[3] This only holds when subsets are identified in certain natural ways. How to characterise such subsets is a very difficult issue of the logic of probabilistic and defeasible reasoning, which we cannot address here (for some references, see Pollock 1995, 69ff.).

(1) the rule ⌈if one is pregnant, then one ought not to take more than two pills a day⌉ is more special than rule ⌈if one is an adult, then one may take up to three pills a day⌉;
(2) if a rule is more special than another rule, then it is preferable to the latter

---

(3) the rule ⌈if one is pregnant, then one ought not to take more than two pills a day⌉ is preferable to rule ⌈if one is an adult, then one may take up to three pills a day⌉

Table 7.8: *Preference inference based upon specificity*

in order to converge with our fellows in a shared way of addressing normative conflicts (see Chapter 12.4.1). And this common attitude is well-known to rule issuers too, who are likely to act on this assumption. Thus this attitude should also be adopted in order to respect the probable intention of the legislators and the way in which this intention is likely to be generally understood.

We cannot here discuss any further the logical grounds of specificity defeat. For our purposes, it is sufficient to consider how specificity works, according to our notion of rebutting. For this purpose it is sufficient to assume that specificity determines preferability, that is, to adopt the meta-rule ⌈If one rule is more special than another rule, then the first rule preferable to the latter⌉. This enables a reasoner to perform inferences like the one in Table 7.8. When one has come to believe that the most specific rule is preferable to the more general one, one will also believe that the reason including the more specific rule is stronger than the reason including the more general rule, and will therefore view the first reason as strictly rebutting the second.

There are many legal contexts where we proceed according to the idea of specificity. For instance, when we learn that all contracts are binding for their parties, but that contracts concerning real estates are void unless they have written form, we understand that the second rule (and the inferences where it is used) is to prevail, thanks to its specificity.

Similarly when we read in a criminal code that a certain penalty is established for theft, and that a higher penalty is established for robbery we assume that the second provision is to prevail over the first one (since robbery is a specific kind of theft). Therefore in case one commits a theft which can be qualified as a robbery, we shall only apply the robbery rule.

In fact specificity plays a fundamental role in the structuring of legal knowledge. Thanks to the idea of defeat by more specific information, it is possible to structure legal knowledge into inheritance-hierarchies (Touretzky 1987; Horty 1999). By this we mean that is possible to have a hierarchy of legal concepts,

or *types* (as Pattaro, Volume 1 of this Treatise, calls them), going from more abstract concepts, such as the concept of a contract, to even more specific ones such as the concept of a sale, to more specific ones such concept of sale of goods, sale of goods to consumers, and so on.

Legal effects can then be attached to concepts at different levels in the conceptual hierarchy. More abstract concepts also cover the entities falling under more specific concepts (a sale contract is still a contract). However, defeat by specificity ensures that qualifications linked to more general concepts are only derived when they are compatible with qualifications linked to more specific concepts. Therefore, rules established for contracts in general will apply to consumer sales only if they are not overridden by incompatible rules concerning sales, or consumer contracts.

7.2.4. Checking Specificity

Notwithstanding the ubiquity of the idea of specificity, it is very difficult to exactly characterise what it means for a rule to be more specific than another rule.

This issue has been extensively discussed in artificial intelligence, where many approaches use specificity as the main or only criterion for solving conflicts between defeasible rules (see, among others, Poole 1985; Delgrande 1988; Simari and Loui 1992; Geffner and Pearl 1992). Examining the various techniques for embedding a specificity check into defeasible reasoning would require a level of technical detail that goes beyond the scope of this book. For our purposes it is sufficient to remark that usually the test for specificity consists in checking whether the precondition of one rule entails the precondition of the other rule. This means that for rule ⌈if A_1 then B_1⌉ to be more specific than rule ⌈if A_2 then B_2⌉ it must be that both of the following conditions obtain:

- in every case where A_1 is satisfied also A_2 is, and
- there is some case where A_2 is satisfied and A_1 is not.

For example, the rule that unwritten contracts concerning real estate are void (in Italian law) is more specific than the rule saying that any contract is binding for its parties. In fact every unwritten contract concerning real estate is a contract (being an unwritten contract concerning real estate entails being a contract) while the opposite is not the case (being a contract does not entail being an unwritten contract concerning real estate). Similarly, the rule saying that minors (people under age) cannot make contracts on their own is more specific than the rule that any person can make contracts (since being a minor entails being a person, while being a person does not entail being a minor).

There are a number of technical problems which are linked to performing a specificity check (see Prakken 1997, 141ff.), but what we need to stress here is that when lawyers speak of specificity they are referring to a broader (and

vaguer) concept, which is not limited to what emerges from a syntactically defined specificity-check. In particular, it seems that in some cases one needs to selectively identify—within the preconditions of the competing rules—what elements to focus on, for establishing specificity.

Consider, for example art. 7 and 8 or the European Data Protection directive:

Art. 7
[P]ersonal data may be processed [. . .] if:

a. the data subject has unambiguously given his consent; or
b. processing is necessary for the performance of a contract to which the data subject is party or in order to take steps at the request of the data subject prior to entering into a contract; or
c. processing is necessary for compliance with a legal obligation to which the controller is subject; or
d. processing is necessary in order to protect the vital interests of the data subject; or
e. processing is necessary for the performance of a task carried out in the public interest or in the exercise of official authority vested in the controller or in the interest of a third party to whom the data are disclosed; or
f. processing is necessary for the purposes of the legitimate interests pursued by the controller or by the third party or parties to whom the data are disclosed, except where such interests are overridden by the interests for fundamental rights and freedoms of the data subject which require protection under Article 1 (1).

Art. 8
1. [It is prohibited the] processing of personal data revealing racial or ethnic origin, political opinions, religious or philosophical beliefs, trade-union membership, and the processing of data concerning health or sex life.

When sensitive data (the types of data listed in Art. 8) are processed under the conditions listed in Art. 7, a conflict seems to arise: According to Art. 7 the data may be processed, while according to Art. 8 the data should not be processed.[4] It may seem that the solution is provided by specificity: specificity should favour Art. 8 over Art. 7 since the concept of sensitive personal data is certainly more specific that the concept of personal data in general (sensitive personal data are always personal data, while personal data may not be sensitive). Unfortunately this is not the case. Art. 7 makes the permission to process personal data dependent upon specific conditions (such as the fact that the data subject has consented) that do not necessarily hold for all sensitive data as specified in Art. 8: Sensitive personal data do not always fall under one of the conditions listed in Art. 8, and thus Art. 8 is not syntactically more specific than Art. 7.

[4] Further provisions of the data-protection directive, which we cannot consider here, specify particular conditions under which even sensitive data can be legally processed.

7.2.5. *Priority of Exceptions*

We need to distinguish specificity from the relation that exists between rules and exceptions. The latter consist in the fact that certain rules, let us call them the *principal rules*, establish certain conclusions, while other rules, called *exception-rules* or simply *exceptions*, contradict the conclusions established by the principal rules, in order to prevent these conclusions being established under certain conditions.[5] Exceptions are intended to prevail over principal rules, and thus, to strictly defeat them. However, exceptions often are not more specific than the corresponding principal rules.

Consider, for example, the criminal rules establishing that one is to be punished with various penalties when one commits various types of crimes (murder, manslaughter, theft, slander). There are various exceptions to these rules, such as those stating that one is not punishable if one acted in self-defence, or in state of necessity, or when one was incapable. Clearly such exceptions are not more special than any one of the criminal rules they are intended to counter.

Compare, for instance, the rule that ⌈one is not punishable if one acts in self-defence⌉, and the rule that ⌈one is to be punished with 30 years of imprisonment if one commits murder (intentional killing)⌉. The self-defence rule is not more specific than the murder rule. For this to be the case, it would be required that all cases of self-defence were also cases of intentional killing. Fortunately this is not always the case: Though it may happen that one kills others in self-defence, fortunately one can often defend oneself in other ways (only injuring the attacker, or damaging his or her property, etc.).

However it is clear that the self-defence provision is intended to prevail over the murder provision, and to defeat the conclusion that can be derived from the latter. Consider for instance the two inferences of Table 7.9 on the following page. It seems clear that inference $\mathcal{A}$ should defeat inference $\mathcal{B}$. The justification for this outcome is provided by the preference inference of Table 7.10 on the next page.

This preference inference exemplifies how, on the basis of the belief that a rule r_1 is an exception to a rule r_2, one is led to believe that r_1 is preferable to r_2. Accordingly, in our example, inference $\mathcal{A}$ strictly defeats inference $\mathcal{B}$ and emerges undefeated.

Unfortunately, we are unable to provide a precise and univocal check for identifying exceptions. However, some textual (syntactic) clues may be helpful:

- rules with negative conclusions often can be viewed as exceptions to rules with the corresponding positive conclusion;
- rules that follow, in the textual order, other rules having a complementary conclusion, often can be viewed as exceptions to the latter;

[5] On rules and exceptions, see, among others: Gordon 1988; Kowalski and Sadri 1990; Sartor 1993b; Winkels et al. 1999. The notions of a principal rule and of an exception-rule are not be understood in absolute qualifications. They are relational notions: Also an exception can have exceptions, in which case the exception is a principal rule with regard to its own exceptions.

Inference $\mathcal{A}$	Inference $\mathcal{B}$
(1) Tom intentionally killed Karl;	(1) Tom acted in self defence while killing Karl;
(2) if one intentionally kills another, then one is to be punished with 30 years of detention	(2) if one acts in self defence, then one is not punishable;
(3) Tom is to be punished with 30 years of detention	(3) Tom is not punishable

Table 7.9: *Principal rule and exception-rule*

(1) the rule ⌈if one acts in self defence, then one is not punishable⌉ is an exception to rule ⌈if one commits murder, then one is to be punished with 30 years of detention⌉;
(2) if one rule is an exception to another, then it is preferable to the latter

---

(3) the rule ⌈if one acts in self defence then one is not punishable⌉ is preferable to the rule ⌈if one commits murder, then one is to be punished with 30 years of detention⌉

Table 7.10: *Preference inference for exception*

- rules having a more restricted scope (though not being more specific in a strict sense) often can be viewed as exceptions to incompatible rules having a broader scope.

However, these textual clues are far from decisive: Establishing whether a rule is an exception to another rule is a problem of interpretation, which needs to be addressed according to the usual interpretation methods (on which, see Peczenik, Volume 4 of this Treatise, secs. 1.4 and 1.5).

7.2.6. Value-Based Priorities

Conflicts between incompatible syllogisms can also be adjudicated by considering what values are served by the competing rules. This leads us to an instrumental evaluation of rules: Rules are viewed as instruments to achieve certain objectives, to implement certain valuable goals in a satisfactory way (taking into account all relevant values). Accordingly, preference goes to the rules having the

better impact on the values at issue: This is what we call *value-based priority*, or *priority by axiology*. To use again a citation by Judge Holmes:

> behind the logical form lies a judgement as to the relative worth and importance of competing legislative grounds, often an inarticulate and unconscious judgement, it is true, and yet the very root and nerve of the whole proceedings. (Holmes 1897, 466)

From our perspective, however, this judgement too may be cast on a logical form. This is the form of *teleological inference*, which we have considered at various places in the preceding pages, starting in Section 1.3.2 on page 18. The difference with regard to the examples we have introduced above is that we are now comparing rules—general normative propositions (or instructions)—rather than specific determinations.

This means that in comparing rules we need to adopt to a certain extent a Kantian attitude: The evaluation of a rule should depend upon the benefit of its universal application (or at least upon the benefit of its application by the number of people which may reasonable be expected to adopt its), rather than upon the benefit deriving from its application by a particular person in a specific case. We need to consider whether one would wish that the rule one is adopting "should become an universal law" (Kant 1972, 84). This Kantian attitude can be limited by providing exceptions, to exclude the application of the rule under the circumstances where we know that it would be inappropriate to apply the rule.

We speak of the *value-impact* of a rule to refer to the positive or negative influence—on all relevant values—of its universal (or generalised) application. We can thus assume the following substantive priority criterion: If a rule has a value impact which is better than the value impact of another rule, then it prevails over the latter.

This leaves us with the task of deciding which rule has a better value-impact. As we have said above, this is a very difficult judgement, which can be made precise only under restricted circumstances, such as when one can apply the idea of Pareto optimality, and when values do not interfere with each other. Obviously, different values may be differently ranked when considered from different perspectives (for instance, according to different legal system, or to different ethical or religious traditions), and this assessment may lead to different comparative evaluations.

Consider for example, the situation of a judge who has to decide a case concerning the publication of a web page presenting and defending racist ideas.

This is a situation to which two conflicting rules may apply:

1. the rule that every one has the right to freely express one's opinions,[6] and

[6] As in the First amendment of the US Constitution, or in Art. 21 of the Italian Constitution.

2. the rule prohibiting the spread of racist theories.[7]

As is well known, this is a conflict that is adjudicated differently within different jurisdictions: US law tends to give primacy to freedom of speech, whereas the law of various European countries gives priority to the prohibition of racist and hate speech. Such a conflict emerged recently in a case concerning the sale of Nazi memorabilia through Yahoo (an Internet portal offering e-business services), which was prohibited in 2000 by a French judge (the Superior Court of Paris), and was allowed in 2001 by a US judge. Here is how district judge James Fogel (San Jose division), in deciding the case *Yahoo vs Ligue contre le racisme et l'antisemitisme*, describes the differences between the French approach and the US approach.

> The French order prohibits the sale or display of items based on their association with a particular political organisation and bans the display of websites based on the authors' viewpoint with respect to the Holocaust and anti-Semitism. A United States court constitutionally could not make such an order [. . .]. The First Amendment does not permit the government to engage in viewpoint-based regulation of speech absent a compelling governmental interest, such as averting a clear and present danger of imminent violence [. . .].

A further complication concerning value-based priority is that one should not consider just consider which values are promoted by a certain rule, but also the degree to which these values are promoted.

Moreover, the comparison should only concern the impact of the concerned rules upon values at issue, rather the values in themselves. For instance, when comparing the rule that ⌈everyone is allowed to express one's opinion⌉ with the rule that ⌈everyone is forbidden from expressing racist views⌉, we should not compare abstractly the value of freedom of speech and the value of non-discrimination (and racial harmony). We need rather to consider whether the impairment of freedom of speech which is determined by the prohibition to express racist views is more important than the impairment of non-discrimination and racial harmony which is determined by allowing the expression of racist views.

The comparison may be further complicated by exclusionary rules, which prohibit from taking certain aspects or values into consideration when performing this comparative evaluation.

Finally we need to consider that value-based comparative evaluations become more complex (and tend to shift into unrestricted teleological reasoning) when we are not confined to two rules in conflict, but we need to examine whether alternative rules would provide a better value-impact than the two rules we are comparing. For example, when establishing whether a certain rule legiti-

[7] According to the UN International Convention on the Elimination of All Forms of Racial Discrimination, which establishes that States "Shall declare an offence punishable by law all dissemination of ideas based on racial superiority or hatred, incitement to racial discrimination."

mately limits a constitutional provision, not only we need to consider whether by endorsing the legislative rule (and assuming that it prevails in certain cases over the constitutional provision) we obtain an impact on to the satisfaction of constitutional values which is better than the result we would obtain by not having that rule. We may also need to consider whether a different rule would provide an even better result.

For instance, it may be argued that the principle of freedom of speech can be combined with a rule that prohibits racist theories being formulated in certain ways (in emotional terms, with incitements to hatred or aggressive behaviour, and so on). Such a selective prohibition would have the effect that such theories, being presented in an understandable form, can become the object of public political and scientific debate, where they can be defeated. The supporters of this solution would say that it entails a much smaller impairment of freedom of speech than the outright prohibition of any racist speech, while not damaging too much (and possibly even enhancing) the values of non-discrimination and racial harmony.

Following this line of thought, we cannot endorse neither the idea that freedom of speech unconditionally prevails over the prohibition to express racist views, nor the idea that the prohibition to express racist views unconditionally prevails over freedom of speech: We can rather say that only the prohibition to express racist theories in certain ways—in emotional terms, with incitements to hatred or aggressive behaviour, and so on—prevails over the principle of free speech.

7.2.7. Factor-Based Priorities

A conflict between rules can also be adjudicated by viewing the conditions of the two competing rules as expressing sets of competing factors. Preference goes then to the rule expressing a stronger set of factors. Which factors are stronger can then be decided by referring to the values that ground the recognition of a certain factor.

For instance, consider the following two rules:

1. it is forbidden to propagate private information;
2. it is allowed to propagate every piece of information having a public significance.

A piece of information about the private life of a person having a public role both concerns the privacy of an individual and has public relevance (assume, for example, that a photo of an actress or a politician is published in a newspaper), so that its propagation puts the mentioned rules into conflict.

To adjudicate the conflict the reasoner may move to factor-based reasoning, and view the antecedents of the two rules as two competing sets of factors, each pleading for the conclusion of the corresponding rule. Then the reasoner

may consider which set of factors more strongly supports its conclusion, and assume that the rule expressing a stronger set of factors is to be preferred. We shall not analyse any further this aspect, since we shall address it in the following: We shall extensively examine preferences between factors in Section 8.1 on page 221, and we shall address the link between rules and factors in Chapter 28.

7.3. Reasoning with Rule-Priorities

After considering various kinds of rule-priorities we shall consider what ways of reasoning are required for determining and using rule-priorities. In particular we shall analyse how can one deal with multiple priorities, general priorities and meta-priorities.

7.3.1. Multiple Priorities and Their Ordering

Priorities between rules establish an order over the concerned rules. On the basis of this order, weaker rules are to be applied only when there is no conflict with stronger rules. Let us consider an example from science-fiction, the famous *three laws of robotics*, which represent an essential component of the vision of Isaac Asimov:

1. A robot may not injure a human being, or, through inaction allow a human being to come to harm;
2. A robot must obey the orders given it by human beings except when such orders would conflict with the First Law;
3. A robot must protect its own existence as long as such protection does not conflict with the First or Second Law. (Asimov 1968, 8)

Asimov has expressed the priority relations between the laws of robotics implicitly, by including in the conditions for deriving the conclusion of each law the requirement that the law's conclusion does not clash against certain other laws (the ones preceding it in the list, which are implicitly assumed to be more important). This makes it unnecessary to reason about priorities, since the outcome of such reasoning—the conclusion that a rule is more important that another, and thus prevails in case of conflict—is already encoded within each rule. However, in a later work by the same author, a fourth rule is considered, the Zeroth (0th) Law, which is assumed to override all other rules:

0. A robot must not injure humanity, or, through inaction, allow humanity to come to harm.[8] (Asimov 1996, 496)

[8] The Zeroth Law allows (and requires) a robot to harm particular human individuals, when this is necessary to prevent damage to humanity.

By using the representational technique used by Asimov, the introduction of this further rule would require the modification of all the existing three: The First Law would need to include the proviso "except when there is a conflict with the Zeroth Law"; the Second Law, the proviso "except when there is a conflict with the Zeroth or the First Law"; the Third Law, the proviso "except when there is a conflict with the Zeroth or the First or the Second Law."

The necessity of making this reformulation was not the reason why Asimov's robots found it so difficult to use the Zeroth Law. This was rather due to a much more serious fact: Robots had great difficulty deciding when something was harmful to humanity since "A human being is a concrete object. Injury to a person can be estimated and judged. Humanity is an abstraction" (ibid.).

The way out was the attempt to unify humanity (and the ecology required to sustain it) in a unique super-organism, and this required endowing individuals with new cognitive capacities (making them capable of participating in each other's thoughts and feelings) and new motivational attitudes (so that they may value the super-organism to which they belong more than their own individuality). This is not the place for discussing Asimov's utopia (or nightmare). We need rather to focus on a much simpler issue, namely, the fact that, relying on preference-based reasoning, one may re-express Asimov's laws of robotics as follows:

0. A robot may not injure humanity, or, through inaction, allow humanity to come to harm;
1. A robot may not injure a human being, or, through inaction allow a human being to come to harm;
2. A robot must obey the orders given it by human beings;
3. A robot must protect its own existence;
4. Rules from (0) to (3) are preferentially ordered according to their numbers: Rule (0) is preferable to rule (1), which is preferable to rule (2), which is preferable to rule (3).

Note that the explicit order of rules, as we shall see in Section 26.4.2 on page 689, is to be extended according to transitivity: Since rule (0) is preferable to rule (1), and rule (1) is preferable to rule (2), then rule (0) is also preferable to rule (2). Given these assumptions, preference-based reasoning would naturally lead to the type of reasoning that Asimov would wish his robots to do.

For instance when being commanded to destroy itself by a human, a complying robot will come to believe that it ought to do this, form the corresponding intention, and start disassembling itself (this case is considered in another famous novel by Asimov, "The Bicentennial Man," see Asimov 1996, 186ff.), since the Second Law of obedience (and the conclusions following from it, like, in this case, the obligation to disassemble itself) takes precedence over the Third Law of self-preservation, according to order indicated in clause (4).

Moving now from science fiction to the real world, we can observe that besides cases where the order is implicit, there are also cases in which the law expressly states that certain rules are to be preferred to certain others. This is to induce preference-based reasoning, so that the legal reasoner can determine accordingly what rules are to be preferentially applied (according to rebutting defeat) when a conflict emerges. For instance, in Italy, in town planning regulations we can find a priority rule stating that rules intended to protect artistic buildings prevail over rules concerning town planning. Similarly, in the Netherlands, sec. 1637c of the Civil Code gives priority to statutory rules concerning labour contracts over statutory rules concerning any other type of contract (these examples are discussed in Prakken and Sartor 1996).

7.3.2. General Priority-Rules

Complex normative systems, besides preferences between particular rules, also contain *general priority-rules*, namely, meta-rules stating that between any rules having a certain type of relation a preference exists.

Priority rules have a general character, and may be used to adjudicate conflicts between all rules falling within their scope. They have different sources: Some have been expressly stated by legislators (like the Italian preference for rules on artistic heritage over rules on town planning), some express very traditional legal principles (like the preference for later or more specific rules over earlier or more general ones), some emerge from case law, as preferential *rationes decidendi*.

