understood) the act of finding a treasure has the same Ought-effect in what is subjectively right in the reality that ought to be; that is, it causes in behalf of the finder the birth of a right of ownership to the treasure.[2]

3.2.4. Transactions, or Declarations of Will

Let us finally look at item (*iii*) of Figure 1 (introduced in Section 3.2.1): transactions, or declarations of will.

Transactions are Is-acts in the reality that is which are voluntary human actions in the specific of the two senses specified in Section 3.2.3: They must produce and will produce Ought-effects (in what is subjectively right in the reality that ought to be) if, and only if, they are voluntary in this specific sense.

No token will be valid with respect to any type of legal transaction unless it gets instantiated with the specific intention of producing the Ought-effects (in what is subjectively right) attached to this type by the norm wherein the same type is set forth.[3]

A legal transaction (*Rechtsgeschäft* in German), as Bernard Windscheid (1817–1892) defined it, is a private declaration of will that aims to produce a legal (Ought-) effect. Scores of scholars have worked on this definition, bringing refinements and adding qualifications to it. Francesco Messineo (1886–1974), for example, defines a transaction as a private statement of intention aimed at producing certain legal (Ought-) effects that the legal system recognises and guarantees so long as the desired effects are congruent with their pursuer's intention and are lawful.[4]

[2] The Ought-effects in what (within the reality that ought to be) is subjectively right will be different according as the finder is or is not the owner of the estate where the treasure is found. But we need not enter into this further detail.

[3] But compare Article 1367 of the Italian Civil Code as quoted in Section 2.2.2.2.

[4] Following are the textual definitions given by Windscheid and Messineo: "Rechtsgeschäft ist eine auf die Hervorbringung einer rechtlichen Wirkung gerichtete Privatwillenserklärung. Das Rechtsgeschäft ist Willenserklärung. Es wird der Wille erklärt, daß eine rechtliche Wirkung eintreten solle, und die Rechtsordnung läßt diese rechtliche Wirkung deßwegen eintreten, weil sie von dem Urheber des Rechtsgeschäfts gewollt ist" (Windscheid 1900, vol. 1, 266–7); "Negozio giuridico è [...] una dichiarazione di volontà [...], o un complesso di dichiarazioni di volontà [...] dirette alla *produzione* di dati *effetti giuridici* [...] che l'ordinamento giuridico *riconosce e garantisce* [...] *nei limiti* della corrispondenza, o congruità, fra essi e la volontà che li persegue e in quanto si tratti di effetti *non-illeciti*" (Messineo 1943, 204–5).

An example of an Is-transaction causing Ought-effects in what is subjectively right is a contract, namely, "the agreement of two or more parties to establish, regulate or extinguish a patrimonial legal relationship among themselves." An example of a contract is a sale, namely, an agreement "having as its object the transfer of the ownership of a thing or the transfer of other rights in exchange for a price" (definitions found in Articles 1321 and 1470, *The Italian Civil Code*).[5]

In conclusion, Is-facts, acts, and transactions are events in the reality that is which cause Ought-effects in what is subjectively right in the reality that ought to be: They will bring about, modify, or extinguish rights and obligations among subjects under the law (provided they are valid tokens of a type of Is-event set forth in, and not forbidden by, what is objectively right in the reality that ought to be: Section 2.2.2.1).[6]

3.3. Distinguishing Ought-Effects in What Is Subjectively Right from Ought-Effects in What Is Objectively Right

As stated in Chapter 1, what is *objectively* right is the content of a norm, that is, a type, insofar as it is qualified as obligatory, permitted, or forbidden by this norm. The content of a norm is a necessary but not a sufficient condition of what is *subjectively* right. What is subjectively right (obligations and rights) does presuppose norms and their content, but it also presupposes that the content of these norms has referents in the reality that is.

For example, the norm not to smoke in public places sets down through its content what is objectively right on the question of people smoking in public places: It is objectively right not to smoke in public places. This norm continues to be a norm even if no one is presently frequenting any public place, and even if no public places exist. The burden here is precisely that the content of a norm, even in default of any referent in the reality that is, is what is objectively right.

Instead, what is subjectively right with regard to smoking in public places requires that two conditions be satisfied: A norm on smoking in public places needs to exist in the reality that ought to be, and one component of the

[5] The Italian original: "Il contratto è l'accordo di due o più parti per costituire, regolare o estinguere tra loro un rapporto giuridico patrimoniale" (art. 1321). "La vendita è il contratto che ha per oggetto il trasferimento della proprietà di una cosa o il trasferimento di un altro diritto verso il corrispettivo di un prezzo" (art. 1470).

[6] As the reader will have noticed, I speak on some occasions of Is-events causing Ought-effects and on other occasions of Ought-effects a norm attaches to Is-events validly instantiating a type set forth in the same norm. These two formulations are used here interchangeably. The first echoes the concept of legal causality, which has a tradition of its own in civil-law legal dogmatics (cf. Zitelmann 1879, 225–9—Ernst Zitelmann, 1852–1923). In the Anglo-Saxon world this idea is referred to by speaking of "operative facts": cf., in Volume 5 of this Treatise, Sartor, Section 20.2.4.

norm's content (a type of event or state of affairs, i.e., the conditioning type of circumstance set forth in the norm; see Section 6.3) needs to have referents in the reality that is (in the example, there needs to be at least one person who shows up in a public place). If, and only if, both conditions are met, something subjectively right will subsist in the reality that ought to be with regard to smoking in public places. Indeed, a possible formulation of the norm that forbids smoking in public places is as follows: "If someone is in a public place, then there will be for this person, because of his or her stay in this public place, an obligation not to smoke."

A person showing up in a public place is a valid Is-fact that produces Ought-effects in what is subjectively right. There will be, for the person showing up in a public place, an obligation arising in what is subjectively right in the reality that ought to be: an obligation to refrain from smoking. The obligation to refrain from smoking incumbent on people in public places belongs to the reality that ought to be: It belongs to what in this reality is subjectively right. Instead, the fulfilments (right behaviours) and non-fulfilments (wrong behaviours) of this obligation belong to the reality that is.

The facts, acts, and transactions illustrated in Section 3.2 are events in the reality that is. And, provided they are valid tokens of a type of circumstance (see Section 6.3) specified in what is objectively right in the reality that ought to be (in the content of norms), they will cause Ought-effects in this last reality. These Ought-effects, as has already been observed, are the birth, modification, or extinction of rights and obligations among subjects under the law. They will be Ought-effects bearing *only* on what is subjectively right in the reality that ought to be, and will not affect what in this same reality is objectively right (the content of norms).

Indeed, we may well imagine that in a given period what is objectively right (the content of legal norms) does not undergo any change, and that at the same time several Ought-changes occur in what is subjectively right (in legal rights and obligations among subjects under the law) through the action of valid Is-facts, acts, and transactions (declarations of will). Let us assume, for example, that nothing changes in Italian family law (what is objectively right) over a period of twenty years. Even then, during this same period numerous Ought-changes will be taking place in what is subjectively right in the ambit of Italian family law (in legal relations, rights, and obligations among subjects under the scope of Italian family law). These Ought-changes have taken place through the action of valid Is-facts, acts, or declarations of will, such as births, deaths, marriages, divorces, and adoptions. In the meantime, nothing has changed in what is objectively right; that is, nothing has changed in the content of the norms making up Italian family law.

What is objectively right (the content of norms) does not change through the action of Is-facts, acts, or transactions, but only through the action of other Is-causes that are different, though not heterogeneous, from the Is-facts,

acts, and transactions considered in Section 3.2. These other Is-causes are likewise valid tokens of types described in and regulated by legal norms (by what is objectively right in the reality that ought to be), and yet are designated by a special name: "sources of law."

The sources of law as Is-events are the ways or causes by which the law comes into existence or is modified or extinguished. The sources of law produce Ought-effects in what is objectively right; that is, they cause the birth, modification, or extinction of legal norms.

The Ought-effects caused by the sources of law bear on the content of norms, that is, on what is objectively right, but as a matter of course, any change in what is objectively right also bears through this last, and so indirectly, on what is subjectively right—on legal rights and obligations among subjects under the law—provided that the content of the new or modified norms has referents in the reality that is.

3.4. Sources of Law as Valid Is-Events (Facts, Acts, and Declarations of Will) Which Cause Ought-Effects in What Is Objectively Right

Through the action of valid Is-events other than those treated in Section 3.2—as through the implementation of a legislative enactment procedure—Ought-effects and changes can be obtained in what is objectively right (in norms and their content). Let us look at Italian family law, to stay with the example given in the previous section. Ought-changes can be made to the minimum age for marriage, or to the conditions for divorce, to the rules of adoption, etc. These changes in what is objectively right, in the content of norms, will affect what is subjectively right as well, if referents of the norms subsist in the reality that is.

The cause (Is-cause) behind the effects (Ought-effects) produced in what is objectively right (in norms and their content)—and indirectly, if at all, in what is subjectively right (in legal rights and obligations) among actual subjects under the law—will be the occurrence in the reality that is of a source of law in one of the senses of this expression: It will be, for example, the occurrence in the reality that is of the valid implementation of a formal enactment procedure (like legislation whose Ought-effects are statutory legal norms), or again it will be the performance and occurrence of a series of acts and facts (for example, the performance of practices and the occurrence of beliefs whose Ought-effects are customary legal norms).[7] Legislation has often been considered a declaration of will, such as the will of the sovereign or of Parliament (see Sections 3.5 and 3.6).

[7] Shiner's Volume 3 of this Treatise is on the sources of law: Chapter 2, in particular, is on legislation, and Chapter 4 on custom. In the same volume, Chapter 7, by Rotolo, is on the sources of law in systems of civil law. Section 1.3 of Peczenik's Volume 4 is on the sources of law, as is Section 25.2 of Sartor's Volume 5.

Let us make a summary as follows.

The valid Is-events that cause Ought-effects are sources of law if their Ought-effects take place primarily in what is objectively right (in norms and their content) and only indirectly in what is subjectively right (in legal rights and obligations) among the subjects under the law who are referents of the norms whose content has been affected.[8]

By contrast, the valid Is-events that cause Ought-effects taking place only in what is subjectively right are not sources of law: They are the Is-facts, acts, and transactions dealt with in Section 3.2. Their Ought-effects affect only what is subjectively right, and so only legal rights and obligations among actual subjects under the law. The Ought-effects resulting from these valid Is-events do not affect norms and their content: They do not affect what is objectively right.

The foregoing distinction suggests a few practical considerations.

The people in power can change what is objectively right in the reality that ought to be by implementing certain enactment procedures, and this way—and so indirectly—they can change as well what is subjectively right (if what is objectively right has referents in the reality that is). This is so because the people in power have access to the sources of law, namely, to the ways or Is-causes by which the law (legal norms) comes into existence or is modified or extinguished. And in particular they have access to the valid implementation of formal enactment procedures: They have the capacity or competence to validly implement these procedures (sources of law), whose types are specified in what is objectively right in the reality that ought to be (in the content of norms; see Section 7.3).

Ordinary citizens, on the other hand, can change only what is subjectively right: legal relations, rights, and obligations among themselves. This they do by means of valid Is-events, or Is-causes, accessible to them: through facts, acts, and transactions (declarations of will) which they are competent to validly realise, or in the capacity of validly realising, but which are not sources of law, or sources for what is objectively right.

Ordinary citizens have at their disposal only three ways of changing what is objectively right: They can push ahead with the formation of a custom (a sluggish process, alas!); or they can attempt to exert influence on the people in power (by redirecting their votes as they see fit, by lobbying, by launching media campaigns, and so on); or, in the extreme, they can make a Lockean appeal to heaven, that is, they can start a revolution (Locke 1948, Sections 241–3—John Locke,1632–1704).

[8] Except that penal norms, among others—if they become harsher—cannot be applied retroactively, at least in an advanced legal system.

3.5. Sources of Law as Ought-Effects (in What Is Objectively Right) Caused by Sources of Law as Valid Is-Events

In this section I will consider how the expression "sources of law" takes on interwoven meanings, thereby becoming a source of misunderstanding. Indeed, few expressions in legal usage are as ambiguous as "sources of law," and the reason rests with the constituent terms "source" and "law," for these are often used in different senses, so that the expression "sources of law" likewise comes to have a variety of meanings.

In civil-law countries, such as France, Germany, Italy, and Spain, we find the expressions *sources du droit*, *Rechtsquellen*, *fonti del diritto*, and *fuentes del derecho*. In England, and in the other common-law countries, the expression equivalent to the ones just listed is "sources of law."

"Source" in French and English, *Quelle* in German, and *fonte* and *fuente* in Italian and Castilian mean "origin of a watercourse." "Source," in French and English alike, derives from French *sourdre*, meaning to "spring up," "gush out," or "spout," from Latin *surgere* ("to spring up"). *Quelle* derives from Old High German *quellan* or *quaellan* and also means "to spring up" or "to gush out." Italian *fonte* and Castilian *fuente* derive from Latin *fons*, which the ancients connected with *fundere*, meaning "to pour."

All these terms, in their respective languages, are used to refer not only to the origin of a watercourse, but also, and figuratively, to the origin or cause of a variety of effects in the physical and cultural worlds, or to the place from which something is drawn (the way water is drawn from a source). Thus, historians understand the sources of history to be the writings and other evidence (such as the ruins of the Parthenon in Athens) from which they extract information on the happenings of the past. In a sense analogous to this last, the expressions *sources du droit*, *Rechtsquellen*, *fonti del diritto*, and *fuentes del derecho* designate the so-called sources for the cognition of law, that is, the documents from which law is extracted, what in English legal language are more simply called "repositories of law."[9]

As to *derecho*, *droit*, *Recht*, and *diritto*, in relation to English "law," I should simply reiterate what was already stated in Sections 1.2 and 1.3, that is: The Castilian, French, German, and Italian terms mean "the law" or "the right," or both, depending on context; while in English, "law" bears no linguistic kinship with "right." Moreover, in civil-law countries the distinction between "what is objectively right" (*objektives Recht*, and its equivalents in civil-law countries) and "what is subjectively right" (*subjektives Recht*, and its equivalents in civil-law countries) plays the important role illustrated in the previous sections.

Let us take up, against this background, the interweaving of figures of speech by which "sources of law" comes to signify both (*i*) "valid Is-events,

[9] On sources for the cognition of law, see, in Volume 3 of this Treatise, Rotolo, Section 7.1.

which occur in the reality that is, and cause Ought-effects in what is objectively right (in the reality that ought to be)" and (*ii*) "Ought-effects in what is objectively right (in the reality that ought to be) caused by valid Is-events occurring in the reality that is." By way of an illustration, I will use a couple of Italian examples.

Let us consider the definition of "sources of law" put forward by a logical-empiricist jurisprudent, Giacomo Gavazzi.

> What is meant by sources of law is the facts and the acts (the manifestations of will) through which norms in a legal system are created, changed, and extinguished. (Gavazzi 1970, 91ff., 22; my translation)

This definition of "sources of law" is interesting especially because it is akin to the definition of Is-facts, acts, and declarations of will provided in Section 3.2: It suggests that the sources of law are Is-events to be considered along with facts, acts, and declarations of will. On Gavazzi's definition, the sources of law are law-creating activities: They are the ways or causes by which the law comes into existence or is modified or extinguished; and, in particular, they consist in either the implementation of a formal enactment procedure that brings about statutory legal norms or in the performance and occurrence of a series of acts and facts that bring about customary legal norms.

An inconsistency seems to arise from Gavazzi's definition, for the following reason. He understands statutory laws to be sources of law. But statutory laws are not law-creating activities: They are themselves a kind of created law. To be sure, the valid implementation of a legislative enactment procedure is a sequence of facts and acts meant to create legal norms, like statutory laws, and so it properly may be called a "source of law" according to Gavazzi's definition of this term. But this does not make statutory laws the same as the valid implementation of the legislative enactment procedure through which they are brought about.

But then, again—on a different consideration—Gavazzi is not really wrong, because he is simply following a consolidated polysemous use of the term "sources of law" (*fonti del diritto* in Italian). As evidence of this, consider the Italian Civil Code, whose provisions—let us assume—are authoritative beyond any doubt, at least from the point of view of the Italian legal system.

Article 1 of the Preliminary Provisions to the Italian Civil Code falls under the heading "Indication of the Sources," and it reads as follows:

> The following are sources of law: (1) statutes; (2) regulations; (3) corporative norms; (4) usage.[10] (*The Italian Civil Code*, art. 1; footnote added)[11]

[10] Item 3 refers to Fascist guilds ("corporazioni") and is no longer in force. "Usage" is to be understood as "custom" in the sense of "customary law."

[11] The Italian original: "Sono fonti del diritto: (1) le leggi; (2) i regolamenti; (3) le norme corporative; (4) gli usi."

The first three items just listed are enacted law, while the fourth is customary law and hence is not the result of an enactment. Articles 2 through 9 of the same Preliminary Provisions to the Italian Civil Code show that there are specific ways of enacting law, meaning by this the implementation of a formal procedure by given persons or bodies; for instance, a legislative procedure to make statutes (statutory laws). Such is not the case with customary law, whose way of coming into existence is based not on any formal procedure, but on acts and facts not fixed formally in advance, that is, on practices and beliefs that develop and take hold over time.[12]

None of the four items listed above under the heading "Indication of the Sources [of law]" is the implementation of a formal enactment procedure (I am referring here to items 1 through 3) or the performance and occurrence of a series of acts and facts (I am referring here to item 4). Instead, the first three items are the Ought-effects of the implementation of formal enactment procedures, and the last item is the Ought-effect of the performance and occurrence of a series of acts and facts. The four items are kinds of legal norms: Ought-effects caused in what is objectively right (in the reality that ought to be) by way of law-creating activities (by way of Is-acts or facts occurring in the reality that is). The only feature the four items have in common is that all are law: They are *kinds* or varieties of legal norms in the legal reality that ought to be.

Plainly, the different kinds of law are brought about in different ways (by different Is-causes): For example, statutes (statutory legal norms) are brought about by way of legislation, and custom (customary legal norms) by way of practices and beliefs. Still, "sources" seems a plausible name not so much for the *outcomes* as for the ways or causes—implementations of procedures, as well as for other facts and acts—by which those outcomes are produced in the reality that ought to be.

"Sources of law" is indeed the metaphorical name for the set of ways (the set of Is-causes) by which law is brought out. And the metaphorical name for this set has been transferred and made to apply to the kinds of law

[12] With custom we cannot pin down the exact moment of its coming into existence. But we can do so with statutory law, because statutory law is the result of the implementation of a formal enactment procedure. In the Italian system of law, the implementation of this procedure comes to an end with a specific formal step that takes the name of promulgation, by which a statutory law comes into existence. By contrast, a custom is not enacted, nor is it brought into existence by the implementation of a formal procedure. Independently of my characterisation of existence of a norm and being-in-force of a norm (see Sections 6.2 and 6.5), it is also doubtful in current continental legal doctrine whether with customary law we can distinguish the moment of its coming into existence from that of its coming into force. In civil-law systems, statutory law makes possible the distinction between these two moments: Statutory law comes into *existence* in the moment of its promulgation and comes into *force* only after a period (called *vacatio legis*) has elapsed since its publication in an official journal.

brought out in such ways: "Sources of law" (metaphorically equivalent to the "*ways* or causes—Is-events—by which the law comes into existence or is modified or extinguished") stands for "*kinds* of law" (legal norms in the reality that ought to be). And this is a metonymy: a metonymy superimposed on a metaphor.[13]

The sources of law float and drift, so to speak, between the reality that is and the reality that ought to be. As causes, they are Is-events occurring in the reality that is. As effects they are Ought-events taking place in the reality that ought to be.

Be that as it may, the moral of the sermon is that if you will allow a metonymy into the hands of a jurist, the jurist will fashion out of it a theory, written in figurative language, in which it is shown that the law (what is objectively right) is what *he* or *she* thinks it is. It just so happens, too, that jurists belong to committees appointed by the lawmaker to draft laws, including those laws regarding the sources of law, as is the case with Article 1 of the Preliminary Provisions to the Italian Civil Code. If the jurists, in their committees, succeed in bringing their figures of speech into agreement, their metaphorical (figurative) terminology will be carried over into the bills of law which the lawmaker will turn into statutes. At this point come the philosophers and the jurisprudents, who will work on the jurists' doctrines *sic et simpliciter*, or they will work on the jurists' doctrines insofar as these are transformed into statutes: That is, in the final analysis, they will be working on those figures of speech previously spoken of, which have in the meantime taken on the authority of "scientific" legal doctrines, or even of statutory law. The philosophers and jurisprudents will, depending on their philosophical and metatheoretical leanings, add their own speculations to the metonymies and metaphors so worked out, stratified in books of legal dogmatics, and finally transformed into statutes. This way, law and (linguistic) disorder concur in giving shape to the reality that ought to be which people share in a given society (cf. Sections 15.2.5, 15.3.2, and 15.3.4).

[13] A caveat is in order here. In this chapter I use "outcomes" to designate Ought-effects (Ought-effects produced by Is-causes) because I am working within an ideal reconstruction of the legal-dogmatic tradition of civil-law countries. In this tradition, the law belongs to the reality that ought to be: Emblematic in this respect is Hans Kelsen's theory of law (cf. Chapter 14). But, as we will see in Sections 8.2.3 and 8.2.4, it is necessary to draw the distinction between Is-outcomes and Ought-outcomes. Thus, for example, the Is-outcome of a valid implementation of a legislative procedure is a text of law; the Ought-outcome of this implementation (in the sense of "Ought-outcome" specified here) is the coming into existence, modification, or extinction of a legal norm.

3.6. The Sovereign Normative Will as the Source of Positive Law in the Natural-Law School and in German Legal Positivism Alike

3.6.1. Two Glorious Examples

In the previous sections I went into the details of the interaction between the reality that is and the reality that ought to be with regard to what, in this reality, is subjectively right and what is therein objectively right. In the former connection I presented (Sections 3.2 and 3.3) a reconstruction of the civil-law legal-dogmatic theory of facts, acts, and transactions (declarations of will) as valid Is-events that cause Ought-effects in what is subjectively right. In the latter connection I discussed (Sections 3.4 and 3.5) the theory of the sources of law as valid Is-events that cause Ought-effects in what is objectively right.

Both of these theories—call them (*a*) the theory of the sources of law, and (*b*) the theory of facts, acts, and transactions, or declarations of will—are aimed for the most part at attributing to human will and to norms (human will belonging to the reality that is, norms belonging to what is objectively right in the reality that ought to be) the role of concurrent causes in creating (modifying or extinguishing) what is right by positive human law.

As we will see in Section 4.4, in the history of legal thought the word "positive," or "posited," when made to refer to law and what is right, means "laid down," or "determined by enactment or convention."

The interaction between human will and norms is handled through the mediation of the legal pineal gland, meaning validity, which gets predicated of Is-events in the reality that is with respect to types set forth in the content of norms, meaning types set forth in what is objectively right in the reality that ought to be. Will and normativeness are concurrent causes, each singly necessary yet capable only by their joint action of creating, modifying, or extinguishing what is objectively or subjectively right by enactment or convention; and of the two—will and normativeness—it is normativeness that enters as a determining cause.

Theories (*a*) and (*b*) are voluntaristic (they are will-theories)[14] as well as normativistic. And they both assign to validity the crucial role of interfacing between the two worlds of Ought and Is, between the reality that ought to be and the reality that is. In fact validity—the crucial, indeed the essential pineal gland (validity as described in Chapter 2)—partakes of both worlds: It partakes of the Ought (the reality that ought to be) because the types in question are types set forth in norms (both theories ask the jurist to ascertain the validity of tokens whose types are types set forth in norms); and it partakes of the

[14] In specific cases both theories come up against problems or find themselves forced to admit exceptions in regard to the role of will: Theory (*a*) in regard to custom, theory (*b*) in regard to Is-facts strictly understood.

Is (the reality that is) because that is where these tokens occur (in other words, the tokens whose validity the jurist, in both theories, is asked to ascertain belong to the reality that is).

Let me recall two glorious examples of the normativist-voluntaristic theory of what is right by virtue of human-posited legal norms. (What is right by nature, or natural law, is a different matter, on which see Section 4.3.)

One example is the natural-law theorist Hugo Grotius and the other the legal positivist Hans Kelsen. Despite appearances to the contrary, Kelsen's theory of positive law bears an interesting resemblance to Grotius's theory of positive law: Both are theories that in a similar way claim a normative status for the law enacted through human will.

Kelsen in a way picks up Grotius's legacy with regard to the normativeness of positive human law: Both scholars cultivate the dualism between Is-causes and Ought-effects and explain in a similar way the interaction between the reality that is and the reality that ought to be. To account for this interaction, and secure the primacy of the reality that ought to be over the reality that is, they both presuppose a (hypothetical) basic norm: Grotius presupposes the norm *pacta servanda sunt* (*cum juris naturae sit stare pactis* [...] *neque vero alius modus naturalis fingi potest*: see Section 3.6.2, and the excerpt from Grotius in footnote 19 in that section); Kelsen presupposes a hypothetical *Grundnorm*. Neither of these norms is a positive (posited, enacted, or conventional) norm: Each is in its own way a presupposed norm. Further, both are designed to explain the normative character of the sovereign's will and the binding force of positive law—of what is right by virtue of human-posited legal norms: They are the grandmother of positive human law (Section 4.2.4).

Grotius and Kelsen stand as giants in the history of legal thought. As the mythical Atlas was condemned to support the celestial vault on his shoulders, the two great jurisprudents appear to be condemned to the titanic undertaking of sustaining on their shoulders the normativeness of positive legal systems—of the law enacted through acts of human will and yet conceived as a per se subsisting and binding reality that ought to be.[15]

3.6.2. The State of Nature and the Promise

If we are to consider the account that 17th- and 18th-century natural-law theories give of the way a sovereign creates (or modifies or extinguishes) what is objectively right—the way the sovereign's will, declared by issuing com-

[15] In Parts Two and Three of this volume I will try my best to do for both—for Grotius and Kelsen—what Heracles did for Atlas (I will try to substitute them provisionally in holding up the celestial vault), and, like Heracles, I will do so only for a while (though not in exchange for three golden apples).

mands,[16] creates (modifies or extinguishes) per se binding positive legal norms—we will have to consider, however sketchily, the state of nature, the promise, and the social contract as expounded in these theories.

The state of nature is a hypothetical prelegal condition that humans live in before forming a society. Some natural-law theorists understand the state of nature as an anarchic condition of disruption and battling of all against all (Thomas Hobbes, 1588–1679); some envision it as a condition of peace, serenity, and happiness (Jean-Jacques Rousseau, 1712–1778); and others still as a condition marked by uncertainty and risk (John Locke).[17]

Karl Olivecrona sums up Grotius's conception of the state of nature as follows:

> In the state of nature there were no rights, properly speaking (no *facultates morales*) either over persons or over things […]. Everybody was free. The right of property did not exist; it was subsequently introduced through the human will.
>
> Nevertheless, according to Grotius everybody had his proper share which belonged to him. This was the *suum*. It comprised his life, limb, and liberty. To deprive somebody of anything pertaining to the *suum* was *iniustum*. […]
>
> When everybody possessed original freedom, how then could a right be established over the individual? How could he become subject to the moral power, the *facultas moralis*, of another person?
>
> There was only one way to achieve this: an act of will on the part of the individual himself. He could voluntarily submit himself to the moral power of someone else. (Olivecrona 1971, 278–9, 281)

The act of will through which one or more persons submit to others is the promise. Under a promise, the promisor—the person making the promise—declares a will (recall declarations of will as discussed in Section 3.2.4) by which he or she shall give something to another person, or else shall do or abstain from doing something for this person: The promisee is the person to whom the promise is made.[18]

Grotius presents the promise to do something (*promissio faciendi*) as analogous to transferring property.

> Our right over our own actions is equivalent to our rights over things. Therefore, we can transfer a right over our own actions to another person as well as we can transfer the right of property. The effect is similar (*perfecta promissio, ... similem habens effectum qualem alienatio dominii*).

[16] A distinction can be made between commands that are in themselves norms and commands that rather *produce* norms. But we need not develop this point any further here. I use the expression "declared by issuing commands," and do so with a purpose, which is to signal that the voluntarism of theories of positive law (theories set out by natural-law scholars and legal positivists alike) sometimes wavers between a declaratory voluntarism and an imperativist one.

[17] In this Treatise, see, on natural-law theories and the problem of the transition from a *status naturalis* to a *status civilis*, Volume 2, Rottleuthner, Section 3.2.1.4, in the frame of the natural foundations of law.

[18] Grotius, *De jure belli ac pacis libri tres* (a), II, 11.

> Thus it appears that in promising to do something, as for instance to pay a sum of money, one desists from the power of decision over this action; it is conferred on the other party. In so doing, one alienates a part of one's liberty: An *alienatio particulae nostrae libertatis* takes place. It is a *moral* power that is transferred. The promisee now has a moral power over the promisor as regards the action promised. This action is no longer subject to the free will of the promisor. He is morally bound to execute it when required by the promisee. (Olivecrona 1971, 284–5)

Through a promise, the promisor confers on the promisee the normative power to order the promisor what to do. The promisee's orders create obligations that bind the promisor (this is the sense in which the power in question is normative). By issuing commands, the promisee exerts the same power over the promisor that the latter had over his or her own behaviour before this behaviour became the object of a promise. This newly acquired power is a *particula libertatis*, a portion of freedom that through a promise the promisor has transferred to the promisee.

A social contract (an act of will like that of a promise) confers part of one's freedom to a sovereign. Like a promisee in relation to a promisor, the sovereign acquires a power that originally rested with the subjects who have entered into the contract. Some natural-law theorists contend that the contract is only a *pactum subjectionis*, a compact of submission to a sovereign; others say that this *pactum subjectionis* is preceded by a *pactum unionis*, a compact of union among consociates.

In any case, the commands the sovereign issues qua sovereign come from the power conferred on him or her through the social contract. This is why the sovereign's command is normative.

In the case of a promise, the promisee issues binding commands on the basis of a *particula libertatis* transferred to him or her through a promise made by the promisor: This is the reason why the promisee's commands create obligations binding upon the promisor. In like manner, the sovereign's commands create norms that bind the subjects who have entered into a social contract (and who are actual addresses of the sovereign's commands); that is so because, in commanding, the sovereign uses the power transferred to him or her by those who have entered into the social contract. What is right by virtue of human-posited legal norms is the content of the sovereign's normative will, namely, the content of the set of commands issued by the sovereign, which commands are binding per se and so carry the force of norms.

The reader will have recognised in the foregoing summary on the promise and the social contract an early version of the theory of declarations of will and, more generally, the theory of Is-facts, acts, and transactions that cause the birth, modification, or extinction of rights and obligations (cf. Section 3.2). What is interesting to point up here, however, is that the social contract creates Ought-effects not in what is subjectively right but in what is objectively right. The social contract creates a competence norm, a norm establishing a sovereignty (or supreme authority) that obligates us to obey as legal

norms the sovereign's commands. Hence, the sovereign's commands are sources of law in the sense specified in Section 3.4: They are Is-events (declarations of will) that create human-posited legal norms. The competence norm created through the social contract is, in turn, the topmost norm in the system of positive law.

The theory of positive law set out by the fathers of the natural-law school is clearly voluntaristic and normativistic at once. Human-posited laws are legal *norms*. They are Ought-effects in what is objectively right in the reality that ought to be which come by way of Is-causes: by way of sovereign commands, or declarations of will, validly occurring in the reality that is.

Grotius descries the source of positive law (*jus in civitate positum* or *constitutum*) in the norm of conduct *stare pactis*, a norm of natural law from which springs, through the social contract, the competence norm "Everyone must obey what gets established by those on whom authority (*potestas*) has been conferred through the social contract."

Again, since it is a rule of the law of nature [since it is right by nature: *cum juris naturae sit*] to abide by pacts [*stare pactis*] (for it was necessary that among men there be some method of obligating themselves to one another, and no other natural method can be imagined), out of this *source* the bodies of municipal law have arisen [*ab hoc ipso fonte jura civilia fluxerunt*]. For those who had associated themselves with some group, or had subjected themselves to a man or to men, [...] had either expressly promised, or from the nature of the transaction [*ex negotii natura*] must be understood impliedly to have promised, that they would conform to that which should have been determined [*constituissent*], in the one case by the majority, in the other by those upon whom authority [*potestas*] had been conferred. (Grotius, *De jure belli ac pacis libri tres* (b), Prolegomena, 15–16; italics added)[19]

In the following section I will briefly compare the conception of positive law of the natural-law school as expressed in Hugo Grotius and Samuel Pufendorf (1632–1694) with the conception of positive law of German legal positivism.

3.6.3. What Divides and What Unites the Natural-Law School and German Legal Positivism

Let it be stressed that the distinction is rarely drawn between the natural-law theories' conception of what is right by nature (by natural law) and the natural-law theories' conception of what is right by virtue of human-posited legal norms (what is right by positive law). Yet the distinction is worth making, for the following reason.

[19] The Latin original: "Deinde vero cum juris naturae sit stare pactis, (necessarius enim erat inter homines aliquis se obligandi modus, neque vero alius modus naturalis fingi potest) *ab hoc ipso fonte jura civilia fluxerunt*. Nam qui se coetui alicui aggregaverant, aut homini hominibusve subjecerant, hi aut expresse promiserant, aut *ex negotii natura* tacite promisisse debebant intelligi; secuturos se id quod aut coetus pars major, aut hi quibus delata potestas erat constituissent" (Grotius, *De jure belli ac pacis libri tres* (a), Prolegomena, 15–16; italics added).

The history of law and philosophy describes natural-law theories as rationalistic and German legal-positivist theories as voluntaristic.

Natural-law theories are described as rationalistic because the main strand of them—the rationalistic strand considered in Section 4.3.4—typically understands nature as divine and human reason and natural law as the law of reason available to humans. By contrast, the natural-law theories' conception of positive law is kept mostly out of sight when natural-law theories are described as rationalistic.

German legal-positivist theories, for their part, are described as voluntaristic on account of their conception of positive law. Indeed, the natural-law conception of German legal positivism consists in disclaiming natural law: When German legal-positivist theories are described as voluntaristic, the description will necessarily regard these theories' conception of positive law, because there is no legal positivist conception of natural law.

This being the case—and it plainly is the case—the opposition between natural-law theories and German legal-positivist theories, when cast as one of rationalism versus voluntarism, springs from an ambiguity concerning what is relative to what: Natural-law theories (the main strand of them) are rationalistic relative to natural law; German legal-positivist theories are voluntaristic relative to positive law.

Since there is no conception of natural law in German legal positivism (there is rather, more simply, a rejection of natural law), the only possible comparison between natural-law theories and German legal-positivist theories is a comparison between their theories of positive law. What we can do—indeed what we should do—is consider what conception of positive law is maintained by natural-law theories, even among those natural-law scholars who are clearly rationalistic relative to what is right by nature. In fact, natural-law theories do have a conception of human-posited legal norms, of positive law, and one that is comprehensive and fully articulated. More interesting still, this conception is voluntaristic (it is a will-theory), even in those natural-law scholars who are rationalistic relative to natural law.

Hence, the result to be had from the only possible comparison between natural-law theories and German legal-positivist theories can only be that the conventional opposition between these two orientations of thought is untenable when it comes to the concept of positive law, for both orientations are voluntaristic with regard to human-posited legal norms.

More than that, the voluntaristic conception of positive law found in German legal positivism flows from the voluntaristic conception of positive law found in the natural-law school. In German legal positivism and in the natural-law school alike, positive law is conceived as the will of the sovereign or the state. German legal-positivist theories developed the conception of positive law as the sovereign's will that they got from natural-law theories of positive law (see Berolzheimer 1905, § 4—Fritz Berolzheimer, 1869–1920—; Pound 1910, 29—Roscoe Pound, 1870–1904—; Fassò 2001, vol. 3, 40–57, 176–212; Olivecrona 1971, Chapter 1).

Natural law is another thing.

The voluntaristic conception of positive law (both in natural law and in German legal-positivist theories) is imperativist, for it takes the "sovereign's will" to mean the "sovereign's commands," understood as commands that are binding per se: commands that are norms or that produce norms in the reality that ought to be. Imperativeness, a distinguishing trait of positive law, amounts to obligatoriness; that is, to the normativeness, Ought (*das Sollen*), or binding force of positive law. The term "imperativeness" derives from Latin *imperium*, which historically—in Roman law, and hence in *jus commune*,[20] as well as in modern natural-law theories—is understood as the power to issue commands (norms) that are binding per se, or commands that produce norms, and also the power to exact compliance with such commands by the use of force, a qualification typical of archaic Roman law.[21]

The voluntaristic theory of positive law held by German legal positivism takes on the traits of a theory under which the state is the sole source of law in that the sovereign and the state are the same thing. German legal positivism, though it has no place for natural law, does set up a duplication of reality into a reality that is (*das Sein*) and a reality that ought to be (*das Sollen*). In this, German legal positivism sides with natural-law theories of positive law, since both understand the sovereign's commands as binding per se, namely, as norms residing in the reality that ought to be.

Here it will be worthwhile to note down a few points.

As was observed in Section 3.6.2, natural-law theories base the binding force of the sovereign's commands on a social-contract doctrine—on the promise by which an *alienatio particulae libertatis* is given effect to. The sovereign's commands must be complied with because the sovereign commands the people by using their own power: the power the people initially had over themselves and then delegated or entrusted to the sovereign through a social contract (*pactum unionis*, *pactum societatis*, *pactum subjectionis*).

Grotius writes, "cum juris naturae sit stare pactis [...] ab hoc ipso fonte jura civilia fluxerunt": "Since it is right by nature to maintain pacts [...], from this very source has flowed what is right among citizens [municipal law]" (my translation) (cf. Section 3.6.2).

A contract theory of this sort made it difficult for natural-law theorists to account for God's power over humans. Indeed, if the lawgiver issues commands by virtue of a power the people delegate to him through a promise (a

[20] With the Latin expression *jus commune* the medieval glossators designated Justinianian law, which was understood as "universal law (*ius commune*, as against the *ius proprium* of the *civitates*)" (Fassò 2001, vol. 1, 182–3; my translation). *Jus commune* emerged in the late 11th century and its fortune lasted several centuries; it was taught at schools of law all across Europe. Cf. Fassò 2001, vol. 2, 294–5, and, in Volume 7 of this Treatise, Padovani, Chapter 2, Errera, Chapter 3, and Pennington, Chapter 4.

[21] On *imperium* in Roman law, see Guarino 1975, 19, 33, 40, 63, 103, 155.

pactum unionis or *pactum subjectionis*, or both), we may be led to think by analogy that God's power over humans results from a trust, a delegation of power that humans have endowed God with—humans placing power in God's hands. Clearly, this solution was theologically unacceptable. So Pufendorf offered the following solution.[22]

God has endowed humans with the freedom of action. The power that humans have over themselves derives from God. But God has not handed all his power to humans: He kept for himself the power to govern humans.

The *imperium* of humans over other people subject to them—the moral power of the human sovereign to issue commands and thereby produce legal norms that are binding per se on other humans—is conferred on human sovereigns through voluntary submission by people who have entered into a social contract. By contrast, the *imperium* of God is original. And in fact the power of humans over themselves is a concession of God: It is the portion of freedom that God bestowed on humans when he created them.

By rejecting natural law and the social contract, equating the sovereign with the state, and retaining the normativistic conception of positive law by which the state's commands are norms or produce norms that are binding per se on their addressees, German legal positivism justified the state's power over its citizens by way of a theory similar to that which Pufendorf had put forward to justify God's power over humankind.

Recall that the absolute monarchs of the European states in the modern age were sovereigns by the grace of God: by divine concession or authorisation, if we want to add some juridical colour. The sovereigns, in their turn, would grant some powers or rights to the citizens. The citizen bore no original powers. Individual freedoms and legal rights were authorisations (*Berechtigungen*) or concessions that the sovereign granted to his subjects (cf. Chapter 14 on Kelsen's use of *Berechtigung*). Even with the advent of constitutional monarchies, constitutions were *octroyées*, or given by concession. Hence the monarchs were qualified as sovereigns by the grace of God *and* by the will of the nation.

The constitutional state, or *Rechtsstaat* (literally, the state founded on what is objectively right), is itself founded on positive law: The state limits its own binding power through the positive law it itself lays down, such that the source of the state's binding power is kept within the state. This in roughly the same way as, on Pufendorf's theory, the source of God's power to bind humans remains with God himself, and if there were any sense in which the power granted by God to humans could be considered a limitation of God's power, this limitation would still have been self-imposed (and hence, in the final analysis, would not have been a limitation at all).

[22] As this solution is brought into relief in Olivecrona 1971, 17–8; cf. Pufendorf, *De jure naturae et gentium*, 1, 6, 12.

This is the sense in which the theory whereby the state is the sole source of law becomes integral to the normativistic voluntarism of 19th-century legal positivism in German countries.

Having done away with the natural-law theory of the social contract, a theory under which the state's will is the will of all consociates, German legal positivism needed a plausible account of the state's binding will—of its sovereignty or *imperium*, the normative power of those who govern in a society. In this effort, some German legal positivists, consciously or not, attributed to the state an original power in a way similar to what Pufendorf had done with respect to God.

Chapter 4

THE PROBLEM OF THE MATRIX

4.1. The Matrix of Normativeness as the Ultimate Source of What Is Right by Virtue of Human-Posited Norms

In this chapter the problem of the foundation of the binding force of positive law—and hence of what is objectively right by virtue of norms posited through human will, that is, by enactment or convention—will be brought under the purview of the wider problem of the matrix of normativeness (the matrix of all norms).

The problem of the binding force of positive law, whatever linguistic formulation we find it expressed in, is the problem outlined in Section 3.6.1 with reference to Grotius's and Kelsen's normativistic will-theories of positive law—only, we can recast it now from the vantage point of the wider problem of the matrix of normativeness.

I will line out this problem proceeding, by way of example, from the work of an Italian scholar, Giorgio Del Vecchio (1878–1970), the foremost legal philosopher of the first half of the 20th century in Italy. A neo-Kantian scholar, he states that

> generally speaking, the source of law is human nature, that is, the spirit that shines from within individual consciences and so enables and forces them to understand, along with their own personalities, the personalities of others. (Del Vecchio 1965, 258; my translation)[1]

This definition may baffle readers enough to warn them that almost anything can be made to fall under the catchall rubric "source of law." Del Vecchio is striving to make this a high-toned expression, for he means to say that the law resides in the critical conscience of human beings as persons who recognise one another as equals: Hence, he is moved by a noble end.

Setting down this noble end does not seem at first to make Del Vecchio's definition of any use in simplifying the matter addressed, if we ascribe to "source of law" the meaning illustrated in Sections 3.4 and 3.5. But Del

[1] Cf. Kant 1991, 56 (translation by Mary Gregor): "Thus the universal law of Right [...], so act externally that the free use of your choice can coexist with the freedom of everyone in accordance with a universal law." The German original: "Also ist das allgemeine Rechtsgesetz: handle äußerlich so, daß der freie Gebrauch deiner Willkür mit der Freiheit von jedermann nach einem allgemeinen Gesetze zusammen bestehen könne" (Kant 1914, 231). Kant's teensy little word *Rechtsgesetz*, literally "the law of right," contains a guidepost useful to anyone translating *objektives Recht* and *subjektives Recht* into English (cf. Chapter 14) and seeking orientation when faced with the disconcerting *das Recht*: Is it "law" or "what is right"? Mary Gregor translates *Rechtsgesetz* aptly as the "law [*Gesetz*] of Right [*Rechts*]."

Vecchio's definition *will* prove to be of help if we note that he implicitly means by "source" "the ultimate source," and that he is writing in Italian: He writes *fonte del diritto*, where *diritto*, as was stressed in Section 1.2, means not only "law" but also, and in this case primarily, "what is right." So Del Vecchio is looking to find and define "the ultimate source of what is right by positive law, namely, what is right by virtue of human-posited legal norms." This ultimate source will be the *matrix* of normativeness—the matrix of all norms understood as per se binding rules belonging to the reality that ought to be.

A matrix is "what makes something be what it is": The word derives from Latin *mater*, meaning "mother," and also "womb," a "place where something is generated," "that which gives origin or form to a thing"; consider, for example, the matrices used to print banknotes.

Hence the question at issue is: "What makes something be right?" The answer will be: "A norm." Here, a second and most important question arises: "What makes something be a norm?" Del Vecchio replies, "human nature, that is, the spirit that shines from within individual consciences."

Del Vecchio was not the first scholar to make this an issue and give it the answer just mentioned. We will see shortly some well-known passages in which Cicero addresses the same problem as Del Vecchio, in a manner no less engagé than Del Vecchio's: Cicero addressed it as the problem of *fons legum et juris*.

And in the 20th century again the problem—which I suggest calling the problem of the "matrix of normativeness as the ultimate source of the binding force of positive law, and hence of what is right by virtue of human-posited legal norms"—is clearly present in Lon L. Fuller, among others; he, too, frames it as a problem of "sources of law":

> The term "sources of law" is ordinarily used in a much narrower sense than will be attributed to it here. In the literature of jurisprudence the problem of "sources" relates to the question: Where does the judge obtain the rules by which to decide cases? In this sense, among the sources of law will be commonly listed: statutes, judicial precedents, custom, the opinion of experts, morality, and equity. In the usual discussions these various sources of law are analysed and some attempt is made to state the conditions under which each can appropriately be drawn upon in the decision of legal controversies. Curiously, when a legislature is enacting law we do not talk about the "sources" from which it derives its decision as to what the law shall be, though an analysis in these terms might be more enlightening than one directed toward the more restricted function performed by judges.
>
> Our concern here will be with "sources" in a much broader sense than is usual in the literature of jurisprudence. Our interest is not so much in sources of law*s*, as in sources of law. *From whence does the law generally draw not only its content but its force in men's lives?* [viz., What is the matrix of normativeness as the ultimate source of the binding force of positive law?]
>
> This problem is, of course, intimately connected with the ancient debate between two opposing schools of legal philosophy, that of legal positivism and that of natural law. (Fuller 1976, 43; italics in original on first occurrence, added on second occurrence)

The sources of law, insofar as they are understood as the matrix of normativeness and hence as the ultimate source of what is right by positive law, will depend in the final analysis on the ethical, metaphysical, philosophical, and religious commitments of those who deal with the question. Of course each scholar regards his or her vision or belief as the final, decisive benchmark for what is right, and also for what is right by positive law: Each scholar finds therein the matrix of all true norms, of the law to be obeyed per se as distinguished from just any command that we accept to comply with out of expediency. And different scholars, according as they follow one or another ethical, religious, or even methodological line of thinking, will assume different things to be the matrix of normativeness, of *true* norms, and hence the ultimate source of what is right by positive law (by virtue of human-posited legal norms).

As we will see, Cicero uses the adjective "true" to qualify a norm as accordant (*congruens*: see footnote 6 in this chapter) with the matrix (or arche-*type*) of normativeness. In the history of legal thought this adjective, "true," gets replaced, consciously or not, with the adjective "valid" to qualify norms in the same way (as accordant, or congruent, with the matrix of normativeness). One place where we find this replacement made, consciously or not, is in Kelsen. Throughout this volume I make my case against this use of "valid" and "validity," suggesting an alternative understanding of these terms as well as of the term "norm" (Chapters 2, 3, and 6 through 9, and Sections 2.2.3, 7.1, and 8.2 in particular).

Natural-law theories find in nature the matrix of normativeness. The ultimate source of what is right by positive law is nature, so that what is right by nature overrides what is right by law when the two do not conform.[2]

Thomas Aquinas, for example, holds that *lex* (a term that in this case I would render as "norm") is derivative of Latin *ligare*, meaning "to bind," and that the reason for this derivation (of the word *lex*) is that a *lex* is binding (*obligat*). *Lex humana* (the human norm) must come from *lex naturalis* (the natural norm) in order to be binding. And where it does not, it will not be *lex*, *sed legis corruptio*, as Augustine had previously expressed himself: It will be a corruption of *lex*—or, in the translation I suggest (cf. Section 13.7), the forgery of a norm—and so it will not be binding. It will not be a true norm, I should comment, so its content will not be what is objectively right (see Aquinas, *Summa Theologiae* (a), 1.2, q. 90, a. 1; q. 95, a. 2, and Augustine, *De libero arbitrio*, I, 6, 15).

[2] What nature itself is will in turn depend on the conceptions espoused by those who believe in natural law. The foremost Italian idealist philosopher, Benedetto Croce (1866–1952), ruthlessly wrote that natural law boils down to "the ideas that writers and professors in haphazard manner lump together" (Croce 1909, 341; my translation). In subsequent editions of the same work (*Filosofia della pratica: Economica ed etica*), and in the same passage, Croce softens his judgement: Natural law becomes "the abstract ideas of writers and professors" (Croce 1957, 336; my translation). The flow of time makes milder the asperities of the rugged ridges, and also those of the thoughts of humans.

The Latin *lex*, contrary to Aquinas's opinion, is derivative of Latin *legere* (*legein* in ancient Greek), meaning "to say." Thus, as previously in Roman law, *lex* is a verbal formula properly so called, oral or written. Aquinas's etymology of *lex* is mistaken, but the substance of his conception stands unaffected: It retains the basic features just outlined. What is (objectively) right is the content of *lex*. The content of *lex humana* (of the human norm) is right if *lex humana* comes from *lex naturalis* (from the natural norm), failing which *lex humana* will not be a norm but the forgery of a norm (a false norm) and its content a forgery of what is right (see Chapter 13).

Among the best-known statements on nature as the matrix for normativeness is a statement that Cicero gives us in *De legibus*.[3] Following is an excerpt from the Loeb translation (with square brackets added to indicate the Latin expressions for which I would rather have a different English translation). Here I will reiterate how in several contexts even the Latin *jus* is best translated as "what is right" (or "the right") rather than as "law," in analogy to what was observed in Sections 1.2 and 1.3 with regard to *droit*, *Recht*, *diritto*, and *derecho* (cf. Chapters 12 through 14).

> The origin of Law and Justice [the source of norms and of what is right: *fons legum et juris*] can be discovered [. . .] not [...] from the praetor's edict, as the majority do now, or from the Twelve Tables [...], but from the deepest [...] philosophy. (Cicero, *De legibus*, I.v.16–7)[4]

> Law [for Latin *lex*, which I feel is better served here by "norm"] is the highest reason [*ratio*; cf. Section 13.7], implanted in Nature, which commands what ought to be done and forbids the opposite. (Cicero, *De legibus*, I.vi.18)[5]

In *De re publica* Cicero offers one of his most famous passages. Following is the Loeb translation (with square brackets added to indicate the Latin expressions for which I would rather have a different English translation).

> True law [here, the true norm: *vera lex*] is right reason [*ratio*; cf. Section 13.7] in agreement with nature; it is of universal application [it is spread among all people: *diffusa in omnes*], unchanging and everlasting; it summons to duty by its commands, and averts from wrongdoing by its prohibitions. And it does not lay its commands or prohibitions upon good men in vain, though neither have any effect on the wicked. It is a sin to try to alter this law [this norm: *huic legi*], nor is it allowable to attempt to repeal any part of it, and it is impossible to abolish it entirely. We cannot be freed from its obligations [from this norm: *hac lege*] by senate or people, and we need not look outside ourselves for an expounder or interpreter of it. And there will not be different laws [a different norm, in the singular: *alia lex*] at Rome and at Athens, or different

[3] See, in this Treatise, the presentation and framing of Cicero provided in Volume 6, Chapter 6, Section 2, by Inwood.

[4] The Latin original: "Fons legum et iuris inveniri potest [. . . n]on ergo a praetoris edicto, ut plerique nunc, neque a duodecim tabulis, ut superiores, sed penitus ex intima philosophia" (Cicero, *De legibus*, I.v.16–7).

[5] The Latin original: "Lex est ratio summa insita in natura, quae iubet ea, quae facienda sunt, prohibetque contraria" (Cicero, *De legibus*, I.vi.18).

laws [a different norm, in the singular: *alia lex*] now and in the future, but one eternal and unchangeable law [one norm: *lex*] will be valid [here, "valid" is the translator's addition; it does not figure in the original Latin text] for all nations and all times, and there will be one master and ruler, that is, God, over us all, for he is the author of this law [of this norm: *legis huius*], its promulgator, and its enforcing judge. Whoever is disobedient is fleeing from himself and denying his human nature, and by reason of this very fact he will suffer the worst penalties, even if he escapes what is commonly considered punishment. (Cicero, *De re publica*, III.xxii.33)[6]

In the excerpts quoted, Del Vecchio, Aquinas, and Cicero present what they consider to be the matrix of normativeness—of all true norms—and hence the ultimate source of what is right by positive law, the final foundation of the duty to obey human-posited legal norms. When this foundation is lacking, a law, however enacted, and by whomever, will not be a true norm, but rather the forgery of a norm (*legis corruptio*).

4.2. A Problem of Authenticity

4.2.1. Orthogonal Norms and Straight Rules

In Section 1.3 norms were distinguished from their content (what is objectively right), meaning that what is objectively right is right because it is the content of a norm: What is objectively right is right inasmuch as it is made obligatory, permitted, or forbidden by a norm.

As was noted in Section 4.1, Aquinas says that if *lex humana* (the norm posited by human beings) should fail to come from *lex naturalis*, it will not be *lex* (it will not be a norm), but *legis corruptio*. From this point of view, not all norms that, *prima facie*, are norms are really such, and hence not all the contents of *prima facie* norms are what is objectively right.[7] One might be tempted to say that what is objectively right (the content of norms) precedes norms, that norms presuppose what is objectively right, and that a norm that is such *prima facie* is a true norm only if its content is what is objectively right.

[6] The Latin original: "Est quidem vera lex recta ratio naturae congruens, diffusa in omnes, constans, sempiterna, quae vocet ad officium iubendo, vetando a fraude deterreat; quae tamen neque probos frustra iubet aut vetat nec improbos iubendo aut vetando movet. Huic legi nec obrogari fas est neque derogari ex hac aliquid licet neque tota abrogari potest, nec vero aut per senatum aut per populum solvi hac lege possumus, neque est quaerendus explanator aut interpres eius alius, nec erit alia lex Romae, alia Athenis, alia nunc, alia posthac, sed et omnes gentes et omni tempore una lex et sempiterna et immutabilis continebit, unusque erit communis quasi magister et imperator omnium deus, ille legis huius inventor, disceptator, lator; cui qui non parebit, ipse se fugiet ac naturam hominis aspernatus hoc ipso luet maximas poenas, etiamsi cetera supplicia, quae putantur, effugerit" (Cicero, *De re publica*, III.xxii.33).

[7] There are several places in this volume in which I will have the occasion to use *prima facie* as synonymous with "at first sight" (leaving out of account the specific use of it by W. D. Ross found in Ross 1930, esp. 18–20, 28, and Ross 1939, esp. 84–6; on this, see Vida 2003, esp. Chapters 3 and 4). Compare, in Volume 4 of this Treatise, Peczenik, Section 1.2.2, the use suggested for *prima facie* and *pro tanto* in the context of defeasible norms.

But I find it more appropriate to say that, in the final analysis, the relationship between norms and their contents remains unchanged. It is not a content that makes a norm, by preceding this norm and making it binding; rather, it is the norm, as something binding per se, that shapes its own content, thereby making this content objectively right. Properly viewed, the question we are considering is not that of the relationship between norms and their content. We are rather considering a different and prior question, a question of authenticity, namely, What is the matrix of normativeness, of true norms? And hence, What is ultimately the source of what is right by virtue of human-posited legal norms?

I will clarify my view on this question as follows.

The words "norm" and "rule" have a peculiar origin: They designate tools that serve to make things straight. *Norma* in Latin designates the carpenter's square: A *norma* is used to make right angles. "Rule," from Middle English and Old French *riule*, from Latin *regula*, means "straight stick," or "ruler"; and "rule" itself is used synonymously with "ruler," as in "a carpenter's rule": A *regula*, or rule, is used to draw straight lines. The carpenter's norms and rules (meaning the tools) make right—norms make orthogonal and rules make straight—that which they shape. It is required for this task to be performed that the carpenter's squares (norms) be truly square and that straight sticks, or rulers (rules), be truly straight. The squareness of squares (of norms) and the straightness of rulers (of rules) depend in turn on the matrix in which the squares and rulers have been moulded: It depends on the master die from which they have been reproduced.

In a similar way, any theory of the source of law as the ultimate source of what is right by virtue of human-posited legal *norms* is a theory of the matrix of normativeness—of the master die where true norms come from.

What is right is made right by a norm that contains it: It is the content of a norm insofar as this content has been qualified normatively as obligatory, permitted, or forbidden. Norms make right their own contents. But this is not enough, say natural-law theorists, and more generally those who mean by "source of law" "the ultimate source of what is right by virtue of human-posited legal norms." For it will also be necessary that norms, in turn, be true norms (just as the carpenter's norms and rules must themselves be truly square and straight respectively). The squareness of norms and the straightness of carpenters' rules come from the matrix of norms and of rules: The normativeness of human-posited legal norms (and hence the ultimate source of what is objectively and subjectively right by virtue of these norms) comes from, and is guaranteed by, the matrix of true norms (more on this in Section 13.7).

The natural-law theorists agree in assuming that the matrix of true norms (per se binding rules) is nature, even if they disagree on what nature is: the will of God, biological instinct, human or divine reason, the cosmic order, and so forth (Section 4.3).

Other scholars find the matrix of true norms not in nature (they are not natural-law theorists, therefore), but in other things, like the spirit of the people (*Volksgeist*), the sovereignty of the state, the *Führerprinzip*, or the emancipation of the proletariat; or again, returning to the peculiar matrix that Kelsen conceived for the true norms of positive legal systems (a peculiar matrix because understood as methodological), they find it in a presupposed basic norm (though of course Kelsen says, not "true norms," but "valid [*gültige*] norms"; see Kelsen 1934, 72; Kelsen 1960, 214).

This way we are brought back to what was previously noticed: The source of law—when understood as the matrix of normativeness, of true norms—will depend in the final analysis on the ethical, metaphysical, philosophical, and religious commitments of those who deal with the question. Of course each scholar regards his or her vision or belief as the final, decisive benchmark for what is right, and also for what is right by positive law: Each scholar finds therein the matrix of true norms, of the law to be obeyed per se as distinguished from just any command that we accept to comply with out of expediency. And different scholars, according as they follow one or another ethical, religious, or even methodological line of thinking, will assume different things to be the matrix of normativeness—of all true norms—and hence also the ultimate source of what is right by virtue of human-posited norms.

Let us go back now to the analogy with the matrices used to print banknotes.

We use banknotes—broadly, money—to *measure* the market value of goods and pay for them. Similarly, we use norms (the types of behaviour they set forth as normatively obligatory, permitted, or forbidden) to *measure* whether actual behaviours in social life are right or wrong. Money works like norms in a sense. If money is to fulfil its function, it must be true money: If it does not come from the matrices of a central bank, it will not be true money (valid money in Kelsen's sense), but the corruption (forgery) of money; it will be false money and so will be of no use in measuring the market value of goods and paying that price. Similarly in the case of norms: If norms are to fulfil their function, they have to be true norms. Their function is to state what is objectively and what is subjectively right (in the reality that ought to be) and hence to serve as the carpenter's rules (*regulae*), as instruments for measuring whether actual behaviours (in the reality that is) are right or wrong.

Aquinas is exemplary in this regard: *Lex quaedam regula est, et mensura actuum*; "a norm is a kind of rule, and a measure for acts" (Aquinas, *Summa Theologiae* (a), 1.2, q. 90, a. 1; my translation) where "measure" means a unit used for stating the measure of something: its size, quantity, or degree, for example.

Aquinas's definition of *lex* I will come back to in Chapter 13, where I discuss the distinction between what is right and what is just.

Norms cannot be true norms—just as money cannot be true money—unless they come from a matrix: They must come from the matrix of normativeness, which matrix will therefore also be the ultimate source of what is right by virtue of human-posited norms. What this matrix consists of is, again, a different matter, a question that is being debated and discussed by schools of ethics and religion and on different methodological approaches (the list is not exhaustive, though; one might also throw in metaphysics, anthropology, astrology, and so on).

And yet the Problem of the Matrix subsists and is here to stay. A central problem in legal philosophy, we often find it treated in conjunction with the sources of law because, implicitly or explicitly, it gets considered and qualified as the problem of the *ultimate source* of what is right: Cicero, we have seen, presents it as the problem of *fons legum et juris*, of the source of norms and of what is right. But the point is not always stated clearly enough that the problem of the matrix—independently of the words it is expressed in: "mother," "archetype," "source," *fons*, or what have you—is not the same as the problem of the sources of law as understood in legal dogmatics, and as discussed in Section 3.4. Let me elaborate on this point in the next section.

4.2.2. A Few Qualifying Remarks

In Section 3.4 we discussed the *ways* by which law is produced, its *modes* of production: the sources of law. That is, we discussed the Is-events (such as the implementation of a legislative procedure) through which to create laws, or legal norms, meaning Ought-effects in what is objectively right.

In this chapter, instead, we are discussing the problem of the matrix of normativeness, a problem understood as that of guaranteeing the *authenticity* or *veridicality* of human-posited norms understood as "instruments for the measurement of what is right." These instruments of measurement, these norms, however produced, will not be authentic or true unless they come from a matrix, from a master die.

The ways or modes of producing laws (legal norms) are *procedures*, while the matrix of true norms might be said to be a *premise.* Which therefore makes for a misleading use, that is, using the same noun, "source," to designate both (*a*) the premise and (*b*) the procedure. But, even worse, as was seen in Section 3.5, "source" is used to also designate what might be called (*c*) the *conclusions*: It is even used to designate the kinds of legal norms (Ought-effects) that are the Ought-outcome of the valid implementation of lawmaking procedures.

And this misleading use of the noun "source" is likely to generate confusion all the more so that we are using "valid" to qualify the noun "source" in the three acceptations just mentioned, (*a*), (*b*), and (*c*). Indeed, given that it is common practice to use the same noun, "source," to designate (*a*) the

premise, (*b*) the procedure, and (*c*) the conclusion—all three—and the modifier "valid" to qualify the congruent execution of (*b*), the procedure, as well as to qualify (*c*), its conclusion (normative outcomes, legal norms), why then should we not want to use the same modifier, "valid," to also qualify (*a*), the premise, that is, the matrix of normativeness? Maybe we are already doing so. As did Kelsen (Kelsen 1946, 111; 1960, 219) with regard to his matrix of normativeness—the presupposed basic norm. And Hart perspicuously objected to it (Hart 1961, 245; cf. Section 8.2.5).

The validity of the performance of a procedure does not guarantee that the norms produced are true norms, just as the validity of the performance of an inferential procedure does not guarantee the truth of the conclusions drawn. Human-posited legal norms are true norms if they come from the matrix of normativeness and they do so through validly performed procedures.

Notice that procedure, in the analogy just made, introduces a further element that contributes to making distinct (and making necessary the distinction between) the problem of the matrix of normativeness, on the one hand, and the problem of the sources of law, on the other.

Where the relationship between the matrix of normativeness and human-posited legal norms is concerned, the procedure at work is that by which human-posited legal norms are derived from a *non-posited matrix* (as happens in natural-law theories and in Hans Kelsen's theory of the presupposed basic norm).

By contrast, the procedure discussed in Section 3.4, on the sources of law, is the procedure by which human-posited legal norms are derived from other, likewise human-posited legal norms.

As was seen in Section 3.4, human-posited legal norms derive from (are created by) other human-posited legal norms through an interaction occurring between these norms and Is-events or Is-acts (sources of law) validly obtaining or validly performed in the reality that is. It can reasonably be assumed that this way of deriving human-posited legal norms from other human-posited legal norms is roughly the same in every human-posited legal system.

When instead, as in this chapter, we have to do with the provenance of human-posited legal norms from a non-posited matrix, the way of deriving the former from the latter will depend on the conceptions that each thinker has of the non-posited matrix and of its relationship to human-posited legal norms: The way of deriving human-posited legal norms will change (and may change considerably at that) according as the matrix is understood to be the voice of conscience, the power and love of God, the spirit of the people (*Volksgeist*), the *Führerprinzip*, the emancipation of the proletariat, the presupposed basic norm, and so on, and according as each such matrix is conceived this way or that by those who uphold it. Even circumscribing our attention to nature as the matrix of true norms (of per se binding rules), for example, we will find different conceptions (which see Section 4.3).

My treating the Problem of the Matrix as a problem of authenticity or veridicality may still leave my readers with some doubts ("O you of little faith!" Luke 12:28). Hoping to dispel these doubts, I will adduce two examples in addition to those given in Section 4.1: One for anyone of Muslim faith, with the Koran (in Section 4.2.3), and the other for anyone of Christian faith (in Section 4.2.4).[8]

4.2.3. Umm al-Kitāb*: The Mother of the Book, or the Matrix of the Koran*

Mr. Saddam Hussein, on the occasion of Gulf War I (1991), declared that the battle for Baghdad would be the Mother of All Battles (*Umm al-Hurub*).[9] We all learned of this solemn declaration from the news media, and many understood him to mean that from the battle for Baghdad all subsequent battles would originate. But I wondered why ever Mr. Hussein would have wanted to make a solemn public declaration if its meaning is the meaning just mentioned. It is plausible that Mr. Hussein spoke those words because, to him and to the audience they were addressed to, they had a deeper and more important meaning: There was maybe a sacred or religious allusion in those words. Mr. Hussein did not simply want to say that the battle for Baghdad would give way to all subsequent battles. If so, what battles was he thinking about? Are we to include the conflicts between Protestants and Catholics in Ireland, for example? And if so, why? On the basis of what causal link? And what about battles past, at Waterloo, for example? No. There had to be another meaning to Mr. Hussein's solemn declaration: The Battle for Baghdad was to be the *matrix*, the *archetype*, the official benchmark against which we were to establish the authenticity or falsity of any standard (rule or norm) that has ever been held up, or will ever be held up, for measuring, judging, or deciding whether a battle is really such and truly deserves the name "battle." Further, Mr. Hussein—however much he may be a man of learning and intelligence—could not have invented such an idea by his own wits, out of whole cloth. Besides, if this idea had been a mere invention of his (and hence an idea whose meaning he alone could appreciate in full), what point would there have been to making it the object of a solemn declaration addressed to the people of the Arab world and to the whole of Islam? The audience would have been hard put to seize the dense and deep meaning of an extravagant invention by the rais. If we are to make sense of Mr. Hussein's proclamation, we will have to look for and find something common to him and the public he

[8] And in this last regard, since I have already considered Aquinas, I will consider a thinker of protestant faith, Grotius, who was Calvinist, and who in particular adhered to the Arminian sect, engaged in conflict with the Calvinist sect of the Gomarists.

[9] Another version is *Umm al-Maarik*. A mosque built in Baghdad and completed in April of 2001 was so named (MacAskill 2002).

was addressing, something of great meaning to both, or something sacred to him (at least officially) as well as to the addressees of the declaration.

It turns out that this conclusion does have some basis, in the Koran, in that there is a heavenly matrix—it is called *Umm al-Kitāb*, literally "the mother of the Book"—and this matrix is the matrix of the Koran.

Of course I have no evidence that Mr. Hussein, when he was speaking of *Umm al-Hurub*, was making this mental association with *Umm al-Kitāb*. Nor do I know if U.S. government officials have questioned Mr. Hussein on this matter, or even if they intend to. What I do know for sure is that *Umm al-Kitāb* is the mother (in the sense of "matrix") of the Book, and that the Book is the Koran.[10]

Let us, therefore, go back in time to the 6th and 7th centuries. According to Islamic tradition, the Koran (*Qur'an*) was recounted (communicated orally) in Arabic by the Archangel Gabriel, who, chosen by Allah, revealed it to Muhammad (ca. 570–632). The matrix of the Koran that Gabriel revealed to Muhammad remained in heaven: It is called the Mother of the Book (*Umm al-Kitāb*), and it is the matrix of all the Korans circulating on Earth.

The contents of the Koran range from the image of Allah, powerful and merciful, to the rules of cult and to moral and legal norms. The content of the Korans that circulate on Earth is what is objectively right—but it is so only on the condition that these Korans be true Arab Korans coming from the matrix. Muhammad learned the Koran by heart from the Archangel Gabriel, and spread the word preaching to his disciples. This way, the verses of the Koran, which Muhammad knew by heart and recited, in addition to being memorised in the brains of his disciples, gradually found their way in writing: Thus came on this Earth the first written Koranic text, which was placed here to be of help to human memory.

But this first written Koran is not the Mother of the Book (*Umm al-Kitāb*): It is not the matrix of the Koran. The matrix of the Koran, the archetype, is in the heavens. To Muslims, every Koranic word is divine, eternal, and irreplaceable because there exists—prior to the Koran revealed to Muhammad and then transcribed by his disciples—the archetypical celestial Koran just mentioned, the *Umm al-Kitāb*, or Mother of the Book, which is kept in the heavens, in the Preserved Table (*Lawḥ Maḥfūẓ*): "By the Luminous book! / We have made it an Arabic Koran that ye may understand: / And it is a transcript of the archetypal Book, kept by us; / it is lofty, filled with wisdom" (*The Ko-*

[10] *Umm al-Kitāb* occurs in *The Koran*, 3: 7; 13: 39; 43: 4 (different expressions to be compared with these occur in 52: 2–3; 56: 78–9; 80: 13–6). Among the English versions of the Koran, see that by J. M. Rodwell (1808–1900) and edited by Ernest Rhys (1859–1946) (listed in the bibliography and cited in the text—when necessary—as *The Koran* (a)) and that by A. J. Arberry (1905–1969) (listed in the bibliography and cited in the text—when necessary—as *The Koran* (b)). On the Koran and Islamic Law, see, in Volume 2 of this Treatise, Rottleuthner, Section 3.1.2.3, in the frame of the religious foundations of law.

ran (a), 43: 2–4). "Yet it is a glorious Koran, / Written on the preserved Table" (*The Koran* (a), 85: 21–2).

J. M. Rodwell knowingly translates *Umm al-Kitāb* ("the Mother of the Book") as "archetypal Book" in the *Koran*, 43: 3 (*The Koran* (a), on page 135 of his translation): "Archetypal Book" is equivalent to my "Matrix of the Book." Further, he is careful enough to point out in a footnote that the translation should literally read "Mother of the Book."[11]

There are English translations other than Rodwell's that do not display the same accuracy—an example being A. J. Arberry's, *The Koran* (b). Here the reader is left without explicative remarks, such as we find in Rodwell. In addition, Arberry renders *Umm al-Kitāb* as "Essence of the Book," which does not give us the literal meaning, "Mother of the Book," or the metaphorical meaning, "Matrix (or Archetype) of the Book."[12]

In *The Koran* (b), 13: 39, Arberry again provides reductively a translation of *Umm al-Kitāb* as "Essence of the Book." Rodwell's version of *Umm al-Kitāb* is, again, much better and more cognisant:

> What He pleaseth will God abrogate or confirm: for with Him is *the Source of Revelation* [*Umm al-Kitāb*]. (*The Koran* (a), on page 337; italics added)

It will be noted that Rodwell not only shows here he is clearly bearing in mind that *Umm al-Kitāb* ("Mother of the Book") has the sense of "Matrix of the Book." He also chooses, not "archetype," as he does for other occurrences of *Umm al-Kitāb*, but "source."

I find it fitting in this regard to refer the reader to the passage by Cicero quoted in Section 4.1 (Cicero, *De legibus*, I.v.16–7): Here Cicero uses the Latin *fons* ("source" in English) in the expression *fons legum et juris*, where, as has been pointed out, there is at play precisely the sense of "matrix."

[11] The reader will notice that Rodwell numbers the Koranic verses differently than I do (cf. footnote 12 in this section); here, Rodwell identifies the verse as 5, and I as 4. This difference is due to the fact that I find more appropriate the verse numbering used by Alessandro Bausani (1921–1988); cf. *The Koran* (c). The difference between Rodwell and Bausani concerns the way the *verses* are numbered within the traditional order established for the Koranic suras. A different matter is the order of the suras themselves. Indeed, Rodwell attempted a chronological reordering of them: He provides a correspondence between the suras as traditionally ordered and the suras as arranged in his own translation.

[12] Arberry renders *Umm al-Kitāb* as "Essence of the Book" in translating *The Koran*, 3: 7 (3: 5 in Rodwell's numbering), *The Koran*, 13: 39 (13: 39 in Rodwell's numbering as well) and *The Koran*, 43: 4 (43: 5 in Rodwell's numbering) (see *The Koran* (b), pages 45, 244, 505). "Essence of the Book" may work only for *The Koran*, 3: 7 (3: 5 in Rodwell's numbering), for it is written in this passage, "He it is who hath sent down to thee 'the Book.' Some of its signs are of themselves perspicuous;—these are the basis of the Book [*Umm al-Kitāb*]—and others are figurative" (*The Koran* (a), page 386): We have here the distinction between "signs of themselves perspicuous" and "figurative signs." Hence, in this passage, *Umm al-Kitāb* ("Mother of the Book") may be so interpreted as to mean "the Essential Part of the Book" rather than "the Matrix (or Archetype) of the Book" (Rodwell himself, after all, uses here "the basis of the Book"). This reading does not instead apply to *The Koran*, 13: 39 and 43: 4.

4.2.4. The Great-Grandmother of Positive Human Law

It was stated in Section 3.6.1 that the norm *stare pactis* in Grotius and the *Grundnorm* (basic norm) in Kelsen are the grandmother of positive law (of human-posited legal norms).

This statement is conceptually true with regard to Kelsen, and conceptually as well as literally true with regard to Grotius.

Also, there is this further difference between Kelsen and Grotius. In Kelsen the basic norm is the grandmother of positive law and as well the matrix of normativeness, and hence the ultimate source of what is right by human-posited legal norms. In Grotius, instead, the norm *stare pactis*, though it is the grandmother of positive law, is not also the matrix of normativeness. In Grotius the matrix of normativeness, namely, human nature, boasts a higher degree of nobility: It is the great-grandmother of positive law. Indeed, says Grotius, on positive human law and its lineage,

> the very nature of man, which even if we had no lack of anything would lead us into the mutual relations of society, is the *mother* of the law of nature. But the *mother* of municipal law is that obligation which arises from mutual consent [the social contract]; and since this obligation derives its force from the law of nature, nature may be considered, so to say, the *great-grandmother* of municipal law. (Grotius, *De jure belli ac pacis libri tres* (b), Prolegomena, 16; italics added)[13]

Grotius, the father of modern natural-law theory, is thus saying that the mother of natural law is human nature, which therefore could be said to be the great-grandmother of positive human law: This is so because the mother of positive human law is a competence norm (*ipsa obligatio*; cf. Section 7.3) produced through the social contract (*ex consensu*).

The social contract is a valid Is-event (in the reality that is). It is a *Rechtsgeschäft* (a declaration of will, and properly a kind of promise: cf. Sections 3.2.1, 3.2.4, 3.6.2, and 10.2.6) whose type is set forth in a natural norm, **n**, *stare pactis* (or *pacta servanda sunt*), that attaches to this type an Ought-effect (in the reality that ought to be), and this Ought-effect (*obligatio*) is in turn the competence norm **c**, "It is binding per se to obey (type of action) the sovereign's commands (type of circumstance)."

By this way of descending from the matrix of normativeness—from human nature—this competence norm, **c**, draws its binding force (*vim*) from the natural norm of conduct **n**, *pacta servanda sunt* (cf. Sections 7.2 and 8.2.1): The natural norm of conduct **n** makes it so that, through it, the posited (or positive) competence norm comes from human nature itself. From human nature the posited (or positive) competence norm **c**, institutive of sovereignty, gets its very

[13] The Latin original: "naturalis juris mater est ipsa humana natura, quae nos etiamsi re nulla indigeremus ad societatem mutuam appetendam ferret: civilis vero juris mater est ipsa ex consensu obligatio, quae cum ex naturali jure vim suam habeat, potest natura hujus quoque juris quasi proavia dici" (Grotius, *De jure belli ac pacis libri tres* (a), Prolegomena, 16).

character of a norm (the power of a norm, *legis virtus*, in Aquinas's words: cf. Sections 13.4 and 13.7). Hence, human nature is the matrix and great-grandmother of the human legal norms posited through the sovereign's commands.

Let us turn now to the question framed in Section 3.6.1: the kinship between Kelsen and Grotius.

With the idea of mother (or matrix), Grotius gives us in outline form a genealogical vision, a pedigree conception, of the binding force or normativeness of positive law. Human nature is the great-grandmother whence descends a grandmother (natural law, and specifically the natural legal norm of conduct *pacta servanda sunt*), whence descends a mother, the posited (or positive) competence norm "It is binding per se to obey the sovereign's commands" (a norm created through a valid Is-act, a transaction: the social contract),[14] whence descends a daughter: the derivative positive law, or human legal norms, posited through the sovereign's commands.

This 17th-century outline by Grotius makes an easy fit with Kelsen's 20th-century *Stufenbau* and its peculiar methodological matrix of normativeness, meaning the *vorausgesetzte Grundnorm*, the presupposed basic norm, the matrix for the reality that ought to be (*das Sollen in einem objektiven Sinn*, whose content is *das Recht in einem objektiven Sinn*: what is right in an objective sense, the only sense that Kelsen admits for *das Recht*; cf. Section 14.5), and hence the matrix for the constitution as a legal competence norm posited (*gesetzte*) by humans, and—moving further down in the genealogy—for the laws enacted by the legislature, for the government's administrative and bureaucratic rules, and finally for individual norms, such as the judge's rulings.[15]

4.3. Nature as the Matrix of Normativeness

4.3.1. A Traditional Starting Point

Some Sophists (5th century B.C.),[16] the way Plato presents them, distinguished what is right by nature (*phusei dikaion*) from what is right by law (*nomōi dikaion*), even if what is right by nature they saw in different ways: as the superiority of the strongest (in Callicles, for example) or the equality of men (in Hippias and Antiphon, for example).[17]

[14] Cf. Section 3.2.4, on the declaration of will and the transaction: *Geschäft* in German; *negotium* in Latin, the term Grotius uses in *De jure belli ac pacis libri tres* (a), Prolegomena, 15–6.

[15] On *Sollen in einem objektiven Sinn*, see Section 5.1, footnote 2 and Section 14.5, footnote 19. On Kelsen's *Grundnorm*, see, in Volume 2 of this Treatise, Rottleuthner, Section 4.1, in the frame of the internal foundations of law.

[16] The Sophists were exponents of the New Learning: This is how the movement they belonged to is called by Gagarin and Woodruff in Sections 1.4 and 1.5 of Volume 6 of this Treatise.

[17] On Callicles, see Plato, *Gorgias* (a), 38–39, 483b–484a. On Hippias, see Plato, *Protagoras*, 24, 337b. On the Sophist Antiphon, see DK 87b 44, b2, a–1–4. See, in Volume 6 of this Treatise, Gagarin and Woodruff, Section 1.3.

At the outset, in Greek thought, this distinction covered more than law: In several fields the question was whether certain things had come about by nature (*phusei*) or by human convention (in either of the two ways: *nomōi* or *thesei*), or custom (*ethei*). In Plato's *Cratylus*, for example, the question is discussed whether or not language is given by nature (*phusei*). And it is stated therein that names are formed not by nature but either by convention (*nomōi*) or by habit or custom (*ethei*) (Plato, *Cratylus*, 384d).[18]

Aristotle in turn wrote that the things which concern what is congruent (suitable) and right (*ta de kala kai ta dikaia*) spawn so much a divergence of opinion (*diaphoran*), and so much open the way to error, as to give us reason to believe that they are what they are by convention (*nomōi*) and not by nature (*phusei*).[19]

It has long been the practice in the history of the philosophy of law to cite, as Aristotle does,[20] the Greek dramatist Sophocles (ca. 496–406 B.C.), and

[18] About 550 years after Plato, Aulus Gellius (ca. A.D. 130–ca. 180), *Noctes atticae*, X, IV, 1–4, speaks of Publius Nigidius (1st century B.C.). Under the title "Quod P. Nigidius argutissime docuit nomina non positiva esse, sed naturalia" ("How Publius Nigidius with great cleverness showed that words are not arbitrary, but natural"), he reports, "Publius Nigidius in his *Grammatical Notes* shows that nouns and verbs were formed, not by a chance use, but by a certain power and design of nature, a subject very popular in the discussions of the philosophers; for they used to inquire whether words originate by 'nature' or are man-made." The Latin original. "Nomina verbaque non positu fortuito, sed quadam vi et ratione naturae facta esse, P. Nigidius in *Grammaticis Commentariis* docet, rem sane in philosophiae disceptationibus celebrem. Quaeri enim solitum aput philosophos, φύσει [by nature] τὰ ὀνόματα sint ἢ θέσει [by position]."

[19] "The subjects studied by political science are Moral Nobility and Justice [in my translation, what is congruent (or suitable) and what is right: *ta kala kai ta dikaia*]; but these conceptions involve much difference of opinion and uncertainty, so that they are sometimes believed to be mere conventions and to have no real existence in the nature of things" (Aristotle, *The Nicomachean Ethics*, 1094b, 14–7). The Greek original: "Τὰ δὲ καλὰ καὶ τὰ δίκαια, περὶ ὧν ἡ πολιτικὴ σκοπεῖται, πολλὴν ἔχει διαφορὰν καὶ πλάνην, ὥστε δοκεῖν νόμῳ μόνον εἶναι, φύσει δὲ μή."

[20] "Let us now classify just and unjust actions [*dikaiōmata*, or "right actions," in my translation, and *adikēmata*, or "unright actions," "wrongs," in my translation] generally, starting from what follows. Justice and injustice [in my translation, right things and unright things: *ta dikaia kai ta adika*] have been defined in reference to laws and persons in two ways. Now there are two kinds of laws, particular and general. By particular laws I mean those established by each people in reference to themselves, which again are divided into written and unwritten; by general laws I mean those based upon nature [*ton kata phusin*]. In fact, there is a general idea of just and unjust in accordance with nature [in my translation, right and unright by nature: *phusei dikaion kai adikon*], as all men in a manner divine, even if there is neither communication nor agreement between them. This is what Antigone in Sophocles evidently means, when she declares that it is just [in my translation, right: *dikaion*], though forbidden, to bury Polynices, as being naturally just [*phusei dikaion*; in my translation, "right by nature"]: 'For neither to-day nor yesterday, but from all eternity, / these statutes live and no man knoweth whence they came'" (Aristotle, *The "Art" of Rhetoric*, 1373b, 1–2). The Greek original: "Τὰ δ' ἀδικήματα πάντα καὶ τὰ δικαιώματα διέλωμεν, ἀρξάμενοι πρῶτον ἐντεῦθεν. ὥρισται δὴ τὰ δίκαια καὶ τὰ ἄδικα πρός τε νόμους [δύο], καὶ πρὸς οὕς ἐστι, διχῶς. λέγω δὲ νόμον τὸν μὲν ἴδιον τὸν δὲ κοινόν, ἴδιον μὲν τὸν ἑκάστοις ὡρισμένον πρὸς αὐτούς, καὶ τοῦτον τὸν μὲν ἄγραφον τὸν δὲ γεγραμμένον, κοινὸν δὲ τὸν κατὰ φύσιν. ἔστι γάρ, ὃ

specifically his play *Antigone*, to exemplify the deontological superiority of what is right by nature, meaning natural law, over what is right by statute or convention, meaning the positive law made by humans.[21]

The protagonist in the tragedy, Antigone, performs a burial rite over her brother, Polynices, who has died in battle fighting Thebes.

By so doing, Antigone infringes a decree issued by the king of Thebes, Creon, who has denied burial rites to Polynices for his role in bringing arms against the homeland. Antigone is brought before the king, who asks her whether she has dared to break his decree, and her reply is

> Yea, for these laws were not ordained of Zeus, / and she who sits enthroned with gods below, / Justice [in my translation, the Right: *Dikē*], enacted not these human laws. / Nor did I deem that thou, a mortal man, / Could'st by a breath annul and override / the immutable unwritten laws of Heaven. / They were not born to-day nor yesterday; / they die not; and none knoweth whence they sprang. (Sophocles, *Antigone*, vv. 450–7)[22]

Antigone is sentenced to death. She faces up resolutely to this sentence because she knows that in flouting Creon's orders she has stood by what is truly right.

The historiography of legal philosophy is traditionally of the view that Antigone's words anticipate the dualism inherent in natural-law theories, meaning the dualism consisting in the superiority and superordination of what is right by nature over what is right by law, such that what is right by law is not truly what is right if it fails to conform to what is right by nature: Nature—I should want to comment—is the matrix of normativeness and hence the ultimate source of what is right.

Let us see, then, how we can understand what is right by nature as consisting in the content of the unwritten norms that Antigone invokes.

First, the norms invoked by Antigone can be construed as divine norms, established by the normative and eternal will of God, since Antigone explicitly contrasts Creon's decrees with God's *agrapta kasphalē theōn nomima* ("the immutable unwritten norms of the gods"; my translation).

According to this construction, those who see Antigone's behaviour as accordant with what is right by nature, and who in nature see the matrix of

μαντεύονταί τι πάντες, φύσει κοινὸν δίκαιον καὶ ἄδικον, κἂν μηδεμία κοινωνία πρὸς ἀλλήλους ᾖ μηδὲ συνθήκη, οἷον καὶ ἡ Σοφοκλέους ᾽Αντιγόνη φαίνεται λέγουσα, ὅτι δίκαιον ἀπειρημένον θάψαι τὸν Πολυνείκη, ὡς φύσει ὂν τοῦτο δίκαιον· / οὐ γάρ τι νῦν γε κἀχθές, ἀλλ᾽ ἀεί ποτε / ζῇ τοῦτο, κοὐδεὶς οἶδεν ἐξ ὅτου φάνη." On justice in Aristotle see, in Volume 6 of this Treatise, Miller, Sections 4.4 and 4.6.

[21] On Sophocles's *Antigone*, see, in Volume 2 of this Treatise, Rottleuthner, Section 3.1.1.3, in the frame of the mythological foundations of law. For an analysis of Antigone's and Creon's reasoning, see, in Volume 5 of this Treatise, Sartor, Section 4.3.

[22] The Greek original: "Οὐ γάρ τί μοι Ζεὺς ἦν ὁ κηρύξας τάδε, / οὐδ᾽ ἡ ξύνοικος τῶν κάτω θεῶν Δίκη / τοιούσδ᾽ ἐν ἀνθρώποισιν ὥρισεν νόμους· / οὐδὲ σθένειν τοσοῦτον ᾠόμην τὰ σὰ / κηρύγμαθ᾽, ὥστ᾽ ἄγραπτα κἀσφαλῆ θεῶν / νόμιμα δύνασθαι θνητὸν ὄνθ᾽ ὑπερδραμεῖν. / οὐ γάρ τι νῦν γε κἀχθές, ἀλλ᾽ ἀεί ποτε / ζῇ ταῦτα, κοὐδεὶς οἶδεν ἐξ ὅτου ᾽φάνη."

normativeness (of the reality that ought to be), will thereby have identified nature with the will of God (on which see Section 4.3.2).

There is also a second angle, one involving a strain, from which to interpret Antigone's behaviour. The key element here is that Antigone buries her own brother's mortal remains, and that she is driven to this act by the mysterious call and strength of her bloodline. Antigone's nature in the character of a sister—as a woman whose compassion and piety draws her close to her kinfolk—brings out the instinct that drives her to perform the due rite, which takes precedence over manmade laws and makes her accept the punishment that will befall her if she goes through with her decision. According to this construction, those who in Antigone's behaviour see a behaviour accordant with what is right by nature, and who see nature as the matrix of normativeness (of the reality that ought to be), will thereby have identified nature with a kind of biological instinct, an instinct that brings forth Antigone's behaviour (on which see Section 4.3.3).

Thirdly, on a different interpretation, those who in Antigone's appeal to unwritten norms see her conscience speaking can take Antigone's inner voice to be her reason: Her inner voice stands for human reason, and human reason overrides other aspects of human beings and human life (including conventions and manmade laws), thereby binding Antigone and calling on her to bury Polynices's body. This way, those who in the content of the norms invoked by Antigone see what is right by nature identify nature, understood as the matrix of normativeness (of the reality that ought to be), with human reason itself (on which see Section 4.3.4).

The last two interpretations of Sophocles' text do involve a strain. But it is not my intent here to carry out a philological and reconstructive analysis of Sophocles' tragedy. Rather, I am using Sophocles' *Antigone* (so often regarded as one of the prime expressions of the opposition between what is right by nature and what is right by law) to line out the features of three main ways in which nature—understood as the matrix of normativeness and as the ultimate source of what is right—has been variously conceived by different thinkers: nature as the will of God, as biological instinct, and as reason.

There is at least another (fourth) conception of nature—understood as the matrix of normativeness and as the ultimate source of what is right—a conception that traces back to Calcidius's commentary to Plato's *Timaeus* (a work that Calcidius, 4th century A.D., also translated into Latin). On this conception, nature is equated with the cosmic order (see Section 4.3.5).

In all the conceptions just outlined, what is truly right is only what is right by nature, or it is what is right by positive law, but here only on the condition that this last thing (what is right by positive law) comes from what is right by nature.

4.3.2. Nature as the Will of God

Although the voluntaristic version (the will-theory) of what is right by nature crops up at several places in the history of ethical and legal thought, it yields to the rationalistic version. The conception of nature as God's will is going to be focal to religiously inspired thinkers: In a veritably religious spirit, they will place God's will at the top as the matrix of the reality that ought to be (the matrix of normativeness, of true norms), and hence as the ultimate source of what is right.

Let us take, for example, William of Ockham.

Ockham says that nature is the will of God, and God has the power to turn evil into good, and vice versa: Hence human behaviour will be right or wrong according as it conforms with or runs contrary to God's precept, and that precept may do an about-face, but its content is always what is objectively right. God can make it so that murder, fornication, and offending God's name should become right things. God can therefore modify nature, and consequently what is right by nature. Even so, manmade law must always come from what is right by nature and from any such modifications of it as God may decide, because God's will is the matrix of normativeness (of the reality that ought to be, of true norms) and the content of his will is always what is right by nature.

> Although the "hate of God," "theft," and "adultery" are qualified as bad—as are acts that under the common law [*de communi lege*] are similar to them—because carried out by persons who by divine precept are bound to the contrary conduct, [...] these terms do not designate such acts in any absolute sense, but rather by implying [*connotando*] or getting us to understand that the author of the same acts is obligated by divine precept to hold the opposite behaviour: [...] Whereas if these acts [hating God or committing theft or adultery] were to be commanded by God, then their authors would not be bound to the opposite behaviour, and then also, these acts would not in consequence be called "theft," "adultery," and so forth. (Ockham, *Quaestiones in Librum Secundum Sententiarum* (a), q. 19; my translation)[23]

[23] This is the Latin original in its wider context (enclosed within angle brackets is the original corresponding specifically to the translation in the run of text): "<Licet odium Dei furari adulterari habeant malam circumstantiam annexam et similia de communi lege quatenus fiunt ab aliquo qui ex precepto divino obligatur ad contrarium>: sed quantum ad esse absolutum in illis actibus possunt fieri a Deo sine omni circumstantia mala annexa: Et etiam meritorie possunt fieri a viatore si caderent sub precepto divino sicut nunc de facto eorum opposita cadunt sub precepto divino. Et stante precepto divino ad opposita eorum non potest aliquis tales actus meritorie nec bene exercere: quia non fiunt meritorie nisi caderent sub precepto divino. Et si fierent a viatore meritorie: tunc non dicerentur nec nominarentur furtum adulterium odium etc. quia <ista nomina significant tales actus non absolute: sed connotando vel dando intelligere quod faciens tales actus per preceptum divinum obligatur ad oppositum>: et ideo quantum ad totum significatum quod nominibus talium nominum significant circumstantias malas: et quantum ad hoc intelligunt sancti et philosophi quod ista statim nominata convoluta sunt cum malicia. <Si autem caderent sub precepto divino: tunc faciens tales actus non obligaretur ad oppositum et per consequens tunc non nominaretur furtum adulterium etc.>" (Ockham, *Quaestiones in Librum Secundum Sententiarum* (a), q. 19). This is not the only version of this passage by Ockham. See, for example, Ockham, *Quaestiones in*

The binding force of manmade law lies in its conformity to what is right by nature understood as a means through which God conveys to humans the content of his binding (normative) will (cf. Fassò 1964, 94, 98–114, 116, 133). When understood as God's will—as divine power, God's sovereign power as moral power—nature becomes the matrix of normativeness (of the reality that ought to be, of true norms), and hence the ultimate source of what is right.

It will be for the historical part of this Treatise to describe and assess the bearing of the conception of nature as God's will (nature understood as the matrix of the reality that ought to be, of true norms), its bearing on Hebrew and Christian thought, for example. My only purpose in this volume is to fix the essential theoretical features of this conception.[24]

4.3.3. Nature as Biological Instinct

The variant that identifies nature with animal and human instinct, that is, with biological nature, is referred to as "naturalistic."

This conception is wholly different from the previously considered voluntaristic and religious conception, in both content and outlook. Even so, it interestingly shares with it some analogous theoretical consequences.

Indeed, if nature (understood as the matrix of the reality that ought to be, of true norms) is taken to be the instinct of all animate beings, then what is right by nature will become the content of the most powerful decisions or actions, in much the same way as it does in Ockham's voluntaristic view, but with one fundamental difference: Where nature is instinct, the power referred to is de facto power, a natural force that belongs to our biological nature; not so where nature is God's will, for here the power referred to is a moral power.

Ulpian (170–228) characterised what is right by nature (*jus naturale*) as

> that which nature has taught to all animals; for it is not a law [*jus*] specific to mankind but is common to all animals—land animals, sea animals, and the birds as well. Out of this comes the union of man and woman which we call marriage, and the procreation of children, and their rearing. So we can see that the other animals, wild beasts included, are rightly understood to be acquainted with this law [*istius juris*]. (Ulpian, *The Digest of Justinian*, I, 1, 1, 3)[25]

Librum Secundum Sententiarum (b), q. 15, "Solutio dubiorum," 3–24: In the manuscript found in this edition, the words "licet odium Dei furari adulterari" are replaced with "licet odium, furari, adulterari," where "odium" is not followed by "Dei."

[24] On early Jewish and Christian legal thought, see, in Volume 6 of this Treatise, Miller, Chapter 7. On Ockham, see, in Volume 6 of this Treatise, Lisska and Tierney, Chapter 13, Sections 13.3 and 13.4.

[25] The Latin original: "Ius naturale est, quod natura omnia animalia docuit: nam ius istud non humani generis proprium, sed omnium animalium, quae in terra, quae in mari nascuntur, avium quoque commune est. Hinc descendit maris atque feminae coniunctio, quam nos matrimonium appellamus, hinc liberorum procreatio, hinc educatio: videmus etenim cetera quoque animalia, feras etiam istius iuris peritia censeri" Ulpian is discussed in this Treatise in Volume 6, Section 10.1, Banchich, and Volume 7, Stein, Chapter 1.

If what is right by nature is *quod natura omnia animalia docuit*, then nature, as the matrix of normativeness (of the reality that ought to be, of true norms), is understood in the biological sense.

The naturalistic conception of what is right by nature had been, long before Ulpian, expressed by some Sophists.

As has been noted, the Sophists distinguished what is right by nature (*phusei dikaion*) from what is right by law (*nomōi dikaion*). And Callicles, as Plato presents him in *Gorgias*, holds that nature shows us that the better and the abler should rightly prevail upon those who are inferior to them, the way it happens among animals and among states.[26]

What is right is—here, too—the content of the most powerful decisions and actions: "Might makes right," a conception that implies a right of domination and supremacy of the stronger over the weaker. To be sure, the weaker can band together and subdue the stronger, issuing manmade laws designed to neutralise the stronger and keep them under control. But the content of these laws of the weaker will be contrary to what is right by nature, and hence will not be what is right: The laws of the weaker are not norms, but the forgery (*corruptio*) of norms, if we are to apply the term considered in regard to Augustine and Aquinas; cf. Section 4.1.

The historical bearing of the naturalistic conception of what is right by nature will be discussed in the historical part of this Treatise. But I will briefly mention here a variant of this conception.

Benedict de Spinoza (1632–1677) works out a pantheistic identification of God and nature. This identification yields a conception of what is right by nature effectively conveyed in the following passage of his *Tractatus Theologico-Politicus.*

By *the right* [*jus*] and ordinance of nature, I merely mean those natural laws [*regulas naturae*] wherewith we conceive every individual to be conditioned by nature, so as to live and act in a given way. For instance, fishes are naturally conditioned for swimming, and the greater for devouring the less; therefore fishes enjoy the water, and the greater devour the less by *sovereign natural right* [*summo naturali jure*]. For it is certain that nature, taken in the abstract, *has sovereign right* [*jus summum habere*] to do anything she can; in other words, *her right* [*jus naturae*] is co-extensive with her power. The power of nature is the power of God, which has *sovereign*

[26] "But I believe that nature itself reveals that it's a just thing [a right thing, I should say: *dikaion*] for the better man and the more capable man to have a greater share than the worse man and the less capable man. Nature shows that this is so in many places; both among the other animals and in whole cities and races of men, it shows that this is what justice [in my translation, the right: *to dikaion*] has been decided to be: that the superior rule the inferior and have a greater share than they" (Plato, *Gorgias* (b), 483d–484). The Greek original: "Ἡ δέ γε, οἶμαι, φύσις αὐτὴ ἀποφαίνει αὐτό, ὅτι δίκαιόν ἐστι τὸν ἀμείνω τοῦ χείρονος πλέον ἔχειν καὶ τὸν δυνατώτερον τοῦ ἀδυνατωτέρου. δηλοῖ δὲ ταῦτα πολλαχοῦ ὅτι οὕτως ἔχει, καὶ ἐν τοῖς ἄλλοις ζώοις καὶ τῶν ἀνθρώπων ἐν ὅλαις ταῖς πόλεσι καὶ τοῖς γένεσιν, ὅτι οὕτω τὸ δίκαιον κέκριται, τὸν κρείττω τοῦ ἥττονος ἄρχειν καὶ πλέον ἔχειν" (Plato, *Gorgias* (a), 483d–484).

right [*summum jus*] over all things; and, inasmuch as the power of nature is simply the aggregate of the powers of all her individual components, it follows that every individual has *sovereign right* [*jus summum*] to do all that he can; in other words, the *rights* of an individual [*jus uniuscujusque*] extend to the utmost limits of his power as it has been conditioned. (Spinoza, *A Theologico-political Treatise*, XVI, 200; italics added)[27]

In several contexts the Latin *jus* is best translated as "what is right" (or "the right") rather than as "law," in analogy to what was observed in Sections 1.2 and 1.3 with regard to *droit*, *Recht*, *diritto*, and *derecho* (Chapter 13). R. H. M. Elwes's just-quoted English translation of Spinoza supports my point of view on this matter. The italics and square brackets added in the foregoing quotation are meant to draw the reader's attention to a variety of uses of *jus* by Spinoza and of "right" by Elwes. For instance, on the first occurrence, *jus* means "the right," "what is right," whereas on the last occurrence it means "a right," and in order to make clear this sense of *jus*, Elwes has wisely adopted the plural form "rights."

4.3.4. Nature as Divine and Human Reason

The rationalistic version of what is right by nature was discussed in Section 4.1 with regard to Aquinas and Cicero, and in Section 3.6 with regard to Grotius. In this version, what is right by nature is the content of the norms inherent in human (and divine) reason understood as human (and divine) nature. I will only add a few remarks here.

The reality that ought to be is a spiritual, ideal, and moral reality. With Hugo Grotius and Samuel Pufendorf the classical natural-law school uses the very terms "moral entities," "moral faculties," and "moral bonds" (*entitates morales*, *facultates morales*, and *vincula moralia*). Natural norms are conceived of as a class of norms that reason sets forth and that even stand above God, or at least will partake of God's nature, in that God cannot turn good into evil, or vice versa: God cannot change what is objectively right, just as he cannot make two and two not add up to four. In this conception, norms—understood as law that is binding per se—precede power. Moral power, as well as

[27] The Latin original: "Per Jus et Institutum Naturae nihil aliud intelligo, quam regulas naturae uniuscujusque individui, secundum quas unumquodque naturaliter determinatum concipimus ad certo modo existendum et operandum. Ex. gr. pisces a Natura determinati sunt ad natandum, magni ad minores comedendum; adeoque pisces summo naturali jure aqua potiuntur, et magni minores comedunt. Nam certum est, Naturam absolute consideratam jus summum habere ad omnia, quae potest, hoc est, Jus Naturae eo usque se extendere, quo usque ejus potentia se extendit. Naturae enim potentia ipsa Dei potentia est, qui summum jus ad omnia habet; sed, quia universalis potentia totius Naturae nihil est praeter potentiam omnium individuorum simil, hinc sequitur, unumquodque individuum jus summum habere ad omnia, quae potest, sive, jus uniuscujusque eo usque se extendere, quo usque ejus determinata potentia se extendit" (Spinoza, *Tractatus Theologico-Politicus*, XVI, 258). On Spinoza see Riley, Volume 8 of this Treatise.

God's power, depends on the binding force of the norm of reason. In the words of Grotius:

> The law of nature [what is objectively right by nature: *jus naturale*], again, is unchangeable—even in the sense that it cannot be changed by God. Measureless as is the power of God, nevertheless it can be said that there are certain things over which that power does not extend; for things of which this is said are spoken only, having no sense corresponding with reality and being mutually contradictory. Just as even God, then cannot cause that two times two should not make four, so He cannot cause that that which is intrinsically [*intrinseca ratione*; cf. Section 13.7] evil be not evil. (Grotius, *De jure belli ac pacis libri tres* (b), I, 1, X)[28]

Note here that this conception is quite at variance with Ockham's conception, whereby God's will can turn good into evil, and vice versa.

It will be for the historical part of this Treatise to describe and assess the bearing of the conception of nature as divine or human reason (nature understood as the matrix of the reality that ought to be, of true norms). My only purpose in this volume is to fix the essential theoretical features of this conception.

4.3.5. Nature as the Cosmic Order

Calcidius translated into Latin and commented Plato's dialogue *Timaeus*. His comment is five times longer than *Timaeus*, and it is thanks to this commentary and translation that *Timaeus* was known to the Middle Ages, unlike what happened with all the other Platonic dialogues (cf. Fassò 2001, vol. 1, 94). Calcidius's comment and Latin translation of Plato's *Timaeus* became popular with the medieval scholars, especially with the 12th-century school of Chartres in France; and it led some of these scholars to a sort of pantheistic naturalism and a conception of what is right by nature wherein nature is understood as cosmic order and harmony (cf. ibid., 199).[29]

In *Timaeus*, Plato depicts the natural world, meaning the universe, as an animate being governed by an Intelligence that imparts to it a harmonious order consisting of proportional relations among its different parts. Calcidius considers Plato's *Timaeus*—of itself a work on metaphysics—as a work on ethics, a kind of complement to and completion of Plato's *Republic*, and finds that as the *Republic* is concerned with what is right in the human world, so *Timaeus* is concerned with what is right in nature—nature understood in its totality, meaning the universe.

[28] The Latin original: "Est autem jus naturale adeo immutabile, ut ne a Deo quidem mutari queat. Quanquam enim immensa est Dei potentia, dici tamen quaedam possunt ad quae se illa non extendit, quia quae ita dicuntur, dicuntur tantum, sensum autem qui rem exprimat nullum habent; sed sibi ipsis repugnant: Sicut ergo ut bis duo non sint quatuor ne a Deo quidem potest effici, ita ne hoc quidem, ut quod intrinseca ratione malum est, malum non sit" (Grotius, *De jure belli ac pacis libri tres* (a) I, 1, X). On Grotius see Riley, Volume 8 of this Treatise.

[29] Some scholars hold that Calcidius's work lapsed out of circulation for a long time and resurfaced only in the 12th century (Moreschini 2003a).

Thus, as Calcidius writes, Socrates limned, in Plato's *Republic*, "a kind of image of a city governed by just customs and norms." And "since it became clear that the justice concerning things human had been looked for and found" in Plato's *Republic*, "but there remained to be done an investigation into natural fairness," Socrates entrusted this task to Timaeus, Critias, and Hermocrates, and they accepted.[30]

Calcidius proceeds with these words:

> Ex quo apparet in hoc libro [in *Timaeus*] principaliter illud agi: contemplationem considerationemque institui *non positiuae sed naturalis illius iustitiae atque aequitatis*, quae *inscripta* instituendis legibus describendisque formulis tribuit ex genuina moderatione substantiam. (Calcidius, *Timaeus a Calcidio translatus commentarioque instructus*, § VI, on page 59; italics added)

The translation of this Latin passage by Calcidius is delicate in several respects. Note, in particular, Calcidius's use of *inscripta*. *Inscriptus* is a tricky Latin word: If understood as a past participle of *inscribo* it means "inscribed," and the like, but if understood as an adjective it will take on quite a different meaning, that is, "unwritten." In the quoted passage by Calcidius, *inscripta* is to be understood as an adjective:[31] Calcidius is discussing a natural justice and fairness that are *unwritten* (cf. *agrapta nomima* in Sophocles' *Antigone*: Section 4.3.1); he is not speaking of a natural justice and fairness somehow and somewhere inscribed or embodied. Calcidius, in the sentence in question, is referring to *naturalis justitia atque aequitas*, and he states that these (unwritten) entities confer on the laws to be established and on the procedures to be defined the substance of a genuine government.

[30] Here is the Latin original in its wider context (enclosed within angle brackets is the original corresponding specifically to the foregoing translation): "Nam cum pridie Socrates decem libris omnibus de re publica disputasset, ad quem tractatum non ex principali causa sed ex consequenti descenderat—siquidem cum de iustitia quaeri coeptum fuisset quam definierat Thrasymacus orator eam esse quae huic prodesset qui plurimum posset, Socrates contra docuisset immo eam potius quae his prodesset qui minimum possent—, ut illustriore uteretur exemplo, si eam non in unius hominis ingenio sed in urbis alicuius populosae frequentia populari scrutaretur, <imaginem quandam depinxit urbis quae iustis moribus institutisque regeretur> et conuenienti legibus felicitate frueretur contraque, si quando degenerasset ab institutis, quam improspera esset ei ciuitati quamque exitiabilis mutatio morum futura. <Igitur cum in illis libris quaesita atque inuenta uideretur esse iustitia quae uersaretur in rebus humanis, superesset autem ut naturalis aequitatis fieret inuestigatio,> huius tanti operis effectum quod ingenio suo diceret onerosum Socrates, Timaeo et Critiae et Hermocrati delegandum putauit atque illi munus iniunctum receperunt" (Calcidius, *Timaeus a Calcidio translatus commentarioque instructus*, §§ V–VI, on page 59; italics added; my translation in the run of text).

[31] The *in-* in *inscriptus* stands for *ab-*, with *inscriptus* equivalent to the Greek *agraphos*, meaning "unwritten." Cf. *Thesaurus linguae latinae editus iussu et auctoritate consilii ab academiis societatis usque diversarum nationum electi*, Volume VII, s.v. "Inscriptus," 1850, 65. Moreschini 2003b, 119, erroneously translates *inscripta* into Italian as *incarnandosi*, from *incarnarsi*, "to become embodied."

I provide below my own English translation of this passage by Calcidius.

It is clear from this that the main purpose of this work [Plato's *Timaeus*] was to undertake an analysis and consideration not of *positive justice and fairness*, but of natural justice and fairness [*naturalis illius justitiae atque aequitatis*], which last, being unwritten [*quae inscripta*], confers on the laws to be established and on the procedures to be defined the substance of a genuine [authentic, true] government. (Calcidius, *Timaeus a Calcidio translatus commentarioque instructus*, § VI, on page 59; my translation; italics added)

Calcidius concludes as follows on the relation between *Republic* and *Timaeus*:

In the same way as Socrates, in discussing justice as practised by human beings, introduced an ideal model of political organisation among citizens [*effigiem civilis rei publicae*], so Timaeus [...] sought to investigate that justice which divinity practises toward itself in what might be called the common city and political organisation of this sensible universe. (Calcidius, *Timaeus a Calcidio translatus commentarioque instructus*, § VI, on pages 59 and 60; my translation)[32]

4.4. The Origin of the Term *Jus Positivum*

The next-to-last passage by Calcidius, as quoted in the previous Section 4.3.5, is important because, among other reasons, there occurs in it the expression *non positiuae sed naturalis illius iustitiae atque aequitatis*. And this Latin expression by Calcidius is thought to be the origin of the term *jus positivum*. As Fassò writes,

It is from this very passage in Calcidius's comment to *Timaeus* that legal language acquired the adjective "positive" as a modifier of "law." Latin writers would use *positivus* in opposition to *naturalis* to express the Greek antithesis of *thései* and *phýsei*, which in the Hellenistic age had come to replace the older antithesis of *nómoi* and *phýsei*, indicating the opposition between what is manmade, on the one hand, and what is natural, on the other (*thésis* is, in Latin, *positio*, and *positivus* thus rendered literally the concept expressed by the dative *thései*). But this use of *positivus* is rarely attested and, more than that, never occurs in connection with ethics or law prior to Calcidius. Calcidius, it was noticed a moment ago, applies the word to justice and this way suggested to the medieval writers who read his comment the coinage *ius positivum*. (Fassò 2001, vol. 1, 94; my translation; the transliterations from the Greek are by Fassò)[33]

[32] Here is the Latin original in its wider context (enclosed within angle brackets is the original corresponding specifically to the translation in the run of text): "<Perindeque ut Socrates, cum de iustitia dissereret qua homines utuntur, induxit effigiem ciuilis rei publicae, ita Timaeus Locrensis> ex Pythagorae magisterio, astronomiae quoque disciplinae perfecte peritus, <eam iustitiam qua diuinum genus aduersum se utitur in mundi huius sensilis ueluti quadam communi urbe ac re publica uoluit inquiri>" (Calcidius, *Timaeus a Calcidio translatus commentarioque instructus*, §§ V–VI, on pages 59 and 60; italics added). See the considerations and information found in this Treatise, Volume 6, Marenbon, Sections 11.1.1, 11.1.2, and 11.3.3.

[33] Fassò points out that there are only two occasions on which the opposition between *thesei* and *phusei* is expressed as one between *positivus* and *naturalis*: The first is in the 2nd century A.D., with Aulus Gellius, who does so with reference to names (see footnote 18 in this chapter); the second is in the 5th century A.D., with the rhetor Fortunatianus (*Ars rhetorica*, II, 3), who does so with reference to places (Fassò 2001, vol. 1, 94, footnote 37).

With Calcidius, then, the expression "positive justice," *justitia positiva*, can be found to trace back to the 4th century A.D.

It is with Justinian's (A.D. 482–565) compilation that the expression *legem ponere*, meaning "to lay down a law," makes its first appearance as a legal term.[34]

Abelard (1079–1142) almost certainly drew inspiration from Calcidius—even if only in regard to this terminological question—in coining (for the first time in the history of legal parlance) the expression *jus positivum*. Specifically, Abelard says *Jus quippe aliud naturale, aliud positivum dicitur*.[35] I provide below the text by Abelard:

> However, in matters of justice one must not only not stray from the path of natural justice, but one must also not stray from the path of positive justice. *Indeed, one right is called natural, another positive*. Natural right is what reason [*ratio*; cf. Section 13.7], which is naturally in everyone and so remains permanent in all, moves us to perform, such as to worship God, to love parents, to punish evildoers, and the observance of these is so necessary for all that without them no merits suffice.
>
> The right of positive justice is what is instituted by men to safeguard utility or uprightness more securely or to extend them, and is based on custom alone or on written authority, for example, the punishments of vengeance or the sentences of judges in the examination of accusations. For with some people there is the custom of duels or of hot iron, but with others the oath is the end of every controversy and every discussion is committed to witnesses. So when we must live with others we must also hold to their institutions which we mentioned, just as we hold to natural rights. (Abelard, *Dialogue of a Philosopher with a Jew and a Christian*, 119–20; italics added)[36]

[34] Cf. Olivecrona 1971, 7–8, with reference to Gagnér 1960, 209, 207 (Sten Gagnér, 1921–2000), where there are mentioned two occurrences from the *Codex* (II, 58, 2 pr. and III, 1, 13 pr.) as well as the equivalent expression, *legem condere* (in *Codex* I, 14, 12, 3). Ullmann (1961, 122ff.) (Walter Ullmann, 1910–1983), points out several places in Justinian's *Novellae* where the expression *legem ponere* occurs.

[35] See Kuttner 1936, 730 (Stephan Kuttner, 1907–1996); cf. Olivecrona 1971, 7–8. On Abelard, see in Volume 6 of this Treatise, Marenbon, Section 11.3.

[36] The English translation quoted is by Pierre J. Payer. Here is the Latin original (in its wider context (enclosed within angle brackets is the original corresponding to the translation in the run of text): "<Oportet autem in his, que ad iustitiam pertinent, non solum naturalis, verum etiam positive iustitie tramitem non excedi. *Ius quippe aliud naturale, aliud positivum dicitur*. Naturale quidem ius est, quod opere complendum esse ipsa, que omnibus naturaliter inest, ratio persuadet et iccirco apud omnes permanet, ut Deum colere, parentes amare, perversos punire, et quorumque observantia ita omnibus est necessaria, ut nulla umquam sine illis merita sufficiant.

Positive autem iustitie illud est, quod ab hominibus institutum ad utilitatem scilicet vel honestatem tutius muniendam vel amplificandam aut sola consuetudine aut scripti nititur auctoritate, utpote pene vindictarum vel in examinandis accusationibus sententie iudiciorum, cum apud alios ritus sit duellorum vel igniti ferri, apud alios autem omnis controversie finis sit iuratum, et testibus omnis discussio committatur. Unde fit, ut, cum quibuscumque vivendum est nobis, eorum quoque instituta, que diximus, sicut et naturalia iura teneamus.> Ipse quoque leges, quas divinas dicitis, vetus scilicet ac novum testamentum, quedam naturalia tradunt precepta, que moralia vocatis, ut diligere Deum vel proximum, non adulterari, non furari, non homicidam fieri; quedam vero quasi positive iustitie sint, que quibusdam ex tempore sunt accomodata, ut circumcisio Iudeis et baptismus vobis et pleraque alia, quorum figuralia vocatis precepta. Romani

Abelard's coinage passed into legal language, and in particular into the language of the canonists (Fassò 2001, vol. 1, 198).

quoque pontifices vel sinodales conventus cotidie nova condunt decreta, vel dispensationes aliquas indulgent, quibus licita prius iam illicita vel e converso fieri autumatis, quasi in eorum potestate Deus posuerit, ut preceptis suis vel permissionibus bona vel mala esse faciant, que prius non erant, et legi nostre possit eorum auctoritas preiudicare. Superest autem nunc, ut post considerationem iustitie ad reliquas duas virtutis species stilum convertamus" (Abelard, *Dialogus inter Philosophum, Iudaeum et Christianum*, 2218–2248, at pages 124–5; italics added).

Part Two

The Reality That Ought to Be: A Monistic Perspective. Norms as Beliefs and as Motives of Behaviour

Ἀμὴν γὰρ λέγω ὑμῖν,
ἐὰν ἔχητε πίστιν ὡς κόκκον σινάπεως,
ἐρεῖτε τῷ ὄρει τούτῳ· μετάβα ἔνθεν ἐκεῖ,
καὶ μεταβήσεται,
καὶ οὐδὲν ἀδυνατήσει ὑμῖν.

For verily I say unto you, If ye have faith as a grain of mustard seed,
ye shall say unto this mountain,
Remove hence to yonder place; and it shall remove;
and nothing shall be impossible unto you.

(Matthew 17:19)

Our beliefs guide our desires and shape our actions. The Assassins, or followers of the Old Man of the Mountain, used to rush into death at his least command, because they believed that obedience to him would insure everlasting felicity. Had they doubted this, they would not have acted as they did. So it is with every belief, according to its degree. The feeling of believing is a more or less sure indication of there being established in our nature some habit which will determine our actions. [...] Belief does not make us act at once, but puts us into such a condition that we shall behave in some certain way, when the occasion arises.

(Charles Sanders Peirce, *The Fixation of Belief*, 1877)

Chapter 5

THE MOTIVES OF HUMAN BEHAVIOUR

5.1. Summary of Part One and Brief Considerations on Some Legal-Philosophical Orientations

Let me reiterate that what I presented in the previous chapters is not my own conception of the reality that ought to be (of what is objectively and what is subjectively right) and of its interaction with the reality that is. I was rather presenting my reconstruction of the conception still current, implicitly or explicitly, in the legal way of thinking in civil-law countries, a way of thinking that has taken shape over the centuries under the influence of natural-law theories first, and of German legal positivism thereafter.[1] German legal-positivist theories in particular, though they deny the existence of any natural law, inherited from natural-law scholarship much of their conceptual apparatus (which took the name of German legal dogmatics), and the legal doctrine of civil law is still proceeding under the lingering influence of this apparatus. Hans Kelsen, the foremost legal theorist of the culture of civil law in the 20th century, sharply criticised some aspects of 19th-century and early 20th-century continental legal dogmatics, yet wound up instead giving us a more effective, compelling, and sophisticated restatement of German legal positivism (see Kelsen 1934, 39ff.; Kelsen 1960, 134–5; Pattaro 1982, XLIIIff.).

The conception underlying the tradition of civil-law legal dogmatics is a sort of dualistic ontology: The reality that is and the reality that ought to be are heterogeneous with respect to each other, but are equally real; law belongs fully to the reality that ought to be. And in fact, we also find (occasionally in Kelsen, for example) the idea that law may be, in the final analysis, the only reality that ought to be, or at least the only dweller in this reality.[2]

[1] Of course we can go back in time. See Section 1.1, footnote 4, and Chapters 11 and 12.

[2] Kelsen calls the reality that ought to be the "Ought in an objective sense" (*Sollen in einem objektiven Sinn*, not to be confused with *Recht in einem objektiven Sinn*, "what is right in an objective sense": see Section 14.5, footnote 19). And he calls "Ought in a subjective sense" (*Sollen in einem subjektiven Sinn*, not to be confused with *Recht in einem subjektiven Sinn*, "what is right in a subjective sense") every other expression of normativeness that is not law. He argues, further, that every subjective sense of Ought—for example, justice—is reducible to the Is, meaning by this the temporary and ephemeral interest or will of individual human beings. It follows from Kelsen's framing of this question that only law resides in the Ought in an objective sense, or, in my words, in the reality that ought to be. This reality transcends the temporariness and randomness of every other expression of normativeness that (individual) humans may exteriorise as expressions of their internalised reality that ought to be. These expressions, it was just noted, get explicitly reduced by Kelsen to individual will and interest, and hence to the Is, to manifestations of the reality that Is. Cf. Kelsen 1989, 4ff.; Kelsen 1991, 2, 26ff. See Pattaro 1982, XLIIff.

The reality that ought to be reproduces itself by its own force in the two dimensions it is made up of (what is objectively and what is subjectively right); it does so depending on the tokens that happen to validly instantiate, in the reality that is, the types specified in what is objectively right in the reality that ought to be (Chapter 3).

Inhabiting what is objectively right in the reality that ought to be are general and abstract norms: These norms are general and abstract because they contain types of circumstance and types of action (which they qualify as obligatory, permitted, or forbidden), and all types (*Tatbestände*) are by definition general and abstract (Sections 2.1.2 and 2.2.1).

By contrast, inhabiting what is subjectively right are obligations and rights, as well as other normative subjective positions, and these get ascribed to subjects (people) in the reality that is. What is subjectively right also belongs to the reality that ought to be, no less so than norms—no less so than what is objectively right. But, in this reality, what is subjectively right occupies the bottom layer, so to speak, which, in contrast to what is objectively right (the top layer), is neither general nor abstract.

What is objectively right and what is subjectively right belong equally to the reality that ought to be, but only what is subjectively right can be said to be, in a sense, individual and concrete, since it is necessarily linked—by way of the legal pineal gland: by way of legal validity—to the reality that is. Indeed, obligations, rights, and other normative subjective positions get ascribed to subjects (people) who live in the reality that is, and these are actual and hence individual and concrete subjects.

Further, the obligations and rights that people have under the law are bound up together; they interlace in a web of legal relations: These, too, belong to what is subjectively right (in the reality that ought to be), and likewise get ascribed to individual and concrete subjects (people) who live in the reality that is. Those subjects to whom obligations get ascribed are duty-holders; and those subjects to whom rights get ascribed are right-holders. As human beings, duty-holders and right-holders live in the reality that is, but as duty-holders and right-holders they hold obligations and rights stationed in the reality that ought to be: in what, in this reality, is subjectively right.

Philosophy of law and general jurisprudence, in civil-law and common-law countries alike, have reacted in different ways to the reifying ontology underlying the legal-dogmatic tradition of continental Europe (the doctrine of which I provided an ideal reconstruction in the four chapters leading up to here, bringing out some of its crucial aspects and criticising some of its specific assumptions).

To begin with, there have been, and there still are, large tracts of legal and legal-philosophical thought that merely tolerate, or yield to, the hypostatising ontology (reification) of this conception, a conception that, it bears pointing out, affords or can afford theoretical and practical advantages (see, in Volume

5 of this Treatise, Sartor, Section 3.3). One place where we can see this passive tolerance or acceptance is in the properly legal-dogmatic work of outstanding jurists looking to attain not so much critical metatheoretical objectives as practical-theoretical objectives that consist in reconstructing legal institutes or in dealing with the problems that come up in the interpretation of legal texts. Among the Italian jurists who pursue this line is Francesco Carnelutti (1879–1965) (see Carnelutti 1951).

Second, something along these lines can also be found in philosophers of law and jurisprudents who follow in the tradition of analytical philosophy and hence adopt and practise rigorous and critical methods and approaches. These scholars simply consider obsolete the normativistic conception of law, a conception rife with reifications, and, leaving it entirely out of account, treat the problems of normativeness critically but from a language-analysis standpoint, thereby not ascribing any normative valence to the concepts of "norm," "ought," "binding force," and "validity," and—in the final analysis—ignoring as unworthy of attention the normative and deontological valence attributed to these concepts by other scholars, likewise philosophers or theorists of law, whom we might call traditionalist. The analytically oriented scholars I am thinking about seem to be of a mind to entrust to the sociology of law and to ethics the task of figuring out normativeness in the sense just explained. Among the Italian scholars who manifest this attitude is Riccardo Guastini (see, for example, Guastini 1998 and 2004).

Third, there have been, and there still are, scholars in legal philosophy and general jurisprudence (some of them scholars of great value) who have explicitly theorised a reifying ontology with regard to law, norms, and the Ought versus the Is. One valid token of this type of scholar is Georges Kalinowski (1916–2004) (cf. Kalinowski 1965 and 1969).

Fourth, there have been, and there still are, scholars who cannot be understood as advocating a hypostatising ontological view, but who have theorised a dualism that might be qualified as transcendental or phenomenological, or in any of a number of other ways. Among the scholars who have put forward conceptions that fit this description are some exponents of contemporary natural-law theory (broadly understood) as well as of German legal positivism: Witness Sergio Cotta (2004), in natural-law theory in Italy, and Hans Kelsen, the foremost champion of this dualism in German legal positivism.

Fifth, we have orientations of thought that I would call empiricist-reductionist. The analytical jurisprudence that traces back to Bentham and Austin is emblematic in this respect, for it seeks to reduce the concept of an obligation to that of a threat of punishment, the concept of a norm to that of a command issued by those endowed with the actual power to obtain obedience in society, and the concept of law to that of a set of such commands.

Sixth, but not least important in rank, we have monistic orientations that are non-reductionist: The exponents of these orientations do not admit of any

dualism between the reality that ought to be and the reality that is, and in particular they do not admit of a reality that ought to be that is heterogeneous to the reality that is at the same time as it enjoys an ontological status on a par with the reality that is. But they also maintain that it is impossible, or at least inadequate, to give an account of law (or of morals or religion—of the practical sphere, in short) without recognising that normativeness strictly understood (in a Kantian or a Stoic sense, to make two familiar examples) plays a fundamental role in individual lives as well as in the life of society. Among these orientations of thought we have Scandinavian legal realism. These orientations do not understand normativeness in a Kantian or a Stoic sense, to be sure, but in their view we can appreciate, through a psychological and sociological account, that normativeness strictly understood (duty for its own sake) acts as a driving force in the minds (brains) and behaviours of human beings—in their social interaction, in their forms of social exchange—and is a crucial, indeed an essential element without which group life would not be a possibility.[3]

The legal philosophy I myself am putting forward can be understood as falling within the last of the orientations mentioned. In the second and third parts of the present volume I will expound a conception of norms (of the reality that ought to be) and of law worked out from within the legal-philosophical framework just referred to. In particular, I will look at norms and legal systems as part of the broader phenomenon of culture and human personality; and norms—herein lies their crucial importance—I will consider in a strict and strong sense as a powerful motive of human behaviour, a basic structural component of the individual and social identity of every man and woman. In what follows I will discuss motives of behaviour (Sections 5.2 through 5.4), with a special focus on norms (in Chapters 6 and 7). I will thereafter occupy myself with law as interference in the motives of human behaviour. I will discuss law in its necessary and important connection and interweaving with normativeness (Chapter 8 and Section 9.6) and with power and influence (Sections 9.4 and 9.5); and there is also, in some cases, a connection with suggestion and charisma (Section 9.3). In treating the law's linkage with motives of human behaviour (with norms, needs, interests, and values), I will have something to say on a classical topic of contemporary jurisprudence, namely, law and language, especially with regard to the distinction between norms (as intrapsychic motives of behaviour) and directives (as linguistic communicative phenomena), a distinction that needs emphasis (Sections 8.1.3, 8.2.3, and 9.2). Finally, in Chapter 10 the law in force is presented as an ambiguous intertwining of normativeness and organised power.

[3] See the works of Axel Hägerström, Karl Olivecrona, and Alf Ross referred to in Chapters 8 and 10.

5.2. Encoding of Behaviour-Types: Human Personality and Culture

I will understand a behaviour-type as a set of one or more types of action conditionally connected with one or more types of circumstance. Actual behaviours are behaviour-tokens, meaning examples or instances of behaviour-types. It may be that a given type of action is connected with different conditioning types of circumstance (the concept of type was introduced in Section 2.1).

A type of action can get more or less deeply and more or less consciously encoded by an acting person, who either inherits it with his or her genetic code (witness the type "suction" in babies) or acquires it by interacting with and adjusting to his or her environment and fellow beings. Or again, and this is more likely to be the case, the acting person develops the type of action by means of both innate factors and acquired factors.

Depending on the instantiated type of circumstance, an acting person performs one type of action rather than another, provided that he or she has a reason, or rather a motive, for acting accordingly (see Section 5.4).

Like the type of action performed, its relevant type of circumstance gets more or less deeply and more or less consciously encoded by the acting person, who in fact usually memorises the former as conditionally connected with the latter, and the two as parts of a whole (the whole being a compound type). A close analysis would be useful (though not here and now) that will take us deeper into the relation between the current concepts of "personality" (defined below) and "memorisation" (as referred to here), on the one hand, and the concept of "background" as offered by Searle (1995), on the other.

Human personality includes memorised types, among which behaviour types. Indeed human personality is a

> relatively stable and organised system, structure, or complex of intra-psychical components, such as perceptive and cognitive modalities, need patterns, affective ties, motivational drives, and attitudes that develop in individuals as their biological endowment interacts [...] with their biographical experiences, with the social systems they are situated in, and with the culture they are exposed to. It is usually the case that some personality components are absent from the individual's consciousness, that is to say, they operate at an unconscious or semi-conscious level. So conceived, personality is a structure that predisposes individuals to act and react in certain ways [*by performing certain types of action*] depending on the situation they find themselves in [*depending on the type of circumstance that gets instantiated*]. (Gallino 2000, s.v. "Personalità," 482; my translation)

In an acting subject's personality, the genotype is usually distinguished from the phenotype. The genotype is

> the whole set of sub-chromosomal particles—called genes—that have self-reproductive functions in living organisms, and which a living organism inherits from its parents together with the mutations that may have taken place during hereditary transmission. (Gallino 2000, s.v. "Genotipo e Fenotipo," 318; my translation)

The phenotype is the whole set of

> characteristics that a living organism displays at a certain point in its lifecycle. (Ibid., my translation)

The phenotype is not just the acquired component of personality: It is the outward personality

> an individual actually displays as the outgrowth of the additive or interactive relation or covariance that holds between this person's genetic makeup or genotype and the environment or environments where he or she has developed up to that moment. (Ibid., my translation)[4]

As I would put it, the phenotype is a genotype in which culture has been injected, as it were, or in which a given culture (one or more cultural environments) has been memorised, and in several respects internalised. Of course memorisation and internalisation are long processes, and may even take a lifetime for certain things. I distinguish "internalisation" from "memorisation" and relate the former to beliefs, and to other components of human personality that can be analytically identified as motives of human behaviour (see Section 5.4).

Culture includes types that are constructed by humans. Manmade reality takes in natural (physical and chemical) reality to the extent that this last gets constructed by humans, that is, framed in types belonging to human culture and personality; manmade reality also takes in social reality, but this reality is, so to speak, entirely constructed by humans (see Sections 15.2 and 15.5). In the above acceptation, culture

> represents the *social reality* on a particular level, a level interdependent with that of interaction (the level of the social system), on the one hand, and with the level of personality, on the other, but analytically independent from them. (Gallino 2000, s.v. "Cultura," 185; my translation; italics added)

5.3. The Conditional Connection between Types of Action and Types of Circumstance. Habits and Practices

A behaviour-type, whether encoded, or memorised, in human brains or described elsewhere, is a compound type comprising at least two types (in turn susceptible of being compound or simple): a type of action and a relevant

[4] There are other definitions out there: They vary slightly in the details, but these differences need not be discussed for the purposes of this volume. Thus, for example, we have a definition of genotype as "the genetic constitution of an organism. The genotype determines the hereditary potentials and limitations of an individual from embryonic formation through adulthood. Among organisms that reproduce sexually, an individual's genotype comprises the entire complex of genes inherited from both parents" (*The New Encyclopaedia Britannica*, s.v. "Genotype"). The phenotype is the sum of "all the observable characteristics of an organism, such as shape, size, colour, and behaviour, that result from the interaction of its genotype (total genetic inheritance) with the environment" (*The New Encyclopaedia Britannica*, s.v. "Phenotype").

conditioning type of circumstance. A behaviour-type results from one or more types of action conditionally connected, in a human brain or in any description, with one or more types of circumstance. We may have a given type of action connected with different conditioning types of circumstance alternative to one another. Or we may have simple types of circumstance common to all the alternative compound types of circumstance a given type of action is connected with.

A type of circumstance is relevant in several respects. Thus, for example, "walking" (type of action) "on hot coals" (type of circumstance) is different, with respect to the type of circumstance, from "walking" (type of action) "on velvet" (type of circumstance). Again, the type of action "walking" cannot be performed when connected with a type of circumstance that makes it impossible to be standing on one's feet: You cannot walk on any bank that is at or above ninety degrees, or on water (making allowance for outstanding exceptions: "So when they had rowed about five and twenty or thirty furlongs, they see Jesus walking on the sea, and drawing nigh unto the ship: and they were afraid"; John 6:19).

This kind of relevance—pertaining to the type of circumstance—we can see pointed up, when it comes to law, in the Latin dictum *Nemo ad impossibilia tenetur* ("Nobody is bound to do what cannot possibly be done"), and also in Celsus's (1st–2nd century) version, *Impossibilium nulla obligatio est* ("There is no obligation to do anything which is impossible") (Celsus, *The Digest of Justinian*, vol. 2, L, 17, 185).

A conditioning type of circumstance can itself be a behaviour-type, or another event-type (a period-type, for example: This type will get validly instantiated by time periods) or a type of state of affairs. Let us assume, for example, that the type of circumstance "being in danger" is a condition for the type of action "calling for help": Being in danger can be the outcome of either a state of affairs (for example, my home being on fire) or a behaviour (for example, an armed criminal chasing me).

From the assumption previously made that a behaviour-type is necessarily compound (it is composed of at least one type of action and one type of circumstance) it follows that a congruent or valid token of a behaviour-type will be a valid performance of the type of action (which in the behaviour-type is conditionally connected with the type of circumstance) only if a token of the relevant type of circumstance has congruently or validly occurred.

It is important not to mistake a type of circumstance, which a type of action is conditionally connected with, for the motive (cause or reason) that prompts a person to perform that type of action when a relevant type of circumstance gets instantiated.

As a fencer, for example, I will perform a certain defensive move (type of action) when my opponent attacks me in a certain way (my opponent's attack being a token of a certain type of circumstance). It does not follow from this,

however, that I will defend myself, or do so with the same defensive move, every time an opponent attacks me in the way specified.

I will only defend myself, or defend myself with that defensive move, if some motive prompts me to do so: I may, for example, want to win the match, in which case I will perform the type of action appropriate to the type of circumstance instantiated by my opponent. But I will not always be motivated to defend myself, or to defend myself appropriately, and may in fact want to avoid that: which, for example, might be the case if I am training and want to let my opponent have the pleasure of a successful lunge, or if I have accepted money for a fixed match.

In such cases I will not perform the above-mentioned type of action, despite the relevant type of circumstance having been instantiated by my opponent: For lack of motive, I will not perform the type of action.

In other words, the instantiation of a type of circumstance is a sufficient condition for an acting person to perform a type of action connected with it, but only if a motive for performing this type of action subsists that prompts the acting person to act.

Let me introduce the term *usus agendi*: This is a legal term sourced from medieval Latin; I will use it to also introduce "custom" (Sections 6.1 and 6.6). A *usus agendi* (a habit or practice) is the consistent and uniform performing of a given type of action whenever a certain type of circumstance gets instantiated. With *usus agendi* (habit or practice), one can metaphorically speak of a law of inertia, but only so long as the acting subject's motives do not change. The acting person performs the type of action that he or she usually performs whenever a certain type of circumstance gets validly instantiated, unless new motives intervene that modify the course of his or her usual behaviour.

I will assume that a habit is individual whereas a practice is collective.

5.4. Needs, Interests, Values, and Norms

In current English a motive is usually taken to be a reason for a certain course of action, whether conscious or inconscious; a reason, in turn, is understood as a cause of or motive for a belief, action, etc. "Reason" is usually preferred for referring to the cause behind an action; still, I prefer "motive," for it prevents possible allusion to *rational* motives of behaviour. Indeed a cause for acting need not be rational: It can be nonrational or even irrational, and yet be very efficacious as a motive of action. Which does not prevent a motive of action, such as an interest or a norm, from being a reason, too, meaning a *rational* motive for acting in a certain way.[5]

[5] I would rather speak of motives of behaviour than of reasons for behaving this way or that. To better appreciate this preference of mine the reader can refer to Raz 1999, 18ff., where Raz explains why he would rather speak of reasons of action than of motives of action. In sum,

Motives of behaviour are the causes (*causae agendi*) that prompt a living organism to perform a certain type of action whenever a relevant type of circumstance gets validly instantiated. The motives of human behaviour lie in the acting subject's personality (which see Sections 5.2, 15.2.5 and 15.3) and may be summed up as follows.

(*i*) The acting person's needs, or what this person *believes* his or her needs to be (*opiniones necessitatis*).[6] Any action this person carries out to satisfy a need of his or hers is *teleologically* oriented. Need is

> the absence of certain material or immaterial resources objectively or *subjectively* [*this is where belief steps in*] necessary to a given (individual or collective) subject whose aim is to achieve a state of greater wellbeing, efficiency, or functionality—or of less uneasiness, inefficiency, or dysfunctionality—relative to his or her present state. (Gallino 2000, s.v. "Bisogno," 72–3; my translation; italics added)

The italics and especially the annotations in square brackets are meant to show where and how the belief-component makes its way, at least implicitly, into the standard sociological notion of "need."

(*ii*) The acting person's interests, or what this person *believes* his or her interests to be (*opiniones utilitatis*). Any action this person carries out to serve an interest of his or hers is *teleologically* oriented. Interest is a

> complex inclination, attitude, or disposition an individual or a collective subject assumes in relation to an object or state of affairs whose achievement, realisation, or preservation the subject *judges* [*this is where belief steps in*] to likely improve or protect his or her situation, which disposition is assumed upon *evaluating* how this situation compares in relation to that of other subjects [...] and also upon evaluating whether it can spontaneously change in the future. Such a disposition includes (a) the subject *focussing his or her attention* on specific objects or states,

Raz prefers "reasons of action" because he sets up his research in terms of what had best be done or what one ought to do; it follows that a motive of behaviour can be, and often is, a belief, but a belief can be mistaken or incongruent with what had best be done or what ought to be done. Thus, for example, if I am coming to pay you a visit because I believe that you are at home, but you are not actually there, the motive of my behaviour is my belief, but because my belief was wrong I had no reason to come and pay you a visit. As Raz observes, reasons serve, among other things, to justify a behaviour, whereas motives serve, among other things, to explain a behaviour. Now, Raz is concerned with reasons that justify behaviours; I, instead, am concerned with the motives that cause and explain behaviours: I am concerned with *causae agendi*. Indeed, I am interested here in clarifying and explaining the causal factors that will account for the "enduring and settled" character of law, or, as I say, of the "law in force" (Chapter 10). (It is a different question whether these causal factors are necessary, sufficient, concurrent, complementary, or overlapping factors.)

[6] I indulge here and in what follows in disquisitions on certain Latin expressions connected with *opinio*, because there hinges on this term the definition of *legal custom* as handed down to us over the course of the centuries. Cf. Section 6.1.

either present or possible; (b) the subject more or less consciously and rationally *choosing* an object or state and not others; and (c) the subject's *intention* or *impulse* to take action aimed at acquiring the object or at realising (or preserving) his or her favoured state of affairs. (Gallino 2000, s.v. "Interesse," 381–2; my translation; italics added)

The italics and the annotations in square brackets are meant to show where and how the belief-component makes its way into the standard sociological notion of "interest."

(*iii*) The acting person's values, the values the acting person *believes* in (*opiniones boni*). Any action this person carries out to give effect to a value of his or hers is *teleologically* oriented. Value is the

conception of a state or condition (one's own condition or someone else's) or of oneself in relation to other objects or subjects, which can include nature and supernatural beings. This state or condition is *viewed* [*this is where belief steps in*] by an individual or a collective subject as especially desirable [or as an end in itself, that is, as desirable per se] or as something that must be achieved or preserved, and it becomes the basis on which the individual *assesses* the appropriateness, adequacy, efficacy, and dignity of his or her own actions and of the actions of others. (Gallino 2000, s.v. "Valore sociale," 708; my translation; italics added)

The italics and the annotations in square brackets are intended to draw the reader's attention to the role of the belief-component in the notion at hand.

(*iv*) The acting person's norms, the norms the acting person *believes* in (*opiniones vinculi*). Any action this person carries out to abide by a norm of his or hers is *deontologically* oriented. This feature of norms—their being deontologically oriented—makes them peculiar motives, at least in comparison with the other motives just defined.

A norm is the belief that a certain type of action must be performed anytime a relevant type of circumstance gets validly instantiated. This must unconditionally be so, that is, regardless of any good or bad consequences that may stem from the performance in question (I will come back to norms in the following chapters).

Different motives of the same kind (e.g., different needs) or of different kinds (e.g., a need and a norm) can concur in bringing about a certain token of a certain type of action (when a certain type of circumstance gets validly instantiated), or they can conflict and lead a person to perform one action rather than another. In this connection, we can distinguish the efficaciousness from the inefficaciousness of a motive as the cause explaining why a certain type of action has been performed, and compare such efficaciousness or inefficaciousness with that of other causes which may have concurred in drawing out the action in question or intervened to thwart it (on the efficaciousness of norms as motives of behaviour, see Section 6.6).

Let us return now briefly to the relationship between motives of behaviour and beliefs.

Physiological needs (nutritional, evacuative, and sexual needs, for example) are rooted in the organism's biochemical makeup—in the acting person's genotype. At the phenotypical level, however, these needs may well differ from one person to another: They are satisfied and controlled in different ways depending on the habits and beliefs an individual has acquired through socialisation processes (they depend, therefore, on the culture the individual participates in). For this reason, I speak generally of needs, including physiological needs, as *opiniones necessitatis*: beliefs about one's own needs. We act based not only on reality as it is (on the brute reality of our needs), but also, and sometimes for the most part, on what *we believe* to be the reality of our needs (on what we believe our needs to consist in). Some needs will have to be specifically understood as beliefs, and that is the case with social needs, such as the need for affection, trust, recognition, and prestige. Indeed, social needs, more so than physiological needs, manifest themselves differently in different cultures.

Interests, and to a greater extent values and norms, are rooted in the acting person's phenotypical level, much more so than needs: At first they are acquired by assimilation and internalisation from the cultural environment through processes of social interaction and of primary and secondary socialisation (see Section 15.2.5); and then they may evolve through personal revision.

I submit that motives for acting are socially constructed cultural realities (or at least they are so in large part). By this I mean that needs (or at least social needs), interests, values, and norms are "posited" by the beliefs of individuals, whose personalities are in turn shaped by the social construction of reality: by the *soziale Schaffung der Wirklichkeit* that phenomenological sociology, symbolic interactionism, interpretive sociology, and ethnomethodology have brought to the forefront of research on human behaviour.

Among the many definitions of "belief" that have been formulated in the history of thought, I should like to recall the following, each of which has specific advantages that I will point out before introducing it, or that I will italicise for emphasis in the quotations.

Edmund Husserl (1859–1938) qualifies as *doxisch* or "belief characteristic" the characteristics specific to belief, and as *thetisch* the commitment proper to a belief, in that each belief posits the reality of its object:[7]

As noetic characteristics related to correlative modes of being—"*doxic*" or "*belief-characteristics*" [*doxische*]—we find perceptual belief and, sometimes, to be sure, perceptual certainty, really inherently included in intuitive objectivations, e.g., in those of normal perceptions as "attentive perceptions;" corresponding to <perceptual certainty> as its noematic correlate belonging to the appearing object is the being-characteristic: "*actual.*" The same noetic or noematic

[7] *Doxisch* comes from Greek *doxa*, meaning "opinion"; and *thetisch* comes from the Greek verb *tithemi*, meaning "to posit."

characteristic is shown by "certain" representation, by every sort of "*sure*" mindfulness of something which was, or is now, or which will be in the future (as in the case of anticipated expectation). They are *being*-"*positing*," "*positional*" [*thetische*] acts. (Husserl 1982, 249–50)[8]

Among Husserl's contemporaries, we should not fail to mention Charles Sanders Peirce, whose words can hardly be underestimated, so balefully topical are they:

Our beliefs guide our desires and shape our actions. The Assassins, or followers of the Old Man of the Mountain, used to rush into death at his least command, because they believed that obedience to him would insure everlasting felicity. Had they doubted this, they would not have acted as they did. So it is with every belief, according to its degree. The feeling of believing is a more or less sure indication of there being established, in our nature some habit which will determine our actions. [...] *Belief does not make us act at once, but puts us into such a condition that we shall behave in some certain way* [type of action], *when the occasion arises* [type of circumstance]. (Peirce 1998, 5.371–5.373, on pages 230–1; italics added)

More than a century before the two authors just recalled, David Hume (1711–1776) had given us a clear-cut description of belief as "something felt by the mind, which distinguishes the ideas of the judgement from the fictions of the imagination." Belief provides ideas with "more weight and influence; makes them appear of greater importance; enforces them in the mind" as "*the governing principle of our actions*." Belief "lies in some sentiment or feeling […] which *depends not on the will*, nor can be commanded at pleasure"(Hume 1957, § V, 2; italics added).

In our day, the concept of belief has been used quite interestingly by Searle and others who have dealt with the ontology of institutional reality (Searle 1995).[9]

In sum, a belief is our commitment and adhesion to an idea, and so also the trust we place in this idea by our acceptance or rejection of it: A belief is the internalisation of an idea. For example, the atheist's conviction that God does not exist is as much a belief as the believer's conviction that God does exist. Which of these beliefs is true is a different issue. Both will affect the way the individuals who believe in them behave.

[8] The German original: "Noetische, auf Seinsmodi korrelativ bezügliche Charaktere—'*doxische*' oder '*Glaubens*-charaktere'—sind bei den anschaulichen Vorstellungen z.B. der in der normalen Wahrnehmung als 'Gewahrung' reell beschlossene Wahrnehmungsglaube und, des näheren, etwa die Wahrnehmungsgewißheit; ihr entspricht als noematisches Korrelat am erscheinenden 'Objekt' der Seinscharakter, der des 'wirklich.' Denselben noetischen, bzw. noematischen Charakter zeigt die 'gewisse' Wiedervergegenwärtigung, die '*sichere*' Erinnerung jeder Art an Gewesenes, an jetzt Seiendes, an künftig sein Werdendes (so in der vorerinnernden Erwartung). Es sind Seins-'*setzende*' Akte, '*thetische*'" (Husserl 1976, 239).

Chapter 6

NORMS AS BELIEFS

6.1. The Concepts of Norm and Custom

As was anticipated in Chapter 5, a norm is, on my view, a motive of behaviour: It is the belief (*opinio vinculi*) that a certain type of action must be performed, in the normative sense of this word, anytime a relevant type of circumstance gets validly instantiated. This must unconditionally be so, regardless of any good or bad consequences that may stem from the performance in question. My concept of norm is *deontologically* oriented. It presupposes that the believer consciously or unconsciously ascribes a normative character to the deontic modalities (obligatory, permitted, and forbidden) set forth in the norms he or she believes in: What this person believes to be objectively right is the type of action qualified as obligatory, permitted, or forbidden in the norm under the conditions specified in the type of circumstance the type of action is connected with in the norm.[1]

I might also say that norms are rules or standards conceived or experienced as binding per se (and in this sense my concept of norm is deontologically oriented). Rules or standards that are not conceived or experienced as binding per se are not norms: They are rather, broadly speaking, rules or standards of prudence. Thus, rules or standards will be norms depending on the attitude or beliefs of the person who takes them into consideration: They will be norms if held to be binding per se; otherwise they will be, in a broad sense, rules or standards of prudence.

The concept of "rule of prudence" is, unlike the concept of "norm," *teleologically* oriented (cf. Kant 1913, B 834). Since rules or standards of prudence are teleologically oriented, we can determine their rationality: We can assess the adequacy of the means dictated by the rule in order that we may reach the end the rule refers to. Not so with norms the way I characterise them. Norms are deontologically oriented and so are independent of ends. As motives of behaviour, norms drive us to hold a behaviour regardless of any ends we may have and of the consequences the same behaviour may lead to.[2]

[1] Deontic modalities are standardly taken to be interdefinable; I will therefore confine myself—in the *definiens* of my characterisation of "norm"—to setting down the expression "*ought* to be (or must be) performed."

[2] As I said in Section 5.4, I would rather speak of motives of behaviour than of reasons for behaving one way or another, this to underscore that rationality does not necessarily characterise motives of behaviour. This, I believe, is especially true in the case of norms. A cognitive model for the adoption of normative beliefs is developed in Volume 5 of this Treatise, Sartor, Chapters 9 and 10.

It suffices, for a type of behaviour to be a norm, that at least one person believes it to be a norm. However, the norms of greatest interest to us here are, of course, the norms shared by a plurality of people making up a group or a society. It will of course be for empirical enquiry to go and see—in a given group or society—which types of behaviour and which rules or standards are believed to be norms and by whom and how widely.

Let me now use "norm" to introduce "custom."

If the motive for performing a type of action consistently and uniformly—the motive behind a habit or practice—is the belief that performing this type of action will be due per se (*opinio vinculi*) every time a given relevant type of circumstance gets validly instantiated,[3] then the habit or practice we have before us is a custom. Custom, as I characterise it, is a habit or practice (a *usus agendi*: see Section 5.3) whose motive is a norm.

Where legal customs are concerned, the *opinio vinculi* (or norm) is traditionally referred to as *opinio* (belief) *juris seu (atque) necessitatis*. The Latin noun *jus*—just like German *Recht*, French *droit*, etc.—means (not only "law" but also) "what is right" (cf. Section 1.3, and especially Sections 13.1, 13.2, and 13.7), so that *opinio juris* may be translated as "the belief that it is right" to perform a certain type of action whenever a certain type of circumstance gets validly instantiated.

6.2. The Existence of a Norm Presupposes at Least One Believer (Doxia)

A norm, like any other belief, cannot be internalised except in someone's mind, so it exists qua norm only in minds (or in brains, if we so choose to express ourselves). A rule or a standard that no one believes to be binding per se is not a norm in the sense I ascribe to this term. The existence of a norm is the existence of a belief **n** in a believer *b* who considers the performance of a certain type of action to be due per se when a relevant conditioning type of circumstance is validly instantiated. Hence the existence of a norm presupposes that at least one person believes it to be binding per se (namely, per se obligatory, permitted, or forbidden) that a certain type of action be performed anytime that a relevant type of circumstance gets validly instantiated. No norm can exist without belief, so if something is a norm there must be at least one subject in whom it is a belief.

This view will not find favour with those who assume that there are norms independently of anyone believing in them. Still, it is obvious that even if there were something like a per se binding norm, this something would not and could

[3] Even with custom I may without inconsistency call "validly instantiated" the tokens of the type of circumstance a type of action is conditionally connected with. This is so because my characterisation of validity as congruence with a type holds no matter where this type is set forth, and so even if the type is not set forth in any enacted law.

not be a motive of human behaviour if no one believed it to be binding per se: Even if one assumes that norms exist apart from anyone believing them to be binding per se, this person will have to acknowledge that there is no point in taking norms to be motives of human behaviour if no one believes in them. If one assumes not only that there are norms per se binding, but also that he or she knows at least one such norm, this person will by his or her own assumptions meet the requirement for treating this norm as a motive of human behaviour.

The expressions "believer in a norm" and "believer in **n**" will be used frequently in this volume and must be handled with care. They presuppose the point of view of "believers," of those people who—because they believe the performance of a certain type of action to be binding per se anytime a relevant type of circumstance gets validly instantiated—are said to believe in a norm in the following sense: They believe that whatever it is that makes the relevant type of action binding *per se*, this thing is independent of anybody's beliefs. But in the terminology introduced in this work, the word "norm" is properly applied only to the relevant psychological states of the people here referred to as "believers," so that these people should rather be described as "holders of" a norm than as "believers in" a norm. That is so, of course, because they will not usually equate a norm they believe in with one of their own psychological states.

Philosophically sophisticated believers will gesture to some spiritual or ideal entity of sorts. But even naive believers will typically refuse to reduce to mere psychological states the norms they believe in. As for me, since I *do* equate the norms I happen to "believe" in with my own psychological states, I am convinced that these norms will cease to exist when I will.[4]

This, however, does not prevent me from sincerely believing it to be binding *per se* that the types of action (rules or standards) involved in the norms I believe in be performed anytime the relevant type of circumstance gets validly instantiated. I cannot declare belief-independent the norms I believe in, as do naive believers and philosophers more metaphysically oriented than I am; still, I regard these norms as norms that are not at my disposal in the crucial sense that it is not (psychologically) in my power to modify at will the norms I believe in.

We should notice, having identified norms with certain psychological states of individuals—with their normative beliefs—that it proves convenient to apply the term "norm" not only to individual beliefs, but also to such normative beliefs as are shared by different individuals. This is so because numerically different beliefs of numerically different individuals will often have the same content. And just as it seems natural to say that numerically different

[4] Which of course does not mean that I could not be survived by many people who will continue to believe in the same norms I believe in, meaning that they will continue to hold beliefs that are generically identical to (have the same content as) the ones I happen to hold.

beliefs having the same content are in a sense the same belief, so it seems natural to say that numerically different norms having the same deontic content are in a sense the same norm.

I use the term "norm" to refer to a deontic propositional content believed by at least one person to be normative: I will say that a deontic propositional content is a norm (and hence that a norm exists) when this content is believed by at least one person. This person is a believer in the norm. The believers in a norm have a particular psychological state which I characterise as a norm, or normative belief. Let me reiterate: People who believe in a norm (and so have a normative belief) may view what they believe in (the deontic propositional content they believe to be normative) as having a non-empirical existence, namely, an existence independent of anybody's beliefs. This idea is misguided, I submit: Normative deontic propositional contents do not designate any non-empirical reality, nor do they have any independent reality of their own. The only way a normative deontic propositional content can exist is by being believed to be normative—by being a norm in the sense previously indicated.

I shall call "doxia" the existence of a norm **n** in a subject *s* who is a believer *b* in **n**. Doxia is the internalisation of **n** by an *s* who is thereby a *b* in **n**.

With regard to a belief in a norm, some prefer to say "acceptance" rather than "internalisation." (A case in point is Hart: He does so especially in reference to officials, saying that they "accept" rules of recognition, or norms, in my terminology; Section 8.1)[5] Still, I prefer "internalisation," for consider: A believer *b* requires a given behaviour of me because *b* has internalised a norm **n** under which I must perform that behaviour; I, on the other hand, am not a believer in **n** (I have *not internalised* **n**), and yet *accept* to act in accordance with **n**, because I think it is in my best interest to do so in order to avoid a given punishment, for example. Further, an internalisation will not always be conscious, or determined by reasoning; it is rather often unconscious and determined by the emotions. "Acceptance," on my understanding, currently carries a different range of meanings and presupposes, more so than "internalisation," that a conscious rational calculus stands behind it.

I shall call "adoxia" the nonexistence of a norm **n** in a subject *s* who is a nonbeliever *nonb* in **n**. Adoxia is the non-internalisation of **n** by an *s* who is thereby a *nonb* in **n**.[6]

[5] Cf. Hart 1961, 97–9, 107, and Hart 1997, *Postscript*, 250, 255. See also, in Volume 5 of this Treatise, Sartor, Chapter 10.

[6] The terms "doxia" and "adoxia" are coinages based on ancient Greek *doxa*, meaning "opinion": Aristotle holds that a *doxa* entails a *pistis*, that is, a belief. It was his view that opinion (*doxa*) implies belief (*pistis*), because no one can have an opinion without also believing it true (Aristotle, *On the Soul*, 428a, 20). Aquinas, following Augustine, claimed that believing is thinking with assent (*credere est cum assensione cogitare*), a claim he made, along with a series of qualifications, in treating of faith as a theological virtue (cf. Aquinas, *Summa Theologiae* (a), 2.2, q. 2, a. 1).

The distinction should be noted between the person *b*, who is a believer in a norm **n**; the person *d*, who is believed to be an actual duty-holder under **n**; and the person *r*, who is believed to be an actual right-holder under **n**. Consider, for example, the norm "The well-off must aid the needy": A well-off person who believes in this norm will be at the same time a believer *b* in **n** and an actual duty-holder *d* under **n**. This, however, will not always be the case. Indeed, any *b* in **n** who is not well-off will not at the same time be a *d* under **n**; and any *d* under **n** who is not a *b* in **n** is tautologically and necessarily a *d* under **n**—although he or she is a nonbeliever in **n**—in the view of those who are believers in **n**.[7]

Hence, a believer *b*, a person in whom a norm **n** exists (doxia), may or may not be a duty-holder or a right-holder, or a combination of the two, under the norm **n**. Likewise, a nonbeliever *nonb*, a person in whom a norm **n** does not exist (adoxia), may or may not be a duty-holder or a right-holder, or a combination of the two, under the norm **n** (cf. Section 10.2.3).

6.3. The Conditionality of the Content of a Norm: The Type of Action and the Type of Circumstance. More on What Is Objectively Right

The content of a norm is compound: It is a compound type, composed of at least one conditioning type of circumstance and one type of action conditionally connected with it. The type of action is qualified as obligatory, permitted, or forbidden and will as such be believed to be binding per se (what is objectively right) if the type of circumstance gets (validly, congruently) instantiated.

To appreciate the importance of the type of circumstance relative to the type of action conditionally connected therewith in the content of a norm, consider that the type of action will be believed to be binding per se (as obligatory, permitted, or forbidden: what is objectively right) *only if* the type of circumstance gets validly instantiated. In the result, what is objectively right can in a sense be said to depend, as what is objectively right, on the type of circumstance.

Recall the previous example of a norm **n**, "The well-off must aid the needy." Here:

(*i*) "The well-off [...] the needy" is the description of the type of circumstance, and in particular of the possible duty-holders and right-holders;

(*ii*) while "aiding" is the description of the type of action that at least one believer believes to be binding per se (in this case, obligatory) upon the well-off (the duty-holders), and whose performance the same believers believe to be a right of the needy (right-holders).

[7] I shall use the letters '*d*' and '*r*' enclosed within single quotation marks to refer to possible duty-holders and right-holders and the letters *d* and *r* without quotation marks to refer to actual duty- and right-holders under the type of circumstance described in a norm **n**. The same holds in other cases; for example, '*s*' stands for a possible subject and *s* for an actual subject.

With the norm **n**, the conditioning type of circumstance is given an extremely simple description: It is described only with reference to possible duty-holders '*d*' and possible right-holders '*r*'. This simplicity raises no problems when the conditioning type of circumstance is itself simple, so that its description, however simple, is exhaustive, as is the case with norm **n**. But in many cases, and especially in the law, the content of a norm is scattered in several different texts each of which describes only in part the norm's content, and this is particularly true of the conditioning type of circumstance. A complete description of a conditioning type of circumstance needs to state all the conditions the type of action is connected with.

Suppose the well-off are believed under **n** to be bound to aid the needy unless the well-off are in failing health: This exception will have to be included in the relevant type of circumstance conditioning the type of action described in **n**—the type "aiding"—which, on my characterisation of norms, is binding per se (what is objectively right: This type will be normatively obligatory, permitted, or forbidden; here, obligatory) every time the conditioning type of circumstance gets validly and hence fully instantiated (of course this requires that the type of circumstance be exhaustively described).

It is one of the jurist's chief tasks to reconstruct exhaustively a norm's relevant type of circumstance, to make it complete for each case in which the norm's type of action is called into play as conditioned by the type of circumstance. Aggravating, extenuating (mitigating), and exempting factors in law are examples well known to any lawyer: These are part of the conditioning type of circumstance relative to a given type of action, namely, the type of circumstance on whose basis a given type of action or several alternative types of action are believed to be binding per se, or what is objectively right.

Consider the provisions which make forbidden the type of action "stealing," and which make this same type of action a type of circumstance on whose basis a thief must be sentenced to a prison term (by instantiating the type of action "sentencing someone to a prison term"). The number of years in prison to be inflicted will vary depending on the circumstances in which a theft is committed: Thus, we will have aggravating factors (as with theft committed or organised with a high degree of planning and sophistication), extenuating or mitigating factors (as with petit larceny), or exempting factors (as with theft under necessity).

A skilled jurist is expected to give an exhaustive reconstruction of the following.

(*a*) The type "stealing." What looks at first sight like a plain type is in reality amazingly complex and involves a considerable number of legal provisions describing the components that concur in framing the type "theft." Indeed, the type "theft," if understood as "a person taking possession of the movable property of another for the purpose of deriving benefit from it for himself or

for others," makes it necessary to characterise a number of further types, such as "possession," "movable property," and the like.

(*b*) A number of other types that will integrate aggravating, extenuating (mitigating), and exempting factors. Here the jurist will have to characterise such things as "theft committed or organised with a high degree of planning or sophistication," "petit larceny" and "under necessity" (as examples of aggravating, mitigating, and exempting factors respectively). These further types will concur or be alternative to one another in an exhaustive description of the type "stealing." Indeed, as noticed a moment ago, this type is at the same time a forbidden type of action and a type of circumstance which the type of action "sentencing someone to a prison term" is conditionally connected with.

(*c*) The types for a number of actions branching out from the central nucleus "sentencing someone to a prison term" and differing from one another as to the length of the prison term. The jurist will then have to take the types branching out from the central nucleus "sentencing someone to a prison term" and connect each with a relevant conditioning type of circumstance as worked out in the reconstructions referred to in (*b*).

It bears repeating that the type of circumstance is of crucial importance to the content of norms, for it states the conditions under which the type of action is binding per se (what is objectively right). This crucial importance proves all the more evident when the conditioned type of action is ethically, politically, or economically consequential or sensitive. Indeed:

First, the conditioning type of circumstance singles out and characterises the cases in which the conditioned type of action is believed to be binding per se (obligatory, permitted, or forbidden: what is objectively right), that is, binding regardless of how desirable its performance is and whatever the pleasure or pain, the advantage or damage, that may result.

Second, any valid occurrence of the conditioning type of circumstance engages the believers' *opinio vinculi* about the conditioned type of action and makes the norm a concretely operative motive of behaviour (*causa agendi*) in those duty-holders who are at the same time believers in the same norm (see Section 6.5).

The crucial importance of the conditioning type of circumstance can be appreciated by considering penal and competence norms.

With penal norms, consider that from a believer's standpoint, the type of action "sentencing someone to death" and the type of action "convicting someone to a short prison term" are equally binding per se (what is objectively right). In either case, if the conditioning type of circumstance gets instantiated, the type of action must be performed irrespective of the desirability of its performance, and whatever the pleasure or pain, the advantage or damage, that will result. In other words, when it comes to normative force, there is no difference between the two beliefs—that "sentencing someone to death" is binding per se (what is objectively right) and that "convicting some-

one to a short prison term" is binding per se (what is objectively right)—other than the difference between the types of circumstance which the two types of action are conditionally connected with; for instance, committing a crime against humanity, in the first case, and committing tax fraud, in the second.

To better appreciate this point, imagine the converse case, in which the type of circumstance for sentencing someone to death (type of action) is committing tax fraud (type of circumstance) and the type of circumstance for sentencing someone to a short prison term (type of action) is committing a crime against humanity (type of circumstance). It is not hard to encounter in the history of humanity, or in present times, penal norms in which the type of action "sentencing someone to death" is conditionally connected with a type of circumstance that is disproportionate from the standpoint of a civilisation based on liberal principles. We have recent examples reminding us that in the world there are norms which people believe in, and under which it is binding per se to sentence people to death (women in particular) by stoning (type of action) for adultery (conditioning type of circumstance).[8]

With competence norms, consider that the type of action always consists in obeying (Sections 7.3, 8.2.1, and 9.6). The type of circumstance singles out those cases in which the type of action "obeying" is believed to be binding per se (what is objectively right) as well as it specifies who is to be obeyed, and on what matters, and how these persons' directives are to be issued.

On my characterisation of norms, believers, and competence norms (Section 7.3) the type of action "obeying" is believed to be binding per se (what is objectively right), that is, binding regardless of whether its performance is desirable or not and whatever the pleasure or pain, the advantage or damage, that may result. A directive enacted by validly instantiating the type of circumstance described in a competence norm can be of little consequence (witness "Don't cross the street!") or dramatically unsettling (as in "Give all your belongings to the needy, leave your loved ones behind, and follow me!").[9]

The issuance of both directives will be valid instances of the type of circumstance specified in a competence norm that at least one believer has internalised. In this case, someone who believes in the competence norm will be-

[8] In reality, stoning (type of action) as punishment for adultery (type of circumstance) is applicable to men as well, according to the *sharia* (though not all Islamic countries apply the *sharia*), even if the punishment is inflicted almost exclusively on women. Further, the convict, in preparation for the punishment, is buried in the ground, except that women are buried up to the chest and men only to the waist: The convicts who manage to flee will have their life spared, and women, of course, because they are buried so much deeper into the ground, manage to flee only rarely, if at all. Stoning is applicable to men for other crimes, too, such as sodomy and the rape of a minor.

[9] "Jesus said unto him, 'If thou wilt be perfect, go and sell that thou hast, and give to the poor, and thou shalt have treasure in heaven: and come and follow me'" (Matthew 19:21).

lieve both directives to be equally binding per se (and their content to be equally right: what is objectively right), despite the fact that their import is enormously different. Again, the only difference between the two beliefs, as far as their normative force is concerned, is that between the types of circumstance the type of action (here, "obeying") is conditionally connected with.

6.4. The Referents of a Norm: Being a Duty-Holder (Deontia) or a Right-Holder (Exousia). More on What Is Subjectively Right

I shall say that something is a referent of a given type description (or type representation) if, and only if, it validly instantiates one or more types that are described therein.

Given a type, any actual object *t* will either be or not be a valid token of this type, and any actual object *t* will either be or not be a referent of the description of this type, according as *t* is or is not a valid token of this type. The phrase "one or more types" points to the fact that we may have tokens partially instantiating compound types as well as tokens fully instantiating types, either simple or compound. Likewise, we may have tokens that are partial referents of compound type descriptions as well as tokens that are full referents of type descriptions, either simple or compound (cf. Section 2.2.2.2, point (*ii*), on attempted crime as described in Article 56 of the Italian Penal Code). In what follows, however, I will specify whether something is a partial or a full instantiation (a partial or a full referent) of a certain type (type description) only where strictly necessary to prevent misunderstandings.

As to norms, we saw in Section 6.3 that their content is a compound type involving at least one relevant conditioning type of circumstance and one type of action conditioned by it. So an object (person, event, action, state of affairs) will be one of the referents of a norm in case it is a valid token of one of the types described in the norm's content.

States of affairs, events, or other actual entities, like persons, are referents of the description of a type of circumstance insofar as they are valid tokens of this type of circumstance.

An actual action is a referent of the description of a type of action insofar as the action is a valid token of the type of action.

But notice the following.

The conditionality of the content of norms (Section 6.3), better yet, the normative character of the relationship of conditionality that holds between the type of circumstance and the type of action set forth in a norm, implies the following: (*a*) the valid instances of the type of action occurring in the absence of valid instances of the type of circumstance do not (and cannot) count as compliance or noncompliance with the norm, and (*b*) the valid instances of the type of action occurring in the presence of valid instances of the type of circumstance will necessarily count as compliance or noncompliance with the

norm, meaning they will be either valid and right tokens or valid and wrong tokens of the type of action (see Section 2.2.2.2).

The type of circumstance set forth in a norm is instantiated by valid tokens independently of obedience or disobedience to the norm (even if this instantiation can consist in obeying or disobeying another norm). The type of action set forth in a norm is instantiated by valid tokens that count as obedience or disobedience of that norm (on the concept of obedience, see Sections 6.7 and 6.8) if, and only if, the relevant type of circumstance, too, has been validly instantiated.

Given a norm **n**, "The well-off must aid the needy," the relevant type of circumstance ("the well-off [...] the needy") will get validly instantiated only when we have actual well-off and actual needy people. Here no obedience to the norm **n** is entailed with respect to the well-off or with respect to the needy.[10]

The type of action "aiding" gets validly instantiated not only when actual well-off people actually aid actual needy people (in which case the valid instantiation of the type of action "aiding" entails obedience to norm **n**), but also when, say, actual needy people actually aid actual well-off people (in which case, however, the valid instantiation of the type of action "aiding" counts neither as compliance nor as noncompliance with norm **n**).

Given a norm **n**, any actual subject *s* will either be or not be a referent of **n**; likewise, any actual action will either be or not be a referent of **n**.

Any *s* who is a referent of **n** will be either a duty-holder *d* or a non-duty-holder *nond* under **n**.

I shall call "deontia" the situation in which one or more subjects *s* who are referents of **n** are *d*s under **n**. Deontia is the normative subjective position (what is subjectively right) by which the subjects *s* are actual duty-holders under **n** (according to those who believe in **n**). Here, the conditioning type of circumstance makes reference to the subjects *s* as duty-holders under **n**. For example, given the norm **n**, "No one can bear arms in public places," anyone in any public place (this being a valid Is-event: a legal fact as characterised in Section 3.2) will be an actual duty-holder under **n**: This person will be under an obligation not to bear arms, and "deontia" expresses his or her normative subjective position (what is subjectively right) as an actual duty-holder under **n**.

It might be said—using the language introduced in Part One to reconstruct the foundations of legal-dogmatic thought in civil-law culture—that in this section I am treating of valid Is-causes (or Is-facts or acts; in the example, finding oneself in a public place) that produce Ought-effects in what is subjectively right (in the example, an obligation not to bear arms).

[10] And if norms other than **n** make it obligatory to become needy or to become well-off, then a valid instantiation of the type "the well-off [...] the needy" will entail obedience to these other norms, provided that the relevant type of circumstance set forth in these other norms has in turn been validly instantiated.

I shall call "adeontia" the situation in which one or more subjects *s*, whether or not they are referents of **n**, are not *d*s under **n** (they are *nond*s under **n**). Adeontia is the normative subjective position (what is subjectively right) by which the subjects *s* are not actual duty-holders under **n**. Here, the conditioning type of circumstance will either make no reference at all to the subjects *s*, or it will make reference to them but not as duty-holders under **n**.

Keeping to the previous example—the norm **n**, "No one can bear arms in public places"—anyone who is not in any public place will be an instance of adeontia: These people will be non-duty-holders with respect to this norm. This is so because no one who is not in any public place is a referent of the norm **n**, a norm that makes it forbidden per se to bear arms in public places. Should this norm read instead, "No one except law-enforcement officers can bear arms in public places," any police officers in any public place will be referents of the norm **n**, but not duty-holders under this norm. Even as referents of **n**, they will be instances of adeontia with respect to **n**.

Any *s* who is a referent of **n** is either a right-holder *r* or a non-right-holder *nonr* under **n**.

I shall call "exousia" the situation in which one or more subjects *s* who are referents of **n** are *r*s under **n**. Exousia is the normative subjective position or situation in which the subjects *s* are actual right-holders under **n** (according to those who believe in **n**). Here, the conditioning type of circumstance refers to the subjects *s* as actual right-holders under **n**. For example, given the norm **n**, "All newborn humans must be kept alive and nourished," every newborn baby (the new birth being a valid Is-event: a legal fact as characterised in Section 3.2) will be an actual right-holder under **n**: This baby will have a right to life and nourishment, and "exousia" expresses his or her normative subjective position (what is subjectively right) as an actual right-holder under **n**.

It might be said—using the language introduced in Part One to reconstruct the foundations of legal-dogmatic thought in civil-law culture—that in this section I am treating of valid Is-causes (Is-facts; in the example, the birth of a baby) that produce Ought-effects in what is subjectively right (in the example just made, the right to life and to nursing ascribed to the baby).

I shall call "anexousia" the situation in which one or more subjects *s,* whether or not they are referents of **n**, are not *r*s under **n** (they are *nonr*s under **n**). Anexousia is the normative subjective position or situation in which the subjects *s* are not actual right-holders under **n**. Here, the conditioning type of circumstance will either make no reference at all to the subjects *s*; or it will refer to them but not as actual right-holders under **n**.[11]

[11] The terms "deontia" and "adeontia" are coinages based on ancient Greek *deon*, meaning "duty"; "exousia" and "anexousia" are based on ancient Greek *exousia*, meaning "power" or "faculty."

No actual subject *s* who is not a referent of **n** can be a *d* or an *r* under **n**: *s* necessarily is a *nond* and a *nonr* under **n**, because *s* is not a referent of **n** (*s* is not under the scope of **n**).

Any actual subject *s* who is a referent of **n** will have one of these capacities or competencies under **n**: *d* and *nonr*, *r* and *nond*, *d* and *r*, or *nond* and *nonr*. From here on out I will be expressing these qualifications, and others like them, by way of an ampersand. So, in the examples just made, I will say of these capacities under **n** that they qualify a subject as a *d*&*nonr*, an *r*&*nond*, a *d*&*r*, or a *nond*&*nonr*.

6.5. The Being-in-Force of a Norm: Being a Duty-Holder and a Believer (Nomia). The Not-Being-in-Force of a Norm: Being a Duty-Holder and a Nonbeliever (Anomia)

The being-in-force of a norm **n** or its not being-in-force can be predicated exclusively of the actual duty-holders *d* under **n**. In other words, deontia is a necessary though insufficient condition for a norm **n** to be in force and for it not to be in force.

If an actual duty-holder *d* under a norm **n** (deontia) is a believer *b* in **n** (doxia), then the norm **n** will be in force in *d*. I shall call "nomia" the being-in-force of a norm. The nomia or being-in-force of a norm is the coexistence of doxia and deontia in the same person, who will then be a *b*&*d* with respect to **n**.

If an actual duty-holder *d* under a norm **n** (deontia) is a nonbeliever *nonb* in **n** (adoxia), then the norm **n** will not exist (adoxia) in this *nonb*&*d* (to whom the norm refers: deontia), nor will it be in force in the same *nonb*&*d*. I shall call "anomia" the not-being-in-force of a norm **n** in a person *d* under **n** who is a *nonb* in **n**. The anomia, or not-being-in-force, of a norm **n** is the coexistence of adoxia and deontia in the same person, who will then be a *nonb*&*d* with respect to **n**. Indeed, actual duty-holders *d* under **n** will not necessarily be nomic with respect to **n**: There can exist *nonb*&*d*s, that is, actual duty-holders under **n** who are nonbelievers in **n** and are therefore anomic with respect to **n**.

Likewise, believers *b* in **n** will not necessarily be nomic with respect to **n**: There can exist *b*&*nond*s, or adeontic believers, who are not actual duty-holders under **n**, and who therefore can be neither nomic nor anomic with respect to **n**. If a norm **n** exists in a believer *b* (doxia) who is not a duty-holder under **n** (adeontia), then **n** will exist in *b* (doxia) but cannot be in force or not in force in the believer *b*, because this person is a *nond* under **n** (adeontia). To put it otherwise: The being-in-force of a norm **n** (nomia), and the not-being-in-force of a norm **n** (anomia), cannot be predicated of persons who are not actual duty-holders *d* under **n.** Adeontia precludes both nomia and anomia (more on this in Section 10.2.3).[12]

[12] "Anomia" comes from Greek *nomos*, meaning "norm," in combination with the

A disclaimer here is that the concept of "a norm being in force in a person," as characterised in this section, does not apply as such where the being-in-force of law is at issue (see Sections 10.1 and 10.2.4).

6.6. The Efficaciousness and Inefficaciousness of a Norm: Abiding and Deviant Duty-Holders. The Whited Sepulchres and the Jesuits. Efficacious Norms as a Subset of Effective Norms

A norm **n** can be a motive of behaviour (*causa agendi*) that is efficacious or inefficacious only with the actual duty-holders *d* under **n** who are also believers *b* in **n**, that is, with *b*&*d*s (those in whom the norm **n** is in force: nomia).

As is known, "efficaciousness," "efficacy," "effectivity," and "effectiveness," as well as their antonyms ("inefficaciousness," "inefficacy," etc.) and their adjectival forms ("efficacious," "effective," etc.), are terms on which general jurisprudence (at least in civil-law countries) has debated and is still debating extensively with reference to the concept of validity, among other things.

To make things clearer here, in what follows I will use "efficaciousness" and its derivatives to signify that a norm is abided by qua norm (norm as *causa agendi*). The same holds for the other motives of behaviour (needs, interests, and values) when they are specifically *causae agendi*; Thus, for example, if a given need is the motive why I hold a behaviour, it will be said to be efficacious with respect to that behaviour.

"Effectiveness" and its derivatives I will use instead to signify that a rule or standard (or a set or system of rules or standards) is complied with *whatever motives* may stand behind this practice, and so without entering into any such motives. In short, I restrict the use of "efficaciousness" and "inefficaciousness" to say that a motive of behaviour (*causa agendi*) functions or does not function as a cause of behaviour. The use of "effectiveness" and "non-effectiveness" I circumscribe to say that a certain rule or standard of behaviour is or is not complied with, independently of the motives—needs, interests, values, or norms (cf. Chapter 5)—out of which such compliance or noncompliance occurs. "Effective," on my understanding of this term, is equivalent to "practised" (see Section 6.8), which makes efficacious norms a subset of effective, or practised, norms.

Note in this regard that there is an ambiguity latent (and maybe even inevitable) in the discourse of jurists and jurisprudents. Saying that a legal norm or a normative legal system is effective will say little or nothing about the moti-

privative prefix *a*-, meaning "not" or "without." "Nomia" likewise contains the root *nomos*, but without the privative prefix. In the social sciences, "anomia" is usually defined as the "lack or absence of norms regulating the social behaviour of individuals or communities (groups, associations, organisations)" (Gallino 2000, s.v. "Anomia," 30; my translation).

vating efficaciousness of legal norms qua norms or of the legal system qua normative system. This ambiguity recoils on us and widens when it comes to characterising the law in force, because "law in force" does carry normative connotations and implications, and yet, despite this fact, we are accustomed to speaking of "law in force" on condition that the law is effective without specifying (or being able to specify) in what proportion the efficaciousness of norms—as against the efficaciousness of other motives of human behaviour—concurs in determining the effectiveness of a legal system (cf. Chapter 10).

Nomia (a norm's being in force) is a necessary condition for both the efficaciousness and inefficaciousness of a norm. Hence, a norm **n** cannot be efficacious or inefficacious with the subjects in whom it is not in force. That is, with (*i*) the actual duty-holders *d* under **n** who are nonbelievers *nonb* in **n** (anomia, *nonb*&*d*), (*ii*) the believers *b* in **n** who are not actual duty-holders *d* under **n** (doxia-adeontia, *b*&*nond*), and (*iii*) the subjects who are neither believers *b* in **n** nor actual duty-holders *d* under **n** (adoxia-adeontia, *nonb*&*nond*). It is only in a broad sense (and in a way inappropriately, given my characterisation of efficaciousness) that in case (*ii*), doxia-adeontia, norm **n** may be said to be efficacious with respect to those believers in **n** who are not duty-holders under **n**: Because of **n**, those who believe in **n** will be likely to take a normative censorious attitude (preventive or repressive social control) toward those people they understand to be actual duty-holders *d* under **n**. This qualification on the use of "efficaciousness of a norm" serves only the purpose of terminological clarification. It does not in any way detract from the fundamental importance of the censorious normative attitude taken by adeontic believers in the play of the law in force (cf. Sections 10.2.1 and 10.2.2).

I shall call "abiders" the actual subjects *b*&*d* (believers in **n** and duty-holders under **n** in whom **n** is in force: nomia) who *on this motive* (*causa agendi*) practise **n** (efficaciousness of **n** in *b*&*d*s). Abiders display the habit or practice (*usus agendi*) of obeying **n** *because* they are nomic with respect to **n**. To put it otherwise, if a norm **n** is efficacious, then the *b*&*d*s (those in whom **n** is in force) will be abiders: They will practise **n** because they believe in **n**. Also, their *usus agendi* is a custom in that it is *caused by a norm* (*opinio vinculi*) (see the end of Section 5.3 and Section 6.1).

I shall call "deviants" the actual subjects *b*&*d* (believers in **n** and duty-holders under **n** in whom **n** is in force: nomia) who do not practise **n** (inefficaciousness of **n** in *b*&*d*) despite the fact that they believe in **n**. Deviants do not display the habit or practice (*usus agendi*) of obeying **n** despite their being nomic with respect to **n**. To put it otherwise, if a norm **n** is inefficacious, then *b*&*d*s (those in whom **n** is in force: nomia) will be deviants: They will not practise **n** *despite* their belief in **n**.[13]

[13] A notion of deviance analogous to the one here advanced was held by Abelard with regard to sin: "Sin, it seems, lies in the disparity between what a person does and what he

Nomia (a norm's being in force) is a necessary condition for being an abider as well as for being a deviant.

If deviance (the violation of **n** by a *b&d* with respect to **n**) becomes a habit or practice, it can sorely try the being-in-force of **n** (nomia) in a *b&d*. In particular, it can work against the existence of **n** in *b&d*: It can undercut *b&d*'s belief in **n** (*b&d*'s doxia), which belief is a necessary and, where coupled with deontia, a sufficient condition of nomia (of the being-in-force of **n**). However, if a *b&d* regards as deviant any habit or practice of his or hers that does not conform to **n**, *b&d* will continue to believe he or she is under an obligation to comply with **n** even after violating **n**: *Video meliora proboque, deteriora sequor* (Ovid, *Metamorphoses* VII, vv. 20–1: "I see the best things and approve of them, and yet I follow the worst"; my translation). Here, even if norm **n** is violated, it will still exist and be in force in *b&d* as long as *b&d*, though a deviant, believes it binding per se to comply with **n**.

In the social sciences, "deviance" is defined as

a verbal or nonverbal act, behaviour, or expression by a recognised member of a collectivity, regarded by most members in that collectivity as a more or less serious practical or ideological departure from or violation of certain norms, expectations, or beliefs they either understand to be legitimate or adhere to in practice: the more this act, behaviour, or expression aggrieves people's sense of offence, the stronger their reaction to it. (Gallino 2000, s.v. "Devianza sociale," 217; my translation).