With regard to judicial creation, consider that general priority-rules adopted by judges to decide one case are frequently applied to new cases, although those cases do not directly concern the solution of the same substantial issue. Consider for example the *Simmenthal* case (1978), a famous decision of the European Court of Justice where EC law was said to prevail over national laws of the Member States, in order to solve a specific conflict between a particular European rule and a particular national rule. The *Simmenthal* ruling was later used in a number of cases in order to support the preference of other European rules against other national rules.

One of the most cited of such cases concerns Italian pasta. According to the Italian law, only products exclusively made with durum wheat could be merchandised under the name "pasta." However, products made with soft wheat were legally sold under the description "pasta" in other European countries. The European Court of Justice declared (in 1986, in a preliminary ruling on *Zoni*, an Italian criminal case) that such prohibition violated the European community law, being incompatible with the principle of the free movement of goods within the European community. This principle requires that goods that are legitimately sold in one Member State can also be sold in any other member State (there are some exceptions, which we cannot consider here). From

this decision (and the priority stated in the *Simmenthal* ruling) it follows that "pasta" products not made of durum wheat, merchandised in other European countries, may also be sold in Italy (nothwithstanding the Italian prohibition).

7.3.3. Meta-Priorities

As we have observed above, in legal reasoning there are various competing priority criteria. These criteria may lead to diverging results: According to criterion (priority rule) p_1, rule r_1 is preferable to rule r_2, but according to criterion p_2, r_2 is preferable to r_1. For example, it is very frequent that there is a conflict between the so-called *hierarchy principle*, according to which, as we have said above, rules issued by a higher source prevail upon rules emerging from a lower source, and the *posteriority principle*, according to which a later rule is preferable to an older one.

Fortunately, the idea of preference-based reasoning includes a way for dealing with such conflicts. In fact that priority rules behave exactly like any other legal rule, with regard to preferential reasoning: Also priority rules make their consequent dependent on the satisfaction of certain conditions, and also conflicts between priority rules can be solved according to priority reasoning, by considering which priority rule is preferable. For instance, it usually makes sense—both in common-sense reasoning and in the law—to assume that the hierarchical criterion prevails over the temporality criterion.

Consider the situation of little Tony, who was given by his mother the following instruction:

i_1: you must not go out while I am away

Assume that Tony, besides accepting the authority of his mother, is also ready to obey his older sister, who is in charge of him, though he believes that she is less important than his mother. Moreover, Tony believes that new instructions, both by his mother and his sister, override previous ones. Finally, assume that his sister, who would like to be left alone with her boyfriend, gives him the following instruction:

i_2: Tony, please, go out and get some milk

Tony believes that the comparative evaluation provided by the hierarchical principle:

mother's instruction i_1 is stronger than sister's instruction i_2

overrides (strictly defeats) the evaluation following from the chronological principle:

the later instruction i_2 is stronger than the prior instruction i_1

Tony therefore believes that ⌈i_1 is preferable to i_2⌉. Accordingly, the conclusion ⌈I am now forbidden to go out⌉, which he gets from i_1 (and his belief that his mother is now away), overrides the conclusion ⌈I now have to go out⌉, which he gets from i_2. This is how he comes to believe he is still forbidden to go out (regardless of the request of his sister).

Tony's reasoning is quite similar to the reasoning of a law-abiding citizen facing a conflict between a lower-level legal rule and higher-level one, for instance, between a statute and the Constitution, or between a regulation and a statute. Such reasoning is frequently left implicit, since one tends to focus on the antecedent issue of understanding the conflicting rules, and of assessing whether there is a conflict between them. However, once a conflict has been identified, preference-based reasoning can intervene to adjudicate it.

Consider for example, the situation of Lisa, who is involved in a charity concerned with the prevention of AIDS, and has participated in setting up an Internet site containing explicit information and images on the ways of transmitting AIDS.

Assume that such information was on Lisa's site when the Communications Decency Act of 1996 (CDA) was issued, which prohibited sending or displaying to a person under 18 of any message "that, in context, depicts or describes, in terms patently offensive as measured by contemporary community standards, sexual [...] activities or organs." She was aware that some images on her site were "patently offensive as measured by contemporary community standards" and that minors surfing the Internet were likely to access the site. However, she believed that (*a*) the need to respect other people's (and their children's) sensitivity was overridden by the need to protect people, and particularly minors, from AIDS infection (according to the values of life and health), but also that (*b*) spreading information on AIDS is covered by the first Amendment to the US Constitution, which gives her the freedom (the permission) to express her opinions. Under such conditions, it seems that the right attitude for Lisa was to continue to keep the information on her site, since the Constitutional permission was to be preferred to the statutory prohibition. Lisa's attitude was then confirmed by the decision of the US Supreme Court, in case *Reno vs American civil liberties union* (1966), which declared that the CDA indeed violated the first Amendment.

Note, however, that Lisa's preferential reasoning would have been correct (before the judicial decision), even if the Supreme Court had decided differently: Lisa may have been wrong in interpreting the Constitution, but not in assuming that it prevails over statutory rules.

Consider, for instance, the situation of Martin, who has published on his web-site results of his studies on how to decrypt DVDs, and believes that this too is a way of expressing his opinions, and falls under the protection of the first Amendment, though being prohibited by legislation. According to this belief, Martin is justified in keeping (at his risk) the information on DVD decryption on his web site.

Assume that the Supreme Court decides that such information does not fall under the first Amendment protection (or that the need to protect intellectual property though technical measures overrides free speech concerning ways of violating such measures). Martin might change his view, and adopt the belief that he ought not to publish decryption instructions. He might do that either because he believes that the supreme judges are better than him in making Constitutional evaluations (according to the idea of qualification-based delegation, which we discussed in Section 5.3.2 on page 163), or because he believes that citizens should sacrifice their view of the Constitution to the view of the Supreme Court, even when the Court is wrong, to contribute to a shared constitutional view (according to the idea of coordination-based delegation). Note that in any case Martin's deference to the Court does not entail that he was wrong in putting the Constitution above the legislation.

7.3.4. Reasoning with Priorities and Belief Revision

In the previous section, we assumed that we can continue to endorse rules leading to incompatible conclusions, while using preferential information to establish what conclusions to accept. For instance, we may continue to accept the general rule that copyrighted work ought not to be duplicated, though being convinced that there are cases where duplication is allowed by fair use prescriptions.

However, a different cognitive attitude may also be adopted. This is the attitude that consists in refusing to endorse conflicting rules: Whenever a conflict emerges, we modify the set of rules we are endorsing in order to obtain consistency. Thus, rather than viewing a weaker rule as being defeated in a specific context by a stronger incompatible rule, we would definitely reject it (expel it from our mind, or refuse to accept it), on the basis of its inconsistency with the stronger rule, and possibly we would try to modify our beliefs in a way such as to keep as much information as possible, while avoiding inconsistencies.

For example, we might solve the conflict between the prohibition to duplicate copyrighted works and the permission of making a fair use of them, by rejecting one of the two, and concluding that it is always forbidden or always permitted to duplicate copyrighted work. More sensibly we might try to rephrase the rule that ⌈copyrighted works ought not to be duplicated⌉, by merging it with the fair use exceptions (and all other possible exceptions), so as to obtain and memorise a rule saying that ⌈copyrighted works ought not to be duplicated unless the following conditions obtain ...⌉.

This latter view is at the basis of the approach that is called *belief revision*. We cannot here discuss the technicalities of belief revision, a complex logical and mathematical theory (for a technical introduction, see Gärdenfors 1987). Let us just observe that belief revision was originally developed specifically to deal with the dynamics of normative systems—with the decisive contribution

of the legal theorist and logician Carlos Alchourrón (Alchourrón and Makinson 1981)—and later became a major approach to deal with change in data-bases and knowledge-bases (Alchourrón et al. 1985). *Belief revision* has also been applied in various ways to the study of legal reasoning (see Alchourrón 1991; Sartor 1992, and for a critical discussion, Prakken 1997).

For our purposes, it may be sufficient to say that a legal reasoner adopting a belief-revision approach does not accept inconsistencies in the law, and rejects the inferior pieces of information that produce such inconsistencies. This would amount to assume that any piece of inferior information, when clashing with more important information is considered to be *derogated*, rather than *defeated*.

It appears that this approach is frequently adopted when there is a conflict between a higher-level norm and a lower-level one (as in conflicts between statutes and legislation).

On the contrary, belief revision is not appropriate to the conflicts between more general rules and more specific ones: In such situations the more general rules continue to govern the cases that are not covered by the more specific rules.

It is very hard to find a general way of choosing between belief revision and defeasible reasoning. It may, however, be useful to go back to the analysis of the incompatibility between rules of Ross (1965, 128ff.), who distinguished cases when the scope of one rule completely covers the scope of another rule (total-partial incompatibility) from the situation when there is only a partial intersection between the scopes of two rules (partial incompatibility). Accordingly, we can distinguish the following situations:

- *Partial priority collision.* The scope of the preferred rule is strictly included in the scope of the weaker rule (the weaker rule is more general): Whenever the antecedent of the preferred rule is satisfied, also the antecedent of the weaker rule is satisfied, but the converse does not hold. In such a context it seems that the weaker rules should survive. The reasoner should continue to endorse it, and should continue to apply it when this is allowed by priority defeat (when there is no conflict with the stronger and more special rule).[9]
- *Total priority collision.* The scope of the preferred rule completely covers the scope of the weaker one (whenever the antecedent of the weaker rule is satisfied, also the antecedent of the preferred rule is satisfied), so that priority defeat would never allow for the application of the weaker rule. In such a context it seems that one should view the weaker rule as being derogated or invalid.

When there is a partial intersection between the scopes of the two rules (there

[9] As an example of the first type of conflict, consider the relation between a rule forbidding unauthorised duplication of computer software and a rule saying that users are allowed to make a back-up copy without authorisation (according to the European directive on software protection).

are possible cases when only the antecedent of the first rule is satisfied, and possible cases where only the antecedent of the second rule is satisfied) it is impossible to state a precise policy. We may just say that that the smaller the intersection, the higher the tendency to continue to endorse the weaker rule.

In any case, such quantitative consideration also needs to be connected to a substantive evaluation: If the stronger rule is inspired by an appreciation of the relevant values that is incompatible with the evaluation which supports the weaker rule, then this pleads for rejecting the latter, according to the idea of (teleological) coherence.

Chapter 8

PREFERENCE-BASED REASONING: FACTORS

After applying preference-based reasoning to rules (in Chapter 7), we shall bring it to bear on *factors*. This will allow us to address some important patterns of normative reasoning, and in particular, to analyse *a fortiori* reasoning. Finally, we shall consider how preferential reasoning approaches combinations of reasons, rejecting the idea that reasons having the same conclusions accrue, that is, add their preferential strengths.

8.1. Reasoning with Factors

Factors pointing to opposite directions need to be compared and evaluated, in order to establish what outcome is indicated by their combination.

One possible approach consists in relying on teleological rationalisation, that is, in ascending to the values that are promoted or impaired by recognising certain factors or certain combinations of them. Then we can assume that the comparison of the factors reflects the relative importance of the corresponding values.

However, one should not rely too much on teleological reasoning, which should be used for rationalising and fixing the outcome of intuitive evaluations, rather than as an autonomous source of practical determinations (see Chapter 28). It is more promising to appeal to precedents, and transfer to new cases the evaluations that were made in the past, as we shall see in next sections. First we shall introduce an example and examine some plausible reasoning moves, and then we shall try to provide a theory that synthesises these moves. Finally, we shall extend our model with reference *dimensions* (scalable factors).

8.1.1. An Example in Factor-Based Reasoning

The following example addresses the issue of whether one's stay in another country changes one's fiscal domicile with respect to income tax (the example is adapted from Prakken and Sartor 1998).

We indicate the direction of the factors with arrows. In general, we write $F{\uparrow}^{\varphi}$, to indicate that factor F favours outcome φ, while we write $F{\downarrow}^{\varphi}$, to indicate that factor F disfavours outcome φ. However, since in our example we are only concerned with one outcome (the change in fiscal domicile) we shall leave

Pro-change factors	*Con-change factors*	*Decision*
long stay↑	domestic company↓	Change
	kept house↓	

Table 8.1: *The representation of case* $Prec_a$

Pro-change factors	*Con-change factors*	*Decision*
long stay↑	domestic company↓	?
minor assets↑	kept house↓	

Table 8.2: *Case* New_{a1}

the outcome implicit: We write $F\uparrow$ to indicate that F is a *pro-change* factor, and $F\downarrow$ to indicate that F is a *con-change* factor.

Assume that the following pro- and con-change factors can be identified in legislation, doctrine, or precedents:

- pro-*change* is that the taxpayer's house was given up [gave up house↑], while con-*change* is that the house was kept [kept house↓];
- pro-*change* is that the taxpayer's company is based in the foreign country [foreign company↑], while con-*change* is that the company is based in the old country [domestic company↓];
- pro-*change* is that the duration of the stay abroad is long [long stay↑], while con-*change* is that the duration is short [short stay↓];
- pro-*change* is that one has minor assets [minor assets↑] in one's country, while con-*change* is the fact that one has large assets there [major assets↓].

We do not presume that each factor receives a definite value in each case: For example, the duration may be neither long nor short, so that it does not push the decision in any direction.

Assume that a binding precedent $Prec_a$, which was decided for *change*, is characterised by the following factors: the taxpayer had a long duration contract for working abroad, was working for a domestic company, and kept his domestic house (see Table 8.1).

8.1.2. *Factor-Based* A-Fortiori *Reasoning*

Consider now the new case, let us call it New_{a1}, which is described in Table 8.2. The new case concerns a worker having a long-term contract for a domestic company, who kept his house and had small assets in his home country. We

Pro-change factors	*Con-change factors*	*Decision*
long stay↑	kept house↓	?

Table 8.3: *Case* New_{a2}

need to establish what we should conclude with regard to the new case New_{a1}, if we want to be consistent with decision in $Prec_a$ (in Table 8.1 on the facing page).

Observe that the $Prec_a$ expresses two messages:

- The first message is that its pro-factor [long stay↑] is sufficient for having a pro-*change* decision (unless defeated by contrary factors). This follows from the fact that a *change* decision was taken in $Prec_a$, where only this pro-*change* factor was present.
- The second message is that factor [long stay↑] outweighs the combination of con-factors [domestic company↓] and [kept house↓]. This follows from the fact that $Prec_a$ has decision *change*, though both these con-factors were present.

Let us see what is the relevance of these messages for New_{a1}. This case shares with $Prec$ one pro-*change* factors, i.e., [long stay↑], and also includes $Prec$'s con-factors [domestic company↓] and [kept house↓]. The only difference which emerges from the factor-based description of the two cases is that New_{a1} has one additional pro-*change* factor, namely, [minor assets↑].

It seems that a reasoner should conclude that also in New_{a1} the fiscal domicile has changed. In fact, if in $Prec$ [domestic company↓] and [kept house↓] were outweighed by [long stay↑] alone, *a fortiori* they should be outweighed when [long stay↑] is joined by an additional pro-*change* factor, [minor assets↑].

Let us consider now another new case, let us call it New_{a2}, which is described in Table 8.3. Assume that neither of [domestic company↓] or [foreign company↑] applies to New_{a2}, since the taxpayer is a free-lance worker. Thus, New_{a2} is characterised by only two factors, [long stay↑] and [kept house↓].

By comparing New_{a2} and $Prec_a$, we can see that New_{a2} contains the same pro-factors as $Prec_a$, i.e., [long stay↑] and only one of $Prec_a$'s con-*change* factors, i.e, [kept house↓].

Therefore, we may conclude that the message of $Prec_a$ also applies to New_2 and dictates the same outcome, i.e., *change*. In fact, if the pro-*change* factor [long stay↑] outweighed in $Prec_a$ the combination of the two con-factors [domestic company↓] and [kept house↓], *a fortiori* it should outweigh in New_{a2} just one of those con-factors.

8.1.3. Factor-Based Inference

Let us try to identify reasoning schemata that may licence the inferences we have just presented.

We can conclude that the facts of New_{a1} lead to the same conclusions as $Prec_a$, on the basis of the following idea: When the factors favouring a conclusion φ prevail over the factors against φ, then adding additional factors favouring φ (the winning conclusion) should not change the outcome of the comparison (but rather strengthen such outcome). This is the inference pattern we call *additive a fortiori*, and that we may describe as follows (we write $F{\uparrow}^{\varphi}$ to denote a set of factors all of which favour a certain conclusion φ, and $F{\downarrow}^{\varphi}$ to denote a set of factors all of which disfavour conclusion φ):

Reasoning schema: *Additive a fortiori*
(1) $F{\uparrow}^{\varphi}$ outweighs $G{\downarrow}^{\varphi}$; AND
(2) $F^*{\uparrow}^{\varphi}$ is at least as inclusive as $F{\uparrow}^{\varphi}$ ($F{\uparrow}^{\varphi} \subseteq F^*{\uparrow}^{\varphi}$)
——— IS A DEFEASIBLE REASON FOR
(3) $F^*{\uparrow}^{\varphi}$ outweighs $G{\downarrow}^{\varphi}$

Note that by a set of factors F being at least as inclusive than a set of factors F^*, we mean that F^* is a subset of F, namely that all factors in F^* are also be contained in F ($B \subseteq A$).[1]

On the basis of this inference, the reasoner believing that the only pro-factor of $Prec_a$ could outweigh the two con-factors of that case, will conclude that also the couple of pro-factors of New_{a1} (including the pro-factor of $Prec_a$) should *a fortiori* outweigh the same couple of con-factors.

This will lead one to conclude that the inference one can make by referring to these pro-factors (according to reasoning schema *factor-based inference*, cf. Section 6.2.2 on page 183) strictly defeats any inference one can make appealing to the con-factors.

There also is a different situation in which a precedent's outcome *a fortiori* dictates the decision of a new case: The new case rather than having more factors favouring the precedent's outcome, has fewer factors against that outcome: We can conclude that the facts of New_{a2} also lead to the same outcome as $Prec_a$ according to the idea that when a set of factors favouring conclusion φ outweighs a set of factors against φ, then the outcome should not be changed (but rather strengthened) by eliminating factors against the winning conclusion.

[1] We shall use the usual set operators in their usual meaning: $a \in B$ means that a is an element of of B (a is contained in B); $A \subseteq B$ means that A is a subset of B (all elements of A are also elements of B); $A \subset B$ means that A is a strict subset of B (all elements of A are elements of B, but some elements of B are not contained in A), $A \cup B$ is the union of A and B (the set of all elements belonging to A or to B); $A \cap B$ is the intersection of A and B (the set of all elements belonging to both A and B).

This is the inference pattern we call *subtractive a fortiori*, which we describe through the following reasoning schema:

Reasoning schema: *Subtractive a fortiori*

(1) $F{\uparrow}^{\varphi}$ outweighs $G{\downarrow}^{\varphi}$; AND
(2) $G^{*}{\downarrow}^{\varphi}$ is no more inclusive than $G{\downarrow}^{\varphi}$ ($G^{*}{\downarrow}^{\varphi} \subseteq G{\downarrow}^{\varphi}$)
——— IS A DEFEASIBLE REASON FOR
(3) $F{\uparrow}^{\varphi}$ outweighs $G^{*}{\downarrow}^{\varphi}$

Note that by a set of factors A being no more inclusive that a set of factors B, we mean that A is a subset of B, i.e., that all elements (all factors) in A are also be contained in B.

The two inference patterns can be merged into reasoning schema *bidirectional a fortiori* which covers the two cases:

Reasoning schema: *Bidirectional a fortiori*

(1) $F{\uparrow}^{\varphi}$ outweighs $G{\downarrow}^{\varphi}$;
(2) $F^{*}{\uparrow}^{\varphi}$ is at least as inclusive as $F{\uparrow}^{\varphi}$; AND
(3) $G^{*}{\downarrow}^{\varphi}$ is no more inclusive than $G{\downarrow}^{\varphi}$
——— IS A DEFEASIBLE REASON FOR
(4) $F^{*}{\uparrow}^{\varphi}$ outweighs $G^{*}{\downarrow}^{\varphi}$

The *a fortiori* conclusion is defeasible, since there may be interference between the factors: It is possible that certain factors individually favour a certain outcome, but do not favour this outcome in their combination. As a common sense example where this happens, consider the following combination of factors. The fact that the weather is hot may favour the conclusion that one should not go jogging. Similarly, the fact that it is raining also favours the conclusion that one should not go jogging. However the combination or hot weather and rain can meet one's tastes and indeed be a reason for one to decide to go jogging (for a discussion of this example, see Prakken and Sartor 1996).

8.1.4. From Binary Factors to Dimensions

By playing with factors different patterns of analogical reasoning can be obtained. For example, we can assume that normally by substituting a pro-φ factor f in a set of factors $F{\uparrow}^{\varphi}$ with another pro-φ factor f^{*} having a strength which is not inferior to the strength of f, one should obtain a set of factors $F^{*}{\uparrow}^{\varphi}$ which has a strength which is not inferior to the strength of $F{\uparrow}^{\varphi}$.

Assume that a new case New_3 is exactly equal to a previous case $Prec$, except that New_3 exemplifies f^{*} rather than f. If $Prec$ was decided for φ, then *a fortiori* New_3 should also have decision φ.

We cannot here explore the multifarious patterns of analogical reasoning that can be obtained by using factors. We shall rather focus on the relationship between *binary factors* and *dimensions* (scalable factors).

Categorising a situation as exemplifying or not certain binary factors is a superficial way of understanding how a the features of that situation favour a certain outcome. In many cases, a binary categorisation results from transforming a deeper dimensional structure into a binary alternative, as we have observed in Section 6.2.1 on page 182 (see Bench-Capon and Sartor 2003; Bench-Capon and Rissland 2001).

Consider for example binary factor [long stay↑]. When looking at a case through this category we are only able to say whether the employment contract abroad has a long duration or not—all long durations being considered in the same way. On the contrary, a more refined analysis of the situation would lead us to identify a *continuous dimension*, the duration of the stay abroad, denoted as [duration of stay]:

- the longer the stay, the more a *change* decision is favoured,
- the shorter the stay, the more a *no-change* decision is favoured.