This idea of deviance stems in part from

the Jewish-Christian conception of the traitor and to a lesser extent of the sinner. In so early a conception lies what a main strand of contemporary sociology sees to be the chief traits of deviance: the community's sense of offence, or of betrayed trust, which prompts and warrants a reaction, and the consequences this breach of trust entails for the deviant's personality. The traitor was a member of a group, operated in the group for a long time and abided by its norms, and broke these norms out of either weakness or self-interest, but cannot bear to stray from them and for this reason is grievously anguished by his or her act. These traits have often been depicted in the mythic-legendary figure of Judas. (Ibid.; my translation)

In sum, a norm **n** exists only in believers *b* in **n**; it is in force only in actual duty-holders under **n** who are also believers in **n** (it is in force in *b&d*s); *b&d*s are the only persons who can be abiders (efficaciousness of **n**) or deviants (inefficaciousness of **n**), and they will necessarily be either the one or the other (nomia is a necessary condition for both the efficaciousness and inefficaciousness of a norm), unless they are whited sepulchres in the sense presently to be explained.

The peculiar case of whited sepulchres is that of a *b&d* who *would be* a deviant (The spirit is willing but the flesh is weak: "Watch and pray, that ye

believes God commands." On the topic of Abelard on sin I am indebted to Marenbon, Volume 6 of this Treatise, Section 11.3.2.

enter not into temptation: The spirit indeed *is* willing, but the flesh *is* weak"; Matthew 26:41) were it not that he or she is driven to comply with **n** out of motives other than **n** (out of needs, interests, or values).

On the characterisation of conformism provided below, in Section 6.7, these *b&d*s cannot be said to be conformists, and that because they believe in **n** (as true conformists do not). But then in a strict sense they cannot be said to be abiders, either, because even though they believe in and practise **n**, they practise **n** out of motives other than **n**. Finally, they cannot, strictly speaking, be said to be deviant: They would be deviant if they did not practise **n**. I will say that these *b&d*s are whited sepulchres. This is how Jesus called the Pharisees: "Woe unto you, scribes and Pharisees, hypocrites! for ye are like unto whited sepulchres, which indeed appear beautiful outward, but are within full of dead *men's* bones, and of all uncleanness" (Matthew 23:27).

The whited sepulchres are false abiders: They are believers who seem to be abiders and claim to be abiders but are not, because motives other than their belief in **n** are the real motive of their compliance with **n**. The situation with whited sepulchres is that norms are actually practised but are not efficacious: These norms *are* obeyed, but not qua norms, and that even if they are believed in qua norms.

A different matter is the Jesuits. I happen to esteem them (cf. the end of Section 10.2.4), but to their detractors they come across as nonbelievers who pretend to be believers, and when they practise a norm they come across as conformists (Section 6.7) who pretend to be abiders, while they are merely practising *nonb&d*s. Cf. Pascal (1623–1662), *Les Provinciales*: *Septième Lettre*, 1928a, and *Neuvième Lettre*, 1928b.

6.7. In the Case of Anomia, a Norm Can Be either Obeyed (Conformism of Duty-Holding Nonbelievers) or Not Obeyed (Nonconformism of Duty-Holding Nonbelievers), but It Cannot Be Efficacious or Inefficacious

As mentioned, a norm **n** that refers to actual duty-holders who do not believe in **n** cannot be efficacious or inefficacious with them, either. It will nevertheless be either obeyed or not obeyed by such *nonb&d*s (actual duty-holders under **n** who do not believe in **n**).

In the former case, **n** is obeyed (*usus agendi*) out of motives other than **n** (out of need, interest, or values, or in virtue of a norm other than **n**). These motives will cause *nonb&d*s to comply with **n** despite the fact that they do not believe in **n** and therefore do not consider themselves to be duty-holders under **n**. Any such habit or practice (*usus agendi*) displayed by *nonb&d*s will not be a custom, because it is not caused by **n** (see the end of Section 5.3 and Sections 6.1 and 6.8).

I shall call "conformists" the actual duty-holders *d* under **n** who obey **n** (who display the *usus agendi*, the habit or practice, of obeying **n**) despite their

being nonbelievers in **n** (despite their being anomic with respect to **n**). By definition, conformists obey **n** out of motives other than **n** (out of need, interest, or values, or in virtue of a norm other than **n**).

A norm **n** that is obeyed out of conformism is practised but *cannot* be efficacious or inefficacious. Even so, it will be effective (cf. Section 6.6).

I shall call "nonconformists" the actual duty-holders *d* under **n** who do not obey **n** (who do not display the *usus agendi*, the habit or practice, of obeying **n**), because they are nonbelievers in **n**: They are anomic with respect to **n**. By definition, nonconformists violate **n** (i.e., they are *d*s under **n** and do not obey **n**) but are not deviant, because they are nonbelievers *nonb* in **n**, that is, they are anomic with respect to **n**, which is not in force in them.

Anomia—as the position of someone being a *nonb*&*d*—is a necessary condition of conformism as well as nonconformism.[14]

6.8. Practising Duty-Holders and Non-Practising Duty-Holders

A norm **n** can be obeyed or violated only by a person who is competent (in the capacity) to comply or not comply with **n**, and therefore only by an actual duty-holder *d* under **n**, whatever motive (need, interest, value, or norm) stands behind this obedience or violation. By definition, a norm **n** can be practised or not practised only by the subjects *s* who are actual duty-holders *d* under **n**. And a *d* will be either a *b*&*d* or a *nonb*&*d*.

I shall qualify as "practising" the actual duty-holders *d* under **n** who display the *usus agendi*, the habit or practice, of complying with **n**, whatever motive (need, interest, value, or norm, including the same norm **n**) accounts for their practice. If this practice is a custom—if it is caused by **n**—then **n** will be practised and efficacious (and the practising *b*&*d*s will properly be abiders). If the same practice is not a custom—if it is caused by motives other than **n** (the practising duty-holders *d* under **n** are either conformists or whited sepulcres)—then **n**, though practised (and hence effective: Section 6.6), will be inefficacious.

I shall qualify as "nonpractising" the actual duty-holders *d* under **n** who do not display the *usus agendi*, the habit or practice, of complying with **n**, whatever motive (need, interest, value, or norm) accounts for the fact that they do not comply with **n**. If such noncompliance is a case of deviance, then **n** will be non-practised as well as inefficacious. If this noncompliance is a case of nonconformism, then **n**, though not practised, will not and cannot be efficacious or inefficacious.

A *nond* can either be a *b*&*nond* or a *nonb*&*nond* (actual *nond*s under **n** are either believers *b* in **n** or nonbelievers *nonb* in **n**). In either case *nond*s are nei-

[14] It is a matter of taste whether it is preferable to say that "conformists" and "nonconformists," in the sense specified, should rather be called "opportunists" and "non-opportunists."

ther practising nor nonpractising subjects under **n**—nor could they be—because they are not actual duty-holders under **n** (they are *nond*s under **n**): **n** does not refer to them as duty-holders, so they are not competent to either comply or not comply with **n** (they are not in that capacity).

Chapter 7

HOW NORMS PROLIFERATE IN HUMAN BRAINS

7.1. Subsuming Valid Tokens under a Type of Circumstance and Producing Derivative Norms from the Type of Action Conditionally Connected with the Type of Circumstance

It was discussed in Section 6.3, with regard to the content of norms, how an important role is played by the type of circumstance a type of action is conditionally connected with (a type of action whose performance will be believed to be binding per se anytime this condition is met). A conditioning type of circumstance determines the ethical, political, or economic import of the content of a norm by singling out and defining the conditions under which the type of action set forth in the norm is believed to be binding per se (per se obligatory, permitted, or forbidden: what is objectively right), that is, binding regardless of how desirable its performance is and whatever the pleasure or pain, the advantage or damage, that may result.

Now I will consider another aspect of the role played by the valid tokens of the type of circumstance described in a norm **n**: their role as multipliers of norms in the brains of believers (a multiplication that starts from **n**). Every token that validly instantiates the conditioning types of circumstance set forth in the norms a believer has internalised specifies and multiplies these norms, and through this process the believer may come to build up a normative system.

In principle, every valid token of the conditioning type of circumstance produces new norms in every believer in **n**. In practice, the amount of such multiplication will equal the amount of valid actual tokens that each believer recognises as instances of the conditioning type of circumstance set forth in **n**.[1]

Norms existing in the brain of a believer easily multiply into derivative norms by illative processes of subsumption and inference. And the multiplication process by which a derivative norm is produced is the same whether a

[1] In reality, a great many officials; scholars; advisors; divulgers; professionals in various fields regulated by norms, and in particular by legal norms (fields such as education, healthcare, sports, labour, and taxes); interest groups; media owners; and suchlike all do an enormous amount of work with regard to norms in general, and with regard to legal norms in particular. Then, too, officials impose on believers (and also on nonbelievers) the outcome of their work, or they propose it, and professionals will even sell it. In the final analysis, the believers need these multitudes of people to help them uphold their beliefs and put them into practice. Nonbelievers (despite their position as nonbelievers) need these multitudes of people, too: in their case to put into practice beliefs (norms) held by others, which they can hardly elude, and which they are forced to conform to (conformism; Section 6.7), if not out of inclination or conviction (belief), certainly because pressed into it, making a virtue out of necessity (cf. Chapter 10).

believer proceeds from norms of conduct or from competence norms. In either case:

(*i*) Actual states of affairs or events in the reality that is validly instantiate (are valid tokens of) the conditioning type of circumstance set forth in a norm **n** existing in the brain of a believer *b* (in *b*'s reality that ought to be; cf. Section 15.3.4).

(*ii*) The valid tokens are subsumed by the believer under the conditioning type of circumstance with which a type of action is connected, and under which the believer believes the same type of action to be binding per se (what is objectively right).

(*iii*) From the type of action set forth in **n** and from the valid tokens subsumed under the type of circumstance set forth in **n** the believer infers derivative norms **n1**, **n2** ... **nn**.

The derivative norms **n1**, **n2** ... **nn** are specifications of the norm **n** in what concerns the type of circumstance described in **n**.

Since the specifications **n1**, **n2** ... **nn** are shaped by those tokens that happen to validly instantiate the type of circumstance set forth in **n**, how many new derivative norms **n1**, **n2** ... **nn** we will have with respect to norm **n** will depend, among other things, on the type of circumstance set forth in **n**. Thus, the norm requiring that we give a present (type of action) for birthdays (type of circumstance) will produce fewer derivative norms than a norm requiring that we give a present (type of action) for un-birthdays (type of circumstance).[2]

[2] "Evidently Humpty Dumpty was very angry, though he said nothing for a minute or two. When he *did* speak again, it was in a deep growl. / 'It is a—*most*—*provoking*—thing,' he said at last, 'when a person doesn't know a cravat from a belt!' / 'I know it's very ignorant of me,' Alice said, in so humble a tone that Humpty Dumpty relented. / 'It's a cravat, child, and a beautiful one, as you say. It's a present from the White King and Queen. There now!' / 'Is it really?' said Alice, quite pleased to find that she *had* chosen a good subject, after all. / 'They gave it me,' Humpty Dumpty continued thoughtfully, as he crossed one knee over the other and clasped his hands round it, 'they gave it me—for an un-birthday present.' / 'I beg your pardon?' Alice said with a puzzled air. / 'I'm not offended,' said Humpty Dumpty. / 'I mean, what *is* and un-birthday present?' / 'A present given when it isn't your birthday, of course.' / Alice considered a little. 'I like birthday presents best,' she said at last. / 'You don't know what you're talking about!' cried Humpty Dumpty. 'How many days are there in a year?' / 'Three hundred and sixty-five,' said Alice. / 'And how many birthdays have you?' / 'One.' / 'And if you take one from three hundred and sixty-five, what remains?' / 'Three hundred and sixty-four, of course.' / Humpty Dumpty looked doubtful. 'I'd rather see that done on paper,' he said. / Alice couldn't help smiling as she took out her memorandum-book, and worked the sum for him: 365 – 1 = 364. / Humpty Dumpty took the book, and looked at it carefully. 'That seems to be done right—' he began. / 'You're holding it upside down!' Alice interrupted. / 'To be sure I was!' Humpty Dumpty said gaily, as she turned it round for him. 'I thought it looked a little queer. As I was saying, that *seems* to be done right—though I haven't time to look it over thoroughly just now—and that shows that there are three hundred and sixty-four days when you might get un-birthday presents—' / 'Certainly,' said Alice. / 'And only *one* for birthday presents, you know. There's glory for you!' / 'I don't know what you mean by "glory,"' Alice said. / Humpty Dumpty smiled contemptuously. 'Of course you don't—till I tell you. I

The proliferation of derivative norms in a believer proceeds from previously internalised norms of conduct and competence norms alike. But in this latter case, the proliferation is particularly lush and noticeable, because (in principle at least) tokens of the conditioning type of circumstance can be validly realised at will or on purpose (by those who are in the capacity of doing so) in greater numbers than in the case of norms of conduct. To put it otherwise, the range, variety, and diversity of tokens admitted by the type of circumstance set forth in a competence norm will in principle be much greater than it is with the type of circumstance set forth in a norm of conduct. Also, the newness of the derivative norms with respect to the norm **n** they are inferred from is particularly visible and consequential when **n** is a competence norm.

In Section 7.2, I will provide an example of a believer's normative system developed from norms of conduct only. In Section 7.3, I will provide an example of a believer's normative system developed from both norms of conduct and competence norms.

7.2. Proliferation from Norms of Conduct. Static Systems and Dynamic Systems

Consider the norm of conduct **n**, "The well-off must aid the needy": This norm exists in me, a believer *b* in **n**; it is part of my internal reality that ought to be, the outcome of social interaction and of primary and secondary socialisation (see Section 15.2.5).

It turns out that one person, Rob, is a man of means, and that two other persons, Frances and Loretta, through unfortunate events, come to find themselves in a state of need. If I assume that, following these events, the conditioning type of circumstance set forth in **n** has validly been instantiated twice (it has actual valid tokens in one *d*, Rob, and two *r*s, Frances and Loretta), then my assumption will in a technical (and a legal) sense be a subsumption.[3]

meant "there's a nice knock-down argument for you!"' / 'But "glory" doesn't mean "a nice knock-down argument,"' Alice objected. / 'When *I* use a word,' Humpty Dumpty said in rather a scornful tone, 'it means just what I choose it to mean—neither more nor less.' / 'The question is,' said Alice, 'whether you *can* make words mean so many different things.' / 'The question is,' said Humpty Dumpty, 'which is to be master—that's all'" (Carroll 1982, 189–90; Lewis Carroll, 1832–1898).

[3] "To subsume, in philosophical language, is properly to bring an individual under a genus, or class [in my usage, a type]. Thus we have a subsumption, for example, in making the minor premise of a classic syllogism of the type 'All men are mortal. / Socrates is a man. / Socrates is mortal.'

Accordingly, jurists call subsumption our bringing a concrete fact, a historical event, under the type [*fattispecie astratta* in the original] set forth in a legal provision or, more generally, a legal norm. […] Thus, for example, we can consider the major premise, as expressed in a legal provision, 'Anyone who should with specific intent kill another person shall be punished for it.' Now, not until we have ascertained so-and-so's belonging to the category [or type, in my usage]

Having subsumed the two above-mentioned tokens under the conditioning type of circumstance set forth in **n**, I—as a ratiocinating believer *b* in **n**—will infer from **n** two other norms of conduct: **n1**, “Rob, a duty-holder *d*, must aid Frances, a right-holder *r*, who is now in a state of need,” and **n2**, “Rob, a duty-holder *d*, must aid Loretta, a right-holder *r*, who is now in a state of need.”

The normative universe that I hold to (my internal reality that ought to be) as a believer *b* in **n** now comprises three norms, namely, the primitive (and parent) norm **n** and the derivative norms **n1** and **n2**: All three are norms of conduct. This is a small normative system (a small reality that ought to be), and it will change by subsumption and inference depending on whether there are valid actual tokens (states of affairs or events) in the reality that is which instantiate the conditioning type of circumstance set forth in **n**, or which will cease to be valid actual tokens instantiating this type of circumstance; in other words, depending on whether there exist valid tokens or referents of the type of circumstance set forth in **n** or whether this type of circumstance is no longer instantiated by any such valid tokens.

Should Loretta cease to be in a state of need, and hence her circumstances no longer be a valid instance (token) of the conditioning type of circumstance set forth in **n**, there will have been an Is-event in the reality that is, and **n2** will consequently become extinct, or cease to exist in my internal reality that ought to be, in the ratiocinating believer which I am, and so will Rob’s duty toward Loretta. My small normative system has thus been reduced to **n** and **n1**.

Should Loretta become needy a second time, this would be another Is-event in the reality that is, and my normative system will consist of **n**, **n1**, and **n2.1**. For **n2** ceased definitely to exist in a previous moment, when Loretta improved her circumstances. When Loretta becomes needy for the second time, a new norm comes into existence: This norm—**n2.1**—will be different from **n2** because of the different period in which it exists in my brain.

Should Loretta again cease to be in a state of need, so that her circumstances cease to be a valid instance (token) of the conditioning type of circumstance set forth in **n**, there will have been an Is-event in the reality that is, and **n2.1** will consequently become extinct, or cease to exist in my internal reality that ought to be, in the ratiocinating believer which I am, and so will Rob’s duty toward Loretta. My small normative system has thus been reduced again to **n** and **n1**.

If trouble, in the reality that is, should befall another person, Herta, who comes to find herself in a state of need, the conditioning type of circumstance set forth in **n** will be instantiated by a further valid token, and my normative system (my internal reality that ought to be) will accordingly expand (by subsumption and inference) with a new norm of conduct, **n3**, “Rob, a duty-

of those who have killed someone with intent (minor premise = subsumption) can we conclude that so-and-so falls subject to that penalty” (Lazzaro 1971, 975–6; my translation).

holder *d*, must aid Herta, a right-holder *r*, who is now in a state of need." My small normative system becomes **n**, **n1**, and **n3**.

Primitive norms—and so other beliefs, such as a belief in God—can take years, even decades, before human brains can internalise them through socialisation processes. But once a human being internalises a norm **n**, **n** will proliferate as the believer subsumes valid actual tokens under the conditioning type of circumstance set forth in **n** and infers derivative norms **n1**, **n2** ... **nn** from **n** and from the tokens subsumed under the type of circumstance set forth in **n**.

As has been noted already, the amount of such proliferation will equal the amount of valid actual tokens that are taken (by the believer) to instantiate the conditioning type of circumstance set forth in **n** (Section 7.1). And the rate of proliferation will run parallel to the time it takes for such tokens to occur in the reality that is and be known, plus the time needed for the believer to subsume them under the conditioning type of circumstance set forth in **n** and to infer derivative norms in his or her reality that ought to be.

Although legal doctrine has often come close to appreciating that this is how norms proliferate in believers (by subsumption and inference), it has never grasped this mechanism fully, nor has it provided a clear account of it. Good attempts at just such a solution are the theory of legal facts, acts, and transactions (declarations of will) productive of legal Ought-effects (see Section 3.2)[4] and the concept of subsumption as applied to the so-called judicial syllogism.

To expedite matters, suppose Loretta never ceased to be needy. Here, the norms of conduct previously introduced (the primary norm **n** I internalised through socialisation processes, and the derivative norms **n1**, **n2**, and **n3**, which I, a believer in **n**, have produced by subsumption and inference) can be considered to make up an extremely stripped-down internal reality that ought to be or normative system as follows: **n**, **n1**, **n2**, and **n3**. There are four norms contained in my head (in my reality that ought to be, a reality situated in my brain): One of these is a primary and parent norm, and the remaining three are derivative norms, which in relation to the primary norm occupy a lower level.

But the normative system of a believer *b* is hugely more complex than this fourplex case admits.

For in the first place, as mentioned, and keeping to my own range of beliefs, **n** can produce within me, not three but many derivative norms, as many as are the tokens that in the reality that is validly instantiate the conditioning type of circumstance set forth in **n**, in what concerns both duty-holders and right-holders. Further, the reality that is can have many cases in which these many valid tokens cease to be, as well as many recurring valid tokens and new

[4] We can also fruitfully bring to bear the theory of sources of law here, but then we will have to bring it into analogy with the theory of legal facts, acts, and transactions (declarations of will), as was done in Section 3.4.

cessations of each of these many valid tokens of the conditioning type of circumstance set forth in **n**.

If my brain is well informed and working, it will produce, repeal, and reproduce a variety of derivative norms by subsumption and inference.

More than that, my brain is not one in which socialisation processes have driven only the norm **n**, "The well-off must aid the needy." Some people are full of resources, and others are full of norms: I myself am full of norms. Other people are full of compulsive neuroses, and these, as neuronal states of affairs, are phenomena not entirely unlike normative beliefs.[5]

Coming back to myself, I have internalised a number of primitive norms in addition to **n**: **g**, "It is per se obligatory not to take other people's movable property"; **h**, "It is per se obligatory to yield to women and the elderly on the street"; **i**, "It is per se obligatory not to have sexual relations with minors or with unconsenting adults"; and so on. The type of circumstance described in **g**, **h**, and **i** will in principle have the same chances of being validly instantiated by tokens (which in turn may cease to be and then occur again) as did the type of circumstance set forth in **n**.

Thus, each of my primitive norms will engender, in my internal reality that ought to be, several other derivative norms depending on the tokens which validly take place in the reality that is and instantiate the conditioning type of circumstance set forth in the same primitive norms.

My normative system initially comprised four norms: the primitive norm **n** and the derivative norms **n1**, **n2**, and **n3**. Lastly, to these four norms I added three other primitive norms: **g**, **h**, and **i**. Most readers will appreciate that, though my norms have grown to seven, they are still only a drop in the bucket. I could not in truth reckon how many norms currently fill my normative universe (or reality that ought to be): certainly more than seven, especially where they refer to others as duty-holders and to myself as the person (a right-holder) entitled to ask that such duty-holders perform what they ought to.

The fathers of systematic natural-law theory—Christian Wolff (1679–1754) among them—did attempt to tally up the norms existing in their normative universes, in an effort to make these norms more accurate and to lay them out neatly. But the resulting normative systems took shape *a priori*, namely, independently of any conditioning type of circumstance getting actually and validly instantiated by tokens occurring in the reality that is, and instead would usually get derived, *continuo ratiocinationis filo*, directly from the types of action set forth in norms of conduct. Given, for example, the norm of conduct "It is binding per se to be kind to ladies," the fathers of systematic natural-law

[5] We have a lightly amusing example in the 1997 film *As Good as It Gets*, produced and directed by James L. Brooks, in which Jack Nicholson plays the part of a man full of compulsive neuroses: These last were his most obsessive norms, and decisive for his behaviours. Cf. Section 15.4.

theory would derive from this norm in the abstract—independently of states of affairs or events occurring in the reality that is—such further norms of conduct as "It is binding per se to take off one's hat before a lady," "It is binding per se to bow when inviting a lady to dance," "It is binding per se to refrain from using foul language before a lady," and of course "It is binding per se to refrain from punching a lady in the face." None of the norms now made to derive hypothetically from "It is binding per se to be kind to ladies" require or presuppose that any valid tokens occur which instantiate the conditioning type of circumstance set forth in this norm, nor is it required that such tokens be subsumed under the same type of circumstance. The believer infers the derivative norms, *continuo ratiocinationis filo*, proceeding exclusively and in the abstract from the type of action "being kind":[6] *per modum conclusionum*, to use the words of Aquinas (*Summa Theologiae* (a), 1.2, q. 95, a. 2).

For this reason—because they are derived *a priori*—these normative systems may be classed as static normative systems (using Kelsen's terminology).[7]

[6] Cf. Wolff 1969, §§ 39, 43, 44. The examples just made are mine, not Wolff's. The reader may want to look at pars III ("De imperio et obligationibus atque juribus inde nascentibus": "On sovereignty, and on the obligations and rights that spring therefrom." On the Latin term *imperium*, see Section 3.6.3, footnote 21.), sectio I ("De imperio privato": "On private sovereignty"), caput II ("De Matrimonio, seu societate conjugali": "On matrimony, or the conjugal society"), § 854 ("De obligatione generis humani conservandi et coitu licito": "On the obligation to preserve the human race and the licit coitus"), to see how Wolff deduces, *continuo ratiocinationis filo*, the details of what a correct sexual conduct between spouses should be like. In § 39 Wolff writes, "*Lex* dicitur regula, juxta quam actiones nostras determinare obligamur. Vocatur autem *naturalis*, quae rationem sufficientem in ipsa hominis rerumque essentia habet." ("A norm [*lex*] is said to be a rule in accordance with which we are obligated to determine our actions. A norm [*lex*] is said to be natural when it finds its sufficient reason in the very essence of men and things.") In § 43 Wolff sets out as follows his *principium generale Juris naturae*: "*Lex naturae nos obligat ad committendas actiones, quae ad perfectionem hominis atque status ejusdem tendunt, et ad eas omittendas, quae ad imperfectionem ipsius atque status ejusdem tendunt.*" ("The natural norm [*lex*] obligates us to perform those actions that tend to the perfection of man and of man's condition, and to omit to perform those actions that tend to the imperfection of man and of man's condition.") Wolff goes on with these words: "Atque hoc *principium Juris naturae* generale ac universale est, ex quo continuo ratiocinationis filo deducuntur omnia, quae Juris naturae suae, prouti ex sequentibus abunde elucescet." ("And this principle of what is right by nature [the law of nature] is general and universal, and from it is deduced, following a continuous line of reasoning, all that by its own nature is right, as clearly emerges from what follows.") In § 854, Wolff, proceeding upon the *principium generale Juris naturae* (§ 43), and following a continuous line of reasoning (*continuo ratiocinationis filo*), comes at his conclusions in regard to the sexual behaviour of spouses. I will not get into this detail, for this book may end up in the hands of minors. If you want to find out more, you know where to find the original, in Latin. The English translations in this footnote are mine.

[7] Kelsen presents the following example of a static normative system: "For example, the norms 'you shall not lie,' 'you shall not cheat,' 'keep your promise,' and so on are derived from a basic norm of truthfulness. From the basic norm 'love your neighbour,' one can derive the norms 'you shall not harm others,' 'you shall help those in need,' and so on" (Kelsen 1992, 55). The German original: "Die Normen etwa: du sollst nicht lügen, du sollst nicht betrügen, du

By contrast, normative systems that develop as I have shown them to develop are systems that get inferred *a posteriori* from norms of conduct according to a process as follows.

Let us take the primitive norm "The well-off must aid the needy." This norm sets forth the type of circumstance "someone being well-off, plus someone else being needy"; every valid token of this type will get subsumed thereunder and stated as the second premise of a syllogism; so we might have, in the example, "Rob is well-off and Francis is needy"; in conclusion, the type of action "aiding" (conditionally connected in the primitive norm with the type of circumstance "someone being well-off, plus someone else being needy") will, by inference, become normatively required with respect to anyone who has actually and validly instantiated the type of circumstance: We will therefore have produced, by inference and *a posteriori*, the derivative norm "Rob (being well-off) must aid Francis (for she is needy)."

Normative systems, as I present them, are therefore clearly dynamic (in Kelsen's terminology again: cf. Kelsen 1934, 62–3; Kelsen 1960, 198–200) because they get inferred *a posteriori*. And unlike what happens in Kelsen's theory, both systems, as I have constructed them here, are dynamic: those derived from norms of conduct (in this section) and those derived from competence norms (in the following section).

In my understanding, a normative system is static when, given a type of action believed to be binding per se under certain conditions, any other type of action included in that type of action will also be assumed to be binding per se under the same conditions. For an illustration we can go back to the example adduced a moment ago, the norm "It is binding per se to be kind to ladies": From the type of action set forth in this norm, "being kind," four other norms of conduct were derived *a priori* (their types of action being "hats off," "bowing," "no foul language," and "no punching"); that is, they were derived independently of any valid tokens occurring or not occurring that would instantiate the type of circumstance ("having a social exchange with a lady") set forth in the initial norm which the type of action ("being kind") is conditionally connected with.

In my understanding, again, a normative system is instead dynamic when, given a norm **n**—whatever type of action is therein set forth, and whether **n** is a norm of conduct or a competence norm—no derivative norms can be inferred from **n** unless valid tokens obtain or occur in the reality that is which instantiate the conditioning type of circumstance set forth in **n**, and unless these tokens are subsumed under the same type of circumstance. The dyna-

sollst dein Versprechen halten usw., leiten sich ab aus einer Grundnorm der Wahrhaftigkeit. Auf die Grundnorm: du sollst die anderen Menschen lieben, kann man die Normen zurückführen: du sollst einen anderen nicht verletzen, du sollst ihm in der Not beistehen usw." (Kelsen 1934, 63).

mism, on my characterisation of dynamic systems, does not result solely from the reality that ought to be, but from this reality *and* from the fact of certain states of affairs obtaining—or certain events occurring—in the reality that is: Dynamic normative systems cannot be but *a posteriori*.

7.3. Proliferation from Competence Norms

A clear-cut distinction exists in legal literature between norms of conduct and competence norms. The distinction is fundamental even though from a conceptual point of view it is not so radical as most people claim, since competence norms are ultimately themselves norms of conduct.

The content of a norm of conduct is a compound type. Thus, a norm of conduct can contemplate any type of action (such as "not killing," "not stealing," or "shaking hands with one's right hand"), a type of action that will be believed to be binding per se anytime a relevant type of circumstance should get validly instantiated.

A competence norm is a norm of conduct whose type of action always consists in obeying. The type of circumstance with which a competence norm connects this type of action specifies who or what the obedience is to be given to (more on this in Section 8.2.1).[8]

Civil-law dogmatics identifies a kind of norm of conduct called a renvoi-norm. A renvoi-norm remits to external standards or methods the determination of its type of action. Imagine the following examples: "The well-off must aid the needy to the extent established by local usage" or "to the extent suggested by the charity programs set up by parish priests." In these cases the determination of the type of action "aiding" is remitted to external standards or methods.[9]

A competence norm is itself a renvoi-norm: It remits the determination of its type of action, "obeying," to qualified directives that are provided by the valid tokens (valid instances) of the conditioning type of circumstance set forth in the same competence norm.

Let me draw on the Bible for an example of a competence norm.

> And it came to pass after these things, that God did tempt Abraham, and said unto him, Abraham: And he said, Behold, *here* I *am*. [2] And he said, Take now thy son, thine only *son* Isaac, whom thou lovest, and get thee into the land of Moriah; and offer him there for a burnt offering upon one of the mountains which I will tell thee of. [3] And Abraham rose up early in the morning, and saddled his ass, and took two of his young men with him, and Isaac his son, and clave the wood for the burnt offering, and rose up, and went unto the place of which God had told him. [4] Then on the third day Abraham lifted up his eyes, and saw the place afar off.

[8] A good overview on competence norms in the contemporary debate can be found in Spaak 1994 and 2003.

[9] There are at least a broad and a narrow meaning of "standard." Here I use "standard" in its broader sense (which takes in the narrow sense). On this question, see Pattaro 1988.

[5] And Abraham said unto his young men, Abide ye here with the ass; and I and the lad will go yonder and worship, and come again to you. [6] And Abraham took the wood of the burnt offering, and laid *it* upon Isaac his son; and he took the fire in his hand, and a knife; and they went both of them together. [7] And Isaac spake unto Abraham his father, and said, My father: and he said, Here *am* I, my son. And he said, Behold the fire and the wood: But where *is* the lamb for a burnt offering? [8] And Abraham said, My son, God will provide himself a lamb for a burnt offering: so they went both of them together. [9] And they came to the place which God had told him of; and Abraham built an altar there, and laid the wood in order, and bound Isaac his son, and laid him on the altar upon the wood. [10] And Abraham stretched forth his hand, and took the knife to slay his son. [11] And the angel of the Lord called unto him out of heaven, and said, Abraham, Abraham: And he said, Here *am* I. [12] And he said, Lay not thine hand upon the lad, neither do thou any thing unto him: for now I know that thou fearest God, seeing thou hast not withheld thy son, thine only *son* from me. [...] [13] And Abraham lifted up his eyes, and looked, and behold behind *him* a ram caught in a thicket by his horns: and Abraham went and took the ram, and offered him up for a burnt offering in the stead of his son. [14] And Abraham called the name of that place Jehovahjireh: as it is said *to* this day, In the mount of the Lord it shall be seen. (Genesis 22:1ff.)

Abraham was an abiding nomic believer; in particular, he believed in and abided by the competence norm "It is binding per se to obey (type of action) God's every command (type of circumstance)."

The conditioning type of circumstance is validly instantiated through a token when God orders Abraham to sacrifice his only and beloved son, Isaac. Abraham, though painfully and tragically affected by what is to come, subsumes this token, God issuing an order, under the conditioning type of circumstance set forth in the competence norm (which Abraham has deeply internalised) and infers the norm "It is binding per se that I sacrifice Isaac to God," a derivative norm of conduct under which he is himself the actual duty-holder.

Abraham is driven to obey the derivative norm of conduct not because he believes its content ("sacrificing Isaac") to be binding per se (in fact he would consider the opposite content, "not sacrificing Isaac," to be binding per se), but because he believes obedience to God's commands (competence norm) to be binding per se (binding irrespective of their content), and "sacrificing Isaac" is the content of a command issued by God.

God's issuing an order drives Abraham to action because that is a valid token of the conditioning type of circumstance set forth in the competence norm which Abraham has internalised through socialisation processes (cf. Section 15.2.5), and on account of which he believes it binding per se to obey God's commands, meaning that he understands these commands to create norms.

Notice that the issuing of the subsequent order, "Lay not thine hand upon the lad, neither do thou anything unto him," is also a token which validly instantiates the type of circumstance set forth in the competence norm "It is binding per se to obey (type of action) God's every command (type of circumstance)."

The sequence of God's two orders is similar, in a way, to what happens with the second instantiation of the type of circumstance set forth in the first

norm of conduct considered in Section 7.2: This sequence is similar to the sequence of tokens "Loretta being in a state of need" and its cessation, "Loretta no longer being in a state of need (having found her way out of her troubles)." Indeed it might be said—in the manner of a voluntaristic theory—that with Abraham, God first wanted Isaac sacrificed and then no longer wanted this sacrifice. Or again it might be said—on the mental-reservation theory that is part of the voluntaristic theory of law—that God never wanted Isaac sacrificed in the first place, and that Abraham could learn of God's mental reservation only upon receiving God's second order, "Lay not thine hand upon the lad, neither do thou anything unto him."[10]

From the standpoint of a non-voluntaristic theory, however, a difference does exist between the two conditions Loretta finds herself in (being needy and being no longer needy) and the two orders that God directs at Abraham ("Sacrifice Isaac" and "Do not lay your hand on the lad"). In Loretta's case, a valid token of the type of circumstance occurs and then ceases to be; in God's case, two successive valid tokens of the type of circumstance occur, and the second token is incompatible with the first. We could say that with God's two valid orders the second somehow cancels out the first, causing it to cease to be. However, this is not the more appropriate way to explain what happens here: What we can say, actually, is that it is impossible to comply with both orders, because they are incompatible, and that Abraham no longer considers God's first order to be normative. The reason why he no longer considers it normative is a different matter having to do with the competence norm internalised by Abraham (a matter that jurists deal with under the heading "implicit abrogation").[11]

In conclusion, a competence norm is a norm of conduct: It is a renvoi-norm of conduct whose peculiar type of action consists in obeying anytime the type of circumstance "issuing directives, texts, or messages" gets validly instantiated. These directives, texts, and messages provide a content (or different contents at different times) for the type of action "obeying." The type of circumstance found in a competence norm sets forth who will issue the directives, texts, or messages to be obeyed; when, how, and on what matters these persons may do so; or even how the messages to be obeyed should be surmised from certain events or states of affairs. In ancient Rome, for example, people would not take momentous initiatives unless they had considered

[10] Even to this day there can still be found, under Article 116 of the German Civil Code (*Bürgerliches Gesetzbuch*), a provision made for mental reservation: "A declaration of intention is not void by reason of the fact that the declarant has made a mental reservation of not being in favor of the declaration made. The declaration is void if made to a person who is aware of the reservation" (*The German Civil Code*, art. 116). The German original: "Eine Willenserklärung ist nicht deshalb nichtig, weil sich der Erklärende insgeheim vorbehält, das Erklärte nicht zu wollen. Die Erklärung ist nichtig, wenn sie einem anderen gegenüber abzugeben ist und dieser den Vorbehalt kennt."

[11] On this, see, in Volume 5 of this Treatise, Sartor, Section 5.3.

the auspices drawn from birds' flights or animal entrails: It was the norm that they should act in keeping with the message drawn from such auspices. This was a competence norm: If the type of circumstance set forth therein was validly instantiated by birds' flights or by animal entrails, then these tokens would—by way of their valid instantiation—cause their supposed message to be viewed as normative, and to be complied with on this motive. The types of circumstance specified in competence norms are institutive of authority (Section 9.6). Indeed, obedience is due to the directives of authority, and in ancient Rome the authority of the gods or of fate was revealed through the auspices drawn from birds' flights or from animal entrails.

Let us now get back to my personal reality that ought to be, as introduced in the previous section. My normative system was developed proceeding solely from norms of conduct: It is made up of four primitive norms of conduct (**n**, **g**, **h**, and **i**) and three derivative norms of conduct (**n1**, **n2**, and **n3**).

Let us now add just one competence norm, **o**, to my personal normative system and observe how the system will become much more complex.

I will not say that my competence norm **o** is the same which Abraham believed in, the naive "It is binding per se to obey (type of action) God's every command (type of circumstance)." I am living in the 21st century, in a hyper-developed society where technology and science are pervasive: I am a rationalist, practical-minded believer, so my competence norm **o** will rather be a sophisticated "It is binding per se to obey (type of action) the most visited Internet horoscope (type of circumstance)." Therefore, let us now add to my personal normative system the primitive competence norm **o**, "It is binding per se to obey (type of action) the most visited Internet horoscope (type of circumstance)."

The most visited Internet horoscope—I take such horoscopes to be the highest authority—issues the directive **l**, "The well-off must give up all sexual activity and replace it with yoga exercises." Directive **l**, insofar as it proceeds from the most visited Internet horoscope, validly instantiates the conditioning type of circumstance set forth in **o**.

In turn, the conditioning type of circumstance set forth in **l** ("someone being well-off") finds a valid actual token in Rob.

Rob, whom I already hold to be bound per se to aid the needy, will come to think that it may be more convenient to be needy than wealthy. Rob's reasoning, however, is not deontologically oriented: It is not a normative reasoning. It is rather a utilitarian line of reasoning, teleologically aimed at furthering his own wellbeing.

Unlike Rob, I am a believer in **o** and will reason normatively by subsumption and inference as follows.

(*i*) Subsumption. The issuing of directive **l** is a valid token of the conditioning type of circumstance set forth in competence norm **o**: It is a directive validly issued by the most visited Internet horoscope.

(*ii*) Inference. It is binding per se to obey directive **l**; that is, **l**, too, is a norm: Its type of action ("giving up all sexual activity and replacing it with yoga exercises") will have to be performed whenever its conditioning type of circumstance ("being well-off") gets validly instantiated.

(*iii*) Subsumption. Rob's being well-off is a valid token of the conditioning type of circumstance set forth in **l** (which to me is a norm).

(*iv*) Inference. "It is binding per se that Rob give up all sexual activity and replace it with yoga exercises." This is a derivative norm of conduct, and I will call it **l1**.

My personal normative system—the reality that ought to be which I have internalised—now comprises ten norms: **n**, **n1**, **n2**, **n3**, **g**, **h**, **i**, **o**, **l**, and **l1**.

Of them, **n**, **g**, **h**, and **i** are primitive norms of conduct; **n1**, **n2**, and **n3** are derivative norms of conduct coming by subsumption and inference from the primitive norm of conduct **n**; **o** is a primitive competence norm. Let us look now at **l** ("The well-off must give up all sexual activity and replace it with yoga exercises"): First, this is a directive whose issuance is subsumed under the type of circumstance set forth in the competence norm **o**; second, in consequence of this subsumption we have (in addition to the major premise, "It is binding per se to obey the most visited Internet horoscope") the minor premise "**l** is a directive validly issued from this horoscope"; third, it follows, by inference from these two premises, that **l** ("The well-off must give up all sexual activity and replace it with yoga exercises") comes to also be a derivative norm of conduct. As for **l1**, this is in turn a derivative norm of conduct inferred from **l** upon subsuming Rob's being well-off under the type of circumstance set forth in **l**.

The believers whose normative systems contain at least one competence norm will thereby be equipped with an inferential engine with which they can develop and diversify their reality that ought to be faster than without such an engine, provided, however, that the same engine is fed by directives, or texts, or otherwise by qualified messages whose issuing validly realises (performs or instantiates) the conditioning type of circumstance set forth in the competence norm. By virtue of this norm-derivation process, a norm, be it a norm of conduct or a competence norm, can *create* derivative norm (norms of conduct or competence norms) and as such can be called the *parent norm* of these derivative norms (cf. Section 8.2.6.1). Once an inferential engine of this sort gets installed in the brain of a believer, we can say that authority (the generalised other: Section 15.3.4) has been therein installed.

Norms are strictly speaking individual phenomena because—granted that they exist—they exist in people's brains, even though the same people internalise them from their family, social environment, and culture. The external sociocultural world moulds people's personality and generalised other and their reality that ought to be, and does so reaching into the deeper strata of personality (cf. Section 15.3.4).

The norm-derivation processes—whereby we subsume valid tokens under conditioning types of circumstance and infer derivative norms from other norms (norms of conduct or competence norms)—are individual processes, too, and the personal normative systems (the reality that ought to be) these processes produce and develop in believers are likewise, strictly speaking, individual. But again, these individual norm-derivation processes take place in society, and the individual normative systems—the reality that ought to be they produce in human brains—are embedded in social settings that control these systems and cause them to be widely shared among the members of society (see Sections 8.1, 15.3, and Chapter 10). That a competence norm can be a parent norm to derivative norms of conduct as much as to derivative competence norms is intuitive. But note that a norm of conduct can be a parent norm to derivative norms of conduct (cf. Section 7.2) as much as to derivative competence norms; such is the case with the norm of conduct "Promises must be kept" (*Pacta sunt servanda*), for example, which can be a parent norm to norms of conduct as much as to competence norms (cf. Section 3.6.2).

Part Three

Family Portraits. Law as Interference in the Motives of Behaviour

The damaging attacks upon a prevalent system of Absolute Idealism that had degenerated into an academic orthodoxy, which were launched almost simultaneously early in the present [20th] century by Hägerström and his followers in Uppsala and by Moore and Russell in Cambridge, occurred in complete isolation from each other. Again, the development of various forms of what I will call "non-predicative" analysis of deontic and evaluatory sentences in the indicative, which began in England and the USA *between the First and the Second World War and has been pursued with such energy by so many able writers ever since, was initiated and has continued in complete ignorance of Hägerström's somewhat earlier and extremely thorough version of the same type of theory. Lastly, the "anti-metaphysical" evangelicism, which may perhaps now be described as the last word but two in much Anglo-Saxon philosophy, was anticipated, unknown to its English and American protagonists, by Hägerström in the slogan "*praeterea censeo metaphysicam delendam esse*."*

(C. D. Broad, *Memoir of Axel Hägerström*, 1964)

Hägerström was throughout his life essentially a highly religious and a highly dutiful man. He arrived, indeed, at what many would regard as a "nihilistic" analysis of morality and of religion. But, unlike many "analytic" philosophers, he had at any rate first-hand religious experience and first-hand experience of moral conflict and of acting from a sense of duty in face of serious obstacles, as the factual basis for his analyses. And, in spite of his "nihilistic" theories, he continued to the end to value genuine religion and genuine morality as springing from the deepest roots in human nature and bearing the finest flowers in human life.

(C. D. Broad, *Memoir of Axel Hägerström*, 1964)

Chapter 8

NO LAW WITHOUT NORMS

8.1. Family Portraits. A Normativistic Gallery: Axel Hägerström, Karl Olivecrona, and H. L. A. Hart 1961

8.1.1. A Caution for All Visitors

The kind of normativism maintained by the Uppsala School—a normativism occurring in similar terms in Hart 1961[1]—I have always considered to be the most satisfactory and adequate, the way I understand norms and their role in the machinery of law: Jerzy Wróblewski (1926–1990) used to tell me, "Enrico, Scandinavian legal realism is no longer cultivated in Scandinavian countries. It is now cultivated in Italy, with you." This was not necessarily a compliment (even if it was Jerzy's intention to make one). It may also be a token of commiseration, as in: "This malefic legal-philosophical trend, Scandinavian legal realism, has finally and fortunately disappeared from Scandinavia. But now a madman in Bologna, Italy—Enrico Pattaro—is regrettably pushing forward with the reckless ideas advanced by the Uppsala School."

Be that as it may, I feel comfortable in making the five points illustrated in the following Sections 8.1.2 through 8.1.6.

8.1.2. A Critique of Voluntarism in Favour of Normativism

Axel Hägerström developed a convincing critique of the voluntaristic theories of law, and showed that they give no satisfactory account of the idea of Ought (what throughout this volume I am calling "the reality that ought to be")[2] and

[1] The normativist Hart who appears in this gallery is Hart 1961, from which I will quote. What transpired since 1961—i.e., Dworkin's criticism of Hart, the replies made to Dworkin by several scholars, and Hart's *Postscript*, published posthumously in 1994 (Hart 1997), along with the ensuing debate (in the *Postscript* Hart makes important revisions to the views expressed in 1961)—resulted in a perceptibly modified picture. For this reason, the portrait of Hart chosen for this gallery is the portrait of him in 1961. I will comment in Section 8.3 on the modified picture as handed down to us by Hart in the *Postscript*.

[2] Hägerström's critique applies to exponents of different kinds of legal voluntarism. A few examples are Thomas Erskine Holland (1835–1926), Otto Friedrich von Gierke (1841–1921), Georg Jellinek (1851–1911), Rudolf Stammler (1856–1938), and John William Salmond (1862–1924). Cf. Hägerström, *Är gällande rätt uttryck av vilja?* of 1916 (an English translation of this paper appears in Hägerström 1953b, by C. D. Broad (1887–1971), under the title "Is Positive Law an Expression of Will?" The original Swedish version can be found in *Rätten och viljan: Två uppsatser av Axel Hägerström*, edited by K. Olivecrona: Hägerström 1961). The collection of writings by Hägerström, *Inquiries into the Nature of Law and Morals* (Hägerström 1953a), translated by C. D. Broad, and edited by Karl Olivecrona, is very useful, but it unfortunately

more generally of the factors in virtue of which a legal system stands, and stands through change, and operates—is in force—among a given people in a given territory.

Hägerström combined his metaethical and meta-juridical noncognitivism (his sharp criticism of the reification of the ideas of "norm," "obligation," "rights," "binding force of law," and the like) with a fecund understanding of the central role of the ideas of "norm," "obligation," "rights," and "binding force of law" in social life. Hägerström does not confine himself to a sociological and operative characterisation of norms; he also enters into an analytical determination of them, a conceptual definition, which he arrives at through an attentive logical and psychological scrutiny of the concepts of command and duty. There are reflected in this scrutiny the main tenets of Hägerström's theory of reality and of knowledge.[3]

Axel Hägerström's "antimetaphysical" philosophy proved much more open and farsighted in its approach to ethical and juridical questions than did logical empiricism,[4] and at the same time it foreshadowed some important and largely influential views that H. L. A. Hart would successfully maintain some forty years later in his 1961 *Concept of Law*.

In 1955, six years before publishing *The Concept of Law*, Hart brought to the public his evaluation of Hägerström's work, presenting Hägerström as a forerunner, so to speak, of his own normativism:

There is [in Hägerström's work] a most original examination of the character of those fundamental constitutional rules to be found in every legal system which specify the legislative organ and what must be done if valid enactments are to be made by it. Hägerström shows that the terminology of will or command used by legal positivists leads to neglect of the special character of such fundamental or basic rules; either the legal positivists will treat the commands of the person having the *de facto* power as law and so will neglect the fact that in any but the most extreme despotism such commands will only rank as laws if they comply with antecedent constitutional rules as to the manner and method of enactment; alternatively recognizing the importance of these fundamental constitutional rules the legal positivist falsifies their character by treating them as commands or "expressions of the will" of members of the community. But no one has ever willed or commanded that what the King in Parliament enacts shall be law; it is a rule (of

contains a few mistranslations that have contributed to making Hägerström's thought difficult to understand—a thought whose prose, to make matters worse, is in its original language not infrequently recondite. Some of these mistranslations I mention in Pattaro 1974, 80–104. I have sometimes found it necessary to avoid Broad's translation.

[3] Cf. Pattaro 1974, 29–66. Hägerström devotes to this scrutiny much of his chief work on the philosophy of law, *Till frågan om den objektiva rättens begrepp. I. Viljeteorien* (Hägerström 1917, translated in Hägerström 1953a as "On the Question of the Notion of Law: The Will-Theory," a title I would rather see translated as "On the Problem of the Concept of What Is Objectively Right. I. The Will-Theory"), and he also devotes to it a series of posthumously published lectures (Hägerström 1963).

[4] Logical empiricism, in its initial phase at least, stopped short and developed only the critical and trenchant side of analytical reflection on ethics and law. This was not the case with Hägerström and the Uppsala School (Pattaro 1974, 58ff.).

course much vaguer than this verbal formulation suggests) which has come to be accepted and rests on a whole mass of heterogeneous factors such as tradition, inertia, patriotism, fear. To compare fundamental rules of this kind to commands or acts of the will is, an "anthropomorphization" and is as absurd as supposing "that a moral climate depends on a popular resolution to maintain it." This is *a real contribution* to the elucidation of the feature which Kelsen considered was at the root of all legal systems and which he termed the *grundnorm*. (Hart 1955, 372–3; italics added on second occurrence, in original on all other occurrences)

So then, if I am a madman, I feel like I am in good company.

8.1.3. Norms versus Commands

8.1.3.1. Diversity among the Contextual Requirements

There are, in Hägerström's view, crucial differences between norms and commands (cf. Section 9.3). Among these differences, in my restatement of them, are those illustrated in Sections 8.1.3.1 through 8.1.3.4.

There need not be, in order for a norm to work (as a motive of behaviour, I should add), any special relationship between the person "issuing"[5] the norm and those the norm applies to. By contrast, a command—meaning a directive that is effective due to suggestion—does require such a special relationship between issuer and receiver: "With commands, the imperative expression [literally, the commanding expression] works through a special relation of the receiver to the commanding person" (Hägerström 1917, 115; my translation).[6]

Norms are not commands but "independent imperatives" in the sense that Olivecrona ascribes to this expression (Olivecrona 1939, 42ff.).[7]

Hart, too, would emphasise that the contextual requirement for a command to be effective is a "face-to-face situation," where a relationship obtains

[5] This is the usual form of expression, even if, properly speaking, norms cannot be issued, or enacted (cf. Section 8.2.4).

[6] The Swedish original: "Vid befallningen verkar befallningsuttrycket genom mottagarens säregna relation till den befallande." Cf. Hägerström 1953c, 193. In my terminology, in Hägerström's thought, and in the thought of Olivecrona (Section 9.3), a command is a directive that is effective due to suggestion. Hägerström dedicates Chapters 4 through 8 of *Till frågan om den objektiva rättens begrepp* to a characterisation of commands as clearly distinguished from norms. Hart entitles Chapter 2 of *The Concept of Law* "Laws, Commands and Orders," where he distinguishes, among other things, orders supported by threats (a topic I treat in Section 9.4) from commands (especially the commands of military authorities; Hart 1961, 19–20). Hart enters into this analysis to draw in the ensuing chapters (and similarly to Hägerström) a clear distinction between "rules," on the one hand, and "commands" or "orders," on the other. That Hart 1961, 132–7 (in a section devoted to the varieties of rule-scepticism) should discuss American legal realism at length without even making any mention of Scandinavian legal realism (which last he knows well: cf. Hart 1955; 1959; 1961, 10, 233, 235, 240, 243) is perfectly coherent with his acknowledgment that Hägerström and Olivecrona give a real contribution to a satisfying conception of normativeness. Cf. Section 8.1.6.

[7] Olivecrona published two editions of *Law as Fact*, the first in 1939 (Olivecrona 1939) and the second in 1971 (Olivecrona 1971). In reality we have to do here with two different books.

between giver and recipient, a relation consisting of a "mere temporary ascendancy" of the former over the latter.[8] Norms, on the contrary, do not require any face-to-face situation: Their characteristic is to be "standing," "persistent," "enduring and settled," and that independently of any relation between issuer and receiver (Hart 1961, 23 and 24). It is worth noticing, with "standing" as used by Hart, that Olivecrona writes of laws (in Swedish) that they are *fristående imperativer* (literally equivalent to the English "freestanding imperatives"): He means by this Swedish expression what he calls "independent imperatives" in his English writings (Hart 1961, 21, 23, 24; Olivecrona 1939, 42ff.; Olivecrona 1966, 132ff.).

Hart, under the heading "Scandinavian legal theory and the idea of a binding rule," notices the following about the normativism of the Uppsala School:

> The most important works of this school, for English readers, are Hägerström (1868–1939), *Inquiries into the Nature of Law and Morals* (trans. Broad 1953) and Olivecrona, *Law as Fact* (1939). The clearest statement of their view on the character of legal rules is to be found in Olivecrona [...]. His criticism of the predictive analysis of legal rules favoured by many American jurists (see op. cit., pp. 85–88, 213–15) should be compared with the similar criticism in Kelsen, *General Theory* (pp. 165ff., "The Prediction of the Legal Function"). It is worth inquiring why such different conclusions as to the character of legal rules are drawn by these two jurists in spite of their agreement on many points. (Hart 1961, 233)[9]

8.1.3.2. What Is Objectively Right: The Internal Point of View, a Point of View Internalised in the Brains of Believers, and Which Manifests Itself in Their Use of a Typically Normative Language

With norms, but not with commands, the required action is regularly "represented as the *right* or *correct one* under the given circumstances" (Hägerström 1917, 74; my translation; cf. Hägerström 1953c, 144, and Hart 1961, 56–7).[10]

With norms, there is in the mind of those a norm applies to (if they are believing duty-holders, I should add: nomia, Section 6.5) a "consciousness of an obligation [*ett medvetande om skyldighet*]" to do the required action, because this action is the right one, and this consciousness is connected with a feeling of duty. Let me stress here, against so many misinterpretations of Hägerström's thought, that what is crucial in his conceptual characterisation

[8] Oliverona called this temporary ascendancy by a more specific name, "suggestion": "Austin's definition of a command is mistaken. He says: 'If you express or intimate a wish that I shall do or forebear from some act, and if you will visit me with evil in case I comply not with your wishes, the expression or intimation of your wish is a command.' The *suggestive* character of the command is overlooked. Instead Austin lays stress on *threats*, which are often added to the command but must be distinguished from the command itself" (Olivecrona 1939, 213).

[9] An attempt to carry out the inquiry Hart refers to may be found in Pattaro 1966, 1968, 1971, 1974, and 1982.

[10] The Swedish original: "Handlingen föreställes reguliärt som den *rätta* eller *riktiga* under föreliggande omständigheter" (Hägerström 1917, 74).

of norms is the consciousness of an obligation (*ett medvetande om skyldighet*); also very important is the feeling of duty, because norms as motives of behaviour depend for their efficacy on the intensity of this feeling, but then Hägerström does not identify norms with any attendant feeling of duty: He refers to norms not as feelings of duty, but as states of a consciousness of duty or as ideas of norm. (Whether he is right or wrong in making this claim is a different matter.)

And it is on this conception of norm that Hägerström bases the distinction between norm and command, a distinction that he considers essential to our understanding of the legal phenomenon (as Hart does too, writing some time later than Hägerström; we saw in Section 8.1.2 how Hart appreciates the work of Hägerström). There is not a consciousness of a duty in the case of the recipient of a command, even if this person experiences feelings of conative impulse and of internal compulsion similar to the feelings of duty experienced by someone having a consciousness of an obligation. This consciousness (this belief) is what from the internal point of view (in Hart's terminology) makes the difference between norm and command in an agent who acts from a norm versus an agent who acts from a command (Hägerström 1953c, 193; cf. Hägerström 1917, 116).

With reference to a norm, but not with reference to a command, people (the believers, in my terminology: doxia, Section 6.2) use a peculiar kind of apophantic sentence: They state the existence of an obligation, or duty, as in "Holding this behaviour *is* my duty [*denna handling* är *min plikt*]" or "I *am* under an obligation to act thus [*jag* är *pliktig att så handla*]" (Hägerström 1953c, 132; cf. Hägerström 1917, 64–5).

In a similar vein, Hart would write that when we have a norm (a "rule," in Hart's usage), its matter-of-fact existence finds its characteristic expression in the use of normative language in sentences like "I (You) ought to [...]," "I (You) must do that," "That is right," "That is wrong" (Hart 1961, 54, 55, 56).

Someone looking to have a grasp of the conception of norms that Hägerström developed in the second decade of the 20th century will find it quite helpful to compare this conception with the theory of the generalised other that Hans Gerth and Charles Wright Mills presented in 1953 following in the wake of George H. Mead (1863–1931). I will get to this theory and give it a brief statement in Sections 15.3.2 and 15.3.4.

8.1.3.3. Universalisability of Norms (Catholodoxia)

People (the believers, in my terminology: doxia, Section 6.2) take it for granted that norms, but not commands, hold for everyone within a given group.

As Hägerström puts it, "it may be so that, in my conception [as a believer], a certain action belongs to this system [to the reality that ought to be, in my usage] given the situation I find myself in. But I will always believe that the same action, given the same situation, would be the right one [*det rätta*] for anyone else

whose individual profile is the same as mine [literally, for anyone "with the same individual determination": *med samma individuella bestämdhet*]" (Hägerström 1917, 85, my translation; cf. Hägerström 1953c, 157).[11] Whence the moral indignation and disesteem for people who fail to perform the right action.

As Hart puts it, when a rule exists, a certain behaviour is regarded "as a general standard to be followed by the group as a whole" (Hart 1961, 55).

In these and other like passages, Hägerström and Hart make at least an implicit reference to universalisability (which in Section 10.2.1 I call catholodoxia).

8.1.3.4. Justified Reaction to Transgression (Dikedoxia)

Hägerström says that, with norms, the idea of obligation makes people (the believers, in my terminology: doxia, Section 6.2) regard it as right to coerce the duty-holder to perform the behaviour he or she has omitted to perform (a behaviour that was due), and as an obligation for the duty-holder to submit to such coercion. This is so because the idea of obligation makes people regard the performance the noncompliant duty-holder is coerced to as a performance equivalent (*ekvivalent prestation*) to the right action the duty-holder was under an obligation to perform and did not.[12]

[11] The Swedish original: "Det må så vara, att det enligt min uppfattning hör till detta system ett egenartadt handlande under den för mig föreliggande situationen. Men alltid menar jag därvid, att för en annan person med samma individuella bestämdhet och i samma situation skulle samma handlande vara det rätta" (Hägerström 1917, 85). Ibidem, 116: "Men i det befallningsuttrycket blir antaget som real bestämning hos ett handlingssystem, blir idéen om ett visst handlande såsom det för annan person i ett föreliggande fall rätta möjlig, och befallningsuttrycket verkar vid idéens inträdande en viljeimpuls äfven i afseende å annan persons handlande, framträdande i sådant som den moraliska indignationen och rättskänslans kraf *och gifvande ett medvetande om skyldigheten för annan person att så handla*" (italics added). Here is Broad's English translation: "But, in so far as the expression of command is taken as a real property of a system of conduct, the idea becomes possible of a certain action being the right one for another person in a given case. Here the expression of command produces a conative impulse in reference to another person's action, when the idea of its rightness occurs. And in such cases the conative impulse manifests itself as moral indignation and the demands of the sense of justice [of sense for what is right: *rättskänslans*], and *it gives rise to a consciousness of an obligation on the part of the other person to act this way*" (Hägerström 1953c, 193; italics added). The italicised words in the English translation can prove ambiguous: It might be questioned whether "on the part of the other person" should logically attach to "consciousness of an obligation" or only to "an obligation." If the reference is to "consciousness" we can take this to mean that there arises *in the other person* a consciousness of an obligation to act in such and such a way. In the Swedish, instead, Hägerström is saying that there arises in *me* a consciousness of an obligation for the other person to act in such and such a way. Thus, the difficulty in reading Hägerström (whose language is univocal on this occasion) is compounded, in translation, by an ambiguity of expression that may cause the reader to misinterpret.

[12] There is a difference between "right coercion" and "just coercion." Cf. Section 10.2.2.

As Hart puts it, when a rule exists, not only do we have a convergence or identity of behaviours within the group, but also deviations from standard behaviour are regarded "as lapses or faults open to criticism," and that criticism is not just "in fact made, but deviation from the standard is generally accepted as a *good reason* for making it." In other words, criticism is considered "legitimate or justified" (Hart 1961, 54–5, 112).

With commands, in contrast, any coercion attached to disobedience will be considered to be merely a fact without normative qualifications.[13]

8.1.4. In What Sense Can a Norm Be Said to Exist (Doxia)

Hart states that "if a social rule is to exist *some* at least must look upon the behaviour in question as a general standard to be followed by the group as a whole. A social rule has an 'internal' aspect, in addition to the external aspect which it shares with a social habit and which consists in the regular uniform behaviour which an observer could record" (Hart 1961, 55; italics added). He also finds that the statement that someone has or is under an obligation implies the *existence* of a norm (of a "rule," in Hart's usage): "There is involved in the existence of any social rules [social norms] a combination of regular conduct with a distinctive attitude to that conduct as a standard" (Hart 1961, 83).

[13] The Swedish original: "Vidare för pliktidéen med sig, att underkastelsen under ett tvång, som framstår som ekvivalent prestation till ett uraktlåtet rätt handlande, kännes såsom något, hvartill man är skyldig, vare sig det gäller en själf eller andra. Är en gång, såsom fallet är vid pliktidéen, befallningsuttrycket vordet en real bestämning hos ett handlingssystem, öfverföres det på det tvång, som fattas som ekvivalent med det uraktlåtna handlandet i enlighet därmed. Då verkar också i ett föreliggande fall idéen om tvångets rätthet en viljeimpuls mot detsamma—en känsla af skyldighet i afseende å detsamma och därmed också föreställning om real skyldighet. För befallningsmottagaren såsom sådan står det med befallningen i fall af olydnad förbundna tvånget blott som ett faktum, hvars verkningar i afseende å honom själf han söker komma undan så mycket som möjligt. I afseende å andra blir tvånget för honom af betydelse endast genom särskilda intressen, positiva eller negativa" (Hägerström 1917, 116–7). This is Broad's translation, with square brackets added to suggest, for certain Swedish terms, translations different from Broad's: "Moreover, the idea of duty carries with it the thought that submission to a compulsion [coercion: *tvång*], which appears as an equivalent reparation [performance: *prestation*] for an omitted right action, is something obligatory, whether it concerns oneself or another. Once the expression of command has become a real property of a system of conduct, as happens in the case of the idea of duty, it is transferred to the compulsion [coercion: *tvång*] which is regarded as equivalent to the omission to act in accordance with that system. So in any actual case the idea of the rightness of the compulsion [the rightness of coercion: *tvångets rätthet*] produces a conative impulse towards it, *viz.*, a feeling of obligation in regard to it and, along with this, also an idea [representation: *förestallning*] of real obligation. For the recipient of a command as such the compulsion [coercion: *tvång*] which is attached to the order, in case of disobedience to it, is merely a fact, whose consequences as regards himself he seeks to avoid so far as may be. In reference to others compulsion [coercion: *tvång*] is significant for him only through his special interests, positive or negative" (Hägerström 1953c, 194).

Regular conduct is the external aspect of norms. Instead, the attitude of regarding conduct of this type as a standard is the internal aspect of norms (it is a belief, as I would put it). The internal aspect is that which makes the difference between norms (rules, in Hart's usage) and habits (in Hart's usage). Social rules and social habits would seem to be joined by their external aspect (a regular conduct) in that both are social. Or, more appropriately perhaps: The regular conduct is qualified by the internal aspect (a normative attitude) where rules are involved but not where habits are involved.[14]

Note that in civil-law literature the distinction is traditionally made in legal custom between, on the one hand, the external, material aspect of it, meaning regular conduct (*usus agendi*), and, on the other, the internal, spiritual, or psychological aspect, meaning the normative attitude to the conduct in question (the *opinio juris seu necessitatis*)—in my terminology, the belief that it is binding per se to hold the behaviour in question. (See the definition of "custom" provided in Section 6.1.)

We need to be clear on the use of the term "psychological" in speaking of norms. In my use, the word "psychological" serves to make two points, one in the negative and the other in the positive: (*a*) in the negative, norms do not have a reality of their own (for example, a reality outside of space and time, à la Kelsen; cf. Section 14.6, or a reality *in rerum natura*, roughly in the manner of natural-law theories), and (*b*), in the positive, norms exist in human brains, minds, psyches, or souls.[15]

In the *psyche* of people, and hence from a *psychological* point of view, there are feelings, of course, but not only that: There are also the will, beliefs, and ideas (even hypostatised ideas); there is *ett medvetande om skyldighet*, "a consciousness of an obligation," as Hägerström says in discussing the state of mind of those who (in Hart's usage) *accept* a norm. These ideas, says Hägerström, result from a combination of *föreställning* ("representation") and a *viljeimpulse* ("conative impulse")—a phenomenon occasioned in us through social conditioning (cf. Section 15.2.5). And again, the feelings of restriction or compulsion connected with this phenomenon are not in themselves norms, but are rather a typical, and important, accompaniment to them (cf. Section 8.1.3.2, and Pattaro 1974, 138–40).

In Section 6.5, on nomia, I made the distinction between abidance and deviance, a distinction relevant to the *efficaciousness* that norms (beliefs) have on believing duty-holders. Norms exist (doxia), and nomia subsists, in the abiding duty-holder no less than in the deviant duty-holder (each of these two

[14] My conception of the distinction between norm, habit, and practice, and the terminology I use to express this distinction (a terminology different from Hart's), is specified in Section 6.1.

[15] The last two words ("minds" and "souls") are perhaps less crude than the first; but then, even Hart lets in a "putting into the *heads* of ordinary citizens" in discussing the "accepting of rules by the populace" (Hart 1961, 59; italics added).

characters to be understood according to the definitions of them already provided). The greater or lesser efficaciousness of norms as motives of behaviour in nomic subjects will depend on the different contexts surrounding the believing duty-holder and on the competing motives of behaviour (or temptations, in the teaching of the Church) that these contexts will cause the duty-holder to have to deal with or to address. Now, in these cases a norm's efficaciousness on a believing duty-holder will depend on the greater or lesser force of the duty-holder's sense of duty.

8.1.5. Constitutional Norms (Hägerström and Olivecrona) and the Rule of Recognition (Hart)

Hägerström's and Olivecrona's distinction between commands and norms, as well as Hart's later distinction between commands and rules, is meant to show that law, as a system of social guidance and control, cannot be given an account without having recourse to the concept of "norm," and specifically to a concept of norm as Hägerström, Olivecrona, and Hart (1961) understand that concept (and as I do, too, following in their footsteps; but recall that Hart uses "rule," not "norm," to express this concept).

A different matter, at least in part, is the question whether the existence of a modern, complex municipal legal system is based on the existence of an ultimate and supreme rule of recognition, a rule serving the function that Kelsen assigned to his presupposed basic norm (in which regard, as is known, a wide debate has developed that was set off by the criticism that Ronald Dworkin addressed to Hart). Here I take up briefly Hart's rule of recognition only to state a parallel between what he maintains with reference to it and what Hägerström and Olivecrona maintain with reference to constitutional norms. The comparison is designed to confirm that in the line of thought represented in the family portrait of my normativistic gallery there can be no law without normativeness: No law without norms, as the title to this chapter reads (even if norms are not enough: see Chapter 9).

Let us take what Hägerström writes about a hypothetical society based on commands versus another based on norms and compare this account in broad strokes with how Hart similarly imagines things to be if a hypothetical King Rex ruled through habitually obeyed commands rather than on the basis of an actually internalised competence norm (an "accepted rule of recognition," in Hart's usage).

The continuity and persistence of law, as well as legal limitations on legislative power, belongs only to a society based on norms: No such continuity and persistence is possible in a society based on commands (Hägerström 1917, 117–22; cf. Hägerström 1953c, 194–201; Hart 1961, 50ff., 56ff., 97–8).

As Hägerström observes, in every case of state domination (*herravälde*; cf. the German *Herrschaft*: Section 10.2.5), making exception for pure despotism

and mob rule, the persons who wield de facto *power* have above them rules endowed with an ideal force (*över sig regler med ideell kraft*; these kinds of rules are competence norms as I characterise them: Sections 7.3, 8.2.1, and 9.6), so that on the basis of these norms alone, or in accordance with them, exercise of de facto *power* can take place (Hägerström 1961, 76; cf. Hägerström 1953b, 34–5).[16]

Norms precede de facto *power*, if we understand *power* as an actual ability to determine people's behaviour, an ability based neither on suggestion nor on an actual or potential recourse to punishment and reward. As private individuals making claims on other individuals must appeal to the law (to what is right, as I would say; cf. the Swedish *rätt*) if they want to have their rights realised, so the political authority must seize on the existing constitution if the regulation of social relations the same authority sets up is to carry any force in society (Hägerström 1961, 72; cf. Hägerström 1953b, 30).[17]

Olivecrona observes, in the lead of Hägerström, that the effectiveness of legislation "results in the first place from the general reverence in which the constitution is held." In virtue of such an attitude toward the constitution, people are predisposed to obey. It is only necessary to tell them how they have to behave. They will obey on condition that they are told to do so in the proper form, that is, in accordance with the constitution's competence norms. People will obey if they are told to do so by those who, like the lawgivers, are

[16] From here on out in this section I will italicise the word *power* because, if I want to avoid misleading the reader on the scholars I refer to, I will have to use it in a sense equivalent not to that specified in Section 9.4 (where I discuss the concept of "power" in the sense currently attributed to this word in sociology), but to that specified in Sections 7.3, 9.6, and 10.2.6 (where I discuss, instead, the concept of "authority"). Indeed, the *power* Hägerström and Olivecrona refer to is a *de facto* power which the people vested with a position of authority have on believing duty-holders (nomia: Section 6.5), in that duty-holders are believers (doxia: Section 6.2), i.e., they have internalised a competence norm. In my use of "power" (Section 9.4), instead, a use that falls in line with sociological usage, this word designates the power to compel people by threatened evils or promised rewards.

[17] The Swedish original: "Är det icke så, att likaväl som den enskilde i sina fordringar på andra enskilda för att kunna realisera sina rättigheter mäste åberopa sig på gällande rätt, måste också den politiska auktoriteten vid sina regleringar av samhälleliga förhållanden stödja sig på bestående konstitution, för att de skola få kraft?" (Hägerström 1961, 72). Here is Broad's English translation of this passage: "Is it not true that, just as the private individual must appeal to the positive law [to valid law, or law in force: *gällande rätt*] when making claims on other individuals if he is to get his rights [in order that his rights may be realised: *för att kunna realisera sina rättigheter*], so too must the political authority base himself on [seize on: *stödja*] the existing [subsisting: *bestående*] constitution in making his regulations for social relationship *if those regulations are to have the force of law?* [in order for those regulations to have force?: *för att de skola få kraft?*]" (Hägerström 1953b, 30; italics added). This translation may prove ambiguous, especially in the final italicised excerpt, because here Hägerström speaks of the conditions under which regulations will have force (*kraft*), i.e., will be internalised as motives of behaviour (to put it in my words).

in a key position "to use those formalities, which, considering the psychological situation in the country, are required in order to give practical effect" to laws (Olivecrona 1939, 52–7, 173ff., 218ff.; cf. Sections 3.4, 7.3, and 9.6).

It is not a de facto *power* of the authorities that creates norms; on the contrary, it is the existence of norms (in people's brains, I should add) that creates and preserves the authorities' de facto *power* (the ability just mentioned). Constitutional norms on the exercise of *power* are the actual basis of an actual *power*, and not vice versa. Certain people, because they are placed in a position of authority in accordance with the constitution's competence norms, have a de facto *power* to determine other people's behaviour.

Legislators enact laws that are complied with and courts pronounce rulings that are carried out (in this sense legislators and courts both possess actual *power*, in that both succeed in getting done what they request), and they are able to do so because they act as legislators and judges in accordance with the constitution's competence norms, and because the citizens at large have internalised these norms as binding per se. The citizens comply with laws and rulings, not because there is somebody's personal command or will behind laws and rulings, but because these last are enacted and pronounced in accordance with the constitution's competence norms (Hägerström 1917, 117–8; cf. Hägerström 1953b, 194–6).

Similarly to Hägerström, Hart would maintain forty years later that only the existence of norms (rules, in his usage) can account for the continuity of *power*, the persistence of laws despite the fact of changing legislatures, and the legal limitations on legislative *power*: There is specified in the accepted rule of recognition who has the right to enact laws and who is entitled to succeed to a legislator; there is also specified that the laws are in force regardless of the legislator's personal history; and there is specified, too, which forms and limits are to be observed for certain enactments to become law.

These fundamental rules, as Hart also calls them (Hart 1961, 59, 61, 149–50), have a factual existence. Hägerström calls them constitutional rules (*konstitutionella regler*; cf. Hägerström, 1961, 72), and also fundamental norms, or again norms on the exercise of *power*.

Legislators accept and acknowledge these norms when they enact laws in accordance with them. So do courts when they apply laws passed in accordance with these norms. So do experts when they advise ordinary citizens on the basis of the laws enacted in compliance with these norms. So do ordinary citizens when they acquiesce in the laws and rulings of legislators and courts, and in the opinion of experts such as jurists, practitioners, and scholars—in the opinion of legal doctrine, or *scientia juris* (Hart 1961, 50ff., esp. 59–60, 60ff., 64ff., 97ff; cf. Pattaro 1974, 178–200).[18]

[18] *Scientia juris* is Peczenik's term for legal doctrine or legal dogmatics; in fact, it is the title he chose for Volume 4 of this Treatise.

Hart speaks in this regard not so much of constitution (Hägerström and Olivecrona do) as he speaks of rule of recognition (more specifically, he speaks of rules of recognition, change, and adjudication; Hart 1961, 92ff.), which he understands to be the best replacement for Hans Kelsen's puzzling presupposed basic norm.

8.1.6. Misinformation about Scandinavian Legal Realism

There is still, in the world of legal philosophy and general jurisprudence, a relapse into misinformation with regard to Scandinavian legal realism. Here is an example from 2001:

> Some positivists like Austin and the Scandinavian Realists are *reductionists*. For them, law is explained by social facts in the sense of being reducible to social facts. Austin reduces law to power and habits of obedience. The Scandinavian Realists reduce law to predictions of untoward consequences in the event of non-compliance. Hart explicitly rejects all reductive accounts because they define out of existence, in the sense of having no room for, an essential feature of law, namely the internal point of view. [...] All positivists embrace the Social Fact Thesis, the claim that while law is a normative social practice it is made possible by some set of social facts. Positivists differ from one another with respect to (1) the relevant social facts and (2) the relationship between those facts and law. Austin advocates a reductive account in terms of power and habits: the Scandinavians are reductionists in terms of predictions. (Coleman 2001a, 116)

Hart 1961, instead, wrote this on the position that Scandinavian legal realism takes with regard to the reduction of law to predictions.

> What then is the crucial difference between merely convergent habitual behaviour in a social group and the existence of a rule of which the words "must," "should," and "ought to" are often a sign? [...] In the case of legal rules it is very often held that the crucial difference (the element of "must" or "ought") consists in the fact that deviations from certain types of behaviour will probably meet with hostile reaction, and in the case of legal rules be punished by officials. [...] It is obvious that predictability of punishment is one important aspect of legal rules; but it is not possible to accept this as an exhaustive account of what is meant by the statement that a social rule exists or of the element of "must" or "ought" involved in rules. To such a predictive account there are many objections, but one in particular, which characterizes a whole school of legal theory in Scandinavia, deserves careful consideration. [...] We see that rules are involved in this activity in a way which this predictive account leaves quite unexplained. For the judge, in punishing, takes the rule as his *guide* and the breach of the rule as his *reason* and *justification* for punishing the offender. He does not look upon the rule as a statement that he and others are likely to punish deviations, though a spectator might look upon the rule in just this way. (Hart 1961, 10)

And indeed Olivecrona—to whom Hart 1961, 10 and 233, refers as an important advocate of anti-predictivism—wrote the following in 1939 about the predictive account that Arthur L. Corbin (1874–1967) provides of normativeness as it takes shape in the concept of "a right."[19]

[19] Arthur L. Corbin contributed to American legal realism. Cf. Twining 1973, 27–34; Fisher, Horwitz and Reed 1993, 80–1; Rumble 1968, 189–90. On American legal realism, see also (but with no mention of Corbin) Summers 1982.

As an example of the confusion between the right and the actual possibility of bringing a successful action may be cited the essay "Conditional Rights" by Arthur L. Corbin in the Law Quarterly Review 44 (1928). [...] "[...] Both Right and Privilege express juristic concepts and denote a jural relation, because both, when used with respect to two persons, *are predictions* (my italics) of societal conduct in accordance with a rule of uniformity. — — As defined above, to say that you have a Right against me means that on the existing facts we can predict with reasonable certainty that you can get societal aid to control my conduct."

The identification of *rights* with *predictions* is an obvious mistake. What we mean by a right is definitely not what we mean by a prediction. If different persons made different predictions about the same case, would there be as many different rights? Do the law-givers make predictions about the actions of the judges when they lay down rules about how rights are to be acquired, transferred etc.? Certainly not. They *regulate* the future actions of the judges. Nor do the judges make predictions when they "determine rights." The judgment cannot be a prediction about what the judge is going to do in the case! Without doubt we mean by rights something other than predictions. Perhaps the right may be the *facts* on which predictions of this sort are reasonably based? No. These facts are many and of varying character. They include the content of the law, the facts constituting a legal title, the personalities of the witnesses and judges, the ability of the advocates, the economic position of the parties etc. etc. What we have in mind when speaking about rights cannot be this mass of heterogeneous facts. Actually we mean that the right is *created* by certain facts within this group, viz. those which make up the legal title. (Olivecrona 1939, 213–4)

Further, there is in Olivecrona 1971, 27–62, a perspicuous outline of the various orientations that had been labelled "legal positivism," or that had so labelled themselves. He distinguishes among these orientations the English theory, the French theory, and the German theory and different meanings of the term "legal positivism." A discussion has been underway for the last few decades in the Anglo-Saxon area on some major developments in legal positivism, and several distinctions have been drawn, such as that between inclusive and exclusive legal positivism (see, in Volume 4 of this Treatise, Peczenik, Sections 4.3 and 4.4, and, in Volume 11, Postema, who treats the topic more extensively). Olivecrona's outline seems to come of use in connecting this current debate with its historical antecedents.

Finally, I suspect that some scholars base their judgment of Scandinavian legal realism on Hart's 1959 review of Alf Ross's *On Law and Justice* (Ross 1958, published as a translation of *Om Ret og retfærdighed. En indførelse i den analytiske retsfilosofi*, of 1953; see Ross 1971). Indeed, Hart's review is quite critical, and justifiably so in many respects, though not in all. Thus, the title of the review, "Scandinavian Realism," may have led some hurried readers to attribute to the Uppsala School en bloc the criticisms that Hart in reality addresses only to Alf Ross, and that not fully with reason.

True, Hart starts out in his review by grouping together Hägerström, Lundstedt (1882–1955), Olivecrona, and Alf Ross as taking an antimetaphysical approach. This collective judgment can in fact apply in different ways to each of these scholars. But the predictive conception of law is attributed only to Alf Ross, and certainly not to Hägerström and Olivecrona, as Hart himself clearly and thoroughly illustrates on more than one occasion: These

clear and correct evaluations on the part of Hart I already referred to in this chapter.

It must be observed, further, that Ross's predictive theory needs to be analysed and assessed more carefully than Hart does. Certainly, Ross upholds a predictive theory (in my opinion a theory that goes off course), but his predictive theory is concerned with legal doctrine, not with norms.[20] Ross attributes a predictive function to legal doctrine because he is looking to make legal doctrine scientific, in line with the criteria of scientificity set out by logical empiricism as requisites for empirical science.

Proceeding upon this premise, Ross argues legal doctrine to be made up of predictions about the judgments that will be handed down by the courts. Notice that Ross finds this brand of legal doctrine to be ultimately concerned with the country's valid law (the law in force in the territory of that country), and "valid law" he understands to be a "shared *normative ideology* of judges when they act in the role of judges" (Ross 1958, 75; Ross 1971, 90; cf. Section 10.2.4, footnote 35). Ross's concept of the judges' normative ideology does not seem to me to fall too far from Hart's concept of the internal aspect of rules and especially of his rule of recognition—with Hart's ascription of the internal point of view to the officials within a legal system when they act in their role as officials.

These qualifications, all counted up, seem to point of necessity to the conclusion that Hart's review of Ross's *On Law and Justice* gets inattentively and improperly used by some of its readers to gain an overall idea (a misguided idea) of Scandinavian legal realism as a whole, and that in certain respects Hart could himself have been more accurate in his review of Ross's book: For example, and to begin with, he could have chosen a more specific title, a title more tailored to his topic and to the object of his review (namely, Alf Ross, rather than the whole of Scandinavian legal realism); and in the second place, he could have worked out more faithfully the details of his account of Ross's predictivism.

Certain aspects of Hart's normativism I will come back to in Section 8.2.6 (devoted to qualifying the use of "validity" in legal discourse) and in a more focused way in Section 8.3, devoted to the "considerable modifications" (Hart 1997, 255) that Hart's *Postscript* brings to Hart 1961. I will come back to Ross and Hart in Section 15.4.

[20] Cf. Pattaro 1966, esp. 1036–50. In his predictive theory of legal doctrine, Ross is influenced not by the Uppsala School, but by certain general conceptions of science of a logical-empiricist cast. It is interesting to note that in the 1950s there was another great jurisprudent working under the influence of logical empiricism, Norberto Bobbio, who likewise undertook to make legal doctrine scientific (in line with the canons of logical empiricism): Bobbio 1950a and 1950b. The two scholars were unaware of each other's contemporaneous attempts in the 1950s. They each had the same objective, and although they pursued it in different ways, neither attempt escapes criticism fully. Ross's and Bobbio's attempts are critiqued in parallel in Pattaro 1978. Cf. also Pattaro 1993.

8.2. A More Targeted Reckoning with "Validity" in Legal Discourse

8.2.1. The Broad and the Narrow Sense of Competence Norms and Norms of Conduct

In a broad sense, all norms, including norms of conduct, may be understood to be competence norms insofar as their content sets forth one or more agent-types (irrespective of whether the agents are duty-holders or right-holders under these norms). And, also in a broad sense, all norms, including competence norms, may be understood to be norms of conduct insofar as their content sets forth one or more behaviour-types (irrespective of whether these behaviours are obligatory, permitted, or forbidden under these norms).

In a narrow sense, on the other hand, a competence norm is a peculiar norm of conduct, one whose type of action is "obeying." And it is a peculiar renvoi-norm of conduct because its type of action ("obeying") is meant to be determined through a renvoi to the content of directives that are validly issued (or through a renvoi to the content of validly enacted texts, regardless of whether this is the content of directives properly so called; on these, see Section 9.6), this by instantiating the type of circumstance set forth in the same competence norm (Section 7.3).

In a narrow sense again, and in consequence, a norm of conduct is any norm whose type of action is something other than "obeying."

Of course norms of conduct in a narrow sense and norms of competence in a narrow sense both require obedience, requiring duty-holders to perform the type of action they are under an obligation to perform every time the type of circumstance set forth in the same norms gets validly instantiated. But only competence norms require duty-holders to perform the type of action "obeying," and that when directives are issued (or texts enacted) in a certain way, thereby validly instantiating the type of circumstance set forth in the same competence norms.

Let us look, for example, at the *stricto sensu* norm of conduct **n**, "Under the circumstances that a person is well-off and another person needy, the former must aid the latter." Here, the type of action is "aiding," and the well-off are required to obey **n**: They are required to perform the type of action "aiding" every time the type of circumstance set forth in **n** gets instantiated by valid tokens.

Let us look now at the *stricto sensu* competence norm **o**, "Under the circumstances that you are driving and a traffic warden gives you a directive, you must obey, provided that the directive is issued in such and such a way." Here, the type of action is "obeying," and drivers are required to obey. They are required to perform the type of action "obeying" every time the type of circumstance set forth in **o** gets instantiated by validly issued directives: In the example, drivers are required to obey the directives validly issued by the traffic warden.[21]

[21] Clearly, the type of circumstance set forth in competence norm **o** will establish not only

It follows from the above that any type of action that a duty-holder is under an obligation to perform ("eating," "drinking," "smoking," etc., or "abstaining" from these actions) is the type of action pertaining to a *stricto sensu* norm of conduct, provided that this type of action is not "obeying" in the sense just clarified.

Even the type of action "refraining from obeying" is not a type of action pertaining to a *stricto sensu* competence norm, but one pertaining to a *stricto sensu* norm of conduct. Let us look, for example, at norm **e**, "Under the circumstance that you are a child and someone other than your parents gives you a directive, you must refrain from obeying." This norm is, in a narrow sense, a norm of conduct; it is so because its type of action ("refraining from obeying") is not intended to be determined through a renvoi to the content of directives validly issued by instantiating the type of circumstance set forth in the same norm. Indeed, the type of action "refraining from obeying" is already determined: It does *not* get determined by the content of directives that are valid tokens of the type of circumstance.

8.2.2. On the Function of a Valid Slap

Validity and invalidity can be predicated of anybody's behaviour, and of course of the behaviour held by agents who are *duty-holders* under a norm.

With a *stricto sensu* competence norm, for example, validity and invalidity can be predicated of the compliant behaviour held by those who are under an obligation to perform the type of action "obeying" (obeying the directives issued or the texts enacted by the people described in the type of circumstance set forth in the same competence norm). And with a *stricto sensu* norm of conduct, validity and invalidity can be predicated of the behaviour held by those people who are under an obligation to perform the type of action "aiding," for example, as set forth in the same norm of conduct (such is the case with the well-off aiding the needy), or even, as was just observed, they can be predicated of the behaviour held by those people who are under an obligation to perform the type of action "refraining from obeying," as set forth in another norm of conduct.

Validity and invalidity can also be predicated of the behaviour held by agents who are *not* duty-holders under a norm that refers to them.

With a *stricto sensu* competence norm, for example, validity and invalidity can be predicated of the behaviour held by those people referred to in the type of circumstance (set forth in the same competence norm) as "the issuers of di-

formal limits to the traffic warden's mode of issuing directives (as by requiring this person to wear a uniform or bear some other markers by which to be recognised as a traffic warden), but substantive limits as well. Thus, a directive, however much issued by a traffic warden in uniform, will be invalid by virtue of its content if it should require a driver to do a triple somersault, and the driver will consequently be under no obligation to obey.

rectives or the enactors of texts that have been or will be issued or enacted in accordance with certain procedures" (the issuer and the enactor may not be under any obligation to issue directives or enact texts). And with a *stricto sensu* norm of conduct, for example, validity and invalidity can be predicated of the behaviour held by those people referred to in the type of circumstance (set forth in the same norm of conduct) as, say, people who have slapped other people.

Indeed, the slappers are not duty-holders: There is no obligation to slap anyone. By contrast, anybody who gets congruently (validly) slapped is under an obligation to turn the other cheek, precisely because the type of circumstance "getting slapped," *though nonobligatory*, has been validly instantiated: "But I say unto you, That ye resist not evil: But whosoever shall smite thee on thy right cheek, turn to him the other also" (Matthew 5:39).[22]

8.2.3. The Metonymic Validity of Legal Directives and Texts of Law

On my characterisation of validity as a token's congruence with a type, every type is constitutive of the possibility of being or not being validly instantiated by actual tokens; and each congruent instantiation of a type is a valid token of that type. That is, each congruent instantiation of a type *counts as* a token of that type: "To be a valid token of a type" and "to count as a token of a type" are to me synonymous expressions.

Turning to behaviours specifically, I will say that an actual behaviour validly performs a type if it has the necessary and sufficient characteristics to be considered a congruent instantiation, or happy performance, of that type. And if a behaviour-type is a compound type consisting of at least one conditioning type of circumstance and one conditioned type of action, an actual behaviour will be a valid token of this compound type if it congruently performs the type of action when the relevant type of circumstance has been validly instantiated.

Moreover, each type of behaviour is constitutive of the capacity, or competence, of those persons who are valid tokens of the type of acting person set forth in the behaviour-type. This capacity, or competence, is irrespective of whether the type is set forth in a norm. And if the type *is* set forth in a norm, this capacity, or competence, is irrespective of whether the type in question is a conditioning type of circumstance or a type of action. Further, if the type in question is a type of action, this capacity, or competence, is irrespective of whether the type is qualified as obligatory, permitted, or forbidden. And, last but not least, when one performs congruently a type of action forbidden under a norm, this valid performance, though it is a wrong, is like-

[22] Plainly, there can be, at least under given circumstances, an obligation to refrain from slapping others (and that would be a welcome obligation), and also an obligation to punish those who do not refrain from slapping others (and that too may be a welcome obligation). But the norm considered in the run of text is not the one from which these two obligations derive.

wise a valid token of that type: Indeed, the validity of the performance is a necessary condition for the performed action to be wrong (typicality of law; cf. Section 2.2.2.2).

Turning to language specifically, I will say that a sentence can be a valid or an invalid token of the type "directive." In Section 9.2 I will characterise the type "directive sentence": With respect to this type, an actual sentence will be a congruent or incongruent, a valid or invalid, token of a directive; it will count or will not count as a directive. For example, a directive issued by a sender forced to issue it against his or her will is nonetheless, with respect to *that* type, a fully valid directive: which see point (1) of Section 9.2.

In the context of law, however, a directive issued by a sender forced to issue it against his or her will, will not, as a rule, be a valid directive (let us imagine, for example, a directive issued by a traffic warden forced to it by a gunman). This is so because in the context of law, with competence norms and the directives or texts issued or enacted in accordance with the type of circumstance set forth in a competence norm, the terms "valid" and "invalid" apply specifically to *activities* that congruently (validly) or incongruently (invalidly) instantiate a type of issuance or of enactment; and this type (in private law and public law alike) usually has this characteristic, among others: That the issuance or enactment activity of agents (private persons or officials) should not be forced but freely performed.

In brief, as was observed in Section 2.1.1, a token's validity depends on a type: on the type with respect to which we predicate its validity, i.e., its congruence with that type. Thus, the type "directive" as characterised in Section 9.2 does not necessarily coincide with the type "directive" as characterised by other scholars (like Alf Ross, *Directives and Norms*, 1968) or with the type "directive" as this type may be characterised in the law of different legal systems.

Further, and importantly, I am making here a matter-of-fact claim to the effect that we *usually* find in legal systems characterisations of types of issuance of directives or types of enactment of texts (where "issuance" and "enactment" designate types of activities) rather than find types of directives or types of texts (where "directives" and "texts" designate types of sentences or of sets of sentences). It follows that the directives and texts in question are the outcomes (Is-outcomes) of these activities (Is-activities), and outcomes are best kept analytically separate from the activities by which they are produced.[23]

Nothing prevents us from saying that in legal discourse "valid" and "invalid" apply to legal directives (or texts), so long as these are validly issued or enacted. But here, to be more precise, we should say that "valid" and "invalid" apply to legal directives or texts *metonymically*: These terms apply to legal directives or texts that have been validly *enacted* through actual *activi-*

[23] See, for example, Alf Ross's distinction between interpretation as activity and interpretation as outcome (or result) (Ross 1958, 117; Ross 1971, 139).

ties that congruently instantiate the type of circumstance (a type of procedure, for example) set forth in a competence norm; this type will usually be, as a matter of fact, a type of activity rather than the type of sentence or of text resulting from (outcome) an instantiation of the same type of activity.

In other words, we ought to bear in mind that with legal directives, or texts (in their interaction with competence norms: Section 9.6), what we are looking at is not the congruence of a text (or directive) with a type of text (or directive), as this type is characterised in Section 9.2 of this volume, for example. Rather, we are usually looking at the congruence of an actual activity with a type of issuance or enactment (with a type of procedure, for example). A legal text, or directive, needs to be enacted (or issued) congruently (validly) with respect to the type of procedure set out in a legal competence norm regulating the enactment (or issuance) of legal texts, or directives.

For this reason, a legal text (or directive: an Is-outcome) will only be *metonymically* valid or invalid. In fact it will be so depending on whether its enactment (or issuance: an actual activity) is a valid or an invalid token of a given type of issuance or enactment activity.

The same does not hold with legal norms (we will see this in Section 8.2.4): Legal norms are neither valid nor invalid, not even metonymically. Norms cannot be issued or enacted, properly speaking, because they are not the outcomes (Is-effects) of certain Is-events or activities. Norms are rather the Ought-effects (or Ought-outcomes) resulting from other norms in combination with the performance of certain Is-activities that validly instantiate a type of circumstance set forth in these other norms. And, as we will see, it does not matter in this regard whether we characterise norms as beliefs (which is how I view norms: Chapter 6) or as Ought-effects in what is objectively right (which is how legal norms are characterised in the tradition of civil law; cf. Sections 2.2.3 and 3.4).

8.2.4. The Slippery Slope of Validity. Norms Cannot Be Issued, or Enacted

Of course, even with the type "norm" we can say that certain actual things are valid or invalid tokens of it (as happens in the case of a sentence-token with respect to a type of directive: see Section 8.2.3).

Thus, given my characterisation of the type "norm" (norms as beliefs and as motives of behaviour: Chapter 6), we may properly ask whether a certain token is valid or invalid with respect to this norm-type; and given any other norm-type—the type "norm" as characterised by Hans Kelsen, for example, or the type "rule" as characterised by Ronald Dworkin—we may properly ask as well whether a certain token is valid or invalid with respect to it. Thus, it will be appropriate to ask, with respect to the type "norm" as characterised in Chapter 6, whether the belief that we should stop walking if a black cat crosses our trail is a valid token of this type, or whether Jack Nicholson's com-

pulsive neuroses in the film *As Good as It Gets* (Chapter 7, footnote 5) are valid tokens of the type "norm" as characterised in Chapter 6 of this volume.

But, again, this is not the sense in which "validity" and "invalidity" are used in legal discourse. Indeed, jurists, when they use these terms, intend to refer instead either to (*a*) the congruence or incongruence of a token of activity with a type of activity (the congruence or incongruence of an actual issuance or enactment of a text, or directive, with a type of issuance or enactment procedure) or to (*b*) the specific existence or coming into existence of norms (or of other Ought-effects, such as obligations and rights), or the lack thereof, in the reality that ought to be. These two senses of "validity" and "invalidity"—senses (*a*) and (*b*)—I will come back to shortly in this section.

Suppose, on the other hand, that we choose to qualify legal norms as metonymically valid or invalid, just as we did in the previous Section 8.2.3 with legal directives, or texts. In this case—if we keep to my view of derivative norms as illustrated in Chapter 7—we should want "validity" and "invalidity" to designate the logical correctness or incorrectness of the inference processes by which a believer infers derivative norms from the norms he or she has previously internalised.

However, when jurists discuss "valid norms" in line with the sense *they* ascribe to this expression, they do not usually intend to refer to the formal correctness of a piece of reasoning.

Besides—on my view of derivative norms as illustrated in Chapter 7—the validity or invalidity of the issuance or enactment of legal directives, or texts, does not affect the logical correctness (or validity) of the inferential process by which a believer infers derivative norms: The valid or invalid enactment or issuance of a directive, or text, will affect *only* the truth value of the second premise under which (in this inferential process) a directive, or text, is subsumed as validly enacted or issued in accordance with the type of circumstance set forth in a competence norm. The truth or falsity of the premises carries over into the truth or falsity of the conclusions, but it does not undermine the logical correctness of the inferential process. In fact, the truth or falsity of the premises carries over into the truth or falsity of the conclusions on condition that the inferential process from premise to conclusion is carried out correctly from a logical point of view.

Those people who believe in a competence norm will come to believe (through the subsumption and inference process presented in Section 7.3) that the valid Is-activities through which metonymically valid directives, or texts, are enacted produce new norms in the reality that ought to be. Hence, it could somehow and figuratively be said of directives, or texts, validly issued in accordance with the procedures provided in the type of circumstance set forth in a competence norm that these directives, or texts, produce or cause derivative norms—derivative beliefs—in those who believe in the competence

norm: Validly enacted directives, or texts, *produce illative effects* in believers (cf. Sections 9.2 and 9.6).

The type of circumstance set forth in a competence norm is, qua type, constitutive of the possibility of the performative capacity and activity of the persons described therein as agents or performers (where performative activity = "issuing directives, or enacting texts, in a certain way," as by following a certain procedure). And in the opinion of a believer in a competence norm, the type of circumstance, as set forth in such a norm, will be institutive as well of the normative capacity and activity of the persons described therein as agents or performers (where "normative activity" = "valid issuance of directives, or texts, in a way that creates derivative norms"). A believer in a competence norm will find it binding per se for an actual duty-holder to obey (type of action) the directives issued, or the texts enacted, if directives, or texts, are validly issued, or enacted, by certain agents or performers in accordance with certain procedures (type of circumstance). This way, the performers who validly issue directives or enact texts, do affect the believer's personal normative universe (or reality that ought to be) by modifying or abrogating his or her norms or adding new ones.

But this subsumption and inference process does not make derivative norms valid, not even metonymically (Section 8.2.3): It does not make valid the illative effects produced in the believer's brain.

Through the illative processes of subsumption and inference illustrated in Sections 7.3 and 9.6, the believers in a competence norm will come to internalise derivative norms whose content is the same as the content of directives issued or texts enacted validly, in accordance with the type of circumstance set forth in the competence norm. So, too, the believers will regard any valid performance of the type of circumstance set forth in the competence norm as being a normative activity: an activity that in a sense creates norms. From the standpoint of a believer, let me reiterate, the conditioning type of circumstance set forth in a competence norm is not only *constitutive* of certain agents' *performative* capacity (competence) to *issue* directives, or to *enact* texts; it is also *institutive* of these same agents' *normative* capacity (competence) to *create* norms by issuing directives, or enacting texts.[24]

After all, as has been observed, in the legal-dogmatic tradition of civil-law scholarship, a legal norm is an Ought-effect in what is objectively right in the reality that ought to be, an Ought-effect whose occurrence will depend on whether a source of law has been *validly* implemented in the reality that is (Section 3.4). The reason why people so often use "valid" and "invalid" to qualify norms, too, is perhaps near at hand.

[24] On this sense of "institutive," compare MacCormick 1974 and, in Volume 2 of this Treatise, Rottleuthner, Section 2.7.

Only *valid* tokens (and hence only *validly issued* directives, or *enacted* texts, where these are concerned) can be subsumed under a type of circumstance set forth in a norm (and hence under a type of circumstance set forth in a competence norm, where directives, or texts, are concerned). The result of this subsumption is the second premise of the reasoning by which a believer infers that an Ought-effect has occurred in the reality that ought to be (Chapter 7).

Now then, in the tradition of civil-law legal dogmatics the word "validity" did go through a shift of meaning: from one sense, (*a*) "congruence of a token with a type of circumstance" (with which a norm connects normative consequences, or Ought-effects, i.e., the production of new norms), to another sense, (*b*) "the coming into existence of a normative consequence, of an Ought-effect, of a new norm in the reality that ought to be" (in consequence of the congruent, or valid, instantiation of a certain type of circumstance).

Presumably, the shift is caused by the fact that, in the standard view, an Is-event valid in sense (*a*) produces Ought-effects. Thus, even the Ought-effects so produced—and derivative norms in particular—have come to be called valid. This is another sense of "valid," sense (*b*), which differs from sense (*a*) and is misleading (Section 2.2.3).

Hart (1961, 105–6), when he replaced Kelsen's *Grundnorm* with his own rule of recognition, took care to underscore that only intra-systemic norms (rules) can be said to be valid or invalid. So now we have to go one step further with respect to Hart. That is: Only intra-systemic *directives*, or *texts*, can be said to be valid or invalid (metonymically, as was seen in Section 8.2.3); not so norms, even intra-systemic *norms*.[25]

To be sure, there are intra-systemic directives, or texts, and intra-systemic norms as well. But only the former can be said to be valid or invalid, albeit metonymically.

Intra-systemic derivative norms do bear an important connection with metonymically *valid* intra-systemic directives, or texts (see Section 9.6), but this does not allow us to equate or confuse the former with the latter, either in general or with specific reference to the possibility of qualifying them as valid or invalid. Norms and directives (or texts) are two different things: They are motives of behaviour and linguistic sentences respectively. A norm whose existence is a matter-of-fact existence *can neither be valid nor invalid* (Hart 1961, 106–7), be it a primitive norm directly internalised from the social environment or a derivative norm as illustrated in Section 7.3.

[25] Hart, in reality, like many other scholars, uses "valid" and "invalid" in senses (*a*) and (*b*) alike without apparently realising that two different meanings are involved. On sense (*a*), see Hart 1961, 30, 32, where Hart speaks of "valid exercise of legal powers"; on sense (*b*), see Hart 1961, 144, where he speaks of "valid rules." Kelsen (1934, 1946, 1960), instead, should be credited for never switching between the two meanings: He uses "valid" only (and consistently) in sense (*b*), which, of the two, is the sense I reject.

The use of "validity" in sense (*b*) would not need any exemplification, so widespread is it. Still, the prime example of it cannot go unmentioned: We have it in the work of Hans Kelsen, one of our two giants of normativism (Section 3.6.1). Here is a passage from Kelsen:

By the word "validity" we designate the specific existence of a norm. When we describe the meaning or significance of a norm-creating act, we say: By this act some human behavior is ordered, commanded, prescribed, forbidden, or permitted, allowed, authorized. If we use the word *ought* to comprise all these meanings, as has been suggested, we can describe the validity of a norm by saying: Something ought to, or ought not to, be done. If we describe the specific existence of a norm as "validity," we express by this the special manner in which the norm—in contradistinction to a natural fact—is existent. The "existence" of a positive norm—that is to say, its "validity"—is not the same as the existence of the act of will, whose objective meaning the norm is. (Kelsen 1989, 10)[26]

I will now give a telling example of the shift from "validity" in sense (*a*), i.e., "a token's congruence with a type," to "validity" in sense (*b*), i.e., "existence of an 'ought,' and so of a norm in the reality that ought to be." The example is offered by the other of our two giants of normativism (Section 3.6.1), Hugo Grotius: It comes out in the form of a test, so to speak.

In a same passage (*De jure belli ac pacis libri tres* (a), II, 11, VIII) Grotius uses "validity" in sense (*a*), and he uses "efficacy" (meaning "normative efficacy") to express, instead, sense (*b*), which today is improperly attributed to "validity" as well:

Materiam promissi quod attinet, eam oportet esse, aut esse posse in jure promittentis, ut promissum sit *efficax*. Quare primum non *valet* promissa facti per se illiciti: quia ad illa nemo jus habet, nec potest habere. (Grotius, *De jure belli ac pacis libri tres* (a), II, 11, VIII; italics added)

The foregoing is Grotius's original Latin text. If we go and read it in Francis W. Kelsey's (1858–1927) English translation of it, the shift from sense (*a*) to sense (*b*) of validity is already there, alas, ready to be handed to readers who prefer English to Latin. Kelsey, in translating the passage just quoted, uses "valid" to render both *efficax* and *valet*. So he writes:

[26] The German original: "Mit dem Worte 'Geltung' bezeichnen wir die spezifische Existenz einer Norm. Wenn wir den Sinn oder die Bedeutung eines normsetzenden Aktes beschreiben, sagen wir: Mit dem fraglichen Akt wird irgendein menschliches Verhalten befohlen, angeordnet, vorgeschrieben, geboten, verboten; oder gestattet, erlaubt, ermächtigt. Wenn wir, wie im Vorhergehenden vorgeschlagen, das Wort 'sollen' in einem Sinne gebrauchen, der alle diese Bedeutungen umfaßt, können wir die Geltung einer Norm dadurch zum Ausdruck bringen, daß wir sagen: irgendetwas soll oder soll nicht sein oder getan werden. Wird die spezifische Existenz der Norm als ihre 'Geltung' bezeichnet, so kommt damit die besondere Art zum Ausdruck, in der sie—zum Unterschied von dem Sein natürlicher Tatsachen—gegeben ist. Die 'Existenz' einer positiven Norm, ihre Geltung, ist von der Existenz des Willensaktes, dessen objektiver Sinn sie ist, verschieden" (Kelsen 1960, 9–10).

In order that a promise may be *valid* [where Grotius writes *efficax*, meaning productive of normative effects], the subject of it ought to be either actually or potentially under the control of the promisor. In the first place, then, promises to perform an act which is in itself illegal are not *valid* [*non valet*]; for no one has, and no one can have, a right to do anything that is unlawful. (Grotius, *De jure belli ac pacis libri tres* (b), II, 11, VIII; italics added)

In this passage, Grotius is speaking of an Is-event (and specifically a declaration of will) that, if it *valet*—if it is a *valid*, or congruent, token of the type "making a promise"—it will then be *efficax*; that is, it will produce the Ought-effect (an obligation incumbent on the promisor) that the norm on promises conditionally and normatively connects with any valid instance of the type of circumstance "making a promise."

More specifically, Grotius remarks that a promise to do something illicit is not valid (*non valet promissa facti per se illiciti*); that would be the case with promising something that is not and cannot be within what is subjectively right for the promisor (*esse, aut esse posse in jure promittentis*). Under these circumstances, a promise will not be valid (*non valet* in sense (*a*) of "valid") and hence will not be efficacious (*efficax*); that is, it will not produce Ought-effects (in sense (*b*) of "valid," an improper and misleading sense, a sense obtained when we use the word "valid" rather than the expression "normatively efficacious").

The same concept can also be expressed in terms of people's capacity to make a promise.

Let us first consider sense (*a*). Having the legal availability of what we promise to give or do is a requisite for our capacity to make promises (cf. Section 2.1.6). Hence, a promise made by someone who, having no such availability, lacks the capacity to make this promise will be an invalid, or incongruent, promise. This person's seeming act of promising will not validly instantiate the type "making a promise"; it will not count as a promise: It *non valet* in sense (*a*) of "validity."

And now consider sense (*b*). The question of the normative consequences of a promise is instead a different matter. It is not a question of Is-event validity. It is a question of normative production of Ought-effects which either occur or do not occur in the reality that ought to be, according as a given type of circumstance has been validly or invalidly instantiated. That gives us the connection between the validity of Is-events—"validity" in sense (*a*)—and the creation of Ought-effects, in which regard the term "validity" is usually and improperly employed in the misleading sense (*b*) (cf. Sections 2.2.3, 8.2.5, and 8.2.6.1).[27]

Norms, in conclusion, whether they are conceived of as Ought-effects (Sections 3.3 and 3.4) or as beliefs (Chapters 6 and 7), are not enacted.

[27] Grotius, after all, is well aware that "nemo plus juris transferre potest quam ipse haberet" ("No one can transfer greater rights to someone else than he possesses himself") (Ulpian, *The Digest of Justinian*, L, 17, 54).

Legal norms as Ought-effects are created (in what is objectively right in the reality that ought to be) by valid Is-events occurring in the reality that is: For example, by the valid implementation of a type of enactment procedure (Section 3.4). But what gets enacted through a valid enactment (say, a valid implementation of a type of enactment procedure) is not an Ought-effect: It is a legal text. And a legal text is not in itself a norm: It will not be an Ought-effect even if its enactment takes place validly. In the legal-dogmatic tradition of civil law, the enactment of texts will have the virtue of creating norms having the same content as the enacted texts if (and only if) the enactment is valid with respect to a type of enactment with which a competence norm connects the coming into existence of new norms in the reality that ought to be. Thus, even on this conception norms are not enacted, or issued, strictly speaking: They are rather *created* by other norms—call them parent norms; cf. Sections 7.3, 8.2.6.1, footnote 32, and 10.2.1—in concurrence with the valid instantiation of certain types of circumstance the same parent norms set forth.

I am simply arguing, with regard to this legal-dogmatic tradition, that it is inconsistent to use "valid" to qualify as congruent (and "invalid" to qualify as incongruent) certain tokens with respect to a given type of circumstance if at the same time we use "valid" or "invalid" to affirm or deny that certain Ought-effects did take place and do exist in the reality that ought to be (Section 2.2.3).

This inconsistency is a source of confusion. An actual Is-enactment is correctly qualified as valid or invalid. But Ought-effects are neither valid nor invalid: They will rather get produced (or created), if the Is-enactment is valid, or they will not get produced (or created), if the Is-enactment is invalid.

Legal norms as beliefs (meaning norms as I conceive of them: see Chapter 6) cannot be enacted, either. They can only be driven into a human brain by the sociocultural environment (see Section 7.2 and Section 15.2.5 for primitive norms), or they can be inferred by a believing human being from another norm (a norm already in existence in the believer's brain) in conjunction with the subsumption of a valid token under the type of circumstance set forth in this other, preexisting norm (Chapter 7 and Section 9.6). If the preexisting norm is a competence norm, and the type of circumstance therein contained is a type of enactment, the directives, or texts, that get validly enacted with respect to this type of circumstance will lead the believer to infer that the content of these directives, or texts, is binding per se. This way—by becoming an object of belief—the content of a validly enacted directive, or text, becomes a norm (on my characterisation of norms) not by enactment, but by subsumption and inference (Section 7.3).

8.2.5. Validity in Its Traditional Sense as a Source of Misguided Legal Normativism: Validity, Law in Force, and Normativeness

In conceptions of law still in use today, "valid law" and "law in force" are used pretty much interchangeably.[28] And the question concerning the effectiveness of law is treated with an intentional, and remarkable, simplification: Kelsen's theory of law is paradigmatic in this respect and still very influential.[29]

I think it seriously misleading to use the expressions "valid law" and "law in force" synonymously (especially if we understand "valid" to mean "binding per se" or "normative," as Kelsen does, though with the best methodological intentions, receiving a use, often uncritical, that is widespread among jurists). But it is also true that the current sense in which a legal system is in force cannot realistically be identified with the sense in which a norm is in force on my characterisation of a norm's being in force (Section 6.5). Therefore, I will not maintain that law is in force in the same sense in which norms are.

Law, meaning a legal system, cannot be found to be an entirely *normative* system, a system made up entirely of norms in the sense in which I understand "normative" and "norm." Nor can this be realistically maintained in any sense, even in Kelsen's, in which normativeness is understood to designate a hypostatised Ought: *das Sollen in einem objektiven Sinn* (see Sections 5.1, footnote 2, and 14.5, footnote 19).

We will have to take into account what follows.

(*a*) Existing norms (doxia: Section 6.2) and norms in force (nomia: Section 6.5) are, on my characterisation, an essential component of law, but this does not entail that all law is norm-based, or made effective through norms.

(*b*) Only on this characterisation, and on characterisations similar to it (which see the normativistic gallery in Section 8.1), are norms an essential fac-

[28] This is true not only in English but also in Italian, with the equivalent expressions "diritto valido" and "diritto in vigore."

[29] Kelsen, like other scholars, operates under an anti-psychologistic prejudice. His position is that "a statement concerning the efficacy of law so understood is a statement about actual behavior. To designate both the valid norm and the idea of the norm, which is a psychological fact, by the same word 'norm' is to commit an equivocation which may give rise to grave fallacies. However, as I have already pointed out, we are not in a position to say anything with exactitude about the motivating power which men's idea of law may possess. Objectively, we can ascertain only that the behavior of men conforms or does not conform with the legal norms. The only connotation attached to the term 'efficacy' of law in this study is therefore that the actual behavior of men conforms to the legal norms" (Kelsen 1946, 40). Certainly, there is little we know about the psyche and the human brain even today: All the more so in Kelsen's day, at the time this passage was written. Still, it strikes me as curious that, with commendable methodological rigor, scholars of Kelsen's intellectual stature should disdain to advance hypotheses and speculations about little-explored or barely explorable objects in the real world (I am referring here to the psyche and the human brain) and should at the same time make so bold as to hypothesize a presupposed basic norm, and to speak of posited legal norms as norms existing outside of space and time and endowed at that with a binding force that is neither psychological nor moral.

tor (cause) of the law's being in force. Otherwise stated: Norms are essential to law only if they are in themselves motives of behaviour, which they will be if they are the peculiar beliefs illustrated in Chapter 6 (and in Chapter 7 with regard to their proliferation) and so exist or are in force in people's brains generally, as well as (and in a sense especially) in the brains of people who hold official positions in society.

If legal norms exist or are in force (in any sense of these terms) only in the brains of some philosopher or in God's mind—but not in society—they will not be motives of individual and social behaviour, and this society's legal system will not subsist or be persistent, enduring, or settled, to use Hart's words (Hart 1961, 24; cf. Section 8.1.3.1).

(*c*) Norms are a necessary but not a sufficient condition for a society and its system of law to exist or be in force. For this to happen, it will be necessary to have concurrent conditions (causes, factors) other than existing norms and norms in force (in the sense illustrated in Sections 6.2, 6.5, and 9.6): It will be necessary to have power, influence, and some forms of charismatic or media suggestion, and to a certain extent the fulfilment of the basic needs, interests, and values (Sections 5.4 and 9.3 through 9.5) of the people the legal system applies to.

(*d*) What was summed up at point (*c*) can hardly have anything to do with Kelsen's conception by which there are two conditions for a legal system to be valid, or to exist. Kelsen's two conditions are that a fundamental or basic norm be presupposed (*conditio per quam*) and that the legal system be as a whole effective (*conditio sine qua non*) (Kelsen 1946, 110, 118–9).

In addition to all the differences between my understanding of "norm," "validity," "being-in-force," and the like, and Kelsen's understanding of "norm," "validity," and the like, there is this further and crucial point of difference: Kelsen's conception entails, through its presupposed basic norm, that law is entirely made up of norms (that the legal system is entirely normative: cf. Chapter 14). I, instead, do not believe that a thesis so framed can realistically be maintained.

Even Hart's theory of the rule of recognition, a rule expressly designed to replace Kelsen's presupposed basic norm (cf. Hart 1961, 245), proves difficult to realistically maintain: It does so in proportion as it entails that law—even if only on the part of the officials—is entirely made up of norms, meaning that all the officials accept it, from an internal point of view, with a normative attitude whereby the legal system is conceived of as entirely made up of guiding or binding standards.

I illustrate in Chapters 6 and 7, and in Section 9.6, some of the ways in which existing legal norms and legal norms in force qua norms (on my understanding of these terms) play an essential role in enabling a society and its system of law to exist and function (and in particular in enabling the legal system to be in force, in the sense of "a legal system's being in force" illustrated in Chapter 10).

But in Sections 9.3 through 9.5 other factors will be considered (suggestion, charisma, power, and influence) that concur with norms—an essential concurrence indeed—in enabling a society and its system of law to exist and function (and in particular in enabling the legal system to be in force, in the sense of "being in force" illustrated in Chapter 10).

8.2.6. Going beyond Hart in Treating the Relationship between Validity and Normativeness in Law

8.2.6.1. Intra-Systemic Norms

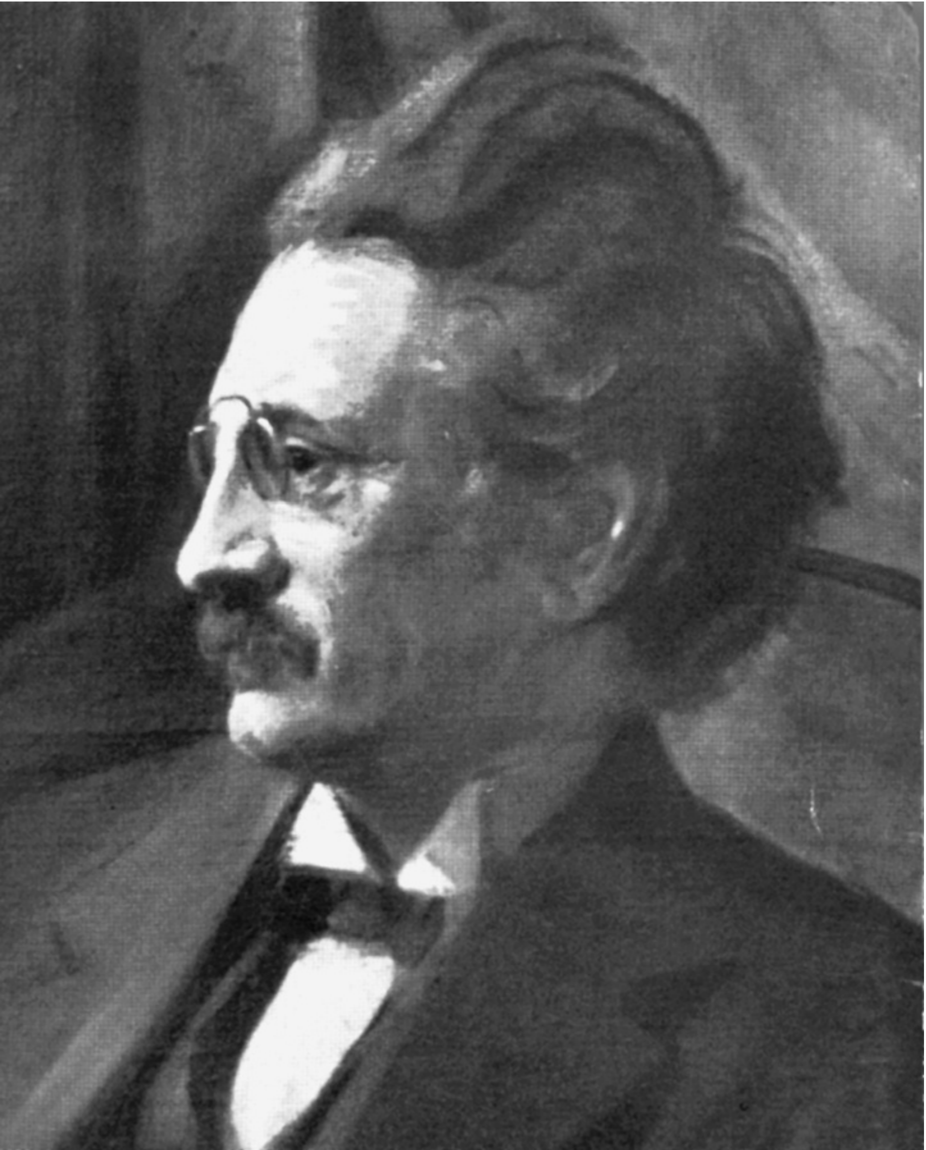
(*a*) I admit—and Hart admits as well—that there can be norms of conduct in no way dependent upon competence norms: In simple prelegal systems and international law (which Hart understands as a set, but not a system, of "obligatory rules," "binding rules," or rules having a "binding force": Hart 1961, 221ff., 230) there can be, in Hart's terminology, "primary rules of obligation" in no way dependent upon any "secondary rule."[30] These primary rules have the same kind of factual existence as that of the rule of recognition.

> In the simple system of primary rules of obligation [...] the assertion that a given rule existed could only be an external statement of fact such as an observer who did not accept the rules might make and verify by ascertaining whether or not, as a matter of fact, a given mode of behaviour *was generally accepted as a standard* and was accompanied by those features which, as we have seen, distinguish a social rule from mere convergent habits. It is in this way also that we should now interpret and verify the assertion that in England a rule—though not a legal one—exists that we must bare the head on entering a church. If such rules as these are found to exist in the actual practice of a social group, *there is no separate question of their validity to be discussed* [...]. *Once their existence has been established as a fact we should only confuse matters by affirming or denying that they were valid* [...]. (Hart 1961, 106; italics added)[31]

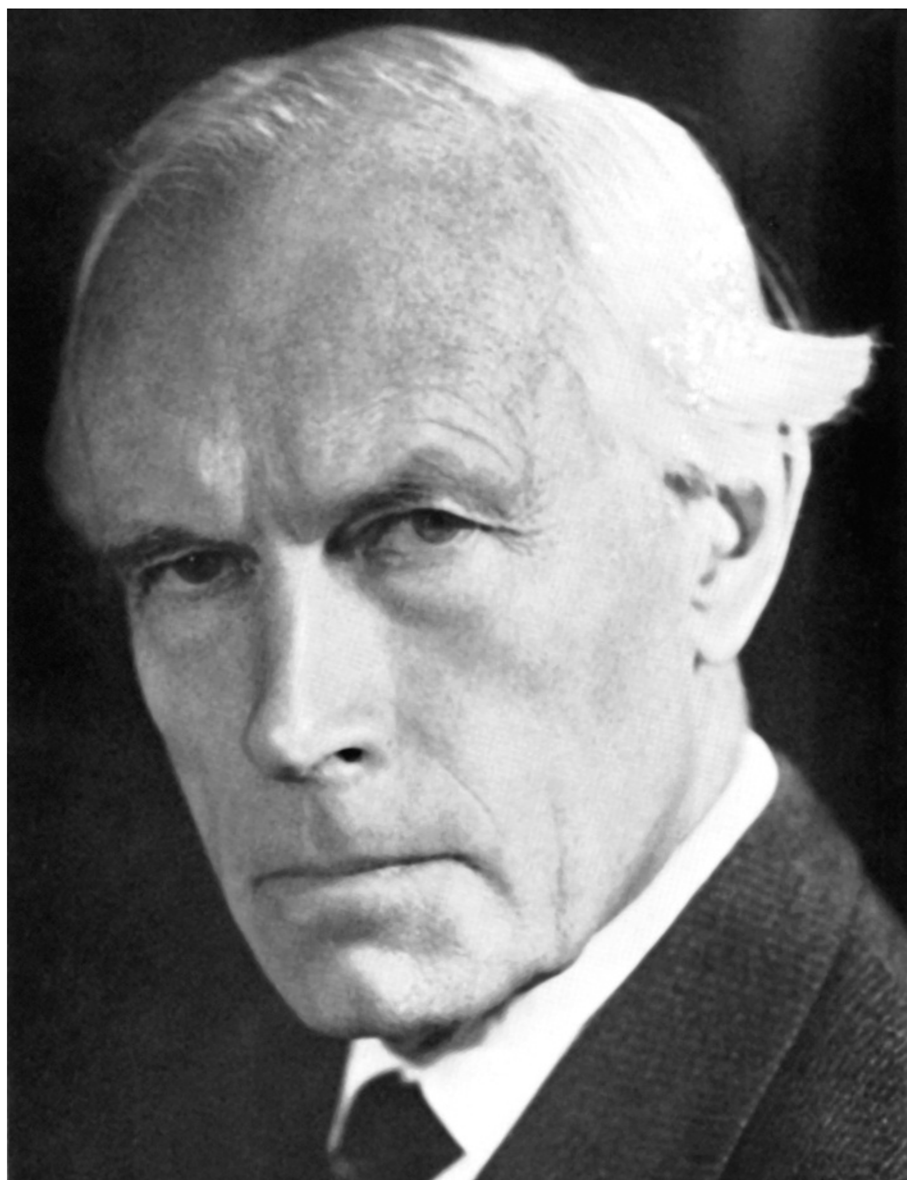
Compare this other statement that Hart makes with regard to international law:

[30] Here is Hart's distinction between primary and secondary rules: "We shall [...] show why law may most illuminatingly be characterized as a union of primary rules of obligation with [...] secondary rules." The secondary rules "may all be said to be on a different level from the primary rules, for they are all *about* such rules; in the sense that while primary rules are concerned with the actions that individuals must or must not do, these secondary rules are all concerned with the primary rules themselves. They specify the ways in which the primary rules may be conclusively ascertained [rule of recognition], introduced, eliminated, varied [rule of change], and the fact of their violation conclusively determined [rule of adjudication]." The rule of recognition "will specify some feature or features possession of which by a suggested rule is taken as a conclusive affirmative indication that it is a rule of the group to be supported by the social pressure it exerts" (Hart 1961, 91, 92).

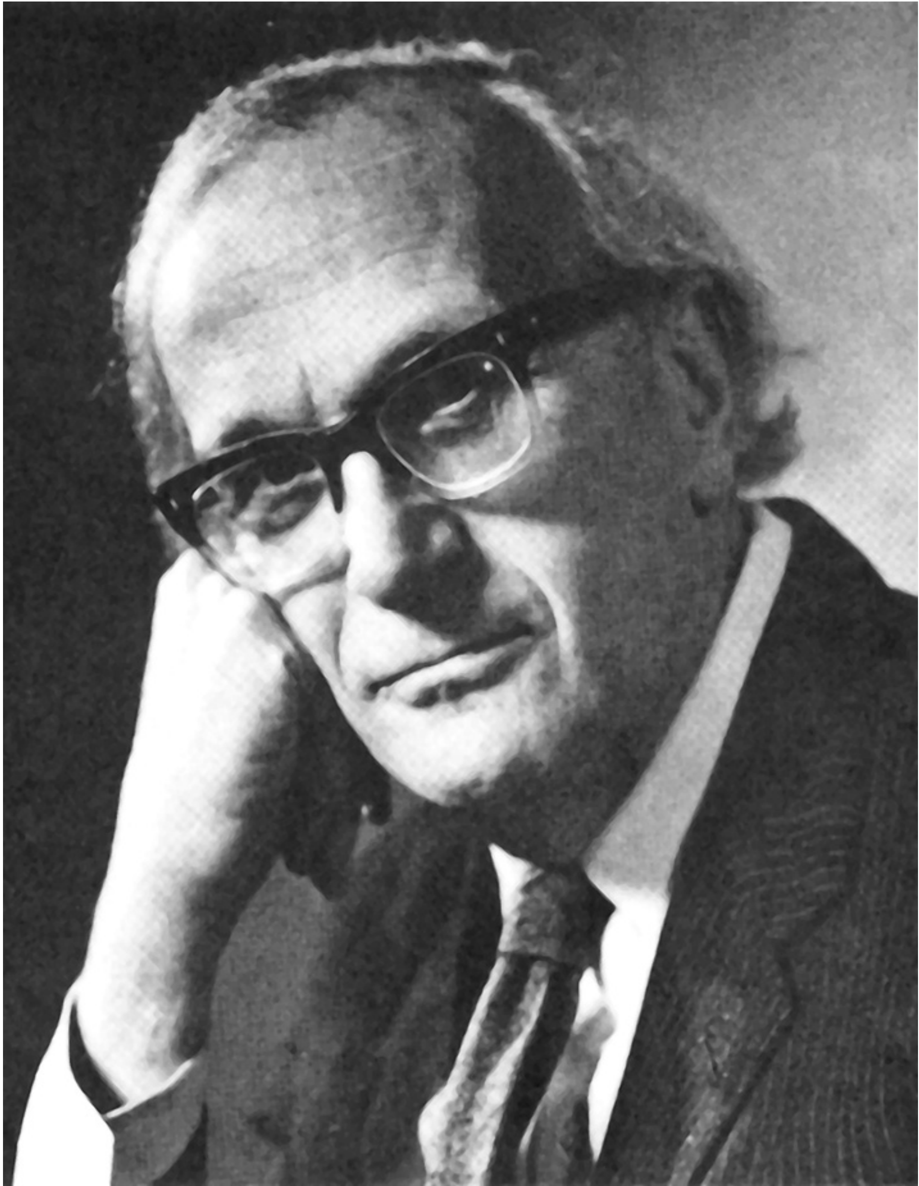
[31] It is interesting to note here how Hart 1961 does not use the term "binding" until page 110.



Axel Hägerström (1868–1939)



Karl Olivecrona (1897–1980)



H. L. A. Hart (1907–1993)

Though, in the simpler structure, the validity of the rules cannot thus be demonstrated by reference to any more basic rule, this does not mean that there is some question about the rules or their *binding force or validity* which is left unexplained. It is not the case that there is some mystery as to why the rules in such a simple social structure are *binding*, which a basic rule, if only we could find it, would resolve. *The rules of the simple structure are, like the basic rule of the more advanced systems, binding if they are accepted and function as such.* (Hart 1961, 230; italics added)

We have to do here, in my terminology, with primitive norms of conduct internalised directly from the social environment: I call *primitive* norms (be they norms of conduct or competence norms) those norms which exist in the brain of a believer and which the believer has not derived from other norms already in existence in his or her brain, but which he or she has internalised from the social environment. As for the terminology of the question, there is no kinship of meaning between my use of "primitive" and Hart's use of "primary."[32]

Hart uses the word "rule" to designate both the secondary rule of recognition, whose existence is a matter-of-fact existence, and those primary rules of obligation whose existence does *not* depend on any power-conferring rule or on any rule of recognition, and which have the same matter-of-fact existence as secondary rules of recognition. As Hart states, neither the former nor the latter can be valid or invalid (Hart 1961, 106–7), but they will be "binding, if they are accepted and function as such" (Hart 1961, 230).

(*b*) At the same time, Hart uses "rule" to also designate other primary rules of obligation: the intra-systemic primary rules of obligation, whose "existence" or "validity" depends on a power-conferring rule (i.e., a secondary rule of recognition). These intra-systemic rules—according to Hart, and à la Kelsen—have a specific existence referred to as "validity," an existence that is

[32] On my view, norms (primitive or derivative) can dynamically beget a system of norms. When this happens, we can distinguish the former group of norms (those that beget the system) from the latter (the norms that are begot in the system), calling them "parent norms" (Section 7.3) and "derivative norms" respectively. In the light of this distinction, all primitive norms can be parent norms but not derivative norms; by contrast, derivative norms (as such never primitive but always derivative) can be parent norms in addition to being derivative norms: They are so (they are parent norms) when they give place to systems or subsystems of norms (cf. Chapter 7). Thus, for example, the constitution of the University of Bologna is a derivative norm of the Italian law on universities. It is so to those who believe the Italian law on universities to be normative, and these people—by going through the subsumption and inference process described in Chapter 7—will come to believe the constitution of the University of Bologna to be likewise normative. At the same time, this constitution functions as a parent norm: It does so in relation to the legal normative subsystem regulating the University of Bologna. (The Italian term *statuto*, as in the expression "statuto dell'Università di Bologna," does not mean "statute." It rather designates the institutive act, or charter, of an institution, such as a university, foundation, or municipality. The English term "statute" does not strike me as suited to express this meaning, and it is for this reason that I have chosen to go with "constitution." An example of this use can be found with the International Association for Philosophy of Law and Social Philosophy, IVR – *Internationale Vereinigung für Rechts- und Sozialphilosophie*, which so calls its own charter: a "constitution.")

different from that of both varieties of rules mentioned under the previous point (*a*).

The essential point here is that Hart, in reality, takes up from Kelsen the ill-suited and confusing equivalence between "validity" and "binding force," an equivalence I reject. It is hard to see why we should bring into play two concepts of "binding rule," or "obligatory rule": On the one hand we have the concept whereby the binding force, obligatoriness, or normativeness of a rule consists in a complex matter-of-fact situation having an internal as well as an external aspect, and that is the case with Hart's social rules, as Hart considers the rules of primitive societies, the rules of international law, the church-goers' rule, and the rule of recognition;[33] on the other hand we have the concept whereby the binding force, normativeness, or obligatoriness of a rule is a question of formal validity à la Kelsen (Hart understands this to be the case with intra-systemic rules of municipal law). I see no way to bring "validity" and "normativeness" into agreement except by proceeding in the manner illustrated in Sections 2.1.1, 3.2 through 3.4, 7.1, and 9.6.

From my point of view, Hart's intra-systemic primary rules of obligation, which Hart admits as amenable to the qualification "valid" or "invalid" (see, in contrast, Section 8.2.4), are not necessarily rules, if we mean by "rule" what I mean by "norm" (Chapter 6) and what Hart means by "rule" in referring to those rules I spoke of in this section under point (*a*) (which rules have a matter-of-fact existence). More clearly stated, Hart's intra-systemic rules of obli-

[33] "The internal aspect of rules is often misrepresented as a mere matter of 'feelings' in contrast to externally observable physical behaviour. No doubt, where rules are generally accepted by a social group and generally supported by social criticism and pressure for conformity, individuals may often have psychological experiences analogous to those of restriction or compulsion. When they say they 'feel bound' to behave in certain ways they may indeed refer to these experiences. But such feelings are neither necessary nor sufficient for the existence of 'binding' rules. There is no contradiction in saying that people accept certain rules but experience no such feelings of compulsion. What is necessary is that there should be a critical reflective attitude to certain patterns of behaviour as a common standard, and that this should display itself in criticism (including self-criticism), demands for conformity, and in acknowledgements that such criticism and demands are justified, all of which find their characteristic expression in the normative terminology of 'ought,' 'must,' and 'should,' 'right' and 'wrong.' These are the crucial features which distinguish social rules from mere group habits" (Hart 1961, 56). Certainly, as Hart writes (and as Hägerström, too, can be made out to say: Section 8.1.4), "there is no contradiction in saying that people accept certain rules but experience no such feelings of compulsion." But then we are left to decide—in regard to the acceptance of, and critical reflective attitude to, the patterns of behaviour which Hart speaks of when he describes the internal point of view of norms—what the nature of this acceptance and critical attitude is, or what dimension they belong to: Do they belong to the psyche, to the human brain? Or do they not? And if they do not belong there, in what sense are they an *internal* aspect, over against an external one? I already expressed in Section 8.2.5 my qualms about Kelsen's anti-psychologistic bias. I will discuss the matter at greater length in Section 15.4. Hägerström, for his part, denies any identification between the idea of duty and the sense of duty: cf. Hägerström 1917, 60–4; Hägerström 1953c, 127–32; Pattaro 1974, 133–40 and 140–78.

gation are not, from my point of view, necessarily "normative rules," "binding rules," "obligatory rules," "rules endowed with a binding force," or whichever linguistic formulation one chooses to express the concept.

In what concerns the point presently under discussion, instead, Hart's intra-systemic primary rules of obligation, which Hart admits as amenable to the qualification "valid" or "invalid," are, from my point of view, metonymically valid legal directives, or texts, meaning directives or texts validly enacted by instantiating the type of circumstance set forth in a competence norm (cf. Section 8.2.3).

It is a different matter whether these metonymically valid directives, or texts, lead to the birth of derivative norms in people's brains (Sections 7.3, 8.2.4, and 9.6).

The process leading from metonymically valid directives, or texts, to derivative norms can take place only in those people who believe in a competence norm and hence subsume under the type of circumstance set forth in the competence norm the valid enactment of directives, or texts, and infer derivative norms from the competence norm and from the metonymically valid directives, or texts, subsumed under the second premise of a reasoning: There can be no derivative norms (or rules) without believers (doxia: Section 6.2).

At any rate, as has already been observed, even from a believer's point of view it cannot be said that derivative norms are valid or invalid, because they more simply do or do not *exist*, either in the reality that ought to be (if the believer adopts the general conception of civil law, as reconstructed in Part One of this volume), or in the believer's brain (on my characterisation of norms as specified in Chapters 6 and 7, a characterisation not much different from Hart's 1961 account of the varieties of de facto existing rules, as outlined in the present section under point (*a*)).

One of the biggest differences between Hart 1961 and me is that Hart is looking to characterise *social* rules at a single stroke (from the external and the internal point of view), whereas I am characterising norms in *individual* persons (in roughly the same way as Hart characterises social rules). The question what it means for an obligatory rule (in Hart's language) or a norm (in my language) to be social is, as I see it, a further question, and one different from the question what it means for something to be an obligatory rule (in Hart's language) or (in my language) a norm existing in the brains of individual believers. This approach of mine is, I believe, methodologically safer than Hart's and more likely to yield better results.

What is lacking in Hart's conception of intra-systemic primary rules of obligation (which rules depend on a power-conferring rule or a rule of recognition) is, on the one hand, the distinction between enacted directives (or texts) and norms (Section 8.2.4) and, on the other, a reconstruction of the subsumption and inference process whereby a believer in a competence norm (Hart seems to hold that all officials, with but a few exceptions, are believers)

derives new norms—new derivative norms of conduct, or even new competence norms—from the valid enactment of a directive, or text (valid with respect to the type of circumstance set forth in the competence norm: Sections 7.3 and 9.6).

It is well to reiterate that "valid" and "invalid," contrary to what Hart claims, can be predicated, and metonymically at that, only of validly enacted directives (texts, statutes, regulations, etc.) and not of the derivative norms inferred by believers (cf. Section 8.2.3). And this holds equally true with believers (internal point of view) and nonbelievers (external point of view): The difference between the ones and the others consists in the fact that believers—through the process illustrated in Sections 7.2 and 7.3—will infer Ought-effects, and derivative norms in particular, whereas nonbelievers will make no such inferences.

Using the terms "valid" and "invalid" to qualify, metonymically, directives or texts of law (or of laws, if by "laws" we mean "texts of law") is appropriate from the internal point of view (that which Hart speaks of) as well as from the external point of view because, on my redefinition, "validity" means "congruent instantiation of a type" and bears no necessary connection with normativeness. In Hart's view, instead, judgments of validity belong only to the internal point of view. Hart, further, like many other scholars, incurs the previously indicated ambiguity of using "validity" in an undeclaredly double sense (senses (*a*) and (*b*) as specified in Section 8.2.4). He uses "valid" to designate both the congruence of an actual activity with a type of procedure (an enactment procedure, for example) and the existence of intra-systemic obligatory rules: To designate different, and indeed heterogeneous, things, namely, the congruence of Is-activities (in the reality that is) with certain types of activity and the existence of Ought-entities (in the reality that ought to be) (cf. Section 2.2.1).[34]

Hart rightly objects to Kelsen's concept of a "presupposed basic norm," and writes,

> It is important to see precisely what these presupposed matters are, and not to obscure their character. They consist of two things. First, a person who seriously asserts the validity of some *given rule of law*, say a particular statute, himself makes use of a rule of recognition which he accepts as appropriate for identifying the law. Secondly, it is the case that this rule of recognition, in terms of which he assesses the validity of a *particular statute*, is not only accepted by him but is the rule of recognition actually accepted and employed in the general operation of the system. If the truth of this presupposition were doubted, it could be established by reference to actual practice: to the way in which courts identify what is to count as law, and to the general acceptance of or acquiescence in these identifications. (Hart 1961, 105; italics added)

[34] Cf. footnote 25 earlier in this chapter, where I indicate some pages in Hart 1961 where we find Hart speaking of the "valid exercise of legal powers" (for congruence) and "valid rules" (for existence).

In this passage Hart uses interchangeably "given rule of law" and "particular statute." That is, he conflates into a single thing the idea of acceptance of statutes as norms (as obligatory rules) and the idea of ascertainment and acceptance of statutes as belonging to the statutory law of a given country (an acceptance that I do not understand as necessarily implying any acceptance of a statute as a norm, or as an obligatory rule). And he speaks of validity without distinguishing between the two cases.

Recall in this regard the distinction between (*i*) the Is-outcome of the valid implementation of a procedure and (*ii*) the Ought-outcome of the valid implementation of a procedure. The Is-outcome of the valid implementation of a procedure (which outcome may be a statute, a legal directive, a text of law, etc.) can be said to be metonymically "valid" or "invalid." Instead, the Ought-outcome of the valid implementation of a procedure (which outcome, in the case presently under consideration, will be a derivative norm inferred by a believer: internal point of view) does not admit of any qualification as "valid" or "invalid" (cf. Sections 2.2.3, 8.2.3, and 8.2.4).

Besides, only in case (*i*) is reference to the actual practice sufficient of itself to determine whether a criterion is employed in the general operation of the system: We can conduct statistical inquiries and quantitative studies, or we can simply get a "journalistic" idea of what the country's legal practice is. Not so in case (*ii*): Here, it will not suffice to refer to a mere (unqualified) practice.

Hart writes that

> we only need the word "validity," and commonly only use it, to answer questions which arise *within* a system of rules where the status of a rule as a member of the system depends on its satisfying certain criteria provided by the rule of recognition. No such question can arise as to the validity of the very rule of recognition which provides the criteria; *it can neither be valid nor invalid* but is simply accepted as appropriate for use in this way. (Hart 1961, 105–6; italics added on second occurrence)

We have to take this statement one step further: That is, we need to go beyond Hart. And "going beyond Hart" means at least two things.

On the one hand it means confining the use of "valid" and "invalid," understood in a metonymical sense, to legal directives, texts, and statutes, thereby abandoning all qualifications of validity for norms and everything we conceive of as normative, this in order not to pollute with normative connotations the precious concept of validity as a token's congruence with a type (cf. Section 2.2.3).

On the other hand, "going beyond Hart" means introducing the concept of a "norm's existence" to refer to the existence of intra-systemic primary rules of obligation as well, and that *only* in the sense of "existence" in which Hart says of the secondary rule of recognition (and of other kinds of norms as indicated under the foregoing point (*a*)) that "its existence is a matter of fact" (Hart 1961, 107). My purpose here for introducing this concept of a "norm's

existence" is to refer not only to those primary rules of obligation that are found in simple prelegal societies, in which there exists no secondary rule of recognition (see the previous point (*a*) in this section), but also to those intra-systemic primary rules of obligation that are found in advanced municipal legal systems (systems equipped with rules of recognition, says Hart) and that in my terminology are derivative norms: They are norms because believed to be such, and derivative because obtained by subsumption and inference (cf. Chapter 7). In other words, my purpose is to refer to norms as beliefs in the brains of believers (doxia; cf. Section 6.2) and, even more important, in the brains of believing duty-holders, in which norms (so conceived) can operate as motives of behaviour, as *causae agendi* (nomia and abidance; cf. Sections 6.5 and 6.6).

Hart, too, sometimes speaks, almost absentmindedly, of norms (or rather, "rules," in his usage) as motives of behaviour:

> They [most people] may indeed obey, from a variety of *motives*: some from prudential calculation that the sacrifices are worth the gains, some from a disinterested interest in the welfare of others, and some because they look upon the *rules* as worthy of respect in themselves. (Hart 1961, 193; italics added)

Of course, intra-systemic derivative norms are such not in all consociates but only in those consociates who are believers and in those who are nomic. (From these consociates' internal point of view, rules, in Hart's words, are "worthy of respect in themselves"; in my words, they are believed to be binding per se.) These intra-systemic derivative norms are extremely important—they are so despite the fact that their existence among consociates carries the limitations just mentioned, and that this matter-of-fact existence may turn out to be only a scattered existence among the members of a society.

Intra-systemic derivative norms are important with respect to three kinds of subjects: (1) believers, even believers who are not duty-holders, because these norms (through the subsumption and inference process illustrated in Section 7.1) prompt them to have attitudes of normative censure toward other believers, whom they consider to be heterodox, paradoxic, or heretic believers, if it comes to that (cf. Section 10.2.1); (2) non-practising duty-holders (whether deviant or nonconformist; cf. Sections 6.6, 6.7, and 10.2.2), because these norms (through the same subsumption and inference process) may elicit a reaction against them on the part of believers and abiding nomic people; and (3) believing duty-holders (nomia; cf. Section 6.5), because these norms (through the same subsumption and inference process) prompt these people to hold behaviours of abidance (cf. Section 6.6) or, should they become deviant, to have attitudes of self-censure, remorse, and the like.

These intra-systemic derivative norms concur powerfully in making settled, lasting, and enduring the law in force as illustrated in Chapter 10; they do so directly and by way of the norm-proliferation effect illustrated in Chap-

ter 7, and even more so by way of the specific proliferation effect proper to competence norms (Section 7.3), especially manifest in the ultimate competence norm ("ultimate" is how Hart qualifies his rule of recognition), a norm institutive of authority (Section 9.6); and they also do so in conjunction with the suggestion exerted by the media, with the influence exerted by significant others (cf. Section 15.3.4), and with organised power (cf. Sections 9.3 through 9.5 and 10.1).

(*c*) If we take a closer look at Hart's internal point of view—especially where Hart concedes that we will find this point of view not only among officials, but also among ordinary citizens when the legal system is in good health—we will see clearly how Hart 1961 welcomes a strong conception of normativeness. And this fact is particularly important in view of what will be said in Section 8.3 on the changes that Hart comes at in the *Postscript*, with respect to Hart 1961, becoming conventionalist on the question of normativeness in law.

Hart proceeds as follows with regard to the ordinary citizen, the citizen making up the bulk of the population:

> Instead, he may think of the rule only as something demanding action from *him* under threat of penalty; he may obey it out of fear of the consequences, or from inertia, without thinking of himself or others as having an obligation to do so and without being disposed to criticize either himself or others for deviations. (Hart 1961, 112)

Hart here is talking about what I have called conformism (Section 6.7), a topic that Hägerström also treats profusely when he looks at the difference between a society governed by norms and a society governed merely by commands backed by a threat of punishment (cf. Sections 8.1.3 and 8.1.4).

Hart wraps up and reiterates:

> There are therefore two minimum conditions necessary and sufficient for the existence of a legal system. On the one hand those rules of behaviour which are valid according to the system's ultimate criteria of validity must be generally obeyed, and, on the other hand, its rules of recognition specifying the criteria of legal validity and its rules of change and adjudication must be effectively accepted as common public standards of official behaviour by its officials. The first condition is the only one which *private citizens need* satisfy: They may obey each "for his part only" *and from any motive whatever*; though *in a healthy society* they will in fact *often accept these rules as common standards of behaviour and acknowledge an obligation to obey them, or even trace this obligation to a more general obligation to respect the constitution*. The second condition must also be satisfied by the officials of the system. They *must regard these as common standards of official behaviour and appraise critically their own and each other's deviations as lapses*.[35] Of course it is also true that besides these there will be many primary rules which apply to officials in their merely personal capacity which they need only obey. (Hart 1961, 113; italics and footnote added)

[35] Cf. Section 10.2.1, on "orthodoxia," "catholodoxia," "heterodoxia," "paradoxia," and "heresy."

This last statement by Hart will look strange unless we admit (as I do) that the internal point of view typical of judges and the other officials may consist in the hypocrisy of the whited sepulchres (Section 6.6). Indeed, when judges and officials at large are sincere believers, they will have to be that way not only in their official capacity, but also when they act as private citizens. At any rate, Hart comes to the following conclusion:

> The assertion that a legal system exists is therefore a Janus-faced statement looking both towards obedience by ordinary citizens and to the acceptance by officials of secondary rules as critical common standards of official behaviour. We need not be surprised at this duality. It is merely the reflection of the composite character of a legal system as compared with a simpler decentralized pre-legal form of social structure which consists only of primary rules. *In the simpler structure, since there are no officials, the rules must be widely accepted as setting critical standards for the behaviour of the group. If, there, the internal point of view is not widely disseminated there could not logically be any rules.* But where there is a union of primary and secondary rules, which is, as we have argued, the most fruitful way of regarding a legal system, the acceptance of the rules as common standards for the group may be split off from the relatively passive matter of the ordinary individual acquiescing in the rules by obeying them for his part alone. *In an extreme case the internal point of view with its characteristic normative use of legal language ("This is a valid rule") might be confined to the official world.* In this more complex system, only officials might accept and use the system's criteria of legal validity. The society in which this was so might be deplorably sheeplike; the sheep might end in the slaughter house. But there is little reason for thinking that it could not exist or for denying it the title of a legal system. (Hart 1961, 113–4; italics added)

8.2.6.2. The Difference between Criteria and Rules as a Difference between Types and Norms

Let us now take things up from point (*b*) of the previous Section 8.2.6.1, on intra-systemic norms, and consider in some detail the interaction between the secondary rule of recognition and intra-systemic primary rules of obligation as this interaction is described in Hart. We will do so by paying special attention to the terms he brings into play to this end. According to Hart,

> wherever such a rule of recognition is accepted, both private persons and officials are provided with *authoritative* criteria *for identifying primary rules of obligation*. The criteria so provided may, as we have seen, take any one or more of a variety of forms: these include reference to an authoritative text; to legislative enactment; to customary practice; to general declarations of specified persons, or to past judicial decisions in particular cases. In a very simple system like the world of Rex I [...] *the sole criterion for identifying the law* will be a simple reference to the fact of enactment by Rex I. [...] In a modern legal system where there are a variety of "sources" of law, the rule of recognition is correspondingly more complex: the criteria for identifying the law are multiple and commonly include [reference to] a written constitution, enactment by a legislature, and judicial precedents. (Hart 1961, 97–8; italics added)[36]

[36] The interpolation introduced with the last pair of square brackets ("reference to") may perhaps be so obvious as to be unnecessary. But, given the doubt, I felt safer making it anyway: Someone might be in disagreement.

I have italicised for emphasis two terminological uses by which Hart effects a conflation similar to the one pointed out in the previous section: In this case he is conflating two concepts between which I feel a distinction is necessary. I have also italicised for emphasis a qualification I find perplexing and telling.

Let us begin with the qualification. It consists in the adjective “authoritative.” This adjective should be reserved—in a strict sense, at least in my terminology—for people invested with authority by a competence norm (by a power-conferring rule or a rule of recognition, in Hart’s terminology), and for these people’s enactments.

Maybe in Hart’s terminology, “authoritative criteria” somehow means “criteria believed to be per se authoritative, or binding.” This interpretation seems to me to be supported by the context in which “authoritative” occurs. Hart (1961, 97; italics added) writes: “Wherever such a rule of recognition is *accepted*, both private persons and officials are provided with *authoritative criteria for identifying primary rules of obligation*.” In my view, these criteria are authoritative only for those who accept them as authoritative, and they are authoritative because accepted as authoritative: Those who accept them as authoritative somehow come to believe them to be binding per se (in the sense specified in Chapter 6; and criteria that are believed to be binding per se are norms); also, in keeping with my terminological choice, I prefer the expression “per se binding types” to “per se authoritative criteria.” And, moreover, a criterion like the one that Hart indicates as “enactment by Rex I” is in my terminology a type of circumstance contained in a competence norm (Sections 5.3, 6.3, 7.3, 8.2.1, and 9.6).

Undoubtedly, a criterion that is *not* authoritative or binding—as is the case with any non-authoritative or non-binding type (any type not set forth in any norm; and norms are in the brains of believers)—does serve nonetheless, and in full, for believers and nonbelievers alike, the constitutive function of making possible valid tokens, and this criterion will be used according to its right use to distinguish tokens that are valid (congruent) with respect to it from tokens that are invalid (incongruent) with respect to it (cf. Sections 2.1.1 through 2.1.6 and 2.2.2).[37]

It is just as doubtless, however, that a criterion that no one believes to be authoritative per se, or a type that no one believes to be binding per se, cannot bring forth (in anyone who does not believe in its authoritativeness or bindingness, therefore) the process, described in Chapter 7, by which derivative norms are inferred. We can now consider, in the light of this premise, Hart’s conflation of two different concepts.

[37] Of course, you cannot use a type that you do not know, a type that is unavailable to you. So if you qualify a token as valid or invalid with respect to a type, you are using to that end a type encoded in your brain. But this type that you are using will enable you to qualify tokens as valid or invalid even if it is not encoded as the content of a norm you have internalised.

In the passage just quoted, and elsewhere, too, Hart's phrasing implies one conflation between "secondary rule of recognition" and "criteria" and another conflation between "used for the identification of primary rules of obligation" and "for identifying the law." Both conflations, I believe, are best avoided.

Now then, in my view, neither criteria nor law is normative per se, if not with anyone who holds it to be normative. Indeed, criteria I understand to be types independently of any norms or rules that may contain them (Chapter 2). And law I do not understand to be entirely normative, that is, normative with everyone (nor even do I understand it to be normative with every official): Law is normative only with those people who, in one way or another, have internalised it as normative; that is, law is normative only with believers; and with each believer, it is normative only in those parts of it (in certain statutes rather than others, for example) that the believer in question believes to be normative (cf. Sections 9.5.2, 9.6, and 10.2.1).

Criteria, even if they are held to be non-normative, can well serve the function of identifying the law, whether the law is held to be normative or not. The function is that of identifying either the law in books[38] (metonymically valid statutory law) or such law as is effective on account of the intertwining (described in Chapter 10) of normativeness and organised power. Which of the two kinds of law we end up identifying will depend on the criteria we use. But here, with both kinds of law, the criteria used serve the function of identifying the law whether the law is normative or not: The criteria do not as such affect the normativeness or non-normativeness of the law identified with them, much less do they determine such normativeness or non-normativeness (unless these criteria are the content of a norm believed in by the people who use them).

Hart's undifferentiated use of "rules" and "criteria," on the one hand, and "primary rules of obligation" and "law," on the other, supports me in my view that the following two conceptual distinctions had best be maintained.

On the one hand, we have the distinction between types (whether set forth in norms or elsewhere) and norms (or obligatory rules, in Hart's terminology) whose existence is a matter of fact.

On the other hand, we have the distinction between norms (or rules, in Hart's terminology) and law. In my view, the law rests on norms, that is, on de facto existing and binding rules as just characterised using Hart's terminology specifically to that end. Norms contribute crucially and powerfully to the law's functioning and persistence; they are a necessary condition of the law's being in force as this concept is characterised in Chapter 10. They are not, however, also a sufficient condition for the law's functioning, persistence, and

[38] As is known, the expression "law in books" was brilliantly treated by Roscoe Pound in opposition to "law in action"; cf. Pound 1910.

being in force; and this implies that law is not made up exclusively of norms (or made effective or in force exclusively by virtue of norms: Section 10.1), and that law is not entirely normative, either with the bulk of the population or with the officials.

The secondary rule of recognition serves at once two functions that must be kept conceptually distinct.

The importance of this distinction can be appreciated, for example, when we have to do with the question of the implementation of enactment procedures. Let us see how so.

The rule of recognition, considered as a provider of criteria, serves to identify in a cognitive sense certain directives, or texts, as metonymically valid tokens of certain types, or as modes of enactment by which law is produced (Is-outcome, i.e., texts of law). Here the type of circumstance set forth in the rule of recognition is considered only qua type. And its constitutive and cognitive function in identifying metonymically valid law (or texts of law) is performed independently of whether the rule of recognition is held to be normative, or binding per se; that is, independently of whether the same type is held to be the type of circumstance contained in a competence *norm* (a power-conferring *rule*: internal point of view).

When, instead, the secondary rule of recognition is not only considered a provider of criteria, but is also accepted as a normative rule (internal point of view) prescribing obedience to the law (texts of law) identified on the basis of the same criteria, it serves this further function with respect to believers: with respect to those people who believe the rule of recognition to be a competence norm that is binding per se (or authoritative, in Hart's terminology). The function—given the contents of directives and of texts enacted validly with respect to the type of circumstance set forth in the rule of recognition—is to drive the believers in the rule of recognition (understood as a competence norm: as a normative, authoritative rule) to believe by subsumption and inference (Chapter 7) that the contents of these directives or enacted texts are per se binding derivative norms. Here, the type of circumstance set forth in the rule of recognition functions normatively as well, because the rule of recognition is held to be binding per se, i.e., it is held to be a competence *norm*: It serves to produce normative illative beliefs, in a causal-psychological sense (and through the subsumption and inference process described in Sections 7.3 and 9.6), and it may involve the reification or hypostatisation of the contents of such beliefs.

Hart introduces with these words the internal point of view:

> The use of *unstated rules of recognition*, by courts and others, in identifying particular rules of the system *is characteristic of the internal point of view*. Those who use them in this way thereby manifest their own *acceptance* of them as *guiding rules* and with this attitude there goes a *characteristic vocabulary* different from the natural expressions of the external point of view. (Hart 1961, 99; italics added)

It seems clear to me here that Hart is using "rules" in the sense in which I use "norms": Significant in this regard is his use of "guiding" to qualify "rules." It may be that my interpretation of Hart's thought is mistaken. What is certain—if I am allowed to enter briefly into autobiographical detail—is that on my reading, Hart's 1961 account of the existence of a norm from an internal point of view has since been lending support to the concept of norm I came at from reading the works of Hägerström and Olivecrona, a concept that is presented and developed in this volume as well.

Observations similar to those previously made—on the importance of the two conceptual distinctions (between types and norms and between norms and law): on the bearing these distinctions have when we consider the functions of the implementation of enactment procedures, for example—are warranted as well by the way Hart brings the external point of view into play in opposition to the internal point of view. He does this as follows:

> This *attitude of shared acceptance of rules* is to be contrasted with that of an observer *who records ab extra the fact that a social group accepts such rules* but does not himself accept them. The natural expression of this external point of view is not "it is the law that ..." but "In England they recognize as law ... whatever the Queen in Parliament enacts ... ." The first of these forms of expression we shall call an *internal statement* because it manifests the internal point of view and is naturally used *by one who, accepting the rule of recognition and without stating the fact that it is accepted*, applies the rule in recognizing some particular rule of the system as valid. The second form of expression we shall call an *external statement* because it is the natural language of an external observer of the system who, without himself accepting its rule of recognition, states the fact that others accept it. (Hart 1961, 99; italics added on first, second, and fourth occurrence; in original on third and fifth occurrence)

In view of the matter discussed in the following Section 8.3—namely, whether Hart 1961 intended to provide a conventionalist account of the internal point of view of norms—I should call attention in the first instance to what Hart 1961 says, in the excerpt just quoted, on those who adopt the internal point of view: This is someone "who, accepting the rule of recognition and *without stating the fact that it is accepted*, applies the rule in recognizing some particular rule of the system as valid." This remark (from Hart 1961) would seem to settle the question: Those who adopt the internal point of view do not do so stating its general acceptance on the part of others. And the reason why they do not state this acceptance, I should comment, is this: Those who adopt an internal point of view (those who believe in a norm) do so (they believe in a norm) precisely inasmuch as they do not make their normative attitude (their belief) dependent on the behaviours or attitudes (beliefs) of other people—precisely inasmuch as their acceptance of a norm cannot correctly be explained by way of a conventionalist account of norms.

In my terminology I would say that those who adopt the internal point of view and make internal statements believe the criteria with which to identify the law to be authoritative or binding per se, in that they believe it to be bind-

ing per se to obey anything that these criteria mark out as binding per se. To put it otherwise, the criteria of validity—when viewed from the believer's standpoint, the internal point of view—are twofold: They are not only criteria with which to determine whether a certain actual item (e.g., a text, statute, directive, or regulation) has been validly or congruently enacted with respect to a certain type of enactment, and hence whether this item is part of the law of the country in question; they are also the type of circumstance with whose valid instances a norm a believer believes in (here, a competence norm, the secondary rule of recognition) connects a per se binding type of action—in this case, since we have to do with a competence norm, it will connect the type of action "obeying" (cf. Section 8.2.1).

And I would also say, on the other hand, that those who adopt, instead, the external point of view and make external statements adopt the aforementioned criteria (which criteria other people, the believers, believe, from an internal point of view, to be types of circumstance with which a competence norm connects the per se binding type of action "obeying") without understanding them to be types of circumstance with whose valid instances there is connected an obligation to obey. The nonbelievers (external point of view) use the same criteria used by believers,[39] but as mere criteria (not as types of circumstance specified in a competence norm): They use these types neutrally as criteria with which to determine whether the law's modes of production have actually taken place validly with respect to these criteria. In nonbelievers—once they have identified a certain token as congruent with that type, or criterion, or valid with respect to it—there is not any going any further: There is not any proceeding to the subsumption of valid tokens under the type of circumstance in order to infer derivative norms (but at most to infer derivative and, in their view, non-binding laws), this because in the brains of nonbelievers there is encoded a type ("type" as criterion for identifying the law of the land) but there is not internalised any per se binding norm (or belief) requiring obedience to this law. And hence, in the brains of nonbelievers, there is no proceeding to the inference of derivative norms, as happens instead in the brains of believers (internal point of view).

On judges and officials, as distinguished from ordinary citizens, Hart also says what follows:

[39] The type used by believers and nonbelievers is roughly the same type in the same sense in which the type of circumstance used by believers is the same type among believers. The presence or absence of a normative qualification of a shared type (in any possible meaning of "shared") can, however, involve differences even in the mere judgment of validity (congruence) that through that type believers and nonbelievers alike apply to certain tokens. The believing and the nonbelieving duty-holder will both turn to a tax lawyer to find out what the country's (metonymically) valid law is, but the believing duty-holder will do so in order to comply with his or her duties as a taxpayer; the nonbelieving duty-holder, to commit fiscal evasion or avoidance and conceal it as effectively as possible.

Individual courts of the system though they may, on occasion, deviate from these rules must, in general, be critically concerned with such deviations as lapses from standards, which are essentially common or public. This is not merely a matter of the efficiency or health of the legal system, but is logically a necessary condition of our ability to speak of the existence of a single legal system. (Hart 1961, 112–3)

In my opinion, the existence or being-in-force of a legal system in a given country requires organised power and norms (cf. Chapter 10), and as Hart observes, it requires in particular that norms be *critically*, that is, consciously, present among officials and judges. But the critical concern of judges and other officials with norms can also be, in a measure not too small, a pretended concern.

The hypocrisy of officials plays a role (first among these officials are the politicians, in their institutional roles, and then come the judges; but there is also the hypocrisy of university professors, just so that we do not discriminate): The role that hypocrisy plays is that of contributing to keeping the legal system in existence, or in force. The whited sepulchres and the Jesuits (cf. Section 6.6), along with sincere believers, play a role that, with a little bit of cynicism (or, in this case, a little bit of realism à la Niccolò Machiavelli, 1469–1527), I feel must be recognised by us, the jurisprudents.

I think that if we (the jurisprudents) did not acknowledge this fact we would ourselves, in our official capacity as scholars, be acting in the manner of whited sepulchres or Jesuits, rather than in the manner of sincere believers in some professional norm that drives us to state things as they are (or as we think they are) vis-à-vis stating things as we'd like them to be.

8.3. Hart's *Postscript* Compared with Hart 1961: An Abjuration of Normativeness in Law

8.3.1. Hart's Masterpiece of 1961

We considered in the foregoing Sections 8.2.5 and 8.2.6 a few problems that Kelsen's theory of validity brought upon the "realistic" normativism ("realistic" à la Hägerström and Olivecrona) characterising Hart 1961. In particular, we considered the two concepts of existence of a norm adopted in Hart 1961.

Hart 1961 admits and theorises (*i*) the factual existence of extra-systemic norms of conduct and competence norms: the primary rules of obligation of prelegal societies, the binding or obligatory rules of international law, the nonlegal rules of churchgoers (males must bare their heads in church), and, last but not least, the rule of recognition.

At the same time, Hart 1961 admits and theorises (*ii*) the existence of intra-systemic norms of conduct and competence norms in advanced systems of municipal law; and he does so equating the existence of these norms with their validity, à la Kelsen. We have to do here with a notion of existence of

norms that, in Kelsen and Hart alike, is formal at the same time as it implies the normativeness, obligatoriness, or binding force of these norms, except that in Hart, unlike what happens in Kelsen, the existence-as-validity of the norms in question does not occur outside of space and time, but within the officials: within their internal point of view.

With his distinction between the two modes of existence of norms—modes (*i*) and (*ii*)—Hart 1961 puts an end to the two main traditions of 19th-century legal positivism: on the one hand, the empirical legal positivism which flourished in Great Britain under the powerful push of Bentham and Austin (analytical jurisprudence), and which spread most prominently in the common-law countries of Europe and North America and, on the other hand, the formalistic legal positivism which flourished in continental Europe under the powerful push of German legal dogmatics (in the stretch from Pandectism to *Begriffsjurisprudenz*, or conceptual jurisprudence,[40] and to *Allgemeine Rechtslehre*, or general theory of law,[41] and its 20th-century sublimation in Hans Kelsen's pure theory of law), and which spread especially in the civil-law countries of Europe and Latin America.

Having dismissed Austin's reductionist voluntarism (whereby a legal norm is equated with a habitually obeyed, or else enforced, command), and having dismissed Kelsen's normativistic reductionism (whereby a legal norm is equated with an *objektives Sollen* that is presupposed whenever the legal system is on the whole effective; cf. Chapter 14), Hart 1961 presents a fresh legal positivism, centred on the notion of social rule, a notion which breaks free of Austin's concept of norm as a habitually obeyed command as much as it breaks free of Kelsen's concept of norm as an objective and hypostatised Ought, but which at the same time satisfies the requisites of empiricalness and sociality (the requisites that Austin's theory was designed to satisfy) as much as it satisfies the requisites of the *prinzipielle Verschiedenheit* (Kelsen 1911, 8), the essential difference between Ought and Is (the requisites that Kelsen's theory was designed to satisfy).

The two reductionisms are overcome with elegance, softness, and careful critical analysis. Hart's rule of recognition—a social rule factually existing in the previously recalled sense (*i*) of "existence of a norm"—is explicitly designed to replace the "general habit of obedience" of analytical jurisprudence as much as it is designed to replace the presupposed basic norm of the pure theory of law.

In the 1970s Hart's idea of social rule drew the heeling criticism of Ronald Dworkin,[42] a criticism framed within the context of a more general challenge

[40] The German *Jurisprudenz* should properly be rendered as "legal science."

[41] But see the terminological qualification made in Section 1 of the Preface to this volume.

[42] Of course Dworkin's was not the only criticism of Hart, but it certainly was the most important, and the one by which the legal-philosophical debate on Hart stood most affected. Cf. Dworkin 1996, 1986a, 1986b. See, among other critics, MacCormick 1981 and Raz 1999.

to Hart's new legal positivism. This challenge, in the exposition of it found in Hart's *Postscript*, focuses on six main topics. The third of them is what Hart calls "the nature of rules."

8.3.2. Hart the Iconoclast: The Postscript*'s Destruction of the 1961 Portrait*

As Hart himself points out in his *Postscript* (published posthumously in 1994), the challenge that Dworkin puts him to consists of a wide range of criticisms "urged [...] in many of the seminal articles collected in *Taking Rights Seriously* (1977) and *A Matter of Principles* (1985), and in his book *Law's Empire* (1986)" (Hart 1997, 239). And, according to Hart, these criticisms involve six topics as follows: (*i*) the nature of legal theory, (*ii*) the nature of legal positivism, (*iii*) the nature of rules, (*iv*) principles and the rule of recognition, (*v*) law and morality, and (*vi*) judicial discretion.[43]

The six topics around which Dworkin builds his critical challenge to Hart are interconnected, to be sure, but here I will concern myself only with the question of normativeness (topic (*iii*)), for it is with regard to this question that I found a placement for the portrait of Hart 1961—and I intend to keep it there; and it is with regard to this question that I will want to consider the changes that take place from Hart 1961 to Hart's *Postscript*.[44] Indeed, from Hart's *Postscript* reply to Dworkin's criticism, there emerges—in what concerns the nature of rules—a complex abjuration of the legal normativeness maintained in Hart 1961. Following are the main points made in Hart's *Postscript* on the question in issue, along with my comments to these points.

(1) Hart speaks of his "original account of social rules" (1961) as no longer corresponding to the new account of them that he is about to provide in the *Postscript*. He finds that "some of Dworkin's criticism" to his original account of social rules "is certainly sound and important for the understanding of *law*" (italics added).[45]

[43] Cf. Hart 1997, 239ff., 244ff., 254ff., 263ff., 268ff., 272ff.

[44] As was to be expected, all the topics treated in Hart's *Postscript* touched off a wide debate in the world of legal philosophy: Exemplary in this regard is Coleman 2001b (with contributions by Joseph Raz, Timothy A. O. Endicott, Nicos Stavropoulos, Jules Coleman, Scott J. Shapiro, Andrei Marmor, Benjamin C. Zipursky, Kenneth Einar Himma, Stephen R. Perry, Brian Leiter, Liam Murphy, and Jeremy Waldron) and the December 2003 issue of *Ragion Pratica* (edited and with an introduction by Cristina Redondo, with essays by Mauro Barberis, Bruno Celano, Pierluigi Chiassoni, Enrico Diciotti, Riccardo Guastini, Mario Jori, Massimo La Torre, Claudio Luzzati, and Vittorio Villa). In Volume 11 of this Treatise, Gerald Postema devotes ample discussion to Hart, his critics, his *Postscript*, and the ensuing debate, especially in the English-speaking world and with reference as well to the different kinds of legal positivism.

[45] "Some of Dworkin's criticism of my original account of social rules is certainly sound and important for the understanding of law, and in what follows here I indicate the considerable modifications in my original account which I now think necessary" (Hart 1997, 255).

I wonder which aspects of law Hart is referring to here, since he is about to state that his practice theory "remains as a faithful account" of *law*, and he also states that in consequence of Dworkin's criticisms, he now holds his original practice theory to be no longer applicable to *morality*.[46]

It would be wrong to think that in the *Postscript* Hart retains his original theory of rules (his 1961 theory) and only restricts its application to law. Quite the contrary: The original theory changes radically in the *Postscript*. Here, in his *new* account of social rules, Hart narrows the range of application by excluding morality from it. And his reason for doing so is precisely that he has changed, not his 1961 account of morality, but his 1961 account of *social rules*, and his new account of social rules (as found in the *Postscript*) is not applicable to morality: It is applicable only to "conventional social rules which include, besides ordinary social customs (which may or may not be recognized as having legal force), certain important legal rules including the rule of recognition," says Hart in the *Postscript* (Hart 1997, 256). I say that this new account is not applicable to law, either, in contrast to the 1961 account of social rules, which was applicable to *both* morality and law (according to Hart 1961). The reason why I understand the new (*Postscript*) account of social rules as not applicable to law either is that conventional rules are not norms (per se binding rules)—and there cannot be law without norms, a point on which I am in agreement with Hart 1961.[47]

(2) Hart writes in the *Postscript*, "In what follows here I indicate the *considerable modifications* in my original [1961] account which I *now* think necessary" (italics added) and he declares that his 1961 account of social rules

[46] "My account of social rules is, as Dworkin has also rightly claimed, applicable only to rules which are conventional [...]. This considerably narrows the scope of my practice theory and I do not now regard it as a sound explanation of morality, either individual or social. But the theory remains as a faithful account of conventional social rules which include, besides ordinary social customs (which may or may not be recognized as having legal force), certain important legal rules including the rule of recognition, which is in effect a form of judicial customary rule existing only if it is accepted and practised in the law-identifying and law-applying operations of the courts" (Hart 1997, 256).

[47] I am not denying here that many legal rules are effective because they are conventions, rather than because they are (believed to be) norms; and after all, I include conformism among the possible kinds of obedience to law: Section 6.7; cf. Sections 9.3 through 9.5). What I do deny is that a legal system can be in force (Chapter 10) and enduring and settled (Section 8.1) if at least a part of the population, and in particular a significant part of the officials, has not internalised as norms (by conviction) a significant amount of the laws making up the legal system. This is also the view of Hart 1961, who in fact criticises John Austin's theory of the law as a set of habitually obeyed commands in a society: He made this criticism on the basis of arguments quite similar to those used by Hägerström and Olivecrona before him. The conclusion these arguments lead to is encapsulated in the title of the present chapter, "No Law without Norms," a slogan that applies equally well to Hägerström, Olivecrona, Hart 1961, and, last and least, to me.

"is, as Dworkin has claimed, defective in ignoring the important difference between a consensus of *convention* manifested in a group's conventional rules and a consensus of independent *conviction* manifested in the concurrent practices of a group" (Hart 1997, 255).

It is this distinction between a consensus of convention and a consensus of independent conviction—a distinction made by Dworkin in *Taking Rights Seriously* and later reiterated and expanded upon in *Law's Empire*[48]—that plays a crucial role in getting Hart to change, in the *Postscript*, his 1961 account of social rules, a change from which flows, in the *Postscript*, his abjuration of normativeness in law.

In fact, Hart's new account of social rules as presented in the *Postscript*—a conventionalist account—has little do to with normativeness. And it is in consequence of giving up normativeness that Hart's *new* account of social rules, as presented in the *Postscript*, cannot be applied to morality. What does instead still apply to morality (even after the *Postscript*) is Hart's 1961 *normativistic* account of rules.

(3) In the *Postscript* Hart maintains that his original (1961) "account of social rules is, as Dworkin has rightly claimed, applicable only to rules which are conventional," and he characterises conventional social rules as follows, by setting them against concurrent rules (an example of concurrent rules is the rules making up a group's shared morality):

> Rules are conventional social practices if the general conformity of a group to them is part of the *reasons* which its individual members have for acceptance; by contrast merely concurrent practices such as the shared morality of a group are constituted not by convention but by the fact that members of the group have and generally act on the same but independent *reasons* for behaving in certain specific ways. (Hart 1997, 255–6; italics added)

This passage is important because Hart adopts in it Dworkin's distinction between conventional rules and normative (concurrent) rules, a distinction worked out for the specific purpose of critiquing Hart's theory of social rules.[49] The passage is important for another reason, too: Hart's adoption of this distinction (in the *Postscript*) is intended to relocate law within the sphere

[48] It is *Law's Empire* that Hart refers to in the sentence just quoted (Dworkin 1986, 114ff., 135ff., 144ff.; cf. Dworkin 1996, 53).

[49] "A community displays a *concurrent* morality when its members are agreed in asserting the same, or much the same, *normative* rule, but they do not count the fact of that agreement as an essential part of their ground for asserting that rule. It displays a *conventional* morality when they do. If the churchgoers believe that each man has a duty to take off his hat in church, but would not have such a duty but for some social practice to that general effect, then this is a case of conventional morality. If they also believe that each man has a duty not to lie, and would have this duty even if most other men did, then this would be a case of concurrent morality" (Dworkin 1996, 53; italics added).

of conventional rules and to reserve for morality alone the sphere of concurrent rules—truly normative rules, as I would call them.

The internal aspect of rules is retained in Hart's *Postscript*, but here it is characterised in two different ways designed to account for the different nature of the two kinds of social rules, conventional and normative (concurrent), in line with the distinction made in the foregoing passage of the *Postscript*. In this passage, the internal aspect of the two kinds of social rules—two heterogeneous kinds—comes into play where Hart speaks of the reasons (I would say the motives) the individual members of a group have for their acceptance of these rules.

According to Hart's *Postscript*, the group's general conformity to conventional rules is a component (an essential component, I should say) of the motives (Hart says reasons) the individual members of the group have for their acceptance of them. In other words, the fact of the group's general conformity to rules plays a crucial role in the internal point of view—in the attitude the individual members of the group take toward these rules.

Not so in the case of normative (concurrent) rules: According to Hart's *Postscript*, the reasons (I would say the motives) the individual members of the group have for their acceptance of these rules do *not* consist in the group's general conformity to them. In fact it would seem that the reasons for the individual members' acceptance of concurrent rules *cannot* consist in the group's general conformity to them. Quite the contrary, the reasons the individual members of the group have here for their acceptance of rules is rather, in every individual member, independent of the practice of the other individual members of the group, and the reasons for acceptance of rules are the same for every individual in the group. And *this* reason—this motive—consists in the internal aspect as characterised in Hart 1961: The internal aspect of concurrent rules is the distinctive critical attitude that Hart 1961 ascribed, not only to people practising certain legal and prelegal rules, like the (legal) rule of recognition, the (legal) rules of international law, and the (prelegal) rules of obligation of prelegal societies, but also to people practising the rules of morality. This internal aspect (of 1961) is a distinctive, critical, truly normative attitude that in the *Postscript* Hart wants to ascribe *only* to people practising the rules of morality, and no longer to people practising the legal and prelegal rules just mentioned.

Why is that so?

Because—I say—Hart, in consequence of Dworkin's criticism, has come to appreciate that the internal point of view by which in 1961 he characterises both the law and morality results in a strict, strong, or true normativeness not susceptible of being conceptually distinguished into different species of normativeness: a moral normativeness and a legal one, for example, the latter being heterogeneous from the former, and for this reason separate from it.

Normativeness and morality, as Dworkin configures them, tend to mix and conflate; so, unless we keep the rules of law heterogeneous from the rules of morality (that is, from norms, or normative rules), the ones will end up implying the others and jeopardising the thesis of the separation of law and morality. Ironically, it was Dworkin himself who showed Hart the escape route; he did so with his distinction between a social morality made of conventional rules (a conventional morality) and a social morality made of normative rules (a concurrent morality). In the light of this distinction, the escape route is the following: Law is made of conventional rules (of conventions) and morality of normative rules (of norms).[50] There is a sense in which Dworkin not only showed Hart the escape route, but forced him to *take* that route.

Indeed, there is not a decisive objection against considering concurrent morality to be social, on a par with conventional morality: both are equally social insofar as they are generally practised by the members of a social group. The difference between the two moralities, both of them socially practised, is the motive (or reason, in Hart's usage) why people practise them: Conventional morality is something that people practise because they see it generally practised in the social group; concurrent morality, in contrast, is something that they practise because they see it as their duty to do so (so, even though a concurrent morality is generally practised, this fact does not figure into the motives, or reasons, that cause people to follow this practice).

I believe that even though Hart 1961 went quite far in stressing the social dimension of rules (he did so on account of a misplaced anti-psychologism that I will return to in Section 15.4), he gave in reality a normativistic characterisation of rules (as I hope to have shown in Section 8.1) by placing emphasis on their internal point of view, or aspect—and this normativistic characterisation applied equally to legal and moral rules (a view that takes Hart 1961 not too far from the positions of Hägerström and Olivecrona). The rules that Hart speaks of in 1961 are in any case normative concurrent rules in what concerns their acceptance, be it the officials' acceptance of the rules of law, the acceptance of the rules of morality by those who share a given morality, or the acceptance of the prelegal rules of a primitive society by the members this society.

Dworkin ascribes to Hart 1961 what he calls the "social rule theory" (Dworkin 1996, 51). Dworkin understands the social-rule theory he ascribes to Hart to be in any event a conventionalist theory: I do not agree on this point, because, as was previously shown, and as Dworkin, too, admits, "social" is not equivalent to "conventional," so that it is possible to have social moralities that are normative and concurrent rather than conventional. Dworkin adds that the conventionalist social-rule theory he ascribes to Hart can take a strong version or a weak one: The former claims to give a conven-

[50] Cf. footnote 49 in this section.

tionalist account of *all* rules (be they legal or moral); the latter it does *not*. According to the weak version of the social-rule theory,

> it is simply *sometimes* the case that someone who asserts a duty should be understood as presupposing a social rule that provides [the grounds, reasons, or motives] for that duty. For example, it might be the case that a churchgoer who says that men must not wear hats in church must be understood in that way, but it would not follow that the man who asserts the duty not to lie must be understood in the same way. He might be asserting a duty that does not in fact depend upon the existence of a social rule. (Dworkin 1996, 52)

Further, in *Taking Rights Seriously*, Dworkin is not categorical in maintaining that Hart 1961 adopts the strong conventionalist version of the social-rule theory: He observes that Hart's conventionalist social-rule theory lends itself to be interpreted as either strong or weak. Ultimately, however, Dworkin maintains (erroneously, in my opinion, or maybe with some provocation) that what Hart 1961 writes in the parts relevant to this question indicates that Hart 1961 adheres to the strong conventionalist version of the social-rule theory (Dworkin 1996, 52). I should reiterate that Hart 1961, despite what he later writes in the *Postscript*, does not adopt a conventionalist social-rule theory, either strong or weak. What he does adopt is instead a normative social-rule theory (rather than a conventionalist one): As I just said, "social" is not equivalent to "conventional," and a social-rule theory can very well characterise as normative the rules concurrently practised in a social group (and this is what Hart does in 1961).

A moment ago, in regard to Dworkin's opinion of Hart 1961, I said that Dworkin was mistaken in his opinion, or that maybe he expressed it with an intent to provoke. I fancied for a minute what Dworkin's attacks on Hart might look like if they were the skilful moves of a chess player. In the metaphor of chess, had Hart fallen for the ruse that had been devised, replying that, contrary to what Dworkin was insinuating, his social-rule theory was framed in reference not to conventional rules but to concurrent normative rules (which is how I view Hart 1961), Dworkin would have checkmated him. That is, Dworkin would then have been able to show that—if that was the case: if Hart was in fact referring not to conventional social rules but to concurrent normative social rules—Hart's thesis of the separation of law and morality would have been undercut.

I do not know whether Hart was a good chess player, but certainly he showed the makings of one: He saw through the ploy, pondered at length, and then, in the *Postscript*, withdrew in defence in the manner I am illustrating in these pages: Hart took the escape route that Dworkin had shown to him, a route he was forced to take if he was to avoid being checkmated on the thesis of the separation between law and morality.

Consider that if Hart had not chosen to take this escape route (an escape route that he was in reality forced to take, in the sense just explained) and had instead claimed and reasserted the normative character he ascribed to so-

cial rules in 1961 (by admitting that in *The Concept of Law* he was presenting rules of a social, normative, concurrent kind), he would have had to come to a very embarrassing conclusion: the conclusion—to paraphrase the title to the present chapter—whereby there is no law without morality.[51] Hart was evidently unwilling to come to this conclusion. For this reason he took the escape route shown to him by Dworkin: In the *Postscript*, Hart says that his social-rule theory was already conventional in 1961 (if he had said that it was normativistic, he would have had to forsake the separation of law and morality); in the *Postscript*, he implicitly argues his 1961 theory of social rules to be the weak version of the conventionalist social-rule theory (whereas Dworkin had argued it to be the strong version). The weak version admits of individual normative rules (accepted as normative by individual people) and of social normative rules (concurrently accepted as normative by the generality of the members of a social group). Neither of these normative rules (individual rules on the one hand, social but concurrent rules on the other) has anything to do with conventional rules: They are the stuff of which morality is made, individual morality as well as social morality. And a social morality made up of normative rules is evidently a normative and concurrent social morality.