The dimension [duration of stay] favours a *change* or a *no-change* decision with a strength that varies continuously, along with the duration of the stay. There is a turning point or threshold—level 0, on the y axis, which corresponds to a duration of two years—where the dimension switches direction. Figure 8.1 shows how, as the stay abroad gets longer, it increasingly favours the change in fiscal domicile. Note that the Figure 8.1 on the facing page represents a linear relationship: It shows a fixed proportion between the quantity of the dimension's property (the duration of the stay) and the strength of the dimension's propensity (its ability to favour *change*). This is not generally the case—we would have to draw a curved line, rather than a straight one, to provide a more accurate representation of this connection—but for our purposes a linear relationship is an adequate approximation.

Besides continuous dimensions, there may be discrete dimensions, concerning a property that may only assume discrete values. For example, higher marks in exams may increasingly favour giving a grant to a student, or the number of children in a family may increasingly favour giving the family an allowance.

Moving to a binary representation, we obtain a coarser and simplified view of the matter, where a gradual increase is transformed into a yes/no question: All stays below a certain threshold (one year and a half) are equalised as instances of the [short stay] factor, while all stays above a certain duration (two years and a half) are equalised as instances of the [long stay] factor (see Figure 8.2 on the next page). The durations in between one year and a half and two years and a half are equalised as being indifferent to the change issue: they promote neither *change* nor *no-change*.

The transformation of dimensions into factors pertains to the strategies of

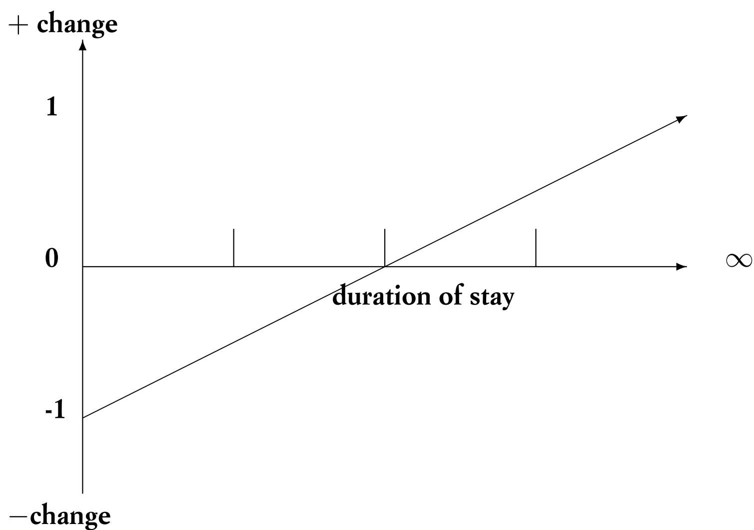

Figure 8.1: *The* [duration of stay] *dimension*

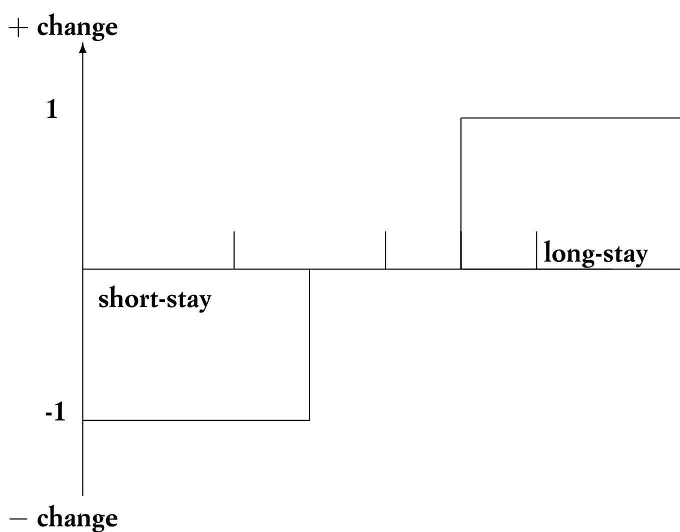

Figure 8.2: *The* [long stay] *factor*

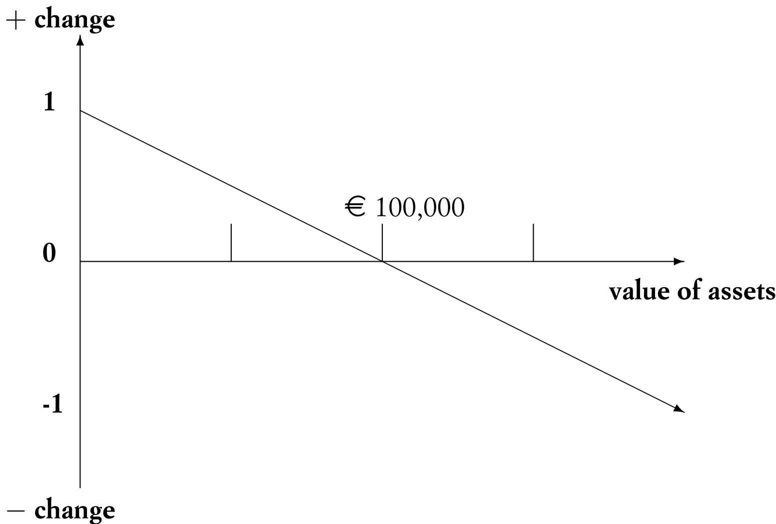

Figure 8.3: *The* [Domestic Assets] *dimension*

bounded rationality: It is a way of simplifying the analysis of complex situations in order to make them tractable. In particular, looking at a set of cases as instantiating or not instantiating certain factors allows one to perceive at a glance their relevant commonalities and differences. The need that lawyers look at social reality in a tractable way, refraining from impracticable distinctions is a real one, which has inspired many legal theorists, from François Gény (see Gény 1924) to Oliver Wendell Holmes. However, the conclusion one may reach by only looking at binary factors may be strengthened or questioned by going back to the finer grid of the underlying dimensions.[2]

For better analysing this issue let as add the new dimension [Domestic Assets], which is represented in Figure 8.3: As the value of the assets (indicated on the x-axis) one has in one's own country increases, the support for a change in the fiscal domicile decreases. The turning point is located at € 100,000.

Let us analyse the example cases of Table 8.4 on the next page. Consider $Prec_b$, which was decided for *change*, and where the taxpayer had a 4-year work contract and assets of 140,000. It seems that we may extract two messages from this decision:

1. level 4 along [duration of stay] is sufficient to produce *change*, and

[2] On the relation between factors and dimensions, see Ashley and Rissland 1988; Bench-Capon and Rissland 2001; for a discussion of the way of passing from the ones to the others, see Bench-Capon and Sartor 2003.

Cases	*Duration of stay abroad*	*Amount of domestic assets*	*Decision*
$Prec_b$	4 years	€ 140,000	*change*
New_{b1}	5 years	€ 140,000	*change a.f.*
New_{b2}	4 years	€ 120,000	*change a.f.*
New_{b3}	4 years	€ 150,000	*distinguish*
New_{b4}	3 years	€ 120,000	*distinguish*

Table 8.4: *Dimensional comparison*

2. this level is sufficient to outweigh the pressure against *change* provided by having € 140,000 of [domestic assets].

Let us now consider the other cases in Table 8.4:

- Case New_{b1} has an easy answer with regard to $Prec_b$: since the duration of the stay abroad is longer (and gives a stronger pull toward change) while the assets remain the same, *a fortiori* New_{a1} should be decided for *change* (in the table we abbreviated *a fortiori* with *a.f.*).
- Case New_{b2} is covered by *a fortiori*, with reference to $Prec_b$: the same pull for change as in $Prec_b$ is contrasted by a smaller pull for no-change, due to the smaller level of the domestic assets (120,000 rather than 140,000).
- Case New_{b3} can be distinguished form $Prec_b$: In it a higher amount of domestic assets (150,000 rather than 140,000) provides a stronger pull for $no-change$. On the basis of $Prec_b$ we cannot tell whether a 4 years duration of the stay abroad still prevails and dictates the outcome. Thus the analogy with $Prec_b$ can be challenged.
- Case New_{b4} can also distinguished from $Prec_b$: it provides a smaller pull for change, due to the inferior duration of the stay abroad (3 years rather than 4), and also a smaller pull for *no-change*, due to the inferior amount of domestic assets (120,000 rather than 140,000). The precedent does not tell us which of these tendencies is going to prevail.

Assume now that the dimension [domestic assets] is factorised as shown in Figure 8.4 on the next page, that is, into factors [negligible domestic assets↑], spanning from 0 to € 75,000, and [substantial domestic assets↓], covering the span above € 125,000.

Let us now look at the cases in Table 8.4 according to the grid provided by the corresponding factors: [long stay], [short stay], [negligible domestic assets], [substantial domestic assets]. We get the representation of Figure 8.5 on page 231. Note that the chances of distinguishing have been lost: The fact that a dimension (for instance, [duration of stay]) is satisfied to different levels in two

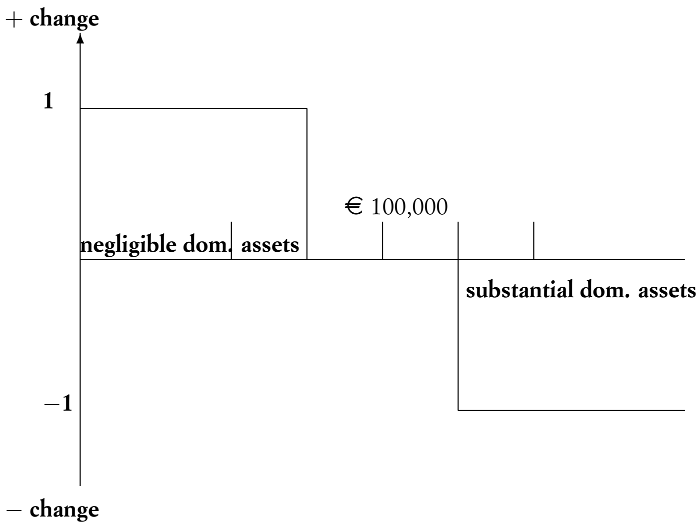

Figure 8.4: *The factors* [negligible domestic assets] *and* [substantial domestic assets]

different cases (for instance, the fact that the duration is 4 years in one case and 3 years in the other), does not matter, as long as the same factor ([long duration]) applies to both. Consequently, some cases of *a fortiori* reasoning we provided according to the dimensional representation have now become cases of identity of factors (as for case New_{b2}), while some possibilities of distinguishing (as for cases New_{b3} and New_{b4}) are now lost.

Only when the difference in the level of a dimension determines the application of a different factor, does this difference becomes relevant to a factor-based perspective. Case New_{b4} is particularly interesting in this regard. According to the factorial representation the inferior duration of the stay, which founded the distinction from $Prec_b$ (and justified not deriving the conclusion $change$, because of the inferior pull for $change$) has become irrelevant. On the other hand, the inferior amount of domestic assets, which provides a stronger pull for change is relevant, since is leads to the non-application of the con-change factor [substantial domestic assets] (which was not satisfied in $Prec_a$). In conclusion, since New_{b4} satisfies the same pro-change factor [long stay] which was in the $Prec_b$, but fails to satisfy the con-change factor [negligible domestic assets], it should *a fortiori* have decision $change$.

This example shows how moving from dimension to factors pertains to ampliative reasoning: It consists in a cognitive *jump* (see Peczenik, Volume 4 of this Treatise, sec. 4.3.2), based upon the unstated assumption that differences

Cases	*Duration of stay abroad*	*Amount of domestic assets*	*Decision*
$Prec_b$	long	substantial	*change*
New_{b1}	long	substantial	*change*
New_{b2}	long		*change a.f.*
New_{b3}	long	substantial	*change*
New_{b4}	long		*change a.f.*

Table 8.5: *Factorial comparison*

between dimensional levels are irrelevant, when covered by the same factor. The ability of making such a jump (and reason accordingly, with the advantages of binary reasoning), but also the ability to challenge the jump, on the basis of a dimensional analysis, is a very important aspect of legal rationality. As we shall see in Section 29.3 on page 765, the challenge may include the proposal of a different way of factorising the same dimension.

8.1.5. Dimension-Based Inference

Let us try to specify an inference schema similar to the one we have devised for factors, but that applies to dimensions and allows for the refinements that are required for capturing the argument moves we have just exemplified.

As we have observed, each dimension is characterised by the fact that it tends to promote certain outcomes to a certain extent, when it is satisfied up to a certain level. Thus, to describe a situation in terms of certain dimensions we need not only to specify what dimensions apply, but also to what level.

For example, in case of the dimension [duration of stay] we need to indicate how long the stay will be, and in the case of [domestic assets] we need to express the importance of such assets. Various scales may be applied, either discrete or continuous.

Let us introduce some notions that may facilitate our analysis of dimensions.

Definition 8.1.1 *Rightward dimensional outcome. We say that outcome O is the* rightward outcome *with regard to dimensions d, and write* $\overrightarrow{O_d}$ *if O is increasingly favoured as d's level increases.*

The denomination *rightward outcome* corresponds to the assumption that the quantity of a dimension is represented along the x axis, from left to right, as in Figure 8.1 on page 227 and Figure 8.3 on page 228. For instance, we may say that *change* is the rightward outcome of dimension [duration of stay] since, as the duration of the stay abroad increases, the outcome *change* is more strongly favoured.

Definition 8.1.2 *Leftward dimensional outcome. We say that outcome O is the* leftward outcome *with regard to dimensions d, and write* $\overleftarrow{O_d}$ *if O is increasingly favoured as d's level decreases.*

For instance, we may say that *no-change* is the leftward outcome of dimension [duration of stay], since, as the duration of the stay abroad decreases, the outcome *no-change* is more strongly favoured. Many dimensions can also be characterised by a pair of complementary outcomes, such that $\overrightarrow{O_d}$, the rightward outcome of d, is increasingly favoured by increasing degrees of d, and $\overleftarrow{O_d}$, the leftward outcome, is increasingly favoured by decreasing degrees of d. For example, with regard to dimension [duration of stay], *change* is the rightward outcome and *no-change* is the leftward outcome. On the contrary, with regard to dimension [domestic assets], *no-change* is the rightward outcome and *change* is the leftward outcome.

Assigning directions to outcomes (with regard to dimensions) allows us to specify when one outcome is more strongly supported according to a dimension.

Definition 8.1.3 *Dimensional support (along a dimension). For any couple of dimensional levels* l_1 *and* l_2 *of dimension d,* l_1 more strongly supports *outcome O than* l_2 *if :*

- $l_1 > l_2$*, in case that* $\overrightarrow{O_d}$*, and*
- $l_1 < l_2$*, in case that* $\overleftarrow{O_d}$*.*

The notion of a dimensional support allows us to define the comparative strength of sets of dimensions, at least in the uncontroversial case where one set is better with regard to one dimensions, and not worse with regard to any other (and there is no interference between dimensions).

Definition 8.1.4 *Dimensional strength (of sets of dimensions). Given a set of dimensions* $\Delta = d_1 \dots d_n$*, and two sets* D^1 *and* D^2 *of dimensional levels on* Δ*,* D^1 *is* dimensionally stronger *than* D^2*, with regard to outcome O if*

- *there is at least one dimension* d_i*, such that* d_i*'s level in* D^1 *more strongly supports O, then* d_i*'s level in* D^2 *does;*
- *for every other dimension* d_j*,* d_j*'s level in* D^1 *does not support O more strongly than* d_j*'s level in* D^2 *does.*

According to this definition, given a set of dimensional levels favouring outcome *change*, if we substitute a stay abroad of 2 years with a stay of 3 years, all the rest remaining equal, we obtain a stronger pull towards a *change* decision. The same result would be achieved by changing the taxpayer's domestic assets from € 100,000 to € 50,000.

Cases	*Duration of stay*	*Domestic assets*	*Decision*
$Prec_b$	4 years	€ 140,000	*change*
New_{b1}	5 years	€ 140,000	*change a.f.*
New_{b2}	4 years	€ 12,000	*change a.f.*

Table 8.6: *Dimensional* a fortiori

8.1.6. *Dimensional* A-Fortiori *Reasoning*

According to the ideas we introduced in the previous section, a dimension-based approach allows for subtler ways of reasoning *a fortiori*. We can indeed provide the following characterisation *dimensional a fortiori*, namely the outweighing relations between sets of dimensional levels, where D, D^*, H and H^* denote sets of dimensional levels over the same dimensions.

Reasoning schema: *Dimensional a fortiori (outweighing)*
(1) $D\uparrow^{\varphi}$ outweighs $H\downarrow^{\varphi}$;
(2) $D^*\uparrow^{\varphi}$ is at least as dimensionally strong as $D\uparrow^{\varphi}$;
(3) $H^*\downarrow^{\varphi}$ is not dimensionally stronger than $H\downarrow^{\varphi}$
——— IS A DEFEASIBLE REASON FOR
(4) $D^*\uparrow^{\varphi}$ outweighs $H^*\downarrow^{\varphi}$

In Table 8.6 you can see the dimensional evaluation of three of the cases we considered in Table 8.4 on page 229, and of which we proposed a factor-based evaluation in Table 8.5 on page 231. Precedent $Prec_b$ had decision *change*, with regard to a taxpayer who was to be abroad for 4 years and had domestic assets for € 140,000. The message of $Prec_b$ is that staying abroad 4 years supports *change* to such an extent as to outweigh the extent in which having domestic assets for € 140,000 supports *no-change*. Thus case New_{b1}, where one stays abroad for 5 years (providing a stronger pull toward *change*), and has domestic assets as in $Prec_b$ (€ 140,000) should *a fortiori* have decision *change*. The same conclusion should hold in case New_{b2}, where the taxpayer stays abroad for 4 years like in $Prec_b$, but holds assets for € 120,000 (which provides a lesser pull toward *no-change* than in $Prec_b$).

8.2. The Accrual of Reasons

We need now to address a very difficult issue in practical reasoning: Do reasons accrue, when do they support the same outcome? In this regard two different approaches, supported by different metaphors, exist, as we shall see in the following paragraphs

8.2.1. The Accrual Thesis

The first view is that reasons accrue: They work in sets, and large (more inclusive) sets of reasons are stronger than smaller (less inclusive) sets.[3] More reasons leading to a certain conclusion give a stronger support to that conclusion.

This is particularly relevant when we need to compare reasons favouring a certain conclusion and reasons against that conclusion. In such a case, according to the accrual idea, we need to collect all reasons for and against and compare the strengths of the two opposed teams.

This view is supported, at the metaphorical level, by the idea that reasons are *forces* or *weights*: Having more reasons going to the same direction leads to an increased effect, similar to that which one would obtain by having more forces pushing or pulling in the same direction, or by having more weights on the same scale: The strength of a set of reasons having the same direction needs to be computed by adding their individual strengths. In simplified quantitative terms: If R_1 and R_2 are reasons for conclusion q, and R_1 has strength 3 while R_2 has strength 4, then the combination of R_1 and R_2 leads to q with strength $3 + 4 = 7$.[4]

8.2.2. The Negation of the Accrual Thesis

The second view, on the contrary, is that reasons do not accrue. Each reason works separately, according its own schema. We may happen to endorse more than one reason leading towards the same conclusion. However, either it is possible to merge these reasons into a unique combined reason (which matches one of the available inference patterns), or the separate reasons have to operate each on their own, without being able to join forces. In simplified quantitative terms: If R_1 and R_2 are reasons for conclusion q, and R_1 has strength 3 while R_2 has strength 4, then the combination of R_1 and R_2 leads to q with strength 4 (the strength of the strongest of the two combined reasons).

This view may also be supported by other analogies, like the one expressed by a brilliant saying of Galileo Galilei:

> If discoursing about a difficult problem was like carrying weights, where many horses carry more sacks of wheat than only one horse, I would agree that many discourses would do more than one,

[3] By a larger set we mean here a more inclusive one: A set S_1 is larger than set S_2 when $S_2 \subset S_1$.

[4] The idea of reasons operate like forces has been analytically developed by Hage (1997), who, according to this analogy (ibid., 24ff., 78ff.), has developed a logic (reason-based logic) which is based upon the idea of collecting and weighing relevant sets of reasons (ibid., 130 ff.). While we agree that Hage's method is appropriate when dealing with factors (Hages's model anticipates indeed various aspects of the treatment of factors we discussed in Section 8.1 on page 221), we believe that a different approach is required when dealing with rules, or with heterogeneous reasons, as we shall argue in the next pages.

but discoursing is like running, and not like carrying, and one only Barbary horse can run quicker than one hundred Frisian ones. (Galilei 1960, par. 45)

The latter view is adopted, for example, by Pollock (1995, 101f.), who, though admitting the intuitive appeal of accrual, concludes that reasons do not accrue:

Cases that seem initially to illustrate such accrual of justification appear upon reflection to be better construed as cases of having a single reason that subsumes the two separate reasons. [...] If we have two undefeated arguments for a conclusion, the degree of justification is simply the maximum of the strengths of the two arguments.

8.2.3. A Terminological Clarification

It is not easy to see clearly how one can find a reasonable and uncontroversial solution to the accrual dilemma. Are reasons like weights or like horses? Can many light reasons outweigh a heavy one by joining their weights, or will many slow reasons be left behind a quick one?

The issue becomes clearer if we distinguish the different senses in which one may speak of a *reason*.

The first way of using the notion of a reason is for denoting any mental state (or, if you prefer, the corresponding noema or fact) that may, in combination with other similar states (noemata or facts) support a certain conclusion. This corresponds to what we have specifically called a *subreason*. For instance, the proposition ⌈Tom intentionally damages another⌉ is a subreason for concluding that Tom is liable, and the rule ⌈If one intentionally damages another, then one is liable⌉ is another subreason for drawing this conclusion. It cannot be doubted that subreasons need to merge in order to lead to conclusions: Only by merging them appropriately with other subreasons do they form a complete reason. However such merging needs to take place in such a way that the resulting combination of subreasons satisfies one reasoning schema (like *syllogism*). One cannot take whatever subreasons, each partially satisfying a different schema, and add them in order to get a stronger reason.

The second way of using the word *reason* consists in referring to a *complete reason*, namely, to a combination of mental states (or, is you prefer, noemata or facts) that is sufficient to lead to a certain conclusion, representing the input to a reasoning schema. According to this second notion of a reason, neither of ⌈Tom intentionally damages another⌉ and ⌈if one intentionally damages another, then one is liable⌉ is a reason for concluding that ⌈Tom is liable⌉. These are just *subreasons* and only their combination provides a reason, according to schema *syllogism*.

Here we follow the second terminological choice: A subreason that does not provide the whole precondition of a reasoning schema is no reason for us. Thus,

the issue we have to discuss is whether two reasons (full reasons) have a strength that is superior to the strength of each one of them.

8.2.4. Merging and Adding Reasons

In some cases, as Pollock (1995) observes, we have the impression that concurrent reasons add their strengths, but on a closer look, we see that this happens because these reasons are merged into a reason which still matches one of our reasoning schema. But then we can forget about the separate full reasons and only consider the new full reason that results from merging their components.

Assume that according to *teleological inference* I form the intention to perform action A, believing that A is a satisfactory way to achieve goal G_1, and I also form the intention to perform the same action A, believing that A is a satisfactory way to achieve goal G_2. It may seem that in such a case the two inferences join their strengths, producing a stronger push toward doing A.

For instance, assume that I have the goal of getting good food, which leads me to form the intention of going to restaurant r_1 since this is a satisfactory way for me to get good food, and I have the goal of getting good wine, which also leads me to form the intention of going to r_1 since this is a satisfactory way for me to get good wine. Similarly, assume a judge is aware that forbidding spamming (sending unwanted advertisements) on the Internet has two effects: on the one hand it protects Internet users from an unwanted trespass to their private sphere, and on the other hand it contributes to promoting the use of the Internet and thus to developing the Internet economy.

It may seem that in both cases we should perform two inferences, one per each goal at issue, and that such inferences will join their strengths, producing a stronger intention of performing the action both of them indicate (the action of going to restaurant r_1 in the first case, and the action of prohibiting spamming in the second).

However, we may doubt that this picture is accurate. For instance, in the restaurant case, it seems that I should rather view myself as having the combined goal of ⌈getting good food and getting good wine⌉. I should there select the action most appropriate to achieve this combined goal just though one teleological inference. The advantage of this way of thinking is that it leads one to focus on the connections between the two goals: For instance, if I only have the money for doing one of the two things (for eating or for having a bottle of good wine), it would be irrational to join the strength of the two intentions of going to restaurant r_1 (I would rather go to the cheaper restaurant r_2 where food and wine are not as good, but where with my money I can have both). Thus, it seems that rather than adding the forces of the two inferences $\mathcal{A}$ and $\mathcal{B}$ of Table 8.7 on the next page (or, if you prefer, adding the weights of the two goals), one had better merge the two inferences into inference $\mathcal{C}$ (or, if you prefer, merge the two reasons into one combined reason).

	Inference $\mathcal{A}$		Inference $\mathcal{B}$		Inference $\mathcal{C}$
(1)	I have the goal of having good food;	(1)	I have the goal of having good wine;	(1)	I have the goal of having good food and having good wine;
(2)	going to restaurant r_1 is a satisfactory way of having good food	(2)	going to restaurant r_1 is a satisfactory way of having good wine	(2)	going to restaurant r_2 is a satisfactory way of having good food and good wine
(3)	I intend to go to restaurant r_1	(3)	I intend to go to restaurant r_1	(3)	I intend to go to restaurant r_2

Table 8.7: *Adding teleological inferences or merging them*

	Inference $\mathcal{A}$		Inference $\mathcal{B}$		Inference $\mathcal{C}$
(1)	w_1 said that Mary shot John;	(1)	w_2 said that Mary shot John;	(1)	w_1 and w_2 said that Mary shot John;
(2)	if w_1 says something then it is likely to be true	(2)	if w_2 says something then it is likely to be true	(2)	if w_1 and w_2 say something then it is likely to be true
(3)	Mary shot John	(3)	Mary shot John	(3)	Mary shot John

Table 8.8: *Adding factual inferences or merging them*

The same considerations seem to apply also to the formation of factual beliefs (see Table 8.8). Assume that two witnesses w_1 and w_2 declare that they have seen Mary shooting John. Assume that a third witness, w_3 says, instead, that Mary was with him at the time when the shooting took place. Assume that there is no ground to doubt their testimonies (except for the fact that they are incompatible). Also in this case it seems that, rather than making two separate inferences and adding their strengths, I had better merge those inferences into one, and take this into consideration. Merging the two inferences will lead me to take into account the possible interference of the facts upon which they are based. For example, I may know that the two witnesses had an interaction, so that one may have influenced the other. The likeness that what both of them say is true is not necessarily obtained by separately establishing what is the likeness that each one is true, and summing up the results.

The idea that, rather than adding the weights of reasons, we should merge

Inference $\mathcal{A}$	Inference $\mathcal{B}$	Inference $\mathcal{C}$
(1) educational use favours fair use;	(1) non-commercial use favours fair use;	(1) educational use and non-commercial use favour fair use;
(2) distributing reading material to students is educational use	(2) distributing reading material to students is non-commercial use	(2) distributing reading material to students is non-commercial and educational use
(3) Fair use is favoured	(3) Fair use is favoured	(3) Fair use is favoured

Table 8.9: *Merging factors*

converging reasons into one combined reason also applies to factors. Rather than making separate inferences for each factor favouring the same outcome, and then adding the strengths of those inferences, one had better build just one inference that considers all factors supporting the same conclusion (see Table 8.9).

The primacy of the idea of merging reasons over the idea of adding their strengths is confirmed by the fact that when reasons cannot be merged, then it does not make sense to add their strengths: Whenever, by combining two separate reasons, we obtain no reason—since the result does not match any reasoning pattern—it seems unreasonable to add the strengths of the two inferences.

For example, it does not make much sense to add the strengths of a *normative syllogism*, and of *teleological inference*.

First of all this may lead to *double counting*: The goals one aims at achieving in adopting the behaviour that is required by a rule may be the grounds supporting the adoption of the rule.

For instance, assume that George is considering whether he is allowed or not to smoke in his office: (*a*) There is a rule which prohibits smoking in public buildings, in order to promote the value of *health*, but (*b*) he believes that other values, namely *freedom* and *autonomy* (as self-determination), require that one is allowed to smoke in one's own working space.

Under these conditions, one might consider that there are two grounds which support the conclusion that George is prohibited from smoking: the no-smoking rule and the value of *health*. Thus, one should put on one pan of the balancing scale the no-smoking rule plus *health* and on the other pan *liberty* and *autonomy*. Assume, for simplicity's sake that each element on the scale has weight 1. It seems that there is a perfect equilibrium: two units of weight for *smoking-allowed* and two units for *smoking-forbidden*.

However, the result is questionable since the value *health* influences in two

different ways the outcome *smoking-forbidden*: on the one hand as a subreason directly supporting *smoking-forbidden*, and on the other hand as a subreason for adopting the no-smoking rule (which in its turn is a subreason for concluding *smoking-forbidden*). Thus, while values *liberty* and *self-determination* have each one been counted for their weight, which is 1, *health* has been counted for the double of its weight: besides the weight 1 of health itself we have added the weight 1 of the non-smoking rule, though this rule was only adopted as a way of advancing the value of health.

More generally, we doubt that the additive approach contributes to clarify George's thoughts. Similarly, we doubt that he would get any clarification by the idea that the no-smoking rule is an exclusionary reason with regard to the values for or against a permission to smoke, so that if he endorses this rule, he should not take values into consideration.

A better solution would be for George to approach the situation by making two distinguished independent inferences:

1. the first inference is a *normative syllogism*, concluding that he ought not to smoke, according to the no-smoking rule;
2. the second inference is a *teleological inference*, concluding that he can smoke in his office, according to the values he sees as proper to his legal system.

Then, he will have to consider which one of these two inferences is stronger, and behave accordingly.

As a further step to be eventually taken on the basis of this assessment, he might (if he sees this as opportune) update his normative beliefs to prevent future conflicts between *syllogism* and *teleological inference*. For example he may recognise a general exception to the non-smoking rules, for the case where nobody else is in a smoker's office. This second step, however, is a rationalisation that has to be performed only when this appears to be opportune (and likely to be endorsed also by George's fellows, see Section 10 on page 267).

Also when we two normative syllogism lead to the same conclusions, it does not seem that such syllogisms may be added to get a stronger pull towards their outcome. In particular it does not seem that the merged strengths of two weaker syllogisms can override a syllogism that prevails singularly over each one of the weaker syllogisms. For instance it does not seem that by adding the weight of various statutory rules that are inconsistent with a constitutional rule, one may obtain a set of inferences that prevail over the inference one may derive from the constitutional rule.

The same happens for exceptions. Assume, for instance, that Tom attempts to rape Laura while she is visiting him, and in order to defend herself, she hits him with a precious vase, both destroying the vase and hurting him, and finally she profits from his resulting state of unconsciousness to lock the door, run away and call the police. It would be strange to argue that the self-defence

exception (saying that one is not liable when one is trying to defend oneself), though prevailing over each one of the single prohibitions Laura has violated (the prohibition to damage property, to harm people, to imprison them) does not prevail over their combination, so that Laura is to be considered to be criminally liable for such actions. Common sense tells us that the fact that Laura was attempting to defend herself against a serious aggression overrides all such prohibitions, regardless of the fact that they come together. It may certainly be said that some actions she performed to defend oneself were excessive, or no longer required since the offender no longer was a real danger: This depends, however, on the comparative balance of all values at stake, and on the existing factual situation (thus, it depends on teleological reasoning), it does not depend on the number of rules one has violated.

In conclusion, we reject the idea that separate reasons add their strengths or weights. Either they can be merged into one combined reason, or each one of them has to fend for itself on its own. Thus, we do not usually need to worry for excluding certain (sub)-reasons when balancing two conflicting reasons.

Thus, our approach provides a simple way for dealing with the problems of double counting: Explicit exclusion is unnecessary since the structure of reasoning schemata takes care that only appropriate materials form the opposing reasons. All materials that do not fit into a reason (according to the structure required by its reasoning schema) will not have any impact on the strength of that reason.

Chapter 9

MULTI-AGENT PRACTICAL REASONING

We shall now consider how a practical reasoner can rationally approach situations where other similar reasoners are involved. After examining what different concerns and points of view an agent may adopt, we shall analyse the ways in which the actions of different agents may interfere, focusing in particular in the dilemmas that characterise strategic interactions.

9.1. The Concerns of an Agent

We must distinguish different *ultimate concerns* an agent may have, and corresponding different focuses of the agent's practical reasoning. When one engages in practical reasoning, one is interested in the fate of certain entities, which are the objects of one's concern. The ultimate object of one's concern may consist in oneself, in certain other agents, in a collective (a group) of agents, or it may even include other types of entities (nature, the environment, cultural heritage, and so on). Here we distinguish the case where one is concerned with oneself, with others, or with collectives.

9.1.1. Three Types of Concerns

First of all an agent has what we may call *self-directed concerns*. When adopting this perspective, one distinguishes oneself from one's social and natural environment, and uses practical reasoning as a way of enhancing and preserving one's own condition. One has then self-directed likings: One likes having certain properties, or being in certain relations which other things. Consider for example how I may like the situation where I am having a good dinner, or more generally the situation where I am handsome, healthy, rich, admired, capable, and so on. Correspondingly, one adopts self-directed desires (desires to achieve the object of one's self-directed likings), chooses self-directed plans of actions to achieve those desires, and feels self-directed wants.

One may also have what we may call *other-directed concerns*. These consist in focusing on other agents, and in using practical reasoning to enhance the conditions of them. The other agents one is concerned about may be individually identified, or they may be characterised by certain properties of them (being my children, my relatives, my human fellows, sentient animals, and so forth). One has then other-directed likings: One likes the fact that certain other agents have

certain properties or are in certain conditions. Consider for example, how one may like the situation where one's children are happy, one's parents are healthy, where no human being is starving, where no sentient being is suffering, and so on. The agent having other-directed likings may form corresponding desires (for instance, the desire that people living in an underdeveloped country are not starving), adopt plans of actions to this purpose (the plan of making a donation), and feel the want to implement them (the want to make the donation).

Finally, an agent may have what we may call *collective-directed concerns*. These consist in focusing on the condition of a group of agents one belongs to (a collective).[1] When one takes a collective-concerned perspective, one views oneself just as a member of the collective one refers to, so that one's identity becomes irrelevant, though one's traits and actions may matter (as they would if they belonged to any other member of the collective), according to the criteria one adopts with regard to the collective. An agent having such concerns will have collective-concerned likings: Consider for example, how one may like that one's country has a booming economy, that its culture and science are flourishing, that its citizens participate in government, that they do not suffer poverty, and so on. The agent will consequently adopt collective-directed desires, select collective-directed plans, and feel collective directed wants.

9.1.2. The Construction of Collective-Directed Concerns

The idea of a collective-directed concern is neutral with regard to the content of this concern. In fact, it can be construed in various ways by different agents.

One possibility is that my collective-concerned preferences result from the self-concerned preferences of the individuals currently belonging to my collective: For instance, my highest preference may refer to the situation maximising the sum of the degrees of satisfaction of the self-directed preferences of all members of my collective (as in some variants of preference-utilitarianism). Another possibility is that I like my society to be organised as is suggested by Rawls (1999c), but not out of self-directed concerns under circumstances of ignorance (as in Rawls's original position), but from a collective-directed concern: I like that my collective be such that every member of it enjoys basic liberties and that its poorest people are as well-off as possible.

Still another possibility is that I like the common good as characterised by

[1] We use the term *collective* in a very generic sense, namely, to refer to any group of people having any kind of cooperation and common interest. To refer to collectives, we shall also the expression *community*, especially when we are referring to political collectives. We are not using the term *community* in the more specific sense of a collective characterised by strong personal and emotional ties, as in the famous opposition of community (*Gemeinschaft*) and society (*Gesellschaft*) due to the German sociologist Ferdinand Tönnies (see Tönnies 2001). Nor as we directly referring to specific communitarian theories of society and politics, though our model of legal reasoning will emphasise collective attitudes and commitments.

Finnis (1980, 154), that is, "securing a whole ensemble of material and other conditions that tend to favour the realisation, by each individual in the community, of his or her personal development." Finally, another option would consist in maximising equal basic capabilities, following the ideas of Sen (1997).[2]

On the other hand, one's collective-concerned preferences may also be focused on global features of one's collective, which are reducible neither to the self-directed nor to the other-directed preferences of its members (for instance, the preservation of the natural and cultural heritage of one's nation, its military power, its economic productivity, its excellence in arts and science). One's collective-concerned preference may also concern the fact that one's fellows conform to what one believes to be patterns of good life.[3] On the other hand, one may believe that a political community should be indifferent (or neutral) with regard whatever patterns of life individuals choose, out of respect for the autonomy of one's fellows, as in some liberal approaches.[4]

We cannot here enter into the controversial domain of normative political philosophy. Let us just say that it seems very difficult to reduce collective-concerned preferences (and values) to a unity, as Nozick (1989, 292) observes:

> There are multiple competing values that can be fostered, encouraged, and realised in the political real: liberty, equality for previous unequal groups, communal solidarity, individuality, self-reliance, compassion, cultural flowering, national power, aiding extremely disadvantaged groups, righting past wrongs, charting bold new goals (space exploration, conquering disease), mitigating economic inequalities, the fullest education for all, eliminating discrimination and racism, protecting the powerless, privacy and autonomy for its citizens, aid for the foreign countries. Not all of these worthy goals can be pursued with full energy and means, and perhaps these goals are theoretically irreconcilable also, in that not all good things can be adjusted together into a harmonious package.

Notwithstanding the difficulty indicated by Nozick, it seems that rationality requires that in framing one's concept of the collective interest one tries to fit into it and balance the (legitimate) interest of the individuals and the groups which are included into the collective, as well as those interests that can only be attributed to the collective as a whole.

[2] An interesting issue is whether my collective-concerned likings may also be a function of collective-concerned likings of members of my collective. Assume that in my collective there is large number of people who would like that everybody in their collective be vegetarian. Would this collective-concerned liking of other people provide me (even if I have no liking for vegetarianism) with a reason to like, from a collective-concerned perspective, that everybody is vegetarian? This issue, which we shall not consider further, is discussed by Dworkin (1977c, 234ff., 275ff.) and Hart (1983b, 208ff.), who take different views on the matter.

[3] Obviously, ideas on good life may be very different: Should we listen to classical music or to heavy metal, should we search for knowledge or live in ignorance, should we let our brain conditions be determined by the natural chemicals produced by the brain or should we use drugs to achieve the brain condition we prefer, should we cultivate cooperation or competition?

[4] Cf. Dworkin 1985b; see however, Raz 1986, and Finnis 1980, 221ff. For a recent discussion of the different views on the matter, see Verza 2000.

Besides the need to consider different collective-concerned values, the circumstances of human life expose the practical reasoner to a further source of conflicts: One may belong to different collectives (a family, an ethnic or religious community, a company, a university, a city, a region, a nation, humanity, and so on), so that one will needs to develop different collective-concerned perspectives, which can conflict one against another.

9.1.3. Reasoning and Collective-Directed Concerns

One may doxify the conative states one has, out of one's different concerns. Thus, one may ask oneself the following questions:

- What should I like for myself (what are my self-directed values)?
- What should I like for my fellows (what are my other-directed values)?
- What should I like for my collective (what are my collective-concerned values)?

These are different questions, to which a rational agent should provide independent answers. Similarly, one should distinguish what desires, plans and wants one should have (are acceptance-worth) out of one's concern for oneself, for others, and for one's collective.

The process of practical reasoning for an agent having other-directed or collective-directed concerns still corresponds to the model we have described in the previous chapters: One adopts desires to achieve what one likes (for one's community), find plans to satisfy those desires, adopts intentions of realising the instructions in those plans, wants to perform the actions indicated by those instructions. In this reasoning process, however, only conative states functional to certain concerns are reasons for adopting lower level conative states that are functional to the same concerns.

Thus, only my collective-concerned likings (values) are reasons for adopting collective-concerned desires, only my collective-concerned desires are reasons for adopting collective-concerned intentions, only my collective-concerned intentions are reasons for having collective-concerned wants. When one views one's self-directed conative states to be reasons for adopting collective-concerned conative states, one reasons irrationally (as far as its collective-concerned deliberation is concerned).

Assume that I am working for a public agency, and that I am offered a bribe to make a contract (in the name of my agency) with company x, though company y is providing more favourable terms. The fact that I would get a bribe from company x is no reason for intending to make the contract with company x, out of my collective-directed concerns. It is rather a reason for intending to make a contract with company x, out of my self-directed concerns. Accordingly, the patterns for practical reasoning that we have introduced in Chapter 1 need

to be indexed to the concerns the reasoning agent is having, as shown in the following:

Reasoning schema: *Collective-concerned desire-adoption*

(1) having a collective-concerned liking for G;
(2) believing that G can be achieved
——— IS A REASON FOR
(3) having a collective-concerned desire for G

Reasoning schema: *Collective-concerned teleology*

(1) having a collective-concerned goal G;
(2) believing that plan P is a satisfactory way of achieving G
——— IS A REASON FOR
(3) having a collective-concerned intention of implementing P

Reasoning schema: *Collective-concerned want-adoption*

(1) having the collective-concerned intention to do action A, under condition C;
(2) believing that condition C obtains
——— IS A REASON FOR
(3) having the collective-concerned intention to do A

Assume for example that I have a liking, out of concerns for my local community, for the preservation of its water reservoirs, and that I indeed desire that a sufficient quantity of water is preserved. This would lead me to have the high level collective-concerned plan to minimise the water I use (as a way of contributing to the satisfaction of that desire), that is, to adopt the instruction ⌈I shall minimise my usage of water⌉. Through the mechanism of subplanning, this would lead me to make the plan not to water my garden, as long as there is little water available (to adopt the instruction ⌈I shall not water the garden, while there is water scarcity⌉), and indeed to feel now that I do not intend to water the garden (though according to my self-directed concerns, I would like to have it watered).

According to the reasoning patterns listed above, rationality excludes that self-directed concerns motivate truly collective-concerned conclusions. Rationality does not exclude, however, various patterns of deviation from the communal concerns: (1) giving priority to self-directed concerns over collective-directed ones (I decide to make the contract with company x and take the bribe, even if I believe that this damages my community); (2) finding a compromise with one's self-directed concerns (I decide to take a lower bribe from company y, which offers better terms, rather than a higher bribe from company x); (3)

cheating one's fellows, depicting a conclusion which is based upon self-directed concerns, as if it was based upon collective-directed concerns (I prepare a detailed justification, based upon false information, intended to make you believe that the bribing company provides our community with the most convenient service).

Moreover, in some cases there is no conflict between one's different concerns. For instance an entrepreneur, while aiming at his profit, within certain legal and moral constraints, may justifiably believe that he is benefiting his community.

The simple fact of the independence of other-directed and collective-concerned reasoning from self-directed concerns seems to imply some features that various authors have associated with moral and legal reasoning.

First of all, acting out of a collective-directed concern implies that the reasons supporting one's collective-concerned deliberation are not indexed to the identity of the deliberating agent, within the collective: My awareness of having a certain identity within the collective (for instance, of being myself, rather than my wife, within my family) is no reason (no justification) to me why I should reach a certain collective-concerned conclusion.

Secondly, acting out of a collective-directed concern implies the idea of the exchange of roles (on this idea, see: Hare 1962, 89ff; Alexy 1989, 70ff., 202ff.): My having a certain position within my collective is no reason for adopting a collective-concerned choice of a plan of action, and therefore my choice should not change if my position is changed. If my particular identity provided me with a reason for drawing a certain conclusion or if I would withdraw such conclusion in case my position were different, then I would be cheating (I would be reasoning out of my self-directed concerns and only pretend to reason out of my collective-directed concerns).