In the *Postscript*, Hart weakens and indeed does away with his original (1961), normativistic account of the internal point of view where the law is concerned. In the *Postscript*, Hart retains his original (1961), normativistic internal point of view to characterise morality, and for the law he conceives a new internal point of view *different* from that which he described in 1961 as characterising the law as well. In the *Postscript*, Hart conceives for the law—for legal rules, including the rule of recognition—a would-be normativistic account of the internal point of view: a conventionalist account. Conventions may be called rules, but they are not norms: They do involve an internal point of view, but not a normative one.

I am not dealing in any essentialism here: The word "rule" takes many meanings. There are rules of prudence, for example. I am trying to make an

[51] The title to this chapter is "No Law without Norms." If normativeness is identical to morality, one must come to the conclusion just indicated. This conclusion might be complemented by paraphrasing as well the titles of Chapters 9 and 10 of this volume, so that not only is there "no law without morality," but also "morality is not enough" and "the law in force is an ambiguous intertwining of morality and organised power." Conclusions of this kind are not embarrassing for those who, like me, and unlike Hart, admit among moralities the moralities that are irrational and iniquitous from the standpoint of a critical and enlightened morality (such as I think Hart, Dworkin, and I by and large share): These moralities are irrational and iniquitous but are moralities nonetheless, just as many legal systems are irrational or iniquitous but are legal nonetheless. Hart, strangely, from my point of view, upholds the second thesis but rejects the first. Examples of irrational or iniquitous moralities are taboo moralities, Nazi and racist moralities, and the morality of terrorism, and I will briefly return to them in Section 15.4.

unambiguous use of the terms I call into play. So, in this effort, I am using "norm" to designate not just any rule, but only those rules that are normative. And, on my characterisation of norms (Chapter 6), a conventional rule is a rule but not a norm.

The social rules that Hart speaks of in 1961 are characterised as having a peculiar internal aspect in addition to an external one—and such are the (prelegal) rules of obligation in prelegal societies, the obligatory (legal) rules of international law, the churchgoers' (nonlegal) rule (males must bare their heads in church), and, last but not least, the (legal) rule of recognition that judges and officials use in advanced municipal law to decide what are to count as valid intra-systemic rules, where "valid," in Hart's 1961 usage, means "rules endowed with binding force" (cf. Section 8.2.6).

Rules as characterised by an internal normative attitude—the believers' belief, the distinctive internal point of view, or acceptance, in the sense of Hart 1961—are a different thing from so-called conventional rules: They are norms. For this reason, the portrait of Hart appearing in my normative gallery next to Hägerström's and Olivecrona's is Hart 1961.

8.3.3. Summing up on Hart 1961 and on Hart's Postscript

Hart's main purpose in the *Postscript* is to safeguard the separation between law and morals. In response to Dworkin's criticisms, he puts his own conception of legal normativeness through a serious revision. And this revision, I submit, is designed to preserve the separation between law and morals, relegating the law to the sphere of the conventional (as Dworkin characterises this concept, beginning with *Taking Rights Seriously* up until the more elaborate exposition found in *Law's Empire*) and reserving the normative dimension for morals, this precisely for the purpose of not jeopardising the separation between law and morals.

Indeed, there are two readings that we can make of the considerable modifications that Hart says he wants to make in the *Postscript* by restricting the scope of his social-practice theory of 1961 in reply to Dworkin's criticisms.

Here is the first reading. Hart says in the *Postscript* that his practice theory of rules was already conventionalist as of 1961, but that he had not at that time realised it: He came around to that realisation only after Dworkin's criticism. On this reading, Hart maintains in the *Postscript* that he had implicitly and half-consciously been a conventionalist from the outset, and that precisely because of this half-conscious way of being conventionalist, he had not realised that the conventionalism of his practice theory of rules could not work as an account of morality. Having become fully aware of this fact with Dworkin's criticisms, Hart, on this first reading, maintains, and remains true to, the conventionalistic setup of 1961, but this only in what concerns the law; and, in consequence of the newly acquired consciousness owed to Dworkin, Hart

informs us that in 1961 he was wrong to draw morality, individual and social, into his conventionalist practice theory of rules.

The second reading. Hart was not conventionalist in 1961: His practice theory of rules was not conventionalist with regard to law or with regard to morality. The practice theory of rules was rather normativistic, in a sense of "normativism" incompatible with "conventionalism," and it was normativistic with regard to law as much as it was normativistic with regard to morality. In the light of this second reading (the reading I find to be the correct one) Hart realised in his *Postscript*, in consequence of Dworkin's criticisms, that it is somehow misguided to make normativeness a genus distinguished into two species, i.e., a legal and a moral normativeness. If that is the case—and I think it is—Hart must give up his thesis of the separation between law and morals, at least on some interpretations of it; and in so doing he would yield to the more crippling of the criticisms that Dworkin levels at him and at his "soft" positivism.

Hart cannot, however, part with his thesis of the separation between law and morality.[52] If he did, he would undermine his entire theoretical construction. He would have to recast *all* of the six positions described in the *Postscript* as the six targets of Dworkin's criticism to his legal positivism. He would have to give up, or at least radically revise, not only the two positions that he does in fact radically refashion (the position on the nature of rules, where law is concerned, and that on the distinction between rules and principles), but also the four other positions described in the *Postscript* as the targets of Dworkin's criticism, namely, the position on the nature of legal theory, on the nature of legal positivism, and on the separation between law and morality, of course, and maybe even on judicial discretion.[53]

Instead, Hart's defence against Dworkin's criticism of Hart's 1961 account of social rules proceeds, in the *Postscript*, in the peculiar way illustrated in the previous Section 8.3.2, a way through which Hart subtracts moral rules from inclusion among rules as he characterises them anew in the *Postscript* (as conventional rules). If, indeed, Hart had accepted Dworkin's criticism in the sense of accepting that legal rules and moral rules are normative in the same way, he would have had to also give up, or at least radically revise, the thesis of the separation between law and morals.

In conclusion, Hart 1961 presents, I believe, a normativistic account of the practice theory of rules, characterised as it is by Hart's construction of the so-called internal point of view, a construction emerging from Hart's treatment

[52] It is undoubtedly out of conviction that he cannot do so, a conviction developed and reinforced over the course of decades.

[53] The remark holds true of Hart's overall theory (his "soft" positivism comprehensively understood), and that mainly because of the wide reception that Hart 1961 makes of Kelsen's theory of the validity, or binding force, of intra-systemic legal rules.

of primary rules of obligation in prelegal societies, of obligatory or binding rules in international law, of the nonlegal rules of churchgoers (nonlegal but normative nonetheless, I should say), and, last but not least, of the rule of recognition shared by officials and in particular by judges in advanced systems of municipal law.

In Hart 1961 these rules, as well as the rules of morality, individual and social, are normative rules, not merely conventional ones. Legal and moral normative rules have in common, in Hart 1961, the peculiar, distinctive, critical internal point of view (thus, for example, the ones and the others carry the same normative language); and they are instead distinguished from each other, according to Hart 1961, by those characteristics that he found to be specific to moral rules: The "four cardinal [...] features which collectively serve to distinguish morality not only from legal rules but from other forms of social rule" (Hart 1961, 169) are "importance," "immunity from deliberate change," the "voluntary character of moral offences," and a characteristic "form of moral pressure" (Hart 1961, 169–76).

Leaving aside the mere acquiescence in rules on the part of the bulk of the population, a mere acquiescence that, as such, does not constitute a normative attitude, we can distinguish in Hart 1961 five varieties of rules, and all of these rules, independently of Hart's terminology of 1961, are to be understood as normative under the same kind of normativeness. These five varieties of rules are as follows:

(*a*) The intermediate rules in the legal system. These rules Hart qualifies, in the manner of Kelsen, as "valid," as legal in the strict sense, though not explicitly as "normative." Hart, further, says clearly that these rules entail normative statements of the kind "I (You) ought to [...]," "I (You) must do that," "That is right," "That is wrong" (Hart 1961, 54, 55, 56).

(*b*) The rule of recognition. This rule, according to Hart 1961, though normative (to use my terminology), cannot be qualified as valid. Nor can it be regarded as "law strictly so called" (pages 107–8); rather, it is "legal" in a broad sense and exists as a matter of fact. Further, Hart 1961 finds that those parts of the rule of recognition that limit legislative power and are not "laws strictly so called" (Hart 1961, 108) are not "conventions," either, this in contrast to Dicey's (1835–1922) distinction between the law of the constitution and the conventions of the constitution.[54]

[54] "The rules which make up constitutional law, as the term is used in England, include two sets of principles or maxims of a totally distinct character.

The one set of rules are in the strictest sense 'laws,' since they are rules which (whether written or unwritten, whether enacted by statute or derived from the mass of custom, tradition, or judge-made maxims known as the common law) are enforced by the courts; these rules constitute 'constitutional law' in the proper sense of that term, and may for the sake of distinction be called collectively 'the law of the constitution.' The other set of rules consist of conventions, understandings, habits, or practices which, though they may regulate the conduct

(*c*) The rules of a prelegal society, a society whose only rules (according to Hart 1961) are rules of conduct, meaning that there are no competence rules in these societies. These rules are prelegal, and hence are nonlegal (even in a broad sense they cannot be said to be legal, as is the case, instead, with the rule of recognition). Further, no validity can be predicated of them (just as no validity can be predicated of the rule of recognition), and they have—on a par with the rule of recognition—a matter-of-fact existence, unlike the intermediate rules in the system. Finally, they are normative, in my terminology: They are so at least as much as the rule of recognition, and maybe even more so, for they impose obligations, which the rule of recognition does not, on Hart's account of it.

(*d*) The rules of international law (Hart 1961 regards these as rules pertaining to a kind of law which is indeed sophisticated, but which in certain respects is primitive because devoid of a rule of recognition). These rules have in Hart 1961 the same status as the rules considered under the foregoing point (*c*). Further, Hart explicitly and repeatedly writes that they are binding (Hart 1961, Chapter 10).

(*e*) Moral rules. Hart 1961 finds these to be normative (in my terminology), on a par with the four varieties of rules just listed, and says they can actually impose obligations in a strict sense. Moral rules are not legal, and they can be qualified with respect to legal rules by the characteristics or requisites that Hart 1961 singles out in the second section of Chapter 8 and in Chapter 9 (Hart 1961, 163–76, 181–208). Hart 1961 distinguishes moral obligation from legal obligation, and he also says that there exists a conventional morality next to critical morality (Hart 1961, 181, 188–9).

So the characteristic common to the five varieties of rules described above, as found in Hart 1961, is that they have the same kind of normativeness or bindingness. What instead make them different from one another are features other than their normativeness or bindingness, or, without any change in substance, and using Hart's more nuanced terminology (though Hart uses "binding rule" in the case of international law), features other than their being rules toward which there is "a critical reflective attitude" that "displays itself in criticism (including self-criticism), demands for conformity, and in acknowledgements that such criticism and demands are justified, all of which find their characteristic expression in the normative terminology of 'ought,' 'must,' and 'should,' 'right' and 'wrong'" (Hart 1961, 56).

In 1961 Hart did *not* give a conventionalist account of social rules: If he had, he would already have denied at that point (in 1961) that morality can be

of the several members of the sovereign power, of the Ministry, or of other officials, are not in reality laws at all since they are not enforced by the courts. This portion of constitutional law may, for the sake of distinction, be termed the 'conventions of the constitution,' or constitutional morality" (Dicey 1959, 23–4).

explained by way of his account of social rules, this for the same reason that led him to make this denial in the *Postscript*, namely, to avoid jeopardising his thesis of the separation between law and morality.[55]

[55] On one occasion Hart 1961 takes up an example of conventional rule, and he qualifies it precisely as conventional. The example is "the rule of the road"—meaning drivers keep left or drivers keep right—an example that turns up frequently in the current debate on conventional rules. Here is Hart in his own words: "It is important to notice that the dominant status of some easily identifiable action, event, or state of affairs may be, in a sense, *conventional* or artificial, and not due to its 'natural' or 'intrinsic' importance to us as human beings. It does not matter which side of the road is prescribed by the rule of the road, nor (within limits) what formalities are prescribed for the execution of a conveyance; but it does matter very much that there should be an easily identifiable and uniform procedure, and so a clear right and wrong on these matters. When this has been introduced by law the importance of adhering to it is, with few exceptions, paramount; for relatively few attendant circumstances could outweigh it and those that do may be easily identifiable as exceptions and reduced to rule" (Hart 1961, 130; italics added). I should like to recall, incidentally, that this concept of conventional rule (independently of the terms that may express it) is already clearly stated in both Aristotle and Aquinas (Aquinas taking it up from Aristotle): Aristotle refers to it when discussing *nomikon politikon dikaion* (as he does in *Nicomachean Ethics* 1134b) and Aquinas when discussing a peculiar kind of *jus positivum* (as he does in *Summa Theologiae* (a), 2.2, q. 57, a. 2) (see Section 13.5). By way of a conclusion, I will recall some more trivial information on the use of "convention" in Hart 1961. The term "convention" and its derivatives (such as "conventional") occur an overall twenty-five times in Hart 1961, including the occurrence cited a moment ago in this footnote. The other twenty-four occurrences (of "convention" and "conventional") can be grouped into five senses sorted according to application. Thus we have sense (*i*), the conventional use of words, or of categories, or of the manner of advancing a claim, this sense occurring eleven times, on pages 3, 4, 5, 40, 107, 124, 210 (four occurrences on this page), and 247 (there is also on this page one occurrence of sense (*v*)); sense (*ii*), conventional etiquette, a sense occurring once, on page 186; sense (*iii*), the sense exemplified through Article V of the Constitution of the United States, a sense occurring once, on page 71; sense (*iv*), conventional morality, a sense occurring once on page 181 and then another time on pages 188–9; and sense (*v*), the constitutional limits set on legislative activity (cf. the foregoing point (*b*) in the run of text), a sense occurring twice on page 68, three times on page 108, twice on page 242, once on page 247 (where we also have an occurrence of sense (*i*)), and once on page 259. In fine, it is perhaps curious to note that in the *Postscript*, unlike what happens in *The Concept of Law*, Hart never uses the expression "conventional morality"; instead, "convention" (and its derivates, such as "conventionalism") occurs twenty-five times (exactly as many times as it does in *The Concept of Law*).

Chapter 9

BUT NORMS ARE NOT ENOUGH. THE INTERACTION BETWEEN LANGUAGE AND MOTIVES OF BEHAVIOUR

9.1. From Norms to Propositions: The Analytical Emasculation

Language-oriented philosophy, in its glorious stretch from logical empiricism to ordinary-language philosophy, has experienced an important season even in connection with the philosophy of law—and that even in Italy, where it yielded, from 1950 onward, significant results which I account myself to be directly indebted to. The two scholars at the forefront of this orientation in legal philosophy in Italy were Norberto Bobbio and Uberto Scarpelli (1924–1993), and I will be writing about them in Volume 11 of this Treatise, on the subject of legal philosophy in the 20th century.[1]

Analytical legal philosophy has often coupled with Hans Kelsen's legal positivism, taking up his conceptual apparatus. Kelsen's legal positivism is not only voluntaristic but also normativistic (see Chapter 14). Its normativism presents two aspects, among others: One of these I judge positively, the other negatively. What I find to be the positive aspect consists in the importance Kelsen attributes to norms as Ought (*das Sollen*, and hence to normativism in a strong acceptation): Without an idea of norms as Ought we cannot, in my opinion, have an adequate account of the legal phenomenon. The negative aspect of Kelsen's normativism consists in the way he conceives the status of norms: He understands them to belong to a dimension (ultimately a spiritual dimension) which he explicitly describes as endowing norms with an existence outside the realm of space and time.[2] His normativism, though it turns proudly against natural-law theories, is in a sense—like these theories' normativism—at once too strong and too weak. It is too strong because it tends more or less latently to reify norms (cf. Section 5.1); it is too weak because it does not treat norms as motives of human behaviour and therefore completely fails to render

[1] One recent book, published in English and edited by Mario Jori and Anna Pintore, collects essays by exponents of the analytical approach to legal philosophy in Italy (Pintore and Jori 1997). The contributions in the book are by the following scholars: Anna Pintore, Norberto Bobbio, Uberto Scarpelli, Giovanni Tarello (1934–1987), Enrico Pattaro, Gaetano Carcaterra, Amedeo G. Conte, Alfonso Catania, Giacomo Gavazzi, Giorgio Lazzaro, Letizia Gianformaggio (1944–2004), Riccardo Guastini, Luigi Ferrajoli, Mario Jori, Andrea Belvedere.

[2] "Die Norm als solche, nicht zu verwechseln mit dem Akt, in dem sie gesetzt wird, steht—da sie keine natürliche Tatsache ist—nicht in Raum und Zeit" (Kelsen 1934, 7). "The norm—not to be confused with the act by which it is posited—does not as such reside in space and time, since it is not a natural fact." (my translation).

norms in the fundamental role they play (along with other factors) as pillars of the subsistence of each legal system, of its being in force in the literal sense (cf. Chapter 10).[3] (See Pattaro 1982.)

Clearly, no analytical philosophy of law, whether it is logical empiricism or ordinary-language philosophy, could welcome the negative, reifying "metaphysical" aspect of Kelsen's normativism. And in fact there was no such reception. Regrettably, however, this lack of reception produced a situation where, as we might say, the baby was thrown out with the bath water: The good (the idea of norms as Ought) was thrown out with the bad (with the metaphysics).

Briefly stated, and with some simplification, analytical philosophy of law has often held—though for the most part only implicitly, which see Section 5.1—that it can account for the legal phenomenon without implying any idea of norm as Ought, this by replacing the "metaphysical" idea of norm (as conceived in the legal-dogmatic tradition of civil-law culture) with a concept of norm as a directive (or prescriptive) sentence or as the propositional content of one.

Now, there is certainly much to gain from treating legal norms as prescriptive propositional contents, or at any rate as linguistic entities (for example in law and logic and in the theory of legal interpretation).[4] But then, on the other hand, we will not get anywhere treating legal norms from an exclusively linguistic-analytic point of view if we want to account for the way norms enter into the functioning of the legal system, that is, if we want to explain the role of norms as motives of human behaviour. (And there is no way to explain the machinery of law without such an account: Section 8.1.) If legal norms were

[3] Kelsen, instead, treats power (punishment) as a motive of behaviour. From this point of view he describes law as a specific social technique. See Kelsen 1934, 28–33; Kelsen 1946, 15ff., 24ff.; Kelsen 1957a; Kelsen 1960, 31ff.

[4] See, for example, by Riccardo Guastini, a fine and recent work (Guastini 2004, 99ff.) in which norms are considered precisely to be propositions resulting from the interpretation of the sentences making up normative texts. This approach is felicitous when it comes to working out a theory of the interpretation of normative texts. But why should we call them "normative"? Is it because they are made up of sentences? I don't think so. Is it because in making interpretations of them we end up with propositions? I don't think so. Is it because the sentences and propositions in question do have the character of being normative? I don't think so, and I don't like it: They will be normative only for those people who believe them to be normative. Does Guastini believe them to be normative? It may be that some of them are not held to be normative by anybody. There remains the problem of considering norms to be motives of behaviour. In the final analysis, the object of an enquiry into the interpretation of texts of law (that is how I prefer to call them) is different from the object of an enquiry into the motives that drive people to hold behaviours compliant with the law. Ultimately, we might use "norm" to refer neither to the sentences and propositions the theory of interpretation is concerned with nor to that peculiar motive of behaviour I am concerned with in this volume under the name "norm." The things referred to with "norm," however, continue to be different. Both are worthy of investigation. Shall we stipulate new and separate names to refer to them separately?

merely the propositional contents of enacted texts, that is, mere linguistic entities, they would not and could not be motives of human behaviour.

There has been, in philosophy of law in Italy, a lot of discussion on the uses and effects of language. All this discussion has proved quite fruitful. However, when language is recognised as performing not only (*a*) indexical-illative functions and (*b*) representative-semantic functions, but also (*c*) directive-conative functions, many caveats will have to be introduced that are not always introduced. Indeed, while the functions under (*a*) and (*b*) are strictly linguistic and communicative, those under (*c*) are not, in that they can only be fulfilled with the determinant concurrence of nonlinguistic factors like needs, interests, values, *and norms*, in my understanding of norms, which implies precisely that they are nonlinguistic entities (Sections 9.3 through 9.6).

There is a crucial difference between functions (*a*) and (*b*), on the one hand, and function (*c*), on the other. Functions (*a*) and (*b*) are fulfilled—inevitably in a sense—with any successful linguistic communication: with words conveyed and understood. Function (*c*), in contrast, cannot be fulfilled by means of a mere successful linguistic communication: with words conveyed and understood. Words are not of themselves sufficient causes for driving a receiver to hold one behaviour rather than another. A successful linguistic communication is a necessary condition respecting which the language *can* produce conative effects, but it certainly is never a sufficient condition for obtaining them. If language is to produce any conative effects in a receiver, successful linguistic communication will have to happen with the concurrent operation, in the receiver, of motives of behaviour, or *causae agendi*, as referred to in Sections 5.2 through 5.4; and these causes are not linguistic causes.

Motives of behaviour are not linguistic entities but intrapsychical components of human personality, and without their operation no linguistic entity (utterance, proposition, or propositional content) would be able to elicit a conative effect. It would be impossible, without the operation of such motives, to drive a receiver to hold one behaviour rather than another: to guide and control individual and social human conduct.

Among the motives of behaviour with which the language must interact in order to bring out conative effects in a receiver are norms as beliefs (Chapters 6 and 7). It is here—especially with competence norms—that we have the crucial interaction between validly enacted directives, or texts, and norms preexisting in the brains of believers, an interaction already discussed in Section 7.3, and which I will return to in Section 9.6, with reference to the concept of authority, among others.

The interaction between linguistic communication (of itself insufficient to cause any human behaviour) and motives of behaviour other than norms—needs, interests, and values—will instead become the focus of Sections 9.3 through 9.5, on suggestion, charisma, power, and influence.

But before that, in the following Section 9.2, I will say something on linguistic communication strictly understood—the above-mentioned functions (*a*) and (*b*)—and further explain my concept of directive use of language with reference to the above-mentioned function (*c*).

9.2. Indices, Symbols, and Conative Effects. Directives

Indices are tokens of types that are components of compound types.

If we perceive a token of a component type we are not perceiving a full compound token of the compound type. Even so, depending on the circumstance, we will be led to think of the full compound type. For example, if we have encoded in our brain the compound type "fire producing smoke," then, upon perceiving a token of smoke, we may be driven to think "fire producing smoke," despite the fact that we are perceiving no token of fire. And, depending on the circumstance, we may be driven as well to believe (illative effect of perceiving a smoke-token) that there actually is fire behind the smoke.[5]

Here I made an example of a nonlinguistic index: a perception of a token of smoke driving the perceiver to believe that there is fire behind the smoke. But there are linguistic indices as well.

Words and linguistic utterances stand for something other than themselves: They are symbols. For example, the word "smoke" is a symbol—it stands for the thing called smoke—and that independently of our actually seeing or smelling any smoke. The concept of "symbol" must be kept analytically distinct from the concept of "index," despite the fact that, as we will see shortly, several functional connections obtain in the language between symbols and indices. Thus, it would be improper to reduce the symbol "smoke" to an index of the thing called smoke, much less to an index of the thing called fire; by contrast, our seeing or smelling smoke does function as an index of fire.[6]

Nevertheless, linguistic signs, though they usually work as symbols (a function we will look at shortly), work as indices (symptoms or clues) as well, and have an illative effect on the receivers, getting them to believe that a larger something else actually subsists: something of which the received linguistic signs are a component.

[5] So many illations! Or so many *prolēpseis*, to use the term the Stoics and the Epicureans used with regard to genera and species (types: Section 2.1), since, through these, sense data get anticipated by the mind (indeed, *prolēpsis* means "preconception," or "anticipation"; Diogenes Laërtius, *Lives of Eminent Philosophers*, VII, 1, 54).

[6] Cf. Deacon 1997, 71ff. There are affinities and analogies between my concept of "type" and Deacon's concept of "icon," who borrows it from Peirce and adapts it to his neurobiological research on language and the brain. It is my opinion that in treating some linguistic problems, and some epistemological problems, too, philosophers, epistemologists, and legal philosophers should begin to take into account—in ways relevant to their lines of research—some of the recent advancements made in the neurosciences.

For example: If a listener, *X*, while attending a lecture, mutters "How long is this going to take?" *X* will have made, consciously or not, an indexical use of the language; given the circumstances, *Y*, the person sitting next to *X*, will not understand *X*'s words to be a request for information, but rather a token of the type "grumble"; and "grumble"—in *Y*'s experience of lectures, lecturers, and listeners—is a component type of the compound type "boredom producing grumbles." Hence, "How long is this going to take?" will lead *Y* to conclude that *X* is getting bored. This conclusion is a belief arising in *Y*'s brain: It is an illative effect resulting from *Y*'s perception of *X*'s uttering of the linguistic expression "How long is this going to take?" in the given circumstances (cf. Pattaro 1978, 57–86).

Neither *X*'s boredom nor the object of the belief produced in *Y* (the belief about *X*'s boredom) is a linguistic entity. "How long is this going to take?" is, in contrast, a linguistic utterance, but one that has worked as an index rather than only as a symbol.

Consider now another example.

My written words "Consider now another example" will be understood by you, the reader, as a directive (an invitation, a suggestion) rather than as an apophantic sentence. "Consider now another example" is a token of the imperative mood, and "imperative mood" is a component type of the compound type "The imperative mood serves the function of expressing directives." The linguistic expression itself is an index enabling the receiver (you, the reader) to understand (illative effect) that the sender (myself) has issued a directive. In virtue of your linguistic competence, you (the receiver) are in a condition to understand (or make the illation) that I (the sender) have written down a directive as opposed to, say, an apophantic sentence, and you will therefore form a belief (illative effect) about the use of language I made in writing "Consider now another example."[7] And the object of your belief is a linguistic state of affairs or event, namely, my directive use of "Consider now another example."

The uses referred to here are the uses of language, and they must be ascribed to the sender. The effects referred to are the effects of linguistic communication, and they take place in the receiver. These uses and effects are uses and effects of linguistic signs, be they considered qua indices (which is what I am doing here) or qua symbols (which is what I will be doing shortly).

Thus, a receiver acquainted with the sender's language will understand whether a directive was issued (directive use of language) or, say, an apophantic sentence (apophantic use of the language). The receiver's coming to understand the kind of use the sender made of the language results from the indexical functioning of linguistic signs, and it sufficed that linguistic com-

[7] The fact that indices operate at a subliminal level (as unconscious routines) in producing illative effects in the receiver bears no relevance to the nature of the indexical-illative process being described.

munication took place for this result to obtain; in other words, it sufficed to have linguistic competence on the receiver's part. What is essential here is that the discursive context, the linguistic signs used, or the linguistic moods (for example, the imperative rather than the indicative) provide enough linguistic indices to enable a receiver to conclude that the utterance received is used by the sender directively (rather than, say, apophantically).

Of course, in the reality of communication the indexical and the symbolic functions of language are intertwined, and the linguistic context interacts with the nonlinguistic context. But in analysis, the distinction must be made between "indexical" and "symbolic" as well as between "linguistic" and "nonlinguistic" (as we will see shortly, with regard to the so-called conative effects of language).

On the basis of this sketchy survey, and for the purpose of examining the directive use and conative effects of language, I distinguish four kinds of indices as follows.

(*i*) Nonlinguistic indices that cause nonlinguistic illative effects. They are (perceptions of) tokens of nonlinguistic states of affairs or events that elicit beliefs (illative effects) concerning nonlinguistic states of affairs or events. Such is the case with one's perception of smoke, which leads the perceiver to think of "fire producing smoke" and to believe that there actually is fire under the smoke. In this case there is no linguistic communication: The index (smoke perceived) is a nonlinguistic token that causes a belief (illative effect) whose object is a nonlinguistic state of affairs or event (fire burning under the smoke).

(*ii*) Linguistic indices that cause nonlinguistic illative effects. They are (perceptions of) language-tokens that elicit beliefs (illative effects) concerning nonlinguistic states of affairs or events. For example, the receiver's perception of "How long is this going to take?" will be an index for the receiver that the sender is getting bored; in other words, given the circumstances, and the receiver's experience with lectures, lecturers, and listeners, this utterance will be perceived as a token of the type "grumbling" encoded in the receiver's brain as a component type of the compound type "boredom producing grumbles."

(*iii*) Linguistic indices that cause linguistic illative effects. These are (perceptions of) language-tokens that elicit beliefs (illative effects) concerning linguistic states of affairs or events: That is the case with "Consider now another example." In consequence of the reader's linguistic competence, the reader's perception of "Consider now another example" becomes an index to the fact that these words are being used in a directive sense.

(*iv*) Concurrence of linguistic and nonlinguistic causes producing linguistic and nonlinguistic illative effects. There are cases in which sentences give effect to an interweaving of the indexical-illative processes specified under points (*ii*) and (*iii*) above.

If, for example, I were to say, "My car travels at a top speed of 300 kilometres an hour," a receiver would rely merely on his or her linguistic competence to un-

derstand and believe that this is an apophantic sentence. Here we have an indexical-illative process based on my using the indicative mood, just as under point (*iii*) the indexical-illative process was based on my using the imperative mood.

But if the receiver will believe my apophantic sentence to be the fruit of braggery, this belief will not depend only on my use of the indicative mood. It will also, and especially, depend on the receiver's experience with cars and with the boastful attitudes of car owners talking about their own cars in this or that circumstance. As under point (*ii*), so here this experience of the receiver is not merely a linguistic competence: It is experience of life, a competence with the world, so to speak. Given that an apophantic sentence, considered in itself, is either true or false, the belief which the receiver comes at with regard to the sender's bragging (illative effect) will depend not on the receiver's linguistic competence, but on his or her competence with the world. The receiver's belief will depend on *nonlinguistic* states of affairs or events and will be a belief about *nonlinguistic* states of affairs or events, such as my braggery and the actual top speed of my car.[8]

It is current to speak of linguistic uses, functions, and effects. But effects presuppose causes. This is why—as I stressed in Section 9.1—I think it relevant to draw a distinction between linguistic and nonlinguistic causes as well as between linguistic and nonlinguistic effects.

There are only nonlinguistic causes and nonlinguistic effects in the indexical-illative process under (*i*): A token of smoke is a nonlinguistic index that causes an illative effect in a person who perceives the smoke and therefore comes to believe that there is also fire. There is neither language nor communication involved in this process. Further, the object of the belief produced in the receiver is a nonlinguistic state of affairs or event.

In the indexical-illative process under (*ii*), we have instead a linguistic index (the utterance "How long is this going to take?") that brings forth a nonlinguistic illative effect. In this case there is communication between sender and receiver, and the object of the belief produced in the receiver is a nonlinguistic state of affairs or event: The effect of the communication consists in the receiver of the utterance—on account of his or her experience of the world—being driven to believe that the sender is getting bored.

In the indexical-illative process under (*iii*), we also have a linguistic index (my sentence "Consider now another example") that brings forth a linguistic illative effect (in you, the receiver). In this case, and from this specific angle, we are communicating through linguistic indices, as sender and receiver were doing in the previous case. But unlike the previous case, the object of the belief produced in the receiver (you, the reader) is a *linguistic* state of affairs or event, and the cause of this belief is the receiver's linguistic competence: The

[8] A receiver's coming to believe an apophantic sentence to be true or false is a nonlinguistic illative effect brought about by nonlinguistic causes.

effect consists in the reader recognising and believing that the sentence "Consider now another example" is used in a directive sense.

Finally, in the indexical-illative process under (*iv*), we have a linguistic cause (the apophantic sentence "My car travels at a top speed of 300 kilometres an hour") that brings forth both (*a*) a linguistic illative effect (as under (*iii*)) and (*b*), in conjunction with nonlinguistic causes, e.g., the experience of the world the receiver has with cars and drivers, a nonlinguistic illative effect (as under (*ii*)), e.g., the effect consisting in the receiver's belief that my statement is a piece of braggery.

In Sections 9.3 through 9.6 I will consider *linguistic causes* (such as directives or enacted texts) that bring forth, in a determinant concurrence with *nonlinguistic causes* (motives of behaviour), those peculiar kinds of *nonlinguistic effects* that we call conative effects.

In the remainder of this section I will consider instead the *directive use of language* as conceptually distinct from other uses of language with which this directive use intertwines in the practice of communication.

Linguistic symbols have for the most part a representative (descriptive) use. Representative linguistic symbols stand for something other than themselves. They have a meaning or sense: "To represent (or describe)" means, metaphorically, "to provide a picture of in words."

I shall call "semantic effect" the linguistic effect that an item of representative linguistic communication will elicit in a receiver acquainted with the language used by the sender when the two are speaking the same language.

On the mainstream view, sentences (such as "The Sun is red" and "Paint the Sun red") are the minimum units of communication—which makes it so that only the set of representative linguistic symbols making up at least one sentence will have any meaning for a receiver, producing semantic communicative effects on this person.[9] On this conception, single linguistic symbols (such as "Sun" and "red") have meaning (they produce semantic communicative effects on a receiver) only within the sentence whose semantic communicative effect they concur in determining (for example, "Paint the Sun red," whose semantic communicative effect comes by way of the joint action of "Paint," "the," "Sun," and "red"). Which is to say that the part makes little or no sense outside the whole: Only the whole makes sense, whereas the part is meaningful only within the whole it concurs in determining.

The semantic communicative effect a sentence is suited to elicit in a receiver (one acquainted with the language the sentence is cast in) is usually referred to as "propositional content." If the sentence is an apophantic sentence, the semantic communicative effect it is suited to elicit in a receiver will be referred to specifically as "proposition," and this proposition will be either true or false.

[9] See in this regard, in Section 2.1.1, the distinction between phrastic and neustic and their joint occurrence in sentences, such as apophantic or deontic sentences.

I shall call "directive" the expressions that in a given language are used to prescribe; and I will call them "directives" quite independently of any conative effect that, *in conjunction with nonlinguistic causes*, they contribute to producing in a receiver.

I shall call "conative" the linguistic expressions that—quite independently of their uses: apophantic, directive, etc.—contribute, *in conjunction with nonlinguistic causes*, to eliciting a conative effect in a receiver.

A receiver acquainted with the sender's language will understand whether a directive was issued or, say, an apophantic sentence about a state of affairs or an event (indexical use and illative effects of linguistic signs: in this section at point (*iii*)). What matters here is that, through the discursive context, the linguistic signs used, or the moods (for example, the imperative or the indicative mood), a linguistic expression provides enough indices to enable a receiver to conclude whether the expression is used directively, apophantically, or in others ways.

This understanding of linguistic signs by a receiver—when these signs work as indices to the way they are used (to their linguistic use)—is what I call an *illative effect* produced through linguistic communication.

Of course, the receiver will also understand what behaviour the directive is prescribing, as well as under what circumstances this behaviour must be held. This understanding of linguistic signs by a receiver—these signs work as symbols of something other than themselves: They stand for this something else—is what I call the *semantic effect* of linguistic communication.

If someone speaks to me in Japanese and in this language orders me to do something, I will not be able to understand that directive expressions are being issued (no illative effect will obtain in me concerning the kind of use of linguistic signs the sender is making, despite all the linguistic *indices* contained in the sender's utterance), nor will I understand what I am being ordered to do (no semantic effect will obtain in me despite all the linguistic *symbols* contained in the sender's utterance): There will be no communication between us. Even so, the sender is formulating (in Japanese) directives capable of having illative and semantic communicative effects (and possibly conative effects, if motives for acting subsist) in those familiar with Japanese.

I shall make five claims about directive language.

(1) An expression formulated through interpersonal linguistic signs (symbols) used directively (in a natural language or in the Morse alphabet, for example) will be a directive even if its sender has no directive intention. This may be the case, for instance, with a directive that one issues because coerced to do so. If well formulated, this directive stands as a directive even if the sender has been forced to issue it against his or her will.

(2) Formulating a directive using linguistic expressions (in Italian, Japanese, Morse alphabet, etc.) containing linguistic indices and symbols, as such abstractly capable of producing illative and semantic linguistic-communica-

tive effects, is a linguistic requirement meeting which the directive becomes linguistically adequate, and without which there would be no directive.

(3) For a directive to qualify as such it need not be cast in a language the receiver is acquainted with, nor need the receiver receive and understand the directive.

(4) Formulating a directive in a language the receiver is acquainted with, and the receiver actually receiving and understanding the directive, are requirements of communication satisfying which the directive becomes fit to produce *linguistic* effects: These effects will be illative, when caused by linguistic signs fit to work as indices (so that the receiver will recognise the sender's utterance as a directive), as well as semantic, when caused by linguistic signs fit to work as symbols (so that the receiver will ascribe to the directives a propositional content).

Still, even without communication, and without its characteristic effects as just mentioned, a linguistic expression used directively, in the sense specified in (1) and (2), is a directive under my definition of this term.

(5) Lastly, though directives are formulated for the most part to bring forth conative effects, even the production of such effects, that is, the directive being complied with, is not a requirement for a linguistic expression to rank as a directive in my characterisation of directives. Nor could things be any different, because, as was noted in Section 9.1, linguistic communication, even if as such successful, does *not* of itself have the power to elicit conative effects in a receiver, prompting this person to hold one behaviour rather than another. Is a directive use of the language sufficient for a linguistic expression to yield a conative effect and prompt the receiver to action? The answer is no.

If a directive is to have a conative effect on a receiver, a sender will have to do more than use the language directively, and neither will it suffice to have successful communication (i.e., communication that conveys meaning, makes sense, gets a message across). In other words, the linguistic expression the sender uses to this end will have to be more than indexically adequate (or be recognisable as a directive), as well as it will have to be more than symbolically adequate, representing clearly what behaviour it requires and under what circumstances.

The sociopsychological phenomenon which is a language shared by senders and receivers, as well as successful communication between them, is a necessary and sufficient condition for there to be produced between these subjects *linguistic-communicative effects*, that is, linguistic-illative and linguistic-semantic effects. But the same does not hold for conative effects, because conative effects are *nonlinguistic effects*: Although my perception and understanding of a linguistic expression addressed to me can concur in producing conative effects in me, this production of conative effects requires in the first place *nonlinguistic causes* that move me to action. In other words, it requires the subsistence of motives of behaviour (as they are illustrated in Chapters 5 and 6 and Sections 9.3 through 9.6).

To stay with the example previously adduced, if I am spoken to in the Japanese language, I will understand nothing of what is said to me, and that because I have never learned to speak Japanese. But I will understand if I am spoken to in Italian, because through a learning process, my brain has been adequately predisposed to this language: If I am ordered to do something in Italian, I will understand that a directive has been addressed to me (linguistic illative effect caused by the linguistic indices contained in the directive), and I will also understand its content, that is, the type of action I am required to perform and the circumstances under which this performance is required of me (linguistic semantic effect caused by the linguistic symbols contained in the directive). But when it comes to actually experiencing a conative impulse, and then obeying the order, or being moved to act in accordance with the directive addressed to me, there are other causes that must come into play, and these are nonlinguistic causes. They are not a part of the sociopsychological conditioning I have undergone as a speaker of the Italian language. What I end up doing will depend on my motives of behaviour as illustrated in Chapters 5 and 6 and Sections 9.3 through 9.6.

Certainly, a linguistic expression can contribute, in conjunction with nonlinguistic causes, to producing a conative effect. It can contribute to eliciting in a receiver an impulse to act, even if, on the one hand, the sender's use of the language was not directive and, on the other, the receiver knew perfectly well that no directive had been issued.

The expressions "effective directive" and "linguistic expression that contributes, in conjunction with nonlinguistic causes, to carrying a conative effect" coincide only in part: All effective directives are linguistic expressions that contribute to carrying a conative effect, but not all linguistic expressions that contribute to carrying a conative effect are directives, because we have linguistic expressions used non-directively (they are not directives) that nevertheless contribute, in conjunction with nonlinguistic causes, to bringing out conative effects.

Thus, suppose I am making my way home and someone unacquainted with me should casually tell me—using non-directive (but, say, apophantic) linguistic expressions—that the house just around the corner is burning. In this case, knowing that it is my house around the corner, I will start running as fast as I can to reach the place where the house is burning. The stranger's linguistic expression was not directive, yet it still elicited in me a conative effect because of my *interest* in the fate of my house (interest being one of the motives of human behaviour).

Now then, a linguistic expression can have conative effects, bringing them forth when—in conjunction with the linguistic expression that has been issued—there is, too, a nonlinguistic cause or a motive (a need, interest, value, or norm) that will move the receiver to action. Besides, language, as we will see in Sections 9.3 through 9.6, is an excellent means by which to interfere—

in conjunction with an appropriate nonlinguistic cause—in other people's behaviour.

9.3. Language That Bypasses the Motives of Behaviour: Suggestion and Charisma

Suggestion is, in a psychological and technical sense, a sort of intrusion on the personality of another. Under the force of suggestion, an agent complies, in the absence of the critical thought that would normally be operating in him or her, with a directive the agent receives.

A classic and emblematic instance of suggestion is hypnosis: Given the appropriate techniques and conditions, the hypnotist can intervene directly in the hypnotised person's brain and give orders that will simply be obeyed.

Suggestion may have to be accounted for by considering the phenomenon of internalisation. In deep hypnosis, for example, the hypnotist can give orders which the subject internalises under a trance and will carry out upon regaining full consciousness, or even later than that, and without ever realising an order had been issued (an example is Emmy von N.'s, as related by Sigmund Freud, 1856–1939).[10]

Suggestion concerns us here not so much in connection with hypnosis: It may rather concern us in connection with phenomena like occult persuasion, subliminal perception, and propaganda intrusion by pervasive media like television (video games and the Internet, whose overuse seems to cause dependence), all of which affect human behaviour on a mass scale and they concur in determining the law in force (Section 10.2.4). Like all suggestion, this kind is one that its addressees are uncritically subjected to.

Moreover, there is a kind of suggestion that operates during primary socialisation through the orders, behaviour, and examples provided by the mother and father figure. This kind of suggestion plays a key role in getting underway in children the shaping of the so-called generalised other (Sections 15.2.5 and 15.3.4), which brings together a number of primitive norms (the reality that ought to be) internalised from the social environment (Section 6.2).

[10] "[While doing hypnosis] I jotted down a few words on a piece of paper, which I handed to her saying, 'You will pour me a glass of red wine today at noon, just as you did yesterday. And when I will raise the glass to my lip you will say, "Oh, would you please fill my glass, too?"; I will then reach for the bottle, and at that point you will exclaim, "No, thanks, I'd rather not!" And then you will look through your purse and pull out this piece of paper, on which these very words are written.' This happened in the morning; a few hours later the scene took place exactly as I had preordained it to happen, and with so much naturalness as not to draw the attention of any of the many people present. She looked visibly conflicted as she asked me to pour the wine—in fact she never drank wine—and then, having countermanded that request with evident relief, she slipped her hand in her purse, pulled out the piece of paper, and read from it the words she had just spoken, at which point she shook her head and looked at me in amazement" (Freud 1952, 139–40; my translation).

Legal philosophers and jurisprudents have been little inclined to consider suggestion as a psychological mechanism through which a receiver is moved to action.

Axel Hägerström and Karl Olivecrona considered suggestion to explain the efficacy of orders and commands, arguing against the widespread, and mistaken, or at least naive, opinion that law is made up of commands. Subsequently, H. L. A. Hart developed arguments similar to Hägerström's and Olivecrona's to criticise Austin's conception of law, whereby law is made up of orders or commands (Section 8.1). Hägerström and Olivecrona's criticism of the reductionism of the analytical jurisprudence of Austin, Salmond, and their epigones was sharp, and it used arguments similar to those that Hart would later use in his own criticism.

Here are a couple of examples of the kind of suggestion that prompts people to action when commands become effective with them.

Suppose that danger should suddenly befall a group of people on a mountain-trail outing. A strong character would in this circumstance give orders that others will obey "automatically," by virtue of the power of suggestion that prevents any other decision from taking hold of the addressees' minds (example by Karl Olivecrona).

Something like this occurs in people who have been subjected to special training based on repetition, a case in point being the order "March!" issued in the appropriate context, as during a military parade: The parading soldiers will mechanically obey the order simply upon perceiving it (example by Axel Hägerström).

Suggestion does not seize on the needs, interests, values, or norms the addressee has internalised: It bypasses them. It bypasses the motives that may drive a person to action, and in fact it will make these inefficacious by acting on the brain directly. Suggestion requires an appropriate relation to exist between the receiver and the sender, such that the receiver becomes especially receptive to the sender's orders (as in the cases previously considered; cf. Section 8.1.3.1).

The receiver will act from an order or command because, in the given context, he or she will be impervious to all other stimuli or motives—even to internal ones, such as depend on personal needs, interests, values, or norms. This person will be temporarily unable to take initiatives and will therefore be receptive solely to the sender's orders.

It is essential not to mistake suggestion, which involves orders and commands in the specific sense just considered, for other ways of interfering in other persons' personality (as through power, influence, and authority: Sections 9.4 through 9.6), whereby receivers are presented with orders or commands broadly understood (with directives) that impel them to action by seizing on their personal needs, interests, values, or norms.

Also bearing on suggestion is charisma, which notion originated from magical-religious beliefs and later came under the focus of political sociology

(witness Max Weber), with some scholars in this area applying the concept of charisma to political leaders, widely perceived as charismatic by masses of people needing to believe and obey, and so sent off to fight. Examples of charismatic leaders are Lenin (1870–1924), Mussolini (1883–1945), Hitler (1889–1945), Mao (1893–1976), and Perón (1895–1974) and his wife Evita (1919–1952). Suggestion is also exerted by demagogues, agitators, and all those who spearhead uprisings and rouse crowds to action.

With the decline of the secular influence and power of religion, contemporary charismatic leaders no longer claim the legitimacy of their rule to be founded on a privileged relation with a deity, or on any extraordinary faculties granted to them by this deity. The place of divine investiture is taken by an appeal to such elements as the myths of national identity and revolution; the recovery of local tradition, invested with liberating and progressive powers [...]; the fight against imperialism; and the construction of a new model for society: All embody goals, destinies, final outcomes, and new horizons that sometimes only the leader and his closest aides seem privy to, such that only they know for certain the road to those places. By and large, a secular and rational observation of the charismatic components of contemporary political systems cannot but confirm the age-old association between charisma and absolutism or totalitarianism. (Gallino 2000, s.v. "Carisma," 99; my translation)[11]

A close linkup between suggestion and law obtained in oral and preliterate societies, when humans had already developed the faculty of speech, but had only their brains as repositories in which to encode the information acquired: They had no writing or documents for the function of storage.

Karl Olivecrona deals with the oral communication of law and the way the law was inculcated in the brains of the members of the earliest Scandinavian civilisations (see Olivecrona 1942).

A fine and engaging scholar of preliterate societies, Eric A. Havelock (1903–1988), whom I will return to in Chapter 12, built in his works a model with which to account for the way oral messages get communicated in these societies and make their way into the common store of their languages: Especially important in this regard are the messages intended to preserve the *nomos* and *ethos* (the norms and customs) of preliterate Greek civilisation. Havelock brought into focus, among other things, the hypnotic effect—and hence the suggestion—exerted by rhythm in the language and enunciation of reciters, chanters, and songsters, who, like Homer (whomever this name corresponds to), were the repositories of what is right in preliterate Greek society.

Oral doctrine can persist as such only when framed in statements which are immune to change, a condition achievable by placing the diction within rhythmic patterns which require the words to maintain their given order. [...] But how persuade the memory to conserve this rhythmic order?

[11] The recent cases of suicide bombing should make one reflect that Gallino's opinion on the decline of religious charisma in public affairs, though perhaps plausible until some time ago, is unfortunately no longer entirely true. Gallino's general statement on the association between charisma and totalitarianism holds true, but the ills of religious charisma have again become a current affair.

[...] In its primary manifestation as employed in culture, rhythm arises in physical motions of parts of the human body. [...] In parallel with these motions, the arms and legs can be mobilized to produce rhythmic movements which harmonize with the vocalic sounds, whether the result is identified as gesture or as dance. Such motions are then supplemented by material instruments from which a fresh set of sounds can be manufactured in rhythmic order by the application of hand or mouth [...]. Of all the tools invented by our species, these were not the least important. [...] A drum and fife band passing down the street, the great operatic aria for which the audience has been waiting, the exaltation produced by a massed choir, the summons of the jazz band which draws us to the dancing floor, the compulsive spell of a rock and roll concert—all these invite a response on the part of the listener which he may find irresistible: It is noteworthy that in normally literate societies it is in particular the young and the semiliterate whose responses to these performances can become instinctive. What is perhaps peculiar to the pleasures of rhythm as distinct from those of the biological functions is that they are pleasures intensified by participation in group activity. Hence their ability to set in motion the *mechanisms of mass suggestion*, which can in extreme cases lead to *hysteria*. (Havelock 1978, 38–40; italics added)

It is no accident that mass demonstrations, for or against war, for or against globalisation, and so forth, take forms similar to those described by Havelock. Nor are the accompanying rave processions—with the music blaring—simply a sign of stupidity or of a misconceived spirit of folk tradition.

To place cultural information in the memory, a difficult task, preliterate societies indulged in a marriage between the rhythms of song, dance, and instrument on the one hand and the rhythms of contrived statement on the other. So the act of memorization, which alone can support the tradition and make it effective, is converted into submission to a spell, which by the employment of effects *almost hypnotic* can engrave upon the memory the required body of doctrinal information. (Havelock 1978, 40; italics added)

9.4. Language That Overwhelms the Motives of Behaviour: Power

A typical example of a conative effect of the language that seizes on interests—the interests of people at large or of those who receive a directive—is a directive backed by a threat of punishment for noncompliance or by the promise of a reward for compliance (or a threat and a promise compounded): Thus we have a punitive sanction on the one hand and a sanction as premium on the other. A sanction (punishment or reward) implies that someone should intervene in people's behaviour by threatening punishment and promising rewards: The interveners must be in the condition to actually do so, or at least must be reputed to have this ability.

Specifically, the problem is to see what considerations the receivers of the directive will make: whether they fear the punishment and value the rewards; whether they believe that a punishment will actually flow from noncompliance and a reward from compliance; and whether, in a comparative assessment, they believe that the cost of compliance is outweighed by the benefit of avoiding punishment or of the reward that comes with compliance.

The threat of a punitive sanction and the promise of a reward are efficacious if the people so addressed hold a behaviour they would not otherwise as

a rule hold, regarding such behaviour as not accordant with their own needs, interests, values, and norms.

In the social sciences "power" is distinguished from "influence" and "authority." "Power" is defined as

> the ability of an individual or collective subject, A, to purposely and not accidentally achieve certain aims in a specific sphere of social life: Power is A's ability to impose his or her will in that sphere despite any opposition that may come from another subject or subjects, B, or any active or passive resistance from B; this ability is based on A's possession and threatened (and sometimes actual) use of means that can in some measure damage something which belongs to B, including B's estate, affections, repute, payments due, relations with others, and intellectual and physical freedom, and even B's physical integrity. (Gallino 2000, s.v. "Potere," 505; my translation)

Where power is involved, the directive provides its receivers with a description of the type of action conditioned by the type of circumstance and required when these circumstances occur, and with a description of the sanction (punishment or reward) that will be made to flow from noncompliance or compliance with the directive. In the case of law, power cloaks itself with normativeness (see Chapter 10).

As for internalisation, it will be noted here that the actual and consistent dealing out of awards, and even more so of punishments (especially the more severe and taxing forms of punishment), will change people's personality: It will change the needs, interests, values, and norms (the generalised other and the reality that ought to be: see Section 15.3.4) that people have internalised in the course of life.

The reeducation camps conceived by totalitarian regimes (Communist regimes in particular, since Nazi camps were outright extermination camps) constitute empirical evidence: Except in a few cases, the survivors came out *converted* in the literal sense of this term.

Further, the discipline based on dispensing rewards and punishments to subjects in their childhood will act, concurrently with the child identifying with his or her parents (or with significant others), to determine the basis of the child's moral conscience: It will determine the child's unconscious internalisation of norms, a phenomenon leading to what psychoanalytic theory refers to as the "superego," and which I call the reality that ought to be.

In law, power, influence, and authority interlock in a number of ways.

9.5. Language That Affects the Motives of Behaviour: Influence

9.5.1. Influence Affecting Needs, Interests, and Values

People behave habitually (by a *usus*) in ways they deem good (or advantageous, and the like) and avoid the behaviour they deem bad (or disadvanta-

geous, and the like) relative to their needs, interests, and values, and they do so without others having to intervene and impel them to behave thus.

Nonetheless, directives can intervene, and usually do intervene, in the operation of needs, interests, and values. Parents, teachers, editorialists, propaganda people, political analysts, and economists, and even talk-show hosts (and comely show hostesses) intervene with advice and recommendations as to what is suitable (convenient or opportune: from a teleological standpoint, therefore), for example by saying, "Hold behaviour *x* (it is convenient, good, bad, or better to hold this behaviour) as opposed to behaviour *y*; in fact *x* will serve the need, interest, or value you want to realise because, as you will doubtless appreciate …"

These directives (advice or recommendations), in addition to describing a type of action with its conditioning type of circumstance (a compound type), will serve an important function by affecting the receivers' needs, interests, and values. The directives concur in giving rise to or reinforcing a belief—an *opinio necessitatis*, *opinio utilitatis*, or *opinio boni*—thereby giving effect to the phenomenon that social-science theorists have called "influence," as distinguished from "power" and "authority."

The theory of the so-called significant others (we will get to it in Section 15.3.4) has developed in various ways the topic of influence.

"Influence" is defined as follows:

> An individual or collective subject, A, exerts influence on—and so affects—another individual or collective subject, B, when B's behaviour or action (or even B's attitudes) appears to undergo a change with respect to its initial or expected course, whether in response to one or more acts by A, including A expressing an opinion or belief; or as a consequence of B highly esteeming a particular ability or trait of A, even if manifested unintentionally; or again in response to any arguments that A may advance to persuade B to do or not do something, as by calling attention to social values or norms which B holds to (but which A need not believe in). These changes in B's conduct may come about even without the means wherewith A may cause harm to B, or without A giving explicit commands [directives, I would say] that B would be bound to obey: in other words, without A exerting any power or any authority on B. (Gallino 2000, s.v. "Influenza," 361; my translation)

In the law, a changing interplay occurs between influence, power, and authority.

9.5.2. Influence Affecting Norms

In the case of nomia, duty-holders have internalised a norm; hence, if the conditioning type of circumstance specified in the norm has been instantiated, and unless stronger motives of action intervene, they will behave habitually (by a *usus agendi*: here, properly, a custom) in ways that instantiate the conditioned type of action, and will do so without others having to intervene and impel them to behave thus (Sections 6.5 and 6.6).

Nonetheless, directives can intervene, and usually do intervene, in the operation of norms: Parents, teachers, editorialists, ethicists, etiquette specialists, and people versed in the law, and even talk-show hosts (and comely show hostesses) intervene with advice and recommendations as to what is right (from a deontological standpoint, therefore), for example by saying, "Hold behaviour *x* (it is right to—you must—hold this behaviour) as opposed to behaviour *y*; in fact *x* accords with your duty because, as you will doubtless appreciate …"

These directives (advice or recommendations), in addition to describing a type of action with its conditioning type of circumstance (a compound type), will serve an important function with respect to the receivers, by affecting norms. The directives concur in reinforcing a belief: an *opinio vinculi* (a norm), thereby giving effect to the phenomenon that social-science theorists have called "influence" (see Section 9.5.1), as distinguished from "power" and "authority."

Here, too, we will have to take into consideration the theory of the so-called significant others (Section 15.3.4).

In the case of influence affecting a norm, the directive is effective because it replicates and reasserts the content of a norm already in force in the receivers. Nomic receivers obey the directive that has been issued; they do so not only because they receive it by an influential personage, but also, and in a sense primarily, because the directive reactivates or brings back into focus a norm they have already internalised, a norm they already believe in.

Consider well-off people who have internalised the norm "The needy must be helped out by the well-off": If they hear a popular TV show host issuing the directive (advice or recommendation) whereby the needy must be helped out by the well-off, they will act from that directive, not because they feel they must comply with a show host's directive, but because the directive expresses a call—it calls the receivers' attention to a type of behaviour they already, on their own account, believe to be due per se.

This is not to say the show host's directive yielded no effect: It had a conative effect on the receivers because (and if) it reactivated in them a preformed attitude, which is their *opinio vinculi* concerning the type of behaviour common to the preexisting norm (the norm already in force in the receivers) and the intervening directive.

An application of this concept can be appreciated in the Latin saying *Jus quia justum* ("What is right is right because it is just").

In the law, a changing interplay occurs between influence, power, and authority.

In law, in particular, influence sways opinion (belief, *doxa*) through legal doctrine (legal dogmatics, *scientia juris*: see Peczenik, Volume 4 of this Treatise), especially when this doctrine is the *communis opinio doctorum*, that is, the belief (*doxa* or *dogma*) that the most esteemed legal scholars currently share (see Section 10.2.1 and Section 10.2.4 at point (*ii*)). The academic doc-

trine imparted by teachers and professors (the importance of education is sometimes underestimated), and given wide currency with the legal-doctrinal books and journals available to judges, legal practitioners, and bureaucrats, plays a crucial role in exerting what might be called "legal influence." Consider, to make another example, the so-called legal opinions solicited from jurists of note to decide whether or not a legal action is worth pursuing.

9.6. Language That Modifies the Internalised Reality That Ought to Be: Authority (Integration between Norms and Validly Enacted Directives or Texts)

Authority, influence, and power are different ways of interfering in the motives of people's behaviour, and must therefore be kept conceptually distinct. But in law they are strictly interlocked, acting jointly to make law an enduring, effective, and objective reality that ought to be no less cogent for humans than is brute reality (especially with regard to those people who are *not* in positions of authority or power; see Chapter 10).

In the social sciences, "authority," as distinguished from "power" and "influence," is defined as the

> faculty to issue binding commands that lay down obligations [I would say *metonymically valid directives that drive derivative norms into believers*; cf. Sections 7.3 and 8.2.3] or that otherwise prompt one or more subjects within a group to act in a certain way, which faculty the members of this group collectively attribute to one or more individuals on the basis of these individuals' traits or status or position. Essential to this definition of authority is that the group under consideration should in the main either tacitly or explicitly recognise the usefulness or necessity of a situation in which some issue commands [*directives*] or have the right to issue commands [*directives*] aimed at guiding the conduct or actions of those within the group—*nothing without such recognition can be referred to as authority*. Authority ought not to be mistaken for a form of power, which is rather the capacity to impose one's will on someone else despite any resistance that may come from the latter. Authority can strengthen or validate the use of power, but is nevertheless distinguished from power: There are as many forms of authority without power as there are forms of power without authority. By association, the individuals or groups the aforesaid faculty has been attributed to are commonly labelled authorities, and are occasionally referred to as such even when no collective recognition obtains. (Gallino 2000, s.v. "Autorità," 58; my translation; italics added)

The route of authority exerts significant weight on the working of law.

In the case of authority, a validly enacted directive exerts illative and conative effects on a believing receiver. What happens here is that a sender, by issuing a directive, validly instantiates the conditioning type of circumstance set forth in a competence norm previously existing, and possibly in force, in the receiver (see Sections 6.2, 6.5, and 7.3).

As we know (Section 8.2.1), the content of a competence norm consists in "obeying" (type of action) "directives issued in certain ways by certain people" (conditioning type of circumstance set forth in the same norm).

Suppose that I believe in a norm (I have internalised and encoded it in my brain) and this is the competence norm **n**, "Drivers on public roadways must obey road signs, traffic signals, and the hand signals (directives) of police officers." Looking from the window of my house, I see a traffic light turn red—I will then be thinking to myself, "Traffic must now and there come to a stop!" This is a new norm, **n1**, that has arisen in my mind. I have derived it by subsuming the light turning red (a kind of directive) under the conditioning type of circumstance set forth in the competence norm **n**, and by inferring **n1** from the type of action "obeying" (set forth in the competence norm **n**, in which I am a believer) and from the valid token ("the light turning red," expressive of a directive) that I have subsumed under the type of circumstance set forth in the same competence norm ("drivers, plus a stoplight turning red on a public roadway").

The light turning red is the valid issuance of a directive, and so a directive that believers receive and perceive as producing a new derivative norm.[12]

If, as a believer *b* in the competence norm **n**, I myself happen to be driving in traffic—a circumstance which makes me, too, an actual duty-holder under **n**—then **n** will be in force in me (nomia), with the consequence that when the stoplight turns red I will be thinking to myself not only **n1**, "Traffic must here and now come to a stop!" but also **n2**, "*I* must now stop here!" The norms **n1** and **n2** have now been internalised by me and are encoded in my mind (and as such exist: doxia): They have entered into my internalised reality that ought to be (into my internalised normative system) by means of the stoplight turning red, because the stoplight turning red is a valid token (and, in a sense, the valid enactment of a directive) of the conditioning type of circumstance set forth in the competence norm **n**. Further, the norm **n2**, in addition to existing in me (doxia: Section 6.2), is in force in me (nomia: Section 6.5), because I am not only a believer *b* in **n2**, but also a duty-holder *d* (deontia: Section 6.4) under **n2**; and, in consequence, I will be experiencing a conative impulse to obey **n2**, and I will do so (abidance), except by virtue of a stronger motive (need, interest, or value) that may prevail in me, egging me on to deviance (Section 6.6).

[12] The traffic-light example can also be interpreted as presupposing in me, the believer, what might be called a multiple norm of conduct: "If the light is red, you must stop; if it is green, you must proceed; if it is yellow and you can stop, you must do so; if it is yellow and you cannot stop, you must proceed." That the norm **n**, which I have internalised, may be interpreted as a multiple norm of conduct in the sense just specified bears out my view (Section 7.3) that competence norms are peculiar norms of conduct. It may also be said that these multiple norms of conduct are borderline between *stricto sensu* competence norms and *stricto sensu* norms of conduct as I understand them (Section 8.2.1), and that they confirm what was maintained in Section 7.1, namely: The mechanism by which derivative norms get produced from primitive norms is the same for both norms of conduct and competence norms. Whichever way we choose to consider the norm **n** which I have internalised with regard to traffic signals—as a multiple norm of conduct or as a competence norm—the three alternative types of circumstance that we assumed to be included in **n** ("red light," "green light," "yellow light") are the issuance of directives which prescribe different types of action.

Competence norms single out plural and complex authorities. It is usual in advanced legal systems to have three kinds of authority: legislative, executive, and judicial.[13] Each of these divide further into different authorities whose characteristics depend on the various competence norms on which they are based.

To stay with the example of road traffic, a stoplight is in its own circumscribed way an authority of an executive kind (and if the example seems dubious, consider a traffic warden).

[13] It is standard usage to qualify these as powers rather than as authorities. But here I understand "power" and "authority" in a different, more specific sense (as illustrated in Section 9.4 for "power" and in this section for "authority"), and I will therefore proceed on this basis.

Chapter 10

THE LAW IN FORCE: AN AMBIGUOUS INTERTWINING OF NORMATIVENESS AND ORGANISED POWER

10.1. Underscoring the Role of Force in Law in order to Avoid Misunderstandings with regard to Normativism

In this chapter I will attempt in outline to give an idea of the concurrence of, and interaction between, norms and the other factors dealt with in Chapter 9 when it comes to keeping a system of law in force in society, among the people of a certain territory.

In my normativist gallery of family portraits, Karl Olivecrona appears between Hägerström and Hart (Section 8.1). He deserves a special place in this gallery, not only because, like the two other outstanding scholars, he convincingly grasped the role of norms in law, but also because he provided a fine and convincing account of the role of force in law, that is, of the way in which force (organised power) concurs and interacts with norms in keeping a system of law in existence, or in ensuring its enduring and settled character, or, as I prefer to say, its being in force in society, among a people within a certain territory.

I agree with Olivecrona's account of the interplay between force and norms in keeping a legal system alive: I agree in holding that the pressure of organised power is largely at the origin of our internalisation of primitive norms (or reality that ought to be; cf. Sections 7.1 and 15.2.5), which norms we assimilate from our sociocultural environment beginning from childhood; I also agree in holding that the pressure of organised power (and of the sociocultural environment at large) is decisive in preserving and reinforcing doxia and nomia (Sections 6.2 and 6.5) in believers. With this said, it should also be noted that doxia and nomia—the existence and being-in-force of norms qua norms—play the essential and specific role in the machinery of law that was seen in Chapter 7 and Section 9.6, and they also play the roles we will consider in Sections 10.2.1 through 10.2.3. But yet the role of norms in law is clear in Olivecrona's works as well. Anyone reading what Olivecrona writes on force in law (which topic will take up the remainder of this section) will have to bear clearly in mind, for an adequate understanding, that what he writes on force in law is complementary (certainly not alternative) to what he writes on norms in law.

In this section, then, I will summarise Olivecrona's opinions on the role of force in keeping a system of law in existence (or, as I prefer to say, in keeping it in force) among a certain people in a certain territory.

In every society in which the machinery of law works at full capacity—and where in this sense the law is in force—force

is consistently applied through the official of the state, more particularly in three forms:—[*a*] police measures against disturbances, [*b*] infliction of punishment and [*c*] execution of civil judgements. In all three cases *physical violence or coercion is the ultimate expedient*. It is used not only to disperse dangerous mobs if need be and to keep the peace generally. It is also an unavoidable instrument in the regular application of criminal and civil law. In criminal law, *actual violence* against the person of the criminal is used in the form of the death penalty and imprisonment. Even in civil law *physical violence* is sometimes used against a person, as e.g. when a tenant is ejected from the premises by means of force and when imprisonment for debt takes place. [...] Physical force is resorted to in administrative law, also, when necessary. *In the whole field therefore, the provisions of the law are ultimately carried out by physical force or violence*. (Olivecrona 1939, 124–5; italics added)

No doubt, manifest and direct violence is kept mostly in the background, and the more this condition obtains, the more fluid and unhampered will be the working of the law in force (cf. Olivecrona 1939, 125).

This fact might lead one to think that violence is foreign to law, or at least that it plays only a role of secondary importance. But this conclusion, if drawn, would make for a "fatal illusion" (cf. ibid., 125).[1]

There is indeed a general tendency, more or less unconscious, to let the organised force of the law appear as something else than mere force. Its real character is largely obscured and this is done by means of metaphysical ideas and expressions. It is not bluntly said, e.g., that the function of the courts is to determine the use of force. Instead their function is said to be the "administration of justice" or the ascertaining of "rights" and "duties." Actually this is the same thing. The statements of the courts concerning rights and duties are imperative statements, through which the use of force by public officers is directed. But this fact is concealed or put in the background by the judgement's being wrongly interpreted as a judgement in the logical sense about existing rights and duties. (Ibid., 127–8; italics added)

Social life rests on the law as it is, on law as fact in the broadest sense, including the fact of organised force being used according to rules called law in the strict sense. This organised force is the backbone that keeps society standing: Society cannot do without it (cf. Olivecrona 1939, 136).

It is quite natural that the rules for the conduct of private persons are not formulated as rules of prudence, saying: If you want to avoid this or that sanction, you should do so and so. *The legislators do not want the public to abide by the law only from fear of the sanctions. It is desirable to create and maintain a feeling that the rules should be obeyed unconditionally.* (Olivecrona 1939, 132–3; italics added)

As Olivecrona writes, the illusion that norms of conduct "have an independent significance is ultimately based on the *belief* that they *really* and *objectively*

[1] There is, further, the tendency to forget that in every state there is not only the police force, but also the armed forces, and these "fulfil the role of a 'fleet in being' which is seldom used in open battle but nevertheless dominates the sea" (Olivecrona 1939, 126).

constitute those ideal rights and duties about which they speak [...]. The right exists—according to current opinion—as soon as the facts that are to give rise to it actually exist." This alleged effect of norms of conduct is illusory, Olivecrona observes, "since no rights or duties are really established through them" (Olivecrona, 1939, 133; italics added), if not in the belief of believers, I should add.

> The sole effect of the rules is their effect on the minds of people—the citizens and the officials concerned, causing them to act in a certain way. The ideas of rights and duties are used as means to describe the actions desired and also to work on people's feelings. *Only these ideas are realities*—the imagined powers and bonds called rights and duties *have no objective existence*. (Ibid., 133–4; italics added)

It should not be hard to see—with the extra help of the added italics—in what sense I find that the works of Olivecrona have inspired my conception of norms. Maybe I have gone one step further than he has, in just this sense: *I take beliefs seriously*. Which, however, in the final analysis, he does also—only, Olivecrona forcefully attacks *die Unwissenschaftlichkeit der Rechtswissenschaft* (the non-scientificity of legal science), as Anders Vilhelm Lundstedt does, too, and in a manner more impetuous than Olivecrona's (Lundstedt 1932–1936). Further, it seems to me that scholars of legal-positivist extraction are nowadays less pretentious and naif than their predecessors in Hägerström's generation and in that of the enfant terrible Lundstedt. What draws the sharp criticism of the exponents of the Uppsala School and elicits their anti-metaphysical overreaction is the conception of legal dogmatics as science advanced by the legal positivists of the late 19th and early 20th centuries, and especially by those scholars from civil-law legal culture most strongly influenced by German legal positivism.

Rights and duties, in the just-quoted words of Olivecrona, cannot be said to have an objective existence. And yet they do have an objective existence,[2] and even Olivecrona recognises that they do have an existence, though he does not understand this to be an objective existence. Rights and duties, I maintain, have an objective existence as beliefs in the brains of the bulk of the population, and especially in the brains of officials. It is not fully accurate to say that "the sole effect of the rules [of norms] is their effect on the minds of people." We should more accurately say that norms *are*, or *exist*, in the minds (brains) of people: Norms are there as beliefs and motives of behaviour (Chapter 6), and they work *and proliferate* in the brains of people in the manner illustrated in Chapter 7 and Section 9.6.

But at any rate, as Olivecrona observes, it is hard to fancy, at least in the modern world, a society not founded on organised force: Nothing without such force would be truly certain, not even our life and limb, or—I should add—beliefs that norms, duties, and rights exist.

[2] The objectivity of the psychological aspects of the internal point of view is a question I will come back to in Section 15.4 in regard to Searle's ontology of the I, an ontology I agree with.

> The *hidden reserves of hate, of lust for revenge, and of boundless egoism* would break through in a destructive way if not held in check by the presence of force, immeasurably superior to that of any single individual or any private combination. *Men need taming in order to live peacefully together. But taming on such a great scale as is required here presupposes unconquerable force.*
>
> Nor could the distribution of property be maintained without the help of force. One need not have seen much of the desperate struggle for gain, for wealth or for bare subsistence even, in order to appreciate the necessity of force to keep up the boundaries between mine and thine. [...] But it is not only in a capitalistic society that force is required for the maintenance of property relations. Even if all property were "vested in the state," i.e. put under the direct control of officials, organised force would be indispensable. The officials would certainly not be able to maintain their control unless they were backed by overwhelming force. (Olivecrona 1939, 136–7; italics added)

The immediate effect of using force consists only in inflicting sufferance upon a number of people, by imprisoning them, depriving them of this or that property, or subjecting them to some other kind of punishment. These punishments will, further, afford satisfaction for other people, assuaging their vengefulness, and that by securing payment of the money owed to them or by satisfying some other claim that they are pressing. These effects of the use of force matter, of course, to the people directly concerned, to be sure, but "it is a great mistake to suppose that the social significance of organised force is exhausted with these immediate effects" (Olivecrona 1939, 140), for that would amount to "turning the whole matter upside down" (ibid., 140). The uniform and persistent use of force has far-reaching consequences that go well beyond the effects felt by those directly involved (Olivecrona 1939, 140).

If we are to measure the true social bearing of organised force we will have to look beyond the single punishments inflicted. We will have to look at the general effects that force has on the community as a whole, on everyone's behaviour in the community. The immediate effects of the single punishments executed look relatively unimportant when measured against the social pressure the existence of organised force exerts on the minds of people at large (ibid., 141).

> The general consciousness of the fact that irresistible force is regularly and conscientiously applied according to the law has a far-reaching effect on our whole conduct of life. It forms one of the basic elements on which we build our whole existence. *Every single person must take the constant use of force—which is wholly independent of his own wishes—into account, just as he must take into account the climatic conditions of the country, or the means of subsistence which it offers.* To disregard the law completely—and the law would be nothing but inane words if force were not applied according to its provisions—would be as foolish as dressing on the latitude of Stockholm in the manner of the natives in the islands of the Pacific. We reflect on the matters as little as we reflect on the necessity of wearing adequate clothing. The necessity makes itself felt so imperiously that there is on the whole no room for a choice. This unbending pressure on millions and millions of people, keeping their actions within certain boundaries, is of infinitely greater importance for the community than the immediate effects of the sanctions applied. The sufferings of some thousands of criminals, the transfer of property in a number of cases from debtors to creditors, is a small matter in comparison with the fact that people in general abstain from the action labelled as crimes, pay their debts, etc.

For several reasons this indirect influence of organised force is easily overlooked. [...] *One reason for this shortsighted view is that we do not regard fear of the sanctions as our essential motive for lawful conduct.* (Olivecrona 1939, 141–3; italics added)

But still, such fear is never completely absent from our relation with the law, even if it is not the immediate motive of our behaving in accordance with the law. Just consider, for example, how preoccupied parents are with instilling obedience into their children. Do they adopt that line only out of moral concerns? Isn't there a decisive role that fear plays, our fear of the dire consequences of unlawful conduct? How much care we must exercise to earn for ourselves a decent tenor of life and a good reputation! (cf. Olivecrona 1939, 146–7).

Fear of the sanctions is certainly not without importance for our conduct. *This does not, however, imply that we live under an ever-present sense of fear of the legal force. The psychological situation is normally of another kind. The human mind has a marvellous adaptability. It is intolerable to live under the stress of constant fear. Consciously or unconsciously we try to avoid it by adjusting ourselves to the prevailing conditions.*

In order to avoid the burden of fear, we have not only to abstain from unlawful acts, which would bring the police or the bailiff on our track. It is also necessary to exclude even the *thought* of such actions. This is a very important fact. If we let the mind play with tempting acts (e.g. of enrichment or revenge), involving breaches of the law, fear also is evoked, since the idea of a sanction, executed with irresistible force, is connected with the idea of law-breaking. Fear raises itself as a barrier against a law-breaking. *But we cannot go on harbouring ideas of law-breaking and at the same time combating them with fear. This would have a disruptive influence on the personality*. We simply cannot do so in the long run without endangering our mental health. The internal cleavage would prove too much. Therefore the dangerous wishes must be excluded from our mind. If we do not entirely succeed in doing this, they are at least relegated to the sphere of the day-dreams more or less completely cut off from our every day activities.

Thus it is explained how fear of sanctions can have a dominating influence on our conduct without being actually felt. It stands at the door of the mind, ready to enter at the same time as the unlawful wishes. Peace of mind is retained only if both remain outside. We seek peace instinctively and on the whole with success as far as this point is concerned. Such is our psychological construction. Fear is not effectively excluded only by calculations about the possibility of getting off with impunity. Some uncertainty is always connected with such calculations. A secure peace of mind with regard to the law must therefore presuppose that the mind is thoroughly freed from thoughts which are apt to call up our fear of sanctions. (Olivecrona 1939, 147–8; italics added on first, third, and fourth occurrence; in original on second occurrence)[3]

[3] "Needless to say, this result can only be attained under specific conditions. Above all, there must be some generally accepted reasons why the sanctions are inflicted just for the actions in question. Otherwise, the exclusion of the dangerous thoughts cannot be successfully achieved. *An internal cleavage of mind takes place. On the one hand the unlawful acts appear in a tempting light or people may even be driven to commit them from reasons of hate or pride or other feelings. On the other hand actual fear of the sanctions stands in the way.*

When the situation is of this kind among considerable sections of the community the regime may adequately be called *terroristic*. Such a régime is characterised by the fact that fear of sanctions is the immediate and dominating motive for lawful conduct. It is well known how strict and unrelenting a terroristic régime must be if it is to be at all effective. Fear is insufficient as a barrier unless it is sustained by very drastic and unflinching menaces. Success on such lines

Olivecrona's opinions, as expressed in the passages just quoted, seem to be very much compatible with those expressed by scholars who study the social self, Gerth and Mills, for example, whose approach I illustrate in Sections 15.3.2 and 15.3.4, and that especially with regard to the all-pervasive importance of organised force in the law, a force that from a sociopsychological standpoint has far-reaching effects on the population at large: These effects go beyond the single individuals who in fact fall subject to them (i.e., the people who have transgressed the law and are reached by the state's coercive apparatus) and operate in the human mind even at a subliminal and unconscious level.

10.2. The Law in Force

10.2.1. Orthodoxia and Catholodoxia. The Normative Social Control on Believers: Dogmas, Heterodoxia, Paradoxia, Heresy

It will be interesting to recall that legal doctrine is also called "legal dogmatics."

"Dogma" derives from ancient Greek *dogma*, which, like *doxa*, means "opinion": Both are noun forms of the verb *dokein*, whose first meaning is "to seem" and the second "to believe." The main difference between *dogma* and *doxa* is that the former more frequently than the latter means "an opinion belonging to a doctrine, to a body or system of teachings," and hence, "a tenet."

Dogmas are those beliefs that are believed to be orthodox by the officials of a given group or society, or by those who are significant others for a believer (cf. Section 15.3.4). "Orthodoxy" ("orthodoxia," if we are to be consistent with "doxia," as introduced in Section 6.2) means "upright (erected, established, settled, or approved) opinion."[4]

Diverging opinions about the interpretation of the types of action and of circumstance set forth in a norm can engender the suspicion of heterodoxy (heterodoxia) among those who uphold the diverging opinions. Indeed, a distinction can be drawn between the orthodox and heterodox opinions that believers hold. Here, "orthodoxia" can be taken to mean "established or ap-

is, however, always uncertain and dearly bought. *The price must needs be not only the sufferings of those who are hit by the sanctions. It must also include an undermining of the mental stability of the population which results in a consequent weakening of the structure of the state.*

There is probably never to be found a régime which for a long time is terroristic through and through. Such a state of things would be untenable. In fact the usual situation in what is called a *reign of terror* is, that the bulk of the law, especially the fundamental rules of civil and criminal law, are accepted without fear's being felt as the immediate motive for obeying them. Only in respect of some part of the law, e.g., political matters, has fear this function, and then vigorous efforts are always made to reduce its importance *by means of propaganda*" (Olivecrona 1939, 148–50; italics added).

[4] The term "orthodoxia" is composed of the ancient Greek terms *orthos*, meaning "upright," and *doxa*, meaning "opinion or belief."

proved opinion or doctrine" about the content of a given (legal) norm or normative (legal) system, and "heterodoxia" can be taken to mean "opinion other than orthodoxia," and hence "unorthodox or disapproved opinion, or doctrine about the content of a given norm, or normative system."

What I call "paradoxia" is instead an unexpected, incomprehensible, or absurd opinion or belief: A paradox is a belief that fails to be in chorus with the mainstream beliefs of a group or society; it is a strident opinion, one that jars with the other voices in the chorus.[5]

Heterodoxia and paradoxia can give rise to heresy: to an opinion that stands so much in contrast with orthodoxia as to be reputed by officials, and by significant others, to be a wilful and persistent rejection of the dogmas about the content of a norm or normative system the believers believe in. In other words, and etymologically, heresy is a choice alternative to those implied by the norms fostered by the officials.[6]

Since anyone who believes in a norm believes that, given certain circumstances, it is binding per se to perform a certain type of action ("per se" meaning irrespective of how desirable this performance may be, and whatever the pleasure or pain, the advantage or damage, that may result from it: Chapter 6), it follows that believers believe that the same holds for them, too, if they themselves are duty-holders under such a norm. The reader may recognise here the topic of universalisation dealt with by R. M. Hare, among others, and which I referred to with regard to Hägerström and Hart (cf. Hare 1952, 151ff.).[7]

I will call "catholodoxia" the assumption by which a belief of ours has a universal character: We might so call the similar assumption found in Hägerström and Hart (Section 8.1.3.3). Catholodoxia is a belief in the universality of one's own beliefs.[8] Norms are typically universal or catholodox beliefs.

It will serve us in good stead—if we are to grasp analogies and avoid misunderstandings—to bear in mind what "catholic" means according to the Catholic Church. "Church," to begin with, means

> a convocation or an assembly. It designates the assemblies of the people, usually for a religious purpose. *Ekklēsia* is used frequently in the Greek Old Testament for *the assembly of the Chosen People before God*, above all for their assembly *on Mount Sinai where Israel received the Law*

[5] The term "paradoxia" is composed of the ancient Greek terms *para*, meaning "contrary to," and *doxa*, meaning "opinion or belief."

[6] "Heresy" comes from the Greek noun *hairesis*; the verb *hairein* means "to take," middle voice of *haireisthai*, "to take for oneself," "to choose."

[7] The subject index in Hare 1952 does not list the term "universalisability" or any terms analogous to it: Even so, the topic is treated from page 151 to page 162. In subsequent works Hare threw the term "universalisability" into relief by making it official as an entry in the subject index: cf. Hare 1963, 228 and Hare 1982, 242.

[8] The term "catholodoxy" is composed of the Greek terms *katholou* (universal) and *doxa* (belief).

and was established by God as his holy people. By calling itself "Church," *the first community of Christian believers recognized itself as heir to that assembly*. In the Church, God is "calling together" his people from all the ends of the earth. The equivalent Greek term *Kyriakē*, from which the English word *Church* and the German *Kirche* are derived, means "what belongs to the Lord." (*Catechism of the Catholic Church*, § 751; italics added on second, third, and fourth occurrence; in original on all other occurrences)

Moreover, we have "catholic" as a modifier of "church." In this use "catholic" means

"universal," in the sense of "according to the totality" or "in keeping with the whole." The Church is catholic in a double sense:

[*a*] The Church is catholic because Christ is present in her. "Where there is Christ Jesus, there is the Catholic Church." In her subsists *the fullness of Christ's body united with its head*; this implies that she receives from him "the fullness of the means of salvation" which he has willed: correct and complete confession of faith, full sacramental life, and ordained ministry in apostolic succession. The Church was, in this fundamental sense, catholic on the day of Pentecost and will always be so until the day of the Parousia.

[*b*] The Church *is catholic because she has been sent out by Christ on a mission to the whole of the human race*: "All men are called to belong to the new People of God. This People, therefore, while remaining one and only one, is to be spread throughout the whole world and to all ages in order that the design of God's will may be fulfilled: he made human nature one in the beginning and has decreed that all his children who were scattered should be finally gathered together as one ... The character of universality which adorns the People of God is a gift from the Lord himself whereby the Catholic Church ceaselessly and efficaciously seeks for the return of all humanity and all its goods, under Christ the Head in the unity of his Spirit." (*Catechism of the Catholic Church,* §§ 830–1; italics added)

Catholodoxia, on my characterisation, sometimes comes with the ontological assumption—properly, a reification or hypostasis—that the object of one's belief subsists of itself, independently of what anyone believes. When coupled with this ontological assumption, catholodoxia in reference to norms leads one to believe in the reproductive automatism of the reality that ought to be, with the consequence, among others, that *ignorantia juris non excusat* ("ignorance of legal norms is no excuse").[9]

There is a sense to *ignorantia juris non excusat* when "catholodoxia" is coupled with the just-mentioned hypostasis concerning the reality that ought to be. This way of thinking is of great help—and indeed essential—to the working of any legal system, but not so plausible if we do not assume at least implicitly that the law is made up of norms and if we do not reify the system of law as something (a reality that ought to be) existing and operating of itself.

In Chapter 7 the dynamics inherent in the norms internalised by a believer were considered in connection with the valid occurrences (tokens) and ceas-

[9] "You cannot readily be excused on account of your ignorance of the law, if, after having passed the age of twenty-five years, you rejected the estate of your mother; for your application for relief will be too late" (*Codex Iustinianus* (b), I, 18, 2). The Latin original: "Cum ignorantia iuris excusari facile non possis, si maior annis hereditati matris tuae renuntiasti, sera prece subveniri tibi desideras" (*Codex Iustinianus* (a), I, 18, 2).

ing valid occurrences of the conditioning type of circumstance found in parent norms (competence norms and norms of conduct alike) making up the believer's normative system.

The valid occurrences and ceasing valid occurrences of the conditioning type of circumstance set forth in a norm **n**, whether this is a norm of conduct or a competence norm, take place at times $\mathbf{t}_1$, $\mathbf{t}_2$, …, $\mathbf{t}_n$. It does not follow from this that a believer *b* in **n** will come to know of the valid occurrences and ceasing valid occurrences of the conditioning type of circumstance set forth in **n** at the same time as such valid occurrences and ceasing valid occurrences take place: It may in fact turn out that *b* should never come to know of any such valid occurrences and ceasing valid occurrences.

The question is what consequences follow from the hiatus that separates the valid occurrences of the conditioning type of circumstance specified in **n** from *b*'s awareness of such occurrences, or even from *b*'s total unawareness of the flow of events affecting the valid occurrences of the conditioning type of circumstance specified in **n**.

More to the point, we will have to ask how these consequences affect the existence and being-in-force of the norms **n1**, **n2**, ..., **nn** that can be made to derive from the type of action contained in parent norms (in norms of conduct or in competence norms) after a valid token takes place which can be subsumed under the conditioning type of circumstance found in the respective parent norms (but which for the time being is not so subsumed, for lack of awareness on *b*'s part).

The most plausible answer to this unawareness problem is that previously identified as the reification of the normative legal system. And this reification depends on the believer's beliefs (be they clearly defined or confusedly present in him or her): That is, on whether *b* thinks that the flow of events resulting in valid tokens (of the conditioning type of circumstance specified in the norms which *b* believes in) generates derived norms independently of *b*'s conscious subsumptions and inferences, or whether *b* does not think this to be the case.

The former view—by which norms are generated independently of anyone believing them to exist—has gained more currency in the law than the view that denies such independent existence. We can appreciate this fact by noting that court rulings, for example in Italy, are prevalently found to have a declarative status: It is assumed that courts do not create rights and duties, but ascertain their existence, which is why court judgements are retroactive.

Indeed, on occasion catholodoxia leads believers to impute norms to a single superior subject, or at least to a collective subject: the Sovereign, the People, the Nation, the State (each of which is, so to speak, the embodiment of a shared reality that ought to be). Catholodox believers are inclined to hold that their normative system exists independently of their beliefs or of other people's beliefs, and that it so exists—it exists normatively—and develops or changes for everybody independently of anybody's awareness or belief: It is a per se sub-

sisting and "auto-poietic" reality that ought to be.[10] Catholodox believers consider this system to be subsistent per se and imputable to a superior or a collective subject (or to both), like God, Nature, the People, the Class, the State, or the Sovereign. Where the law is concerned, all such superior or collective subjects, historically appealed to in different ages and under different conceptions, have been variously called into play as the "pillars" that prop the legal system.

The previously quoted definition of the qualifier "catholic" provided by the Catholic Church's official catechism, as well as Rousseau's idea of a *volonté générale* (see the excerpt quoted in Section 10.2.6), should be of help in understanding the presently discussed hypostasis or reification of a reality that ought to be.

But then catholodoxia, strictly speaking, needs no reifications, or hypostases, like those just mentioned: All it needs is a universalisation of norms in the terms suggested by Hare. It is no accident that Hägerström, with his conception of constitutional norms, and Hart after that, with his conception of the social rule of recognition, attributes to norms in law the essential function of accounting for change in the system in its continuity.

10.2.2. Dikedoxia. The Normative Social Control on Duty-Holders: The Idea of Just Coercion

The believers and the nonbelievers in a norm **n** can either take up or not take up a censorious attitude toward those duty-holders *d* under **n** who do not practise **n**.

Censurers will exert pressure, or social control, aimed at having duty-holders under **n** validly perform the type of action required under **n** every time the conditioning type of circumstance is validly brought about.

Those censurers who are *b*s in **n** will exert pressure on *d*s under **n**, and will do so out of a belief that obedience to **n** by *d*s is obligatory.

Those censurers who are *nonb*s in **n** will pressure *d*s under **n**, not by virtue of norm **n**, but because other motives (needs, interests, or values, or norms other than **n**) urge them to exert such pressure.

"Social control" is defined in sociology as the

> set of mechanisms, responses, and sanctions that a group devises and employs in order to prevent an individual or collective subject from deviating [diverging] from a norm of behaviour, or in order to check any deviance [difformity] already underway, so as to have the subject resume a line of behaviour that conforms to the norm, or again to prevent deviance [difformity] from repeating itself or spreading to other subjects. [...]
>
> Processes and forms of social control exist not only in all societies, but also across all strata of each society: in all kinds of groups and associations, in political parties and labour unions, in

[10] "Auto-poietic"—from Greek *autos*, "self," plus *poiein*, "to do or make"—is a term successfully brought into circulation in sociology by Niklas Luhmann. The term is used here independently of Luhmann's use of it.

corporate settings, in youth gangs and street gangs, in criminal organisations, and so on; nor can we say that social control at one level is the specific outgrowth of social control at the societal level as expressed in a penal code. A group of revolutionary extremists, for instance, will either disregard or challenge the social control exerted in the society the group works against, but it will nevertheless subject its members to forms of social control whose function is to secure the norms the group has set down and to advance the aims it is trying to achieve. Such social control can be studied using instruments substantially analogous to those used elsewhere. (Gallino 2000, s.v. "Controllo sociale," 172, 174; my translation)[11]

In the law, social control is brought to bear on difformity, that is, on deviance and nonconformism (Sections 6.6 through 6.8), by the officials and in particular by the judiciary and military apparatuses (Section 10.1).

When social control is held to be just, or even objectively right, that is, due per se, we have before us a phenomenon I will call "dikedoxia."[12]

We can distinguish varying degrees of intensity of dikedoxia depending on whether dikedoxia entails the justice of social control or, in a stronger version, its obligatoriness, but also depending on the kind of social control found to be just or, in a stronger version, obligatory.

Thus, in the stronger version, dikedoxia occurs when, in a believer *b*, a norm **n1** exists that sets forth a particular type of behaviour. Indeed, the conditioning type of circumstance described in **n1** is that an actual duty-holder *d* under **n** not obey **n**; the conditioned type of action described in **n1** is that *d* (the person who has failed to obey **n**) should be forced to comply with **n**. Dikedoxia may also entail that *d* should be subject to punishment either in every case or at least in those cases where *d* does not comply with **n** even when forced to do so.[13]

A case in point: If I, a believer *b*, believe in **n**, "You must not steal," it would not be unusual for me to also believe in **n1**, "If you have stolen something, you must return it, and if this is no longer a possibility, because you are no longer in possession of what you stole, a penalty should be inflicted on you," or also, in a stronger version, "A penalty should be inflicted on you in any case, even if you *can* return the stolen property and you actually do so." But with this last implication—the infliction of a punishment—there come into play further ideas that differ from the idea by which it is just, or even obligatory, to force rioters to comply with the norm **n** with which they are under an obligation to comply (in the case considered, it is just, or even obligatory, to force the thief to return what was unduly abstracted). These further ideas relate to the justice, or even the obligatoriness, of punishment understood in the strict sense as infliction of a sufferance (*infra*).

[11] My square brackets are meant to remind the reader that my concept of "deviance" is narrower than Gallino's; cf. Sections 6.6 through 6.8.

[12] "Dikedoxia" I have formed blending the Greek term *dikē*, meaning "what is right" (see Sections 12.2.3 through 12.2.5), with the term "doxia" (introduced in Section 6.2).

[13] On dikedoxia and Chisholm's (1916–1999) paradox, see Section 11.3.3.

According to Heraclitus (ca. 540–ca. 480 B.C.), if the Sun should stray from its course, then the Erinyes—the officials working for *dikē* (*dikēs epikouroi*)—would force the Sun back to where it should be: on its course. This example by Heraclitus—taken up apart from any of the interpretations given of it, which I will not enter into—is a classic and oft-cited example of what I call dikedoxia (DK 22 B 94).

Dikedoxia is entailed by doxia, namely, by the existence of a norm (Section 6.2): by the belief that the content of a norm is what is objectively right. And dikedoxia justifies the use of force as follows.

The idea that (given a valid token of a certain type of circumstance) a certain type of action is what is objectively right connects with the idea whereby it is just (*rättvis*) that someone who behaves unrightly (*orätt*) or simply fails to behave rightly (*rätt*) (this person omits to perform the right type of action) be forced into a performance equivalent (*ekvivalent prestation*) to the token of right action that this person failed to carry out (Hägerström 1917, 100–1).[14]

The right type of action is the type of action that "must be" and that for this reason must be performed. It is objectively right, for example, that property owners should not be deprived of the property they own; consequently, we must quell every impulse of ours that may egg us on to appropriate others' property. When people fail to carry out the right action, they will have to hold another behaviour equivalent to the behaviour they ought to have performed. For example, if we take someone else's property we will have to give it back. If we do not spontaneously carry through the performance equivalent to the right action we failed to carry out (where the equivalent performance is in a sense a succedaneum of the right action), then it will be just to exact such equivalent performance coercively: For example, it will be just to force the thief to return the stolen property.

In the foregoing example, the idea of an equivalent performance as a right or due performance comes in as the liaison by means of which the idea of a just coercion is connected with the idea of what is right. The idea that people must return any property they unduly appropriate and the idea that this course of action is justly enforced when not undertaken spontaneously appear against the background of another idea, and this—in the example just made—is the idea of an owner's right, of an owner's rightful claim to others' respect for his or her property: What is right, the rightness (*rätthet*) of returning the property, and what is just, the justice (*rättvisa*) of exacting this action coercively, can be said to rest on the very same norm that sets forth what is objectively right—in the example considered, in the norm that forbids theft and in the norms that make it obligatory to respect others' property.

[14] Cf. Pattaro, 1974, 242ff., where there is illustrated, among other things, the difference between a "just coercion" and a "right coercion" (cf. Section 8.1.3.4) to perform an action that was the right action and that the duty-holder failed to perform.

The linking idea is that of an equivalent performance: Coercion is rendered just on the basis of this idea. Right behaviour is—or rather was—the behaviour we had to hold but failed to hold. Hence, the right behaviour *now* is to perform another behaviour equivalent to the one we omitted. It is therefore just to force people to perform this behaviour (equivalent to the original right behaviour) if they fail to do so spontaneously—here coercion is just because designed to have people do their duty (cf. Hägerström 1917, 100ff.).[15] (The relationship between "right" and "just" is treated in Chapter 13 with reference to Aquinas's concepts of *justitia* and of *jus* as what is right—*quod est rectum*—toward others).

I mentioned theft but no longer spoke of punishments. Indeed, I simply referred to the (coercive) restitution of stolen property. This is because punishment is different from a coercion to carry out a right action we have omitted to carry out, as well as from a coercion to carry out an action *equivalent* to the right one we omitted to carry out (an equivalent action that we omitted to carry out, just as we omitted to carry out the right one to begin with). To stay with the example of theft, punishing a thief to a certain number of whippings or to a certain number of years in prison is not the same as or equivalent to the right action the thief omitted to carry out: It is not equivalent to "refraining from stealing" (this, in principle, is true even from the standpoint of the owner of the stolen property), and hence is not equivalent, either, to the equivalent performance ("returning the loot"), which, too, the thief may omit to carry out.

A punishment, strictly speaking, cannot be equivalent to any right behaviour that was not held. Putting a thief in jail is not the equivalent of this person having respected others' property, because jailing does not return the stolen property to its rightful owner, nor does it compensate this person for the loss incurred. So, too, an execution of capital punishment inflicted upon a murderer is not equivalent to this person having respected other people's lives, because it will not bring the murdered person back to life. In the strict sense, only returning stolen property is equivalent to the right behaviour the thief ought to have had; and only bringing the murdered person back to life is equivalent to the right behaviour the murderer ought to have had. And yet it is a commonly held belief that inflicting a punishment, and hence a sufferance, for certain criminal acts is what is just, or even obligatory.

Even so, despite this belief, the question of the justification of punishment is different from the question of the justice or the obligatoriness of coercing others to hold the right behaviour that was not held or a behaviour equivalent to the right behaviour not held. The idea of an equivalent performance—the

[15] See also Hägerström's *Naturrätt i straffrättsvetenskapen?* (Hägerström 1920) and *En straffrättslig principundersökning* (Hägerström 1939), two essays that sharply criticise the prevailing doctrine.

liaison between the idea of an objectively right type of action and the idea of justly forcing people to perform a type of action equivalent to the right one they failed to instantiate—is not equipped to account for the idea of the justice of a punishment (the justice of inflicting a sufferance).[16]

Clearly, there come into play—with the justice of punishment—ancestral attitudes that are exclusively human and divine. These attitudes set humans and divinity apart from beasts: Only God (cf. Lombardi Vallauri 1992) and humans are vengeful and avenging. There comes open here an important chapter in the history of ethical thought, which chapter has developed along two well-known and fundamental lines: *Puniatur quia peccatum est* ("Let punishment be inflicted because sin has been committed": retributivist theory) and *Puniatur ne peccetur* ("Let punishment be inflicted so that sin is no longer committed": deterrence theory).[17]

10.2.3. The Characters of the Play, the Play of Characters

In the previous sections of this chapter some questions were taken up that had been developed in Chapters 5 through 9. It was seen in summary in these sections that norms are essential to the existence and functioning of law (to the law's being in force), but that it is misleading, and may even be mystifying, to maintain that law is made effective by norms alone (Section 10.1); power, meaning organised force, works in conjunction with norms as an element essential to social life and to the legal system that governs social life and keeps it under control. The admixture of normativeness and force, when not explosive,[18] is a necessary and highly effective glue of social cohesion (cf. Section 10.2.5), as concerns the relations among norm-believers who share the same belief (orthodoxia and cathodoloxia, Section 10.2.1) and as concerns the relations between (believing or nonbelieving) duty-holders and believers (dikedoxia, Section 10.2.2).

[16] I am not sure how it works in English, but in Italian it is certain that "punishment" (*punizione*, *pena*) does not carry the same immediate emotive efficacy as "sufferance" (*sofferenza*). Punishment does not touch us: It is something objective and abstract (something whose dueness falls on the top layer of the reality that ought to be); it may happen to others but not to us. Sufferance, instead, does touch us: It is close to us, concrete; we imagine it to be something that may affect us, too (it does not carry normative connotations).

[17] On retributive and deterrent conceptions of punishment, see, in Volume 6 of this Treatise, Stalley, Chapter 3, Sections 2, 5, and 6, with regard to Plato in *Protagoras*, *Gorgias, Republic,* and *Laws*; also in Volume 6, see Lisska, Chapter 12, Section 7, in connection with Aquinas.

[18] Consider the cases of minorities who are believers and heretic (heretic in the sense illustrated in Section 10.2.1) as well as compact, joined by strong cohesion, and who will stop at nothing. There are countless, however diverse, examples in contemporary times: the phenomena of the Red Brigades in Italy, Basque terrorism in Spain, Ecoterrorism in various parts of the world. In reality, we can draw on many current examples of terroristic fanaticism. On fanaticism as a degeneration of moral normativeness, see Kant as quoted in Chapter 15, footnote 44.

In this section and the next I will make some comments on the question of the ambiguous intertwining of normativeness and organised power.

In this section I present a brief analysis of the positions of subjects, which positions I call "characters of the play in the game of the law in force." These characters are not equivalent to the traditional normative subjective positions in law that have been the object of important analyses tracing back to Wesley Newcomb Hohfeld (1879–1918).[19] My characters play the game of law in force, and so in treating them I must take into account not only duty-holders and right-holders, but also norm-believers (who in turn may or may not be duty-holders and/or right-holders). Taking into account the norm-believer component is interesting for various reasons. For example: This taking into account of the norm-believer relativises normativeness (as in the question, Duty-holder and right-holder in whose opinion?); it underscores the fact of people sharing or not sharing norms, or normative beliefs; it underscores, too, the social consequences of the phenomena just listed.

In the next section (Section 10.2.4) I will consider the referees or umpires in the game of the law in force (the judges) as well as some categories of fans or concerned spectators who—from different positions and in different ways: as legislators, as jurists (*scientia juris*), as interest or pressure groups—work to steer the course of the game of the law in force as well as the referees themselves, the judges.

Let us begin, then, with the characters of the play and the play of characters in the game of the law in force.

Wherever norms exist—among the members of a group or of a society—the basic characters of the play are the six simple characters indicated in Chapter 6, namely: the believer *b* in **n** (doxia); the nonbeliever *nonb* in **n** (adoxia); the actual duty-holder *d* under **n** (deontia); the actual subject *nond*, who is not a duty-holder under **n** (adeontia); the actual right-holder *r* under **n** (exousia); and the actual subject *nonr*, who is not a right-holder under **n** (anexousia).

If a pair consists of two basic, or simple, characters played by the same subject *s*, and these two characters stand in contradiction with respect to the same norm **n**—meaning that the positions of *s* relative to **n** are of doxia and adoxia, deontia and adeontia, or exousia and anexousia—then this pair will obviously be inconsistent. The same subject *s* cannot personate any of the following three pairs: (1) *s* being at the same time a believer *b* and a nonbeliever *nonb* in **n**, (2) *s* being at the same time an actual duty-holder *d* and a non-duty-holder *nond* under **n**, or (3) *s* being at the same time an actual right-holder *r* and a non-right-holder *nonr* under **n**.

[19] The greatest sophistication over Hohfeld's traditional positions, as found in Hohfeld 1964a and Hohfeld 1964b, was achieved by Kanger (1924–1988) and Lindahl: Kanger 1971 and 1972; Lindahl 1977. See also Alexy 1986. On normative subjective positions, see, in Volume 5 of this Treatise, Sartor, Chapters 19 and 22.

By contrast, each of the six basic, or simple, characters introduced in Chapter 6 (*b*, *nonb*, *d*, *nond*, *r*, *nonr*), if they are not in contradiction with respect to the same norm **n** when played by the same subject *s*, they will be compatible, and their joining in different ways brings out eight compound characters who, with respect to the same norm **n**, actually play the game of the law in force. Given a legal norm **n,** any member of a given social group can play any of the following compound characters with respect to **n**, but no more than one such compound character at any one time: (*i*) *b*&*d*&*r*, (*ii*) *b*&*d*&*nonr*, (*iii*) *b*&*nond*&*r*, (*iv*) *b*&*nond*&*nonr*, (*v*) *nonb*&*nond*&*r*, (*vi*) *nonb*&*d*&*r*, (*vii*) *nonb*&*nond*&*nonr*, and (*viii*) *nonb*&*d*&*nonr*. Thus, making allowance for a few qualifications that I will be making at the end of this section, whenever a norm **n** of the kind “Debtors must pay what they owe to their creditors” gets internalised within a group or society, it will be possible to assign *any* member of the group or society (and not just those who have internalised the norm) to a definite place in the following three-dimensional diagram.[20]

The compound characters (*i*) through (*iv*), each of whom includes the component-character believer *b* in **n**, are positioned on the corners of the bottom square of the cube of the law in force, this because believers prop up the system (here, the legal norm **n**). Nonbelievers (*nonb*s) in **n** are instead positioned on the corners of the top square, because nonbelievers are propped up within or by the system (here, again, with respect to the legal norm **n**).

These positionings are clearly a matter of taste: They might very well be turned upside-down or the positions rearranged at random around the cube’s eight corners. But I have a ranking of my own, which I illustrate as follows: (*i*) *b*&*d*&*r*, i.e., *doxia-deontia-exousia*; (*ii*) *b*&*d*&*nonr*, i.e., *doxia-deontia-anexou-*

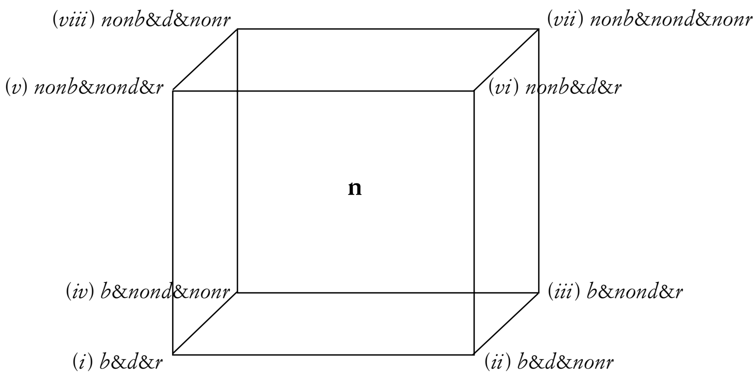


Figure 2: *The cube of the law in force*

[20] I am indebted to Giorgio Volpe for suggesting this cube-shaped diagram to represent my eight compound characters.

sia; (*iii*) *b*&*nond*&*r*, i.e., *doxia-adeontia-exousia*; (*iv*) *b*&*nond*&*nonr*, i.e., *doxia-adeontia-anexousia*; (*v*) *nonb*&*nond*&*r*, i.e., *adoxia-adeontia-exousia*; (*vi*) *nonb*-&*d*&*r*, i.e., *adoxia-deontia-exousia*; (*vii*) *nonb*&*nond*&*nonr*, i.e., *adoxia-adeontia-anexousia*; (*viii*) *nonb*&*d*&*nonr*, i.e., *adoxia-deontia-anexousia*. Each of these eight is a compound character in the play of the law in force. If there is a sense to my ranking it is to set up among the compound characters a hierarchy based on the criterion of normative force.[21] Thus, consider, for example, the following two compound characters a subject can play relative to **n**.

The subject who plays character (*i*) with respect to **n** is at once a believer, a duty-holder, and a right-holder with respect to **n**: This subject plays the strongest normative character with respect to **n** and hence the strongest normative character in favour of the stability and permanence of the law in force—of the normative force of the law in force. And this subject plays character (*i*) not only in relation to himself or herself, but also in relation to the other subjects who believe in **n**, in that they play characters (*ii*) through (*iv*); and—even more important—the same subject plays character (*i*) in relation to subjects who do *not* believe in **n**, in that they play characters (*v*) through (*viii*). These last four nonbelieving subjects need to be propped up with respect to **n** within the system of the law in force, while the first four subjects prop up this same system with respect to **n**. More accurately, like the compound characters (*ii*) through (*iv*), the compound character (*i*) includes the component-character believer *b* in **n** (doxia), and in virtue of this inclusion exerts normative social control on believers (in the cube, the subjects personating the compound characters (*i*) through (*iv*)): The social control exerted in this case consists in orthodoxia and catholodoxia as discussed in Section 10.2.1.[22] Further, like the compound character (*iii*), the compound character (*i*) includes, in addition to the component-character believer *b* in **n** (doxia), the component-character right-holder *r* under **n** (exousia), and in virtue of this further inclusion exerts a specific, and strong, normative social control on duty-holders (in the cube, the subjects personating not only (*i*), but also the other compound characters, (*ii*), (*vi*), and (*viii*)): The social control exerted in this case consists at its most extreme in dikedoxia as discussed in Section 10.2.2.

Instead, the subject playing the compound character (*viii*) with respect to **n** is at once a nonbeliever, a duty-holder, and a non-right-holder with respect to **n**: This subject plays the weakest character with respect to **n** and hence the weakest character in favour of the stability and permanence of the law in

[21] Of course "normative force" is to be understood here in the light of my conception of "norm" as a motive of behaviour (Sections 5.4, 6.1, 6.2, 6.5, and 6.6).

[22] Clearly, a believer can exert control even over himself in the form of orthodoxia or cathodoloxia. Thus, he can ask himself whether his belief is subject to heterodox influences (orthodoxia), just as he can ask himself whether he is impartially bringing his belief to bear on everyone, friend or enemy (cathodoloxia). Compare, on dikedoxia, the following footnote 23 in this chapter.

force, and especially in favour of the normative force of the law in force. This subject, as a nonbelieving duty-holder, will need to be driven to comply with **n** out of motives other than **n**. More precisely, he or she will need to either be converted into believing in **n**, or at least will need to be induced to be a conformist with respect to **n** (cf. Section 6.7). This will be the normative attitude the compound characters (*i*) through (*iv*) will have toward (*viii*).

Let us now look analytically at the eight compound characters making up the cube of the law in force.

(*i*) *Doxia–deontia–exousia*. Here, an actual subject *i* is a *b*&*d*&*r* with respect to **n**.

Doxia. Since *i* believes in **n** (doxia: Section 6.2), *i* will be predisposed to support and maybe even foster **n** in consequence of **n** existing in him or her. Hence *i* will take a normative censorious attitude toward those people who in his or her view are actual duty-holders under **n** (deontia: Section 6.4) and do not practise **n** (Section 6.8). This can happen with any *d* under **n**, and hence, in our cube, with (*i*) as well as with (*ii*), (*vi*), and (*viii*).[23]

Deontia. Since *i* is a duty-holder *d* under **n** (deontia: Section 6.4), *i* will be predisposed to abide by **n** in consequence of **n** being in force in him or her (nomia: Section 6.5). In other words, *i* will be predisposed to perform the type of action set forth in **n**, which he or she believes to be under an obligation to perform. This is so provided that the type of circumstance with which *i* conditionally connects the type of action in **n** gets validly instantiated. If other motives (needs, interests, or values, or norms other than **n**) should act on *i* and work against **n**, they will not prevent **n** from being in force in *i*, but they can make **n** inefficacious in *i* (deviance: Section 6.6).

The normative censorious or repressive attitude that *i* may take toward the people who in his or her view are *d*s under **n**—as *i* believes he or she is—will likely be stronger if and to the extent that *i* not only believes in **n**, but also abides by **n** (efficaciousness of **n**: Section 6.6).

Exousia. Finally, since *i* is a right-holder *r* under **n** (exousia: Section 6.4), *i* will be predisposed, in consequence of **n** existing in him or her (doxia: Section 6.2), to make specific normative claims on other subjects who in his or her view are non-practising *d*s under **n** (Sections 6.8 and 6.4): *i* believes he or she is entitled to sue these subjects because they are *d*s in relation to *i* specifically; and *i* will consequently take a *strong* normative censorious attitude in demanding that they obey **n**. This can happen under **n** with any *d* other than *i* and hence, in our cube, with (*ii*), (*vi*), and (*viii*).[24]

[23] On my characterisation of norms, a subject *i* who is deviant will very well be able to have a normative censorious attitude toward himself, too, up to the extreme point of self-punishment or of turning himself in for the crimes committed (dikedoxia).

[24] Clearly, the idea presented in the previous footnote 23—someone turning himself in for

(*ii*) *Doxia–deontia–anexousia*. Here, an actual agent *ii* is a *b*&*d*&*nonr* with respect to **n**.

Doxia. Since *ii* believes in **n** (doxia: Section 6.2), *ii*, though a *nonr* under **n** (anexousia: Section 6.4), will be predisposed to support and maybe even foster **n** in consequence of **n** existing in him or her. Hence *ii* will take a censorious attitude toward those people who in his or her view are actual duty-holders under **n** (deontia: Section 6.4) and do not practise **n** (Section 6.8). This can happen with any *d* under **n**, and hence, in our cube, with (*ii*) as well as with (*i*), (*vi*), and (*viii*).[25]

Deontia. Since *ii* is a duty-holder *d* under **n** (deontia: Section 6.4), *ii* will be predisposed to abide by **n** in consequence of **n** being in force in him or her (nomia: Section 6.5). In other words, *ii* will be predisposed to perform the type of action set forth in **n**, which he or she believes to be under an obligation to perform. This is so provided that the type of circumstance with which *ii* conditionally connects the type of action in **n** gets validly instantiated. If other motives (needs, interests, or values, or norms other than **n**) should act on *ii* and work against **n**, they will not prevent **n** from being in force in *ii*, but they can make **n** inefficacious in *ii* (deviance: Section 6.6).

The normative censorious or repressive attitude that *ii* may take toward the people who in his or her view are *d*s under **n**—as *ii* believes he or she is—will likely be stronger if and to the extent that *ii* not only believes in **n**, but also abides by **n** (efficaciousness of **n**: Section 6.6).

Anexousia. Finally, since *ii* is a *nonr* under **n** (anexousia: Section 6.4), *ii* will not be predisposed, in consequence of **n** existing in him or her (doxia: Section 6.2), to make specific normative claims on other subjects, even if in his or her view they are non-practising *d*s under **n** (Sections 6.8 and 6.4): *ii* will not believe he or she is entitled to sue these subjects; and *ii* will consequently not take the strong normative censorious attitude that only a subject *b*&*r* (in our cube, only characters (*i*) and (*iii*)) can take toward those people he or she believes to be not only *d*s under **n**, but also *d*s under **n** in relation to him or her specifically.

(*iii*) *Doxia–adeontia–exousia*. Here, an actual agent *iii* is a *b*&*nond*&*r* with respect to **n**.

Doxia. Since *iii* believes in **n** (doxia: Section 6.2), *iii*, though a *nond* under **n** (adeontia: Section 6.4), will be predisposed to support and maybe even foster **n** in consequence of **n** existing in him or her. Hence *iii* will take a normative censorious attitude toward those people who in his or her view are actual

a crime he has committed—is something we may very well conceive. But, from a legal point of view, we cannot say that someone can sue himself or herself.

[25] Cf. footnotes 22 through 24 in this chapter.

duty-holders under **n** (deontia: Section 6.4) and do not practise **n** (Section 6.8). This can happen with any *d* under **n**, and hence, in our cube, with (*i*), (*ii*), (*vi*), and (*viii*).

Adeontia. Since *iii* is a *nond* under **n** (adeontia: Section 6.4), *iii* will not be predisposed, in consequence of **n** existing in him or her (doxia: Section 6.2), to perform the type of action set forth in **n**. If other motives (needs, interests, or values, or norms other than **n**) should act on *iii*, they can induce *iii* to perform the type of action set forth in **n** despite the fact that *iii* believes he or she is not under any such obligation.

Exousia. Finally, since *iii* is a right-holder *r* under **n** (exousia: Section 6.4), *iii* will be predisposed, in consequence of **n** existing in him or her (doxia: Section 6.2), to make specific normative claims on other subjects who in his or her view are non-practising *d*s under **n** (Sections 6.8 and 6.4): *iii* believes he or she is entitled to sue these subjects because they are *d*s in relation to *iii* specifically; and *iii* will consequently take a *strong* normative censorious attitude in demanding that they obey **n**. This can happen with any *d* under **n**, and hence, in our cube, with (*i*), (*ii*), (*vi*), and (*viii*).

It will be noted, en passant, that experience shows that we are more inclined to believe in our own rights and in other people's duties toward us than in our own duties and in other people's rights in our regard.

(*iv*) *Doxia–adeontia–anexousia.* Here, an actual agent *iv* is a *b*&*nond*&*nonr* with respect to **n**.

Doxia. Since *iv* believes in **n** (doxia: Section 6.2), *iv*, though a *nond* and a *nonr* under **n** (adeontia and anexousia: Section 6.4), will be predisposed to support and maybe even foster **n** in consequence of **n** existing in him or her. Hence *iv* will take a normative censorious attitude toward those people who in his or her view are actual duty-holders under **n** (deontia: Section 6.4) and do not practise **n** (Section 6.8). This can happen with any *d* under **n**, and hence, in our cube, with (*i*), (*ii*), (*vi*), and (*viii*).

Adeontia. Since *iv* is a *nond* under **n** (adeontia: Section 6.4), *iv* will not be predisposed, in consequence of **n** existing in him or her (doxia: Section 6.2), to perform the type of action set forth in **n**. If other motives (needs, interests, or values, or norms other than **n**) should act on *iv*, they can induce *iv* to perform the type of action set forth in **n** despite the fact that *iv* believes he or she is not under any such obligation.

Anexousia. Finally, since *iv* is a *nonr* under **n** (anexousia: Section 6.4), *iv* will not be predisposed, in consequence of **n** existing in him or her (doxia: Section 6.2), to make specific normative claims on other subjects, even if in his or her view they are non-practising *d*s under **n** (Sections 6.8 and 6.4): *iv* will not believe he or she is entitled to sue these subjects; and *iv* will consequently not take the strong normative censorious attitude that only a subject *b*&*r* (in our cube, only characters (*i*) and (*iii*)) can take toward those people

he or she believes to be not only *d*s under **n**, but also *d*s under **n** in relation to him or her specifically.

(*v*) *Adoxia–adeontia–exousia*. Here, an actual agent *v* is a *nonb*&*nond*&*r* with respect to **n**.

Adoxia. Since *v* does not believe in **n** (adoxia: Section 6.2), *v* will not be predisposed by **n** to support or foster **n**, this in consequence of his or her lack of belief in **n**. Hence *v* will not take a normative censorious attitude toward any subject who is believed by somebody other than *v* (in our cube, by characters (*i*) through (*iv*)) to be an actual duty-holder *d* (deontia: Section 6.4) and who does not practise **n** (Section 6.8): *v* will take a censorious attitude only if motives other than **n**—needs, interests, or values, or norms other than **n**—induce him or her to do so.

Adeontia. Since *v* is a *nond* under **n** (adeontia: Section 6.4) and a *nonb* in **n** (adoxia: Section 6.2), *v* will not be predisposed by **n** to perform the type of action set forth in **n**.

Exousia. Finally, although *v* is assumed by somebody other than *v* (in our cube, by characters (*i*) through (*iv*)) to be a right-holder *r* under **n** (exousia: Section 6.4), *v* does not himself or herself believe in **n** (adoxia: Section 6.2) and for this reason will not be predisposed by **n** to make any sincere specific normative claims on other subjects who, in the opinion of characters (*i*) through (*iv*), are *d*s under **n** (deontia: Section 6.4). Thus, if *v* sues them, it will be out of motives other than **n**; *v* will consequently not take the strong normative censorious attitude that only a subject *b*&*r* (in our cube, only characters (*i*) and (*iii*)) can take toward those people he or she believes to be not only *d*s under **n**, but also *d*s under **n** in relation to him or her specifically.

(*vi*) *Adoxia–deontia–exousia*. Here, an actual agent *vi* is a *nonb*&*d*&*r* with respect to **n**.

Adoxia. Since *vi* does not believe in **n** (adoxia: Section 6.2), *vi* will not be predisposed by **n** to support or foster **n**, this in consequence of his or her lack of belief in **n**. Hence *vi* will not take a normative censorious attitude toward any subject who is believed by somebody other than *vi* (in our cube, by characters (*i*) through (*iv*)) to be an actual duty-holder *d* (deontia: Section 6.4) and who does not practise **n** (Section 6.8): *vi* will take a censorious attitude only if motives other than **n**—needs, interests, or values, or norms other than **n**—induce him or her to do so.

Deontia. Although *vi* is assumed by somebody other than *vi* (in our cube, by characters (*i*) through (*iv*)) to be a duty-holder *d* under **n** (deontia: Section 6.4), *vi* does not himself or herself believe in **n** (adoxia: Section 6.2) and for this reason (anomia: Section 6.5) will not be predisposed by **n** to perform the type of action set forth in **n**. If other motives (needs, interests, or values, or norms other than **n**) should act on *vi*, they can induce *vi* to perform the type

of action set forth in **n** despite the fact that *vi* does not believe he or she is under any such obligation.

Exousia. Finally, although *vi* is assumed by somebody other than *vi* (in our cube, by characters (*i*) through (*iv*)) to be a right-holder *r* under **n** (exousia: Section 6.4), *vi* does not himself or herself believe in **n** (adoxia: Section 6.2) and for this reason will not be predisposed by **n** to make any sincere specific normative claims on other subjects who, in the opinion of characters (*i*) through (*iv*), are *d*s under **n** (deontia: Section 6.4). Thus, if *vi* sues them, it will be out of motives other than **n**; *vi* will consequently not take the strong normative censorious attitude that only a subject *b*&*r* (in our cube, only characters (*i*) and (*iii*)) can take toward those people he or she believes to be not only *d*s under **n**, but also *d*s under **n** in relation to him or her specifically.

(*vii*) *Adoxia–adeontia–anexousia*. Here, an actual agent *vii* is a *nonb*&*nond*&*nonr* with respect to **n**.

Adoxia. Since *vii* does not believe in **n** (adoxia: Section 6.2), *vii* will not be predisposed by **n** to support or foster **n**, this in consequence of his or her lack of belief in **n**. Hence *vii* will not take a normative censorious attitude toward any subject who is believed by somebody other than *vii* (in our cube, by characters (*i*) through (*iv*)) to be an actual duty-holder *d* (deontia: Section 6.4) and who does not practise **n** (Section 6.8): *vii* will take a censorious attitude only if motives other than **n**—needs, interests, or values, or norms other than **n**—induce him or her to do so.

Adeontia. Since *vii* is a *nond* under **n** (adeontia: Section 6.4) and a *nonb* in **n** (adoxia: Section 6.2), *vii* will not be predisposed by **n** to perform the type of action set forth in **n**.

Anexousia. Finally, since *vii* is a *nonr* under **n** (anexousia: Section 6.4) and a *nonb* in **n** (adoxia: Section 6.2), *vii* will not be predisposed by **n** to make any specific normative claims on other subjects.

Note, in passing, that experience shows that it is not necessary to be a believer in a norm **n** in order to sue someone. Human egoism suffices of itself, independently of normative beliefs, to foment disputes that end up in the courts. Which last will have to issue rulings, and they will not always (not necessarily) issue them in favour of the party against whom a suit has been brought without any normative or legal grounds or basis, and with the awareness on the plaintiff's part that such a ground or basis is absent.

(*viii*) *Adoxia–deontia–anexousia*. Here, an actual agent *viii* is a *nonb*&*d*&*nonr* with respect to **n**.

Adoxia. Since *viii* does not believe in **n** (adoxia: Section 6.2), *viii* will not be predisposed by **n** to support or foster **n**, this in consequence of his or her lack of belief in **n**. Hence *viii* will not take a normative censorious attitude toward any subject who is believed by somebody other than *viii* (in our cube, by

characters (*i*) through (*iv*)) to be an actual duty-holder *d* (deontia: Section 6.4) and who does not practise **n** (Section 6.8): *viii* will take a censorious attitude only if motives other than **n**—needs, interests, or values, or norms other than **n**—induce him or her to do so.

Deontia. Although *viii* is assumed by somebody other than *viii* (in our cube, by characters (*i*) through (*iv*)) to be a duty-holder *d* under **n** (deontia: Section 6.4), *viii* does not himself or herself believe in **n** (adoxia: Section 6.2) and for this reason (anomia: Section 6.5) will not be predisposed by **n** to perform the type of action set forth in **n**. If other motives (needs, interests, or values, or norms other than **n**) should act on *viii*, they can induce *viii* to perform the type of action set forth in **n** despite the fact that *viii* does not believe he or she is under any such obligation.

Anexousia. Finally, since *viii* is a *nonr* under **n** (anexousia: Section 6.4) and a *nonb* in **n** (adoxia: Section 6.2), *viii* will not be predisposed by **n** to make any specific normative claims on other subjects.

By way of a conclusion, I will return briefly to the problems of consistency indicated at the beginning of this section, on pages 223–4.

As I have said, if a pair consists of two basic, or simple, characters played by the same subject *s* and these two characters stand in contradiction with respect to the same norm **n**—meaning that the positions of *s* relative to **n** are of doxia and adoxia, deontia and adeontia, or exousia and anexousia—then this pair will obviously be inconsistent. The same subject *s* cannot personate any of the following three pairs: (1) *s* being at the same time a believer *b* and a nonbeliever *nonb* in **n**, (2) *s* being at the same time an actual duty-holder *d* and a non-duty-holder *nond* under **n**, or (3) *s* being at the same time an actual right-holder *r* and a non-right-holder *nonr* under **n**.

Notice, however, that the incompatibility with respect to **n** specified at point (1) depends only on one and the same subject, *s*, who will either believe or not believe in **n**; not so in the case of the incompatibilities with respect to **n** specified at points (2) and (3). Indeed, whether a subject *s* will be a *b* or a *nonb* in **n** depends exclusively on whether he or she believes in **n**. In contrast, whether the same subject *s* will be a *d* or a *nond*, or an *r* or a *nonr*, under **n** depends not only on whether *s* believes in **n**, but also—and independently of his or her personal belief in **n**—on whether other subjects believe in **n**.

Suppose that *s* is a *nonb* in **n**, but is a *d* under **n**, and that *s* is a member of a social group, say a group of 1,000 people including *s*. If *s*, though a *nonb* in **n**, is still a *d* under **n**, we can gather that at least one member of the group is a *b* in **n**, and that at most 999 members of the group are *b*s in **n**: Clearly, the dictum holds in principle whereby *tot capita*, *tot sententiae* (so many heads, as many beliefs). The incompatibilities specified at points (2) and (3) with regard to *s* under **n** (*s* being at the same time a *d* and a *nond*, or an *r* and a *nonr*, under **n**) will be such relative to each *caput* and each *sententia* singly considered, that is,

relative to each believer *b* in **n**, and to each belief in **n**, whether only one member of the social group to which *s* belongs is a believer or 999 members of the same group are believers (*s*, recall, is by hypothesis a nonbeliever).[26]

Note, too, in regard to points (2) and (3), that the content of a single norm **n** can entail plural positions for a duty-holder *d* and plural positions for a right-holder *r*. Thus, the same subject *s* may in fact with respect to **n** at the same time be a *d* and a *nond*, but that with reference to different obligations imposed by **n** on *s*; or the same subject *s* may in fact with respect to **n** be an *r* and a *nonr*, but that with reference to different rights ascribed by **n** to *s*. For reasons of brevity, I have not in the foregoing pages developed the possible implications of cases such as this one, even if in practice these cases are rather commonplace.[27]

Also, I distinguished in Section 6.4 between those subjects who are referents of a norm and those who are not, and it follows from this distinction that a subject can in different ways be a non-right-holder or a non-duty-holder. This, too, is a distinction I have not applied or developed in the foregoing pages.

10.2.4. Who Is to Say What Is the Law in Force: The Judges as Managers of What Is Subjectively Right (Dikaspoloi)

Let us imagine that each of us can choose without veils of ignorance which of the eight compound characters presented in the previous section we prefer to find ourselves playing in the game of the law in force given the scene of culture and society into which we have been thrown by fate (cf. Section 11.1). Even then, once we are thrown into one scene rather than in another (for example, in 16th-century China or in 15th-century Italy), what law will *actually* be in force for each of us, in the scene we have been thrown into, will not depend on us, despite the privilege we have exercised.

As to attempting to change the law, we might try to change the law in books. And even confining ourselves to the law in books, we can reasonably expect our attempt to have some measure of success only if (or at least, especially if) we are in the key position of legislators; otherwise, it will be no easy task to achieve this result (which in any event concerns the law in books, but not necessarily the law in force, a point already made): This much we saw in treating the sources of law (Section 3.4).

[26] Let us enter into greater detail by considering a case of this sort. We have, out of 1,000 people, 999, all of them *b*s who believe in a norm **n** and who believe that the remaining person—*s*, a nonbeliever *nonb* in **n**—is a duty-holder *d* under **n**, even if this last person does not believe in **n** and so does not believe he or she is a duty-holder under **n**. It will not be unlikely, in this situation, that many of the 999 believers *b* in **n** should believe this norm to have an objective existence independently of their beliefs, and that by so doing they reify **n**.

[27] For example, an owner's right and duties will be different and multiple depending on the good owned: depending on whether this good is movable or immovable, potentially hazardous or not, or of artistic value or not, or even whether this good is mineral, vegetable, or animal.

But, then, whatever the law in books is, who decides what is the law in force? What language does the law in force speak? Who is *la bouche de la loi*, the mouth of the law?

Les juges, replied Monsieur Charles Louis de Secondat Baron de La Brède et de Montesquieu (1689–1755): "The national judges are no more than the mouth that pronounces the words of law, mere passive beings, incapable of moderating either its force or rigour" (Montesquieu 1980, book XI, chap. 6).[28] And he was right.

True, Montesquieu can be criticised for this claim, by way of the argument that it is impossible to be la *bouche de la loi*: It is impossible not to have interpretation in the actual practice of law; it is impossible not to have interpretation find its way into the law in action. This criticism may seem sound and plausible. But then even Monsieur Montesquieu's claim needs to be interpreted. And my interpretation is this: "The judge is *la bouche de la loi*" is an analytic truth.

"The judge is *la bouche de la loi*" does not mean that the judge refrains from interpretation. Quite the contrary: It means that *la loi* has no other *bouche* than the judge's, just as the oracle has no other voice than the Sibyl's, or that of another *more or less inspired* agent who is in charge of pronouncing the response to the concrete cases presented to the oracle.

The law sets forth types: It is general and abstract (see Section 2.1.2). Further, the law, if conceived normatively, belongs to the higher level of the reality that ought to be: The law sets forth what is objectively right (see Section 1.3). The interaction between the reality that ought to be and the reality that is gets mediated by the validity or invalidity (congruence or incongruence) of the events occurring in the reality that is with respect to the types set forth in what is objectively right in the reality that ought to be. Finally, what is objectively right gets concretised, actualised—it becomes a daily affair—in what is subjectively right. What is subjectively right, too, partakes of the reality that ought to be, even though, as we know, it occupies its bottom layer (Section 1.2). It is a concrete reality that ought to be—a reality lived by people living in this world: cf. Section 14.6—because it gets ascribed *by* actual people (by judges, for example) *to* actual people (to litigants, for example), whether or not the ones or the others, or both, are believers.

Hence the question is: Who is it that *inspires* the ascriber?

Unless we believe in some mysterious entity, such as that which inspires the Sibyl, we will have to concede that the judge is inspired by the environment, by the society and culture he or she lives in, which concur in shaping the law in force of which the judge is the mouth.

[28] The French original: "Les juges de la nation ne sont [...] que la bouche qui prononce les paroles de la loi, des êtres inanimés qui n'en peuvent modérer ni la force ni la rigueur" (Montesquieu 1862, book XI, chap. 6). On Montesquieu, see, in Volume 2 of this Treatise, Rottleuthner, Section 3.2.1.1, in the frame of the natural foundations of law, and Volume 8, Riley.

Let us reread Montesquieu by placing his previously quoted words in context, and let us try to tag to the word *lois* the expression *en vigeur* ("in force"). We will realise then that Montesquieu is not denying the fact of the interpretation of judges. Rather, he is affirming the "analytic truth" whereby the judges cannot provide anything but a law they themselves interpret—a biased interpretation at that—according to the social conditioning which the judges inevitably stand affected by.

So writes Montesquieu, then:

> The great are always obnoxious to popular envy; and *were they to be judged by the people, they might be in danger from their judges*, and would, moreover, be deprived of the privilege which the meanest subject is possessed of in a free state, of being tried by his peers. […]
>
> It is possible that the law, which is clear-sighted in one sense, and blind in another, might, in some cases, be too severe. But as we have already observed, *the national judges are no more than the mouth that pronounces the words of the law* [in force], mere passive beings [*êtres inanimés*], incapable of moderating either its force or rigour. […]
>
> *It might also happen that a subject* entrusted with the administration of public affairs may infringe the rights of the people, and *be guilty of crimes which the ordinary magistrates either could not or would not punish*. But, in general, the legislative power […] can only […] impeach. But before what court shall it bring its impeachment? Must it go and demean itself before the *ordinary tribunals*, *which* are its inferiors, and, *being composed*, moreover, *of men who are chosen from the people* as well as itself, *will naturally be swayed by the authority of so powerful an accuser*? No: In order to preserve the dignity of the people, and the security of the subject, the legislative part which represents the people must bring in its charge before the legislative part which represents the nobility, who have neither the same interests nor the same passions. (Montesquieu 1980, book XI, chap. 6; italics added)[29]

[29] The French original in its wider context (enclosed within angle brackets is the original corresponding specifically to the translation in the run of text): "Quoique en général la puissance de juger ne doive être unie à aucune partie de la législative, cela est sujet à trois exceptions fondées sur l'intérêt particulier de celui qui doit être jugé.

<Les grands sont toujours exposés à l'envie; et, *s'ils étoient jugés par le peuple, ils pourroient être en danger*, et ne jouiroient pas du privilége qu'a le moindre des citoyens dans un État libre, d'être jugé par ses pairs.> Il faut donc que les nobles soient appelés, non pas devant les tribunaux ordinaires de la nation, mais devant cette partie du corps législatif qui est composée de nobles.

<Il pourroit arriver que la loi, qui est en même temps clairvoyante et aveugle, seroit, en de certains cas, trop rigoureuse. Mais *les juges de la nation ne sont*, comme nous avons dit, *que la bouche qui prononce les paroles de la loi* [en vigeur], *des êtres inanimés qui n'en peuvent modérer ni la force ni la rigueur*. […] Il pourroit encore arriver que quelque citoyen, dans les affaires publiques, violeroit les droits du peuple et feroit des crimes que les magistrats établis ne sauroient ou ne voudroient pas punir. Mais, en général, la puissance législative> ne peut pas juger; et elle le peut encore moins dans ce cas particulier, où elle représente la partie intéressée, qui est le peuple. Elle <ne peut> donc <être qu'accusatrice. Mais devant qui accusera-t-elle? Ira-t-elle s'abaisser devant *les tribunaux* de la loi, *qui lui sont* inférieurs, et d'ailleurs *composés de gens qui*, étant peuple comme elle, *seroient entraînés par l'autorité d'un si grand accusateur*? Non: il faut, pour conserver la dignité du peuple et la sûreté du particulier, que la partie législative du peuple accuse devant la partie législative des nobles, laquelle n'a ni les mêmes intérêts qu'elle, ni les mêmes passions.>

C'est l'avantage qu'a ce gouvernement sur la plupart des républiques anciennes, où il y avoit cet abus que le peuple étoit en même temps et juge et accusateur" (Montesquieu 1862, book XI, chap. 6; italics added).

It should emerge from the italicised expressions that the judge Montesquieu is talking about is the mouth not of the law in books, but of the law interpreted and shaped by the milieu the judge operates in. It is a law in force which (regrettably, as Montesquieu suggests) the judge cannot shrink away from. This law has incorporated itself within the judges; it has entered into their brains—where it is in force. For this reason, the judges, inanimate beings (*êtres inanimés*), far from being able to control this law, fall subject to it: They pronounce those words that this law dictates to them such as it gets interpreted, shaped, and maybe even biased in the milieu in which they operate.[30]

The concretisation of what is *objectively* right into what is *subjectively* right cannot take place and apply to us without somebody—a manager—attending to this task. There is needed somebody in charge of what is subjectively right, at least when anything having to do with what is subjectively right is or may be controversial. And the things having to do with what is subjectively right are of at least five different kinds: (*a*) the content of norms (what is objectively right in the reality that ought to be); (*b*) actual states of affairs and events in the reality that is; (*c*) the question whether these last (actual states of affairs and events in the reality that is) have to do with types set forth in what is objectively right in the reality that ought to be; and if they do, (*d*) what these types are; and (*e*) the question whether the same actual states of affairs and events are congruent or incongruent, valid or invalid, tokens of these types.

As we will see in Section 12.2.3, so early as in Homer's time, *dikē* (what is objectively right) gets restored, and the *dikai* (what is subjectively right) get administered by the *dikaspoloi* (the managers of what is subjectively right: cf. Section 12.2.4). And their verdict or pronouncement constitutes in any event what is subjectively right, the law in force in the concrete case.

Of course we are all in a sense free to call "law in force" whatever we think the law in force is or should be, and to hold that something is not law in force unless it possesses certain characteristics. Questions arise when other subjects enter the scene (or rather other compound characters, as presented in the previous section), especially people of position, meaning those people who exert authority, power, and influence—in a word, domination—in society, and so have more say than others as to what counts as law in force (cf. Sections 9.3 through 9.6).

[30] Students of Montesquieu have different views on the famous passage about the *bouche de la lois*. Thus, it will be necessary to also take into account other passages of Montesquieu, as well as, among other things, the role he assigned to aristocracy. These questions fall beyond the scope of this volume. And in any case, the mere fact of suggesting a kind of court rather than another, a composition of it rather than another, shows of itself that even the most aseptic conception of the judge's role presupposes (explicitly or implicitly) that the judge cannot be anything but the *bouche de la lois* in the sense just specified, that is, of the *lois* in force as the outcome of the cultural and social conditioning of the environment the judge belongs to.

Here, with some simplification, we can distinguish four classes of people (each of which can be regarded as a social group within the social system).

(*i*) Those who understand it as their job to enact the law that must be in force in society. This social group comprises lawmakers and other government authorities that produce law in books.[31] Let us say that these people try to translate their ideals of earthly justice into enactments, and whenever possible into norms, on my understanding of "norm" (lawmakers need believers who believe their enactments to be or to create norms).

(*ii*) Those who understand it as their job to say what the law in force is by explaining its content. These people figure they are explaining, stating, and describing what the law in force is, but in fact they are prescribing and suggesting by argumentation what should be applied as law in force. In this social group are professors of law, and more generally all those who study the law and are practised in it, namely, jurists, who are capable of exerting a specific influence in this respect.[32]

(*iii*) Those who use force to exact compliance with the directives they themselves enact, believing that this way they are obeying and enforcing the law in force (cf. Section 10.1), and whose meaning they themselves explain and state. In this social group are enforcement authorities, especially judges:[33] From different angles the group can also be seen to include public-administration officials (bureaucracy) and, when necessary, the state's military apparatus.

"Bureaucracy" is

> the public offices and functionaries entrusted with executing the acts established or regulated by a state's central power and providing administrative control for such execution; both functions are to be discharged impersonally, on the basis of preset standard criteria, and for all subjects who fall within given general categories [...].
>
> A surveillance bureaucracy, as is the Italian bureaucracy, will display the characteristics specific to both caste bureaucracy and patronage bureaucracy. [...]
>
> A political class seeking to expand and strengthen its domination can effect bureaucratic buildup on purpose, and without regard to what public administration technically requires, as has been typical of Italy before and after 1945 [...].
>
> The resistance that bureaucracy puts up against all forms of change stems from different processes that integrate to transform what are means—offices, hierarchies, operative procedures, and norms—into ends, thereby refashioning all political problems into administrative problems [...]. These norms, procedures, and offices often undergo a sort of *sanctification* [...] effected by functionaries; this way, the functionaries' more technical activities tend to become untouchable. (Gallino 2000, s.v. "Burocrazia," 79, 81, 82; my translation)

(*iv*) Those elements that can exert and do exert influence on the three groups above. This fourth class is better understood as that of interest groups

[31] Cf., in Volume 3 of this Treatise, Shiner, Chapters 2 and 9, and Rotolo, Section 7.2.

[32] Legal dogmatics, or *scientia juris*, which see Section 9.5.2 and Peczenik's Volume 4 of this Treatise.

[33] On judge-made law, see Volume 3 of this Treatise, Shiner, especially Section 2.3.

and includes corporations, political parties, labour unions, associations, financial groups, media people, and so on.

The expression "interest group" designates social groups like

> economic and professional groups, ethnic and religious groups, the people engaged in any one sport or recreational activity, sectors of social classes and social strata, those active in any one sector of the economy, or the workers employed in any one industrial, or farming, or service sector, the residents of any one area or local community or city section, and the members of a minority group, all which groups mobilise and take action specifically aimed at defending or furthering their primary and secondary interests against the rest of society and the state. To effectively pursue these ends, the members of an interest group will usually create sundry forms of association and organisation framed as active instruments with which to achieve representation within the political or the economic system as well as to build a bargaining position, exert pressure and influence, and gain power. Sometimes interest groups will seek to have a direct hand in governing society, but for the most part they prefer to act from outside the constitutional framework. Such groups as labour unions, trade associations, industry alliances, and chambers of commerce are themselves interest groups when they take in all the members whose category they represent; otherwise they act as the associative and organisational apparatus within an interest group that has more members than they have and that can occasionally comprise more than one apparatus. A political party usually embraces or represents several interest groups; conversely, there are interest groups that support more than one political party. (Gallino 2000, s.v. "Gruppo di interesse," 330–1; my translation)

When the matter is the law in force (legal directives, or texts, and norms in force), we will have to ask: Law in force (legal directives, or texts, and norms) according to whom? In whose opinion or belief, or in accordance with whose wishes? In connection with which of the social groups singled out above? The lawmakers? The jurists? The judges? Interest groups? And if so, which interest groups?

It may be that the aforesaid social groups advance compatible opinions about which legal directives and norms are law in force—as such to be applied *by* force, if necessary—but this will not necessarily be the case.[34]

Judges hold a special position with respect to lawmakers, jurists, and interest groups.

Lawmakers issue directives, laws, and the like and trust judges to recognise as law in force the texts the lawmakers themselves enact (namely, the law in books).

Jurists explain and illustrate what they think the law in force to be, and count on judges to heed them, out of deference to *scientia juris*, or legal dogmatics (this law we may perhaps call "doctrinal law" or "scientific law," using an expression of Savigny's—Friedrich Carl von Savigny, 1779–1861; cf. Section 15.5).

Interest groups exert pressure, mostly on lawmakers and judges, and on jurists as well.

[34] As is clear, and as has already been pointed out, there is at play here not only the question what directive or legal text is in force, as such to be applied *by* force, if necessary, but also the broader question what *interpretation* of a directive or legal text is in force, as such to be applied *by* force, if necessary.

On one account, judges are understood to lie in a state of passivity, because they are entreated with different kinds of requests coming from lawmakers, jurists, and interest groups. But again, unless a revolution interposes, judges apply the law in the sense that they use force to exact compliance with what *they* understand the law in force to be (and with what the demands addressed to them by lawmakers, jurists, and interest groups lead them to believe the law in force to be).

The expression "sources of law" suggests (at least in civil-law systems) that there are people, such as the lawmakers, whose job it is to make (or enact) the law that must be in force in society, and others, such as the judges, who apply the law in force (when citizens fail to comply with the lawmaker's statutes out of normative beliefs or out of conformism); it also suggests that those who apply the law in force, such as judges, must keep to enacted law, and to a certain hierarchy which the different sources of law are set in.

Hence, in theory, those who make law (the lawmakers) hold a higher-level position relative to those who apply the law (the judges): Those who make law "decide" what law must be in force in society; those who apply the law "obey" the other group.

In practice, however, because those who apply the law, and judges in particular, can use force (they have the law enforced), the two positions are not so marked out. And when conflict arises, it is those who enforce the law who decide which legal enactments (directives, texts of law, and the like) and which norms, and on what interpretation, are the law in force, as such to be applied *by* force, if necessary.

Lawmakers making laws, jurists studying law, and interest groups—using such means as suggestion (the media, propaganda, etc.), influence, and power—all work (most often successfully) to have an effect on judges deciding what the law in force is, thereby deciding what law is to be applied *by* force, if necessary.

Lawmakers, jurists, and interest groups are not, however, themselves in a condition to use force to apply and exact compliance with what they consider to be the law in force. Hence the law in force is what judges (and officials capacitated to take coercive measures) understand as law in force: It is what they apply as law in force, as such to be applied *by* force, if necessary.

It follows from this that in deciding what legal enactments and norms are to be applied, if necessary by *force*, and on what interpretation, if lawmakers, jurists, judges, and interest groups should advance conflicting opinions, the opinion that will actually override the others—the one that matters (principle of effectiveness)—will be the judges' opinion.

A disclaimer is in order here. The view just outlined is not that law in force is whatever judges believe to be law, and so apply as law, if this is taken to mean that judges take decisions based on their whims and interests. This can happen, to be sure. But by and large the likelihood of it happening is no greater among judges than it is in any other social group in which people hold

positions of authority or power. The view advanced here is rather that the law in force is what judges believe to be law, and so apply as law, because judges belong to a social group whose position in the social system, and especially within the state, gives them the last say in deciding what is law in force.

The "last say" that judges have is not necessarily their personal, spur-of-the-moment opinion qua individuals: It is rather the set of legal beliefs current among judges as a social group. The social group of judges is part of the same social system (the state) that also takes in the social groups of lawmakers, jurists, and interest groups; hence, the legal and normative beliefs that judges come to have are largely informed by the opinions the other groups in the social system have, and this influence is proportional to the power and influence the latter groups exert.

Judges, though subject to such conditioning, are convinced, in good faith for the most part, that the law they apply is the law in force as it objectively exists. What they actually apply, instead, are enactments (directives, or texts) and norms, whose content they contribute to shaping: They do so by interpreting, integrating, and especially applying the content of these enactments and norms to the behaviour of citizens. Judges, in their capacity as the official agents of social control, will consider the actual behaviours of citizens to be valid or invalid with respect to the types they (the judges) assume to be set forth in law. At the same time, judges will assume the behaviour of citizens to be right or wrong, a qualification that presupposes, but does not coincide with, its qualification as valid or invalid (cf. Section 2.2.2). And the behaviour they consider wrong, they will censure and repress.

It is not a play on words to say that the question of the law in force has to do with the force of the law in force, meaning by this last expression all factors that concur in determining the force of the law in force: not only norms (Chapter 8 and Section 9.6), but also organised power and the other factors considered in Sections 9.3 through 9.5 and 10.1. All these factors concur in making it so that judges—whose role is to decide what the law in force is in the actual controversies brought before them—should actually believe the law in force to be normatively and objectively what they find it to be. Or these factors will concur in making it so that judges should at least pretend they believe this to be the case, behaving, in this event, as whited sepulchres or as Jesuits (cf. Section 6.6).

Alf Ross has argued convincingly that the law in force is the judges' "normative ideology" (Ross 1958, 75ff.).[35] One of the strongest points in support

[35] "The mental process by which the judge decides to base his decision on one rule rather than another is not a capricious and arbitrary matter, varying from one judge to another, but a process determined by attitudes and concepts, a *common normative ideology*, present and active in the minds of judges when they act in their capacity as judges" (Ross 1958, 75; italics added). The Danish original: "Den mentale proces hvorigennem dommeren når frem til at basere sin afgørelse på just denne regel fremfor en anden, ikke forløber lunefuldt og vilkårligt, vekslende fra dommer Per til dommer Poul, men er bestemt af indstillinger og forestillinger, *en normativ*

of Ross's opinion is the twofold position that judges enjoy: When controversies arise, judges make the institutional decision as to what is the law in force, the law that is to be applied, if necessary *by* force; at the same time, judges detain the use of force—they govern the law-enforcement apparatus (police, the prison system, etc.) over which the state has a monopoly.

I would only add to Ross's just-mentioned opinion the qualification previously made: It is not strictly necessary that all judges be believers, that they belong to the bottom square of the cube of the law in force presented in Section 10.2.3. It suffices that they be whited sepulchres or Jesuits. What is necessary, in other words, is that they *act* as if they were believers.

Whether it is preferable that judges be sincere believers, whited sepulchres, or Jesuits is a different matter, and up for discussion.

Experience and history teach (or rather have taught me, who am a naughty pupil) that excess of belief, of normativistic zeal, is pregnant with risk; that whited sepulchres are people devoid of humanity; and that—all things considered—Jesuits are the least worst people we can hope to have to do with when others are playing the character of judge in our regard: the character of manager of what for us personally is subjectively right (our obligations and rights) when we stand trial or are even remotely affectible by the outcome of a trial.[36]

10.2.5. The Law in Force as Domination (Herrschaft)

On the whole, law is domination (*Herrschaft*), even when such domination is, as we might hope, liberal and democratic, as against totalitarian, authoritarian, or tyrannical. "Domination" is defined in the social sciences as

> a relation built on the superordination or superiority of one individual or collective subject, A, upon one or more individual or collective subjects—B, C, etc.—in a social system that embraces A, B, C, etc., such that, *despite appearances to the contrary*, A controls to A's advantage [or furthers A's plans or visions of society by controlling] the distribution of the material and nonmaterial resources the system as a whole either produces or acquires: Under this relation, A also controls the political processes affecting such distribution, using to this end, and in combinations gauged to the situation, different forms and amounts of power, authority, influence, and other means suited to conditioning both *the behaviour and the conscience* of the dominated subjects, in much the same way as the mechanisms of socialisation and social control do, effectively preventing B, C, or others from escaping this distributive framework or modifying it to a degree unacceptable to A, and effectively bringing them to recognise the framework in force as legitimate. (Gallino 2000, s.v. "Dominio," 249; my translation; italics added)

Human beings can rely on actual experience (knowledge by acquaintance) to relate to the reality that surrounds them. But there is only so much actual ex-

ideologi, der på ensartet måde er præsent og virksom i danske dommeres sind, når de handler i deres kald som dommere" (Ross 1971, 90; italics added).

[36] Note in passing that what I maintain on the relationship between normativeness and fanaticism (cf. Section 15.4) evidently applies to judges too.

perience each person can have in relation to the whole of past and present states of affairs and events and of the future states of affairs and events susceptible of being predicted. Beyond actual experience, the only mediums available with which human beings can understand the reality around them is knowledge by description, abstract knowledge acquired through concepts or types.[37]

This is so with type descriptions given in apophantic sentences (sentences that express propositions that are either true or false), as well as with type descriptions given in deontic sentences or directives (sentences that express propositional contents that cannot be true or false).

The reality that is, abstractly described in apophantic sentences expressing propositions (such as are either true or false), is in an important sense independent from authority, power, influence, suggestion, and charisma (which can indeed shape the content of apophantic sentences designed to describe and state the reality that is, but which cannot shape this same reality). For this reason, when comparisons are possible, the actual reality that is prevails upon false or manipulative propositions (modelled by authority, power, and influence) and shows them to be false or manipulative, this on Karl Popper's (1902–1994) falsification principle (Popper 1983, 78ff.).

By contrast, the reality that ought to be is largely, if not completely, contingent on authority, power, influence, suggestion, and charisma, that is, on domination. Still exemplary in this regard is Hans Gerth and Charles Wright Mills's *Character and Social Structure: The Psychology of Social Institutions*, dating to 1953 (Gerth and Mills 1961). The title of this work is in itself significant; the contents I will get to in Section 15.3.

The action of authority, power, influence, suggestion, and charisma on the propositional contents, would-be propositions, or type descriptions designed to move people to action—as are the types described in deontic sentences, in directives, or contained in norms (normative beliefs), which cannot be true or false—consists not only in modelling such propositional contents, would-be propositions, or type descriptions, but also in making them actual: in determining the tokens (the actual behaviours) that validly perform such types.

This is done officially (in the courts, for example, or through bureaucracy: Section 10.2.4) by qualifying as valid or invalid the behaviour-tokens, and as we know, where these are assumed to be invalid, they will not produce (see Section 2.2 and Chapter 3) the Ought-effects that the reality that ought to be (the law) attaches *only* to the tokens that *validly* instantiate the types in question. And where behaviour-tokens are assumed to be not only valid but also wrong (precisely inasmuch as they are valid; see Section 2.2.2)—that is, where they are assumed to depart from what is objectively right (deviance, anomia, nonconformism)—the authority, power, influence, suggestion, and charisma, in sum, the

[37] The distinction between knowledge by acquaintance and knowledge by description I use in the sense expounded by Russell (1992).

law in force with all its components and means, will intervene to censure and change deviance and nonconformism, if necessary using force to this end.

There are two salient features of law: heteronomous normativeness—implied by authority—and effectiveness, requiring organised power or force.

The normativeness of law is heteronomous because it depends largely on authority: *Jus quia jussum*; "What is right is right because prescribed." I welcome this Latin expression: It serves to point out that directives and texts validly issued by a sovereign authority do bring about heteronomous derivative norms in the brains of believers (Sections 7.3 and 9.6)—norms that no artifice, however elegant, can retrace to the addressees' autonomy, despite the fact that the addressees of the authority's directives or enacted texts do believe in the competence norm institutive of the sovereign authority.

Ne m'en voulez pas, monsieur Rousseau. I cannot agree with you: *Vous vous êtes trompé*. And on account of your error, full of good faith, ingenuity, and idealism, a great many simple-minded people have been led astray.

Vous dites: "La volonté générale est toujours *droite*." You say: "The general will is always *right*."[38] This conclusion proceeds on a misunderstanding with regard to the promise and the social contract. I will come back to this question in Section 10.2.6.

The effectiveness of law depends partly on the efficaciousness that heteronomous norms have on believing duty-holders (cf. Sections 6.5 and 6.6) and partly on force: not only on force as the means of last resort with which to decisively resolve conflicts, but also, and most importantly, on force understood as the compelling social environment without which there would not be any peaceful social life, not even relatively peaceful.

We may try to soften through our culture the compelling force embedded in our social environment, or we may try to do so through critical and enlightened ideas as well as through political wrangling. But despite recurrent contrary illusions (anarchism, Marxism, etc.), the law, the state, and the ambiguous intertwining of norms and organised force by which they are characterised cannot be abolished, if not at the cost of putting an end to all kinds of social coexistence (cf. Sections 10.1 and 15.3.3).

If we are to briefly describe the being-in-force of the state's legal system, it will be as follows.

As a relatively effective normative system, the state is a set of social relations and of processes and structures that guide, give shape to, stabilise, and regulate the most varied activities of a people, in the economic sphere as in the political, familial, cultural, educational, and religious sphere. The social relations between husband and wife, parent and child, teacher and student, entrepreneur and factory worker, tenant and landlord (whether this last person is a private citizen or a public entity), soldier and officer, and a thousand other relations, *bear the deep imprint of the norms the state consists of and exists in*. Their *effectiveness*, however relative, *is due in*

[38] The English translation and the French original are from Rousseau 1980, II, 3, and Rousseau 1817, II, 3, respectively; italics added.

large part to the near-absolute power wielded by the state to enjoin respect for the norms which come from it, or which are received into it; *but it is due in no less measure to the adhesion the same norms are an object of on the part of those who are subject to them*, and to the consensus with which these subjects welcome the decisions of the political class. This adhesion and consensus are in turn the product of the influence exerted by the politicians, and by the intellectuals who serve them, either directly or through mass communication; the same adhesion and consensus is also the product of the authority conferred on politicians and on those who hold offices in the administrative-judicial apparatus; it is the product of the mechanisms of patronage the ones and the others use to turn to their own advantage the will of electors, interest groups, associations, and enterprises.

If we want to explain both the effectiveness of the state's normative system and its loss of effectiveness, it will then prove essential to couple the *objective* elements of power to the *subjective* elements of authority, influence, and patronage. It is the coming together of these objective and subjective elements that constitutes the state's real domination over the members of society, such as permanently and effectively controls their conduct. When the subjective elements disappear, the objective elements—crude power—will not by themselves suffice to secure such control, or rather they will secure it, but only temporarily or under exceptional circumstances, or by exacting heavy tolls […].

All contemporary states are without exception more extended than they were at their outset, meaning that they now intervene to control and dominate public and private life, as well domains like education and the economy, under more aspects than they used to […].

The state's overall greater force and extension has generally not been used to bring greater oppression and exploitation to bear down on the subordinate classes, to be sure, and has often been used, rather, to decrease such exploitation and facilitate the historical process of emancipation—but none of this does anything to remove the state's relentless presence, designed to interpose assistance and control alike, even in the life of the subordinate classes, nor does it prevent the state's oppressive and repressive potential, now used in several societies to advance civilisation, from being readily used at some future time for purposes contrary to progress.

The phenomenon we must look at is not the use this instrument is put to, but rather the boundless power it has been endowed with. And it will be hard to rebut the claim that *the state as a morally and politically "ambiguous" instrument* has never been so powerful as it is in capitalistic and socialistic societies alike. (Gallino 2000, s.v. "Stato (Sociologia dello)," 641–2, 642–3, 643; my translation; italics added)

10.2.6. On Authority, Autonomy, and Heteronomy

In Section 10.2.5 I maintained that there are two salient features of law: One is heteronomous normativeness, which flows from authority, and the other is effectiveness, which requires normativeness, and at the same time it requires organised power, or force. Also, I called Rousseau to account in regard to the first feature: With some impertinence on my part I imputed to his ingenuousness and idealism the pitfall which I explain below and which so many people have fallen into.

I will now present a few arguments in support of my basic objection to theories that, like Rousseau's, can prove misleading in having the concept of individual autonomy tie up too closely with that of promise and, in the arena of politics, with that of the social contract, justifying by this device a certain ignis fatuus: an illusion and excessive optimism about the compatibility between autonomy and delegation, or conferral of power.

The arguments concern the concept of promise implied in the account of the social contract offered by various 17th- and 18th-century natural-law theories (cf. Section 3.6.2).

If the object of a promisor's promise is "obeying" ("I will obey your commands"), then the directives the promisee issues to the promisor so as to have the promisor maintain the promise made are heteronomous with respect to the promisor, despite the fact that making a promise—here, entering into a social contract—makes the promisor the source of the promisee's sovereign authority.

Granted, if a promisor's promise is a valid instance of the type of circumstance set forth in the norm on promises (**n**, "Promises must be kept") and the promisor believes in this norm (doxia), then any promise validly made by the believing promisor will, by the subsumption and inference process illustrated in Chapter 7, lead to derivative norms in the promisor's reality that ought to be.

Thus, if I, a believer in the norm on promises **n**, make the promise "I will quit smoking when you will ask me to," or also, for something of a provocative example, "I will kill myself when you will ask me to,"[39] and you ask me to quit smoking or to kill myself, I will then believe that there is now a new norm **n1**, "I must now quit smoking," or **n2**, "I must now kill myself." Further, I will have to admit that the norms **n1** and **n2** are autonomous in my regard because their content is stuff that *I* have decided, not someone else.

But suppose now that I make the promise "I will obey your every command": I will thereby have lost my autonomy.

Of course if I am a believer in the norm on promises, my last promise, like any other promise, will produce in me the belief that I am now under an obligation to keep my promise. And the promisee's issuing of directives to me will set off in me the subsumption and inference processes illustrated in Sections 7.3 and 9.6, and these processes will have me believe that the promisee's issuances have produced new norms which I believe to be per se binding on me (nomia: Section 6.5).

But there is a point that holds only in the case of promises like "I will obey your every command." And the point is the following. It is true that everything happens through *my* promise, and that *my* beliefs are to account for my normative conclusions, and that the promisee's directives create (in me, as a believing promisor) new norms under which I am a duty-holder. But it is false that these new derivative norms may be ascribed to my autonomy. Let us see why.

We need to be careful with norms that derive from the norm on promises ("Promises must be kept"). These derivative norms, depending on the content of the promise from which they flow, may come in either of two forms: as norms of conduct in the strict sense ("No smoking," for example) or as com-

[39] Or, for a more likely and topical example, let us imagine a doctor promising a patient to perform euthanasia on him or her if and when the patient should make that request.

petence norms in the strict sense, whose peculiar type of action is "obeying."[40] It all depends on the content of the promise.

If, as a believing promisor, I promise to perform a type of behaviour different from "obeying" (I might promise I will quit smoking when you will ask me to, for example, or commit suicide when you will ask me to), my promise will lead to a norm of conduct in the strict sense. And the content of this norm of conduct will be a type of action as I have determined it—ab ovo and in full—through the content of my promise. In this case, therefore, the content of the promisee's directive ("Quit smoking now," or "Commit suicide now") will effectively be traceable to my autonomy as a promisor having decided these types of behaviour in the first person.

If instead I promise, as a believing promisor, to perform the type of behaviour "obeying" ("I will obey your every command"), then my promise will lead to a competence norm in the strict sense. Of course, this competence norm is definitely one I have decided in autonomy, but what in this case I have autonomously done through my promise is transfer my freedom and autonomy to the promisee. This transfer takes place in the reality that ought to be (or, which amounts to the same, it takes place in the brains of the believers in the norm on promises), and it does so precisely in virtue of the mechanism proper to promises and to the inferential process illustrated in Chapter 7 and Section 9.6.

Recall Grotius's *alienatio dominii* as the paradigm for *alienatio particulae libertatis*.

> A perfect promise [...] has an effect similar to alienation of ownership. It is, in fact, an introduction [*via*, better translated here as "way," "mode," or "means"] either to the alienation of a thing or to the alienation of some portion of our freedom of action. (Grotius, *De jure belli ac pacis libri tres* (b), II, 11, IV)[41]

If and to the extent that I promise to obey the directives received from the promisee, I will have transferred my autonomy to the promisee, and my autonomy will thereby, and tautologically, have changed into my "heteronomy": My autonomy will have become the promisee's "autonomy" in laying norms on me. Indeed, the valid directives that drive derivative norms into my brain are such that the types of action each time so required of me by the promisee will have been determined and decided by the promisee, not by me. The promisee will issue directives that are heteronomous to the promisor and bring about in the promisor's brain heteronomous derivative norms.

If autonomy amounts to deciding for yourself which directives, laws, or types of action you will believe to be binding per se, then, as happens with the

[40] On this distinction, see Section 8.2.1.

[41] The Latin original: "Perfecta promissio est, similem habens effectum qualem alienatio dominii. Est enim aut via ad alienationem rei, aut alienatio particulae cuiusdam nostrae libertatis" (Grotius, *De jure belli ac pacis libri tres* (a), II, 11, VI). Cf. Section 3.6.2.

social contract, any promise that creates a *stricto sensu* competence norm will necessarily lead to heteronomous directives and derivative norms.

It is a question of degree, and it depends on our political opinion, whether this conclusion holds true even in the event that a social contract should set up not only formal restraints but also substantive ones limiting the matters on which the sovereign promisee can validly issue or enact directives or texts of law.[42]

Competence norms are useful, and quite likely necessary as well, but—if I may indulge in a truism—they are at the same time risky. It is purely by reason of an ideology that they get reduced to the autonomy of the person required to obey them. There is no need to mention here the well-known cases of legitimately elected dictators. Bureaucracy makes a fine-enough example. Bureaucrats live and thrive on competence norms: I have never known of anyone who has felt autonomous dealing with bureaucracy; even ministers and heads of state (a crowd I mingle with habitually) do not feel autonomous in that respect, despite the fact that they are formally in a position superordinate to that of bureaucrats (see Section 10.2.4).

Rousseau's theory of the general will traces the sovereign's decisions to the citizens' autonomy.

"The general will is always right" (Rousseau 1980, II, 3) ("la volonté générale est toujours droite"; Rousseau 1817, II, 3) and, further, "an act of Sovereignty [. . .] is not a convention between a superior and an inferior, but a convention between the body and each of its members. [...] So long as the subjects have to submit only to conventions of this sort, they obey no-one but their own will" (Rousseau 1980, II, 4).[43]

[42] On this point, my political opinion, at least the main features of it, can be gleaned from the previous sections on law in force and especially on law and domination.

[43] Here are Rousseau's words in their wider context: "From the very nature of the compact, every act of Sovereignty, i.e., every authentic act of the general will, binds or favours all the citizens equally; so that the Sovereignty recognises only the body of the nation, and draws no distinction between those of whom it is made up. What, then, strictly speaking, is an act of Sovereignty? It is not a convention between a superior and an inferior, but a convention between the body and each of its member. [...] So long as the subjects have to submit only to conventions of this sort, they obey no-one but their own will; and to ask how far the respective rights of the Sovereign and the citizens extend, is to ask up to what point the latter can enter into undertakings with themselves, each with all, and all with each" (Rousseau 1980, II, 4). The French original: "Par la nature du pacte, tout acte de souveraineté, c'est-à-dire tout acte authentique de la volonté générale, oblige ou favorise également tous les citoyens; en sorte que le souverain connoît seulement le corps de la nation, et ne distingue aucun de ceux qui la composent. Qu'est-ce donc proprement qu'un acte de souveraineté? Ce n'est pas une convention du supérieur avec l'inférieur, mais une convention du corps avec chacun de ses membres. [...] Tant que les sujets ne sont soumis qu'à de telles conventions, ils n'obéissent à personne, mais seulement à leur propre volonté: et demander jusqu'où s'étendent les droits respectifs du souverain et des citoyens, c'est demander jusqu'à quel point ceux-ci peuvent s'engager avec eux-mêmes, chacun envers tous, et tous envers chacun d'eux" (Rousseau 1817, II, 4).

Part Four

In Search of Confirming Others

Ὦ πέπον, εἰ μὲν γὰρ πόλεμον περὶ τόνδε φυγόντε
αἰεὶ δὴ μέλλοιμεν ἀγήρω τ᾽ ἀθανάτω τε
ἔσσεσθ᾽, οὔτε κεν αὐτὸς ἐνὶ πρώτοισι μαχοίμην
οὔτε κε σὲ στέλλοιμι μάχην ἐς κυδιάνειραν·
νῦν δ᾽ ἔμπης γὰρ κῆρες ἐφεστᾶσιν θανάτοιο
μυρίαι, ἃς οὐκ ἔστι φυγεῖν βροτὸν οὐδ᾽ ὑπαλύξαι,
ἴομεν, ἠέ τῳ εὖχος ὀρέξομεν, ἠέ τις ἡμῖν.

Ah friend, if once escaped from this battle we were for ever to be ageless and immortal,
neither should I fight myself amid the foremost, nor should I send thee into battle
where men win glory; but now—for in any case fates of death beset us,
fates past counting, which no mortal may escape or avoid—
now let us go forward, whether we shall give glory to another, or another to us.

(Homer, *The Iliad*, XII, vv. 322–8)

Death, alas, is not vague, or abstract, or difficult to grasp
for any human being. It is only too hauntingly real, too concrete,
too easy to comprehend [...].
Myth, warranting the belief in immortality, in eternal youth, in a life
beyond the grave, is not an intellectual reaction upon a puzzle,
but an explicit act of faith born from the innermost instinctive
and emotional reaction to the most formidable and haunting idea.

(Bronislaw Malinowski, *Myth in Primitive Psychology*, 1926)

*Nur wenn im Sein eines Seienden Tod, Schuld, Gewissen, Freiheit
und Endlichkeit dergestalt gleichursprünglich zusammenwohnen wie
in der Sorge, kann es im Modus des Schicksals existieren,
d. h. im Grunde seiner Existenz geschichtlich sein.*

Only if death, guilt, conscience, freedom, and finitude reside together equiprimordially
in the Being of an entity as they do in care, can that entity exist in the mode of fate;
that is to say, only then can it be historical in the very depths of its existence.

(Martin Heidegger, *Sein und Zeit*, 1927)

Chapter 11

THE REALITY THAT OUGHT TO BE AS FATE

11.1. Consciousness of Death, Anxiety, and Self-Defensive Creation of Myth

The expression "reality that ought to be" may well be a coinage of mine, but what it expresses—something like a pragmatic and vital nonsense (Malinowski, *infra*—Bronislaw Malinowski, 1884–1942)—is not. Nor was it invented by Hans Kelsen, even if he was its foremost 20th-century theoriser and built on *das Sollen* a daring cathedral of crystal, sophisticated, glorious, and fragile. Finally, the idea of the reality that ought to be was not invented by the jurists, either, despite the fact that they have been handling it for centuries, not always consciously or with due care.

A number of traits distinguish humans from minerals, plants, and animals, such as their brain's huge memory capacity, their advanced learning skills, an advanced ability to choose, and self-consciousness. This last trait implies a consciousness of time—of past, present, and future—and so of death, and the anxiety incident to that consciousness. The idea of the reality that ought to be is, I believe, an outcome of the anxiety that humans experience when they become conscious of the ineluctability of death.

The idea of the reality that ought to be comes in conjunction with the idea of fate, the normatively necessary order of *heimarmenē*—of what has been allotted and must happen. The fate common to all human beings is the fate of death (*koinou thanatou meros*). *Heimarmenē* connects up with *anagkē* as well, whose meaning, "necessity," also nests in itself the Is-Ought dualism.

The reality that ought to be is a primeval belief that has been passed down through the millennia, gone through hundreds of interpretations and versions, and intermingled with feelings of compulsion savouring of tragedy and, when sublimated, of nobleness. This belief speaks of ineluctability, transgression, and punishment: a transgression as terrible as the original sin, a punishment as inexorable and unavoidable as death and hell.

At the outset of Greek civilisation, the reality that ought to be appeared in Homer's epic, in the poets' mythical cosmologies, in the doctrines of the Mysteries, in the mottoes of the Seven Sages, and in the poets' ethical-political reflection, and it later evolved in the works of the philosophers: for example, in the Stoic doctrine of *orthos logos* (literally, "upright reason").

There are other ancient Greek terms besides *heimarmenē* and *anagkē* that refer or allude to the reality that ought to be or have to do with it; among them, *moira* (whose derivation is the same as that of *heimarmenē*), *aisa*, *dikē* and *themis*, *kosmos*, *tukhē*, and *khreōn*. These terms are polysemous, but at least some of their meanings express the normative necessity of the reality that

ought to be and of fate. *Aisa*, for example, means "part," or "portion," and specifically "the allotted part"; *kat' aisan* (or *en aisēi*) means "conforming to the established norm," or "conforming to fate"; *huper aisan* (or *par' aisan*) means "beyond the established norm," or "beyond fate" (cf. Section 11.3.2).[1]

We can now reconnect fate with anxiety and with the peculiar necessity of the reality that ought to be.

The philosophical sense of "anxiety" was handed down to us less than two centuries ago, in 1844, by Søren Kierkegaard (1813–1855), in his *Begrebet angest*:

> When it is stated in Genesis that God said to Adam, "Only from the tree of the knowledge of good and evil you must not eat," […] the prohibition induces in him anxiety, for the prohibition awakens in him freedom's possibility. What passed by innocence as the nothing of anxiety has now entered into Adam, and here again it is a nothing—the anxious possibility of *being able*. […] Only the possibility of being able is present as a higher form of ignorance, as a higher expression of anxiety, because in a higher sense it both is and is not, because in a higher sense he both loves it and flees from it.
>
> After the word of prohibition follows the word of judgement: "You shall certainly die." Naturally, Adam does not know what it means to die. On the other hand, there is nothing to prevent him from having acquired a notion of the terrifying, for even animals can understand the mimic expression and movement in the voice of a speaker without understanding the word. If the prohibition is regarded as awakening the desire, the punishment must also be regarded as awakening the notion of the deterrent. This, however, will only confuse things. In this case, the terror is simply anxiety. Because Adam has not understood what was spoken, there is nothing but the ambiguity of anxiety. The infinite possibility of being able that was awakened by the prohibition now draws closer, because this possibility points to a possibility as its sequence ["consequence" seems more fitting to me: *Følge*]. (Kierkegaard 1980, 44, 45)[2]

The root of anxiety is existence as possibility. Unlike fear and other mental states relating to determinate things, anxiety does not relate to any specific

[1] Again: *kakēi aisēi* means "with baleful fate"; *aisa moi esti* means "it is my fate." I will return to *heimarmenē* and *moira* in Section 11.2 and to *dikē* and *themis* in Section 12.2. *Kosmos* means "order"; *eu kata kosmon* means "suitably," "in good order." *Tukhē* means "fate" (where context determines whether it is good fate or bad fate). *Khreōn* also means "fate," "fatality," "necessity"; *tou khreōn meta* means "by force of fate"; *es to khreōn ienai*, "to meet fate, death."

[2] The Danish original: "Naar det saaledes hedder i Genesis, at Gud sagde til Adam: 'blot af Kundskabens Træ paa Godt og Ondt maa Du ikke spise' […]. Forbudet ængster ham, fordi Forbudet vækker Frihedens Mulighed i ham. Hvad der gik Uskyldigheden forbi som Angestens Intet, det er nu kommet ind i ham selv og er atter her et Intet, den ængstende Mulighed af at *kunne*. […] Kun Muligheden af at kunne er der som en høiere Form af Uvidenhed, som et høiere Udtryk af Angest, fordi det i en høiere Forstand er og er ikke, fordi han i en høiere Forstand elsker og flyer det.

Efter Forbudets Ord følge Dommens Ord: da skal Du visseligen døe. Hvad det vil sige, at døe, fatter naturligviis Adam slet ikke, hvorimod der jo Intet er til Hinder for, hvis man antager det sagt til ham, at han har faaet Forestillingen om det Forfærdelige. Selv Dyret kan jo i denne Henseende forstaae det mimiske Udtryk og Bevægelsen i den Talendes Stemme uden at forstaae Ordet. Dersom man lader Forbudet vække Lysten, saa maa man ogsaa lade Straffens Ord vække en afskrækkende Forestilling. Dette forvirrer imidlertid. Forfærdelsen her bliver kun Angest; thi det Udsagte har Adam ikke forstaaet, og her altsaa kun igjen Angestens Tvetydighed. Den uendelige Mulighed af at kunne, som Forbudet vakte, rykkes nu nærmere ved, at denne Mulighed udviser en Mulighed som sin Følge" (Kierkegaard 1991, 43).

thing: It is the pure feeling of possibility. Humans on Earth thrive on possibility, in that possibility is the mode of the future, and humans live projecting themselves into the future.

In Kierkegaard's words, the nothing of anxiety signifies fate.

> If we ask more particularly what the object of anxiety is, then the answer, here as elsewhere, must be that it is nothing. Anxiety and nothing always correspond to each other. [...] But what then does the nothing of anxiety signify more particularly in paganism? This is *fate*. [...]
>
> *Fate is* precisely *the unity of necessity and the accidental*. [...] A necessity that is not conscious of itself is *eo ipso* the accidental in relation to the next moment. [...] Whoever wants to explain fate must be just as ambiguous as fate. And this the *oracle* was. However, the oracle in turn might signify the exact opposite. So the pagan's relation to the oracle is again anxiety. (Kierkegaard 1980, 96, 97; italics added on first, second, and third occurrence; in original on fourth and fifth occurrence)[3]

What Kierkegaard refers to as "the accidental" in fate corresponds, in my own terminology, to the events in the reality that is. What he refers to as "the necessity" in fate (in combination with "the accidental") corresponds, in my terminology, to the normative must of Ought-consequences: This "necessity" is the reality that ought to be as conditionally and normatively (fatally) connected with the types of circumstance that happen to get instantiated in the reality that is. Sin and guilt express the ambivalent necessity of the reality that ought to be.

[3] The Danish original in its wider context (enclosed within angle brackets is the original text corresponding specifically to the translation in the run of text): "<Spørge vi nu nærmere, hvad Angestens Gjenstand er, da maa der svares her som allevegne, den er Intet. Angest og Intet svare bestandigen til hinanden.> Saasnart Frihedens og Aandens Virkelighed er sat, er Angesten hævet. <Men hvad betyder nu nærmere i Hedenskabet Angestens Intet? Det er *Skjebnen*.>

Skjebne er et Forhold til Aand som udvortes, den er et Forhold mellem Aand og et Andet, som ikke er Aand og som den dog skal staae i et aandeligt Forhold til. Skjebne kan betyde lige det Modsatte, da den er en Eenhed af Nødvendighed og Tilfældighed. Dette har man ikke altid paaagtet. Man har talt om det hedenske Fatum (dette igjen forskjelligt modificeret i den orientalske og den græske Opfattelse) som var det Nødvendigheden. En Rest af denne Nødvendighed har man ladet blive tilbage i den christelige Anskuelse, hvor den kom til at betyde Skjebnen: det Tilfældige, det i Retning af Forsynet Incommensurable. Dog forholder det sig ikke saa; thi <*Skjebne er* netop *Eenhed af Nødvendighed og Tilfældighed*.> Dette er sindrigt udtrykt derved, at Skjebnen er blind; thi den, der gaaer blindt frem, gaaer ligesaa meget nødvendigt som tilfældigt. <En Nødvendighed, der ikke er sig selv bevidst, er *eo ipso* i Forhold til det næste Øieblik Tilfældighed.> Skjebnen er da Angestens Intet. Den er Intet, thi saasnart Aanden er sat, er Angesten hævet, men ogsaa Skjebnen, da Forsynet netop ogsaa derved er sat. […] I Skjebnen har da Hedningens Angest sin Gjenstand, sit Intet. I Forhold til Skjebnen kan han ikke komme, thi i samme Øieblik som den er det Nødvendige, er den i næste Øieblik det Tilfældige. Og dog er han i Forhold til den, og dette Forhold er Angesten. Nærmere kan Hedningen ikke komme Skjebnen. Det Forsøg, Hedenskabet gjorde derpaa, var dybsindigt nok til at kaste et nyt Lys derover. <Den, der skal forklare Skjebnen, maa være ligesaa tvetydig som Skjebnen. Det var *Oraklet* ogsaa. Men Oraklet kunde igjen betyde lige det Modsatte. Hedningens Forhold til Oraklet er da igjen Angest>" (Kierkegaard 1991, 89–90; italics added on first, second, and third occurrence; in original on fourth and fifth occurrence).

The concepts of guilt and sin in their deepest sense do not emerge in paganism. If they had emerged, paganism would have perished upon the contradiction that *one became guilty by fate*. [...]

The concepts of sin and guilt posit precisely the single individual as the single individual. There is no question about his relation to the whole world or to all the past. The point is only that he is guilty, and yet he is supposed to have become guilty by fate. (Kierkegaard 1980, 97, 98; italics added)[4]

After Kierkegaard, it was Martin Heidegger (1889–1976), seventy-seven years ago, that made anxiety the linchpin of a crucial philosophical analysis of the human condition, in his *Sein und Zeit*, 1927. In Heidegger, as in Kierkegaard, there is a path that leads from anxiety to our consciousness of death to the idea of fate and the Ought—of the unavoidable must of the reality that ought to be.

Dasein's Being reveals itself as *care*. If we are to work out this basic existential phenomenon, we must distinguish it from phenomena which might be proximally identified with care, such as will, wish, addiction, and urge. Care cannot be derived from these, since they themselves are founded upon it. (Heidegger 1962, 227)[5]

Anxiety is anxiety in the face of death, and it must not be confused with fear in the face of one's demise.

Death is the possibility of the absolute impossibility of Dasein. Thus death reveals itself as that *possibility which is one's ownmost, which is non-relational, and which is not to be outstripped* [*unüberholbare*]. As such, death is something *distinctively* impending. [...]

[4] The Danish original in its wider context (enclosed within angle brackets is the original text corresponding specifically to the translation in the run of text): "<Begrebet Skyld og Synd kommer ikke frem i dybeste Forstand i Hedenskabet. Forsaavidt det skulde komme frem, da vilde Hedenskabet gaaet til Grunde paa den Modsigelse, at *Een blev skyldig ved Skjebnen*>. Dette er nemlig den høieste Modsigelse, og i denne Modsigelse bryder Christendommen frem. Hedenskabet fatter den ikke, dertil er det for letsindigt i Bestemmelsen af Begrebet Skyld.

<Begrebet Synd og Skyld sætter netop den Enkelte som den Enkelte. Ethvert Forhold til den ganske Verden, til alt det Forbigangne er der ikke Tale om. Der er kun Tale om, at han er skyldig, og dog skal han blive det ved Skjebnen>, altsaa ved alt det, hvorom der ikke er Tale, og han skal derved blive Noget, der netop hæver Begrebet Skjebne, og dette skal han blive ved Skjebnen" (Kierkegaard 1991, 90–1; italics added).

[5] The German original in its wider context (enclosed within angle brackets is the original text corresponding specifically to the translation in the run of text): "Als eine solchen methodischen Erfordernissen genügende Befindlichkeit wird das Phänomen der *Angst* der Analyse zugrundegelegt. Die Herausarbeitung dieser Grundbefindlichkeit und die ontologische Charakteristik des in ihr Erschlossenen als solchen nimmt den Ausgang von dem Phänomen des Verfallens und grenzt die Angst ab gegen das früher analysierte verwandte Phänomen der Furcht. Die Angst gibt als Seinsmöglichkeit des Daseins in eins mit dem in ihr erschlossenen Dasein selbst den phänomenalen Boden für die explizite Fassung der ursprünglichen Seinsganzheit des Daseins. <Dessen Sein enthüllt sich als die *Sorge*. Die ontologische Ausarbeitung dieses existenzialen Grundphänomens verlangt die Abgrenzung gegen Phänomene, die zunächst mit der Sorge identifiziert werden möchten. Dergleichen Phänomene sind Wille, Wunsch, Hang und Drang. Sorge kann aus ihnen nicht abgeleitet werden, weil sie selbst in ihr fundiert sind>" (Heidegger 1929, 182).

Dasein does not, proximally and for the most part, have any explicit or even any theoretical knowledge of the fact that it has been delivered over to its death, and that death thus belongs to Being-in-the-world. Thrownness into death reveals itself to Dasein in a more primordial and impressive manner in that state-of-mind which we have called "anxiety." [...] Anxiety in the face of death must not be confused with fear in the face of one's demise. *This anxiety* is not an accidental or random mood of 'weakness' in some individual; but, as a basic state-of-mind of Dasein, it *amounts to the disclosedness of the fact that Dasein exists as thrown Being towards its end*. (Heidegger 1962, 294, 295; square brackets in original on first occurrence; italics added on third and fourth occurrence)[6]

Resolute anxiety frees the human being from possibilities that are not authentic; it makes the person free *for* death and takes *Dasein* (the individual human being) into the simplicity of its fate.