Assume, for example, that I am a Member of Parliament, and that I participate in a committee concerned with determining the allowance for members of Parliament. Assume that I develop the following piece of reasoning:

Reasoning instance: *Faked collective-concerned teleological inference*

(1) desiring a higher allowance;
(2) believing that voting for an increase of the allowance for members of Parliament is a satisfactory way to contribute to increasing my allowance

——— IS A REASON FOR

(3) my intending to vote for an increase of the allowance for members of Parliament, out of my concern for my community

This piece of reasoning is not only strange, but also irrational: From a goal functional to my private concerns, it concludes with a collective-concerned inten-

tion. From this case of flawed reasoning we need to distinguish other reasoning processes, leading to the same outcome without violating rationality:

- I may develop a genuine collective-concerned argument leading me to the same conclusions I can get though my self-concerned reasoning. Assume that I sincerely believe that giving a higher allowance to members of Parliament would induce better people to get this job, or will induce present members of Parliament to better do their work.
- I may fake, out of my self-directed perspective, to engage in collective-concerned reasoning, and pretend to derive from collective-concerned premises I do not endorse a conclusion I endorse out of different premises (pertaining to my self-directed concerns). Assume that I do not believe that a higher allowance would contribute to having better Members of Parliament, but I state this premise in order to justify an increase I desire out of personal reasons.

The idea that agents are motivated by different concerns implies that one may have certain conative states only out of some of one's concerns, to the exclusion of other concerns. When seen from the perspective of the excluded concerns, those cognitive states appear to the agent as something that "should" determine his or her actions, though they may fail to do so (if the excluded concerns prevail in the end).

Assume, for example, that I adopt, out of my concerns for my fellows in a third world country, the intention of making a large donation. When reasoning out of my concern for myself this intention appears to me as a constraint (a should) that restrains my own determination. The same applies, however, when I reach a certain conative state according to my concern for myself (I formed the intention of spending the holidays working for the sake of my career), which conflicts with my concerns for my family: My intention to work appears to me as a "should" which constraints the determinations I may adopt out of my concerns for my family.

9.2. Acting in a Social Context

In the previous paragraph we have seen how one may have concerns for others, but the presence of others has a further implication: the need to take into account in one's determination the behaviour of others, and therefore also their practical reasoning.

This is particularly clear if we consider *planning* (teleological reasoning). Planning, as we have seen, involves finding a course of action that enables one to reach a goal. However, whether this course of action will realise the goal, and what are its impacts on other likings one has, usually depends on how others will behave: Will they thwart one's action, or will they provide preconditions for one's action to succeed?

For example, the achievement of my goal of flying to Barcelona depends on the actions of thousands of people, many of whom I do not know (employees in the travel agency, airport clerks, pilots, hotel personnel, and so on). To make a travel plan I must form expectations concerning the behaviour of all those people, and adapt my plan to these expectations (for instance, my plan for going to Barcelona needs to be different if I expect that tomorrow there will be an air strike).

9.2.1. External Motivation and Threats

In general, when acting in a social context, one needs to consider that many results one is interested in (out of one's self-, other- or collective-directed concerns) can only be obtained through the *cooperation* of others. However, one directly commands only one's own behaviour.

Let us first consider what possibilities are available when one only focuses on one's own individual action, viewing others only as parts of the context in which such action is to take place.

Under such conditions, one's practical reasoning will usually proceed in two steps. First one will consider what *action profiles* (sets of actions by oneself and by others, see Definition 9.2.1 on page 252) would produce (if they were implemented) the outcomes one desires. Secondly, one will consider how one can produce these action profiles through one's own action. This can be reduced to the mechanism of instrumental desire we considered in Section 1.3.3 on page 21. Thus, we may distinguish two reasoning patterns.

The first results in desiring that a certain action profile is implemented, being a way of satisfying a goal of the reasoner.

Reasoning schema: *Desiring action-profile*

(1) having goal G;
(2) believing that action profile A is a satisfactory way of achieving G

——— IS A REASON FOR

(3) desiring that action profile A is realised

Assume that I am the administrator of a discussion group on the Internet, and I believe that the action profile where nobody sends commercial information to this discussion group would be a good one, in order to promote participation in the discussion group, out of my concern for the discussion group and its participants. This leads me to desire that this profile be realised.

Reasoning instance: *Desiring an action profile*

(1) having the goal that participation is increased;
(2) believing that realising action profile ⌈nobody posts commercial information⌉ is a satisfactory way to increase participation

——— IS A REASON FOR

(3) desiring that action profile ⌈nobody posts commercial information⌉ is realised

This desire would prompt me to search for plans to implement this action profile. Assume that I am in a condition of excluding people from the group (of making so that the computer system hosting the discussion refuses access to people I include in a certain list). Then my plan for achieving the result I am instrumentally interested in (making so that nobody sends commercial information) would consist in threatening exclusion against those who send commercial information. This corresponds to the schema *teleological inference*:

Reasoning instance: *Teleological inference*

(1) desiring that action profile ⌈nobody posts commercial information⌉ is realised;
(2) believing that ⌈threatening with exclusion those who post commercial information⌉ is a satisfactory way of implementing that action profile

——— IS A REASON FOR

(3) intending to threaten with exclusion those who post commercial information

In such a case, the reason why I believe that through the *threat* I will achieve the action profile is my assumption that my threat (and the expectation that I will implement it) will provide others with the belief that if they send unsolicited commercial information they will be excluded from the group. This belief should lead them to adopt the intention of not sending such information, as a way to avoid being excluded.

Note that the reasoning patterns just described (that is, the psychology of threats) may be associated with those models of the law that focus on the threat of sanctions. Here are the constituents of the law, according to Austin (1995, 17):

> 1. A wish [...] by a rational being, that another [...] do or forebear. 2. An evil to proceed from the former, and be incurred by the latter, in case [of disobedience]. [...] 3. An expression or intimation of the wish in words or other signs.

On the side of the threatened person, the psychology of threats can be reduced to a combination of epistemic and practical reasoning. Epistemic reasoning con-

cerns the expectation that the threat will be carried out, if the precondition is provided.

Reasoning instance: *Threat acceptance*

(1) believing that you have threatened that ⌈if I send commercial information I will be excluded⌉;
(2) believing that you will implement your threat

——— IS A REASON FOR

(3) believing that ⌈if I send commercial information I will be excluded⌉

Practical reasoning concerns forming the intention not to realise the precondition of the threat.

Reasoning instance: *Teleological inference (avoiding the undesired)*

(1) desiring not to be excluded;
(2) believing that ⌈if I send commercial information I will be excluded⌉

——— IS A REASON FOR

(3) intending not to send commercial information

One can succeed in obtaining the action profiles one desires, by providing incentives rather than threats. Consider for example how I (if I had sufficient money at my disposal) could achieve an action profile which I think is good for my collective (for instance, the profile where children coming from deprived families pursue their studies) by providing financial rewards for the actions which contribute to implementing this action profile (paying teachers and social workers, providing some support to students and parents, etc.).

As another example of using external motivation to implement an action profile, this time undoubtedly out of self-directed concerns, consider the case of a large software company, desiring to gain a monopoly over Internet browsers.

The action profile the company desires to implement, as a way of extending and securing its market dominance, is that we all use the browser it provides, rather than the products of competitors.

The plan though which the company tries to achieve this profile will consist in a combination of actions intended to provide us with incentives to use the monopolist's product and with disincentives to use other products: giving away that browser, providing it as a free add-on included in other company's products, signing exclusive agreements with hardware and software companies, providing the browser with powerful and unique features, making it difficult or impossible to remove it once installed, making it impractical to use other browsers in com-

bination with other products of the company (in segments where the company already dominates the market).

These examples show that sometimes an action profile can be realised by externally motivating the agents involved. Under such conditions, the agents performing the actions in the profile do not need to have the goal of realising the whole profile. They only need to have the intention of performing the individual actions that contribute to the realisation of the profile.

A further way of achieving an action profile through the behaviour of agents who do not intend to realise the whole profile (each one just focusing on his or her own actions) consists in motivating these agents through commands.

This is different from the case of a threat. When issuing a threat, one expects that the other people's awareness of one's intentions will *indirectly* provide them with reasons to behave in certain ways. Correspondingly, (*a*) my awareness that one intends to punish a certain behaviour will lead me (*b*) to forecasting that the one will punish me, which would provide me with a reason for (*c*) my intention not to perform that behaviour. On the contrary, a commander *directly* intends that others behave in a certain way. More precisely, when I follow a command (*a*) my awareness that the commander intends that I shall behave in a certain way directly provides me with a reason for (*b*) my intention to do so (see Section 1.4.4 on page 35).

9.2.2. Double Contingency

In many situations external motivation is impossible or inopportune. When one cannot (or does not desire to) directly influence the deliberation of others by providing them with incentives or disincentives, one finds oneself in a peculiar situation: One can determine only one's own behaviour, but one is aiming at results which also depend upon the behaviour of others.

Moreover, one knows that the behaviour of the others depends upon their deliberation, and that the deliberation of the others may depend upon they others believe one will do. But what the others believe one will do depends on what they believe that one believes that others will do, which, in its turn, depends on what they believe that one believes they believe that one will do.

Consequently, one is caught in a trap of an endless spiral of mutual expectations: What I will do (Shall I pay the price?) depends on what I believe that you will do (Will you deliver the merchandise?), but this, in its turn, depends on what you believe that I will do (Shall I pay the price?).

This is the aspect of human interaction which was famously called by Parsons *double contingency* (cf. also Luhmann 1990):

> The crucial reference points for analysing interaction are two: (1) that each actor is both acting agent and object of orientation both to himself and to the others; and (2) that, as acting agent, he orients to himself and to others, in all of primary modes or aspects. The actor is knower and object

of cognition, utilizer of instrumental means and himself a means, emotionally attached to others and an object of attachment, evaluator and object of evaluation, interpreter of symbols and himself a symbol. (Parsons 1968, 436)

The problem of double contingency takes us into the domain of strategic reasoning. This is the reasoning of rational decision-makers who, in determining their behaviour, take into account their knowledge or expectations of the behaviour of other rational decision-makers (Osborne and Rubinstein 1994, 1). The study of strategic reasoning is the domain of *game theory*, a well-developed and very technical discipline, which we cannot approach here.[5] Let us just introduce a few simple notions, which we shall use in the following.

A *strategic framework* is characterised by a set of agents S, where each agent j in S is capable of performing certain actions (when we speak of actions in general, we also include negative actions, or omissions). A combination of actions of those agents is called an *action profile*.

Definition 9.2.1 *Action profile. An action profile for a set of agents S is a combination of actions, one per each agent in S.*

For example, if S includes all 100 people taking part in my Internet discussion group, the combination of actions where 5 members of my discussion group send commercial information, and the other 95 do not, is an action profile. Another action profile for my discussion group would be the combination of actions where everybody (all 100 people) omits sending commercial information.

Another basic notion we need is that of *common belief*. In this regard, we follow the usual idea of distinguishing the simple fact that different agents share the same belief (they all believe the same proposition), from the fact that they have a common belief, which also implies that they are aware of sharing the same belief (and of sharing the awareness of this):[6]

Definition 9.2.2 *Common belief. A proposition P is* common belief *of a set of agents S exactly when all members of S believe that P, they believe that all of them believe that P, they believe that all of them believe that all of them believe that P, and so on.*

9.3. Strategic Dilemmas

In the following paragraphs we shall see how in strategic interactions some problems or dilemmas emerge, which individual rationality seems unable to tackle.

[5] See, for a technical introduction to game theory, Osborne and Rubinstein 1994, for a discussion of its relevance to normativity, Ullman-Margalit 1977, for applications to the law, Baird, Gerner, and Picker 1994.

[6] See, for example: Wooldridge 2000, 113; Balzer and Tuomela 1997. The idea of a common belief is analysed with regard to the law and other institutions by Lagerspetz (1995), who expresses this concept by using the expression "mutual belief."

In particular, we shall consider three kinds of such dilemmas: prisoner's dilemmas, coordination dilemmas and assurance dilemmas. We shall argue that in order to solve such dilemmas we need collective intentionality, and in particular, the shared endorsement of normative beliefs.

9.3.1. Prisoner's dilemmas

The prisoner's dilemma concerns the plight of two people who are imprisoned, having been found with illegal weapons near a bank. The prosecutor, who believes they were trying to rob the bank, tells them that he will ensure that the following takes place:

- if only one prisoners confesses the attempted robbery while his mate does not, then the confessing prisoner will walk free, while his mate will get the whole punishment for attempted robbery (10 years);
- if both prisoners confess, both will get a lower punishment (4 years).

Both prisoners know that the prosecutor cannot prove the attempted robbery without the confessions of one of them: If both omit the confession, each will only get the mild punishment established for carrying illegal weapons (1 year).

After listening to the prosecutor, each prisoner has to decide separately whether to confess that they were trying to rob the bank or to omit the confession. They know that whatever they do, their decision is having no influence on the decision of their partner, who is in a separate cell (at decision time there is no communication between the two prisoners).

In this example, the set S of agents contains two individuals, which we call "I" and "you," abbreviated into I and Y:

$$S = [I, Y]$$

The set of possible actions available to me (I) are confessing or omitting the confession, which we denote as c^I (I confess) and o^I (I omit to confess). Therefore I's actions are $A_I = \{c^I, o^I\}$. Also you (Y) can confess or omit the confession. The set of Y's actions is therefore $A_Y = \{c^Y, o^Y\}$.

The set of our possible action profiles is given by all possible combinations of our actions: I confess and you confess $[c^I, c^Y]$, I confess and you omit $[c^I, o^Y]$, I omit and you confess $[o^I, c^Y]$, I omit and you omit $[o^I, o^Y]$. In other words the set A of all profiles is:

$$A = \{[c^I, c^Y], [c^I, o^Y], [o^I, c^Y], [o^I, o^Y]\}$$

This decisional context is captured by Table 9.1 on the following page, where rows represent my choices and columns represent your choices. Each entry in the table corresponds to a profile (a combination of actions of the prisoners), and it contains the penalties that prisoners get for that profile, first my years

$I \backslash Y$	c^Y	o^Y
c^I	$4, 4$	$0, 10$
o^I	$10, 0$	$1, 1$

Table 9.1: *The prisoner's dilemma*

of imprisonment and then yours. For example, the top left entry, which is at the crossing of row c^I and column c^Y, and therefore corresponds to the profile $[c^I, c^Y]$ (both of us confess), contains the data $[4, 4]$ (I get 4 years and you get the same). Each one of those profiles is going to satisfy to different extents the likings of the two agents.

Let us assume that each prisoner has purely self-concerned likings: Both I and Y like to stay in jail as little as possible and are indifferent to the fate of their colleague. This implies that for me the profiles are ordered as follows:[7]

$$[c^I, o^Y] \succ [o^I, o^Y] \succ [c^I, c^Y] \succ [o^I, c^Y]$$

I prefer the profile where I confess and you do not (and I get 0 years of detention) to the profile where both of us omit to confess (and I get 1 year). Moreover I prefer the latter profile to the profile where both of us confess (and I get 4 years). Finally I prefer the latter profile to the profile where I omit to confess and you confess (and I get 10 years).

Obviously, according to your self-directed likings, the order is different:

$$[o^I, c^Y] \succ [o^I, o^Y] \succ [c^I, c^Y] \succ [c^I, o^Y]$$

Your most preferred profile is the one where I omit to confess and you confess (since in that case you get 0 years of prison), which is my least preferred one (since I get 10 years of prison). These preferences are expressed by Table 9.2 on the facing page, were each slot indicates the comparative position that each party assigns to the action profile represented by that slot: I_n and Y_m indicate respectively that I puts the concerned profile at position n in the order of his preferences, while Y puts the concerned profile at position m in the order of her preferences.

Observe that, though I am evaluating our action-profiles only according to my self-directed preferences, the realisation of these profiles will not depend on my action alone, it will also depend on your action. The fact that I confess (c^I)

[7] We write $x \succ w$ to mean that profile x is preferable to profile w (see footnote 4 on page 155).

$I\backslash Y$	c^Y	o^Y
c^I	I_3, Y_3	I_4, Y_1
o^I	I_1, Y_4	I_2, Y_2

Table 9.2: *The prisoner's dilemma: preferences*

does not determine univocally what outcome I will obtain: According to what you will do, I may get a 4 year sentence (in case that you confess too) or a 0 years sentence (in case you do not confess). In general, one will achieve one's preferred profile, only if the others contribute to realising that profile.

The example shows that, when there is a mismatch between the preferences of the concerned agents, if each one behaves as required by his or her own most preferred profile, nobody will realise his or her most preferred profile. In fact, my preferred profile includes my action c^I, but also your action o^Y, your preferred profile includes your action c^Y, but also my action o^I. If each one of us unilaterally chooses the action included in the profile he or she prefers, we shall produce profile $[c^I, c^Y]$, that is, our third choice.

To approach this situation, we need to use two important notions from game theory. The first is the idea of a *dominant choice*.

Definition 9.3.1 *Dominant choice. An action A is a dominant choice for agent j, if A enables j to achieve the best outcome according to j's likings, whatever the other agents do.*

According to the table above, the dominant choice, both for me and you, is to confess. Consider for example my situation: If you confess (c^Y), my best action is to confess (c^I), since doing so I get 4 years of detention rather than 10; if you omit to confess (o^Y), my best action is still to confess, since by doing so I get 0 years rather than 1. Your reasoning is exactly the same: Your dominant choice is c^Y.

The idea of a dominant choice allows the agent to escape from the problem of double-contingency: If a choice of mine gives me, for every one of your choices, a result which is preferable to the result I would obtain making any other choice, then this is the action I should perform. I can go for it regardless of what you will do (therefore I do not need to try to model your reasoning, and to anticipate your beliefs on what I will do). The second important notion is that of a *Nash-equilibrium* (Nash 1950).

Definition 9.3.2 *Nash-equilibrium. An action profile is a* Nash-equilibrium*, if no agent can do better by changing his or her choice alone, assuming that the actions of all other agents remain unchanged.*

For example, the situation when everybody confesses is the only Nash equilibrium for our prisoners. With regard to this profile, no one can improve one's lot, by changing one's position unilaterally. If one changes one's mind, omitting to confess (while the other keeps confessing) one will get 10 years rather than 4. The situation where we both omit to confess—though providing us with a better payoff (1 year of prison each, rather than 4)—is not a Nash-equilibrium: If you maintain your choice of not confessing, I may improve my position by confessing, and the same holds for you.

The prisoner's dilemma is characterised by having just one Nash-equilibrium, which obtains when both agents implement their dominant choice (confessing). Consequently, it seems that the decision for both parties should be straightforward: Both of them should implement their dominant choice. However (and this is why prisoners are assumed to face a dilemma), both parties would be better off if, rather than both confessing, they both omitted to confess (if they did so, they would get 1 year each, rather than 4). This action profile, however, is inaccessible to them, when each is separately moved by his or her self-directed concerns, as characterised by the above likings, and has no possibility of influencing the decision of the partner through his or her decision. Confessing is the only rational choice, even when one believes that the other party will not confess (remember that we have excluded any communication between the two prisoners).

9.3.2. Prisoner-Dilemma Structured Situations

The prisoner's-dilemma situation exemplifies a more general type of context, which we may call *prisoner's-dilemma structured situation* (Ullman-Margalit 1977, chap. 2, sec. 3). This is the context where everybody prefers the profile where everybody acts in a certain way A (for instance, omitting the confession) to the profile where everybody acts in way B (confessing). However, one still prefers (to both the all-A's profile and the all-B's profile) the profile where one is the only agent doing B (confessing), and all others are doing A (omitting the confession). Finally, one dislikes the situation in which another agent is doing A and all others (including oneself) are doing B.[8]

Consider for example, my problem of deciding whether to go to work by bicycle or by car. Assume that according to my self-concerned likings, the possible action profiles are ordered as follows:

1^I I am going by car and everybody else is cycling (I get very quickly and comfortably to work, since I find no traffic).

[8] This ideas can be further extended and generalised, for example to situations where more than one person is defaulting (see Ullman-Margalit 1977, chap. 2, sec. 3.2).

2^I Everybody, me included, is going by bicycle (I get to work quickly enough, though with some effort).

3^I Everybody, me included, is going by car (I get stuck in the traffic and breathe polluted air).

4^I I am going by bicycle and everybody else is going by car (I get stuck in the traffic, breathe more polluted air, and run the risk of being run over by cars).

In such a situation, the rational thing to do for me, when I take a separate decision, according to my self-directed concerns, is taking the car. Taking the car dominates going by bicycle since:

- taking the car is my best choice when all others take the bicycle (I will get profile 1^I, rather than 2^I), and moreover
- taking the car is my best choice also when all others take the car (I will get profile 3^I rather than 4^I).

The problem is that, if everyone else reasons the way I do, we shall end up all driving our cars, stuck in the traffic, and this would be a profile we all consider inferior to the profile where we all are cycling.

As another example of prisoner's-dilemma structured situation, consider also the following interpretation of Hobbes's state of nature.[9] My problem is to decide whether I should respect other people's life and property. Assume that possible profiles are ordered as follows, according to my likings:

1^I I am the only one that does not respect other people's life and property (I am able to take from them what I want, under favourable circumstances).

2^I Everybody respects other people's life and property (I will get a more moderate but secure lifestyle).

3^I Nobody respects other people's life and property (I will live in misery and insecurity).

4^I I am the only one who respects other people's life and property (I will be even more miserable and insecure).

In such a situation, the rational thing for me to do, namely, what I should do, as a rational reasoner (assuming that I am only motivated by my self-directed concerns), is not to respect other people's life and property; this is my dominant choice, since it will give me the best result whatever the others do. But if everybody reasons this way, we shall end up in profile 3^I, which we all consider inferior to profile 2^I.

[9] For a game-theoretical discussion the state of nature according to Hobbes 1968, chap. 13, cf. Gauthier 1969 and Ullman-Margalit 1977, chap. 2, sec. 11.

As everybody knows, in Hobbes' story, the framework is changed by the empowerment of the sovereign, who changes the payoffs of the game: By threatening (and implementing) sanctions for the violation of other people's life and property, he makes so that the profiles where I attack others are less attractive to me than the profiles where, *ceteribus paribus*, I do not attack (since now there is a serious chance of being punished, whenever I am the attacker). In this way the sovereign takes me (and everybody else) out of the prisoner's dilemma.

9.3.3. The Tragedy of the Commons

The literature provides many other examples of prisoner's-dilemma structured situations. One particularly interesting class of cases pertains to the so-called *tragedy of the commons*: Self-interested individuals are not motivated to contribute to the supply of public goods (like, security, environmental protection, infrastructures).

The supply of these goods is likely to be suboptimal on account of the following preferences: One prefers the situation where a public good is supplied (though everybody pays a share of its costs) to the situation where the public good is not supplied (and nobody pays anything), but one mostly prefers the situation where one does not pay one's share and the good is still supplied (though at a slightly lesser level) using the resources provided by one's fellows.

Therefore one's dominant choice is not to pay one's share: If all others are paying, the public good will be supplied anyway and one will enjoy it without paying; if the others are not paying, one's paying one's share will be useless. However, if everybody reasons in this way, nobody will pay, so that the public good will not be supplied, a situation that, according to everybody's evaluation, is worse than the situation where the good is supplied and all are paying their share.

9.3.4. Strategic Dilemmas and Collective Concerns

In all examples we have so far considered, agents involved in a prisoner's-dilemma type situation were motivated by their self-directed concerns. However, prisoner's-dilemmas can also emerge when the parties are only motivated by other- or collective-directed concerns. As an example where agents are motivated by other-directed concerns, consider the following.

Assume that I am the head of my department, and I have to decide whether to promote to professorship one of my collaborators, who unfortunately has a very weak research record, but whom I like very much on personal grounds. Also other heads of department are facing the same issue with regard to their collaborators. Assume that I like to have my collaborator promoted out of my concern for him, but I also like professors in general in my university to have strong research records. More exactly, I would grade possible profiles as follows:

1^I I promote my collaborator, but no other lecturer having a weak research record is promoted to professorship (this would preserve a high standard for professors, which would not be much impaired by having just one exception, and I will have my collaborator promoted).

2^I No weak lecturer is promoted to professorship.

3^I All weak lecturers (one per department) are promoted to professorship.

4^I All weak lecturers are promoted, except my collaborator.

It is easy to see that my dominant choice is promoting my collaborator. This gives me a better result both when others do not promote their collaborators (I get 1^I rather than 2^I) and when they do (I get 3^I rather than 4^I). However if everybody reasons in the same way, we shall end up in situation 3^I (having all weak lecturers promoted to professorship, which I (as all other heads of department) like less then 2^I.

Finally, let us consider a prisoner's-dilemma type situation where everybody is only motivated by collective-directed concerns. Assume that you and I are leading competing political parties: I am leading the labour party, and you are leading the conservative party. I believe that it would be better for our community if my party gets bribes (br^I), while your party does not get any ($nobr^Y$), that is, I communally prefer $[br^I, nobr^Y]$.

I have this preference out of purely unselfish collective-directed concerns: I sincerely believe that these bribes would allow my party to win the elections, and implement what I view as a communally advantageous policy (improving health care and education, developing public services, providing support to the poor, and so forth). This policy would, I believe, produce communal benefits that largely outweigh the damage deriving from the need to reward the bribing company with public favours (for instance, by providing it with certain advantageous public contacts).

You think the same for your party, that is, you communally prefer $[nobr^I, br^Y]$, since you believe that this would allow you to win the election and so implement what you view as a communally advantageous policy (lowering taxes, promoting the economy, reducing welfare dependency).

However, both of us believe that the common interest would be better served when none of our parties were bribed, rather than when both of them were. For both of us the following preference holds

$$[nobr^I, nobr^Y] \succ [br^I, br^Y]$$

In fact, if both parties get equal bribes (as is likely to happen), then bribes will have no electoral impact, but the winner (who would have won anyway) will have to reward its briber. Thus in any case (whoever wins), and to both of us, the situations where we both receive bribes is worse then the situation where nobody receives them.

I/Y	br^Y	$nobr^Y$
br^I	I_3, Y_3	I_1, Y_4
$nobr^I$	I_4, Y_1	I_2, Y_2

Table 9.3: *The bribes dilemma*

The combination $[nobr^I, nobr^Y]$, however, is inaccessible to us, since for each of us the dominant choice, according to (what we view as) the interest of our community, is receiving bribes, so that we shall inevitably fall to the inferior state $[br^I, br^Y]$ (see Table 9.3, where numbers indicate the order of the profiles, according to the preferences of the parties).

9.3.5. Coordination Dilemmas

Let us now move away from the prisoner's dilemma and consider a different type of interaction problem. This is what we shall call a *coordination dilemma*, by which we refer to the situations which characterise the so-called *coordination games* (for a characterisation of those games, see Lewis 1969, and Ullman-Margalit 1977, chap. 3).

Coordination games are characterised by the presence of *multiple Nash-equilibria*. This means that such games include multiple action-profiles having the following property: No one in those profiles can improve one's own position (produce a profile that looks better to oneself) by a unilateral change. Therefore, one will choose an action of oneself that belongs to a particular equilibrium-profile, if only one may forecast that the others are choosing the actions of theirs that are included in the same profile. Moreover, one will not change one's choice so long as it forecasts that the others are maintaining theirs.[10]

Consider the classical pattern of the café vs pub choice. Both of us (I and You) want to meet, and we have no possibility of communication. We have the common knowledge that there are just two places where we may possibly meet: One is a pub and the other is a café. Assume that we do not care which place we shall go to: We only care about meeting each other.

This situation is represented in the matrix of Table 9.4 on the facing page, where one's evaluation for an action profile is express by 1 (positive evaluation)

[10] A finer account is provided by Ullman-Margalit (1977, chap. 3, sec. 1), who distinguishes profiles where each one can only make things worse through unilateral change, from profiles were each one cannot make things better through unilateral change.

I/Y	c^Y	p^Y
c^I	$1,1$	$0,0$
p^I	$0,0$	$1,1$

Table 9.4: *A coordination dilemma: pub vs café*

and 0 (negative evaluation), p is for pub and c is for café.

The matrix of Table 9.4 corresponds to the following ordering:

$$[c^I, c^Y] = [p^I, p^Y] \succ [p^I, c^Y] = [c^I, p^Y]$$

which holds for both of us (there is a perfect match in the way we order possible profiles).

However, to achieve either of the profiles we like best ($[c^I, c^Y]$ or $[p^I, p^Y]$), we need to co-ordinate our choices, and this requires that each of us can anticipate what the other will do. It is not sufficient for realising one of our preferred profiles (we both go to the café, or we both go to the pub) that I perform one action of mine included in one of these profiles. If you do not perform the same action we shall end in neither of these profiles: We shall rather realise one of the profiles we both dislike (those where we do not meet).

This is a genuine example of double contingency: One party cannot decide what to do until it can forecast what the other party will do (I will go where I believe that you will go, and I do not know where you will go, since I only know that you will go where you believe that I will go).

9.3.6. Salience

The key idea for getting out of the coordination paradox is *salience*. If I know that one action profile is salient to both of us (for whatever reason this may happen), then I should choose the action of mine included in that profile, assuming the you will do the same salience-based reasoning.[11]

For instance, Lewis (1969) links salience to *precedent*, namely, to the existence of the repeated practice of a certain action profile. This makes this action profile salient to each one: One will perform one's own action belonging to that profile, in order to achieve that profile. This profile will therefore perpetuate itself, since every one will continue to perform the action that belongs to that

[11] The idea of salience is described in Schelling 1960, elaborated in Lewis 1969, and criticised by Gilbert 1996.

profile, on the basis of the salience of the profile, and consequently every one will contribute to keep the profile salient. Besides being linked to precedent, salience may arise (initially) from other factors such as, for example, the casual fact that a certain convergence has emerged, the deliberation of a body charged with setting standards, the particular convenience of a certain practice for most agents, and so on.

The mechanism we have just described makes *communication protocols* spread and become established. Consider for example, how the Internet took shape though the spontaneous adoption (by all of its numerous and diverse users) of the same salient protocols, such as TCP-IP (for exchanging messages divided in packets) or HTTP (specially used for accessing resources on the WWW).

In the Internet, salience is provided by precedent use of the protocols, and also by their adoption by well-known technical committees, such as IETF (Internet Engineering Task Force). By choosing to follow a certain protocol I contribute to preserving it. For instance, by choosing to use a certain format for publishing a file over the Internet, on the basis of the expectation that everybody is or will be using that format, I contribute to maintaining the situation where everybody is using that format, and therefore, to provide the precondition for people continuing to choose it.

Once the protocol has become salient, self-interest provides a sufficient incentive for everyone to follow it. This does not exclude that one may also consider that it would be good for one's fellows or for one's collective that a certain protocol is established (rather than certain other protocols). However, this is not necessarily the motivation of all or most of the participants in that convention: A protocol may also be established by a powerful commercial player, just in its own interest (this happens frequently for protocols in computing, which result from commercial battles and agreements). As we shall see, even when it is clear that the protocol is suboptimal for most participants (a different protocol would better suit them), one is forced (by one's own interest) to follow the salient (and dominant) pattern of behaviour. The protocol has become what Lewis (1969) calls a *convention*. As further examples of conventions, consider using a certain language form, dressing in a certain way when going to a certain type of event, driving on the right (or on the left), and so on.

In general, for a coordination dilemma to exist, and for salience to provide its solution, it is not necessary for all coordination profiles to be equally appreciated by all parties. In particular, it is not necessary that all parties view the salient profile as the best one. As a variant of the example above, consider the case where I prefer to stay with you in the café and you prefer to stay with me in the pub. This would lead to following pattern (increasing numbers express a higher liking) in Table 9.3.6.

The pattern of table 9.3.6 corresponds for *me* to the following order of preference:

$$[c^I, c^Y] \succ [p^I, p^Y] \succ [p^I, c^Y] = [c^I, p^Y]$$

I/Y	c^Y	p^Y
c^I	$2,1$	$0,0$
c^I	$0,0$	$1,2$

Table 9.5: *A coordination dilemma with diverging preferences*

and for *you* to the following:

$$[p^I, p^Y] \succ [c^I, c^Y] \succ [p^I, c^Y] = [c^I, p^Y]$$

This still is a coordination game, since the profiles we (I and You) most dislike are those where we act differently. Therefore, the main objective of each one of us should still be making the same choice, rather than going alone to the place where we would prefer to stay together. If each one of us chooses of one's own the action of oneself which would contribute to the profile one likes most, we shall get none of those profiles: We shall end up making different choices (I will go to the café and you will go to the pub).

This example shows that in the context of a coordination game we should abandon the Kantian maxim: "Act as if the maxim of your action were to become through your will a universal law of nature" (Kant 1972, 84), since we want different maxims to become a law of nature. I want the maxim ⌈Each one of us ought to go to the café⌉ and you want the maxim ⌈Each one of us ought to go to the pub⌉. If each one of us acted according to his or her preferred maxim, we simply would not meet and would thus produce the worst possible action profile, that is $[p^I, c^Y]$. Therefore, in the context of coordination problems, the following observation by Mackie (1977, 148), seems to hold true:

> The prescription "Think of a set of rules and principles the general adoption of which would best promote what you value and see worthwhile, and then follow them yourself, regardless of what your think others will do" may well be a recipe for disaster.

Note that, as we have observed for prisoner's-dilemma structured situations, coordination dilemmas may emerge when the parties are only motivated by their collective-directed concerns. Consider for example the case where an Englishman prefers the profile where everybody drives in England on the left, to preserve a distinctive national tradition, and an Englishwoman prefers that everybody in England drives on the right, to facilitate English people in buying cars and travelling abroad. This situation would have the character of a coordination

game, though each party only is motivated by his or her collective-concerned preferences.

However, in many cases parties having different self-directed concerns share the same collective-concerned views. Then a way out of the dilemma may be represented by focusing on the equilibrium profile they both prefer, when motivated by their collective-directed concerns. Even if the parties, according to their self-directed concerns, have different preferences regarding different coordination equilibria, their shared collective-concerned preference for one equilibrium can make this equilibrium salient, and therefore an appropriate choice, also when they are mainly motivated by their self-directed concerns.

Assume that you have a slight preference for pubs, but you know that I have a very strong preference for cafés, due to my health conditions (smoke makes me sick). Assume that it is our common knowledge that the collective of the two of us (where our communal likings are obtained by summing up our private likings) would be better in the café then in the pub. Then this should make the café salient to us, and you should go there (in the expectation to meet me), even if you do not care much about my health.

9.3.7. Assurance Dilemmas

A way out of the dilemmas determined by the clash of self-directed concerns may be found when all of the following conditions are true:

1. the agents share their preference for one action profile over all the others, out of their collective-directed concerns,
2. their collective-directed concerns prevail over their self-directed concerns,
3. items (1) and (2) are common knowledge.

Consider again the prisoner's dilemma, and assume that we (You and I) share the view that it would be communally better for us not to confess: Both of us prefer, when looking at the situation from the perspective of our communal concern, the action profiles where the total time of detention is lower (see Table 9.6 on the next page). This is expressed by the pattern of preferences in Table 9.6 on the facing page, to which the following ordering corresponds:

$$[o^I, o^Y] \succ [c^I, c^Y] \succ [o^I, c^Y] = [c^I, o^Y]$$

Assume also that the following is common knowledge between us: We share these collective-concerned preferences, and we intend to give priority to our collective-directed concerns. Then a solution to the prisoner's dilemma would be available to us: We should both omit confession. In fact, with regard to our collective-concerned preferences, the game has now become a coordination dilemma, where two Nash-equilibria are available: We both omit to confess, or

$I\backslash Y$	c^Y	o^Y
c^I	I_2, Y_2	I_3, Y_3
o^I	I_3, Y_3	I_1, Y_1

Table 9.6: *Assurance dilemma*

we both confess. However, not confessing is salient to both of us, being the situation we both prefer (and we are aware of this): Therefore we can safely choose to omit confession.

However, the only fact that all partners share the collective-concerned preference for an action profile (this being our common knowledge), is not sufficient to solve the dilemma when one has no certainty that his partner will give priority to her collective-directed concerns over her self-directed concerns.

Assume that we (the two prisoners) share the collective-concerned preference for the situation where we both omit the confession. Additionally, I intend to give priority to my collective-directed concerns over my self-directed ones. However, I know that you have the following self-directed ordering, and that you will act upon your self-directed concerns (since these will override your concerns for our collective, and for your colleague):

$$[c^I, o^Y] \succ [o^I, o^Y] \succ [c^I, c^Y] \succ [o^I, c^Y]$$

Under these conditions, I know that you are going to confess (since this is your dominant choice, when you take the self-directed perspective), and therefore the rational thing for me to do (out of my concerns for our collective), is to confess too. If I do not confess, we shall get into profile $[o^I, c^Y]$, where we shall get 10 years of detention (all for me), while if I confess, we shall realise profile $[c^I, c^Y]$ where we shall get 8 years (4 each).

In fact, my attitude transforms the prisoner's dilemma to me into an *assurance game*: I would do the co-operative action (omitting the confession) only if I am sufficiently sure that you are doing the same (on viewing the prisoners' dilemma as an assurance game, see Sen 1974).

Therefore, also when facing an assurance game, the Kantian attitude—doing what we would like everybody would do—may be irrational, even when one is aiming at the collective good and one's view of the collective good coincides the view of one's fellows. If I omit to confess I fail to achieve the profile that would produce the collective good, since you will confess, following your self-concerned preferences. The resulting profile (I confess and you do not) would be worse, according to my very collective-concerned likings, than the profile

where we both confess. Therefore, in the described condition, though I am acting out of our collective-directed concerns, rationality commands me to contribute to the profile where we both confess, which is the same sub-optimal choice would do when looking only at my individual interest.

As another example of an assurance-dilemma, consider the following elaboration on the bicycle example. Assume that that the profile I like most (in the bicycle example), out of my collective-directed concerns, is the profile where all go by bicycle, and I know that we all like most this profile, from our collective-concerned perspective. However, assume that I believe that most other people are guided by their self-directed concerns, characterised by the preferences indicated above. Then it makes no sense for me to decide to go by bicycle. By doing so, I will not realise the situation I would mostly like for my community (the situation where everybody goes by bicycle), but I would contribute to bringing about the nasty situation when a few cyclists (me included) are polluted and run over by their self-concerned fellows, all driving their cars.

Chapter 10

COLLECTIVE INTENTIONALITY

In Chapter 9 we have seen how agents may fail to participate in action profiles that would be advantageous to themselves and their collectives, due to their inability to cooperate with their fellows. In this chapter we shall see how this inability may be overcome by engaging in what we shall call *plural intentionality*.

This will require us to consider how individual reasoners, while maintaining their personal (and possibly diverging) opinions about what best suits themselves and their collective, may succeed in participating in a collective perspective. In particular, we shall consider how reasoners can develop a specific legal intentionality and endorse legal rules.

10.1. Coordination and Collective Intentionality

Under the heading of prisoner's dilemmas, coordination dilemmas, and assurance dilemmas, we have seen in Chapter 9 various situations where individual rationality is unable to find satisfactory solutions.

Such a solution is out of reach even for agents being selflessly motivated by their concerns for their fellows and their collective: When such agents have different collective-concerned likings, preferences, beliefs, or when they are not sure of the "pureness" of the motivations of their fellows, cooperation may still be out of reach.

The fact that some agents are acting out of their collective-directed concerns, can put even more stress on the interaction between the agents, providing new, and more serious, occasions for conflicts between them (as many tragic religious or political conflicts show).

In fact, on the one hand it seems easier to achieve consistency between collective-directed concerns, since having the same collective-directed objective means having compatible likings: If both of us like the same thing for our collective (for instance, we both want our company to be located in a certain new building), then we have a common aim, which will be satisfied by producing the same state of affairs (getting the new building for the company). Though we may disagree on the ways in which this result is to be achieved (we may evaluate differently different plans producing this result), we have a common starting point for our practical reasoning.

On the contrary, having the same self-directed likings (we both would like, for our individual offices, the same room in the new building) when limited

resources are available, means to have incompatible desires: My satisfaction would be maximised by giving all resources to me, while your satisfaction would be maximised by giving everything to you (if I get the room you do not get it, and vice versa).

On the other hand, however, it is more difficult to make one's collective-directed concerns consistent with the (self- or collective-directed) concerns of one's fellows, since the action-profiles which serve the interest of a collective concern a larger set of actions, by a larger set of subjects. When I consider the interests of my collective, the behaviour of all others becomes relevant (being susceptible of impacting on our collective interest), even if they are remote from me.

For example, I may not know who you are and have no private relation to you, but still have a collective-directed concern that you do not dump your industrial waste in the nearby river, or that you pay your share of the costs for the provision of public goods to our community.

On the contrary, when I am focused on my self-interest, most actions of the others would be irrelevant to me (I am not drinking or smelling your waste, since I live very far away from that river), or very unlikely to obtain for me (I would like you to give all your money to me, but I know that you would never do that), and therefore negligible to me. I would have no (serious) desires with regard to those actions, so that no conflict would arise with regard to them: My self-directed desires do not include that you do not dump your waste and that you give your money to me, and so they do not conflict with your preference for dumping the rubbish and keeping the money.

In the following we shall investigate how rational agents, concerned with their fellows and collectives, may approach in a rational way the dilemmas we have considered above. In particular, we shall investigate whether the idea of participating in a collective intentionality (rather than individually aiming at achieving what one views as the common good, according to one's collective-directed concerns) can provide a way out of strategic dilemmas.

10.1.1. Collective Cognitive States

One first clue comes from the distinction between individual and collective agency, and between individual and collective cognitive states.

Let us start by remarking that actions and cognitive states can be ascribed to collectives as well as they can be ascribed to individuals. In fact, in order to maintain themselves, also collectives need to act appropriately in their environment. The persistency of a collective can be explained by the ability of that collective of adapting itself to its environment, and to adapt the environment to itself.

A collective, obviously, will act through the behaviour of its members, a behaviour that (when it is intentional) will be ascribed by the agents themselves

to their collective: One will act as a member of one's collective, that is, one will view one's action as the participation in the functioning of one's collective. Consider, for example, how a football player may see his scoring a goal as an action that his team is performing, and how his colleagues will see this action as something they are performing too (as a team).

The capacity of a collective to react appropriately to its environment can be explained by the working of evolutionary mechanisms, which tend to preserve collectives having the best adapted behavioural reactions: Selective evolution, combined with the mechanisms of fixed and conditioned reflexes (see Section 1.1 on page 3), may explain why certain collectives may prevail and be imitated, while others may collapse and die out. This may apply, for example, to animal communities (consider for example social insects): The patterns of collective behaviour of these communities are well adapted to their environment, and having been "learned" through selective evolution.

The same explanation can also be applied to social systems: Consider, for example, how firms having ways of functioning that provide them with higher profits may not only survive and grow, but also tend to be imitated (so that their ways of functioning tend to be replicated), and how similar considerations apply to football teams winning more matches. This is the view of social evolution that has been defended, in particular by Friedrich Hayek:

> "Learning from experience" among men no less that among animals, is a process not primarily of reasoning but of the observance, spreading, transmission and development of practices which have prevailed because they were successful—often not because they conferred any recognizable benefit on the acting individual but because they increased the chance of survival of the group to which he belonged. The result of this development will in the first instance not be articulated knowledge but a knowledge which, although it can be described in terms of rules, the individual cannot state in words but is merely able to honour in practice. The mind does not so much make rules as consist of rules of action, a complex of rules, that is, which it has not made, but which have come to govern the actions of the individuals because actions in accordance with them have proved more successful than those of competing individuals or groups. (Hayek 1973, 18)

From this perspective, the fact that the members of a collective feel the conative disposition to act in ways that are traditional in their collective, out of their concern for their collective, can be viewed as the way in which behavioural patterns characterising a certain collective are stored and replicated. This would allow collectives to be characterised by certain peculiar behavioural practices, and would enable collectives having the most successful behavioural practices to persist and be imitated, and in this way would lead social evolution to select and preserve the most successful practices. This is the perspective from which Hayek (1976) looks at social evolution, a perspective which provides a social parallel to the idea of kin-selection developed by socio-biology (Wilson 1975; Wilson 1999, 186–7).[1]

[1] These cursory comments are not intended to provide an account of legal evolution, on which

Another interesting idea going in this direction is that *docility*—the tendency to adopt and reproduce whatever behaviour is practised and approved by society[2] —by ensuring the persistence of collectives, would also contribute to the survival of individuals belonging to these collective.