Anxiety arises out of Being-in-the-world as thrown Being-towards-death. [...] But anxiety can mount authentically only in a Dasein which is resolute. *He who is resolute knows no fear; but he understands the possibility of anxiety as the possibility of the very mood which neither inhibits nor bewilders him*. Anxiety liberates him *from* possibilities which 'count for nothing' ["nichtigen"], and lets him become free *for* those which are authentic. (Heidegger 1962, 395; square brackets in original on last occurrence; italics added on first occurrence, in original on second and third occurrence)[7]

[6] The German original in its wider context (enclosed within angle brackets is the original text corresponding specifically to the translation in the run of text): "Als Seinkönnen vermag das Dasein die Möglichkeit des Todes nicht zu überholen. <Der Tod ist die Möglichkeit der schlechthinnigen Daseinsunmöglichkeit. So enthüllt sich der *Tod* als die *eigenste*, *unbezügliche*, *unüberholbare Möglichkeit*. Als solche ist er ein *ausgezeichneter* Bevorstand.> Dessen existenziale Möglichkeit gründet darin, daß das Dasein ihm selbst wesenhaft erschlossen ist und zwar in der Weise des Sich-vorweg. Dieses Strukturmoment der Sorge hat im Sein zum Tode seine ursprünglichste Konkretion. Das Sein zum Ende wird phänomenal deutlicher als Sein zu der charakterisierten ausgezeichneten Möglichkeit des Daseins.

Die eigenste, unbezügliche und unüberholbare Möglichkeit beschafft sich aber das Dasein nicht nachträglich und gelegentlich im Verlaufe seines Seins. Sondern, wenn Dasein existiert, ist es auch schon in diese Möglichkeit *geworfen*. <Daß es seinem Tod überantwortet ist, und dieser somit zum In-der-Welt-sein gehört, davon hat das Dasein zunächst und zumeist kein ausdrückliches oder gar theoretisches Wissen. Die Geworfenheit in den Tod enthüllt sich ihm ursprünglicher und eindringlicher in der Befindlichkeit der Angst>. Die Angst vor dem Tode ist Angst 'vor' dem eigensten, unbezüglichen und unüberholbaren Seinkönnen. Das Wovor dieser Angst ist das In-der-Welt-sein selbst. Das Worum dieser Angst ist das Seinkönnen des Daseins schlechthin. <Mit einer Furcht vor dem Ableben darf die Angst vor dem Tode nicht zusammengeworfen werden. *Sie* ist keine beliebige und zufällige 'schwache' Stimmung des Einzelnen, sondern, als Grundbefindlichkeit des Daseins, *die Erschlossenheit davon, daß das Dasein als geworfenes Sein zu seinem Ende existiert*>" (Heidegger 1929, 250–1; italics added on fifth and sixth occurrence).

[7] The German original in its wider context (enclosed within angle brackets is the original text corresponding specifically to the translation in the run of text): "Die Furcht hat ihre Veranlassung im umweltlich besorgten Seienden. Die Angst dagegen entspringt aus dem Dasein selbst. Die Furcht überfällt vom Innerweltlichen her. <Die Angst erhebt sich aus dem In-der-Welt-sein als geworfenem Sein zum Tode.> Dieses 'Aufsteigen' der Angst aus dem Dasein besagt zeitlich verstanden: die Zukunft und Gegenwart der Angst zeitigen sich aus einem ursprünglichen Gewesensein im Sinne des Zurückbringens auf die Wiederholbarkeit.

Fate (*Schicksal*)—consciously, authentically, and resolutely chosen—has to be distinguished from destiny (*Geschick*).[8]

Only Being-free *for* death, gives Dasein its goal outright and pushes existence into its finitude. Once one has grasped the finitude of one's existence, it snatches one back from the endless multiplicity of possibilities which offer themselves as closest to one—those of comfortableness, shirking, and taking things lightly—and brings Dasein into the simplicity of its *fate* [*Schicksals*]. This is how we designate Dasein's primordial historizing, which lies in authentic resoluteness and in which Dasein *hands* itself *down* to itself, free for death, in a possibility which it has inherited and yet has chosen. (Heidegger 1962, 435; square brackets in original)[9]

Martin Heidegger achieves an *amor fati*, that which Friedrich Nietzsche (1844–1900) writes of: "My formula for greatness in the human being is *amor fati*: that one wants to have nothing else, not ahead, not behind, not in all eternity. Not merely to endure the necessity, still less to dissemble it—all idealism is mendaciousness in the face of necessity—but to *love* it" (Nietzsche 1969, 295; my translation).[10]

Amor fati is acceptance—indeed a conscious and resolute choosing—of the ambiguous necessity (of the reality that ought to be) that is inevitably

<Eigentlich aber kann die Angst nur aufsteigen in einem entschlossenen Dasein. *Der Entschlossene kennt keine Furcht, versteht aber gerade die Möglichkeit der Angst als der Stimmung, die ihn nicht hemmt und verwirrt*. Sie befreit *von* 'nichtigen' Möglichkeiten und läßt freiwerden *für* eigentliche>" (Heidegger 1929, 344; italics added on first occurrence, in original on second and third occurrence).

[8] Heidegger's excellent translators, J. Macquarrie and E. Robinson, observe that "the English-speaking reader would perhaps be less troubled if he were to read that the irresolute man can have no 'destiny'" rather than no "fate." Yet "Heidegger has chosen to differentiate sharply between the words 'Schicksal' and 'Geschick,' which are ordinarily synonyms. Thus 'Schicksal' ([...] 'fate') might be described as the 'destiny' of the resolute individual; 'Geschick' ([...] 'destiny') is rather the 'destiny' of a larger group, or of Dasein as a member of such a group. [...] The suggestion of an etymological connection between 'Schicksal' and 'Geschick' on the one hand and 'Geschichte' ([...] 'history') and 'Geschehen' ([...] 'historizing') on the other, [...] is of course lost in [the English] translation" (Heidegger 1962, 436, footnote 1).

[9] The German original in its wider context (enclosed within angle brackets is the original text corresponding specifically to the translation in the run of text): "Je eigentlicher sich das Dasein entschließt, d. h. unzweideutig aus seiner eigensten, ausgezeichneten Möglichkeit im Vorlaufen in den Tod sich versteht, um so eindeutiger und unzufälliger ist das wählende Finden der Möglichkeit seiner Existenz. Nur das Vorlaufen in den Tod treibt jede zufällige und 'vorläufige' Möglichkeit aus. <Nur das Freisein *für* den Tod gibt dem Dasein das Ziel schlechthin und stößt die Existenz in ihre Endlichkeit. Die ergriffene Endlichkeit der Existenz reißt aus der endlosen Mannigfaltigkeit der sich anbietenden nächsten Möglichkeiten des Behagens, Leichtnehmens, Sichdrückens zurück und bringt das Dasein in die Einfachheit seines *Schicksals*. Damit bezeichnen wir das in der eigentlichen Entschlossenheit liegende ursprüngliche Geschehen des Daseins, in dem es sich frei für den Tod ihm selbst in einer ererbten, aber gleichwohl gewählten Möglichkeit *überliefert*>" (Heidegger 1929, 384).

[10] The German original: "Meine Formel für die Grösse am Menschen ist *amor fati*: dass man Nichts anders haben will, vorwärts nicht, rückwärts nicht, in alle Ewigkeit nicht. Das Nothwendige nicht bloss ertragen, noch weniger verhehlen—aller Idealismus ist Verlogenheit vor dem Nothwendigen—, sondern es *lieben*."

proper to every human being: It is the resolute acceptance of *dikē brotōn*, of what is objectively right for mortal beings (see Section 12.2.3).

> Fate is that powerless superior power which puts itself in readiness for adversities—the power of projecting oneself upon one's own Being-guilty, and of doing so reticently, with readiness for anxiety. As such, fate requires as the ontological condition for its possibility, the state of Being of care—that is to say, temporality. *Only if death, guilt, conscience, freedom, and finitude reside together equiprimordially in the Being of an entity as they do in care, can that entity exist in the mode of fate*; that is to say, only then can it be historical in the very depths of its existence. (Heidegger 1962, 436–7; italics added)[11]

Heidegger and Nietzsche's *amor fati* seems to me to be significantly prefigured so early as in the Homeric poems, and in particular in the clear and poignant words that Sarpedon speaks to Glaucus in *The Iliad*. There is, in Sarpedon's words, in a unique manner as compared with the repetition of the same formula in other places of Homeric epic (*The Iliad*, IV, vv. 257–64, vv. 341–7; VIII, vv. 161–3), a clash between an easily imaginable and keenly (and painfully) imagined immortality—the immortality of the gods—and the certain mortality of humans, an *unüberholbare* mortality (insuperable; it cannot be outstripped): This fate is chosen head-on, countered, in a sense challenged (or rather, it is we who accept the challenge that our fate as mortals throws at us) in the game of chess of life, a game that death has already insuperably won *ab origine* (cf. Bergman 1956).

Here, then, are the words that Sarpedon speaks to Glaucus:

> Ah friend, if once escaped from this battle we were for ever to be *ageless* and *immortal*, neither should I fight myself amid the foremost, nor should I send thee into battle where men win glory; but now—*for in any case fates of death beset us*, fates past counting, which no mortal may escape or avoid—now let us go forward, whether we shall give glory to another, or another to us. (Homer, *The Iliad*, XII, vv. 322–8; italics added)[12]

Anxiety is "the state-of-mind which can hold open the utter and constant threat to itself arising from Dasein's ownmost individualised being," meaning the threat of death. The human being "finds itself *face to face* with the 'nothing' of the possible impossibility of its existence" (Heidegger 1962, 310). In

[11] The German original: "Schicksal als die ohnmächtige, den Widrigkeiten sich bereitstellende Übermacht des verschwiegenen, angstbereiten Sichentwerfens auf das eigene Schuldigsein verlangt als ontologische Bedingung seiner Möglichkeit die Seinsverfassung der Sorge, d. h. die Zeitlichkeit. Nur wenn im Sein eines Seienden Tod, Schuld, Gewissen, Freiheit und Endlichkeit dergestalt gleichursprünglich zusammenwohnen wie in der Sorge, kann es im Modus des Schicksals existieren, d. h. im Grunde seiner Existenz geschichtlich sein" (Heidegger 1929, 385).

[12] The Greek original: "Ὦ πέπον, εἰ μὲν γὰρ πόλεμον περὶ τόνδε φυγόντε / αἰεὶ δὴ μέλλοιμεν *ἀγήρω τ᾽ ἀθανάτω* τε / ἔσσεσθ᾽, οὔτε κεν αὐτὸς ἐνὶ πρώτοισι μαχοίμην / οὔτε κε σὲ στέλλοιμι μάχην ἐς κυδιάνειραν· / νῦν *δ᾽ ἔμπης γὰρ κῆρες ἐφεστᾶσιν θανάτοιο* / μυρίαι, ἃς οὐκ ἔστι φυγεῖν βροτὸν οὐδ᾽ ὑπαλύξαι, / ἴομεν, ἠέ τῳ εὖχος ὀρέξομεν, ἠέ τις ἡμῖν" (italics added).

this sense, anxiety constitutes what Heidegger calls "Being-towards-death" (*Sein zum Tode*) meaning the human acceptance of death as "the ownmost, non-relational possibility, which is not to be outstripped" (ibid.).[13] Such an *unüberholbare* possibility gets resolutely chosen as an inevitable reality that ought to be: as the fate common to all human beings.

Not only philosophers, but also psychologists and psychoanalysts, and then neurobiologists, have tried to explain to us the all-pervasive nature of anxiety. But it is in myth that humans first hypostatised their anxiety of death, justifying it as a reality that ought to be (Heidegger can be said in the final analysis to have returned myth to us, having recast it in philosophical terms).

In an impassioned style, Bronislaw Malinowski tells us:

> Death, alas, is not vague, or abstract, or difficult to grasp for any human being. It is only too hauntingly real, too concrete, too easy to comprehend for anyone who has had an experience affecting his near relatives or a personal foreboding. If it were vague or unreal, man would have no desire so much as to mention it; but the idea of death is fraught with horror, with a desire to remove its threat, with the vague hope that it may be, not explained, but rather explained away, made unreal, and actually denied. Myth, warranting the *belief* in immortality, in eternal youth, in a life beyond the grave, is not an intellectual reaction upon a puzzle, but *an explicit act of faith* born from the innermost instinctive and emotional reaction to the most formidable and haunting idea. Nor are the stories about "the origins of rites and customs" told in mere explanation of them. They never explain in any sense of the word; they always state a precedent which constitutes an ideal and a warrant for its continuance, and sometimes practical directions for the procedure. (Malinowski 1976, 33; italics added)

The human consciousness of time and death poses questions and exacts answers, or rather justifications. Humans respond; they provide such justifications: What their science does not reach, they reach with their myths. Myth serves in human society a function radically different from that of science, to be sure, but this function is doubtless just as important as that of science, and perhaps even more important. Again: The reality that ought to be is something like a pragmatic, self-defensive, vital nonsense (a nonsense necessary to the survival of the human species) that plays a fundamental role in individual and social human life.

> Myth […] is not of the nature of fiction, such as we read to-day in a novel, but it is a living reality, *believed* to have once happened in primeval times, and continuing ever since to influence the world and human destinies. This myth is to the savage what, to a fully believing Christian, is the Biblical story of Creation, of the Fall, of the Redemption by Christ's Sacrifice on the Cross. As our sacred story lives in our ritual, in our morality, as it governs our faith and controls our conduct, even so does his myth for the savage.
>
> […] Myth […] is not symbolic, but a direct expression of its subject-matter; it is not an explanation in satisfaction of a scientific interest, but a narrative resurrection of a primeval real-

[13] The German original: "Die eigenste, unbezügliche und unüberholbare Möglichkeit [...]. *Die Befindlichkeit aber, welche die ständige und schlechthinnige, aus dem eigensten vereinzelten Sein des Daseins aufsteigende Bedrohung seiner selbst offen zu halten vermag,* [...] befindet sich [...] *vor* dem Nichts der möglichen Unmöglichkeit seiner Existenz" (Heidegger 1929, 264–6).

ity, told in satisfaction of deep religious wants, moral cravings, social submissions, assertions, even practical requirements. Myth fulfils in primitive culture an indispensable function: It *expresses, enhances, and codifies belief; it safeguards and enforces morality; it vouches for the efficiency of ritual and contains practical rules for the guidance of man.* Myth is thus a vital ingredient of human civilization; it is not an idle tale, but a hard-worked active force; it is not an intellectual explanation or an artistic imagery, but a pragmatic charter of primitive faith and moral wisdom.

[...] The *myth* comes into play when rite, ceremony, or a social or moral rule demands justification, warrant of antiquity, *reality*, and sanctity. (Malinowski 1976, 18, 19, 28; italics added on first, second, and fourth occurrence; in original on third occurrence)

Originally, the reality that ought to be was fate, the myth of fate, the living reality of fate: a believed-in reality that lives internalised in human minds (in human brains). The term "fate" derives from Latin *fatum*, past participle of *fari*, to "speak," and means "utterance," "oracle," and "destiny." Fate has been conceived in various ways, and these variants almost always bear, more or less distinctly, connotations that get subsequently attributed to the idea of a reality that ought to be, even when this last, having become an object of philosophical and scholarly enquiry, is treated without any reference to fate. Fate is:

(*a*) That which unavoidably befalls one. It happens, it cannot but happen; it must (normatively) happen.

(*b*) A divine agency by which the order of things is prescribed. Although humans possess no godly attributes, they can devote certain periods or things to certain activities, which therefore will have to be accomplished according to this predestination (see Section 3.6.2 on the promise). A predestination of this kind, if decided by the gods, will obviously have an overwhelming force and weight, the kind specified at the following point (*c*). (Compare Rousseau's concept of heteronomy as discussed in Section 10.2.6.)

(*c*) That which is inevitably predetermined. This may be a propitious (happy) fate or a nefarious (unhappy) one. One might be born to kill or be killed, to love or be loved, to suffer or delight. Surely, we are all born to die.

(*d*) A prophetic declaration of what must be, as given by an oracle. There is a sentence spoken by the oracle at Delphi to the messengers sent by Croesus that is often repeated in literature (cf. Homer, *The Iliad*, XV, v. 117; Hesiod [8th century B.C.], *Theogony*, v. 220; see Otto 1961, 358—F. Otto, 1874–1958): "None may escape his destined lot, not even a god" ("Τὴν πεπρωμένην μοῖραν ἀδύνατα ἐστὶ ἀποφυγεῖν καὶ θεῷ·") (Herodotus, *Histories*, I, 91); ("but not even God, they say, can grapple with necessity"; Plato, *Laws* (b), 5, 741a) ("ἀνάγχην δὲ οὐδὲ θεὸς εἰναι λέγεται δυνατὸς βιάζεσθαι"; Plato, *Laws* (a), 5, 741a).

(*e*) Death, destruction, or ruin. These are instances of doom—of a final end that is always unhappy or terrible, and brought about by fate.

It won't be easy for us to recognise the apparently nonsensical reality of myth if we are not believers and do not believe that faith *can* move mountains: "For verily I say unto you, If ye have faith as a grain of mustard seed, ye shall say unto this mountain, Remove hence to yonder place; and it shall remove; and nothing shall be impossible unto you" (Matthew 17:20).

I believe in the phenomenon of faith because we have evidence of it. And I conceive of this phenomenon as Malinowski understood myth, that is, as "a pragmatic charter of primitive faith and moral wisdom." Faith exists even if its object does not exist. Norms as beliefs are varieties of faith, though of course we must make allowance for all the differences and specificities that distinguish belief in a norm from faith in a divinity.

> The forms of myth which come to us from classical antiquity and from the ancient sacred books of the East and other similar sources have come down to us without the context of living faith, without the possibility of obtaining comments from true believers, without the concomitant knowledge of their social organization, their practised morals, and their popular customs—at least without the full information which the modern field-worker can easily obtain. Moreover, there is no doubt that in their present literary form these tales have suffered a very considerable transformation at the hands of scribes, commentators, learned priests, and theologians. It is necessary to go back to primitive mythology in order to learn the secret of its life in the study of a myth which is still alive—before, mummified in priestly wisdom, it has been enshrined in the indestructible but lifeless repository of dead religions. [...]
>
> There is no important magic, no ceremony, no ritual without belief; and the belief is spun out into accounts of concrete precedent. The union is very intimate, for myth is not only looked upon as a commentary of additional information, but it is a warrant, a charter, and often even a practical guide to the activities with which it is connected. On the other hand the rituals, ceremonies, customs, and social organizations contain at times direct references to myth, and they are regarded as the results of mythical event. (Malinowski 1976, 18–9, 29)

So early as 1,000 centuries ago, Neanderthal man was performing burial rites over the dead, and so was *Homo sapiens* some 400 centuries ago. As for *Homo sapiens sapiens*, meaning us, some 65 centuries ago we were building megalithic tombs in Brittany, a place we now visit as tourists, to take in the sights and capture them on film.

There is an allusion to the megalithic tombs of Brittany in the monolith that Stanley Kubrick (1928–1999) introduces us to in *2001: A Space Odyssey*, telling us of a journey to Jupiter. This film is a contemporary myth on the origins of humans, on death, and on humankind's resurrection in the form of a fetus in gestation among the stars—the birth of a new humanity.[14]

The year 2001 is behind us, writer and reader. *Homo sapiens sapiens* has not yet set foot on Jupiter. We continue to believe in funeral rites, and we continue to believe that after the Is-events of life (and the Is-event of death, which brings life to its conclusion), and consequent upon these events, there will be Ought-events in the reality that ought to be, Ought-effects in what is subjectively right with reference to each of us: Even in our day *Homo sapiens sapiens* believes that there must be an afterlife for each of us, since we all are duty-holders or right-holders referred to by the primeval reality that ought to be. Our afterlife will unfold the way it ought to depending on the conduct

[14] Kubrick's film was released in 1968, thirty-six years ago, and is based on a 1948 novel by Arthur C. Clarke entitled *The Sentinel* (Clarke 1996).

(valid Is-behaviour, right or wrong) we have had in the reality that is, in earthly life.

If we have died as Christians and in the grace of God, we can look forward to heaven and to an eternal contemplation of God. If we have died as Muslims and as sincere servants of God, there will be awaiting us a Garden of Bliss, serene and comfortable, free of sickness and intoxication, where we will be in the company of wide-eyed maidens. For God's sincere servants

> awaits a known provision, / fruits—and they high-honoured / in the Gardens of Bliss / upon couches, set face to face, / a cup from a spring being passed round to them, / white, a delight to the drinkers, / wherein no sickness is, neither intoxication; / and with them wide-eyed maidens / restraining their glances / as if they were hidden pearls. (*The Koran* (b), 37: 40–8)

If we have died as Hindus or as Buddhists, our soul will transmigrate (unless we succeed in attaining Nirvana, according to the teachings of Buddha, 6th–5th century B.C.):

> As in this body, infancy and youth and old age (come) to the embodied (self), so does the acquisition of another body. (*The Bhagavadgita*, II, 13)

If, on the other hand, our lives and deaths have been led beyond the norm (*huper moron*), or have swerved appreciably from what is right (*dikē*), another *dikē*, or restoration of what is right, will be awaiting us (see Sections 11.3.3 and 12.2.4).

Where Christians are concerned, there is a grand illustration of afterlife's reality that ought to be in the work of a universal genius of humanity: in *The Divine Comedy* of Dante Alighieri (1265–1321). This work represents the Christian myth of the afterworld with an orthodoxy comparable to what one finds in a treatise of Thomistic theology and is magnificently adorned with figures and symbols, some going back to pagan mythology.

Only humans practice the cult of the dead, produce myths, believe in some kind of afterlife, and conceive of an inescapable and normative force, necessitating and binding: the force of fate.[15]

Cult, every cult, and its every rite, connects with normativeness. Thus, normative beliefs were in all likelihood already in existence some 1,000 centuries ago in the brain of Neanderthal man. The symbolism of funerary practices transcends the sphere of individual and social needs. The use of red ochre, thought to have represented blood and life as far back as the oldest epoch of burial practice by Neanderthal man, is also a case of symbolism that transcends the sphere of individual and social needs. There is evidence of such a use in different prehistoric sites of the Lower Palaeolithic period (Facchini 1995,

[15] *La forza del destino*—an opera by Giuseppe Verdi (1813–1901), the libretto by Francesco Maria Piave (1810–1867)—went onstage on November 10, 1862, at Saint Petersburg's Imperial Theatre. The opera is based on *Don Álvaro, o La fuerza del sino*, of 1835, by Ángel de Saavedra (1791–1865): cf. de Saavedra 1986.

148ff., 192). Even prehistoric man, like modern man, has posed and turned to the problem of death as an ineluctable fate, this by virtue of the human capacity for abstraction and anticipation, and for projecting oneself into the future.

11.2. *Heimarmenē* and *Moira*: To Each His Own

"To each his own" is the formula I have chosen to explain the sense of *heimarmenē*. The Greek term *heimarmenē* comes from *meiromai*—"to divide into parts or lots," and hence "to allot"—from which comes *Moira*, meaning "lot," "allotted part," "task." The Moirai are the Fates, the three goddesses who weave the destinies of humans. *Heimarmenē* means "fate," the normatively necessitating action that the order of the reality that ought to be exerts on every single human in the world of the reality that is.

Normativeness resides in the concept of "part" (*meros* in Greek; see *mereo* in Latin), in the concept of one's due, to each his own: *Suum cuique tribuere*. Accordingly, the Latin definition of *justitia* is "constans et perpetua voluntas Jus suum cuique tribuendi" ("Justice is a steady and enduring will to render unto everyone his right": see Section 13.4). Compare "Juris praecepta sunt haec: honeste vivere, alterum non laedere, suum cuique tribuere" ("The basic principles of right are: to live honorably, not to harm any other person, to render to each his own") (Ulpian, *The Digest of Justinian*, I, 1, 10).[16]

The definitions of *justitia* found in the *Digest* and the *Institutions* present several analogies to Plato's definition of *dikaiosunē* as "doing one's own business," "τὸ τὰ αὑτοῦ πράττειν [...] δικαιοσύνη ἐστί" (Plato, *The Republic*, 433a–433b).[17] And Plato's definition of *dikaiosunē* is, in the final analysis, the definition of "what is right"(Section 12.2.3).

There is a *suum*—better yet, a *proprium*—that is common to all human beings: the fate of death (*koinou thanatou meros*).[18]

[16] Even in *Institutiones* (I.1) "iustitia est constans et perpetua voluntas ius suum cuique tribuens" ("Justice is the constant and perpetual wish to render every one his due"; *The Institutes of Justinian*, I, 1).

[17] "'Listen then' said I, 'and learn if there is anything in what I say. For what we laid down in the beginning as a universal requirement when we were founding our city, this I think, or some form of this, is justice. And what we did lay down, and often said, if you recall, was that each one man must perform one social service in the state for which his nature was best adapted.' 'Yes, we said that.' 'And again that to do one's own business and not to be a busybody is justice, is a saying that we have heard from many and have very often repeated ourselves.' 'We have'" (Plato, *The Republic*, 433a–433b). The Greek original: "'Ἀλλ', ἦν δ' ἐγώ, ἄκουε, εἴ τι ἄρα λέγω. ὃ γὰρ ἐξ ἀρχῆς ἐθέμεθα δεῖν ποιεῖν διὰ παντός, ὅτε τὴν πόλιν κατῳκίζομεν, τοῦτό ἐστιν, ὡς ἐμοὶ δοκεῖ, ἤτοι τούτου τι εἶδος ἡ δικαιοσύνη. ἐθέμεθα δὲ δήπου καὶ πολλάκις ἐλέγομεν, εἰ μέμνησαι, ὅτι ἕνα ἕκαστον ἓν δέοι ἐπιτηδεύειν τῶν περὶ τὴν πόλιν, εἰς ὃ αὐτοῦ ἡ φύσις ἐπιτηδειοτάτη πεφυκυῖα εἴη. Ἐλέγομεν γάρ. Καὶ μὴν ὅτι γε τὸ τὰ αὑτοῦ πράττειν καὶ μὴ πολυπραγμονεῖν δικαιοσύνη ἐστί, καὶ τοῦτο ἄλλων τε πολλῶν ἀκηκόαμεν καὶ αὐτοὶ πολλάκις εἰρήκαμεν. Εἰρήκαμεν γάρ." On the history of the Greek word *dikaiosunē* see Havelock 1969.

[18] "Seven captains at our seven gates / thundered; for each a champion waits, / each left

The Moirai provide humans at birth with good and evil. Clotho (the Spinner) is she who spins the thread of man's life; Lachesis (the Disposer of Lots) assigns to each man his fate; Atropos (She who cannot be turned) is the fury with the abhorred shears.

Also she [the Night] bare the Destinies and ruthless avenging Fates, Clotho and Lachesis and Atropos, who give men at their birth both evil and good to have, and they pursue the transgressions of men and of gods. (Hesiod, *Theogony*, vv. 216–20)[19]

Moira comes in as the powerful (*Moira khrataiē*; see Homer, *The Iliad*, V, v. 83, v. 629; XVI, v. 853; XIX, v. 410; XX, v. 477) that, in the manner of the personifications of death, seizes humans and makes them fall headlong into the night: "And down over his eyes came dark death and mighty fate" ("τὸν δὲ κατ' / ὄσσε / ἔλλαβε πορφύρεος θάνατος καὶ μοῖρα κραταιή"; "huiusque oculos occupavit purpurea mors et fatum violentum." See *The Iliad*, V, vv. 82ff.; XVI, vv. 333ff.; XX, vv. 476ff.; cf. XII, vv. 116) (cf. Otto 1961, 263–4).[20]

But in Homeric epic the Moira is not conceived of as a person but as an impersonal force—as fate.

Beyond the range of the formulas, the Moira is never thought of as a person, not in any living relationship, as happens, in contrast, with the lesser deities, such as Oceanus, Thetis, and Night. How strange that to this day it can still be said of the Moira that in Homeric times she gradually changed from an impersonal "force" to a personality, this just as Homer was doing precisely the opposite—getting her to manifestly shed her plastic life—even though she retained such plastic life in the popular mind. [...] And yet the Moira is only one—there is but one "fate." If we each have our "day of fate" (*morsimon hēmar*), we cannot be said to each have our own Moira. Moira is the law [*das Gesetz*] which stands above life and fixes and impresses each person's fate—our passing away, our death. [...] Thus, the ancient belief in the personal powers of fate gives place to the idea of an ineluctable order and fate that are given and that stand before the gods, who are alive and personal. It follows that the only consequence awaiting us after a violation of such a law is an upsetting of the order [*die Ordnung*]. (Otto 1961, 270–1; my translation)

behind his armour bright, / trophy for Zeus who turns the fight; / save two alone, that ill-starred pair / one mother to one father bare, / who lance in rest, one'gainst the other / drave, and both perished, brother slain by brother" (Sophocles, *Antigone*, vv. 141–7). The Greek original: "Ἑπτὰ λοχαγοὶ γὰρ ἐφ' ἑπτὰ πύλαις / ταχθέντες ἴσοι πρὸς ἴσους ἔλιπον / Ζηνὶ τροπαίῳ πάγχαλκα τέλη, / πλὴν τοῖν στυγεροῖν, ὣ πατρὸς ἑνὸς / μητρός τε μιᾶς φύντε καθ' αὑτοῖν / δικρατεῖς λόγχας στήσαντ' ἔχετον / κοινοῦ θανάτου μέρος ἄμφω."

[19] The Greek original: "Καὶ Μοίρας καὶ Κῆρας ἐγείνατο νηλεοποίνους, / Κλωθώ τε Λάχεσίν τε καὶ Ἄτροπον, αἵτε βροτοῖσι / γεινομένοισι διδοῦσιν ἔχειν ἀγαθόν τε κακόν τε, / αἵτ' ἀνδρῶν τε θεῶν τε παραιβασίας ἐφέπουσιν."

[20] The English translation of *The Iliad* is from the Loeb edition. Appearing within brackets is the Greek original (Loeb Edition) followed by its Latin translation by Stephan Bergler (ca. 1680–ca. 1740) as found in Bergler 1791–1792.

11.3. The Double Conditionality of Fate. *Huper Moron* at the Origins of Chisholm's Paradox

11.3.1. Kata Moiran*: In Accordance with the Norm*

First comes the fate established for us humans (our *moira*, or *aisa*), and then comes its fulfilment, meaning human action, or simply the unfolding of human events in accordance with what has been established: in accordance with the norm (*kata moiran, kata aisan*) assigned to each of us. In Homeric epic, human beings are all bound by fate: There is a type of circumstance; the consequence of death is conditionally connected with its instantiation (and hence with the time of its instantiation), and this connection is preestablished for each of us. Fate will be accomplished at a certain time when a certain type of circumstance gets actually instantiated; fate is conditionally connected with the valid instantiations of this type in the must-be of the reality that ought to be.

In what follows the reader will find five excerpts in which there are set in italics (in English, in the Greek original, and in Bergler's 18th-century Latin translation) the words expressing the connection by which fate will necessarily be fulfilled only when certain circumstances occur, and so only at the established time.[21]

(*a*) Helenus the Seer says to Hector:

Make the Trojans to sit down, and all the Achaeans, and do thou challenge whoso is best of the Achaeans to do battle with thee man to man in dread combat. *Not yet is it thy fate to die* and meet thy doom ["*ou gar pō toi moira thanein* kai potmon epispein"; "*nondum enim tibi fatum mori* et interitum attingere"]; for thus have I heard the voice of the gods that are for ever. (*The Iliad*, VII, vv. 49–53; italics added)

(*b*) Proteus the Immortal, servant to Poseidon, says to Menelaus:

For it is not thy fate ["*ou gar toi prin moira*"; "*non enim tibi antea fatum est*"] to see thy friends, and reach thy well-built house and thy native land, before that thou hast once more gone to the waters of Aegyptus, the heaven-fed river, and hast offered holy hecatombs to the immortal gods who hold broad heaven. (*The Odyssey*, IV, vv. 475–9; italics added)

(*c*) Hermes, turning to Calypso, says this of Odysseus:

For it is not his fate to perish here far from his friends, *but it is still his lot to see his friends and reach his high-roofed house* and his native land ["*ou gar hoi tēid' aisa philōn aponosphin olesthai*, / all' eti *hoi moir' esti philous t' ideein kai hikesthai / oikon* es hupsorophon kai heēn es patrida gaian"; "*non enim ei hic fatale est ab amicis seorsim perire*, / sed adhuc *ei fatale est amicosque videre, et pervenire / domum* in excelsam, et suam in patriam terram"]. (*The Odyssey*, V, vv. 113–5; italics added) (see also *The Odyssey*, V, vv. 36–42; V, vv. 206–10; V, vv. 286–90; V, vv. 343–5; IX, vv. 532–5)

[21] The Greek original and the English translation used for the five examples are from Homer, *The Iliad* and *The Odyssey* (Loeb Edition). Appearing within square brackets is the Greek original (Loeb edition) followed by its Latin translation as found in Bergler 1791–1792.

(*d*) Poseidon, turning to the other gods, says this of Aeneas:

For it is ordained unto him to escape, that the race of Dardanus perish not without seed [“*morimon de hoi est' aleasthai, / ophra mē aspermos geneē kai aphantos olētai / Dardanou*”; “*fatale vero ei est effugere, / ut ne sine prole genus et prorsus extinctum pereat / Dardani*”] and be seen no more—of Dardanus whom the son of Cronos loved above all the children born to him from mortal women. For at length hath the son of Cronos come to hate the race of Priam; and now verily shall the mighty Aeneas be king among the Trojans, and his sons' sons that shall be born in days to come. (*The Iliad*, XX, vv. 302–8; italics added)

(*e*) Apollo, on the walls of Troy, urges Patroclus to stand back:

Then would the sons of the Achaeans have taken high-gated Troy by the hands of Patroclus, for around and before him he raged with his spear, had not Phoebus Apollo taken his stand upon the well-builded wall thinking thoughts of bane for him, but bearing aid to the Trojans. Thrice did Patroclus set foot upon a corner of the high wall, and thrice did Apollo fling him back, thrusting against the bright shield with his immortal hands. But when for the fourth time he rushed on like a god, then with a terrible cry Apollo spake to him winged words: “*Give back, Zeus-born Patroclus. It is not fated* [“*khazeo, diogenes Patroklees: ou nu toi aisa*”; “*Recede nobilissime Patrocle: neque enim fatum*”], I tell thee, that by thy spear the city of the lordly Trojans shall be laid waste, nay, nor by that of Achilles, who is better far than thou.” (*The Iliad*, XVI, vv. 698–709; italics added)

11.3.2. The Possibility of Acting beyond the Norm: Huper Moron

In excerpts (*a*) through (*e*) of the previous Section 11.3.1, there is involved a norm, a *moira*, an *aisa*, a fate. And hence there is involved a type of circumstance: The fulfilment and accomplishment of fate is conditionally connected with the instantiation of this type of circumstance and so with the time of its instantiation.

But in other places of Homeric epic we find explicit word that human action and earthly events can take place beyond the norm, *huper moron*, beyond *aisa* or fate. In what follows, the reader will find four excerpts in which there are set off in italics the English, Greek original, and Latin words expressing the possibility of something happening beyond fate.[22]

(*i*) Zeus says, in answer to a question asked by Poseidon:

For if Achilles shall fight alone against the Trojans, not even for a little space will they hold back the swift-footed son of Peleus. Nay, even aforetime were they wont to tremble as they looked upon him, and now when verily his heart is grievously in wrath for his friend, I fear me lest even *beyond what is ordained* [“deidō mē kai teikhos *huper moron* exalapaxēi”; “vereor ne et murum *praeter fatum* evertat”] he lay waste the wall. (*The Iliad*, XX, vv. 26–30; italics added)

[22] In the four examples that follow, the Greek original and the English translation are from Homer, *The Iliad*, and *The Odyssey* (Loeb Edition). Appearing within square brackets is the Greek original (Loeb edition) followed by its Latin translation as found in Bergler 1791–1792.

(*ii*) Poseidon takes Aeneas to safety, and thereupon says to him:

Aeneas, what god is it that thus biddeth thee in blindness of heart do battle man to man with the high-hearted son of Peleus, seeing he is a better man than thou, and therewithal dearer to the immortals? Nay, draw thou back, whensoever thou fallest in with him, lest even *beyond thy doom* thou enter the house of Hades ["mē kai *huper moiran* domon Aidos eisaphikēai"; "ne et *praeter fatum* domum orci pervenias"]. But when it shall be that Achilles hath met his death and fate, then take thou courage to fight among the foremost, for there is none other of the Achaeans that shall slay thee. (*The Iliad*, XX, vv. 332–9; italics added)

(*iii*) Apollo enters Troy, preoccupied about its untimely downfall:

On this wise spake they one to the other; but Phoebus Apollo entered into sacred Ilios, for he was troubled for the wall of the well-builded city, lest the Danaans *beyond what was ordained* should lay it waste on that day ["mē Danaoi perseian *huper moron* ēmati keinōi"; "ne Danai everterent *praeter fatum* die illo"]. (*The Iliad*, XXI, vv. 514–7; italics added)

(*iv*) Ulysses is cast upon the reefs by the waves unleashed by Poseidon, in wrath for the blinding of Polyphemus:

Then verily would hapless Odysseus have perished *beyond his fate* ["*huper moron*"; "*praeter fatum*"], had not flashing-eyed Athene given him prudence. (*The Odyssey*, V, vv. 436–7; italics added)

11.3.3. The Fulfilment of the Second Condition: Huper Moron *Behaviour, the Violation of the Norm. Chisholm's Paradox*

It may happen that humans should behave beyond fate (*huper moron*), even if this is possible only in the negative. An *huper moron* behaviour will overcome or exceed the limits set by fate, and one who holds this behaviour will be said to be *skhetlios* and *atasthalos*: arrogant, excessive, extravagant.

In this case death, too, will come *huper moron*, like the behaviour that led to it: Death will come earlier and more grimly than what had originally been established, and in connection with a type of circumstance different from the one with which the Moira had originally connected it; that is, in connection with transgression and excess on the part of those humans who have behaved *huper moron*. "*Skhetlios* and *atasthalos* [...] denote persons or actions which exceed the bounds of what is allowable" (Havelock 1978, 183); the same idea is expressed in the words *exaisimos* and *aisulos*, which designate an action which exceeds the *aisa*, the due portion.

In relentless and dogged pursuit, the Moirai—who in this role are known as the Erinyes—will stay after the people who have overstepped the bounds of what is allowed and will lead them into catastrophe, precisely because these people have behaved wrongly, beyond the limits of fate, *huper moron*.[23]

[23] "Like many of the other characters in this grim and somber sphere, the Moirai govern a

An example of an *huper moron* behaviour is Aegisthus's. The question is presented through words that Zeus speaks to the other gods at the beginning of *The Odyssey*.

Look you now, how ready mortals are to blame the gods. It is from us, they say, that evils come, but they even of themselves, through their own blind folly ["*sphēisin atasthaliēisin*"; "*sua insipientia*"], have sorrows *beyond that which is ordained* ["*huper moron*"; "*praeter fatum*"]. Even as now Aegisthus, *beyond that which was ordained* ["*huper moron*"; "*praeter fatum*"], took to himself the wedded wife of the son of Atreus, and slew him on his return, though well he knew of sheer destruction, seeing that we spake to him before, sending Hermes, the keen-sighted Argeïphontes, that he should neither slay the man nor woo his wife; for from Orestes shall come vengeance for the son of Atreus when once he has come to manhood and longs for his own land. So Hermes spoke, but for all his good intent he prevailed not upon the heart of Aegisthus; and now he has paid the full price of all. (*The Odyssey*, I, vv. 32–9; italics added)[24]

As Walter F. Otto rightly observes,

this story brings out a question of vital importance. It is not just the inevitable lightning of fate that strikes in the realm of human existence. There also occur disasters that in the judgment of natural experience can be averted. These disasters become just as necessary and fatal the moment we humans commit actions already fraught with their consequences. A knowledge of these things could induce us to abstain from such actions [...]. Hermes appears to Aegisthus and clarifies for him the misadventure tied to his action; by going ahead and committing the action anyway, Aegisthus becomes blamable for his own fall. (Otto 1961, 266–7; my translation)[25]

That was myth.

Legal norms are likewise marked by a double conditionality. On the one hand we have norms of conduct (*legis virtus hac est: permittere, imperare, et vetare*), and on the other hand we have sanctioning or punitive norms—*legis virtus hac est*: not only *permittere, imperare, et vetare*, but also *punire*, punishing disobedience (cf. Modestinus [3rd century A.D.], *The Digest of Justinian*, I, 3, 7).

sacred order and implacably avenge the infractions committed against it. According to Hesiod, the Moirai and the Keres would stay close behind the infractions committed by humans and the gods, and would not find peace until the crime received the punishment it deserved" (Otto 1961, 261; my translation). "The Erinyes, also known as the Eumenides, are the Furies of Italic mythology, the daughters of Acheron and of the Night or, on a different account, the daughters of Gaea, born by the blood of Uranus or of Hades and of Persephone. There were three of them, Alecto, Megaera, and Tisiphone. They were punitive divinities, goddesses of the curse and vengeance that comes with war, pestilence, and discord, and, in the inner recesses of the spirit, with remorse. The offenders, especially assassins, would find persecution even after death. When they repented and purified their guilt, the Erinyes would become kindly, whence the name Eumenides (from Greek *Euméneia*, 'benevolence'). They were represented as having a gloomy and ghastly appearance, apparelled in a black, bloodied robe, and with serpents on the head in the place of hair" (Gislon and Palazzi 1997, s.v. "Erinni," 174–5; my translation).

[24] The Greek original and the English translation are from Homer, *The Odyssey* (Loeb Edition). Appearing within square brackets is the Greek original (Loeb edition) followed by its Latin translation as found in Bergler 1791–1792.

[25] On Aegisthus in Aeschylus's (525/524–456/455 B.C.) *Oresteia*, see, in Volume 2 of this Treatise, Rottleuthner, Section 3.1.1.2, in the frame of the mythological foundations of law.

The jurists, with their *scientia juris*, have known of this double conditionality of legal norms for centuries. Deontic logicians became aware of it about forty years ago: It was Roderick M. Chisholm who clearly framed the problem from the standpoint of deontic logic. He pointed out that some obligatory types of action (especially the type "punishing"), as set forth in a norm, **n1**, have this peculiar feature: The type of circumstance they are conditionally and normatively connected with consists in failing to comply with another obligatory type of action (such as "not killing"), a type set forth in another norm, **n**, and therein in turn conditionally connected with its own type of circumstance (such as "except for legitimate defence or in the event of war").[26] Anyone who kills *huper moron*, that is, in violation of norm **n**, thereby instantiates the type of circumstance set forth in norm **n1**: It is a normative consequence of this instantiation that the type of action set forth in **n1** must also be instantiated. The punishment of whoever violated **n**—of whoever acted *huper moron* with respect to **n**—must be inflicted. And this is a case of dikedoxia (Section 10.2.2).

In that mechanism lies Chisholm's double conditionality of norms, which in the final analysis is the double conditionality of fate as illustrated in this section.

With fate, the first conditionality is that which the Moirai establish between a certain type of circumstance and a certain time and manner of death: We have here an effect—death—that must normatively take place when the preestablished type of circumstance gets instantiated. The second conditionality is that by which the type of action consisting in the Moirai doggedly pursuing punishment and retribution depends on the valid instantiation of the type of circumstance "acting *huper moron* (beyond fate)": It depends on behaving in excess, beyond the norm, doing the wrong thing. Because of this double conditionality, the exceeder (the *atasthalos*) will be inflicted with an earlier, more atrocious death than that established by the Moirai at the time the same person was born.

In myth, the double conditionality of fate (of norms, in contemporary terms) opens a margin of action for humans, too, but a margin in the negative only.

The gods and the oracles know in advance the *huper moron* paths of human behaviours and the *huper moron* consequences that follow from excessive

[26] The logical and philosophical problems arising in connection with the double conditionality of duty (with primary norms of conduct and secondary norms of punishment, the latter understood in the language of civil-law jurists as rules for deciding the punishment to be applied in particular cases) have been studied in different respects, in such works as Chisholm 1963 and 1978. Cf. Artosi 2000; Vida 2001; cf., in Volume 5 of this Treatise, Sartor, Section 10.3.2, devoted to an examination of the role of sanctions in a game-theoretical framework.

or transgressive (*atasthaloi*) behaviours. They sometimes warn humans of such paths, so as to place humans in the condition of steering clear of the danger, but the advice is not always followed: Humans will at times refuse to accept the divine counsel or will misunderstand it (failing to grasp the meaning of the oracle's words). It is here that a negative margin of action opens up for humans, in that humans will be enabled to behave *huper moron*, wrongly, exceeding and overstepping the bounds of fate, thereby provoking by their own behaviour the *huper moron* consequences (i.e., the events beyond those originally inscribed in fate) that must normatively flow from the *atasthalon* behaviour held despite receiving the warning of the gods or the oracle.

Chapter 12

WHAT IS RIGHT IN HOMERIC EPIC

12.1. Homage to Eric A. Havelock

12.1.1. Why Havelock?

This chapter pays homage to Eric A. Havelock. I have not been fortunate enough to meet him in person or to correspond with him. But I have received from him three gifts I much appreciate.

(*i*) I found confirmation, in his thoughtful and finely crafted works, of my opinion about how misleading it is to translate the ancient Greek word *dikē* with "justice."

Indeed, if we accept the suggestion made in Chapter 1—using "what is objectively right" and "what is subjectively right" to convey the distinction between *objektives Recht* and *subjektives Recht* (and the equivalent distinctions in Castilian, French, and Italian)—we will come to see that although "justice" has taken root as the standard, historically settled translation of *dikē*, a more suitable rendition of this last word is, I believe, "the right," or rather "what is right."

(*ii*) Havelock, belying his reputation as a "revisionist heretic," did not object to the centuries-old (and in my opinion misleading) tradition of rendering the early Greek *dikē* as "justice." One might say that he left it to me to take this pleasure. He did so providing me with the best arguments I have ever come across in support of such an objection, even if he obviously did not have before him the problems introduced in Chapter 1 with regard to the concept of "what is (objectively or subjectively) right" as this problem may be reconstructed from within the legal-dogmatic thought of civil law, nor of course did he intend to concern himself with such problems.

Here is my take on the question. In ancient Greek culture the normative idea of "what is right" was originally expressed by *to dikaion*, from *dikē*. The usual translation of *dikē* as "justice" does not do *dikē* justice: It does not give *dikē* its due; it does not give *dikē* what ought to be given to it. *To dikaion*, in its most inclusive sense—especially with reference to behaviours—means "what is as it ought to be."

For centuries, philosophers and jurisprudents have been drawing the distinction, sometimes cast as an outright opposition, between natural law and positive law. It becomes evident why we should take *to dikaion* to mean "what is right" (rather than "what is just") if we consider that the distinction between *phusei dikaion* and *nomōi dikaion* ("what is right by nature" and "what is right by law," in my rendition of these Greek expressions) is thought to be

among the first in Western philosophy to have expressed the dualism between natural law and positive law.

The distinction between *phusei dikaion* and *nomōi dikaion* leads to the problem (discussed in Chapter 4) of the matrix of normativeness as the ultimate source of what is right. This problem emerges with the advent of philosophical reflection—not so the idea of what is right. This idea, like the idea of the reality that ought to be (Chapter 11) emerges in human culture long before human culture becomes capable of any philosophy, and indeed even before human culture becomes capable of writing. Further, a point not without consequence, it is uncertain whether the connection between the reality that ought to be and what is right emerges at once with the ideas so brought into relation, even if the connection between them can be detected so early as in myth.

(*iii*) The concept of norm (*nomos* and *ethos*) I have come to detect in Homeric epic, the way I understand it in Havelock's reading of it,[1] supports fully the way the concept of norm was characterised in Chapter 6, a concept I feel we are well advised to recover for an adequate understanding of the legal phenomenon.

What is of interest to me in this chapter is the concept of what is right as expressed in the ancient Greek *dikē* and its derivatives, such as *to dikaion*. But still, I will interpose a brief comment on *dikē* in mythology.

In mythology, Dike was a goddess—born to Zeus and Themis—and one of three Horae. Her sisters were Eunomia (the good order or legality) and Eirene (peace). Dike was also called Astraea and was said to inhabit the earth in the Golden Age; but then she was driven away from the earth by the sins of humans and she ascended to the heavens, finding her home in that part of the zodiac which is the constellation Virgo.

> And in a hymn an unknown poet [...] urges them—the daughters of the Night—to bring Eunomia along with her sisters Dike and Eirene. That explains why these three so often appear together with the other powers of order, along with the Erinyes and with the Horae, and especially with Themis. (Otto 1961, 261; my translation)

The meaning of *dikē*, according to Émile Benveniste (1902–1976), is what is right among the families of a tribe, while *themis* is what is right within a family (*genos*). Themis is of divine origin: It is the order (the reality that ought to be) established for the family (*genos*) by a king (*basileus*) whose origin is celestial and who draws inspiration from the gods. Where there is no *genos* and no *basileus*, there is no *themis*; the Cyclopes are uncouth, and so *athemistes*: They

[1] My reference here is to what Havelock calls the *nomos* and *ethos* of Homeric epic, referring as he does to what Milman Parry (1902–1935) calls "the way of life" of Homeric epic. An unlikely occurrence of *nomos* in Homeric epic is in *The Odyssey*, I, 3. The term occurring in this verse is thought to be, not *nomos*, but rather *nón*. Cf., in the Loeb Edition, page 2, footnote 1.

act without the sacred order of *themis* (Homer, *The Odyssey*, IX, vv. 106–15) (see Section 12.2.2).

> The root common to Sanscrit *ṛta*, Iranian *arta*, and Latin *ars*, *artus*, *ritus* designates "order" understood as the harmonious adaptation of the parts of a whole and does not have any juridic designation in Indo-European.
>
> The "law" [*la "loi"*] is *dhāman* in Sanscrit and *thémis* in Greek: It is literally the rule established by the gods (from the root **dhē*, "positing," "bringing into existence"). This rule defines *le droit* [what is objectively right] within a family: Thus *thémis* is contrary to *dikē*, which means "droit [what is objectively right] among families." (Benveniste 1969, 99; my translation)[2]

> The Latin *dico* and the Greek *dikē* impose a representation of a formulary *droit* [what is right] which determines, for each particular situation, that which must be. The judge—*dikas-pólos* in Homer—is the person who conserves the formulary and who with authority pronounces (*dicit*) the appropriate ruling. (Benveniste 1969, 107; my translation)[3]

In the following sections I will continue with *dikē* taking up Havelock and retracing the path he charted.

12.1.2. A Heresy Unaccomplished

The work I will mostly be referring to was entitled by Havelock *The Greek Concept of Justice: From Its Shadow in Homer to Its Substance in Plato* (1978). We can see that the term "justice" figures in the title, and it also turns up frequently in the text—more than 600 occurrences in all, counting "justice" and its derivatives—to designate *dikē* or its derivatives (*to dikaion* and the like). But then Havelock states clearly that the early *dikē*, in its core meaning, should be rendered not with "justice," but with "propriety" (some sixty occurrences of this term), "seemliness," or "correctness"—in a word, with "what is right" in the sense I ascribe to this expression in this volume.

The term "right" occurs about eighty times in the 300-plus pages of *The Greek Concept of Justice*. In thirty-two of these occurrences, the term is used to translate into English *dikē* and its derivatives, and on three occasions it figures in the very expression "what is right"—just what I wanted to see (detail provided in Section 12.2). In brief, Havelock shows that the core meaning of

[2] The French original: "La racine commune à skr. *ṛta*, ir. *arta*, lat. *ars*, *artus*, *ritus*, qui désigne l''ordre' comme adaptation harmonieuse des parties d'un tout entre elles, ne fournit pas, en indo-européen, de désignation juridique.

La 'loi' c'est en skr. *dhāman*, en gr. *thémis*—littéralement la règle établie (racine **dhē* 'poser dans l'existence') par les dieux. Cette règle définit le droit familial: ainsi *thémis* s'oppose à *díkē*, 'droit interfamilial.'" On *loi*, Section 1.2, footnote 7.

[3] The French original: "Le latin *dico* et le grec *díkē* imposent la représentation d'un droit formulaire, déterminant pour chaque situation particulière ce qui doit être. Le juge—hom. *dikas-pólos*—est celui qui a la garde du formulaire et qui prononce avec autorité, *dicit*, la sentence appropriée."

dikē in the Homeric poems is "what is right," and that *dikē* carries this meaning also in Hesiod, Solon, the Presocratics, Aeschylus, and Herodotus, and in Plato himself, with his *dikaiosunē*, which is *dikē* elevated to the status of *eidos*: of form, idea, or type.

Some scholars consider it something of a heresy (or at least a kind of revisionism) that Havelock should maintain what he maintains about the society the Homeric poems refer to—not the Mycenaean society, but that of the early Greek city-states (Section 12.1.3). Even more heretic, in some scholars' view, is Havelock's rejection of the traditional practice of tracing to Homer and the Presocratics (Havelock prefers to call them the Preplatonics, since the Presocratics are contemporaries of Socrates himself)[4] a number of philosophically fashioned ideas that, according to Havelock, are possible only from Plato onwards, from the time writing gets superimposed on merely oral and acoustic cultural storage, so as to allow the Greek language to develop a syntax (hitherto unseen) enabling a copulative use of the verb "be" (*einai*) rather than only an existential, or stative, use.[5]

But the further heresy—whereby *dikē* takes as its core meaning not "justice," but "what is right"—is one that Havelock falls short of proclaiming, even as he illustrates it with excellent examples, and in fact demonstrates it, I daresay. For example, he does not introduce this heresy in the title of the book he dedicates to *dikē*, or in the chapter and section titles this book is divided into.

To clarify matters, I will now provide two examples of the way Havelock speaks of *dikē*: one example apropos of Homer's *Iliad* and another apropos of Hesiod.

First example: apropos of Homer's *Iliad*. Havelock entitles Chapter 7 of *The Greek Concept of Justice* "The Justice [*dikē*] of *The Iliad*" (square brackets added). This he does after illustrating the role that epic plays in the preliterate societies described by Homer (not Mycenaean society, but that of the early city-states), the psychology of rhythmic memorisation in these societies, and the method and manner by which the Homeric storage of oral culture proceeds.

In Havelock's Chapter 7 the term "justice" and its derivatives turn up some forty times, and of the ten sections the chapter is divided into, four carry the term "justice" in the title. But then, in the last of these sections—Section 10, entitled "Procedure in Place of Principles," in which Havelock wraps up the analysis carried out in the chapter—he arrives at the conclusion that the

[4] See Havelock 1996, especially 15–22. This posthumous work by Havelock has been published in Italian but not in English. Yet thanks to the courtesy of Thomas Cole, I was able to look at the original English manuscript, entitled *The Preplatonic Thinkers of Greece: A Revisionist History*.

[5] For a critical assessment of *The Greek Concept of Justice*, see Gagarin 1980 (very balanced and fair); Gill 1980; MacIntyre 1980 (a harsh and irritated trouncing, which I do not understand).

justice of *The Iliad* is what is right (he does so without once using "right" or "rights" anywhere in the foregoing nine sections). Here he is in his own words:

> In sum, the "justice" of the *Iliad* is a procedure, not a principle or any set of principles. It is arrived at by a process of negotiation between contending parties carried out rhetorically. As such, it is particular, not general, in its references, and can be thought of either in the singular or in the plural—the "*right* of it" in a given case or "the *rights*" as argued and settled in one or more cases. (Havelock 1978, 137; italics in original on first occurrence, added on all other occurrences)

Havelock—given the nature and aims of his enquiry—is mainly interested in showing that Homer's *dikē* is not a principle. (Not until Plato's *dikaiosunē* will *dikē* become a principle). As for me—given the nature and aims of my enquiry into what is right—I am mainly interested in what Havelock does when he draws his final conclusions; that is, he states clearly that *dikē* means "what is right": *Dikē* means "the right of it" or it means "the rights." In the passage just quoted, Havelock sets "justice" within quotation marks to refer to *dikē*, perhaps on account of the style rules his publisher asked him to follow. But there may also be a further rationale guiding Havelock's use of "justice" within quotation marks in reference to *dikē*; that is, it may be that he is about to declare that *dikē* means, in reality, "the right."[6]

No one who should consider *The Greek Concept of Justice* by its index, or by its table of contents, or by the contents of its Chapter 7, or again by looking things up here and there, would be able grasp the important truth that Havelock effectively illustrates with regard to the core meaning of *dikē*. Again, it is not Havelock's prime objective to bring this core meaning to light. Rather, his objective is, depending on the occasion, to explain the sense of the transformation of Greek civilisation from preliterate to literate; or to explain how cultural storage can happen and how it can pass from generation to generation with the only device of oral language, and hence only in human brains, in which the information is encoded (considering that human brains are much more perishable and short-lived than written records); or to illustrate how our language and thinking changes as we pass from language as an exclusively oral and acoustic medium to language as a medium that is written and visual, too; and especially to show how—in view of the foregoing considerations—*dikē* becomes a concept and a principle only with Plato. I find Havelock convincing in the arguments he develops in his theory with regard to these points.

But our specific interest here is a byproduct of Havelock's enquiry—a byproduct of special value to us, but which Havelock may not have paid full attention to. Nor could he have been aware of its importance: *Dikē* (as it turns

[6] On page 192 Havelock (1978) himself writes that "to speak of the 'justice' of the *Odyssey* is perhaps allowable if the word is placed in quotation marks." And that is what he in fact does (cf. Section 12.2.4, page 291).

up in several texts and contexts of ancient Greek civilisation, at least until Plato) can be said to encapsulate in embryo some distinctions that we, instead, have picked up, with regard to the concept of "what is right," in dealing with the legal dogmatics of the civil-law tradition as this tradition has consolidated over the last two centuries.

That *dikē* takes "what is right" as its core meaning emerges more and more clearly as we proceed further and further into *The Greek Concept of Justice*. This finding is one of the products of Havelock's enquiry, a fruit that ripens as Havelock comes closer and closer to the point of drawing his conclusions: The fruit falls from the tree that Havelock himself grew and nurtured so that other, more important fruits would issue (and such fruits have in fact issued). Havelock seems to recognise the secondary fruit or byproduct of his enquiry, but he does not bring it to bear: He leaves this fruit to other people, to people who, like us, may be ready to accept it and invest it with the particular importance it deserves.

As was noted a few moments ago, not only in Chapter 7 of *The Greek Concept of Justice*, nor even with regard only to *The Iliad*, does Havelock put forward "propriety," "seemliness," "the right," "rights," or "what is right" as the best way to convey the core meaning of *dikē*: He does so also with regard to *The Odyssey*, as well as to Hesiod, the Presocratics, and Herodotus (and even Plato, in a sense) (see Havelock 1978, 309ff.).

But of these—here comes the second of the two examples I promised I would make—it is Hesiod that prompts Havelock to lay out with true crescendo the view whereby "right" and its derivatives are par excellence the terms with which to account for the field of meaning expressed in ancient Greek by *dikē* and its derivatives.[7] The crescendo I am referring to is the following.

> The Loeb version of Hesiod renders *dikē* in the singular variously as "right," as "justice," and as "punishment"; in the plural, as "judgments." The Penguin version allows itself a larger indulgence, using for the singular "right," "justice," "verdict," "punishment," and "law"; the plural becomes "judgments" and "law-suits," or else is omitted through paraphrase; the adjectives *dikaios* and *adikos* are taken to signify "an honest man," "a just man," and "a felon."
>
> Command of such flexibility may be thought commendable; the style of translation has been "improved." By adjusting translation to the variety of contexts in which the word is placed, the disjunction between the hexameters is smoothed out. But the intention of the poet and the difficulty he has in achieving it are masked by this procedure. What in effect he is trying to do is to define a "field of meaning"; he is not playing with a concept which has been delimited and hardened by the resources of literate definition. To substitute a variety of terms for the single one which is obsessing him is in effect to destroy his topic, to conceal the act of integration which he is performing upon those epic situations from which he is extracting the new "subject" of discourse. In oral speech, the sound is the sign of the meaning. If a sound

[7] Havelock looks at Hesiod's *Works and Days*, a poem 800 lines long: In just under 100 of these—a sort of poem within the poem—Hesiod presents to us what Havelock describes as a "concentrate of *dikē*" (Havelock 1978, 194; cf. Havelock 1966).

keeps repeating itself like a refrain, the effect is most faithfully rendered in another tongue if the refrain is imitated. The word "*right*," its plural, "*rights*," and its adjectives "*rightful*," "*righteous*," and "*unrighteous*" could in English achieve something of this effect. The variety of applications to which the word is subject goes back into English preliterate usage. Given the definite article, "the *right*" symbolizes an abstract principle, also indicated in the antithesis "*right*" versus "*wrong*." But pluralize it, and we get the "*rights*" and "*wrongs*" of a situation, which are more specific, as also is "the divine *right* of kings," identifying a source of authority which kings alone control. Again in the plural, to speak of "my *rights*" is to identify claims against individuals or communities as if these were pieces of property; the "*rights*" of a legal case symbolize the claims as argued and given verbal form. As adjective, "*right*" can indicate either correctness—"this is the *right* road to take"—or propriety—"this is the *right* thing to say under the circumstances"; as an adverb, the word describes movement in a straight direction—"keep *right* on going"; and, of course, it designates the "*right* hand" from the left, possibly a basic signification.

The Greek *dikē* and its correlatives perform a similar diversity of symbolic functions, which Hesiod is endeavoring to assemble into his "field of meaning." (Havelock 1978, 230–1; italics in original on first, second, third, and last occurrence; added on all other occurrences)

Thank you indeed, Mr. Havelock.

12.1.3. The Anthropology of the Homeric Poems: The Didactic Function of Epic in the Oral Civilisation of the Early Greek City-States

Havelock devoted himself persistently to the study of oral civilisations and to the language of archaic Greece. His chief work on *dikē* is intended to demonstrate that this symbol, like other symbols in use in preliterate societies, cannot express a concept or a principle before the advent of writing (until Plato, in the case of the Greek civilisation). Indeed language—at first oral, recited language memorised only in brains, and neither written nor read, because not recorded on documents—undergoes a radical transformation with writing as the medium by which our thought develops and finds expression.

According to Havelock, *The Iliad* and *The Odyssey* are a unique piece of documentation when it comes to the anthropological study of oral civilisations, and that for five reasons as follows.

(*a*) *The Iliad* and *The Odyssey* are oral compositions. They were composed in the 9th and 8th centuries B.C. and found their way into writing only subsequently.[8] They got transcribed exactly as they had been shaped in oral compo-

[8] "The Greek cultural experience as late as the period between 1100 and 700 B.C. was nonliterate" (Havelock 1978, 15). "No evidence is available for the use of Linear B after the fall of Mycenae, or for the introduction of the Greek alphabet at any date earlier than the last third of the eighth century B.C. [...] A condition of either nonliteracy or semiliteracy—depending upon the scholar's judgment—persisted in Greece to the middle of the seventh century" (Havelock 1978, 9). The Homeric poems travel across the centuries, forward and backward—a situation that depends on the findings and especially the hypotheses of the various scholars. The dates just cited, and those I will refer to in what follows, are those specified by Havelock. The latest hypothesis in this regard comes from Janko 1982 and Morris 1986. On this question, see the survey by Eva Cantarella (2002b, 376ff.). Cf. Morris 1986 and Janko 1982, 228–31. Cf.

sition within a "society free from any literate contact or contamination" (Havelock 1978, 339). We can see clearly the importance of this feature if we only consider what happens with a preliterate society (a society whose culture is based exclusively on human memory, rather than on written documents) the moment it should receive, for whatever reason, an entire system of writing, or even part of it, from outside sources: This society will inevitably, in putting this *foreign* system to use, deform the contents of the exclusively oral language proper to it (an exclusively oral language, and hence exclusively mental or cerebral in what concerns its memorisation).

(*b*) The society in whose oral tradition the Homeric poems were recited—as *living* and topical poems—was a politically and socially autonomous society, and as such it would continue to exist even after the advent of writing. It was therefore a society that "possessed a firm consciousness of its own identity" (Havelock 1978, 339). Again, we can see the importance of this second feature: Social or political forms that come in from without, and get superimposed on autochthonous forms before these last get recorded in writing, taint the preliterate culture that will then be transcribed. Instead, the culture of early Greece—as it has come down to us, orally at first, through Homeric epic, and then in the form of documents in which this epic was transcribed—is fully expressive of early Greek society, for this society preserves its autochthony, politically and socially, throughout the delicate period of transition from merely spoken language to spoken and written language.

(*c*) From the 10th or 9th century to the 7th century B.C., when the role of preserving the consciousness of a social identity was entrusted to oral language, oral language existed without exception as the only medium of documentation and collective memory. Having no conduit other than merely oral language, collective memory could not get stored except in the brains of the people making up the whole of society (Havelock 1978, 38ff., 106ff.). This lack of storage modalities (even autochthonous modalities) other than oral language makes it so that contents—the contents fixed in merely oral (mental, cerebral) linguistic forms—should, in this form, come through intact when the process of their transfer into written language gets underway.

(*d*) The transition from oral language to writing happened by way of written symbols invented by the very people who in preliterate society would communicate by oral language only (Havelock 1978, 218ff.). When anthropologists take notes and document their fieldwork in exclusively oral societies, they interpose not only the medium of writing, but also their own native language, in their reports on the contents of the preliterate society they are investigating. To put it the other way around, the language expressing these

Volume 6 of this Treatise, Gagarin and Woodruff, Chapter 1, Section 1, where the Homeric poems and the works of Hesiod are grouped together as composed around the end of the 8th century B.C.

contents of preliterate society is not only a different language than the investigator's, but also an exclusively oral language; the investigator's language is foreign as well as written. Instead, in early Greek society the transition from oral to written language comes by way of the native speakers of the society, and the interposition of another's written language (the anthropologist's) does not occur.

(*e*) Because the speakers of the early Greek language transcribed their own oral language in their own writing, they controlled in the first person the transcription process of sorting out the oral memory encoded in their brains, and therefore decided for themselves what contents would get transferred on nonhuman supports in writing (Havelock 1978, 221–32). When this "natural selection" of the oral contents of preliterate culture in the changeover to the written form is effected from within—by the members of the culture in question—it is better able than other methods to make sure that the screening reflects the topicality and vitality of the contents (hitherto exclusively oral) as these are entrusted to written documentation.

Homer, Havelock writes, was an instructor. His poems—what the *modern* reader understands to be poems—were in fact a store of oral directives. Or, as I prefer to say, they were a store of oral information on norms and other beliefs intended to shape personality, the generalised other, and the internal reality that ought to be (see Sections 15.2.5 and 15.3.4), thereby guiding the behaviour of the addressees of such epic. Homeric epic was primarily educative, and was anciently recognised as such: We have, in the Homeric poems, a teacher addressing an audience of people to be instructed, or of people who may need to have these instructions reinforced (by remedial work, we might say today). The Homeric poems are a "tribal encyclopedia" (ibid., 337; Havelock 1963, 66). The very first Homeric scholar, Theagenes of Rhegium (late 6th century B.C.), attributes didactic intentions to Homer. And he is followed in this by Xenophanes (ca. 570–ca. 478 B.C.) and Heraclitus. Both are poignantly critical of Homer and Hesiod: Heraclitus considers them to be "teachers of an immoral theology" (Havelock 1978, 5).

It is well known that Plato subjects Homer, Hesiod, and poetry at large to severe criticism, calling for its censorship and then for a complete ban. Plato, in his criticism of poetry, did not have the understanding of poetry that we have, but rather the understanding of it current in Homer's time and still current in the time of Plato himself: the conception of poetry as a teacher of life.

Plato claimed for philosophers, and for himself in the first place, the task of educating, more so than the youths, the philosopher-statesmen, who are the rulers (*oï arkhoi*) in the ideal form of government. Plato criticises the practice of centring education around the work of Homer and Hesiod (and around poetry at large), taking exception to the contents taught, as well as to the way these contents would be imparted (Plato, *The Republic*, 598d7–600d6; cf. Havelock 1978, 6–7 and Havelock 1963, Part One).

This didactic function that the philosophers (and Plato in particular) found objectionable was something that Homeric epic came to assume characteristically—almost by natural consequence—on account of the general preliteracy of the exclusively oral language in which and for which Homeric epic was composed. As Havelock suggests, "a condition of either nonliteracy or semiliteracy [...] persisted in Greece to the middle of the seventh century" (Havelock 1978, 9). Yet the first forms of social organisation that are considered to be among the achievements of ancient Greece took shape from 1100 to 900 B.C. There occurs in the span of two and a half centuries, from 900 to 650 B.C., "the genesis of that classical culture which becomes evident to documentary inspection only in the sixth and fifth centuries" (Havelock 1978, 9–10).[9]

In Chapter 4 of *The Greek Concept of Justice*, titled "The Society Reported by Homer," Havelock sets out to show that Homer, in *The Iliad* and *The Odyssey*, makes reference not to Mycenae (if not in a fantastical manner) but to the poleis. The account we have before us is in the first place an account of the institutional life of the poleis, or city-states. The Greek way of social life—the basic features of it—was already functioning and organised so early as the 9th century B.C. (Havelock 1978, 9–10).

> The towns of mainland Greece must be deemed already capable by the tenth century of supporting forms of social life which went well beyond the limits of village existence. At the level of technology, these communities were capable of forging iron, and presumably of smelting it, a feat beyond the competence of the Mycenaeans. Their activities in commerce and navigation may not have exceeded Mycenaean standards. Their temple architecture not later than the end of the eighth century can be shown to have anticipated in wood the conceptions and refinements of the archaic age now partially preserved for us in stone. In the realm of the arts, this period saw at its inception the invention and perfection of the geometric style of decoration, followed by the introduction of naturalistic motifs in the so-called orientalizing period, which began, appropriately enough, about the time that the Phoenician letters were put to Greek use. The same period fostered the verbal art of Homer. (Havelock 1978, 10)

All these things happened without the help of written documentation. Now, it can be said, with regard to Greek architecture and art from 900 to 650 B.C.,

[9] "If true, this raises a formidable question for the historian. It was precisely in these centuries that Greece invented the first forms of that social organization and artistic achievement which became her glory. Perhaps the start was slow, and from about 1100 to 900 the achievement did not amount to much. Archaeology has made evident the physical ruin of the Mycenaean palace-complexes, and it is usually deduced that with this went also the destruction of those political and social arrangements which had previously rendered commerce, art, and a settled way of life possible. Even this hypothesis of a totally dark age supervening upon the Mycenaean period has lately been questioned. Whatever the truth of it, there is no reason to doubt that, as has recently been emphasized, the centuries after 900 were 'dark' only in the sense that so much about them is unknown. If we consider the period from 900 to 650 as a chronological unit, it is obvious that we view in this period, however obscurely, the genesis of that classical culture which becomes evident to documentary inspection only in the sixth and fifth centuries" (Havelock 1978, 9–10).

that draftsmen could apply geometry without having to read, and that many skills were transmitted orally from father to son or from master to apprentice. But the Greeks' political organisation, their moral and social conscience, is something remarkably more refined and complex which, too, will have to be accounted for as a development within a preliterate society equipped only with an oral language (ibid., 11).

Havelock concludes as follows:

> In sum, the stories and episodes of both epics [the two Homeric epics] are fashioned in such a way as to take for granted a polity and life-style which are contemporary, meaning that they reflect Greek life as it was lived in the period when the poems assumed their final compositional form. The characters live and behave as people in that society would live and behave even though they often wear the fancy dress of Mycenaean legend. The institutions, the domestic proprieties, the military and maritime dispositions, the agriculture, the commerce, the architecture and art, and we may add the recreations, are those of the early maritime complex of Hellenic city-states, originating perhaps in the tenth century, but attaining their full development in the eighth and seventh centuries. The local geography, the agriculture, the commerce, the seafaring, the endemic warfare, the legalities of family and property, the citizen's identity, the oral procedures for decision making, all seem to be versions in embryo of the essential elements out of which the societies of Solon and Pericles evolved—adapting, enlarging, codifying, complicating, but never departing from them. Both the *Iliad* and the *Odyssey* reveal a veiled portrait of Greece in the historical period. That is why a citizen of Periclean Athens could still feel himself to be a "Homeric man."
>
> If the period thus reported in both epics was also nonliterate, we can reasonably expect, on the analogy of practices in other oral societies, that the epics will not confine themselves to story telling. They are likely to use the mythos as a vehicle of storage, a repository of the pragmatic values of their audience. The epics may constitute that enclave of contrived speech constructed according to the rules of oral memorization which oral societies find necessary for this purpose. For the performance of such a function, the Mycenaean fantasy could provide an essential support, giving to the cultural index a distance and a solemnity which the living memory would welcome. The mores of the present are transposed into the past; historical Hellenism becomes a prehistoric tradition. (Ibid., 87)

12.2. A Revisitation of Homeric *Dikē* in the Light of the Distinction among "Norms," "What Is Objectively Right," and "What Is Subjectively Right"

12.2.1. Premise

In the sections that follow I will take up again the notions of "norm," "what is objectively right," and "what is subjectively right" as presented in Chapters 6 (for "norm") and 1 through 4 (for "what is right"). I will try to see if and how these notions can be discovered to exist in Homer's epic, proceeding to this end on the basis of Havelock's reading of this epic. In some cases, though, I will be putting forward some interpretations of my own and laying them on top of Havelock's, or at least I will be putting to use the notions just referred to, fully aware in this that these are notions I have come at through my own understanding of "norm" and through an ideal and critical reconstruction of

the frame in which the concept of law has been developed within the tradition of continental legal dogmatics over the last two centuries.

12.2.2. Norms and Society

It will be recalled, to start with, that a norm (as characterised in Chapter 6) is the belief (*opinio vinculi*) that a certain type of action must be performed anytime a relevant type of circumstance gets validly instantiated. Further, norms are social: They are social insofar as they are beliefs shared in society, or at least within certain strata or classes of society.

Havelock informs us with Milman Parry of a known fact, namely, that the Homeric hero embodies a moral dimension, and that this dimension is

> stated as a set of obligations imposed by a corresponding set of social relations within which his life is lived. These are regulated by general rules of behavior. The ideal (a better term would be ethos) is not conceived a priori as a set of principles to which one aspires, but as a pragmatic response to the general rules which impose "responsibilities" and confer "rewards" for performance. (Havelock 1978, 9)

In these words we can recognise my own concept of norm, at least in embryo. We can recognise that the content of a norm is a type of action binding per se relative to certain conditioning types of circumstance—to certain types of social relations instantiated in the social reality of the Homeric hero (in his reality that is).

On Havelock's reading of Homeric epic, norms are the *nomos* and *ethos* (the way of life, in Parry's words) of the early Greek city-states.[10] And *nomos* and *ethos* are quintessentially normative in the sense of "norm" introduced in Chapter 6. They are a social reality that is, but at the same time they normatively must be: They are a socially constructed social reality that ought to be, the mores, the customary law of a preliterate society that operates without written laws (of course) and without any formal enactment of laws. (On social, or institutional, reality, see Sections 15.2.4 and 15.3).

There needn't be any enactment of laws for norms to exist: There need only be (for such an existence) social beliefs (*doxia* and *nomia*; Sections 6.2 and 6.5) and ways by which to preserve, confirm, and reinforce the sharing of beliefs in society, as well as ways by which to pass them down from generation to generation (cf. Sections 7.1 and 15.2.5, on primitive norms).

As Havelock notices, the Greek city-states were constantly at war with one another and spoke different dialects, to be sure, but they had a common language (at that time a merely oral language), as well as common deities and mythologies, common rituals and customs, and especially common beliefs:

[10] This independently of the terms occurring in the Homeric poems: see footnote 1 in this chapter.

The city-states shared "an assumption of social order and regulated usage [this is where belief steps in] shared by all who called themselves Hellens." Even the neighbouring barbaric peoples were aware of this state of affairs. "It was a culture, in fact," a culture summed up with greatest power of expression "in the two Greek words *nomos* and *ethos* in their earlier usage" (Havelock 1978, 11).

> The stories in the [Homeric] poems are told in such a way as to include a mass of directive information covering the nomos and ethos [covering norms, in the meaning I ascribe to this term], the life-style and its proprieties, appropriate to the society to which the poems are addressed and which was guided by them [...]. The poems constitute two major reports upon propriety [what is objectively right] both social and personal, practiced as a conservative ethic and implemented in a thousand specific proprieties. [...] They employ one regulative symbol which was to acquire special significance after Homer, and predictably so because of the way Homer used it. This was expressed in the Greek word *dikē* and its derivatives, a word not easy to render in strictly conceptual terms, but furnishing a prototype of what we might designate as Homeric "justice." (Havelock 1978, 13)[11]

But this prototype of Homeric justice is in reality *what is right*. Havelock says so himself:

> If justice be identified as the central principle of modern morality, conceptually defined, oral societies could get on very well without it. What they did rely on for cohesion—as does any society—was a set of proprieties, of general rules of behavior which in sum total constitute "*what is right*." (Ibid., 53; italics added)

As an oral encyclopedia, *The Odyssey* describes and recommends types of right Panhellenic behaviour: types of action believed to be per se obligatory, permitted, or forbidden relative to certain conditioning types of circumstance. We have here an international or intercity propriety, whereas the propriety described and recommended in *The Iliad* is, in Havelock's words, an "intracity" propriety. In a strict sense, propriety among cities was not legal: It was entrusted to a "moral" sentiment sanctioned and protected by religion. Intracity

[11] "Viewing the enclave of contrived speech performing its function in society, we may be tempted to describe its content as providing models, patterns, or paradigms of character and action suitable for imitation. [...] These words [...] might [...] induce us to believe [...] that [the tradition] offers ideal characters performing actions which follow the proprieties proper to the society which uses the tradition. To be sure, *propriety* and *seemliness* provide the best operative definition of oral mores—not so much a definition as a validation; the 'done thing,' to use a schoolboy phrase, is the 'right thing.' But it would be an error to draw the conclusion that what the agents actually do in the required narrative is itself governed by propriety. [...] Warfare as a subject of epic has mnemonic advantages, as does any hazardous enterprise. It follows that plots of memorized speech will offer heroes and sometimes gods who, so far from providing copybook models of approved action, will illustrate the proprieties by defying them. They will do this successfully for a time; the logic of the function of storage will, however, require that penalty be paid in the end, or redress achieved or balance restored" (Havelock 1978, 52–3; italics added).

propriety, in contrast, *was* legal, in that any controversy that might arise could find its legal solution in the agora, while no form of judicial authority existed with which to regulate international affairs.

The *Odyssey* is par excellence the oral encyclopedia of the maritime complex, encoding and reporting and recommending those patterns of pan-Hellenic behaviour [norms, in my understanding of "norm"] which also could protect interpolis traffic and enable the complex to work. [...] Yet the poem does not stop there. When upon Odysseus the stranger-guest there is superimposed Odysseus the impoverished beggar, the moralities of the story take us back within the walls of the polis. A second lesson is to be learned, aside from the international one. Any polis society contained both its rich and its poor. The poor need sustenance, and it should be given them when they ask for it. They also are free men and should be guarded against insult. This too is part of the nomos of the Greek polis, for without it community is threatened and the society may cease to be viable. (Ibid., 177–8)

A case apart, in *The Odyssey*, are the Cyclopes. The case is emblematic because the Cyclopes do not practise any "international morality" (any set of norms, or beliefs, as related and recommended in *The Odyssey*), and at the same time they are stigmatised in Odysseus's account because they do not have any legal propriety among themselves, either. They have no *themistes* or *dikai*: *Themistes* are norms; *dikai* (in the plural) are judicial procedures with which to decide what is subjectively right when controversies arise (see Sections 1.2, 1.3, and 12.2.4).

The Cyclopes do not have any form of associated life, even among themselves: They lived on the peaks of mountains in gloomy caves (wherein each Cyclops is a kind of autocrat or tyrant, making decisions not only for himself, but also for his women, children, and sheep). There is no polis among the Cyclopes, nor even is there any associated tribal life. The Cyclopes hold no meetings in the agora; they have no *themistes*, and in fact do not even know of any (or they know them scarcely: The assertion is different in different passages of *The Odyssey*). As was noted earlier, there can be no social norms without any shared normative beliefs: The Cyclopes are not believers, and hence—from Odysseus's standpoint: according to the norms he believes in—they are anomic (cf. Section 6.5). They are a group of anomic savages.

Thence we sailed on, grieved at heart, and we came to the land of the Cyclopes, an overweening and lawless ["athemistōn"; "nefariorum"] folk [...]. Neither assemblies for council ["agorai boulēphoroi"; "conciones consiliariae"] have they, nor appointed laws ["oute themistes"; "neque leges"] but they dwell on the peaks of lofty mountains in hollow caves, and each one is lawgiver ["themisteuei"; "*jus* autem dat"] to his children and his wives, and they reck nothing one of another. (*The Odyssey*, IX, vv. 105–15)[12]

Havelock translates *themistes* to "formularies," and *dikai* to "procedures":

[12] I am using the Loeb edition: Homer, *The Odyssey*, with an English translation by A. T. Murray. For each relevant expression there are added the Greek original and its Latin translation as found in Bergler 1791–1792, vol. 2. See also *The Odyssey*, IX, vv. 187–9; IX, vv. 213–5; VI, v. 120; VIII, vv. 572–6; IX, vv. 171–6; XIII, vv. 201–2.

> As in the *Iliad* [so also in the *Odyssey*], a distinction is implied between the precedents or formularies [*themistes*] on which oral memory must draw and their administrative application in a given procedure or an oral judgment […] of what the just [right] thing in a given case requires. (Havelock 1978, 180)

It is not clear what the relationship is between *themistes* and mores. The way I would put it, *themistes* provide, through their content, what is objectively right, namely, the content of mores (see Section 12.2.3). And it is through the procedures or oral judgments just referred to that the courts of the period administered and ascribed what is subjectively right (see Section 12.2.4).

> It is to be remarked that the epic voices an awareness that there is a connection between the existence of such procedures and the existence of human society as such—or more particularly, the agora society. The Cyclopes are not members of that kind of city-state. (Havelock 1978, 180)

12.2.3. Dikē *as What Is Objectively Right*

It will be recalled, to begin with, that on my characterisation of norms, what is objectively right is the content of norms at large: It consists of any type of action believed to be obligatory, permitted, or forbidden per se relative to a type of circumstance the type of action is conditionally connected to within a norm (Section 6.3).

In Homeric epic, what is objectively right is *dikē* (in the singular) understood as the set of the thousand proprieties found in the mores: in norms as shared beliefs that make up the skeleton of ordered social life (*eunomia*) in the early city-state. Havelock writes that *dikē*, in the singular, "comes close to indexing" a "rule of propriety," whereas *dikai*, in the plural, indicate the acts by which any violated proprieties are restored.

Dikai, in the plural, are what is subjectively right (cf. Section 12.2.4). They

> are, in fact, "proprieties" administered in given contexts [administered with reference to *actual* subjects among whom an *actual* controversy has arisen: Sections 1.3 and 12.2.4]. This kind of "justice" is simply the rule of conservation of existing mores, or the correction of a violation. It does not prescribe what in general the mores "ought" to be. (Havelock 1978, 181)

Havelock's understanding of *dikē* in the Homeric poems can lead to two lines of reflection—two lines which he is not bearing in mind, and which he may not be able to, either, because they fall outside his field of research.

Here is the first line of reflection.

In Havelock's *Greek Concept of Justice* we do not only find the distinction between the *dikai* as what is subjectively right (the *dikai*, in the plural, administered during trial; cf. Section 12.2.4) and *dikē* as what is objectively right (*dikē*, in the singular, as the content of norms or mores).[13] We also find the

[13] Of course we can only find this distinction if we are prepared to recognise it, since Havelock does not express it in these terms.

idea that *dikē* (in the singular) is what is objectively right *because* it is the content of norms: *Dikē* is the content of all norms, of all mores, simply as these exist in society. Indeed, Havelock observes that *dikē* does not prescribe what the mores ought generally to be, does not tell us what the content of mores (or norms) ought to be, does not fix these contents in advance, nor does it criticise (approve or disapprove) any of the contents of actual mores.

I made the same assumption in Section 1.3 of this volume, where I said that the content of norms is by definition what is objectively right, whatever such content may be. It is not the contents per se that are objectively right. Rather, what makes them such is the fact that they are the contents of a norm. Thus, for example, "You must *not* commit murder" and "You *must* commit murder" are equally what is objectively right if they are the contents of norms (cf. Section 4.2.1).

The statement that *dikē* does not prescribe what in general the mores *ought* to be is obvious from the standpoint taken in Sections 1.3 and 4.2.1: It cannot be otherwise if we translate *dikē* to "what is objectively right." Indeed, what is objectively right is the *content* of norms, and the problem of the content of norms may well be a problem of interpretation, but never one of justification. This last problem is the problem of the matrix of norms, of normativeness (the matrix of the reality that ought to be) as the ultimate source of what is right (Chapter 4). Only if *dikē* prescribed what in general the mores ought to be would it be possible to say that *dikē* is justice in one sense or another, as found in nature, for example, or in God, in the Gospel, or the Koran, or again in the emancipation of the proletariat, in the *Fürher Prinzip*, or in Rawls's *Theory of Justice* (Rawls 1999).[14]

In this case *dikē* would properly be the matrix of what is right; it would be the archetype by which to establish what is right.

There are at least two reasons why the *dikē* of the Homeric poems cannot be said to be justice: On the one hand, *dikē* is not a virtue (as are Plato's and Aristotle's *dikaiosunē* and Aquinas's *justitia*); on the other hand, *dikē* is not the matrix of the reality that ought to be, of normativeness (and hence of true norms).

The *dikē* of the Homeric poems is rather the content that socially believed norms happen to take. It is no more than what is right: In the common understanding of early preliterate Hellenic culture, *dikē* is not anything "greater," "higher," or "nobler" than what is straight, orthogonal, proper, or right,

[14] As we will see in Chapter 13, justice—at least in Aquinas—does not in reality prescribe. Prudential reason does prescribe (*epitaktikē esti*, as Aristotle says of *phronēsis*; cf. Aristotle, *The Nicomachean Ethics*, 1143a 2–3): It prescribes the means with which to achieve the ends apprehended and established by synderesis (and synderesis, too, belongs to practical reason). Justice, instead, is a moral virtue: Its subject matter is will, and it functions as the keeper of the effective and constant pursuit of what is right according to reason. On other conceptions, instead, the idea of justice connects with the idea justification, and of matrix.

whether "right" is understood as what is objectively right (as *dikē*, in the singular) or as what is subjectively right (as *dikai*, in the plural).

It is clear from what was said in Sections 12.1.1 and 12.1.2 that Havelock—despite his continued use of "justice" to translate *dikē*—wants to show, and does show, that *dikē* is not justice. This is so, he points out over and again, because Homeric epic is oral and not written, because it is not and cannot be philosophy, because the idea of justice as a principle is in point of fact absent in Homer and does not emerge in Greek culture until Plato (who, in expressing the idea of justice as a principle, uses not *dikē*, but *dikaiosunē*). So then, in conclusion, *dikē* must be some other thing: not justice, but what is objectively or subjectively right. And when it occurs in the form of the modifier *dikaios*, it is equivalent to the adjective "right": So *dikaios* is used in Homer to qualify as right a person or a thing.

Even the second line of reflection which Havelock's understanding of *dikē* (in the singular) in the Homeric poems can lead to is of great interest to us, and like the first line, it is something that Havelock touches on but does not develop. I will introduce it with his own words:

> This significance of the singular [*dikē*] offers a bridge to the understanding of a usage of *dikē* in the *Odyssey* which has often been needlessly severed from that of "justice" [yet Havelock, as has been noted, and wittingly or not, shows *dikē* to mean not "justice," but "what is objectively right"], almost as though we were dealing with two different words with perhaps common etymology but separate references. Seven examples of this usage can be pertinently reviewed. (Havelock 1978, 181)

Havelock is referring here to the problem arising in connection with the opinion of Rudolf Hirzel (1846–1917) and others (Havelock 1978, 353, endnote 2 of Chapter 10), and in particular with the opinion of Michael Gagarin (cf. Hirzel 1907; Gagarin 1973).[15] These authors claim that *dikē*, in seven passages of *The Odyssey*, means "characteristic," the passages in question being IV, vv. 690ff.; XI, vv. 217ff.; XIV, vv. 59ff.; XVIII, vv. 275ff.; XIX, vv. 36ff.; XIX, vv. 167ff., and XXIV, vv. 253ff.[16]

[15] The reader should see, by Gagarin, not only Gagarin 1973, but also Gagarin 1974.

[16] Following, for each of the seven passages, are the Greek original (Loeb edition, italics added to mark off the relevant Greek expressions) and Havelock's translation; in all seven, Havelock renders *dikē* as "justice":

(*i*) "Οὔτε τινὰ ῥέξας ἐξαίσιον οὔτε τι εἰπὼν / ἐν δήμῳ, *ἥ τ' ἐστὶ δίκη θείων βασιλήων·* / ἄλλον κ' ἐχθαίρῃσι βροτῶν, ἄλλον κε φιλοίη. / κεῖνος δ' οὔ ποτε πάμπαν ἀτάσθαλον ἄνδρα ἐώργει" (*The Odyssey*, IV, vv. 690–3): "Neither doing or saying to any man anything out of rule [*ex-aisimon*] / in the demos; the 'justice' of divine lords stands so [*esti*] / that one should hate this one of mortals and love that one—/ but he never once at all did any abominable thing [*atasthalon*] to a man" (ibid., as translated in Havelock 1978, 181; square brackets in original).

(*ii*) "Οὔ τί σε Περσεφόνεια Διὸς θυγάτηρ ἀπαφίσκει, / ἀλλ' *αὕτη δίκη ἐστὶ βροτῶν*, ὅτε τίς κε θάνῃσιν· / οὐ γὰρ ἔτι σάρκας τε καὶ ὀστέα ἶνες ἔχουσιν, / ἀλλὰ τὰ μέν τε πυρὸς

Havelock finds that, in these passages, "Homer's intention is not to give a series of definitions." And this much, I should say, is clear enough to everyone. "The various [seven] samples of *dikē* are not properties belonging to persons," Havelock adds. On this point, too, I agree.

Things become more interesting when Havelock puts forward his interpretation in the positive of the seven occurrences of *dikē* in question, all seven of which he translates to "justice," enclosing the word within quotation marks. Havelock finds that here *dikē* means

> standing procedures or behavior patterns which are accepted or expected. The reference is not to a characteristic, but to what one is supposed to do or feel or what is supposed to happen "in the case of lords, gods," and so forth; the genitive is one of reference, not of possession. *Dikē* indicates a code which is followed: Mortals lose their bodies at death, suitors ought to bring gifts, gods can throw magic light, old men should sleep soft. Such codes can be regarded either as "expected customs" (*nomoi*), or as "expected habits" (*ēthē*) [...], or as a combination of the two. It is significant that in most instances the code is stated by way of protest: It has been abrogated or challenged; it is being defended as the proper thing to expect. (Havelock 1978, 182)

κρατερὸν μένος αἰθομένοιο / δαμνᾷ, ἐπεί κε πρῶτα λίπῃ λεύκ' ὀστέα θυμός, / ψυχὴ δ' ἠύτ' ὄνειρος ἀποπταμένη πεπότηται" (*The Odyssey*, XI, vv. 217–22): "No, Persephone is not cheating you. / The 'justice' of mortals stands so / [*esti*]: they lose flesh and bones, which the fire consumes, and the / psyche takes wing and flies away" (ibid., as translated in Havelock 1978, 181; square brackets in original).

(*iii*) "Δόσις δ' ὀλίγη τε φίλη τε / γίγνεται ἡμετέρη· *ἡ γὰρ δμώων δίκη ἐστὶν* / αἰεὶ δειδιότων, ὅτ' ἐπικρατέωσιν ἄνακτες / οἱ νέοι"(*The Odyssey*, XIV, vv. 58–61): "Tiny and precious is the giving I can give; so stands [*esti*] the 'justice' / of servants who are continually afraid, when ruled by youthful masters" (ibid., as translated in Havelock 1978, 181; square brackets in original).

(*iv*) "Μνηστήρων *οὐχ ἥδε δίκη τὸ πάροιθε τέτυκτο·* / οἵ τ' ἀγαθήν τε γυναῖκα καὶ ἀφνειοῖο θύγατρα / μνηστεύειν ἐθέλωσι καὶ ἀλλήλοις ἐρίσωσιν, / αὐτοὶ τοί γ' ἀπάγουσι βόας καὶ ἴφια μῆλα, / κούρης δαῖτα φίλοισι, καὶ ἀγλαὰ δῶρα διδοῦσιν· / ἀλλ' οὐκ ἀλλότριον βίοτον νήποινον ἔδουσιν" (*The Odyssey*, XVIII, vv. 275–9): "This has not been the 'justice' of suitors as hitherto arranged, who want / to court a noblewoman in competition; it is they who bring the oxen / and sheep … and give gifts" (ibid., as translated in Havelock 1978, 181).

(*v*) "'[...] Ἦ μάλα τις θεὸς ἔνδον, οἳ οὐρανὸν εὐρὺν ἔχουσι.' / Τὸν δ' ἀπαμειβόμενος προσέφη πολύμητις Ὀδυσσεύς· / 'Σίγα καὶ κατὰ σὸν νόον ἴσχανε μηδ' ἐρέεινε· / *αὕτη τοι δίκη ἐστὶ θεῶν*, οἳ Ὄλυμπον ἔχουσιν […]'" (*The Odyssey*, XIX, vv. 40–3): "There must be a god inside—those who hold high heaven! / Hush! (replies his father) control your wits and do not ask questions; / this that you see is the present [*esti*] 'justice' of the gods who hold / Olympus" (ibid., as translated in Havelock 1978, 182; square brackets in original).

(*vi*) "Ἦ μέν μ' ἀχέεσσί γε δώσεις / πλείοσιν ἢ ἔχομαι· ἡ γὰρ *δίκη, ὁππότε πάτρης* / *ἧς ἀπέῃσιν ἀνὴρ* τόσσον χρόνον ὅσσον ἐγὼ νῦν" (*The Odyssey*, XIX, vv. 167–9): "You will endow me with sorrows even greater than possess me; (so is) / the 'justice' whenever from his native land a man has been severed a long / time as I (have) now" (ibid., as translated in Havelock 1978, 182).

(*vii*) "Βασιλῆϊ γὰρ ἀνδρὶ ἔοικας. / τοιούτῳ δὲ ἔοικας, ἐπεὶ λούσαιτο φάγοι τε, / εὑδέμεναι μαλακῶς· *ἡ γὰρ δίκη ἐστὶ γερόντων*" (*The Odyssey*, XXIV, vv. 253–5): "You have the likeness of a lordly man, / yet, a likeness to such a one as would bathe and eat / and sleep soft; for the 'justice' of the aged so stands [*esti*]" (ibid., as translated in Havelock 1978, 182; square brackets in original).

Again Havelock goes right on target, in my opinion. But again he is overcautious: Why is it that here, too, he translates *dikē* with "justice," quotation marks notwithstanding? Havelock, it must be noted, translates *The Odyssey* IV, vv. 690ff., not only in Chapter 10 (page 181) of his *Greek Concept of Justice*—where he translates to "justice" all seven of the occurrences of *dikē*—but also in Chapter 9 of the same book, on page 152, where *dikē* (as found in *The Odyssey*, IV, vv. 690ff.) is instead rendered as "the right."[17]

Havelock proceeds in Chapter 10 by writing:

> All this amounts to saying that it is "right" or "just" for gods or mortals or suitors or exiles to do so and so [...]. Homeric *dikē* remains faithful to that sense of social propriety which surrounds its legal usages. It symbolizes what one has a "right" to expect, what it is "just" to expect, of given persons in given situations. (Havelock 1978, 182–3)[18]

No, Mr. Havelock. That is not so. The two terms, "right" and "just," as you yourself maintain and demonstrate, are *not* equivalent: In the excerpt just quoted, you are caught between "justice" and "what is right," and struggle with both—with "justice," from which you cannot unfetter yourself, and with "what is right," which you cannot appropriate.

The solution actually seems simple to me, and ready at hand: Even in the seven excerpts from *The Odyssey* where the occurrence of *dikē* gives rise to the above-mentioned interpretive debate, *dikē* is the content of a norm: It is what is objectively right, meaning by this expression a type of action conditionally connected with a type of circumstance specified in the same norm, a norm properly to be understood as a socially shared normative belief. Havelock either knows this but does not state it outright (as in Chapter 10, on pages 181–2, where he translates *The Odyssey*, IV, vv. 691, and renders *dikē* as "justice") or he does not know it but states it absentmindedly (as in Chapter 9, on page 152, where he translates the same line in the same way with the

[17] Havelock's rendition of *dikē* on page 181 (italics added): "Neither doing or saying to any man anything out of rule [...] / in the demos; *the 'justice'* [*dikē*] of divine lords stands so [...] / that one should hate this one of mortals and love that one—/ but he [Odysseus] never once at all did any abominable thing [*atasthalon*] to a man" (*The Odyssey*, IV, vv. 690ff., as translated in Havelock 1978, 181; square brackets in original on fifth occurrence). Havelock's rendition of *dikē* on page 152 (italics added): "Neither doing nor saying to any man anything out of rule / in the demos, which is *the right* [*dikē*] of divine lords [...] to do—/ that one should hate this one of mortals and love that one—/ but as for him he [Odysseus] never once at all did any abominable thing [...] to a man" (*The Odyssey*, IV, vv. 690ff., as translated in Havelock 1978, 152).

[18] "The expectation, in order to be 'just' [right], must fit with the kind [type] of behavior that pragmatic common sense would view as normal in specific cases [types of circumstance], and therefore as *normative*, in the sense that the crazy-quilt variety of behavior patterns adds up to a total for the society which is socially cohesive and 'works.' It is not the index of a general rule of justice governing all human relations uniformly. This is shown quite strikingly in the first example, where the 'justice' [what is objectively right] that belongs to autocrats is contrasted with the evenhanded methods of Odysseus" (Havelock 1978, 183; italics added).

single exception of the crucial little word *dikē*, which on this occasion he renders as "the right").

Marked out in italics in what follows are the types of circumstance that *dikē* (what is objectively right) is referred to in the seven *Odyssey* passages in question: (*i*) *The Odyssey*, IV, v. 691, "what is objectively right *for divine lords* ["hē t' esti dikē *theiōn basilēōn*"]"; (*ii*) *The Odyssey*, XI, v. 218, "what is objectively right *for mortals* ["all' hautē dikē esti *brotōn*"]"; (*iii*) *The Odyssey*, XIV, v. 59, "what is objectively right *for servants* ["hē gar" *dmōōn* "dikē estin"]"; (*iv*) *The Odyssey*, XVIII, v. 275, "this has not been what is objectively right as hitherto arranged *for suitors* ["*Mnēstērōn* oukh hēde dikē to paroithe tetukto"]"; (*v*) *The Odyssey*, XIX, v. 43, "what is objectively right *for gods who hold Olympus* ["hautē ... dikē esti *theōn, hoi Olumpon ekhousin*"]"; (*vi*) *The Odyssey*, XIX, vv. 168–9, "what is objectively right *for a man who has been severed a long time from his native land* ["hē gar dikē, *oppote patrēs / hēs apeēisin anēr*"]"; (*vii*) *The Odyssey*, XXIV, v. 255, "what is objectively right *for aged persons* ["hē gar dikē esti *gerontōn*"]."

Of course neither Homer nor Havelock was thinking exactly in terms of "what is objectively right." But—I maintain—this was the sense in which the one used *dikē* and the other interpreted *dikē* in the seven excerpts from *The Odyssey* just listed, as happens in the other passages of Homeric epic where *dikē* occurs.

12.2.4. Dikai *as What Is Subjectively Right and Its Management, That Is,* Dikē *as the Restoration of What Is Right*

I find it fitting to convey the sense of *dikai*—in the plural, and as used in Homeric epic—with the expression "what is subjectively right": *Dikai* are the rights and obligations of actual subjects under the Hellenic mores described in Homer.[19]

In the society of the early city-state, the assembly (*agora*) did not legislate; it judged what is *subjectively right* (what is right in the concrete case) anytime a dispute or feud would break out, as happened between Achilles and Agamemnon. So, in this society, the *basileus* had among his prerogatives (as leader and lord) the all-important prerogative of being a manager-of-rights in his city (even if he is not necessarily the only manager-of-rights). Such was, for example, Odysseus in his Ithaca before setting off to fight in the war against Troy.

In Volume 6 of this Treatise, Section 1.1, Michael Gagarin and Paul Woodruff introduce us to law and legal procedure in early Greece and show

[19] Apropos of *dikai* Havelock writes, "These 'justices' administered in the plural by kings (archaistically) or by magistrates (realistically) are processes not principles, solving specifics, not applying general laws; they express themselves in negotiated settlement of rival claims. They operate to restore proprieties in human relationships. They are, in fact, 'proprieties' administered in given contexts" (Havelock 1978, 180–1). On the ancient Greek conceptions of rights, see, in Volume 6 of this Treatise, Miller, Section 4.8.

us that *dikē* is the term typically used, especially in the pre-philosophical period, to designate the legal procedure, process, and judgement represented, among other places, in Homer's epic and in Hesiod's works. Gagarin and Woodruff, on one side, and Havelock, on the other side, agree on this point.[20]

Havelock is of interest to us here because he gives us, in *The Greek Concept of Justice*, an ample and commented illustration of the way the public trials of the poleis would restore what is subjectively right whenever this thing (what is subjectively right) would become an object of dispute or would be disrupted.

In every society, literate or preliterate, the behaviour of individuals

> will interrupt and disrupt the web of custom and precedent by the self-motivated arrogance of personal decision or desire, anger or ambition, or even mere eccentricity. From time to time, the general rules will be broken: And very often their correct application in given cases will be doubtful, because of uncertainty created by competing claims. The nomos and ethos continually recalled and illustrated in Homeric narrative and rhetoric are *normative*. They state and restate the proprieties of behavior as these are assumed and followed. But the oral medium, in order to fulfill its complete function as the verbalized guide of the culture, will also be required to describe situations and frame statements which are *corrective* rather than merely *normative*, which, describing how the mores are abrogated, therewith describe also the means and manner whereby they are *restored*. The master symbol of this corrective process, which is also a procedure, is the Homeric *dikē* and its plural *dikai*. (Havelock 1978, 123–4; italics added on first, second, third, and fourth occurrence; in original on fifth and sixth occurrence)

Dikē also appears in *The Iliad* in the sense of redress, or restoration of what is subjectively right, when that has been disrupted, or at least has become an object of dispute. *Dikē* in this sense of the term is managed in public trials—sometimes making little headway, other times turning out in a full success—and it is on these last occasions that what is subjectively right gets effectively restored. The *dikaspoloi* were the managers-of-rights. (Havelock 1978 says "managers-of-justices" with *almost* perfect consistency: He allows at least one "managers-of-rights" to slip in, on page 99.) They would hold the sceptre during an assembly (*agora*) where a trial was held, and they protected the *themistes* under Zeus.[21]

[20] In Volume 6 of this Treatise, Section 1.1, there is to be found, in Gagarin and Woodruff's translation, the trial scene portrayed on Achilles' great shield (*The Iliad*, XVIII, vv. 497–508; the translation is also found in Gagarin and Woodruff 1995). See Eva Cantarella's analysis of this scene, and of various related problems, in Cantarella 2002a; cf. Gagarin 1986, 26ff.

[21] In Havelock's translation, they conserved the formularies in memory: "Now just as surely the sons of the Achaeans / carry and handle it [the sceptre], the managers-of-justices [...] [*dikaspoloi*: the managers-of-rights, in my translation] who also the / formularies [*themistes*] / under Zeus do conserve" (*The Iliad*, I, vv. 237–9 as translated in Havelock 1978, 129). For a comparative view, see the same passage (*The Iliad*, I, vv. 237–9) in the Loeb English version, in the Greek original, and in Bergler's Latin translation, with the original Greek terms (from the Loeb edition) and Bergler's Latin terms set off in italics: "Now the sons of the Achaeans that give judgement bear it in their hands, even they that guard the dooms by ordinance of Zeus." The Greek original: "Νῦν αὖτέ μιν υἷες Ἀχαιῶν / ἐν παλάμῃς φορέουσι *δικασπόλοι*, οἵ τε

The managers-of-rights work as professionals, but sometimes

> the litigant himself could act, for knowledge of oral formularies was to some extent general. So Achilles speaks and acts here [in the *Iliad* passage quoted in footnote 21 in this chapter], as Menelaus later does, in his own cause. The *skēptron*, a wooden club, serves less as a permanent badge of rank (except in Mycenaean memory) than as a signal that whoever is holding it commands the audience. (Havelock 1978, 351, endnote 6 of Chapter 7)

The feud between Achilles and Agamemnon is resolved in book 19 of *The Iliad* with *dikē* getting fully restored. This restoration is so expressed in the words of Odysseus, in the English and Latin translation provided by A. T. Murray and Bergler respectively:

> Thou mayest have nothing lacking of *thy due* [*dikēs*]. Son of Atreus, towards others also shalt thou be *more righteous* [*dikaioteros*] hereafter for in no wise is it blame for a king to make amends to another, if so be he wax wroth without a cause. (*The Iliad*, XIX, vv. 180–3; italics added)

> [Ut] ne *quid juris* [*dikēs*] mutilum habeas. / Atride, tu vero deinde *aequior* [*dikaioteros*] et in alium / eris. Haudquaquam enim indigne ferendum, regem / virum placare quando prior injuriam fecerit. (Bergler 1791–1792, vol.1, XIX, vv. 180–3; italics added)

Note how the Latin translator renders *dikēs* with *juris* and *dikaioteros* with *aequior*. Even *jus* takes “what is right” as its core meaning (cf. Chapter 13).

As was observed earlier, Havelock proceeds with near-perfect consistency in translating *dikē* and its derivatives with “justice” and its derivatives, and that never without quotations marks. We can also see this consistency in the just-quoted passage, where he translates not only *dikēs* to “of justice” but also *dikaioteros* to “more just,” also wrapped in quotation marks.[22]

Quotation marks—when they occur in uses other than those prescribed by some convention, as when quoting authors or defining the meaning of a term—are a symptom of a problem left unresolved. They are the defence put

θέμιστας / πρὸς Διὸς εἰρύαται· ὁ δέ τοι μέγας ἔσσεται ὅρκος”. “Nunc id [sceptre] Achivi / in manibus portant *judices*, quique *jura* / a Jove tuentur” (Bergler 1791–1792, vol. 1; italics added). Havelock makes the following observations with regard the *Iliad* passage just quoted: “The text incorporates two different nouns, *dikai* and *themistes*; [...] the text uses two different verbs meaning ‘manage’ (the root in *dikaspolos*) and ‘protect’ (*eiruatai*); [...] both *dikai* and *themistes* are pluralized; they symbolize some specifics of action or speech, not an abstraction; [...] *pros dios* does not mean ‘of Zeus’ but ‘under (the authority of) Zeus’; the *themistes* are not Zeus’s personal property, or even his creation, though he keeps an eye on them, or, more correctly, on their proper protection by the *dikaspoloi*” (Havelock 1978, 351, endnote 6 of Chapter 7).

[22] “You [Achilles] will not be left holding anything that falls short of ‘justice,’ [*dikēs*] / and you [Agamemnon] thereafter ‘more just’ [*dikaioteros*] on any other / ground as well / shall stand […], since it is no matter of reproach / that a *basileus* should appease a man in a case where one has been the first / to make trouble” (*The Iliad*, XIX, vv. 180–3, as translated in Havelock 1978, 132; square brackets added on second and fifth occurrence, in original on all other occurrences).

up by the problem's bearer, a bearer who is awkwardly aware of the problem, in that the solution, though not yet found, is felt to be near at hand. And Havelock is indeed awkwardly aware:

To speak of the "justice" of the *Odyssey* is perhaps allowable if the word is placed in quotation marks. There is no concept of justice in Greek epic, in our sense of that word. (Havelock 1978, 192)

It is fair to observe, at any rate, that these symptoms and defences are often accompanied with the genius of those they come from, and Havelock is no exception in this regard.

Lastly, even the verb *dikazein* means, in its turn, "to state the right." It is Havelock (1978, 352, endnote 12 of Chapter 7) who makes this annotation, when he refers us to H. J. Wolff (1946) and J. H. Kells (1960) (cf. Havelock 1978, 42–5).[23] In this endnote Havelock seems to welcome Wolff's translation of *dikazein* as "to state the right," even if in the running text, on page 134, he translates *dikasō* (*The Iliad*, XXIII, v. 579) as "I will do the justicing," taking care, however, to provide the original Greek term *dikasō*. For a comparative assessment, developed further in footnote 24 below, here is the Greek expression from *The Iliad* (XXIII, v. 579), followed by A. T. Murray's English translation and Bergler's Latin translation: "ei d' ag' egōn autos *dikasō*"; "Nay, but I will myself *declare the right*"; "Eja age ego ipse *dijudicabo.*"[24]

[23] Havelock's (1978, 373) reference to Wolff's work is rather infelicitous: He cites Wolff 1946 as "Judicial *Legislation* among the Greeks" instead of "The Origin of Judicial *Litigation* among the Greeks" (both italics added). So, too, he lists an incomplete title. Cf. Kells 1960.

[24] Havelock, in his translation of *The Iliad* XXIII, vv. 573ff., has Menelaus speak thus: "Lords and leaders of the Achaeans, [...] apply justice [*dikassate*] to this [...]. [...] No, I will do the justicing [*dikasō*] myself, without, I think, any risk of criticism; the justice [*dikē*] will be straight" (*The Iliad* XXIII, vv. 573ff., as translated in Havelock 1978, 134; square brackets in original on fifth and sixth occurrence). Following are the Greek original, the English translation by A. T. Murray, and the Latin translation by Bergler. The terms whose rendition is discussed are set in italics for emphasis: "᾿Αλλ᾿ ἄγετ᾿, ᾿Αργείων ἡγήτορες ἠδὲ μέδοντες, / ἐς μέσον ἀμφοτέροισι *δικάσσατε*, μηδ᾿ ἐπ᾿ ἀρωγῇ, / μή ποτέ τις εἴπῃσιν ᾿Αχαιῶν χαλκοχιτώνων· / ‘᾿Αντίλοχον ψεύδεσσι βιησάμενος Μενέλαος / οἴχεται ἵππον ἄγων, ὅτι οἱ πολὺ χείρονες ἦσαν / ἵπποι, αὐτὸς δὲ κρείσσων ἀρετῇ τε βίῃ τε.’ / εἰ δ᾿ ἄγ᾿ ἐγὼν αὐτὸς *δικάσω*, καί μ᾿ οὔ τινά φημι / ἄλλον ἐπιπλήξειν Δαναῶν· ἰθεῖα γὰρ ἔσται" (*The Iliad*, XXIII, vv. 573–80). "Come now, ye leaders and rulers of the Argives, *judge* ye aright betwixt us twain, neither have regard unto either, lest in aftertime some one of the brazen-coated Achaeans shall say: 'Over Antilochus did Menelaus prevail by lies, and depart with the mare, for that his horses were worser far, but himself the mightier in worth and in power.' Nay, but I will myself *declare the right*, and I deem that none other of the Danaans shall reproach me, for my judgment shall be just" (ibid.). "Sed agite Argivorum ductores et principes, / in medium utrisque *dijudicate*, neque in gratiam: / ne quando quis dicat Achivorum aere loricatorum, / Antilochum mendaciis opprimens Menelaus / ivit equam ducens; nam ei longe deteriores erant / equi, ipse vero melior armisque vique. / Eja age ego ipse *dijudicabo*, et me nullum puto / alium increpaturum Danaorum: rectum enim erit *judicium*" (Bergler 1791–1792, vol. 1; italics added on first and second occurrence).

12.2.5. "Right" and "Wrong" as Adjectives Used to Qualify Things and People

I already considered *huper moron* or *huper aisan* behaviours in Section 11.3.3. These behaviours are beyond measure—immoderate, in the etymological sense of this term, from Latin *modus* ("measure," "size," "limit," "manner," "harmony," "melody"): *Est modus in rebus* ("There is a measure in all things" Horace, *Satires*, I, 1, 106). They are unright, and in this sense wrong, behaviours.

Behaviours that are right, within bounds, correct (even politically correct) are *kata moiran* or *kata aisan* behaviours. And people who in Homeric epic are correct, or right, are *dikaioi*: They conform to proprieties, to the contents of norms, to what is objectively right.

For example: "Pisistratus hands a wine cup to the elder of the two visitors (Athene in disguise). Athene is gratified: Pisistratus "is a 'just [*dikaios*] man,' that is, he does the *right thing*" (Havelock 1978, 156; italics added); "So he spake, and placed in her hand the cup of sweet wine. But Pallas Athene rejoiced at the man's wisdom and judgment ["khaire d' Athēnaiē pepnumenōi andri *dikaiōi*"; "delectata est autem Minerva prudenti viro et *justo*"], in that to her first he gave the golden cup."[25]

People and behaviours that are incorrect, unright, wrong are said to be *exaisioi* and *kakoi*, *hubrizoi*: They overstep the bounds of propriety; they are exaggerated, eccentric, outlandish (*hubrizoi* is exemplified by Penelope's suitors, who with great villainy crowded her house to have her choose one of them as her new husband).

> The characters grouped round the house of Odysseus (aside from traitors), consisting of wife, son, and servants, political supporters, and finally Odysseus himself, are consistently represented or represent themselves as protesting against *wrongs* which are inflicted upon them. Their opponents, the suitors, with equal consistency are represented as the inflicters of *wrong*, not just as enemies. (Havelock 1978, 150–1; italics added)

Several moral formulas in Homeric epic contain the word *dikaios*: "right," in my translation (mostly "just" in that of Havelock, who observes that *dikaios* occurs in these formulas as "an epithet applicable to certain kinds of human beings").[26] In this regard, too, Havelock uses terms (here italicised for emphasis) that are welcome for the way they evoke the role of beliefs and the cultural nature of normativeness:

> Two epithets [are] constantly employed in both epics to indicate moral disapproval. They are *schetlios* [as transliterated by Havelock] and *atasthalos* [...]. They denote persons or actions which exceed the bounds of what is allowable. But what precisely is the allowable if it is not what

[25] English translation by A. T. Murray. Homer, *The Odyssey*, III, vv. 51–4; enclosed within square brackets are the Greek original and Bergler's Latin translation (Bergler 1791–1792, vol. 2), with italics added to mark off relevant terms.

[26] "The adjective may seem commonplace enough, but it is in the *Odyssey* that it seems to come into its own. Occurrences in the *Iliad* are rare" (Havelock 1978, 179).

is *deemed* seemly or appropriate, this being determined by the regular and recurrent patterns of behavior in the *culture*, whatever these may happen to be? (Havelock 1978, 183; italics added)

Havelock suggests that the above-mentioned moral formulas give place to an echo pattern in which the adjective *dikaios* may or may not occur, and even when it does not, its presence can still be felt implicitly. And he identifies eight ways in which the above-mentioned moral formulas permeate Homer's epic.

The first of these ways in which the echo pattern shows up is with the adjective *dikaios* not appearing: For example, in *The Odyssey*, I, v. 368, Homer "merely identifies" Penelope's "suitors pejoratively as committing *hubris*, [...], 'outrage' being only one possible rendering, though perhaps the least unsatisfactory" (Havelock 1978, 185, 190–1).

The second way in which this echo pattern shows up is with Homer introducing explicitly the adjective *dikaios* (ibid., 185, 187, 191). See, for example, *The Odyssey*, III, v. 133, where Nestor says that Zeus planned a painful return for the Argives, for they had shown themselves to be neither intelligent nor *dikaioi*.

In the third way, Homer "more significantly connects the commission of outrage with deliberate intention, giving it a psychological dimension," and the adjective *dikaios* does not appear, either, as it does not in the first way (ibid., 185, 188, 189, 191). See, for example, *The Odyssey*, XX, vv. 169–71, where Odysseus, in the guise of a beggar, turns to Eumaeus expressing the wish that the Gods avenge the abominable outrage which the suitors have had in another's house, showing no due portion of respect.

In the fourth way, Homer brings the outrageous and the *dikaios* together "in a formal antithesis, the 'outrageous' man being equated with the 'savage'" (ibid., 186, 191): Such is the case with the Cyclopes as previously considered in Section 12.2.2. Cf., for example, *The Odyssey*, IX, vv. 174–6.

In the fifth way, Homer "returns to purely pejorative idioms, linking *hubris* with *bia*, outrage with violence or physical aggression." Even here, as in the first and third way, *dikaios* does not appear (Havelock 1978, 187, 188, 191). See, for example, *The Odyssey*, XVII, vv. 561–73, where Odysseus, in the guise of a beggar, turns to Eumaeus saying that he will soon disclose all the truth to Penelope. But now is not the moment: Prudence requires waiting until nightfall, because the suitors' outrage and violence is too strong now.

In the sixth way, "*hubris* is retained as the negative term, but it is interesting that *dikē* will not do as the positive one. A metrical means for using it could have been devised if required. Instead, the term 'orderliness' (*eunomia*) is substituted" (ibid., 187, 191). Thus, in *The Odyssey*, XVII, vv. 483–7, one of the suitors turns to Antinous and says he should not have struck the beggar (Odysseus), for there may be concealed in him a divinity, who has come down to earth to witness the behaviour of men, their outrage and orderliness (*eunomia*).[27]

[27] Strangely enough, on page 187 Havelock translates *eunomia* as "lawfulness," whereas on

In the seventh way, Homer opposes the "right thing" (*to dikaion*) to violence, as each is embodied in speech (see Havelock 1978, 188, 189, 191; cf., for example, *The Odyssey*, XX, vv. 322–3): Havelock, without belying himself, renders *dikaios* as "just," and I—putting the lie to *him*, with his own arguments—render it as "right."

In the eighth way, Homer simply has Penelope oppose "the suitable and right thing" (*to kalon kai to dikaion*) to maltreatment of guests: Havelock, without belying himself, renders *dikaios* as "just," and I—putting the lie to *him*, with his own arguments—render it as "right" (Havelock 1978, 188, 189, 191; cf., for example, *The Odyssey*, XXI, vv. 312–3).

page 191 he keenly and convincingly suggests the translation "orderliness." "Lawfulness" is a standard translation but it is inappropriate because it merely suggests adherence to a rule: Indeed, there can be lawfulness under ill-framed laws. "Orderliness," in contrast, appropriately suggests things being in good order, and hence good laws.

Chapter 13

WHAT IS RIGHT, WHAT IS JUST, *RATIO* AS TYPE: *SANCTUS THOMA DOCET*

13.1. *Jus* in the History of the Idea of What Is Right

Like the terms *derecho*, *diritto*, *droit*, and *Recht* (as considered in Sections 1.2 and 1.3),[1] the Latin term *jus* means both "what is right" and "law," so even with regard to *jus*, when it comes to providing an English translation of it, we face an alternative between "what is right" and "law," or an ambiguity when *jus* carries both of these meanings. The meaning of *jus* in the Latin excerpt considered in Sections 4.1 and 4.3.3 is "what is right": We considered how Cicero, Spinoza, and others understand the matrix of normativeness (the matrix of the reality that ought to be), and hence the ultimate source of what is right by positive law.

According to Émile Benveniste, *jus* comes from Indo-European *yous*, meaning "the state of regularity or normality required by ritual rules" (Benveniste 1969, 113), and it expresses

> the Indo-European notion of conformity with a rule—of a requirement to be met—in order that an object (a thing or a person) be accepted, fulfil its office, and have all the effects pertaining to the latter. (Benveniste 1969, 119; my translation)[2]

Moreover, *jus*—like *derecho*, *diritto*, *droit*, and *Recht*—means "what is right" in the two senses introduced in Section 1.2: the sense "what is objectively right" (as happens in *jus naturale*, *jus civile*, and *jus gentium*) and the sense "what is subjectively right" (as happens in *jus libertatis*, *jus civitatis*, *jus sententiae dicendae*, and *jus retinendi*).[3]

[1] The ancient Greek term *dikē*, as it occurs in Homeric epic, was considered in Section 12.2, where we saw how in different contexts, and depending on inflection, it can take the meaning "what is objectively right" (*dikē*, in the singular) or "what is subjectively right" (*dikai*, in the plural).

[2] The French original: "La notion indo-européenne de conformité à une règle, de conditions à remplir pour que l'objet (chose ou personne) soit agréé, qu'il remplisse son office et qu'il ait toute son efficace" (Benveniste 1969, 119). On the concept of *jus* in Aquinas, see, in Volume 6 of this Treatise, Lisska, Section 12.8. Moreover, on the ancient Roman conceptions of rights, see, in Volume 6 of this Treatise, Miller, Section 6.6. On conceptions of rights in medieval canon law, see, in Volume 6 of this Treatise, Reid, Section 10.5.

[3] Michel Villey (1953–1954, 170ff.—Michel Villey, 1914–1988) argues perspicuously that in Roman law *jus* signified what is right with reference to the subjects, whether they were duty-holders or right-holders. Cf. Villey 1946–1947. See also the different positions of Giovanni Pugliese (1914–1995) in Pugliese 1953.

Over the centuries, authoritative translations of terms that are crucial in legal philosophy and general jurisprudence, as is the case with the Latin *jus* and the Greek *dikē*, have become firmly lodged in the major European languages, and yet these translations are unfortunately sometimes misleading not only with regard to the distinction between "law" and "what is right" (Sections 1.2 and 1.3 and Chapter 14) but also with regard to the distinction between "what is right" and "justice" (such is the case, in particular, with *dikē* in the Homeric poems, as we saw in Chapter 12).[4]

To be sure, "right" and "just" are often used interchangeably, each to signify the other. Even so, the two concepts must be kept separate, and it will be necessary to decide, by looking at the context, the sense in which the two words are used. Of course they may find a use so ambiguous that it becomes impossible to give them a specific meaning, even taking context into account. At any rate, now is the time to settle the question, at least for the purposes of this volume, of the distinction between "what is right" and "justice." I will do that in this chapter, making special reference to Aquinas and to his way of characterising *jus* and *justitia*.

There are of course many reasons for choosing Aquinas, one of them being his role as a liaison between Aristotelian and Christian thought: In the 13th century Aquinas represents a crucial anchor point in the continuity of the renewed development and vigour of Western philosophy. The circumscribed ambit of this volume—on law and the right—gives me a specific and additional reason for choosing Aquinas. Essentially, I will be referring to him even in treating the relationship among "type," "norm," and "what is right" (*ratio*, *lex* and *jus*: cf. Sections 4.1 and 4.2.1). There is in Aquinas an interweaving of *ratio*, *lex*, *jus*, and *justitia*. Multiple strands are plied together in this interweaving, but its chief ones are three: (*a*) reason (*ratio*: synderesis and prudence), which makes right what is right (see Sections 13.2, 13.7, and 13.8); (*b*) normativeness (*virtus obligandi*, the virtue of being binding: the binding power or force proper to *leges*, or norms; see Sections 13.4 through 13.7); and (*c*) virtuous action (*actus virtuosus*), meaning action that is voluntary, stable, and firm (*voluntarius, stabilis et firmus*; see Sections 13.3 through 13.6).[5]

[4] The deontological idea of rightness (of the right, what is right) is different from the axiological, teleologically oriented idea of justice (of the just, what is just). Indeed, it makes sense to say of a behaviour that it is right (correct) but not just (fair), and vice versa. The idea that if something is a norm it will be binding per se (duty for its own sake: Kant) determines the deontological idea of what is right, but not the axiological, teleologically oriented idea of what is just. Finnis (1980, 298) writes that "we must set aside as spurious the categorizations of a textbook tradition which divides all moral thought between 'deontological ethics of obligation' and 'teleological ethics of happiness or value.'" Finnis's invitation is pertinent if intended to say that in Aquinas the two aspects, the teleological and the deontological, interweave.

[5] It will be a good idea to note down right now two of the senses that *virtus* takes in Aquinas: we have (*a*) a broad sense, under which *virtus* means "characteristic that comes

13.2. Three Senses of *Quod Est Rectum*, or What Is Right. *Jus* as What Is Right (*Quod Est Rectum*) toward Others

We can construct out of the *Summa Theologiae* a distinction among three senses of *quod est rectum*, or "what is right." (The third of these senses is expressed by Aquinas with the Latin *jus*.) Let us look at them in turn.

(*i*) "Whatever can be rectified by reason [or made right by reason] is the matter of moral virtue, for this is defined in reference to right reason [*omnia quaecumque rectificari possunt per rationem, sunt materia virtutis moralis, quae definitur per rationem rectam*]" (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 8).[6]

Here, what is right (*quod est rectum*) is determined solely by reason (*ratio*): Reason makes right. All that can be made right by reason (*ratio*) is the subject matter (*materia*) of the moral virtues, and what is right (*quod est rectum*) is the objective (*objectum*) of the moral virtues. Still, no moral virtue is taken into account in determining this first, larger sense of "what is right" (*quod est rectum*): Only reason (*ratio*) enters into this determination.

We should want to make a note already of the distinction between "subject matter" (*materia* or *subjectum*) and "objective" (*objectum*). I will return to it in Sections 13.3 and 13.7.

(*ii*) The second sense of "what is right" (*quod est rectum* as made such by *ratio*) comes into play when making reference to one or another of the moral virtues and to its subject matter. It is irrelevant here which virtue we are making reference to: It might be the virtue of temperance, whose subject matter is desire, or the virtue of fortitude, whose subject matter is anger, or again the virtue of justice, whose subject matter is the will of the acting person in regard to his or her actions and insofar as these actions affect other people.

This second sense of "what is right" (*quod est rectum*) is narrower than the previous but is still a broad sense: Its narrow, and proper, sense is that specified under the following point (*iii*).

(*iii*) This third sense of "what is right" (*quod est rectum* as made such by *ratio*)—its strict sense—comes into play when making specific reference to the moral virtue of justice (*justitia*), whose subject matter is the *will* of the acting

through in a causal power" (thus, for example, the sun has the *virtus* of heating the bodies it sheds light on, and here *virtus* is a causal power); and then we have (*b*) a narrow sense (we might call it a technical sense), under which *virtus* means "attitude" (*habitus* in Latin, *hexis* in Greek), as is the case with the moral virtues, such as fortitude, temperance, and justice.

[6] Aquinas himself refers to Aristotle's *Nicomachean Ethics*, and to this passage in particular: "Virtue [*aretē*] then is a settled disposition of the mind [an attitude: *hexis*] determining the choice of actions and emotions, consisting essentially in the observance of the mean relative to us [*mesotēti ousa tēi pros hēmas*], this being determined by principle [reason: *logōi*], that is, as the prudent man [*phronimos*] would determine it" (Aristotle, *The Nicomachean Ethics*, 1106b–1107a). The Greek original: "Ἔστιν ἄρα ἡ ἀρετὴ ἕξις προαιρετική, ἐν μεσότητι οὖσα τῇ πρὸς ἡμᾶς, ὡρισμένῃ λόγῳ καὶ ὡς ἂν ὁ φρόνιμος ὁρίσειεν."

person in regard to his or her actions and insofar as these actions *affect other people*.

This strict sense of "what is right" (*quod est rectum*) is specifically expressed by the term *jus* (Sections 13.3 and 13.7).

What is right (*quod est rectum*) is invariably made right by reason (by *ratio*): Nothing is made right if not by reason. But where moral virtues other than justice are concerned, it is made right with respect to the acting person only. Instead, where the moral virtue of justice is concerned, it is made right (by reason: by *ratio*) with respect as well, and indeed in the first instance, to such other people as find themselves affected by the acting person's action.

Aquinas says it in this way:

> The other virtues [the virtues other than justice] perfect man in those matters only which befit him in relation to himself. Accordingly that which is right [what is right: *quod est rectum*] in the works of the other virtues, and to which the intention of the virtue tends as to its proper object [objective: *objectum*], depends on its relation to the agent only. (Aquinas, *Summa Theologiae* (b), 2.2, q. 57, a. 1)[7]

> Man's dealings with himself are sufficiently rectified [made right] by the rectification of the passions by the other moral virtues [the moral virtues other than justice]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 2)[8]

> The other moral virtues [the virtues other than justice] are chiefly concerned with the passions, the regulation of which [their rectification: *rectificatio*] is gauged entirely by a comparison with the very man who is the subject of those passions, in so far as his anger and desire are vested with their various due circumstances. Hence the mean in such like virtues is measured not by the proportion of one thing to another, but merely by comparison with the virtuous man himself, so that with them the mean is only that which is fixed by reason [*secundum rationem*] in our regard [*quoad nos*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 10)[9]

But where justice is concerned, says Aquinas, man's

> dealings with others need a *special* rectification [*rectificatio*], not only in relation to the agent, but also in relation to the person to whom they are directed [*ad quem sunt*]. Hence about such

[7] The Latin original: "Aliae autem virtutes perficiunt hominem solum in his, quae ei conveniunt secundum seipsum; sic ergo illud, *quod est rectum* in operibus aliarum virtutum, ad quod tendit intentio virtutis quasi in proprium objectum, non accipitur nisi per comparationem ad agentem" (Aquinas, *Summa Theologiae* (a), 2.2, q. 57, a. 1; italics added).

[8] The Latin original: "Actiones quae sunt hominis ad seipsum, sufficienter rectificantur, rectificatis passionibus, per alias virtutes morales" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 2).

[9] The Latin original: "Aliae virtutes morales [virtues other than justice] principaliter consistunt circa passiones; quarum rectificatio non attenditur nisi secundum comparationem ad ipsum hominem, cujus sunt passiones; secundum scilicet quod irascitur, et concupiscit, prout debet, secundum diversas circumstantias; et ideo medium talium virtutum non accipitur secundum proportionem unius rei ad alteram, sed solum secundum comparationem ad ipsum virtuosum: et propter hoc in ipsis est medium solum secundum rationem quoad nos" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 10; cf. a. 8).

dealings there is a *special* virtue, and this is justice [*justitia*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 2; italics added)[10]

Now the reason [*ratio*] can rectify not only the internal passions of the soul, but also external actions, and also those external things of which man can make use. And yet it is in respect of external actions and external things by means of which men can communicate with one another, that the relation [the ordainment: *ordinatio*] of one man to another is to be considered; [...] since justice [*justitia*] is directed [ordained:[11] *ordinetur*] to others, it is not about the entire matter of moral virtue, but only about external actions and things, under a certain special aspect of the object [according to a special type of objective: *secundum quamdam rationem objecti specialem*], in so far as one man is related [*coordinatur*] to another through them. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 8)[12]

In this excerpt, and in truth in other excerpts as well, the Fathers of the English Dominican Province have translated the Latin *ratio* to "aspect." But in this case, and in others similar to it, "aspect" is ill-suited, and *ratio* is better translated as "type," "schema," "concept." It is important for us in this volume to detect this sense of *ratio* in Aquinas's *Summa Theologiae* because, as we will see, this sense corresponds to a great extent to the sense attributed to types in Section 2.1. This point I will come back to in Sections 13.7 and 13.8.[13]

13.3. *Jus* as the Objective of Justice: *Justitia Est Rectitudo Causaliter Tantum*

Justice, unlike any of the other virtues, ordains us in those matters that affect others; it entails a sort of *equality*, and, as the name suggests, it makes one

[10] The Latin original: "Sed actiones, quae sunt ad alterum, indigent speciali rectificatione, non solum per comparationem ad agentem, sed etiam per comparationem ad eum, ad quem sunt: et ideo circa eas est specialis virtus, quae est justitia" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 2).

[11] In the pages that follow, *ordinare*, *ordinari*, and *ordinatio*, as these words occur in *Summa Theologiae* (a), I will translate as "ordain," "be ordained," and "ordainment" respectively. This may be something of a stretch, but it helps to convey the idea of preordination or foreordination (taking into account as well the preordaining that God effects with the *lex aeterna*).

[12] The Latin original: "Possunt autem per rationem rectificari et interiores animae passiones, et exteriores actiones, et res exteriores, quae in usum hominis veniunt: sed tamen per exteriores actiones, et per exteriores res, quibus sibi invicem homines communicare possunt, attenditur ordinatio unius hominis ad alterum [...]; [...] cum justitia ordinetur ad alterum, non est circa totam materiam virtutis moralis, sed solum circa exteriores actiones, et res, secundum quamdam rationem objecti specialem; prout scilicet secundum eas unus homo alteri coordinatur" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 8).

[13] The reader should also refer in this regard to Volume 6 of this Treatise, Lisska, Chapter 12, esp. Sections 12.3 and 12.4. Here Lisska shows clearly how the theory of Platonic archetypes or forms, as received in the Middle Ages by way of Plotinus (A.D. 204/205–270) and Augustine, bears importantly on Aquinas's conception of *lex aeterna*, and consequently on his conception of *lex naturalis*. Lisska speaks of a theory of natural kinds in Aquinas. I prefer to speak of types, this on account of the role that in this volume I have assigned to "type" and to the concept I want this term to express.

thing adequate (*justari*) to another. What is right in acts of justice is what is right in regard to others before being so in regard to the acting subject (it is *justum*, *quod respondet secundum aliquam aequalitatem alteri*).

It is proper to justice, as compared with the other virtues, to direct man in his relations with others [to ordain man in those things that affect others: *ut ordinet hominem in his, quae sunt ad alterum*]: because it denotes a kind of equality, as its very name implies; indeed we are wont to say that things are adjusted [*justari*] when they are made equal [or adjusted: *adaequantur*], for equality is in reference of one thing to some other. [...] the right [*rectum*] in a work of justice [*justitiae*], besides its relation to the agent, is set up by its relation to others [*per comparationem ad alium*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 57, a. 1)[14]

Something is said to be just insofar as it partakes of the rectitude of justice. The objective of justice is to attain *justum*, or, which Aquinas says amounts to the same thing, to attain *jus*. And this objective, *jus*, consists in what is right with respect to others.

A thing is said to be just [*justum*], as having the rectitude of justice [*rectitudinem justitiae*], when it is the term [*ad quod terminatur*] of an act of justice [...]. [...] justice has its own special proper object [objective: *objectum*] over and above the other virtues, and this object [objective: *objectum*] is called the just [*justum*], which is the same as *right* [*jus*, the strict sense of "what is right"]. Hence it is evident that right [*jus*, the strict sense of "what is right"] is the object [objective: *objectum*] of justice [*justitiae*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 57, a. 1)[15]

The word *jus* ["right," the strict sense of "what is right"] [...] was first of all used to denote the just thing itself [*ipsam rem justam*], but afterwards it was transferred to designate the art whereby it is known what is just [*quid sit justum*], and further to denote the place where justice is administered [*in quo jus redditur*, where *jus* expresses the strict sense of "what is right"], thus a man is said to appear *in jure*, and yet further, we say even that a man, who has the office of exercising justice [*justitiam facere*], administers the *jus* [*jus redditur*] even if his sentence be unjust [*iniquum*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 57, a. 1)[16]

The just man, Aquinas remarks, quoting Isidore of Seville (ca. 560–636), is said to be just because he keeps custody of *jus*, of what is right toward others: *Justus dicitur, quia jus custodit*.

[14] The Latin original: "Justitiae proprium est inter alias virtutes, ut ordinet hominem in his, quae sunt ad alterum: importat enim aequalitatem quamdam, ut ipsum nomen demonstrat, dicuntur enim vulgariter ea quae adaequantur *justari*, aequalitas autem ad alterum est: [...] rectum vero, quod est in opere justitiae, etiam praeter comparationem ad agentem, constituitur per comparationem ad alium" (Aquinas, *Summa Theologiae* (a), 2.2, q. 57, a. 1).

[15] The Latin original: "Justum dicitur aliquid, quasi habens rectitudinem justitiae, ad quod terminatur actio justitiae, [...] specialiter justitiae prae aliis virtutibus determinatur [...], secundum se objectum, quod vocatur *justum*: et hoc quidem est jus; unde manifestum est, quod jus est objectum justitiae" (Aquinas, *Summa Theologiae* (a), 2.2, q. 57, a. 1).

[16] The Latin original: "hoc nomen *jus* primo impositum est ad significandum ipsam rem justam: postmodum autem est derivatum ad artem, qua cognoscitur quid sit justum: et ulterius ad significandum locum, in quo jus redditur; sicut dicitur aliquis *comparere in jure*: et ulterius dicitur etiam, quod jus redditur ab eo, ad cujus officium pertinet justitiam facere, licet etiam id, quod decernit, sit iniquum" (Aquinas, *Summa Theologiae* (a), 2.2, q. 57, a. 1).

The act of justice in relation to its proper matter and object [its proper subject matter and *objectum*, or "objective"] is indicated in the words, *Rendering to each one his right* [*jus suum unicuique tribuens*], since, as Isidore says (*Etym.* x), *a man is said to be just because he respects the rights* [...] *of others* [where "rights" is *jus*, in the singular]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 1)[17]

The just man keeps custody of *jus*, of what is right toward others, for the moral virtue of justice endows him with a virtuous will (*voluntas*), a will that is conscious, stable, and firm (*sciens*, *stabilis*, and *firmus*; cf. Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 1).[18] Indeed "*justice is a habit* [an attitude: *habitus*; *hexis* in Aristotle] *whereby a man renders to each one his due* [what is *subjectively* right: *jus suum*] *by a constant and perpetual will*" (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 1).[19]

Note how in the foregoing passages, *jus* has quite appropriately and consistently been translated by the Fathers of the English Dominican Province as "right."

In Article 4 of the same Quaestio 58 of Pars 2.2 of *Summa Theologiae* (b), Aquinas specifies as follows the relationship between the virtues and their subject matter, on the one hand, and the subject matter specific to justice, on the other.

The subject of a virtue [its subject matter: *subjectum*] is the power [*potentia*] whose act that virtue aims at [is ordained to: *ordinatur*] rectifying [*rectificandum*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 4)[20]

Note the use of the verb *ordinari*—the passive voice of the Latin verb *ordinare*—expressing the concept of something being so ordained as to achieve a certain end or objective, or so arranged as to bring out that result (cf. Section 13.2, footnote 11). The subject matter of a virtue is that power (*potentia*) whose act the same virtue is ordained (*ordinatur*) to rectify, or make

[17] The Latin original: "Actus justitiae per comparationem ad propriam materiam [subject matter], et objectum [objective] tangitur, cum dicitur: *Jus suum unicuique tribuens*: quia, ut Isidorus dicit in lib. 10. Etym. (*ad lit. I*): *Justus dicitur, quia jus custodit*" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 1).

[18] "In order that an act bearing upon any matter whatever be virtuous, it requires to be voluntary [*voluntarius*], stable [*stabilis*], and firm [*firmus*], because the Philosopher says (*Ethic.* ii. 4) that in order for an act to be virtuous it needs first of all to be done *knowingly* [*sciens*], secondly to be done *by choice*, and *for a due end* [*eligens et propter debitum finem*], thirdly to be done *immovably* [*immobiliter*]" (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 1). The Latin original: "Quod aliquis actus circa quamcumque materiam sit virtuosus, requiritur quod sit voluntarius, et quod sit stabilis et firmus; quia Philos. dicit in 2. Ethic. (*cap. 4.*), quod ad virtutis actum requiritur, primo quidem quod *operetur sciens*: secundo autem quod *eligens, et propter debitum finem*: tertio quod *immobiliter operetur*" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 1).

[19] The Latin original: "justitia est habitus, secundum quem aliquis constanti, et perpetua voluntate jus suum unicuique tribuit" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 1).

[20] The Latin original: "Illa potentia est subjectum virtutis, ad cujus potentiae actum rectificandum virtus ordinatur" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 4).

right. The objective to which every moral virtue gets ordained is that thing which is right (what is right: *quod est rectum*) for the act of that virtue's subject matter. Since the subject matter of justice is the will behind those actions by which the agent affects other people, the objective to which justice is ordained is what is right in those actions that affect other people. The *subject matter* of justice is the will behind the agent's action, this to the extent that this action affects other people. Hence, the *objective* to which justice is ordained is the rightness (in the sense of "what is right") of an agent's acts of will to the extent that this agent's actions affect other people.

Aquinas circumscribes to the practical sphere—to action—the subject matter (*subjectum*) of justice as against the theoretical sphere: Justice is a *moral* virtue.

Justice does not aim at directing [is not ordained to direct: *non ordinatur ad dirigendum*] an act of the cognitive power [*actum cognoscitivum*], for we are not said to be just [*justi*] through knowing something aright [*recte*]. Hence the subject of justice [its subject matter: *subjectum*] is not the intellect or reason which is a cognitive power [*intellectus, vel ratio, quae est potentia cognoscitiva*]. But since we are said to be just [*justi*] through doing something aright [*aliquid recte agimus*], and because the proximate principle of action is the appetitive power [appetitive force: *vis appetitiva*], justice must needs be in some appetitive power [appetitive force: *vis appetitiva*] as its subject [subject matter: *subjecto*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 4)[21]

The appetitive force (*vis appetitiva*) which is the subject matter of justice is the will. In the words of Aquinas:

The appetite is twofold; namely, the will which is in the reason [*voluntas, quae est in ratione*], and the sensitive appetite which follows on sensitive apprehension [*appetitus sensitivus consequens apprehensionem sensus*], and is divided into the irascible and the concupiscible [...]. Again the act of rendering his due [*quod suum est*] to each man cannot proceed from the sensitive appetite, because sensitive apprehension does not go so far as to be able to consider the relation [*proportionem*] of one thing to another; but this is proper to the reason [*proprium rationis*]. Therefore justice cannot be in the irascible or concupiscible as its subject [its subject matter: *subjecto*], but only in the will [*solum in voluntate*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 4)[22]

[21] The Latin original: "Justitia autem non ordinatur ad dirigendum aliquem actum cognoscitivum: non enim dicimur justi ex hoc quod recte aliquid cognoscimus; et ideo subjectum justitiae non est intellectus, vel ratio, quae est potentia cognoscitiva: sed quia justi in hoc dicimur quod aliquid recte agimus, proximum autem principium actus est vis appetitiva, necesse est quod justitia sit in aliqua vi appetitiva sicut in subjecto" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 4).

[22] The Latin original: "Est autem *duplex* appetitus; scilicet *voluntas*, quae est in ratione; et *appetitus* sensitivus consequens apprehensionem sensus, qui dividitur per irascibilem, et concupiscibilem, ut habitum est in part. 1. *(q. 81. art. 2.)*: reddere autem unicuique quod suum est, non potest procedere ex appetitu sensitivo: quia apprehensio sensitiva non se extendit ad hoc, quod considerare possit proportionem unius ad alterum; sed hoc est proprium rationis; unde justitia non potest esse sicut in subjecto in irascibili, vel concupiscibili, sed solum in voluntate" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 4).

In conclusion, says Aquinas, "justice is rectitude, though not by essence, but only as a cause, in that justice is an attitude according to which somebody acts and wills rightly" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 1; my translation. The Latin original, emphasis added: *Neque etiam justitia est* essentialiter *rectitudo, sed* causaliter *tantum, est enim habitus, secundum quem aliquis recte operatur, et vult.*).[23]

The conception of justice as *virtus ad alterum* is closely bound up with the peculiar rational nature of will:

> The will is borne towards its object [objective: *objectum*] consequently on the apprehension of reason [*rationis*]: wherefore, since the reason directs one thing in relation to another [reason ordains one thing to another: *ratio ordinat in alterum*], the will can will one thing in relation to another [the will can will one thing as ordained to another: *voluntas potest velle aliquid in ordine ad alterum*], and this belongs to justice. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 4)[24]

What is right (*jus*) is the objective of the virtue of justice, yet justice does not make right what is right; it does not determine *jus*—rather, it causes people to pursue it.

13.4. The Justice of Human-Posited Norms (*Justitia Legalis*) Presupposes the Constant and Perpetual Just Will of the Ruler Who Has the Community in His Care

A norm, as I describe norms in Section 1.3 (where I reconstruct the civil-law tradition of legal dogmatics), contains a type, or rule, and makes this type right by qualifying it as obligatory, permitted, or forbidden. In Aquinas's words, a rule (*regula*)—in my words, a type specifying what is right—becomes the content of a *lex* (of a norm) when a *lex* subsists in the sense of meeting the requirements stated in the definition of *lex* found in *Summa Theologiae* (a), 1.2, q. 90, aa. 1 and 4: "Lex quaedam regula est, et mensura actuum, secundum quam inducitur aliquis ad agendum, vel ab agendo retrahitur: dicitur enim lex a ligando, quia obligat ad agendum": "A norm is a kind of rule, and a measure for acts by which one is induced to act or is held back from acting: Indeed *lex* [norm] is so called from *ligare* [to bind], because it obligates one to act" (Aquinas, *Summa Theologiae* (a), 1.2, q. 90, a. 1; my translation).[25]

[23] In the translation of the Fathers of the English Dominican Province: "Justice is the same as rectitude, not essentially but causally; for it is a habit [an attitude: *habitus*] which rectifies the deed and the will" (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 1).

[24] The Latin original: "Voluntas fertur in suum objectum consequenter ad apprehensionem rationis; et ideo quia ratio ordinat in alterum, voluntas potest velle aliquid in ordine ad alterum: quod pertinet ad justitiam" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 4).

[25] This is the English translation by the Fathers of the English Dominican Province: "Law is a rule and measure of acts, whereby man is induced to act or is restrained from acting: for *lex* [in my translation, "the norm"] [...] is derived from *ligare* (to bind), because it binds one to act" (Aquinas, *Summa Theologiae* (b), 1.2, q. 90, a.1).

In Aquinas's words again, *lex* is "quaedam rationis ordinatio ad bonum commune, ab eo, qui curam communitatis habet, promulgata": A norm is "an ordainment which reason makes to achieve the common good, and which is promulgated by him who governs the community" (Aquinas, *Summa Theologiae* (a), 1.2, q. 90, a. 4; my translation).[26]

And here is Aquinas's general definition of *lex*, in which there occur all the essential elements of *lex*, including its promulgation (*promulgatio ipsa necessaria est ad hoc, quod lex habeat suam virtutem*: the *virtus obligandi*):

A norm [*lex*] is imposed on others in the manner of a rule and a measure [*per modum regulae, et mensurae*]. Rules and measures are imposed by application: They are applied to those things that need to be ruled and measured. Therefore, if a norm [*lex*] is to obtain a binding power [*virtus obligandi*]—which power is proper to norms [*proprium legis*]—it will have to be applied to those people who are to be ruled according to it [*qui secundum eam regulari debent*]. Such application is effected as follows: The norm is promulgated and thereby made known to those people to whom it is to apply, so that promulgation is itself necessary if a norm is to have its power [*quod lex habeat suam virtutem*]. So from the four points previously mentioned we can gather a definition of norm [*legis*]: A norm is nothing other than an ordainment of reason [*rationis ordinatio*; cf. the Greek *taxis*] promulgated by him who has the community in his care. (Aquinas, *Summa Theologiae* (a), 1.2, q. 90, a. 4; my translation)[27]

At the same time, as we have seen, Aquinas presents his definition of justice by drawing on Aristotle:

The definition of justice mentions first the *will*, in order to show that the act of justice must be voluntary; and mention is made afterwards of its *constancy* and *perpetuity* in order to indicate the firmness of the act. [...] *justice is a habit* [an attitude: *habitus*; *hexis* in Aristotle] *whereby a man renders to each one his due* [what is *subjectively* right: *jus suum*] *by a constant and perpetual*

[26] This is the English translation by the Fathers of the English Dominican Province: "An ordinance of reason for the common good, made by him who has care of the community, and promulgated" (Aquinas, *Summa Theologiae* (b), 1.2, q. 90, a. 4).

[27] The Latin original: "Lex imponitur aliis per modum regulae, et mensurae: regula autem, et mensura imponitur per hoc, quod applicatur his quae regulantur, et mensurantur; unde ad hoc quod lex virtutem obligandi obtineat, quod est proprium legis, oportet quod applicetur hominibus, qui secundum eam regulari debent: talis autem applicatio fit per hoc, quod in notitiam eorum deducitur ex ipsa promulgatione; unde promulgatio ipsa necessaria est ad hoc, quod lex habeat suam virtutem. Et sic ex quatuor praedictis potest colligi definitio legis: quae nihil est aliud, quam quaedam rationis ordinatio ad bonum commune, ab eo, qui curam communitatis habet, promulgata" (Aquinas, *Summa Theologiae* (a), 1.2, q. 90, a. 4). On every occurrence in this passage, *virtus* takes the meaning "causal power" as specified under point (*a*) in footnote 5 of this chapter. This is the English translation by the Fathers of the English Dominican Province, a translation I feel is off course at a few crucial points: "A law is imposed on others by way of a rule and measure. Now a rule or measure is imposed by being applied to those who are to be ruled and measured by it. Wherefore, in order that a law obtain the binding force which is proper to a law, it must needs be applied to the men who have to be ruled by it. Such application is made by its being notified to them by promulgation. Wherefore promulgation is necessary for the law to obtain its force. Thus from the four preceding articles, the definition of law may be gathered; and it is nothing else than an ordinance of reason for [*ad*] the common good, made by him who has care of the community, and promulgated" (Aquinas, *Summa Theologiae* (b), 1.2, q. 90, a. 4).

will: and this is about the same definition as that given by the Philosopher (*Ethic*. v. 5) who says that *justice is a habit* [an attitude: *habitus*; *hexis* in Aristotle] *whereby a man is said to be capable of doing just actions* [the right thing: *tōn dikaiōn* in Greek] *in accordance with his choice*. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 1)[28]

Aquinas specifies that *perpetua* can take two meanings as a modifier of *voluntas*:

The will may be called perpetual in two ways. First on the part of the will's act which endures for ever, and thus [in this first way] God's will alone is perpetual. Secondly on the part of the subject [on the part of the objective of the will: *ex parte objecti*], because, to wit, a man wills to do a certain thing always [and so the objective remains unchanged], and this is a necessary condition of justice [and this is required for the type "justice": *et hoc requiritur ad rationem justitiae*]. For it does not satisfy the conditions of justice [the type "justice": *rationem justitiae*] that one wish to observe justice in some particular matter for the time being, because one could scarcely find a man willing to act unjustly in every case; and it is requisite that one should have the will to observe justice at all times and in all cases. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 1)[29]

The definition of justice as a constant and perpetual will (perpetual in the second sense just specified) applies as well to the ruler: to the person who has the community in his care. Justice presides over norms in the sense that it presides over the will of those who have the power to create norms (*leges*). The ruler of a community will promulgate just norms (*leges*) on the twofold condition of possessing the right reason and the virtuous will: On the one hand, where reason is concerned, the ruler must have at hand the rules dictated by legislative prudence (by *legispositiva*, *nomothetikē*, norm-positing prudence: cf. Aquinas, *Summa Theologiae* (a), 2.2, q. 57, a. 1); on the other hand, where the will is concerned, the ruler must be possessed of justice, that is, of a conscious, stable, and firm will that will sustain him consistently in promulgation,[30] and hence in transforming the rules dictated by prudence into binding norms, into *leges* having *legis virtus*, or *virtus obligandi* (cf. Aquinas, *Summa Theologiae* (a), 1.2, q. 90, a. 4; see also footnote 5 in Section 13.1 and footnote 27 in this section).

[28] The Latin original: "In definitione justitiae primo ponitur *voluntas*, ad ostendendum quod actus justitiae debet esse voluntarius: additur autem de constantia et perpetuitate ad designandam actus firmitatem; [...] *justitia est habitus, secundum quem aliquis constanti, et perpetua voluntate jus suum unicuique tribuit*: et quasi est eadem definitio cum ea, quam Philos. ponit in 5. Ethic. *(cap. 5.)* dicens 'quod justitia est habitus, secundum quem aliquis dicitur operativus secundum electionem justi'" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 1; italics added on second occurrence).

[29] As I have indicated in my square brackets, the English translation fails to capture, here too, the sense of Aquinas's words, and in particular his sense of *ratio* as "type." The Latin original: "Voluntas potest dici perpetua *dupliciter*: *uno modo* ex parte ipsius actus, qui perpetuo durat: et sic solius Dei voluntas est perpetua: *alio modo* ex parte objecti, quia scilicet aliquis vult perpetuo facere aliquid, et hoc requiritur ad rationem justitiae; non enim sufficit ad rationem justitiae, quod aliquis velit ad horam in aliquo negotio servare justitiam, quia vix invenitur aliquis, qui velit in omnibus injuste agere: sed requiritur, quod homo habeat voluntatem perpetuo, et in omnibus justitiam conservandi" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 1).

[30] A will that will sustain him perpetually in the second sense of "perpetual" as specified a moment ago in the words of Aquinas: *Summa Theologiae* (a), 2.2, q. 58, a. 1.

These *leges* will not be *leges*, but rather *legum corruptio*—they will not be norms but the forgery of norms—if they should come to be at variance with *lex naturalis*, that is, with their matrix in the sense specified in Chapter 4 (and Section 4.1 in particular).

In Pars 1.2, q. 96, a. 4, Aquinas explains the ways a *lex* can be unjust:

Laws [norms: *leges*] may be unjust in two ways: first, by being contrary to human good [...]—either in respect of the end, as when an authority imposes on his subjects burdensome laws [norms: *leges*], conducive, not to the common good, but rather to his own cupidity or vainglory;—or in respect of the author, as when a man makes a law [a norm: *legem*] that goes beyond the power committed to him;—or in respect of the form, as when burdens are imposed unequally on the community, although with a view to the common good. The like are acts of violence rather than laws [norms: *leges*]; because, as Augustine says (*De Lib. Arb.* i. 5), *a law* [a norm: *lex*] *that is not just, seems to be no law* [norm] *at all.* Wherefore such laws [norms: *leges*] do not bind in conscience, except perhaps in order to avoid scandal or disturbance, for which cause a man should even yield his right [*juri suo*], according to Matth. v. 40, 41: *If a man . . . take away thy coat, let go thy cloak also unto him; and whosoever will force thee one mile, go with him other two.*

Secondly, laws [norms: *leges*] may be unjust through being opposed to the Divine good: such are the laws [the norms: *leges*] of tyrants inducing to idolatry, or to anything else contrary to the Divine law [the Divine norm: *legem*]: and laws [norms: *leges*] of this kind must nowise be observed, because, as stated in Acts v. 29, *we ought to obey God rather than man.* (Aquinas, *Summa Theologiae* (b), 1.2, q. 96, a. 4)[31]

13.5. In What Sense Is the Justice of Human-Posited Norms (*Justitia Legalis*) General

Note how in Pars 2.2, Quaestio 57, Articulus 2, and also in Pars 1.2, q. 95, a. 2, Aquinas discusses the justice of norms (*leges*) rather than the justice of individual human behaviours proper. This is important because the justice we are here interested in is the justice of *leges*, of legal norms, of the law insofar as it belongs to the reality that ought to be.

Following are the conditions satisfying which the human will can make *jus* ("what is right toward others"), and make *jus positivum* in particular ("what is

[31] The Latin original: "Injustae autem sunt leges *dupliciter*. *Uno modo* per contrarietatem ad bonum humanum [...]: vel ex *fine*, sicut cum aliquis praesidens leges imponit onerosas subditis, non pertinentes ad utilitatem communem, sed magis ad propriam cupiditatem, vel gloriam: vel etiam ex auctore sicut cum aliquis legem fert ultra sibi commissam potestatem: vel etiam ex *forma*, puta cum inaequaliter onera multitudini dispensantur, etiamsi ordinentur ad bonum commune. Et hujusmodi magis sunt violentiae, quam leges: quia, sicut August. dicit in lib. 1. de Lib. Arb. *(cap.5. parum a princ.)*, lex esse non videtur, quae justa non fuerit; unde tales leges non obligant in foro conscientiae, nisi forte propter vitandum scandalum, vel turbationem: propter quod etiam homo juri suo debet cedere secundum illud Matth. 5.: *Qui angariaverit te mille passus, vade cum eo alia duo: et qui abstulerit tibi tunicam, da ei et pallium. Alio modo* leges possunt esse injustae per contrarietatem ad bonum divinum: sicut leges tyrannorum inducentes ad idololatriam, vel ad quodcumque aliud, quod sit contra legem divinam: et tales leges nullo modo licet observare: quia, sicut dicitur Act. 4., *obedire oportet Deo magis quam hominibus*" (Aquinas, *Summa Theologiae* (a), 1.2, q. 96, a. 4).

right by position"). What guarantees the rightness of *jus positivum* is its compatibility with *jus naturale*; what guarantees its justice is the moral virtue of justice as applied to norms, i.e., the justice of human-posited norms (*justitia legalis*), which takes as its subject matter (*subjectum*) the will of the ruler, or lawgiver.

The human will can, by common agreement, make a thing to be just provided it be not, of itself, contrary to natural justice [*voluntas humana ex communi condicto potest aliquid facere justum in his, quae secundum se non habent aliquam repugnantiam ad naturalem justitiam*], and it is in such matters that positive right [what is right by position: *jus positivum*] has its place. Hence the Philosopher says (*Ethic.* v. 7) that *in the case of the legal just* [in Greek, *nomikon politikon dikaion*], *it does not matter in the first instance whether it takes one form or another, it only matters when once it is laid down*. If, however, a thing is, of itself, contrary to natural right, the human will cannot make it just [*si aliquid de se repugnantiam habeat ad jus naturale, non potest voluntate humana fieri justum*], for instance by decreeing that it is lawful [*liceat*] to steal or to commit adultery. Hence it is written (Isa. x. 1): *Woe to them that make wicked laws* [*leges iniquas*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 57, a. 2)[32]

Aquinas is not discussing here the justice or injustice of individual behaviours (*actiones* or *opera*: see footnotes 10 and 12 of this chapter); he is rather discussing the justice or injustice of human-posited norms (*leges*), of what has been set down (*statuatur*) or posited (*ponitur*) by those who have the community in their care.

Justice [*justitia*], as stated above (A. 2) directs man [ordains man: *ordinat*] in his relations with other men [*hominem in comparatione ad alium*]. Now this may happen in two ways: *first* as regards his relation with individuals [*ad alium singulariter consideratum*], *secondly* as regards his relations with others in general [*ad alium in communi*], in so far as a man who serves a community, serves all those who [*omnibus hominibus*] are included in that community. Accordingly justice in its proper acceptation [according to its type: *secundum propriam rationem*] can be directed [*se potest habere*] to another in both these senses. Now it is evident that all who are included in a community, stand in relation [*comparantur*] to that community as parts to a whole; while a part, as such, belongs to a whole [it is a part of the whole: *totius es*], so that whatever is the good of a part can be directed to the good of the whole [*quodlibet bonum partis est ordinabile* (can be ordained) *in bonum totius*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 5; italics added)[33]

[32] The Latin original: "Voluntas humana ex communi condicto potest aliquid facere justum in his, quae secundum se non habent aliquam repugnantiam ad naturalem justitiam: et in his habet locum *jus positivum*; unde Philos. dicit in 5. Ethic. *(cap. 7.)* quod 'legale [in Greek, *nomikon*] justum est, quod ex principio quidem nihil differt sic, vel aliter: quando autem ponitur differt': sed si aliquid de se repugnantiam habeat ad jus naturale, non potest voluntate humana fieri justum; puta si statuatur, quod liceat furari, vel adulterium committere; unde dicitur Isa. 10.: *Vae qui condunt leges iniquas*" (Aquinas, *Summa Theologiae* (a), 2.2, q. 57, a. 2).

[33] On the English translation of *ratio* in this passage, see footnote 29 in this chapter. The Latin original: "Justitia, sicut dictum est [...], ordinat hominem in comparatione ad alium. Quod quidem potest esse *dupliciter*: *uno modo* ad alium singulariter consideratum: *alio modo* ad alium in communi; secundum scilicet quod ille qui servit alicui communitati, servit omnibus hominibus, qui sub communitate illa continentur: ad utrumque ergo se potest habere justitia secundum propriam rationem: manifestum est autem, quod omnes, qui sub communitate aliqua continentur, comparantur ad communitatem, sicut partes ad totum: pars autem id quod est, totius est; unde et quodlibet bonum partis est ordinabile in bonum totius" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 5).

From this point of view,

the good of any virtue, whether such virtue directs man [ordains man: *ordinantis*] in relation to himself [as in the case of temperance and fortitude], or in relation to certain other individual persons [as in the case of justice among individuals], is referable to the common good, to which justice directs [*ad quod ordinat justitia*]: so that all acts of virtue [the actions of all the virtues: *actus omnium virtutum*] can pertain to justice, in so far as it directs man [ordains man: *ordinat*] to the common good. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 5)[34]

On account of this all-inclusiveness, the justice of norms (*justitia legalis*) is called a general virtue (*virtus generalis*). Indeed,

since it belongs to the law [to the norm: *ad legem*] to direct to the common good [*ordinare in bonum commune*] [...], it follows that the justice which is in this way styled general, is called *legal justice* [the justice of norms: *justitia legalis*], because thereby man is in harmony with the law which directs [with the norm which ordains: *legi ordinanti*] the acts of all the virtues to the common good. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 5)[35]

And in regard to the all-inclusiveness of the justice of norms (*justitia legalis*), Aquinas distinguishes two ways in which the term "general" (*generalis*) can be made to apply to something. The first of these ways is by predication (*per praedicationem*).

Thus *animal* is general in relation to man and horse and the like: and in this sense that which is general must needs be essentially [*essentialiter*] the same as the things in relation to which it is general, for the reason that the genus belongs to the essence of the species [*quia genus pertinet ad* (pertains to) *essentiam speciei*], and forms part of [*cadit in*] its definition. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 6)[36]

The second way in which the term "general" can be made to apply to something is *secundum virtutem*,[37] in the same way as a general cause (compare *causaliter tantum*: Sections 13.3 and 13.7) is general with respect to all its effects, as is

[34] The Latin original: "Secundum hoc ergo bonum cujuslibet virtutis, sive ordinantis aliquem hominem ad seipsum, sive ordinantis ipsum ad aliquas alias personas singulares, est referibile ad bonum commune, ad quod ordinat justitia; et secundum hoc actus omnium virtutum possunt ad justitiam pertinere, secundum quod ordinat hominem ad bonum commune" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 5).

[35] The Latin original: "Et quantum ad hoc justitiae dicitur virtus generalis; et quia ad legem pertinet ordinare in bonum commune, ut supra habitum est […]; inde est, quod talis justitia praedicto modo generalis dicitur *justitia legalis*; quia scilicet per eam homo concordat legi ordinanti actus omnium virtutum in bonum commune" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 5).

[36] The Latin original: "Sicut *animal* est generale ad hominem, et equum, et ad alia hujusmodi: et hoc modo *generale* oportet quod sit idem essentialiter cum his, ad quae est generale; quia genus pertinet ad essentiam speciei, et cadit in definitione ejus" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 6).

[37] Here, *virtus* takes the meaning "causal power" as specified under point (*a*) in footnote 5. See also footnotes 27 and 58 of this chapter.

the sun, for instance, in relation to all bodies that are illumined, or transmuted by its power [*per virtutem ipsius*]; and in this sense there is no need for that which is *general* to be essentially the same [*idem in essentia*] as those things in relation to which it is general, since cause and effect are not essentially the same [*non est eadem essentia*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 6)[38]

Now, it is in this last sense—as a causal power—that the justice of norms (*justitia legalis*) is said to be a general virtue (*virtus generalis*). The justice of norms ordains

the acts of the other virtues to its own end, and this is to move all the other virtues by its command [*quod est movere per imperium omnes alias virtutes*]; for just as charity may be called a general virtue in so far as it directs [*ordinat*] the acts of all the virtues to the Divine good, so too is legal justice [the justice of norms: *justitia legalis*], in so far as it directs [*ordinat*] the acts of all the virtues to the common good. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 6)[39]

Justice, like charity, is a special virtue (special in the etymological sense of its being a *species*): It is so *essentialiter*, meaning in what concerns its essence. But in what concerns the production (or causation) of its own effects (here, just effects), justice is a general virtue. It is so not in the sense of its being a *genus*, but rather as a general cause (*causaliter*, *secundum virtutem*). Indeed, justice produces effects ordained to the common good, and produces them even on the actions of all the other virtues, which are *essentialiter* different from justice.

Accordingly, just as charity which regards the Divine good [*bonum divinum*] as its proper object [objective: *objectum*], is a special virtue [*specialis virtus*, with *specialis* understood in the sense of this word's derivation from *species*] in respect of its essence [*secundum suam essentiam*], so too legal justice [the justice of norms: *justitia legalis*] is a special virtue [*specialis virtus*, with *specialis* understood in the sense of its derivation from *species*] in respect of its essence [*secundum suam essentiam*], in so far as it regards the common good as its proper object [objective: *objectum*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 6)[40]

Of course, the justice of norms (*justitia legalis*) is general principally in the ruler (in the prince: *princeps*). It is general not in the sense of its being a ge-

[38] The Latin original: "Ut sol ad omnia corpora, quae illuminantur, vel immutantur per virtutem ipsius: et hoc modo *generale* non oportet quod sit idem in essentia cum his, ad quae est generale; quia non est eadem essentia causae, et effectus" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 6).

[39] The Latin original: "Justitia legalis [...] ordinat actus aliarum virtutum ad suum finem, quod est movere per imperium omnes alias virtutes: sicut enim charitas potest dici virtus generalis, inquantum ordinat actus omnium virtutum ad bonum divinum: ita etiam justitia legalis, inquantum ordinat actus omnium virtutum ad bonum commune" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 6).

[40] The Latin original: "sicut ergo charitas, quae respicit bonum divinum ut proprium objectum [objective], est quaedam specialis virtus secundum suam essentiam: ita etiam justitia legalis est quaedam specialis virtus secundum suam essentiam, secundum quod respicit commune bonum, ut proprium objectum [objective]" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 6).

nus, but because its effects invest as well, in the sense specified a moment ago, the actions of all the other virtues. In the ruler, justice is general in its being almost architectonic (*quasi architectonice*). In the people who are subject to the ruler, instead, the justice of norms (*justitia legalis*) is general in a secondary way, that is, in an administrative way, as it were (*quasi administrative*).

And thus it [the justice of norms] is in the sovereign [ruler or prince: *princeps*] principally and by way of a master-craft, while it is secondarily and administratively in his subjects. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 6)[41]

Aquinas further generalises and relativises:

However the name of legal justice [the justice of norms: *justitia legalis*] can be given to every virtue, in so far as every virtue is directed to the common good [it is ordained to the common good: *ordinatur*] by the aforesaid legal justice [the justice of norms: *justitia legalis*], which though special essentially [*in essentia*] is nevertheless virtually general [general to the extent that it is understood as a causal power: *generalis autem secundum virtutem*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 6)[42]

Aquinas can now draw the following conclusion:

Speaking in this way, legal justice [the justice of norms: *justitia legalis*] is essentially the same [*idem in essentia*] as all virtue [*cum omni virtute*], but differs therefrom logically [but as a type is different from it: *differt autem ratione*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 6)[43]

This Aquinas's conclusion may seem sphinxlike. Maybe we can straighten it out, and remove the ambiguity, by noting how in the same place Aquinas writes that *genus pertinet ad essentiam speciei* (the genus pertains to the essence of the species). Let us consider these points: (*a*) *ratio* also takes in *Summa Theologiae* the meaning "type," or "species" (Sections 13.7, and 13.8); (*b*) the genus pertains to the essence of all its species; and (*c*) the different special virtues are part of the genus "virtue" in what concerns their *generic* essence as virtues; but (*d*) the special virtues are distinguished from one another by their *ratio*, i.e., by their *specific* types (they are special virtues, or virtues of different species, or types). If we take points (*a*) through (*d*) into account, we will be able to clarify Aquinas's passage as follows: The essence of the justice of norms (of *justitia legalis*) will be the same as that of all the other virtues to the extent that "essence" is referred to the genus common to all these virtues;

[41] The Latin original: "et sic est in principe principaliter, et quasi architectonice; in subditis autem secundario, et quasi administrative" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 6).

[42] The Latin original: "potest tamen quaelibet virtus, secundum quod a praedicta virtute (speciali quidem in essentia, generali autem secundum virtutem) ordinatur ad bonum commune, dici justitia legalis" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 6). The first two occurrences of *virtus* in this passage (*quaelibet virtus* and *a praedicta virtute*) carry sense (*b*) and the third occurrence (*secundum virtutem*) sense (*a*), causal power, as indicated in footnote 5 of this chapter.

[43] On the English translation of *ratio* in this passage, see footnote 29 in this chapter. The Latin original: "et hoc modo loquendi justitia legalis est idem in essentia cum omni virtute; differt autem ratione" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 6).

it will be *different* from the essence of each of the other virtues to the extent that "essence" is referred instead to the species, i.e., the species or type (*ratio*) proper to the justice of norms.

Indeed, Aquinas refers the essence to the species as well; and in this sense he says that the justice of norms is different *per essentiam* from every other virtue.

> Every virtue strictly speaking directs [every virtue in keeping with its own type ordains: *secundum propriam rationem ordinat*] its act to that virtue's proper end: that it should happen to be directed [ordained: *ordinetur*] to a further end either always or sometimes, does not belong to that virtue considered strictly [it does not belong to that virtue in keeping with its own type: *hoc non habet ex propria ratione*], for it needs some higher virtue to direct it [*ordinetur*] to that end. Consequently there must be one supreme virtue [a superior virtue: *superior*] essentially distinct from every other virtue, which directs all the virtues to the common good [which ordains them (*ordinet*) in the common good]; and this virtue is legal justice [*quae est justitia legalis* (the justice of norms)*, et est alia per essentiam ab omni virtute*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 6)[44]

This is not to say that the justice of norms, because it is general, can do without the different virtues by which men are ordained with respect to particular goods (*particularia bona*). Further, included among these virtues is particular justice (*particularis justitia*), which ordains man with respect to those things that concern a single other person.

> Legal justice [the justice of norms: *justitia legalis*] is not essentially [*essentialiter*] the same as every virtue, and besides legal justice [the justice of norms: *justitia legalis*] which directs man [ordains man: *ordinat*] immediately to the common good [*immediate ad bonum commune*], there is a need for other virtues to direct him [to ordain him: *ordinant*] immediately in matters relating to particular goods [*immediate circa particularia bona*]: and these virtues may be relative to himself or to another individual person. Accordingly, just as in addition to legal justice [the justice of norms: *justitia legalis*] there is a need for particular virtues to direct man [*ordinant*] in relation to himself, such as temperance and fortitude, so too besides legal justice [the justice of norms: *justitia legalis*] there is need for particular justice to direct man [a particular justice that ordains man: *quae ordinet*] in his relations to other individuals [*particularem quamdam justitiam, quae ordinet hominem circa ea, quae sunt ad alteram singularem personam*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 58, a. 7)[45]

[44] On the English translation of *ratio* in this passage, see footnote 29 in this chapter. The Latin original: "Quaelibet virtus secundum propriam rationem ordinat actum suum ad proprium finem illius virtutis: quod autem ordinetur ad ulteriorem finem, sive semper, sive aliquando, hoc non habet ex propria ratione; sed oportet esse aliam superiorem virtutem, a qua in illum finem ordinetur: et sic oportet esse unam virtutem superiorem, quae ordinet omnes virtutes in bonum commune, quae est justitia legalis, et est alia per essentiam ab omni virtute" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 6).

[45] The Latin original: "Justitia legalis non est essentialiter omnis virtus, sed oportet praeter justitiam legalem, quae ordinat hominem immediate ad bonum commune, esse alias virtutes, quae immediate ordinant hominem circa particularia bona; quae quidem possunt esse vel ad seipsum, vel ad alteram singularem personam; sicut ergo praeter justitiam legalem oportet esse aliquas virtutes particulares, quae ordinent hominem in seipso, puta temperantiam et fortitudinem; ita etiam praeter justitiam legalem oportet esse particularem quamdam justitiam,

13.6. Prudence and Justice in the Judgments That Judges Are to Pass

If we look at the judgments and rulings of judges we will find the same interweaving of prudence and justice that is found in Aquinas with regard to *jus*: We saw this in Sections 13.2 through 13.5 and will see it again in Section 13.7. The *jus* treated in these other sections is primarily *jus* as what is *objectively* right, meaning the content of *leges*, or norms. The *jus* treated in this section, instead, is the *jus* found in the judgments and rulings of judges. We are therefore concerned here with what is *subjectively* right, with *jus* in the concrete case, the *jus* of duty-holders and right-holders, the normative subjective positions as actually determined, or rather declared, by the prudent and just judge: prudent because possessed of reason (intellectual virtue), just because possessed of that moral virtue which makes its subject matter (the will) conscious, stable, and firm in rendering to each his due (*jus suum*: see footnote 19 in this chapter). Let us not forget Aquinas's previously introduced list of the senses assumed by *jus* and *justitia*:

The word *jus* ["right," the strict sense of "what is right"] [...] was first of all used to denote the just thing itself [*ipsam rem justam*], but afterwards it was transferred to designate the art whereby it is known what is just [*quid sit justum*], and further to denote the place where justice is administered [*in quo jus redditur*, where *jus* expresses the strict sense of "what is right"], thus a man is said to appear *in jure*, and yet further, we say even that a man, who has the office of exercising justice [*justitiam facere*], administers the *jus* [*jus redditur*] even if his sentence be unjust [*iniquum*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 57, a. 1)[46]

There are, in regard to the judicial administration of what is subjectively right, some interesting observations that can be made on *sunesis*, *eusinesia*, *gnomē*, and other kindred concepts in Aquinas, who takes them up from Aristotle. But these observations we cannot here enter into. What we will consider, instead, are *judicium* (judgment), *judex* (judge), *jus* (what is right toward others), and *justitia* (justice). Here is Aquinas's own summary presentation of them:

Judgment [*judicium*] properly denotes the act of a judge [*judex*] as such. Now a judge (*judex*) is so called because he asserts the right (*jus dicens*) and right [*jus*] is the object of justice [its objective: *objectum*], as stated above (Q. 57, A. 1). Consequently the original meaning of the word *judgment* is a statement or decision of the just or right [*judicium importat ... definitionem vel determinationem justi sive juris*]. Now to decide rightly [well: *bene*] about virtuous deeds proceeds, properly speaking, from the virtuous habit [attitude: *habitus*]; thus a chaste person decides rightly [*recte determinat*] about matters relating to chastity. Therefore judgment, which denotes a right decision about what is just [hence judgement, which involves a right determination of what is just: *et ideo judicium, quod importat rectam determinationem ejus, quod est justum*], belongs properly to justice. For this reason the Philosopher says (*Ethic*. v. 4) that *men*

quae ordinet hominem circa ea, quae sunt ad alteram singularem personam" (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 7). In Pars 1.2, q. 96, a. 4, Aquinas explains the ways a *lex* can be unjust (see the end of Section 13.4).

[46] The Latin original is in footnote 16 of this chapter.

have recourse to a judge as to one who is the personification of justice [*sicut ad quandam justitiam animatam*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 60, a. 1)[47]

In rejoinder to an argument traceable to Saint Paul, Aquinas draws a parallel, on the question of judgment, between *donum sapientiae* and *virtus prudentiae*, on the one hand, and *regulae divinae* and *regulae juris*, on the other. Let us look at Aquinas's presentation of this parallel:

The spiritual man, by reason of the habit of charity [its attitude: *habitus*], has an inclination to judge aright [*recte*] of all things according to the Divine rules [*secundum regulas divinas*]; and it is in conformity with these that he pronounces judgment through the gift of wisdom [*ex quibus judicium per donum sapientiae pronuntiat*]: even as the just man pronounces judgment through the virtue of prudence conformably with the ruling of the law [with the rules setting out what is right: *sicut justus per virtutem prudentiae pronuntiat judicium ex regulis juris*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 60, a. 1)[48]

The Fathers of the English Dominican Province translate *regulae juris* to "rulings of law." They do so inconsistently, for *jus* they usually translate to "right."

In discussing judgment and the judge who issues it, Aquinas clearly brings back the idea of *justitia legalis* (the justice of norms), though not calling it by that name.

Justice is in the sovereign [in the ruler, or prince: *princeps*] as a master-virtue [as an architectonic virtue: *virtus architectonica*], commanding and prescribing what is just [*quod justum est*]; while it is in the subjects, as an executive and administrative virtue [*virtus executiva, et ministrans*]. Hence judgment, which denotes a decision of what is just [it entails a definition of what is just: *importat definitionem justi*], belongs to justice, considered as existing chiefly in one who has authority [*secundum quod est principaliori modo in praesidente*]. (Aquinas, *Summa Theologiae* (b), 2.2, q. 60, a. 1)[49]

Compare this against *Summa Theologiae* (a), Pars 2.2, q. 58, a. 6; and, in this chapter, compare Section 13.5, footnote 41.

[47] The Latin original: "Judicium proprie nominat actum judicis, inquantum judex est: judex autem dicitur, quasi *jus dicens*: jus autem est objectum justitiae, ut supra habitum est (*q. 57. art. 1.*); et ideo judicium importat, secundum primam nominis impositionem, definitionem vel determinationem justi sive juris: quod autem aliquis bene definiat aliquid in operibus virtuosis, proprie procedit ex habitu virtutis: sicut castus recte determinat ea, quae pertinent ad castitatem; et ideo judicium, quod importat rectam determinationem ejus, quod est justum, proprie pertinet ad justitiam: propter quod Philos. in 5. Ethic. *(cap. 4.)* dicit, quod homines ad judicem confugiunt, sicut ad quamdam justitiam animatam" (Aquinas, *Summa Theologiae* (a), 2.2, q. 60, a. 1).

[48] The Latin original: "Homo spiritualis ex habitu charitatis habet inclinationem ad recte judicandum de omnibus secundum regulas divinas, ex quibus judicium per donum sapientiae pronuntiat; sicut justus per virtutem prudentiae pronuntiat judicium ex regulis juris" (Aquinas, *Summa Theologiae* (a), 2.2, q. 60, a. 1).

[49] The Latin original: "Justitia in principe quidem est sicut virtus architectonica, quasi imperans, et praecipiens quod justum est; in subditis autem est tamquam virtus executiva, et ministrans; et ideo judicium, quod importat definitionem justi, pertinet ad justitiam, secundum quod est principaliori modo in praesidente" (Aquinas, *Summa Theologiae* (a), 2.2, q. 60, a. 1).

Aquinas specifies three requisites of just judgment: an inclination toward justice, serving to stay clear of perverted, unjust judgments; an authority legitimated to judge, so as to forestall usurpation; and *recta ratio prudentiae*, a rational capacity for knowing rightly, which capacity is proper to prudence, and which makes it so that judgment is not based on suspicion and is not rash:

> Judgment is lawful [*licitum*] in so far as it is an act of justice. Now it follows from what has been stated above (A. 1, *ad* 1, 3) that three conditions are requisite for a judgment to be an act of justice [*justitiae actus*]: first, that it proceed from the inclination of justice [*ex inclinatione justitiae*]; secondly, that it come from one who is in authority [*ex autoritate praesidentis*]; thirdly, that it be pronounced according to the right ruling of prudence [*secundum rectam rationem prudentiae*]. If any one of these be lacking, the judgment will be faulty and unlawful [*vitiosum et illicitum*]. First, when it is contrary to the rectitude of justice [*rectitudinem justitiae*], and then it is called *perverted* or *unjust*: secondly, when a man judges about matters wherein he has no authority, and this is called judgment *by usurpation*: thirdly, when the reason lacks certainty [*deest certitudo rationis*], as when a man, without any solid motive, forms a judgment on some doubtful or hidden matter, and then it is called judgment by *suspicion* or *rash* judgment. (Aquinas, *Summa Theologiae* (b), 2.2, q. 60, a. 2)[50]

As happens with other occurrences of *ratio* (some of which have been indicated in the previous pages), so on this occasion (in the closing lines of this last passage) the Fathers of the English Dominican Province fail to capture the sense of this word in context.

The Latin original is *quando deest certitudo rationis*; literally, "when there is not the certainty of *ratio*." The point here is, again, the meaning of *ratio*: Its meaning is "type," or "species" (*Tatbestand* in German, *fattispecie astratta* in Italian). Therefore, a sensible translation will be "there is no certainty as to whether the relevant type has been instantiated in the concrete case, as when one judges on doubtful or concealed things on the basis of some light conjecture (*propter aliquas leves conjecturas*)."

The English translation by the Fathers of the English Dominican Province shows that here they understand *ratio* to mean "reason" in the sense of "motive." Indeed, they write, "reason lacks certainty, as when a man *without any solid motive* forms a judgment on some doubtful or hidden matter" (italics added); and "without any solid motive" has no corresponding expression in the Latin original.[51]

[50] The Latin original: "Judicium intantum est licitum, inquantum est justitiae actus: sicut autem ex praedictis patet *(art. praec.)*, ad hoc quod judicium sit actus justitiae, *tria* requiruntur: *primo* quidem, ut procedat ex inclinatione justitiae; *secundo*, quod procedat ex auctoritate praesidentis; *tertio*, quod proferatur secundum rectam rationem prudentiae. Quodcumque autem horum defuerit, judicium erit vitiosum, et illicitum: *uno* quidem modo, quando est contra rectitudinem justitiae: et sic dicitur *judicium perversum*, vel *injustum*: *alio* modo, quando homo judicat de his, in quibus non habet auctoritatem: et sic dicitur *judicium usurpatum*: *tertio* modo, quando deest certitudo rationis; puta cum aliquis de his judicat, quae sunt dubia, vel occulta, propter aliquas leves conjecturas: et sic dicitur *judicium suspiciosum*, vel *temerarium*" (Aquinas, *Summa Theologiae* (a), 2.2, q. 60, a. 2).

[51] This translation looks rather more like a wild guess. Dear Fathers: five *Pater, Ave et Gloria*!

13.7. *Jus* (What Is Right toward Others) Is Made Right, in What Concerns Its Essence (*Essentialiter*), by the Type (*Ratio*) Contained in a *Lex* (Norm)

Let us start off by taking a second look at the passage from *Summa Theologiae* (a), 2.2, q. 58, a. 1:

> Justice is rectitude, though not by essence [*essentialiter*], but only as a cause [*causaliter*], in that justice is an attitude according to which somebody acts and wills rightly [*recte*]. (Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 1; my translation)[52]

The Latin term *rectitudo* ("rectitude")—from the adjective *rectus*, "right," and from *rectum*, past participle of *rego*, whence comes *regula* (plain old "ruler" or "rule," the instrument for drawing straight lines)—connects up with the geometric-philological considerations made in Section 4.2.1 on "norm," as well as with the legal-conceptual byzantine considerations that will be made in Chapter 14 on *objektives* and *subjektives Recht* (cf. Section 14.3).

Even in Aquinas *rego* means "to rule": It does so in an acceptation of this Latin verb that ascribes to it a particular density of meaning, an acceptation that forms the basis of the idea of *lex aeterna*—the *aeternum conceptum* of *divina ratio*, the divine plan that *non concipitur ex tempore*. Divine Providence sets out the rules (*regit*) of the universe according to a design of reason that is right (*rectum*); at the same time, Divine Providence supports these rules with its just will (*justa voluntas*).

> It is impossible that God should will anything but what is of the type [*ratio*] of His wisdom. And the type of His wisdom is like the norm of justice, a norm in accordance with which His will is right and just. Hence, what He does in accordance with His will He does justly, as we, too, do justly what we do in accordance with the norm. (Aquinas, *Summa Theologiae* (a), 1, q. 21, a. 1; my translation)[53]

Again, the Fathers of the English Dominican Province fail to grasp the sense that *ratio* takes in context. They therefore avoid translating *ratio* and resort rather to a circumlocution (italicised in footnote 53) that is vague and does little service to the reader.

It might be said that Aquinas's palatable distinction between *essentialiter* and *causaliter* (a typically Scholastic distinction, as formulated in 2.2, q. 58, a. 1, the passage quoted before the last) gives to each his own (*suum cuique*

[52] The Latin original is provided in Section 13.3, and appended to it (in footnote 23) is its English translation by the Fathers of the English Dominican Province.

[53] The Latin original: "Impossibile est Deum velle nisi quod ratio suae sapientiae habet. Quae quidem est sicut lex justitiae, secundum quam ejus voluntas recta, et justa est. Unde quod secundum suam voluntatem facit, juste facit; sicut et nos, quod secundum legem facimus, juste facimus" (Aquinas, *Summa Theologiae* (a), 1, q. 21, a. 1). In the translation of the Fathers of the English Dominican Province: "*It is impossible for God to will anything but what His wisdom approves*. This is, as it were, His law of justice, in accordance with which His will is right and just. Hence, what He does according to His will He does justly: as we do justly what we do according to law" (Aquinas, *Summa Theologiae* (b), 1, q. 21, a. 1; italics added).

tribuit): It gives to *jus* that which pertains to *jus*, to *justitia* that which pertains to *justitia*, and to both that which pertains to both.

That which pertains to both is what is right (*quod est rectum*) toward others: What is right toward others pertains *essentialiter* to *jus*; while it is *causaliter tantum* that it pertains to *justitia*. Let us enter into this question.

Behind *jus* (inasmuch as *jus* is *essentialiter* what is right, or *rectitudo*, toward others) stands divine reason (and there also stands human reason, but only to the extent that there is in it a share of divine reason). Behind *justitia* (inasmuch as *justitia* is *causaliter tantum* what is right, or *rectitudo*, toward others) stands the virtuous will (rational will is the subject matter of justice), meaning a will (*voluntas*) that is conscious (*sciens*), stable (*stabilis*), and firm (*firmus*) (Section 13.3).

As a cognitive power, practical reason (*ratio practica*) consists in (*i*) synderesis, with regard to the apprehension of the principles of action (*principia operabilium*, which synderesis entrusts, as ends, to the moral virtues) and (*ii*) prudence, with regard to the means to the ends entrusted to the moral virtues. Synderesis entrusts ends to the virtue of justice (as well as to the other moral virtues), and these ends will be attained through the means, i.e., the rules, provided and set forth by prudence. In such a way, practical reason arranges people's relations and ordains them to the attainment of the ends entrusted to the moral virtues.[54]

[54] "Now, to a thing apprehended by the intellect, it is accidental whether it be directed [ordained: *ordinetur*] to operation or not, and according to this the speculative and practical intellects differ. For it is the speculative intellect which directs [ordains: *ordinat*] what it apprehends, not to operation, but to the consideration of truth; while the practical intellect is that which directs [ordains: *ordinat*] what it apprehends to operation. And this is what the Philosopher says (*De Anima* iii, [...]); that *the speculative differs from the practical in its end.* Whence each is named from its end: the one speculative, the other practical—*i.e.*, operative'" (Aquinas, *Summa Theologiae* (b), 1, q. 79, a. 11). The Latin original: "Accidit autem alicui apprehenso per intellectum, quod ordinetur ad opus, vel non ordinetur. Secundum hoc autem differunt intellectus speculativus, et praticus; nam intellectus speculativus est, qui quod apprehendit, non ordinat ad opus, sed ad solam veritatis considerationem: practicus vero intellectus dicitur, qui hoc quod apprehendit, ordinat ad opus. Et hoc est, quod Philosophus dicit in 3. de Anima [...], quod speculativus differt a practico fine; unde et a fine denominatur uterque, hic quidem *speculativus*, ille vero *practicus*, idest operativus" (Aquinas, *Summa Theologiae* (a), 1, q. 79, a. 11). "Now it is clear that, as the speculative reason argues about speculative things, so that practical reason argues about practical things. Therefore we must have, bestowed on us by nature, not only speculative principles, but also practical principles. Now the first speculative principles bestowed on us by nature do not belong to a special power [*potentiam*], but to a special habit [attitude: *habitum*], which is called *the understanding of principles*, as the Philosopher explains (*Ethic.* vi. 6). Wherefore the first practical principles, bestowed on us by nature, do not belong to a special power, but to a special natural habit [attitude: *habitum*], which we call *synderesis*" (Aquinas, *Summa Theologiae* (b), 1, q. 79, a. 12). The Latin original: "Constat autem, quod, sicut ratio speculativa ratiocinatur de speculativis; ita ratio pratica ratiocinatur de operabilibus; oportet igitur naturaliter nobis esse indita, sicut principia speculabilium, ita et principia operabilium. Prima autem principia speculabilium

Aquinas lays out elegantly as follows the relation that holds among the moral virtues (among which is justice), the ends of action, synderesis, and prudence:

Now, just as, in the speculative reason [*in ratione speculativa*], there are certain things naturally known [*naturaliter nota*], about which is *understanding* [rational intuition: *intellectus*], and certain things of which we obtain knowledge through them [*quae per illa innotescunt*], viz., conclusions, about which is *science* [*conclusiones, quarum est scientia*], so in the practical reason [*in ratione practica*], certain things pre-exist, as naturally known principles [*principia naturaliter nota*], and such are the ends of the moral virtues [*fines virtutum moralium*], since the end [*finis*] is in practical matters what principles are [what the principle is: *principium*] in speculative matters. (Aquinas, *Summa Theologiae* (b), 2.2, q. 47, a. 6)[55]

Natural reason [*ratio naturalis*] known by the name of *synderesis* appoints the end to moral virtues [*virtutibus moralibus praestituit finem*], [...] but prudence does not do this [...]. The end concerns the moral virtues, not as though they appointed the end, but because they tend to the end which is appointed by natural reason [*a ratione naturali praestitutum*]. In this they are helped by prudence, which prepares the way for them, by disposing the means [*ea quae sunt ad finem*]. Hence it follows that prudence is more excellent than the moral virtues, and moves them: yet *synderesis* moves prudence, just as the understanding of principles [the rational intuition of them: *intellectus*] moves science. (Aquinas, *Summa Theologiae* (b), 2.2, q. 47, a.6)[56]

To clarify the nexus among *ratio*, *regula*, and *lex*, I quote here two passages by Aquinas (1.2, q. 90, a. 1 and q. 95, a. 2) already discussed briefly in Section 4.2.1 and more extensively in Section 13.4.

"Lex quaedam regula est, et mensura actuum": "A norm is a kind of rule, and a measure for acts" (Aquinas, *Summa Theologiae* (a), 1.2, q. 90, a. 1; my translation).[57] Here "measure" designates a unit of measure, as for measuring the size, quantity, or degree of something.

nobis naturaliter indita non pertinent ad aliquam specialem potentiam, sed ad quemdam specialem habitum, qui dicitur *intellectus principiorum*, ut patet in 6. Ethic. *(cap. 6.)*. Unde et principia operabilium nobis naturaliter indita non pertinent ad specialem potentiam, sed, ad specialem habitum naturalem, quem dicimus *synderesim*" (Aquinas, *Summa Theologiae* (a), 1, q. 79, a. 12).

[55] The Latin original: "Sicut autem in ratione speculativa sunt quaedam ut naturaliter nota, quorum est intellectus, et quaedam, quae per illa innotescunt, scilicet conclusiones, quarum est scientia: ita in ratione practica praeexistunt quaedam, ut principia naturaliter nota: et hujusmodi sunt fines virtutum moralium: quia finis se habet in operabilibus, sicut principium in speculativis" (Aquinas, *Summa Theologiae* (a), 2.2, q. 47, a. 6).

[56] The Latin original: "Virtutibus moralibus praestituit finem ratio naturalis, quae dicitur synderesis, [...] non autem prudentia [...]. [...] finis non pertinet ad virtutes morales, tamquam ipsae praestituant finem; sed quia tendunt in finem a ratione naturali praestitutum: ad quod juvantur per prudentiam, quae eis viam parat, disponendo ea quae sunt ad finem; unde relinquitur, quod prudentia sit nobilior virtutibus moralibus, et moveat eas: sed synderesis movet prudentiam, sicut intellectus principiorum scientiam" (Aquinas, *Summa Theologiae* (a), 2.2, q. 47, a. 6).

[57] The Latin original is provided in Section 13.4, and appended to it (in footnote 25) is its English translation by the Fathers of the English Dominican Province.

There is no norm [*lex*] that is not just; hence, insofar as a norm [*lex*] takes after justice, to that extent it will take on the power of a norm [the virtue of being binding or of having a binding power, or force: *de virtute legis*, and *legis virtus* is *virtus obligandi*]: and in human things we say that something is just because of the fact that it is right [*rectum*] according to a rule of reason [*secundum regulam rationis*]; but the first rule of reason is the norm of nature [*rationis autem prima regula est lex naturae*] [...]; hence, every human-posited norm [*omnis lex humanitus posita*] will be of the type norm [*habet de ratione legis*] to the extent that it derives from the norm of nature [*a lege naturae*]: Indeed, if in some respects the human-posited norm is at variance with the norm of nature, then it will not be a norm, but the forgery of a norm [*non erit lex, sed legis corruptio*]. (Aquinas, *Summa Theologiae* (a), 1.2, q. 95, a. 2; my translation)[58]

Note how *ratio*, on its last occurrence in the foregoing passage—in the string *habet de ratione legis* (Aquinas, *Summa Theologiae* (a), 1.2, q. 95, a. 2)—means "type," whereas on other occurrences in the same passage, it means "reason," understood as a cognitive power (cf. Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 4).[59]

When *ratio* stands for "type," it may be translated as well, depending on context, to "essence," "plan," "idea," "form," "concept," "design," and the like.

There is one passage in this regard where Aquinas discusses *lex aeterna*. Let us look at this passage and see the various senses in which the term *ratio* figures in it.

[58] This is the Latin original in its wider context (enclosed within angle brackets is the original corresponding specifically to the translation in the run of text): "Sicut August. dicit in 1. de Lib. Arb. [...] <non videtur esse lex, quae justa non fuerit; unde inquantum habet de justitia, intantum habet de virtute legis: in rebus autem humanis dicitur esse aliquod justum ex eo quod est rectum secundum regulam rationis: rationis autem prima regula est lex naturae [...]; unde omnis lex humanitus posita intantum habet de ratione legis, inquantum a lege naturae derivatur: si vero in aliquo a lege naturali discordet, jam non erit lex, sed legis corruptio>" (Aquinas, *Summa Theologiae* (a), 1.2, q. 95, a. 2). The Fathers of the English Dominican Province provided this translation of the foregoing passage, which, too, is shown here in its wider context: "As Augustine says (*De Lib. Arb.* i. 5), *that which is not just seems to be no law at all*: Wherefore the force of a law depends on the extent of its justice. Now in human affairs a thing is said to be just, from being right, according to the rule of reason. But the first rule of reason is the law of nature, as is clear from what has been stated above (Q. 91, A. 2, *ad* 2). Consequently every human law has just so much of the nature of law, as it is derived from the law of nature. But if in any point it deflects from the law of nature, it is no longer a law but a perversion of law" (Aquinas, *Summa Theologiae* (b), 1.2, q. 95, a. 2). Note how, in the passage just quoted, Aquinas makes this point about *justum* and "straight": In human things *justus* is said of that which is *rectus* (or "right") according to a rule of reason. *Justus* derives from *jus*. Recall on *legis virtus* (in my translation, "the power of a norm") that *legis virtus haec est imperare, vetare, permittere, punire*; "the force of a law" [the power of a norm, the way I understand *legis virtus*] is this: to command [obligate], to prohibit [forbid], to permit, or to punish" (Modestinus, *The Digest of Justinian*, I, 3, 7). On *virtus* as "characteristic that comes through in a causal power," see footnotes 5, 27, and 37 in this chapter.

[59] "Reason" as an intellectual faculty may occur as intuitive reason—like that of God or like human *intellectus* and synderesis (Aquinas, *Summa Theologiae* (b), 1, q. 14, a. 8)—or it may occur as human discoursive reason.

Now it is evident, granted that the world is ruled [*regatur*] by Divine Providence, [...] that the whole community of the universe is governed [*gubernatur*] by Divine Reason [by divine plans: *ratione divina*]. Wherefore the very idea [*ratio*, meaning "design," "schema," "type," or "plan"] of the government of things in God [*gubernationis rerum in Deo*] the Ruler of the universe, has the nature of a law [is of the type "norm": *legis habet rationem*]. And since the Divine Reason's conception of things is not subject to time but is eternal [...] therefore it is that this kind of law must be called eternal [*et quia divina ratio* (*ratio* meaning "rational intuitive cognitive power") *nihil concipit ex tempore, sed habet aeternum conceptum,* [...] *inde est, quod hujusmodi legem oportet dicere aeternam*]. (Aquinas, *Summa Theologiae* (b), 1.2, q. 91, a. 1)[60]

I do not agree with the way the Fathers of the English Dominican Province have translated the last lines of the foregoing excerpt. The Latin is *et quia divina ratio*, where *ratio* means "reason" understood as a cognitive power. And God's reason as cognitive power is intuitive reason, a concept akin to that expressed by the ancient Greek *nous*. God's reason as cognitive power *nihil concipit ex tempore, sed habet aeternum conceptum*, where *conceptum* means "concept," "design," "schema," "type," or "plan." The word *ratio* takes two meanings on its different occurrences in the excerpt just quoted: (*a*) "reason as rational cognitive power," which in God is intuitive rational power, and (*b*) reason as the "plan, "concept," "design," "schema," or "type" devised by reason in sense (*a*), or therein contained.

Also relevant to the meaning of *ratio* is the stimulating argument that Aquinas considers in Pars 2.2, Quaestio 57, Articulus 1, of *Summa Theologiae* (a). Aquinas attributes this argument to Isidore and so frames it that it seems to contrast his own thesis.

In this regard, a congruent reconstruction will require maintaining the distinction among three interpretations of the terms *jus* and *lex* according as they occur in (*i*) Isidore, (*ii*) Aquinas, or (*iii*) Isidore as quoted and interpreted by Aquinas. In case (*i*), *jus* means "law" and *lex* "statutory written law"; in cases (*ii*) and (*iii*), *jus* means "what is right toward others" and *lex* "norm," whether written or unwritten.

Aquinas's thesis, as we saw in Section 13.3, is that *jus* is the objective (*objectum*) of justice. In Isidore's *Etymologiae*, says Aquinas, we find instead the view that *lex juris est species*; hence—Aquinas proceeds—"a norm [*lex*] is the objective [*objectum*] not so much of justice as of prudence; indeed Aristotle, too, states that there is a legislative [*legispositiva*] part of prudence; therefore, what is right toward others [*jus*] is not the objective [*objectum*] of justice" (*Summa Theologiae* (a), 2.2, q. 57, a. 1; my translation).[61]

[60] The Latin original: "Manifestum est autem, supposito quod mundus divina providentia regatur, [...] quod tota communitas universi gubernatur ratione divina; et ideo ipsa ratio gubernationis rerum in Deo, sicut in principe universitatis existens, legis habet rationem; et quia divina ratio nihil concipit ex tempore, sed habet aeternum conceptum, [...] inde est, quod hujusmodi legem oportet dicere aeternam" (Aquinas, *Summa Theologiae* (a), 1.2, q. 91, a. 1).

[61] The Latin original: "*Lex* [the norm], sicut Isid. dicit in lib. 5. Etymol. *(cap. 3.)*, *juris est species*: lex [the norm] autem non est objectum justitiae [the objective of justice], sed magis

As was observed in Section 13.1, *jus*—just like *derecho*, *droit*, *Recht*, and *diritto*—can mean either "law" or "what is right," depending on context; and as I have just pointed out, *jus* in Isidore means "law" and *lex* "statutory written law" or "statute."[62]

In answer to Isidore's argument, Aquinas gives us an interesting passage on the relation between *lex* and *ratio*. In truth Aquinas, in this rejoinder, speaks more broadly of the relationship among *ratio*, *regula*, *justitia*, *prudentia*, *lex*, and *jus*. Here is this rejoinder translated into English.

Just as there preexists in the craftsman's mind a type [*quaedam ratio*] for the things that become external by his craft, which type is called a rule of art [*regula artis*], so there preexists in the mind a type [*ratio*] for the just work [*illius operis justi*] that is determined by reason [here, reason as cognitive power: *ratio*]. This type is almost a rule of prudence [*prudentiae regula*], and this rule, if formulated in writing, will be called a *lex.* For a *lex*, according to Isidore (*Etym*. v. 1), is a written statute [a *constitutio scripta*]. Hence, *lex* is not, properly speaking, the same as *jus* [what is right toward others], but is rather a type for what is right [*aliqualis ratio juris*]. (Aquinas, *Summa Theologiae* (a), 2.2, q. 57, a. 1; my translation)[63]

prudentiae; unde et Philos. *legispositivam* partem prudentiae ponit *(lib. 6. Ethic. cap. 8.)*; ergo jus [what is right] non est objectum justitiae [the objective of justice]." This is the English translation by the Fathers of the English Dominican Province: "*Law* [*lex*], according to Isidore (*Etym*. v. 3), *is a kind of right* [*juris est species*]. Now law [*lex*] is the object not of justice but of prudence [*non est objectum justitiae* (the objective of justice) *sed magis prudentiae*], wherefore the Philosopher reckons *legislative* [in Greek, *nomothetikē*] as one of the parts of prudence [in Greek, *phronēsis*]. Therefore right [what is right: *jus*] is not the object of justice" (*Summa Theologiae* (b), 2.2, q. 57, a. 1).

[62] Aquinas quotes Isidore's text with an addition designed to set up the argument that Aquinas wants to reply to; the addition consists in "lex autem non est objectum justitiae sed magis prudentiae" and in the conclusion "ergo jus non est objectum justitiae," neither of which appears in Isidore. Further, Isidore uses *jus* in the sense of "law," and *lex* he uses not in the sense of "norm" but in that of "statutory written law," or "statute"; in fact, Isidore sets *lex* against *mos*, which he understands as designating customary unwritten law. Isidore divides "law" into *lex* (statutory written law, such as a *constitutio*, meaning "statute") and *mos* (customary unwritten law). If *jus* means "law," *lex* "statutory written law," and *mos* "customary unwritten law," then it clearly follows that *lex*, on a par with *mos*, is *juris species*—a type, or species, of law. Following is Isidore's Latin original followed by my English translation: "Ius [the term "law"] generale nomen est, lex [statutory law] autem iuris est species. [...] Omne autem ius [law] legibus [statutory laws] et moribus [customs] constat. Lex [statutory law] est constitutio scripta [a written statute]. Mos [custom] est vetustate probata consuetudo, sive lex non scripta [unwritten law]. Nam lex [statutory law] a legendo vocata, quia scripta est" (Isidore, *Isidori Hispalensis Episcopi Etymologiarum sive Originum*, V, 3). "Law [*jus*] is the noun for a genus [*jus generale nomen est*: *generalis*, from *genus*], and a statutory law [*lex*] is a type of law. [...] Indeed, all of law [*jus*] is made up of statutory laws [*legibus*] and customs [*moribus*]. A statutory law [*lex*] is a written statute [*constitutio scripta*]. A custom is a long-established practice: It is an unwritten statute [*lex non scripta*]. Indeed, *lex* [statutory law] is so called from *legendo* [reading], because a *lex* is written."

[63] The Latin original: "Sicut eorum, quae per artem exterius fiunt, quaedam ratio in mente artificis praeexistit, quae dicitur regula artis: ita etiam illius operis justi, quod ratio determinat, quaedam ratio praeexistit in mente, quasi quaedam prudentiae regula: et hoc si in scriptum redigatur, vocatur *lex*, est enim lex, secundum Isid. *(lib. 5. Etym. cap. 3.)*, *constitutio scripta*; et

In translating this passage, the Fathers of the English Dominican Province have rendered *ratio* as "expression" when they should have translated it as "type," "schema," "plan." See their English translation in this footnote.[64]

The connection between *ratio*, *regula*, *prudentia*, *lex*, and *jus* in Aquinas is a question of no small account.

In fact the argument by Isidore as Aquinas presents it in 2.2, q. 57, a. 1—with Aquinas's addition and conclusion as indicated in footnotes 61 and 62 of this chapter—is in certain respects a grounded argument. *Lex juris est species* (this expression appears in Isidore's original as well as in Aquinas's text): *Lex autem non est* objectum *justitiae, sed magis prudentiae* (this expression appears in Aquinas but not in Isidore). If we translate Isidore's fragment according to meaning (*i*) of *lex* and *jus*, and Aquinas's fragment according to meaning (*ii*) of *lex* and *jus*, we will have the following translation: "Statutory written law [*lex*] is a species of law [*jus*]"; "now, the norm [*lex*] is more an objective of prudence than of justice."

Aquinas uses *objectum* here, a term that does not figure in the original passage by Isidore that Aquinas develops in his own words in *Summa Theologiae* (a), 2.2, q. 57, a. 1. And, as I said in Sections 13.2 and 13.3, the term needs to be clarified. In fact when Aquinas discusses the moral virtues, he uses *subjectum* to refer to their subject matter (as I translate *subjectum* throughout this chapter) and *objectum* to refer to their objective (as I translate *objectum* throughout this chapter). Thus *justitia* takes will as its subject matter (*subjectum*), and as its objective (*objectum*) it takes *jus*, meaning "what is right toward others."

As we saw in Section 13.3, *jus*, in the sense just specified, is argued by Aquinas to be the *objectum justitiae*: the objective of justice. The burden is on

ideo lex [the norm] non est ipsum jus [what is right], proprie loquendo, sed aliqualis ratio juris" (Aquinas, *Summa Theologiae* (a), 2.2, q. 57, a. 1). It is an established fact that Aquinas accepts that there exist not only written *leges*, or norms, but also unwritten ones. Indeed Aquinas treats, among several *leges*, of *lex aeterna* and *lex naturalis*, and these are not written. Isidore, in turn, qualifies custom, *mos*, as *lex non scripta*; and this, I believe, bears out the view that we need to maintain the distinction among meanings (*i*), (*ii*), and (*iii*) of *lex* (along with those of *jus*) as specified a moment ago in the run of text.

[64] This is the English translation by the Fathers of the English Dominican Province: "Just as there pre-exists in the mind of the craftsman an expression [*ratio*] of the things to be made externally by his craft, which expression [*ratio*] is called the rule of his craft [*regula artis*: the pronoun specifying that this is *his* craft is absent from the Latin and best avoided in translation], so too there pre-exists in the mind an expression [*ratio*] of the particular just work [*illius operis justi*: "particular" cannot adequately translate *illius* here, because Aquinas is speaking of a type of just work, and "particular," which Aquinas does not use, conveys an idea of actualness, whereas types are abstract] which the reason determines, and which is a kind of rule of prudence. If this rule be expressed in writing, it is called a *law* [*lex*], which according to Isidore (*Etym*. v. 1) is *a written decree* [a written statute: *constitutio scripta*]: and so law [the norm: *lex*] is not the same as right [what is right: *jus*], but an expression of right [a type for what is right: *aliqualis ratio juris*]" (Aquinas, *Summa Theologiae* (b), 2.2, q. 57, a. 1).

him, in his rejoinder, and without letting go of the point that *jus* is the objective of *justitia*, to explain why and in what sense *jus* is not rather the *objectum prudentiae*: the objective of prudence. In other words, Aquinas will have to explain, in his rejoinder, how *jus* relates to *prudentia*, and relates to *prudentia* differently than it does to *justitia*.

Aquinas rejoins with analytical clarity.

Lex is not *ipsum jus*, *proprie loquendo, sed aliqualis ratio juris*. In my reading: *Lex* [the norm] is not, *properly* speaking, the same as *jus*, as what is right; it is rather a type (*aliqualis ratio*) for what is right. (I needed the italics on "properly" to put the accent on Aquinas's own qualification.)

I should want to explain this in my own words.[65] *Jus* is determined and made such—made right—by reason, that is, by *ratio* understood as a cognitive power. *Ratio* as cognitive power provides *juris rationes*: It provides types for what is right toward others. And these types (these *rationes juris*) will make up the content of a *lex*. A *lex*, i.e., a norm—a rule having the *virtus obligandi* (the power to bind: footnote 5 in this chapter)—will include these types in its content. It will set them forth as its content. Against this conceptual background, Aquinas says, and is justified in saying, that *lex* is not *ipsum jus, proprie loquendo, sed aliqualis ratio juris*: The norm is not properly speaking the same as what is right, but is rather a type for what is right.

At the same time, *jus* (what is right toward others) is the objective (*objectum*) of justice insofar as it is willed with a virtuous will (*voluntas*), a will that is conscious, stable, and firm (*sciens*, *stabilis*, and *firmus*: cf. Aquinas, *Summa Theologiae* (a), 2.2, q. 58, a. 1).

It is in this regard that we see revealed the full importance of one of the meanings of *ratio* brought earlier into relief in considering the passage by Aquinas on *lex aeterna* (footnote 60 in this section). Against this meaning of *ratio*—a *ratio*, or type, that preexists in the mind of the craftsman: That *in mente artificis praeexistit*—we can, and indeed should, evaluate what Aquinas states in Pars 1.2, Quaestio 95, Articulus 2, where he discusses the derivation of *lex humana* from *lex naturalis per modum determinationis*.

In illustrating the operation of the *modus determinationis*, Aquinas says that this *modus*

> is likened to that whereby, in the arts, general forms [*formae communes*] are particularized as to details [*determinantur ad aliquid speciale*]: thus the craftsman needs to determine the general form of a house [its *formam communem*] to some particular shape [*figuram*]. (Aquinas, *Summa Theologiae* (b), 1.2, q. 95, a. 2)[66]

[65] The Latin in this paragraph is not literally Aquinas's.

[66] The Latin original: "simile est, quod in artibus *formae communes* determinantur ad aliquid speciale: sicut artifex *formam communem* domus necesse est quod determinet ad hanc, vel illam domus figuram" (Aquinas, *Summa Theologiae* (a), 1.2, q. 95, a. 2; italics added).

In this excerpt Aquinas speaks of *forma*, which I understand as "type" (Section 2.1). But even in 2.2, q. 57, a. 1, in the penultimately quoted excerpt, in rejoinder to Isidore's argument, Aquinas refers to a type, or rather to two types: the type the craftsman needs to have in the mind to produce his craftwork and the type that those who act justly need to have in their minds to carry out just actions. Each of these two types Aquinas calls *ratio*.

As we saw, the first *ratio* he refers to as a "rule of art" (*regula artis*) and the second as a "rule of prudence" (*prudentiae regula*).

In rejoinder to Isidore's argument, Aquinas makes a call for analysis, a call similarly elicited in me by Searle with regard to forms and rules (see Section 2.1.4). This is the call to distinguish among "form" (meaning "type": *ratio*), "rule" (*regula*), and "norm" (*lex*).

Perhaps the subtleties involved in this threefold distinction do not bother Aquinas any more than they bother Searle. I believe we can hold in some way that both thinkers, depending on context, understand "type" to be interchangeable with "rule" (*regula*), or even with norm (*lex*), whether the concept in issue (type) is designated by the word "form," as in Searle (*forma* in Aquinas) or by the word *ratio* (in Aquinas again).

The term *ratio* can take at least four meanings in Aquinas:

(*a*) Cognitive power understood as intuitive reason. Here, where practical human reason is involved, *ratio* consists in synderesis, the practical equivalent of what in the theoretical sphere is *intellectus*. Synderesis identifies the principles of action and entrusts them to the virtues as ends to be attained (through virtuous behaviour on the part of humans).

(*b*) Cognitive power understood as abstractive reason, meaning the faculty we use in the ascending path of the cognitive process whereby we come at forms or types.

(*c*) The forms or types arrived at through the powers listed under (*a*) and (*b*).

(*d*) Cognitive power understood as discursive reason. Here, in the practical sphere, reason (*ratio*) presents itself as the intellectual virtue of prudence. Prudence provides the means with which to attain the ends identified through synderesis, so it provides rules or types of behaviour.

The meanings of *ratio* just listed connect up with the types and rules treated in Chapter 2 of this volume. This question is set now within a wider context, for we are concerned here with the relationship between "norm" (*lex*) and "what is right" (*jus*) as treated in Chapter 1 and taken up again in Section 4.2.1.

13.8. The *Redde Rationem* (the Day of Reckoning): *Ratio* as Type in the Rendition of the Fathers of the English Dominican Province

The English version of *Summa Theologiae* I used was by the Fathers of the English Dominican Province. It was first published in 1911 and was then revised in 1920 and reprinted in 1948; it was also reprinted in 1981 as part of the Christian Classics series. It is premissed by "On the Restoration of Christian Philosophy According to the Mind of Saint Thomas Aquinas, the Angelic Doctor" (*De Philosophia Christiana ad mentem Sancti Thomae Aquinatis Doctoris Angelici in Scholis Catholicis instauranda*), an encyclical letter given by Pope Leo XIII in Rome, at Saint Peter's, on August 4, 1879, the second year of his pontificate.

The Dominican Fathers, well aware of how *transit gloria mundi*, leave us clueless as to the identity of the author or authors of their translation. So I cannot know from that source what kind of division of labour was set up to carry through this great endeavour. I can only guess that the translation was done by many hands: In quoting the passages discussed in this chapter I have had to go back and forth between the Latin original and the corresponding translation provided by the Fathers, because I could not obtain from them a consistent and plausible English rendition of *ratio* according to the different senses in which this Latin term occurs in *Summa Theologiae*.

On some occasions, however, the Fathers do provide a translation of *ratio* that I judge plausible for one of the senses of this term. Abetted in my doggedness in wanting to know if the Fathers ever used "type" to render *ratio*, I eventually found 161 instances in which they do so.[67] Also, the Fathers, in translating Pars 1.2, q. 74, a. 7, offer a cautious and hardly explicative footnote to account for their use of "type" for *ratio*. This explanatory note is appended to the seventh of the following eight excerpts from *Summa Theologiae* (b) that I have selected for analysis from those listed in footnote 67. The reader will find below the Fathers' translation of these eight excerpts, accompanied with a few brief comments on my part. As usual, the corresponding Latin original is provided in the footnotes.

[67] My thanks for the abetting go to Corrado Roversi. Here are the places where the 161 occurrences of "type" appear as a rendition of *ratio* in the Fathers' translation of *Summa Theologiae* (I do not claim this list to be exhaustive): 1, q. 12, a. 8; 1, q. 14, a. 13; 1, q. 15, a. 2; 1, q. 15, a. 3; 1, q. 18, a. 4; 1, q. 22, a. 1; 1, q. 22, a. 2; 1, q. 22, a. 3; 1, q. 23, a. 1; 1, q. 23, a. 2; 1, q. 32, a. 1; 1, q. 44, a. 3; 1, q. 45, a. 6; 1, q. 45, a. 7; 1, q. 55, a. 2; 1, q. 55, a. 3; 1, q. 65, a. 4; 1, q. 84, a. 5; 1, q. 87, a. 1; 1, q. 89, a. 3; 1, q. 93, a. 2; 1, q. 93, a. 8; 1, q. 105, a. 3; 1, q. 106, a. 1; 1, q. 108, a. 1; 1, q. 108, a. 5; 1, q. 108, a. 6; 1, q. 108, a. 7; 1, q. 110, a. 1; 1.2., q. 74, a. 7; 1.2, q. 74, a. 8; 1.2, q. 74, a. 9; 1.2, q. 93, a. 1; 1.2, q. 93, a. 2; 1.2, q. 93, a. 3; 1.2, q. 93, a. 4; 1.2, q. 93, a. 5; 1.2, q. 102, a. 4; 1.2, q. 102, a. 5; 2.2, q. 2, a. 10; 2.2., q. 45, a. 3; 2.2, q. 173, a. 1; 3, q. 46, a. 7; 3 Suppl., q. 82, a. 3; 3 Suppl., q. 92, a. 3. There are also places in which the Fathers use "type" to translate terms other than *ratio*. Here are some of them: 1, q. 1, a. 10; 1, q. 15, a. 1; 1, q. 71; 2.2, q. 85, a. 1; 2.2, q. 173, a. 1; 3, q. 31, a. 3; 3, q. 33, a. 1; 3, q. 36, a. 3.

(*i*) "Whether there are ideas? [*Utrum ideae sint*]"

It is necessary to suppose ideas [*ideas*] in the divine mind. For the Greek word *Ἰδέα* is in Latin *Forma*. Hence by ideas [*ideas*] are understood the forms [*formae*] of things, existing apart from the things themselves. Now the form [*forma*] of anything existing apart from the thing itself can be for one of two ends: either to be the type [*exemplar*] of that of which it is called the form [*forma*], or to be the principle of the knowledge [*principium cognitionis*] of that thing, inasmuch as the forms [*formae*] of things knowable are said to be in him who knows them. In either case we must suppose ideas [*ideas*], as is clear for the following reason:

In all things not generated by chance, the form [*formam*] must be the end [*finem*] of any generation whatsoever. But an agent does not act on account of the form [*propter formam*], except in so far as the likeness [*similitudo*] of the form [*formae*] is in the agent, as may happen in two ways. For in some agents the form [*forma*] of the thing to be made [*rei fiendae*] pre-exists according to its natural being, as in those that act by their nature; as a man generates a man, or fire generates fire. Whereas in other agents (the form of the thing to be made pre-exists) according to intelligible being [*secundum esse intelligibile*], as in those that act by the intellect [*per intellectum*]; and thus the likeness [*similitudo*] of a house pre-exists in the mind of the builder. And this may be called the idea [*idea*] of the house, since the builder intends to build his house like to the form [*formae*] conceived in his mind. As then the world was not made by chance, but by God acting by His intellect [*per intellectum agente*], as will appear later (Q. 46, A. 1), there must exist in the divine mind a form [*forma*] to the likeness [*ad similitudinem*] of which the world was made. And in this the notion of an idea [*ideae*] consists [And in this consists the type (*ratio*) for an an idea (*ideae*)]. (Aquinas, *Summa Theologiae* (b), 1, q. 15, a. 1)[68]

Notice that in this passage the Fathers use "type" for the Latin *exemplar* and "notion" for the Latin *ratio*. The Latin *idea* and *forma* are correctly and consistently rendered in English as "idea" and "form."

(*ii*) "Whether ideas are many? [*Utrum sint plures ideae*]"

Now there cannot be an idea of any whole [a type (*ratio*) for any whole], unless particular ideas [types: *propriae rationes*] are had of those parts of which the whole is made; just as a builder

[68] The Latin original: "*Necesse est ponere in mente divina ideas. Ἰδέα* enim graece, latine forma dicitur. Unde per ideas intelliguntur formae aliarum rerum praeter ipsas res exsistentes. Forma autem alicujus rei praeter ipsam exsistens ad duo esse potest: vel ut sit exemplar ejus cujus dicitur forma, vel ut sit principium cognitionis ipsius, secundum quod formae cognoscibilium dicuntur esse in cognoscente.

Et quantum ad utrumque est necesse ponere ideas, quod sic patet. In omnibus enim, quae non a casu generantur, necesse est formam esse finem generationis cujuscumque. Agens autem non ageret propter formam, nisi inquantum similitudo formae est in ipso. Quod quidem contingit *dupliciter*. In *quibusdam* enim agentibus praeexsistit forma rei fiendae secundum esse naturale, sicut in his, quae agunt per naturam: sicut homo generat hominem, et ignis ignem. In *quibusdam* vero secundum esse intelligibile, ut in his, quae agunt per intellectum: sicut similitudo domus praeexsistit in mente aedificatoris. Et haec potest dici idea domus, quia artifex intendit domum assimilare formae, quam mente concepit. Quia igitur mundus non est casu factus, sed est factus a Deo per intellectum agente, ut infra patebit, *(q. 46. art. 1.)* necesse est, quod in mente divina sit forma, ad similitudinem cujus mundus est factus. Et in hoc consistit ratio ideae" (Aquinas, *Summa Theologiae* (a), 1, q. 15, a. 1).

cannot conceive the idea of a house [its species: *speciem*] unless he has the idea of each of its parts [unless he has the type proper to each such part: *propria ratio*]. So, then, it must needs be that in the divine mind there are the proper ideas of all things [the proper types (*rationes*) for all things]. Hence Augustine says (*Octog. Tri. Quæst*; *qu.* xlvi), *that each thing was created by God according to the idea proper to it* [the type proper to it: *propriis rationibus*], from which it follows that in the divine mind ideas [*ideae*] are many. Now it can easily be seen how this is not repugnant to the simplicity of God, if we consider that the idea of a work [*ideam operati*] is in the mind of the operator as that which is understood [*quod intelligitur*], and not as the image whereby he understands, which is a form that makes the intellect in act [*forma faciens intellectum in actu*]. For the form [*forma*] of the house in the mind of the builder, is something understood by him, to the likeness of which he forms [*format*] the house in matter. Now, it is not repugnant to the simplicity of the divine mind that it understand many things; though it would be repugnant to its simplicity were His understanding to be formed by a plurality of images [a plurality of species: *plures species*]. Hence many ideas [*ideae*] exist in the divine mind, as things understood by it; as can be proved thus. Inasmuch as He knows His own essence [*essentiam*] perfectly, He knows it according to every mode in which it can be known. Now it can be known not only as it is in itself, but as it can be participated in by creatures according to some degree of likeness [according to some mode of similitude: *secundum aliquem modum similitudinis*]. But every creature has its own proper species [*speciem*], according to which it participates in some degree in likeness [*similitudinem*] to the divine essence [*divinae essentiae*]. So far, therefore, as God knows His essence [*essentiam*] as capable of such imitation [*imitabilem*] by any creature, He knows it as the particular type [*propriam rationem*] and idea [*ideam*] of that creature: and in like manner as regards other creatures. So it is clear that God understands many particular types [*plures rationes proprias*] of things, and these are many ideas [*plures ideas*]. (Aquinas, *Summa Theologiae* (b), 1, q. 15, a. 2)[69]

On the whole, the translation by the Fathers of the English Dominican Province is not consistent. Thus, *ratio* is rendered five times as "idea" and twice as

[69] The Latin original: "Ratio autem alicujus totius haberi non potest, nisi habeantur propriae rationes eorum, ex quibus totum constituitur. Sicut aedificator speciem domus concipere non posset, nisi apud ipsum esset propria ratio cujuslibet partium ejus. Sic igitur oportet, quod in mente divina sint propriae rationes omnium rerum. Unde dicit Aug. in lib. 83. QQ. *(q. 46. post med.)* quod *singula propriis rationibus a Deo creata sunt*; unde sequitur, quod *in mente divina sint plures ideae*.

Hoc autem quomodo divinae simplicitati non repugnet, facile est videre, si quis consideret ideam operati esse in mente operantis, sicut quod intelligitur, non autem sicut species, qua intelligitur, quae est forma faciens intellectum in actu. Forma enim domus in mente aedificatoris est aliquid ab eo intellectum, ad cujus similitudinem domum in materia format. Non est autem contra simplicitatem divini intellectus, quod multa intelligat: sed contra simplicitatem ejus esset, si per plures species ejus intellectus formaretur.

Unde plures ideae sunt in mente divina, ut intellectae ab ipsa. Quod hoc modo potest videri. Ipse enim essentiam suam perfecte cognoscit: unde cognoscit eam secundum omnem modum, quo cognoscibilis est. Potest autem cognosci non solum secundum quod in se est, sed secundum quod est participabilis secundum aliquem modum similitudinis a creaturis. Unaquaeque autem creatura habet propriam speciem, secundum quod aliquo modo participat divinae essentiae similitudinem. Sic igitur inquantum Deus cognoscit suam essentiam ut sic imitabilem a tali creatura, cognoscit eam ut propriam rationem, et ideam hujus creaturae: et similiter de aliis. Et sic patet, quod Deus intelligit plures rationes proprias plurium rerum, quae sunt plures ideae" (Aquinas, *Summa Theologiae* (a), 1, q. 15, a. 2).

In the first paragraph of the excerpt we can read the distinction between "compound type" and "component types" as discussed in Section 2.1.5 and in Section 2.2.2.2 under point (*ii*).

"type." Further, *species* is rendered as "idea" on one occurrence and as "image" on another, and on a third occurrence it is correctly rendered as "species"; *idea* turns up five times and is correctly and consistently rendered as "idea"; *forma* turns up twice and is correctly and consistently rendered as "form."

For God by one understands [*intelligit*] many things, and that not only according to what they are in themselves, but also according as they are understood [*intellecta sunt*], and this is to understand the several types of things [*plures rationes rerum*]. In the same way, an architect is said to understand a house, when he understands the form [*formam*] of the house in matter. But if he understands the form of a house, as devised by himself, from the fact that he understands that he understands it, he thereby understands the type [*rationem*] or idea [*ideam*] of the house. Now not only does God understand many things by His essence [*per essentiam suam*], but He also understands that He understands many things by His essence [*per essentiam suam*]. And this means that He understands the several types of things [*plures rationes rerum*]; or that many ideas [*plures ideas*] are in His intellect as understood by Him. (Aquinas, *Summa Theologiae* (b), 1, q. 15, a. 2)[70]

Ratio turns up three times in the original of this passage and is correctly and consistently rendered as "type"; *forma* occurs once, correctly rendered as "form"; *idea* turns up twice, correctly and consistently rendered as "idea."

(*iii*) "Whether there are ideas of all things that God knows? [*Utrum omnium, quae cognoscit Deus, sint ideae*]"

As ideas [*ideae*], according to Plato, are principles of the knowledge of things and of their generation [*principia cognitionis rerum et generationis*], an idea [*idea*] has this twofold office, as it exists in the mind of God. So far as the idea is the principle of the making [*principium factionis*] of things, it may be called an *exemplar* [*exemplar*], and belongs to practical knowledge [*practicam cognitionem*]. But so far as it is a principle of knowledge [*principium cognoscitivum*], it is properly called a *type* [*ratio*], and may belong to speculative knowledge [*scientiam speculativam*] also. As an exemplar [*exemplar*], therefore, it has respect to everything made by God in any period of time; whereas as a principle of knowledge [*principium cognoscitivum*] it has respect to all things known by God, even though they never come to be in time; and to all things that He knows according to their proper type [*secundum propriam rationem*], in so far as they are known by Him in a speculative manner [*per modum speculationis*]. (Aquinas, *Summa Theologiae* (b), 1, q. 15, a. 3)[71]

[70] The Latin original: "Deus autem uno intellectu intelligit multa, et non solum secundum quod in seipsis sunt, sed etiam secundum quod intellecta sunt: quod est intelligere plures rationes rerum. Sicut artifex, dum intelligit formam domus in materia, dicitur intelligere domum: dum autem intelligit formam domus ut a se speculatam, ex eo quod intelligit se intelligere eam, intelligit ideam, vel rationem domus. Deus autem non solum intelligit multas res per essentiam suam, sed etiam intelligit se intelligere multa per essentiam suam. Sed hoc est intelligere plures rationes rerum, vel plures ideas esse in intellectu ejus, ut intellectas" (Aquinas, *Summa Theologiae* (a), 1, q. 15, a. 2).

[71] The Latin original: "Cum ideae a Platone ponerentur principia cognitionis rerum, et generationis ipsarum, *ad utrumque se habet idea, prout in mente divina ponitur*. Et secundum quod est principium factionis rerum, exemplar dici potest, et ad practicam cognitionem

Ratio occurs twice in the original of this passage and is correctly and consistently rendered as "type." *Exemplar* occurs twice, correctly and consistently rendered as "exemplar," whereas in a. 1 of the same *quaestio* it is rendered as "type." *Idea* occurs twice, correctly and consistently rendered as "idea."

(*iv*) "Whether providence can suitably be attributed to God? [*Utrum providentia Deo conveniat*]"

Since, however, God is the cause of things by His intellect, and thus it behooves that the type [*rationem*] of every effect should pre-exist in Him, as is clear from what has gone before (Q. 19, A. 4), it is necessary that the type of the order of things towards their end [*ratio ordinis rerum in finem*] should pre-exist in the divine mind: and the type [*ratio*] of things ordered towards an end [*in finem*] is, properly speaking, providence. For it is the chief part of prudence, to which two other parts are directed [to which they are ordained: *ordinantur*]—namely, remembrance of the past, and understanding of the present; inasmuch as from the remembrance of what is past and the understanding of what is present, we gather how to provide for the future. Now it belongs to prudence, according to the Philosopher (*Ethic.* vi. 12), to direct other things towards an end [to ordain them (*ordinare*) towards an end (*in finem*)] whether in regard to oneself—as for instance, a man is said to be prudent, who orders well [who ordains well: *qui bene ordinat*] his acts towards the end [*ad finem*] of life—or in regard to others subject to him, in a family, city, or kingdom; in which sense it is said (Matth. xxiv. 45), *a faithful and wise servant, whom his lord hath appointed over his family*. In this way prudence or providence may suitably be attributed to God. For in God Himself there can be nothing ordered towards an end [there can be nothing ordained (*ordinabile*) towards an end (*in finem*)], since He is the last end [*finis ultimus*]. This type of the order in things [*ratio ordinis rerum*] towards an end [*finem*] is therefore in God called providence. Whence Boëthius says (*De Consol.* iv. 6) that *Providence is the divine type* [*divina ratio*] *itself, seated in the Supreme Ruler; which disposeth all things*: which disposition may refer either to the type of the order of things towards an end [*ratio ordinis rerum in finem*], or to the type of the order of parts in the whole [to the *ratio* of this order]. (Aquinas, *Summa Theologiae* (b), 1, q. 22, a. 1)[72]

pertinet. Secundum autem quod principium cognoscitivum est, proprie dicitur ratio, et potest etiam ad scientiam speculativam pertinere. *Secundum ergo quod exemplar est, secundum hoc se habet ad omnia, quae a Deo fiunt secundum aliquod tempus. Secundum vero quod principium cognoscitivum est, se habet ad omnia, quae cognoscuntur a Deo, etiamsi nullo tempore fiant*, et ad omnia, quae a Deo cognoscuntur secundum propriam rationem, et secundum quod cognoscuntur ab ipso per modum speculationis" (Aquinas, *Summa Theologiae* (a), 1, q. 15, a. 3).

[72] The Latin original: "Cum autem Deus sit causa rerum per suum intellectum, et sic cujuslibet sui effectus oportet rationem in ipso praeexsistere, ut ex superioribus patet *(q. 19. art. 4.)*, necesse est, quod ratio ordinis rerum in finem in mente divina praeexsistat; ratio autem ordinandorum in finem proprie providentia est. Est enim principalis pars prudentiae, ad quam aliae *duae* partes ordinantur, scilicet *memoria praeteritorum,* et *intelligentia praesentium*; prout ex praeteritis memoratis, et praesentibus intellectis conjectamus de futuris providendis; prudentiae autem proprium est, secundum Philos. in 6. Ethic. *(cap. 12. circa med.)*, ordinare alia in finem, sive respectu sui ipsius, sicut dicitur homo prudens, qui bene ordinat actus suos ad finem vitae suae; sive respectu aliorum sibi subjectorum in familia, vel civitate, vel regno; secundum quem modum dicitur Matth. 24.: *Fidelis servus, et prudens, quem constituit dominus super familiam suam*. Secundum quem modum prudentia, vel providentia Deo convenire potest [...]. Nam in ipso Deo nihil est in finem ordinabile, cum ipse sit finis ultimus. Ipsa igitur ratio ordinis rerum in finem providentia in Deo nominatur. Unde Boet. 4. de Cons. *(pros. 6. paullo a princ.)* dicit, quod *providentia est ipsa divina ratio in summo omnium principe constituta, quae*

Ratio turns up seven times in this passage and is correctly and consistently rendered as "type."

(*v*) "Whether God has immediate providence over everything? [*Utrum Deus immediate omnibus provideat*]"

Two things belong to providence—namely, the type of the order of things [*ratio ordinis rerum*] foreordained towards an end [*provisarum in finem*]; and the execution of this order, which is called government. As regards the first of these, God has immediate providence [*providet*] over everything, because He has in His intellect the types of everything [*rationem omnium*], even the smallest; and whatsoever causes He assigns to certain effects, He gives them the power to produce those effects. Whence it must be that He has beforehand the type of those effects [*illorum effectuum in sua ratione*] in His mind. (Aquinas, *Summa Theologiae* (b), 1, q. 22, a. 3)[73]

Ratio occurs three times in the original of this passage and is consistently rendered as "type."

(*vi*) "Whether men are predestined by God? [*Utrum homines praedestinentur a Deo*]"

Hence, properly speaking, a rational creature, capable of eternal life, is led towards it, directed [*trasmissa*], as it were, by God. The reason [type: *ratio*] of that direction pre-exists in God; as in Him is the type of the order of all things towards an end [*ratio ordinis omnium in finem*], which we proved above to be providence. Now the type [*ratio*] in the mind of the doer of something to be done, is a kind of pre-existence in him of the thing to be done. Hence the type [*ratio*] of the aforesaid direction [*transmissionis*] of a rational creature towards the end [*in finem*] of life eternal is called predestination. For to destine, is to direct or send. Thus it is clear that predestination, as regards its objects [its objectives: *objecta*], is a part of providence. (Aquinas, *Summa Theologiae* (b), 1, q. 23, a. 1)[74]

Ratio occurs four times in the original of this passage and is correctly and consistently rendered as "type" on second, third, and fourth occurrence. On its first occurrence, instead, the Fathers render it, without justification, as "reason."

cuncta disponit. Dispositio autem potest dici tam ratio ordinis rerum in finem, quam ratio ordinis partium in toto" (Aquinas, *Summa Theologiae* (a), 1, q. 22, a. 1).

[73] The Latin original: "Ad providentiam *duo* pertinent, scilicet *ratio ordinis* rerum provisarum in finem, et *executio hujus ordinis*, quae gubernatio dicitur. *Quantum igitur ad primum horum, Deus immediate omnibus providet*, qui in suo intellectu habet rationem omnium etiam minimorum, et quascumque causas aliquibus effectibus praefecit, dedit eis virtutem ad illos effectus producendos. Unde oportet, quod ordinem illorum effectuum in sua ratione praehabuerit" (Aquinas, *Summa Theologiae* (a), 1, q. 22, a. 3).

[74] The Latin original: "Unde, proprie loquendo, rationalis creatura, quae est capax vitae aeternae, perducitur in ipsam, quasi a Deo transmissa. Cujus quidem transmissionis ratio in Deo praeexsistit; sicut et in eo est ratio ordinis omnium in finem, quam diximus esse providentiam. Ratio autem alicujus fiendi in mente actoris existens est quaedam praeexistentia rei fiendae in eo. Unde ratio praedictae transmissionis creaturae rationalis in finem vitae aeternae praedestinatio nominatur. Nam destinare est mittere. Et sic patet, quod praedestinatio, quantum ad objecta, est quaedam pars providentiae" (Aquinas, *Summa Theologiae* (a), 1, q. 23, a. 1).

(*vii*) "Whether the sin of consent to the act is in the higher reason? [*Utrum peccatum consensus in actum sit in ratione superiori*]"

The higher reason [*ratio superior*] *is intent on contemplating and consulting the eternal law* [the eternal types: *rationibus aeternis*],* as Augustine states (*De Trin*. xii. 7). But sometimes consent is given to an act, without consulting the eternal law [the eternal types: *rationibus aeternis*]: since man does not always think about Divine things, whenever he consents to an act. Therefore the sin of consent to the act is not always in the higher reason [*in ratione superiori*]. (Aquinas, *Summa Theologiae* (b), 1.2, q. 74, a. 7)[75]

Ratio occurs four times in the original of this passage: It is rendered as "reason" on two of these occurrences and as "law" on the other two.

Also, the asterisk after the first occurrence of "eternal law" refers to a footnote where (as mentioned at the beginning of this section) the Fathers of the English Dominican Province give a cautious and hardly explicative account of their use of "type" to render some occurrences of *ratio*. Here is the text of the footnote referred to by the asterisk (*Summa Theologiae* (b), Volume 2, page 923):

**Rationes æternæ*, *cf.* P. I, Q. 15, AA. 2, 3, where as in similar passages *ratio* has been rendered by the English *type*, because St. Thomas was speaking of the Divine *idea* as the archetype of the creature. Here the type or idea is a rule of conduct, and is identified with the eternal law (*cf.* A. 8, *Obj.* 1; A. 9).

(*viii*) "Whether the eternal law is a sovereign type existing in God? [*Utrum lex aeterna sit summa ratio in Deo existens*]"

Just as in every artificer there pre-exists a type [*ratio*] of the things that are made by his art, so too in every governor there must pre-exist the type of the order [*ratio ordinis*] of those things that are to be done by those who are subject to his government. And just as the type [*ratio*] of the things yet to be made by an art is called the art [*ars*] or exemplar [*exemplar*] of the products of that art, so too the type [*ratio*] in him who governs the acts of his subjects, bears the character of a law [it bears the type specific to norms: *rationem legis obtinet*], provided the other conditions be present which we have mentioned above (Q. 90) [as being proper to the type "norm": *esse diximus de legis ratione*. (This fragment was omitted by the translators.)]. Now God, by His wisdom, is the Creator of all things in relation to which He stands as the artificer to the products of his art, as stated in the First Part (Q. 14, A. 8). Moreover He governs all the acts and movements that are to be found in each single creature, as was also stated in the First Part (Q. 103, A. 5). Wherefore as the type of the Divine Wisdom [*ratio divinae sapientiae*], inasmuch as by It all things are created, has the character of art [the type for art: *rationem artis*], exemplar [*exemplaris*] or idea [*ideae*]; so the type of Divine Wisdom [*ratio divinae sapientiae*], as moving all things to their due end [*ad debitum finem*], bears the charac-

[75] The Latin original: "Ratio superior intendit rationibus aeternis inspiciendis, et consulendis, ut August. dicit 12. de Trin. *(cap. 7. in fin.)*: sed quandoque consentitur in actum non consultis rationibus aeternis: non enim semper homo cogitat de rebus divinis, quando consentit in aliquem actum; ergo peccatum consensus in actum non semper est in ratione superiori" (Aquinas, *Summa Theologiae* (a), 1.2, q. 74, a. 7).

ter of law [it bears the type specific to norms: *rationem legis*]. Accordingly the eternal law is nothing else than the type of Divine Wisdom [*ratio divinae sapientiae*], as directing all actions and movements. [...] And things, which are in themselves different, may be considered as one, according as they are ordained [*ordinantur*] to one common thing. Wherefore the eternal law is one since it is the type of this order [*ratio hujus ordinis*]. (Aquinas, *Summa Theologiae* (b), 1.2, q. 93, a. 1)[76]

Ratio occurs twelve times in the original of this passage and is rendered as "type" on the first through the fourth occurrence, as well as on seventh, ninth, eleventh, and twelfth occurrence; it is rendered, instead, as "characteristic" on fifth, eight, and tenth occurrence; the sixth occurrence of *ratio* is not translated at all. *Exemplar* occurs twice in this passage, correctly and consistently rendered as "exemplar." *Idea* occurs once, correctly rendered as "idea."

[76] The Latin original: "Sicut in quolibet artifice praeexistit ratio eorum, quae constituuntur per artem: ita etiam in quolibet gubernante oportet quod praeexistat ratio ordinis eorum, quae agenda sunt per eos, qui gubernationi subduntur: et sicut ratio rerum fiendarum per artem vocatur ars, vel exemplar rerum artificiatarum, ita etiam ratio gubernantis actus subditorum rationem legis obtinet, servatis aliis, quod supra *(q. 90.)* esse diximus de legis ratione: Deus autem per suam sapientiam conditor est universarum rerum; ad quas comparatur sicut artifex ad artificiata, ut in 1. habitum est *(q. 14. art. 18.)*: est etiam gubernator omnium actuum, et motionum, quae inveniuntur in singulis creaturis; ut etiam in I. habitum est *(q. 103. art. 5.)*; unde sicut ratio divinae sapientiae, inquantum per eam cuncta sunt creata, rationem habet artis, vel exemplaris, vel ideae: ita ratio divinae sapientiae moventis omnia ad debitum finem obtinet rationem legis: et secundum hoc lex aeterna nihil aliud est, quam ratio divinae sapientiae, secundum quod est directiva omnium actuum, et motionum. [...] ea autem, quae sunt in seipsis diversa, considerantur ut unum, secundum quod ordinantur ad aliquod commune; et ideo lex aeterna est una, quae est ratio hujus ordinis" (Aquinas, *Summa Theologiae* (a), 1.2, q. 93, a. 1).

Chapter 14

THE LAW AND WHAT IS RIGHT. HANS KELSEN UNDER SUSPICION

14.1. Prologue

Recall what was observed in Section 1.2: Translating *objektives Recht* to "law" and *subjektives Recht* to "right" would prove misleading to common-law and civil-law jurisprudents and jurists: It would not help toward improving their reciprocal understanding of those issues that are peculiar to each other's legal culture. The distinction between "what is objectively right" and "what is subjectively right" is not a distinction pertaining to the concept expressed by "law." It rather pertains to the concept expressed by "what is right" or "the right."

In civil-law literature one and the same word, the German *das Recht*, for example, can mean "the law" or "the right," or both, depending on context; and this word, *das Recht*, in expressions like *objektives Recht* and *subjektives Recht*, is used regularly to mean that the thing referred to is in some sense either objective or subjective. Now, this thing is not the law but the right, which for the reasons explained in Section 1.2 I suggest referring to with the expression "what is right."

As we saw in Chapters 1, 12, and 13, the examples in favour of this view are many and significant, not only for the noun *Recht* and its equivalents (*droit*, *diritto*, *derecho*) in the languages of several civil-law countries, but also for the Greek *dikē* and *dikai* as used in the Homeric poems with regard to what is objectively right and what is subjectively right, and for the Latin *jus* (we looked at several Latin authors on *jus*, with a focus on Aquinas in Chapter 13).

Still, it is not unusual to come across present-day English translations in which the distinction between *subjektives Recht* and *objektives Recht* (where German is concerned) is rendered with "objective law" and "subjective law"—or even "objective law" and "subjective right."

My suspicions about what may be one of the sources of these puzzling English translations fall on Hans Kelsen. I will now consider, beginning in the next section, the reasons and the arguments supporting these suspicions of mine.

14.2. Kelsen in the 1940s

Hans Kelsen consistently maintained in his works that the legal system, indeed every legal system, is made up entirely of norms. His pure theory is designed to purify legal normativeness not only of all ideological and political

contamination, and of all admixtures with sociology and psychology, but also of every parasitic notion that should nestle itself into it as a carryover from natural-law theories.

Having established that every legal system is made up entirely of norms, that *das Recht* is all normative—and having therefore emplaced *das Recht* entirely in the reality that ought to be (in *das Sollen*)[1]—Kelsen made it one of his theoretical objectives to reduce what is subjectively right to what is objectively right.

He pushed forward with this strategy even in the United States, when, upon transferring to Harvard, he entered into a thorough comparison and confrontation between his own pure theory of law and John Austin's analytical jurisprudence, which appeared to him to be the paradigm of Anglo-Saxon legal thought. In the preface to his *General Theory of Law and State*, of 1945, Kelsen announces what follows to his Anglophone audience.

> [(*a*)] When this doctrine is called the "pure theory of law," it is meant that it is being kept free from all the elements foreign to the specific method of a science whose only purpose is the cognition of law, not its formation. (Kelsen 1946, xiv)

> [(*b*)] *The legal order* determines what the conduct of men ought to be. It *is a system of norms*, a *normative order*. (Ibid.; italics added)

> [(*c*)] Only by separating the theory of law from a philosophy of justice as well as from sociology is it possible to establish a specific science of law. (Ibid., xv)

> [(*d*)] Like John Austin in his famous *Lectures on Jurisprudence*, the pure theory of law seeks to attain its results exclusively by an analysis of positive law. [...] In this respect, there is no essential difference between analytical jurisprudence and the pure theory of law. Where they differ, they do so because the pure theory of law tries to carry on the method of analytical jurisprudence more consistently than Austin and his followers. This is true especially as regards such fundamental concepts as that of the *legal norm* on the one hand, and those of the *legal right* and the *legal duty* on the other, in French and German jurisprudence *presented as a contrast between law in an objective and law in a subjective sense.* (Ibid., xv-xvi; italics in original on first occurrence, added on all other occurrences)

> [(*e*)] Just as the pure theory of law eliminates the dualism of law and justice and *the dualism of objective and subjective law* so it abolishes the dualism of law and State. (Ibid., xvi; italics added)

Excerpts (*d*) and (*e*) are telling indicia that any good state's attorney would produce in court to maintain that Hans Kelsen, with his *General Theory of Law and State*, helped to spread in common-law countries, and indeed in the entire

[1] Hans Kelsen is probably the clearest and most well-rounded of the scholars who maintain that they can arrive at a methodological matrix of the reality that ought to be, of norms, of the "Ought in an objective sense": *Sollen in einem objektiven Sinn*, not to be confused with *Recht in einem objektiven Sinn*, with "what is right in an objective sense" (Kelsen 1934, 66; Kelsen 1960, 45–6; cf. footnote 19 in this chapter). This matrix in Kelsen is the so-called presupposed basic norm. My arguments against the line adopted by Kelsen are set out in Pattaro 1982. On Kelsen and Grotius, see also Section 3.6.

Anglophone area, the opinion that "the law" is equivalent to "the right" ("what is right"), and that *objektives Recht* and *subjektives Recht* must be translated into English as "objective law" and "subjective law" respectively.[2]

This is how I fancy an arraignment might proceed on the part of a public prosecutor describing and charging Kelsen before an imaginary court.

Kelsen "was privileged to come to the United States and to work during two years at Harvard University. This opportunity he owes above all to the generous help of the Rockefeller Foundation" (Kelsen 1946, xviii). He was given considerable assistance "by the Bureau of International Research" (ibid.). He acknowledges that "the Committee on Translation and Publication of a 20th Century Legal Philosophy Series of the Association of American Law Schools" (ibid.) provided him with "the funds for the translation" into English of his German manuscript, a translation that was entrusted to a student of Axel Hägerström: Anders Wedberg (1913–1978).

This young man was only thirty years old when he did his translation for Kelsen, and was yet to become assistant professor (at Stockholm University). Hence Wedberg—on account of his dubious philosophical extraction (he had written in 1937 a dissertation on logical structure in the philosophy of Christofer Jacob Boström (1797–1866), whose dogmatic idealist philosophy prevailed in the 19th century in Sweden and influenced Hägerström's first philosophical credo),[3] and also on account of his youth and his still-modest academic position—certainly allowed Kelsen to influence him when it came to translating into English the legal terms that Kelsen had used in his German manuscript. Lastly, Kelsen (1946, xviii) declares that he revised Wedberg's translation of *General Theory of Law and State* himself; and that is quite plausibly how things went, especially with regard to the preface.

In short—our prosecuting attorney will conclude—it must be held beyond all reasonable doubt that Kelsen in person was the instigator behind the English rendition of *objektives Recht* and *subjektives Recht* with the two oxymorons "objective law" and "subjective law."[4] We do not know whether anyone before Kelsen committed a similar linguistic misdeed, but Kelsen did

[2] Note with regard to point (*d*) that Kelsen is explicit in stating that in French and German jurisprudence, "law in an objective sense" means "legal norm" and "law in a subjective sense" means both "legal right" and "legal duty." (This last is a point already discussed in Section 1.2.)

[3] Wedberg 1937. In the *Förörd* of this book Wedberg acknowledges in the first place his debt to his professor of philosophy at Uppsala University, Axel Hägerström, and also to *docenterna* Harry Meurling (1878–1938) and Gunnar Oxenstierna (1897–1939), under whose supervision he compiled his work. Wedberg has many words of thanks as well for Adolf Phalén (1884–1931), who in fact served brilliantly at Uppsala as chair of theoretical philosophy at the time when Hägerström was chairing practical philosophy, and finally for Einar Tegen (1884–1965). Cf. Pattaro 1974, 29–33, 37–9, 63–4, 75.

[4] But on at least one occasion there also appears in the *General Theory of Law and State* the expression "subjective right": One such occasion is on page 82, where the expression occurs next to "subjective law." Cf. footnote 6 in this chapter.

certainly commit it at Harvard in 1943–1944 with the English translation of the German manuscript of his *General Theory of Law and State*.[5]

14.3. A Few Other Contemporary English Translations of *objektives Recht* and *subjektives Recht*

The second edition of *Reine Rechtslehre* (1960) was translated in English before the first edition. We owe this translation, of 1967, to Max Knight, 1909–1993 (Kelsen 1989).

Even Knight, like Wedberg before him, almost invariably translates *objektives Recht* and *subjektives Recht* using "objective law" and "subjective law" (see, for example, page 125).[6] More than that, he sometimes changes the order of Kelsen's sentences and introduces in his English translation German expressions that do not appear in Kelsen's original (see, for example, Kelsen 1989, 125, and compare that with Kelsen 1960, 130).

Anyone who should read Max Knight's translation of the second edition of *Reine Rechtslehre* will notice remarkable differences from the German original. As far as I can tell, either of two things happened, or a mixture of them: Knight made a "free" translation of the second edition of *Reine Rechtslehre*, or Kelsen himself intervened in the course of Knight's translation and suggested changes with respect to the original German edition (which changes the translator does not, however, point out); or, again, the divergence between the German original and the English translation can be explained by taking into account the translator's free interpretation of the text in conjunction with the suggestions indicated to him by Kelsen. However that went, it may well be that Kelsen himself was not foreign to this mixup. In Knight's preface to his translation we can read what follows:

> This translation, carefully checked by the author, represents a compromise between a contents-conscious author and a form-conscious translator. Kelsen's immense experience with misinterpretations of his works as a result of "elegant" translations had to be the deciding factor when

[5] Anders Wedberg was an excellent scholar in the analytical tradition. Upon completing his first studies at Uppsala and Stockholm, he went to Princeton and Harvard, taught logic and philosophy at Cornell University from 1941 to 1943, and then served as professor of philosophy at Stockholm University from 1949 to 1975. A fine work from his scholarship is *Filosofins Historia*, a history of philosophy from ancient Greece to Ludwig Wittgenstein (1889–1951), published in Swedish from 1958 to 1966 and posthumously in English from 1982 to 1984 (Wedberg 1982–1984). He also translated into Swedish Wittgenstein's *Tractatus* and *Philosophical Investigations*. Last, but not least, Anders Wedberg's essay *Some Problems on the Logical Analysis of Legal Science* is among the sources of Hart's fortunate expressions "internal point of view" versus "external point of view" (Wedberg 1951, 252ff., 258ff.). Cf. Hart 1961, 244.

[6] Even in Knight's translation there occur cases of "subjective right," as on pages 129, 130, 168, and 171. Like Wedberg, Knight uses "subjective right" in the sense of "a legal right" as distinguished from "a legal duty" or "a legal obligation." Note, finally, that both translators use as well "a legal right" and "a right" in precisely this sense.

seemlingly repetitious or Germanic-sounding passages, expunged from or rephrased in an earlier draft of the translation as too literally mirroring the original, were restored. In view of the detailed Contents page an index was dispensed with. (Kelsen 1989, vi).

Kelsen, therefore, intervened in an earlier draft of the translation, and did so to make that translation more faithful to the original. Even so, the final translation fails in good measure to mirror the original: This discrepancy may be due to Knight or to Kelsen, or to both.[7]

The credit for finally making available to the English-speaking reader the first edition of Hans Kelsen's *Reine Rechtslehre* (Kelsen 1934) goes to Bonnie Litschewski Paulson and Stanley Paulson (Kelsen 1992). This translation came out in 1992: The original was published in German fifty-eight years earlier.

Even in the fine and faithful English translation of this work we have evidence of the difficulties involved in providing English equivalents of *objektives Recht* (or *Recht in einem objektiven Sinn*) and *subjektives Recht* (or *Recht in einem subjektiven Sinn*). The translators did what they could, and they worked out the following expressions: "objective law," "law—as objective law—," "law in (the) objective sense," "subjective right," and "law in (the) subjective sense" (Kelsen 1992, 37–46, 67). I will come back to this translation in Section 14.5, where I consider Kelsen's normativistic reductionism.

Allow me one last example here that seems to me to fall in line with the English translation of Kelsen 1934, except that this time around the translation is that of Alexy 1986.

Julian Rivers slips in these words on pages xxiii–xxiv of *A Theory of Constitutional Rights and the British Constitution*, an essay (Rivers 2002) that introduces his English translation of Robert Alexy's *Theorie der Grundrechte* (Alexy 2002):

There is a familiar distinction within German jurisprudence between objective law and subjective rights. (Rivers 2002, xxiii–xxiv)

That is not exactly so: The basic distinction is that between *objektives Recht* and *subjektives Recht*, in the singular ("what is objectively right" and "what is subjectively right"); and, in the light of this distinction, *subjektives Recht*, or *Recht in einem subjektiven Sinn*, refers not only to rights but also to obligations (Section 1.2).

It is not for us to decide whether a civil-law jurist or jurisprudent would be more puzzled at finding the distinction between *objektives Recht* and

[7] Further, the fact that Knight's last remark (in Kelsen 1989, vi) admits of at least two interpretations has me wondering whether the index was dispensed with by Kelsen himself or by Max Knight. It was not dispensed with in the French translation, of 1962 (Kelsen 1962) (which contains, among other things, an *Avant propos*, an authenticating piece, it might be said, penned by Kelsen himself), nor was it dispensed with in the Italian translation, of 1966 (Kelsen 1990). Lastly, both of these translations, the French and the Italian, do in fact mirror the German original more so than the English does.

subjektives Recht expressed (in English) as one between "objective law" and "subjective rights" or as one between "objective law" and "subjective law." Yet this latter rendition seems to be the lesser of the two evils because, in parallel to the German distinction, it uses the same noun ("law," however inappropriate this term may be) and specifies it with the modifiers "objective" and "subjective."[8] Civil-law jurists and jurisprudents can of course attempt a guess at what is the subject matter being referred to with these English expressions, and they can get it right if they are familiar with the kinds of clarifications made in Chapter 1 and in this chapter, among others.

As for scholars of common law, I wonder whether would they rather be more inclined to think that, luckily for them, the locutions "objective law," "subjective law," "subjective rights," and the like, are in the final analysis the literal translation found for abstruse coinages conceived in German conceptual jurisprudence (in the pejorative sense of the qualifier "conceptual"),[9] behind which, indeed behind the whole of civil-law legal culture, there is after all a Byzantine tradition[10] (here, too, in the pejorative sense of the qualifier "Byzantine"): These readers will be less inclined to venture a guess and attempt to understand what lies in concealment beneath the coinages offered to them than to thank God and Our Ladye the Common Lawe[11] for the fact that it is not in the end their job, nor is it within the scope of their academic interests, to deal with these vestiges from a Byzantine past, however much translated into English.

Cum de re constat, de verbis non est disputandum ("When the thing is clear, no discussion about words"): I agree with this dictum, but I am not completely sure that the thing here in question is clear. The things discussed in this chapter—but which actually were taken up beginning in Chapter 1, and indeed are treated in the whole of Part One, as well as in Chapters 12 and 13 of this volume—are some fundamental concepts of the legal-dogmatic tradition of civil law, a tradition that goes back further than German legal positivism: to natural law and ultimately to Roman law. These things, these concepts, may have been superseded by contemporary legal culture (even if I am not entirely convinced of this), but at least in an ideal reconstruction of the normativism of the legal-dogmatic tradition of civil law we should want to prevent any linguistic confusion (whomever it springs from, even Kelsen) from engendering confusion with regard to the underlying things or concepts, especially when different (however similar) cultural traditions—here, that of

[8] Cf. footnote 12 in this chapter.

[9] The term *Begriffsjurisprudenz* was coined in this sense by Philipp Heck (1858–1943).

[10] That of Justinian and Tribonian (ca. 475–545).

[11] The expression "ladye lawe" appears in a 1567 translation by Thomas Drant of Horace's Third Satire: "Thus, graunte you must, that feare of wronge, / set ladye lawe in forte" (Drant 1972, 166). The Latin original: "Iura inventa metu iniusti fateare necesse est" (Horace, *Satires*, I, 3, v. 111). Cf. Fassò 1982, 916.

civil law and that of common law—seem to be on a course toward a kind of fusion. Fusion is fine. Not so confusion.

Rivers makes an interesting remark: The adjectives "objective" and "subjective" are "made necessary by the ambiguity of the word *Recht*." An observation along the same lines is to be found in Hans Kelsen's second edition of *Reine Rechtslehre*, both in German and in the English translation (Kelsen 1960, 130–1; Kelsen 1989, 125): Maybe what we have here is a further indicium on which basis our public prosecutor would argue Kelsen's responsibilities.

In the second edition of *Reine Rechtslehre*, Kelsen observes with regard to the ambiguity of *Recht* that English, unlike German and French, has no need to bring into the equation the two adjectives "objective" and "subjective," for English can express the distinction in question by drawing on two nouns already at its disposal, namely (in Kelsen's opinion, an opinion I do not agree with: Section 1.2), "law" and "a right."[12] Here a question comes up: Why is it that those scholars who translate *objektives Recht* and *subjektives Recht* in English assuming that the first expression is equivalent to "law" and the second to "a right" should end up using as well the qualifiers "objective" and "subjective" (as in "objective law" and "subjective right")? If their assumption is correct (and I argue it not to be: Section 1.2), it will be superfluous, and ultimately a thing best avoided, to use the qualifiers "objective" and "subjective":[13] Law is

[12] This observation of Kelsen's is unfortunately omitted in Max Knight's nonchalant translation: "It is usual to oppose to the concept 'obligation' the concept 'right,' and to cede priority of rank to the latter. Within the sphere of law we speak of 'right and duty,' not of 'duty and right,' as within the sphere of morals, where greater stress is laid on duty; and we speak of a right as something different from law. But the right *is* law—law in a subjective sense of the word in contradistinction to 'law' in an objective sense, that is, a legal order or system of norms. In describing the law, the right is so much in the foreground that the obligation almost disappears; in German and French legal language, the same word, namely *Recht* and *droit*, is used to designate 'right' as well as 'law,' as a system of norms forming a legal order. Hence, in order to distinguish right and law, it is necessary to speak in German of *subjektives Recht* and *objektives Recht* (subjective law and objective law) or of *Recht im subjektiven Sinne* and *Recht im objektiven Sinne* (law in a subjective sense and law in an objective sense); and in French of *droit subjectif* and *droit objectif*" (Kelsen 1989, 125). This is Kelsen's German original; the italics show the observation that Max Knight omits to translate: "Der Rechtspflicht stellt man für gewöhnlich die Berechtigung als subjektives Recht gegenüber und rückt dabei dieses an die erste Stelle. Man spricht im Bereiche des Rechts von Recht und Pflicht, nicht von Pflicht und Recht (im Sinne der Berechtigung) wie im Bereich der Moral, wo jene mehr als dieses betont wird. In der Darstellung des Rechts steht die Berechtigung so sehr im Vordergrund, daß hinter ihr die Pflicht beinahe verschwindet und jene—in der deutschen und französischen Rechtssprache—sogar mit demselben Worte bezeichnet wird wie das System von Normen, das die Rechtsordnung bildet: mit dem Worte 'Recht,' 'droit.' Um mit diesem nicht identifiziert zu werden, muß die Berechtigung als 'subjektives' Recht, das ist also das Recht eines bestimmten Subjektes, von der Rechtsordnung, als dem 'objektiven' Recht, unterschieden werden. *In der englischen Rechtssprache freilich steht das Wort 'right' zur Verfügung, wenn man die Berechtigung, das Recht eines bestimmten Subjektes, zum Unterschied von der Rechtsordnung, dem objektiven Recht, dem 'law,' bezeichnen will*" (Kelsen 1960, 130–1).

[13] Of course the question would be out of place if the translator were writing on a meta-

law (objective by definition, as it were); a right is a right (subjective by definition, as it were).

14.4. The "Dualism" between *objektives Recht* and *subjektives Recht*: A Further Investigation into Kelsen

As was mentioned in the preceding section, the question of the "ambiguity of the word *Recht*" comes up in Kelsen before Rivers comes around to it in his essay. In Kelsen this question comes up in different formulations in the passage from the *General Theory of Law and State* to the second edition of *Reine Rechtslehre*, and also—and surprisingly enough—in the passage from the German original of the second edition of *Reine Rechtslehre* to Max Knight's translation of it.

Kelsen's first major work to appear in English was the *General Theory of Law and State*, published in 1945 (Kelsen 1946) as a translation of the corresponding German manuscript. In this case, then, the date of the English translation of Kelsen's work coincides with the date of the work's first edition.[14]

Kelsen's second major work to appear in English was the second edition of *Reine Rechtslehre*, published in German in 1960 and translated into English by Max Knight in 1967 under the title *The Pure Theory of Law*.

Lastly, the first edition of *Reine Rechtslehre*, markedly different from the second edition, was originally published in German in 1934, and only in 1992 was it given an English translation, by Bonnie Litschewski Paulson and Stanley L. Paulson.[15]

The 1934 *Reine Rechtslehre* (first edition) had not been conceived by Kelsen for an English-speaking audience, so in treating some questions common to all three of the works just listed, this work supplies a few more details than Kelsen 1946 and Kelsen 1960 as well as it omits to provide us with many others.

In the *General Theory of Law and State*, as well as in the English translation of the second edition of *Reine Rechtslehre*, the distinction between *objektives Recht* and *subjektives Recht* is almost invariably rendered with "objective *law*" and "subjective *law*." We will see shortly the context in which it is instead the expression "subjective *right*" that turns up.

linguistic level, that is, as in the case of the passage by Kelsen quoted in footnote 12, in a discussion not about concepts but about the terms (in German, French, etc.) that designate them. Besides, in this case, a translator seeking to render the distinction between *objektives Recht* and *subjektives Recht* (or that between *droit objectif* and *droit subjectif*) should use "objective right" versus "subjective right," thereby achieving a uniformity between the English, on the one hand, and the German, French, etc., on the other. As far as I know, this possibility is the only one that has not yet been explored.

[14] Kelsen had published an *Allgemeine Staatslehre* in German in 1925, but what he put out in 1945 is a different work.

[15] *Allgemeine Theorie der Normen*, published posthumously in German in 1979 (Kelsen 1979), was translated into English in 1991 by Michael Hartney (Kelsen 1991).

By contrast, in the 1992 English translation of the first edition of *Reine Rechtslehre* (1934), the distinction between *objektives Recht* and *subjektives Recht* is almost invariably rendered with "objective *law*" and "subjective *right*" (rather than with "subjective *law*"). Why?

The reason for this different terminological choice with respect to Wedberg's and Knight's translations may be that there developed in the meantime an awareness, among English-speaking scholars and in common-law milieus, of just how awkward it was to use "subjective law" (which in all likelihood was originally the chosen expression of Kelsen himself); and another reason may be that the development of the debate on human rights had in the meantime made English-speaking scholars more familiar with the original German expression, *subjektives Recht*, egging them on to work out for it "subjective *right*," which might be considered a more faithful or literal English rendition.

But what especially draws out our curiosity is the fact that there are passages in the English translation of the first edition of *Reine Rechtslehre* in which the translators use "*law* in (the) subjective sense" rather than "subjective *right*." Why do they do so? For some reason, the expression "subjective *right*" struck them as unusable in certain contexts. And—I maintain—the reason why they went with the different solution just mentioned is that Kelsen uses *subjektives Recht* to designate not only rights but also obligations (cf. Section 1.2).

14.5. Kelsen's Reduction of What Is Subjectively Right to What Is Objectively Right. A Textual Analysis (or Rather a Crossword Puzzle)

If we are to grasp the different nuances with regard to normativeness in the parlance of civil-law legal dogmatics, as well as the different conceptions of normativeness present in the tradition of civil-law legal thought (Kelsen's conception in particular), we will have to distinguish, I think, at least nine items, or concepts.

(*i*) "Law" (*das Recht*), understood as a legal order, or system, independently of any relations to the concept expressed by "the right" or "what is right," and hence independently of normative connotations.[16]

(*ii*) "The reality that ought to be (*das Sollen*)," understood in the manner illustrated in Sections 1.1 through 1.3.

[16] In this sense, "law" might be a mere Is (it might be found to pertain only to the reality that is). See, for example, the interesting theory of law worked out by Italy's foremost institutionalist, Santi Romano (1857–1947); he, too, incidentally, was an eminent professor in public law, as was Kelsen. Santi Romano's most widely known work is entitled *L'ordinamento giuridico* (1917; cf. Romano 1945), which in German would translate to *Die Rechtsordnung* (The legal order). But Santi Romano's *die Rechtsordnung*—his legal order—is not a system of norms; rather, as he writes, it is an institution or an organisation.

(*iii*) "What is right" (*das Recht*), understood in the manner illustrated in Sections 1.2 and 1.3, and as inclusive of the six items that follow.

(*iv*) "Norm" (*die Norm*), understood as the entity which belongs par excellence to the reality that ought to be, and which best expresses the sense of this reality.

(*v*) "What is objectively right" (*objektives Recht*), understood in a broad sense as referring to norms and their contents in the reality that ought to be (the top layer of the reality that ought to be: Section 1.2).

(*vi*) "What is objectively right" (*objektives Recht*), understood in a narrow sense as referring to the content of norms (Section 1.3).

(*vii*) "What is subjectively right" (*subjektives Recht*), understood in a broad sense as referring to all normative subjective positions, active and passive (both rights and obligations, for example),[17] which make up the bottom layer of the reality that ought to be (Section 1.2).

(*viii*) "What is subjectively right" (*subjektives Recht*), understood in a narrow sense as referring only to passive normative subjective positions in the reality that ought to be, and hence as referring to obligations but not to rights (Sections 1.2 and 1.3). Cf. Kelsen 1934, 46ff.

(*ix*) "What is subjectively right" (*subjektives Recht*), understood in a narrow sense as referring only to active normative subjective positions in the reality that ought to be, and hence as referring to rights but not to obligations: Sections 1.2 and 1.3. Cf. Kelsen 1934, 40ff., 46ff.

It is against this background that we should consider the previously mentioned charge levelled at Kelsen (Section 14.2). And we can test forthwith the use of the distinctions and qualifications just made by bringing them to bear in seeking to grasp his normativistic reductionism and to assess the terminology he chose ("objective law" and "subjective law") to render into English the distinction between *objektives Recht* and *subjektives Recht*.

(1) Kelsen sets *das Recht*—in both of its possible and different meanings: (*i*) the law and (*iii*) what is right—within (*ii*), the reality that ought to be, *das Sollen*. *Das Recht* is, according to Kelsen, entirely and exclusively a reality that ought to be. What was indicated under point (*i*), the law, must therefore flow entirely and necessarily into what is right as implied under points (*ii*) through (*ix*). This is Hans Kelsen's preliminary, first, and crucial normativistic reduction. The reality of the law is simply the same reality as what is right: It is the reality that ought to be.

(2) Kelsen, further, effects another and full normativistic reduction, a sort of Final Solution: He reduces the bottom layer of the reality that ought to be (what is subjectively right in a broad sense as characterised under point (*vii*)) to the top layer of the reality that ought to be (to what is objectively right in a

[17] On the use of "active" and "passive" in reference to normative subjective positions, see Section 1.3, footnote 13.

broad sense as characterised under point (*v*)). More precisely, Kelsen makes these three reductions: (*ix*) legal rights (*Berechtigungen*) reduced to (*viii*) legal obligations (*Rechtspflichten*), (*viii*) legal obligations to (*iv*) legal norms (*Rechtsnormen*), and (*iv*) *legal* norms[18] to (*ii*) the reality that ought to be (*das Sollen*). This last reduction is in truth already and preliminarily made in (1), where everything that is *legal*, in the sense of having to do with (*i*), the law, gets located within (*ii*), the reality that ought to be (in *das Sollen*).[19]

With these grand reductions in place, Kelsen, in his *General Theory of Law and State*, has *das Recht* translated to "the law," *objektives Recht* to "objective law," and *subjektives Recht* to "subjective law." What is amiss here is that "the law" and "what is right" ("the right") are equivalent in Kelsen's thought, but not all his English readers make the same equivalence. The fact that *das Recht* can mean "the law" or "the right," or both, and that Kelsen reduces the law to the right, suggests that the most appropriate translation of Kelsen's *das Recht* is not "the law," but "what is right," or "the right" (as happens with Hegel's *Philosophie des Rechts*);[20] and the most appropriate translation of *objektives Recht* and *subjektives Recht*, the way Kelsen uses these expressions, is not "objective law" and "subjective law" (as Kelsen writes in the *General Theory of Law and State*), but "what is objectively right" and "what is subjectively right" (see Section 1.2).

Kelsen's normativistic reductionism (as specified under the foregoing points (1) and (2)) may help explain, but does not justify, the English expressions he chose to use. This choice has in all likelihood played a role in spreading in the English language and in common-law countries the awkward English usages ("objective law," "subjective law") presently under discussion.

In the remainder of this section I provide some passages from Kelsen 1934, along with the corresponding passages from the 1992 English translation, plus a few comments on both based on the foregoing distinction among nine items, or concepts.

[18] It would be more appropriate to say "legal, objectively *valid* norms," keeping to Kelsen's understanding of validity (a conception of validity I do not agree with: Sections 2.1.1, 2.2.2, 2.2.3, 3.2, 3.4, 7.1, and 8.2.2 through 8.2.4).

[19] Besides, Kelsen distinguishes the *Sollen* (the reality that ought to be) in a subjective sense (*Sollen in einem subjektiven Sinn*, not to be confused with *Recht in einem subjektiven Sinn*) from the *Sollen* in an objective sense (*Sollen in einem objektiven Sinn*, not to be confused with *Recht in einem objektiven Sinn*): see Section 5.1, footnote 2. The *Sollen* (the reality that ought to be) in a subjective sense can be any non-legal *Sollen*, and Kelsen reduces it to *das Sein* (the reality that is): to will or interest. According to Kelsen, only the legal *Sollen* (*das Recht*) is the *Sollen* in an objective sense, namely, the objective reality that ought to be. And this objectivity is designated by Kelsen as "(legal) validity." Cf. Pattaro 1982, LXXVII–LXXIX. See Kelsen 1934, 66; Kelsen 1960, 45–6. Cf. also Kelsen 1911, 64–71; Kelsen 1946, 30–7, 47–9; Kelsen 1957b, 211ff., 229; Kelsen 1960, 7, 9, 17, 19, 20–3, 231; Kelsen 1979, 4, 21–2, 30–7, 47–9, 103ff., 124–5, 132ff., 239–40.

[20] Cf. Section 1.2 (and its footnote 8) and Section 4.1, footnote 1.

In the first edition of *Reine Rechtslehre*, Kelsen had already written the following:

Wenn die allgemeine Rechtslehre ihren Gegenstand, das Recht [Is this *das Recht* in the sense of "law," as specified earlier under point (*i*), or in the sense of "what is right," point (*iii*)? I believe we have to do here with concept (*iii*), to which Kelsen entirely reduces concept (*i*)], nicht nur in einem objektiven [concept (*v*)], sondern auch in einem subjektiven Sinn [concept (*vii*)] als gegeben behauptet, so verlegt sie damit schon in die Grundlage ihres Systems—und das ist der Dualismus von objektivem und subjektivem Recht [concepts (*v*) and (*vii*) respectively]—einen prinzipiellen Widerspruch. Denn sie behauptet damit, daß das Recht [*das Recht* as "what is right": concept (*iii*)]—als objektives [concept (*v*)]—Norm, Komplex von Normen, das heißt Ordnung [concept (*iv*)], und zugleich, daß es [*es*, referring to "das Recht": concept (*iii*)]—als subjektives [concept (*ix*)]—etwas davon [*davon*, referring to *das Recht als objektives*: concept (*v*)] völlig Verschiedenes, damit unter keinen gemeinsamen Oberbegriff zu Subsumierendes, nämlich: Interesse oder Wille sei. Dieser Widerspruch kann auch dadurch nicht aufgehoben werden, daß zwischen dem objektiven und dem subjektiven Recht [concepts (*v*) and (*ix*) respectively] eine Beziehung behauptet und dieses als das von jenem geschützte Interesse, der von jenem anerkannte oder gewährleistete Wille definiert wird. (Kelsen 1934, 40–1)

I provide for the reader's convenience my own translation of the foregoing excerpt: This translation is based on Kelsen 1992 (itself a translation of Kelsen 1934) and has been tailored to the specific needs of the textual analysis I am carrying out in this section.[21]

When general legal theory claims that its object of enquiry, *das Recht* [Is this *das Recht* in the sense of "law," as specified earlier under point (*i*)? or in the sense of "what is right," point (*iii*)? I believe we have to do here with concept (*iii*), to which Kelsen entirely reduces concept (*i*)], is given not only in an objective sense [concept (*v*)] but also in a subjective sense [*nicht nur in einem objektiven, sondern auch in einem subjektiven Sinn*: concept (*vii*)], it builds into its very foundation a basic contradiction, that is, the dualism between what is objectively and what is subjectively right [*der Dualismus von objektivem und subjektivem Recht*: concepts (*v*) and (*vii*) respectively]. For general legal theory is thereby claiming that *das Recht* [*das Recht* as "what is right," I would say here: concept (*iii*)]—insofar as it is objectively right [*als objektives*: concept (*v*)]—is norm, a complex of norms, a system [*Norm, Komplex von Normen, das heißt Ordnung*: concept (*iv*)], and is claiming at the same time that what is right [*es*, referring to *das Recht*: concept (*iii*)]—insofar as it is subjectively right [*als subjektives*: concept (*ix*)]—is interest or will, something altogether different from what is objectively right [*das Recht als objektives*: concept (*v*)] and therefore impossible to subsume under any general concept common to both. This contradiction cannot be removed even by claiming a connection between what is objectively

[21] From here on out, in providing selected passages from the first edition of *Reine Rechtslehre*, I will be using my own adaptation of Kelsen 1992. This adaptation will consist, for example, in substituting the original German (*das Recht*) or my own expressions ("what is right," "what is objectively right," "what is subjectively right") for the terms occurring in Kelsen 1992; these substitutions I will make whenever it seems necessary to bring to the reader's attention the terminological and conceptual details I am treating of; in particular, I will need to point out Kelsen's ambiguous uses of the term *das Recht* and the crucial passages in which Kelsen effects the normativistic reductionism I have been treating of. In any event, I will be providing—for the reader's convenience, and to *suum cuique tribuere*—the corresponding original German text of Kelsen 1934 as well as the English version of it by Bonnie Litschewski Paulson and Stanley Paulson (Kelsen 1992).

and what is subjectively right [*zwischen dem objektiven und dem subjektiven Recht*: concepts (*v*) and (*ix*) respectively], by claiming that the latter is defined as interest that is protected by the former, as will that is recognised or guaranteed by the former. (My adaptation of Kelsen 1992, 38; cf. Kelsen 1934, 40–1)[22]

The reader may notice the following about the passage just quoted: Concept (*i*) occurs once (in an ambiguous conjunction with concept (*iii*)); concept (*iii*) occurs three times (on the first of these three occasions it does so ambiguously in conjunction with concept (*i*)); concept (*iv*) occurs once; concept (*v*) occurs five times; concept (*vii*) occurs twice; and concept (*ix*) occurs twice. There is no occurrence of concept (*vi*) or (*viii*).

Those readers who should want to apply themselves to the crossword puzzle just introduced may give it a try by assigning concepts (*i*) through (*ix*) to the expressions occurring in the unadapted version of the passage just quoted (the passage is Kelsen 1992, 38; the unadapted version is quoted in footnote 22 of this section, where the relevant expressions are marked out in italics). The results obtained may then be compared against what I myself came up with working on the original German version (and on my English translation of it). This comparison would make it possible to detect all cases of convergence and divergence (between my own results and the reader's) as well as any undecidables. At any rate, these are the results I obtained working on the unadapted Kelsen 1992, 38, quoted in footnote 22: Concept (*i*) occurs three times, concept (*iv*) once, and concept (*ix*) three times; there is no occurrence of concept (*ii*), (*iii*), or (*v*) through (*viii*); four cases are undecidable, which happens when "objective" is used to modify "law."

In Section 24 of the first edition of *Reine Rechtslehre* Kelsen proceeds to his reduction *des subjektiven Rechts* (in the foregoing sense (*vii*)) *auf das objektive* (in the foregoing sense (*v*)).

In particular he argues the following:

Gerade an diesem Punkte setzt die Reine Rechtslehre mit ihrer Kritik der herrschenden Lehrmeinung ein, indem sie mit dem größten Nachdruck den Begriff der Rechtspflicht [where there is implicit the concept specified under point (*viii*)] in den Vordergrund stellt. Und auch

[22] Here is the 1992 English translation, unmodified save for the italics, which I have put in as an aid for the reader in spotting the concepts listed immediately after this footnote, in the run of text: "When general legal theory claims that its object of enquiry, the *law*, is given not only in an *objective sense* but also in a *subjective sense*, it builds into its very foundation a basic contradiction, that is, the dualism of *objective law* and *subjective right*. For general legal theory is thereby claiming that law—as *objective law*—is *norm*, a complex of norms, a system, and claiming at the same time that *law*—as *subjective right*—is interest or will, something altogether different from *objective law* and therefore impossible to subsume under any general concept common to both. This contradiction cannot be removed even by claiming a connection between *objective law* and *subjective right*, by claiming that the latter is defined as interest that is protected by the former, as will that is recognized or guaranteed by the former" (Kelsen 1992, 38; italics added).

in diesem Punkte zieht sie nur die letzte Konsequenz gewisser Grundgedanken, die in der positivistischen Theorie des 19. Jahrhunderts schon angelegt waren, aber nicht über verhältnismäßig bescheidene Ansätze entwickelt wurden. Sie erkennt in der Rechtspflicht [concept (*viii*) is implicit here] nur die Rechtsnorm [concept (*iv*)] in ihrer Beziehung auf das von ihr statuierte konkrete Verhalten eines ganz bestimmten Individuums, das heißt die individualisierte Rechtsnorm [concept (*viii*) as reduced to concept (*iv*)]; und sie emanzipiert den Begriff der Rechtspflicht [concept (*viii*) is implicit here] dadurch vollkommen von dem der Moralpflicht, daß sie ihn in der folgenden Weise interpretiert: zu einem bestimmten Verhalten ist ein Mensch insoweit rechtlich verpflichtet, als das Gegenteil dieses Verhaltens in der Rechtsnorm [concept (*iv*)] als Bedingung für einen als Unrechtsfolge qualifizierten Zwangsakt gesetzt ist. (Kelsen 1934, 47)

In this case—in the foregoing excerpt—the English translation (from Kelsen 1992) lends itself as is, without any modifications, to receive the qualifications introduced with the previously listed concepts (*i*) through (*ix*). Therefore, the English translation from Kelsen 1992, provided in footnote 23 below, bears the same comments inserted in the German original.[23]

The reader may notice how, in the passage just quoted, concept (*iv*) occurs three times and concept (*viii*) four times. There is no occurrence of concepts (*i*) through (*iii*), (*v*) through (*vii*), or (*ix*).

Kelsen also argues that

eine Berechtigung [concept (*ix*) is implicit here] liegt dann vor, wenn unter die Bedingungen der Unrechtsfolge eine auf diese gerichtete, in der Form einer Klage oder Beschwerde abzugebende Willensäußerung des durch den Unrechtstatbestand in seinen Interessen Verletzten aufgenommen ist. Nur in der Beziehung zu diesem individualisiert sich die Rechtsnorm [concept (*iv*)] zur Berechtigung [concept (*ix*) is implicit here], wird sie—in diesem von der Rechtspflicht [in one sense of *subjektives Recht*, i.e., its sense under concept (*viii*), different from *die Rechtspflicht*, concept (*viii*)] verschiedenen Sinne [*subjektives Recht*: concept (*iv*)]—subjektives Recht [concept (*ix*)], das heißt Recht eines Subjekts [concept (*ix*)], indem sie [*sie*, referring to *Rechtsnorm*: concept (*iv*)] sich ihm zur Geltendmachung seiner Interessen zur Verfügung stellt. Als Berechtigung [concept (*ix*) is implicit here] steht das subjektive Recht

[23] "At exactly this point, the Pure Theory of Law launches its critique of the received academic opinion by bringing the concept of *legal obligation* [*der Rechtspflicht*, where there is implicit the concept specified under point (*viii*)] emphatically to the fore. Here, too, the Pure Theory is simply drawing the obvious conclusion from certain basic ideas already expressed in nineteenth-century positivist theory but not developed beyond their relatively modest beginnings. The Pure Theory recognizes in legal obligation simply the individualized legal norm, that is, a legal norm (establishing [as obligatory] certain behaviour) in its connection to the concrete behaviour of a particular individual [*erkennt in der Rechtspflicht* (concept (*viii*) is implicit here) *nur die Rechtsnorm* (concept (*iv*)) *in ihrer Beziehung auf das von ihr statuierte konkrete Verhalten eines ganz bestimmten Individuums, das heißt die individualisierte Rechtsnorm*: concept (*viii*) as reduced to concept (*iv*)]. And the Pure Theory completely emancipates the concept of legal obligation [*Rechtspflicht*: concept (*viii*) is implicit here] from that of moral obligation by interpreting the former as follows: A human being is legally obligated to behave in a certain way in so far as the opposite behaviour is set in the legal norm [*Rechtsnorm*: concept (*iv*)] as the condition for a coercive act qualified as the consequence of an unlawful act" (Kelsen 1992, 43; italics added).

[concept (*ix*)] dem objektiven Recht [concept (*v*)] nicht als etwas von ihm Unabhängiges gegenüber; denn es gibt so etwas wie ein subjektives Recht [concept (*vii*)] nur, weil und sofern es das objektive Recht [concept (*v*)] normiert [concept (*iv*)]. Die Berechtigung [concept (*ix*)] ist überhaupt nur eine mögliche und keineswegs notwendige inhaltliche Gestaltung des objektiven Rechts [concept (*v*)], eine besondere Technik, deren sich das Recht [Is this *das Recht* in the sense of "law," as specified earlier under point (*i*), or in the sense of "what is right," point (*iii*)? I believe we have to do here with concept (*iii*), to which Kelsen entirely reduces concept (*i*)] bedienen kann, aber durchaus nicht bedienen muß. (Kelsen 1934, 48)

I provide for the reader's convenience my own translation of the foregoing excerpt: This translation is based on Kelsen 1992 (itself a translation of Kelsen 1934) and has been tailored to the specific needs of the textual analysis I am carrying out in this section.

An authorisation [*Berechtigung*: concept (*ix*) is implicit here] exists where an expression of will is included among the conditions for the consequence of an unlawful act, an expression of will that addresses this consequence and that is to be brought in the form of a complaint or claim by the party whose interests were violated by the unlawful act. Only in relation to its becoming individualised in an authorisation [*Berechtigung*: concept (*ix*) is implicit here] does the legal norm [*die Rechtsnorm*: concept (*iv*)] become what is subjectively right [*subjektives Recht*: concept (*ix*)]—in a sense which is different from that in which a legal obligation [*der Rechtspflicht*: concept (*viii*) is implicit here] is what is subjectively right [*subjektives Recht*: concept (*viii*)]—that is, the legal norm [*sie*, referring to *Rechtsnorm*: concept (*iv*)] becomes a subject's right [*Recht eines Subjekts*: concept (*ix*)], this to the extent that the legal norm [*sie*, referring to *Rechtsnorm*: concept (*iv*)] places itself at the disposal of a subject in order to enable the subject to advance his or her own interest. Understood as authorisation [*Berechtigung*: concept (*ix*) is implicit here], what is subjectively right [*das subjektive Recht*: concept (*ix*)] stands in relation to what is objectively right [*dem objektiven Recht*: concept (*v*)] not as something independent of and contrary to it; indeed, there can be something like a right [*ein subjektives Recht*: concept (*vii*)] only because and to the extent that what is objectively right [*das objektive Recht*: concept (*v*)] regulates it normatively [*normiert*: concept (*iv*)]. Authorisation [*Berechtigung*: concept (*ix*)] is quite simply one of several possible content forms that what is objectively right [*des objektiven Recht*: concept (*v*)] can take: It is therefore not a necessary content form; it is by no means a necessary way. It is one particular technique that *das Recht* [Is this *das Recht* in the sense of "law," as specified earlier under point (*i*)? or in the sense of "what is right," point (*iii*)? I believe we have to do here with concept (*iii*), to which Kelsen entirely reduces concept (*i*)] can, but need not, use. (My adaptation of Kelsen 1992, 44; cf. Kelsen 1934, 48)[24]

[24] Here is the 1992 English translation, unmodified save for the italics, which I have put in as an aid for the reader in spotting the concepts listed immediately after this footnote, in the run of text: "A legal *right* exists where an expression of will is included among the conditions for the consequence of an unlawful act, an expression of will that addresses this consequence and that is to be brought in the form of a complaint or claim by the party whose interests were violated by the unlawful act. Only in its connection to the violated party is the legal *norm* individualized as a legal *right*; in making itself available to a subject for the assertion of his interests, the *legal norm* becomes the *right of that subject*, that is, a *subjective right—law in a subjective sense* different from *legal obligation*. As *legal right*, *law in the subjective sense* is not independent of the *objective law*, for there is such a thing as a *subjective right* only because and in so far as the *objective law* normatively regulates it. The *legal right* is quite simply one possible way of shaping the content of the *objective law*; it is by no means a necessary way. It is one particular technique that *the law* can, but need not, use" (Kelsen 1992, 44; italics added).

The reader may notice the following about the passage just quoted: Concept (*i*) occurs once (in an ambiguous conjunction with concept (*iii*)); concept (*iii*) occurs once (in an ambiguous conjunction with concept (*i*)); concept (*iv*) occurs four times; concept (*v*) occurs three times; concept (*vii*) occurs once; concept (*viii*) occurs twice; and concept (*ix*) occurs seven times. There is no occurrence of concept (*ii*) or (*vi*).

Those readers who should want to apply themselves to the crossword puzzle previously introduced may give it a try by assigning concepts (*i*) through (*ix*) to the expressions occurring in the unadapted version of the passage just quoted. The passage is Kelsen 1992, 44; its unadapted version is quoted in footnote 24 of this section, where the relevant expressions are marked out for emphasis. (I have italicised in this unadapted version the expressions "law in a subjective sense" and "law in the subjective sense," which the translators use on exceptional occasions, straying from their otherwise consistent use of "subjective right": see *infra*.)

And, lastly, Kelsen adds that

> mit dieser Einsicht der Reinen Rechtslehre in das Wesen dessen, was man Recht im subjektiven Sinne nennt [concept (*vii*)], ist der Dualismus von subjektivem [concept (*vii*)] und objektivem Recht [concept (*v*)] aufgehoben. Das subjektive Recht [concept (*vii*)] ist kein vom objektiven [concept (*v*)] verschiedenes, es ist das objektive Recht [concept (*v*)] selbst, nur sofern es [*es*, referring to *das objektive Recht selbst*: concept (*v*)] sich mit der von ihm [*von ihm*, meaning *objektives Recht* (concept (*v*))] statuierten Unrechtsfolge gegen ein konkretes Subjekt richtet (Pflicht [concept (*viii*) is implicit here]) oder einem solchen zur Verfügung steht (Berechtigung [concept (*ix*) is implicit here]). (Kelsen 1934, 49)

I provide for the reader's convenience my own translation of the foregoing excerpt: This translation is based on Kelsen 1992 (itself a translation of Kelsen 1934) and has been tailored to the specific needs of the textual analysis I am carrying out in this section.

> With this insight into the essence of what is called what is subjectively right [*was man Recht im subjektiven Sinne nennt*: concept (*vii*)], the Pure Theory of Law eliminates the dualism between what is subjectively and what is objectively right [*von subjektivem* (concept (*vii*)) *und objektivem Recht* (concept (*v*))]. What is subjectively right [*Das subjektive Recht*: concept (*vii*)] is not different from what is objectively right [*vom objektiven*: concept (*v*)]; it is the same as what is objectively right [*das objektive Recht selbst*: concept (*v*)]; it is what is objectively right [*es*, referring to *das objektive Recht selbst*: concept (*v*)] only inasmuch as it turns against an actual subject with a consequence (a consequence established by what is objectively right itself [*von ihm*, referring to *objektives Recht* (concept (*v*)) *statuierten*]) of an unright (in this case there is a duty [*Pflicht*: concept (*viii*) is implicit here]), or it is at the disposal of this subject (and in this case there is an authorisation [*Berechtigung*: concept (*ix*) is implicit here]). (My adaptation of Kelsen 1992, 44; cf. Kelsen 1934, 49)[25]

[25] Here is the 1992 English translation, unmodified save for the italics, which I have put in as an aid for the reader in spotting the concepts listed immediately after this footnote, in the run of text: "With this insight into the essence of what is called *law in the subjective sense*, the

The reader may notice the following about the passage just quoted: Concept (*v*) occurs five times, concept (*vii*) three times, concept (*viii*) once, and concept (*ix*) once. There is no occurrence of concepts (*i*) through (*iv*) or of concept (*vi*).

Those readers who should want to apply themselves to the crossword puzzle previously introduced may give it a try by assigning concepts (*i*) through (*ix*) to the expressions occurring in the unadapted version of the passage just quoted. The passage is Kelsen 1992, 44; its unadapted version is quoted in footnote 25 of this section, where the relevant expressions are marked out for emphasis. I have italicised in this unadapted version the expression "law in the subjective sense," occurring twice, which the translators use on exceptional occasions, straying from their otherwise consistent use of "subjective right"; and I have also italicised "subjective right (*qua* legal right)." All these expressions used in translation can be explained by the fact that the translators have had to find some way of rendering into English the idea that the German *subjektives Recht* refers not only to legal rights, but also to legal obligations.

14.6. How What Is Subjectively Right, Having Been Pushed out the Front Door, Slips in through the Back Disguised as an Individualised Norm

We will see now that Kelsen fails in his reduction of what is subjectively right to what is objectively right (as these two expressions were specified earlier in Section 14.5, under points (*vii*) and (*v*) respectively). Kelsen mistakenly believes he has eliminated what is subjectively right (*subjektives Recht*) by reducing it to what is objectively right (*objektives Recht*). In reality, what he has pushed out the front door (what is subjectively right), creeps in through the back disguised as an individualised norm.

It was seen in Section 1.2 how in the expression *subjektives Recht* ("what is subjectively right"), the word *subjektives* ("subjectively") is taken to mean that there are actual people, or subjects, involved in what is right; the expression, in other words, is taken to mean that these subjects are the referents (Section 6.4) of a norm applicable to them: They are referred to by the content of that norm. The German expression *objektives Recht* ("what is objectively right") designates instead norms and their content, and that independently of whether these have any actual referents (or are applicable to any actual subjects) in the reality that is.

Pure Theory of Law eliminates the dualism of *objective law* and *subjective right*. The *subjective right* is not different from *objective law*; it is itself objective law. For there is a *subjective right (qua legal right)* only in so far as the *objective law* is at the disposal of a concrete subject. Similarly, the *legal obligation* (the other form of *law in the subjective sense*) is itself *objective law*, for there is a *legal obligation* only in so far as the *objective law* aims—with the consequence it establishes for an unlawful act—at a concrete subject" (Kelsen 1992, 44; italics added).

Further, as was observed in Section 14.5, with reference to items (*i*) through (*ix*), Kelsen reduces the law (item (*i*)) to a system of norms (item (*iv*)); and norms he reduces to *das Sollen* (to the reality that ought to be: item (*ii*)). Kelsen, further, is looking to reduce *subjektives Recht* (normative subjective positions: item (*vii*)) to *objektives Recht* (to norms and their contents, to what is objectively right: item (*v*)).

Also, when Kelsen speaks of *objektives Recht* in order to reduce to it the *subjektives Recht*, he is always speaking of an *objektives Recht* (norms and their content: item (*v*)) that has referents (Section 6.4) in actual subjects (actual duty-holders and right-holders, in the traditional understanding of them) in the reality that is. And he does so without distinguishing this case from the case—a very likely case—in which *objektives Recht* (norms and their content: item (*v*)) does not have any referent in any actual subject (in any duty-holder or right-holder, in the traditional understanding of them) in the reality that is.

Kelsen does not seem to realise that in so doing he is not objectifying the *subjektives Recht* by reducing it to the *objektives Recht*, but is rather subjectivising the *objektives Recht* by presenting it in its making reference and being applied to actual subjects (to actual duty-holders and right-holders): He does so in the hope of showing that there is no room for *subjektives Recht*, because the place the theories he criticises regard as occupied by *subjektives Recht* is in reality taken up in full by *objektives Recht*. From Kelsen's point of view, *subjektives Recht* would thereby find itself dissolved into *objektives Recht*.

But a subjectivised *objektives Recht* is precisely a *subjektives Recht*, because *subjektives Recht* is *objektives Recht* insofar as it gets subjectivised. This makes it so that the purported reduction of *subjektives Recht* to *objektives Recht* revolves around a self-contradiction: Kelsen shows the opposite of what he is looking to demonstrate.

Kelsen apparently cannot deny, and does not deny, that *objektives Recht* (norms and their content: item (*v*)) exists in the reality that ought to be (in the *Sollen*) even independently of whether norms and their content refer and apply to any actual subjects in the reality that is, and even independently of whether any such subjects actually exist. Kelsen, in his theory, does not and *cannot* do without general and abstract norms, i.e., norms having no referents in the reality that is.

Being it so that Kelsen does not, and cannot, forgo the *objektives Recht* (general and abstract norms and their content), and that, at the same time, there is no way of avoiding, from an analytical point of view, the distinction between (*a*) an *objektives Recht* having no referents in actual subjects belonging to the reality that is and (*b*) an *objektives Recht* that does instead have such referents, Kelsen found himself forced to introduce the notion of an individual, or individualised, norm understood as a particular case of general and

abstract norms (a particular case of *objektives Recht*), this in order to give an account of (*b*) as distinct, distinguishable, and to be distinguished from (*a*).[26]

On close inspection, individualised norms turn out to be none other than *subjektives Recht* (rights, duties, and legal relationships), now appearing under the new labels "individual norm" and "individualised norm."

Thus, by way of example, courts administer what is subjectively right, meaning such rights and obligations as exist in the reality that ought to be, which rights and obligations get ascribed to actual subjects (people), who in contrast dwell in the reality that is. We appeal to a judge when—given what is objectively right (the content of norms in the reality that ought to be), and given actual subjects (people) in the reality that is, to whom what is objectively right refers—a controversy arises over the question what rights and obligations should get ascribed, and to whom, in what is subjectively right.

The act by which a ruling is issued that administers rights and obligations takes place in the reality that is, and yet the ruling as an individual norm (just like the rights and obligations the ruling ascribes) exists only in what is subjectively right in the reality that ought to be.

As Kelsen states, *die Norm als solche steht nicht in Raum und Zeit*: "The norm does not as such reside in space and time" (Kelsen 1934, 7; my translation). And "what is subjectively right [*Das subjektive Recht*] is not different from what is objectively right [*vom objektiven*]; it is the same as what is objectively right [*das objektive Recht selbst*]; it is what is objectively right [*das objektive Recht selbst*] only inasmuch as it turns against an actual subject with a consequence—a consequence established by what is objectively right itself [*von ihm*, namely, *objektives Recht statuierten*]—of a wrong (and in this case there is a duty [*Pflicht*]), or it is at the disposal of this subject (and in this case there is an authorisation [*Berechtigung*])" (ibid., 49; my translation).[27]

Kelsen does not seem to realise that, this way, he gives us the best characterisation of what is subjectively right insofar as this thing (what is subjectively right) is distinguished from what is objectively right and not reducible to it; nor does he seem to realise that, far from reducing what is subjectively right to what is objectively right, he is setting things up for a reduction in the opposite direction—offering a reduction of what is objectively right to what is subjectively right; this holds at least when norms (what is objectively right) have

[26] Several admiring scholars have worked to illustrate the importance of Kelsen's theoretical innovation, the innovation that consists in introducing individual, or individualised, norms. This admiration has often depended on the misconception whereby Kelsen, through his notion of an individualised norm, would deal a fatal blow to the traditional doctrine of the distinguishing traits of legal norms, among which traits there proudly towered abstractness and generality.

[27] The German original: "Das subjektive Recht ist kein vom objektiven verschiedenes, es ist das objektive Recht selbst, nur sofern es sich mit der von ihm statuierten Unrechtsfolge gegen ein konkretes Subjekt richtet (Pflicht) oder einem solchen zur Verfügung steht (Berechtigung)" (Kelsen 1934, 49).

referents in actual subjects in the reality that is. In this sense, Kelsen ends up in self-contradiction.

An individual, or individualised, norm is a general and abstract norm as made to apply to actual subjects in the reality that is. Should these subjects—the referents of a general and abstract norm—change their condition, and no longer be referents of the type of circumstance (Section 6.4) set forth in the general and abstract norm, the general and abstract norm will not be affected as to what is objectively right in the reality that ought to be. The individual, or individualised, norms, instead, depend for their existence on this general and abstract norm, *as well as they depend* on there being valid subject-tokens instantiating the subject-types described in the type of circumstance therein set forth, and therefore cease to exist when these subject-tokens (duty-holders and right-holders) cease to be valid tokens of the subject-types described in the type of circumstance set forth in the general and abstract norm.

Indeed, as was seen in Section 7.2, given the general and abstract norm **n**, "The well-off must aid the needy," if it turns out that one person, Rob, is a man of means, and that two other persons, Frances and Loretta, through unfortunate events, should come to find themselves in a state of need, then the conditioning type of circumstance set forth in **n** will have been validly instantiated twice (with referents, i.e., actual valid tokens, in one *d,* Rob, and two *r*s, Frances and Loretta). In consequence of this double instantiation, there will exist (outside of space and time, according to Kelsen), in addition to the general and abstract norm **n**, the two individual norms **n1**, "Rob [a man of means] must aid Frances [now in a state of need]," and **n2**, "Rob [a man of means] must aid Loretta [now in a state of need]."

Should Loretta improve her circumstances and her state of need cease to be a valid instance (token) of the conditioning type of circumstance set forth in **n**, there will have been an Is-event in the reality that is, and the individual norm **n2** will consequently become extinct, or cease to exist in the reality that ought to be (in Kelsen's *Sollen*) or, more accurately, in what in this reality is subjectively right. This small normative system—conceived à la Kelsen as a system of general and abstract norms (in our example, the single norm **n**, a norm existing in what is objectively right in the reality that ought to be) and of individual norms (in our example, **n1** and **n2**: what is subjectively right in the reality that ought to be)—has thus been reduced to **n** (the general and abstract norm: what is objectively right in the reality that ought to be) and **n1** (an individual norm: what is subjectively right in the reality that ought to be).

Should Frances, too, improve her circumstances, such that her state of need ceases to be a valid instance (token) of the conditioning type of circumstance set forth in **n**, there will have been an Is-event in the reality that is, and **n2** will consequently also become extinct, or cease to exist in the reality that ought to be (in Kelsen's *Sollen*) or, more accurately, in what in this reality is subjectively right. This small normative system—conceived à la Kelsen as a

system of general and abstract norms (in our example, the single norm **n**, a norm existing in what is objectively right in the reality that ought to be) and of individual norms (in our example, **n1** and **n2**: what is subjectively right in the reality that ought to be)—has thus been reduced to **n** only (the general and abstract norm).

As should emerge from the illustration just made, Kelsen's individual norms replace for all intents and purposes the normative subjective positions of those who admit a bottom layer (*subjektives Recht*, what is subjectively right) of the reality that ought to be in addition to admitting a top layer (*objektives Recht*, what is objectively right).

Indeed, Kelsen's individual norms, not unlike normative subjective positions (*subjektives Recht*, what is subjectively right), require two conditions for their existence: They require the existence of (1) general and abstract norms (*objektives Recht*, what is objectively right, the top layer of the reality that ought to be) and (2) actual subjects in the reality that is who are referents, i.e., valid tokens, of the type of circumstance set forth in general and abstract norms. General and abstract norms (*objektives Recht*) do not require, for their existence in the top layer of the reality that ought to be, that condition (2) be satisfied: They will exist independently of whether there exist in the reality that is actual subjects who are referents, i.e., valid tokens, of the type of circumstance therein set forth (set forth in the same general and abstract norms). By contrast, individual, or individualised, norms require, for their existence in the bottom layer of the reality that ought to be (the only layer where they can exist), not only that condition (1) be satisfied, in the top layer of the reality that ought to be, but also that condition (2) be satisfied, in the reality that is.

In short, individual norms cannot, pace Kelsen, be counted among general and abstract norms: They cannot be placed within the *objektives Recht*, what is objectively right. Individual, or individualised, norms are not any different from normative subjective positions. It's six of one, half a dozen of the other—either way, we have to do with what is subjectively right.

Chapter 15

NATURE AND CULTURE

15.1. Summing up on My Confirming Others

The anthropologists, philosophers, philologists, and jurisprudents called into play in the foregoing Chapters 11 through 14—Malinowski, Kierkegaard, and Heidegger, on the connection between the ideas of reality that ought to be and of fate (Chapter 11); Havelock, on *dikē* in Homeric epic (Chapter 12); Aquinas, on *jus* and *justitia* as what is right *essentialiter* and *causaliter* respectively, and on *ratio* as type (Chapter 13); and Kelsen, on *objektives Sollen* and *objektives Recht* (Chapter 14)—have been making their way into this fourth, and final, part of the present volume as "confirming others":[1] They have been doing so in regard to my characterisation of normativeness, of the reality that ought to be, and of what is objectively and subjectively right, as well as in regard to other kindred notions presented in this volume (such as type-constitutiveness and nomia; Sections 2.1 and 6.5).

Other modern classic scholars are a rich source of inspiration for appreciating, on one hand (with Marx, for example), the role that socioeconomic conditioning plays in modelling individual personalities, and on the other hand (with Freud, for example), the complexity of the human psyche and the peculiar and striking unconscious components of our individual and subjective inner experiences. Further, sociopsychology has offered theories that can be brought to bear on the question of norms as born of the relationship between individuals and the social environments they live in. Thus, we are offered, among other things, three sets of hypotheses: (*i*) hypotheses about the ways beliefs and other components of culture propagate in society from one individual to another and are passed down from generation to generation (these propagations concern the human psyche, the internal point of view, and the subjective experiences of humans, none of which are on the whole amenable to external observation), (*ii*) hypotheses about the way the social environment moulds individual personalities and so makes them uniform, and (*iii*) hypotheses about the ways individual personalities concur in nurturing and keeping alive the society that moulds them, and even in constituting that society, in a sense.[2]

It is not within the scope of this volume to go back to such modern classic authors as Marx and Freud, or to Max Weber and Talcott Parsons (1902–

[1] On the meaning of the expression "confirming others," see Gerth and Mills 1961, 87, 94 (cf. Section 15.3).

[2] When speaking of the social environment we may distinguish in it various kinds of social formations, like groups, associations, organisations, and institutions. The current definitions of these terms are not always compatible.

1979),[3] even if these last two enjoy to this day a high standing with scholars who deal with what is known as the micro-macro link.

> The path toward linkage [between micro and macro] and the implied possibilities for theoretical synthesis were prepared by the earlier theorizing of Max Weber and Talcott Parsons. Their theories resist classification as either micro or macro. The current movement from reduction to linkage is inspired by the example set by these first great attempts at micro-macro synthesis, even when they do not follow the theories themselves. (Alexander et al. 1987, 3)

Indeed, it is rather with reference to the question of the micro-macro link that I will call into play two further contributions.

Distributed artificial intelligence (DAI) has recently been aimed at simulating and reproducing individual intersubjective relations and the micro-macro link. And the research done by some scholars in this field, such as Conte and Castelfranchi 1995, seems to me worthy of attention because it shows a theoretical concern with advancing a conception of normativeness similar to that illustrated in this volume. These scholars hold the view that only a normativeness of this kind, if implemented among artificial intelligent agents operating in multi-agent systems (MAS), can make it possible to effectively simulate social intercourse, group life, and the micro-macro linkage.[4]

Another contribution that I will bring into play is the venerable and lamentably forgotten psychosocial theory of "significant others" and the "generalised other." These concepts trace back to C. H. Cooley's (1864–1929) *Human Nature and Social Order* (Cooley 1922) and Georg H. Mead's *Mind, Self, and Society* (Mead 1934) and in the 1950s received further specification and development within an organic theory by Hans Gerth and Charles Wright Mills, a theory setting out the relation between individual character structure and social structure. These concepts (which I would assume to be of interest as well to scholars working in distributed artificial intelligence, on the approach of Conte and Castelfranchi) still retain a remarkable ability to explain the individual (internal) and the social (external) dimensions of the reality that ought to be and the linkup between these two dimensions, that is, between the micro and the macro.

Thus, the further scholars entering here as confirming others will be Conte and Castelfranchi (on account of the appreciation of the psychological aspects

[3] On Marx, see, in Volume 2 of this Treatise, Rottleuthner, Section 3.2.2. The reader will also find Weber taken into account, even if not in a dedicated section; rather, as Rottleuthner says in the preface to his volume, Weber is an ever-present inspirer and accompanies him throughout the volume in his critique of the mono-foundationalists (ibid., 11).

[4] With different nuances, the same approach is espoused as well by Giovanni Sartor (who treats these questions in Volume 5 of this Treatise, Chapters 9 through 11, though it seems to me that Sartor is less markedly normativistic than Conte and Castelfranchi) and by Antonino Rotolo, Guido Governatori, Jan Broersen, Mehdi Dastani, Zhisheng Huang, Joris Hulstijn, and Leendert van der Torre. Cf. Broersen et al. 2001; Governatori and Rotolo 2004.

of the internal point of view of normativeness which they show in their approach to distributed artificial intelligence and the multi-agent cyber-society) and Gerth and Mills (on account of their treatment of the concepts of "significant others" and "generalised other" and of the importance they, too, attribute to the internal point of view, to the individual character structure, and to its shaping by the social structure). I will expound their contributions in Section 15.3. But before that, in Section 15.2, I will discuss a few relevant preliminary questions, namely: culture, types, the social construction of reality and the construction of social reality, and, finally, norms as one of the core elements of socialisation, and hence of the formation of individual personality.

15.2. Eighteen Thousand Centuries of Culture

15.2.1. From Homo Habilis *to* Homo Sapiens Sapiens

We have entered the 21st century *post Christum natum*; that is, regardless of the calendars adopted in various cultures, the history of man on Earth (a history whose beginnings are conventionally made to coincide with the advent of writing) has been going on for some fifty centuries now. But that is a trifle thing compared to what went on before.

(*i*) 18,000 centuries (1,800,000 years) ago. *Homo habilis* developed the ability to knap stones, albeit on one side only: pebble-tool culture.

(*ii*) 10,000 centuries (1,000,000 years) ago. *Homo erectus* was moving on the hind limbs, and was also handling fire and knapping stones on either side (making double-edged tools called Acheulian). Great strides were made in the span of 8,000 centuries. A developed ability to construct and internalise types (among which behaviour-types) and coordinate them, as well as a great memory capacity (encoding in brains), was the mark of a superior culture. Ten thousand centuries ago, the culture of *Homo erectus* was already superior to that of any other animal species (including modern species).

(*iii*) 400 centuries (40,000 years) ago. It was so late that *Homo sapiens* came into Europe from Africa, where they made their first appearance (more than 100,000 years ago). Even *Homo sapiens* are not the human kind that populates Earth today, but their ability to construct and internalise types, and to coordinate them, in combination with their memory capacity (encoding in brains), further advanced culture relative to what *Homo erectus* had achieved. In this more-developed culture (a development attested by European finds dating back to 400 centuries ago) inventions were made, and stone, wood, and animal bones and teeth were being used to manufacture bows and spearheads for hunting as well as needles for threading. *Homo sapiens* also painted, burned animal fats in stone lamps, used fire to carve canoes out of tree trunks, and built rafts. Further, *Homo sapiens*—like Neanderthal man, a Palaeanthropus of more than 1,000 centuries ago—performed burial rites over the

dead. This fact gives us reason to believe that *Homo sapiens* (and perhaps Neanderthal man) practised rudimentary forms of customary law as well.

(*iv*) 240 centuries (24,000 years) ago. At this time came our first appearance on Earth. The humans that now populate Earth are *Homo sapiens sapiens*: That's us, the savants! Later, about 100 centuries ago, we started farming, and about 80 centuries ago we started domesticating goats and dogs, building houses using raw bricks, modelling clay, and building the first cities fortified by walls (Jericho). After this, prehistory began rolling into history: Sixty-five centuries ago we were building megalithic tombs in Brittany—evidence of religion and the cult of the dead—and heat-treating metals in Cilicia and Palestine.

(*v*) 50 centuries (5,000 years) ago. At this point came the wheel, the plough, the yoke, and the horizontal loom—and writing, with Sumerian cuneiform and Egyptian ideographic writing (hieroglyphs). The appearance of writing conventionally marks the beginning of history, about fifty centuries ago. But this does not yet mean that *Homo sapiens sapiens* lived so early as that in a literate society and enjoyed the advantage of a written culture.

In archaic Greek history, for example, preliterate oral culture continued until about twenty-seven centuries (or 2,700 years) ago: Hesiod lived in the 8th century B.C.; Homeric epic—a typical expression of oral culture—dates back to about twenty-nine centuries (2,900 years) ago. The Homeric poems were kept in memory, encoded in human brains, for about 250 years, at least through the 8th century B.C. (about 2,700 years ago), and they are thought to have been set down in written linguistic signs in the 8th century (cf. Section 12.1).

15.2.2. Culture Encoded in Human Brains and Culture Inscribed in Documents and Artifacts

What I summed up in the previous section is, at least in some part, basic schoolbook learning, and students tend to forget it the moment they leave school. But we can retrieve this learning, because it is encoded in different memory bases: in human brains, as well as on wood, stone, metal, paper, and digital supports.

The ability to make choices, and the actual choices made, enables humans to devote themselves to the acquisition of knowledge in different domains. This way, different individuals share the burden of learning, thereby cutting down hugely the amount of types to be encoded in each person's brain. With the advent of written culture, humans were enabled to transfer to other humans what they encoded in their brains, not only phonetically or with icons and graffiti, but through writing as well. Memories on nonhuman support make it possible for fellow humans and posterity to access and learn the token and type descriptions recorded on supports like wood, stone, metal, papyrus, and suchlike. With the advent of written culture, the amount of token and type descriptions (among which behaviour-type descriptions) accessible to all

humans becomes impressive, and the learning of the tokens and types recorded on these supports spreads among individuals, even if, on account of writing itself, actual access to such supports is selective.

Culture is a reality spread in a given society over human brains and on the nonhuman supports that humans have access to.

The individual cultures of different people are individual realities that share in culture as a social reality and concur in shaping it, even if social culture precedes the individual cultures of any newborn member of a given society, of course. As I noticed in Section 15.1, the relationship between individual and society is treated in the present day under the label "micro-macro." The individual agent is considered a micro-system, society a macro-system. The matter in question is the interaction between the individual and society (even if those who study the micro-macro problem will reject this reduction, be it conceptual or terminological). The effort is to identify and explain (*a*) the modes and mechanisms by which the individual adopts social attitudes and goals and (*b*) the reasons why the agent more or less consciously cooperates toward the achievement of common (social, institutional) objectives.[5]

A norm is a belief and a motive of behaviour (Chapter 6) that human agents receive from the outside (from the society they are born into and from the cultural environments they live in: from the macro-system). Human agents internalise norms in their brains (within the micro-system, which is what each individual is with respect to the macro-system he or she operates in). Internalisation makes it so that a norm—understood as a belief and as a motive of behaviour coming from the macro-system—becomes part of the individual micro-systems' personalities: of the individual personalities of human beings. These last, thanks to the internalisation of norms and of other motives of be-

[5] Here is how Jeffrey C. Alexander and Bernhard Giesen present the problem in their introduction to *The Micro-Macro Link*: "Although the micro-macro theme has entered sociological theorizing as a distinct and firmly established issue only in recent decades, its prehistory can be traced from late medieval thinking through postwar meta-methodological debates over science, epistemology, and political philosophy. We will argue that the micro-macro dichotomy should be viewed as an analytic distinction and that all attempts to link it to concrete dichotomies—such as 'individual versus society' or 'action versus order'—are fundamentally misplaced. Only if it is viewed analytically, moreover, can the linkage between micro and macro be achieved. During its intellectual prehistory, however, the very distinction between micro and macro was superseded by other conceptual oppositions. [...] Rather than confronting incompatible conceptions about the constitution of social reality, the theoretical arguments presented in this volume seek to discover empirical relations among different levels of social reality. This analytical differentiation of the micro-macro relation has generated a new level of interparadigmatic discourse and a new statement of the problem: The conflict over reduction is replaced by the search for linkage" (Alexander et al. 1987, 1–3). The other contributions to this volume are by Raymond Boudon, Peter M. Blau, Dean Gerstein, Niklas Luhmann, Reinhard Wippler, Siegwart Lindenberg, James S. Coleman (1926–1995), Hans Haferkamp, Randall Collins, Emanuel A. Schegloff, Edith Kurzweil, Karl Otto Hondrich, Niel J. Smelser, and Richard Münch.

haviour, concur with the other individual micro-systems (the other human beings who are part of a society) in securing the subsistence and functioning of the social and institutional macro-system, and in a broad sense the cultural macro-system, which they are all part of. The overall mass of types and beliefs that humans variously produce and memorise constitutes culture. Indeed, "culture" is our

> intellectual and material heritage: Almost invariably it is heterogeneous—some degree of integration may obtain; otherwise, internal antagonism prevails—and in the main it lasts through time, but does so undergoing continuous transformations that proceed at a changing pace and depend on the nature of its elements and on the epochs which come to pass. Such heritage is made up of (a) *values, norms, definitions, languages, symbols, models of behaviour* [behaviour-types], and mental and bodily techniques whose function is cognitive, affective, evaluative, expressive, regulative, and manipulative; (b) *the objectifications*, supports, and material and bodily mediums of the foregoing; and (c) the material means for the *social production* [viz., construction] and *reproduction* of humans. The entire production and development of this heritage is the outcome of social work and social interaction: For the most part it gets passed on and inherited from past generations, from within the same society and from without; only in part is it produced or modified by the living generations; and the members of society share it to varying degrees, or they access its various parts selectively, or even appropriate them under given conditions. (Gallino 2000, s.v. "Cultura," 185; my translation; italics added)

A characteristic of our present time is the fast pace of change, at least in cultures where information-and-communication technology has become deeply entrenched. Thus, it might be asked whether in some cases and some ways the generations of today can, in the course of a single lifetime, make leaps that in the past would have required the coming of several subsequent generations: A grandfather and a grandchild living today may not be sharing one culture as they would have shared it some fifty years ago. Further, we still have today, each copresent with the other, pebble-tool culture (in some parts of Africa) and information-and-communication-technology cultures (in developed countries).

Culture can be distinguished by area of interest as artistic, scientific, gastronomic, legal, and so on: Law is a part of culture; it is one such area. Culture can be distinguished by geographical area as American, French, Japanese, and so on. Further, distinctions are made according to the epoch involved: Thus we have prehistoric culture (as previously noted), ancient culture, modern culture, and so on. Still more distinctions are possible. Essential among these is the distinction between living cultures and dead cultures (a distinction, observe, analogous to the distinction between living languages and dead languages: Languages are of course an essential component of human culture).

The concept of life is relative, yet we do have a fairly clear-cut concept for the life of a human individual: This life is what a person does and becomes from birth to death. My personal culture will die with me. Should I leave any trace of it, it will survive me as dead culture for as long as a trace of it exists in

some memory bases, as in a human brain, or on wood, stone, paper, or other support. Someone might come along and bring my culture back to life, but this person would have to do more than just remember my culture; we would also have to see this person adopt many of the attitudes, and especially the beliefs, I have picked up in my lifetime relative to what I have learned and memorised. When people die the attitudes and beliefs they have internalised die with them, of course: Their personal cultures die with them (Alzheimer's disease prefigures in living beings the death of their culture and personality). The different cultures an individual takes part in—Italian, Japanese, legal, artistic, gastronomic, and whatnot—will doubtless undergo an imperceptible change when that person dies, but they will not die with him or her, this to the extent that there are people left who will carry those cultures on.

Another important distinction is the one previously referred to between culture encoded in human brains and culture borne on nonhuman supports, as on wood, stone, paper, or digital supports.

This distinction—between culture encoded in human brains and culture stored on nonhuman supports—does not in any way correspond to the distinction between living culture and dead culture. There is a great deal of living culture not encoded in human brains: This culture is largely stored on nonhuman supports (such as wood, stone, or paper), and only a small part of it will get internalised (by humans). This is due to the previously mentioned division of labour among humans and to the mounting trend toward strong specialisation that knowledge and practices are seeing. For example, the latest biotechnology research or a recent tax law is living culture, but is encoded in human brains (or therein internalised, if it comes in the form of beliefs) only by those specialists who deal in it in person. So the rest of us, the laypeople, will have no knowledge of it, or may have only a faint idea of it, and because we have not encoded (much less internalised) it, it cannot really guide or control our behaviour. We may, however, if driven by some motive, try to access it, and that by referring to specialists (who can transfer part of their culture orally) or to nonhuman supports (like the books written by these specialists), or again by getting different kinds of media access to information (as by reading books and watching films and educational programs).

Conversely, a certain amount of dead culture is encoded in human brains. The Athenian culture of the 5th century B.C. is dead and yet may be encoded in the brains of those scholars who are studying that culture today. Plainly, the language and culture that lived in the Athenian society of the 5th century B.C. are quite other than the language and culture of the scholars who study this language and culture today at, say, the Department of Ancient History at the University of Bologna. Here, what is living—what has been internalised and guides these scholars' behaviour (at least in their work as scholars)—is not ancient Athenian culture, but the research that they conduct, and this research is part of present culture in Italy and the world (in the 21st century).

Both of the distinctions mentioned, between living versus dead culture and between culture in human brains versus culture on nonhuman supports, as well as their combination, apply to law also. Norms, for instance, and so also legal norms, as I conceive of them—and as I am interested in treating them: as beliefs, and as motives of human behaviour—exist and are in force in individual human brains and are shared among the members of a given society in a way that cannot be essentially different from the way other kinds of culture exist in individual human brains and are shared among the members of a given society (cultures such as the arts and the sciences, which too can be said to be in force, but only in a sense).

15.2.3. Types and Memory

The reader will have noticed the kind of attention that from Chapter 2 onward I have been devoting to types and tokens in an effort to free the concept of "validity" from those of "norm," "rule," and the like.

Types—independently of the conceptions of them actually put forth from Plato to Aquinas to the neurosciences at their present stage[6]—play an essential role in shaping the relation between humans and the natural environment, among human beings themselves, and between nature and culture. I believe we can with good reason maintain that since prehistoric times the human brain has operated by making use of types. In prehistory, some 400 centuries ago or so, *Homo sapiens* was threading, burning animal fats, and carving canoes, and hence instantiating tokens of the types "threading," "burning animal fats," and "carving canoes." If these types are not innate, they got constructed at different stages in prehistory, by humans, and somehow got encoded in their brains, got therein internalised, and in this sense existed. And behaviour-types like "threading," "burning," and "carving" got repeatedly instantiated for millennia. They were, and still are, the very constitutive condition of the possibility of their instantiation through valid performances and actual behaviour-tokens.

I will not venture to guess when prehistoric humans began speaking, communicating with one another by way of articulated sounds, using meaningful oral-acoustic linguistic signs, or oral symbols. It might have been some 10,000 centuries ago, with *Homo erectus*; or 1,000 centuries ago, with Neanderthal man; or again 400 centuries ago, with *Homo sapiens* (but compare Edelman and Tononi 2000, 194ff.). Whichever it is, when the spoken word first appeared, that was the time when oral culture began—when the oral transmission of culture in time and space began, from human brain to human brain: Knowledge would no longer be limited to a knowledge by acquaintance (by direct experience), and would become progressively and especially a knowledge by description, eventually overbalancing the earlier kind of knowledge.

[6] Cf. footnote 7 in this chapter.

Linguistic descriptions of tokens and types, both, involve a complex process of elaboration of the experiential input.

Linguistic description and communication presuppose a culture. Human culture antedates not only history (whose beginning conventionally coincides with the invention of writing) but also the use of merely oral-acoustic linguistic signs, that is, the invention of the spoken word.

Anthropologists tell us that the emergence of human culture manifests itself in the following: (*a*) the ability of humans to suit to themselves, in a thought-out fashion, the environment they live in and to adapt conveniently to this environment; (*b*) language, by which humans enact communication with signs that make abstraction from concreteness and from the immediacy of their instinctive life; (*c*) the ability of humans to understand the natural world, whose behaviour they can predict and whose transformation they can guide; and (*d*) the human tendency toward greater and greater attainments of knowledge and volition (see Facchini 1995, 113ff.).

We have with *Homo habilis* the oldest intentional working of stone. With *Homo erectus* we have, in addition to pebble-tool industries and bifacial and flake industries, and at a more advanced stage yet, Levallois industries (see ibid., 141ff.). This industry is of great interest to us on account of this feature, among others: In the Levallois technique, the actual modelling of the stone does not begin until the shape the artifact is going to take has been outlined around the flake's nucleus; that is, until a type has been set out that the final artifact will instantiate. There is a biological continuity between humans and the animal world that justifies classifying the human species within the order of the primates. This continuity does not, however, rule out peculiarities of a biological kind. Thus, for example, so far no primates other than humans practise bipedalism. This is one of the earliest human behaviour-types, and it is constitutive of the possibility of its performance on the part of humans. Whether the type "bipedalism" is innate or constructed, countless performances of it have so far been instantiated in countless tokens since the time of *Homo erectus*.

In addition, the tools and products coming from human activity take on different meanings in the context of human culture. Manmade tools are never throwaway objects, as are the stones and sticks that primates use. They are preserved on account of the reuse that can be made of them: They have been made by humans as tokens of types and get used as such (as tokens of types) every time a situation comes up that in turn instantiates one type of circumstance rather than another.

Culture is the environment proper to the human species and to the personality of individual humans. Humans are born within cultures, where they grow up and live; culture shapes their relationships among themselves, as well as their relationship with the physical world, and hence it ultimately shapes their personality.

Social anthropology has called attention to the unique ability possessed by our species to take charge of our own development. Upon the genetic inheritance determined by previous natural selection we superimpose a process of cultural evolution under our own management, which becomes especially conspicuous as human society becomes urbanized. To explain how this works, there has been introduced the concept, borrowed from genetics, of cultural information placed in storage for reuse. As the biological information is encoded in the living cell, so cultural information is encoded in language. Human culture is not inherited but learned, and through language transmitted from generation to generation. (Havelock 1978, 11)

Havelock finds that it can be misleading to borrow the concept of "cultural information" from genetics, for that can cause one to think of some kind of document.

The metaphor of storage implies the existence of a material object that can be so treated. The term "information," though not necessarily referable to a documentary source, tends to carry this coloration. Encoding, another metaphor commonly employed by biologists and anthropologists, is explicitly referable to a written medium, a slip of paper, a punched card. Terms like program, system, and structure, applied to beliefs or institutions or customs characteristic of a given society, evoke the presence of objects which can be seen and touched. If these metaphors have become easy to accept, it is surely because the information upon which modern societies depend has become materialized. It exists as it is documented. The document, whether in circulation or on a shelf, whether book, pamphlet, report, card or code, rule or regulation, law or literature, philosophy or religion, is essentially information placed in storage and reused, corrected, enlarged, redrawn, read, and reread. (Ibid., 11–2)

Havelock, in this passage, as in much of his other work, is looking to mark the difference between written culture (or culture in any event fixed onto a document or artifact) and oral culture memorised in human brains and proper to preliterate societies. It will be interesting in this regard, with respect to human brains, to take note of the perspectives that have been suggested over the last thirty years by the neurosciences (these I will return to briefly in Section 15.4) on the questions that I have been treating since early on in this volume (beginning with Section 2.1) under the label "type and tokens" and that connect with the effort to explain the way memory works in the animal and human brain (see, for example, Deacon 1997, 60, on icons, indices, and symbols; see also, from a different angle, Edelman 1989, 72ff.; Edelman 1994, 91–3). Edelman, in his discussion of perceptual categorisation—against which we should compare the question of types and tokens—introduces the notion of maps as sheets of neurons. I also refer the reader to these authors for attempts at explaining memory in the frame of neurobiological knowledge at its present state of advancement.[7]

[7] This is how categorisation (typification) works according to the way Searle interprets Edelman's theory of it (the examples adduced are Searle's own; they are not found in Edelman): "Suppose an animal has acquired a perceptual category of cats [the type "cat"]. It acquires this category [this type] through the experience of seeing a cat and organizing its experience by way of the reentrant maps. Then the next time it sees a cat, and thus has a

15.2.4. What Is Mind? No Matter. What Is Matter? Never Mind. Social Construction of Reality and the Construction of Social Reality

The distinction between culture and nature is crucial. It is crucial but does not entail any ontological dualism between mind and matter. My conception of reality is monistic. Dualistic conceptions come up against insurmountable difficulties when they attempt to explain the relationship between mind and matter. Reality is either all mind or all matter. As to the word with which to refer to this one reality, I share the opinion that Bertrand Russell's grandmother reportedly expressed: "What is mind? No matter; what is matter? Never mind!" (Russell 1967, 45).

The very distinction between nature and culture is not natural but cultural. Even the notions of "nature" and "culture" are cultural. Is reality therefore all cultural? Never mind. What is entirely cultural is the typification, representation, and construction that humans make of natural as well as cultural reality, and their symbolisation and description of these realities by linguistic signs. What is also entirely cultural is the way humans treat or process natural and cultural reality. Typification, representation, construction, symbolisation, and description by linguistic signs are cultural realities. Culture is lodged in human brains, yet it is shared by different human beings in the same society.

But human beings and human brains are not themselves culture; they are nature: Through human culture they become *objects for humans*, as does physical and chemical nature in general. Humans are made an object of typification, representation, construction, symbolisation, description, discourse, communication, and suchlike by humans themselves. Human beings are objects of self-consciousness on their own part, and of consciousness on the part of others.[8] Our consciousness of ourselves (our self-consciousness) and of others, as well as of every other object, is determined in each of us by the culture of the society we live in. This phenomenon has been called "the social construction of reality" (Berger and Luckmann 1969).

similar perceptual input, it recategorizes [re-typifies] the input by enhancing the previously established categorization [typification]. It does this by changes in the population of synapses in the global mapping. It does not just *recall* a stereo*type* but continually *reinvents* the category of cats [the type "cat"]" (Searle 1997, 44; italics added on second occurrence, in original on first and third occurrence). Searle finds that the conception of memory that Edelman presents in *Bright Air, Brilliant Fire* (Edelman 1994) is among the most remarkable aspects of the book "because it provides an alternative to the traditional idea of memory as a storehouse of knowledge and experience, and of remembering as a process of retrieval from the storehouse" (Searle 1997, 44). I suspect the traditional idea of memory that Searle is referring to has been developed by scholars framing the problem in computational terms, or on the basis of studies in mathematics, logic, or set theory: Anyone who should instead address the problem of memory from a biological perspective will find it hard to subscribe to a rigid and mechanical conception of memory conceived on the model of a retrieval of objects from a repository.

[8] Here I am using "consciousness" in a generic sense.

Humans and their brains, as well as animals, plants, minerals, I, you, and the world at large—all these things may cease to be made an object of human attention, typification, and suchlike, thereby failing to be objects of human consciousness and of the culture that constitutes it. Even then, humans and their brains, as well as animals, plants, minerals, I, you, and the world at large, continue to be real—though of course only naturally, physically, chemically, brutely real. They would be naturally real even if no human brain were processing them—typifying, symbolising, or describing them, in much the same way as it was before the first humans began to make culture on the earth. And if all humans were to disappear from the face of the earth, we would be left with nature (physical and chemical matter), and with the artifacts of past human culture, to be sure, but the one and the other would cease to be objects of human consciousness and culture.

The distinction between culture and nature, then, remains crucial, but the ontological dualism of mind and matter does not hold: I cannot help being a monist (Section 15.4). And, as far as I am concerned, the choice between idealism and materialism[9] has been made final within the ambit of monism—this at least as far back as the late 19th and early 20th centuries, when Bertrand Russell fleshed out his "rebellion against idealism" (Pattaro 1974, 58ff.; see Russell 1960, 69ff.).

The decisive, and in many ways constitutive, importance of culture can hardly be stressed enough. Wherever, and to the extent that, our personality is not determined (or constituted) by our genetic endowment, it is determined (or constituted)—in a more oblique way—by culture: by our family, education, and working environment, by the pervasive contemporary media and society (cf. Sections 15.2.5 and 15.3.2). In a sense, each of us *counts as* a valid token of a certain type. It is interesting to note that in medieval Scholasticism culture was called *humanitas* (humanity), which translated the Greek *paideia* and means "education": Individual personality in human beings is determined by education (not only by their genetic endowment), which is imposed on them by the social environment. (There reemerges here the micro-macro problem as previously referred to, and which I will return to in Section 15.3.)

Culture precedes not only the advent of writing but also of merely oral language. Better still: As oral and written language develops, becoming more and more a constituent of culture, it plays an increasingly fundamental role in culture understood as the condition constitutive of the social construction of the reality that is and of the social construction of the reality that ought to be (see Chapter 1).

[9] On the sense in which I am willing to style myself a "materialist" (cf. footnote 8 of the Preface), see the qualifications made in Section 15.4 in the light of Searle's distinction between "eliminative reduction" (and reductionism) and "causal reduction" (and reductionism).

The Social Construction of Reality is the title of a book written by two sociologists (Berger and Luckmann 1969), and *The Construction of Social Reality* of a book written by a philosopher (Searle 1995).[10] The assonance between the two titles is clear, even though in the second book there is no reference to the first: In both, however, language is one of the main objects under scrutiny.

Language is crucial for the social construction of all human (cultural) reality. Human reality includes both (*a*) natural, or brute, reality, even if only to the extent that brute reality is the object of human treatment and consciousness (for brute reality precedes the consciousness that humans have of it), and (*b*) social, or institutional, reality, which exists only insofar as it is the object of human treatment and consciousness, for institutional reality does not precede the treatment and consciousness that humans have of it, in that it comes about and exists only as the *product* of human treatment and consciousness.[11]

The difference between brute and institutional reality can be expressed roughly as follows.

Brute reality. A cessation of every human treatment and consciousness will not imply a cessation of brute reality: It will only imply a cessation of the human treatment and consciousness of brute reality, and so only a cessation of the social construction of brute reality, that is, a cessation of only the cultural and institutional treatment of brute reality.

Institutional reality. A cessation of every human treatment and consciousness will imply a cessation not only of the social construction of institutional reality (of the cultural and institutional treatment of institutional reality), but also of institutional reality as such, for this reality subsists exclusively in individual human treatment and consciousnesses as socially determined.

"Social construction of reality" is defined as

> the set of interior and exterior dialectically interdependent processes wherewith human beings work out norms, values, moral codes, and institutions, that is, social relationships normatively regulated from the standpoint of action and legitimated from a moral and affective standpoint. These processes are imposed on the self and on others with such concreteness, firmness, and indifference to the individual's will and fate as is found in material reality [...].
>
> The social construction of reality [...] is neither a collective representation nor a form of social consciousness; rather, it is the very activity that produces the constrictions typical of both life in society and the individual's almost complete powerlessness before such constrictions, as is characteristic of the relationship between individuals and traditional local communities, on the one hand, and between the individual and the state, on the other. (Gallino 2000, s.v. "Costruzione sociale della realtà," 176–7; my translation)

[10] In 1984 Anthony Giddens came out with a book entitled *The Constitution of Society* (Giddens 1984). Even the label "constitution of society" gathers a certain amount of literature.

[11] In speaking of human reality I am not referring to human beings singly considered, but to the appearance and spread of humankind on Earth. Also, I use the expression "treatment and consciousness" because there are cases of human treatment of brute reality that introduces culture without humans being conscious or aware of that fact.

15.2.5. Norms in the Formation of Individual Personality. Socialisation and Normative Revolution (Metanoia)

We each initially assimilate norms from the sociocultural environment we live in, and which shapes our personality from the very beginning of our lives. Babies that are abandoned to themselves do not survive. If they do, that is because someone has cared for them. Making exception for cases like that of Mowgli—brought up by benevolent animals—human babies survive because they are reared more or less benevolently by other humans: by their biological families or by other human organisations. The family, or the social organisation that takes its place, models the deep structure of personality in babies, who develop this personality as they grow up, and as they enter adolescence and adulthood and interact in social environments other than the family, undergoing processes of adaptation and of critical revision.

The social construction of reality shapes individual personalities. In individual personality it forges the generalised other (Section 15.3.4). And in everyone's generalised other it determines the reality that ought to be.

The generalised other and the reality that ought to be are things that individuals internalise from the culture of the society they live in, and are therefore shared widely among these individuals (the members of a society). The generalised other and the reality that ought to be are individual phenomena insofar as they pertain to individual personalities. They are social phenomena insofar as they are shared by the members of the same society. It may be said that the generalised other belongs to our individual dimension in much the same way as *la parole* belongs to our individual dimension with respect to *la langue*, which essentially belongs to the social dimension. In a way, as our actual and individual *parole* presupposes our participation in *la langue* as a social phenomenon, so our actual and individual generalised other presupposes the culture in which we live:[12] The generalised other, the reality that ought to be, and norms all get internalised by us individually, but they each come from the sociocultural environments we live in.

Our assimilation of culture, and the formation of our social self (the generalised other, the reality that ought to be), depends for the most part on two processes that sociology calls "social interaction" and "socialisation."[13]

"Social interaction" is defined as

> the short- to medium-term relation that engages two or more individual or collective subjects and in the course of which each subject repeatedly changes his or her behaviour or social ac-

[12] Saussure's definitions of *langage*, *langue*, and *parole* can be found in the original in the text of ms 160 B as quoted in de Saussure 1970, n. 63, 385. Cf. de Saussure 1985, 25, 30–1.

[13] Again, sociologists and philosophers approach the same subject matter in different ways, and sometimes with different terminologies; as for the philosophers, see Lewis 1969, 88–96—David K. Lewis, 1941–2001; Lagerspetz 1995, 30–59.

tion in view of the other subject's behaviour or action, either after such action has taken place or before that time, by anticipating or imagining (whether correctly or not is beside the point) what the other subject might do, whether in reply to this person's actions or for other reasons. (Gallino 2000, s.v. "Interazione sociale," 378; my translation)

"Socialisation" is defined as the set of

processes through which an individual, throughout his or her life, develops the communicative competence […] and performance skills that make possible his or her psychophysical *survival* in a given culture, at a given level of civilisation, and amid different kinds of groups and organisations whose forms of exchange provide the means with which to acquire such competence and skills. The latter are thereby acquired in the course of social interaction with an indefinite number of groups (first among which is in most cases either a family or an organisation that can take its place in the early stages of development, when the child is physically and psychically dependent on others), and their mastery, achieved to a bare-minimum degree at first, is increased as certain conditions are met and is commensurate with the successive stages an individual goes through in a lifetime. (Gallino 2000, s.v. "Socializzazione," 590; my translation; italics added. See Berger and Luckmann 1969, 149–82)

Primary socialisation occurs in the early stages of the development of individual personality; secondary socialisation, in life's later stages; and "primary socialisation concurs in structuring longer-lasting and more deep-seated motivational drives than secondary socialisation" (Gallino 2000, s.v. "Socializzazione," 591; my translation). Socialisation leads the socialised person to have beliefs, among which are norms.

The omnipresence of norms in society at large and in all kinds of groups makes norms one of the core elements of socialisation. *The social norms that make up the family setting will mould the individual from the very earliest stages of development by channelling and to a certain extent determining his or her beliefs, representations, language, motivational makeup, and states of consciousness* […]. For this reason, and because a norm adhered to by a group exerts psychological pressure on the individual, many norms become an object of affective ties, some stronger than others, even when their rational, moral, and affective grounds are weak. (Gallino 2000, s.v. "Norma sociale," 459; my translation; italics added)

Some socialisation processes are specific: They are expressly aimed at shaping such character traits, habits, norms, and language as are relevant to behaviour in a specific social sphere, and they are also specific in that their content is obviously part of that sphere. Hence, specific socialisation is spoken of, for example, to refer to sexual, religious, moral, juridic, economic, professional, or political socialisation.

Through social-interaction and socialisation processes, the sociocultural environment shapes human personality and drives primitive norms (and other primitive beliefs) into the brains of individuals. Believers develop their normative systems from primitive norms through illative operations (described in Chapter 7 and Section 9.6) largely controlled by the social and institutional environment (Section 10.3): These systems are here understood as clusters of beliefs, primitive and derivative. They are the believers' reality that ought to be.

> No socialisation process would be possible if the individual's psychical structure were not sensitive to mechanisms that through forms of exchange, transaction, and interaction with the environment, and of adaptation to it, *produce personality traits*, need patterns, preferred modes of conduct, interpretive frameworks, and other like "products" brought forth as psychophysical states, both actual and dispositional, lasting and fleeting, profound and relatively superficial. Commonly reckoned among these mechanisms are the *differentiation/integration* of personality elements and of the map of cognitive, affective, and evaluative definitions that governs them; the *reinforcement/extinction* mechanism, founded on the law of effect whereby the subject will tend to reproduce all pleasure-yielding behaviour and abstain from all behaviour leading to privation; *inhibition*, through which the individual learns to postpone satisfying certain inner drives in view of the mediated or immediate consequences thereby entailed; the *replacement* of one source of pleasure with another; the *imitation* of role models, taken up from within the family at first and outside it afterwards; and lastly *identification*, which to a much greater degree than the previous mechanism *involves the deeper strata of personality*. (Gallino 2000, s.v. "Socializzazione," 591; my translation; italics added on first and last occurrence, in original on all other occurrences)

Primitive norms (and other primitive beliefs) originally driven into the human mind by the sociocultural environment can be as a matter of fact further shaped or revised by believers through personal processes of critical revision. Even dramatic changes occur, as with Saint Paul's conversion on his way to Damascus, and these are cases of metanoia:[14]

> [4] And I persecuted this way unto the death, binding and delivering into prisons both men and women. [5] As also the high priest doth bear me witness, and all the estate of the elders: from whom also I received letters unto the brethren, and went to Damascus, to bring them which were there bound unto Jerusalem, for to be punished. [6] And it came to pass, that, as I made my journey, and was come nigh unto Damascus about noon, suddenly there shone from heaven a great light round about me. [7] And I fell unto the ground, and heard a voice saying unto me, Saul, Saul, why persecutest thou me? [8] And I answered, Who art thou, Lord? And he said unto me, I am Jesus of Nazareth, whom thou persecutest. [9] And they that were with me saw indeed the light, and were afraid; but they heard not the voice of him that spake to me. [10] And I said, What shall I do, Lord? And the Lord said unto me, Arise, and go into Damascus; and there it shall be told thee of all things which are appointed for thee to do. [11] And when I could not see for the glory of that light, being led by the hand of them that were with me, I came into Damascus. (*Holy Bible–The Acts* (b) 22:4–11;[15] cf. ibid. 9:3–9)

[14] The term "metanoia" comes from Greek *metanoein*, meaning "to change one's mind," from *meta* ("after") plus *nous* ("mind"). But perhaps the concept may be rendered more effectively with the idiomatic expression "to have a change of heart."

[15] The Greek original: "Ὃς ταύτην τὴν ὁδὸν ἐδίωξα ἄχρι θανάτου δεσμεύων καὶ παραδιδοὺς εἰς φυλακὰς ἄνδρας τε καὶ γυναῖκας, ὡς καὶ ὁ ἀρχιερεὺς μαρτυρεῖ μοι καὶ πᾶν τὸ πρεσβυτέριον, παρ᾽ ὧν καὶ ἐπιστολὰς δεξάμενος πρὸς τοὺς ἀδελφοὺς εἰς Δαμασκὸν ἐπορευόμην, ἄξων καὶ τοὺς ἐκεῖσε ὄντας δεδεμένους εἰς Ἰερουσαλὴμ ἵνα τιμωρηθῶσιν. Ἐγένετο δέ μοι πορευομένῳ καὶ ἐγγίζοντι τῇ Δαμασκῷ περὶ μεσημβρίαν ἐραίφνης ἐκ τοῦ οὐρανοῦ περιαστράψαι φῶς ἱκανὸν περὶ ἐμέ, ἔπεσά τε εἰς τὸ ἔδαφος καὶ ἤκουσα φωνῆς λεγούσης μοι· Σαοὺλ Σαούλ, τί με διώκεις; ἐγὼ δὲ ἀπεκρίθην· τίς εἶ, κύριε; εἶπέν τε πρός με· ἐγώ εἰμι Ἰησοῦς ὃ Ναζωραῖος, ὃν σὺ διώκεις. οἱ δὲ σὺν ἐμοὶ ὄντες τὸ μὲν φῶς ἐθεάσαντο τὴν δὲ φωνὴν οὐκ ἤκουσαν τοῦ λαλοῦντός μοι. εἶπον δέ· τί ποιήσω, κύριε; ὁ δὲ κύριος εἶπεν πρός με· ἀναστὰς πορεύου εἰς Δαμασκὸν κἀκεῖ σοι λαληθήσεται περὶ πάντων ὧν τέτακταί σοι ποιῆσαι. ὡς δὲ οὐκ ἐνέβλεπον ἀπὸ τῆς δόξης τοῦ φωτὸς ἐκείνου, χειραγωγούμενος ὑπὸ τῶν συνόντων μοι ἦλθον εἰς Δαμασκόν" (*Holy Bible–The Acts* (a), 22:4–11).

Different and interesting cases have happened in Italy, at the end of World War II, for example, with the conversion of several million Fascists to antifascism (a number of Fascists converted to Communism directly); similarly, when the Berlin Wall came down, in 1989, several million Communists in Italy converted to social democracy and a number of them converted directly to some form of conservative libertarianism: It may be that some have lived long enough to go through both metanoias.

This kind of phenomenon is well known to sociopsychologists, and indeed its manifestations are not confined to Italy:

> Such "crises of conscience" have occurred several times in the course of Western history, for example, in cases of political revolutions and religious revivals and conversions. In fact, crises of this sort are quite widespread in contemporary society, in connection with totalitarian parties. (Gerth and Mills 1961, 98)

15.3. The Micro-Macro Link

15.3.1. Cognitive and Social Action: A Society of Minds

For two decades now, universities and research centres around the world have been working on a sacred experiment, or rather a very profane one:[16] They are trying to reproduce in cyberspace the social interaction and socialisation typical of human culture. Nonhuman and yet "intelligent" agents—the software products of artificial intelligence—are endowed with a capacity for reasoned action and reaction: They are made to meet on the Web and to act "on their own account" by taking decisions dependent on the twists and turns of their interchange (they will buy or sell wisely, for example); they will change their own attitudes toward *their* environment and their neighbours; they will count their fellow intelligent agents as more or less trustworthy or reliable; they will internalise beliefs; and so on.[17]

[16] The expression "sacred experiment" is sometimes used to refer to the experiment carried out in the 17th century by those Puritans who, in order to escape the persecution of the Anglican Church, migrated from England, crossing the Atlantic on the *Mayflower* and landing at what would later become Plymouth, Massachusetts. Here they sought to found a new society informed by the ideals of the English Congregationalist Calvinists, devoted to restoring—even in social practice—the relationship between man and God that had been severed after the original sin. Cf. Bonazzi 1970; Miller 1984.

[17] The 1995 book *Cognitive and Social Action*, by Conte and Castelfranchi, came out directly in English. In 1996 they put out their own Italian translation of it and entitled it *La società delle menti: Azione cognitiva e azione sociale* (The society of minds: Cognitive action and social action) (Conte and Castelfranchi 1996). It may be that the idea in so differentiating the two titles was to adapt to two mentalities: that of Anglo-Saxon readers, empirically oriented, and that of Italian readers and the Latin world at large, more inclined toward allusion and the literary style. The title to this section takes up the title chosen for the Italian edition of this work.

Most of the research done in this field has focussed for some ten years now on getting these agents to internalise attitudes of a merely *rational* sort. To this end, researchers have designed intelligent agents and their multi-agent societies by drawing on game theory, on sophisticated logics of preference and belief, on the prisoner's dilemma and other such refined brainteasers.

More recently, however, some of these researchers have come at the conclusion that mere rationality, for all its sophistication, will not of itself suffice to adequately reproduce, in the artificial world of cyberspace, human sociality, interaction, conflict, and culture properly so called: There is something lacking. In particular, stated in my own words, the intelligent agents of multi-agent societies seem to lack a social self endowed with an internal reality that ought to be: They lack norms as beliefs and motives of behaviour (Chapters 5 through 7) in the double dimension of the individual and the social, whereby the individual agent (micro-system) assimilates from the social environment (macro-system) the norms proper to the social environment itself; the agents draw these norms into their own self, and often do so irrationally, making these norms binding per se without having any rational motive for doing so.

This way, social norms become the internal motives for the individual behaviours of individual agents: These motives will be internal despite deriving from the social environment and being therefore in accord with it.

We do *not* have to do here with rules in a broad and generic sense, or with anything like conventional rules: These rules (because they are not norms as I characterise norms) explain, justify, and produce behaviour insofar as behaviour is the result of a criterion of functionality, cooperation, convenience, least effort and greatest result, maximin and minimax, and so on (cf., in Volume 5 of this Treatise, Sartor, Chapters 5 and 10). These rules in a broad and generic sense (these rational devices, different from norms as I characterise norms) are indeed at this present stage available to the intelligent software agents (or micro-systems) operating in the multi-agent societies (or macro-systems) of cyberspace: Software micro-systems (artificially intelligent agents) already have these rules built in them by their developers. What these individual digital agents and their brains are instead lacking—and what some of their developers say they need—are norms as internal motives of behaviour: norms as beliefs, akin to those that I have been characterising in this volume.

We aim to explore the role of the external (social) environment in the regulation of cognitive autonomous[18] agents' behaviours. In particular, the following issues are examined:

— how objective conditions and relations regulate social action, i.e., how they determine the agents' knowledge and motivations to act (their beliefs and goals);

— how an autonomous agent becomes an instrument for external forces (an instrument for other agents' needs and requests, as well as for social conventions, norms, laws, etc.).

[18] Of course, the autonomy in question is not political autonomy as discussed in Section 10.2.6, i.e., political autonomy vis-à-vis political heteronomy.

In other words, when, why and how do external demands *on* one given agent become goals of that agent?

We endeavour to show that cognition is a fundamental medium between individual action and external (social) forces, cognitive medium meaning the *mental* interpretation and processing of these external forces. (Conte and Castelfranchi 1995, v; footnote added; italics added on second occurrence, in original on first occurrence)

I have italicised "mental" because I do not understand Conte and Castelfranchi to be mentalists. Rather, as I will explain in outline in Section 15.4, I believe they use mentalistic terms for want of more-adequate terms not yet available, terms that cognitive science and the neurosciences will be supplying as research in these fields gains a better understanding of the workings of the human brain.

Add to this that what I will call "the irrational" (and which is customarily so called) will eventually, in my opinion, become explainable in terms of cause and effect. Therefore, "irrational" does not designate anything more indeterminate and uncontrollable than any other part of matter before it comes to be scientifically known, and governable by technique: "Natura enim non nisi parendo vincitur" (Bacon, *Novum Organum* (a), I, 3—Francis Bacon, 1521–1626) ("Nature is only subdued by submission"; Bacon, *Novum Organum* (b), I, 3).

After all, the world of subatomic particles was not behaving any differently before scientists first came to have an understanding of it. It may be that some phenomena now explainable in terms of subatomic particles were once explained in mentalistic terms, or also animistic ones. But if at that time there had been any materialist scholars around seeking to advance speculations, if not hypotheses, on the phenomenon in question, they would perhaps have found it necessary to do so using mentalistic, or also animistic, terms (if anything to be able to come across to others), even if these scholars were thinking not of minds or souls, but of certain kinds of matter, however finer than any observable matter. And maybe, by thinking that way, the same scholars were moving closer to the objects of their discourse (certainly more so than the animists), and further, they could get there by treading the right path.

AI [Artificial Intelligence] is essential for solving the *vexata quaestio* of the relationships between *psychology*, on the one hand, and economics, sociology and political science on the other. More generally, AI [Artificial Intelligence] is required in the treatment of the well-known problem of the micro-macro link. Only by representing (either formally or experimentally) agents' *internal mechanisms*, interactions and global functions can we have a chance to solve this problem in a non-speculative way. (Conte and Castelfranchi 1995, v–vi; italics added on second and third occurrence, in original on first occurrence)

I have italicised "psychology" and "internal mechanisms" for the same reason I italicised "mental" in the passage before that. Conte and Castelfranchi are not two 13th-century metaphysicists:[19] They are specialists in distributed arti-

[19] But then, as the reader may have noticed in Chapter 13, I hold *Sanctus Thoma* to be, in my regard, a confirming other.

ficial intelligence (DAI), as well as in psychology and cognitive and social science, and are attempting, by working from within these research fields, an integrated scientific approach to the ancient problem of the relation between individual and society (or, as they prefer to say, of the link between micro and macro). They deal

> with a paradox concerning social agenthood, namely the paradox of bounded autonomy. On one hand, the social world provides inputs to the agents' goals. On the other, social agents are autonomous, that is, endowed with the capacity to generate and pursue their own goals. How is it possible that an autonomous agent's goals be inputted from the outside? (Conte and Castelfranchi 1995, 1)

In seeking to find an answer to this problem, Conte and Castelfranchi undertake to

> explore the footprints that a multi agent system (MAS) (social system or macro-system) leaves not only on the behaviour of its component members, but also in their minds; to examine how a social system is embedded or incorporated into the behaviour of its members; to reconstruct how the social system works through its members. (Ibid., 2)

The paradox that Conte and Castelfranchi are concerned with, and the exploration they have entered upon, has become the focus of theories that they find to be less than fully satisfactory (as I do too), or at least incapable of solving the paradox at hand or of achieving the objective they have set themselves to (cf. Section 15.3.3).

On the other hand, the paradox that Conte and Castelfranchi are concerned with, and the exploration they have entered upon, has also been the focus of theories earlier than the ones identified by Conte and Castelfranchi as less than fully satisfactory, and these earlier theories seem congenial to the approach of Conte and Castelfranchi, as well as to my approach (which seems close to theirs). I think we should count among these earlier theories the one by Gerth and Mills, the most consistent investigation into sociopsychology to have been based on the concepts of "significant others" and "generalised other." I will start out in Section 15.3.2 by pulling this theory out of oblivion; I will then come back to Conte and Castelfranchi's normativistic approach (in Section 15.3.3) and finally draw a conclusion on Gerth and Mills (in Section 15.3.4). In this process I will be providing ample room and leeway for these scholars in their role as confirming others, but will at the same time be intervening myself by weaving into the narrative my characterisation of norms as presented in Parts Two and Three of this volume.

15.3.2. The Interaction between Social Structure and Character Structure

Gerth and Mills, in addition to drawing inspiration from Freud, C. H. Cooley, and George H. Mead, also bear in mind the psychiatric studies conducted by Harry Stack Sullivan (1892–1949) (see Sullivan 1955). So early as 1939 Mills

himself had called for a social psychology "which studies the *impact* of social structures and objects, of class biases, and technological changes upon the mind of an organism" (Mills 1939, 671; italics added).

The interaction between individual agents (character structure, or micro-system) and society (social structure, or macro-system) is schematically represented in the following diagram.[20]

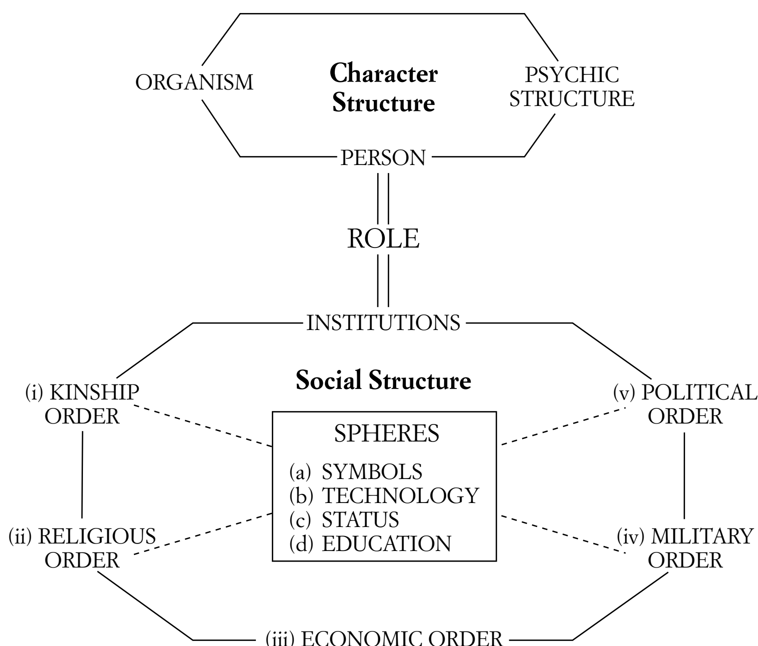

Figure 3: *Role is the bridge between social structure and character structure*[21]

[20] I will comment on the diagram by quoting Gerth and Mills themselves or by paraphrasing them, the primary aim being expository.

[21] This diagram is from Gerth and Mills 1961, 32. The caption and the letters are instead my own addition. Here are Gerth and Mills's definitions of "character structure" and "social structure." "*Character structure*, in our vocabulary, is the most inclusive term for the individual as a whole entity. It refers to the relatively stabilized integration of the organism's psychic structure linked with the social roles of the person. On the one hand, a character structure is anchored in the organism and its specialized organs through the psychic structure: on the other hand, it is formed by the particular combination of social roles which the person has incorporated from out of the total roles available to him in his society. The uniqueness of a certain individual, or of a type of individual, can only be grasped by proper attention to the organization of these component elements of the character structure" (Gerth and Mills 1961, 22). "A *social structure* is composed of institutional orders and spheres. The precise weight which each institutional order and sphere has with reference to every other order and sphere, and the ways in which they are related with one another—these determine the unity and the composition of a social structure" (Gerth and Mills 1961, 30–1, and Chapter 12).

The character structure (the individual human micro-system as an entity in its entirety) is determined by the joint action of organism, psychic structure (in a psychological sense: feelings, sensations, and impulses), and person (in a sociological sense: a combination of roles assimilated by an individual human agent by selection from the roles made available by society) (Gerth and Mills 1961, 10–22).

The term "human organism" refers to "man as a biological entity. The term invites attention to structural mechanisms and undefined impulses" (ibid., 21).

The term "psychic structure" refers to "the integration of *feeling*, *sensation*, and *impulse*."

These elements are anchored in the organism, but their specific integrations into emotions, perceptions, and purposes must be understood with reference to man as a person. (Gerth and Mills 1961, 22)

The term "person" refers to "man as a player of roles." With the term "person" Gerth and Mills then consider the human agent as a social actor and look to understand how a human agent so conceived stands affected by his or her own social acting and experience.

By his experience in enacting various roles, the person incorporates certain objectives and values which steer and direct his conduct, as well as the elements of his psychic structure. Viewing man as a person we try *to understand his conduct* in terms of motives rather than *to explain his behavior*, in terms of stimuli and responses, or as an expression of physiological constants in the organism. (Ibid.)

A social structure (a social human macro-system) is made up of institutional orders[22]—i.e., sets of institutions[23] serving similar objective functions—as well as of spheres,[24] meaning aspects of social behaviour.

The main kinds of institutional order brought to our attention in the diagram in Figure 3 are identified as follows: (*i*) the kinship order, composed of institutions that regulate and facilitate legitimate sexual relations as well as

[22] "An *institutional* order, as we shall use the phrase, consists of all those institutions within a social structure which have similar consequences and ends or which serve similar objective functions" (Gerth and Mills 1961, 25).

[23] "Just as role is the unit with which we build our conception of institutions, so institution is the unit with which we build the conception of social structure. There is more to a social structure than the interrelations of its institutions, but these institutions, in our view, do make up its basic framework" (Gerth and Mills 1961, 23).

[24] "There are several aspects of social conduct which characterize all institutional orders, the most important being: technology, symbols, status, and education. All orders may be characterized by technological implements, by the modes of speech and symbols peculiar to them, by the distribution of prestige enjoyed by their members, and by the transmission of skills and values. We shall arbitrarily call these 'spheres,' in contradistinction to 'orders,' because they are, in our view, rarely or never autonomous as to the ends they serve and because any of them may be used within any one of our five orders" (Gerth and Mills 1961, 29).

procreation and child rearing; (*ii*) the religious order, composed of the institutions within which the collective cult of one or more divinities is organised or supervised, generally on regular occasions and in established places; (*iii*) the economic order, composed of institutions serving to organise work, material resources, and the tools for producing and distributing goods and services; (*iv*) the military order, composed of the institutions under which legitimate violence is organised and supervised; and (*v*) the political order, composed of the institutions by which the distribution of power and authority within the social structure is obtained, maintained, or influenced (Gerth and Mills 1961, 26; cf. ibid., Chapters 8 and 9, on institutional orders and social controls).

The main spheres of social behaviour are identified as follows: (*a*) visual or acoustic symbols, such as signs, signals, emblems, ceremonials, language, music, and other forms of art (we would find it impossible without symbols to understand the behaviour of human actors, or how people's beliefs in the value of their symbols, and their use of them, can serve to support and justify the institutional order); (*b*) technology, consisting of tools, equipment, machinery, etc., serving to implement social behaviour; (*c*) status, consisting of the factors and means by which to distribute prestige, deference, and honour among the members of the social structure (each role, in any institutional order, can become the basis on which to lay claim to a status); and (*d*) education, consisting of the activities by which values and specialised knowledge are conveyed to those who have not yet acquired them (Gerth and Mills 1961, 29–30, and Chapters 5, 9, 10, 11, and 13).

The concept of role is crucial in Gerth and Mills' theory. They

> speak of roles as organized or instituted when they are guaranteed by authority. Thus, the cluster of roles enacted by the members of a household is guaranteed by "parental authority": The "head" of the household may use sanctions against infractions of the role pattern. Thus, employees are subject to the control of owners and managers; soldiers are subject to the authority of the commanding officer; parishioners stand under the jurisdiction of church authorities. Whatever ends the organized and interacting partners may pursue and whatever means they may employ, "authority" exists: and whenever a role configuration is so guaranteed or stabilized by a "head" who wields authority over the "members" who enact the roles, the configuration may be called an institution. (Gerth and Mills 1961, 23)[25]

On the subject of authority and making sure that the single members of a social group enact their roles, we should notice how Conte and Castelfranchi develop a theory of their own in regard to the "sovereign" and the "defenders of norms" (Conte and Castelfranchi 1995, 87f.), a theory that in my opinion can be made sharper (even though we should recall that Conte and Castelfranchi have specific objectives: They are concerned, as Gerth and Mills are not, with artificial rather than with human societies). Now, if I am not led

[25] It is interesting to compare these notions of social psychology with Karl Olivecrona's (quite compatible) observations on law and force (cf. Section 10.1).

astray by my limited competence with multiagent systems, it seems to be that Gerth and Mills give us theoretical instruments useful to the research that Conte and Castelfranchi are carrying forward. Thus, going back to Figure 3 (shown earlier in this chapter), we can appreciate that roles are so positioned in Gerth and Mills's diagram as to bridge between social structure, or macro-system (and institutions in particular) and character structure, or micro-system (wherein roles shape the person): What is specifically at play here is, therefore, the micro-macro link.

Further, I find it appropriate to connect roles more clearly with persons (individual agents, or micro-systems), this because individual persons enact roles in institutions, as well as because roles, or segments thereof, inasmuch as they are internalised by individuals, concur in determining the person in the individual character structure (in the micro-system). For this reason, I suggest modifying Gerth and Mills's diagram as shown in Figure 4 below.

Figure 4 illustrates more clearly how institutions (social structure, macro-system), which obviously belong to the social dimension, operate inevitably through individual characters (micro-systems) who, as persons, enact roles. This Figure 4 also illustrates how the person belongs to the individual dimension and consists in an internalisation of roles.

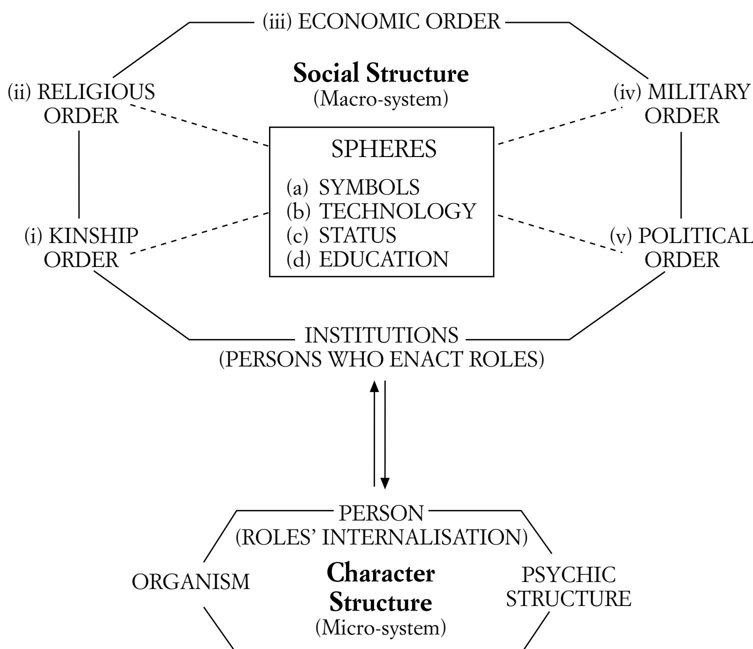

Figure 4: *Enactment and internalisation of roles*

In fine, I have placed social structure (macro-system) at the top level in Figure 4, and individual character structure (micro-system) at the bottom level. It is in the end a matter of taste: My taste, or rather, my sense of reality, instructs me to so express the predominance of social structure over individual characters.

The social structure (macro-system) necessarily includes human agents (micro-systems) in which the person-component enacts previously internalised roles. The character structure (individual human agents or micro-systems) presupposes the internalisation of roles in the person-component.

The social macro-structure goes through an evolution of its own, an evolution remarkably slower than that of the individual character structure, or micro-system, so much so that the social macro-structure can appear static by comparison. The individual character structure develops in relation to the social structure with extreme rapidity, a rapidity analogous to that of an embryo's development within the mother's womb (the mother can appear static by comparison, just like the social structure). The embryo's development is impressively dynamic as compared with the mother's development.