According to Simon (1983), docility can increase individual fitness directly (by facilitating learning and access to rewards), and also indirectly, by promoting the success of the group to which docile individuals belong.

10.1.2. Collective Rationality and Collective Cognitive States

However, in a changing environment, docility needs to be supplemented with ways to invent and experiment new behavioural patterns. In this regard, we may observe that collectives can also function according to the model of *rationality*. This means that a collective would have likings or preferences for certain states of affairs, would adopt, on the basis of these likings, the desire to achieve certain goals, would build and evaluate (according to its likings) plans to attain such goal, would adopt the intention of adopting those plans, would want to implement the instructions in those plans when the appropriate conditions are satisfied. Obviously, the states of mind would need to be possessed by the individual members of the collective, when they view themselves as reasoning and acting as members of their collective, to wit, according to their collective intentionality (on collective intentionality, see, for example, Searle 1995).

This idea requires us to specify when the intentionality of single members of a collective can be viewed as the intentionality of the collective itself. We need to distinguish one's attempt to participate in a cognitive state of one's collective, from the fact that one succeeds in doing so. We cannot here discuss the difficult problems involved in the notion of an attempt. However, we hope that the following example may suffice to exemplify the difference between participating in collective intentionality and failing to do so. Imagine a lunatic, declaring war on a foreign country, in the name of his own country. In such a case, the concerned individual certainly attempts to act for his own country, but it is equally certain that he fails to do so: Neither his action, nor the intention to perform it, can be ascribed to his country.

There have been various proposals to define the idea of collective intentionality on the basis of the idea of common knowledge (see, for example, Dunin-Keplicz and Verbrugge 1996). According to such proposals a cognitive state S is a cognitive state of a collective C if:

1. every member of C has cognitive state S, and
2. it is common knowledge in C that (1) holds.

see, among others: Luhmann 1996, chap. 6; Barberis 1996.

[2] See Simon 1983, 63–4: "Docility may be defined as the propensity to behave in socially approved ways and to refrain from behaving in ways that are disapproved."

This account however is not satisfactory for our purposes: A cognitive state is frequently attributed to a collective though not all members of the collective share it (it would be very difficult to find one single cognitive state that is shared by all members of a large collective, such as a national State), and it may also be argued that under certain circumstances the fact that all members of a collective have a cognitive state and are aware of this fact is not sufficient to make this cognitive state attributable to their collective (Gilbert 1996, 194ff.).

To understand the difference between having a cognitive state as an individual and having a cognitive state as a member of a collective, we need to specify what it means to accept a cognitive state. An adequate notion of acceptance is provided by the following definition:

> [T]o accept that p is to have or adopt a policy of deeming, positing, or postulating that p—i.e., of including that proposition or rule among one's premises for deciding what to do or think in a particular context, whether or not one feels it to be true that p. (Cohen 1992, 4)

Thus, it seems that we may say that a cognitive state may be attributed to a group, when the members of the group have adopted the shared policy of accepting this cognitive state when acting or reasoning for the group, and this is their common knowledge. This problem has been investigated in particular by Tuomela who, in a number of contributions (see in particular Tuomela 2000), has provided a deep and precise analysis of collective agency and collective intentionality. In particular, he defines collective intentionality (we-intentionality) as follows:

> A member A_i of a collective g we-intends to do X if and only if:
>
> i. A_i intends to do his part of X (as his part of X);
> ii. A_i has a belief to the effect that the joint action opportunities for an cognitive performance of X will obtain (or at least probably will obtain), especially that a right number of the full-fledged and adequately informed members of g, as required for the performance of X, will (or at least probably will) do their parts of X, which will under normal conditions result in a cognitive joint performance of X by the participants;
> iii. A_i believes that there is (or will be) a mutual belief among the participating members of g (or at least among those participants who do their parts of X intentionally as their parts of X) to the effect that the joint action opportunities for a cognitive performance of X will obtain (or at least probably will obtain);
> iv. (i) in part because of (ii) and (iii). (Tuomela, forthcoming)

Following Tuomela's suggestion, we extend the notion of a collective cognitive state beyond the notion of a common belief (as introduced in Definition 9.2.2 on page 252):

1. We admit collective cognitive states concerning actions performed only by some members of the group.

2. We include in collective cognitive states not only beliefs, but also other kinds of mental states (including intentions and desires).
3. We include attitudes which are not accepted by each single member of the group.
4. We assume that acceptance by the group does not need to exist in the moment when the collective cognitive-state is adopted by a single member of the group.

Let us consider the third condition, to wit, the fact that the acceptance of a cognitive state by all members of a group is not necessary for the cognitive state to be attributed to the group. In this regard, we can substitute the requirement of everybody's acceptance with a functional and gradual approach. The group has a cognitive state to the extent that the acceptance of this cognitive state by members of the group plays the appropriate *functional role* in the reasoning of the group, that is, in the decisional process that will determine the action of the group (on a functional view of cognitive states, cf. Dretske 1986). We believe that indeed the existence of collective cognitive states contributes to explaining why we can look at collectives from the *intentional stance*, that is, why we can interpret and forecast the behaviour of collectives by assuming that they have cognitive states.[3]

Consider the example of a football team. The adoption of a certain objective by the president of the team (concentrating efforts in winning a certain competition) is to be viewed as a goal of the team (even if it is not communicated to the players, but only to the coach), since it will lead the coach of the team to devise a multi-agent plan to achieve that goal. The adoption of this plan by the coach is again to be viewed as an intention of the team, since it will lead each individual player to adopt this plan, and to adopt the plan of performing the task that the plan assigns to him. Finally, each player's desire to perform his task and his plans to make it in a certain way—in the name of his team—still can be ascribed to the team (though his colleagues may not be aware of all the details of such plan), since implementation of those plans will lead the team to act appropriately.

Thus, a cognitive state can be attributed to a group, though many members of the group do not share it, and possibly are not even aware of it. Most members of the group must rather share the general acceptance of the collective reasoning process to which those cognitive state belongs (a process in which different agents play different roles), and offer their availability to play their part in this process.

Let us move to the last weakening, that is, the fact that the acceptance by other members is not required at the time when an agent participates in the formation of the cognitive state by the group: The acceptance of the others may follow later. Consider again the case of a football team. A multi-agent

[3] On the intentional stance, see Dennett 1989. For a discussion of possibility of attributing intentionality to artefacts and collective bodies, see Sartor 2003 and Sartor, forthcoming.

plan of action (for example, the strategy of renouncing further attacks in order to defend a goal that has just been scored) may be adopted by one player in the name of his team, in the belief that the other players will join this strategy. What will decide whether this strategy is a strategy of the team, and not a just a strategy individually (and wrongly) adopted in the name of the team by a single player, will be the subsequent attitude of the other members of the team. The interpretation that one gives to one's action—viewing it as a part of common plan of action—will be correct if a sufficient number of the others join in this plan, so that the individual action becomes part of a joint action; it will be wrong if the others do not join. This leads us to define as follows what it means to attribute to a collective a cognitive state of a certain kind (perception, belief, liking, goal, intention, and so on), that is, to view a certain cognitive state as a communal attitude of that collective:

Definition 10.1.1 *Cognitive state of a collective (collective mental state). A cognitive state S of kind T is a* collective cognitive state *of a collective C, with regard to a certain decisional process of C when*

1. *certain members $c_1, \ldots, c_n$ of collective C attempt at participating in cognitive state S,*
2. *thanks to 1, cognitive state S effectively plays a type T role in the decisional process of collective C.*

The issue concerning whether cognitive state S plays the functional role proper to a cognitive state of type T in the decision process of collective C is an empirical question, to be decided according to the way of functioning of C (though the functioning of the collective may, in its turn, be governed by shared rules, as we shall see).[4] This may require that S is adopted by a sufficiently large number of members of C, vesting appropriate roles (consider the issue of when a certain judicial practice may be viewed as generating a binding rule), that S is expressed in appropriate ways (consider for example voting procedures as a way of expressing the attitude of the people or of a parliament), and so on.

Going back to our football example, we may say that one player's collective intention to adopt a defensive strategy contributes to the adoption of a defensive strategy by his team, when a sufficient number of players are adopting (or will adopt) the intention to defend and this is (or will be) common knowledge of these players. Our notion of a collective cognitive state allows us to distinguish clearly two different attitudes and ways of reasoning:

- *collective-concerned reasoning*, namely, reasoning on the basis of one's collective-directed concerns;
- *collective reasoning*, namely, participating in the reasoning of one's collective.

[4] On the link between collective agency and collective intentionality, see Pettit 1993, and more recently Pettit 2002. On personifying a political community, see also Dworkin 1986, 167ff.

As we shall see in the following there is no necessary conflict between these two attitudes. In particular, while aiming at pursuing one's view of the common good, one may be complying with the determinations of one's collective, or doing what is not only permitted but also encouraged according to these determination (consider one's voluntary engagement in a non-governmental organisation acting for some collective purpose). However, as we shall see, conflicts are possible: Acting according to what I view as the good of my collective may conflict with the determinations of the same collective.

10.1.3. Rational Adoption of a Collective Cognitive State

We need to introduce a further distinction. This concerns the difference between the existence of a collective cognitive state and the existence of an individual attempt to participate in such a cognitive state: Though the community's cognitive state supervenes upon the participation of individuals, individual attempts can be unsuccessful.

To identify the attitude of an individual that tries to participate in a collective cognitive state, we use the expression *plural* attitude, and we speak correspondingly of a *plural* cognitive state, to refer to the state of mind an individual agent who views his or her endorsement of such state as his or her participation in a collective state (an opinion which may be wrong).

We need now to consider when one may rationally adopt a plural attitude. Rational plural endorsement of a cognitive state seems to require two conditions:

1. the belief that the collective is likely to have this cognitive state;
2. the belief that this cognitive state would be better, for the community, than any alternative cognitive state the community is likely to have.

Condition (1) refers to the fact that one needs to believe that by adopting a cognitive state in the name of one's community, one will really contribute to form that collective cognitive state. When a cognitive state can be attributed to my community only if others participate in it, and I know that they will not participate, it makes no sense for me to try to participate in my community's intentionality (though I can act individually according to my collective-directed concerns). On the other hand, if I value consent and participation, the more people will join in (and the less people will refuse to join in), the better it is. Moreover, if I value rational deliberation, the more people will join in on the basis of a rational reasoning process, the better it is.

Consider again the example of the football team. When I form the intention of participating in my team's attack strategy, then I must hope that a sufficient number of my colleagues are joining in that cognitive state, so that this state may play the appropriate role in the team's decisional process (it may become the intention of my team, and determine its way of playing). As a matter of fact, I also hope that all of my colleagues will join in, so that we may really

play together. These hopes are to be intended as *factual forecasts*. It makes no sense that I intend to participate in a certain strategy of my team, when I know that others will not join me in that strategy (so that my team will not adopt the strategy in which I intend to participate).

Condition (2) refers to the fact that one must believe that one's plural endorsement will contribute to the satisfaction of one's collective-directed concerns (it will contribute to the common good, as one sees it), or anyway to what one views as the appropriate stand for one's community. Note that condition (2) does not require that one believes that the cognitive state at issue is the best possible choice for one's community (the cognitive state that it would be best for the community to have). It rather requires that one believes that this is the best cognitive state in which one could participate, in the name of one's community (and in any case that participating this way is better that acting alone, though for the common good). In other words one cannot consider all logically possible cognitive states: One's choice—when one intends to participate in collective reasoning—is restricted to those cognitive states that are practically possible, namely, those which satisfy conditions (1) and (2) above.

For instance, in the football example, to join an attack I must believe that my joining the attack will contribute to the good of my team, more than any alternative strategy in which I may participate, and in any case more than my playing a different strategy alone. I need not believe that the attack is the best strategy that my team could possibly play.

In evaluating one's participation in collective intentionality, one must also consider that the significance of a collective cognitive state depends on that cognitive state playing an appropriate role in the deliberation of the collective. Thus, when I participate in a desire of my collective, this should correspond to likings (values) of my collective; when I participate in the adoption of a plan in the name of my collective, this should be a way of satisfying a desire we collectively adopt, to be evaluated according to collective values; when I feel the want to do something in the name of my collective, this should be required by a collectively adopted plan.

For instance, my participation in the intention (of my football team) to play an attack strategy should be linked to my team's desire to win the match, which will lead us to get a good position in the national cup. Similarly, my participation in the team's adoption of an attack plan should be linked to our common aim to achieve this objective, according to the indication of our coach.

Let us try to analyse further, in relation to this football example, the connection between the two conditions we have just indicated, and in particular, to establish how condition (1) restricts the scope for condition (2).

Assume that I believe that the only collective cognitive state in which I may join, according to condition (1) will be the attack strategy. In fact, I know that my colleagues are determined to pursue an attack strategy, according to the indications of our coach, and this will be my team's strategy, whatever I do. How-

ever, I also believe that my colleagues (and our team) are wrong: A defence strategy would be a much better choice for my team. To win the match we should defend our current advantage, rather than continue to attack. What should I do, under these conditions?

Since I have no possibility of influencing the behaviour of my colleagues through my choice, I need to consider which one of the following profiles is better:

a. To join my colleagues in the attack strategy, so that we all co-ordinate our efforts in attacking, according to a collective intention.

b. To adopt the defence strategy alone, and act individually (though on the basis of my concerns for my team), detaching my individual intention from the collective intention of my team (and so disrupting, to a certain extent, the implementation of that intention, and more generally, the decisional process of our team).

Assume that I believe that option (*a*) is better than option (*b*). Then what I should do is to join, as a member of the team, the collective intention of playing attack. This is not in contradiction with my belief that it would be better if we all shared the collective intention of playing defensively, since I have no way of making my community adopt that intention.

Assume that, on the contrary, I believe that option (*b*) is better than option (*a*). Then what I should do is to abandon the attempt of engaging in collective intentionality, and adopt an individual defensive strategy. I would then act for (what I view as) the good of my team, but not as a participant in the intention of my team.[5]

The first decisional context is represented by Table 10.1 on the next page, where we have adopted the following notation; I means "I," O means "the other players," a means "attack," d means "defence," and subscript numbers indicate the position of a profile according to the preferences of the indicated player, (for instance I_1 indicates the most preferred choice of player I). The matrix shows how for all the other players the dominant choice is to attack, since in this case they will obtain either their top option (we all attack together) or their second best (I defend alone while all others attack). Therefore I know that the others will be attacking. Given this assumption, my choice is restricted to the alternative between the profile were I join the attack and the profile where I defend alone while all the others are attacking. Therefore I will choose to join the attack.

Table 10.2 shows a different assessment of the situation. The dominant choice for the others is still to attack, as above. However, I now prefer (in

[5] Obviously, the conclusion that option (*b*) is better than option (*a*) requires a complex evaluation, which takes into account not only the immediate effects of my behaviour, but also its impact on the cohesion of the team, on the mutual trust that we have, on the functioning of our deliberative process, and so on

$I\backslash O$	a^O	d^O
a^I	I_3, O_1	I_2, O_4
d^I	I_4, O_2	I_1, O_3

the interest of my team) the profile where I defend alone while all the others are attacking, to the situation where we are all attacking together. Therefore, I should defend alone, abandoning the collective intention to attack, though still acting for (what I believe to be) the interest of my team.

10.1.4. Collective and Plural Optimality

As the football example we have just discussed shows, the question "What cognitive state (liking, desire, intention, want) should we adopt?" can be given two distinct meanings.

The first meaning expresses what we may call *collective optimality*: "What cognitive state would it be better that we all adopted?" In the example we have just discussed, my answer to this question would be "We should all adopt the collective intention of defending."

The second meaning is *distributive*, or *plural optimality*: "To what cognitive state of my community should I participate, along with each one of my fellows?" To this question my answer (according to the matrix in Table 10.1) will be: "I should join the collective intention of attacking."

The first meaning expresses the idea of the *collective optimality* of a collective cognitive state.

Definition 10.1.2 *Collective optimality of a cognitive state. A cognitive state of*

a cllective C is collectively optimal *for members of C, when optimal cognition by collective C would lead C to adopt that collective cognitive state.*

Note that I may consistently believe that a collective cognitive state is optimal, and that such cognitive state will not come to existence, whatever I do: My fellows (especially those who are able to contribute to the intention of the community) are not going to join me into that cognitive state, in the time frame in which this would be useful. Therefore, my belief in the collective optimality of a possible collective cognitive state is not sufficient for justifying my attempt to participate in that cognitive state (I should not attempt at participating, if I know that the attempt is going to fail). This leads us to the idea of the *plural optimality* of a cognitive state. The idea of plural optimality is different from the notion of collective optimality, as characterised in Definition 10.1.2 on the page before, since it takes into account the chance that one's fellows may be wrong, and that one is unable convince them in time.

Definition 10.1.3 *Plural optimality of a cognitive state. A cognitive state M is* plurally optimal *for an individual j, with regard to a community C, when optimal cognition would lead j to plurally endorse M, as being a cognitive state of C.*

By relaxing the idea of plural optimality—according to the idea of bounded rationality—we may obtain what we may call *participability*.

Definition 10.1.4 *Plural adoptability of a cognitive state (participability). A collective cognitive state M is* plurally adoptable *or* participable *to an individual j, if*

- *participating in M is better for j that acting independently for the common good, and*
- *j cannot think of any superior incompatible collective cognitive state in which j could effectively participate.*

This is the idea that is relevant, when one is considering whether one should endorse a plural cognitive state. The evaluation of participability can be viewed as resulting from the product of two factors:

1. the importance (the value-impact) of adopting a certain cognitive state, that is, the advantage that its adoption would have for one's community, and
2. the chance that the community will adopt this cognitive state, that is, the probability that, by attempting to participate in a collective cognitive attitude, one succeeds in participating in it.

By using the expression *product*, we do not exactly refer to mathematical calculation ($importance * chance$), but rather to the need of combining these two aspects. Accordingly, I may choose to attempt to participate in a certain collective intention (the defence strategy, for the football team) even if there is only a

slight chance that my fellows will follow me, if I am sure that the adoption of this intention would be very beneficial to my team (while my failure to converge with them would have a negligible cost). On the other hand, I may prefer attempting to join an intention that has a greater chance of being adopted by my community (the attack strategy), though I believe that its collective adoption would be less beneficial that the adoption of a different strategy (the defence strategy).

Similarly, consider how a judge may choose to adopt a rule he believes would lead to a much better social practice, if it were adopted by everybody (for example, a rule allowing for compensation of moral damages also in the tort domain), though there is only a slight chance that his colleagues and citizens will join him. Consider how, on the other hand, the judge may choose to stick to a rule he believes to be less beneficial to his community (e.g., allowing compensation only for damages to health), since he is knows that everybody endorses this rule, and he expects that a different decision by him would not be followed by his colleagues, and would therefore only cause uncertainty and useless litigation.[6]

10.1.5. The Gamble of Participation

Thus, the choice of adopting a certain collective cognitive state, at least for those agents who may influence, through their behaviour, the attitude of their fellows, appears to be the result of a gamble, where one has to consider the two aspects we mentioned in Section 10.1.4 on page 277: importance (or rather value-impact) and chance.[7]

The second aspect (chance) characterises participation in collective attitudes. When one intends to contribute to a collective cognitive state, one must take into account beliefs and propensities of all other agents with whom the one intends to concur into forming that collective cognitive state. All these agents form the *audience* that one must bear in mind when one is giving a plural reference to one's behaviour.

Note that by an *audience* here we are not only referring to the people that may hear or read a verbal message addressed to them, nor to the people that a speaker intends to convince through arguments (as in Perelman and Olbrechts-Tyteca 1969). For our purposes a broader notion of an audience is required, which also includes people one addresses in tacit communication, and even people to whom one refers when one tries to anticipate the reasoning and the behaviour of others, in order to converge with them into shared attitudes and behaviour. From such a perspective, one's audience is the set of agents with

[6] Our ideal of rational participation can be linked to the view that the task of the lawyer (and of legal science) consists in the formulation of the best possible law, that is, in identifying the best legal choice among the choices that are factually possible. For this characterisation of the purpose of legal science, see Lombardi Vallauri 1989, 7.

[7] For simplicity's sake, we omit to consider a third aspect of this evaluation, i.e., the degree of certainty with which one can express judgements concerning importance and chance.

which may concur in forming the collective cognitive states in which one wants to participate. Therefore, one's audience consists in a set of minds rather than a set of hearers and speakers. With reference to such an audience (even when silently following the train of one's own thoughts) one develops legal and moral arguments "in which he expects all his audience to concur with him" (Hume 1978, 272).

One may need to consider different audiences, these being related to the different collective cognitive states in which one wants to participate. For example, the audiences a judge needs to consider include:

- the parties in the proceedings, whom she would like to join her reasoning concerning the case at hand (though in this regard, her attitude is sufficient to bring about the community's attitude);
- her colleagues with whom she would like to contribute into forming shared rules governing judicial decision-making;
- her fellow citizens with whom she would like to concur into forming the law of her country.

She would fail to participate in a collective attitude if the parties considered her decision to be arbitrary, if her colleagues adopted different rules and considered her decision to be wrong, if her fellows disregarded the *ratio* of her decision as being absurdly incompatible with their beliefs and practices. In relation to each of such audiences, however, the judge is not reporting her view of her audience, nor trying to convince them: She is participating, in her official role, in the process through which a collective attitude is formed, and the very input she is providing may contribute to changing the outcome of this process.