But this may not yet be the most fitting simile with which births, developing individual characters, and the passing of generations of individual agents (or micro-systems) might be compared with the social structure and culture they pass through—with its permanence. Individual character structures (or micro-systems) are moulded by culture, whose typically sluggish change they more or less consciously contribute to effecting. Individuals issue from institutions the way leaves bud forth from plants. They nurture institutions the way leaves nurture plants. They are produced by institutions the way leaves are produced by plants. What this is meant to convey, by analogy to individual human beings, is the time it takes for a leaf to bud, develop, and fall from a tree—the span of a season—against the lifespan of the tree itself, from its birth as a seed to the bud, to the sapling, to the fully developed tree, through the entire course of the tree's life, until the tree reaches its final decay: A process sometimes lasting several centuries.

15.3.3. Norms and the Mental Implementation of a Social System

The character structure—as far as the psychic-structure component and the person-component are concerned—is by and large the product of interpersonal situations, and the person consists of a combination of internalised roles. These roles are conditionally connected in the brains of individuals with certain types of circumstance, and people perform roles as these types get instantiated.

Consciousness involves our waking experience of such things, events, or states of affairs as are either external to us (and in this sense public: Thus, this page is public in that anyone can see it who is not subject to some physiological impairment) or internal to us (and in this sense private: Thus, my head-

ache is private in that my experience of it is confined to myself and is separate from everyone else's experience). Consciousness presupposes an object and a subject. The object is the internal or external thing, event, or state of affairs one is said to be conscious of. The subject is an individual character (or micro-system) that Gerth and Mills describe as having three components: organism, psychic structure, and person (Section 15.3.2).

What is of special interest to us here is that in self-consciousness, too, there is the person-component involved.

> In *self*-consciousness, or *self*-awareness [...], the person is also involved. Although our bodily feelings and our awareness of our toes, hands, and noses are involved in our image of self, or at least often color it with feelings and sensitivities, our total self-image involves our relations to other persons and their appraisals of us. (Gerth and Mills 1961, 80)

It seems to me that we have to do with roughly the same problem when treating (*i*) the interaction between character structure and social structure, in Gerth and Mills's treatment of this interaction; (*ii*) the link between micro and macro, in Conte and Castelfranchi's treatment of this link; and (*iii*) the relationship between individuals and society, the way I see this relation in norms as motives of human behaviour on the part of the individual agent, an agent who internalises norms (as beliefs in the brain) by variously assimilating them from the social environment.

And it also seems to me that there is, in a broad sense, the same approach to questions (*i*), (*ii*), and (*iii*)—an internalistic approach, one that brings into relief the internal point of view, the ontology of the I (Section 15.4)—in Gerth and Mills, in Conte and Castelfranchi, and in the kind of normativism adopted in this volume in the line connecting Hägerström, Olivecrona, Hart 1961, and myself (cf. Chapter 8).

Further, Conte and Castelfranchi, in their quest for normativeness, explicitly refer on several occasions to Hart 1961 (which they interpret not much differently than I do), as well as they refer to Alf Ross 1968 (Conte and Castelfranchi 1995, 77, 87–8, 93, 200, 201). They also refer to Edna Ullmann-Margalit, who in turn draws inspiration from Hart 1961 in treating the emergence of norms (Ullmann-Margalit 1977), and does so going "beyond mere conventions and norms of co-ordination" (Conte and Castelfranchi 1995, 75), without, however, achieving the supersession of what Conte and Castelfranchi call the *game-theoretical rational solution*. And for this reason Conte and Castelfranchi expressly refer to Ullmann-Margalit: They do so in looking to show (as they do in fact show) that her investigation, however important for their own research purposes, will not help toward attaining the concept of normativeness they are in quest of (a concept that I maintain is the same as that discussed throughout much of this volume).

Conte and Castelfranchi are obviously aware that "the idea that a social system and, more generally, the social environment are incorporated into the

characteristics of the agents involved, is not a new one." And they explain as follows, in summary, three main formulations of this idea.

(a) The *building through interaction* formulation, very popular in the 1960s, according to which the social systems are viewed as macro-uniformities produced by a mass of interpreted interactions (Berger & Luckmann 1966, Blumer 1969 [Herbert Blumer, 1900–1987]). Rules and norms are not imposed on the agents from the outside, but are negotiated by the interacting agents (Garfinkel 1967). Any social interaction, therefore, "effects a form of social organization" (Schegloff 1987: 207).

(b) The theory of the *social shaping of the mind*, implying that cognitive structures and processes are shaped by objective social and material conditions. This view, introduced in the 1930s by the Soviet school of psychology ([Lev S.] Vygotsky [1896–1934], [Alexei N.] Leontiev [1903–1979], [Aleksandr R.] Luria [1902–1977], etc.), has strongly influenced cognitive, developmental and social psychologists. From the 1970s, a large number of studies have been conducted (cf. [Michael] Cole et al. 1971, [Sylvia] Scribner 1975, Cole et al. 1978; cf. [Klaus F.] Riegel [1925–1977] & [John A.] Meacham 1975) into the impact of literacy and the school education system on cognitive development. Gradually, this view has led to a somewhat generic assumption of learning and cognition as necessarily social processes ([Lucy A.] Suchman 1987, [Lauren B.] Resnick et al. 1990).

(c) The hypothesis of the *mental implementation of the social systems*, which is closer to formulation (b), at least in its earlier version, than it is to formulation (a); it extends and enriches the theory of shaping, and claims that the social system not only shapes cognition by virtue of some sort of side-effect, but also influences directly, and sometimes even explicitly, the behaviour of its members by modifying their cognition. More explicitly, it is claimed that a social system achieves a purpose by means of its members' actions, and therefore through their minds. (Conte and Castelfranchi 1995, 3)[26]

With regard to the hypothesis of the mental implementation of social systems, Conte and Castelfranchi do not refer to any specific author or study, but rather declare that this hypothesis "is crucial for an adequate theory of the micro-macro link, that is, a theory of the connections between the macro-social systems and their members" (ibid., 3). In Gerth and Mills's *Character and Social Structure: The Psychology of Social Institution*, there is represented precisely a hypothesis (or theory) of this kind. In fact, so early as 1939, Mills writes that "what is needed is a concept of mind which incorporates social processes as intrinsic to mental operations" (Mills 1939, 672).

It is especially worthy of note here how Conte and Castelfranchi criticise what they call the "rational solution," and how they do so from their perspective as specialists in distributed artificial intelligence, looking at the role of normativeness in multi-agent systems. Indeed, I too, from my legal-philosophical point of view, and in relation to my investigation into the function

[26] Conte and Castelfranchi also refer to the studies on the micro-macro link done by scholars working from a phenomenological, ethno-methodological, critical, and hermeneutical perspective, the merits of which they acknowledge, but which they believe (for reasons we shall not enter into) fall short of offering adequate solutions to the problems involving the micro-macro link and normativeness as Conte and Castelfranchi frame these problems (Conte and Castelfranchi 1995, 4–5).

that norms have in the machinery of the law in force, share the kind of criticism they direct at this solution (cf. Section 15.4). Here is a sampling of the arguments that Conte and Castelfranchi produce against the "rational solution."

According to the theory of rationality, autonomous, self-interested decision-making is explained in terms of the **rational choice principle**, that is, in terms of the maximum expected utility. Given two options, a rational agent is expected to choose the one which ensures the maximum outcome compared with the relative probability of occurrence. This fundamental mechanism is essential for explaining decision-making processes, but it is neither the only, nor the primary motor of deciding systems ["motor" is indeed aptly chosen here]. Agents are *not* moved to action ["moved," aptly chosen] by the principle of maximum utility, although their actions are controlled by this principle. Actions are motivated by needs, desires, etc. ["motivated," aptly chosen]. In a word, they are directed towards realizing specific *goals* ["goals" is too narrow for me; indeed, norms are motives of behaviour that are not goal-oriented].

Conversely, in the theory of rationality, *the agent's goals* ["motives" would be better suited] *are ignored*. In AI [Artificial Intelligence] and cognitive science, the agent is a *planning* system, and goals are essential for explaining why and how actions are planned. But in the theory of rationality, agents are not seen as planning systems and their actions are explained directly in terms of the rational choice principle ([Ken] Binmore 1987, [R. Duncan] Luce & [Howard] Raiffa 1989, [Eric] Rasmusen 1990). In particular, in game theory, which can be defined as a theory of rationality applied to situations involving more than one agent, *the agents' social goals, the agents' reasons* ["motives" would be better suited] for actively engaging in social actions, are ignored. Therefore, while macro-social phenomena are allowed to emerge from the agents' choices, *the mental mechanisms of micro-interactions are taken for granted*. They always pre-exist and explain the macro-social level, but are never shown to be produced or influenced by it. Essentially, the *mental mechanisms* are considered irrelevant by game theorists for explaining rational social choice. (Conte and Castelfranchi 1995, 6; italics added on the last three occurrences)

The comments and italics added to the foregoing excerpt serve to mark out those words and expressions that I find to be especially congenial to the internalistic approach I myself adopt, as well as to point out certain improvements in this regard where I believe this approach is less adequately reflected. Thus, in this last connection, I italicised "the agent's goals are ignored" to indicate a delicate point in the view that Conte and Castelfranchi are fleshing out.

It is no accident, the way I see it, that Conte and Castelfranchi shift from the "agent's social goals" to the "agent's reasons." They seem to understand these two expressions as equivalent. But if "reasons" is equivalent instead to "motives"—as I believe it is in Conte and Castelfranchi (on reasons as motives, see Section 6.1, and footnote 2 in particular)—then "reasons" ("motives") will cover greater ground than "goals": Many goals, and maybe all goals, if adopted by an agent, become by and large motives of this agent's behaviour; but not every motive of human behaviour is a goal. Norms (which Conte and Castelfranchi treat in a way congenial to my approach) are motives that are not properly goals (see "deontological versus teleological" in Chapter 5); and it is this aspect of norms that the neurosciences will hopefully, some

time in the future, be able to shed light on, for example by working within the frame of neuropsychiatric research into the pathological phenomena referred to as "obsessive-compulsive disorders."

I am not advancing the hypothesis that the internalisation and existence of norms in human brains is a pathological phenomenon (along the lines of obsessive-compulsive disorders); I am rather speculating that norms—on account of the way they are internalised, and the way they exist in the human brain—are non-pathological phenomena of which obsessive-compulsive disorders are perhaps a cognate pathological-degenerative phenomenon. A few minimal arguments in support of this speculation come from the studies on, and experiences with, changing human personality by using drugs or violent or highly repressive treatments, especially on subjects, such as children and adolescents, whose personality is in process. Totalitarian regimes and religious sects have variously brought such methods to bear in seeking to model the moral (normative) conscience of their victims and acolytes (cf. Section 9.4).[27]

Significantly, Conte and Castelfranchi hold—and understandably so, judging from their perspective—that adopting a norm is a particular case of adopting a goal. But in reality they force norm adoption into their previously developed theory of goals and goal adoption (Conte and Castelfranchi 1995, 30–41). Conte and Castelfranchi's counting of norms among the motives of human behaviour is necessary and welcome but requires, in my opinion, that Conte and Castelfranchi modify their theory of goals and goal adoption to at least suit norms.[28] If norms—as I characterise them—bear any remote relation to obsessive-compulsive disorders, they will very likely not be adopted by individuals in the way that goals are adopted. The adoption of a goal requires making rational calculations (though not always, say Conte and Castelfranchi; these calculations may be conscious, but they may also be unconscious, as in the case of an unconscious routine); the adoption of a norm, in contrast, does not require making any rational calculations, at least not for the most part, according to my opinion. Our adoption of norms from the environment, or better yet, our assimilation or internalisation of them (norms understood as I do) implies rather the socialisation phenomena referred to in

[27] In addition to these cases, all of them belonging to history and to the chronicling of the domination of man over man, the reader can refer to the neurological-psychiatric literature on this subject: see, for example, Smeraldi 2003, where there is to be found a bibliography that covers the field extensively.

[28] "The general form of a prosocial action is based on goal adoption, i.e. one pursuing another's goal. More precisely, we define goal adoption as the process by which a given agent comes to have another agent's goal as his own [...]: *x adopts a goal of y's when x wants y to obtain it as long as x believes that y wants to achieve that goal*. In other words, *x* has a new goal as a result of goal adoption. He has it, (a) *as long as* he believes that *y* has it, and (b) in order for *y* to obtain it. Thanks to condition (b), the present notion of adoption excludes all cases in which one is led to have a new goal by others pursuing the same goal (imitation)" (Conte and Castelfranchi 1995, 31).

Section 15.2.5 and the subsumption and inference processes described in Chapter 7 and in Section 9.6.

At any rate, Conte and Castelfranchi effectively call our attention to the limits of the game-theoretical, rationalistic approach, which explains how the macro emerges out of the micro but does not instead explain how the micro derives from the macro; and they also bring out the "hypercognitive fallacy" that the studies applying artificial intelligence to the social sciences have inherited "from phenomenological, post-Wittgensteinian social theory" (cf. Conte and Castelfranchi 1995, 5, 18–20).

15.3.4. Internalising the Reality That Ought to Be: From Significant Others to the Generalised Other

Conte and Castelfranchi make explicit as follows their intentions and approach as compared against approaches and orientations different from theirs:

> Unlike scientists of rationality, we believe that cognition reflects and *embodies* in various ways objective pre-conditions, societal prescriptions and institutions, and reinforcing effects. (Conte and Castelfranchi 1995, 9)

What is needed, say Conte and Castelfranchi, is a theory of

> (a) how the macro-social system is implemented in the agents, and how it works through their minds. That is, a theory of:
>
> —*cognitive shaping*, or in other words, the reasons and processes by means of which the agents acquire beliefs and goals from external social sources;
>
> —*behavioural shaping*, especially the functional mechanisms of reinforcement;
>
> (b) how macro social phenomena may be derived from micro interactions. (Conte and Castelfranchi 1995, 9–10)

As has been anticipated, the theory that Gerth and Mills based on the concept of "significant others" and of "generalised other" provides, in my opinion, at least some clues to the answers sought by Conte and Castelfranchi—and does so with regard to points (a) and (b), both.

According to Gerth and Mills,

> man as a *person* [the person-component of an individual agent, or micro-system: cf. Section 15.3.2] (from the Latin *persona*, meaning "mask") is composed of the specific roles which he enacts and of the effects of enacting these roles upon his self. And society as a *social structure* is composed of roles as segments variously combined in its total circle of institutions. [...] From the sociological point of view, man as a person is a social-historical creation. If his view of his self and of his motives is intimately connected with the roles which are available to him and which he incorporates, then we may not expect to learn much that is very concrete about individual men unless we investigate a number of his specific roles in a number of varied social-historical settings. (Gerth and Mills 1961, 14)

It falls to the social scientist to show how the main ideas and beliefs current in a society, as well as its symbols and modes of communication, contribute to the formation, preservation, and efficacy of individual motives.

An individual agent's person-component is by and large a product of interpersonal situations. A person's integration with others—the roles this person acts out—is key to understanding that what constitutes an individual agent's person-component is the combination of the roles he or she acts out: A person is made up of the organised social roles he or she has internalised and enacts; language is the mechanism by which this internalisation occurs (Gerth and Mills 1961, 80, 83).

A role is an established model of personal conduct, that is, a model that we are expected to follow: "The roles a person plays thus integrate one segment of his total conduct with a segment of the conduct of others" (Gerth and Mills 1961, 83).

When we enter a new role and do not yet know what is expected of us, we take direction from other people's words of approval and disapproval and learn therefrom whether the moves we have made were right or wrong: The voiced expectations of others are what we use as our guide in instantiating a type of behaviour.

> When we have internalized the vocal gestures of others, we have internalized, so to speak, certain key features of an interpersonal situation. We have taken over into our own person the gestures which indicate to us what others expect and require. And then, we can make certain expectations of ourselves. The expectations of others have thus become the self-expectations of a self-steering person. The social control and guidance which the gestures of others provide have thus become the basis for self-control—and for the self-image of the person. (Gerth and Mills 1961, 84)[29]

Besides, the person—having learned to read—chooses models as well from among those he or she finds in the culture stored (written) on nonhuman supports (cf. Section 15.2.2).

When we reach adulthood, our self-image, however subject to some extent to the evaluations that other people make on specific occasions, will usually

[29] Let me observe en passant that there is something in these concepts that echoes the excerpts by Rousseau quoted in Section 10.2.6 on the interaction between the individual wills and the general will—but with this crucial difference. Rousseau says we can be proud of ourselves: The general will is our own, truest individual will. By contrast, these crude social psychologists, Gerth and Mills, do not get carried away by suggesting sentiments. They simply tell us the exact opposite of what Rousseau seems to be saying: Our own, truest individual will (the character structure) is the general will (the social structure) that moulds us. Three comments are in order here. First, if we are to seek out any 18th-century antecedent, we should say that Gerth and Mills follow in the wake not so much of the pre-Romantic Rousseau as in the wake of the pre-Positivist Montesquieu (cf. Section 10.2.4). Second, Gerth and Mills do not try to elicit emotions, yet they may inspire melancholy (as Kierkegaard and Heidegger in a sense do: Section 11.1). Third, quite independently of the first two comments, Gerth and Mills are right, or so I fear.

be strong enough to have an existence of its own. This autonomy[30] of our self-image rests on the long string of antecedent evaluations and expectations that others have expressed in our regard.

> The self-image which we have at any given time is a reflection of the appraisals of others as modified by our previously developed self. (Gerth and Mills 1961, 85)

Only when another's evaluation is in some way *significant* to us does it carry any weight in forming and maintaining our self-image. Quite likely, the first self-image a child will have of itself is the image its mother has of it, but as the child grows older there will be many and different *significant others* that come to bear.

The individual is not completely passive in taking some people rather than others as significant others. There are at least three criteria that we use in selecting significant others from whom to draw inspiration:

(*i*) *Cumulative confirmations*. The image we already have of ourselves, and which we value, induces us to select those people who confirm it or make it seem even more appealing. This process is self-reinforcing: The more we succeed in selecting as significant others those people who confirm our self-image, the more we will be induced in the future to seek out this kind of person as significant. So there is in our personal history a tendency to accumulate over time those people who support our self-image, who are willing to regard us in the way we want to be regarded: These people are our *confirming others* (Gerth and Mills 1961, 86–7).

(*ii*) *Selection by position and career*. In forming and maintaining a valued self-image, we will select significant others in ways circumscribed by our institutional position and by the positions we will assume over the course of a career. The range of possibilities allowed by any one position makes it so that the workings of this process are not mechanical (Gerth and Mills 1961, 87).

> The class and status positions of a person may thus be restrictions upon his *selection* of significant others, as well as determinants of the *degree and kind of significance* and of the *angles of refraction* which other persons of differing status may possess for the person of a given status position. (Ibid., 88)

(*iii*) *The confirming use of the intimate other*. If we find obstacles in our outward search of a confirming other, we may end up restricting our search to those confirming others with whom we are intimate. The circle of intimate others can become extremely tight, possibly coming down to a single significant other. In these cases, we will be trying to gauge our self-image entirely to the evaluations of this single particular other, thereby forming with this person a unit in isolation from the rest of society (Gerth and Mills 1961, 90).

[30] The autonomy in question is not political autonomy as discussed in Section 10.2.6, i.e., political autonomy vis-à-vis political heteronomy.

Our self-image is moulded by the attitudes that significant others take toward us: These attitudes become matter deriving from social experience, which matter we will experience anew and reprocess in evaluating our self-image. When internalised, these attitudes form our *generalised other*.

The experience of this generalized other—the experience of "conscience"[31]—is not the experience of a self-image; it is the experience of the appraisals of *others who are not immediately present*, but who, nevertheless, restrain or facilitate our own appraisals and images of our self. (Gerth and Mills 1961, 95; footnote and italics added)

The significant others are those people whose evaluations we heed and factor into our evaluations of ourselves. The authoritative others are significant others whose evaluations approve or disapprove of our actions and desires. The generalised other is what results from integrating the evaluations and values of our significant others and, even more so, of those significant others who are authoritative.[32]

In the generalized other, the appraisals of many particular others are organized into a pattern. The contributions of any particular other are fused with the contributions of these various others, and thus formed the generalized other. Accordingly, when the person performs an act that is out of line with expected norms he may experience a general disapproval of his self, which means that the generality of his significant and authoritative others expected an alternative act. He may not be able to locate and specify just which other forbids this act, for this particular other has become part of his generalized other. (Gerth and Mills 1961, 97; italics added)[33]

[31] The difference between "conscience" (i.e., the moral conscience) and "consciousness" is standardly so characterised. "Conscience can signify those very moral convictions persons cleave to most firmly and judge themselves by. Second, the notion may cover the faculty by which we come to know moral truths (assuming there to be such) and apply them to ourselves. Third, conscience can be said to concern the examination by a person of the morality of their desires, actions, and so on." (*Routledge Encyclopedia of Philosophy*, s.v. "Conscience," vol. 2: 579). "Consciousness," instead, is used in philosophy "for four main topics: knowledge in general, intentionality, introspection (and the knowledge it specifically generates) and phenomenal experience" (*Routledge Encyclopedia of Philosophy*, s.v. "Consciousness," vol. 2: 581).

[32] "The generalized other of any given person does not necessarily represent the 'entire community' or 'the society,' but only those who have been or who are significant to him. And some of those who have been significant others may not operate in the generalized other, but may have been excluded from awareness—a fact that is in line with the principia of selecting as significant those others who confirm the desired image of self" (Gerth and Mills 1961, 96).

[33] "If the others who have been most significant to a person have been very forbidding, the person may be burdened by feelings of unbearable guilt. In a restricting parental situation he may have incorporated a generalized other that is too narrow for the requirements of the later institutional world of business and pleasure, and he may not have been able to integrate the appraisals and expectations of later others which are more appropriate to his adult roles. With psychiatric aid the person may be able critically to review his internal behavior and escape his generalized feelings of guilt by specifying and recomposing the significance of particular others within his generalized other. He may be able to add (or even to substitute) the authority of the psychiatrist to his generalized other in such a way as to gain genuine independence for rational determination of self.

As new appraisals are added to older ones, and older ones are dropped or excluded from

Hägerström's theory of norms; Karl Olivecrona's theory of norms as independent imperatives (*fristående imperativer*: Section 8.1.3.1); Hart's 1961 rules, understood as having a matter-of-fact existence and as implying an internal point of view (at least insofar as they exist in single individuals in addition to existing in society: Section 8.2.6.1, point (*a*)); Alf Ross's conception of norms (initially expressed in *Om ret og retfærdighed*, of 1953—Ross 1971—and then better reformulated in *Directives and Norms*, Ross 1968, 78ff., 106ff.); and my own characterisation of norms as beliefs (Chapters 6 and 7) find a counterpart in the psychosociological theories of the social self: in the theory of the generalised other, for example, which is here being brought anew to the reader's attention. Neither the theory of norms presented in this volume nor the theory of norms as an objective system of modes of conduct (Hägerström) or as independent imperatives (Olivecrona) or as standing, enduring, and settled rules (Hart 1961) enters into any full reconstruction of the way the macro (society and its culture) is internalised in the micro (in the individual)—a reconstruction such as we find in Gerth and Mills. Even so, these theories recognise fully the phenomenon of internalisation (a phenomenon that Gerth and Mills attempted to reconstruct), and they recognise its importance. Hägerström was conducting his research much earlier than Gerth and Mills and so couldn't possibly have known of their theory, but it is also clear that Olivecrona, Hart, and Ross had no knowledge of it, either. For my part, I am content to mark the parallelism, the points of contact, and the affinities that can reasonably be said to exist between the theory of the generalised other and my own conception of norms, a conception I develop by following through on Hägerström, Olivecrona, and Hart 1961. I do not mean this to say that the theory of the generalised other, as I have summed it up, is the best theory with which to account for the normative phenomenon. I am rather saying that this theory is plausible, that the research line it follows—a line inaugurated by George H. Mead—is the right way to go in investigating the normative phenomenon, and that ultimately it will be for the neurosciences to conduct this investigation (Sections 15.3.3 and 15.4). I am also saying that, as I mentioned earlier, Gerth and Mills's theory is a theory concerned with the mental implementation of social systems: It is the kind of theory that Conte and Castelfranchi also aspire to.

In fine, our having a moral conscience entails not only that we have internalised roles variously assimilated from the social environment, but also that we have attained a degree of individualisation, which in turn requires a certain detachment from these roles, namely, a certain distance from the expectations that others express relative to them. Such a detachment and its accompanying

awareness, the generalized other normally changes. Such changes in the composition of the generalized other may occur as an aspect of the person's growing up or maturing" (Gerth and Mills 1961, 97–8).

individualisation occur throughout our career when expectations are directed at us that stand in mutual conflict or in conflict with our current circles of significant others. This individualisation of the self results from the variety and scope of the voluntary actions we undertake, and it implies that we actually have had the possibility to take an individual decision, and that others credit us as responsible for such personal choices.

> Personal or joint "responsibility" exists socially when the individual, as an individual or as a member of a group, is held accountable for his activities, in short, when his acts are ascribed to his self or his group. In a society where roles are quite stereotyped, this reality of alternatives, and such conceptions as personal responsibility, may not exist. Only if they do may a person come to address himself in an attempt to secure "consistency" and unity of self-image on the basis of self-expectations. There must be an area of voluntary action, which normally involves the perception of open alternatives or of conflicting expectations. The chances for an *individual* to emerge and to control himself by a generalized other are decreased as the variety of voluntary choices and decisions which confront persons diminish. (Gerth and Mills 1961, 100)

In a society in which we are offered only consistent roles and only so many choices, it is society itself that sees to it that our self is self-consistent: There will be no way that we can individually work at integrating our self because society has already done that for us. But in a society in which conflicting expectations come our way, and hence in a society where we have actual alternatives to choose from, we will each have to attain such a coherence and unity of the self with our own resources. In this effort we forge an identity: We take the different, conflicting expectations of significant others and work them into a coherent whole that becomes our generalised other (Gerth and Mills 1961, 100–1).

15.4. The Palingenesy of the Psychological Aspects of the Internal Point of View. Overcoming the Analytical Paradigm: Willard Van Orman Quine, John R. Searle, and the Neurosciences

I already dealt with the analytical emasculation in Section 9.1. This emasculation consists in reducing norms to propositions, thereby renouncing considering them as internal—psychological—motives of human behaviour.

In this Section I will deal more extensively with the anti-psychologism of analytical philosophy, with some negative consequences resulting from this attitude, and with the path taken as a way out of the paradigm of analytical philosophy, a path I feel needs to be pointed out, and which follows in the footsteps of Willard Van Orman Quine and others in the direction of the neurosciences.[34]

[34] Terms such as "anti-psychologism," "anti-mentalism," and "anti-internalism" have been used with importantly different meanings in a wide number of debates within the philosophy of logic and mathematics, epistemology, and the philosophy of mind. Here I will largely disregard

Since the latter half of the 1940s, the dominant Anglo-American philosophy—analytical philosophy—contributed widely to spreading an anti-mentalistic attitude, with Wittgenstein and Ryle (1900–1976), for example. Furthermore, philosophers working in the analytical tradition, conceiving their enquiries as enquiries of a conceptual sort, were mostly inclined to consider irrelevant, or at least to belittle, the importance that scientific hypotheses and the empirical discoveries of psychology and the social sciences bore for their work.[35]

What matter here are the consequences that this exclusionary attitude has had on the study of society and culture at large, and in particular on the study of law, morality, and politics. The paradigm of Anglo-American philosophy developed under the powerful influence of both logical empiricism and ordinary-language philosophy, and it manifested itself in a kind of a censorious attitude toward hypotheses on human individual and social behaviour when these hypotheses were argued by making reference to psychological, subjective experiences, or—as I should say in my approach and terminology—to human brains.

> The golden age of analytical philosophy in its different versions in the Anglo-American area came in the postwar period and lasted through the 1960s—a period of virtually uncontrasted academic dominance, in that the other philosophies, though present, took up marginal spaces in university teaching and failed to have a hold on the newer generations. The 1970s saw the end, not of analytical philosophy, or rather of the analytical philosophies, but of their dominance. (Restaino 1999, 913; my translation)

Ordinary-language philosophy takes hold in the United States in the 1950s and 60s, with different orientations internal to it, "but the analytical tradition itself, with all its internal divisions, is undoubtedly predominant in pretty much every department of philosophy and logic in American universities" (Restaino 1999, 915; my translation).

such differences and use those terms almost interchangeably to indicate a number of preclusive attitudes toward investigating inner subjective experiences in the study of normativeness, especially moral and legal normativeness.

[35] Bertrand Russell had this to say in 1959: "In English-speaking countries and especially in England, there is a new philosophy which has arisen, I think, through the desire to find a separate field for philosophy. [. . .] It would appear that philosophy is merely incomplete science, and there are people who don't like that view. They want philosophy to have a sphere to itself. That had led into what you may call linguistic philosophy, in which the important thing for the philosopher is not to answer questions but to get the meaning of the questions quite clear. I myself can't agree to that view, but I can give you an illustration. I was once bicycling to Winchester, and I lost my way, and I went to a village shop and said, 'Can you tell me the shortest way to Winchester?' and the man I asked called to a man in a back room and whom I couldn't see—'Gentleman wants to know the shortest way to Winchester.' And a voice came back, 'Winchester?'— 'Aye'— 'Way to Winchester?'— 'Aye'— 'Shortest way?'— 'Aye'— 'Don't know.' And so I had to go on without getting any answer. Well, that is what Oxford philosophy thinks one should do [...]. It's somebody else's business to give the answer" (Russell 1974, 15–6).

In England, on the other hand,

> the logical-empiricist orientation had been pushed into minority, sidelined—the chief, and virtually only, exponent still holding out was A. J. Ayer [1910–1989], with the emigree K. Popper propounding positions different from those fashioned in the manner of Carnap [1891–1970]. Coming up strong in the analytic tradition, inaugurated in England by B. Russell and G. E. Moore [1873–1958] in the early 1900s, was the well-known version of it that went by the name of "ordinary-language philosophy": The views held by the later Wittgenstein at Cambridge became predominant, and virtually exclusive, as did those of G. Ryle and, even more so, J. L. Austin, and their many colleagues and students at Oxford, among whom H. L. A. Hart, P. Strawson, R. M. Hare, P. Nowell-Smith, S. Toulmin, and many others. From the 1940s to the 1970s the analytical techniques of the Oxford school made up *the* philosophy of England par excellence. (Restaino 1999, 914; my translation)

Even in legal philosophy and in general jurisprudence there are traces of the preclusive negative effects of the anti-mentalism that characterised the academic paradigm of the 1950s and the ensuing decades (there have obviously been many positive effects as well, and more numerous than the negative, which came from analytical philosophy). Traces of this kind can be detected in the 1953 work of Alf Ross (Ross 1971), for example, in which these effects were caused by logical empiricism, as much as they can be detected in the work of H. L. A. Hart (1961), in which these effects were caused by ordinary-language philosophy.

Both of these scholars chose to attack the question of normativeness by bringing it into too close a connection with outward observable behaviour, and in the final analysis with outward, observable, linguistic behaviour. In different ways, they both found they could not deal with normativeness without taking into account the external point of view: They could not attempt to identify normativeness by considering it exclusively—however provisionally, and only for the purposes of analysis—from the internal point of view, that is (and I must stress, provisionally and for the sole purpose of analytical identification), without taking social behaviour into account.

Thus, in 1953 Alf Ross sought to connect the psychological aspect with the behavioural aspect of norms, and did so, under the influence of logical empiricism, by fashioning legal dogmatics after the scientific model that logical empiricism had worked out for the empirical sciences.[36] Ross drew from this

[36] Among the exponents of logical empiricism which Ross explicitly refers to in both *Law and Justice* (Ross 1958, 40, 112, 237) and the Danish original, *Om ret og Retfærdighed*, of 1953 (Ross 1971, 53, 132, 311, 320), are Victor Kraft (1880–1975) and Arne Naess. Mentioned, instead, only in the Danish original are Georg H. von Wright and Eino Kaila (1890–1958) (Ross 1971, 53). Of course the logical-empiricist literature that Ross draws inspiration from, even when he is not making any specific reference, is wide and varied: see, for example, the work of Moritz Schlick (1882–1936) and Herbert Feigl (1902–1988) (cf. Pattaro 1966, 1036ff.). After Alf Ross died, in 1979, I managed to have the University of Bologna acquire part of the personal collection of books that his heirs had sold to an antiques library in Copenhagen. Some of these books are greatly interesting because they carry Alf Ross's handwritten annotations.

model the principle of verification and the idea that the empirical assertions of science can all be understood, in a sense, to be predictive; he set this model right in the centre of legal dogmatics, despite the incompatibility between the two; this course led him to embrace a form of predictivism whereby legal doctrine—by stating the validity of a law (where "valid" is to be understood to mean that the law in question is in force: cf. Section 8.1.6)—takes the function of predicting the court's decisions.

Alf Ross expressly distinguished the psychological realism of the Uppsala School (in the sense of "psychological" illustrated in Section 8.1.4) from the behaviouristic realism of the American realists; and he declared as well his intention to attempt a synthesis between the two realisms, for behaviours (here, the verbal behaviours of judges) are observable; not so the normative ideology that judges adopt (in their brains, I should say) when they act in the role of judges: This normative ideology cannot be observed, because it is internal to the heads of the judges singly considered; in a word, it exists (Section 6.2) as a subjective experience (Section 10.2.4, footnote 35; cf. Pattaro 1966, 1047–8; Ross 1958, 73–4).

And there is a sense in which the preclusive attitude that analytical philosophy has had against psychology can be detected in Hart 1961.

Hart, concerned as he was to proceed in a methodologically safe way, chose—as Alf Ross had done in 1953, and yet differently from Ross—to anchor the internal aspect of norms to the external, observable social practice of the officials. Hart pursued in this sense the same objective that Ross had pursued, and for methodological reasons akin to Ross's, but he did so in a different way than Ross, because, among other reasons, his methodological concerns were rooted not in logical empiricism (as had been the case with Ross) but in ordinary-language philosophy. (Hart's methodological concerns can be explained by pointing to his attitude of caution, and maybe even of suspicion, toward psychologism.) So we see here Hart working out what has been called the social-rule theory; this he does against the backdrop of J. L. Austin's philosophy of language and of the reading of Wittgenstein that Peter Winch came at in the effort to provide an understanding of human and social behaviour.[37] But Hart 1961—fortunately, in my opinion—received as well the counterbalancing influence of Hägerström and Olivecrona, and that despite his ever-present anti-psychologistic caveats. As I attempted to show in Section 8.1.3, Hart recognised Hägerström's and Olivecrona's works (certainly not

See, for example, Schultzer 1938 (Bent Schultzer, 1904–1973), esp. Chapters 2 ("The Validity of Protocol Statements," 9ff.), 7 ("On Verification," 59ff.), and 8 ("On Objectivity," 69ff.): These chapters Alf Ross carefully underlined using two colours. A report on this acquisition by the Bologna University Department of Law has been published by Carla Faralli (Faralli 1984, 310–2).

[37] MacCormick 1981, 30. Cf., in Volume 11 of this Treatise, Postema.

Ross's works) as very important, if not fundamental, to an understanding of the functioning of the model of rules as compared with the model of commands and of habitual social obedience in describing and explaining the legal phenomenon.

Hart's soft positivism has earned it, on the part of Ronald Dworkin, the label "semantic sting" (Dworkin 1986a, 45ff.). And, on closer inspection, this description strikes at Hart's soft legal positivism where Hart fences in, circumscribes, and avoids looking into the psychological aspects of the internal point of view (even though Dworkin, in truth, requires so much as to have the internal point of view not only be explored and investigated, but also adopted by general jurisprudence, which in a way he counts among the sources of law).

The advantage that Hägerström and Olivecrona had over Alf Ross and H. L. A. Hart is that they did not operate under the influence of logical empiricism or of ordinary-language philosophy (clearly, in Hägerström's case this was so for chronological reasons). Their advantage is that, in undertaking to explain the functioning of a social phenomenon such as the law is—and specifically the normativeness of law—they did not fall subject to the anti-mentalistic preclusions of these philosophies. Clearly, the fact of these philosophies not influencing Hägerström and Olivecrona brought as well a disadvantage for them, in that they could not use or master (for better or worse) the refined conceptual tools that Ross and Hart could use: Ross thanks to his familiarity with logical empiricism, Hart thanks to his familiarity with ordinary-language philosophy.

The dividing line between internal and external—internal states of mind or processes versus external, observable behaviour—comes into play as well in this further way.

Rational thought (which, too, seems to me to pertain to the internal dimension of the human being: to the human brain) is not affected by the anti-internalistic preclusion, on the part of logical empiricism or on the part of ordinary-language philosophy, because rational thought, and especially logic and mathematics (both of them formal sciences: *Formalwissenschaften*), is considered in the analytical tradition as having an objectivity of its own that is independent of the human psyche.

So far, so good.[38] And, further, logical empiricism carried forward its faith in the formal sciences along with a parallel, equally unshakeable faith in emotivistic non-cognitivism in metaethics. The metaethical emotivism of logi-

[38] But then, on the other hand, I also believe, and believe to some degree with aprioristic conviction, that the neurosciences, by investigating the brain, may be able in the future to give contributions relevant to logic and to mathematics. Attempts in this direction have been made so early as the late 1980s (see Churchland 1986; Churchland 1989; Churchland 1995; Churchland and Sejnowski 1992), though I do not share the computational perspective these authors express.

cal empiricism certainly presented negative aspects tied to its radicalism.[39] And yet they certainly presented a positive aspect, too: They underscored the existence and importance of the irrational, emotive, psychological side of the human mind, even if they sometimes did so especially in an effort to shed light on what they judged to be its nonsensical character, a character they viewed as a hindrance to a correct understanding of individual and social human behaviour. (And next to this side they underscored the rational side, the side capable of rationally treating the empirical data of the external world, and the data on individual and social behaviour, where the external world in question is the human world.)

Naturally, the metaethical non-cognitivism and emotivism of logical empiricism was soon to be reacted against: This counter-reaction came from within the same cultural fold of analytical philosophy. Coming as it did from within analytical philosophy, the reaction against non-cognitivism and emotivism followed paths in one way very much understandable and in another rather puzzling. Indeed, rational thought (however much it may be rooted in the human brain, and hence be *in interiore hominis*) is considered objective in the analytical tradition (and in this tradition, again, the formal sciences are considered to be in a way more objective than the empirical sciences)—and on that account, the goal in analytical philosophy in its reaction to metaethical non-cognitivism and emotivism (two orientations characterising analytical philosophy from its very inception) became to recover for the rational dimension of human beings as great a quantity of morality and law as could be recovered, this precisely in order not to leave morality and law to the indeterminacy, subjectivity, and uncontrollability of emotions and psychological impulses. Even in this regard, I must remark: So far, so good.

But when this "rationalistic" and rationalising attitude (see Section 15.3.3) ends up disregarding that there exists, and in mass proportions, an irrational dimension of man, and so of morality and law, thereby refusing to concern itself with this dimension, then rationalistic neo-cognitivism in morality and law will again discriminate against the internal, psychological, and emotive dimension of man, insofar as this dimension cannot be treated from within an empirical approach or a practical rationality.[40]

Even in the field of artificial intelligence applied to the social sciences the limitations of hyper-rationalistic accounts of social behaviour have been perceived:

[39] See the survey in Oppenheim 1976. Obviously, traditionally cognitivistic metaethical theories, such as those religiously inspired, or those that trace back to some form of natural-law theory, took an immediate stand against the non-cognitivism and emotivism of logical empiricism.

[40] It is from the wellspring of analytical philosophy that rationalistic neo-cognitivism ripened, only to turn against it in rejecting some of its metaethical emotivistic aspects. Cf. Lewis 1969; Ullmann-Margalit 1977.

> A fundamental misconception has pervaded the social sciences, and is also reflected in the social studies carried on in AI [Artificial Intelligence]. It is a static, non-emergent view of micro-interactions. Social needs and capabilities are taken for granted, either because they are inherent in the structure of the situation investigated (think of game theory), or because they are built into the agents (think, again, of the strategic beliefs found in game theory and, more generally, in the theory of rationality). This statement may appear unwarranted given the impressive number of game-theoretic studies about the *emergence of co-operation*. However, co-operation and other positive social phenomena are considered as emergent macro-effects of micro-interactions, the latter being essentially taken for granted.
>
> An analogous consideration should be made with regard to the social studies conducted within the field of AI [Artificial Intelligence]. Over the last decade, AI [Artificial Intelligence] has certainly taken on a significant role within cognitive science and has usefully contributed to a general theory of intelligence and of cognitive processes. Unfortunately, this is not true of social studies in AI [Artificial Intelligence]. Indeed, none of HCI [Human-Computer Interaction], MAS [Multi-Agent System] research, and CSCW [Computer-Supported Co-operative Work] are good candidates for working out a general theory of the bases and reasons for social relations and interactions. (Conte and Castelfranchi 1995, 18)

The rationalising neo-cognitivism (also adumbrated in this description) is in my opinion purblind and ungainly. It therefore runs a serious risk of tripping over the enormous mass of human irrationality and falling flat, precisely because it refuses to see this irrationality and to take it into account.

Indeed, we sometimes take in our critical or rational morality a pride so blinding that we throw our uncritical morality out the window (we do not give to nonrational, not critically analysed components the attention that is due to them). It is a critical or an uncritical morality (or normativeness) that prevails among the bulk of the population?[41] At what age do young people on average pass from an uncritical to a critical morality? And when they—or rather, we—grow old, at what age do *we* on average lapse back from a critical to an uncritical morality? Where no critical morality exists, is there no morality at all? What about taboo morality,[42] Nazi or racist morality,[43] the morality

[41] For example, a morality as important and as widespread as the official Catholic morality is held by authoritative scholars to be "in radical contrast with the principles of ethical and juridical reason that are universally accepted at least in the West" (Lombardi Vallauri 1992, 328). Cf. also Lombardi Vallauri 2001, 95–149.

[42] For example, "it is typical of Hindu morality that Hindus shouldn't eat beef. The Mohammedans and the Jews say you mustn't eat pork, and there is no reason for that, it's just taboo" (Russell 1974, 63).

[43] The question is discussed in Hare 1963, 170–1, 219ff. "Let us suppose that there is a racialist the mainspring of whose racialism is a horror of miscegenation; and let us suppose that the source of this horror is not any belief about the consequences, social or biological, of miscegenation. [...] Let us suppose [...] that his grounds are [...] simply a horror of the very idea of a black man mating with a white woman [but note that the converse case—a white man mating with a black woman—would not be perceived to be as shocking]. This cannot be touched by any scientific or factual argument [...]. And it may well be true that, if miscegenation is to be prevented, it is necessary to have a rigid color bar [...]. If this is true, then it will be hard for us to argue with this man. He detests miscegenation so much that he is prepared to live in a police state in order to avoid it.

of terrorism and other fanatical moralities?[44] To say of these moralities that they are not moralities because they do not correspond to our rational, liberal, progressive moralities is to show that if our morality is a critical morality, our metaethical attitude, our philosophical and scientific approaches to moral and legal phenomena, is itself not fully critical.

In my opinion, what we experience in a strictly deontological way—as binding per se, or as normative, on my characterisation of norms—originates not in mere rationality (even when the contents of the norms we believe in make rational sense from many points of view), but to a great extent in some activity of the brain designated by mentalistic terms, such as "emotion" and "feeling"[45]

And he must be prepared for more than this. He must, if he is going to universalize his moral judgements, be prepared that he himself should not merely live in a police state, but live in it in the same conditions as he is now prepared to make the blacks live in [...].

Now it may be that there are people so fanatical as to be prepared for all these things in order to avoid miscegenation" (Hare 1963, 219–20).

[44] Kant had already defined fanaticism, or enthusiasm: "Now if we search we shall find for all actions that are worthy of praise a law [*Gesetz*] of duty which *commands*, and does not leave us to choose what may be agreeable to our inclinations. This is the only way of representing things that can give a moral training to the soul, because it alone is capable of solid and accurately defined principles.

If *fanaticism* in its most general sense is a deliberate overstepping of the limits of human reason, then *moral fanaticism* is such an overstepping of the bounds that practical pure reason sets to mankind, in that it forbids us to place the subjective determining principle of correct actions, that is, their moral *motive*, in anything but the law [*Gesetze*] itself, or to place the disposition which is thereby brought into the maxims in anything but respect for this law [*Gesetz*], and hence commands us to take as the supreme *vital principle* of all morality in men the thought of duty, which strikes down all *arrogance* as well as vain *self-love*" (Kant 1980, 327). This is Kant's passage in its German original: "Wenn wir nur wohl nachsuchen, so werden wir zu allen Handlungen, die anpreisungswürdig sind, schon ein Gesetz der Pflicht finden, welches gebietet und nicht auf unser Belieben ankommen läßt, was unserem Hange gefällig sein möchte. Das ist die einzige Darstellungsart, welche die Seele moralisch bildet, weil sie allein fester und genau bestimmter Grundsätze fähig ist.

Wenn *Schwärmerei* in der allergemeinsten Bedeutung eine nach Grundsätzen unternommene Überschreitung der Grenzen der menschlichen Vernunft ist, so ist *moralische Schwärmerei* diese Überschreitung der Grenzen, die die praktische reine Vernunft der Menschheit setzt, dadurch sie verbietet, den subjektiven Bestimmungsgrund pflichtmäßiger Handlungen, d. i. die moralische Triebfeder derselben, irgend worin anders, als im Gesetze selbst, und die Gesinnung, die dadurch in die Maximen gebracht wird, irgend anderwärts, als in der Achtung für dies Gesetz, zu setzen, mithin den alle *Arroganz* sowohl als eitele *Philautie* niederschlagenden Gedanken von Pflicht zum obersten *Lebensprinzip* aller Moralität im Menschen zu machen gebietet" (Kant 1956, A 152–3). The question of enthusiasm and fanaticism may receive further light by discoveries that I assume the neurosciences may make in the future on certain affinities between normativeness and obsessive-compulsive disorders, in the sense that these disorders may turn out to be degenerative forms of the neurological basis of normativeness (cf. Section 15.3.3, footnote 27).

[45] "Of course a great deal of taboo morality is entirely compatible with what one might call rational morality. For instance, that you shouldn't steal or that you shouldn't murder. Those are precepts which are entirely in accord with reason, but they are set forth as taboos; they have consequences that they ought not to have. For instance, in the case of murder it is considered that it forbids euthanasia, which I think a rational person would be in favour of" (Russell 1974, 62).

(and by philosophical terms such as "hypostasis" and "reification"), an activity that several scholars persist in not wanting to take into consideration when it comes to explaining morality or law.

If mentalistic terms are still in use today, this is not a good reason to leave out of consideration what these mentalistic terms can figuratively refer to. And if this thing exists, and a deeper knowledge of it is attained, the neurosciences will be able to, and will *have* to, designate it by new terms in order to avoid confusion. This kind of development—a terminological development, and sometimes a revolution in this regard—has consistently accompanied scientific advancements or revolutions in every domain of knowledge.

With regard to the investigation of the points identified at the beginning of Section 15.1, I believe it will be necessary to effect an integration of philosophical studies with scientific studies. As I said on that occasion, we get from sociopsychological theories three sets of hypotheses: (*i*) hypotheses about the ways beliefs and other components of culture propagate in society from one individual to another and are passed down from generation to generation (these propagations concern the human psyche, the internal point of view and the subjective experiences of humans, none of which are on the whole amenable to external observation), (*ii*) hypotheses about the way the social environment moulds individual personalities and so makes them uniform, and (*iii*) hypotheses about the ways individual personalities concur in nurturing and keeping alive the society that moulds them, and even in constituting that society, in a sense. I believe many objects of enquiry—among which (*i*), (*ii*), and (*iii*)—require philosophy to follow the path already indicated by Russell (a precursor) and Quine (a revisionist) and, in this day, by philosophers like Searle.

The sciences evolve. And cognitive science and the neurosciences, I believe, will say interesting things, in the coming decades, on those things that for the time being are being said by psychology and sociology in a more or less figurative way. In the remainder of this section I will try to illustrate the sense of these positions of mine that I am taking up.

I have been using, and will continue to use, in regard to analytical philosophy the words that Thomas Kuhn (1922–1996) used in regard to paradigms in science. In fact I do not believe that the history of philosophy has the privilege of eluding many of the characterisations (paradigm, maturity, normality, revolution) that Thomas Kuhn worked out in regard to the history of science.[46]

[46] In private conversation, Giorgio Volpe has drawn my attention to the fact that talk of paradigms is hardly appropriate when applied to a discipline like philosophy, the situation of which more closely resembles the condition of physical optics before Newton ("a number of competing schools and sub-schools, most of them espousing one variant or another of Epicurean, Aristotelian, or Platonic theory") than that of those disciplines which exhibit that "transition from one paradigm to another via revolution" which "is the usual developmental pattern of mature science" (Kuhn 1974, 12). I believe Volpe's objections to be grounded, strictly speaking. But in a broader sense, and retaining the mutatis mutandis clause, I also

Analytical philosophy has been a paradigm, and it still is, among certain scholars. And paradigms, according to Kuhn (1974, 23ff.), get articulated more through the work of epigones (some of them authoritative, and of outstanding scholarship) than through the work of precursors and revisionists.

Few people who are not actually practitioners of a mature science realize how much mop-up work [...] a paradigm leaves to be done [...]. Mopping-up operations are what engage most scientists throughout their careers. They constitute what I am here calling normal science. Closely examined, whether historically or in the contemporary laboratory, that enterprise seems an attempt to force nature into the preformed and relatively inflexible box that the paradigm supplies. No part of the aim of normal science is to call forth new sorts of phenomena; indeed those that will not fit the box are often not seen at all. Nor do scientists normally aim to invent new theories, and they are often intolerant of those invented by others. Instead, normal-scientific research is directed to the articulation of those phenomena and theories that the paradigm already supplies. (Kuhn 1974, 24)

Under normal conditions the research scientist is not an innovator but a solver of puzzles, and the puzzles upon which he concentrates are just those which he believes can be both stated and solved within the existing scientific tradition. (Kuhn 1977, 234)

Even in the case of the paradigm represented by analytical philosophy (logical empiricism and ordinary-language philosophy), it is the precursors (Russell, for example), and some of the revisionists (Quine and Searle, for example), that we must look to in order to find the starting point from which to overcome the typically paradigmatic preclusions that make it impossible to enter deeper into the internal, psychologically considered point of view of the acting subjects performing individual and social human behaviours.[47]

Bertrand Russell had the occasion to say that "science is what we know and philosophy is what we don't know" (Russell 1974, 11).[48] The conception underlying this statement implies that from philosophy (our speculations on what we do not know) to science (proven scientific theories) there must be a relaying of objects of enquiry that proceeds with the advancement of time and of scientific research. If this relaying of objects is to happen (this is the teaching I draw from Russell's words), there must not be put up between the two research fields—the philosophical and the scientific—barriers too tall and in-

believe that some Kuhnian concepts can be applied to certain philosophical orientations that have held sway for long periods in certain countries: Witness medieval Scholasticism, German idealism in the 19th century in Europe (and into the mid-20th century in Italy), and analytical philosophy within the historical and geographical boundaries indicated.

[47] Insofar as this point of view is internal, is it made up of unobservable subjective experiences.

[48] "Well, roughly, you'd say science is what we know and philosophy is what we don't know. That's a simple definition and for that reason questions are perpetually passing over from philosophy into science as knowledge advances" (Russell 1974, 11). "My own view would be that philosophy consists of speculations about matters where exact knowledge is not yet possible" (ibid.).

flexible (preclusive barriers): There will have to be contacts between these two research fields, which contacts, when the time is ripe, will facilitate collaboration first and the relaying thereafter.

Positions not in any strict sense equal to the one expressed in Russell's statement, but from which we can draw teachings similar to the one I have drawn from Russell, are to be found in Willard Van Orman Quine so early as 1951.

First off, Quine, in his pragmatically inspired empiricism, has an unbiased conception of the objects of human knowledge as cultural posits. This version of his is perhaps excessively radical: Certainly—in my opinion—it serves an important therapeutic function with respect to preclusions and dogmas having their origin in a paradigm.

Physical objects are conceptually imported into the situation as convenient intermediaries—not by definition in terms of experience, but simply as irreducible posits comparable, epistemologically, to the gods of Homer. For my part I do, qua lay physicist, believe in physical objects and not in Homer's gods; and I consider it a scientific error to believe otherwise. But in point of epistemological footing the physical objects and the gods differ only in degree and not in kind. Both sorts of entities enter our conception only as *cultural posits*. The myth of physical objects is epistemologically superior to most in that it has proved more efficacious than other myths as a device for working a manageable structure into the flux of experience. (Quine 1980, 44; italics added)

Moreover, the abstract entities which are the substance of mathematics—ultimately classes and classes of classes and so on up—are *another posit* in the same spirit. *Epistemologically these are myths on the same footing with physical objects and gods, neither better nor worse except for differences in the degree to which they expedite our dealings with sense experiences.* (Ibid., 45; italics added)

Secondly, and consequently, Quine, like Russell, does not put up fences or wedge in unbridgeable heterogeneities between philosophy and science; least of all does he attribute to philosophy a position of preeminence over science, much less a foundational position with respect to it.

There have been philosophers who thought of philosophy as somehow separate from science, and as providing a firm basis on which to build science, but this I consider an empty dream. Much of science is firmer than philosophy is, or can ever perhaps aspire to be. I think of philosophy as continuous with science, even as a part of science. [...] I'm on the materialists' side. I hold that physical objects are real, and exist externally and independently of us. I don't hold that there are only these physical objects. There are also abstract objects: objects of mathematics that seem to be needed to fill out the system of the world. But I don't recognize the existence of minds, of mental entities, in any sense *other than as attributes or activities on the part of physical objects, mainly persons*. (Magee 1982, 143, 144; italics added)

We are aware of these things [mental states and events], and I'm not denying their existence; but I'm construing them, or reconstruing them, as activities on the part of physical objects, namely on our part. The fact that they are not observable, on the whole, from the outside does not distinguish them from much that the physicist assumes in the way of internal microscopic or sub-microscopic structure of inanimate objects. A great deal goes on that we do not observe

from the outside. We have to account for it conjecturally. [...] *A man senses and feels and thinks, and he believes this and that, but the man who is doing all this is a body, a living body, and not something else called a mind or soul.* Thus we keep our easy old mentalistic way of talking, while yet subscribing to materialism. [...] Behaviourism, mine anyway, does not say that the mental states and events *consist* of observable behaviour, nor that they are *explained* by behaviour. They are *manifested* by behaviour. *Neurology is the place for the explanations, ultimately.* (Magee 1982, 146, 147; italics added on first and last occurrence, in original on all other occurrences)

Behaviourism—such as is thought by some to be expressed by G. Ryle (Ryle 1975), among others—was one of the ways in which, in Searle's words, an eliminative reductionism was come at from within the paradigm of analytical philosophy, a reductionism that precluded investigations into the internal point of view and precluded as well internalistic approaches of any kind.[49]

Certainly, outward human activities and behaviours are amenable to observation and empirical experimentation, and are doubtless easier to treat scientifically if considered independently of what happens or what can be imagined to happen inside the human being: in the human brain. But none of this is reason enough to preclude oneself or to discourage others from taking into consideration the psychological aspects of the internal point of view in the effort to better understand individual and social human behaviour. This taking into consideration can proceed to the level that science and philosophy will allow: in the form of conjecture, in the form of speculation, or in the form of a cultural posit.

Over the last three decades, the baton relayed through the approach of Bertrand Russell and Willard Van Orman Quine has been picked up, among others, by John Searle, whom I credit for holding that the sciences relevant to the study of the mind are the neurosciences (rather than cognitive science: Lewis, Dennett).

Searle advances in regard to the relation between philosophy and science a vision quite similar to that of Russell and Quine, as presented with the passages previously quoted, and as I understand it in its therapeutic function.

[49] "The first of the great twentieth-century efforts to offer a materialist reduction of the mind was behaviorism—the view, presented by Gilbert Ryle and Carl Gustav Hempel [1905–1997], that mental states are just patterns of behavior and dispositions to behavior, when 'behavior' just means bodily movements which have no accompanying mental component. Speech behavior, for example, according to the behaviorists' conception, is just a matter of noises coming out of one's mouth. Behaviorism sounds obviously false because, for example, everyone knows that a feeling of pain is one thing and the behavior associated with pain is another. As C. K. Ogden [1889–1957] and I. A. Richards [1893–1979] once remarked, to believe in behaviorism you have to be 'affecting general anæsthesia.'" (Searle 1997, 137). It is controversial to interpret Ryle as a behaviourist, independently of Searle's opinion in this regard. Searle is on the whole persuasive in the critical arguments (Searle 1997, 135–76) he offers against behaviourism and functionalism understood as alternatives to psychology (Searle makes reference to Hilary Putnam and David Lewis). And the same goes for the computational hypothesis that Searle attributes to Daniel C. Dennett (cf. Searle 1997, 95–131; Searle 1980 and 1984).

> Because philosophy deals with framework questions and with questions that we do not know how to answer systematically, it tends to stand in a peculiar relationship to the natural sciences. As soon as we can revise and formulate a philosophical question to the point that we can find a systematic way to answer it, it ceases to be philosophical and becomes scientific. Something very much like this happened to the problem of life. It was once considered a philosophical problem how "inert" matter could become "alive." As we came to understand the molecular biological mechanisms of life, this ceased to be a philosophical question and became a matter of established scientific fact. It is hard for us today to recover the intensity with which this issue was once debated. The point is not so much that the mechanists won and the vitalists lost, but that we came to have a much richer concept of the biological mechanisms of life and heredity. (Searle 1999, 2069)

Allow me, while on the subject of Searle and the neurosciences, a digression that I will then bring concisely to fruition in regard to normativeness.

Searle writes these words on the topical question, a question of great import, whether the problem of consciousness is or should be an object of philosophy or an object of science:

> I hope a similar thing [the handing over of questions from philosophy to science, as exemplified in the foregoing quotation] will happen to the problem of consciousness and its relation to brain processes. As I write this it is still regarded by many as a philosophical question, but I believe with recent progress in neurobiology and with a philosophical critique of the traditional categories of the mental and the physical, we are getting closer to being able to find a systematic scientific way to answer this question. In which case it will, like the problem of life, cease to be "philosophical" and will become "scientific." (Searle 1999, 2069–70)

It seems to me that the problem of consciousness—phenomenal as well as psychological consciousness (cf. Chalmers 1996, Chapter 1)—concerns the psychological aspects of the internal point of view. These psychological internal aspects (psychological and internal in a broader sense than consciousness alone) include as well norms as beliefs and as motives of individual and social human behaviour.

Significantly, Searle takes a monist, anti-idealist stance; and in a manner that is especially interesting to us here, he is reductionist at the same time as he is non-reductionist: He is an upholder of causal reductionism, but at the same time, as I said a moment ago, he rejects eliminative reductionism (and so rejects behaviourism and computationalism, to make two examples). In this way, Searle—however much proceeding from within a monistic, and in a sense a materialistic approach, which I agree with—recognises in full the internal aspect (i.e., the ontology of the I: he so calls what I am here referring to as the psychological aspects of the internal point of view) as playing, not just a role, but a *crucial and determinative* role in enabling an understanding of individual and social human behaviour.[50] Searle's position is particularly interesting because it is monistic, and at the same time it retains and exalts the inter-

[50] An ontology of this kind is foreshadowed in Hägerström (albeit in a prose that is recondite). Cf. Hägerström 1964, 34ff.

nal aspect, the internalistic approach, and it serves the needs already served by psychologism (the approach that analytical philosophy ill-advisedly marginalised).

"Reduction" is actually a very confused notion and has many different meanings. In one sense you *can* reduce conscious states to brain processes. All our conscious states are causally explained by brain processes, so it is possible to make a *causal* reduction of consciousness to brain processes. But the sort of reduction that materialists want, an *eliminative* reduction, one which shows that the phenomenon in question does not really exist, that it is just an illusion, cannot be performed on consciousness [...]. Eliminative reductions require a distinction between reality and appearance. For example, the sun appears to set but the reality is that the earth rotates. But you cannot make this move for consciousness, because where consciousness is concerned the reality is the appearance. If it consciously seems to me that I am conscious, then I am conscious. And this is just another way of saying that the ontology of consciousness is subjective or first-personal. (Searle 1997, 212–3)

The idea that "where consciousness is concerned the reality is the appearance" has a parallel in the domain of norms as these are treated throughout this volume. Just as it makes sense to say that "if it consciously seems to me that I am conscious, then I am conscious," so it makes sense to say that if I believe a norm to exist, then that norm exists—whether I am conscious of my belief or unconscious of it. Just like the ontology of consciousness, the ontology of norms "is subjective or first-personal." I believe a norm to exist; hence, there exists a norm in my brain. A norm **n** exists insofar as there exists at least one believer *b* who believes in **n**.

Consciousness is a natural, biological phenomenon. It is as much a part of our biological life as digestion, growth, or photosynthesis.

We are blinded to the natural, biological character of consciousness and other mental phenomena by our philosophical tradition, which makes "mental" and "physical" into two mutually exclusive categories. The way out is to reject both dualism and materialism, and accept that consciousness is both a qualitative, subjective "mental" phenomenon, and at the same time a natural part of the "physical" world. Conscious states are qualitative in the sense that for any conscious state, such as feeling a pain or worrying about the economic situation, there is something that it qualitatively feels like to be in that state, and they are subjective in the sense that they only exist when experienced by some human or other sort of "subject." (Searle 1997, xiii–xiv; italics added)[51]

Searle finds it necessary to deny not only the plausibility of dualism, idealistic monism, and eliminative reductionism, but also that of materialism, precisely insofar as this last is an expression of eliminative reductionism. The distinction between "biological naturalism" and "materialism" could seem merely terminological, but it carries a deeper sense in the light of the reasons adduced by Searle, and presented in the foregoing quotation.

[51] "Consciousness is a natural biological phenomenon that does not fit comfortably into either of the traditional categories of mental and physical. It is caused by lower-level microprocesses in the brain and it is a feature of the brain at the higher macro levels. To accept this 'biological naturalism,' as I like to call it, we first have to abandon the traditional categories" (Searle 1997, xiv).

In attributing serious drawbacks to our philosophical tradition for its long practice, through the centuries, of setting "mental" against "physical," Searle is expressing in an articulated and argued manner the same concept that, in a figurative manner, I was seeking to express in Section 15.2.4 with all the humour of which Bertrand Russell's grandmother was capable: "What is mind? No matter. What is matter? Never mind!"

This is the path I have in mind with regard to monism, meaning that brand of materialism which implies a causal reductionism but not any eliminative reductionism, and so a reductionism that does not eliminate the psychological aspects of the internal point of view, but rather exalts them. It is a path in philosophy and in the neurosciences: In philosophy it spans from Russell to Hägerström, Quine, and Searle;[52] in the neurosciences, and as far as my understanding of this discipline goes, it proceeds along the perspectives from which Searle himself draws inspiration. Searle draws critical inspiration from the neurobiological perspectives of Francis Crick (1916–2004) (Crick 1995), Gerald Edelman, and Israel Rosenfeld (cf. Searle 1997, 21, 179).[53]

The neurosciences have now progressed to the point where we can address the problem of norms as motives of individual and social human behaviour "as a straight neurobiological problem" (to use the expression that Searle uses with regard to the mind-body problem in general).[54]

The traditional philosophical categories are obsolete and stand as roadblocks barring the way to a more adequate understanding of the internal psychological aspect of individual and social human phenomena.[55]

Searle keenly points out the "logical fallacy" undermining the censure against the internalistic approach:

Science is not used to dealing with phenomena that have a first-person ontology. By tradition, science deals with phenomena that are "objective," and avoids anything that is "subjective." In-

[52] It does so at least on my reading of Hägerström. He first developed a materialistic ontology of his own that is reductionist but not in the sense of an eliminative reductionism, and *then* he built on it his "psychological," internalistic theory of norms. The fact that Hägerström figures in this ideal line is not meant to suggest that I see him as playing as important a role in 20th-century philosophy as that which is commonly ascribed to the other scholars among whom I have grouped him. The inclusion is to be taken at face value: I am just placing him in that line of philosophical thought (cf. Pattaro 1974, 58–76).

[53] But on my understanding of the question, especially in what concerns language and knowledge, see also Deacon 1997.

[54] "In its simplest form, the question is how exactly do neurobiological processes in the brain cause conscious states and processes, and how exactly are those conscious states and processes realized in the brain?" (Searle 1999, 2073).

[55] Thus, the traditional philosophical categories stand as roadblocks barring the way to a "satisfactory explanation of the relation of neuron firings to consciousness. [...] Consciousness is, by definition, subjective, in the sense that for a conscious state to exist it has to be experienced by some conscious subject. Consciousness in this sense has a first-person ontology in that it only exists from the point of view of a human or animal subject, an 'I,' who has the conscious experience" (Searle 1999, 2074).

deed, many philosophers and scientists feel that because science is, by definition, objective, there can be no such thing as a science of consciousness, because consciousness is subjective. This whole argument rests on a massive confusion, which is one of the most persistent confusions in our intellectual civilization. There are two quite distinct senses of the distinction between objective and subjective. In one sense, which I will call the epistemological sense, there is a distinction between objective knowledge, and subjective matters of opinion. If I say, for example, "Rembrandt was born in 1606," that statement is epistemically objective in the sense that it can be established as true or false independently of the attitudes, feelings, opinions or prejudices of the agents investigating the question. If I say "Rembrandt was a better painter than Rubens," that claim is not a matter of objective knowledge, but is a matter of subjective opinion. (Searle 1999, 2074)

But in addition to the distinction between epistemically objective and subjective claims, there is a distinction between entities in the world that have an objective existence, such as mountains and molecules, and entities that have a subjective existence, such as pains and tickles. I call this distinction in modes of existence, the ontological sense of the objective-subjective distinction. (Ibid.)

Among the entities having an ontologically subjective existence in the sense just now specified in Searle's words are norms as these have been characterised in this volume.

The palingenesy of the psychological aspects of the internal point of view is now in the making. Of course there is not any speaking of a "psychological approach," or of an "internalistic approach," nor even of an "internal point of view."[56] The vocabulary is now rather that of "intentionality." Intentionality is the basic subject of cognitive science,[57] a science which "includes at least beliefs, desires, memories, perceptions, intentions (in the ordinary sense), intentional actions and emotions" (Searle 1999, 2075), and which includes, among beliefs, norms as characterised and treated in this volume. With regard to norms, so characterised as beliefs and as motives of individual and social human behaviour—characterised as entities belonging to the ontology of the I—I should emphasize a point which seems paradoxical but which in reality is grounded on a solid foundation:

[56] I sometimes have prudently borrowed this last formulation of Hart's (rather than the crude "brain") in order not to awaken the censure of analytical philosophy, still active, combative, and well equipped. See, for example, by P. M. S. Hacker, a leading authority on Wittgenstein's philosophy, and M. R. Bennett, former president of the International Society for Autonomic Neuroscience, the weighty defence of philosophy against the neurosciences that they make in *Philosophical Foundations of Neuroscience*, a book of about 500 pages (Bennett and Hacker 2003).

[57] "The rise of the new discipline of cognitive science has opened to philosophy whole areas of research into human cognition in all its forms. Cognitive science was invented by an interdisciplinary group, consisting of philosophers who objected to the persistence of behaviourism in psychology, together with like-minded cognitive psychologists, linguists, anthropologists and computer scientists. I believe the most active and fruitful general area of research today in philosophy is in the general cognitive science domain.

The basic subject matter of cognitive science is intentionality in all of its forms" (Searle 1999, 2075).

> *Where the ontology of consciousness is concerned, external behavior is irrelevant*. At best, behavior is epistemically relevant—we can typically tell when other people are conscious by their behavior, for example—but the epistemic relevance depends on certain background assumptions. It rests on the assumptions that other people are *causally similar* to me, and that similar causes are likely to produce similar effects. If for example you hit your thumb with a hammer, then, other things being equal, you are likely to feel the sort of thing I feel and behave the sort of way I behave when I hit my thumb with a hammer. That is why I am so confident in attributing pains to you on the basis of the observation of a correlation between stimulus input and behavioral output. I am assuming that the underlying causal mechanisms are the same. (Searle 1997, 204–5)

Borrowing Searle's words, I shall say, "That is why I am so confident in attributing norms to you on the basis of the observation of a correlation between stimulus input and behavioural output: I am assuming that the underlying causal mechanisms are the same." In the case of norms, the stimulus input may be a *perceived* token of a certain type of circumstance. Let us consider in regard to the question of one norm, **n**, existing in my brain and yours, the case considered by Hart 1961 (a case taken up by Dworkin 1996, and by Hart again in the *Postscript*), namely, the norm "Adult males must bare their heads upon entering into a church." Here, with this norm, the stimulus input is a *perceived* token of the type of circumstance "being an adult human male and entering into a church"; the behavioural output will be a token of the type of action "baring one's head," which you and I—both of us believers in the same norm (the norm relative to baring one's head upon entering into a church), and both of us entering into a church—will both instantiate because the underlying internal causal mechanisms are the same for you and me (cf. Sections 6.3 and 8.2.4).[58]

As was just said, then, the basic subject matter of cognitive science is intentionality, where intentionality includes all the kinds of internal aspects of human beings (the deprecated psychical states and events, such as beliefs, desires, memories, and perceptions). Now then, cognitive science, according to Searle, was itself paradoxically originally founded on a mistake: "The mistake was to suppose that the brain is a digital computer and the mind is a computer program" (Searle 1999, 2075). This mistake was an aspect of the rational solution of which we have already spoken, and done so to criticise it (in Section 15.3.3) together with Conte and Castelfranchi.

Searle himself contributed to demonstrating—from Searle 1980 onward—the inadequacy of the rational solution in this computational formulation of it. In our day, instead, according to Searle,

[58] Clearly, further information is needed in order to decide whether the motive you and I have for baring our heads upon entering into a church consists in the same norm **n**, a norm we have both internalised, or whether *my* motive for so behaving consists in norm **n** and *your* motive in your desire to avoid disapprobation (your interest in avoiding it: conformism, Sections 5.4 and 6.7). Such information might be garnered from an interview by a psychologist, for example. But then, problems such as these—seeking further information and ascertainment—may arise as well in the case of hitting your thumb with a hammer (the case Searle considers in the foregoing quotation).

what is actually happening in cognitive science is a paradigm shift away from the computational model of the mind and toward a much more neurobiologically based conception of the mind. [...] As we come to understand more about the operations of the brain it seems to me that we will succeed in gradually replacing computational cognitive science with cognitive neuroscience. Indeed I believe this transformation is already taking place. (Searle 1999, 2076)

Recent developments in the neurosciences (see Deacon 1997 and Edelman and Tononi 2000, among others) have opened new horizons that seem to bring back into the limelight ancient and venerable monistic (and, in a non-eliminative way, materialistic) intuitions. Nowadays, the neurosciences, after the decline of the psychoanalytic vogue and surge, a decline which they themselves helped to accelerate, are trying to bring back into operation a concern with the internal functioning of human beings—of their brains—in the effort to arrive at a better understanding of outward human activities and behaviours as well.

Edelman has not hesitated to bring back into play Arthur Schopenhauer (1788–1860) and his considerations on the self and on the identity between the subject of will and the knowing subject, this to draw the attention of scholars to the fact that it is methodologically unproductive, and may even be an error, to banish the "world knot" from a close enquiry that will imply a close cooperation between the neurosciences and philosophy:

The flattened dome of the sky and the hundred other visible things underneath, including the brains itself—in short, the entire world—exist, for each of us, only as part of our consciousness, and they perish with it. This enigma wrapped within a mystery of how subjective experience relates to certain objectively describable events is what Arthur Schopenhauer brilliantly called the "world knot." (Edelman and Tononi 2000, 2)[59]

15.5. A Few Closing Remarks That Go Back to What Is Right and Law: What Is Right by Nature and What Is Right by Law as Cultural Products

It was outlined briefly in Sections 4.3 and 4.4 how, for centuries, legal philosophers have been drawing the distinction, sometimes cast as an outright opposition, between natural law and positive law, or, as I prefer to say, between what is right by nature and what is right by law.

In our day, we too are in the habit of distinguishing what is made by nature from what is made by man: We speak of natural versus artificial diets, the products of nature versus the products of art, natural versus artificial or human-altered environmental equilibriums, natural versus artificial intelligence,

[59] This is the passage by Schopenhauer that Edelman and Tononi refer to: "But the identity of the subject of will and the knowing subject, in virtue of which identity (and necessarily so) the word 'I' includes and designates both, is the world knot, and as such is unexplainable" (Schopenhauer 1986, §42; my translation). The German original: "Die Identität nun aber des Subjekts des Wollens mit dem erkennenden Subjekt, vermöge welcher (und zwar notwendig) das Wort 'Ich' beide einschließt und bezeichnet, ist der Weltknoten und daher unerklärlich."

and so on. The distinction between what is natural and what is artificial is at once ancient and topical, and on the whole does not seem to present any *prima facie* difficulties: It is intuitive.[60]

Let us see if we can apply this distinction to law by affecting an air of ingenuity and naturalness ourselves; that is, by steering clear of the artifices which the philosophical debate has layered on the terms "natural law" and "positive law." In what sense can we say of law, or of a certain kind of law, that it is natural?

With humans, the distinction between nature and convention, or things artifactual, can be recast as a distinction between nature and culture. There are natural aspects and processes in human life and events: witness childbirth, the genetic makeup we inherit, and the biological and physiological traits of human existence. Other aspects of human life and events are largely cultural; they depend on human production. Examples are economics, technology, art, morality, and law—society at large (compare, in Section 15.2.4, the distinction between brute and institutional, or social, reality).

We can safely assume that law belongs to the cultural dimension of humans: That law is a human product and not a physical (material) or biological issue of nature. All law is the work of humans; it is positive, if we take "positive" to mean "produced or made by humans." But if law is entirely a human product, how can anyone argue that a "natural law" (*phusei*) exists in addition to positive law (*nomōi*)?

There may be one way in which this is possible. The qualification "natural" may befit spontaneous law, meaning the set of rules of coexistence that people in a society follow spontaneously, or rather by tradition. Something to this effect has been maintained by positivist conceptions (in the sense of philosophical positivism, not to be mistaken with legal positivism). Roberto Ardigò (1828–1920), an exponent of philosophical positivism in Italy, considered natural law to be "the more advanced social idealities that dawn from our social conscience," in distinction to positive law as set forth in statutes (Ardigò 1886, 159–60; my translation).

But even here, these social idealities, if they can be regarded as immediate, fresh, and spontaneous, and less institutionalised than state-enacted laws, are nonetheless a product of human culture: granted, a product less elaborate and sophisticated than others, but still a product of culture and society, not of nature.

Friedrich Carl von Savigny, the father of German legal historicism, underscored the distinction between customary law, doctrinal law (or scientific law, as he liked to say), and statutory law.[61]

Customary law is produced directly by the people, or by popular consciousness (by the so-called *Volksgeist*, or people's spirit, as Savigny would

[60] On my use of *prima facie*, see Section 4.2.1, footnote 7.

[61] On Savigny's theory of law, see, in Volume 4 of this Treatise, Peczenik, Chapter 5.

later say, taking up the term from a disciple of his, Georg Friedrich Puchta, 1797–1846): Customary law is a primitive, genuine, "natural" law which is the direct expression of social reality.

Doctrinal law is the work of jurists, whom Savigny represented as a sort of intellectual elite among the people: They are as close to the needs of society as the people are, and in addition to this, they have the knowledge and the technical and intellectual skills with which to produce a refined, sophisticated law. Doctrinal law is as genuine as customary law and more developed technically and scientifically: It is in fact the best kind of law, according to Savigny, because it is both rooted in the people's history and conceptually reworked to meet the needs of an advanced society.

Lastly, statutory law is produced by lawmaking bodies (like assemblies and parliaments) that are specialised and so in a sense severed from society's ongoing change. Statutory law, on Savigny's view, befits mature societies, and in fact is typical of societies whose legal framework is past its prime.

If we accept for a moment Savigny's model, nothing would prevent us from regarding statutory law (the law produced by a parliament or other lawmaking body) as artificial—made in the operations room, so to speak—and customary law (the law produced by the people "spontaneously") as natural. But here, too, customary law, and *a fortiori* the jurists' doctrinal law, is not natural law if that is taken to mean law "issuing from nature." Rather, customary law is produced by culture, by humans: It is conventional (in the broad sense of this term) as well as historical (and of course Savigny is well aware of this) (Savigny 1973, 102ff.).

Law is a part of culture and for this reason partakes of the reality and life that other cultural phenomena have, and that cultures have in general; so, too, it is housed in the same place, namely, in brains, or else—and in fact today for the most part—it is memorised on nonhuman supports that humans can have access to: on wood, stone (of which Rome's Twelve Tables are one example), paper, digital media, etc. (Section 15.2).[62]

As with dead cultures, dead law is not living law even if recorded on some kind of support. True enough, if dead law is so recorded it can become an object of study on the part of historians, but it becomes living law only when people in society, and especially the judges, believe it to be law and practise it as such: *opinio juris seu necessitatis*, with all the ambiguity this expression entails. Indeed, I restrict it to norms as I characterise norms (as the belief that a rule is binding per se under given circumstances; see Section 6.1). But then, as has been observed, when we get to the law in force (Chapter 10), the being-in-force of law does not coincide with the being-in-force of norms (as I characterise the being-in-force of norms: Section 6.5); rather, the being-in-force of law is an ambiguous interweaving of norma-

[62] The Twelve Tables were originally made of wood, and only later was stone used.

tiveness and organised power. So, how should we translate *opinio juris seu necessitatis* when we relate this expression to the law in force? *Opinio juris* we may translate as "our belief about what is objectively right." And how should we translate *opinio necessitatis*? As "our belief about what organised power makes necessary for us"? And how should we translate the monosyllabic *seu*?

There are formal criteria, for example in the Italian Constitution and in the Preliminary Provisions to the Italian Civil Code, designed to establish what is to count as "living" law in Italy. But if these criteria, though recorded on some kind of support (human or nonhuman), are not themselves invested with the ambiguous *opinio juris seu necessitatis* just mentioned, they will fail to be criteria that people believe in and act from, and consequently, so will the law they introduce. (They will fail in this respect at least partly or temporarily, in proportion as the belief in them as law fails to obtain.)

When law exists (presently there is a surplusage of it), it is a part of human culture. Human culture in turn is a part of reality, and reality is one. But human culture ceases to be reality when the human consciousness ceases whose content is that culture (Section 15.2).

We can look now at Savigny's fine pages previously referred to, seeing how they shadow forth a conception of law as culture. We can see in these pages how such a conception could be maintained, felicitously and with good reason, by one of the fathers of the modern tradition of civil law, indeed by the one who, perhaps better than the others, traced out the line that spans from the glorious roots of Roman law, and its elaboration by the Bolognan glossators, to the *culta jurisprudentia*. By way of a conclusion to this chapter and volume, I will let Savigny speak, then:

In the earliest times to which authentic history extends, the law [*das bürgerliche Recht*] will be found to have already attained a fixed character, peculiar to the people [*dem Volk*], like their language, manners [*Sitte*] and constitution. Nay, these phenomena have no separate existence, they are but the particular faculties and tendencies of an individual people [*einzelne Kräfte und Thätigkeiten des einen Volkes*], inseparably united in nature, and only wearing the semblance of distinct attributes [*Eigenschaften*] to our view. That which binds them into one whole is the *common conviction* [*Ueberzeugung*] of the people [*des Volkes*], the kindred consciousness [sentiment: *Gefühl*] of an inward necessity, excluding all notions [*allen Gedanken*] of an accidental and arbitrary origin.

How these peculiar attributes [*Functionen*] of nations [*diese eigenthümlichen Functionen der Völker*], by which they are first individualized, originated—this is a question which cannot be answered historically. Of late, the prevalent opinion has been that all lived at first a sort of animal life, advancing gradually to a more passable state, until at length the height on which they now stand, was attained. We may leave this theory alone, and confine ourselves to the mere matter of fact of that first authentic condition of the law [*des bürgerlichen Rechts*]. We shall endeavour to exhibit certain general traits of this period, in which the law [*das Recht*], as well as the language, *exists in the consciousness* of the people [*im Bewußtseyn des Volkes lebt*].

This youth of nations [*der Völker*] is poor in ideas, but enjoys a clear perception [*ein klares Bewußtseyn*] of its relations and circumstances, and feels and brings the whole of them into

play; whilst we, in our artificial complicated existence, are overwhelmed by our own riches, instead of enjoying and controlling them. This plain natural state is particularly observable in the law [*im bürgerlichen Rechte*]; and as, in the case of an individual, his family relations and patrimonial property may possess an additional value in his eyes from the effect of association,—so on the same principle, it is possible for the rules of the law [*die Regeln des Privatrechts*] itself to be amongst the objects of popular faith [folklore: *zu den Gegenständen des Volksglaubens gehören*].

But these moral faculties [*jene geistigen Functionen*] require some bodily existence to fix them. Such, for language, is its constant uninterrupted use; such, for the constitution, are palpable and public powers [*die sichtbaren öffentlichen Gewalten*],—but what supplies its place with regard to the law [*bey dem bürgerlichen Rechte*]? In our times it is supplied by rules, communicated by writing and word of mouth. This mode of fixation, however, presupposes a high degree of abstraction, and is, therefore, not practicable in the early time alluded to. On the contrary, we then find symbolical acts universally employed where rights and duties were to be created or extinguished [*Rechtsverhältnisse entstehen oder untergehen sollen*]: It is their palpableness [*sinnliche Anschaulichkeit*] which externally retains law [*Recht*] in a fixed form; and their solemnity and weight correspond with the importance of the legal relations themselves [*der Rechtsverhältnisse selbst*], which have been already mentioned as peculiar to this period. In the general use of such formal acts, the Germanic races [*Stämme*] agree with the ancient Italic, except that, amongst these last, the forms themselves appear more fixed and regular, which perhaps arose from their city constitutions. These formal acts may be considered as the true grammar of law [*eigentliche Grammatik des Rechts*] in this period; and it is important to observe that the principal business of the early Roman jurists consisted in the preservation and accurate application of them.

We, in latter times, have often made light of them as the creation of barbarism and superstition, and have prided ourselves on not having them, without considering that we, too, are at every step beset with legal forms, to which, in fact, only the principal advantages of the old forms are wanting,—namely, their palpableness [*die Anschaulichkeit*], and the popular prejudice [general folklore: *der allgemeine Volksglaube*] in their favour, whilst ours are felt by all as something arbitrary, and therefore burthensome. In such partial views of early times we resemble the travellers, who remark, with great astonishment, that in France the little children, nay, even the common people, speak French with perfect fluency.

But this organic connection of law [*des Rechts*] with the being and character of the people [*des Volkes*], is also manifested in the progress of the times; and here, again, it may be compared with language. For law [*Recht*], as for language, there is no moment of absolute cessation; it is subject to the same movement and development as every other popular tendency [*wie jede andere Richtung des Volkes*]; and this very development remains under the same law [*Gesetz*] of inward necessity, as in its earliest stages. Law [*Das Recht*] grows with the growth, and strengthens with the strength of the people, and finally dies away as the nation [*Volk*] loses its nationality [*Eigenthümlichkeit*]. But this inward progressive tendency, even in highly cultivated times, throws a great difficulty in the way of discussion. It has been maintained above, that the *common consciousness of the people* [*das gemeinsame Bewußtseyn des Volkes*] is the peculiar seat of law [*des Rechts*]. This, for example, in the Roman law [*im Römischen Rechte*], is easily conceivable of its essential parts, such as the general definition of marriage, of property, etc. etc., but with regard to the endless detail, of which we have only a remnant in the Pandects, every one must regard it as impossible.

This difficulty leads us to a new view of the development of law [*des Rechts*]. With the progress of civilization, national tendencies [*alle Thätigkeiten des Volkes*] become more and more distinct, and what otherwise would have remained common, becomes appropriated to particular classes; the jurists now become more and more a distinct class of the kind; law [*das Recht*] perfects its language, takes a scientific direction, and, as formerly it existed [*lebte*] in the consciousness of the community [*im Bewußtseyn des gesammten Volkes lebte*], it now devolves upon the jurists [*so fällt es jetzt dem Bewußtseyn der Juristen anheim*], who thus [*nunmehr*], in

this department, represent the community [*das Volk*]. *Law* [*das Daseyn des Rechts*] *is henceforth more artificial and complex, since it has a twofold life; first, as part of the aggregate existence* [*Leben*] *of the community* [*ganzen Volkslebens*], *which it does not cease to be; and, secondly, as a distinct branch of knowledge* [as a distinct science: *als besondere Wissenschaft*] *in the hands of the jurists*. All the latter phenomena are explicable by the co-operation of those two principles of existence; and it may now be understood, how even the whole of that immense detail might arise from organic causes, without any exertion of arbitrary will or intention. For the sake of brevity, we call, technically speaking, the connection of law [*des Rechts*] with the general existence [*Lebe*] of the people [*mit dem allgemeinen Volksleben*]—the political element; and the distinct scientific existence of law [*des Rechts*]—the technical element.

At different times, therefore, amongst the same people, law will be natural law (in a different sense from our law of nature), or learned law, as the one or the other principle prevails, between which a precise line of demarcation is obviously impossible [*In verschiedenen Zeiten also wird bey demselben Volke das Recht natürliches Recht (in einem andern Sinn als unser Naturrecht) oder gelehrtes Recht seyn, je nachdem das eine oder das andere Princip überwiegt, wobey eine scharfe Gränzbestimmung von selbst als unmöglich erscheint*]. (Savigny 1975, 24–9; italics added; cf. Savigny 1973, 102–5)[63]

[63] Because this quotation is so long, I did not provide the reader with the entire original passage in German. However, I did insert (within square brackets) a number of terms and short excerpts from Savigny's original, this to enable the reader to have, at least in tidbits, an idea (and a taste) of Savigny's wording.

Appendix

ELEMENTS FOR A FORMALISATION OF THE THEORY OF NORMS DEVELOPED IN THIS VOLUME

by Alberto Artosi, Antonino Rotolo, Giovanni Sartor, and Silvia Vida[*]

1. Preliminaries

The aim of this appendix is to sketch a formalisation of some aspects of the theory of norms developed in this volume. In this regard, the appendix does not provide any new logical contribution: The purpose is simply to use some logical tools, standard in the literature, to reconstruct some concepts and definitions proposed, in particular, in Chapters 6 through 10.

Let us first define our formal language. Here it suffices that it consist of the language of classical first-order logic with variables x, y, z … and constants a, b, d … to denote agents belonging to a finite set G of agents, the identity symbol, and the following intensional operators and supplementary connectives:

- the obligation operator 'O'; this operator, as we shall see, will be indexed by agent variables and constants to express directed obligations (cf. Herrestad and Krogh 1995; 1996);
- the action operator 'Does_x', such that an expression like '$\text{Does}_x A$' means that the agent x brings about that A (cf. Santos and Carmo 1996);
- the operators 'Utters_x' and 'Proc_x' to express agents' generic actions of utterance and the speech act of institutional proclamation respectively (see Gelati, Governatori, Rotolo, and Sartor 2002a and 2002b; Sartor, Volume 5 of this Treatise, Chapter 23);
- the modal operators 'Know_x' and 'Bel_x' for the agent's knowledge and beliefs respectively (cf. Meyer and van der Hoek 1995);
- the binary connective '⇒' to represent normative conditionality (cf. Prakken 1997; Nute 1997);
- the binary connective '≡>' to capture the notion of typicality or normality (cf. Delgrande 1987);
- the unary temporal operators 'A' and 'E', which read "for all possible courses of future events" and "for at least one possible course of future events," respectively, and the binary temporal operator "until" 'U', such that

[*] Thanks are due to Guido Governatori for his comments on an earlier version of this appendix.

the expression 'A U B' means that A will be true until B is true (cf. Emerson and Halpern 1986; Schild 2000).

It is worth noting that we will not commit ourselves to adopting any specific logical characterisations of such notions: A number, and sometimes a plethora, of different axiomatisations are in fact available. The reader is thus recommended to consult at least the literature cited above for further details. It will suffice here to focus on some well-known properties that seem indisputable and, above all, required for developing the formalisation of the theory of norms proposed in this volume.

As is well known, a very minimal characterisation of the obligation operator is that it does *not* enjoy axiom **T**

$$\mathrm{O}\,A \rightarrow A \tag{1}$$

Of course, if A is obligatory, this should not imply that A is true.

On the contrary, the logic for the action operator 'Does' has to be characterised at least by the schema

$$\mathrm{Does}_x\,A \rightarrow A \tag{2}$$

since such an operator is meant to represent successful actions. In addition, the logic for 'Does' as well as that for 'O' is normally closed under logical equivalence:

$$\models A \equiv B \text{ entails } \models \mathbf{X}\,A \equiv \mathbf{X}\,B \tag{3}$$

where **X** stands for either O or Does_x. As understood in this volume, obligations, permissions, and prohibitions are interdefinable:

$$\mathrm{P}\,A =_{\mathrm{def}} \neg\,\mathrm{O}\,\neg\,A \tag{4}$$

$$\mathrm{F}\,A =_{\mathrm{def}} \mathrm{O}\,\neg\,A \tag{5}$$

Like 'Does', the operators 'Utters' and 'Proc' are action operators. An action of utterance is not in general successful. On the other hand, the notion of proclaiming is used to cover all those acts by which a subject makes a statement expressing a certain proposition, and this statement has the function of making this proposition true. However, even 'Proc' is not necessarily successful: $\mathrm{Proc}_x\,A$ is only an attempt to achieve A. Whether it will be successful or not, within a certain institution, linguistic context, or system, depends on whether the institution, the linguistic context, or the system contains (implicitly or explicitly) a rule that guarantees its effectiveness. In addition, the logics for 'Utters' and 'Proc' are closed under logical equivalence.

The main difference between knowledge and belief is often as follows: If the agent x knows that A, then A is true, whereas this does not apply for beliefs. In other words, only 'Know_x' enjoys the schema **T**. Intuitively, it may be said that knowledge implies belief:

$$\text{Know}_x A \rightarrow \text{Bel}_x A \qquad (6)$$

As regards normative conditionality, we have different options depending on the approach we want to adopt. For example, we can view '$\Rightarrow$' as either a monotonic or a non-monotonic link. A great part of the recent literature focuses in particular on the second alternative, since it is widely acknowledged that normative reasoning is basically defeasible (cf., e.g., Nute 1997; Prakken 1997). In general, conditional logics for modelling normative reasoning are characterised by different axiomatisations. Most of them do not adopt any explicit or unrestricted form of detachment of the consequent. Here a (restricted) form of detachment will be adopted. However, since no explicit reference is made in this volume to the notion of defeasibility (but see Treatise Volume 5)—and there is no requirement here for the essential use of other formal properties of $\Rightarrow$—the logical behaviour of normative conditionality looks more like that of material implication.

Now to the binary connective '$\equiv>$'. An expression like '$A \equiv> B$' means that, normally, B is true whenever A is true. This exemplifies a typicality-based notion of plausible consequence which is often characterised within the framework of default reasoning. Here, we are not required to provide any axiomatisation for this connective. The same applies to the temporal operators we have introduced above, for which it is sufficient to assume that

$$\text{E} A =_{\text{def}} \neg \text{A} \neg A \qquad (7)$$

In addition to that, in both cases it is sufficient to bear in mind the intuitive meaning of these operators. The interested reader may refer to the relevant literature we have previously cited.

2. The Definition of "Norm"

According to the view expounded in this volume, the content of a norm can be expressed propositionally. In this regard, it may correspond to the description of one conditioning type of circumstance and one conditioned type of action; this last is qualified deontically as obligatory, permitted, or prohibited. In very abstract terms, a norm can thus be conceived of as a conditional structure stating that a given type of action ought to be performed if a certain type of circumstance occurs. In the present context, we shall confine our analysis

to the case in which the "ought" of the norm corresponds to the deontic operator 'O'. Thus, a norm **n** could be trivially represented as follows:

$$A \Rightarrow \mathrm{O}B \quad (8)$$

which is simply one of the usual representations of conditional obligation.

However, a crucial point of this volume's approach is that a norm exists qua norm if and only if at least one person believes it to be a norm (*doxia*): No type of action that no one believes to be objectively binding is a norm, and no norm can exist without belief; therefore, if something is to be a norm it must have at least one believer. Accordingly, the existence (definition) of a norm **n** as binding is strictly connected with the existence of a norm-believer *b*:

$$\mathrm{Bel}_b\ (A \Rightarrow \mathrm{O}B) \quad (9)$$

Trivially, the notion of *adoxia* (the nonexistence of a norm **n** in a subject *b* who is a nonbeliever) is rendered as follows:

$$\neg\ \mathrm{Bel}_b\ (A \Rightarrow \mathrm{O}B) \quad (10)$$

and, if applied to all agents in the group G, it corresponds to

$$\wedge_{b \in \mathrm{G}} \neg\ \mathrm{Bel}_b\ (A \Rightarrow \mathrm{O}B) \quad (11)$$

3. Duty-Holder (Deontia) and Right-Holder (Exousia). The Being-in-Force and Not-Being-in-Force of a Norm. Efficaciousness and Inefficaciousness of a Norm

As a second step, we will show how to give an account of the concepts of deontia and exousia: The former corresponds to the fact that one or more subjects are actual duty-holders under a norm **n**; the latter is related to the fact that one or more subjects are actual right-holders under **n** (Section 6.4). While the notion of deontia can be easily defined via the usual obligation operator (indexed by the agents who bear such an obligation), the same does not apply to the case of exousia. As is well known, the logical representation of normative positions such as rights, duties, etc., is one of the most discussed issues in contemporary logic of norms.[1] We will not enter here into a discussion of this problem. The interested reader is referred to Krogh 1997.

[1] Since the seminal contributions of Hohfeld are some of the authors who have worked on this issue S. Kanger, L. Lindahl, D. Makinson, I. Pörn, A. Jones and M. Sergot.

Following Herrestad and Krogh's (1995; 1996) approach (developed in particular to deal with the so-called directed obligations in contracts), the representation of normative relations between two subjects corresponding to the right/duty bilaterality requires

1. that the obligation operator be indexed by the subjects/agents who are the holders of such an obligation;
2. a distinction between two kinds of obligation: (a) a bearer-relativised ought-to-do obligation O_d on the agent *d* (duty-holder) to bring about a certain state of affairs *B* with respect to another agent *r* (right-holder); (b) a counterparty-relativised ought-to-be statement relative to *r* that *d* makes it so that *B* holds with respect to *r*.

In the spirit of Kanger-Lindahl-Pörn's tradition (see, in this Treatise, Sartor, vol. 5), this is the reason why a convincing account of such normative positions requires the introduction of the action operator 'Does' so that each subject involved in the right-duty relation also has the status of agent. When combined in a bilateral normative relation between two subjects *d* and *r*, deontia and exousia lead to the following formalisation:

$$(A \Rightarrow O_d \mathrm{Does}_d\, B) \wedge (A \Rightarrow O^r \mathrm{Does}_d\, B) \tag{12}$$

The first conjunct is an ought-to-do statement expressing that *d* has the obligation to perform *B* if *A* is given (deontia); the second conjunct corresponds to an ought-to-be statement saying that *r* requires *d* to perform *B* if the same set of conditions *A* occur (exousia). In addition, such expressions must be integrated by introducing the belief operator 'Bel' (Section 6.2). Notice that this operator may be indexed by subjects other than those involved in the normative relation. Let us consider the following case:

$$\mathrm{Bel}_a\, ((A \Rightarrow O_d \mathrm{Does}_d\, B) \wedge (A \Rightarrow O^r \mathrm{Does}_d\, B)) \tag{13}$$

Suppose there exists a subject *a* such that $a = d$ and consider the conjunct on the left side. This case corresponds to the being-in-force of a norm: If an actual duty-holder *d* under a norm **n** (deontia) is a believer (doxia), then the norm **n** will be in force in *d*.[2] In other words, this means that[3]

$$\mathrm{Bel}_d\, (A \Rightarrow O_d \mathrm{Does}_d\, B) \tag{14}$$

[2] Notice that the notions of adeontia and anexousia can be trivially obtained by negating the content of the corresponding obligations.

[3] In this perspective, it may be useful to also accept the schema $\mathrm{Bel}_x\, (A \wedge B) \rightarrow (\mathrm{Bel}_x\, A \wedge \mathrm{Bel}_x\, B)$.

Notice that this intuition may also be applied to right-holders. We can have the case of an agent r who is a believer in a norm as a right-holder:

$$\text{Bel}_r\,(A \Rightarrow \text{O}^r\,\text{Does}_d\,B) \tag{15}$$

or a situation where both a duty-holder d and a right-holder r, involved in a given normative relation, are believers:

$$\text{Bel}_d\,((A \Rightarrow \text{O}_d\text{Does}_d\,B) \wedge (A \Rightarrow \text{O}^r\,\text{Does}_d\,B)) \wedge \text{Bel}_r\,((A \Rightarrow \text{O}_d\text{Does}_d\,B) \wedge \wedge\,(A \Rightarrow \text{O}^r\,\text{Does}_d\,B)) \tag{16}$$

or, finally, a case where the right-holder is a believer and the ought-to-do obligation is believed in by a subject a who is not the actual duty-holder (or the other way around):

$$\text{Bel}_a\,((A \Rightarrow \text{O}_d\text{Does}_d\,B) \wedge (A \Rightarrow \text{O}^r\,\text{Does}_d\,B)) \wedge \text{Bel}_r\,((A \Rightarrow \text{O}_d\text{Does}_d\,B) \wedge \wedge\,(A \Rightarrow \text{O}^r\,\text{Does}_d\,B)) \tag{17}$$

Notice that this formalism enables us to represent all the subjective positions described in Section 10.2.3. By way of an example, let us consider first the case of doxia, deontia, and exousia. This may correspond to the formula $\text{Bel}_z\,(\wedge_{z,d \in \text{G}}\,(A \Rightarrow \text{O}_z\,\text{Does}_z\,B) \wedge (C \Rightarrow \text{O}^z\,\text{Does}_d\,D))$. On the other hand, a case of adoxia, deontia, and exousia can be represented as $\neg\,\text{Bel}_z\,(\wedge_{z,d \in \text{G}}\,(A \Rightarrow \text{O}_z\,\text{Does}_z\,B) \wedge (C \Rightarrow \text{O}^z\,\text{Does}_d\,D)) \wedge \text{Bel}_s\,(\wedge_{z,d \in \text{G}}\,(A \Rightarrow \text{O}_z\,\text{Does}_z\,B) \wedge (C \Rightarrow \text{O}^z\,\text{Does}_d\,D))$. The other cases may be trivially formalised according to the same policy.

Let us give now some brief suggestions for representing the notions of efficaciousness and inefficaciousness of a norm (Section 6.6). Recall that nomia is a necessary condition for both cases. In particular, a norm **n** is efficacious when a duty-holder under **n** practises **n** because she believes in it. A convincing account of efficaciousness depends here on the possibility of formalising a notion of "mental causality," since it is maintained that the behaviour of a duty-holder is caused by her normative belief **n**. This is a very hard task and we will not deal with it here. Let us just show how to represent something similar to the original idea.

A norm **n** is the cause of the behaviour A which is the content of the obligation in **n** and is related to duty-holders' *usus agendi* as a custom; this being so, it can be reasonable to say that A is the normal consequence of the fact that **n** is believed to be objectively binding by the duty-holders under **n**. If so, the notion of efficaciousness could be represented as follows:

$$(\text{Know}_x\,A \wedge \text{Bel}_x(A \Rightarrow \text{O}_x\,\text{Does}_x\,B)) \equiv> (\text{Does}_x\,B) \tag{18}$$

However, this analysis may be seen to be too weak. This holds in particular if the meaning of '≡>' is intended as a strict relation of relevance between the antecedent and the consequent. As is argued, for example, in Delgrande and

Pelletier 1998, the notion of relevance can hardly be defined by using a particular conditional (or other dyadic operators; for more details, see ibid.). Thus, a different option is to provide a meta-theoretical account of relevance. Accordingly, given a knowledge base Th, the proposition X is said to be relevant with respect to a conditional $Y \equiv> Z$ iff

$$Th \models Y \equiv> Z \tag{19}$$

and

$$Th \models X \wedge Y \equiv> \neg Z \tag{20}$$

With good approximation, this approach can be adapted to the definition of efficaciousness. If d's normative belief is a determinant and a necessary reason for d's complying with the deontic content of the norm, then we may assume that

$$Th \models \text{Know}_d A \equiv> \neg \text{Does}_d B \tag{21}$$

but

$$Th \models (\text{Know}_d A \wedge \text{Bel}_d (A \Rightarrow \text{O}_d \text{Does}_d B)) \equiv> \text{Does}_d B \tag{22}$$

Accordingly, if a custom is interpreted as the consistent and uniform performance within a group of the same type of action, a type set forth in a norm, it may be said to correspond to

$$Th \models \wedge_{d \in G} (\text{Know}_d A \equiv> \neg \text{Does}_d B) \tag{23}$$

but

$$Th \models \wedge_{d \in G} ((\text{Know}_d A \wedge \text{Bel}_d (A \Rightarrow \text{O}_d \text{Does}_d B)) \equiv> \text{Does}_d B) \tag{24}$$

However, a custom is rightly viewed as a law of inertia with regard to the uniform and *persistent* performance of a certain type of action so long as the acting subject's motives do not change. This means that "the acting person performs the type of action that he or she usually performs whenever a certain type of circumstance gets instantiated, unless new motives intervene to modify the course of his or her usual behaviour." If so, given

$$Th \models \wedge_{d \in G} (\text{Know}_d A \equiv> \text{A} \neg (\text{Does}_d B)) \tag{25}$$

or, alternatively,[4]

[4] In the first case, the occurrence of A has the consequence that, for all possible courses of events, the agent d does not perform a certain model of action. In the second case, such nonperformance holds at least for one possible course of future events.

$$Th \models \wedge_{d \in G} (\text{Know}_d A \equiv> \text{E} \neg (\text{Does}_d B)) \tag{26}$$

we also have

$$Th \models \wedge_{d \in G} ((\text{Know}_d A \wedge \text{Bel}_d (A \Rightarrow \text{O}_d \text{Does}_d B)) \equiv> \text{A} ((\text{Does}_d B) \text{ U}$$
$$((\text{Know}_d \neg A \vee \neg (\text{Bel}_d (A \Rightarrow \text{O}_d \text{Does}_d B))))) \tag{27}$$

Formula (27) means, in conjunction with (25) or (26), that *d*'s normative belief with regard to a certain type of action will be the motive for performing this action until *d* has such a normative belief and condition *A* is true.

Notice that, in all these cases the definition of inefficaciousness follows trivially. In addition, it is evident that any agent *d* characterised by (25)–(26) and (27), may be said to be an "abider" with respect to the norm '$\text{Bel}_d (A \Rightarrow \text{O}_d \text{Does}_d B)$'.

"Deviants," on the other hand, though norm-believers, are subjects who do not practise the model of action included in the norm. In this regard, we may have different formalisations. In a first case, given (25)–(26), we can state the falsehood of the conditional in (27), which may amount to saying that there exists at least one future course of events in which the agent *d* does not perform the type of action:

$$Th \models (\text{Know}_d A \wedge \text{Bel}_d(A \Rightarrow \text{O}_d \text{Does}_d B)) \equiv> \text{E} \neg ((\text{Does}_d B) \text{ U}$$
$$((\text{Know}_d \neg A \vee \neg (\text{Bel}_d(A \Rightarrow \text{O}_d \text{Does}_d B)))) \tag{28}$$

In a different perspective, we can simply state that the normative belief is in general irrelevant, namely, that

$$Th \models (\text{Know}_d A \wedge \text{Bel}_d (A \Rightarrow \text{O}_d \text{Does}_d B)) \equiv> \text{A} \neg (\text{Does}_d B) \tag{29}$$

Finally, let us focus on the notions of "white sepulchre," "conformist" and "Jesuit" (Section 6.6). In the first case, the agent practises a certain type of action, and believes in the bindingness of this type of action, but the motive of this practice is not this belief and amounts to another reason *X*. This idea can be expressed as follows:[5]

$$Th \models \text{Know}_d A \equiv> \text{A} \neg (\text{Does}_d B) \tag{30}$$

$$Th \models (\text{Know}_d A \wedge \text{Bel}_d (A \Rightarrow \text{O}_d \text{Does}_d B)) \equiv> \text{A} \neg (\text{Does}_d B) \tag{31}$$

[5] A different formalisation can be provided in which we state the grounds that lead one to distinguish between formulas (25) and (26). For the sake of simplicity, we will analyse only one case.

but

$$Th \models (\mathrm{Know}_d A \wedge \mathrm{Bel}_d (A \Rightarrow \mathrm{O}_d \mathrm{Does}_d B)) \equiv> \mathrm{E}\,((\mathrm{Does}_d B)\ \mathrm{U}\ X) \qquad (32)$$

Conformism, on the other hand, may be expressed as follows:

$$Th \models \mathrm{Know}_d A \equiv> \mathrm{A}\,(\mathrm{Does}_d B) \qquad (33)$$

and

$$Th \models (\mathrm{Know}_d A \wedge \neg\, \mathrm{Bel}_d (A \Rightarrow \mathrm{O}_d \mathrm{Does}_d B)) \equiv> \mathrm{A}\,(\mathrm{Does}_d B) \qquad (34)$$

Jesuits are nonbelievers who pretend to be believers in practising a certain norm. So, given

$$Th \models (\mathrm{Know}_d A \wedge \neg\, \mathrm{Bel}_d (A \Rightarrow \mathrm{O}_d \mathrm{Does}_d B)) \equiv> \mathrm{A} \neg\, (\mathrm{Does}_d B) \qquad (35)$$

we have

$$Th \models (\mathrm{Know}_d A \wedge \neg\, \mathrm{Bel}_d (A \Rightarrow \mathrm{O}_d \mathrm{Does}_d B) \wedge \mathrm{Utters}_d \mathrm{Bel}_d (A \Rightarrow \mathrm{O}_d \mathrm{Does}_d B))$$

$$\equiv> \mathrm{A}\,(\mathrm{Does}_d B) \qquad (36)$$

That an agent pretends to be a believer may be rendered by saying that such an agent declares to be one, and this public attitude, which conflicts with the agent's real belief, is decisive with regard to her practicing B.

4. How Norms Proliferate in Human Minds

Let us discuss how to formalise the process of proliferation of norms as described in this volume (Chapter 7 and Section 9.6). To illustrate this process, and to capture at least partially its dynamic character, we will focus on norms such as the following:

$$\wedge_{d \in \mathrm{G}} \mathrm{Bel}_b (A \Rightarrow \mathrm{A}\,(\mathrm{O}_d \mathrm{Does}_d B\ \mathrm{U}\ (\mathrm{Does}_d B \vee \neg A)) \qquad (37)$$

Formula (37) says that agent b believes that, under a certain condition A, and for all possible courses of events, it will be obligatory for any agent d to do B until this is performed by d or until A holds. This norm is an example of a *norm of conduct* whose bindingness is conditioned by the performance of the type of action set forth in the norm itself.

In this volume, concrete norms are generated by means of the standard mechanism of subsumption. Let us see a norm like this at work with an exam-

ple. Notice that, in addition to what we stated in Section 1, we have to assume the following property:

$$\mathrm{Bel}_x (A \Rightarrow B) \rightarrow (\mathrm{Bel}_x A \Rightarrow \mathrm{Bel}_x B) \tag{38}$$

Suppose we have a norm such as

$$\wedge_{d,r \in \mathrm{G}} \mathrm{Bel}_b ((\textit{well-off}\,(d) \wedge \textit{needy}\,(r)) \Rightarrow \mathrm{A}\,(\mathrm{O}_d\, \mathrm{Does}_d\, \textit{aided}\,(r)\ \mathrm{U}$$

$$(\mathrm{Does}_d\, \textit{aided}\,(r)) \vee \neg\, \textit{well-off}\,(d) \vee \neg \textit{needy}\,(r))) \tag{39}$$

A specific agent b believes that well-off people ought to aid needy people. Suppose that b knows that d is well-off and r is needy:

$$\mathrm{Know}_b\, (\textit{well-off}\,(d) \wedge \textit{needy}\,(r)) \tag{40}$$

On the basis of (6), we will have

$$\mathrm{Bel}_a\, (\textit{well-off}\,(d) \wedge \textit{needy}\,(r)) \tag{41}$$

from which, thanks to (38) and detachment for '⇒', we may infer

$$\mathrm{Bel}_b\, \mathrm{A}\,(\mathrm{O}_d\, \mathrm{Does}_d\, \textit{aided}\,(r)\ \mathrm{U}\ (\mathrm{Does}_d\, \textit{aided}\,(r) \vee \neg\, \textit{well-off}\,(d) \vee \neg\, \textit{needy}\,(r))) \tag{42}$$

namely, the agent b believes that it is obligatory for d to aid r. Of course, as soon as d aids r—or as soon as r is no longer needy, or d is no longer well-off—such an obligation, according to (39), will no longer hold.[6]

Now to the proliferation of norms via competence norms. In the spirit of this volume (Sections 7.3 and 9.6), a competence norm believed by an agent b may be represented as follows:

$$\mathrm{Bel}_b\, (\wedge_{l,d \in \mathrm{G}}\, (\mathrm{Proc}_l\, (A \Rightarrow \mathrm{A}\,(\mathrm{O}_d\, \mathrm{Does}_d\, B\ \mathrm{U}\ (\mathrm{Does}_d\, B \vee \neg A)) \Rightarrow$$

$$\Rightarrow (A \Rightarrow \mathrm{A}\,(\mathrm{O}_d\, \mathrm{Does}_d\, B\ \mathrm{U}\ (\mathrm{Does}_d\, B \vee \neg A))))) \tag{43}$$

Here, proclamation is meant to capture l's act of issuing a certain directive. On the basis of (43) and according to the analysis developed in this volume, l is empowered or has the authority to issue directives. Since this last is the content of agent b's belief, if we have

[6] If we had make this fully explicit we would have to express within the language state transitions and time instants. For these details, see Schild 2000.

$$\text{Know}_b\ (\wedge_{l,d \in \text{G}}\ \text{Proc}_l\ (A \Rightarrow \text{A}\ (\text{O}_d\ \text{Does}_d\ B\ \text{U}\ (\text{Does}_d\ B \vee \neg A)))) \tag{44}$$

we will also have

$$\text{Bel}_b\ (\wedge_{l,d \in \text{G}}\ \text{Proc}_l\ (A \Rightarrow \text{A}\ (\text{O}_d\ \text{Does}_d\ B\ \text{U}\ (\text{Does}_d\ B \vee \neg A)))) \tag{45}$$

which implies

$$\text{Bel}_b\ (\wedge_{d \in \text{G}}\ A \Rightarrow \text{A}\ (\text{O}_d\ \text{Does}_d\ B\ \text{U}\ (\text{Does}_d\ B \vee \neg A))) \tag{46}$$

As expected, (46) is nothing but a norm in the personal normative system of *b*.

INDEX OF SUBJECTS

Abidance (efficaciousness of a norm). See *Norms and behaviour.*

Acceptance 87, 96, 100, 160, 162–3, 166, 169–70, 176–8, 181, 254–6. Cf. *Norms as beliefs.*

Agent. See *Micro-macro*. Cf. *Person (personality).*
Aisa. See *Fate.*
American legal realism. See *Legal realism.*
Amor fati. See *Fate.*
Analytical emasculation (from norms to propositions). See *Analytical Philosophy.*
Analytical jurisprudence. See *Legal positivism.*
Analytical paradigm. See *Analytical philosophy.*

Analytical philosophy 87, 187–90, 390–2, 394, 397–8, 400, 402, 404. See also *Paradigm.*
  Analytical emasculation (from norms to propositions) 187, 189–90, 389
  Analytical paradigm 389–406

Anomia. See *Norms as beliefs.*

Anthropology 64, 256–8, 269–94, 357–64

Anticipations 190. Cf. *Language*, *Types and tokens.*

Anxiety 249–60
  Consciousness of death XIX, XXXIII, 4, 30, 37, 72, 83, 96, 103–4, 210, 247–62, 264–6, 286, 360–1, 370

Apophantic sentences. See *Language.*

Artificial Intelligence (AI) XVI, XXVIII, 261, 264, 357, 371–4, 379–84, 394, 406, 430, 433
  Multi-agent systems (MAS) XXVI, 297, 356, 374, 381, 395, 436

Authority. See *Interference in the motives of behaviour.*

Autonomy 242–6, 372, 374, 386

Behaviour. See *Norms and behaviour.*

Behaviourism 400–1, 404

Belief. See *Norms as beliefs.*
Binding force. See *Norms as beliefs.*
Biological instinct. See *Nature.*
Brain. See *Neurosciences.*
Bureaucracy. See *Social control.*
Byzantine jurists. See *Jurists.*
Canonists. See *Jurists.*
Capacity (competence). See *Types and tokens.*
Catholodoxia (universalisability of norms). See *Norms as beliefs*, and also *Social control.*
Character structure. See *Micro-macro.*
Charisma. See *Interference in the motives of behaviour.*
Civil law. See *Law.*

Cognitive science XIX, XXI, XXII, 16, 89, 97, 169, 302, 316, 318–20, 322–3, 360, 370–4, 381–2, 384, 395, 397, 400, 404–6, 427. Cf. *Neurosciences.*

Commands. See *Language*, and also *Norms.*
Common law. See *Law.*
Communism. See *Totalitarianism.*
Competence (capacity). See *Types and tokens.*
Competence norms. See *Norms*, and also *Norms as beliefs.*
Conative effects. See *Voluntarism.*
Conceptual jurisprudence. See *Jurists.*
Conditionality of the content of a norm. See *Norms.*
Confirming others. See *Significant others.*
Conformism. See *Norms and behaviour.*
Conscience. See *Generalised other.*
Consciousness. See *Anxiety*, *Neurosciences.*
Consciousness of death. See *Anxiety.*
Constitution (constitutional norms). See *Norms.*
Constitutive rules. See *Types and tokens.*

Construction of social reality. See *Culture*.
Content of norms. See *Norms*.

Convention XXXI, 47, 57, 71–3, 175–6, 178, 180, 183–5, 246, 290, 357–8, 363, 372, 380, 407, 433

Cosmic order. See *Nature*.
Cultural products. See *Culture*.

Culture XXI, XXVI, XXVIII, 7, 17, 23, 67, 85, 88–90, 104, 106–7, 127, 188, 200–1, 211, 232–3, 242–3, 249, 257, 259, 269–70, 272–8, 281, 284–5, 289, 293, 333, 338, 358–61, 363–4, 366, 369, 371–2, 377, 379, 385, 388, 390, 397, 408–9, 433. See also *Nature*.
 Construction of social reality 357, 365, 367, 436
 Cultural products 406–11
 Nature and culture 355, 362, 365, 407
 Social construction of reality 95, 357, 365, 367–8, 426

Custom. See *Norms and behaviour*, and also *Law*.
Customary law. See *Law*, and also *Norms and behaviour*.
Declarations of will. See *Operative facts*.
Deontia (being believed to be a duty-holder). See *Norms as beliefs*.
Deontic sentences. See *Language*.
Deontological versus teleological. See *Norms as beliefs*.
Derivative norms. See *Norms as beliefs*.
Descriptions. See *Language*.
Deviance. See *Norms and behaviour*, and also *Effectiveness*.

Dikē 11, 70–2, 76, 185, 219–20, 235, 249–50, 255, 259, 269–75, 279–96, 307, 333, 355, 428, 430

Dikedoxia. See *Norms as beliefs*, and also *Social control*.
Directives. See *Language*.
Dogmas. See *Norms as beliefs*, and also *Social control*.
Domination. See *Law*.
Doxia (being a believer, existence of a norm, internal point of view). See *Norms as beliefs*, and also *Acceptance*.

Dualism XXIII, 1, 13, 22, 48, 72, 87–8, 249, 270, 334, 340–1, 344–5, 348–9, 365–6, 402

Duty-holders. See *Norms as beliefs (Deontia)*, and also *Normative subjective positions*, *Reality that is (Referents of a norm)*.

Effectiveness XXVII, XXX, 5, 15, 25, 33, 53, 83, 85, 87, 96, 105–6, 109–13, 123–4, 126, 133, 137, 140–2, 145, 156–8, 166, 168–9, 171, 173, 175, 197, 199, 201–2, 204–5, 213, 218, 222, 236, 238, 242–3, 261, 264–6, 283–4, 393, 414. Cf. *Law*, *Norms and behaviour*.

Efficaciousness of a norm (abidance, being a nomic practising duty-holder). See *Norms and behaviour*.
Eidos. See *Ratio*.
Epigones. See *Paradigm*.

Eunomia 270, 283, 293

Exousia (being believed to be a right-holder). See *Norms as beliefs*.
Facts, acts, and transactions. See *Operative facts*.
Fanaticism (enthusiasm). See *Norms as beliefs*.
Fascism. See *Totalitarianism*.

Fate XXVI, 126, 197, 232, 248–67, 355, 367
 Aisa 249–50, 262–4
 Amor fati 254–5
 Heimarmene 249–50, 260
 Moira 249–50, 259–67, 292

Forgery of a norm. See *Matrix (authenticity)*.
Forma. See *Ratio*.
Formalisation of the theory of norms as beliefs. See *Norms as beliefs*.
Foundations of law. See *Law*.

Generalised other XXVI, 127, 135, 198, 277, 356–7, 368, 374, 384, 389
 Conscience 5, 57–8, 65, 73, 202, 240, 248, 255, 279, 306, 371, 383, 387–8, 407

German legal positivism. See *Legal positivism.*

Glossators. See *Jurists.*

God 53–5, 61–2, 65, 68, 72–8, 81, 96, 111, 119, 123–6, 157, 215–6, 218, 222, 250, 257, 259, 263–4, 284, 286, 299, 305–6, 315, 318–9, 325–30, 338, 371. Cf. *Voluntarism.*

Good XXVII, 6, 30, 60, 74, 77–8, 94, 97, 116, 119–20, 123, 133, 137, 150, 165, 179, 188, 202–3, 213, 215, 232, 239, 242, 250, 261, 265, 270, 294, 296, 304, 306–11, 334, 337, 362, 393–5, 397, 409, 419, 425–6, 431, 435. Cf. *Motives of human behaviour.*

Great-grandmother of positive human law. See *Matrix (authenticity).*

Group XXIX, 4, 51, 88, 98, 109, 111, 115, 135–7, 142–3, 158–60, 166, 170, 176–80, 199, 201, 205, 214–5, 218–9, 223–4, 231–2, 236–9, 243, 254, 282, 355–6, 369, 377, 389, 404, 416, 419

Habit. See *Norms and behaviour.*

Heimarmenē. See *Fate.*

Heresy. See *Norms as beliefs*, and also *Social control.*

Heterodoxia. See *Norms as beliefs*, and also *Social control.*

Heteronomy. See *Law.*

Hypocrisy 112, 166, 172. Cf. *Norms and behaviour.*

Illative effects. See *Language.*

Indices. See *Language*, and also *Anticipations.*

Individual, or individualised, norm. See *Normative subjective positions.*

Influence. See *Interference in the motives of behaviour.*

Institutions. See *Micro-macro.*

Integration between norms and validly enacted directives. See *Norms as beliefs*, and also *Interference in the motives of behaviour*, *Normative production (normative causality)*, *Types and tokens.*

Intellectus. See *Ratio.*

Interests. See *Motives of human behaviour (causae agendi).*

Interference in the motives of behaviour XXIII, 129, 197. See also *Language*, *Totalitarianism.*

- Authority (modifies, in concurrence with language, the internalised reality that ought to be) XXII, 8, 46, 50–1, 81, 126–7, 133, 140–1, 165, 167, 189, 199, 202–7, 234–5, 239–46, 271, 275, 282, 290, 306, 313–4, 377, 387, 404, 422
- Influence (affects, in concurrence with language, the motives of behaviour) 42, 85, 88, 96, 144, 157, 158, 165, 189, 198–200, 202–5, 213–4, 225, 235–41, 243, 256, 335, 381, 390–3, 436
- Power (overwhelms, in concurrence with language, the motives of behaviour) XXV, 4, 6, 8, 42, 49–50, 53–5, 65, 70–1, 74–8, 87–8, 99, 107, 132, 139, 140–2, 156–9, 161, 165, 167–9, 172, 180, 183–4, 188–9, 196, 199, 200–5, 207, 209, 222–3, 234–7, 239–43, 255, 281, 291, 296–7, 301–2, 304–6, 308–10, 316, 318–20, 322–3, 329, 377, 409, 429
- Suggestion and Charisma (bypass, in concurrence with language, the motives of behaviour) 88, 133–4, 198–201, 241

Internalisation XXIII, XXIV, XXV, XXVII, 28, 70, 90, 95–6, 100, 117–20, 127, 134–5, 137–8, 142, 144, 151, 157, 160–6, 169–71, 173, 177–8, 180–3, 198–9, 202, 209, 211, 213, 277, 299, 336, 355–7, 359–60, 368, 371–3, 378–80, 383, 385, 387–94, 397–401, 403–6

Is. See *Reality that is.*

Is-events. See *Reality that is*, and also *Operative facts*, *Sources of law.*

Is-outcomes of Is-events (of Is-activities). See *Reality that is.*

Jesuits, behaviour of. See *Norms and behaviour.*

Judge-made law. See *Law*, and also *Social control.*

Judges (courts). See *Social control*. Cf. *Reality that ought to be (What is subjectively right).*

Jurists XV, XXVIII, XXIX, 3–5, 7, 16, 23, 25, 28, 47–8, 87, 102–3, 109, 117, 125, 134, 150, 156, 205, 238–9, 249, 333, 337, 408, 411

Byzantine jurists 338
Canonists 82
Conceptual jurisprudence (Begriffsjurisprudenz) 173, 338
Glossators 53, 409
Legal doctrine XIX, XXI, XXII, XXXIII, 2, 22, 24, 26–7, 32, 36–7, 39, 45–6, 64, 85, 119, 141, 144, 152, 173, 204, 211, 214, 223, 236–7, 266, 274, 280, 303, 341, 391–2, 434
Legal historicism (Historische Rechtsschule) 407
Pandectism (Pandektenwissenschaft) 173, 410
Roman jurists 410
Scientia juris XIX, XXI, XXII, XXXIII, 141, 204, 223, 236–7, 266

Jus XVI, XVII, XIX, XXI, XXII, XXIV, XXVIII, XXXIII, 4, 7, 11, 48, 51, 53, 58, 60, 64, 68–9, 75–8, 80–1, 98, 121, 138, 141, 153–4, 185, 204, 216, 221, 223, 236–7, 242, 260, 266, 282, 290, 295–331, 333, 338, 355, 408–9, 429, 432–3, 436–7. See also *Justitia*.

Justice XVI, 60, 71–2, 76, 79–81, 85, 136, 143–4, 210, 219–22, 236, 260, 269, 271–4, 278, 281, 283–7, 289–91, 296–322, 334, 391, 429–30, 432–3, 435

Justitia XXXIII, 79, 81, 221, 284, 296–7, 299–314, 318, 320–1, 355. See also *Jus*.
Justitia legalis (the justice of norms) 303, 306–11, 313
Voluntas (justitia est constans et perpetua voluntas jus suum cuique tribuens) 260, 301–3, 305, 307, 315–6

Justitia legalis (the justice of norms). See *Justitia*.
Koran. See *Matrix (authenticity)*.
Lag. See *Law*.

Language XIX, XXIII, XXXII, 5, 9, 43, 46, 68, 71, 80, 82, 106–7, 117, 121–2, 166, 170, 183, 233, 243, 272, 278, 280, 333, 339, 343, 361, 366, 390–2, 398, 403, 409–10, 433. See also *Interference in the motives of behaviour*.
Apophantic sentences 13–5, 17–8, 22, 26–7, 33, 135, 191, 193–5, 241
Commands 3, 49–51, 53–4, 59–60, 63, 69–70, 83, 87, 96, 111, 124, 126, 132–7, 139, 141, 165, 173, 175, 199, 203, 205, 244–5, 274, 290, 309, 318, 393, 396
Deontic sentences XVI, 10, 11, 13–5, 18–9, 22, 25, 97, 100, 129, 194, 241, 266, 416, 419, 427, 429–31, 434, 436–7
Descriptions 52, 87, 91, 96, 101–3, 105, 202, 241, 358, 362–3, 365, 393, 395, 415, 436
Directives 13, 18, 20, 88, 104–5, 123, 125–7, 133, 145–52, 155, 161–3, 169, 171, 188–99, 201–6, 236–9, 241–2, 244–6, 277, 281, 284, 296, 388, 422, 435
Illative effects 151, 190–5, 197
Indices XXXIII, 190–8, 215, 273, 279, 287, 290–1, 337, 364
Language and motives of behaviour 187–207
Language that affects the motives of behaviour (influence) 202–5
Language that bypasses the motives of behaviour (suggestion, charisma) 198–201
Language that modifies the internalised reality that ought to be (authority) 205–7
Language that overwhelms the motives of behaviour (power) 201–2
Neustic 14–5, 19, 194
Parole 368
Phrastic 14–5, 19, 194
Proposition XXV, 187–9, 194, 241, 389, 414, 419
Propositional content 100, 188–9, 194, 196
Representations 13–4, 96, 105, 137–8, 189, 194, 237, 271, 365, 367, 369, 416–7, 429
Semantic effects 194–7
Symbols 95, 190–8, 256, 259, 275–6, 281, 289, 360, 362, 364, 375–8, 385, 413, 427

Law XVI, XVII, XXI, XXIV, XXVII, XVIII, XXIX, XXXIII, 2, 8, 14, 16, 20–1, 26–33, 35, 38, 40, 42, 48, 50–5, 57–65, 69, 71, 73–5, 77–8, 80–2, 91–2, 98, 102, 115, 117, 119–21, 125, 129, 132, 134–5, 141–3, 154, 157–8, 160, 166, 170, 174, 176–9, 181–2, 184–5, 190, 199–200, 202–4, 207, 215–9, 227, 230,

261, 270–1, 275, 281–2, 287–9, 295–6, 304, 306–11, 313, 315, 318, 330–1, 335–6, 340, 342, 344–51, 360–2, 364, 370, 377, 381, 390–4, 396–7, 406, 410–1, 419, 429–34, 436–7. See also *Culture*, *Effectiveness*, *Interference in the motives of behaviour*, *Language, Reality that is (Is-outcomes of Is-activities)*, *Social control*, *What is right*.
Civil law XIX, XXIII, XXX, 3–7, 9, 11, 15, 17, 22, 24–5, 36–7, 39, 41, 43, 45–7, 85–6, 106–7, 109, 123, 138, 149, 151–2, 155, 161, 173, 188, 210, 238, 266, 269, 274, 303, 333, 337–8, 341, 409, 427
Common law XX, 5–7, 15, 36, 43, 86, 173, 183, 333–4, 338–9, 341, 343, 428
Customary law XXII, 44–5, 280, 358, 407–8
Domination 76, 139, 235–6, 240–3, 246, 383
Foundations of law XIX, XXII, XXIII, 49, 67, 70, 72, 233, 265
Heteronomy 242–6, 257, 372
Judge-made law XXII, 236
Lag 5
Law as cultural reality 357–62, 406–11
Law in books 168, 232–3, 235–7
Law in force (an ambiguous intertwining of normativeness and organised power) XXV, 88, 93, 110, 140, 144, 156, 164, 180, 198, 209–46, 382, 408–9
Legal directives 147–9, 150, 161, 163, 237
No law without norms XXV, 23, 131–42, 175, 180
Norms are not enough XXV, 139, 187, 189–207
Organised power, or force XXV, 76, 88, 107, 133, 165, 168, 172, 180, 201, 206, 209–14, 218–22, 232–43, 250, 252–3, 263, 385, 409
Statutory law XXII, 41, 44–6, 72, 159, 162–3, 168, 171, 183, 319–21, 407–8
Texts of law XV, 46, 87, 127, 145, 147–52, 155, 161–3, 169, 188–9, 194, 205–7, 237–9, 242, 246

Law as cultural reality. See *Law*.
Law in books. See *Law*, and also *Types and tokens*.
Law in force. See *Law*.
Legal directives. See *Law*.
Legal doctrine. See *Jurists*.

Legal historicism. See *Jurists*.

Legal positivism 48, 58, 132, 143, 174, 182, 187, 393, 407
Analytical jurisprudence 5, 87, 173, 199, 334
German legal positivism XXIV, 4–5, 8, 47–55, 85, 87, 211, 338

Legal realism XXV, 172
American legal realism 133, 142
Scandinavian legal realism 5, 88, 131–44

Legal relations. See *Normative subjective positions*.

Lex XXIV, 45, 54, 63, 70, 81, 121, 265, 282, 296, 303–5, 307–8, 312, 317, 319–20, 323. See also *Norms*.
Lex aeterna 299, 315, 318, 321–2, 330–1
Lex humana 59–61, 322
Lex naturalis 59–61, 299, 306, 321–2

Materialism XXVI, XXVII, 366, 373, 400–3, 406

Matrix (authenticity) 4, 57–82, 198, 216, 261, 284, 306, 379, 386, 407. See also *Norms*.
Forgery of a norm XXIV, 59–61, 318
Great-grandmother of positive human law 69
Matrix of normativeness XXIV, 57–9, 61–5, 69–80, 270, 295
Matrix of the Koran 66–8
Mother of all battles (Umm al-Hurub or Umm al-Maarik) 66–7
Mother of the Book (Umm al-Kitāb) 66–8
Orthogonal norms and straight rules 61
Presupposed basic norm 48, 63, 65, 69–70, 121–2, 133, 139, 142, 152, 156–7, 162, 173, 334
Rule of recognition 139–42, 144, 152, 157–75, 177, 180–1, 183–4, 218

Metanoia (normative revolution). See *Norms as beliefs*.
Metonymic validity of legal directives and texts of law. See *Types and tokens*, and also *Law*.

Micro-macro 366, 373–91. See also *Culture*.
Agent XXII, XXV, XXVI, 21–2, 26,

135, 198, 227–30, 233, 298, 300, 302, 325, 356–7, 359, 368–74, 376, 380–5, 395, 413, 415, 417–22, 429, 436
Character structure 356–7, 374–6, 378–80, 385
Institutions XIX, XX, XXI, XXII, XXVIII, 81, 159, 241, 260, 279, 341, 355, 364, 367, 375–9, 381, 384, 414, 426, 429
Social structure XV, 159, 166, 241, 356–7, 374–81, 384–5, 429
Socialisation 95, 117, 119–20, 124, 198, 240, 357, 368–71, 383

Moira. See *Fate*.

Monism XXIII, XXIV, XXVI, 1, 83, 87, 365–6, 401–3, 406

Mop-up work. See *Paradigm*.

Morality XVII, XX, XXII, XXIII, XXV, 6, 46, 49–50, 54, 58, 67, 71, 74–5, 77, 88, 129, 131, 133–4, 136, 156, 174–85, 202, 213, 222, 243, 256–8, 279–82, 284, 292–3, 296–9, 301–2, 307, 312, 316–7, 321, 339, 346, 367, 369, 383, 387–8, 390, 394–7, 407, 410, 429–30, 432, 434. See also *Norms as beliefs*.

Mother of all battles (Umm al-Hurub or Umm al-Maarik). See *Matrix (authenticity)*.
Mother of the Book (Umm al-Kitāb). See *Matrix (authenticity)*.

Motives of human behaviour (causae agendi) XXIII, XXV, XXX, 5, 33, 83, 85–7, 91, 97, 99, 103, 110, 126, 135, 139, 152, 177–9, 187–207, 211, 213, 314, 359, 361–2, 369, 383–5, 396, 401, 404, 419–20. See also *Culture*, *Norms and behaviour*, *Norms as beliefs*, *Person (personality)*.
Interests XV, 58, 85, 88, 92–6, 98, 100, 109, 111–3, 115, 137, 157, 164, 189, 197, 199, 201–3, 206, 218, 223, 226–31, 234, 236–9, 243, 256, 270, 273, 285, 289, 338, 343, 344–5, 347, 356, 360, 363, 380, 405
Needs XXI, XXIV, XXVIII, XXXII, 9, 21, 27–8, 38–40, 49, 60, 88–90, 92–6, 102, 109, 112–3, 115, 117–9, 121, 125, 133, 138, 144, 149, 153, 157, 163, 165–6, 189, 196–7, 199, 202–3, 206, 210, 212, 214, 218, 225–33, 236, 244, 246, 259, 277, 280, 282, 298, 301–2, 304, 308–9, 311, 321–3, 326, 339, 344, 347–8, 352, 370, 372, 382, 389, 395, 402, 408
Norms 94–6
Values XX, XXII, 37, 63, 87–8, 92–6, 109, 112–3, 129, 150, 157, 189, 197, 199, 201–3, 206, 218, 226–32, 273, 279, 296, 360, 367, 376–7, 386–7, 403, 410, 432

Multi-agent systems (MAS). See *Artificial intelligence (AI)*.

Myth XXVI, 200, 247, 249–60, 265–6, 270, 399, 433

Natural-law theories XXIV, 4–5, 8, 47–55, 59, 62–3, 65, 69, 72, 85, 87, 120–1, 138, 187, 244, 334, 394. Cf. *Nature*.

Nature XXIII, XXIV, XXVI, XXVIII, 2–5, 8, 47, 50–1, 53–5, 57–61, 63, 65, 69–81, 83, 85, 87, 90, 94, 96, 99–100, 120–1, 129, 131, 134, 138, 153, 160, 169–70, 174, 177, 182, 185, 187, 191, 195, 210, 216, 218, 233, 244, 246, 256, 260, 265, 269–70, 273, 277–8, 284, 292, 299, 303, 307, 317–8, 325, 334, 338, 356, 360, 363–4, 366–7, 373, 394, 398, 401–2, 406, 408–11, 427–30, 432–3. See also *Culture*, *Matrix (authenticity)*, *Reality that ought to be*, *What is right*.
Nature and culture 355, 362, 365, 407
Nature as biological instinct 62, 73, 75–7
Nature as divine and human reason 52, 62, 73, 77–8, 316, 319, 323, 396
Nature as the cosmic order 62, 73, 78–80
Nature as the will of God 62, 72–5
State of nature 48–51

Nazism. See *Totalitarianism*.
Needs. See *Motives of human behaviour (causae agendi)*.

Neurosciences 382, 388–9, 397

Consciousness 22, 24, 27, 37, 55, 59, 89, 92, 94, 97, 100, 134–6, 138, 172, 181, 191, 198, 212–3, 217, 249, 251–2, 254, 256, 276, 301, 305, 312, 316, 322, 336, 359, 365–7, 369, 379–80, 383, 387, 401–7, 409–10, 427–8, 436

Obsessive-compulsive disorders 383, 396

Neustic. See *Language*.

No law without norms. See *Law*.

Nomia (being a believing duty-holder, being-in-force of a norm). See *Norms as beliefs*.

Nonconformism. See *Norms and behaviour*.

Normative language. See *Norms*.

Normative production (normative causality), the chain of 22–34, 154. See also *Interference in the motives of behaviour*, *Law*, *Norms as beliefs*, *Operative facts*, *Reality that ought to be (Ought-effects)*, *Sources of law*, *Types and tokens (Validity as a pineal gland)*.

Sovereign normative will 47–55

Typicality (abstractness and generality) of law XXIII, 15–7, 22, 29, 32, 35, 86, 148, 233, 350–3

Normative social control. See *Social control*.

Normative subjective positions. See also *Norms as beliefs*, *Reality that ought to be (What is subjectively right)*.

Individual, or individualised, norm 70, 128, 349–53

Legal relations 4, 11, 40, 42, 86, 410

Obligations (or duties) 4–6, 8–11, 22–3, 25, 27, 29, 35, 37, 39–42, 50, 60–1, 69, 86–8, 91, 101–3, 105–14, 118–21, 124, 129, 132, 134–40, 145–7, 150–1, 154, 158–61, 163–8, 171–2, 176–9, 181, 183–4, 203–6, 215, 218–23, 225–32, 240, 242, 244, 258, 266, 280, 288, 296, 312, 334–7, 339, 341–3, 346–52, 396, 413–4, 416–8, 422, 426–7, 430

Rights 4–6, 8–11, 22–3, 29, 35, 37, 39–42, 49–50, 54, 77, 81, 86, 121, 132, 140, 143, 150, 154, 174, 176, 179, 181, 210–1, 217, 228, 232, 234, 240, 246, 273–5, 288–90, 295, 301, 337–8, 341–3, 349, 351, 410, 416, 425, 428, 435

Normative will. See *Voluntarism*.

Normatively obligatory, permitted, or forbidden types of action. See *Types and tokens*.

Normativeness XXIII, XXIV, XXV, XXVI, XXVII, 33, 47–8, 53, 57–65, 69–80, 85, 87–8, 133, 139, 142, 156, 158, 160, 162, 165, 168, 172–85, 202, 209–46, 259–60, 270, 284, 292, 295–6, 333, 341, 355–7, 380–1, 390–1, 393, 395–6, 401. See also *Matrix (authenticity)*, *Morality*, *Norms as beliefs*.

Normativism XXIV, XXV, 11, 47–8, 51, 54–5, 57, 87, 131–2, 134, 139, 144, 153, 156, 172–3, 176, 178, 180, 182, 187–8, 209–14, 240, 337–8, 342–4, 356, 374, 380

Norms XVI, XVII, XXIII, XXIV, XXV, XXVI, XXVII, XXX, 2–6, 13–4, 16–23, 25–42, 44–9, 52–3, 57–60, 63–7, 72–9, 83, 86–8, 92, 94–5, 97–100, 105–13, 131–3, 136–8, 144, 153–4, 156–73, 175, 178, 180–1, 187–90, 197–200, 202–3, 209, 214, 216, 219, 222–33, 235–6, 238–9, 241, 243, 249–51, 257–60, 262–4, 267, 270, 277, 279–92, 296, 303–13, 315, 317–23, 330, 333–5, 339, 341–7, 349–55, 357, 360, 362, 368–70, 372, 374, 377, 379–83, 387–9, 391–2, 396, 401–5, 408, 413–4, 416–20, 423, 432, 434, 436–7. See also *Lex*, *Matrix (authenticity)*, *Normative production (normative causality)*, *Norms as beliefs*, *Reality that ought to be (What is objectively right)*.

Competence norms 50–1, 69–70, 103–4, 116–7, 122–8, 139–41, 145–6, 148–52, 155, 158–9, 161–2, 165, 167, 169, 171–2, 189, 205–7, 217, 242, 245–6, 422

Conditionality of the content of a norm (conditioning type of circumstance and conditioned obligatory, permitted, or forbidden type of action) 7–11, 39, 61–2, 90, 101–5, 115, 123, 167–8, 204, 215, 220, 266, 280, 287, 415

Constitution (constitutional norms) 15, 54, 70, 90, 132, 139–42, 159, 165–6, 183–5, 218, 237, 337, 359, 367, 409–10, 425, 427–9, 435
Normative language 134–5, 183
Norms of conduct 51, 69–70, 116–28, 145–7, 158–9, 162, 172, 206, 210–1, 217, 244–5, 265–6, 421
Norms versus commands 133–7

Norms and behaviour XXVII, 10–1, 17, 24–5, 40, 88–9, 120, 147, 170, 188, 269, 292, 306–7, 372, 398, 400. See also *Norms as beliefs*.
Conformism (being an anomic practising duty-holder) 112–3, 115, 165, 175, 226, 238, 405, 420–1
Custom XXII, 41–2, 44–5, 47, 58, 71, 79, 81, 92–3, 97–8, 110, 112–3, 138, 175, 183, 200, 203, 256, 258, 279–81, 283–4, 286, 288–9, 320–1, 364, 418–9
Deviance (inefficaciousness of a norm, being a nomic non-practising duty-holder) 94, 109–13, 138, 164, 199, 206, 218–9, 226–7, 241–2, 416, 418, 420
Efficaciousness of a norm (abidance, being a nomic practising duty-holder) 33, 92, 109–13, 124, 138, 154, 164, 201, 399, 418, 420
Habit 71, 83, 90–2, 96, 98, 110–3, 137–8, 173, 301, 303–5, 312–3, 316, 406
Jesuits, behaviour of 109–12, 172, 239–40, 420–1
Nonconformism (being an anomic non-practising duty-holder) 112–3, 164, 219, 241–2
Pharisees, behaviour of 112, 258
Practice XXXII, 4, 15, 26, 32, 41, 45, 59, 63–4, 71, 90–2, 98, 104–6, 109–15, 123, 125, 132, 134, 138–9, 141–2, 145–6, 158, 162–3, 165–6, 171, 173, 175–8, 181–3, 194, 197–8, 202–6, 210, 214, 218–9, 226–33, 236, 238, 244–5, 259, 266, 272, 277, 279, 320, 361, 371, 392, 403, 418, 420
Whited sepulchres, behaviour of 109–12, 166, 172, 239–40

Norms are not enough. See *Law*.

Norms as beliefs XXII, XXIII, XXIV, XXIX, XXX, 9–10, 13–5, 17, 19, 25–30, 33, 36, 39, 41, 45, 63, 66, 83, 88, 90, 97–114, 149, 154, 192, 199, 221, 238–9, 247, 256, 277, 281, 283, 292, 346, 360–2, 364, 368–71, 377, 380, 384–5, 388, 393, 395, 397, 401, 404, 410, 413–23, 426. See also *Culture*, *Fate*, *Interference in the motives of behaviour*, *Motives of human behaviour (causae agendi)*, *Normative production (normative causality)*, *Norms and behaviour*, *Person (personality)*, *Reality that ought to be*.
Anomia (being a nonbelieving duty-holder, not being-in-force of a norm) 108–10, 112–3, 229, 231, 241, 282, 416–21
Binding force 3, 5–7, 20, 48–50, 53–5, 57–9, 61–2, 65, 69–70, 73, 75, 77–8, 87, 97–9, 101–5, 111, 115–6, 120–4, 126–7, 132, 134, 138, 141, 151, 155–61, 164, 167–73, 175, 181–4, 205, 215, 244–5, 259, 280, 296, 303–5, 309, 318, 370, 372, 396, 408, 416, 418
Catholodoxia (universalisability of norms) 135–6, 165, 214–8, 225
Deontia (being believed to be a duty-holder) 8, 11, 86, 101–3, 105–14, 118–20, 124, 134, 136, 138–40, 145–7, 151, 164, 171, 203, 206, 215, 218–20, 222–32, 242, 244, 258, 312, 350, 352, 416–8
Deontological versus teleological 72, 87, 203–4, 296, 382, 396
Derivative norms 115–22, 124, 126–8, 150–2, 159, 161–4, 167, 169, 171, 205–6, 242, 244–6
Dikedoxia 136–7, 164, 214–20, 222, 225–6, 265–6
Dogmas 204, 214–8, 399, 435
Doxia (being a believer, existence of a norm, internal point of view) 93–101, 103–4, 108–13, 115–9, 121, 124, 126–8, 134–40, 150–2, 155–6, 159, 161–4, 166–9, 171–2, 181, 189, 204–6, 209, 211, 214–20, 222–33, 236, 240, 242, 244–5, 257–8, 280, 282, 349, 369–70, 383, 398, 400, 402, 405, 416–8, 420–2
Exousia (being believed to be a right-holder) 8, 11, 86, 101–2, 105–8, 118–9, 145, 223–32, 258, 295, 312, 350, 352, 416–8
Fanaticism (enthusiasm) 222, 240, 396
Formalisation of the theory of norms as beliefs 413-23

Heresy 164–5, 214–8, 222, 269, 271–2
Heterodoxia 164–5, 214–8, 225
Integration between norms and validly enacted directives 205–7
Metanoia (normative revolution) 368, 370–1
Nomia (being a believing duty-holder, being-in-force of a norm) 108–11, 124, 134, 138–40, 156, 164, 171, 203–4, 206, 209, 226–7, 242, 244, 280, 355, 418
Orthodoxia 165, 214–8, 222, 225
Paradoxia 164–5, 214–8
Parent norms 118–9, 127–8, 155, 159, 217
Primitive norms 119–20, 122, 126–7, 152, 155, 159, 198, 206, 209, 280, 369–70
Proliferation by subsumption and inference 23, 115–28, 150–2, 155, 157, 159, 161, 164–5, 169, 171, 206, 217, 244–5, 421–3
Proliferation from competence norms 123–8
Proliferation from norms of conduct 117–23
Systems, dynamic and static 117–23

Norms of conduct. See *Norms*, and also *Norms as beliefs*.
Norms versus commands. See *Norms*.
Obligations (or duties). See *Normative subjective positions*.
Obsessive-compulsive disorders. See *Neurosciences*.
Officials. See *Social control*.

Operative facts XXIV.
Declarations of will 24, 35–42, 44, 47, 49–51, 69–70, 119, 154
Facts, acts, and transactions 24, 30, 35–42, 47, 49–51, 53–55, 69–70, 119, 242–4, 246, 435
Promises 17, 48–51, 53, 69, 121, 128, 154, 201, 242–6, 257

Organised power, or force. See *Law*, and also *Interference in the motives of behaviour*, *Social control*.
Orthodoxia. See *Norms as beliefs*, and also *Social control*.
Orthogonal norms. See *Matrix (authenticity)*.
Ought. See *Reality that ought to be*.
Ought-effects in what is objectively right (birth, modification, or extinction of norms). See *Reality that ought to be*, and also *Sources of law*.
Ought-effects in what is subjectively right (birth, modification, or extinction of normative subjective positions). See *Reality that ought to be*, and also *Normative subjective positions*.
Pandectism. See *Jurists*.

Paradigm XX, 156, 245, 281, 334, 389–91, 397, 399–400, 406. See also *Analytical philosophy*.
Epigones 199, 398
Mop-up work 398

Paradoxia. See *Norms as beliefs*, and also *Social control*.
Parent norms. See *Norms as beliefs*.
Parole. See *Language*.

Person (personality) XV, XXV, XXIX, XXX, 6–9, 13, 21, 26, 30, 37, 40, 45, 49, 57, 71, 74, 88–95, 97–102, 104–6, 108–11, 113, 115–8, 120, 125, 127, 132–3, 135–6, 140, 143, 145–8, 151, 154, 161–2, 166–7, 189, 191, 193–4, 196, 198–9, 202, 205, 210, 212–3, 219–21, 232, 241–3, 245–6, 253, 260–1, 264, 266, 269, 271, 277, 285–8, 292, 295, 297–8, 305, 308, 311–2, 335, 352, 355, 357–61, 363, 366, 368–70, 375–81, 383–9, 396–7, 399, 403, 416, 419. Cf. *Culture*.

Rights. See *Normative subjective positions*, and also *Reality that ought to be*.

Role XXV, XXX, 24, 43, 47, 72, 88, 94, 115, 131–2, 144, 157, 172, 176–7, 188, 198, 205, 209–10, 213, 235, 239, 256, 264, 266, 272, 276, 292, 296, 299, 343, 355, 362, 366, 370, 372, 374–9, 381, 384–5, 387–9, 392, 395, 401, 403

Roman jurists. See *Jurists*.
Rule of recognition. See *Matrix (authenticity)*.
Scandinavian legal realism. See *Legal realism*.
Scientia juris. See *Jurists*.
Semantic effects. See *Language*.

Significant others 165, 202–4, 214–5, 357, 384, 387, 389. See also *Generalised other*.
Confirming others XXIII, XXV, XXVI, 247, 355–6, 374, 386

Social construction of reality. See *Culture*.

Social control 5, 110, 136–7, 201–2, 213, 221, 385. See also *Law*, *Norms as beliefs*.
Bureaucracy XXVIII, 205, 236, 241, 246
Judges (courts) XXII, 58, 61, 70, 81, 93, 141–4, 162, 166, 169, 171–2, 175, 181, 183–4, 187, 205, 210, 217, 219, 223, 230, 232–41, 271, 274, 282–3, 291, 312–4, 324, 351, 387, 392, 408
Normative social control on believers 214–8, 225
Normative social control on duty-holders 218, 225
Officials 67, 100, 115, 142, 144, 148, 157, 161, 165–7, 169, 171–3, 175, 178, 181, 183–4, 210–2, 214–5, 219–20, 236, 238, 392

Social structure. See *Micro-macro*.
Socialisation. See *Micro-macro*.

Sources of law XIX, XX, XXI, XXII, XXIV, XXX, 24, 29, 35–55, 57–9, 62–5, 119, 151, 166, 232, 238, 393. See also *Reality that is (Is-events)*, *Reality that ought to be (Ought-effects)*.
Sources of law as Ought-effects in what is objectively right in the reality that ought to be 43
Sources of law as valid Is-events 35, 41, 43, 47

Sovereign normative will. See *Normative production (normative causality)* and also *Voluntarism*.
Species. See *Ratio*.
State of nature. See *Nature*.
Statutory law. See *Law*.
Suggestion. See *Interference in the motives of behaviour*.
Symbols. See *Language*.
Synderesis. See *Reason*.
Systems, dynamic and static. See *Norms as beliefs*.
Texts of law. See *Law*.

Themis 249–50, 270–1, 282–3, 289–90

Tokens. See *Types and tokens*.

Totalitarianism 200, 383. See also *Interference in the motives of behaviour (Suggestion and charisma)*.
Communism 202, 371
Fascism 44, 371
Nazism 180, 202, 395

Type of action. See *Types and tokens.*
Type of circumstance. See *Types and tokens.*
Types. See *Types and tokens.*

Types and tokens XXXIII, 10, 13–22, 105–8, 129, 138, 166–72, 225, 272, 295–6, 299, 305, 307, 310–1, 315, 320–3, 326–31, 355, 365, 385, 414. See also *Ratio.*
- Competence (capacity) 21–2, 24, 42, 50–1, 69–70, 103–4, 113–4, 116–7, 122–8, 139–41, 145–52, 154–5, 158–9, 161–2, 165–7, 169, 171–2, 184, 189, 191–4, 205–7, 210, 217, 239, 242, 245–6, 249, 260, 278, 314, 357, 369, 371, 374, 378, 422, 436
- Metonymic validity of legal directives and texts of law 147–9
- Normatively obligatory, permitted, or forbidden types of action 9, 11, 13–5, 17, 19, 26, 28–30, 33, 39, 61–3, 86, 97–8, 101–3, 115, 145, 147, 281, 283, 303
- Tokens XXIII, 2, 13–33, 35–41, 44–5, 47–8, 65, 86–7, 89, 91–2, 94, 97–9, 101, 103–7, 115–28, 131, 136–7, 145–55, 163, 167, 169, 171, 187, 190–3, 197, 206, 215–7, 220–1, 235, 241, 257, 279–80, 286, 324, 352–3, 358–9, 362–4, 366, 369, 405, 419, 421
- Type of action 16, 69, 86, 89–94, 96–9, 101–6, 115–16, 120–7, 145–7, 151, 171, 197, 202–6, 214–5, 217–20, 222, 226–31, 245, 266, 280–1, 283, 287, 405, 415–6, 419–21
- Type of circumstance XVI, 16, 21, 40, 69, 86, 89–94, 96–9, 101–7, 115–28, 145–52, 154–5, 161–2, 167, 169, 171, 202–6, 217–20, 226–7, 239, 244, 251, 262–4, 266, 280–1, 283, 287–8, 325, 352–3, 356, 359, 363, 371–5, 378–9, 381–2, 384, 395, 404–5, 413, 415–7, 419, 426, 436
- Types are constitutive, rules are regulative 13, 16–22, 33, 147, 151, 167, 169, 362–3, 366
- Validity as a pineal gland 13, 24, 35, 47, 86
- Validity as a token's congruence with a type 13–17, 19–44, 46–7, 50–1, 59, 61, 63–5, 69–71, 83, 86–7, 91–4, 96–9, 101–7, 115–28, 132–7, 140–1, 144–73, 181, 183, 189, 199, 205–6, 216–8, 220, 226–7, 233, 235, 239, 241–2, 244–6, 259, 262, 266, 274, 280, 309, 318–9, 343, 352–3, 362, 366, 392

Typicality (abstractness and generality) of law. See *Normative production (normative causality)* and also *Law*, *Types and tokens.*
Universalisation. See *Norms as beliefs (Catholodoxia).*
Validity. See *Types and tokens.*
Values. See *Motives of human behaviour (causae agendi).*

Voluntarism (will-theories) XXIV, 26, 48–9, 51–3, 55, 57, 74-5, 125, 131–3, 173, 187. See also *Legal positivism.*
- Conative effects XXV, 135–8, 189–97, 201, 204–6
- Normative will 47, 50, 75
- Will of God 62, 72–4

Voluntas. See *Justitia.*
What is objectively right. See *Reality that ought to be* and also *Norms*, *What is right.*

What is right XIX, XXIII, XXVI, XXIX, 6–7, 11, 43, 57–61, 64, 71, 94, 98, 107, 134–7, 140–1, 143, 200, 204–5, 211, 219–22, 242, 259–60, 270–353, 355, 373, 388, 417–8, 435. See also *Dikē, Jus*, *Reality that ought to be.*
- What is right by law 59, 70, 72–3, 76, 269, 406–11
- What is right by nature XXIV, 4–5, 8, 47–55, 58–9, 62–3, 65, 69–70, 72–8, 80–1, 85, 87, 120–1, 138, 187, 244, 269–70, 307, 334, 338, 394, 406–8, 411, 428

What is right by law. See *What is right.*
What is right by nature. See *What is right.*
What is subjectively right. See *Reality that ought to be* and also *Normative subjective positions*, *Norms*, *What is right.*
Whited sepulchres, behaviour of. See *Norms and behaviour.*
Will of God. See *Voluntarism* and also *Nature.*
Wrong tokens (valid and invalid). See *Reality that is* and also *Types and tokens.*

TABLE OF CONTENTS

A Note on the Authors IX

Preface XI

Chapter 1 - What Does "Foundations" Mean? 1

1.1. Basic, Fundamental Concepts 1
1.2. Basic Research 2
1.3. Logical and Epistemological Foundations 2
1.4. Moral or Legitimacy Foundations 3
1.5. Historical, Genetic Foundations of Law 3
1.6. Extra-legal Foundations of Law 4
1.7. Preconditions for the Efficacy of Law 5

Chapter 2 - The Explanandum: What Is Law? 7

2.1. Normativism and Realism 7
2.2. Concept of Law and Theory of Law 8
2.3. Concept of Law and Ideal or Idea of Law 11
2.4. Actor and Observer—Internal and External Point of View 12
2.4.1. Actor and Rules 13
2.4.2. Actor and Observer 14
2.4.3. A Proposal: Scaling Internality 17
2.5. The Concept of Law—A Realist Approach 19
2.5.1. Regularities and Rules 20
2.5.2. A Realist Approach to Legal Norms 23
2.5.3. Etatism versus Pluralism 24
2.5.4. Realism in Practice: Socio-Legal Research 24
2.6. Dimensions of a Legal Order 27
2.7. Functions of Law 27

Chapter 3 - Extra-Legal Foundations of Law—Variations on Legally External Foundations 31

3.1. Transcendent Foundations of Law 31
3.1.1. Mythological Foundations of Law 31
3.1.1.1. On the Notion of Myth 32
3.1.1.2. The *Oresteia* of Aeschylus 33
3.1.1.3. Sophocles' *Antigone* 40

3.1.2. Religious Foundations of Law 42
3.1.2.1. The Process of Civilization in Jewish Law 43
3.1.2.2. Christian Elements 45
3.1.2.3. Islamic Law 50
3.2. Immanent but Legally External Foundations of Law 57
3.2.1. Natural Foundations of Law 57
3.2.1.1. Natural, Extra-Human Foundations: Montesquieu 58
(1) The Approach 58
(2) Counsel to the Legislator 60
(3) Explanations of Social Institutions 61
(4) Résumé 64
(5) After Montesquieu 65
(6) Recent Studies 69
3.2.1.2. Natural, Human Foundations of Law: Biology and Anthropology 70
3.2.1.3. The Cognitive Foundations of Law—An Introduction to the Mentalist Theory of Ethics and Law (*by Matthias Mahlmann*) 75
3.2.1.3.1. The Human Rights Culture and Its Philosophical Reflection 75
3.2.1.3.2. The Moral Faculty and Human Rights 84
3.2.1.3.3. The Properties of the Moral Faculty and the Problem of Justification 92
3.2.1.4. Natural Law Theories—Problems of Transition 100
3.2.2. Economic Foundations of Law 106
3.2.2.1. The Economic Foundationalism of Marx and Engels: Basic Assumptions 106

A NOTE ON THE AUTHORS

HUBERT ROTTLEUTHNER, PhD in philosophy, is Professor of Sociology of Law, Freie Universität Berlin, Faculty of Law. His fields of interest encompass judicial research, the role of law and lawyers (judges, practitioners, law professors, corporate counsel, legislative counsel), efficacy research, Nazi law, law in the former East Germany (GDR), and the theoretical foundations of law. He is author of *Rechtstheorie und Rechtssoziologie* (Alber, 1981), *Einführung in die Rechtssoziologie* (Wissenschaftliche Buchgesellschaft, 1987), and *Steuerung der Justiz in der DDR* (Bundesanzeiger, 1994); he contributed the articles "Nazi Law" and "Class and Law" to the *Encyclopedia of the Social and Behavioral Sciences* (Elsevier, 2002); he is editor of *Recht, Rechtsphilosophie und Nationalsozialismus* (ARSP-Beiheft No. 18/1983).

MATTHIAS MAHLMANN, PhD in law, Assessor, Assistant Professor of Law, Freie Universität Berlin. Areas of research: public law, European law, philosophy of law, sociology of law. Publications include *Rationalismus in der praktischen Theorie* (Nomos, 1999); *Der Staat der Zukunft* (ed. with G. P. Calliess; Steiner, 2002); Katastrophen der Rechtsgeschichte und die autopoietische Evolution des Rechts, *Zeitschrift für Rechtssoziologie* 2000; Die Grundrechtscharta der Europäischen Union, *ZeuS* 2000; Law and Force: 20th Century Radical Legal Philosophy, Post-Modernism and the Foundations of Law, *Res Publica* 2003; The Liberalism of Freedom in the History of Moral Philosophy, *Archiv für Rechts- und Sozialphilosophie* 2003 (with J. Mikhail); Judicial Methodology and Fascist and Nazi Law, in *Darker Legacies of Law in Europe* (ed. Ch. Joerges and N. S. Galeigh; Hart, 2003); Heidegger's Political Philosophy and the Theory of the Liberal State, *Law and Critique* 14, 2003.

PREFACE

While working on this volume I was from time to time confronted with the usual question by my colleagues: what am I writing about? When I told them that—having worked at the "Institute for Foundations and Frontiers of Law" at the Free University Berlin—I was writing about what the Institute stands for, their reactions made clear that the topic of "Foundations of Law" is far from clear. Some expected an essay on basic concepts of law, others thought of moral or natural law foundations, one colleague even thought of foundations in the sense of philanthropic institutions. It should be evident, that this is not what I am writing about. However, observing the wide varieties of meaning given to "Foundations" it seems necessary to clarify at the start what this book is about and what it is not about. In the first part I shall distinguish various meanings of "foundations" of law: basic, fundamental concepts; the normative basis of law; epistemological foundations, etc. I shall deal with these "foundationalisms." Greater weight, however, will be given to what one might call explanatory foundations, i.e., sets of variables by which the origin, the development and the functions of law are sought to be explained. This presupposes that justification and explanation can be distinguished, which is not (yet) the case with mythological and religious foundations. The separation between justification and explanation takes place as soon as "natural" foundations are alluded to: external human conditions as well as human nature. And it is most clearly made in the grand theories that refer to economic, moral (in the sense of empirically given beliefs and attitudes), political and societal foundations.

The goal of exposing and discussing various foundationalist approaches is to criticize what could be called "mono-foundationalism," i.e., those theories that stress only one set of variables, e.g., "the" economy or "the" political power relations. Therefore, I discuss in detail "top foundationalists" like Marx and Engels with their theory of an economic "basis" and a legal "superstructure."

In the main I refer to the history of theories about law; in addition, however, one can find remarks on substantial issues like the development of Islamic societies or problems of transformation in former socialist countries.

Although I deal with a variety of foundationalisms this is not a post-modern piece that celebrates a cult of diversity and multiplicity. Rather, I share a multi-variate approach of the kind that can be found, e.g., in Max Weber. There is no special chapter on Weber; however, his writings will accompany us invariably in the critique of mono-foundationalists. As a "multi-foundationalist" Weber still claimed to explain law in its various dimensions

by referring to external variables. There is no great story to tell about historical steps and stages in foundationalist theories. Rather, there are developments, regressions, revivals. Does this suggest a post-modern point of view? Of course, one could be called upon to explain the development of theories on the explanatory foundations of law. However, I am not going to a meta-meta-discourse.

The reader will find many quotations from classical authors. This is a matter of hermeneutical fairness, which has the side-effect that this volume could also be used as an introductory text-book. Unfortunately the forms of citation requested by the editor of this series, e.g., Hegel 1991, might give the impression that Hegel wrote this book in 1991. When, instead, as you would see for the bibliography, the 1991 edition is of a book originally published in 1820.

My thanks go to Enrico Pattaro for his patient pressure and to his excellent Bologna staff. I am grateful for the linguistic assistance of Lester Mazor, for the discussions and the substantial contributions (partly included in this volume) by Matthias Mahlmann. Last, but not least, Angela Ludwig, Nora Markard and Karen Avetissian where helpful in preparing the manuscript.

Chapter 1

WHAT DOES "FOUNDATIONS" MEAN?

Those who seek for the foundations of something might be searching for a fixed basis, perhaps for an ultimate explanation; for determining grounds or causes; he or she looks for an origin, a beginning, for deeper strata, maybe even for an entity, the essence under or behind the phenomena. This investigation can move within hierarchical models: One drills into the depths or one even finds the "basis" up above, the foundations of religious or governmental authority for instance in God and his grace. Foundations are sought and established, however, also in historical dimensions. Political domination is traced back to a first sovereign, maybe to a mythical king, or to an initial contract, the better to avoid investigating into its historical dating. The basis of existing property relationships is seen in a first acquisition, in a first taking possession of unclaimed property, in a first tillage, etc. In all these models justification and explanation form an indissoluble mixture.

Concerning more particularly the foundations of law, we can find a quite trivial starting point—not in grand theories, but in the law itself. The German *Richtergesetz* (law for the judiciary) states in §5a for the first, academic phase of the study of law "compulsory subjects are the core fields of civil law, criminal law, public law and procedural law, including the implications of European law, of the methods of law and of its philosophical, historical, and social foundations." What did the legislator mean by these "foundations"?

1.1. Basic, Fundamental Concepts

By "foundations" one might mean fundamental, crucial elements that appear in a definition of the concept of law, or basic concepts that are used in order to explain important features or the "essence" of law.[1] One starting point often used in legal-theoretical elaborations is the notion of a norm, and this may be further divided into social norms and legal norms. Sometimes we find a sequence running from instinct—custom—convention—morality to law. We find the distinction between state law and customary law. In order to delineate the realm of legal norms usually the notion of physical sanction is introduced or of coercion issuing from a specialized legal staff. Via the distinction between primary and secondary rules or norms one can explain the hierarchi-

[1] This understanding of "foundations" can be found in Schäfer 1989—with further "basic" topics like positivism and natural law, application, interpretation, and improvement of the law. The Festschrift for Peter Landau collects, under the title "*Grundlagen des Rechts*" (Helmholz et al. 2000), contributions mostly devoted to legal history.

cal structure (the "*Stufenbau*") of a legal order. This leads to the distinction between legislation and adjudication as well. Alternatively, one can start with the differentiation between the social system and the legal system. Usually theories contain remarks on the aims or functions of law (or single legal norms), e.g., on social control, conflict resolution, orientation of expectations and actions, etc. The concepts coupled with law are almost innumerable. Among these "law and ..."-relations we find law and morality, law and state, law and politics, law and power, law and religion, law and economics, law and/as literature, law and social classes as well as law and social change/evolution. Or antithetic couplings like: law in the books/law in action, validity and effectivity (or efficacy), not to mention the classical one of natural law and positivism. Finally law is placed in the context of comprehensive theoretical concepts, mostly from general social theories, like social order, anomie, deviance, conflict, consensus, acceptance, legitimation, domination, authority, sovereignty, etc.

1.2. Basic Research

"Basic research," in contrast to "applied research," could mean, in the case of law, that the basic disciplines like history of law, philosophy of law and sociology of law are separated from the practice of law, which forms the focus of legal doctrine and practical advice. The delimitation sometimes is not so sharp, because the basic disciplines also claim to have a practical impact on legal reasoning, e.g., as an "interpretive and evaluative legal theory" (Dworkin 1986) or a "sociological jurisprudence" providing information that can be applied in legal practice.

1.3. Logical and Epistemological Foundations

Theoretical reconstructions of a legal system as a hierarchical order of norms often use the metaphor of a foundation that sometimes is also placed on the top of the order. Kelsen's "*Grundnorm*" transforms into an "apex norm." It is neither explanatory nor justificatory, but is rather understood as a necessary epistemological presupposition in order to interpret a social order as a legally valid one (see below sec. 4.1). And H. L. A. Hart's fundamental "rule of recognition" is interpreted by G. J. Postema to mean: "law rests, at its foundations, on a special and complex custom or convention" (Postema 1982, 166).[2] Dealing with the same topic, Hart's rule of recognition and his notion of a

[2] Cf. Hart 1961, chap. 6 ("The Foundations of a Legal System"). Postema's "foundationalist" article explains Hart's "rule of recognition" as falling midway between "social fact" and "reason for action." On epistemological "foundationalism" in general, see Chisholm 1982; Sosa 1991 and 1998.

rule in general, Stanley Fish (1989, 507) states: "the foundations of law are linguistic," thus shifting the focus to problems of interpretation. This is not what I shall discuss.

1.4. Moral or Legitimacy Foundations

Under the heading of "moral foundations" one might be treating with extra-legal sources for the binding or legitimizing force of legal norms. Why should one obey the law in general or comply with a particular legal norm? (In contrast to the empirical question: Why is law obeyed or not? Cf. Tyler 1990.) Why should, in particular, a judge apply the law or a specific rule? Or from the point of view of a legislator: Should a certain norm be issued? Is the legislator permitted and competent to do so? What are or should be normative restrictions upon a law-maker, in contrast to empirically restrictive conditions for the efficacy of norms? In general one would have to deal with reasons that can be given in order to justify a legal system/order or single legal rules as valid and/or obliging. Such patterns or criteria of justification could be described in their historical development without regard for their validity. One could also, from a moral or normative point of view, try and give reasons for such criteria (cf. Habermas 1992; Kriele 1994).

1.5. Historical, Genetic Foundations of Law

Another sense of foundations is to speak of historical conditions for the development of the characteristic features of a legal system or of law in general.[3] This entails trying to give answers to the following why-questions:

(a) Why is there normativity at all? How do norms evolve? Is there an evolutionary pattern starting from underlying behavioral regularities or instinct or egoistic calculi via → custom → convention → morality → law? Why does *law* exist in human societies—and not other normative orders? What are the conditions for the evolution of law in human societies? Is there an anthropological basis so that only in human societies (and not also in ape-societies) law can exist? An answer to the question about the historical, phylogenetical origin of law certainly depends on a definition of the concept of law. Of course, the definitions given should be applicable to some kind of historical evidence. So one could ask, e.g.: When was the "unity of primary and secondary norms" (H. L. A. Hart) established? When and where did the big bang of the "autopoietical" closure of the legal system take place (N. Luhmann)?

(b) Why does law develop in a certain way? In particular:

(c) What are the prerequisites for the development of a state monopoly of

[3] Schäfer (1989, 1–8) also contains remarks on the origin of law.

force, rudimentarily embodied in a "third" person or party that can issue obligatory decisions in case of a conflict and is capable of enforcing them? One can consider examples from ethnological research. Other examples, however, from societies that are torn by civil wars, guerrilla war(fare), etc. might be revealing as well.

(d) What are the foundations of the secularization of law (e.g., in the Occident, unlike the Islamic world), of the separation of state and church, of politics and creed?

(e) What are the general preconditions for the existence of the rule of law? (Recent examples might be: Columbia, CIS, countries with civil wars—Ulster, Balkans; see below sec. 3.2.1.4 on transformation of the state of nature.) What are the historical preconditions for the development and institutionalisation of principles of the *Rechtsstaat*, limiting political power by valid legal rules; for the relative autonomy of law, making it immune from economic or political instrumentalization? In order to approach these questions, one can look at the European tradition with its doctrines of natural law and social contract theories. Also currently one is faced with the difficulties of the transformation of formerly nominally-socialist countries into societies under the "rule of law."

(f) What are the preconditions for the development of a global official recognition of human rights? (cf. *infra*, sec. 3.2.1.3)

(g) Following another direction, one could finally take a look at the preconditions for an increasing erosion of legal etatism, considering the various countertendencies of globalization, supranational integration and, at the same time, regionalization. What are the legal losses in these cases? What might be the place of law in a decentralized, deterritorialized "Empire" (Hardt and Negri 2000), in which the fields of economics, politics, and culture are communicatively indistinguishable?

1.6. Extra-legal Foundations of Law

These various kinds of historical preconditions can be brought into a synchronous order under the systematic aspect of the *explanation* of certain legal phenomena—namely an explanation given by reference to extra-legal features. This might be what the legislator of the *Richtergesetz* had in mind. One might, then, refer to mythological, religious, moral, biological, anthropological, natural, economic, political, etc., foundations of law.[4] These "foundations" form a complex variety of variables by which an explanation can be given for different aspects of law: its origin, evolution, and function. "Law is the product of other social facts in the society in which it exists" (Cotterrell 1999, 40).

[4] In Nazi legal education there was also a lecture on "*Völkische* foundations of legal science," where *Volk* is to be understood as a racial unity.

1.7. Preconditions for the Efficacy of Law

From a genetic point of view this set of extra-legal variables often is used in order to explain the origin and evolution of law. Thus law has the status of a dependent variable. From an instrumental point of view, however, those extra-legal variables operate as preconditions for obedience to law and the efficacy of law, i.e., the realization of the aims of the legislator. What counted as genetic conditions for the evolution of law can also be interpreted as limiting conditions for the efficacy of legal regulations. So convention might be the basis upon which legal norms evolve and depend. But from an instrumental point of view, from the perspective of the legislator and the enforcement of legal norms, the conventional or customary orientation of the addressees plays the role of a set of restrictive conditions that have to be taken into account.

Given all the above possibilities, I want to make clear that when I speak in the following about foundations of law I generally mean

– empirical factors, variables, features that are referred to in order to explain the origin, the creation, the development of law and its content, and/or

– external conditions that have to be taken into account by a law-maker, i.e., restrictive conditions for the efficacy of law.

Chapter 2

THE EXPLANANDUM: WHAT IS LAW?

Before we look for extra-legal foundations of law we have to clarify what we mean by law, be it a dependent or an independent variable. Can we find foundations of law "in general"? Or do we have to restrict the analysis to particular legal norms? Do we refer to formally valid law or rather to efficacious legal norms and their functions? Are there similar foundations of the "law in the books" as for the "law in action"? Can we focus on the content of legal norms and on their forms as well? These are well-established systematic distinctions in legal theory. In addition, one could ask from a developmental point of view for the phylogenetic or anthropological foundations, i.e., preconditions of the existence of law in human societies. Furthermore, how did the separation of law from other rules, especially religious or moral ones, take place. Are there fundamental regularities in the historical development of law? With regard to recent times: What are the preconditions of the rule of law and of democracy? What are the foundations of human rights?

2.1. Normativism and Realism

To what are we referring, as law, when we discuss these issues? As a first step, before I begin with problems of how to define "law," I will recall the old debate on the "nature" of law between normativism and realism. Normativists conceive of law as a symbolic, linguistically represented entity with inherent normatively binding force. Their position is based on the experience of feeling obliged, being bound by "valid" norms. They privilege the perspective of an actor who consciously attempts to observe and/or apply given legal rules. In contrast, a realist stresses the objective, real, factual dimensions of a legal order. He or she refers to external events or circumstances existing in time and space, i.e., to "facts." Norms "as such" do not exist. There are observable facts like actors and their activities, organizations and institutional arrangements. Psychic or mental states also might exist. However, they must be accessible for an observer via external patterns of behavior. Intrasubjective knowledge (introspection) and first-person-statements must be replaced by intersubjectively testable propositions.

Realism, so it is said, reduces norms to facts ("law as fact"), but neglects the actor's point of view, i.e., the introspective experience of being bound, obliged by (legal) norms. Rather, realists share the "bad man's" view (Holmes) that looks at law as predictions of future (court) actions. But this, a normativist would reply, is not an adequate description of an internal, e.g., a judge's point of view. A normativist would state that norms exist independent

of being applied or observed. However, in what way do norms or rules "exist"? In the case of moral rules the answer is contestable. Some refer to their social practice or to their acceptance, others to their justifiability. In the case of legal norms the legal order itself implies the answer: Legal norms exist if they are valid, and their validity is constituted or is identifiable by legal norms of a higher order, e.g., if they are constitutionally created.

A normativist would hold that legal norms cannot be reduced to facts because both differ:

– in the way they are created (legal norms are created by "competent" actors according to other legal norms of a higher order; and this is not a way that, e.g., a computer is "materially" produced);
– in the mode of their existence (i.e., their validity in contrast to "things" or events in time and space);
– in the way we can gain knowledge of them, i.e., in their epistemological status. Facts might be observable from an external point of view by applying empirical methods; legal norms require an "understanding" of their particular normative meaning from an internal point of view.

A realist would doubt the meaningfulness of notions like competence, a hierarchy of norms as such, validity, or privileged access from an internal point of view. In what follows next I shall deal with these foundational issues of legal epistemology, before I turn to substantive and explanatory issues of the foundations of law.

2.2. Concept of Law and Theory of Law

In many writings on the concept of law there is a failure to distinguish between definition and theory. They deal with very complex theoretical questions, such as the origin and also the effects or the functions of law; but, they do not provide a definition which may work for pre-theoretical purposes, e.g., for the establishing of mutual consent about what might belong in the sociolegal universe of discourse. What are we talking about when we use the notion of "law"?

This confusion of theory and definition is well revealed in the Marxist-Leninist understanding of law. Here law is "defined" as:

The totality of norms (standards of conduct) determined or confirmed by the state which can be and will be enforced by public authority. They express the present will of the dominant class. Law is the fixation of existing property relations and of the social interactions generated by them. It protects and preserves these conditions. (Klaus and Buhr 1964, 463; my translation)

Law is the state-will of the dominant class whose content is ultimately determined by the material conditions of life. It is expressed by a system of universally binding rules which aim at in-

fluencing the social conditions, the realisation of which is guaranteed by public coercion. (Institut für Theorie des Staates und des Rechts der Akademie der Wissenschaften der DDR 1975, 88; my translation)

These definitions contain brief statements about the origin, the development, and the effects or functions of law. This is, however, what one would expect from a *theory* of law, or more exactly, from a sociological theory of law. Consequently, the question arises whether such a theory is empirically testable and if so, whether the theory will stand the test. One objection, e.g., might be that the multifarious functions of law are inadequately reduced to only one, e.g., the preservation of property relations in the interest of the ruling class.

Enumerating the functions of law "theoretically" (e.g., as social control, securing of expectations, solution of conflicts, providing legitimation, etc.) one always can ask if law really fulfils those functions and/or to which extent this might be the case. However, determining these functions presupposes first at all that we know how law can be identified as a set of rules as distinct from other kinds of rules.

Luhmann similarly mixes definition and theory when he "defines" law as structure of a social system based on a substantively, temporally and socially congruent generalisation of normative behaviour expectations (Luhmann 1972, 105; cf. *infra*, sec. 4.2). This is an abridged version of his theory of the origin of legal norms.

In contributions on the sociological concept of law, W. Krawietz (1988; 1989) characterises imperatives (commands), coercion (sanctions) or recognition as different structural elements of law, thus trying to establish a new definition of "law." By mentioning these three features or "factors," he alludes to the well known triad of the imperative or command theory of law, the sanctions theory and the recognition theory of law. By using these labels it is obvious that this is a *theoretical* approach and not a definition. Nevertheless, Krawietz attempts to use these theories in order to re-define the sociological concept of law. I understand these three "theories" in the sense that they attempt to give an answer to quite different questions (therefore, they do not have to necessarily contradict each other). I do not interpret these "factors" as constitutive elements of the "essence," or "nature," or "structure" of law. Instead, I understand at least two of them, i.e., the sanctions theory of law as well as the recognition theory, as theories containing different, empirically testable assumptions about the motivating power of legal rules, especially of the threats of legal sanctions.[1] These two theories claim that either legal norms are observed mainly because of the threat of sanctions or that the addressees "voluntarily" comply with the law. Therefore, both theories imply verifiable

[1] The "imperative theory" of law (Austin, Kelsen, et al.) claims that all legal norms can be reduced to imperatives or commands. This is a problem of definition concerning the *genus proximum* of law.

explanations of norm conforming behavior. These still sketchy explanations could be elaborated within the framework of research on the efficacy of law. But frequently the assumptions made within these theories are treated as necessary and essential statements about law which do not require any empirical proof.

Max Weber usually is treated as a prominent representative of the "coercion or sanctions theory" of law. He distinguishes between convention and law as two "social orders." According to his definition the validity of a legal order is guaranteed by the probability ("*Chance*") of coercion executed by a specialized staff (in contrast to a diffuse "disapproval" by a given group of persons in the case of convention).

> An order will be called
> (a) *convention* so far as its validity is externally guaranteed by the probability that deviation from it within a given social group will result in a relatively general and practically significant reaction of disapproval;
> (b) *law* if it is externally guaranteed by the probability that physical or psychological coercion will be applied by a *staff* of people in order to bring about compliance or avenge violation. (Weber 1978, 34)

An "order" in Weber's sense does not consist of behavioral regularities or "factual regularities *of* conduct" ("*Regelmäßigkeiten des Sichverhaltens*"), but of rules *for* conduct ("*Regeln für das Verhalten*"). "Factual regularities *of* conduct ('customs') can [...] become the source of rules *for* conduct ('conventions,' 'law')" (ibid., 332).

Weber's definition is wrongly criticised by T. Raiser (1999, 124) who maintains that Weber had seen coercion by a legal staff as the crucial motive for compliance with the law. This, however, Weber did not claim in giving his definition of a legal order. The question of motivation for norm conforming behavior—with which Weber dealt elsewhere—can only be answered by a substantive theory of the sociology of law. The framing of such a theory presupposes the solution of the question of definition, i.e., that legal rules can be demarcated from other kinds of rules, e.g., from conventional rules. It would be more accurate, therefore, to say that Weber presented a legal *concept* implying coercion, instead of a coercion *theory* of law. The use of the concept of coercion as one element of the definition of a legal order does not necessarily imply that the threat of sanctions is the main motive for the observation of legal norms.[2] It is one thing to identify legal rules in contrast to other social

[2] Weber clearly states that it is not the threat of sanctions that makes people comply with legal norms: "It is in no way inherent, however, in the validity of a legal norm as normally conceived, that those who obey do so, predominantly or in any way, because of the availability of such a coercive apparatus as defined above. The motives for obedience may rather be of many different kinds. In the majority of cases, they are predominantly utilitarian or ethical or subjectively conventional, i.e., consisting of the fear of disapproval by the environment"

rules, but quite another thing to answer the question why people obey legal rules thus identified. It is important to see, especially in the case of Weber, that one can use "coercion" as an essential element of the definition of law, and at the same time state that legal norms are not complied with because of the threat of sanctions, but because of, e.g., the "internalization" of conventional rules. Max Weber's typology of legitimate forms of domination ("*Herrschaft*") (charismatic, traditional, legal) is introduced in order to explain why people in general observe commands.

2.3. Concept of Law and Ideal or Idea of Law

Another misunderstanding of Weber's attempt to give a definition of a legal order lies in the critique (also presented by Raiser 1999, 124) that Weber's "value-free" concept of law confers legal validity upon every regulation issued by a state authority. Max Weber, however, offers a definition of law but does not intend to frame an ideal of law. A definition should allow the drawing of a distinction between the legal and the non-legal, between law and not-law, but need not distinguish between the legal and illegal (just and unjust law).

Kant's question "What is law?" aims exactly at the difference between "*iustum et iniustum*" with which—as Kant (1954, 33ff.) stated—one can embarrass legal scholars just as one can embarrass logicians with the question "What is truth?" Kant's aphorism—a standard quotation in treatises on the concept of law—is apt to be misleading since Kant does not intend to define what is to be understood by "law," but instead is attempting to establish an ideal of law by finding reasonable criteria for the just and the unjust. Kant's distinction between a "philosophical theory" of law that seeks the source of judgements in pure reason and an "empirical theory of law" does not correspond to the distinction between the ideal of law and the concept of law used in an empirical approach to law. Kant's so-called "empirical theorist of law" who is able to answer the question "*quid sit iuris?*" is not a sociologist or anthropologist of law but is actually employing a legal-dogmatic approach. He or she uses it to determine the content of positively valid law. This "empirical" treatment of law is not a sociological, but a legal-dogmatic one.[3]

Advocates of the theory of recognition of law shift from statements about the motives of why the law actually is obeyed to the formulation of an ideal of law by deploying the element of acceptance or consensus as a *normative* criterion by which the validity (in the sense of the legitimacy) of legal rules can be

(Weber 1978, 314). "A legal order is empirically 'valid' owing not so much to the availability of coercive guaranties as to its habituation as 'usage' and its 'routinization.' To this should be added the pressure of convention which, in most cases, disapproves any flagrant deviation from conduct corresponding to that order" (ibid., 332). See also ibid., 320, 324–5, 332–3.

[3] This false interpretation can be found in Krawietz 1989, 109ff.; but cf. Dreier 1986, 9.

assessed. They answer the Kantian question of which legal rules are just or unjust by saying: only those rules that are accepted or, rather, that are acceptable. This is an issue for the philosophy of law and not for the sociology of law.

To sum up: One should clearly distinguish between substantive aspects that concern a theory of law (e.g., why do people comply with a law: Because of the threat of sanctions; because of their voluntary acceptance?) on the one hand and methodological issues on the other such as the formulation of criteria that permit the identification and delimitation of legal rules. That is what the task of a definition is about.

Theoretical efforts require first and foremost a definition that allows the identification of *legal* rules in order to set them apart from other social rules. And all these efforts for theory as well as for definition should be separated from efforts for the formulation of an ideal law. A definition is neither true nor false. It can be more or less useful and appropriate to solve certain problems. The aim of a sociological definition of law is to determine the area and scope of socio-legal statements. The adequacy of a proposed definition can be judged according to its capacity for coping with this problem.

2.4. Actor and Observer—Internal and External Point of View

The distinction between a philosophical analysis of (ideal) law and a sociological treatment sometimes is labelled with the dichotomy of an internal and external point of view. Thus wrote Habermas:

> Without the view of law as an empirical action system, philosophical concepts remain empty. However, insofar as the sociology of law insists on an objectivating view from the outside, remaining insensitive to the symbolic dimension whose meaning is only internally accessible, sociological perception falls into the opposite danger of remaining blind. (Habermas 1996, 66)[4]

This kind of distinction between external and internal point of view, of external or internal statements, is crucial in the work of H. L. A. Hart (Hart 1961).[5] From his perspective this is so not only for the analysis of central legal concepts like "obligation," but beyond legal theory for disciplines concerned with social rules and thus for legal sociology.

The distinction of internal and external aspects is apparently used in two contexts in Hart's work:

[4] German original: "Ohne den Blick auf das Recht als empirisches Handlungssystem bleiben die philosophischen Begriffe leer. Soweit sich aber die Rechtssoziologie auf den objektivierenden Blick von außen versteift und gegenüber dem nur intern zugänglichen Sinn der symbolischen Dimension unempfindlich ist, gerät umgekehrt die soziologische Anschauung in Gefahr, blind zu bleiben" (Habermas 1992, 90).

[5] In the postscript to the second edition of *The Concept of Law* Hart distinguishes internal and external statements of law and internal and external aspects of law (Hart 1994, 254).

– First, in the context of the relation of a (single) actor towards social rules;
– Second, in the context of the relation of actor and observer.

An internal point of view is explained by the intrasubjective relationship of the actor towards the rules he/she is abiding by. To explain an external point of view an observer is included in the analysis, making it intersubjective. In what follows, I am going to elaborate this basic distinction further. I want to show that the distinction between an internal and external point of view can be used in both dimensions of intra- and of intersubjectivity. I will put greater emphasis on the second, social dimension.

2.4.1. Actor and Rules

a) Internal

Hart takes a stand against the kind of realism in legal theory that regards the meaning of rules as nothing but a prediction of conduct, e.g., of judges. Instead, he says that rules are guides of conduct. They are the basis of justifications and critique of decisions. Rules are a reference point for claims and demands, for social pressure in order to achieve conformity. An "internal point of view" is marked by "a critical reflective attitude to certain patterns of behaviour as a common standard" (Hart 1961, 56). Somebody characterized by such an attitude is behaving conforming to the rules. He or she accepts the rules and regards them as patterns of action orientation.[6] A "feeling" of obligation is—contrary to A. Ross—not necessary (ibid., 56, 86). That kind of psychologism is dispensable in an analysis of normative language (e.g., of "I/you have an obligation…") like that of Hart.

b) External

The "external point of view" is taken to be that of an observer who investigates the action of an agent only as it corresponds to underlying regularities and who formulates a prediction without regard to the understanding of the agents. (An example for this is the kind of investigation of the judiciary that tried to understand and predict judicial behavior by investigating the social background of the judges.) There are remarks by Hart referring to an actor who deals with rules differently than from an internal point of view. Such an agent does not accept them and does not use them as a standard for acting.

[6] "[…] to be concerned with the rules […] as a member of the group which accepts and uses them as guides to conduct" (Hart 1961, 86); "accept and voluntarily co-operate in maintaining the rules" (ibid., 88).

He/she shows conformity only to evade the negative sanctions imminent in the case of a breach of the rules. He/she considers thus regularities in the reaction after violations of the norm. "I am likely to suffer for it if…" is the respective first-person-singular remark.

> The external point of view may very nearly reproduce the way in which the rules function in the lives of certain members of the group, namely those who reject its rules and are only concerned with them when and because they judge that unpleasant consequences are likely to follow violation. (Hart 1961, 88)[7]

2.4.2. Actor and Observer

The external point of view is usually not explained in term of the relation of an agent towards the rules he abides by, but in the relationship of an observer towards an actor following rules. This point of view is external because it neglects the subjective point of view of the actor and focuses on a description of the actor's behavior "in terms of observable regularities of conduct, predictions, probabilities and signs" (Hart 1961, 87; cf. ibid., 55, 88). "He (i.e., the observer) may merely record the regularities of behaviour on the part of those who comply with the rules as if they were mere habits, without referring to the fact that these patterns are regarded by members of the society as standards of correct behaviour" (ibid., 244). The external observer describes acting not according to the rules that are the internal basis of orientation for the actors, including the law applying officials, but as a regularity—perhaps in the sense of T. Geiger: Given a certain situation, a certain action is manifested (cf. Geiger 1964, 49).

One could call the relationship of observer and actor "internal," if the former would take account of the subjective orientation in his descriptions, explanations and predictions. This is neither the case for Hart nor for his critics. It required some argumentative efforts to clarify that an observer cannot only use a kind of description that solely relies on empirical correlations (regularities), but includes the subjective understanding of the actor as well. This seems to be self-evident for a sociologist who is familiar with interpretive sociology (e.g., in Max Weber) and the notion of a "participant observer"[8] which relativises the apparently clear dichotomy of observer and actor.

Neil MacCormick (1981, 33–40) decomposed the external point of view into an extreme external point of view and a less extreme, hermeneutical point of view. A hermeneutic observer knows cognitively about the subjective

[7] Ibid.: "reject the rules and attend to them only from the external point of view as a sign of possible punishment."

[8] A classic example of legal sociology is Lautmann 1972. Lautmann participated as a judge in legal proceedings. He also wrote a sociological protocol, leaving open the question when he acted as Dr. Jekyll and when as Mr. Hyde.

grounds for acting of the actors within a relevant group, without necessarily sharing volitionally their point of view, without sharing their personal commitments. He is informed about the legal situation without regarding it as an obligation. A descriptive use of rules, their use as information does not imply their acceptance. This yields a trichotomy of internal, hermeneutical and extreme external.

Hart (1983a, 14ff.) later accepted this trichotomy. He distinguishes between an internal perspective in the sense of the "'acceptance' of preferred patterns of conduct as guides and standards of criticism" and an external perspective meaning "recognition of their acceptance by others" (ibid., 14). A third perspective, that is not explained further, would be an extreme external perspective. This concession of Hart is not surprising. He allowed the observer in the first edition of *The Concept of Law* to do much more than just to state regularities and probabilities or give predictions. The distinction of "accepting a rule" and "stating the fact that it is accepted" appears already (Hart 1961, 99, 244).[9] In general, Hart's observer seems to know that rule guided behavior is subject to observation.[10] This behavior is only described *as if* it consists of nothing but regularities and correlations—in an act of conscious estrangement ("as if they were mere habits," cf. *supra*, 14). The more fundamental problem, how to determine by observation whether somebody is following a rule or whether the behavior is nothing but a regularity, is not a problem for Hart's observer.[11] The essential point of the external perspective for Hart is that the observer, unlike the actor, is not necessarily accepting the rules. "For the observer may, without accepting the rules himself, assert that the group accepts the rules, and thus may from the outside refer to the way in which they are concerned with them from the internal point of view" (ibid., 87). "Not accepting" does not mean for Hart as for MacCormick that the observer is against these rules. The observer takes rather a detached uncommitted stance towards them.[12]

The concept of "detached normative/legal statements," introduced by J. Raz (1979, 153ff.), criticising Kelsen, was taken up by Hart and MacCormick to clarify the hermeneutical point of view. An "uncommitted adoption" of the perspective of somebody following rules is possible. This perspective does not oblige somebody to accept these rules. Examples of such detached statements are the advice by a lawyer for his clients, the lecture of an academic about the

[9] The second kind of statement is a case of "external statement."

[10] Hart (1961, 96) describes as external "the view of those who do not merely record and predict behaviour conforming to rules." This implies a hermeneutical presupposition.

[11] In research, this problem emerges in societies lacking a developed legal order (in Hart's sense). Cf. *infra*, sec. 2.5.1.

[12] I am not sure about Hart. The external point of view is something he finds in members of a group "who reject its rules" (Hart 1961, 88). In any case, acceptance carries a positive connotation in Hart.

existing law or the Catholic being an expert on Jewish law who advices an uninformed Jew about an obligation.

Raz develops a different trichotomy of statements than the trichotomy of external, hermeneutical and internal:

– "Internal statements are those applying the law, using it as a standard by which to evaluate, guide, or criticize behaviour" (ibid., 154).[13]

– External remarks are concerned with empirical states of affairs like actions or attitudes related to law. "External statements about the law are statements about people's practices and actions, attitudes and beliefs concerning the law" (ibid.).[14] They are not the extreme-external remarks of Hart in the sense of pure regularities or correlations without concern for aspects of rule following.

– In addition, there are distanced remarks about the normative situation in the sense of information or legal advice: "non-committed normative statements," "detached statements or statements from the legal point of view" (Raz 1980, 236). These are not statements about opinions, attitudes or convictions about norms. For this third group Raz introduced the term "indirect normative statements" in contrast to direct normative or internal statements (ibid., 49).

MacCormick (1981, 40) introduced the distinction of

– "statement of a rule" in the sense of an informative statement of norms and

– "statement about a rule." Such a statement adds to the information about the norm a further empirically verifiable element, e.g., "it is improbable, that the norm *X* will be derogated soon." Or it contains an assertion that somebody is of the opinion that norm *X* exists. Such a statement (e.g., "In England they recognize…") both Hart as Raz took as an "external statement" (Hart 1961, 99). In such a statement no acceptance of a norm is expressed but something is asserted about the fact of acceptance.

Hart's initial dichotomy begins to become dubious. We have thus developed a distinction of statements that is at least fourfold.

– Internal: direct normative statements; committed normative statements; acceptance of rules that are a point of orientation for the actor;

– Hermeneutical: indirect normative statements; uncommitted, detached information; recommendations; "statement of a rule";

[13] "They are internal, fully committed normative statements"(ibid., 155).

[14] Or: Such a statement "does not commit the speaker to the normative view it expresses" (ibid., 153).

– Statements about facts related to norms: "statement about a rule"; about opinions, attitudes, convictions, actions, that are related to rules, e.g., their acceptance. The case of an external attitude of a (single) actor abiding by laws only because of the fear of sanctions belongs to this group of statements. This is because these kinds of statements are dependent on a prediction about the actions of the legal staff who are guided by rules.

– Extreme-external: statements about pure regularities, correlations, predictions of behaviour without reference to the internal point of view.

Hart apparently does not distinguish in his "postscript" (Hart 1994, 242ff.) between the second and third kind of statement. His "descriptive legal theory" is formulated from the point of view of a non-participating observer who describes the internal perspective of the agents from a morally neutral point of view. The agent's point of view consists in accepting the rule as an orientation for action and as a standard of critique. The observer does not accept the rules himself, but he can describe the fact of accepting a rule. Extreme-external statements are no longer part of the theory.

2.4.3. A Proposal: Scaling Internality

As the initial dichotomy has been dissolved, it seems reasonable to abandon the classification of different points of views or types of statements in order to develop as an alternative an ordinal scale. This would recognise different grades of "internality" (or "externality") in the relation between observer and actor—or to be more precise: of agents, who occupy different roles and positions in social interaction as regards to rules.

– A relation beyond the medium of language can be adopted as the beginning. The agent does not possess the faculty of language; the observer, who has the capacity to speak, is thus unable to enter into a communicative relation. This situation is found in the context of ethological research with primates. One can ask, for example, whether baboons, chimpanzees, etc. are following rules, in general, whether there is an ape-law (cf. Mahlmann 1999, 311ff.). One has to seriously ask the question in this context whether there is real rule following in these cases or mere regularities. Is linguistic symbolisation the precondition of abiding by a rule? When does—to use Hart's terminology—the observation of social "patterns of conduct" become the agent's use of these patterns as "guides to future conduct"? And what is it that an external observer is actually observing in this process?

– We introduce the capacity to use language for both the agent and the observer. They do not, however, actually have to communicate with each other. This constellation applies to the "understanding of foreign cultures" at an early stage, e.g., when anthropologists are investigating the rules of an un-

known tribe and are in the beginning only able to identify certain regularities. Or: What does a foreigner understand about behavior in Tokyo if he does not know Japanese?

– Further gradations of "internality" are significant for the social sciences at least in two dimensions: First, as to the choice of the descriptive frame of reference. An "external" description of actions consists in the use of concepts that are unfamiliar to the agent. One can, e.g., describe a trial in terms of symbolic interactionism, of role theory, of linguistics, etc. (This is not a description in the framework of correlation and probabilities.) One can analyse, too, on a higher grade of internality, the same actions by using the rules that are applied by the agents themselves. In these cases legal norms are used in a descriptive manner, e.g., if a trial is described in terms of the relevant procedural norms, actions appear as cases of application of rules. A problem for legal sociology consists—among others—in deciding to which degree the interpretations of the agents or even the exegetical endeavours of judges are part of the study. One thus uses to a smaller or greater degree knowledge about the norms and values of the actors. This perspective is an equivalent to the perspective of a hermeneutical observer (in the sense of MacCormick), who is cognitively concerned with the self-understanding of the relevant group without sharing their point of view, however, volitionally.

– A further gradation is the result of the choice between different methods of data collection. In empirical sociology a distinction is drawn between unobtrusive and obtrusive (non-reactive and reactive) methods. The researcher does not influence the object of scrutiny in the former case, e.g., analysing the content of texts or conducting (covert) observations. In the latter case the data collection itself causes certain reactions in the object of research, e.g., in the context of interviews and questionnaires. In this case there are communications between researcher and "object."

– We have spoken about rule following and acceptance in the context of the discussion of Hart's work. In the practice of sociology and criminology there is the problem of identifying and explaining the following of rules and their transgression. One has to decide whether the variable "norm compliance" simply to be interpreted as "norm corresponding behaviour" or whether internal motivation is to be a precondition (the actor complies with the norm *because of* the norm).[15] In the first case an observer is from an external point of view capable of determining whether there is rule-following or not.[16] The first version is preferable because it allows a clear distinction be-

[15] Compare Theodor Geiger 1964, 87 (my translation): "To act *in accordance* with the norm does not necessarily mean to *follow* the norm." ("In tatsächlichem *Einklang* mit der Norm handeln, heißt nicht notwendig: die Norm *befolgen*.")

[16] Cf. Opp 1973. On the theory of norm compliance, see ibid., 190ff. Opp (ibid., 192) prefers to define rule following as abiding by rules from the perspective of an observer.

tween the behaviour of the agent and his motives. A theory of norm compliance would contain variables to explain the dependent variable "degree of norm conformity." Some of these explanatory (independent) variables would be knowledge of the norms; identification with the aims of the legislator (this might be what is meant by "acceptance" in Hart); or the subjective assumptions about the probability and severity of sanctions. These variables would be—as far as the relations of agents and rules are concerned—a mixture of internal and external points of views. One can find out something about them only through communication with the agents.

– Within this social scientific communication further gradations are possible. The communication that usually takes place in survey studies (using questionnaires or conducting interviews) is usually wholly "external" or unilateral in the sense of a sheer, asymmetrical asking of opinions, convictions, etc. (This is known, too, from certain journalistic interviews.) The detached or uncommitted point of view in the sense of MacCormick or Raz disappears for a researcher to the degree that he/she conducts what has been called "action research."

– Given these insights the demarcation between neutral, "value-free" social research and strategic communication motivated by interests becomes obscure. A case of the latter kind of communication (which forms a part of MacCormick's and Raz's examples, too) is, e.g., the advice of an advocate to her client. She can give information about the probable outcome of a trial without accepting the result as right or just.

– A further step that truly leads to an internal relation between agent and observer consists in a communication between the two about the justification of norms and values. This is only possible if both are prepared to take the other's point of view. Such a commitment (that is not only cognitive any more) does not imply the acceptance of the values and rules of the other. In this internal relation the distinction of actor and observer is dissolved. Both act within a normative discourse. The attribute "internal" however, does not refer anymore to the individual relation of an agent towards guiding rules.

– I do not think the final step towards "internality" is necessarily a state of affairs where both actors agree in their normative orientations. This appears to demand too much harmony. An "attitude of shared acceptance of rules" (Hart 1961, 99) might be the result of the process. One might even take "acceptance" to be a very valuable state of affairs. This seems to be true for Hart. One should, however, not lose interest in normative dissent and reasoned divergent behaviour.

2.5. The Concept of Law—A Realist Approach

This scale of internality can be applied in order to clarify some traditional problems of the concept of law. There is a widespread inclination to enter

into an abstract discussion of "the" realist (sociological) concept of law in contrast to "the" idealist (philosophical) concept, of how the normative and empirical are dialectically interwoven, of the intricate relationship of is and ought, etc. The real need to give a definition of the concept of law to be used in empirical research, however, arises from the question whether certain observable patterns of behavior can be described as an act of following or violating a norm or of using it; and not only compliance with or using a norm in general, but especially: a *legal* norm. It is this context that the problem of what comprises an external description comes up. Is it sufficient to describe an action as being in accordance with a legal rule or must the observer, in addition, presuppose that the actor himself feels obliged or is oriented by the rule—and how can an observer find that out?

2.5.1. Regularities and Rules

This problem, however, rarely appears in conventional socio-legal research (i.e., in societies with an elaborated legal system). It typically arises in legal-anthropological research when a field-observer tries to find out which norms, and in particular which legal norms, exist in a group or in a whole society (level 2/3 on the scale of internality). The problem may also appear in the analysis of modern societies—if one studies them from the artificially alienated point of view of an anthropologist, i.e., if one does not simply rely on legal-dogmatic information about Acts of Parliament or if one does not only ask a "native" lawyer. As a field-researcher in modern societies one could, e.g., observe in the USA that people put their beer-cans, bottles of wine and whiskey into brown paper bags when they leave a liquor-store. When is a norm observed, when is a legal rule observed, where does only a habit or custom exist?

Two distinct questions have to be answered from the legal-anthropological point of view:

(1) Do our observations reveal merely a simple custom, a regularity in behavior, or is what we observe the following of or the use of a rule, of a norm?

(2) If a norm is followed (or transgressed or used) what kind of a norm is it: an ethical norm, a moral norm or a legal norm?

The second question deals with the classification or definitory delimitation of different kinds of norms or rules. The classification of custom / morality / law is also genetically used with a double meaning: first, phylogenetically (concerning the question how law came into this world and how it evolved), second, in relation to actual legislation—as if legal rules flow in a kind of a norm-cascade from custom and morality (cf. Geiger 1979, 170). This would

be again a *theoretical* attempt to explain the origin and evolution of law, but not a *definition* in the strict sense of a classificatory delimitation of various kinds of social norms. The solution of the genetic question requires that an answer be given to the question of definition first, i.e., the question of classificatory identification. Otherwise one could not know if one is speaking about legal rules at all.

An answer to the two above mentioned questions relevant in legal anthropology should consequently be found in observational studies: (1) the question of the delimitation of regularities and rules or norms, and (2) the question of the delimitation of different kinds of social norms. What kind of behavior and what behavioral sequences do we have to observe in order to say that there is a valid legal rule, and in order to state its content? Referring to the scale of internality, we can distinguish between a situation where no communication is possible, where the observer is restricted to "mere" observation and a situation where he or she can communicate with the "natives," e.g., by conducting interviews with them. But how trustworthy and reliable are their statements? Do these persons actually know that they are following a rule and which one it is? Who in a given society is competent to provide valid information?

We can speak of a norm as existing only if there is a violation that is followed by a sanction. And we can only speak of a legal rule if the sanction is enforced by a special person or group which displays at least rudimentary elements of a "legal staff." In this sense R. Lautmann defines "law" in a dictionary of sociology as "the sum of those behavioral rules the violation of which is sanctioned by an authorized instance (at least in a psychic manner, like indignation). This broad concept also can be used in the work of ethnologists" (Lautmann 1978, 626; my translation). And this concept—I would add—can also be used by lawyers of public international law and canonical law. The original problem, however, recurs on a higher level: How can we identify from an external point of view an "authorized instance"? Can we reduce "authority" or "authorization" to behavioral regularities, e.g., of obedience? Is it necessary to identify and to "understand" rules that confer competences upon certain persons and groups? Must these persons/groups and their activities be "accepted" by a majority of people—whose acceptance could not be reduced to mere regularities of compliance? In addition, the definition quoted above neglects the constitutive function of legal norms (cf. *infra*, 29–30).

The distinction between regularities and rules often is understood in the sense of a temporal sequence or as a genetic chain: First there were regularities of behavior, habits, customs, usage, etc. out of which rules of convention, morality and finally law evolved. In the beginning there were customs, then came customary law, and at the end positive, state law. Or, in general, first there were facts, then came norms. I already have quoted from Max Weber the statement: "Factual regularities *of* conduct ('customs') can [...] become

the source of rules *for* conduct ('conventions,' 'law')" (Weber 1978, 332).[17] But what does "source" here mean? Do rules evolve out of regularities? Can rules be qualified as regularities + a deontic operator? That means: to the expression of a regularity $x \rightarrow y$ via the "normative power of facticity" ("*normative Kraft des Faktischen*," G. Jellinek) an obligation-operator would be added: $x \rightarrow (O)y$. It is not clear whether Weber distinguishes regularities and rules, or: Custom, convention, law systematically and thus coexisting, or whether he means to arrange them as a sequence in temporal order.

> Law, convention, and custom belong to the same continuum with imperceptible transitions[18] leading from one to the other. We shall define *custom* (*Sitte*) to mean a typically uniform activity which is kept on the beaten track simply because men are "accustomed" to it and persist in it by unreflective imitation. It is a collective way of acting (*Massenhandeln*), the perpetuation of which by the individual is not "required" in any sense by anyone.
>
> *Convention*, on the other hand, shall be said to exist wherever a certain conduct is sought to be induced without, however, any coercion, physical or psychological, and, at least under normal circumstances, without any direct reaction other than the expression of approval or disapproval on the part of those persons who constitute the environment of the actor. (Weber 1978, 319)

This "continuum" could be interpreted as both a systematical and a temporal one. In another paragraph Weber clearly qualifies mere regularities as phylogenetically "primary," and in our sense as "foundational" for rules or norms. According to Weber, organically conditioned regularities, as a psychophysical reality, are "primary." "Binding" norms are based upon "natural" norms.

> We have no access, however, to the "subjective" experiences of the first *homo sapiens* and such concepts as the allegedly primordial, or even *a priori*, character of law or convention are of no use whatsoever to empirical sociology. It is not due to the assumed binding force of some rule or norm that the conduct of primitive man manifests certain external factual regularities, especially in his relation to his fellows. On the contrary, those organically conditioned regularities which we have to accept as psychophysical reality, are primary. It is from them that the concept of "natural norms" arises. The inner orientation towards such regularities contains in itself very tangible inhibitions against "innovations," a fact which can be observed even today by everyone in his daily experiences, and it constitutes a strong support for the belief in such binding norms. (Ibid., 321)

The approach which locates the foundations of law in a complex of facts out of which norms are generated can be found, as we shall see later in detail, in many authors. In Marx, e.g., a superstructure full of norms is built upon a factual, norm-free basis (cf. *infra*, 113–5). In Eugen Ehrlich so-called "facts of law" generate the living law (cf. *infra*, sec. 3.2.4.). And according to Theodor Geiger norms evolve out of factual "*Gebaren*" (Geiger 1964, 48ff.).

[17] "Everywhere what has been traditionally handed down has been an important source of what has come to be enforced" (ibid., 29).

[18] "It should thus be clear that, from the point of view of sociology, the transitions from mere usage to convention and from it to law are fluid" (Weber 1978, 325).

This point of view has become taken for granted, almost a truism. Therefore it is important to clearly point out distinct counter-positions. In Kelsen, e.g., is and ought (*Sein* and *Sollen*) form two original epistemological modes of perceiving the world (i.e., the neo-kantian "*Etwas*"). One cannot be reduced to another, neither systematically nor temporally. The "early" Luhmann introduced expectations as a basic category. They are facts; but there are originally two different modes of expecting: a cognitive and a normative one. Norms, and finally legal norms, evolve out of normative expectations. This leads to the strong phylogenetic assumption that norms and even law existed from the start (*ubi societas, ibi ius*):

> We are not returning to the popular thesis that there have been societies without law either in the history of mankind or even in crosscultural comparisons of the present (namely, those which do not have a coercive state apparatus). Rather, our functional concept of law makes it clear that law fulfils a necessary function in every meaningfully constituted society and must therefore always exist. The development of law is not to be understood as the step from the pre-legal to legal forms of societies, but as a gradual differentiation and functional independence of law. (Luhmann 1985, 82–3)

Later I shall return to the question of how law, i.e., according to Luhmann, "congruently generalized normative behavioral expectations" came into being (cf. *infra*, 100ff.). Luhmann's assumption comes from Parsons' critique of the utilitarian model of action. In a state of nature norms exist as soon as there are actions. There are no actions without norms, nor are there actions based merely on individual calculi of cost and benefit. In this context, however, it is revealing that also Economic Analysis (of Law) employs as a basic category not brute facts but preferences as evaluative dispositions. This comes close to Weber's *interessenbedingtes Handeln* which he *systematically* distinguishes as one type of "factual regularities of conduct" besides usage (*Brauch*) and custom (*Sitte*).

2.5.2. A Realist Approach to Legal Norms

It is only in the ethnology/anthropology of law—as mentioned before—that one typically has to cope with the problem of proving the existence of rules and, especially, that of legal rules, by using solely observational or interview techniques; this methodological restriction rarely exists in socio-legal research in modern societies. Here the sociologist of law relies on a simple juridical (i.e., the formal) concept of validity in studying, inter alia, the efficacy of law, in doing judicial research, investigating the mobilization of law, alternatives to legal conflict resolution, knowledge and opinion about law, etc. In societies with elaborated legal systems (in Hart's theory: One in which the distinction between primary and secondary norms is institutionalized) the sociologist of law reveals the legal state of this society not by observing "pure" behavior but, rather, the other way around: Starting from valid legal norms "in the books" he/she proceeds to examine the "law in action," i.e., observable activi-

ties of the application, following, violation and use of legal norms, including their social and natural conditions as well as their effects. The basic distinction underlying this type of investigation is the one between *normative* and *factual*—"factual" not as non-normative but as involving norm-related facts (cf. *infra*). Besides that, the sociologist of law also looks at the *informal* aspects of social and legally relevant activities in contrast to the *formal* aspects that could be revealed and described solely by applying the notions formed in legal norms.

2.5.3. Etatism versus Pluralism

The sociologist of law takes sides with the etatists by routinely using as a starting point of his/her investigation the juridical concept of validity orientated to the fulfilment of procedural requirements. In contrast, it is mainly legal anthropologists who argue in favor of a pluralist concept of law in which the existence of law is related to social (in any case pre- or extra-state) characteristics. But I think that even ethnologists or advocates of "legal pluralism" necessarily have to rely on statist features as significant elements of the concept of law, e.g., the rudimentary existence of legal personnel in the sense of a "third" who is not related to the conflicting parties and who can issue compulsory decisions or settlements.[19]

A "pluralist" or pure "social" concept of law (which would, of course, be a sociological, but not an etatist one) is confronted with insurmountable difficulties, as is shown in the classic attempt of Eugen Ehrlich (1936, 164). Ehrlich tried to introduce a pure "social" definition of "norms" and "legal norms" by distinguishing overtones of feelings and reactions in particular situations (cf. *infra*, 139ff. in detail). Usually, as a sociologist of law, one can etatistically refer to juridical criteria of validity in societies with elaborated legal systems (with explicit criteria of validity such as a "rule of recognition"; Hart 1961, 97ff.). Problems may crop up when one uses the concept of "customary law." But also in this case one has to refer to etatist elements: Customary "law" only consists of what has been recognized as such by the courts.[20]

2.5.4. Realism in Practice: Socio-Legal Research

Some scholars state that a realist treats law "as fact," in its "facticity" and not in its "normativity." A close analysis of the research practice of the sociology of law gives rise to doubts about this statement. Firstly, sociologists of law

[19] This is the definition of a "judge" (mediator) whose existence marks the first step in the development of law, according to Schwartz and Miller 1964.

[20] The notion of "customary law" is an interesting case of a temporal sequence (first there was customary law and then came "real" law) that clashes with a normative classification (is customary law valid or invalid?).

sometimes do analyse legal rules "as such," i.e., with no regard to their origin and social effects, just as linguistic entities that can be studied by using, e.g., methods of content analysis. If someone, e.g., tries to test the thesis that there has been an increase in normative regulations, one should count legal regulations "as such," independent of their social practice, their effects or impact. When discussing tendencies of materialization or proceduralization or decriminalization or changes in the typology of forms of legal rules we can for descriptive purposes restrict our analysis to legal rules without looking at the circumstances of their creation (here it might be sufficient to ascertain the date of their issuing) and at their effects.

Secondly, socio-legal research does not deal with law as a complex of facts ("law as fact"), it rather deals with *law-related facts*, i.e., with facts that have a reference to legal rules. These references are manifold, and therefore a clear cut delimitation of the socio-legal domain is almost impossible (but also normally not necessary). When a realist talks about law-related facts he/she makes "external statements" in the sense of J. Raz (cf. *supra*): "External statements about the law are statements about people's practices and actions, attitudes and beliefs concerning the law" (Raz 1979, 154). Or what N. MacCormick (1981, 40) called a "statement about a rule." Correctly speaking, it is not a statement about a rule as such; rather it is a statement about facts that are related to rules/norms. These facts can be manifold:

– There is the issuing, the enactment of a legal rule (and its legislative history with processes of influencing the legislator, etc);
– There is the application, interpretation and enforcement of legal rules (and also further effects of these activities);
– There is the following, violation and circumvention of legal rules and their effects;
– There is the employment, the use, the thematization and mobilization of legal rules (in civil law-suits, reports to the police, etc.);
– There are opinions about legal norms and institutions; there is knowledge about them; there are beliefs concerning legal rules and legal institutions (e.g., trust in them).

These facts consist of different *actions*, activities (also communication, interaction), and they all are differently related to legal rules. Additional norm-related elements are *actors* on different levels of aggregation (persons, groups, organisations, institutions). Their expectations are investigated, their beliefs, opinions of, their knowledge about legal rules and legal institutions, i.e., certain *psychological dispositions* in reference to "law." All these elements are not "law" itself, but they are related to law, to law as a set of norms. Law, therefore, is not "reduced" to certain facts, but a large amount of facts is multifariously related to legal rules. A realist has to "understand" the meaning of these

legal rules; therefore a certain degree of legal education might be wholesome for him/her. But as a sociologist or a psychologist he or she does not hermeneutically aim at statutory interpretation the way a jurist does.

In contributions on the concept of law we can find two strategies of coming to grips with this notion. One strategy consists of giving a *genus proximum*, i.e., a generic term, according to the traditional way of defining a concept. Thus law is—in a first step that should be followed by determining the *differentia specifica*—defined as a set of norms, as a social order, as a set of facts (Olivecrona 1971), as a system, as a social structure, as a (communicative) medium, as art (Bagnall 1996), game (Ost 1988; Arnauld 2003), communication,[21] etc. Here we find a connection between theory and definition (which I had separated *supra*). In choosing a *genus proximum* of law one has to analyse the theoretical consequences of a choice among these options. What happens in constructing a comprehensive theory in which law plays a prominent role when one makes a conceptual decision among the options mentioned above, e.g., whether to conceive of law as a system or as social structure? (Cf. *infra* on Luhmann, sec. 4.2.)

Following another strategy, the whole body of law is reduced to basic or ultimate elements out of which in reverse law in its totality can be extracted. Thus law, as a set of norms, is reduced to imperatives or commands (Kelsen), to certain psychological states (e.g., feelings as in Ehrlich's famous overtones, cf. *infra*, 139–40). Law is also defined by actors, persons and their social features, their roles and positions (e.g., the position of a compulsory deciding third person who is not related to the conflicting parties). Law was for purposes of definition reduced to certain statements, e.g., the predictions of future court actions. O. W. Holmes' famous definition of law should be understood in this way: "the prophecies of what the courts will do in fact" (Holmes 1952, 73). Unlike other legal realists Holmes does not identify law with (future) actions of the courts,[22] but rather with statements uttered in order to predict the future actions of the courts.

Such a reductionist strategy in the construction of theories might have—as I suggested before—a certain aesthetic charm and attraction. But it is not very helpful for empirical research. Here one deals with a great variety of elements that are multifariously related to all kinds of legal rules—unaffected by reductionist and other "purely theoretical" considerations like the presented ones.

[21] Nelken 1996; Van Hoecke 2002; Luhmann, the autopoietic one, regards legal communications as the basic elements of a legal system (cf. *infra*, 168).

[22] As in the definition given by Max Radin (1963, 15): "Since [...] our law is what courts will decide it is evident that we must base our prophecies on our knowledge of the courts."

2.6. Dimensions of a Legal Order

In describing a legal order from a realist point of view one can opt for an *actor's* frame of reference, alluding to persons, groups, organizations, institutions and their properties—or one can opt for an *action's* frame of reference. In this case one analyses the (norm-related) activities of the relevant actors, encompassing the results of these activities, namely the content of promulgated norms, of the decisions issued or of arrangements made, etc.

One could start at the top level with lawmakers, i.e., persons, groups etc. that are in charge of legislative activities, the issuing of legal norms. These activities not only result in rules; they are norm-related also in the sense that they are supposed to be performed according to the rules of issuing or of changing norms, in general, in accordance with competence rules that form a part of Hart's "secondary rules."

On a second level one deals with public officials, with what Weber called the "legal staff," i.e., persons, organisations etc. who are professionally in charge of the administration of justice, of norm application, interpretation and the enforcement of official rules and decisions. In a broad sense the legal staff also includes legal scholars (so far as they are professionally in charge of making norm-related interpretative proposals). The actions of judges, prosecutors, lawyers, policemen, bailiffs and state administrative bodies include decisions, interpretations, doctrines, enforcement activities etc.

On the societal bottom private individuals are located. The focus of analysis of this everyman's world lies in legally relevant social activities: rule abiding behavior or norm transgressions, in the use that is made of legal rules (use-rules), e.g., in making contracts, wills, establishing companies, etc. One can analyse their general knowledge, opinions, beliefs and attitudes about or towards legal norms and institutions.

From a developmental point of view the top level of lawmaking is the latest stage. Law, however, does not start at the bottom. It is only the establishment and societal mobilization of rudimentary forms of a legal staff that brings law into existence. On the bottom level as such law does not yet exist. I shall allude to this assertion *infra* in the discussion of Ehrlich's "pluralist" approach (cf. sec. 3.2.4).

2.7. Functions of Law

The manifold contributions that deal with the "functions of law" often are characterized by an ambiguity about what "function" might mean: Is reference made to the aims, the objectives of a legal order or is the analysis concerned with the real effects of legal norms and a whole legal order? In what follows I have collected a set of assertions that are made about the functions

of law arranged according to the three dimensions. In any case one should ask whether law really does fulfil these functions and to what degree.

1. For the lawmaker legal provisions serve as a means in order to achieve certain ends. The function of law consists in *social control*, social engineering or the steering of social processes. Law is efficacious insofar as the legislative ends are achieved. Its aims are reached mainly by prohibiting, prescribing or permitting a certain type of behavior, by the threat of sanctions or by offering incentives. Either the performance of the wanted behavior itself or, rather, the effects of this behavior contribute to the efficacy of the norms. This instrumental conception of lawmaking predominates nowadays.

2. Norms and also court decisions might fulfil a *declarative function*, i.e., they decree what type of behavior will be officially accepted or condemned—without associating this declaration with an instrumental claim, i.e., leaving aside the question whether the expected behavior really will be performed or whether the norm will or can be enforced. Legislation thus comes close to what often is pejoratively named “symbolic politics.” The legislator has demonstrated seriously his will to achieve the best. The German Constitutional Court stated in a decision concerning abortion legislation:

> The law not only functions as an instrument in order to steer social processes according to sociological knowledge and predictions; it is also a permanent expression of ethical—and in consequence—legal evaluations of human actions. The law should say what for the individual is right and wrong.[23]

3. Legal procedures in the field of legislation and of the administration of justice also might serve a *legitimation function* insofar as the formally correct issuing of norms or decisions accounts for their validity.[24] Decisions by legislative bodies and public officials in general are by and large accepted if the procedural prerequisites are fulfilled. According to Max Weber legality is the predominant mode of legitimation today.

4. An important function of law consists in the *limitation of political power*. Legal rules should not only be instruments in the hands of lawmakers that attempt to achieve certain aims. The lawmaker himself should be bound by legal rules. He or she should rule via law under the rule of law. At the collapse of socialist regimes legal scholars demanded, against the purely instru-

[23] Bundesverfassungsgericht 25.2.1975 (on § 218 of the German Penal Code), in: Neue Juristische Wochenschrift 1975, 580.

[24] From a detached point of view, validity means the existence of norms (in contrast to derogated or fictious norms). Validity, however, is also understood as the obligation to comply with a (valid) norm. Within our multidimensional model, one could ask then whether this obligation holds for the members of the legal staff only or whether “everyman” is obliged to obey the valid legal rules instead of reading them as informative predictions about future court decisions.

mental conception of law in Marxist-Leninist legal theory, the acknowledgement of law as "*Maß der Macht*" (measure of power or limit on power).

5. Traditionally the function of *conflict resolution*, or to put it more neutrally, the adjustment of trouble cases, is located on the level of the legal staff. This objective is derived from the very basic idea of law as a social institution designed to break the chain of private vengeance (cf. *infra*, sec. 3.1.2.1). According to Luhmann, law does not solve or reduce conflicts. Rather it multiplies conflict opportunities (Luhmann 1984, 518, 535). At the beginning of legal evolution, law probably was used to control the extreme outburst of public reactions in the face of an infringement of norms (ibid., 455), yet it now makes conflicts communicable. It serves the continuation of communication by other means (ibid., 511). On a pre-court level—"in the shadow of the law" (Mnookin and Kornhauser 1979)—the mere anticipation of a possible juridification of a conflict might have an appeasing function. In many cases, however, the thematization of law, the employment of lawyers or the threat to mobilize courts intensifies the conflict. The pacification of a dispute finally follows from the issuing of a binding decision that can be enforced if necessary by state power. The decision might be "accepted" because it was issued according to established rules

6. A core function of legal rules which is often neglected is their *constitutive role*. By performing certain actions correctly, i.e., in accordance with constitutive rules innumerable social facts are constituted. In this way positions, organizations, procedures, competences of the legal staff as well as of the legislative and administrative bodies are created. This happens without any threat of sanctions. The "sanction" of an incorrect use is not illegality but invalidity. In the social field the majority of positions is created by the (correct) use of legal rules: the position as a citizen, a student, an employer or an employee, as a spouse, etc. The use of legal "use rules" brings into existence all kinds of social institutional facts on the basis of which certain activities then become possible. One can create a corporation, one can institute a civil marriage with its rights and obligations, can write a last will, establish a worker's council, etc. These are activities that cannot be performed "naturally," as "brute facts" (like killing another person, living together as man and wife, etc.). What Pattaro calls "types" might be constitutive for the *description* of a "token" *as* a certain token, e.g., the labelling of an activity as murder according to the "type" in a norm of the penal code. This activity, however, is actually not constituted by the "type." The constitutive force of legal rules, i.e., their faculty to create new facts lies in acts performed according to what Neil MacCormick (1974, 102) has named "institutive rules" as the initial part of constitutive rules. If these institutive rules are used correctly (making a contract, a marriage, etc.), then "consequential rules" connect these institutional facts with certain legal consequences that form a part of the "meaning" of a contract, a marriage, etc. Law therefore is ubiquitous: Our roles, positions

and options in everyday life—in the workplace, in the family, as a consumer, tenant, etc.—are brought about by the correct use of institutive rules which together with the consequential rules constitute the social network of institutional facts. Once used these rules recede into the social background and our everyday attention is no longer focused on them.

7. In the realm of legally relevant social activities legal rules are rarely thematized; usually they are brought to our attention only if conflicts arise. In everyday life legal rules serve the function of *securing* (*normative*) *expectations*. They stabilize or strengthen our action orientation—but not by being present as a permanent object of our attention (although this might be the case in a jurist's mind), rather they operate as a safeguard in the background of almost every kind of social action (cf. Luhmann 1981, 269).

To repeat: It is always an open question whether these various functions actually will be fulfilled.

Chapter 3

EXTRA-LEGAL FOUNDATIONS OF LAW—VARIATIONS ON LEGALLY EXTERNAL FOUNDATIONS

While the distinction between an external and internal point of view of an (observing) actor and an (acting) observer was introduced on the level of intersubjectively related individuals, the following core part of this volume uses the distinction between external and internal with respect to the topic of the foundations of an entire legal system or legal order and its various dimensions. The analysis is conducted on a collective or holistic level. It combines a hermeneutic point of view, attempting to understand the authors to whom I refer, with statements of facts related to norms.

I start with extra-legal foundations through which the origin, the development, the effects, and functions of law might be explained. Basic "foundational" concepts will be introduced and elucidated in this context. Epistemological foundations will be dealt with briefly as far as the logic of explanation is concerned (cf. *infra*, chap. 7). Moral foundations form a part of extra-legal foundations in the sense of moral attitudes and beliefs (e.g., in the legitimacy of a legal order). I mainly treat them as an empirically observable set of variables, not within a normative discourse. However, there will be occasions in which the empirical and conceptual analysis necessarily leads to normative issues as such.[1] The whole collection of foundations may be incomplete; I do not claim to provide an entire overview. Nor can one find an obvious principle of how to arrange the foundational variations, neither historically nor systematically. At the end I shall try to propose a systematic scheme.

3.1. Transcendent Foundations of Law

3.1.1. Mythological Foundations of Law

The starting point appears to be historically remote. However, one has to bear in mind that myths are revived time and again. Apparently they are used to respond to fundamental needs of making sense of the world, of making intelligible natural as well as social conditions. (In fact, both are fused in a cosmological unity.) Often they narratively report about the origin of the cosmos, of social institutions, of norms, sometimes even about the origin of law. Greek tragedies will serve as an example.

[1] At the end of the Durkheim sec. 3.2.3.2 (3d) and in chapter 4 in the case of all three authors (Kelsen, Luhmann, Fuller).

3.1.1.1. On the Notion of Myth

The notion of myth is an ambiguous one.[2] In opposition to the *logos*, it has a negative connotation: It implies an untrue story, a lie (lat. *fabula*). On the other hand, myth is considered definitely to have a useful function. Employed for instruction, it unfolds circumstances in a narrative and (often picturesque?) graphic way. In its poetic character, it is not merely held to be aesthetically valuable. For the purposes of ethnography, the history of religion, and the study of antiquity—that is, for a scientific "mythology"—myth also serves as a valuable source for the explanation of humanity's phase of infancy (*infantia generis humani*). This positive aspect is sometimes overstated by explicitly anti-rationalist endeavours (e.g., of L. Klages) to revive myth as indispensable, particularly in modern times. According to A. Baeumler, myth is rooted in "timeless primeval times," in the "ancient origins of human soul." In a "disenchanted" modernity, myths are used in a functional way: Carl Gustav Jung's analytical psychology presupposes the continuing presence of myths and employs them as a key to dreams or for the specification of collective archetypes. An explicitly political application is propagated by G. Sorel ("social myth")—leading to Arthur Rosenberg's *Der Mythus des XX. Jahrhunderts* (published in 1930).

While the utilization of the term "myth" has grown almost ubiquitous, today, the negative connotations appear to predominate again. We recognize the legitimizing function of certain myths, lacking of course any transcendence. Partly, these represent collectively unrecognized patterns of interpreting the world. Partly, in a kind of belated *Priestertrugstheorie* (theory of deception by priests), a deliberate instrumentalization is insinuated, e.g., speaking of the Marxian "myth of revolution" or of antifascism as the "foundational myth" of the GDR (Zimmering 2000). Initially, this was the service the notion of ideology performed. Also in recent legal theory one can find the use of the notion of "myth": Peter Goodrich (1987, 77) declares the distinction between a core and a penumbra of meaning in legal concepts to be a "myth" that distracts from the insight that historical and particular "forms of life" determine the content of legal rules.

In the context of ancient Greek tragedy, in what follows, I will mean by a myth a narrative held to be true that reaches back to prehistoric, undated times (*in illo tempore*); that extends from the divine (or heroic) into the human sphere. As an explanation of the world's genesis, not only "physical" myths of creation are to be found, which interpret forces of nature animistically; there are also "ethical" myths: Narratives about the emergence of societal institutions and regulations. Consequently we encounter the Gods on the one hand as a personification of forces of nature, on the other hand as

[2] On modern "mythology," see Blumenberg 1971 and 1979.

a personification of ethical principles. In this sort of myth, the explanatory and the legitimatizing functions are not separated: A genetic-narrative explanation is connected with a legitimatization of the cosmos.

3.1.1.2. The *Oresteia* of Aeschylus

Aeschylus (525/4–456/5 B.C.) came to Athens in 468. Before, he had lived mostly in Syracuse, to which he returned in 458, the year his *Oresteia* was first performed in public.[3] For legal theory, particularly the third part of this *œuvre* is of relevance: *The Eumenides*.[4] It treats the establishment of a court, the Areopagus, to end a blood feud. Originally, the Areopagus—that is the "Hill of Ares" (*areios pagos*)—was the site where Ares had slain Halirrhotios, son of Poseidon, and where the trial of the Gods against him later took place. Also located on the Areopagus were the altars of the Erinyes. Thus, the place itself has a mythological origin. Now, its appellation becomes the name of a court.

In the *Oresteia*, the Gods are still active: Apollo incites Orestes to revenge the murder of his father; later on Athena appears and—coming from an even earlier layer of mythology—the Erinyes, as a chorus.

The narrative is formed by a series of bloody events: Agamemnon was killed by his wife Clytaemnestra and her lover Aegisthus, in fact at the behest of Apollo. Orestes faces the dilemma of being called upon to kill his mother to revenge his father. But the story reaches back even further. The line Orestes descends from is accursed. Tantalos, King of Lydia, first attracted the wrath of the Gods when he tried to delude them with a dish—which was nobody else but his cut-up son Pelops. The almost restored Pelops is then cursed by Myrtilos the charioteer after a dubious manoeuvre during a chariot race for Hippodameia, daughter of Pelops' adversary and father-in-law Oinomaos, King of Pisa in Elis.

Between the offspring of Pelops, who has by the time become King of Pisa in Elis, a network of sex & crime develops that makes modern spectacles look petty. The sons of Pelops, Atreus (King of Mycenae) and Thyestes, feud with one another bitterly (but only after having killed their half-brother Chrysippos together, which brought upon them a curse by Pelops). The wife of Atreus, Aërope, has cuckolded her husband with Thyestes. This leads to an unrelenting enmity between the brothers, which is fuelled even more by the Gods. Atreus kills the first three sons of Thyestes (and presents them to him, as it seems to have been quite traditional in his clan, as a dish). Thyestes asks an oracle for advice on how to take revenge. The only solution presented to

[3] A (different) version by Euripides ("Orestes") was put on stage in 408 B.C.

[4] The *Oresteia* of Aeschylus—"perhaps the greatest achievement of the human mind" (Algernon C. Swinburne, quoted in Meier 1993, 117)—is composed of three parts: "Agamemnon," "The Libation Bearer," ("Choephoroi"), and "The Eumenides."

him is to sire a son with his daughter who would then avenge him. Disguising himself with his daughter Pelopia, he begets Aegisthus, who shall grow up into a particularly sinister fiend. In the course of all this Uncle Atreus has married Pelopia, who then kills herself, when she gets word of the incest. Predictably, Aegisthus kills Atreus, whereupon Thyestes becomes King of Mycenae.

The sons of Atreus, Agamemnon (then King of Mycenae) and Menelaos (King of Sparta), marry the daughters of Tyndareos (previous King of Sparta), Clytaemnestra and Helena. As is well known, these will not prove to be particularly lucky marriages. Earlier, Clytaemnestra had been married to another Tantalos, this one a son of Thyestes, who had to be assassinated by Agamemnon first. When Agamemnon then goes to war against Troy, she decides to live with Aegisthus. Agamemnon himself finds a mistress in Cassandra whom he does not hesitate to bring home. Both, Agamemnon and Cassandra, are slain by Aegisthus and Clytaemnestra on their return. Agamemnon's son Orestes (who would later become King of Sparta, Argos, and Mycenae) then revenges his father by killing the couple Aegisthus and Clytaemnestra. This is the spine-creeping and ill-fated case history.

In this genealogy, it is not only the permanence of curse and revenge that is significant. This part of Greek mythology also allows us to draw some general conclusions. The transition from the Gods via the mythological king unto the heroes of the Iliad comes about in the form of a genealogic series which remains peculiarly timeless, at any rate at least undated. We are given, however, precise designations of space, that is, of the sovereign territories of the kings. But we are not told how old they became or when they lived. The definition of (dominated) space precedes the determination of time.

This is particularly significant when compared with the chronological narrative of the Old Testament. There the indications of the age of the individual generations are so precise, that one could later hit on the idea of calculating the exact day of Genesis on this basis.[5] By contrast, Greek chronology begins quite late; the Olympic Games have been dated only since 776 B.C.

This part of the Greek mythology is also a key to the relation between the Gods and Men—between transcendence and temporality: The Gods, especially Zeus, are still constantly present appearing in the most various non-human disguises—e.g., Zeus who, as a swan, begets Helena with Leda. But also humans experience a metamorphosis: For example, according to one record, Menelaos becomes immortal after his death and is admitted to the Elysian Fields. Again, the Old Testament can be seen as the contrast: Here, the one God stays bodily distant from Men; He is only present through his word. It is

[5] For example, Bishop James Ussher (1580–1656) assessed that Creation happened on 23 October 4004 B.C. (*Annalen*, published in 1650–1654); the Anglo-Saxon monk Beda (673–735) calculated 18 March 3952 B.C. (*De temporum ratione*, published in 725).

only in the New Testament that God becomes "flesh," that the "Son of God" walks on Earth, spreads the Gospel, sacrifices Himself, and is resurrected with the promise of the immortality of all human souls.

We return to the *Oresteia*: A never-ending bond of feud has been tied. "*Now force clash with force—right with right*" (The Libation Bearers, v. 448). Orestes, hounded by the Erinyes, claims that as instigator Apollo had promised him exemption from guilt and pain:

I say to my friends in public: I killed my mother,
not with a little justice. She was stained
with father's murder, she was cursed by god.
And the magic spells that fired up my daring?
One comes first. The Seer of Delphi who declared,
"Go through with this and you go free of guilt.
Fail and—"
I can't repeat the punishment.
What bow could hit the crest of so much pain? (Ibid., vv. 1024ff.)

The Delphic priestess sends Orestes to Athens where a tribunal is to be founded (Eum., vv. 83ff.).

The chorus of the Erinyes condemns Apollo's promise:

– You—child of Zeus—you, a common thief!

– Young god, you have ridden down the powers
proud with age. You worship the suppliant,
the godless man who tears his parent's heart–

– The matricide, you steal him away, and you a god!
– Guilt both ways, and who can call it justice? (Eum., vv. 150–5)

The Erinyes are concerned only to revenge crimes between blood relatives (that is, the killing of Clytaemnestra by Orestes), but not a crime between (not related) spouses (Agamemnon murdered by Clytaemnestra). Today, to give greater weight to kinship (between parents and children) in comparison to marital bonds may appear peculiar. But it is the protection of just this kinship that the ancient Titanic deities, the Erinyes, represent against the more recent Olympic Gods, Apollo and Athena. This is not about the pros and cons of the blood feud in general; it was none other than Apollo himself who imposed blood revenge against his mother on Orestes. But as it seems, Apollo does not take the blood feud as a principle, when he considers legitimate a blood revenge for a killing between non-related persons. For the more traditional Erinyes, however, a revenge for the assassination of one's spouse is out of question. The chorega: "That murder would not destroy one's flesh and blood" (ibid., v. 210; also ibid., v. 611).

Then, Athena appears (ibid., vv. 408ff.). The Erinyes charge her with the decision (v. 446). But Athena does not feel able to judge the case—quite as-

tounding for a goddess. According to tradition, Orestes has well expiated by bringing a blood sacrifice; but the Erinyes will not yield. They threaten to inflict great pain on the city if their will is not to be fulfilled. It is in this dilemma that Athena creates the Areopagus as an aristocratic institution:

But since the matter comes to rest on us,
I will appoint the judges of manslaughter,
swear them in, and found a tribunal here
for all time to come.

My contestants,
summon your trusted witnesses and proofs,
your defenders under oath to help your cause.
And I will pick the finest men of Athens,
return and decide the issue fairly, truly–
bound to our oaths, our spirits bent on justice. (Ibid., vv. 497ff.)

The trial begins with Apollo's intervention as a witness for Orestes:

I am the one who purged his bloody hands.
His champion too, I share responsibility
for his mother's execution.
Bring on the trial.
You know the rules, now turn them into justice. (Ibid., vv. 584ff.)

For this purpose, Apollo refers to his father Zeus as the highest deity:

This is his justice—omnipotent, I warn you.
Bend to the will of Zeus. No oath can match
the power of the Father. (Ibid., vv. 626ff.)

In response, the chorus attacks Zeus and emphasizes once again the mother's assassination by her son. Thereupon, Apollo falls back on a very special argumentation. He invokes the image of a mother reduced to a mere host for a guest.

The woman you call the mother of the child
is not the parent, just a nurse to the seed,
the new-sown seed that grows and swells inside her.
The *man* is the source of life—the one who mounts. (Ibid., vv. 666ff.)

"The father can father forth without a mother" (ibid., v. 673)—to which Athena herself is proof. What follows, is the "speech of foundation" of Athena:

And now
if you would hear my law, you men of Greece,
you who will judge the first trial of bloodshed.

Now and forever more, for Aegeus' people
this will be the court where judges reign.

This is the Crag of Ares, where the Amazons
pitched their tents when they came marching down
on Theseus, full tilt in their fury, erecting
a new city to overarch his city, towers thrust
against his towers—they sacrificed to Ares,
named this rock from that day onwards Ares' Crag.

Here from the heights, terror and reverence,
my people's kindred powers
will hold them from injustice through the day
and through the mild night. Never pollute
our law with innovations. No, my citizens,
foul a clear well and you will suffer thirst.

Neither anarchy nor tyranny, my people.
Worship the Mean, I urge you,
shore it up with reverence and never
banish terror from the gates, not outright.
Where is the righteous man who knows no fear?
The stronger your fear, your reverence for the just,
the stronger your country's wall and city's safety,
stronger by far than all men else possess
in Scythias's rugged steppes of Pelops' level plain.
Untouched by lust for spoil, this court of law
majestic, swift to fury, rising above you
as you sleep, our night watch always wakeful,
guardian of our land—I found it here and now.

So I urge you, Athens. I have drawn this out
to rouse you to your future. You must rise,
each man must cast his lot and judge the case,
reverent to his oath. Now I have finished. (Ibid., vv. 693–725)

Apparently, there is no consultation between the judges. They just hand in their voting stones. Before the polling, Athena awards the last vote to herself and votes for Orestes. An early traitor to the women's movement, she takes up the "anti-feminist" argumentation of Apollo:

No mother gave me birth.
I honour the male, in all things but marriage.
Yes, with all my heart I am my Father's child. (Ibid., vv. 751ff.)

And she decides: "Even if the vote is equal, Orestes wins" (ibid., v. 756)—and so it happens. Is the formation of law in the preservation of patriarchal power?

The Erinyes rage with fury. They want to stick to their "old law." Now, the recognition of the new court on the part of the losers is at stake. Repeatedly interrupted by a chorus wild with rage, Athena argues that the Erinyes were not actually losers, as the equality of votes showed clearly. She stresses the role of Zeus and of witness Apollo in the case. She promises to the Erinyes "glis-

tening thrones" (ibid., v. 818) in Athens; they would be in high honour; she assures them a seat of honour and considerable competences in Athens. "Theirs to rule the lives of men, it is their fated power" (ibid., vv. 942ff.). They would be in charge of the well-being of the city ("that Fury like a beast will never rampage through the land," ibid, vv. 991ff.).

Eventually, the Erinyes agree. Phylogenetically, this lays the foundations of the precedence of the *polis* over the *genos*.[6] On the world's stage there has now appeared a court that is formed by persons not related to the parties and that is vested with the competence to pass a binding judgement. The topos of the *Oresteia* can be translated into modern terms: The establishment of a court in a wider sense—that is, of the position of a third not related to the parties who can take and enforce binding decisions—can be seen as the beginning of law and state.[7] We will see the reasons for a similar step in the contractual *ius-naturale* doctrine: How is it possible to pass from the state of nature (*status naturalis*) into a civil state (*status civilis*)? In this sense, the state of nature and the social contract can be seen as a myth as well: as an undated (hi)story to explain and to justify a civil state, a competent State—without Gods, of course.

To the advantage of a better understanding of the text itself, let us consider its contemporary historical context. In the beginning, the Areopagus was an oligarchic institution. As members, Dracon had appointed the so-called Epithets, 51 judges elected from the nobility under the chairmanship of archon Basileus (an uneven number obviating a decision by the final ballot of a goddess). Competent for criminal jurisdiction, the court held meetings in five locations including the Areopagus. After the Constitution promulgated by Solon (ca. 640–559 B.C.) in 594, the Areopagus was formed by an indefinite (uneven or even?) number of meritorious former archons who held the office for life. Its jurisdiction was enlarged too. Now, the Areopagus also watched over the laws and their execution; it could lodge an objection against the Council and against the People's Assembly. Religious convictions and education were placed under its supervision.

It would be entirely inadequate to consider the ancient Greek tragedies solely as autonomous works of art. The political relevance of their performances and the political role of the poets can be evaluated by, e.g., visualizing Sophocles (497–407/6 B.C.) not only as a poet but also as a strategist in Perikles' surroundings. The latter had introduced a theatre tax (*Theorikon*) for the citizens of Athens—an early form of subsidies of cultural institutions, surely not for apolitical reasons.

[6] Cf. Wolf 1950, 410, 416. On Aeschylus, see ibid., 340–424; on the *Oresteia*, see ibid., 379ff.; and on the *Eumenides*, see especially 407ff. Of course, E. Wolf does not accept this evolutionist interpretation (ibid., 413). Considering the conflicting Gods' inability to recognise and enforce justice, he sees at work "supernatural powers," "a general dispensation of being," and "fate" (ibid., 415).

[7] Cf. *supra*, 24, with reference to Schwartz and Miller 1964.

The *Oresteia* of Aeschylus was performed in 458 B.C. (it brought him victory in the tragics' agon), two years after the competences of the Areopagus had been cut back by the reforms of Ephialtes (under the rule of Perikles). The democratic party had defeated the Oligarchs. The priority had shifted among the judicial organs of Athens, that is, the court of the Ephethetes (competent for non-premeditated homicide), the Areopagus (competent for murder, mixing of poison, bodily injury with intent to kill, and arson—but now no longer for the control of the civil servants), and the Heliaia, the people's court formed by 5,000 members elected yearly, with its dicasteries. The Areopagus retained only its function as blood court; it lost its competence to supervise legality.

This historical context seems to allow only one conclusion: The *Oresteia*, with its legitimatory creation myth of the Areopagus, has to be seen as a conservative, pro-aristocratic tragedy. Solely the end, describing the integration of the Erinyes into Athens's commonwealth, could also be seen as an apotheosis of contemporary Athens. Perhaps it is also possible to infer that Aeschylus wanted to reinforce the restriction of the Areopagus to a court's functions with this myth about its origin.[8]

It is not clear if the old competences were restored to the Areopagus after the Peloponnesian War (413–404). In the 350s, in his *Areopagiticos*, orator Isokrates pleads for a return to the old order characterized by a primacy of the Areopagus.[9] This court is said to have existed unto the times of Vespasian (Emperor from 69–79 A.D.).

Around A.D. 50, apostle Paul's second missionary voyage leads him also to Athens. There, on the Areopagus, he gives a speech containing criticism of the Athenians' polytheism. He has found an altar dedicated to "the unknown God." "Whom therefore ye ignorantly worship, him declare I unto you" (Acta Apost. 17, 23). And it is to be a harsh message:

> And the times of this ignorance God winked at; but now commandeth all men every where to repent: Because he hath appointed a day, in the which he will judge the world in righteousness by that man whom he hath ordained; whereof he hath given assurance unto all men, in that he hath raised him from the dead. (Acta Apost. 17, 30–1)

On the site once occupied by a court of mythological origin, the Last Judgement is eschatologically heralded—by the way, to resume our underlying

[8] It is not clear if the reforms undertaken by Ephialtes did not merely lay down a state that had evolved before. Cf. Welwei 1999, 91–5; on the *Oresteia*, see ibid., 95. The "supertemporal validity" of the exhortation for civil concord in the Eumenides which Welwei assumes does not, however, suspend from an interpretation in the historical context. On this point, opinions obviously diverge. Cf. Latacz 1993, 130: The *Oresteia* as a "caustic requital for the deprivation of the Areopagus by Ephialtes." Cf. Meier 1993, 368ff.; Knox 1992, 275; Podlecki 1966, 96–100; Marr 1993; MacLeod 1982, 126–7; Nicolai 1988; Flashar 1997. On the Areopagus, see de Bruyn 1995; Hall 1990 (also on research literature); Wallace 1985.

[9] It was the title of this speech that inspired John Milton's "*Areopagitica*" almost 2,000 years later, a criticism of the censorship law passed by the Presbyterian parliament in 1643.

(anti-)feminist subject, the Judgement through a man. Though this Judgement still seems to be a long time in coming, the patriarchy will find its institutionalization in the Christian church. Among the listeners on the Areopagus was a certain Dionysos (Acta Apost. 17, 34) who, converted by Paul, is said to have become the first bishop of Athens. As a member of the Areopagus, he was called Dionysos Areopagita.[10] He represents the early beginnings of an institutionalization of Christianity. Among the converted listeners was also a woman named Damaris. Of her we shall not hear any more.

The Supreme Court of today's Athens is called Areopagus. In this way, a myth continues as a present-day source of legitimacy.

3.1.1.3. Sophocles' *Antigone*[11]

Sophocles' *Antigone* (first performed in 442 B.C.) is not based on a myth any more; the gods no longer appear. They—especially Zeus and Athena, but also Eros and Aphrodite—still are worshipped and invoked by the human protagonists ("for Zeus' sake") and are referred to in support of one's own opinion. They serve for an explanation of earthly incidents: "the gods have righted once again our storm-tossed ship of state, now safe in port" (*Antigone*, Creon, v. 163). "[…] something more than natural at work," the chorus suspects (ibid., v. 278). A whirlwind is taken as a sign from the gods (ibid., vv. 454ff.). Athena is only present as an idol (ibid., v. 1185). But the gods are above all present through the "immutable unwritten laws of Heaven" (ibid., vv. 454ff.) to which Antigone refers. It was Hades who demanded the same treatment for everybody: A funeral for Eteocles as well as Polyneikes (ibid., v. 519; see also on Hades, ibid., v. 811). Creon points out that Hades was Antigone's only god (ibid., v. 777): "'tis labour lost, to reverence the dead" (ibid., v. 780). Haemon (Antigone's fiancé) reproaches Creon for abusing the law of the "gods below" (ibid., v. 749). Thus, every side instrumentalizes the gods for his or her own position. But then, how should the unwritten laws of the gods be revealed? What kind of an existence do these laws have? They might be perceivable through reason given to man—although apparently not to all men—by the gods themselves (ibid., vv. 683ff.). In so far, as this is so, the divine law is at the same time a law of reason. Against them, Creon asserts reasons of state as well as of his own authority (the state being the prince's property, ibid, v. 738; the holy dignity of the prince, ibid., v. 744).

[10] Around A.D. 500, a Christian published several important essays in Greek under that name, in which he treated above all the theory of God as the "*purposeless One.*" Since he pretended (bringing prestige to himself) to be the figure mentioned in the apostle's story, he later came to be called pseudo-Dionysios Areopagita.

[11] I quote from the translation of F. Storr 1956 and refer also to the translation of Richard Jebb 1962.

This kind of altogether unspecific reference to the gods is only possible because the gods themselves do not appear, do not intervene to express and to enforce their authentic position. They have not even revealed themselves in Holy Scriptures which could be subject to the exegetic efforts of human intelligence. Left alone by the gods, Antigone breaks into lament:

For succour, call on any man for help?
Alas, my piety is impious deemed.
Well, if such justice is approved of heaven,
I shall be taught by suffering my sin;
But if the sin is theirs, O may they suffer
No worse ills than the wrongs they do to me. (Ibid., vv. 920ff.)

The gods do not intervene, they do not protect Antigone, and they don't reprimand Creon. It is only Teiresias the prophet—apparently endowed by the gods with a special organ for reason—who manages to make Creon listen to reason again (ibid., vv. 988ff.) by threatening to bring the Erinyes into play. Creon himself, by contrast, had not been given a similar capacity by the gods. He interprets his delusion as divinely-ordained, a god smote him from above (ibid., v. 1272). The chorus' final appeal (ibid., v. 1350) that the reverence towards the gods must be inviolate, sounds a bit too much of a Sunday's sermon, if the gift of the gods can just as well be taken away by them.

Here, the "godless" conflict between man and his principles is at stake (according to Hegel: between the principle of State and the principle of Family). Creon stands for the undemocratic, etatist-authoritarian principle; Antigone defends the (family) law and the obligation to bury her brother; Haemon eventually speaks for the people (see ibid., v. 733: "The Theban commons with one voice say, No"—which causes Creon's mentioned justifications).

Where do law and justice come from in the Greek-Roman world, if the gods themselves—in particular Zeus—are everything but virtuous, at least according to our current tame standards? The world of the pre-Olympic as well as of the Olympic gods is characterized by quarrel and revenge, there is betrayal, rape and murder. That is to say, it displays very human traits. Athena, too, is not the goddess of virtue she is portrayed as in the *Oresteia*. During the Trojan War, she took sides for Ulysses, and also in the *Oresteia* her biased vote is decisive. By contrast, the Israelite's God is "the Just," He has imposed norms to be observed by the Israelites to realize the rule of God, despite all the problems of theodicy (e.g., in the case of the Sacrifice of Abraham and the life of Job). And Jesus spoke: "There is no one good but one, that is, God" (Mk. 10, 18; cf. Mt. 19, 17). This kind of moral purity is made possible by locating God as a transcendent being, remote from human affairs and understanding.

3.1.2. Religious Foundations of Law

In the abrahmitish religions, however, God establishes a visible and normatively rigid contact with mankind. The myth is in a certain sense timeless. In Greek mythology there are only undated successions of generations. The history in the Bible, however, unfolds in real time. A religious foundation of law is often found in the monotheistic religions based on written revelations.[12] A God absolutely transcending the world exists who is present among men by his creation, his laws, his son or his word.

The creation of a monopoly of (state) force can be reconstructed in the stories of the Old Testament. Elements are the interruption of vengeance by the mark of Cain, the canalisation of private revenge, the prerogative of divine retribution delegated to human institutions and the limitation of retribution by the *ius talionis*. The New Testament is much more reluctant to formulate principles of statepower and the law because of its eschatological tendencies. Christian doctrine, however, had ample opportunity to turn to the immanent problems of social order given the permanent postponement of redemption. St. Thomas Aquinas has—drawing from "the philosopher" (Aristotle)—formed the first great summary of the philosophy of law and the state. In Thomas' work explanation and justification of the *lex humana* are achieved by its subordination to the *lex aeterna*, *divina* and *naturalis*. In Islam, the last abrahimitish Religion, the top of the normative order is formed by a text derived from direct divine inspiration of the prophet delivered to him by the Archangel Gabriel. This text forms, together with the deeds and opinions of the prophet, the source—the narrative base of justification and in this sense the foundation—for Islamic law, the *sharia*.

I shall not deal with the relationship between law and religion in modern societies as a reflexive interaction, e.g., concerning questions of religious freedom, judicial treatment of religious controversies, tensions between religious organizations and the state, etc. (cf. on these topics, e.g., Ahdar 2000). Instead the focus lies on the "origin" of law as it is manifested in the religious sources. And because the following analysis will be restricted to the abrahamitish religions (Jewish, Christian, Islamic) this means: on holy texts. The God in question is not far away from the world, the laws are not Antigone's indeterminate, unwritten laws. In the monotheistic religions God reveals himself in specific holy texts. They are the authoritative, literally interpreted bases for argumentation. What these texts tell us is nevertheless an indiscriminate mixture of explanation and justification.

[12] Monotheism, however, is not necessarily connected with revelation through texts. What is presumed to be the first monotheistic religion—the religious system of Echnaton in Egypt, around 1400 B.C.—did not have any textual basis. The only God in this religion, Aton, revealed himself in the light of the sun. His only voice was Echnaton, the son of God; he did not form a congregation and had no successor. After his death, this religion disappeared.

3.1.2.1. The Process of Civilization in Jewish Law

The Jewish religion as one of the great monotheistic religions is distinguished by a transcendent god who has revealed himself to the world, to humanity (or certain chosen human beings), most importantly at Sinai and generally in the holy texts of the Thora with its legalistic and narrative parts. Most important in this respect are the Second book of Moses (Exodus) (more precisely Exod. 20 with the Ten Commandments[13]) and the other books of Moses containing detailed divine laws. The exegesis of holy texts remains a well-guarded tradition in the Mischna and Gemara, i.e., in the Talmud with its legalistic (Halacha) and narrative (Haggada) parts and in the Midrasch.

The idea of Jews as the chosen people, the covenant with God, forms a special connection of the divine and worldly sphere surmounting the absolute transcendence of the divine.[14] If the Jewish people, however, do not obey to the commands of God, terrible revenge is threatened (Lev. 26, 14ff.). In exchange for conformity God offers a "promised land" with holy places. Since the fall of the Temple, the Jewish religion—like Islam—knows no supreme institutionalized instance of belief like the Catholic Church. It does not, however, clearly separate state authorities and believers.

I do not want to give an overview of the development of the Jewish law and its interpretation. I want to refer to the "foundational" holy text and will try then to show its connection to a law for the world. The divine source of law is given—but how does the word of God establish itself in the world?

A fundamental step of the evolution of law seems to be—as we have seen in the discussion of the *Oresteia*—the limitation of revenge, illustrated by the neutralization of the Erinyes. This limitation of revenge is achieved by religious means in the Thora and afterwards through the canalization of revenge by means of the state. Revenge (*naqam*) has the function to re-establish a disturbed order. It is not to be practised endlessly and indiscriminately. By God's command the chain of vengeance is broken. Cain's mark is a stop sign:

> "I shall be a vagrant and a wanderer on earth, and anyone who meets me can kill me." The LORD answered him, "No: if anyone kills Cain, Cain shall be avenged sevenfold." So the LORD put a mark on Cain, in order that anyone meeting him should not kill him. (Gen. 4, 14–5)

A further interruption or limitation of revenge is the establishment of especially protected areas. They are spaces chosen by God (Exod. 21, 12–3), en-

[13] Van Seters 2002 argues that the Covenant Code (Exodus 20, 23; 22, 33) cannot be taken as the "foundation of Hebrew Law." In fact it comes later than the laws in Deuteronomy and the Holiness Code.

[14] The connection of God and the world is not only established by the Commandments, but by another legal instrument as well: a contract. Has God really made a contract with the Jewish people? Or did he make an offer the Jewish had to accept? Cf. Walzer, Lorberbaum and Zohar 2000.

tered for protection if somebody has committed manslaughter (Num. 35, 10ff.; Deut. 19, 4).

A limitation of private revenge also is achieved by limiting the group of people entitled to retribution. Revenge stops to be a right of everybody. Only some relatives are allowed to execute revenge, more precisely the closest male relative (Judg. 8, 18ff.).

There are many forms which distribute the competence of retribution between God and human beings. In principle God alone is entitled to take revenge. The retributive God acts as a judge. Punishment and vengeance are his privilege (the interpretation of Deut. 32, 35 and 41, according to R. 12, 19). The persons concerned can plead for retribution but cannot execute it themselves: "Oh LORD, thou God of vengeance, thou God of vengeance, show thyself" (Ps. 94, 1).

Man may pray to God and beseech him to take vengeance: "LORD, thou knowest; remember me, LORD, and come to visit me, take vengeance for me on my persecutors" (Jer. 15, 15). "O LORD of Hosts, thou dost test the righteous and search the depths of the heart; to thee have I committed my cause, let me see thee take vengeance on them" (Jer. 20, 12). One has to be patient and wait for God's vengeance. "Do not think to repay evil for evil, wait for the LORD to deliver you" (Prov. 20, 22).

God wants to take vengeance upon his enemies (Isa. 1, 24), or upon his own people (Jer. 5, 9). There is a day of God's retribution (Isa. 34, 8; 63, 4; Jer. 46, 10). One year of grace is followed by a day of reckoning (Isa. 61, 2). "See, your God comes with vengeance, with dread retribution he comes to save you" (Isa. 35, 4). The sinners that live well on earth will be destroyed in the end by God (Ps. 73).

Sometimes God permits a human being explicitly to take revenge. E.g., he allows Jephtah to take vengeance upon the Ammonites (Judg. 11, 36). But in exchange he has to keep his promise and sacrifice his daughter (or her virginity?). Sometimes God demands revenge, e.g., the retribution on the Amalekiterians (Deut. 25, 17ff). God's command, a command of complete extinction, has to be obeyed literally. Saul, who does not do that, is rejected by God and loses his dignity as a king (1 Sam. 15, 1ff.). God orders Moses to take revenge upon the Midianites. For this purpose an army shall be recruited from the Israelite tribes (Num. 31, 1ff.). A different affair is regulated without divine intervention: Saul has become guilty, because he tried to destroy the Gibeonites, even though the Israelites had sworn to keep on peaceful terms with them. The Gibeonites give up revenge, demand and receive, however, as retribution from King David seven male descendants of Saul (2 Sam. 21, 1ff.): The vengeance upon Abner remains without retribution. King David only curses the family and the descendants of the murderer (2 Sam. 3, 27).

The "appropriation" of revenge by the state is achieved by its delegation to human beings and more precisely to special institutions and people fulfill-

ing certain roles in society. God gives up the monopoly of vengeance. The "state"—even though rudimentary—takes his place.

A further step apart from this clarification of competences is formed by the limitation of the content of revenge. It has to be materially circumscribed; it has to be "proportionate." This is the core of the famous verse "eye for eye…" (Exod. 21, 23ff.; Lev. 24, 19ff.). In addition to that, collective responsibility is abolished. Guilt is imputed individually: "Fathers shall not be put to death for their children, nor children for their fathers; a man shall be put to death only for his own sin" (Deut. 24, 16).

The Old Testament, too, knows the duty of love, the commands of charity: Love your neighbor as you love yourself (Lev. 19, 17–8). Justice is the highest value in a religion of law like the Jewish religion. There are no saints, but there are people who are just. In the Old Testament Noah is one of the just. Therefore, he is chosen and remains alive, to enable a new beginning of creation (Gen. 6, 8–9). Abraham, too, is just and God knows that he will pass on this property to his children (Gen. 18, 19). According to Jewish tradition the world will exist as long as there are 36 anonymous, unknown just people ("lamedwownik" = thirty-six) in each generation. They are distinguished by their humility, modesty, limitless mercy and—most of all—by their ignorance of their status.

3.1.2.2. Christian Elements

The world as the creation of God has become a profane object to be used by human beings. Nature no longer is a field for polytheistic and mythological projections nor does it serve as the model of cosmic order. The Stoic law of nature, however, remains—as *lex naturae* for the external nature or *lex naturalis* for the human nature—a normative standard. (Human nature, however, is—most clearly in Augustine—divided into an original nature and, since the original sin, a fallen nature [*natura lapsa*].) The transcendence of God has been bridged not only by the creation of the world and the revelation of the Holy Book; what is more, God has become for a certain historical period of time a human being in Jesus Christ.

The foundations of Christianity were laid over the centuries as a composition of the reports on the messages and the life of Jesus, the additions of St. Paul that were included in the New Testament, doctrines of Christian scholars who referred to elements of Roman and Greek philosophers (mainly the Stoa, Plato and later) and after the reception via Islamic scholars, to Aristotle (the "*philosophus*" in Aquinas), and the autonomous decisions of the ecumenical councils after the establishment of an ecclesiastical organization.

"In consequence of the New Testament's eschatological withdrawal from the world" (Weber 1978, 829)[15] it is impossible to find an elaborate collection

[15] In the German original: *eschatologische Weltabgewandtheit*.

of (legal) norms for the transitory life on earth. Because of the Last Judgment soon to come, there are very few remarks on social justice, justice here below that can be found in the New Testament, e.g., compared to the multitude of provisions in the Old Testament.[16] Norms guiding our behavior here on earth can rarely be found. The Ten Commandments are still valid. The Golden Rule is renewed (Mt. 7, 12; L. 6, 31). In the Sermon on the Mount Jesus Christ demands not only charity to your neighbour but even to your enemy (Mt. 5, 43ff. in contrast to Lev. 19, 18; cf. also R. 13, 8). Jesus propagates reconciliation instead of vengeance. He favors a life in poverty and demands to give money to the poor. There is, however, compared to the Koran, no prohibition of alcohol.

The old prohibition of private vengeance remains (Mt. 5, 38ff.). It is God, and not mankind, who will overcome evil (R. 12, 19ff.), finally on Judgement Day (Heb. 10, 29ff.; Rev. 6, 10; 19, 2). The worldly empire or a Christian community, however, can be entrusted by God with executing punishment against the wrongdoers. On the empire as "*ekdikos*" cf. R. 13, 4: "For he [i.e., the reigning power] is the minister of God to thee for good. But if thou do that which is evil, be afraid; for he beareth not the sword in vain: For he is the minister of God, a revenger to execute wrath upon him that doeth evil" (On the community as a "revenger" cf. 2 Cor. 7, 11).

The most radical maxim against vengeance was stated by Jesus (Mt. 5, 39; similar L. 6, 29): "But I say unto you, That ye resist not evil: But whosoever shall smite thee on thy right cheek, turn to him the other also." The prohibition of vengeance is trumped by the obligation to love one's enemy. It is a long way from this maxim to the doctrine of a "preemptive strike" proclaimed by a Christian politician of our days.

Swearing is forbidden (Mt. 5, 34). To mention another of these rare norms: "This gospel of the kingdom shall be preached in all the world for a witness unto all nations" (Mt. 24, 14; cf. Mt. 28, 19) was interpreted as an obligation to proselytize.

Paul demands obedience to the worldly powers, which includes paying taxes (R. 13, 1–7). A Christian should not take an external point of view to state authorities. It is necessary to obey "not only for wrath, but also for conscience sake" (R. 13, 5; cf. on various kinds of obedience Col. 3, 18ff. "And whatsoever ye do, do it heartily, as to the Lord, and not unto men"; Col. 3, 23).

The New Testament prescribes rules concerning marriage and divorce. An absolute prohibition of divorce and re-marriage is proclaimed (Mt. 19, 3–8; Mk. 10, 2–9; L. 16, 18; R. 7, 2f.; 1 Cor., 7, 10–1, 39). The issue of monogamy is not clearly settled. Later interpretations understand the remarks of Jesus in

[16] The Old Testament (Exod. 22, 24/25; Lev. 25, 36; Deut. 23, 20) states that it had long been the practice among Christian communities to prohibit charging interest on a poor fellow-countryman; the same prohibition is generalized with reference to L. 6, 35: "lend, hoping for nothing again."

Mt. 19, 3–9 as a prohibition of polygamy; the explicit reference that he makes to Gen. 2, 24 and Gen. 1, 27 clearly shows that Jesus is speaking about divorce.[17] It was only after the institutionalization of a Christian church that monogamy became the exclusive form of marriage—with various exceptions (cf. the official permissions by Luther and Melanchton or after the Thirty Years' War): rather polygamy than divorce. The absolute prohibition of divorce was relativized in secular marriage law only during the last century in Catholic countries. Not to forget, the wife has to submit unto her husband (Eph. 5, 22–3; Col. 3, 18; 1 Pet. 3, 1).

The surrender of the hope of the Savior's imminent return and the turn to the worldly life took a long time. In the first centuries after Christ's existence on earth we regularly find movements of withdrawal from the world, e.g., in early monastic and other spiritual groups who searched for private access to God, as well as counter-movements that attempted to institutionalize a church on earth permanently. In A.D. 380 Theodosius I outlawed all religions except the Christian one thus accepting it as the sole official religion. At the same time Augustine (354–430) accomplished a decisive turn towards the world in Christian doctrine, dealing with matters of the *civitas terrena* (*vel diaboli*)—eschatologically orientated towards the *civitas Dei*—and questions of the organization of the church. While the first Fathers of the Church were radical pacifists, Augustine developed a doctrine of the *bellum iustum,* thus providing worldly authorities with opportune justifications. As a consequence of his doctrine of original sin, i.e., the inborn human concupiscence, he advocated the requirement of secular sanctions and *disciplina*.

The small set of norms that can be found in Christ's sermons and messages (and the additional counsels of St. Paul) were insufficient to guide everyday behavior down on earth nor could they be used to establish social institutions, including a "church." Hence after the turn to the secular world the lack of guiding rules was experienced not only as a normative deficiency, but instead it offered the opportunity for a wide scope of normative inventions. The rules of the Holy Book could be supplemented by recourse to traditions of antiquity, mainly Stoic philosophy and the Platonic tradition, later, and mainly via Aquinas, Aristotle.

Because of the complex foundations of Christian religion itself, i.e., the blending of disparate elements, it is difficult to find homogenous Christian foundations of law. In the Christian tradition we find a plurality of movements, groups, separations from the mainstream, etc.: Resistance to the institutionalization of a church and in favor of a personal access to God in mystical groups; movements against the pollution of the pure Biblical doctrine by external, even pagan elements (Luther's attack against Aristotle and his own

[17] The Old Testament accepts polygamy: see, e.g., Lev. 18, 18; Deut. 21, 15–17; on divorce, see, e.g., Deut. 24, 1–4.

principle of "*sola scriptura*"); mendicant orders that criticized by their way of living in poverty the worldliness of the church (e.g., the fight against simony); anti-authoritarian movements against a close liaison of church and state; pacifists who refer to the sermon on the mount—"Blessed are the peacemakers ..." (Mt. 5, 9)—and there are others who fight against evil in the name of justice, rather than peace (referring to, e.g., Apocalypsis ch. 19). This group includes some who even favor the use of state power to enforce justice on earth, which extend to military means (referring to R. 13).

Within the church and the official Christian doctrine law could be developed under the following conditions: institutionalization of a hierarchical organization; relative freedom from the Holy Book, i.e., no dogmatic restriction to a sacred text, thus enabling a rather autonomous development of Christian doctrine; engagement in worldly, especially economic and political affairs. This happened in the long struggle between the church and the secular *imperium.* The Bible does not offer a clear solution of the question: What are the things to be rendered unto Caesar and what unto God? (Mt. 22, 21 = Mk. 12, 17 = L. 20, 25) What was made out of the "two-sword-doctrine" that Pope Gelasius I offered in his letter of A.D. 494 with a strange reference to L. 22, 38? Did the secular emperor receive one sword as well as the church from God? Were both originally given to the church and then one transferred to the emperor? Does the emperor as a sinful human creature depend on the church for his salvation? New arguments were required to support interpretations of the dichotomy as a hierarchy or as existing in parallel.

The autonomous development of Christian institutions with a hierarchy of offices was accompanied by the elaboration of Canon Law (with the Decretum Gratiani about 1140 as the basis of the Corpus Iuris Canonici) that could serve as a model for secular law, esp. in the fields of procedural law and court organization. Canon law became one of the models for secular law on the road to rationality (Weber 1978, 829; Berman 1985). Theology and jurisprudence, however, were separate faculties within the European universities, permitting both the development of secular law, especially via the reception of the Roman law, and the elaboration of theological doctrines of justice and law. Another contribution of the Christian doctrine to secular law was asserted more recently, namely the idea of universal equality of men and of human dignity. Basic human rights are now based on the idea of human beings as God's image (with reference to the Old Testament, e.g., Gen. 1, 26–7; Psalm 8, 5–6). The words of the Bible bearing on the idea of universal equality—"There is neither Jew nor Greek, there is neither bond nor free, there is neither male nor female: for ye are all one in Christ Jesus" (Gal. 3, 28)[18]—are contradicted, however, by the long tradition of slavery, crusades, colonialism, discrimination

[18] This idea is taken up by Hegel: "A human being counts as such because he is a human being, not because he is a Jew, Catholic, Protestant, German, Italian, etc" (Hegel 1991, § 209).

against women, etc. in Christian countries, justified by representatives of Christian institutions. Only recently mutual recognition as autonomous individuals is interpreted to be a consequence of the commandment of love (apparently the love of your neighbour, not the love of God). Thus the Christian precept of love would form the foundation of law (Huber 1999, 203ff.).

Just a brief discussion of Aquinas, the most prominent theological scholar who intensively dealt with problems of justice and law, locating the foundations of human law in reference to Stoic elements and mainly to Aristotle (Aquinas, *Summa Theologiae* I-II, 90–105; II-II, 57–79). The well-known sequence of *lex aeterna* (including *lex divina*)—*lex naturalis*[19]—*lex humana* forms a hierarchical order of top-down-justification, with the lower levels "participating" in the higher ones, and of concretization via *determinationes* and *conclusiones*. This order can also be interpreted as a temporal sequence of norms because there must have existed before the *lex divina*, e.g., the Ten Commandments, unwritten laws of God to which Noah, the just, abided and laws that are known to pagan people who never had heard of the Holy Book (cf. R. 2, 14–5). Therefore, *lex aeterna* is not identical with *lex divina*. *Lex divina* contains the rules revealed by God in the Holy Book. They are written rules, i.e., given texts that can be interpreted, while *lex aeterna* forms an ideal object of human knowledge and *ratiocinatio*, a starting point for a comprehensive philosophical doctrine.

Aquinas defines *lex aeterna* as "Nothing other than the exemplar of divine wisdom as directing the motions and acts of everything" (*Summa Theologiae* I-II, qu. 93, art. 1 resp.).[20] Augustine, in contrast, said: "The true eternal law is the divine reason and/or the will of God commanding to preserve the natural order and prohibiting to perturb it" (*Contra Faustum* XXII, 27; my translation).[21] These different notions nourished a debate over centuries about the relationship between *ratio* and *voluntas* (reason and will) of God. The conflict between reason and will can be reconstructed as one about the limits of human capacities: Is the world an intelligible object of human knowledge, is it possible to justify and to explain all states of affairs or is there something that is not accessible to human understanding, which cannot be justified or explained in a rational way?

In Aquinas we not only find a hierarchical foundation of law—in which explanation and justification are not distinguished[22]—there is also a teleologi-

[19] The *lex naturalis*, revealed to human beings and then an object of rational knowledge, contains mainly rules from Stoic doctrines: One is to do good and avoid evil; *neminem laedere*, *suum cuique tribuere*, *honeste vivere*.

[20] "Nihil aliud est quam ratio divinae sapentiae, secundum quod est directiva omnium actuum et motionum."

[21] "Lex vero aeterna est ratio divina vel voluntas Dei ordinem naturalem conservari iubens, perturbari vetans."

[22] Here it is important to see that the Christian tradition makes no sharp distinction between explanation and justification. The two converge in God. The "natural" is the "correct" and "ens et bonum convertuntur."

cal argument that human law necessarily is orientated towards the realization of the *bonum commune* promulgated by those who have to care for the community.[23] And the legislator has to take into account the limits of the *conditio humana*. People must be able to abide by the legal rules and should not be put under excessive demands of a rigid morality (Aquinas, *Summa Theologiae* I-II, qu. 96, art. 2 resp). Hence, human law is conceived as separate from morality and religious injunctions as well.

3.1.2.3. Islamic Law[24]

It is not only since September 11, 2001 that the Islamic world has attracted the attention of the occident during recent decades. The revolution in Iran (1979), the long-standing Palestine conflict, the introduction of the *sharia* in Sudan, Nigeria, the Taliban regime, etc. were, in Western eyes, issues on which different cultural points of views have clashed. In our context I choose as a starting point the brief remarks that Max Weber made about Islamic law in his *Sociology of Law* (Weber 1978, 818–22). One may doubt the adequacy of his descriptive accounts; however, two distinctive features of Islamic law in contrast to the development of occidental law that Weber points out are still of interest:

(1) Only in the Christian occident did the separation between theocratic, sacred law and secular law take place. This stage of developmental differentiation has not been reached in Islamic states.

(2) In contrast to occidental law which arrived at the peak of formal rationality during the 19th century, Islamic law never has gotten beyond the lower stage of material rationality, if it has reached this level at all.

(1) Theocracy and Secularization, Religion and State

Islam forms the third and, according to its founder, final great monotheist religion based on a holy Scripture with which the Jewish-Christian tradition comes to an end. Muhammad is the last prophet in the succession of Adam, Henoch, Abraham,[25] Jacob, Joseph, David, Moses, Salih, Hud, Jesus (who was not the son of God), and John the Baptist.

[23] Law in general is defined as follows: “Law is nought else than an ordinance of reason for the common good made by the authority who has care of the community and promulgated” (Aquinas, *Summa Theologiae* I–II, qu. 90, art. 4 resp.). (“Nihil aliud quam quaedam rationis ordinatio ad bonum commune, ab eo qui curam communitatis habet, promulgate.”)

[24] Introductory literature: Schacht 1964; Coulson 1964 and 1969; Linant de Bellefonds 1965; Nagel 2001. A bibliography can be found in Makdisi and Makdisi 1995.

[25] Abraham and his son Ismael laid the basis of the Ka’ba with the Black Stone (*Hadjar al-Aswad*) (sura 2: 127). According to sura 3:67, Abraham was not a Jew.

The Koran is the immediate word of God revealed to Muhammad by the archangel Gabriel (sura 2:97), the "reliable spirit" (sura 26:193). It is not only a human report on the commands of God, on the history of Israel or the life and words of Jesus. A Christian can read the Bible as a human work written down during a certain historical period. He or she can make assumptions about the authors and their circumstances, bearing in mind time and place of origin. During centuries of exegesis sophisticated hermeneutic strategies and rules could be developed by the "people of the book" (as Jews and Christians are named in the Koran, e.g., sura 3:64). This reflexive relationship between text and reader could not develop in the case of the Koran. It is the unquestionable word of God, revealed in "*clear* Arabian language" (sura 26:195; cf. 16:103, 39:28). It should be orally presented (*Qur'ān* means reading, lecture). In its essence it cannot be translated into other languages.

Islamic law has its foundation in this incontestable holy book. The Koran contains, in contrast to the ambiguities of the New Testament, many detailed prescriptions for daily life and political and economic matters. It is only the hierarchy of sources of Islamic law, i.e., the *sharia* (= the way), that opens explicitly the way to more flexible interpretations. The *sharia* consists of the Koran itself; in addition: the *hadith,* the reports of Muhammad's comrades about his instructions and acts (finished two to three centuries after the death of the prophet). Presumably there exist about 600,000 *hadiths* of which by the authentic hadith collectors only some thousand are accepted as true. The s*unna*, the good custom, contains the sum of Muhammad's collected statements, decisions and acts; also included in the *sharia* is the consensual tradition of the legal experts (*ulemas*), what is called *idjma* and the *qijas*, i.e., deduction, analogies etc. for new problems and a kind of customary law, usages, conventions that are established in society. As a residual there remains some kind of discretion based on legal-religious expertise (*raj*).

There is no clearly defined realm of secular law (like in the occident and its autonomous development of canon law). The *sharia* embodies religious-moral obligations, rules for family life including matters of inheritance, contracts, property, taxes, criminal as well as procedural issues, administrative regulations, etc. It is a mixture of religious, moral, legal rules interpreted and applied by *ulemas* who are legal experts and, at the same time, leaders of the religious community (conducting, e.g., the Friday prayer). Judges (*kadis*) are trained in special branches of theological faculties (*medrese*), often associated to a mosque. As a consequence of the lack of differentiation within the normative material the *sharia* penetrates the whole life with a religious, cultic, legal, moral, conventional, ethical network. In an Islamic society there is no separation between religion, political power and social order.

Islam belongs to the state-founding religions. At the beginning we find a successful integration of five competing tribes in Medina (in 622 A.D.—the Christian calendar permitted) according to religious commands instead of tra-

ditional genealogical patterns. Islam implies a transtribale potential of integration (Ammann 2001). "And obey God and His Messenger and do not dissent together, lest you should fail and wither away. And persevere, for God is with the persevering" (sura 8:46). "If you dissent on anything, refer it to God and the Messenger, if you believe in God and the Last Day" (sura 4:59).

Allah and the prophet are the supreme arbitrators. Allah himself guards the holy commands (sura 15:9). Nowadays on earth there is no highest binding authority in religious matters (like the Pope for Catholics). The relationship between God and the individual Muslim is less mediated by ecclesiastical institutions as is the case for a Christian believer. Religious-moral-legal controversies therefore are rather an "everyman"-problem, rather than an issue resolved within a formal, mainly hierarchical order of competences.

Compared to Christian faith, Islam is much more worldly orientated. Muhammad was a secular emperor, a political leader, like Moses and unlike Jesus, leading holy wars (*ghazweh*), dominating a territory and founding communities on earth. The paradoxical thing, however, is that the Koran, and the *sharia* in general, does not contain provisions for the institutionalization of state authorities. Indeed, it is in fact the Catholic church that, leaving behind its eschatological origin, was able after its secular turn to develop patterns of a hierarchical structure that could be transferred to a secular state as a formal institution.

Weber has pointed out (cf. *supra*) that in the European tradition canon law was able to serve as a model for the rationalization of secular law. The occident, in addition, could revert to Roman law in particular to promote the development of private law. In Europe a parallel evolution of ecclesiastical and secular law and institutions could take place. Weber also has emphasized the separation of theological and legal education in the occident. In the Islamic orient there never were battles between state and religious groups nor among conflicting religious movements (e.g., between the Sunnis and Shiites or among the four sunnit legal schools) that led—like in Europe after the bloody religiously motivated civil wars of the 16th and 17th century—to a separation between state and religion, i.e., a neutralization of state authorities in religious matters and civil religious liberty. The fixation on a holy text and related sources together with a lack of a hierarchical organization that could issue binding provisions has impeded systematic lawmaking. Positive law as a separate context of meaning independent of the religious leadership could be created only occasionally.

What is lacking in Islamic law, despite the more worldly orientation of Muhammad's message, is a distinctive public law containing provisions that constitute and limit state competences, with procedural rules for the creation of binding decisions and the participation of the citizens. There are proposals for an Islamic constitution. The highest authority, however, in the Sunnit branch—the Al-Azhar university (which is a religious institution as well)—it-

self is in control only of uncertain and limited competences. And the constitution of the "Islamic Republic Iran" cannot with all its provisions be derived from the Koran and other holy sources. They do not provide anything for the determination of constitutional structures, procedures and competences.[26]

Islamic law emphasizes the values of the *umma*, i.e., the community of Muslims, and of the family as its core. Christian communitarists might be delighted (though probably not with the participation of the community in stoning an adulterous member). There is a peculiar relationship between perpetrator and victim (and the relatives) that restrains the state monopoly of sanctions: The perpetrator can purify himself by doing a good action. The victim (or the bereaved) can pardon the perpetrator, even preserve him from being executed. Taking justice into ones own hands reaches beyond the limits of preventive self-defence. "And surely those who defend themselves after being wronged, such shall have no way against them" (sura 42: 41).

The appreciation of the *umma* in constitutional matters leads to a diffuse relationship between an absolute monarch and his people, e.g., in Saudi-Arabia. Since 1992 there exists a "basic order for the government," allegedly founded on the *sharia.* The Koran prescribes "consultations" between ruler and ruled (sura 42:38 and cf. 3:159, 27:32). Insofar as the king himself appoints the members of the council (*Madjlis asch-Schura*) this model introduces a pseudo-democratic element according to the pre-constitutional ideal of the "good ruler."

The essential question in our context, which not only concerns the foundations of law in general, is whether the basic principles of the rule of law, of democracy and human rights can be realized on an Islamic foundation. Are they inherent elements of this religious base or is a radical secularization of law and the political order required, a separation and functional differentiation of law, politics and religion?

The case of modern Turkey indicates that a radical secularization of an Islamic society was only possible by dictatorial means. The developmental dictatorship of Atatürk imposed modern, Western structures upon a traditional Islamic society: with the abolition of the caliphate in 1924, the introduction and enforcement of a dress code, of the Christian calendar, the Latin alphabet. Western culture was adopted, e.g., in the school system, and Western codifications were introduced (besides many other codes, e.g., the Swiss ZGB in 1926). Religion is not a privatized matter but remains under state control. Turkey is an excellent example of the distinction between the law in the books and the law in action. The Western law cannot be interpreted as the "expression" of a popular spirit (the "*Volksgeist*"), a gradually developed culture. Rather it serves as an instrument in order to achieve a profound social change.

[26] In analogy, the basic principles of the Soviet state could not be derived from the writings of Marx and Engels.

A secular regime dominates a still Islamic society. Secularization is, in the background, guaranteed by military force, i.e., by the national security council which is nothing else but the institutionalization of a coup d'etat (the last one took place "unconstitutionally" in 1980). As in colonial countries the problem arises under what conditions this radical top down legislation can be efficacious. The societal, i.e., religious and cultural conditions are not the foundation of state law; rather they form restrictive conditions an authoritarian legislation has to cope with. If one looks only at the legal surface, the law in the books, e.g., from the point of view of the E.U. members, deliberating whether to admit Turkey or not, one might observe remarkable progress towards the principles of the rule of law, democracy, human rights and protection of minorities. But what about the law in action: Are these principles accepted and practiced in society, in communities and families, e.g., concerning the position and role of women? Not to mention the actual activities of the legal staff which can rarely be investigated.

The counter-tendencies of re-islamization of law and state in many countries during the last decades[27] are not only an expression of popular beliefs. Parts of family law and criminal law were renewed according to Islamic standards in Tunisia (1956), Morocco (1958), Iraq (1959), Libya (1972–1974). The whole body of Islamic law, the *sharia* was introduced in Iran (1979–1982), in the northern parts of Sudan (1991), in Afghanistan (1996) by the Taliban regime, and 1999 in the northern provinces of Nigeria. The revival of Islamic fundamentalism, at least in Nigeria, has no autochthonous "religious foundation." In this case it is obvious that a variety of reasons have contributed to the introduction of the *sharia*. It is an attempt to compensate for the loss of power of the Northern provinces that wish to participate in the wealth of the oil industry of the South. Jurisdiction according to the *sharia* permits the establishment of autonomous power structures in the North that can gain legitimacy by appealing to traditional sentiments of justice among the people, in particular in the fight against criminality. Islam can be presented as the religion of law and order. Thus re-islamization turns out as a way of instrumentalizing the religious "foundations."

(2) Why does Islamic law not reach the level of formal rationality?

Max Weber pointed out the relationship between secularization and rationalization. He insisted, however, on the religious foundations of secular processes: The rationality of secular law is derived to a considerable part from the

[27] A revival of "true" Islam took place so early as the 18th century, when the Wahabit movement and the Saudi family established a political regime in Arabia. Most Islamic countries adopted European models during the 19th century. The achievement of political autonomy during the 20th century often resulted in revitalizing parts of the *sharia*.

development of canon law; the "spirit of capitalism" has its roots in Calvinism. (But is there also a Calvinist foundation of civil law?) The occidental process of rationalization took place in many fields (economy, political organization, law, religion, art, etc.). In the realm of law Weber describes the development in different dimensions: according to the differentiation of legal categories (sacred/profane, criminal/civil/public law, formal/material, objective/subjective, etc.); according to the leading professions ("law prophets," legal honoratiores, lawyers with formal legal training) (Weber 1978, 882–3). And he theoretically constructs four stages of rationalization of lawmaking and lawfinding by combining two dichotomies: rational/irrational and formal/substantive (material) (ibid., 656–7).

formally irrational	no intellectual control, e.g., recourse to oracles
substantively irrational	concrete evaluation of a particular case on an ethical, emotional, political basis
substantively rational	decision according to ethical imperatives, political maxims
formally rational	a) adherence to external characteristics of the facts, sense data; casuistry b) logical interpretation of meaning; consistent complex of abstract legal propositions

The notion of "*khadi* justice" Weber uses in order to characterize the theocratic lawfinding in Islamic countries. This notion, however, appears again when he alludes to the English courts of justices of the peace and the German "popular justice of the jury" (*Geschworenengerichte*).[28] This way of administering justice is, according to Weber, extremely "informal," focused on material justice, opportunistic, unsystematic, lacking rational reasons.

Certain essential characteristics of Islamic organization, viz., the absence of [Church] Councils as well as of doctrinal infallibility [like that ascribed to the papal office], influenced the development of the sacred law in the direction of a stereotyped "jurists' law." Actually, however, the direct applicability of sacred law was limited to certain fundamental institutions within a range of substantive legal domain only slightly more inclusive than that of medieval canon law. However, the universalism which was claimed by the sacred tradition resulted in the fact that inevitable innovations had to be supported either by a *fetwa*, which could almost always be obtained in a particular case, sometimes in good faith and sometimes through trickery, or by the disputatious casuistry of the several competing orthodox schools. As a consequence of these factors,

[28] Weber 1978, 823, on *khadi* justice in Islamic countries; see ibid., 814, on *Geschworenengerichte* in England: "But the courts of justices of the peace, which dealt with the daily troubles and misdemeanors of the masses, were informal and representative of khadi-justice to an extent completely unknown on the Continent." On *Geschworenengerichte* in Germany, see ibid., 892.

together with the already mentioned inadequacy of the formal rationality of juridical thought, systematic lawmaking, aiming at legal uniformity or consistency, was impossible. The sacred law could not be disregarded; nor could it, despite many adaptations, be really carried out in practice. As in the Roman system, officially licensed jurists (*muftis*, with the *Sheikh-ül-Islam* at their head) can be called on for opinions by the khadis or the parties as the occasion arises. Their opinions are authoritative, but they also vary from person to person; like the opinions of oracles, they are given without any statement or rational reasons. Thus they actually increase the irrationality of the sacred law rather than contribute, however slightly, to its rationalization. (Weber 1978, 821)

In Weber's stage model *khadi* justice oscillates somewhere between the first and the third level. Similar depreciating statements can be found in more recent authors.[29]

Are logical interpretation and abstract thinking Greek to scholars of Islamic law? One can take that literally: Rational Greek philosophy, in particular the logic and metaphysics of Aristotle, were saved by Islamic scholars during the 9th–12th century for the medieval occident. Has this heritage been lost?[30]

How does Islamic law react to the pressure that is put on societies by economic modernization? Property law including commercial and corporation law has been codified in all Islamic states, following the western models, with the exceptions of Saudi-Arabia and Oman. In so doing *sharia* law is still respected in very subtle ways. In particular the prohibition of taking interest (sura 2: 275ff.) is interpreted rather as a provision against usury.[31] The prohibition of insurances is ingeniously integrated into stock-market and bank law. Instead of interest, models of participation in gains and losses are preferred. In order to comply with the religiously based prohibitions concerning pork, alcohol, pornography, gambling, armament, etc., special funds are established, listed in the Dow-Jones-Islamic-Market-Index. No banks, insurance and other such corporations are admitted that deal with the above mentioned goods—a small part of the business in these branches, however, is permitted (cf. Rodinson 1966).

Weber refers to a multiplicity of causes in order to explain the particular process of rationalization of law in the occident (Weber 1978, 882–3). Rationalization according to his stage model implies secularization. What were the

[29] See, e.g., Fikentscher 1975, 319, on the lack of rational means in legal argumentation. Experts in Islamic law contest this assessment.

[30] During the Christian crusades Muslims were horrified to see the invaders' use of ordeals (a clear case of formal irrationality in Weber's sense). Islamic procedural law admits oral and documentary evidence, and at that time admitted as well a restricted use of torture: Torture was more restricted than in Western Inquisition trials, and was used not so much to force confessions as to obtain substantial proof. Cf. Johansen 2001.

[31] Cf. the Cairo declaration of human rights in Islam, of August 5 1990, under art. 14: "Everyone is entitled to make legitimate profit, without monopolizing, defrauding or injuring others. In any case usury is forbidden."

conditions that could change the religious foundations or that could contribute to the rationalization of a separate secular law? Weber points out that economic conditions played an important role "but they have nowhere been decisive alone and by themselves." The "need for the purely formal certainty of the guaranty of legal enforcement" fosters formal legality. More important, however, were the tensions between the diverse political powers, e.g., the power of the *imperium* in relation to the powers of the kinship groups, the folk community and status groups, and generally the relations between theocratic and secular powers. In addition, the structure of the "legal notables" was significant for the development of law, a structure which also was largely dependent upon political factors.

I would add that in the Christian occident because of the eschatological character of the New Testament and the lack of detailed worldly provisions an autonomous secular law could be developed. Islamic law, in contrast, is in its roots more worldly orientated and at the same time permeated by religious and ethical considerations. Secularization of law in the Islamic world will not be brought about—if we extend Weber's explanation—solely by changing economic conditions. Political power relations as well as the structure of the legal-religious professions might be more significant factors.

According to Weber the pinnacle of formal rationality had been reached in continental *Begriffsjurisprudenz*. This achievement, however, was challenged by the demands of the free law movement and by legal ideologists of the labor movement.[32] While the claims of the free law movement can be interpreted in Weber's stage model as a regression to the level of material irrationality, the efforts of modern legal ideologists would be seen as an attempt to replace formal legality by substantive justice. Ethical norms should become more significant than juristic or conventional or traditional norms. According to Weber's model the recent Western human rights discourse, as a legal discourse, would also mean a step backward to the stage of material rationality. This stage, however, is achieved also in many parts of Islamic law in which "material" implies a compound of religious and ethical values. It is this stage at which, again according to Weber, the ineluctable and just as insoluble battle between the highest values takes place. These values do not only exist in an ideal sphere.

3.2. Immanent but Legally External Foundations of Law

3.2.1. Natural Foundations of Law

Foundations in the sense of extra-legal factors that could be used in order to explain the origin, the development and the given body of legal norms as well

[32] On the free law movement, see Weber 1978, 886–7, 894; on the legal ideologists of the labour movement, see ibid., 886.

as (extra-legal) conditions for the efficacy of law could be "natural" ones belonging to the environment, the extra-human sphere, like climate, the nature of the soil etc. By natural foundations one might also refer to human "nature," the internal sphere, which is the subject of biology or anthropology.

3.2.1.1. Natural, Extra-Human Foundations: Montesquieu

(1) The Approach

Montesquieu (1689–1755) is nowadays well known, or rather "honored" as a classic and thus reduced to an author who had written something about the English constitution, about the separation of powers and the role of the judge (as the mere "bouche qui prononce les paroles de la lois" with a social function "en quelque façon nulle"[33]). These quotations can be regularly found in pieces on Montesquieu. But one should not only read book 11, chap. 6 of the *Esprit des Lois*. What this book actually is about, is the attempt to give a more or less (rather less) systematic account of the travel reports of his time (Dodds 1929) mixed with references made to antique authors. These travel reports, the favorite bourgeois reading during the 18th century, produced a flood of information about foreign and rather exotic cultures. One reaction to them, besides extinguishing or colonializing them, was "to take the role of the other," i.e., describing one's own culture from the point of view, say, of a Huron American Indian. These are early contributions to anthropological studies of western societies, describing them from an external, somehow oblique perspective. And this is what Montesquieu did in his bestselling *Lettres Persanes* (published in 1721). Another reaction was, instead of producing an exotic thrill by talking about monstrous creatures and bizarre institutions, to describe and explain the variety of foreign cultures. And this Montesquieu did as well; and he did it in his *L' Esprit des Lois*. He collected multifarious features ("rapports") in order to explain the variety of social (and legal) institutions. He did not aim at justifying or criticizing them—like the natural law theorists, instead he attempted to explain them neutrally. This made him a precursor of modern sociology (Durkheim 1892; Cotta 1953). "In all this I only give their reasons, but do not justify their customs" (Montesquieu 1949, book 16, chap. 4).[34] In the first book he exposes the program of his analysis:

> Law in general is human reason, inasmuch as it governs all the inhabitants of the earth: The political and civil laws of each nation ought to be only the particular cases in which human reason is applied.

[33] Montesquieu 1748, book 11, chap. 6 (the chapter on the English constitution). "Judges are no more than the mouth that pronounces the words of the law" (Montesquieu 1949, 159). "The judiciary is in some measures next to nothing" (Montesquieu 1949, 156).

[34] "Dans tout ceci je ne justifie pas les usages, mais j'en rends les raisons."

> They should be adapted in such a manner to the people for whom they are framed that it should be a great chance if those of one nation suit another.
>
> They should be in relation to the nature and principle of each government: Whether they form it, as may be said of politic laws; or whether they support it, as in the case of civil institutions.
>
> They should be in relation to the climate of each country, to the quality of its soil, to its situation and extent, to the principal occupation of the natives, whether husbandmen, huntsmen, or shepherds: They should have relation to the degree of liberty which the constitution will bear; to the religion of the inhabitants, to their inclinations, riches, numbers, commerce, manners, and customs. In fine, they have relations to each other, as also to their origin, to the intent of the legislator, and to the order of things on which they are established; in all of which different lights they ought to be considered.
>
> This is what I have undertaken to perform in the following work. These relations I shall examine, since all these together constitute what I call the Spirit of Laws. (Montesquieu 1949, book 1, chap. 3)

Reading these paragraphs it becomes clear that Montesquieu does *not* draw important distinctions.

The notion of "law" is still ambivalent in Montesquieu, meaning laws of nature (natural laws or regularities) as well as laws of morality (or legal rules). This distinction to which we refer under the heading of Is and Ought was clearly introduced by David Hume (1711–1776) with whom Montesquieu corresponded.

And Montesquieu does not distinguish between the two types of "foundations": the genetic variables and, from an instrumental point of view, the restrictive conditions of the efficacy of legal regulations. Referring to these two types of factors or variables (genetic and restrictive) he explains on the one hand the creation and development of social institutions (including legal ones), on the other hand, he offers recommendations for a rational legislator who should take into account given and possibly restrictive conditions to which he should adapt in order to issue efficacious rules.

> If it be true that the temper of the mind and the passions of the heart are extremely different in different climates, the laws ought to be in relation both to the variety of those passions and to the variety of those tempers. (Montesquieu 1949, book 14, chap. 1)

> I do not deny that the climate may have produced a great part of the laws, manners, and customs of this nation; but I maintain that its manners and customs have a close connection with its laws. (Ibid., book 19, chap. 27)

Montesquieu is not a pure "naturalist" solely using natural variables in order explain human institutions. Among the genetic conditions (as well as the functional, restrictive ones) he mixes natural and human-made features. One could even identify a developmental sequence from natural and customarily determined to deliberately established institutions:

> Mankind are influenced by various causes: by the climate, by the religion, by the laws, by the maxims of government, by precedents, morals, and customs; whence is formed a general spirit of nations.

In proportion as, in every country, any one of these causes acts with more force, the other in the same degree are weakened. Nature and the climate rule almost alone over the savages; customs govern the Chinese; the laws tyrannize in Japan; morals had formerly all their influence at Sparta; maxims of government, and the ancient simplicity of manners, once prevailed at Rome. (Ibid., book 19, chap. 4)

But such an idea of a phylogenetic sequence of factors is not elaborated in Montesquieu.

(2) Counsel to the Legislator

In many chapters Montesquieu gives counsel to a rational legislator, i.e., one who attempts to issue norms that might be efficacious under given conditions. In the above mentioned programmatic paragraphs (ibid., book 1, chap. 3) he recommended:

– the laws should be adapted to the people for whom they are framed;
– they should be in relation to the natural conditions like climate, the quality of the soil, extent, number of inhabitants;
– they should be in relation to the mode of production (huntsmen, shepherds, trade and commerce etc.);
– they should have relation to the religion of the inhabitants;
– they should be in accordance with the degree of constitutional freedom;
– and the legislator should take into account the inclinations, manners and customs of the inhabitants, in general the "*esprit de la nation*" (ibid., book 19, chap. 5).

The legislator should not attempt to change manners and customs by legal norms. They should be modelled on new manners and customs.[35] But the legislator should not only adapt his legislation to given conditions. Sometimes legislative policy should also *counteract* "natural" tendencies. If the legislator cannot change the natural environment itself, e.g., the hot climate, he can have an impact on the social reactions to the environmental conditions.

Agriculture is the principal labor of man. The more the climate inclines him to shun this labor, the more the religion and laws of the country ought to incite him to it. (Ibid., book 14, chap. 6)

[35] "Laws are established, manners are inspired; these proceed from a general spirit, those from a particular institution: Now it is as dangerous, nay more so, to subvert the general spirit as to change a particular institution" (Montesquieu 1949, book 19, chap. 12). "We have said that the laws were the particular and precise institutions of a legislator, and manners and customs the institutions of a nation in general. Hence it follows that when these manners and customs are to be changed, it ought not to be done by laws; this would have too much the air of tyranny: it would be better to change them by introducing other manners and other customs" (ibid., book 19, chap. 14).

There are countries where the excess of heat enervates the body, and renders men so slothful and dispirited that nothing but the fear of chastisement can oblige them to perform any laborious duty: Slavery is there more reconcilable to reason. (Ibid., book 15, chap. 7)[36]

It is then far from being true that to be incontinent is to follow the laws of nature; on the contrary, it is a violation of these laws, which can be observed only by behaving with modesty and discretion. […] When, therefore, the physical power of certain climates violates the natural law of the two sexes, and that of intelligent beings, it belongs to the legislature to make civil laws, with a view to opposing the nature of the climate and re-establishing the primitive laws. (Ibid., book 16, chap. 12)

Legislative adaptation to the "*esprit de la nation*" is limited by the basic principles of government:

It is the business of the legislature to follow the spirit of the nation, when it is not contrary to the principles of government; for we do nothing so well as when we act with freedom, and follow the bent of our natural genius. (Ibid., book 19, chap. 5)

Sometimes these principles are more important than the general spirit. But it is totally unclear in which cases the legislator should restrict his policy to the legal "reduplication" of the given manners and customs and when he should and could attempt to realize new aims.

(3) Explanations of Social Institutions

Counsel to the legislator is mixed with explanations of legislative activities. Variables that had to be taken into account from an instrumental point of view as restrictive conditions change their status and become explanatory variables.

Geographical factors play an important role as explanatory variables (cf. Kriesel 1968; Merquiol 1957): The *size of a country* might correlate with the type of political regime. Despotic regimes exist in large empires (in order to compensate for the long distance of communication and enforcement); monarchies one can find in medium size states and republics in small ones.

It is natural for a republic to have only a small territory; otherwise it cannot long subsist. (Montesquieu 1949, book 8, chap. 16)

A large empire supposes a despotic authority in the person who governs. It is necessary that the quickness of the prince's resolutions should supply the distance of the places they are sent to; that fear should prevent the remissness of the distant governor or magistrate; that the law should be derived from a single person, and should shift continually, according to the accidents which incessantly multiply in a state in proportion to its extent. (Ibid., book 8, chap. 19)[37]

[36] This leads to a moderate justification of slavery in Montesquieu (cf. Montesquieu 1949, book 15, chap. 8). But see ibid., book 15, chap. 1: Slavery is incompatible with non-despotic forms of government (i.e., monarchy, democracy, aristocracy).

[37] But there are exceptions: India is home to "an infinite number of petty states, which

If it be, therefore, the natural property of small states to be governed as a republic, of middling ones to be subject to a monarch, and of large empires to be swayed by a despotic prince; the consequence is, that in order to preserve the principles of the established government, the state must be supported in the extent it has acquired, and that the spirit of this state will alter in proportion as it contracts or extends its limits. (Ibid., book 8, chap. 20)

In Asia they have always had great empires; in Europe these could never subsist. Asia has larger plains [...]. Power in Asia ought, then, to be always despotic: For if their slavery was not severe they would make a division inconsistent with the nature of the country.

In Europe the natural division forms many nations of a moderate extent, in which the ruling by laws is not incompatible with the maintenance of the state: On the contrary, it is so favorable to it, that without this the state would fall into decay, and become a prey to its neighbors. It is this which has formed a genius for liberty that renders every part extremely difficult to be subdued and subjected to a foreign power, otherwise than by the laws and the advantage of commerce.

On the contrary, there reigns in Asia a servile spirit, which they have never been able to shake off, and it is impossible to find in all the histories of that country a single passage which discovers a freedom of spirit; we shall never see anything there but the excess of slavery. (Ibid., book 17, chap. 6)

It is not only the size of the country but also other morphological or topographical features that are important, e.g., whether it is an *island* or whether it is *flat* or *mountainous*. The *quality of the soil* may play an important role.[38]

These fertile provinces are always of a level surface, where the inhabitants are unable to dispute against a stronger power; they are then obliged to submit; and when they have once submitted, the spirit of liberty cannot return; the wealth of the country is a pledge of their fidelity. But in mountainous districts, as they have but little, they may preserve what they have. The liberty they enjoy, or, in other words, the government they are under, is the only blessing worthy of their defence. It reigns, therefore, more in mountainous and rugged countries than in those which nature seems to have most favored. (Ibid., book 18, chap. 2)

The inhabitants of islands have a higher relish for liberty than those of the continent. Islands are commonly of small extent;[39] one part of the people cannot be so easily employed to oppress the other; the sea separates them from great empires; tyranny cannot so well support itself within a small compass: Conquerors are stopped by the sea; and the islanders, being without the reach of their arms, more easily preserve their own laws. (Ibid., book 18, chap. 5)

The goodness of the land, in any country, naturally establishes subjection and dependence. […] Thus monarchy is more frequently found in fruitful countries, and a republican government in those which are not so. (Ibid., book 18, chap. 1)

Montesquieu became famous for his "theory of *climate*" (cf., e.g., Mercier 1953).

Upon the migration into Spain, the climate soon found a necessity for different laws. (Montesquieu 1949, book 14, chap. 14)

from causes that we have here no room to mention are rendered despotic" (Montesquieu 1949, book 16, chap. 10).

[38] On the role of the soil in general, see Montesquieu 1949, book 18, chap. 1ff.

[39] Again, we have an exception: "Japan is an exception to this, by its great extent as well as by its slavery" (Montesquieu 1949, book 18, chap. 5).

In this case there is a direct correlation between the climate and legislation. But in general there is no "automatic" correlation between climatic conditions and legal norms. Sometimes the aims of the legislator are achieved "naturally":

Regulations on the number of citizens depend greatly on circumstances. There are countries in which nature does all; the legislator then has nothing to do. What need is there of inducing men by laws to propagation when a fruitful climate yields a sufficient number of inhabitants? (Ibid., book 23, chap. 16)

In other cases the climate compels the legislator to issue certain confining regulations that might not be necessary under different conditions. Montesquieu takes his examples from the nice field of prohibition, still very much appreciated today:

The law of Mohammed, which prohibits the drinking of wine, is, therefore, fitted to the climate of Arabia: And, indeed, before Mohammed's time, water was the common drink of the Arabs. The law which forbade the Carthaginians to drink wine was a law of the climate; and, indeed, the climate of those two countries is pretty nearly the same.

Such a law would be improper for cold countries, where the climate seems to force them to a kind of national intemperance, very different from personal ebriety. Drunkenness predominates throughout the world, in proportion to the coldness and humidity of the climate. Go from the equator to the north pole, and you will find this vice increasing together with the degree of latitude. Go from the equator again to the south pole, and you will find the same vice travelling south, exactly in the same proportion.

It is very natural that where wine is contrary to the climate, and consequently to health, the excess of it should be more severely punished than in countries where intoxication produces very few bad effects to the person, fewer to the society, and where it does not make people frantic and wild, but only stupid and heavy. Hence those laws which inflicted a double punishment for crimes committed in drunkenness were applicable only to a personal, and not to a national, ebriety. A German drinks through custom, and a Spaniard by choice.[40]

[…] It is the variety of wants in different climates that first occasioned a difference in the manner of living, and this gave rise to a variety of laws. Where people are very communicative there must be particular laws, and others where there is but little communication. (Ibid., book 14, chap. 10)

Again there is a mixture of a genetic and an instrumental point of view. In this case climate is not the only independent variable. In addition he introduces as a consideration the degree of communication. Put in modern terms, Montesquieu applies "multivariate" models of explanation. And he also seems to be aware of what we would call now "intervening" variables, in this case it is religion:

The Christian religion is a stranger to mere despotic power. The mildness so frequently recommended in the gospel is incompatible with the despotic rage with which a prince punishes his subjects, and exercises himself in cruelty. […] It is the Christian religion that, in spite of the extent of the empire and the influence of the climate, has hindered despotic power from being

[40] What do Germans do in Mallorca?

established in Ethiopia, and has carried into the heart of Africa the manners and laws of Europe. (Ibid., book 24, chap. 3)

The size of the empire together with hot climate foster despotic regimes—if religion does not intervene. But Montesquieu is not sophisticated enough to explain the correlation between extent + climate and religion.

In general Montesquieu does not employ developmental schemes in order to systematize the various countries. They are characterized without putting them into any rank order. But there is one famous paragraph in which Montesquieu sketches a theory of historical (including legal) progress according to the *mode of production*:

> The laws have a very great relation to the manner in which the several nations procure their subsistence. There should be a code of laws of a much larger extent for a nation attached to trade and navigation than for people who are content with cultivating the earth. There should be a much greater for the latter than for those who subsist by their flocks and herds. There must be a still greater for these than for such as live by hunting. (Ibid., book 18, chap. 8)

(4) Résumé

- Montesquieu mixes natural and normative (moral, legal) "laws."
- He mixes a genetic and an instrumental perspective, i.e., he uses natural conditions as explanatory patterns, and also as restrictive conditions for the legislator without distinguishing them systematically.
- The counsel to the legislator is rather opportunistic. It is not clear in which cases the legislator should simply adapt his rules to the given conditions (manners and customs) and when he should (and could) change them.
- Although Montesquieu starts his *Esprit* with some anti-Hobbesian remarks about human nature[41] they do not play any systematic role in his explanation of human institutions.
- He applies a plurality of natural, mental and socio-cultural variables that are not weighed according to their impact. There is also lacking the idea of a historical sequence of a growing predominance of man-made conditions for the explanation of human institutions and of a growing independence of the legislator from natural conditions.
- Nor does he classify the various societies according to an evolutionary rank order (as was done later with, e.g., the Tierra del Fuego Indians at the bottom and the Western Europeans on top). The idea of progress (*le progrès*) becomes dominant only after Montesquieu.[42]

[41] This is basically the faculty of conceiving of a Creator; he then enumerates four laws of nature: the quest for peace, the need to obtain food, the sexes' natural inclination for each other, and the desire to live in society (Montesquieu 1949, book 1, chap. 2).

[42] It was rather decline that he dealt with: *Considérations sur les causes de la grandeur des Romains et de leur décadence* (published in 1734).

(5) After Montesquieu

In the same year that *L' Esprit* appeared (1748) David *Hume* published his critique of the theory of climate.[43] Hume clearly distinguishes—in contrast to Montesquieu—between moral and physical causes. He provides many examples against the influence of natural causes, i.e., the "influence of air or climate." The logic is clear: Under the same or similar natural conditions one can find different "national characters" and under different natural conditions one can find similar characters or institutions. In the same country there exist synchronically different populations, e.g., Jews in their host country; likewise Europeans live without change of manners in their colonies. And also diachronically we can observe cultural changes within a constant natural environment: Ancient and modern Greeks are different, but not the climate in Greece. Similarities grow out of communication among nations. But there is one pattern that is constant in Hume as well as in Montesquieu: "people in the northern regions have a greater inclination to strong liquors, and those in the southern to love and women" (Hume 1875, 256). *Skol*!

Despite Hume's thorough critique, theories of climate remain a constant issue in the following decades, e.g., in Rousseau's *Contrat Social* (1941, III, 8). Among other variables (like expenditure of work, consumer customs, available food etc.) in Rouseeau climate plays an important role in explaining different types of government and also among the conditions a legislator has to take into account.

Gotthold Ephraim *Lessing* (1729–1781) established a theoretically continuous sequence in maintaining that states have "different climates, hence they have different needs and ways of satisfying them, hence they have different customs and manners, hence quite different moral philosophies (*Sittenlehren*), hence quite different religions" (Lessing 1956, 559; my translation).

Johann Gottfried *Herder* (1744–1803) mentions the "great Montesquieu" (Herder 1878, 371). However, he criticizes his geographic determinism: Without changing geographic conditions there are flowering periods as well as declines of nations as Montesquieu himself had shown in his analysis of the Roman Empire. Herder distinguishes in his *Ideas* internal and external factors, giving greater weight to internal, "organic" forces in contrast to external ones like climate (cf. Herder 2002, especially book 6 [originally published in 1785] on climate and other external conditions).

G. W. F. Hegel (1770–1831) explicitly deals in his *Lectures on the Philosophy of History* with the "Geographical Basis of History" (Hegel 2001, 96–120).

[43] *Of National Characters* (Hume 1875). This piece of writing acquired fame because of the footnote (ibid., 252) on negroes and their natural inferiority.

Contrasted with the universality of the moral Whole and with the unity of that individuality which is its active principle, the *natural* connection that helps to produce the Spirit of the People (*Volksgeist*), appears an extrinsic element; but inasmuch as we must regard it as the ground on which that Spirit plays its part, it is an *essential* and *necessary* basis. (Hegel 2001, 96)

And in § 3 of his *Grundlinien der Philosophie des Rechts* (1820) he again refers to the importance of natural foundations:

In terms of *content,* this right acquires a positive element through the particular *national character* of a people, its stage of *historical* development, and the whole context of relations governed by *natural necessity.* (Hegel 1991, § 3)

In a corollary to this paragraph he praises Montesquieu:

With regard to the historical element in positive right (first referred to in § 3 above), Montesquieu stated the historical view, the genuinely philosophical viewpoint, that legislation in general and its particular determinations should not be considered in isolation and in the abstract, but rather as a dependent moment within *one* totality, in the context of all the other determinations which constitute the character of a nation and age; within this context they gain their genuine significance, and hence also their justification. (Ibid.)

For Hegel the plurality of unweighed factors makes up a "totality." It was, however, not the aim of Montesquieu to use these factors as justificatory determinations ("*Bestimmungen*"). And insofar as Montesquieu stresses the necessity of natural conditions among the plurality of all his "*rapports*," this seems contrary to Hegel's assumption that the true basis of law, its foundation lies in free will:

The basis [*Boden*] of right is the *realm of spirit* in general and its precise location and point of departure is the *will*; the will is *free,* so that freedom constitutes its substance and destiny [*Bestimmung*] and the system of right is the realm of actualized freedom, the world of spirit produced from within itself as a second nature. (Hegel 1991, § 4)[44]

The legal system is based on "spirit." It is the substantially free will that constitutes law, not one free of natural necessities, but mediating them into a "second nature." The totality of all the "*Bestimmungen*" is manifested in a collective, "objective" spirit—what Hegel sometimes calls the "*Volksgeist*," a term that will be used by Savigny and other members of the "Historical School" in order to denote the basis in which legal evolution finds its organic source.

The emancipation of the legal sphere from natural foundations in Hegel[45] caused some problems for the neo-Hegelian legal philosophers during the Nazi era. The dominant doctrine stated that "race" was an invariable natural

[44] See also: "The real fact is that the whole law and its every article are based on free personality alone—on self-determination or autonomy, which is the very contrary of determination by nature" (Hegel 1971, § 502).

[45] But he had problems justifying hereditary monarchy; cf. Hegel 1991, §§ 280–1 on the "immediate naturalness" of the monarch. On hereditary nobility, see ibid. § 307.

property, based in "blood." How should this natural category be transformed into a legal concept based on the "spirit"? "Blood must become spirit, and spirit must become blood, if one has to have a creative fortune."[46] In fact, no blood examination was conducted; instead the religious affiliation of parents and grandparents was administratively registered. In place of the invariable, quasi-natural element of "race" there was substituted the fact of the religious affiliation of the ancestors—which could not, because it was a historical fact, be changed.

The spirit of the laws in Montesquieu is an aggregation of quite diverse elements. Hegel found in it a genuinely philosophical viewpoint, that Montesquieu had interpreted social institutions as dependent moments "within *one* totality, in the context of all the other determinations." But this "totality" is quite arbitrarily composed. Hegel's objective spirit in contrast has itself developed through world history, producing its manifestations in law, religion, arts and philosophy.

It is the idea of a growing emancipation from the natural environment that leads to an end of the kind of theories of nature we find in Montesquieu. The impact of natural elements is seen as decreasing as the domination or control over nature grows. From the idealistic viewpoint domination means the development of a higher "spiritualized" reality. But in the first instance it is the transformation of the natural environment in order to secure the material reproduction of humankind by applying more and more sophisticated technological instruments within certain social institutions, thus producing a second nature. Ludwig Feuerbach and then in particular Karl Marx and Friedrich Engels put the objective spirit and "*Volksgeist*" on its materialistic, i.e., anthropological and economic feet. For them, the first premise of all human history is the physical organization of living human individuals and their relation to their natural environment. One has to start from the natural bases of human life and their transformation in the course of history through the production of the means of subsistence by which men indirectly produce their material life (Marx and Engels 1976b, 31; cf. Marx and Engels 1969a, 20–1).

Mankind produces its second nature by gaining more and more control over first nature. Hegel's objective spirit and his "*Volksgeist*" are substituted at the dawn of the modern sociological tradition by the concept of "society," which now operates as the mediating totality within which all dependent moments gain their genuine significance. 19th century theories still are full of natural explanations of a more or less monocausal type. Besides Social Darwinism, race becomes a key-variable in explaining the development of world history. Geopolitical writers like Friedrich Ratzel, Rudolf Kjellén and Karl Haushofer stress other geographic features. But at the same time a strictly so-

[46] My translation of Larenz 1935, 42: "Blut muß zu Geist, und Geist zu Blut werden, wo ein schöpferischer Wurf gelingen soll."

ciological approach develops, solely using social or societal variables in order to explain societal facts. This is the program of Émile Durkheim, who consistently dismisses natural variables from his explanatory tableau, e.g., in the case of explaining suicide rates:

> We must therefore seek the cause of the unequal inclination of peoples for suicide, not in the mysterious effects of climate but in the nature of this civilization, in the manner of its distribution among the different countries. (Durkheim 1951, 105)[47]

"Society" becomes the reservoir of explanatory variables. External natural variables—derived from the environment or from human nature as well—are relevant only insofar as they are mediated as sociologically relevant, as socially interpreted ones.

É. Durkheim dealt with Montesquieu intensively in his *thèse* of 1892, accepting him as a precursor of sociology (Durkheim 1892; 1960b). Durkheim finds a sociological perspective in Montesquieu insofar as he deals with "social facts" in a strict sense, i.e., facts that exist independent of individual consciousness, like law, customs, and religion. These "*faits sociaux*" are not representations of a subjective mind; instead they are produced by the social organism. Furthermore, Montesquieu focussed on social regularities, even though he did not clearly distinguish between laws of nature and moral laws. The warm welcome extended to Montesquieu within the tradition of sociological thought, however, serves as a prelude to the stress placed on the theoretical progress that separates the two. Durkheim points out that Montesquieu, contrary to what he claimed, criticized overtly social institutions (e.g., despotical regimes), instead of analyzing them neutrally, as normal social facts. Durkheim does not attack Montesquieu's environmental determinism. Quite the contrary, it is the idea of almost unlimited legislative sovereignty that is not well received. Durkheim points out that the characterization of societies via their forms of government (despotism, monarchy, aristocracy, republic) is inadequate. Montesquieu lacks a concept of society as well as one of progress.

It is always easy to trace back the chain of "founders" to even earlier "founders." So one of the founders of the sociology of law, Eugen Ehrlich, stated "In fact *L' Esprit des Lois* must be considered the first attempt to fashion a sociology of law" (Ehrlich 1915–1916). Again, as in Durkheim, this reverence is retouched with critical remarks. In *L' Esprit* the concepts of society, of evolution and development are lacking (Ehrlich no longer speaks, in 1915–1916, of progress). The main point, however, is the lack of a direct correlation between environmental factors and legislative policy. "The natural circumstances brought forward by Montesquieu, geographical configuration or climate, cannot have any influence on law except by operating on society, which in turn acts on law. Thus in order to discover the *social foundation of law* we

[47] See also ibid., 297ff., on natural variables in general.

must seek the very form in which it is engendered by society" (Ehrlich 1915–1916, 585). There is a level of primary law within a society out of which, via court decisions and legal doctrine, legislative acts grow. Montesquieu focuses on the final, legislative outcome without recognizing the law-generating role of social institutions.[48] Law does not originate from natural foundations; law is surrounded by a social environment.

(6) Recent Studies

Natural, extra-human conditions remain a standard topic in theories of society (or civilization or culture).[49] E.g., Karl August Wittfogel's theory of "hydraulic" cultures became quite famous.[50] Civilizations advanced early where a central organization had to coordinate problems of water supply and protection against high water (at the rivers like the Euphrates and Tigris, Indus, Hwangho, Yuan Jiang [Song Koi or Hong Ha], and Nile). Peasants were obliged by an expanding state bureaucracy to render services in order to erect huge levees, water reservoirs and a network of irrigation canals. In conjunction with the construction of embankments streets were built; commerce and cities developed accordingly.

Jared Diamond deals with an old Weberian question (Diamond 1997): Why did the occident—in Diamond's case this means Eurasia—succeed? Among other reasons it is the flora, together with a climate advantageous for the plants; there were animals that could be domesticated; hence the production of an economic surplus was possible very early; hence the establishment of a political class that was in charge of distributing and storing the surplus product; a class of craftsmen and mechanics could evolve that was not engaged in the direct production of agricultural subsistence. Later on other social conditions push the occident ahead, e.g., competition between European states. But the whole story does not provide a sufficient explanation of the peculiar European forms of state and law. The same holds for the global analysis of David Landes (1998) of the wealth and poverty of nations. The most recent attempt to employ a theory of climate in the explanation of historical developments can be found in Fagan 2000.

[48] Ehrlich, however, should have taken a closer look at these sentences, found in Montesquieu's *Esprit*: "Before laws were made, there were relations of possible justice. To say that there is nothing just or unjust but what is commanded or forbidden by positive laws, is the same as saying that before the describing of a circle all the radii were not equal" (Montesquieu 1949, book 1, chap. 1).

[49] On climate, see Huntington 1924 and, in general, Glacken 1967.

[50] Wittfogel's *Study on Oriental Despotism* (1957) is the starting point of Fuller's study on the relationship between natural conditions and social ordering, with Fuller looking specifically at the organization of "managerial direction" (Fuller 1965). See also Fuller 1971, 163: "Other considerations of climate, geography, technology, culture, and past history have to be taken into account in the design of any legal system."

External nature became the object of increasing technological control. What are the consequences of the almost unlimited human domination of nature? What are the consequences for state and law today? We can recognize a revival of the old, 18th century theories of the importance of climate today: The menace of a drastic change in the climate and its consequences (global warming, desertification, scarcity of water supply, ozone hole, etc.) is not a matter of "first" nature. Rather, it is the result of the "second nature" deforming the first one.

3.2.1.2. Natural, Human Foundations of Law: Biology and Anthropology

Biology is a discipline composed of different sub-fields. It is systematic as well as evolutionary; it implies, to mention only some important topics, morphological classifications, observation of behavior, the analysis of tissue, cells and genes. In the following I shall focus the discussion of biological foundations of law on research in the fields of ethology and on genetic, evolutionary theories like sociobiology.

Foundations once again, here means both, natural, biological elements that can be used in order to explain the origin, the evolution and existence of human behavior and social institutions on the one hand, and natural, biological elements that form restrictive conditions for legislative policies on the other. A fundamental strategy in ethology,[51] i.e., the systematic observation of behavior, aims at discovering homologies between human and animal behavior. The idea is that a homology indicates a natural basis that human beings share with their pre-human ancestors, e.g., patterns of aggressive behavior. A second strategy consists in identifying universals of human behavior. The idea in this case is that behavioral universals can be found to exist independent of any particular kind of cultural or historical formation. The constant, the universal is the natural. Examples regularly mentioned are: hierarchical structures of societies, aggression, territorial exclusion, nepotism, coupling, hypergamy, incest taboo, killing taboo,[52] separation of in-group and out-group, mimic and gesticulative patterns, etc.

A third strategy to identify a natural substance, free of cultural disturbance, is the investigation of human beings that are not or not yet "normally" encultured: children born deaf and blind or infants.

The existence of homologies and universals is claimed on the level of observable behavior patterns. In addition to the observation of overt behavior, underlying biological strata are presupposed, like instinct or cerebral, neuro-

[51] See Gruter 1991 and Hof 1996; on the application of biology in the legal domain in general, see Rottleuthner 1985.

[52] Is there a biological basis to this taboo, when marriage barriers exist between individuals who have grown up in close relations?

physiological structures. Whatever might be gained for the explanatory power of the ethological model by adding this "foundation," when it comes to the explanation of law, its origin, its development and the existence of legal norms and institutions, this approach turns out to be quite limited. Besides the arbitrary selection of homologies from one species or the other—even among kinds of apes a choice must be made—the general problem is: Why do we need norms, particularly legal ones, in order to enforce universal regularities? In the case of norms not only do exceptions take place, but rather, transgressions must be possible. Norms do not serve as mere duplicators of natural regularities. Why should norms permit what is naturally given? Or should they channel natural regularities (e.g., aggression)? What kind of aggressive behavior should be prohibited, which kinds permitted or even rewarded? Why prohibit murder (or incest) if there exists a taboo against murder (and incest)? Who should count as a member of the in-group (kinship)? What should count as holding a higher social rank? What is the socially adequate form of coupling? If coupling is "naturally" given, should we prohibit polygamy; should divorce be permitted?

Again, we encounter the distinction between regularities (habits) and rules or norms. Some ethologists attempt to dissolve this dichotomy by introducing the notion of some kind of proto-norms that might exist in ape-societies. Hierarchical structures, limitations on aggressive behavior, demarcations of group membership, etc. might not exist as constant, universal patterns. Transgressions take place (and not only exceptions), which is indicated by consistently enforced sanctions. But does this prove the existence of rules?

And once again we can recur to the internal / external distinction. According to the scale of internality that I introduced above (cf. sec. 2.4.3) an ethologist is restricted to the first step: a non-communicative ascription of behavior patterns to his agent-object. According to a strict realist like Theodor Geiger this would be sufficient to detect the existence of rules.[53] H. L. A. Hart would insist on an internal point of view and this would require an actor endowed with language faculty, enabling him to use a normative language (e.g., "I am obliged ..."), not only a denotative one.[54]

The traditional approach of ethology mainly depended upon—as the biological basis of behavior—theoretical constructs like instinct or assumptions from cerebral physiology. During recent decades interest has shifted to genetics combined with evolutionary theories. This new approach became famous in the work of E. O. Wilson: Sociobiology (Wilson 1975; as a more recent contribution cf. von Rohr 2001). Here the theoretical, explanatory claim embraces almost every kind of social behavior and institutions. Our genetic

[53] See his realist translation of obligation as alternative effects (observance or sanctions) in Geiger 1964, 207ff.

[54] Cf. Mahlmann 1999, 311ff., with even stronger presuppositions.

equipment includes the faculty of calculating costs and benefits, of maximizing an outcome according to genetic preferences, i.e., mainly the maximization of the gene pool. On this genetic foundation the theory claims to explain individual actions or behavioral regularities as well as social institutions in terms of their function for the replication of the genes. The evolution of the human species is characterized by mutations, selections and adaptations that lead to an evolutionary fitness not of the individual, however, but of the genes. Hence, human beings rather operate as survival machines for the gene pool. It is not primarily individual egoism that contributes to evolutionary fitness. Rather, it is the kinship group that sets the standards of inclusive fitness. Therefore, nepotism is—from a genetic point of view—a natural, basic orientation in social life. Evolutionarily profitable is a kind of in-group morality, not a morality of universal, indeterminate altruism or charity. "Thou shalt love thy neighbour" would be in accordance with our genetic makeup, especially when the neighbour belongs to the kinship group. However, Jesus Christ's command "love your enemies" (Matt. 5, 44) would be contrary to it, against our "nature." Since, according to sociobiology, kinship relationships still form the basic structure of a society, one would have to conclude that we still live in a segmentary society—despite the high degree of functional differentiation.

Consequently, favorite topics in sociobiology are aggressive behavior against foreigners or members of out-groups in general and behavior patterns in close relationships like nepotism, marriage patterns,[55] e.g., hypergamy of women, divorce, killing of infants of a former breed, negligence towards stepchildren, fertility, i.e., the number of children. Maximal reproduction of the inclusive fitness of the kinship group does not necessarily mean a maximum of children. Our selfish genes aim at a possible maximum under given environmental conditions. This environment, however, is not only naturally given. What counts as cost and benefit is not a matter of the genetic structure adapting itself to natural conditions; it is always to be interpreted within a social setting. Therefore one should ask about the *social* costs and benefits of children. In order to explain the decrease in the number of children in Western societies a new "genetic" goal is introduced: It is no longer the enhancement of the descendants, rather, it is the improvement of the competitive competences of the children.

Sociobiologists do not analyse the structure of our biological makeup by employing means of genetic technology, rather they project the calculi, de-

[55] "A new marriage of the plaintiff, now in his 54th year, is undesirable at his age and runs afoul of the laws of nature" ("Die Eingehung einer neuen Ehe des im 54. Lebensjahr stehenden Klägers ist bei seinem Alter nicht erwünscht und entspricht auch nicht den Naturgesetzen"), from a 1943 decision by the Landgericht Berlin; quoted in Mammeri-Latzel 2002, 169. The German *Reichsgericht* (Supreme Court) declared the age difference of a couple—the wife was two years older than the husband—as against nature ("naturwidrig") (Reichsgericht, 17 May 1940, in: Deutsches Recht 1940, 1362). How would a sociobiologist argue in these cases?

rived from an economic theory of rational action, onto a genetic basis and the genetic basis echoes the rational calculi back accordingly. It is rather a difference in the *façon de parler* that distinguishes the economic approach of, e.g., Gary S. Becker from Richard Dawkins' genetic terminology (Becker 1976; Dawkins 1976). The rational calculus says aloud what the selfish genes only whisper. The problem is similar to the one that brain research has to cope with. Is it possible to correlate mental states of affairs or even types of behavior with certain cerebral states? Let us wait till sociobiologists working together with genetic engineers succeed in identifying a gene that is in charge of calculating the optimum number of children. Maybe they will be able, after a while, to produce and implant a gene that does not aim at maximizing quantity of descendents. No doubt, this M-gene (M for Malthus) will be a success on the Chinese market.

Biological approaches not only aim at explaining the origin, development and existence of behavior patterns and social institutions, including legal norms. They also point out restrictive conditions a legislator has to cope with. Ethologists as well as sociobiologists maintain that there are natural constraints, which limit the efficacy of legal norms. Human plasticity is not unlimited. The basic thesis is: Legal norms are efficacious in so far as they correspond to innate properties. But does this mean anything more than the traditional principle of "ultra posse"—a biological "posse"? Or, turned the other way around, can a high degree of inefficacy be explained by the fact that the legislator has misconceived the biological limits of human nature? How can one explain widespread delicts like the violation of alcohol prohibition,[56] shop lifting, fare dodging, black market work, tax evasion, etc.?

True enough, there is no unlimited plasticity in human nature. There certainly exist "architectural constraints" (Gould). Human beings cannot be conceived as a *tabula rasa* that can be acculturated in what way whatsoever. A sharp distinction between innate and achieved properties is not possible. Cultural learning takes place within given genetic, neuronal, physiological structures. The biological approaches, however, are totally insufficient inasmuch as their explanatory power is restricted to the analysis of rudimentary or proto-rules. The particular elements of a legal order (the formal requirements of legal norms; the unity of primary and secondary rules; competences; facilitating and constitutive norms; the basic principles of the rule of law, etc.) are not focussed upon at all as the explanandum of these approaches. And sociobiology can easily be translated into an (economic) theory of rational action by simply erasing the genetic *façon de parler*. Often the biological point of view can be reduced to the platitude that because human beings can do something, there must be a corresponding underlying biological capacity to do it.

[56] Compare Montesquieu's explanation (*supra*, 63).

Reflections on the inner nature of human beings were a standard theme long before a science of biology was created. Indeed, *Philosophical anthropology* had systematized everyday experiences of human nature, sometimes stimulated by observations of animal behavior as well. This branch of philosophy produced countless labels in order to specify peculiar properties of human beings (homo sapiens, homo creator, faber, loquens, ludens, oeconomicus, sociologicus, viator etc.). It has played with fantasies of an "*Übermensch*" and has urged against idealistic abstractions the fact that men have to reproduce themselves materially.

A basic insight of philosophical anthropology at least since the 18th century is the openness of human beings. They are neither determined by their natural environment nor by their own natural properties. Man is "the animal whose nature has not yet been fixed"[57] (Nietzsche 1990, 88). He/she is by nature a cultural being ("*von Natur ein Kulturwesen*") (Gehlen 1993, 88).

Four relationships between anthropological and social features can be distinguished:

a) Enabling conditions. Upright walking, bipedy, opposite thumb are preconditions for a sophisticated use of tools, consequently for the development of technique. Cerebral structures and the larynx foster the development of language, consequently of human interaction.

b) There are conditions that stimulate development of social compensations; the lack of instinct orientations is, according to Gehlen, compensated by social institutions. The long period of breeding and rearing, the helplessness of the newborn makes socialization institutions necessary (family relationships in a broad sense); permanent sexual appetite might foster the formation of couples.

c) There are restrictive, containing conditions of human nature that make permanent habitation under extreme circumstances (altitude, temperature etc.) impossible. But they can, to a certain degree, be overcome by technical inventions.

d) Today the genetic equipment of human beings is becoming more and more at our disposal. Are there "natural" limits or rather only moral limits?

As far as law is concerned, social institutions—in general: a legal order—compensates for the lack of instinct-based action orientation. Human beings are in need of normative "leadership" (Gehlen). But this is only one part of the social function of law. On the basis of a "poor" physiological, i.e., instinctive makeup human beings cannot but produce their social order autonomously, as a "second nature." Law is not the immediate "expression" of interests, needs, instincts, desires. Rather it fulfils a constitutive function by enabling

[57] "Das noch nicht festgestellte Tier" (Nietzsche 1966, Aph. 62).

activities that do not have any equivalent on a physiological level. Law enables human behavior to be autonomous; it is constitutive for non-natural behavior: making contracts, establishing organizations, corporations, producing artificial persons, the state, etc. Sometimes law, and in particular penal law, is conceived of as a restraint of aggressive tendencies, necessary in order to canalize destructive drives and residual instincts. Thus from the "*Menschenbild*," i.e., basic anthropological assumptions, certain consequences for the understanding of a legal order are derived: law as a repressive order that restricts the *homo lupus*; law as an instrument of a paternalistic legislator who authoritatively provides patterns of action orientation; law as a Kantian order of mutual freedom for autonomous human beings.

Internal and external nature no longer appear pre-eminently in the role of restrictive conditions for legislative policy. Instead, increasing domination of nature leads to a reversal of perspective: The aim of the legislator today is to establish normative restrictions, rather than to permit the full range of options that would be technologically possible. As far as external nature is concerned, this is what environmental law is all about. Technological manipulation of our internal, genetic naturals are the object of new regulations. The maxim no longer is "should implies could," instead we have had to learn that we should not do everything that we could do.

3.2.1.3. The Cognitive Foundations of Law—An Introduction to the Mentalist Theory of Ethics and Law (*by Matthias Mahlmann*[58])

3.2.1.3.1. The Human Rights Culture and Its Philosophical Reflection

Many terrible things have happened in the 20th century. One of the rather positive developments, however, is the growth of a global human rights culture. The protection of human dignity, life, health, personal freedom, and equality forms a secular Decalogue that at least on the level of political deliberation hardly anybody questions. Furthermore, human rights are more and more at the core of the architecture of positive legal orders: They form the ultimate standard with which developed legal systems have to accord. A constitutional or supreme court often safeguards them.

Of course, there are contentious questions as to certain details of the content of human rights, and the positive catalogues vary in some aspects considerably. There are serious issues involved. But given the enormous heterogeneity of human culture and history, and the power, cruelty, and determination of

[58] The author would like to thank N. Chomsky, J. Mikhail, and H. Rottleuthner for comments on previous drafts. Parts of the material have been presented in talks at the World Congress of the International Association for Philosophy of Law and Social Philosophy 2001 in Amsterdam; at Hampshire College, Amherst, Mass.; and at the Political Science Department of the Freie Universität Berlin.

opposing forces, it is quite remarkable that something like a fragile consensus on the core of human rights actually developed which forms the basis of further debate and—ironically—often even the basis for the ideological cover-up manoeuvres of the perpetrators of human rights violations.

Given this development a question naturally arises: What is the basis of this remarkable moral consensus? Is there any at all? Is the security of beliefs in human rights nothing but a transparent veil, which covers badly vain illusions that do not stand the scrutiny of critical reflection? The philosophers disagree over this point. There are attempts by "cognitivists" to find a basis for rational moral argumentation for moral contents generally, and thus for the content of human rights, too. To these theorists moral judgements seem to be in their epistemological status comparable to scientific insights. These attempts have powerful and famous predecessors in the history of thought.[59]

But the contemporary mainstream view is different. It is widely assumed that there is no knowledge in the domain of ethics in the sense of insights gained in other fields of human understanding. The idea that moral judgements are somehow as verifiable as other propositions, e.g., of the natural sciences—an idea that inspired impressive intellectual endeavours in the past for thousands of years of thought—is for most philosophers nothing worth pursuing anymore. For them—to put it in Reichenbach's classical terms—this hopeful idea of truth in ethics, the "ethico-cognitive parallelism," has run its course. It led to nothing; it has to be given up as a leading heuristic idea (Reichenbach 1971, 52). The alternative is, from this point of view, non-cognitivism, which takes moral judgements as expression of some sort of subjective feeling of approval or disapproval of the situation considered or witnessed without any truth-value.[60]

This non-cognitive meta-ethical position has more or less set the framework of any ethical discussion today, and thus the framework of discussions about the foundations of human rights as well. Accordingly, to influential parts of scientific reflection, human rights have no universal, cross-cultural, intersubjective foundations. There is no truth about them to be discerned by the enquiring minds of human beings. Instead, dependent on the particular theoretical taste, arbitrary decisions of individuals or contingent cultural tra-

[59] Various systems of thought have endeavoured to achieve the aim of truth in ethics—from Platonist theories of grasping with moral judgements some pre-existing, metaphysical idea (Plato, *The Republic*, 508a3–509b7); to Kantian accounts of the commands of practical reason (Kant 1908, 15ff.); or Hegelian assumptions of morality and—on a higher level "Sittlichkeit" as an emanation of metaphysical "Geist" (Hegel 1821, §§ 1–4, 141, 151). For religious thinking, compare, e.g., Thomas Aquinas (*Summa Theologiae*, I–II, q. 19, 9; q. 91, 2): "Et talis participatio legis aeternae in rationali creatura lex naturalis dicitur." In my translation: "The participation in the eternal law by the rational creature is called the natural law."

[60] Compare, e.g., the formative contributions to this position by Ayer 1956, 107; Reichenbach 1971, 276ff.; Stevenson 1950 among others.

ditions are invoked by mainstream moral relativism to account for the content of human rights.[61]

The standard view of cultural relativism is well summarised by Richard Rorty in his Oxford Human Rights Lecture. The way forward for a moral culture is according to this view not paved by arguments appealing to rationality but by appeals to emotions. Rational Foundationalism is thus bad as it hinders humans pursuing the real task in moral debates, namely, "manipulating sentiments" (Rorty 1993, 122) by other more effective means,[62] e.g., by a "long, sad, sentimental story" (ibid., 133).[63]

On first glance Rorty's restatement of a widespread view hints at something obviously right. Massacring people is not only illogical. It is not only a contradiction against an abstract principle. It is something revolting, something that turns the stomach and creates a strong moral sentiment. The moral judgement "That is wrong!" after witnessing a massacre has a decisive emotional dimension that the theoretical judgement "That is wrong!" refuting the claim "2+2=5" has not. The emotional dimension of moral judgement is thus surely a truism that did—of course—not escape important thinkers of the past.

On the other hand, there seems to be something obviously wrong about Rorty's statement, too. Three shortcomings of Rorty's ethical sentimentalism come to mind. First, moral judgement is not just some feeling of aversion or approval but has a distinctive cognitive content. This cognitive content distinguishes (among other features of a moral sentiment) the aversion felt by witnessing a massacre and the aversion seeing a rotten dish. Secondly, moral philosophers have often observed that moral judgement is supervenient on facts—given a certain set of facts a certain moral judgement follows. If changes of the facts occur, the moral judgement changes as well. Thirdly, often (or—in historic perspective—perhaps mostly) human rights are not springing from the fertile womb of a majority culture forming the "malleable"

[61] This is of course only true as a rough approximation. The theories on the foundations of human rights are heterogeneous. One can distinguish theories of "absolute" or "objective" foundations of human rights from relativistic theories of these foundations. Examples of the former are Spaemann 1987, Gewirth 1996, Höffe 1992; of the latter Rorty 1993, Walzer 1996, Tugendhat 1993, Rawls 1993, to name just a few.

[62] Rorty 1993, 122: "The best, and probably the only, argument for putting foundationalism behind us is the one I have already suggested: It would be more efficient to do so, because it would let us concentrate our energies on manipulating sentiments, on sentimental education."

[63] These are familiar arguments from emotivism compare, e.g., Stevenson, more precisely his ideas of moral argument as "persuasive definition" with the consequence that all "moralists are propagandists" (Stevenson 1950, 334). In the general public these kinds of arguments might be regarded as less convincing. Nobody would have taken a Nazi seriously that had claimed in 1945—while facing the heaps of corpses of the Shoah—that the sole basis for the moral condemnation of these crimes by the rest of the world is just due to some kind of culturally relative emotional manipulation, based on a shrewdly devised "long, sad, sentimental story" about Jews and their suffering.

human nature into pro-human rights shape, but quite to the contrary, human rights are defended by individuals *against* the majority culture which mostly—taking the global perspective—pursues a quite different path. The origin of human rights thus seems to be rather the conscience of individuals than well-developed cultural patterns.[64] These observations clearly seem to capture important features of human morality. They indicate that moral sentimentalism as proposed by Rorty among others is not on the right track. Something deeper seems to be involved in moral judgement than some kind of "emotional manipulation" by a contingent cultural tradition.

The following remarks will try to show how an alternative account of the foundations of human rights from a *mentalist* point of view might settle these far-reaching issues. Given the outlined importance of human rights as a central feature not only of modern morality, but of modern legal systems, too, a mentalist theory of human rights is a crucial part not only of ethics but of a general theory of the law as well. These remarks are thus not merely meant as a contribution to the ethical understanding of human rights but as a general introduction to the basic assumptions, explanatory content and theoretical prospects of a *mentalist theory of ethics and law*.

One has first to consider the question what a *mentalist* theory of ethics and law actually means. The term *mentalist* might seem surprising concerning morality, as morality appears to be a *social*, not a mental phenomenon. But this intuition—even though buttressed by much of classical and recent theoretical thought—might be to a certain degree misleading. Morality is without doubt a social phenomenon insofar as it concerns at its core the relationship between human beings, but it is clearly a cognitive phenomenon as well: Morality is not a physical thing in the outside world, one cannot touch or see it, it is a normative order that humans create with and in their minds which then, in turn, has quite significant social consequences as it regulates their comportment towards others.[65] A mentalist theory of morality takes this fact of the

[64] Rorty (1993, 125) claims: "Outside the circle of post-Enlightenment European culture, the circle of relatively safe and secure people who have been manipulating each others' sentiments for two hundred years, most people are simply unable to understand why membership in a biological species is supposed to suffice for membership in a moral community." This claim is at least out of two reasons false: 1. It overlooks quite interesting phenomena—racism, slavery, or colonialism among others—which cast some doubt, that in "post-Enlightenment European culture" it is so self-evident that being human really means being part of the same moral community. 2. It overlooks the sometimes desperate attempts of people outside "post-Enlightenment European culture" to make the point that —even though being African, Asian, etc.—they still regard themselves as human beings and thus as part of the same moral community as the rest of the world.

[65] It might be true that as many theorists of moral cognition argue, moral concepts are somehow originally derived from social practises, see, e.g., Piaget 1986, Kohlberg 1984a and 1984b, Habermas 1983. But to answer this question one has to understand better the nature of moral knowledge. Only if one understands more clearly what properties the cognitive system

mental basis of morality seriously and asks: What is the nature of moral knowledge? Where does it derive from? What are its cognitive preconditions? What is its origin and use?

The same is true of the law. There are many differences between law and morality, and the differentiation of both is surely an important achievement of legal theoretical thought not to be abandoned.[66] But the law is no less than morality a normative order that is formed by and in the human mind. Legal rules might be written in statutes, constitutions, and the like, or might be derived from precedents or from normative customs. But the understanding and application of these rules is something that people do with their minds. It seems therefore not to be too far-fetched to ask for the law as well: What is the nature of legal knowledge? Where does it derive from? What are its cognitive preconditions? What is its origin and use?

In what follows, these questions are attempted to be answered from a particular theoretical point of view. The background assumption is that recent cognitive theory is basically on the right track arguing that empiricist thought, despite its great achievements for understanding the nature of human mind, was in certain crucial respects misled assuming that the human mind is a *tabula rasa*, a "white paper, void of all characters" (Locke 1823, book 1, chap. 1, § 2), an organ without inborn properties apart from a general learning ability. Instead it is assumed that human beings have a differentiated highly structured mind with a certain amount of inborn properties. A well-researched example is the language faculty as the basis of human language: Human beings have, from this perspective, a genetically determined ability to acquire language. One of the main reasons for this assumption is that—as linguistic scrutiny reveals—any human being acquires a rich and very complex knowledge of language far beyond the simple rules found in schoolbooks and grammars even though being exposed to only impoverished and limited experience.[67]

A promising theory of the mind must thus be a theory of these higher mental faculties that are the basis of these mental achievements. A first crucial distinction for the mentalist approach is the distinction of *competence* and *performance*: the performance being the actual behaviour shown, the competence

that generates moral judgement possesses, one can ask meaningful questions about the ontogenetic origin of this system. For a detailed discussion on some aspects of this question which casts some serious doubts on the widespread assumption of morality as an internalised system of knowledge derived from social practices, see Mahlmann 1999 and the remarks that follow.

[66] On the differentiation of law and morals compare Kant 1907, § C; Austin 1885, 171ff.; Habermas 1992, 143ff. Cf. also Hart 1983b, 54: "There are [...] two dangers between which insistence on this distinction will help us to steer: the danger that law and its authority may be dissolved in man's conceptions of what law ought to be and the danger that the existing law may supplant morality as a final test of conduct and so escape criticism."

[67] Chomsky calls this the argument from poverty of stimulus, see, e.g., Chomsky 1986, xxvff.

the underlying and enabling faculty. The object of theoretical enquiry is this competence. The performance provides only data for constructing a theory about the mental faculty that generates this performance (Chomsky 1965, 4).

A second crucial distinction is the one between *operative* and *express* principles: Operative principles are the principles that are in fact governing the generation of a human act, e.g., the forming of a sentence. Express principles are the principles the agent thinks to apply. Operative and express principles need not to converge, as the agent might have quite erroneous ideas about what she is actually doing.

Generative Grammar claims that human beings possess a "universal grammar," an inborn faculty to acquire language. The exposure to language triggers together with this inborn faculty the acquisition of a native human language. These languages differ obviously on first view significantly from each other. But upon further scrutiny it turns out that the differences are nothing but variations of the same underlying principles.[68] From this point of view human beings thus speak in a deep sense all the same language. Generative Grammar is an empirical science. The principles of universal grammar are derived from empirical evidence.[69] The data for the theory construction are (among others) grammaticality judgements of native speakers.

One should take these findings very seriously. They have made linguistics a core discipline of modern theories of the human mind.[70] The relevance of these findings for the understanding of moral knowledge is obvious.[71] Human beings develop independently of other aspects of their mental development—e.g., to count, to discern faces—the ability for moral judgement. This ability is not limited to cases and situations similar to the ones encountered in their life, but is applicable to new situations different from anything experienced before. There is very much emphasis in philosophical debates on the differences of moral judgements, and these differences seem obvious enough. People disagree about abortion, research on embryos, or the just distribution of wealth in a community. But apart from these differences there are many common features in any moral order and further scrutiny could reveal that the much discussed moral differences might be, at least to a considerable degree,

[68] The technical means to account for the differences of languages are, e.g., "parameters" (Chomsky 1988, 62ff.).

[69] The notion "empirical evidence" is for sure highly contentious. It is not contested here that what counts as evidence is dependent on the theory developed.

[70] For an outline compare Jackendoff 1994; Pinker 1994.

[71] Accordingly, it spread to moral and legal philosophy as well. Rawls (1971, 46ff.) drew a linguistic analogy, much criticised afterwards and not pursued by him in his later work. Compare for a detailed discussion Mikhail 2000. Compare for innovative recent work on mentalism and ethics: Stich 1993; Bierwisch 1992; Harman 2000; Jackendoff 1999 and 2003; Hauser 2004; Mikhail, Sorrentino and Spelke 1998; Dwyer 1999; Mahlmann 1999—the latter with a discussion of mentalism and the law; Mahlmann and Mikhail 2003—on its position in the history of moral philosophy.

dependent on factors like the non-moral preconditions of moral judgement among other influences.[72] In consequence, the common view—taking the moral differences of people as the starting point of reflection—might have been led astray by nothing but the surface appearance of moral variety, under which some deeper features of a possibly universal human moral cognition are hidden. If this is true, it seems not far-fetched to take as a plausible heuristic hypothesis worth further study that a moral faculty generates moral judgement whose basic ruling principles are at least partly inborn and universal to the human species.[73]

To avoid misunderstandings: Mentalism has nothing to do with socio-biology or certain varieties of evolutionary psychology. It stands in marked contrast to it. To name just two important differences: First, mentalism is not adaptionist. It does not adhere to the view of some socio-biologists and evolutionary psychologists that the properties of human cognitive nature have evolved because they maximise reproductive success. Instead, it adheres to evolutionary pluralism (like Darwin himself) that takes a plurality of factors beyond adaption into account—like random variations without initial adaptive value, concomitants of adaptive variations or architectural constraints. Second, mentalism is not biologistic. It does not assert that the main purpose of human life is reproduction of the species or a certain set of genes. Quite to the contrary, it seems obvious that not only in art and science, but in morality and law as well, the most essential parts (say a value like human dignity) are concerned with the quality of human life and not its sheer biological reproduction.[74]

In consequence, from a mentalist perspective the scientific project of the Enlightenment—trying to come to terms with the origin of moral judgement

[72] If further study would confirm this impression, it would not be anything new. Frankena (1973, 110) observed: "It is not enough to show that people's basic ethical judgements are different, for such differences might all be due to differences and incompletenesses in their factual beliefs."

[73] Generative Grammar has developed to a complex theory of considerable explanatory power. It is evolving fast and new assumptions supersede others of the past. Its success for language and its implications for the general theory of the mind might make it plausible to approach problems of other cognitive domains informed by its research strategies. But it is important not to take its explanatory success as a real reason to be convinced of the explanatory power of the parallel assumption of a moral faculty in ethics. To assert this one needs independent reasons. The study of language can be a methodological and conceptual inspiration for the study of morals. But it cannot be a substitute for it. What may be true for language may not be true for morals. Possibly moral judgement is based on mechanisms completely different than the ones found in language. Possibly language is based on mechanisms partly inborn and morality is not. Whether that is so or not is an empirical question. To answer it, one therefore has to turn to an enquiry of morals on its own ground.

[74] For an extensive discussion of these matters compare Mahlmann 1999, 285, among others on the value of the distinction of ultimate and proximate causation. As an example for an evolutionary pluralist account of the evolution of language compare Hauser, Chomsky and Fitch 2002.

by basing it, in one way or another, on human (mental) nature—was not at all as funnily flawed as many modern and post-modern thinkers tend to believe. Quite to the contrary, by taking moral judgement as the operation of a mental faculty of the subject—be it a moral sense[75] or be it practical reason[76]—a level of understanding had been reached by enlightened thinkers that is surely not current today. In consequence, this project has to be taken up again, but with the new theoretical and conceptual means of the modern theory of the mind.[77] A *mentalist theory of ethics and law* does exactly that—certainly contrary to the powerful and dominating dogmas of the post-modern mainstream culture of contingency, relativism, and the modern contempt for the concept of human nature as a proper object of theoretical enquiry, but with the sceptical self-confidence of a developing science. It is thus a post-metaphysical heir to the ethical project of enlightenment.

Two last remarks before embarking on the more detailed discussion of the foundations of human rights from a mentalist perspective. To avoid confusion, some possible understandings of the question "Why do humans have human rights?" that is to be answered by the following remarks have to be clarified. The question can aim at three different things: Firstly (question 1): Why do *humans* have human rights? Framed like this, the question asks for an explanation for the choice of the *subject* of human rights. Why do humans belong to the personal scope of human rights? Why do humans have such rights and not stones, flowers or winds? Secondly (question 2), it can mean: Why do humans have human *rights*? Here the nature of a *right* is at stake in contrast, e.g., to a *duty* or a *habit* or a *factual possibility* to do something. And thirdly (question 3): Why do humans have *human* rights? In this form, the question aims at a justification of the content of the classical rights catalogues formulated since the 18th century. It asks: Where do these contents derive from? What is their origin? What is the legitimation of these contents? Why are they defended rather than others? Why are somehow liberty, equality and

[75] Compare Shaftesbury 1984 and 1987, Hutcheson 1971a and 1971c. For some comment compare Frankena 1955, Schrader 1984, Mahlmann 1999, 67ff. A predecessor of these theories in Renaissance thought is Cudworth's nativist account of morality, compare Cudworth 1976, posthumously published.

[76] Kant (1908, 34, 38) was critical of the moral sense theories because for him these theories did not provide the objective moral knowledge he was aiming for. But one might ask how Kant's theory of the moral law as a "fact of reason" or his nativist moral psychology (Kant 1907, 399–403) can be understood if not as a metaphysical version of a property of some kind of individual moral faculty.

[77] Mentalism does not fit neatly into the dichotomy of cognitivism and non-cognitivism. Unlike (classical) cognitivism, mentalism is internalist: the moral properties are cognitively ascribed to entities and not inherent in these entities independently from human cognition. They are on the other hand not just subjective preferences as (classical) non-cognitivism asserts. Rather, they are taken to emanate from a moral cognition that is uniform across the species.

human dignity at the core of these catalogues and not rather oppression, privilege and human humiliation?[78]

Questions 1 and 2 are very intriguing upon further reflection and merit close scientific scrutiny if something like a mentalist theory of law is to be developed which deserves the name of a theory but they are not very contentious in the respects of interest here. Take question 1: Nobody seems to disagree that people have rights and stones do not. To be sure, there are serious political, legal, and philosophical problems involved if the personal scope of a right is in question, e.g., whether animals have rights too and what they could be, or what legal entities—cooperatives, corporations, charitable funds, collectives, public bodies, etc.—can enjoy rights at all, and—if so—what kinds of rights that might be. But here these problems can be put to the side as it is generally taken for granted that at least people in principle can have rights—whoever might have rights beyond that too.

Concerning question 2, serious analytical work on a theory of the structure of rights has been conducted with partly very interesting findings possibly of great relevance for a general mentalist theory of the law.[79] But that rights exist and what is meant by this term is well enough understood to make further discussion here superfluous.

The really contentious question is 3 that asks what kind of rights people have. This question is the real issue in arguments about the foundations of human rights. Therefore question 3 will be the focus of attention in the remarks that follow.

Second, given this theoretical background, it is clear in which sense the following remarks are theoretical accounts of the foundations of law. They are not accounts of the concrete historical, social, economical, or religious influences on the content and development of the law. They concern anthropological foundations as they specify the properties of human cognition that are the mental preconditions of the possibility of law. These remarks investigate, furthermore, how these mental properties enter into the legitimation of human rights. The following account is thus a cognitive explanation of human justification of human rights. Whether this account has any normative implications beyond this explanatory intention, will be the last question considered.

[78] Even though, of course, historically, human rights catalogues had at least partly the function to secure some unjustified institutions—like slavery or the exclusion of women to take some classic examples. But to conclude from this that human rights are generally unable to achieve their universalistic aim—as is sometimes argued in post-modern theory with reference to the historic particularity of any human rights codification, see, e.g., Lyotard 1983, 208ff.—is very unconvincing. The way forward is not the abandonment of the instrument of human rights to avoid these pitfalls, but rather to abolish unjustified exclusions of people from the protection of human rights.

[79] For some illuminating discussion see Jackendoff 1999; Alexy 1985, 159ff. A classic analysis is Hohfeld 1917.

3.2.1.3.2. The Moral Faculty and Human Rights

There are surely many influences on the content of human rights—political, social, or historical. These contents, however, must be morally justifiable, too. A catalogue of human rights that is not morally justifiable is clearly not really a catalogue of human rights. Moral justification however is derived from moral judgement. Something is morally justified if a moral judgement renders it so. Thus, there is no theory of human rights without a theory of moral judgement as the origin of their legitimation. The question of the foundations of human rights leads to the question of the foundations of moral judgements.

As explained above, morality is a mental phenomenon. Moral judgements have many social consequences but they are not social in any comprehensible way of understanding this term. They are made by individuals at the occasion of some particular situation. More precisely they are the product of the minds of the judging persons processing some information about the situations, which demands an evaluation, and yielding a result: a moral judgement of some sort. This moral judgement is a mental event. The most natural starting point for the kind of mentalist enquiry pursued here are thus these concrete moral judgements. They are the data with which explanatory hypotheses of some kind are constructed.[80] To take a paradigm case of moral behaviour: (1) *The boy gives his banana to a hungry child.* This seems to be a straightforward case of an act that is morally good. It is an example of altruism. Before asking what properties of this event might render it morally good it is useful to distinguish *morally* good things from things that are *non-morally* good. Consider, e.g., (2) *The sofa is comfortable, spacious, well designed, and supports a healthy posture.* This sofa seems to be a paradigm case of a good thing. But it is clearly not a *morally* good thing. There are no morally good sofas as there are not morally good chairs, stones, or planets. This may seem banal but is a very interesting result: There is a differentiation between morally good entities and entities which are good but not morally so. And clearly whole classes of things cannot be morally good whereas others—like actions—can.[81] The things, which can have a moral value, are not either morally good or morally bad. Consider (3) *A child is hungry and eats a banana.* This is an action but one that is neither morally good nor morally bad. It is morally neutral. In consequence, one can conclude that one of three possible deontic statuses—morally good, morally bad, and morally neutral—are assigned by human cognition to a certain specified class of events—e.g., actions—that can be the object of moral

[80] Schlick pointed out that any empirically orientated approach of ethics has to turn to actual moral judgements as data. The question whether these data have empirical reality was rightly discarded by him as being senseless and uninteresting as these judgements are part of mental reality and thus of empirical reality. Compare Schlick 1984, 70ff.

[81] This is a familiar distinction of the philosophical tradition but one which escaped nevertheless the attention of some philosophers, see, e.g., Moore 1993, chap. 1, sec. 2, 3.

evaluation.[82] This is not a new but nevertheless interesting observation about human moral cognition, as there are no a priori reasons for this classification of events. In Kant's terminology: It is a synthetic, not an analytic truth. We can easily imagine a being for which all events fall into the moral domain, knowing no morally neutral events or for whom there is no moral sphere at all. The assignment of three deontic statuses to certain classes of events thus turns out to be a distinguishing empirical property of human moral cognition.

What are, however, the properties that render (1) a moral action? One could, e.g., consider objective qualities of the actions like "Conduciveness to the well-being of a person" as such a property. From this hypothesis, it seems that the fact that bananas have nutritional value accounts for rendering (1) morally good. But consider (4) *The child gives a banana to a hungry child, hoping it will suffocate devouring it too quickly.* Examples like this show that internal states of the agent, more precisely his intentions, are important for the assignment of a deontic status like "morally good" as in (4) the action has the objective quality of being conducive to the well-being of the person—the banana is as healthy as in (1), and only the greed of the other person might make it less so—but the action is nevertheless not morally good due to the underlying intention of the agent. Again, there is no a priori reason why this should be so. On the other hand consider (5) *The child gives poison to the other child wanting to help him into a better world.* This is clearly not a morally good action. Therefore, not only the good intention of a person can be decisive for the evaluation but the objective qualities of the action are of relevance too. Let us consider three more simple cases of moral judgement in addition to the cases discussed to formulate then a possible principle of moral cognition: (6) *The child gives its banana to a hungry ape*; (7) *The wind shakes the banana tree and a banana falls in the lap of the hungry child*; (8) *The child gives the hungry child a banana because it wants to get its action-man.*

(6) seems to be a clear case of moral behaviour. One might conclude in consequence that moral behaviour is not limited to human beings as proper objects of moral action but perhaps more generally to feeling beings. The event in (7) is not an example of a morally good tree. It is not an act by an agent but a lucky event. Apparently, some sort of agency is thus a precondition of something being morally good. (8) is not a morally good action. It is barter. One can in consequence conjecture that an egoistic interest in the action's result precludes its moral goodness. Considering the examples (1)–(8), one can tentatively take something like the following as a principle *P* governing the moral faculty, which one might call the Basic Principle of Altruism:

[82] These statuses appear to be related to the notions of obligation, permission, and interdiction, e.g., as one is obliged to do what is regarded as morally good. Possibly there are reasons to believe that one should start any explanatory account with the notions of obligation, permission, and interdiction. This is the way Mikhail 2000 tries to proceed.

Morally good is an action if
a) the agent acts with the intention to foster the well-being of a feeling being without regard to the non-moral interests of the judging person (either the agent herself or an observer) and
b) the action is conducive to the well-being of a feeling being.

To avoid misunderstanding: This principle is supposed to describe the operation of a human higher mental *competence*. It is not supposed to describe their actual moral *performance*. What people actually do is clearly dependent on many factors, which have nothing to do with their moral judgements. Non-moral motives like pursuit of wealth, recognition, or power have for example obviously perennial importance in this respect as well. Secondly, this principle is supposed to be an *operative*, not an *express* principle. It is about how people *do* judge morally, not about what they think the basis of their action is. They might, e.g., think that their moral judgements are based on the commands of god, on a utility calculation, the emotional manipulation of a long, sad, sentimental story, or the perception of a metaphysical idea. Whatever their theories in this respect are, is something irrelevant for what they actually do. Only the latter is the object of a mentalist enquiry into ethics and law.

This principle is by no means new or original.[83] Nevertheless it is not banal but quite to the contrary highly contentious as it contradicts the great amount of scholarly work denying the reality of altruism (e.g., Hobbes 1965). It clearly does not explain many cases of moral judgement but certainly covers some core cases as we have seen. The way ahead is thus not to abandon this formulated principle because it gives no comprehensive account of human moral judgement (what of course it does not) but to refine it, develop additional principles, exception and default rules, etc., to construct by and by a theory with greater explanatory power.[84] The situation is not different to other sciences, which start with simple principles, which are then in turn refined and elaborated by generations of scientific work. There is no reason to assume that scientific understanding of the moral judgement of human beings should be easier to obtain than scientific understanding in chemistry or physics. It thus seems to be plausible enough to assume that this principle hints in the right direction and captures some properties of the moral faculty, which somehow any theory of moral cognition has to account for.

Let us now shortly consider the question of the learnability of this principle. Can the hand of parents and society write it on the blank paper of the child's

[83] Compare, e.g., Hutcheson 1971a, 112, 137, 177. Kant (1908, n. 8) took explicitly the point of view that moral knowledge is equally the domain of any human being. For him moral philosophy has to clarify the foundations of morality, not to invent daring new moral conceptions. This seems to be a quite convincing view.

[84] For some attempts to account for the anti-utilitarian moral judgements of human beings compare Mikhail 2000.

mind? The answer seems to be intuitively yes. Do parents not labour hard to teach their children some regard for others? Is this not one of the most difficult tasks of teachers and other educational instances? Is this influence not to be continued during lifetime, e.g., by the powerful institutions of the law and the state keeping some social fabric intact against the onslaught of unfettered egoism? But this intuitive answer might be misleading. One widespread model of moral learning relies on the application of (physical, emotional, etc.) sanctions. It is, however, impossible even to teach the meaning of normative categories like "ought" or "obligation"[85] to children by sanctions as the point of these concepts is that they are not reducible to force and compulsion. In addition, one cannot teach the moral evaluation of a disinterested concern for others as being good and thus a core content of morality by (physical, emotional, etc.) sanctions. Learning by exposure to sanctions would obviously mean that this learning process is based on some sort of utility calculation on the side of the child to avoid these sanctions or—in the case of positive sanctions—to obtain them. It has been long clarified, however, that genuinely altruistic comportment never can be the result of such utility calculations. The result of utility calculations can only be altruistic behaviour if sanctions are probable (as in this case this behaviour yields benefits) and free riding if not (as there is no danger to incur any losses by egoistic behaviour).[86] Thus, a child would never acquire the moral appreciation of a disinterested concern for others just by sanctions. In consequence, it seems that the case for a nativist account of altruism is not as weak as it might seem on first glance as standard learning theories appear to be less satisfying than mostly assumed.[87] Thus, Kant might have been right to argue that one cannot teach morality through sanctions (Kant 1908, 152) but that one has to cultivate this given fact of human nature, e.g., by showing through examples that a moral life is a preferable choice (ibid., 154).

Given these reasons, the principle *P* is plausible enough and thus suffices for the present purpose, which is not to formulate a comprehensive theory of the moral faculty but to explore what this kind of theory could have as an impact for the theory of human rights. What consequences, then, has such a principle for a theory of the foundations of human rights?

This question shall be answered by looking at the example of those human rights that traditionally form the core of human rights catalogues—civil liberties.[88] Most modern human rights catalogues possess other rights—most importantly a principle of equality, often granting legal claims beyond the provision of equality before the law. They thus incorporate a principle that one

[85] Compare Mahlmann 1999, 184ff.

[86] For an overview about the arguments compare Wolf 1984, 34ff.

[87] For some proponents of such theories, see note 7 above.

[88] Rights that confer normative powers, e.g., to enter into a contract are here taken to be a subcategory of civil liberties. The same is assumed for procedural rights, e.g., to stand trial under due process of law.

might call the Basic Principle of Justice which is to treat equal cases equally if there are no good reasons for differentiation. Another group of rights are social rights to material benefits that raise questions of distributive justice. No mentalist account of these kinds of rights will be attempted here—not because mentalism in ethics and law has nothing to say about justice (quite to the contrary the opposite seems to be true) but because it is not necessary for the limited purpose of these remarks. The plausibility or implausibility of mentalism in ethics and law can be illustrated well enough by discussing one central group of rights on which in consequence the attention will be focussed in what follows now.

Given this limitation one can ask more concretely: What importance can such a principle have for the foundation of civil liberties of the classical catalogues, say, to take an example, the freedom of the press?

As we have seen, the content of human rights must be morally legitimate. They have to be morally good according to the moral judgement of human beings to be morally justified. As it is assumed that the principle *P* captures some properties of the moral faculty, it follows that those civil liberties are morally justified that are morally good according to the principle *P*. In one word: Morally good are those contents of civil liberties that are intended to foster the well-being of other feeling beings—more precisely *human* beings as *human* rights are in question—without concern for the interests of the judging person (or to put it differently—from a neutral or disinterested point of view) and that are objectively conducive to this end.

This result has two important consequences. Firstly, the content of human rights are thus dependent on assumptions about the needs of human beings. One can only address the question of what would be conducive to their well-being if one knows what human beings actually need. Thus, a theory of the foundations of human rights presupposes a theory of human nature that specifies what the human needs are.

However, the principles of the moral faculty together with a theory of human nature are not enough to account for the foundations of human rights. The reason is the following. Social circumstances vary in history. There is cultural, economic, technological, and political change. Human rights are always codified in such concrete historical circumstances. Thus, at least to a certain degree, their content depends on these circumstances. The freedom of the press is clearly senseless under a historical circumstance where there is no press as writing or printing has not yet been developed. Given this dependency of the content of human rights on concrete historical circumstances one has to know how the needs (determined by a theory of human nature) of human beings are best realized in the given circumstances. Thus, secondly, a theory of the realization of human nature in given historical circumstances (political, economical, cultural, etc.) is necessary for any account of the foundations of human rights too.

To clarify the non-moral preconditions of a theory of the foundations of human rights, we take up again the example of the freedom of the press. Consider the following case. Somebody holds, first, that human beings can not think for themselves, that they need guidance from an elite, that they are too weak to act responsibly on reasonable and moral grounds, and, secondly, that in consequence it is harmful for the society to have an open exchange about opinions on contentious issues so that some kind of educational or other variety of dictatorship is actually the best thing for the overall well-being of the community. This person has formed firstly, a special theory on human nature (a kind of pessimistic anthropology along the lines of Hobbes 1965, Nietzsche,[89] Gehlen,[90] or Skinner[91]) and secondly a particular theory of the realization of this nature under given historical circumstances, namely, an authoritarian one. Given these assumptions the freedom of the press is morally not good as it does not foster the well-being of human beings and is thus not justified.

Given a different kind of anthropology following, e.g., the lines sketched out by classical enlightened thinkers like Kant or W. v. Humboldt, holding that human beings are autonomous, responsible agents, acting—at least partly—on the ground of rational insight and moral judgement and a social theory that takes—given the fallibility of the human mind—competing opinions and free access to information as the best way to assure the due course of public affairs, the contrary is true. The freedom of the press is then morally good and thus justified.

It is important to notice that theories about human nature and about the realisation of human nature under given historical circumstances are theories about *facts*, not *values*. It is as much a factual question what needs human beings have as it is a factual question how these needs are best realised under given historical circumstances. These—unavoidable—factual assumptions form thus the non-moral preconditions of moral judgements about human rights.

Given these findings one can summarize that a civil liberty *A* (e.g., to run freely newspapers, to found unions, to own property, etc.) is morally justified,

[89] Nietzsche called man "das nicht festgestellte Tier," the animal without fixed properties. The context of this famous remark merits attention: Nietzsche is discussing the function of religions which in the hand of philosophers can be in his view quite useful as they can serve to consolidate the power of the strong over the weak, they are "Züchtigungs- und Erziehungsmittel," means to sanction and to educate (Nietzsche 1966, Aph. 62).

[90] Gehlen called man a "Mängelwesen," a "deficient being." The consequence is again authoritarian: Gehlen (1993, 59, 64, 450ff., 709ff.), with explicit reference to Nazi ideology, abolished in later editions of the highly influential work "Der Mensch." For some comments see Mahlmann 1999, 348.

[91] Skinner 1953 and 1972. "[Our culture] has, to a considerable extent, a concern for its own future. But if it continues to take freedom and dignity, rather than its own survival, as its principal value, then it is possible that some other culture will make a greater contribution to the future" (Skinner 1972, 181).

if *A* is intended to foster the well-being of human beings from a neutral or disinterested point of view and is objectively conducive to this end according to the best theory of human nature and the best theory of the realization of this nature under given historical circumstances.[92] In this case, the right to *A* is justified according to human moral judgement, generated by an inborn moral faculty uniform across the species. This is in a nutshell the mentalist account of the moral justification of core contents of classical catalogues of human rights.[93]

This kind of moral justification is, of course, not sufficient for a full justification of human rights both in the moral and the legal sphere if one considers concrete cases in which the rights of the various persons might collide and normative conflicts do arise. This is a well researched area not to be pursued in detail here. Some sketchy remarks might suffice. Both for moral and legal rights it is a truism that no right (apart perhaps the right to human dignity) is boundless: A full theory of the foundations of human rights implies, therefore, a theory of the justified limitations of human rights given the social character of human life. An obvious choice for the distribution of rights in a community is, e.g., the application of the basic principle of justice demanding equal treatment of equals and thus of limiting rights by the rights of others, or the application of the outlined principle of altruism with the result that one of the normative standards the limitations have to meet is that they foster the well-being of feeling beings according to the best theory of human nature and the best theory of the realization of human nature under given historical circumstances from a neutral point of view.[94] In addition, as familiar considerations reveal, there seem to be limitations to the possible limitations of rights as well—e.g., that any limitation has to be proportional or that it is not morally justifiable to use a human being as a means to some (public) end even for the protection of the liberty of others.[95]

[92] "Best theory" is not meant normatively. It just refers in accordance with usual practice in the theory of science to the theory with the greatest explanatory power.

[93] This account is not a variety of utilitarianism. The well-being referred to is not an aggregate good. It is the good of a somewhat idealized individual.

[94] Other types of rights have additional limits—rights to material benefits might be limited by the resources available in the community or by principles of distributive justice. Other limits might include the principle of "nemo ultra posse obligatur" as rights imply an obligation on the side of the addressee of the right. Love or sunshine might foster the well-being of any human being considerably. But there is surely no right to be loved or to sunshine. Another issue arising in a full theory of justification is the importance or weight of the matter concerned to exclude banalities from consideration.

[95] An example for this kind of reasoning is the following: The liberty of the individual is limited by the criminal code, that regulates the possibility of legal sanctions. These sanctions, however, are themselves limited by the principle of human dignity, that every person is an end in itself. Following this kind of reasoning, the German Federal Constitutional Court upheld lifelong imprisonment as a sanction imposed by the German criminal law for murder but held that the principle of human dignity of Art. 1 of the German Basic Law demands that any

What all this concretely means for the various possible constellations of collisions of different rights is a question mainly to be answered on a case-to-case basis, sometimes very hard indeed as the practice of human rights adjudication amply shows. The moral justification outlined of the content of the human rights considered above concerns thus what is traditionally called *prima facie* rightness as opposed to rightness *sans phrase*,[96] or rightness *all things considered*, or rightness *on balance* (Baier 1958, 102ff.).[97] This is however all that is needed for the question pursued—the question of the foundations of the justification of a human rights catalogue is normally posed as a question of *prima facie* rightness, not of rightness *sans phrase*—not surprisingly, as no abstract rights catalogue can solve all normative conflicts and thus provide rightness *sans phrase* for all possible cases in advance. Consequently, legal catalogues regularly give only a very abstract outline of what kind of limitations are possible. The independent question of the limitations of the *prima facie* rights has to be answered thus in a second step.

Another important question to be answered in this context is the question of *institutionalization*. Not every right that might be morally justified can become part of a positive legally valid rights catalogue, e.g., the right to be treated politely in everyday life. This is mainly due to pragmatic reasons. There are rights that have to be protected by political or informal social, not legal means.[98]

convicted person has to have the concrete possibility to regain her liberty, compare BVerfGE 45, 187ff. It is one of the many challenges for a mentalist theory to account for this kind of moral/legal reasoning.

[96] Ross 1930, 19: "I suggest 'prima facie duty' or 'conditional duty' as a brief way of referring to the characteristic (quite distinct from that of being a duty proper) which an act has, in virtue of being of a certain kind (e.g., the keeping of a promise), of being an act which would be a duty proper if it were not at the same time of another kind which is morally significant." In contrast, actual duties are duties to do one particular act in particular circumstances (ibid., 28).

[97] Compare for further comments Hare 1981, 38; Alexy 1985, 87.

[98] This leads to the question—why are rights institutionalized at all? What has a mentalist theory of ethics and law to say about this process of legal institutionalization? Are there new insights to be achieved by this approach in this respect, too? On the one hand, mentalism has nothing to add to traditional accounts of the institutionalization of legal orders. This common analysis takes different reasons to be at the basis of this process that generates positive laws like human rights catalogues. Among these reasons is first the uncertainty of moral codes—e.g., concerning the question who the subject of a right is, what content it has or who the addressee is. These problems bring about the need for written normative orders with all that this institutionally entails—e.g., somebody that generates these laws with legitimacy like a parliament or bodies that adjudicate legal rules like courts. Secondly, moral obligations have surprising power directing human action. Nevertheless, in many respects the pure moral motivation of human beings is clearly not enough to rely on. Thus, it is buttressed by law and more precisely by its threat of sanctions. Thirdly, any society does need norms that have no moral status but are just rules derived from pragmatic necessities—there is no deeper moral reason to drive on the right or the left side of the street but it is nevertheless a good idea to secure the traffic rules by the force of the law. Fourthly, institutionalization opens up the

3.2.1.3.3. The Properties of the Moral Faculty and the Problem of Justification

In linguistic theory the perennial aim seems to be to achieve explanatory adequacy of the developed theory. It is usually not asked whether human beings have a "good" or "right" language faculty. (Even though one might ask that, e.g., as regards to its utility for communication, etc.[99]) In moral theory the situation appears to be different. Here not *explanation*, e.g., through mentalism but *justification* of moral contents is the central aim. From this perspective one will question whether—even given an adequate account of the moral faculty—the principles that govern it are "good" and "right" ones in a normative sense.[100] Concerning human rights this question arises, too. The content of core human rights is, according to the analysis above based on a moral judgement generated by the human moral faculty, a theory of the nature of human beings and a theory of the realization of human nature under given historical circumstances. Concerning the normative component—the moral judgement—one might ask whether the judgements of the human moral faculty justifying certain contents of human rights are *themselves* morally justified: Is it justified that human beings take those contents of civil liberties as being justified that are intended to foster the well-being of human beings without concern for the non-moral interest of the judging person and are objectively conducive to this end? Why this? Why not something else?

So far nothing has been said about this problem of justification. Quite to the contrary, the principles governing the moral faculty have been explicitly taken as an empirically based account of a higher mental faculty, the moral faculty. As explained, the account was not about how human beings actually act morally in every day life, as the theory is not about moral performance but

possibility of rational choice of the content of norms ideally in a democratic procedure. Furthermore, it creates the possibility to adapt the written rules to social changes and concrete needs. Mentalism adds nothing to these familiar and quite convincing theoretical accounts of the institutionalization of the law. This is not surprising because it is not a theory of everything but a theory of a very concrete and determined research interest without denying the equally justified value of other research projects. It does serve, however, an important service to legal theory: It clarifies what the cognitive preconditions of legal orders are as has been shown in a rough sketch for the foundations of human rights. These are familiar remarks. Hart (1961, 90ff.) lists the following disadvantages of morality that entail the necessity to establish a legal order: 1) uncertainty, 2) static, 3) inefficiency. Habermas (1992, 147ff.) lists three advantages of legal orders: 1) compensation of cognitive uncertainty of moral orders, 2) compensation of motivational deficiencies, 3) clarification of the addressee of obligations. For some more remarks compare Mahlmann 1999, 213ff.

[99] On the notion of the perfection of language compare Chomsky 1995 and 2002.

[100] This problem is the problem of the "open question argument" of G. E. Moore against the "naturalistic fallacy" that whatever naturalistic account of "good" may be offered, it may be always asked, with significance, whether it is itself good; compare Moore 1993, 67. One might think of Frege's critique of psychologism in logic in this context as well.

about moral competence. But nevertheless a theory of the moral faculty is not a theory about what kind of moral faculty human beings *ought* to have but what kind of moral faculty (taken as a competence) they actually *do* have. It is thus not normative in the sense philosophers might expect it to be if it wants to be taken seriously as a theory that really tackles the core issue of moral philosophy instead of illegitimately sidestepping it: The question which moral judgements are *really* morally justified. The following remarks try to sketch out the possible paths for finding solutions to this problem, which is difficult and contentious indeed.[101]

There seem to be three possible answers to the question of last-order normative justification which might all appear rather surprising on first glance but which are without alternative upon closer reflection. The first leads to a notion of trust in the reliability of higher mental faculties (a), the second to questions of taste in choosing ways of life (b), the third to an assessment of general consequences for the agent if she follows the commands of the moral faculty (c). All of these three answers show that it is rational and well-justified to follow moral judgements generated by the moral faculty and thus, in consequence, to take those contents of human rights as justified which are justified according to the judgements of the human moral faculty. But these answers show too, that the question whether these moral judgements are themselves morally good cannot be answered. The pursuit of last order normative justification, foundationalism, or "Letztbegründung" is thus senseless.

a) One might wonder why it should not be possible to show that the properties of the moral faculty are morally good themselves, that it is right in a normative sense that human nature happens to have this faculty yielding these judgements. Endeavours of "Letztbegründung" or "foundationalism" aiming exactly at this are after all—from Platonism to discourse ethics—not unfamiliar to practical philosophy. They try to give last reasons why some moral beliefs are justified and others are not. Why should one abandon this enterprise? Could one not point out that it is morally good, e.g., to have a disinterested concern for others? Is it not possible to underline the moral value of this judgement? But this kind of argumentation would beg the question. It is circular. Why is altruistic acting really morally good—because it helps others? Why is humane acting really humane? The judgement about the moral worth of the principles governing the moral faculty is made according to exactly those principles of the moral faculty, which are the object of evaluation. The principles that govern moral judgement are those that determine the

[101] One might say with some reason that the central criticism against the linguistic analogy drawn by Rawls by various critics was that the justification of the judgements of the moral faculty would be an open question. See Nagel 1975; Dworkin 1975; Hare 1975; Daniels 1979; Williams 1985. For a comprehensive account and criticism, see Mikhail 2000. See also Mahlmann 2003 on these questions.

judgement whether it is morally good to have these principles in the first place.[102]

The situation is not different to other domains of human knowledge. Take the example of science: The question whether science is really science (and not just a system of errors) can only be answered by applying the principles that distinguish science from non-science in the first place. The mental faculties yielding science—"theoretical reason" to use a traditional term—assess in this case the scientific value of theoretical reason as the science yielding faculty. The question whether science is the right science would be answered scientifically—and thus in a sense, not at all. The answer would be circular and thus begging the question, which was asked in the first place, namely, whether theoretical reason is reliable, whether it is yielding insights or errors.

The only way out of this circle seems to be not to enter it in the first place by just trusting the reliability of higher mental faculties like the moral faculty or theoretical reason. To be quite clear: This means not to take a surprising path in moral and theoretical epistemology. To take again the example of science. Since the sceptical crisis of the 17th century anti-foundationalism is deeply incorporated in the scientific enterprise.[103] Since then it should be well understood that there is no way to determine whether human knowledge is "objective," or "real" knowledge about the world. Any theory answering this question is still a *human theory*. The reach and reliability of human theories is, however, exactly the point in question. Humans cannot determine the objectivity of their knowledge from a non-human point of view. But exactly this point of view beyond their reach is necessary to evaluate the merits of human theories if one strives to achieve "Letztbegründung" or a foundationalist account of knowledge. Nevertheless, even taking these limits into account, there is still the hope and trust that science and thus the mental faculties involved in this mental activity yield at least some valuable results about the world. This is achieved most importantly by constantly improving according to given human standards of understanding the theories of science. One exercises the higher human mental faculties because one is faced with the desire and need to gain some understanding of the world and these faculties are all human possess to pursue these projects even though it is clear that the understanding achieved

[102] This problem arises in one way or another for any ethical theory. Take Platonism. A Platonist might assert that a moral judgement p has a last-order justification because this judgement grasps a metaphysical idea. But why is the judgement that this moral judgement grasps a metaphysical idea *itself* justified? By another judgement that grasps the metaphysical idea of grasping a metaphysical idea by a moral judgement? Or take discourse ethics: The content of moral judgements is justified according to this theory if everybody in a free discourse could accept it. The question is here: How is it determined whether this condition is met? By another discourse? How is it determined whether this meta-discourse is meeting the condition of universal consensus on the existence of universal consensus on the content of moral judgement? By yet another discourse?

[103] See Popkin 1979, 129ff., for a concise overview.

is not "absolute" or "objective" knowledge in a foundationalist sense. It is *human* knowledge and as such the best we can hope for.[104]

The same reasoning applies to the moral faculty. Human beings use it faced with the desire and need to act as an individual morally, and to establish a social order that is morally justified, e.g., by regarding certain rights protecting human dignity, equality, and liberty as morally justified, and others perpetuating human humiliation, discrimination, and servitude as utterly illegitimate. One certainly has to think about one's judgements, clarifying their factual basis, trying to preserve consistency, assessing the influence of interests and passions, etc. In the last instance, however, one has to trust that this faculty does not lead us astray with these last order judgements as the alternative to this trust is not absolute justification (which is unattainable for human beings) but the abyss of moral disorientation. To say it again: There is no real reason for this trust. It is not in any deep sense justified. But there is no alternative, either. It is as impossible to determine whether what to human beings seems to be morality is Real Morality as it is impossible to determine whether what to human beings appears to be science is Real Science.[105]

b) Apart from this argument for trust in higher mental faculties due to a lack of rational alternatives there might be a second and third path for answering the question raised why one *should* follow the judgements generated by the moral faculty. These paths of justification point to consequences of acting according to the demands of the moral faculty that are good, but now understanding "good" in a non-moral sense. It turns out that the use of this faculty (as it is happens to be) is in the immediate and long-term non-moral self-interest of human beings.

Arguments of the former kind have a long tradition.[106] To take an example of enlightened thought not susceptible of too much naivety: Hume argued that the "immediate feeling of benevolence and friendship, humanity and kindness, is sweet, smooth, tender, and agreeable, independent of all fortune

[104] Popkin calls this view "constructive scepticism" defined as "the recognition that absolutely certain grounds could not be given for our knowledge, and yet that we possess standards of evaluating the reliability and applicability of what we have found out about the world" (Popkin 1979, 150). On the relevance of this observation for the naturalistic study of the mind compare Chomsky 2000, 76ff.

[105] The example of scientific judgement is arbitrary. One could use other examples to make the same point, e.g., the language faculty. One might ask, then, whether the grammaticality judgement of native speakers yields Real Grammaticalness or whether it is corrupted and thus misleading, so that the native speaker really speaks ungrammatically according to the standards of Real Grammaticalness. Philosophers and linguists had then the task to determine what Real Grammaticalness is (like philosophers trying to determine what Real Science or Real Morality is). But it seems obvious that this is in fact not a very promising research project.

[106] The reason is obvious, as Hume (1975, 279) remarked: "Truths which are pernicious to society, if any such there be, will yield to errors, which are salutary and advantageous." Thus, one better proves the advantageousness of one's assertions independently of their truth.

and accidents," and thus superior to other, non-moral desires (Hume 1975, 282). "What wonder then," Hume asked "that moral sentiments are found of such influence in life; though springing from principles, which may appear, at first sight, somewhat small and delicate?" (ibid., 275). To act morally—if this depiction is right—means thus to have a refined taste for the good aspects of a human life.

It might be a mistake to regard an argument which appeals to taste as a basis of choices between different actions as weak, open to irrationality, or even base. It seems, however, that when faced with the necessity of a moral act and a possible price to pay for it the motivation for acting morally despite the consequences derives—apart from the command of morality to act for its own sake—to a certain degree from an aversion against the emotional consequences of acting immorally (like shame, etc.) and positively from the wish to feel the austere but lasting satisfaction which is the result of moral acting. One might prefer the pleasure to be able to see oneself with some respect in the mirror in the morning to the often more material benefits of satisfying other primary desires. The seemingly base appeal to taste appears to be thus nothing but the attempt not to rape one's own nature in one of its possibly finest and most delicate parts. And as human beings share a common nature there is nothing subjective or irrational about this decision.

The consequence of these ideas could be regarded as a re-humanization of morality. From this perspective it seems that morality is not a harsh and pleasure denying cold and thus to a certain degree inhuman realm of duty but might be in fact the path to the gentle satisfaction of intimate human desires.[107] It would be obviously hypocritical to assert that human beings could ever be motivated mainly by moral inclinations and not mostly by other desires. But it seems that there is something to be found in the consequences of moral acting, the very special taste of preserved dignity, which perhaps is sometimes not appreciated enough.

Thus, there is a second way to answer the question why one should follow the judgements of the moral faculty: To give moral acting some modest room in ones' actions might lead to a quite agreeable form of life.

c) Finally, there seems to be a further line of argument for answering the question why one *should* follow the commands of the moral faculty. Morality might from this point of view lead to substantial long-term non-moral gains. The benefits to others, on the surface a neglect of one's own wishes, might be in fact in the long run highly beneficial to oneself.

[107] This, again, is not a new observation. As Hutcheson dryly remarked, commenting on Mandeville's selfish system with obvious bewilderment that moral acting could be regarded as necessarily unpleasant: "He has probably been struck with some Fanatick Sermon upon Self-denial in his Youth, and can never get it out of his head since" (Hutcheson 1971b, 169). Schlick's remarks on pleasure in ethics (though perhaps misleading in other respects) are another example of this quite human idea; compare Schlick 1984, 201.

To understand the main thought behind this line of argument is to recall W. v. Humboldt's insight that the unfolding of the various capacities of any individual is strongly dependent on the development of the faculties of others. The reason is the following: Every person is obviously capable of very limited things. Only a social fabric, which provides space for individual variety can realize at least partly, what human life could be about. Thus the prospering of others has at least two rather crucial advantages for any individual in comparison to widespread misery: Firstly, the developed abilities of others can trigger the individual's own development. Everybody who wants to perfect her musical abilities profits, e.g., from Mozart's achievements in this respect. Secondly, the developed skills of others can be the key to human potentials, which the individual cannot develop herself. Somebody who has no clue of writing music and does not aim to do so because her main interest is mathematics might be nevertheless quite thankful that somebody like Mozart made it (unlike many children of the third world) to his mature age and had the chance to do his work, as it is possible in consequence for everybody to enjoy the results now. This line of argument is of course not limited to great achievement of arts and sciences but quite to the contrary applicable to any human quality—from managerial skills to good cooking.

The result of this thought is a strong and entirely rational argument for solidarity as a precondition for a good individual life.[108] Other people are in this view not just limits to the liberty of an individual as in standard formulas of political philosophy but the precondition of its substantial realization. Without the enhancing benefits of the contributions of others to human life the options of actions of human beings are severely limited. In a community of human deprivation liberty is meaningless. Therefore, a person living at the expense of others reducing their possible contribution to human culture lives in fact at the expense of his own benefits.

To take an example: Many artistic, scientific, social, individual contributions by women have been barred in the past by social arrangements that offered no space for them. By enforcing these arrangements men have—seemingly profiting from comfortable patriarchal positions—deprived themselves of the chance to enjoy the possible fruits of these achievements. It was surely advantageous for many men to bar the female Titians from developing their talents while profiting from their workforce in the kitchen. But it deprived many people from significant profits of confronting themselves with their achieve-

[108] In Humboldt's words: "Durch Verbindungen also, die aus dem Inneren der Wesen entspringen, muss einer den Reichthum des andren sich eigen machen" (Humboldt 2002, 64ff.). In my translation: "It is through ties, therefore, rooted in the inner self, that each is enabled to participate in the richness of the other." Rawls has made some remarks on the good of the "union of social union" taking up Humboldt's thought of the rationality of solidarity. But he devalues his insights by—somehow inconsistently—asserting that this argument can not claim universal validity. See Rawls 1971, 520ff., 567ff.

ments. The benefits of the suppression of women—e.g., comfortable lives for generations of men—are surely not worth the price paid for that—e.g., the deprivation of human culture of most of the possible contribution by women.

This line of argument holds obviously as well for the denial of life-chances for other less privileged groups in societies and for the existence of powerful cultures at the expense of the less fortunate ones. All this might yield some primitive short term gain, but impoverishes human culture significantly in the long run.

Obviously, a moral faculty with principles like altruism seems very suited to foster a kind of humboldtian community, as it drives people with its gentle coercion of the human will to do what in the end is most profitable to all: to take a disinterested concern in the well-being of others.[109]

Thus, to sum up, the question, whether the judgements of the moral faculty *should* be followed can be answered in three ways:

(1) by a notion of trust that the moral faculty, like other higher mental faculties does not lead us completely astray (argument from trust in higher mental faculties);
(2) by pointing out that moral acting might fulfil one of human beings' most delicate desires (argument from taste);
(3) by pointing out the general advantages for the general well being of this course of action (argument from utility of solidarity).

Correspondingly, to the question whether human rights, which are justified according to human moral judgement, are *really* justified, the following three answers are possible. First, one can point out that there is no moral yardstick beyond the moral judgement of human beings. They have thus no alternative to taking the rights as morally justified which appear to be so from their human perspective as no other perspective is available to them. Human rights might not be justifiable for Martians, but they are surely justified for human beings. And this, it seems, is all that is sensibly required from a theory of the foundations of human rights.

Secondly, to follow the command of the moral faculty to protect human rights might be a good choice if one is demanding as regards to the pleasures of life: The implied moral acting possibly yields delicate pleasures preferable to those of alternative courses of action.

[109] The assessment of the worth of the humboldtian community fostered by a moral faculty governed by a principle of altruism is not a moral one itself as the agents following this kind of argument are motivated by their non-moral interests and not by a disinterested concern for others. Consider this case: "*A* gives the child a banana, because he likes her voice and wants her to continue to sing for his entertainment." This is not a moral act. Adequately, the rational choice of a humboldtian community is truly a rational, not a moral one.

Thirdly, the fostering of a human rights culture might be very advisable if one hopes for a human culture less maimed by destructive forces as in most epochs of the past as a precondition of a human life not equally impoverished. The disinterested concern for others embodied in human rights might well turn out to be the best path to a satisfying individual life.

Thus, it is quite rational—contrary to relativistic conclusions—to ask whether human beings have certain human rights or not. There are standards to decide this question. The rational enquiry, e.g., whether freedom of the press is a human right or not, needs not be given up in favour of telling a long, sad, sentimental story that is manipulating sentiments on suffering journalists. Its answer is provided by moral judgement and empirical theories about facts, more precisely about human nature (which is of course not as "protean" and "malleable" as Rorty among many others wants us to believe[110]—any suffering individual will bear witness for that) and its realization in society. If there are better reasons to believe that the freedom of the press helps satisfying the human need to understand and act upon reflection responsibly in political and other spheres under given historical circumstances it is justified. If not, it is not justified. In consequence, a rational discussion about the content of human rights is possible. Serious work of many people is rightly devoted to this task trying to develop a systematic and coherent order of human rights, which is applicable in concrete cases and generally justified according to the moral and rational standards that human beings are able to apply. Asking this question and conducting this work is important, as this seems to be the only way to improve the standards of human rights in the time ahead.

These results are, however, surely less than philosophers and other reflective people had hoped for when they embarked to discover the foundations of morality and more concretely of human rights. One might regard a mentalist theory of law and ethics therefore as a further step of the "Entzauberung," the destruction of the magic spell of the world as Weber described the effect of progressing science (Weber 1968, 612)[111] as it depicts the limits of human moral understanding and renders morality a human—no more, no less—affair. In any case, however, this result is not nothing. As shown, there are good reasons to take the moral judgements of human beings seriously. Thus, there are good reasons to take human rights which are justified by these moral judgements seriously and to make human rights—being as well justified as achievable for human beings—a firm basis of action. It seems that neither the

[110] Rorty 1993, 115: "We have come to see that the only lesson of either history or anthropology is our extraordinary malleability. We are coming to think of ourselves as the flexible, protean, self-shaping, animal rather than as the rational or the cruel animal."

[111] Even though this impression is to a certain degree misleading as the analysis of the higher mental faculties reveals a rather enchanting complexity of human mental nature.

consequences of this course of affairs for the individual agent nor for mankind at large would turn out to be detrimental at all.

3.2.1.4. Natural Law Theories—Problems of Transition

Looking back a century from Montesquieu's program, the character of the 17th century approach to a new natural law doctrine, especially the Hobbesian type, becomes clearer: It is already a non-theological approach, referring to human nature as the foundation of law and state solely. The assumptions about human nature, however, are made in a context of justification. No clear distinction between justification and explanation is made yet. In general, natural law doctrines that use the idea of a social contract attempt to give a justificatory answer to a problem of transition or transformation. It is not offered as an explanation of how societies were constituted historically. Rather, it is an answer to the question of how a *status naturalis* should be transformed into a *status civilis*. This basic question can be specified as taking place in three steps:

(1) How is the *status naturalis* qualified?
(2) How is the *status civilis* qualified?
(3) How should the transition from one status to the other take place?

Again, as in Greek mythology, a foundational story is told. This time, however, no God or Goddess would appear. Human beings are left alone with their natural properties (although perhaps with a belief in God). The path to a civil, legal state is not mapped out for the human creatures by a transcendent being.[112] Rather, the demand to leave the state of nature issues from negative projections of human nature in this brutish, anarchic state.

> Whatsoever therefore is consequent to a Time of Warre, where every man is Enemy to every man; the same is consequent to the time, wherein men live without other security, than what their own strength, and their own invention shall furnish them withall. In such condition, there is no place for Industry; because the fruit thereof is uncertain: and consequently no Culture of the Earth; no Navigation, nor use of the commodities that may be imported by Sea; no commodious Building; no Instruments of moving, and removing such things as require much force; no Knowledge of the face of the Earth; no account of Time; no Arts; no Letters; no Society; and which is worst of all, continuall feare, and danger of violent death; And the life of man, solitary, poore, nasty, brutish, and short. (Hobbes 1965, I, 13)

Men can scarcely avoid having the desire to escape this way of life.

[112] In the Christian tradition, too, there exists the idea of a transition: from the state of nature, which is the state of the original sin (*peccatum originale*), to the state of salvation or justification. The transition is made possible by God's grace, manifested in Christ's sacrifice; but we may also achieve the same transition, at least to a certain extent, by individual effort.

(1) How is the *status naturalis* specified?

a) The *status naturalis* is negatively characterized by the lack of law, state, authority, domination, there is no sense of justice and there is no money. Only the "brute" nature of human beings is left: their passions, basic faculties, desires, drives, instincts. In the narrative of the state of nature anthropological properties, constants of human nature are all that is available: a drive for aggression or dominance, fear of death and the will to survive. On the other hand a longing for peace[113] and a social sense are ascribed to these socially uncorrupted creatures.

Do norms exist already in the state of nature? Of course, there are no legal norms, because their existence characterizes a civil state. Norms in the broader sense of more or less generalized normative expectations, however, do exist. There are kinship relationships as basic patterns of group formation. In some theories, e.g., in Locke, private property is assumed, albeit not (yet) protected by any kind of "officials." Original, unalienable rights are asserted that a state legislator in a future state is not permitted to restrict: life, liberty and the pursuit of happiness.

b) It is interesting to see where the images of the state of nature originate from. They are constructions for the sake of a theoretical foundation of a normative claim; however, they are not free from empirical allusions. In this sense these images are metaphors transferred from certain circumstances that an author of the 16th/17th century might experience. But how could one have any experience of "brute" human nature?

It is a well known argument that the experience of the religiously motivated civil wars of the 16th–17th century provided collectively shared images that became a central part of theories of the state of nature at that time. This source of images usually is ascribed to the theory of Hobbes.[114]

Other authors correlate the images of the state of nature with features of a nascent antagonistically organized market society dominated by egoistic, utilitarian orientations (cf. Macpherson 1962).

[113] Cf. the critique of Hobbes's *De Cive* in Montesquieu 1949, book 1, chap. 2.

[114] From a biographical point of view this makes sense. In his *Leviathan*, however, Hobbes is quite unclear on this point: He concedes that a war among private people never existed, while war among sovereigns has always existed. But if "particular men" would wage war like sovereigns, the misery of the state of nature would ensue: "But though there had never been any time, wherein particular men were in a condition of warre one against another; yet in all times, Kings, and Persons of Soveraigne authority, because of their Independency, are in continuall jealousies, and in the state and posture of Gladiators; having their weapons pointing, and their eyes fixed on one another; that is, their Forts, Garrisons, and Guns upon the Frontiers of their Kingdomes; and continuall Spyes upon their neighbours; which is a posture of War. But because they uphold therby, the Industry of their Subjects; there does not follow from it, that misery, which accompanies the Liberty of particular men" (Hobbes 1965, I, 13).

The 16th and 17th centuries not only were times of religiously motivated wars. They were (starting at the end of the 15th century) a time of great discoveries. Montesquieu could use the travel reports that had been accumulated and collected at his time for explanatory purposes. The authors of the 16th and 17th century were well aware of reports about "primitive" societies and "natural" people. Sometimes these savages were imported to Europe for exotic entertainment.[115] Reports, unreliable stories and fantasies were used to paint a picture of the *status naturalis*. How the sovereign of a (European) *status civilis* should have to deal with real people living in an assumed state of nature in the New World was an issue dealt with by scholars of Spanish late scholasticism (Vitoria, Suárez et al.)

Still another experience—say, a Grotian experience—was the battle between European maritime states, expanding globally and hence demanding a *mare liberum*. These states lived in a *status naturalis* not yet pacified by international law.

Irrespective of the fictitious character of images of the state of nature, these metaphors play an essential role in the normative context of justifying the exit out of this unpleasant state or of justifying a *status civilis*.

(2) How is the *status civilis* specified?

If there were original rights in the state of nature, are they at the disposal of the state sovereign or is it the function of the state to preserve and expand these "natural rights"? Is the state bound by legal provisions? Is the sovereign *legibus absolutus* or is there a supreme rule of law? How far does state domination reach in civil and religious matters? Is there a right to resistance? Are the roles of *homme/bourgeois* and *citoyen* split?

[115] I will mention only a few names from a long line of great thinkers: Michel Montaigne (1992, Book 1, chap. 31.) Thomas Hobbes: "It may peradventure be thought, there was never such a time, nor condition of warre as this; and I believe it was never generally so, over all the world: but there are many places, where they live so now. For the savage people in many places of America, except the government of small Families, the concord whereof dependeth on naturall lust, have no government at all; and live at this day in that brutish manner, as I said before. Howsoever, it may be perceived what manner of life there would be, where there were no common Power to feare; by the manner of life, which men that have formerly lived under a peacefull government, use to degenerate into, in a civill Warre" (Hobbes 1965, I, 13). John Locke: "Thus in the beginning all the World was America, and more so than that is now; for no such thing as Money was anywhere known" (Locke 1960, § 49). Montesquieu (1949, book 1, chap. 2): Man in a state of nature "would nothing feel in himself at first but impotency and weakness; his fears and apprehensions would be excessive; as appears from instances (were there any necessity of proving it) of savages found in forests." In a footnote Montesquieu mentions a savage man found in the forests of Hanover who was carried over to England during the reign of George I. For less known writers, see Bitterli 1976; Kohl 1981.

(3) How does the transition to a *status civilis* take place?

The systematic problem of justification is twisted into an allegedly temporal sequence of two states (*status naturalis* and *civilis*): a temporalization of justification. To ask for the "origin" of the state does not mean its historical development but its legitimation. The transformation from one state to the other is mediated by a contract. Who are the participants in this constitutive contractual procedure? Do they submit to a newly established authority or do they transfer their rights with a proviso of countermand? The idea of a consensual contract does not necessarily lead to a democratic government. By a social contract a people can also surrender to an authoritarian regime (as in Hobbes). A common consensus manifested in a social contract forms the normative foundation of a legal order guaranteed by state authorities. Only a government that passes the test of the social contract can claim legitimacy. Despite the fictitious character of the social contract other types of legitimation are systematically excluded: State authority can no longer be derived from God's grace nor will it find its foundation in a military coup. Social contract theories replace religious or transcendent modes of legitimation with an immanent one. This is part of the process of secularization and "*Aufklärung*."

The doctrine of a social contract implies the idea of the "makebility" of a whole society. The problem, however, is to what degree will natural conditions, the external environment as well as anthropological constants, still have an impact on our decision about how to make a society. The reference to a "second nature" is ambivalent insofar as it indicates that the conditions we live in are man-made; at the same time, however, they are not at our free, collective disposition. They are still "nature." This is an issue Marx and Engels pointed out in maintaining the existence of objective laws of the development of human societies that operate *a tergo*, beyond human intentions. The societies that we live in have not been constituted consciously by a collective will. It is only the future, socialist society that will be formed according to human plans—not via a social contract, but after a revolution (and probably after a phase of dictatorship).[116]

Traditional Natural Law doctrine is based on fictions: A natural state is a fictitious one. We do not know the pure "nature" of *homo sapiens* (perhaps as "*homini lupus*"). A real social contract never was concluded in historical time and space. The homogeneity of the people joining in a contract for a historical second is a fiction as well. In modern social contract theories these fictions are made explicit as counterfactual, i.e., normative presuppositions. One can see this strategy, e.g., in J. M. Buchanan's (1975) stage theory: Starting with a state of nature characterized by egoism and inequality, contractual relationships for

[116] The idea of makeability is fundamental to European integration. Will the European Union be the result of social contracts and democratic participation, or rather of top-down administrative decision-making?

common advantage are established. As a third step a protective state with courts is introduced in order to stabilize the mutual expectations built in contracts. Finally a productive state with legislation will evolve. The most famous renewal of classical social contract theories surely is John Rawls' *Theory of Justice*.[117] There the initial state is, however, characterized by ignorance as far as our natural makeup and our social status is concerned. The original position is a state of veiled nature. Robert Nozick (1974) also deals in *Anarchy, State, and Utopia* clearly with the problem of transition or transformation: from a state of nature via (dominant) protective associations to a minimal state, and from the original acquisition of property to the existing state of holdings. It is an obvious piece of justification, by and large, of the existing property distribution. However, he does not construct a normative theory based on counterfactual presuppositions. Instead he claims historical evidence for justice in the original acquisition (mainly following Locke) and justice in transfer. What comes out is a ridiculous piece of history—especially given the history of slavery in the U.S. and how the American Indians were maltreated and "maltreatied" (considering the unjust treaties between U.S. authorities and Indian nations and the breaches of contracts). According to his third principle of justice ("rectification of injustice in holding") Nozick ought to have become a fervent counsel opposing the Bureau of Indian Affairs and supporting class actions by the descendants of American slaves.

What remains of the state of nature and the doctrine of a social contract beyond ideal constructions and historically blind theories? Real problems of transition today originate from attempts to establish the condition of the rule of law. What are the foundations, i.e., the preconditions for the establishing of a regime of the rule of law, maybe even further of democracy and the guarantee of human rights? Examples appear from many quarters: the transforma-

[117] Rawls 1971, 11: "Thus we are to imagine that those who engage in social cooperation choose together, in one joint act, the principles which are to assign basic rights and duties and to determine the division of social benefits. Men are to decide in advance how they are to regulate their claims against one another and what is to be the foundation charter of their society. Just as each person must decide by rational reflection what constitutes his good, that is, the system of ends which it is rational for him to pursue, so a group of persons must decide once and for all what is to count among them as just and unjust. The choice which rational men would make in this hypothetical situation of equal liberty, assuming for the present that this choice problem has a solution, determines the principles of justice." "Among the essential features of this situation is that no one knows his place in society, his class position or social status, nor does any one know his fortune in the distribution of natural assets and abilities, his intelligence, strength, and the like. I shall even assume that the parties do not know their conceptions of the good or their special psychological propensities. The principles of justice are chosen behind a veil of ignorance. This ensures that no one is advantaged or disadvantaged in the choice of principles by the outcome of natural chance or the contingency of social circumstances. Since all are similarly situated and no one is able to design principles to favor his particular condition, the principles of justice are the result of a fair agreement or bargain" (ibid., 12).

tion of former socialist, totalitarian countries into liberal democratic societies (cf. Merkel 1999; Pribán 2002); states torn by guerrilla warfare (e.g., Colombia) with para-military groups acting without official authorization (this resembles the image of a state of nature in the sense of a civil war); South Africa after the fall of the Apartheid regime; states emerging from dictatorships (Spain, Argentina, Chile, etc.); Afghanistan after the Taliban, Iraq …

What were the aims of these transitional processes and how did they actually take place? In order to set up basic principles of the rule of law—like the separation of powers, independence of the judiciary, legality of state activities, protection of minorities, guarantee of basic rights, etc.—constitutional provisions had to be changed (e.g., elimination of the dominant role of the Communist Party or other organisations); new forms of political representation and competition were required (introduction of a multi-party system and new electoral rules). At the same time, however, the foundations of a civil society had to be established (freedom of association, in particular freedom of trade unions; freedom of speech, freedom and plurality of information). In general, new provisions for a rearrangement of economic structures were made, aiming at a market society. The economic system should provide sufficient revenue for state activities. Political consolidation not only took place on the level of constitutional and electoral measures. In addition, essential changes on a behavioral level were required in order to establish a legal culture.[118] A basic aim to be attained is the elimination of corruption in state offices, in general the strengthening of professional ethics, i.e., the formation of a legalistic attitude among the members of the legal staff, a special ethos (Max Weber's "*Amtsethos*") of those who hold offices, the understanding of law as a limit on political power and not only as an instrument to uphold the power of a given regime. And all this should be based on a democratic culture shared by the citizens.

What can we learn from these recent examples? A civil state, a state based on the rule of law is not created *ex nihilo*. In every case there existed a predecessor state the transformation of which often resembles the picture of emerging from an anarchic state of nature. Therefore regularly the problem arises of how to cope with the atrocities and injustices committed under the former state. People did not leave a classical state of nature in which the distinction between just and unjust had not applied, as in Hobbes' *status naturalis*:

> To this warre of every man against every man, this also is consequent; that nothing can be Unjust. The notions of Right and Wrong, Justice and Injustice have there no place. Where there is no common Power, there is no Law: where no Law, no Injustice. (Hobbes 1965, I, 13)

[118] Linz and Stepan 1996 distinguish four levels of consolidation: constitutional, representative, behavioural, and a level of civil culture.

New bodies were designed for coping with the past (truth commissions, lustration tribunals). The issue of "transitional justice" became salient.[119]

These recent examples of state transformation show that the establishment of a regime based on the rule of law is not a matter of human nature from which the legal rules could be derived; instead it will be the result of a very complex learning process, the conditions of which are not deliberately constituted in the moment of a singular expression of the common will, i.e., a collective contract. The transition does not take place during the juridical instant of making a contract, but is a collective learning process that long endures. The idea of a contract played a certain role at the beginning of the recent state transformations, as we can see from the use of Round Tables, commissions, treaties between government and guerrilla groups, the German unification treaty between two states, etc. But these were only starting points for efforts that have not yet ended.

On the broader front, today the situation among states might be still described as a state of nature, considering the erosion of the validity of international law. UN resolutions are declared irrelevant. The International Penal Court is not accepted by all states. A state of nature reappears in the global fight against terrorism: There is no rule of law in Guantánamo. In Hobbes the civil state is not marked, as in Kant, by a civil court; instead it is a supreme power, today maybe a hegemonial global power that identifies its interests with the global law. Ought this to be the new foundation of a global legal order?

3.2.2. Economic Foundations of Law

3.2.2.1. The Economic Foundationalism of Marx and Engels: Basic Assumptions

The discussion of Natural Law Theories and the application of the basic idea of transition via a social contract to recent phenomena lead us away from "natural" properties to man made conditions in a society. We have seen in the paragraphs on anthropological foundations, and in particular in those on Marx and Engels, that in consequence of their physical organization men are able to modify their environment and they have to modify it in order to survive. The material reproduction of mankind leads to the production of a second nature, to the production of food and means of producing it, to the production of social relationships as an institutionalized framework for the mode of reproduction. Thus the economic foundations of a society are built.

The first premise of all human history is, of course, the existence of living human individuals. Thus the first fact to be established is the physical organisation of these individuals and their

[119] Cf. Elster 1998 and forthcoming; Kritz 1995; Krygier 1999; McAdams 1997; Misztal 1998; Offe 1996; Pogany 1997; Pribán and Young 1999.

consequent relation to the rest of nature. Of course, we cannot here go either into the actual physical nature of man, or into the natural conditions in which man finds himself — geological, hydrographical, climatic and so on. The writing of history must always set out from these natural bases and their modification in the course of history through the action of men.

Men can be distinguished from animals by consciousness, by religion or anything else you like. They themselves begin to distinguish themselves from animals as soon as they begin to *produce* their means of subsistence, a step which is conditioned by their physical organisation. By producing their means of subsistence men are indirectly producing their actual material life.

The way in which men produce their means of subsistence depends first of all on the nature of the means of subsistence they actually find in existence and have to reproduce. This mode of production must not be considered simply as being the production of the physical existence of the individuals. Rather it is a definite form of activity of these individuals, a definite form of expressing their life, a definite *mode of life* on their part. As individuals express their life, so they are. What they are, therefore, coincides with their production, both with *what* they produce and with *how* they produce. Hence what individuals are depends on the material conditions of their production. (Marx and Engels 1976b, 31–2; cf. Marx and Engels 1969a, 20–1)

Marx, and Engels as well, are surely "foundationalists" par excellence. It was they who introduced the notion of an economic "basis" on which societal institutions—and prominently among them: law, as the "superstructure"—are based. Marx' famous Preface to his *Contribution to the Critique of Political Economy* summarizes in the lines of a woodcut his basic assumptions. Nevertheless, it is sufficient to set forth the essential assumptions and basic distinctions, e.g., between basis and superstructure (*Basis/Überbau*) or between existence and consciousness (*Sein/Bewußtsein*). The economic foundations, primarily the forces of production (*Produktivkräfte*) by which men reproduce themselves materially within the framework of the relations of production (*Produktionsverhältnisse*), determine the other social conditions, the so-called superstructure (*Überbau*): ideas, ideologies and social institutions like law and the state. Law, in any case, is a secondary, derived phenomenon. "It must not be forgotten that law has just as little an independent history as religion" (Marx and Engels 1976b, 90–1; cf. Marx and Engels 1969a, 63). The origin, development and the functions of law have to be explained by reference to extra-legal, mainly economic conditions, antagonism between the forces of production and the relations of production, and the given mode of production.

My inquiry led me to the conclusion that neither legal relations nor political forms could be comprehended whether by themselves or on the basis of a so-called general development of the human mind, but that on the contrary they originate in the material conditions of life, the totality of which Hegel, following the example of English and French thinkers of the eighteenth century, embraces within the term "civil society"; that the anatomy of this civil society, however, has to be sought in political economy. [...] The general conclusion at which I arrived and which, once reached, became the guiding principle of my studies can be summarised as follows. In the social production of their existence, men inevitably enter into definite relations, which are independent of their will, namely relations of production appropriate to a given stage in the development of their material forces of production. The totality of these relations of production constitutes the economic structure of society, the real foundation, on which arises a legal and political superstructure and to which correspond definite forms of social consciousness.

The mode of production of material life conditions the general process of social, political and intellectual life. It is not the consciousness of men that determines their existence, but their social existence that determines their consciousness. At a certain stage of development, the material productive forces of society come into conflict with the existing relations of production or—this merely expresses the same thing in legal terms—with the property relations within the framework of which they have operated hitherto. From forms of development of the productive forces these relations turn into their fetters. Then begins an era of social revolution. The changes in the economic foundation lead sooner or later to the transformation of the whole immense superstructure. In studying such transformations it is always necessary to distinguish between the material transformation of the economic conditions of production, which can be determined with the precision of natural science, and the legal, political, religious, artistic, or philosophic—in short, ideological forms in which men become conscious of this conflict and fight it out. Just as one does not judge an individual by what he thinks about himself, so one cannot judge such a period of transformation by its consciousness, but, on the contrary, this consciousness must be explained from the contradictions of material life, from the conflict existing between the social forces of production and the relations of production. No social order is ever destroyed before all the productive forces for which it is sufficient have been developed, and new superior relations of production never replace older ones before the material conditions for their existence have matured within the framework of the old society. Mankind thus inevitably sets itself only such tasks as it is able to solve, since closer examination will always show that the problem itself arises only when the material conditions for its solution are already present or at least in the course of formation. In broad outline, the Asiatic, ancient, feudal, and modern bourgeois modes of production may be designated as epochs marking progress in the economic development of society. The bourgeois relations of production are the last antagonistic form of the social process of production—antagonistic not in the sense of individual antagonism but of an antagonism that emanates from the individuals' social conditions of existence—but the productive forces developing within bourgeois society create also the material conditions for a solution of this antagonism. The prehistory of human society accordingly closes with this social formation. (Marx 1987, 262–4; cf. Marx 1969b, 8–9)

The basic assumptions concerning the development of law can be summarized in the following statements: Law evolves primarily out of factual economic conditions. The moving principle, the historical *movens* is the development of the forces of production (tools, instruments, machines, including human technological skills). The basic factors are pre-normative. Again we find the assumption that norms originate from facts, i.e., from the basic conditions of material reproduction. There is a legal lag. The superstructure, and among it the law, lags behind the advancing economic basis. Law even can become an obstacle, a fetter for the progress of the forces of production. This is the occasion were revolutionary changes of the superstructure take place.[120] In a socialist state still the performance principle will remain valid ("To each according to his achievements."), while in a later communist society everyone will earn according to his/her needs. Classes and class antagonisms will dissolve. Finally state and law will whither away (cf. *infra*, sec. 3.2.2.3).

[120] From a Marxist point of view one could apply this idea to the fall of the socialist states. Their institutional framework no longer allowed an efficient growth of the productive forces, especially in computer technology.

3.2.2.2. Critique

This foundationalist theory has to cope with five problems at least. Marx and Engels dealt with the first four problems which will be demonstrated by quoting the relevant paragraphs at length. However, I cannot find allusions to the final one.

(1) The Reception of the Roman law—How can one, in the framework of Marx' theory, explain the fact that similar law exists although the economic basis has changed essentially? Roman law developed and existed, according to Marx' classification of historical epochs, in a slaveholder society. Private Roman law, however, survived the stage of feudalism and was renewed in codifications during the capitalist era. A solution to this problem might be that only a small part of Roman law, i.e., the one concerning the exchange of commodities, was received, but not Roman family law nor penal law.

However, the real difficult point to be discussed here is how the relations of production as legal relations take part in this uneven development. For example the relation of Roman civil law (this applies in smaller measure to criminal and constitutional law) to modern production. (Marx 1986, 45; cf. Marx 1969a, 640)

Civil law develops simultaneously with private property out of the disintegration of the natural community. With the Romans the development of private property and civil law had no further industrial and commercial consequences, because their whole mode of production did not alter. With modern peoples, where the feudal community was disintegrated by industry and trade, there began with the rise of private property and civil law a new phase, which was capable of further development. The very first town which carried on an extensive maritime trade in the Middle Ages, Amalfi, also developed maritime law. As soon as industry and trade developed private property further, first in Italy and later in other countries, the highly developed Roman civil law was immediately adopted again and raised to authority. When later the bourgeoisie had acquired so much power that the princes took up its interests in order to overthrow the feudal nobility by means of the bourgeoisie, there began in all countries—in France in the sixteenth century—the real development of law, which in all countries except England proceeded on the basis of the Roman Codex. In England, too, Roman legal principles had to be introduced to further the development of civil law (especially in the case of movable property). (It must not be forgotten that law has just as little an independent history as religion.) (Marx and Engels 1976b, 90–1; cf. Marx and Engels 1969a, 63)

[...] that Roman law, modified to a greater or lesser extent, was adopted by modern society because the *legal* idea that the subject of free competition has of himself corresponds to that of the Roman *person* (not that I have any intention of enlarging at this juncture on what is a most important point, namely that the *legal* representation of certain property relations, though undoubtedly deriving from them, is not for all that, and cannot be, congruent with them). (Marx 1985, 317; cf. Marx 1964, 614)

Roman Law is the consummation of the law of *simple*, i.e., of precapitalist, *commodity production*, though the latter also embodies much of the legal system of the capitalist period. Exactly, that is, what our burghers *needed* at the time of their rise and, in accordance with local common law, did *not* get. (Engels 1995, 155; cf. Engels 1967c, 167)

If the state and public law are determined by economic relations, so, too, of course, is private law, which indeed in essence only sanctions the existing economic relations between individu-

als which are normal in the given circumstances. The form in which this happens can, however, vary considerably. It is possible, as happened in England, in harmony with the whole national development, to retain in the main the forms of the old feudal laws while giving them a bourgeois content; in fact, directly reading a bourgeois meaning into the feudal name. But, also, as happened in Western continental Europe, Roman law, the first world law of a commodity-producing society, with its unsurpassably fine elaboration of all the essential legal relations of simple commodity owners (of buyers and sellers, debtors and creditors, contracts, obligations, etc.) can be taken as the foundation. In which case, for the benefit of a still petty-bourgeois and semi-feudal society, it can either be reduced to the level of such a society simply through judicial practice (common law) or, with the help of allegedly enlightened, moralizing jurists it can be worked into a special code of law to correspond with such social level—a code which in these circumstances will be a bad one also from the legal standpoint (for instance, Prussian *Landrecht*). But after a great bourgeois revolution it is, however, also possible for such a classic law code of bourgeois society as the French *Code Civil* to be worked out upon the basis of this same Roman Law. If, therefore, bourgeois legal rules merely express the economic life conditions of society in legal form, then they can do so well or ill according to circumstances. (Engels 1990b, 392; cf. Engels 1969b, 301–2)

(2) The English development—Different legal cultures appear to be able to exist on the same or on a similar economic basis. In capitalist societies we find a common law tradition as well as a legal culture of the continental type. In this case a solution might be that even though differences in court organization, professionalization, types of legal argument, etc. do exist, the different provisions serve similar functions (e.g., as regards the mobilization of real property).

In England, the continuity of pre-revolutionary and post-revolutionary institutions, and the compromise between landlords and capitalists, found its expression in the continuity of judicial precedents and in the religious preservation of the feudal forms of the law. In France, the Revolution constituted a complete breach with the traditions of the past; it cleared out the very last vestiges of feudalism, and created in the Code Civil a masterly adaptation of the old Roman law—that almost perfect expression of the juridical relations corresponding to the economic stage called by Marx the production of commodities—to modern capitalist conditions; so masterly that this French revolutionary code still serves as a model for reforms of the law of property in all other countries, not excepting England. Let us, however, not forget that if English law continues to express the economic relations of capitalist society in that barbarous feudal language which corresponds to the thing expressed, just as English spelling corresponds to English pronunciation—*vous écrivez Londres et vous prononcez Constantinople*, said a Frenchman—that same English law is the only one which has preserved through ages, and transmitted to America and the Colonies, the best part of that old Germanic personal freedom, local self-government, and independence from all interference (but that of the law courts), which on the Continent has been lost during the period of absolute monarchy, and has nowhere been as yet fully recovered. (Engels 1990a, 294; cf. Engels 1963, 303–4)

(3) The relative autonomy of law—Legal development cannot sufficiently be explained by economic variables alone. There are other causes like power relationships, particular political class constellations (cf. Rottleuthner 2001), theories and even internal requirements of legal consistency. Economic variables can explain ultimately, or as Engels put it in the German original, in the last instance ("*in letzter Instanz*") the historical development of law. The given

social conditions emerge out of an interplay of multifarious factors. Engels clarified this point in a letter to Joseph Bloch that is worth a lengthy quotation:

According to the materialist conception of history, the *ultimately* determining element in history is the production and reproduction of real life. Other than this neither Marx nor I have ever asserted. Hence if somebody twists this into saying that the economic element is the *only* determining one, he transforms that proposition into a meaningless, abstract, senseless phrase. The economic situation is the basis, but the various elements of the superstructure—political forms of the class struggle and its results, to wit: constitutions established by the victorious class after a successful battle, etc., juridical forms, and even the reflexes of all these actual struggles in the brains of the participants, political, juristic, philosophical theories, religious views and their further development into systems of dogmas—also exercise their influence upon the course of the historical struggles and in many cases preponderate in determining their *form*. There is an interaction of all these elements in which, amid all the endless host of accidents (that is, of things and events whose inner interconnection is so remote or so impossible of proof that we can regard it as non-existent, as negligible), the economic movement finally asserts itself as necessary. Otherwise the application of the theory to any period of history would be easier than the solution of a simple equation of the first degree.

We make our history ourselves, but, in the first place, under very definite assumptions and conditions. Among these the economic ones are ultimately decisive. But the political ones, etc., and indeed even the traditions which haunt human minds also play a part, although not the decisive one. The Prussian state also arose and developed from historical, ultimately economic, causes. But it could scarcely be maintained without pedantry that among the many small states of North Germany, Brandenburg was specifically determined by economic necessity to become the great power embodying the economic, linguistic and, after the Reformation, also the religious difference between North and South, and not by other elements as well (above all by its entanglement with Poland, owing to the possession of Prussia, and hence with international political relations—which were indeed also decisive in the formation of the Austrian dynastic power). Without making oneself ridiculous it would be a difficult thing to explain in terms of economics the existence of every small state in Germany, past and present, or the origin of the High German consonant permutations, which widened the geographic partition wall formed by the mountains from the Sudetic range to the Taunus to form a regular fissure across all Germany.

In the second place, however, history is made in such a way that the final result always arises from conflicts between many individual wills, of which each in turn has been made what it is by a host of particular conditions of life. Thus there are innumerable intersecting force, an infinite series of parallelograms of forces which give rise to one resultant—the historical event. This may again itself be viewed as the product of a power which works as a whole *unconsciously* and without volition. For what each individual wills is obstructed by everyone else, and what emerges is something that no one willed. Thus history has proceeded hitherto in the manner of a natural process and is essentially subject to the same laws of motion. But from the fact that the wills of individuals—each of whom desires what he is impelled to by his physical constitution and external, in the last resort economic, circumstances (either his own personal circumstances or those of society in general)—do not attain what they want, but are merged into an aggregate mean, a common resultant, it must not be concluded that they are equal to zero. On the contrary, each contributes to the resultant and is to this extent included in it. (Engels 2001b, 34–6; cf. Engels 1967b, 463–5)

It is similar with law. As soon as the new division of labour which creates professional lawyers becomes necessary, another new and independent sphere is opened up which, for all its general dependence on production and trade, still has its own capacity for reacting upon these spheres

as well. In a modern state, law must not only correspond to the general economic position and be its expression, but must also be an expression which is *consistent in itself,* and which does not, owing to inner contradictions, look glaringly inconsistent. And in order to achieve this, the faithful reflection of economic conditions is more and more infringed upon. All the more so the more rarely it happens that a code of law is the blunt, unmitigated, unadulterated expression of the domination of a class—this in itself would already offend the "conception of justice." Even in the Code Napoleon the pure logical conception of justice held by the revolutionary bourgeoisie of 1792–1796 is already adulterated in many ways, and in so far as it is embodied there has daily to undergo all sorts of attenuation owing to the rising power of the proletariat. Which does not prevent the Code Napoleon from being the statute book which serves as a basis for every new code of law in every part of the world. Thus to a great extent the course of the "development of law" only consists: first in the attempt to do away with the contradictions arising from the direct translation of economic relations into legal principles, and to establish a harmonious system of law, and then in the repeated breaches made in this system by the influence and pressure of further economic development, which involves it in further contradictions (I am only speaking here of civil law for the moment).

The reflection of economic relations as legal principles is necessarily also a topsy turvy one: It happens without the person who is acting being conscious of it; the jurist imagines he is operating with *a priori* principles, whereas they are really only economic reflexes; so everything is upside down. And it seems to me obvious that this inversion, which, so long as it remains unrecognised, forms what we call *ideological conception,* reacts in its turn upon the economic basis and may, within certain limits, modify it. The basis of the law of inheritance—assuming that the stages reached in the development of the family are equal—is an economic one. But it would be difficult to prove, for instance, that the absolute liberty of the testator in England and the severe restrictions imposed upon him in France are only due in every detail to economic causes. Both react back, however, on the economic sphere to a very considerable extent, because they influence the division of property. (Engels 2001a, 60; cf. Engels 1967a, 491–2)

The specific economic form, in which unpaid surplus-labour is pumped out of direct producers, determines the relationship of rulers and ruled, as it grows directly out of production itself and, in turn, reacts upon it as a determining element. Upon this, however, is founded the entire formation of the economic community which grows up out of the production relations themselves, thereby simultaneously its specific political form. It is always the direct relationship of the owners of the conditions of production to the direct producers—a relation always naturally corresponding to a definite stage in the development of the methods of labour and thereby its social productivity—which reveals the innermost secret, the hidden basis of the entire social structure and with it the political form of the relation of sovereignty and dependence, in short, the corresponding specific form of the state. This does not prevent the same economic basis—the same from the standpoint of its main conditions—due to innumerable different empirical circumstances, natural environment, racial relations, external historical influences, etc. from showing infinite variations and gradations in appearance, which can be ascertained only by analysis of the empirically given circumstances. (Marx 1998, 777–8; cf. Marx 1965b, 798–9)

(4) The feedback of superstructure, including the law, to the basis ("*Rückwirkung*," "*Wechselwirkung*")—There is more than only a one-way relation between the economic basis (as a set of independent variables) and the law (as a set of dependent variables). Legal provisions can have an impact on economic conditions. Marx shares as a scholar of the 19th century an expressive notion of law. Law is conceived of as an expression of an underlying substance, in Marx' case: the economic basis. There are only few places in which

Marx and Engels make remarks that take an instrumental point of view interpreting law as a means of social control and of steering economic processes.

Factory legislation, that first conscious and methodical reaction of society against the spontaneously developed form of the process of production, is, as we have seen, just as much the necessary product of modern industry as cotton yarn, self-actors, and the electric telegraph. (Marx 1996, 483; cf. Marx 1965a, 504)

Society gives rise to certain common functions which it cannot dispense with. The persons selected for these functions form a new branch of the division of labour *within society.* This gives them particular interests, distinct too from the interests of those who gave them their office; they make themselves independent of the latter and - the state is in being. And now the development is the same as it was with commodity trade and later with money trade; the new independent power, while having in the main to follow the movement of production, also, owing to its inward independence (the relative independence originally transferred to it and gradually further developed) reacts in its turn upon the conditions and course of production. It is the interaction of two unequal forces: On one hand the economic movement, on the other the new political power, which strives for as much independence as possible, and which, having once been established, is also endowed with a movement of its own. On the whole, the economic movement gets its way, but it has also to suffer reactions from the political movement which it established and endowed with relative independence itself, from the movement of the state power on the one hand and of the opposition simultaneously engendered on the other. (Engels 2001a, 59–60; cf. Engels 1967a, 490–1)

[...] the fatuous notion of the ideologists that because we deny an independent historical development to the various ideological spheres which play a part in history we also deny them any effect upon history. The basis of this is the common undialectical conception of cause and effect as rigidly opposite poles, the total disregarding of interaction; these gentlemen often almost deliberately forget that once an historic element has been brought into the world by other elements, ultimately by economic facts, it also reacts in its turn and may react on its environment and even on its own causes. (Engels 2003; cf. Engels 1968b, 98)

It is only after the establishment of the Soviet power that the model of basis and superstructure is turned around so that law is seen as an instrument to enforce the building of a socialist society.[121]

(5) The conceptual distinction between economic basis and legal superstructure—Is the basis, are material conditions really free of norms? Is law only an element of the superstructure? What happens in the case of a feedback of law on the economic basis? What about the constitutive role of legal norms?

[121] Cf. Stalin's "definition" of law: "The superstructure is a product of the base, but this by no means implies that it merely reflects the base, that it is passive, neutral, indifferent to the fate of its base, to the fate of the classes, to the character of the system. On the contrary, having come into being, it becomes an exceedingly active force, actively assisting its base to take shape and consolidate itself, and doing its utmost to help the new system to finish off and eliminate the old base and the old classes. It cannot be otherwise. The superstructure is created by the base precisely in order to serve it, to actively help it to take shape and consolidate itself, to actively fight for the elimination of the old, moribund base together with its old superstructure." (Stalin 1972, 5).

Can the relations of production be described without reference to (legal) norms?

In the paragraph from the Preface to the *Critique of Political Economy* (quoted *supra*, 108, from Marx 1987, 263; cf. Marx 1969b, 8), we should take a closer look at the sequence "[...] the material productive forces of society come into conflict with the existing relations of production or—this merely expresses the same thing in legal terms—with the property relations [...]." "Expresses" in this context means a linguistic expression, and not, as in the expressive model of law, expression of an underlying substance. What in the language of political economy is denoted as "relations of production," is called in legal language "property relations." These are two different ways of describing "the same thing." This would be a case of extensional identity and intensional difference. There are a few other remarks by Marx in which he extensionally identifies relations of production and property relations or in which "property" is used as a category belonging to the basis. I had already quoted from the following paragraph:

> [...] how the relations of production as legal relations take part in this uneven development [...]. (Marx 1986, 45; cf. Marx 1969a, 640)

Property plays the role of a basic category, a category that is part of the basis:

> Upon the different forms of property, upon the social conditions of existence, rises an entire superstructure of distinct and peculiarly formed sentiments, illusions, modes of thought, and views of life. The entire class creates and forms them out of its material foundations and out of the corresponding social relations. (Marx 1979, 128; cf. Marx 1973a, 139)

In the draft of the *Manifesto of the Communist Party* (1847–1848) Marx and Engels state that the bourgeois "ideas are products of the (existing) bourgeois production and property relations."[122]

Apparently Marx distinguishes between property and its "legal representation":

> that the *legal* representation of certain property relations, though undoubtedly deriving from them, is not for all that, and cannot be, congruent with them. (Marx 1985, 317; cf. Marx 1964, 614)

This relationship, however, is not explained. Property cannot be defined without making reference to norms. An adequate description of the basis requires normative and even legal notions. In order to characterize the different social formations (e.g., feudalism or capitalism), one has to apply legal terms, e.g., capitalist ownership, labor contract, etc. As a consequence, the scheme of basis and superstructure, as far as law is concerned, is flawed. The collapse of

[122] And they continue: "as your legal system is merely the will of your class elevated into law" (Marx and Engels 1976a, 577; cf. Marx and Engels 1969b, 610).

the socialist states and their replacement by capitalist structures made clear that a social order has its legal foundations. Therefore it makes sense to speak of the "legal foundations of capitalism" (cf. Commons 1959). Rules concerning property relations, the organization of market competition and corporations, industrial relations, a credit system, provisions for bankruptcy procedures, stock exchange and a bank system, etc. are constitutive for a whole societal formation. In addition to changes in the political structure, such measures were adopted and put into effect immediately after the downfall of socialist regimes which had theoretically claimed to be in step with the achieved state of the productive forces.

Nevertheless, still fruitful in Marx' theory of law, however, is the notion of a legal lag (in analogy to Ogburn's cultural lag). There are technological and medical innovations that, as a reaction, call for legal provisions (e.g., in the case of electricity; traffic facilities; communications media; computer technology, including the internet; genetic technology). However, those inventions and innovations take place within legally regulated and constituted fields (firms, research institutes, universities). The "economic" sphere, the exchange of commodities including labor force and firms in which they are produced and used are legally constituted. The means of production do not evolve in a non-normative state of nature. They belong to a normatively infiltrated second nature. Usually legal norms are issued in order to cope with negative consequences of technological inventions without affecting the inventions as such. However, it is interesting to look for examples of (legal) norms the aim of which was to prohibit the use of certain technologies (e.g., the use of guns in Japan during its isolation).

3.2.2.3. The Future of Law

Several times I have alluded to the "foundational" question of when law came into being. What are the phylogenetic preconditions of the very existence of law? Marx and Engels dealt with this question (cf. Engels 1990c and 1969a). However, they belong to the very few who raised the issue of the future *end of the law* suggesting the "withering away" of state and law. If we look at the preconditions that must be fulfilled in a future lawless epoch it might become clearer what the foundations of the existence of law and state might be, according to Marx and Engels.

On the one hand it is asserted that that the state will fade away quasi automatically as soon as class antagonisms will have ended. Free association will replace the previous class domination organized and stabilized by the state.

When, in the course of development, class distinctions have disappeared, and all production has been concentrated in the hands of a vast association of the whole nation, the public power will lose its political character. Political power, properly so-called, is merely the organized power of one class for oppressing another. If the proletariat during its contest with the bour-

geoisie is compelled, by the force of circumstances, to organize itself as a class; if, by means of a revolution, it makes itself the ruling class, and, as such, sweeps away by force the old conditions of production, then it will, along with these conditions, have swept away the conditions for the existence of class antagonisms and of classes generally, and will thereby have abolished its own supremacy as a class.

In place of the old bourgeois society, with its classes and class antagonisms, we shall have an association in which the free development of each is the condition for the free development of all. (Marx and Engels 1976c, 505; cf. Marx and Engels 1969c, 482)

As soon as there is no longer any social class to be held in subjection; as soon as class rule, and the individual struggle for existence based upon our present anarchy in production, with the collisions and excesses arising from these, are removed, nothing more remains to be repressed, and a special repressive force, a state, is no longer necessary. The first act by virtue of which the state really constitutes itself the representative of the whole of society—the taking possession of the means of production in the name of society—this is, at the same time, its last independent act as a state. State interference in social relations becomes, in one domain after another, superfluous, and then dies out of itself; the government of persons is replaced by the administration of things, and by the conduct of processes of production. The state is not "abolished." It dies out. (Engels 1987, 268; cf. Engels 1968a, 262)

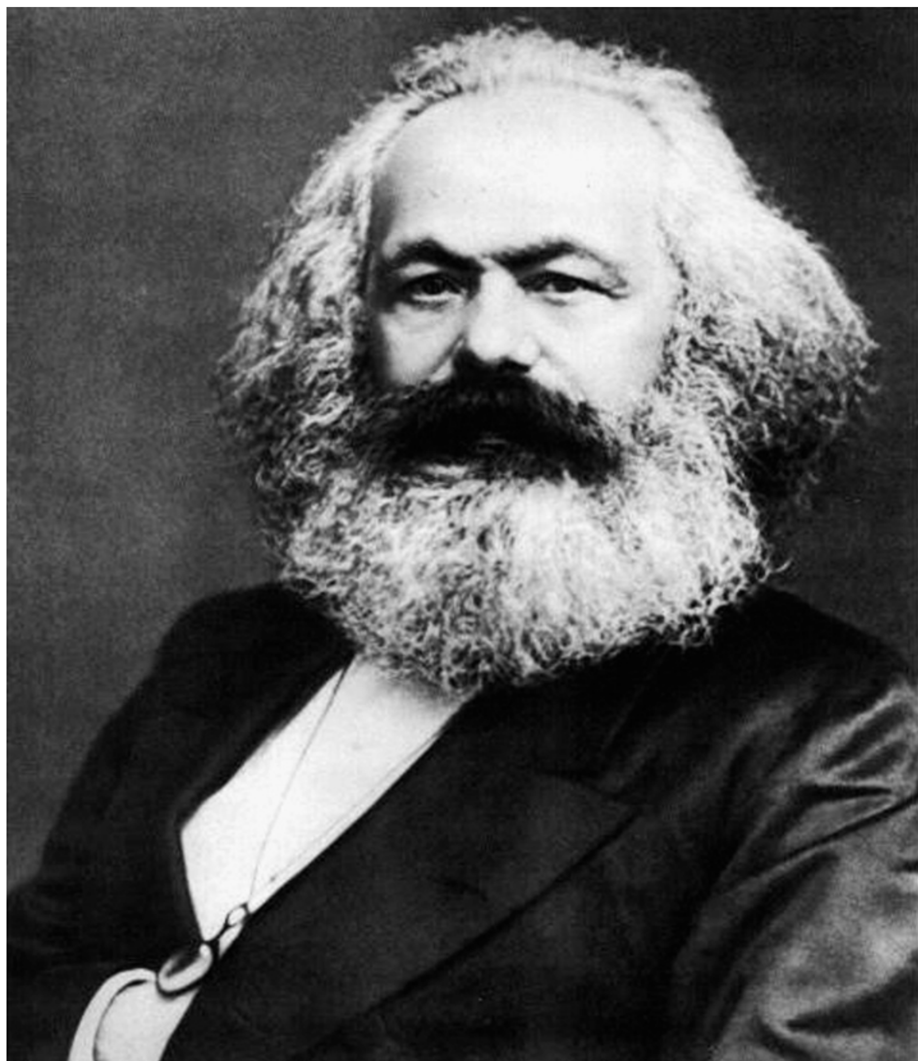
On the other hand there are rather drastic statements about the phase of transformation. As a lesson from the Commune in Paris (1870–1871) Marx postulated that the bourgeois state—that will not vanish silently—has to be smashed during a transformational period of the dictatorship of the proleriat (Marx 1989b, 131; cf. Marx 1966, 205). And Engels wrote later, on the occasion of Marx' death:

Marx and I, ever since 1845, have held the view that one of the final results of the future proletarian revolution will be the gradual dissolution and ultimate disappearance of that political organisation called *the State;* an organisation the main object of which has ever been to secure, by armed force, the economical subjection of the working majority to the wealthy minority. With the disappearance of a wealthy minority the necessity for an armed repressive State-force disappears also. At the same time we have always held, that in order to arrive at this and the other, far more important ends of the social revolution of the future, the proletarian class will first have to possess itself of the organised political force of the State and with its aid stamp out the resistance of the Capitalist class and re-organise society. This is stated already in the *Communist Manifesto* of 1847, end of Chapter II. (Engels 1989, 477–8; cf. Engels 1973, 344)

The stage of the dictatorship of the proletariat is, according to Marx/Engels and then Lenin, signified by the use of law as an instrument of overt state domination, even of terror, in order to suppress the old capitalist class. After that, law is used as an instrument to build up and to secure a socialist society.

The future of state and law in a communist society remained an open question. The answers range from the notion of the "withering away" of law and state to a "state of the whole people" in which law still serves administrative purposes. The thesis of the withering away of law and state was discussed in the Soviet Union after 1920. Under Stalin's domination this topic came to nought. In 1924 Eugen Pašukanis (who was executed in the 30s) published a book on the *General Theory of Law and Marxism* (Pašukanis 1980). He de-

Charles-Louis de Secondat, Baron de la Brède et de Montesquieu (1689–1755)



Karl Marx (1818–1883)

Émile Durkheim (1858–1917)

Max Weber (1864–1920)

nied the assumption that in hierarchical societies, economically based on slavery or a feudal system, state and law play a dominant role. According to his approach, law exists only in capitalist (market) societies with antagonistic interests of the owners of commodities. Preceding social formations are marked by pure, lawless domination. Hence, the existence of law, or the "legal form" as he says, presupposes (1) that a society is constituted by and large by isolated, "autonomous" owners of commodities who are integrated via the market, (2) that an antagonism of interests exists among these owners of commodities. This restricted notion of the preconditions, i.e., the foundations of law implies that law in a strict sense exists only in capitalist societies. Relationships between slaveholder and slave, between feudal lords and serfs are not legal at all. Rather, they are based on brute force. Legal relationships exist only among formally equal subjects. Therefore relationships between a capitalist and a paid worker are legal as long as both meet on the labor market. As soon as the worker enters the factory he is subjected to the "despotism of the capitalist" (Marx 1996, 337; cf. Marx 1965a, 351). The regulation of order within a factory is an act of private legislation, thus a piece of pure feudalism. According to Pašukanis' definition law will cease to exist if a society longer consists of isolated owners of commodities with antagonistic interests. Gradually, legal provisions will be replaced by technical regulations and plans—"the administration of things and the conduct of processes of production" (Engels 1987, 268; cf. Engels 1968a, 262)—the conduct of which must still be controlled, but rather in a medical-pedagogical way.

An utopian idea of the end of law that was more influential, at least in the philosophy of law, had been sketched by Marx in his *Critique of the Gotha Programme* (written in 1875, originally published in 1891). Bourgeois law measures people according to a standard of formal equality. Law is by necessity a law of inequality ("*Recht der Ungleichheit*") that cannot cope with the full variety of individual features. Even in a society in which the workers could determine the distribution of goods, they would be following bourgeois rules if the distribution would be exercised according to the achieved quantum of labor irrespective of individual features like age, marital status, number of children, etc. ("To each according to his achievements"). The dross of bourgeois law would be overcome only if the law would become "unequal." For Marx the end of equal law signals the end of law entirely. Then the need principle shall reign: "From each according to his abilities, to each according to his needs!" (Marx 1989a, 87; cf. Marx 1973b, 21). If the socio-economic conditions allow the application of the need principle there would no longer be law. This principle could be realized in a communist society, i.e., under conditions without class antagonism, in a society of "free associations," where no division of labor exists any longer, where the antithesis between mental and physical labor has vanished, after labor has become life's prime want and where no scarcity of goods ex-

ists according to the societal level of needs ("all the springs of common wealth flow more abundantly").

Marx apparently misunderstood the legal principle of equality. It is true, legal provisions cannot take every individual feature into account (which comes close to the classic *individuum est ineffabile*). Completely individualized justice by law is impossible.[123] The examples he mentioned, however, were during the last century accepted politically as legally relevant circumstances ("fact-types") and were "internalized" into labor law, social security law, tax law, etc.

3.2.2.4. Economic Analysis of Law

Marx' economic analysis can be used as a background in contrast to which the standard assumptions of neo-classical economics take on a sharp profile.

(1) A well known difference lies in the theory of value. Marx holds a theory of objective exchange value according to the amount of invested labor as opposed to a theory that explains market prices according to subjective preferences.

(2) While Marx assumes historical plasticity of anthropological needs and technological productivity (with an abundance of goods in the communist society relative to the collective needs), neo-classical economics is based on the assumption of an everlasting scarcity of goods and infinite needs. Therefore it is always necessary to form preferences among goods and to make choices.

(3) Marx' approach is holistic, dealing with structures, processes and collective mentalities. In contrast, neo-classical economics is characterized methodologically and in substance by an individualistic approach.

(4) The neo-classical approach normally is restricted to an analysis within the framework of given institutions, mainly those of market societies. Marx studied long term developments and revolutionary changes of economic structures or modes of production. Does the neo-classical theory yield any insights in other types of societies, e.g., those which do not have a money economy? What can it say about non-monetary costs of slavery or serfdom?

(5) Economic analysis attempts to be both, explanatory ("positive") as well as normative. The course to be taken depends on the use of standards of efficiency. One can either hold that people in general make choices according to standards of efficiency or one can state that they should do so. Marx, on the other hand, was very cautious about making evaluative or normative statements, programs and demands. Predictions on the basis of scientific knowl-

[123] Derrida (1992, 25) speaks in this sense of the "infinite 'idea of justice,'" which is quite other from the expression the U.S. president used—the "idea of infinite justice"—in his prelude to the Afghanistan war.

edge of historical laws should replace values and normative postulates. His normative claims, however, are concealed within scientific parlance.

Neo-classical economics has contributed substantially to the theory of law. Economic analysis of law,[124] however, has to cope with a fundamental problem. The basic assumption of self-interested maximization of preferences, the paradigm of rational egoism, and the explanation (and evaluation as well) of behavior according to standards of efficiency, i.e., mainly wealth maximization or willingness to pay, lead to the question of how individual preferences can form the foundations of law (cf. Kornhauser 1999). In Marx the crucial problem lay in the passage from the brute facts of the basis to the normativity of the superstructure. Economic analysis on the other hand starts with the evaluative and normative notion of preferences. They are not simple "factual" regularities of behavior, not just customs or habits. The problem, however, that economic analysis of law has to cope with could be framed by the categories of the individual and the general or the subjective and the objective. How can legal norms be *generated* on the basis of subjective preferences if legal norms or a legal order imply notions of obligation, duty, generality, objectivity? Do general norms "emerge" out of individual decisions? Is generalization the result of "aggregation"? One answer from the standpoint of the economic analysis of law is that particular cases present examples in which the judge can choose that rule which most promotes economic efficiency. Over time rules of this type will emerge. How can legal norms be *applied* by adjudicators according to standards of neutrality, impartiality—and not according to their private policy preferences? How does economic analysis apply to the behavior of legislators? Is it only the interest of maximizing power or of being re-elected that can explain legislative activities? And how does this approach apply to the behavior of public officials, in particular to that of the members of the legal staff? The problem is similar to that of the predictive theory of judicial behavior in legal realism. According to the self-concept of judges law cannot be reduced to a set of predictions of their own future actions. Likewise the basic professional doctrine of being bound by rules, precedents and principles is incompatible with a description of judicial behavior as purposive or goal orientated ("judicial consequentialism"). Private individuals also may share a detached attitude towards legal norms. They might from an external point of view "prudentially" calculate legal costs and benefits, i.e., the consequences of norm compliance and of non-compliance. Again the problem of the internal-external perspective comes up when we focus on the attitudes and the self understanding of those who feel obliged to conscientiously follow a legal norm.

[124] The classical writings in the economic analysis of law surely are Calabresi 1961, Coase 1960, and Posner 1973.

3.2.3. Moral Foundations of Law

3.2.3.1. Law and Morality

The relationship between law and morality is manifold. The starting point should be a definition, i.e., a conceptual distinction between both. As we have already seen in Weber, law was distinguished from convention (instead of morality) as an order "if it is externally guaranteed by the probability that physical or psychological coercion will be applied by a *staff* of people in order to bring about compliance or avenge violation" while the validity of a conventional order was externally guaranteed by the probability that deviation from it within a given social group would result in a relatively general and practically significant reaction of disapproval (Weber 1978, 34). What Weber calls "convention" is, in a conceptual context, treated by others as "morality." In the case of Durkheim, e.g., both, legal as well as moral rules, are defined as "rules of conduct that have sanctions" (Durkheim 1957, 2). Legal rules are determined and rather uniform; if transgressed sanctions are issued by specialized organizations. Moral rules, instead, have a nebulous and inchoate nature; they are backed by diffuse disapproval by public opinion.[125] In all these cases the distinction refers mainly to the way of sanctioning an infringement of rules, not to the content of rules (in the case of Durkheim it is in addition the formal character of preciseness).

In Max Weber's stage model of the development of law the moral and the legal domain are only separated at the level of formal rationality. Pure legality counts as the climax of occidental rationality. On the level of material rationality law still is impregnated with morality. Morality, however, also can be held to develop so that it reaches a formal, i.e., procedural stage, as in Habermas' approach (cf. Baurmann 1991).

Usually legal philosophers treat the relationship of law and morality as a normative one: The validity of law needs to be justified by moral standards. Legal norms or a legal order in general are valid only if they are capable of justification by meta-legal reasons (cf. Dreier 1991; Alexy 1992, 201). Scholars who are more realistically orientated, like Luhmann, argue that these meta-legal, moral standards are too diffuse as to be capable of conferring validity to a legal order. Since I have decided not to talk about "moral foundations" in the normative sense leading to some kind of natural law theory, I treat morality as a phenomenon of more or less shared convictions about right behavior and the good or virtuous life.

In socio-legal or legal anthropological writings morality often appears as a genetical foundation of law in a developmental chain of social orders. A temporal sequence is asserted like: custom—convention—morality—law. Th.

[125] Durkheim 1964, 79. A similar distinction between law and morality can be found in Geiger 1964.

Geiger argued against such a cascade of regularities and rules. According to him custom (“*Sitte*”), intertwined with religion, was the starting point out of which morality and law developed separately rather than in succession.

> Genetically, there is a close relationship between law and morality [...]. As systems of rule orientated behavior both have their common origin in custom, usage and convention. To this extent, embryonic morality and embryonic law coincide. In a primitive state, the life of a community is determined by accustomed forms of behavior, which are on the one hand backed by a religious taboo, on the other hand enforced against the individual by the community. In this state an internal as well as an external motivation leads to the observance of accustomed behavior. Thereafter, a process of polarization takes place separating more and more morality and law into two autonomous systems. (Geiger 1979, 170; my translation)

Geiger suggests a phylogenetical sequence. In the continuous process of legislation as well there is no recognizable moral base out of which legal norms evolve. Enacted legal norms are not a selection taken from underlying moral norms. Only occasionally do legal norms refer to moral ones.

On an ontogenetic level the development of legal consciousness and ideas of justice from general moral judgements has been studied (e.g., by J. Tapp following the writings of Piaget and Kohlberg; cf. Tapp and Kohlberg 1971; Tapp and Levine 1977).

Law also can be treated as being an observable indicator for discovering underlying states of social morality, e.g., in Durkheim, who used legal norms as indicators of social solidarity which, according to his methodological assumptions, cannot be directly observable (cf. *infra*).

Finally law could be understood, instrumentally, as a means to reinforce moral feelings and attitudes, thus strengthening the degree of social integration.

Concerning the last two issues—law as an indicator of “social solidarity” and law as an instrument of social integration—Durkheim has made essential contributions.[126]

3.2.3.2. Émile Durkheim

The sociology of Émile Durkheim (1858–1917) can be characterized, at least, by two peculiarities:

(1) The Approach

(a) Durkheim’s subject is long term developments in societies, distinguishing two great phases: from segmentary societies to industrial ones based on the division of labor. He thus reflected like many other scholars a basic collective

[126] On Durkheim’s theory of law, morality and religion, cf. Clarke 1976; Marra 1986; Gebhart 1993, 321ff.; Cotterrell 1999.

experience of the 19th century: the division of labor in society. The main problem that was raised by this new type of differentiation was social integration: What guarantees the coherence of a society? What is it that brings "social solidarity" about in a society that is dominated by contractual relationships on the market?

(b) In his methodology Durkheim emphasizes the autonomy of the "social" in contrast to the individual and the mental (psychic). As far as theoretical disciplines are concerned he draws a sharp distinction between sociology and psychology. Sociology has its own domain: social facts (*faits sociaux*), social actions in the sense of the society acting, and as one result of the "works of society"—social solidarity.

In both contexts, substantive as well as methodological, law is placed in a prominent position. For Durkheim, law, in particular codified private and penal law, is an instrument creating or ensuring (guaranteeing) social integration (later he stresses the similar role of religion). On the other hand law is a social fact par excellence. Here, the "social" crystallizes beyond any mental manifestation. Law exists outside the individual. As such it can be used in his developmental theory as an indicator for changes in fundamental social processes, especially within the forms of social solidarity.

(2) Law as an Indicator of Social Solidarity

Within the framework of his developmental theory Durkheim distinguishes "two great currents of social life to which two types of structure, not less different, correspond" (Durkheim 1964, 229). These two great currents are arranged in a developmental sequence: Initially, there is a similarity of collective consciousness. There are no autonomous individuals; the individual is absorbed by the collective. Social, moral, religious, and legal rules form one complex of indiscernible normativity (e.g., as we have seen, in Islamic societies where social life is religious life under the commands of the *sharia*). Law, particularly penal law, is embedded in an all-embracing collective morality. Many activities are controlled by public opinion and sanctioned by a more or less coherent community (ibid., 226).

The following phase is characterized by the division labor. It leads to a greater individualization; at the same time, however, to a more considerable interdependence among individuals. Moral rules tend to focus on professional activities. In contrast to the first phase in which the disapproval of offenses against public opinion dominated, now, in the second phase, misbehavior in the professional fields becomes the focus of public attention and sanctioning (Durkheim 1964, 226–7).

Both "currents" vary in the opposite direction (ibid., 229), i.e., a decrease in one aspect is accompanied by an increase in the other. The two currents

correspond to two forms of morality: The morality of segmentary societies, i.e., societies that are organized by kinship relationships, is constituted by shared faith. This type of morality is strong where the individual is not. Rules are practiced uniformly and observed without any argument. In contrast to this uniform morality, the morality in societies based on the division of labor depends on the autonomy of the individual. Individual decisions and private initiative are strengthened not without regard, however, to social liabilities. Moral rules are not focussed on a commonly shared way of life; rather they concern issues of professional ethics.

In his pertinent book *De la division du travail social* (1893) Durkheim dealt with the core problem of social integration. He sought the social bonds tying together a society increasingly based on the division of labor—he seeks its social solidarity. In order to make statements about the development of specific societies or to compare different societies it is necessary to classify different kinds of solidarity, i.e., to define them. Hence, the methodological problem arises of how to identify different types of social solidarity.

> But social solidarity is a completely moral phenomenon which, taken by itself, does not lend itself to exact observation nor indeed to measurement. To proceed to this classification and this comparison, we must substitute for this internal fact which escapes us an external index which symbolizes it and study the former in the light of the latter. This visible symbol is law. (Durkheim 1964, 64)[127]

This distinction between law and morality according to their epistemological status as an observable "external fact" and a not really measurable "internal fact" does not correspond to Kant's distinction between external and internal concerning the determination or motivation of actions. For Durkheim, law has a methodological function: It can be used as a well observable indicator for the moral state (which he believes is not observable) of a community or, in other words, for the kind of "social solidarity." Law renders possible access to the "internally" concealed moral phenomenon of social solidarity.

Today we would, in order to find out the moral state of a society, apply methods of empirical research, like interview techniques, etc., focussing, as the object of our research, on opinions and attitudes towards moral issues. However, from the point of view of a long term developmental study—and this is what Durkheim is interested in—this approach would be very limited.

Law is not the foundation of social bonds; rather it is, from a methodological point of view, the indicator that can be best observed in order to analyse "the social," i.e., the given forms of social solidarity.

[127] Durkheim uses the terms "fait interne" and "fait extérieur" (Durkheim 1960a, 28). Instead of "index" in the English translation I prefer the concept of an indicator because "index" has too many meanings, and "indicator" can be clearly used in the philosophy of science in reference to the relation between dispositional predicates and indicator sentences.

An observation is more objective the more stable the object is to which it relates. This is because the condition for any objectivity is the existence of a constant, fixed vantage point to which the representation may be related and which allows all that is variable, hence subjective, to be eliminated. If the sole reference points given are themselves variable, continually fluctuating in relationship to one another, no common measure at all exists and we have no way of distinguishing between the part of those impressions which depends on what is external and that part which is coloured by us. So long as social life has not succeeded in isolating itself from the particular events which embody it, in order that it may constitute itself a separate entity, it is precisely this difficulty which remains. As these events do not take on the same appearance each time nor from one moment to another and as social life is inseparable from them, they communicate to it their own fluctuating character. Thus social life consists of free-ranging forces which are in a constant process of change and which the observer's scrutinising gaze does not succeed in fixing mentally. The consequence is that this approach is not open to the scientist embarking upon a study of social reality. Yet we do know that social reality possesses the property of crystallising[128] without changing its nature. Apart from the individual acts to which they give rise, collective habits are expressed in definite forms such as legal or moral rules, popular sayings, or facts of social structure, etc. As these forms exist permanently and do not change with the various applications which are made of them, they constitute a fixed object, a constant standard which is always to hand for the observer, and which leaves no room for subjective impressions or personal observations. A legal rule is what is and there are no two ways of perceiving it. Since, from another angle, these practices are no more than social life consolidated, it is legitimate, failing indications to the contrary,[129] to study that life through these practises.

Thus when the sociologist undertakes to investigate any order of social facts he must strive to consider them from a viewpoint where they present themselves in isolation from their individual manifestations. It is by virtue of this principle that we have studied elsewhere social solidarity, its various forms and their evolution, through the system of legal rules whereby they are expressed. (Durkheim 1982, 82–3)

Durkheim quite simply states: "Law is enshrined in legal codes" (ibid., 71). Today, this would be an amazing statement for a legal realist or sociologist of law! However, considering the aim of Durkheim's restricted use of legal norms (as they are written in legal codes), his statement makes sense. We can interpret Durkheim's position as a kind of methodological etatism: Codified law can be used as an appropriate indicator of the underlying type of social solidarity.

[128] The concept of "cristallisation" can be found already in the early writings of Durkheim, e.g., in Durkheim 1975, 275 and in Durkheim 1970, 109.

[129] In a footnote he adds: "For example, one should have grounds to believe that, at a given moment, law no longer expressed the real state of social relationships for this substitution to be invalid." But when does one have grounds to doubt that legal norms do "no longer express the real state of social relationships"? The texts the norms are encapsulated in will not by themselves tell us whether the norms are being applied or observed, or how they are being interpreted. This is what is meant by the distinction between law in the books and law in action. Hence, sociologists of law call systematically into question the claim that formally valid rules are actually observed and effective. Durkheim is aware of this problem in his statement that social institutions and customs change the function of norms without changing their "nature" (Durkheim 1982, 120). The idea that legal institutions change the social function of norms, while the text the norms are expressed in remains unchanged, is developed in Karl Renner 1904 and 1929.

Indeed, social life, especially where it exists durably, tends inevitably to assume a definite form and to organize itself, and law is nothing else than this very organization in so far as it has greater stability and precision. The general life of society cannot extend its sway without juridical life extending its sway at the same time and in direct relation. We can thus be certain of finding reflected in law all the essential varieties of social solidarity. (Durkheim 1964, 65)[130]

Unlike Marx, Durkheim understands law not as a reflexion of the particular mode of production but of—one could say—a society's mode of morality. Law may not be the only observable manifestation of social solidarity. According to Durkheim, however, it is the one that mirrors the essential form of social solidarity and that is best available for us.

Our method has now been fully outlined. Since law reproduces the principal forms of social solidarity, we have only to classify the different types of law to find therefrom the different types of social solidarity which correspond to it. (Durkheim 1964, 68)

We have seen that in Durkheim it is a special type of sanction and a way of sanctioning that distinguishes legal norms from other kinds of norms. Therefore Durkheim classifies different types of law according to different types of legal sanctions (ibid., 68–9), and differentiates between:

– repressive law (penal law);
– restitutive or compensatory law (also "cooperation law," i.e., contract law, commercial law or family law).

Repressive law with retaliation as the rationale of sanctions is an expression of a homogenous collective consciousness threatened fundamentally by transgressions.

There exists a social solidarity which comes from a certain number of states of conscience which are common to all the members of the same society. This is what repressive law materially represents, at least in so far as it is essential. (Durkheim 1964, 109)

Restitutive law is much more differentiated by permitting a wide range of individual arrangements. Durkheim attributes repressive law to a society which is characterized by mechanical solidarity, restitutive law to one which is characterized by organic solidarity (ibid., 129ff.):

Law	repressive	restitutive
solidarity	mechanical	organic

[130] The term "reflected" is used here differently than in Marx, where the superstructure "reflects" (*wiederspiegeln*) the basis but does not indicate it; much less can it indicate an unobservable basis.

Now we can turn back to the "two great currents" with which we started. Through different legal glasses Durkheim can observe different forms of social solidarity. In societies with mechanical solidarity, associations are formed via "similarities": blood-relationship, affection to the homeland, ancestor-worship, tradition. Religious/moral beliefs are shared homogenously and are enforced by repressive law. The individual is rather an object within the society, not an individualized subject. There is no mobility of the "social molecules." In contrast, organic solidarity results from social differentiation, i.e., the division of labor. The social elements are not fixed mechanically but they fulfill various functions. They are interconnected via contractual agreement. Only societies with organic solidarity enable the development of free and autonomous individuals. Contracts alone, however, are not sufficient to obtain social coherence (cf. *infra*). According to Durkheim mechanical solidarity, indicated by repressive law, characterizes segmentary societies, i.e., societies composed of similar elements (often characterized as "primitive" societies). The clan forms the essential segment of this type of society. On the other hand organic solidarity exists in a complex and modern society with functional differentiation based on the division of labor.

Durkheim introduces a historical aspect by depicting both, mechanical and organic solidarity, as successive phases (in terms of the "two currents"). He recognizes the transformation from mechanical to organic solidarity in the gradual replacement of repressive by restitutive law. For Durkheim division of labor is the underlying *movens* (thereby coming closer to Marx).

Law	repressive	restitutive
solidarity	mechanical	organic
division of labor	simple (segmentary; clans)	complex (functional; role, groups)

One conclusion concerning the development of law is that law in so-called "primitive societies" was solely repressive. Penal law marks the early phase of the development of law. It is replaced and superimposed step by step by restitutive law responding to the "great currents of social life." Repressive law, however, does not vanish totally. Durkheim states: "As far as we can judge of the state of law in very inferior societies, it appears to be entirely repressive" (Durkheim 1964, 138).[131]

Because of his methodological preference for *written* law as a sociological source Durkheim is confronted with the problem that there is, by definition, no written law in illiterate societies. However, he attempts to prove his hypothesis

[131] On Durkheim's thesis of the phylogenetic primacy of penal law cf. Schwartz and Miller 1964; Baxi 1974; Schwartz 1974.

that penal law is the phylogenetic starting point of law by using—"as far as possible" (Durkheim 1964, 138)—sources of written law. Of course, the French school of the anthropology of law (Lévy-Bruhl 1910, 1921; Mauss 1923), influenced by Durkheim, did not restrict its studies to this "literal" approach.[132]

(3) Law as an Instrument of Social Integration

(a) The Problem of Social Integration

The different types of social solidarity represent different types of social integration. In particular Durkheim discusses theoretical approaches that deal with the problem of social integration of societies during the phase of organic solidarity, i.e., societies with contractual relationships as their structural element. He alludes to the tradition of the "social contract," first in Rousseau's version, then (and mainly) to Herbert Spencer's approach.

(i) The Theory of the Social Contract

Durkheim deals with social contract theories under the aspect of social integration, not, however, from the point of view of an ideal that would provide the justification or critique of given societies and states, nor does he deal with problems of transformation to a state of the rule of law, e.g. (cf. *supra*).

Here, Durkheim refers particularly to Rousseau. According to Durkheim, Rousseau's idea of a *Contrat Social* is irreconcilable with the notion of the division of labor. In a functionally differentiated society there is no homogeneity; instead we find a plurality of opinions according to the level of the division of labor.

> For in order for such a contract to be possible, it is necessary that, at a given moment, all individual wills direct themselves toward the common bases of the social organization, and, consequently, that each particular conscience pose the political problem for itself in all its generality. But that would make it necessary for each individual to leave his special sphere, so that all might equally play the same role, that of statesman and constituents. Thus, this is the situation when society makes a contract: If adhesion is unanimous, the content of all consciences is identical. Then, in the measure that social solidarity proceeds from such a cause, it has no relation with the division of labor. (Durkheim 1964, 201)

> Not only are there no societies which have such an origin, but there is none whose structure presents the least trace of a contractual organization. It is neither a fact acquired through history nor a tendency which grows out of historical development. (Ibid., 202)

[132] Even if Durkheim's methodological restriction appears odd today, we should still find it worthwhile to follow his line by relying solely on codified legal norms, this to analyze through these indicators a society's underlying "mode of morality" and its long-term changes. The results obtained, however artificially tethered by these methodological blinders, might then be validated on the basis of other material external to law.

Societies with a high level of division of labor are characterized by a lack of homogeneity, by a plurality of opinions, a "moral polymorphism" (Durkheim 1957, 7)[133] that makes a consensus shared by the whole society totally improbable.

(ii) Spontaneous Agreement as a Result of Individual Interests

Durkheim finds the idea of a spontaneous agreement resulting from individual interests in Spencer.[134] Both authors, Spencer as well as Durkheim, classify world history according to two stages. In contrast to Durkheim, Spencer differentiates between:

– Military societies in which, within a hierarchical order, imperatives are imposed top down.
– Industrial societies with "industrial solidarity," i.e., free exchange as the dominant mode of social interaction. The net of social solidarity is woven by the large quantities of spontaneous agreements of individual interests. Administrative law and state interventions decline. (Durkheim 1964, 219ff.)

Spencer and Durkheim agree in explaining the development from one stage to the other—in Durkheim: The development of societies from a segmental type to an organized type (ibid., 222)—as being caused by a growing division of labor. According to Durkheim, however, no society could be bound together only by contractual agreements.

Contrary to Spencer, Durkheim holds that it is not possible to integrate a market society only by the pursuit of the self-interest of isolated individuals. "There is nothing less constant than interest" (ibid., 204). In that case only temporary relations could exist.

> Society would be solely the stage where individuals exchanged the products of their labor, without any action properly social coming to regulate this exchange. (Ibid., 203)

No society could rest upon self-interest. There would be eternal hostility. Only occasional encounters would take place. Therefore another explanation for its coherence must be found, and social coherence has to be—normatively spoken—created in another way.

(iii) Durkheim's Own Version

In contrast to Spencer, Durkheim points out the relevance of the "social" for the creation of integration. When Durkheim speaks in this context of "social

[133] He also speaks of a "moral particularism," ibid., 5.
[134] On Durkheim's critique of Spencer in general, see Durkheim 1964, 200ff.

action," further explanation is required. In Durkheim "social action" doesn't mean—as we are used to use it today—an action that is orientated by an "ego" towards an "alter" in a relation of "double contingency" (Parsons), i.e., with their expectations and expectations of expectations.

Rather, society is conceived of as a particular subject to which actions can be ascribed ("acting society"). The actions of this social aggregate are particularly manifested or indicated in law. Law is not the result of individual acts nor of collective group acts; it is something distinct from experience at the personal, psychic level. In law the individuals are confronted with general and objective obligations; they experience an anonymous pressure.

Durkheim consequently distinguishes between individual and social acts. Again he finds a historical tendency in their interrelationship: The domain of individual acts increases relative to the realm of social acts. However, the correlation differs from the one between the quanta of repressive and restitutive law. Restitutive law increases at the expense of repressive law, while the amount of individual as well of social acts can expand at the same time. This additional evolutionary hypothesis Durkheim attempts to prove again by analyzing long term tendencies in the development of law in which social acts are represented. Law therefore is not only used as an indicator of the types of social solidarity—organic/mechanical—but also as an indicator of the extent of "social action."

> The obligations that society imposes upon its members, as inconsequential and unenduring as they may be, take on a juridical form. Consequently, the relative dimensions of this system permit us to measure with exactitude the relative extent of social action.
>
> But it is very evident that, far from diminishing, it grows greater and greater and becomes more and more complex. (Durkheim 1964, 204–5)

A special instance of social action is the State's action. Hence:

> There is no contradiction in the fact that the sphere of individual action grows at the same time as that of the State. (Ibid., 220)[135]

In contrast to Spencer, Durkheim assumes, e.g., that administrative law increases according to the level of social development (which implies a higher degree of individualization). Spencer's ideal state, being responsible only for adjudication and warfare, rather represents a primitive form of state. In fact the state had gained a lot of new functions like: new branches of courts, increase of the military sector, education, public health, public welfare, administration of (public) transport and of communication, statistical services, international relations, control of credit institutions (ibid., 221–2).

[135] "To be sure, it does not result in making the sphere of individual activity smaller" (ibid., 205).

Durkheim sometimes seems to associate "social action" with "social discipline" (ibid., 205) which also doesn't decrease. Social discipline can be imposed by repressive as well as by restitutive law. Their relative proportion might change but not the grand total of discipline. Or, as Durkheim puts it in another way: In the course of history "more life" grows, hence there is more discipline, though it is manifested in different forms. In general, the various rules determining behavior multiply.

(b) Private Law: The Extra-Contractual Foundations of Contracts

According to Durkheim individual and social (State) actions increase in correspondence with the division of labor; contractual relations as well as extra-contractual relations accumulate (which Spencer did not realize) (Durkheim 1964, 206). Durkheim attempts to demonstrate this double tendency in the case of private law,[136] especially in the field of family law. Marriage and adoption would lose more and more their private contractual character, instead gaining a public character. Guardianship and incapacitation become an object of stronger state intervention. Social control over how to create, to use, to dissolve or to change these obligations increases. "The reason lies in the progressive effacement of segmental organization" (ibid., 210). Clan and family as original segments of social life are absorbed by the "social mass" and merged in the "system of social organs" (ibid.). A family is no longer based on contracts; rather, it becomes a public institution.

This serves as a prelude to Durkheim's famous thesis of the extra-contractual foundations of contract (cf. Röhl 1978). This thesis can be unfolded via three basic assumptions of Durkheim:

– "The greater part of our relations with others is of a contractual nature" (Durkheim 1964, 213–4).
– "For everything in the contract is not contractual" (ibid., 211).
– "Every society is a moral society" (ibid., 228).

"*The greater part of our relations with others is of a contractual nature.*"

Starting from the indubitable fact of the division of labor, which is contractually consolidated in a social net, Durkheim agrees with the notion of a society based on a market economy. But as we have learned from his quarrel with Spencer, contractual relationships cannot guarantee permanent social coherence.

[136] Durkheim 1964, 206ff. His second example is administrative law; cf. ibid., 219ff. It would not be far-fetched to apply this assumption to the recent developments by which we have allegedly greater individualisation, flexibility, deregulation, etc., accompanied with increasing state activity.

"*For everything in the contract is not contractual.*"

Durkheim points out that "a contract is not sufficient unto itself, but is possible only thanks to a regulation of the contract which is originally social" (Durkheim 1964, 215). Only society can confer obligatory power to it. "As soon as we have made the first step towards co-operation, we are involved in the regulative action which society exercises over us" (ibid., 216). Although a contract implies an obligation based on the free will of a person, its consequences no longer depend on private autonomy. A contract is always subjected to rules that are the "work of the society" (ibid., 211).

> Even where society relies most completely upon the division of labor, it does not become a jumble of juxtaposed atoms, between which it can establish only external, transient contacts. Rather the members are united by ties which extend deeper and far beyond the short moments during which the exchange is made. Each of the functions that they exercise is, in a fixed way, dependent upon others, and with them forms a solidary system. Accordingly, from the nature of the chosen task permanent duties arise. Because we fill some certain domestic or social function, we are involved in a complex of obligations from which we have no right to free ourselves. There is, above all, an organ upon which we are tending to depend more and more; this is the State. (Ibid., 227)

The conditions of co-operation based on contractual agreement have to be made permanent. A contract includes more than what the parties figured out when the contract was concluded. Matters which were not anticipated by the parties are regulated by the State through the provisions of contract law. They determine what the parties didn't arrange: the normal standards of an equilibrium.

> A *résumé* of numerous, varied experiences, what we cannot foresee individually is there provided for, what we cannot regulate is there regulated, and this regulation imposes itself upon us, although it may not be our handiwork, but that of society and tradition. It forces us to assume obligations that we have not contracted for, in the exact sense of the word, since we have not deliberated upon them, nor even, occasionally, had any knowledge about them in advance. Of course, the initial act is always contractual, but there are consequences, sometimes immediate, which run over the limits of the contract. We co-operate because we wish to, but our voluntary co-operation creates duties for us that we did not desire.
>
> From this point of view, the law of contracts appears in an entirely different light. It is no longer simply a useful complement of individual conventions; it is their fundamental norm. Imposing itself upon us with the authority of traditional experience, it constitutes the foundation of our contractual relations. (Ibid., 214)

Official contract law increases in volume and complexity—both in terms of law which may be drawn upon by the parties as well as in terms of mandatory law. Contract law imposes obligations on individuals they haven't agreed upon. In such cases it becomes obvious what "the society" regulates in addition and sometimes to the contrary of what the parties have agreed upon. E.g., it determines:

– legal capacity to conclude a contract,
– terms of concluding a contract,
– obligations in fulfilling a contract,
– sanctions for non-performance,
– terms, such as duration,
– substantive limitations on freedom of contract (like *ordre public* or good faith),
– requirements of justice.[137]

The role of society is not, then, in any case, simply to see passively that contracts are carried out. It is also to determine under what conditions they are executable, and if it is necessary, to restore them to their normal form. (Durkheim 1964, 216)

Also as autonomous subjects of a contract we are absorbed in a net of obligations previously woven by the state. The extra-contractual foundations of contracts, according to Durkheim, lie mainly in statutory, i.e., state law. This legal base is supplemented by the pressure of custom: "Finally, besides this organized, defined pressure which law exercises, there is one which comes from custom" (ibid., 215).

The "basis" of a society is its moral constitution, its "social solidarity." Statutory law is not only, as an indicator, useful in identifying the mode of social solidarity. It also forms substantially, together with customs, the moral constitution of a society.

"*Every society is a moral society.*"

Obviously Durkheim was not content with the private law of his age. Sometimes the pathos of the moralist overwhelms a sober analysis of society. Durkheim states that altruism must remain the basis of a (moral) society. Living together means to strive for mutual understanding, to make sacrifices, to undertake strong and permanent commitments. No one can exist on his/her own. An individual receives everything from society that he/she requires (Durkheim 1964, 228). Cooperation in society needs its own morality which, according to Durkheim, has not yet been sufficiently deployed. He complains about the "amoral character of economic life" (Durkheim 1957, 12) and trusts, as a remedy, on the development of professional ethics; otherwise industrial society would sink into anarchy (ibid., 11).

For Durkheim a moral society has to be a just society, which becomes obvious in another of his great evolutionary assumptions in which he asserts a sequence from a "real contract" via a "ceremonial contract" and a "consen-

[137] And "just" means in Durkheim that what is so labelled has "social value" (Durkheim 1964, 215).

sual contract" to a "just contract": "It is not enough that the contract is based on consensus, beyond it has to be just" (Durkheim 1957, 207).

Economy may be the basis of a society; but what does "economy" imply? Marx wanted to analyze the economic basis, in particular the forces of production, as a set of brute facts, applying scientific methods. Morality and law were placed in the superstructure. According to Durkheim economic activities are deeply embedded in morality. For this reason he complains about the amorality of economic life and pins his faith on professional ethics. In this respect he differs not only from Marx but also from the psychology of preference-utilitarianism in modern economic theories. Recently, however, there is an increasing interest in problems of institutionalizing ethical standards in economic life (cf., e.g., Korff 1999).

(c) Penal Law: Crime and Punishment—Innovation and Integration

In the later works of Durkheim religion plays a larger role than law—in terms of the indicator function (now he says: "It is through a religion that we are able to trace the structure of a society"; Durkheim 1957, 160[138]) as well as in terms of the integrative function of religious faith. Durkheim already had sketched in his early work on the division of labor in society the close connection between law and religion with respect to their integrative function, pointing out the religious base of penal law.

As a starting point of his analysis of penal law, Durkheim stresses the "normal" character of crimes.

> From this viewpoint the fundamental facts of criminology appear to us in an entirely new light. Contrary to current ideas, the criminal no longer appears as an utterly unsociable creature, a sort of parasitic element, a foreign, unassimilable body introduced into the bosom of society. He plays a normal role in social life. For its part, crime must no longer be conceived of as an evil which cannot be circumscribed closely enough. Far from there being cause for congratulation when it drops too noticeably below the normal level, this apparent progress assuredly coincides with and is linked to some social disturbance. Thus the number of crimes of assault never falls so low as it does in times of scarcity. (Durkheim 1982, 102)[139]

Concerning the function of penal law Durkheim already had developed a concept which today would be referred to as "positive general prevention."[140] Criminal law is addressed especially to "normal" people, strengthening by its threat of sanctions and their enforcement their moral feelings as members of a

[138] Cf. Gebhart 1993, 392ff. on the close relation between sociology of religion and sociology of law in Durkheim. On this topic, see also Cotterrell 1999, 49ff., and the quotation from Geiger (*supra*, 121) on custom and religion as the phylogenetic foundation of morality and law.

[139] On the normal character of crimes, see ibid., 32, 98–9.

[140] On Durkheim's theory of criminal law, see Gebhart 1990.

norm-complying "in group" and excluding the deviant members of an "out group." Penal law fortifies the coherence of the "normals" in juxtaposition to the anomalous criminals. Social exclusion strengthens "social solidarity." Because of this basic function repressive law will be perpetuated in modern societies.

> Although it (i.e., punishment) proceeds from a quite mechanical reaction, from movements which are passionate and in great part non-reflective, it does play a useful role. Only this role is not where we ordinarily look for it. It does not serve, or else only serves quite secondarily, in correcting the culpable or in intimidating possible followers. From this point of view, its efficacy is justly doubtful and, in any case, mediocre. Its true function is to maintain social cohesion intact, while maintaining all its vitality in the common conscience. [...] We can thus say without paradox that punishment is above all designed to act upon upright people, for, since it serves to heal the wounds made upon collective sentiments, it can fill this role only where these sentiments exist, and commensurately with their vivacity. (Durkheim 1964, 108–9)

Along with the *integrative* function of *penal law* Durkheim ascribes an *innovative* function to *crimes*.

> Crime itself may play a useful part in this evolution. Not only does it imply that the way to necessary changes remains open, but in certain cases it also directly prepares for these changes. Where crime exists, collective sentiments are not only in the state of plasticity necessary to assume a new form, but sometimes it even contributes to determining beforehand the shape they will take on. Indeed, how often is it only an anticipation of the morality to come, a progression towards what will be! (Durkheim 1982, 102)

In a later article Durkheim stated two laws of the development of penal law (Durkheim 1899–1900). Here, the two aspects explicated above are linked together: the general development of social solidarity and the particular integrative function of penal law. Durkheim relativizes and specifies the general tendency that he had assumed in "*Division*," i.e., that repressive law is steadily replaced by restitutive law (without vanishing totally). Rather, according to the *law of quantitative change,* the severity of punishment is the greater the less developed a society is *and* the more the central power obtains an absolute character—by which he especially referred to the age of absolutism. The *law of qualitative change* implies that imprisonment becomes more and more the normal instrument of social control instead of corporal or capital punishment.

In Durkheim punishment is the symbolic expression of collective sentiments. The fact, however, that punishment becomes less severe does not mean that moral consciousness is losing its strength. Rather, the scope of what is defined as criminal is shifting. The growing emphasis that is put on crimes against individuals causes the problem that feelings run high not only for the victim, but that also the perpetrator arouses sympathy (whereas everyone could be affected by crimes against the collective and could easily exclude a deviant individual). This might serve as an explanation for the tendency toward mitigation of punishment.

(d) The Law of the Welfare State: Integration, Inclusion, and Exclusion

Durkheim clearly saw the interplay of exclusion and inclusion in the case of penal law. The exclusion of delinquents reinforces the collective sentiments of the "normals." In the legal domain the mechanism of exclusion and inclusion, however, extends far beyond the realm of penal law. In general, social statuses are constituted by legal norms that trigger a set of legal consequences. These norms are inclusive as well as exclusive. In the field of private law Durkheim mentioned, e.g., rules of legal capacity. What Durkheim did not see at that time, however, is the basic function of rules of citizenship (in the field of constitutional law, with the connected institutions of suffrage, conscription, tax liability, etc.) and of rules of "social citizenship" (in the field of welfare law).

In explaining the notion of "integration" we can distinguish between integration of an element into something more comprehensive and the integration of something as such, e.g., the level of integration of a society. Apparently the latter seems to be meant with "social integration." As to the rules of citizenship they define the elements which shall be deemed to be part of the whole state (and the parts that shall be excluded as well). However, they do not reveal anything about the level of integration of the state. The quantity of elements that may be included in a system doesn't necessarily reveal anything about the level of integration of the system. In order to find out something about the level of social integration one has to look at how others are *excluded* from the system. How does the system deal with foreigners, deviant persons, homeless people, etc.?

This mechanism of integration by exclusion is brought to a head in the case of "social citizenship." To what extent does inclusion in "normal" industrial life, as well as exclusion from it strengthen social integration? What degree of unemployment as an exclusion from the world of labor threatens social integration? Or isn't rather, by a high unemployment rate, pressure put on those who are (still) employed? Unemployment rates, however, do not reveal how unemployed people are treated. Are they excluded from the social net, are they put under pressure to "accept" whatever kind of work? Durkheim did not see at his time this core aspect of social integration. He considered the market economy as a place for the exchange of the products of labor, but he did not realize the special problems of the labor market. The integration of the vast majority still depends on their status in the labor market and the workplace. An earned income is the normal basis for social inclusion. Labor-related income (also in terms of household income or transfer income that is labor-related) is the source which guarantees reproduction, directly or indirectly. The most important social risks are absorbed or alleviated by labor-related systems of social security. The major part of the national revenue depends on employment and consumption. Finally, social acknowledgment still widely depends on labor-related status.

These different legal statuses could be arranged in a sequence (cf. Dimmel 2000) of full integration into the labor market (integration in the first sense)—inclusion in the system of the welfare state, implying all kinds of social security systems—exclusion of people who don't or cannot make use of social benefits and compensation (homeless people, persons involved in debt, with insufficient skills, persons addicted to drugs, prostitutes, victims of domestic violence, etc.).

What kind of a society would we want to live in? This is an essential question of the moral foundations of a society, in Durkheim's sense: Of social solidarity—how these statuses of integration, inclusion and exclusion should be legally defined and allocated. What is the due proportion among these statuses? Is mobility from one status to another possible? What is the result in terms of social integration given a certain constellation of those statuses? What are the consequences of an increasing "individualization" of social risks, of more "flexibility" and deregulation in the field of labor law and the law of the welfare state in general? Durkheim spoke of a quasi-religious cult of the individual. However, the erosion of the traditional structures of the welfare state in which social citizenship might be embedded does not lead to a new individual who could be an object of empathic admiration. Rather, the individual shrinks to a residue that is left when social structures dissolve.

3.2.4. Societal Foundations of Law: Eugen Ehrlich

Economic or moral foundations surely are social ones, in contrast to natural ones. One might speak of social or societal foundations in a narrow sense, in the sense of Eugen Ehrlich (1862–1922)—where societal means "non-etatist." Law in this sense is not a matter of the state or only in the last instance. Law, instead, is by origin and by its normal existence a matter of the society, of the societal associations.

> It is often said that a book must be written in a manner that permits of summing up its content in a single sentence. If the present volume were to be subjected to this test, the sentence might be the following: At the present as well as at any other time, the center of gravity of legal development lies not in legislation, nor in juristic science, nor in judicial decision, but in society itself. This sentence, perhaps, contains the substance of every attempt to state the fundamental principles of the sociology of law. (Ehrlich 1936, *foreword*)[141]

In this famous introduction to his *Grundlegung der Soziologie des Rechts* Ehrlich announces a concept of the origin and development of law that nowa-

[141] And similar: "The center of gravity of legal development therefore from time immemorial has not lain in the activity of the state but in society itself, and must be sought there at the present time. This may be said not only of the legal institutions but also of the norms for decision. From time immemorial the great mass of norms for decision has been abstracted from the social institutions by science and by the administration of justice, or has been freely invented by them; and legislation by the state, too, can generally find them only by following the social institutions and by imitating scientific or judicial methods" (ibid., 390).

days represents a standard version of a pluralist approach in legal theory in contrast to an etatist one.[142] Law, according to Ehrlich, emerges from social practice that is further developed by the judiciary together with academic legal scholars via *Entscheidungsnormen* (in the English translation: norms for decision) till the legislator (state) fixes them in written, codified norms (what Ehrlich calls "*Rechtssätze*" = legal propositions).

The very basis of normativity, according to Ehrlich, lies even deeper. Legal norms are founded in facts, in the "facts of the law" ("*Tatsachen des Rechts*"[143]), by which he means four types: usage, domination, possession, declaration of will (contract or testament) (*Übung, Herrschaft*, *Besitz*, *Willenserklärung* [*Vertrag und letztwillige Verfügung*]). Like many other authors (e.g., Marx or Geiger) Ehrlich believes in the norm-generating quality of facts.

> The state existed before the constitution; the family is older than the order of the family; possession antedates ownership; there were contracts before there was a law of contracts; and even the testament, where it is of native origin, is much older than the law of last wills and testaments. If the jurists think that before a binding contract was entered into, before a valid testament was made, there must have been in existence a legal proposition according to which agreements or testaments are binding, they are placing the abstract before the concrete. (Ehrlich 1936, 35–6)

Again, as in the case of Marx' "*Produktionsverhältnisse*," the question is whether these pre-normative facts are really non-normative. This is obviously not the case. The four types of "facts of the law" are shot through with norms, i.e., normative expectations, obligations, transgressions, and sanctions. Ehrlich falls prey to the doctrine of a fact → norm-sequence, i.e., that norms evolve out of facts.

Ehrlich is a clear exponent of a "bottom up"-approach of legislation and of legal development in general. State law, manifested in "legal propositions" ("*Rechtssätzen*"), is the final point of a development that starts with the societal "facts of the law," which become norms of the living law—"rules of action" living in the societal associations—then condensed by the legal staff cooperating with legal science into "norms for decision" ("*Entscheidungsnormen*")[144] that are systematized or rather certified by the legislator codifying them as "*Rechtssätze*." So we have the following sequence:

[142] On legal pluralism in general and its critique, see Galanter 1981; Griffiths 1986; Merry 1988; Chiba 1989; Teubner 1992; Tamanaha 1993; Roberts 1998.

[143] Ehrlich does not speak of "Rechtstatsachen" (legal facts). By legal facts one could understand facts that might be relevant and useful in the application of law, or simply facts (such as a courtroom proceeding) that can only be described by way of legal norms, and not by way of a non-legal descriptive frame of reference, adapted, e.g., from symbolic interactionism in the study of small groups.

[144] "Every norm for decision therefore is based primarily upon this inner order, i.e., the facts of the law, which create the order, upon the usages, which assign to each individual his position and his function in the association, upon relations of domination and possession, contracts, articles of association, testamentary dispositions" (Ehrlich 1936, 123).

– "facts of the law,"
– living law (norms living in the societal associations), rules of conduct,
– norms for decision (formulated, interpreted and applied by the legal staff in cooperation with legal science),
– legal propositions, i.e., written norms of the legislator.

The smallest units of a society in Ehrlich are not individual persons. Instead, he starts with societal associations ("*Verbände*") like families, economic associations, but also state administrative bodies. The great majority of conflicts can be resolved within these associations. For the remaining conflicts special institutions are established, e.g., courts that produce decision rules, that can be applied in future similar cases. They form the material for the sophisticated systematization and interpretation in the realm of legal dogmatics. Finally the state legislator transforms this body of norms to codified "*Rechtssätzen*," legal propositions.

Today, in a period of a predominantly instrumental understanding and development of legislation, it would be worthwhile to analyze cases that do not fit the picture of "top down" legislation. Are there codified norms that, more or less, confirm social rules of conduct and validate corresponding "norms for decisions" stated by the courts? In some instances this picture might still be adequate nowadays: Whenever the legislator reacts to new developments in society or to cases and decisions of courts. To give a few examples from German legislation: The law on standard contracts (*AGB-Gesetz*) is a systematization of court decisions that evolved out of conflicts about this type of contract. Another example might be the legal regulation of extra marital partnerships. There was a societal "forerunner," then came court decisions, finally the legislator reacted. *Lex mercatoria* might serve as another example for legal development beyond the nation state: It is a societal as well as a global phenomenon (cf. Teubner 1996a and 1996b). Such a model of a "bottom-up" evolution of law is the heritage of Ehrlich's early efforts. Ehrlich surely does not subscribe to an instrumental view of legislation. But he recognizes the increasing use of legislation in order to control societal processes.

> The legal proposition is not only the result, it is also a lever, of social development; it is an instrumentality in the hands of society whereby society shapes things within its sphere of influence according to its will. Through the legal proposition man acquires a power, limited though it be, over the facts of the law; in the legal proposition a willed legal order is brought face to face with the legal order which has arisen self-actively in society. (Ehrlich 1936, 202–3)

Ehrlich assumed that the pinnacle of this type of legislative intervention had been reached already. Apparently he could not predict what would happen since World War I.

The basis of law, according to Ehrlich, cannot be found in popular moral sentiments, e.g., in the "Volksgeist," as the Historical School believed.

The Historical School of jurisprudence has taken infinite pains to show how "customary law," or, to put it more accurately, legal propositions of "customary law," arise immediately in the popular consciousness. It is a vain endeavor. Lambert has shown conclusively that with the exception perhaps of legal maxims, legal propositions do not arise in the popular consciousness itself. Legal propositions are created by jurists, preponderantly on the basis of norms for decision found in the judgements of courts. (Ehrlich 1936, 175, alluding to Lambert 1903)

Because of the cascade of transformational steps running from the living law to "Rechtssätze," these codified legal norms cannot be used as indicators of popular morality or "social solidarity" in Durkheim's sense. There is no moral foundation of law in Ehrlich. There are facts that generate legal norms. These have to be distinguished systematically (and, one could assume, also genetically) from moral norms and other types of norms.

But how is it possible to *define* law strictly on a societal level without alluding to etatist features like the existence of a legal staff? This no longer is a question of theory (of the development of law) but one of defining the concept of law (cf. *supra*, sec. 2.2). Ehrlich, in introducing the notion of living law, subscribes to a non-etatist concept of law. Law is generated at the bottom of societal associations, evolving from the facts of the law. Law, according to Ehrlich, exists within the society, on a pre-state level. The famous etatist Kelsen doubted that what Ehrlich called "living law" can be named "law" at all:

With respect to the notion of "living law" which Ehrlich introduced, distinguishing it from positive law is untenable. It is evident that the "inner order of the behavior of people in society" is not "law" as long as this inner order is not applied by the organs in charge of the administration of justice, especially by the courts. This inner order might be valid as custom or morality, however, it becomes law only via its application by competent legal organs. This so-called living law may diverge from the substantively determined general norms of positive or customary law. To apply it, the organs in charge of the administration of justice, however, must be empowered to do so by valid positive or customary law—if only in the sense that the living law which they apply becomes law via the principle of legal force (*Rechtskraft*) incorporated in positive law. From this follows that the so-called "living law," if it is law, must be a part of positive law. Therefore, a distinction or even a contradiction between the two is not possible. (Kelsen 1979, 224; my translation)

How does Ehrlich proceed in establishing a strictly societal definition of law—separating it from other types of norms like moral ones, and without referring to etatist elements? (This societal definition would be, of course, a sociological one.)

Difficult though it may be to draw the line with scientific exactitude between the legal norm and other kinds of norms, practically this difficulty exists but rarely. In general anyone will be in position to tell without hesitation whether a given norm is a legal norm or whether it belongs to the sphere of religion, ethical custom, morality, decorum, tact, fashion, or etiquette. This fact must be made the basis of the discussion. The question as to the difference between the legal and the non-legal norm is a question not of social science but of social psychology.[145] The vari-

[145] This distinction is misleading. Social psychology is obviously a branch of social sciences.

ous classes of norms release various overtones of feeling, and we react to the transgression of different norms with different feelings. Compare the feeling of revolt that follows a violation of law with the indignation at a violation of a law of morality, with the feeling of disgust occasioned by an indecency, with the disapproval of tactlessness, the ridiculousness of an offense against etiquette, and lastly with the critical feeling of superiority with which a votary of fashion looks down upon those who have not attained the heights which he has scaled. Peculiar to the legal norm is the reaction for which the jurists of the continental common law have coined the term *opinio necessitatis*. This is the characteristic feature which enables one to identify the legal norm. (Ehrlich 1936, 164–5)

It is clear that Ehrlich attempts to offer a definition of legal norms, i.e., he attempts to separate them from other kinds of norms. He assumes that a distinction can be found by observing the feelings among the people, who intuitively "define" the various types of social norms. He distinguishes two situations in which these feelings are displayed: the feeling that is associated with a norm as such ("various overtones of feeling") and the feeling that is shown in the case of an infringement of a norm ("different feelings when we react to the transgression"). In the first case, however, he speaks only about legal norms, not the other types, and the corresponding feeling. Let us have a closer look at the quotation and its formal structure:

types of norms	norms *as such* release various overtones of feeling	*transgression* of norms → reaction: different feelings*
– legal norms	*opinio necessitatis*	→ revolt (*Empörung*)
Other types of norms:		
– religion	?	?
– ethical custom	?	?
– morality	?	→ indignation (*Entrüstung*)
– decorum	?	= indecency → disgust (*Ärgernis*)
– tact	?	= tactlessness → disapproval (*Mißbilligung*)
– etiquette	?	→ ridiculousness (*Lächerlichkeit*)
– fashion	?	= "not attaining the hights of fashion" → critical feeling of superiority (*kritische Ablehnung*)

* In parentheses I have added the original German expressions.

What does, firstly, the "opinio necessitatis"-reference imply? Ehrlich is often associated with the "doctrine of recognition," i.e., a theory that states that legal norms are valid if they are by and large accepted by their addressees.

(Fn. contd. from page 139) What Ehrlich means is that definitions are not the theoretical inventions of social scientists; instead, the relevant distinctions can already be found in the popular mind. The social scientist only has to observe the various feelings that become current among people.

The only point that supports this interpretation is the notion of "opinio necessitatis" that is combined with legal norms as such (not their infringement). But Ehrlich never would have adhered to a "strict" theory of recognition like the one that can be found, e.g., in Bierling:

Law in a juridical sense in general is what people living together in some community recognize mutually as a norm or rule of their relationships. (Bierling 1894, 19; my translation)[146]

Ehrlich rectifies this doctrine of recognition:

We must not conceive of this doctrine as Bierling did, as implying that the norm must be recognized by each individual. The norms operate through the social force which recognition by a social association imparts to them, not through recognition by the individual members of the association. (Ehrlich 1936, 167)

What Ehrlich means by "*opinio necessitatis*" is:

The legal norm regulates a matter which, at least in the opinion of the group within which it has its origin, is of great importance, of basic significance [...]. Only matters of lesser significance are left to other social norms. (Ibid., 167–8)[147]

Also the living law has to be enforced, primarily not by a legal staff but by the members of the social associations themselves (as soon as they experience a feeling of "revolt") backed by extra-legal norms. Social and economic force is imposed in order to strengthen the living law.

The truth is that the legal order always was based not on the threat of penal or civil sanctions but on social and economic pressure. People observe their legal duties, if external respect for them is required at all, because otherwise they are in danger of losing their social status, their office, their position, their job, their customers, their business connections, their credit, and, in the case of severe transgressions, that they are threatened with being ostracized from society. The everyday work of the courts generally is not directed towards the masses of the people, but against a relatively small group of pariahs and derelicts, as well as against insolvent people who are not responsible for their situation, i.e., against those who cannot be motivated by economic or social sanctions because they already are outside of society. (Ehrlich 1986, 186; my translation; German original published in 1913–1914)

Now to the second and more specific part of Ehrlich's definition: the different feelings in the case of a transgression of various kinds of norms. It's a definition, not a theory! Ehrlich states: If a norm is transgressed and revolt (or rather revulsion) is displayed, then it is/was a legal norm that has been transgressed. And not: Whenever a legal norm is transgressed, revolt will be dis-

[146] "Recht im juristischen Sinne ist im allgemeinen das, was Menschen, die in irgendwelcher Gemeinschaft miteinander leben, als Norm oder Regel dieses Zusammenlebens wechselseitig anerkennen." Ehrlich (1936, 167) refers to Bierling (and the translator mentions *Juristische Grundbegriffe* IV, S. 39–53, 68–105).

[147] By "Rechtsnorm" Ehrlich means, as we have seen, the norms of living law, in contrast to "Rechtssätze," which the legislator issues.

played. For this would presuppose that we already know that it is a legal norm. The first statement cannot be falsified; if revolt is not shown, it was not a legal norm. The second one only would be empirically testable if we knew how to define "legal norm" irrespective of possible reactions.

- We can easily see that the definition is incomplete in various aspects. Not only is there nothing said about feelings accompanying other kinds of norms besides legal ones—this is the first problem—, but there is also nothing said about the feelings in the case of transgression of religious norms and of ethical custom.
- Are these feelings observable? Ehrlich's etatist counterpart, Durkheim, holds that such overtones of feeling are not observable. They are not "societal facts," only internal, moral, psychic states of the mind of the people. Therefore he chooses legally fixed norms (what Ehrlich would name "*Rechtssätze*") as an observable indicator of the moral state of a society. In Durkheim written law is the indicator of underlying, unobservable collective moral sentiments. How would Ehrlich proceed in order to locate these feelings?
- There is no sharp distinction among the possible reactive "feelings"—neither from the point of view of an observer, and possibly not from the point of view of the (re-)actors themselves. If the living law has to be backed by extra-legal norms there must always exist a mixture of feelings among those who try to uphold the normative web of a society. Are they able to distinguish these graduations of feelings?

And now we must point out the significance, but slightly considered hitherto, of the extra-legal norms for the inner ordering of the associations. The statement that legal institutions are based exclusively on legal norms is not true. Morality, religion, ethical custom, decorum, tact, even etiquette and fashion, do not order the extra-legal relations only; they also affect the legal sphere at every turn. Not a single one of the jural associations could maintain its existence solely by means of legal norms; all of them, at all times, require the aid of extra-legal norms which increase or eke out their force. Nothing short of the cooperation of the social norms of every description can offer a complete picture of the social mechanism. (Ehrlich 1936, 55–6)

- Whose feelings are relevant? The feelings of the victim, of an observer, of other neutral persons? Must even a judge share a feeling of revolt in order to apply *legal* norms? And in this context: What about feelings in the case of "secondary rules"?
- It can be doubted whether there exists a high degree of homogeneity of reactions.
- From a methodological point of view one could argue, applying the criterion of adequacy of a definition, that Ehrlich's proposal is very remote from a "normally" accepted use of the term law.
- What is more, Ehrlich's definition is inconsistent with the frame of his theory of legal development: What is the relationship between feelings and

the "facts of the law"? What are the feelings of the elementary associations? Ehrlich uses individual feelings in order to distinguish between different types of norms. But if associations are the elementary units of society (and not individuals) what do these associations "feel"? In his definition Ehrlich shifts to a psychological account of law, while his substantive theory of legal development treats law as the structure of social associations.

The attempt to give a solely societal definition of law failed. In sum, as Kelsen put it, Ehrlich has exposed himself with his definitional attempt to *ridiculousness* without transgressing a norm of *etiquette* (Kelsen 1915, 862).

3.2.5. Political Foundations of Law

It is easy enough to say that everything is political. But what does it mean in different contexts, subtexts, hypertexts, paratexts, and, not to forget, texts? Obviously this is an occasion where subtle distinctions may be required. Therefore, the following chapter will be mainly an analytical piece.

3.2.5.1. Law and State

I start with the distinction (and the interrelations) between law and state and take a look back at what we have seen already concerning the state, as the political unit par excellence, and law.

- In contrast to a pluralist approach I have pointed out the necessity of etatist elements in the definition of law. It makes sense to refer to at least a rudimentary form of a legal staff (like Max Weber did) in order to distinguish legal norms or a legal order from other social norms or orders (like moral or conventional norms or orders).
- Also in describing the phylogenetic development of state and law it may be useful to have a close look at the decisive step from stateless societies or even lawless societies to those in which the role of a neutral third is institutionalized, i.e., the role of a person who is not related to the conflicting parties. Or if we hold, according to Luhmann (cf. *supra*, 23) that *ubi societas, ibi ius*, what does this imply for the origin of a state?
- Among the various functions of law we have attributed the instrumental use of legal norms to state authorities, to the state legislator who attempts to achieve certain aims by issuing legal provisions.
- On the other hand, activities of state authorities are regulated, controlled, and bound by law, especially by norms of the constitution. This is at the heart of a state governed by the rule of law.
- As far as the constitutive function of law is concerned it is clear that state organizations are, as "institutional facts," established by the correct use of

"institutive" legal provisions. Thus, this leads to the famous "identity thesis" of Kelsen: If law is the "form of state order" every state is a law-state.[148]

3.2.5.2. Law and Politics

A distinction between law and politics often is drawn based on the separation of *courts and legislature*. In Luhmann, e.g., courts operate as core elements of the legal system while legislation is located within the political system. Some like to draw distinctions, others like to blur them. Thus it is a popular game to show that court activities are not free of political elements and that politics does not take place outside of law.

- In general courts are passive, they depend on applications, claims or motions of people involved in a conflict; they cannot define and solve conflicts on their own. In the political arena, however, the definition and solution of problems is actively pursued. Nevertheless, highly controversial, political questions can be brought to courts, and not only to constitutional courts.
- Courts decide according to given criteria. In contrast the legislator sets the criteria to which the legal staff and other state agencies are expected to abide. The legislator, however, is himself bound by legal norms, in particular by those of the constitution. And courts, not only constitutional ones, might have in an unpredictable number of cases a wide scope of discretion.
- Courts decide about past events while the legislator attempts to anticipate the future effects of his efforts. Courts, however, are used to taking into account the possible impact of their decisions ("judicial consequentialism").
- Judges in courts have become professionalized, undergoing a special type of education that aims, inter alia, at neutralizing their social background and other personal traits. In contrast, politicians are permitted, even expected to declare and demonstrate their interested positions and points of view. Judges, however, often are recruited—appointed or elected—on the basis of their political preferences or membership loyalties. The independence of judges is itself a fundamental political value. As long as they share the attitudes of the political regime in power judges and the principle of independence are accepted. In case of a conflict between courts and the political power groups judges (as well as prosecutors) can be put under a Berlusconi-like pressure.

[148] Cf. Kelsen 1925, 44, 91, 109; 1928, 187; 1960a, 314f., 320. The German version of the identity thesis ("Jeder Staat ist ein Rechtsstaat") is misleading because it confers the value-laden attributes of the "Rechtsstaat" to every state. One should not mingle law as a constitutive mechanism for state power and law as limit to state power.

One can also discuss the various relationships between law and politics according to the three dimensions of a legal order that I previously distinguished (cf. *supra*, sec. 2.6, 27). Thus, within a legal order one can identify several political topics.

- On the level of legislation the life of law begins in political processes. Lawmaking may be bound by legal rules. Rules of competence and basic legal norms, however, cannot determine the content of the legislative output. Legal rules function as political instruments, i.e., they are issued, even in the case of symbolic politics, in order to achieve certain aims, including symbolic ones. There are also unintended results that count as political effects for which the legislator can be held responsible.
- The recruitment and promotion of members of the legal staff often is based on political decisions. Legal education as well the organization of exams can be put under the control of political bodies. Courts cannot exclude jurisdiction over political questions. They are expected to decide independently on legal grounds. However, the impact of political attitudes (of the "*Vorverständnis*") of the judges on the decisional outcome should not be neglected. A neutral, apolitical self-understanding of the judiciary does not deny the fact that court decisions can have a political impact on the society.
- In the third "everyman's" dimension political attitudes play an important role, of course, in voting behavior by which the legislative bodies are constituted or as far as the acceptance of legal rules and institutions is concerned. A fundamental legal culture is embedded in a general political culture.

3.2.5.3. Law and Power (Violence, Force)

It is power that forms the final foundation of law and of authority in general. The German notion of "*Gewalt*" is even more fascinating. Therefore Walter Benjamin with his *Kritik der Gewalt* is frequently alluded to. Fascinating is the notion of "*Gewalt*" for its multiple connotations. One can choose between violence or power or force—and perhaps also might, authority, sovereignty and domination.[149] The state has the monopoly of power (in German "*Gewaltmonopol*"). The police is, according to the model of the separation of powers, part of the executive power (in German: *exekutive Gewalt*) which can en*force* certain decisions (in German[y] it may do it with *Gewalt*). The notion of sovereignty as the apex of power implies the idea of ultimate indeterminacy: There are no further explanations possible, therefore no further foundations exist. Finally there is something that rests in itself. And the foundationalist is satisfied.

[149] On the other hand, Hannah Arendt's essay *On Violence* (Arendt 1970) is translated into German under the title "Macht und Gewalt."

The relationship between law and power, however, is quite a bit more complicated.

(1) Power as the Origin of State and Law

Power, so it is frequently maintained, is at the origin of state and law. State and law do not rest on a consensus or a contract. The creation of a new state, the invention of a legal code are the result of power conflicts which include the use of violence. Rudimentary legislation in ancient Rome or Athens is explained by struggles between groups in power and aspiring groups (like the *plebs* or the *hoplites*). The modern Turkish state is a recent example of, at least at its beginnings, a politically founded kind of modernizing dictatorship in opposition to an Islamic society.

Political power does not destroy law, rather, political power is transformed into law. Powerful social groups can cast their claims into legal forms. "Unusquisque tantum iuris habet, quantum potentia valet" (Spinoza 1973, chap. 2, § 8).[150] Or simply: "Might makes right."

In what is apparently a combination of a hierarchical and developmental model the origin of law and state is held to rest at the apex of a supreme authority, which issues commands from the top down (the reverse of Ehrlich's bottom-up model). The first, original establishment of political power took place without any "higher" legitimation. There were no rules according to which commands, as legal commands, were issued. This origin of only afterwards legally legitimate political power forms a central theme in Jacques Derrida's essay on the force of law: the "mystical foundation of authority" (Derrida 1992). His chain of great thinkers ranges from Montaigne, Pascal to Benjamin (and presumably himself). A deconstructivist turns out to be a foundationalist: In the case of law he claims to have identified its "mystical foundation"—in power. From Montaigne's *Essais* he quotes: "even our law, it is said, has legitimate fictions on which it founds the truth of its justice."[151] But this is only a side-note which Montaigne does not elaborate. That law operates legitimately on the basis of legal fictions is an insight that does not deserve too great notice. The notion of a "mystical foundation" Derrida finds in another chapter of the *Essais:*

[150] German literature abounds with this topic. Here is a small sampling: "Man hat Gewalt, so hat man Recht" ("One possessed of power is also possessed of the Right") (Goethe, Faust II, V); "Im Leben gilt der Stärke Recht" ("In life it is the right of the strong that gets validated") (Schiller "Die Weltweisen"); "Hast du die Macht, du hast das Recht auf Erden" ("If you have the power, you have the Right in this world") (Adelbert von Chamisso "Die Giftmischerin"). (My attempts at translation.)

[151] Derrida 1992, 12, quoted from Montaigne, *Essais*, book 2, chap. 12. Here I use the English translation in Derrida's text. (Montaigne's *Essais* first appeared in 1580.)

And so laws keep up their good standing, not because they are just, but because they are laws: that is the mystical foundation (*fondement mystique*) of their authority, they have no other […]. Anyone who obeys them because they are just is not obeying them the way he ought to.[152]

Laws, paraphrases Derrida, are not obeyed because they are just but because they have authority. But what, then, is the foundation of their authority? What is the mystical foundation of their authority? Montaigne says that the authority of the laws is the fact that they are laws. One can make a mystery out of the "mystical" foundation, clouded in linguistic obscurity. In the passage, that Derrida elides "[...]," Montaigne, however, made explained the mystical foundation insofar as he maintains that laws are often made by fools, more often by men, who, in hatred of equality, have want of equity. By their irregularity and deformity the (French) laws lend a helping hand unto disorder and corruption. If there is any foundation of the laws, it is the irrational and amoral character of the legislators and judges as well.

Derrida started with quotations from Pascal's *Pensées* (1670). For there he found also the notion of the "mystical foundation," in *Pensées* no. 294:

One man says that the essence of justice is the authority of the legislator, another that it is the convenience of the king, another that it is current custom; and the latter is closest to the truth: Simple reason tells us that nothing is just in itself; everything crumbles with time. Custom is the sole basis for equity, for the simple reason that it is received; it is the mystical foundation of its authority. Whoever traces it to its source annihilates it.[153]

While Montaigne maintained that laws are obeyed (have authority) because they are laws, Pascal holds that it is mainly custom that makes people believe in justice. People abide by the law because it is law and nothing more. "Law was once introduced without reason, and has become reasonable" (Pascal 2000, no. 294).[154] Conformity, however, requires a belief in the truth or justice of the law. This belief has to become a custom, unquestioned as far as its source is concerned. If one would carry it back to its origin one would destroy this customary belief.

It is dangerous to tell the people that the laws are unjust; for they obey them only because they think them just. Therefore it is necessary to tell them at the same time that they must obey them because they are laws, just as they obey superiors, not because they are just, but because they are superiors. In this way all sedition is prevented, if this can be made intelligible and it be understood what is the proper definition of justice. (Pascal 2000, no. 326)

Pascal then moves somehow between custom—justice—force.

[152] Derrida 1992, 12, quoted from Montaigne, *Essais*, book 3, chap. 13.
[153] Pascal, *Pensées* 293 as translated in Derrida 1992, 11–2.
[154] In *Pensées* no. 325 Pascal criticises Montaigne explicitly: "Montaigne is wrong. Custom should be followed only because it is custom, and not because it is reasonable or just. But people follow it for this sole reason, that they think it just. Otherwise they would follow it no longer, although it were the custom; for they will only submit to reason or justice."

> Justice, force—It is just that what is just be followed, it is necessary that what is strongest be followed. Justice without force is impotent, force without justice is tyrannical. Justice without force is contradictory, as there are always the wicked; force without justice is accused of wrong. And so it is necessary to put justice and force together; and, for this, to make sure that what is just be strong, or what is strong be just [...]. And so it is necessary to put justice and force together [...]. And so, since it was not possible to make the just strong, the strong have been made just.[155]

Men have made it just to obey might. They have justified might: That is called just which men are forced to obey. The belief in the justice of the laws of the mighty becomes engrained in custom and thus peace as beneficent will of the sovereign will be secured.

This is nothing more than the interpretation of a classical text (rather remote from Derrida's way of exploiting it). The substantive questions, however, cannot be answered in this way: Is every state historically based on violence? Are constitutions written or designed on the battlefield? Are there states that are not founded on violence? Of course, one has to distinguish various forms of violence: civil revolutions, foreign military occupations (including colonization) and their obverse: the violent liberation from occupation or colonization. Are there historical instances of states constituted according to the social contract theories of classical natural law, i.e., based on consensus instead of violence? The state of nature is characterized by the predominance of the strong and the reign of force, it is "a state of violence and wrong, of which nothing truer can be said than that one ought to depart from it" (Hegel 1971, § 502). But how does this departure take place? The recent non-violent revolutions in Eastern European countries, their transformation from socialist states to liberal-capitalist states might be counter-examples that do not fit the model of universal violence as the origin of state and law. For those who appreciate metaphors one could renew the debate in 18th/19th century geology between volcanists and neptunists: Is the birth of dry land—similar to new states—caused by volcanic eruptions or does it take place in a long enduring process in which layer over layer settles to form a firm deposition?

Instead of turning to texts about or from historical instances, Derrida continues to forge the chain of great thinkers and, inevitably, arrives at Walter Benjamin and his *Kritik der Gewalt* (from 1921). Benjamin draws, as is well-known, a distinction between

(1) mythic violence that can be divided into
 - violence creating or founding law (*rechtsbegründende, rechtsetzende, schaltende Gewalt*),
 - violence maintaining law (*rechtserhaltende, verwaltete Gewalt*),

[155] *Pensées*, no. 298 as translated in Derrida 1992, 10–1. See also *Pensées*, no. 297, 299, 878 (Pascal 2000).

(2) divine violence, annihilating violence (*rechtsvernichtende Gewalt, reine Gewalt, waltende Gewalt*).

Legally permitted forms of violence according to Benjamin are:

- strikes that create and modify legal relations,
- *ius ad bellum* that creates new law,
- the death penalty (which rather is the symbol of the real origin of law).

This is surely not a complete list; what about prisons, family life, hospitals—not to forget "the despotism of the capitalist" (Marx 1996, 337; cf. Marx 1965a, 351), etc.? How is violence maintained and justified in these institutions?

Violence, "*schicksalhaft gekrönte Gewalt*" (Benjamin 1966, 51), is at the origin of law. This extreme foundationalist statement leads to several overgeneralizations in Benjamin. Thus he states—in the word of Derrida—that "every juridical contract, every *Rechtsvertrag* ('legal contract') is founded on violence. There is no contract that does not have violence as both an origin (*Ursprung*) and an outcome (*Ausgang*)" (Derrida 1992, 47). Therefore, the antithesis between violence or social contract as the origin of the state would not make sense if a contract itself is founded in violence. Furthermore, Benjamin maintains that if knowledge of the latent presence of violence in a legal institution vanishes then it will lapse. (Benjamin 1966, 53) It might be interesting to see whether one could find any empirical evidence for such statements. Derrida, as apodictically as Benjamin, states without any scruples as regards historical evidence:

The foundation of all states occurs in a situation that we can thus call revolutionary. It inaugurates a new law, it always does so in violence. (Derrida 1992, 35)

With such statements Derrida reveals himself to be a fervent, not to say violent, foundationalist. At the same time he is an expert at disguise. At the end we find him somewhere beyond foundationalism and anti-foundationalism.

Its very moment of foundation or institution (which in any case is never a moment inscribed in the homogeneous tissue of a history, since it is ripped apart with one decision), the operation that amounts to founding, inaugurating, justifying law (*droit*), making law, would consist of a *coup de force*, of a performative and therefore interpretative violence that in itself is neither just or unjust and that no justice and no previous law with its founding anterior moment could guarantee or contradict or invalidate. No justificatory discourse could or should insure the role of metalanguage in relation to the performativity of institutive language or its dominant interpretation. (Ibid., 13)

Since the origin of authority, the foundation or ground, the position of law can't by definition rest on anything but themselves, they are themselves a violence without ground. Which is not to say that they are in themselves unjust, in the sense of "illegal." They are neither legal nor

illegal in their founding moment. They exceed the opposition between founded and unfounded, or between any foundationalism or anti-foundationalism. (Ibid., 14)

The words start to tumble and the mystical foundation of law vanishes into a misty opacity. Derrida, foundationalist and non-foundationalist at the same time, moreover is totally unclear about the notion of "*Gewalt*": He not only employs Benjamin's distinctions between "mythic" law-making violence (*rechtssetzende*) (which sounds ancient Greek to him) and law-preserving violence[156] (*rechtserhaltende Gewalt*) or between the founding violence of law and the "divine," law-annihilating violence (*rechtsvernichtende Gewalt*) (which sounds Jewish to him, Derrida 1992, 31), i.e., violence that destructs, destroys law. Furthermore he speaks of direct and indirect violence; physical and symbolic v.; exterior and interior v.; brutally or subtly discursive and hermeneutic v.; coercive or regulative v. There also is "the violence of language" (ibid., 48). And besides mythical violence there exists objectivist, representational, communicational, performative, interpretative v., etc. (ibid., 13, 60). Apparently, violence is everywhere and has many faces. Derrida seems to belong in a group of neo-apocalyptics in the tradition of Carl Schmitt, e.g., like G. Agamben, for whom the foundation of the state is the permanent state of emergency and concentration camps form the appropriate paradigm of state force (Agamben 1995).

A much more interesting and fruitful approach concerning the relation between power and law can be found in the writings and interviews of Foucault (1976; 1978; 1980; on Foucault and law in general cf. Hunt and Wickham 1994). Like Ehrlich he shares a pluralist approach: Power exists before the state and before state law came into existence. Power evolves bottom up, it is formed—as a kind of "living power," if I may say—in everyday fights, in strategic conflicts among social actors about competing aims. In this way a network of power relations is created on a societal level, in families, at the workplace, in social groups, etc. Foucault, according to his "microphysics of power," discards the etatist notion of centralized power according to which the state is either conceived of as the result of a collective contract or, in a Marxist version, as an apparatus conquered by a ruling group or class. There is no sovereign actor to whom supreme power can be ascribed.

I don't want to say that the State isn't important; what I want to say is that relations of power, and hence the analysis that must be made of them, necessarily extend beyond the limits of the State. In two senses: first of all because the State, for all the omnipotence of its apparatuses, is far from being able to occupy the whole field of actual power relations, and further because the State can only operate on the basis of other, already existing power relations. The State is superstructural in relation to a whole series of power networks that invest the body, sexuality, the family, kinship, knowledge, technology and so forth. True, these networks stand in a condi-

[156] *Rechtsvernichtende Gewalt* is erroneously translated as "annihilating violence of destructive law" (Derrida 1992, 31).

tioning-conditioned relationship to a kind of "meta-power" which is structured essentially round a certain number of great prohibition functions; but this meta-power with its prohibitions can only take hold and secure its footing where it is rooted in a whole series of multiple and indefinite power relations that supply the necessary basis for the great negative forms of power. (Foucault 1980, 122)

At the very basis of society, forming the foundation of centralized power systems like the state, lies a whole series of societal power networks. These decentralized power relations emerge out of everyday conflicts. The (theoretical) question, however, is how these momentarily established asymmetrical relations can be generalized and temporally stabilized, i.e., "institutionalized." The problem in Marx was how to move from a non-normative basis to the superstructural norms of law, including property rights, and the state. In the case of Foucault we are confronted with the problem of how to move from interactions to institutions and a whole social order if, according to Foucault, neither physical violence nor ideology as a generalized media contribute to social integration. In his interactionist model "norms" only can play the role of strategic devices in order to deceive the other or to disguise one's interests. However, Foucault understands "norms" as imposed customs (which resembles to a certain degree Pascal's belief in the customary justice of law). But how to proceed from these customs to social institutions? This problem remains unresolved in Foucault (cf. Honneth 1986, 193ff.). Instead, his analysis shifts to historically established institutions that impose pressure, create customs, and produce social discipline. These institutions form a power-knowledge complex. As power is not concentrated in the state, so knowledge is not acquired solely in an academic, scientific realm. Rather, it is produced in institutions like schools, prisons, hospitals, and at the workplace. They operate not ideologically, not on a cognitive or moral level, but rather by getting access to the human body (what Foucault calls bio-politics).

(2) Power Destroys Law

In many cases violence and power are at the origin of state and law. However, there is another line in the tradition of thought concerning the relationship of power and law. The powerful do not create law, instead they break the law. Maybe this is what Benjamin meant by "*rechtsvernichtende Gewalt*." Thus the prophet Habakuk (1, 3–4) lamented:

Devastation and violence confront me; strife breaks out, discord raises its head, and so law grows effete; justice does not come forth victorious; for the wicked outwit the righteous, and so justice comes out perverted.

With the now proverbial formula "*Macht geht vor Recht*" ("might precedes right") Maximilian Graf von Schwerin condensed in 1863 a parliamentary speech of Bismarck. The idea is that an overwhelmingly strong power breaks,

even annihilates the formerly valid law without creating *ipso facto* a new legal order. In such a case legal norms are not observed or court decisions are disobeyed by those who are powerful enough not to fear any negative consequences. Law-annihilating powers rarely abolish the validity of an entire legal order. Rather, as in the case of the Nazis after having gained power in 1933, we find a concoction of using traditional legal forms, introducing new legal measures and applying brute force beyond all legal limits. In 2003 we can witness a hegemonial power that exempts itself from basic principles of human rights and international law. Decisions of the International Court of Justice are disobeyed in the name of national sovereignty,[157] principles of *Habeas Corpus* are invalidated in Guantánamo where indefinite detention of "illegal combatants" without a right to a hearing, and without a right to legal counsel is practiced,[158] new justifications for military intervention are introduced ("war against terror," "preemptive strike," "humanitarian" maybe even "democratic intervention"). Is this the annihilation of a traditional legal order, and nothing else, or is it the starting point for the creation of a new order of international law according to the interests of the new hegemonial power?

(3) Political Power that Uses Law

In the usual pattern of relations between political power and law we find a legally established regime using law as an instrument in order to achieve certain goals. Here it is not the origin of a legal order, which is in question; a legal order already exists and within its frame the state power issues legal regulations. The instrumental use of legal norms becomes the predominant conception.

(4) Restrictive Conditions: Factual Limits of State Power

The lawmaker, however, is confronted with two types of restrictions: factual and normative ones. Marx, following his non-normative approach, pointed out limits of state sovereignty that lie primarily in economic conditions. It is not the will of the sovereign in power that forms the foundation of law. Legal regulations are not based on his unalloyed volitions. He cannot achieve whatever he wants. Therefore, social conditions do not have their origin in a powerful, legally expressed will.

[157] Hans Kelsen (1920) points out that in international law the concept of state or national sovereignty is used to favour state law over international law when the two come in conflict. The powerful (in the sense of the mighty states) benefit from this device. They feel justified to ignore international law whenever it seems to get in their way.

[158] Obviously, this status is similar to the status of "Schutzhäftlinge" in the early Nazi concentration camps.

Society is not founded upon the law; this is a legal fiction. On the contrary, the law must be founded upon society, it must express the common interests and needs of society—as distinct from the caprice of the individuals—which arise from the material mode of production prevailing at the given time. This Code Napoleon, which I am holding in my hand, has not created modern bourgeois society. (Marx 1977, 327; cf. Marx 1968, 245)

State power and its law rests on the given material conditions of life. In order to express the "dominant" will (in fact, determined by such conditions) of a thus dependent "sovereign" in the form of law, universalization of this form is required.

If power is taken as the basis of right, as Hobbes, etc., do, then right, law, etc., are merely the symptom, the expression of *other* relations upon which state power rests. The material life of individuals, which by no means depends merely on their "will," their mode of production and form of intercourse, which mutually determine each other—this is the real basis of the state and remains so at all the stages at which division of labour and private property are still necessary, quite independently of the *will* of individuals. These actual relations are in no way created by the state power; on the contrary they are the power creating it. The individuals who rule in these conditions—leaving aside the fact that their power must assume the form of the *state*—have to give their will, which is determined by these definite conditions, a universal expression as the will of the state, as law, an expression whose content is always determined by the relations of this class, as the civil and criminal law demonstrates in the clearest possible way. Just as the weight of their bodies does not depend on their idealistic will or on their arbitrary decision, so also the fact that they enforce their own will in the form of law, and at the same time make it independent of the personal arbitrariness of each individual among them, does not depend on their idealistic will. Their personal rule must at the same time assume the form of average rule. Their personal power is based on conditions of life which as they develop are common to many individuals, and the continuance of which they, as ruling individuals, have to maintain against others and, at the same time, to maintain that they hold good for everybody. (Marx and Engels 1976b, 328; cf. Marx and Engels 1969a, 311)

It is a question for empirical research, i.e., of socio-legal efficacy research, to analyze the factual limits a lawmaker has to cope with. The most salient restrictive conditions on the side of addressees of the norm are: lack of information, attitudes counter to the aims of the legislator, denial of legislative competence, sanctions not sufficiently severe, improbability of imposition of sanctions, and rewards for non-compliance (cf. Rottleuthner 1987, 54ff.).[159]

(5) Law as a Limit on Political Power

In addition, the lawmaker is confronted with normative limits. The state monopoly of power gains its legitimation from the idea that state power is bound by law. In Jewish law we found, as the basic norm of a legal order, the prohibition of private violence. An important step is added by the prohibition of

[159] Again, Turkey might be an interesting example of how an authoritarian, secular lawmaker is capable of changing substantially the social conditions of an Islamic society (cf. *supra*, 53–4).

violence between states in international law ("the gentle civilizer of nations"). Thus the state is externally peaceful and internally a powerful pacifier. In order to bring about internal peace the state is not permitted to instrumentalize law in an unlimited way. *Pax et iustitia* are the aims. A peaceful society can only exist if the state operates within a legal frame, according to pre-established criteria and procedures with predictable consequences and institutionalized competences. It is this subtle framework, not only the validity of a secondary rule of identification (Hart), that makes the difference between a state and a gunman.

The existence of (territorial, nation) states with a monopoly of power depends on various historical conditions that we only perceive in cases where state structures have collapsed. To mention only some of those conditions: the civilization and professionalization of warriors (in contrast to partisans, guerillas, para-military groups, warlords and private belligerents); the separation of internal and external control, i.e., of police and military forces; the distinction between a state of war and a state of peace; of war and the work for one's living (and not leading war in order to earn one's living); the distinction between (military) combatants and (civil) non-combatants; of war *inter nationes* and civil war. All these distinctions are becoming blurred in many places of the world nowadays (cf. also *supra*, sec. 3.2.1.4 on problems of transition).

(6) Political Power and Legitimation

From a normative point of view political power should not instrumentalize law at its discretion; it should act within a legal framework. Obviously, in our times, legality is not sufficient. In addition, political power requires legitimacy, and every regime attempts to present itself as legitimate. Max Weber drew the distinction between power (*Macht*) and domination (*Herrschaft*). The latter, in its various forms as charismatic, traditional or legal domination, is characterized by different modes of legitimation (affectual, traditional, value-rational, legal), while power refers to the brute fact that someone is capable of imposing one's will upon another. The predominant mode of legitimation today, according to Weber, would be the legal one. State activities can be interpreted and thus justified as procedures following legal rules.

However, legality per se no longer enjoys the presumption of legitimacy it once did after the experience of the 20th century, i.e., of the use that was made of law by criminal regimes. The discourse on human rights and their institutionalization in international agreements, national constitutions and constitutional courts is a response to this unceasing experience. By engaging in a human rights discourse we necessarily employ a normative frame of reference. Then power no longer *should* be the foundation of law and state. Instead, a basic structure of collective social identity and self-understanding, in the sense of Habermas (1992), becomes the framework of legal institutions. It will

no longer solely be a democratic, i.e., majority's consent at the origin that constitutes the validity of law in a classical sense:

> It is the people's support that lends power to the institutions of a country, and this support is but the continuation of the consent that brought the laws into existence to begin with. (Arendt 1970, 41)[160]

The problem rather today is how democratic structures (if they are established anyway) can be combined with human rights. Do political dilemmas emerge when majority decisions collide with human rights' demands? (Cf. Habermas 1996, 134, 481ff.; Alexy 1998; Oquendo 2002.)

3.2.6. Historical Foundations of Law

To make a long foundationalist journey short: Everything, except God, has its history (and even the Christian God became for a certain period of time a historical being). Why, then, is it important to point out the historical foundations of law? Is it necessary in order to "understand" law, i.e., legal norms, legal institutions, positions, activities, etc., to understand its history?

The maxim that one can understand something only if one knows its history is self-referential. In order to understand it we should know its origin and development. It was not the baby of 19th century historicism. It can be found earlier, e.g., in Nicolaus Hieronymus Gundling's *Vorbericht zu den winterlectionen* at the University of Jena in 1710. It then becomes a standard topic, e.g., in Savigny and the Historical School.[161] The scientific character of "Rechts*wissenschaft*" was derived from the fact that it could be understood as a branch of the historical sciences. During the 19th century for a couple of decades history, as a science, played the role of the leading science.

"Historical foundations" of law can mean both the phylogenetic origin of law and its further historical development (or legal evolution) as well. With assumptions about the phylogenetic *origin* of law I have dealt in the section on anthropological and biological foundations of law (including the question whether there might be something like ape law). We might identify as a very widespread assumption a model that starts with the origin of law in non-normative or pre-normative phenomena out of which in some way norms and finally legal phenomena evolve. A classical example is found in a quotation from Engels in which he suggests a sequence of repetitive activities—rules—custom—law—state organization—legislation—professional jurists:

[160] Arendt is referring to the 18th century picture of the Athenian *polis* and the Roman *civitas*.

[161] I am grateful to Reimer Hansen for these suggestions; cf. Hansen 1992, 8–9.; in Savigny it becomes a standard topic; cf. his opening article to the *Zeitschrift für geschichtliche Rechtswissenschaft*, Savigny 1815.

At a certain, very primitive stage of the development of society, the need arises to co-ordinate under a common regulation the daily recurring acts of production, distribution, and exchange of products, to see to it that the individual subordinates himself to the common conditions of production and exchange. This regulation, which is at first custom, soon becomes law. With law, organs necessarily arise which are entrusted with its maintenance—public authority, the state. With further social development, law develops into a more or less comprehensive legal system. The more complicated this legal system becomes, the more its terminology becomes removed from that in which the usual economic conditions of the life of society are expressed. It appears as an independent element which derives the justification for its existence and the reason for its further development not out of the existing economic conditions, but out of its own inner logic, or, if you like, out of "the concept of will." People forget the derivation of their legal system from their economic conditions of life, just as they have forgotten their own derivation from the animal world. With the development of the legal system into a complicated and comprehensive whole the necessity arises for a new social division of labor; an order of professional jurists develops and with these legal science comes into being. (Engels 1988, 380–1; cf. Engels 1969c, 276)

In Max Weber we found a continuum of usage, custom (i.e., unreflective perpetuated imitation, organically conditioned factual regularities of conduct) leading to rules for conduct as binding norms: namely, convention and law (cf. *supra*, 21–2, the quotations from Weber 1978, 29, 319, 321, 325, 332). Similarly Theodor Geiger (1979, 170; cf. *supra*, 121) established a sequence of traditional manners and customs (combined with religious taboos) out of which morality and law develop separately. Not to forget Pascal (*Pensées* no. 293) who located the "mystical foundation" of the authority of justice in custom (cf. *supra*, 147). Counterpositions might stress the original normativity of human action or the basically evaluative character of action orientation (normative expectations, preferences, etc.).

Developmental theories of law differ in their temporal range. Some theories are designed to cover the whole of human history = development of law, mainly applying stage models of evolution. Important steps or stages are, as we have seen in Jewish law: (1) The prohibition of private violence, primarily implemented by the institutionalization of the role of a "neutral" third who is not related to the conflicting parties. This marks the end of segmentary societies and the step to hierarchical state organizations. (2) The invention of writing. Written legal documents (laws, contracts, etc.) facilitate temporal stabilization and offer the possibility of interpretation. (3) The unity of primary and secondary rules (Hart), which permits the solution of problems of identification, application, and change of a legal order.

There are famous theories of legal evolution which adopt binary distinctions of stages: from status to contract (H. S. Maine); from repressive to restitutive law (É. Durkheim). More sophisticated is the model of Max Weber with different levels of rationalization and legitimation (cf. *supra*, 54ff.). Luhmann (the "old" one of 1972) employs a model of three stages (the law of segmentary societies, the law of hierarchical societies, and finally the law in a functionally differentiated society which is characterized by its "positivity").

The later "autopoietic" Luhmann would distinguish law before and after its autopoietc closure (whenever this event might have taken place in history). Other authors restrict their evolutionary analysis to shorter time spans, like Habermas (1981) with the *Rechtsstaat*, the welfare state and the democratic state.

From such historical models of legal development which refer to dates of "real" history one can distinguish systematic models which point out general *mechanisms* of legal evolution. Marx' model of economic basis and superstructure is the most famous one. Also Ehrlich's approach belongs to this type of systematic stage model starting with "facts of law" out of which law—living law, decision rules, and legal propositions—is evolving permanently. Both theories share, once again, the assumption of a pre-normative state that forms the basis of evolving normative, legal phenomena.

In all of these models, which form a long tradition in socio-legal theory, it is not an internal "logic" of law that brings about a new stage. Legal development depends on external conditions, be they natural, economic, moral, political, etc. Marx and Engels argued against a solely "internal," doctrinal analysis of legal development, which they found in the Historical School, in their famous sentence: "It must not be forgotten that law has just as little an independent history [*eine eigene Geschichte*] as religion" (Marx and Engels 1976b, 90–1; cf. Marx and Engels 1969a, 63).

History for Marx and Engels, in particular in their critique of the Historical School, was the leading science. For them historical analyses always implied a comprehensive point of view. History or tradition are composite variables, like culture in the sense of a traditional context of institutions, forms of collective life and thought. Of course, one also may speak of the cultural foundations of law. However, since law itself forms a part of culture, in the form of "legal culture," one has to ask whether a distinction can be drawn between general, extra-legal culture, and legal culture. This might cause problems as the notion of culture is employed in a diffuse, all-encompassing way. History/tradition include all the foundational elements that we have discussed before. Now they are brought into a temporal order, i.e., into diachronous sequences. This holds even for natural foundations, since nature also has its history. (It was only in Greek mythology that we encountered the phenomenon of totally undated events.)

The Marx-Engels thesis that law does not have its own, independent history found a serious rival in Max Weber. In his general account of legal development he accepts the importance of economic needs and interests. However, patterns of political organization and legally internal mechanisms might have an even greater impact on legal development. Economic conditions are not "expressed" automatically in legal forms. Legal institutions must be invented. Their invention depends on legal techniques and modes of legal thought.

> The mode in which the current basic conceptions of the various fields of law have been differentiated from each other has depended largely upon factors of legal technique and of political organization. Economic factors can therefore be said to have had an indirect influence only. To be sure, economic influences have played their part, but only to this extent: That certain rationalizations of economic behavior, based upon such phenomena as a market economy or freedom of contract, and the resulting awareness of underlying, and increasingly complex conflicts of interests to be resolved by legal machinery, have influenced the systematization of the law or have intensified the institutionalization of the polity. [...] All other purely economic influences merely occur as concrete instances and cannot be formulated in general rules. On the other hand, we shall frequently see that those aspects of law which are conditioned by political factors and by the internal structure of legal thought have exercised a strong influence on economic organization. (Weber 1978, 654–5; cf. also ibid., 687–8)

The peculiar differences between the Common Law system and continental law—the explanation of which caused some problems for adherents of the basis-superstructure-doctrine (cf. supra, sec. 3.2.2.2)—can only be explained by reference to "the internal structure and modes of existence of the legal profession" (Weber 1978, 889), i.e., the organization of legal training (in England: in the hands of lawyers) and the way how judges are recruited (in England: out of the group of lawyers) (cf. ibid., 889–92).

Therefore, cognitive and professional aspects of a legal system also have to be taken into account. Since they form elements of the legal system itself, one might accept them as evidence for an autonomous development of law. However, because Weber stressed the importance of other "factors" as well (mainly political and economic), it might be more appropriate to speak of a "relative autonomy" of the development of law.[162]

Another approach can be found on the general theory of hermeneutics. According to Gadamer texts implicate a particular historical impact ("*Wirkungsgeschichte*"). For him legal hermeneutics is the paradigm case for understanding in general, because legal texts as such exert a binding force (Gadamer 1965, 307ff.). The binding force of authoritative legal texts, however, is not a matter of some intrinsic, encapsulated quality that evolves autonomously in legal tradition. Legal texts, rather, are experienced quite differently according to social roles, institutionalized positions, and professionalized habits inside or outside the legal system. Attitudes towards legal texts will vary among actors and observers of the legal system, among judges (who are and feel bound by the law), lawyers, legal scholars, lay people, etc. There is no autonomous channel through which legal tradition speaks across time.

The most recent version of a developmental theory of law emphasizing the autonomous character of legal evolution was created by Niklas Luhmann. From general evolutionary theory he adapts the three basic mechanisms of evolution that can be extended to the realm of law: variation (by legal inven-

[162] On the notion of (relative) autonomy, see, among many others, Lempert 1988; Rückert 1988.

tions)—selection (e.g., via legislation)—stabilization (via legal dogmatics). In contrast to this almost universal applicability of evolutionary mechanisms, the development of the legal system, as a social system among others, follows its own logic. Other social systems, like the political or economic system, do not "determine" the content of law. There are only "irritations" from other systems that must be transformed, according to the internal legal code, into legally relevant events in order to become elements of the legal system and thus alter this system internally.

Thus ends the part on external foundations of law. I shall return to Luhmann's model in the next chapter in discussing the internal foundations of law.

Chapter 4

INTERNAL FOUNDATIONS OF LAW

In speaking about the external foundations of law, I was alluding mainly to thoughts and theories *about* law. Sometimes I inserted substantive considerations on the "real" development and functions of law (e.g., on law in Islamic countries; problems of transformation; law, morality, and the welfare state). A general and persistent problem of the various theories lies in their explanatory shortcomings. Some of the theoretical models seem to have lost explanatory power over the centuries. Thus, the historical foundations of foundational thinking themselves change: transcendent conceptions in which explanation and justification were not yet separated fell prey to secularisation; theories that gave great weight to natural conditions, as in Montesquieu, are undermined by tendencies towards growing control of our natural environment. Great theories that emphasize one set of factors, like economic or political ones, are insufficient in that they can explain only limited aspects of law. Mixed models, as in Weber, that apply multifarious factors leave open the question of how to determine their relative weight. Thus, it is not a surprise to find other theorists who point to legally internal variables in order to explain the development and functions of law. Law, then, would lead, to a certain degree, its own life. It would be nice and aesthetically satisfying if one could construct a sequence from external foundations that become more and more manmade to internal foundations. However, I am not going to tell a grand narrative about growing "internalization," in the tradition of the philosophy of history. Rather, I turn to three "internalists." Two of them, Kelsen and Luhmann, emphasize, albeit in different ways, the self-generating character of a legal order. The third one, Lon Fuller, "internalizes" the moral requirements of a legal order. Morality is no longer, as in Durkheim for example, an external societal foundation of law that is symbolized in the sediments of legal norms. It becomes an internal element of law that is required if law is to be capable of fulfilling its basic social functions.

4.1. Kelsen's *Grundnorm*

In his analyses of the structure and dynamics of a legal order Kelsen adapted from A. Merkel the notion of a "*Stufenbau der Rechtsordnung*," i.e., that the norms of a legal system can be ranked in a hierarchical order. Norms of a higher level form the "*Geltungsgrund*" of norms of a lower level, i.e., the normative basis of their validity. Thus an internal normative network is established in which legal norms are produced and changed. A legal system can be interpreted as a self-generating linkage of legal elements. Norms are created by (on the basis of) norms. The idea of a hierarchical order necessarily leads to a final

norm if one does not accept infinity or circularity. Kelsen marked the end of a normative regress with his well-known "*Grundnorm*" (cf. Kelsen 1960a, 46–54, 190ff., 202–39; Kelsen 1979, 208). The basis of its validity cannot be questioned any further (Kelsen 1979, 205). This apex norm consists of a conditional imperative: One should behave according to the prescriptions of a legal order or a constitution if the norms of a legal order or a constitution are in fact issued and if they are by and large efficacious (Kelsen 1960a, 219). The apex norm implies two validity-conditions (*Geltungsbedingungen*), namely, factual promulgation and efficacy; it is itself not the final validity-basis (*Geltungsgrund*).[1] Therefore the apex norm is not itself an element of a legal order, it is not an internal foundation of law. Rather, in Kelsen's Pure Theory of Law it plays the role of an *epistemological* presupposition, external to its object, which has to be made in order to describe a normative order as a valid legal order. The apex norm is not a positive norm. Without it, anyone could sit down and design a valid legal order—just for fun. With it there is "reality" instead of fantasy-law.

The basic idea that makes Kelsen an "internalist" is that law regulates its own creation. Norms of a higher level do not determine the content of norms of a lower level (Kelsen 1979, 355). They empower the addressee to issue a valid norm. The subjective meaning of a volitional act is transformed into an objective meaning if the act is authorized by a positive normative order, be it a moral or legal one (ibid., 204). This makes the difference between a volitional act of, say, a robber and of an agent of a legal (= empowered) organ.

The basic distinction in Kelsen's Pure Theory of Law is the one between Is and Ought. According to his Neo-Kantian approach this distinction is conceived of not as an ontological one. Rather, it forms the basis for his epistemological schism between *Seinswissenschaften* (empirical sciences) and *Sollenswissenschaften* (normative sciences). In the realm of *Sein* the laws of causality reign, while in the world of *Sollen* the elements are connected by ascriptive relationships (*Zurechnung*). Therefore no connection can exist between any of our external factual variables such as natural, economic, political, etc., conditions (except religious commands since they are norms!) and the purely normative world of law.[2] Since Kelsen was very strict in keeping

[1] In other contexts the *Grundnorm* simply states that people should behave in accordance with what is historically the first constitution. ("Man soll sich so verhalten, wie die historisch erste Verfassung bestimmt"; Kelsen 1979, 207.)

[2] Therefore a sociology of law cannot exist, for it would be based on an epistemological contradiction by which (legal) norms are linked in a causal network. This was the point of view from which Kelsen criticised Ehrlich's attempt (cf. Kelsen and Ehrlich 2003; Rottleuthner 1984). It must be noted, however, that Kelsen, especially in his critique of political ideologies (like "justice"), also contributed essentially to *Seinswissenschaften.* He later relativized his critique of Ehrlich: A sociology of law is possible if it restricts itself to facts. I have proposed *supra* (sec. 2.5.4) one way of dealing with legal norms in an empirical way by using the notion of "law-related facts," such as the enactment and application of norms, and hence by looking at events that (relate to law and) take place in time and space.

apart the two sciences, his critics happily engaged in demonstrating that Kelsen was not as puristic as he claimed to be. A favorite topic was the apex norm in which—so it was argued—Is and Ought are mixed together. The very basis of Kelsen's theory would be defectively designed because empirical conditions (promulgation and efficacy) are connected with an obligation (to abide by the legal order). This critique, however, misreads the character of the apex norm as a conditional imperative. Every standard norm of a penal code, e.g., connects empirical conditions (a "fact type" or *Tatbestand*) with an obligation directed to the legal staff (to issue legal consequences in case of ...):

$$A \rightarrow (\mathrm{O})\, B$$

The apex norm connects promulgation (P) and efficacy (E) with the obligation to act in conformity (C) with the legal order:

$$P \wedge E \rightarrow (\mathrm{O})\, C$$

The problem at the foundation of Kelsen's theory, therefore, is not the breakdown of his basic distinction. Rather, it is, very fundamentally, the problem of revolution, i.e., the establishment of a historically first constitution. Does this take place *ex nihilo*, out of a legal vacuum? How can transformation processes be described (both formally legal and informal), including losses and gains of legitimacy? The other problem that I am going to deal with in more detail lies in efficacy. While positive promulgation, as one part of the apex norm, might be easy to identify, the determination of efficacy, the other part, raises serious problems. Kelsen explained: A legal norm is valid "if it belongs to a legal order that is by and large efficacious, i.e., if the individuals whose conduct is regulated by the legal order in the main actually do conduct themselves as they should according to the legal order" (Kelsen 1960b, 268).

What does it mean to say that *a whole legal system* has to be efficacious as a criterion of the validity of this system and its elements, i.e., the single norms. Kelsen uses the term "efficacious" to refer to general compliance with the norms. However, this is what "effectivity" denotes. "Efficacy," in contrast, is attributed to a norm if the goals of the legislator are achieved. Norm compliance and goal achievement coincide only in cases of standard penal norms: By observing the prohibition of murder the aim of the legislator is attained at the same time. In many cases, however, the legislator uses norm compliance as a means in order to achieve a separate goal. Standard examples can be found in traffic regulations and in many other fields. Therefore it is important to distinguish effectivity from efficacy, or norm compliance from goal achievement respectively. From an empirical point of view it might be almost impossible to find out whether a whole legal order is by and large observed. Even compliance with the majority of rules to a certain degree is impossible to prove.

Compliance only with secondary rules, i.e., general application of them by the legal staff based on a legalistic attitude is not sufficient. Neither is a general acceptance, a broad belief in the legitimacy of the legal order. All these alternatives leave open the question of the *efficacy of a whole legal order.* And this question reads: What are the objectives of a whole legal order? Is it protection or security in exchange for obedience (Hobbes)? Is it the guarantee and enlargement of individual freedom (Kant)? Should a legal order provide people with the basic requirements of social orientation (Fuller; cf. *infra*)? How could consensus be established on this matter? And, one could add from an empirical point of view, how could any or all of these desirable states of affairs be operationalized intersubjectively? Who decides whether these goals are being achieved? Thus the foundational basic norm in Kelsen leads to fundamental moral issues about a legal order.

4.2. Luhmann's Autopoietic Theory of Law

The "early" Luhmann, the Luhmann of *Rechtssoziologie* (1972; cf. Luhmann 1985), began the construction of his theory with the distinction between cognitive and normative expectations. He does not follow the traditional paths that commenced with the schism of Is and Ought or of fact and norm, neither does he introduce norms, then legal norms in a sequence that originates in regularities and customs, then moves via conventions and moral rules to law. Cognitive as well as normative expectations are events determinable in space and time. They differ in the way how one reacts in the case of disappointments: Does one change the expectation (then it was a cognitive one) or does one adhere to one's expectation (then it is a normative one).[3] Norms can be defined as counterfactually stabilized (normative) behavioural expectations. The notion of law is introduced as congruently (i.e., in the temporal, objective, and social dimension) generalized normative (i.e., counterfactually stabilized) behavioural expectations. Finally, law is defined as structure of a social system:

> We can now define law as structure of a social system which depends upon the congruent generalisation of normative behavioural expectations. (Luhmann 1985, 82)

> Law must be seen as a structure that defines the boundaries and selection types of the societal system. Of course, it is not the sole societal structure; apart from law, we have to take account of cognitive structures, the media of communication, such as, for example, truth or love, and particularly, the institutionalisation of the scheme of societal system differentiation. However, law is essential as structure, because people cannot orient themselves toward others or expect

[3] A problem that one would have to deal with in empirical research is to provide a clear operationalization of this distinction. Normative expectations would entail all the feelings among which Ehrlich attempted to discriminate (like revolt, indignation, disgust, and disapproval). Cf. *supra*, 139ff.

their expectations without the congruent generalisation of behavioural expectations. This structure has to be institutionalised at the level of society itself, because it is only here that we can build beyond preconditions and create those establishments which domesticate the environment for other social systems. It therefore changes with the evolution of societal complexity. (Ibid., 105)

Ehrlich, who discussed various overtones of feelings in the case of "disappointment," i.e., the transgression of norms, based his definition of law on psychic events; and so does Luhmann. Both are confronted with the problem of how to move from the psychic to the social—in the case of Ehrlich from feelings to social associations ("*Verbände*") that form, according to Ehrlich, the basic elements of a society; in the case of Luhmann from expectations to structure. In his case the problem lies in the still mysterious mechanism(s) of generalization. This approach to the design of a theory changes after Luhmann's autopoietic turn.

(1) Law now is conceived of as a *system*, i.e., the legal system, and no longer as (the) *structure* of a social system. The term "structure" is no longer used systematically. The legal system (*L*) is one among many other social (sub-)systems like the political (*P*), the economic (*E*), the military (*M*) one, etc.