More generally, whenever one evaluates one's chance of success in participating in a collective attitude, one needs to consider how one's action (and in particular the very fact of publicly attempting to participate in a certain attitude, and of publicly expressing the reasons supporting one's choice) can modify the chance that such an attitude is adopted by one's community.

Moreover, besides considering the specific behavioural outcome that the collective attitude is likely to produce, one also needs to consider how that attitude will fit into the decisional process of one's collective.

Thus, when I try to lead my fellow players to participate in a defence strategy, I need to consider that adopting this strategy would imply disregarding the instructions of our coach, which may have further negative impact on the functioning of our team (if everybody starts disregarding the coach's indication whenever one believes they are inappropriate, we would end in chaos).

Similarly, before adopting a decision that openly contradicts a statutory prescription (or goes against the clear intention of the legislator), a judge should consider that even if her choice is successful (her colleagues follow her, and her fellow citizens approve her choice) such decision might have negative impacts on future coordination between legislation and judicial decision-making.

Respect for the (rationality of the) decisional process of one's community may command judicial restraint.

10.2. Participation as a Coordination Game

The decision to participate in a collective cognitive state can be viewed as the solution to a *coordination game*. There are various collective cognitive states that I (according to my concern for my collective) prefer to the situation where we have no collective cognitive state. For instance, in the football example, having any of the collective strategies of defending or attacking is better than having no collective strategy at all.

Also for my fellows (some) such cognitive collective cognitive states are better than the situation when we have no collective cognitive state at all. Therefore, to us all, any of such collective cognitive states is a coordination equilibrium: Each one of us prefers to join in a collective cognitive state rather than acting alone (or attempting to bring about a different collective cognitive state, and failing to produce it).

10.2.1. Salience as a Guide to Success

To succeed in joining my fellows in a collective cognitive state, I need to anticipate what they will do, and this requires me to understand what equilibrium would be salient to all of them, when the time for their decision comes. Salience may be based upon different factors:

- Explicit agreement. We have explicitly agreed to adopt together a certain cognitive state (assume that, before entering the playing ground one of us asked all others: "Do you agree to attack?" and everybody replied "Yes").
- Currently-shared endorsement. Most of us are currently collectively endorsing a certain cognitive state (my football team has the intention of playing an attack strategy), which is functioning as our collective cognitive state and this is our common knowledge. If I join this cognitive state, I insert my attitude into an existing framework, which has already led us to further collective cognitive states and behaviours (we are now attacking). The currently adopted cognitive state tends to be more salient to us than any alternative cognitive state, and has a high chance of persisting.
- Currently-shared optimality-belief. A certain cognitive state appears, to us all, as the best choice out of our collective-directed concerns (with regard to this behaviour, our collective-concerned preferences overlap). Then, firstly each one of us will have this pattern in mind (and know that the others share this thought), and secondly each one will be likely to join in (and know that the others will join in as well). Assume that each

player in our team believes that the optimal strategy for us all would be defence, and this is common knowledge. This makes defence salient to us all, so that one may safely adopt this intention as our collective intention, expecting that the others will join.

- Currently-shared meta-rules. We share the collective intention that we shall adopt certain collective cognitive states under certain conditions, and this is our common knowledge (for instance, we know that we all accept that we shall adopt the strategy of attacking whenever we are playing at home and we are not winning the match). Then I can expect that under such conditions we all will adopt the corresponding attitude.
- Currently-shared values and principles. The adoption of a cognitive state follows from collective cognitive states that most of us (or the most competent, or most knowledgeable, of us) are already adopting. Shared values, principles, standards—i.e., what Aristotle (*Topics*, 104a8–11) calls *endoxa*—besides being endowed with a certain cognitive plausibility (because of the merit of the processes of collective learning from which they result)[8] are endowed with a salience of their own.
- Equilibrium-forecast. I can forecast that most of my fellows will join in the collective cognitive state, for some of the reasons above. This allows me to forecast that also the others (though not sharing these reasons) will join in, understanding that no alternative collective cognitive state has a chance of becoming a shared equilibrium.

According to the list of clues we have just seen, in many cases agents can converge on the same collective attitude and solve to a certain extent the problem of double contingency (Section 9.2.2 on page 251). However, having the same collective attitude is not a fully adequate solution to double contingency since it is still possible that agents follow self-directed concerns, disregarding the collective intention. This conflict is taken care by the mechanism of sanctions, on which we shall comment later.

10.2.2. Rational Participation and Consent

From our perspective, rational adoption of a plural cognitive state is constrained by the need to find a real convergence with one's fellows. This distinguishes our approach from the view that the optimality or the rationality of a cognitive state is a sufficient (and necessary) condition for its collective adoption.

In particular, we need to distinguish our approach from the well-known theory—advanced by Habermas (1971) and developed with regard to the law

[8] The cognitive merit of processes of collective learning of a certain community depends on the contingent character of these processes, which may vary according to the context in which they take place. For instance, they can be based on open critical discussion (joint with distributed processes of experimentation and imitation), or on orchestrated propaganda.

by Alexy (1989)—that a proposition is true (justified) when adopted in an ideal discursive situation (see Section 3.3.4 on page 111).

First of all, for us cognitive optimality does not depend just on dialogue: Perception, experiment, reasoning, implicit cognition are an essential part of it.

Secondly, and most importantly, plural endorsement (participability) is linked to *plural cognitive optimality*, rather than to collective cognitive optimality. When one tries to figure out what one should think or do, as a member of one's community, one should not refrain from overcoming, as we said in Section 3.3.5 on page 114 the limits of one's own current cognition, and modify one's cognitive states. However, one has no power of modifying the cognitive states of one's fellows (except that by providing certain cognitive inputs to their reasoning), and one cannot act on the basis of the assumption that they will accept whatever one believes to be cognitively optimal.

The problem here lies in the inevitable and inextricable intertwining of the particularity and the universality of reason (as we said in Section 4.2.4 on page 131): The only way I have to check whether a thesis is cognitively optimal (and in this sense universally valid) is to apply my cognition to my own perceptions and cognitive states. Therefore, I will believe that a thesis is cognitively optimal whenever I still believe in that thesis after an adequate (but necessarily limited) cognitive effort. The reasoning through which I can try to establish whether a thesis should be believed—whether it is cognitively optimal, namely, whether it would be adopted by everybody in an ideal cognitive situation—is no different from the reasoning through which I come to believe this thesis, and is equally fallible. Therefore, my assumption that I am right—and that I should indeed maintain the beliefs and conative attitudes I happen to have, to wit, that these beliefs correspond to optimal cognition—is insufficient to ensure that you will agree with me, so that we may join in a collective intention (on disagreement, see Rescher 1993, and on disagreement in legal reasoning, see Waldron 1999b).

To clarify this issue, let us consider a further example. Assume that you and I are writing a paper together, which neither of us can write alone (since, for example, the paper requires a combination of law and logic, and I am a lawyer, while you are a logician). I think that it will be optimal for us to develop approach A, which I believe to be the right solution to our problem: I should write the introductory part A_1 and you should provide the formal analysis in part A_2. However, you think that B is the right approach: I should introduce it in part B_1 and you should formalise it in part B_2. Both of us sincerely believe that one of the two approaches is right, but unfortunately our beliefs do not match. In such a context, my belief that approach A is right (so that you too would adopt it in a cognitively ideal situation) and B is wrong, does not license the plural plan $\langle A_1, A_2 \rangle$, since I know that you are not going to choose this plan.

In the face of your opposition, I can still try to implement what I believe is better for us both, but to do that I need to move from a collective to an

individual view. Knowing that you will not collectively choose the right action (A_2), I can succeed in having it done by motivating you externally—for instance, by paying you, coercing you or cheating you. The abandonment of the plural perspective does not necessarily imply egoism: I can push you into doing A_2 since I believe this is good for both of us, or even for you (you need a good paper, as A would be, to improve your career chances). I can act altruistically, but still not collectively.

10.2.3. Rational Participation in a Future Collective State of Mind

Though our notion of participability does include a reference to the chance of successful participation, one's rational attempt to participate in a collective cognitive state does not presuppose that one's fellows already share that cognitive state: I may expect that my fellows will later converge in the collective cognitive state to which I am attempting to participate. Participation does not necessarily presuppose either an agreement with others (I may expect you to agree later), or a previous communication with others (my action implementing my plural choice can be the very way in which I communicate my choice). What is necessary is that one can forecast—with a degree of certainty that is sufficient, considering the importance of collective adoption—that a sufficient number of one's fellows are going to converge on that cognitive state when that cognitive state is to play its role in the decisional process of the community.

One way to establish whether my fellows are going to share a certain cognitive state is through vicarious reasoning. I may anticipate that you will join me in adopting a certain attitude if I can mimic the reasoning process that you would instantiate when wondering about what collective attitudes you should participate in, as a member of our community. I need to hypothetically adopt your current epistemic and conative states, and in particular the ones you are adopting in the name of our community, and see how, through a reasoning process, you would move from having those states into adopting a certain other collective-concerned attitudes. I may also anticipate that you will have new cognitive inputs in due time (for instance, since I will provide them), so that you will be able to use these inputs in your reasoning. I may anticipate that your reasoning will lead you to change your views and to abandon some of your beliefs. I may even intend to produce this result by providing you with new cognitive inputs. However my vicarious reasoning needs to start from the views you are currently endorsing (rather than from my current views) and from the views you are attributing to our community.

Another way in which people may come to share a collective cognitive state is through dialogue or collective *deliberation*. This consists in engaging in communicative interactions where different people express their views on a collective issue, articulate their collective-concerned attitudes, present the reasoning steps that should lead their collective to adopting certain deliberations (so that these

collective-concerned attitudes become collective ones), take into account the view of others and engage in a learning process that may lead them to revise their initial opinions. In this process, by sharing reasons through language people try to come to a common point of view. What cognitive states the discussing partners are committed to adopt, as argumentation goes on, depends on different aspects: on the initial beliefs and attitudes of each of the partners, on the contents of their interchange, on the rules that govern the particular argumentation process they are engaged in (the *argumentation protocol*, see Section 11.1.1 on page 304). In any case, if the dialogue partners reach shared conclusions, these conclusions are obvious candidates for collective intentionality.

A difficult issue concerns the extension of the participation in the dialogue. On the one hand, a larger participation provides additional cognitive inputs to each participant, and gives additional importance to shared premises and outcomes (as preconditions of a larger future cooperation). On the other hand, a larger participation entails a higher "computational" burden over each agent, in order to process all information provided in the dialogue. Thus, dialogues enhance the chance of reaching collective cognitive states and the cognitive quality of those cognitive states, so long as enough time and energy is available. However, engagement in a dialectical process is not the only way to come to a collectively adopted intention, and in any case, it is not constitutive of the correctness of such an intention (as we have argued Section 3.3.2 on page 106).

10.2.4. The Intrinsic Value of Participation

Though effective participation in collective intentionality may require that one sometimes does not aim at implementing what one views as optimal for one's community, such participation has a distinct value, which makes it particularly appealing, whenever it is possible. Consider that when I am acting individually, I am taking a *parametric view* with regard to the actions of other agents. My own action is the only thing I am deliberating about. Expected attitudes of others, like expected natural events, only provide the context for my choice, determining my chances of generating (though my action) certain results. This also happens when I am taking a strategic perspective, and I am forming my own expectations by anticipating the reasoning of other agents. To use (or, possibly, to abuse) a well-known Kantian idea, when I am taking a parametric choice, I am viewing others as *means*, rather than as *ends*: Even when I am acting on my own for what I view as a value for my community (what I believe I should desire from the collective-concerned perspective), I am not recognising my fellows as deliberators within my own deliberation.[9]

[9] One of the formulas expressing Kant's categorical imperative is indeed the requirement that every one "should treat himself and all others, never merely as a means, but always at the same time as an end in himself" Kant (1972, 95).

This is not the case when I am reasoning plurally, namely, when I am trying to participate in the collective reasoning of my community. In this case I recognise the autonomy of my fellows and attempt to converge with them into what may be viewed as our common point of view.[10]

10.2.5. The Process of Collective Reasoning

Also collective reasoning can be developed both downward and upward. According to the downward direction, one starts with likings (values) one attributes to one's community, from this one moves into desires (goals) one has in the name of the community, from this into having collective intentions and wants.

Reasoning schema: *Plural desire-adoption*
(1) participating in value V;
(2) believing that V is achievable
——— IS A REASON FOR
(3) participating in desiring V

Reasoning schema: *Plural plan-adoption*
(1) participating in desire G;
(2) participating in the belief that plan P is a satisfactory way of achieving G
——— IS A REASON FOR
(3) participating in the intention of implementing plan P

Reasoning schema: *Plural intention-detachment*
(1) participating in the intention to do A, under condition B;
(2) participating in the belief that condition B obtains
——— IS A REASON FOR
(3) participating in the intention to do A

Those reasoning schemata correspond to the schemata we have previously introduced for individual reasoning. We have just added the fact that, when engaging

[10] This may be linked to the notion of reciprocity, on which see for instance Rawls (1999a, 136), who says that those proposing certain terms of fair cooperation must "think at least reasonable for other to accept them," though we emphasise the factual chance that other may converge with us, or at least the chance that they may find acceptable the view we are endorsing, rather than the reasonableness of their acceptance. On reasoning in the first person plural, see Postema 1995 and 1998. On the plural perspective, see also Gilbert 1996 and Tuomela 2000. For an excellent collection of contributions on public reason, see D'Agostino and Gaus 1998.

in collective reasoning, one is viewing oneself as participating in the decisional process of one's community. Note that, as we said before, at the time when one is reasoning, one does not know for certain whether the community will adopt the cognitive state in which one wants to participate. Rather than "participating in cognitive state S," we should rather say "plurally endorsing cognitive state S."

Also with regard to collective cognitive states, rational agents may apply a doxifying approach: Rather than directly trying to participate in a collective cognitive state, one may ask oneself whether one should participate in it. Thus, the agent should consider the following questions:

1. "What should I like, in order to participate, along with my fellows, to form the likings of my community?" or more shortly "What preferences should I endorse, on behalf of my community?"
2. "What should I desire, in order to participate, along with my fellows to forming the desires of our community?" or more shortly "What is desirable to us?" or "What values and goals should I pursue, on behalf of my community?"
3. "What instructions should each one of us adopt, in order to participate, along with his or her fellows, to forming the intentions of our community?" or more shortly "What instructions (rules) are binding, on behalf of my community?"
4. "What wants should I adopt, in order to contribute, along with my fellows, to the determinations of my community" or more shortly "What ought I to do, as a member of my community?"

As we observed in Chapter 3, thanks to doxification, practical reasoning can also be developed upwards. In this case, one would start with lower level conative states (a want, an obligation or an intention) one is adopting as a member of a community, and start wondering: "Why should we want (intend, be obliged) to do this action?"

Assume, for instance, that I wonder whether I should pay a certain tax. The first answer consists in finding a rule I believe to be collectively binding, for example a rule of tax law according to which one has to pay taxes in a certain percentage of one's income. I will then ask myself: "Why should I (plurally) adopt this rule in the name of my community?" An answer to this further question may consist in finding a higher-level rule which requires adopting the tax rule (for example, a rule empowering the Parliament to issue binding laws). Finally, the question, "But why should I (plurally) adopt this higher rule?" may be answered by finding that its practice serves certain collective values I am endorsing (legal certainty, democracy, and so on).

Additionally, I may find some goals that are directly served by the practice of the tax rule (for instance, providing resources for public goods, or helping the less well-off among my fellows), goals that contribute to realising collective

values. Besides reasons for paying the tax, I can have reasons against paying it. For instance, I may believe that the money will also be used for other objectives, like aggressive warfare, whose achievement will impair the realisation of the values my community should pursue.

10.2.6. Collective Practical Theories

As individual rationality, also collective rationality can be seen as contributing to the production of a practical theory. Such a theory will include the various cognitive states that a community adopts: conative states (likings, desires, intentions, and wants), their doxified reformulation, and the epistemic beliefs the acceptance of which is relevant to the adoption (or the retraction) of these conative states (beliefs concerning, for example, causal connections between actions and the realisation of collective values, beliefs concerning the conditions for applying a plan's instructions, etc.).

The construction of such a theory is a task that is collectively performed by the individual members of the community, who are reasoning on behalf of their community, and who are trying to converge on such a theory. Thus, one needs to view one's participation in collective reasoning as one's contribution to solve a specific collective problem, but also as one's contribution to the practical theory of one's community. One may also consider how to change that theory, but this must happen in ways which, being accepted by a sufficient number of relevant members of the community, can produce a new functioning practical theory for the community.

Beside this, when one intends to put forward a change in the current collective practical theory, one must consider what effects this change is going to produce on the theory as a whole. Thus, we may repeat for collective practical theories the coherence requirements we stated in Section 4.1.4 on page 125.

First of all, a collective practical theory must be an efficient reasoning tool: It must be usable by (a sufficient number of) members of the community (in the appropriate positions) with a limited effort, it must be controllable by them, and easily updateable.

Secondly, there should be a certain degree of support between beliefs in the theory. This means that rational reasoning patterns must allow reasoning to go from one belief to the other in the theory. This is good, since it means that each lower element in the theory can be inferred from higher elements, and the latter can be rationalised according to lower elements.

A third consideration pertains to the capacity of a practical theory to assimilate (to explain) the inputs provided by non-rational cognition. We have discussed this issue in Section 1.5 on page 41, where we observed that reason is no autarchic cognitive faculty, which may proceed on its own: It must rather use the inputs provided other cognitive faculties (perception, pattern matching, conditioned reflexes, heuresis, and so on), giving them all the credit they deserve. We

have also observed that each of these faculties has a degree of reliability of its own (which does not depend on reasoning), and provides independent support to a theory able of explaining its outcome.

With regard to the collective practical theories, a similar argument can be mounted in favour of those collective conative dispositions that are part of the tradition of the community. Also with regard to such traditions, one may assume that they should be collectively adopted (until a better option becomes collectively accessible). This is because, according to evolutionary selection, their persistence shows that they are not incompatible with the survival and success of the community, and that it is likely, though not necessary, that they contribute to this result. Moreover, though one may be unable to reproduce the reasoning that other agents did in the past, the adoption and the persistence of certain collective attitude may be explained through the hypothesis that people achieved those attitudes via correct cognition. The combination of these hypotheses should lead the agent to adopt what Perelman and Olbrechts-Tyteca (1969) famously called the "law of inertia": It is not necessary to justify the adoption of existing practices, but on the contrary, change requires a (collectively acceptable) justification (Alexy 1989, 216ff.).

In the light of these considerations, we may see that a (critically) rational approach to collective decision-making does not require adopting that "prejudice against prejudice itself, which denies tradition its power" (Gadamer 1989, 270), which characterised the age of Enlightenment, according to its critics. On the contrary, both individual and collective rationality are fully compatible with the belief that "Logic is a poor guide compared with custom" (Churchill 1951).[11]

The fact that one has not yet found a plausible rationalisation for a certain traditional attitude is no sufficient ground for the rational rejection of that attitude. For this purpose, specific grounds are required. Such grounds for rejection can indeed by found in many cases without much effort, as for example when ethnic or racial prejudices are at issue. However, when this is not the case, shared conative attitudes—especially when tested by time—deserve due respect.

10.2.7. Collective Adoption of Multi-Agent Plans

Some further considerations are required concerning the collective adoption of multi-agent plans of actions (actions profiles), which we considered at the beginning of this paper.

[11] The importance of traditions in practical reasoning is stressed by MacIntyre 1988, who emphasises the differences between different traditions (like the Aristotelian understanding of virtues, the Augustinian version of Christianity, the Scottish Enlightenment). While we agree with this author in assuming that traditions provides a fundamental input to practical reasoning, we deny that traditions provide alternative accounts of practical rationality: They rather provide different inputs (values, priority, rules, techniques) to the universal faculty of practical cognition.

With regard to multi-agent plans, we need first to observe that adopting a collective attitude provides a way out of the dilemmas we considered above.

The collective attitude provides a way out of prisoner's-dilemma situations, even when emerging out of conflicting views of the interest of a community. Consider for example, the bribes case we considered above. The situation when the socialist party gets bribes, and the conservative party does not, is no eligible collective choice, since this is a choice that you (being conservative) will never share with me. This choice is not participable from your perspective, since, according to your view of the public interest, it is worse than the result that you would obtain by acting alone (we both get bribed).

Similarly, the collective attitude provides a way out of coordination dilemmas, at least when a plan is salient to everybody since it better satisfies collectively participable values.

We have seen in Chapter 1 how agents may adopt general and abstract instructions (standing plans), and how such instructions, from the doxified perspective of Chapter 3, correspond to general normative propositions. We have used the term *rule* to refer both to general instructions and to general propositions. For example, consider rules requiring that everybody drives on the right when on the public road, that everybody stops when approaching a red light, that everybody performs any contracts he or she has made. Here we need to focus on the situation where a rule is collectively adopted, that is, the situation where one does (or tries to) participate with one's fellows in the collective endorsement of a rule-instruction (or in the collective belief in a rule-proposition).

Remember that, as we said above, an individual should participate in adopting a rule when it would be cognitively optimal for that individual to do that, to wit, when the rule is participable by that individual. We have seen in chapter 1 how one may infer from the intention to implement a general instruction, the intention to implement the specific instructions that follow from it (according to the reasoning schemata *intention specification*). Therefore, my intention to implement a rule leads me to intend to implement any single specification-individualisation of the rule, from which (when having appropriate beliefs) I can infer further intentions and wants. For example, my acceptance of the rule that we all drive on the right implies my intention that I drive on the right, and my want to stay to the right, when I am driving my car. It also implies my intention that you drive on the right, and my want that you stay to the right side of the road, when you are driving.

Finally, let us remark that not every pattern of action I wish to have in my society can (or should) be translated into a normative requirement, established for our common interest: Many beneficial patterns of action can also or only emerge through the interaction of self-interested behaviour. However, there is a link between normative patterns and non-normative regularities: Often the latter (such as the efficient resource allocation provided by the market) will only emerge if certain rules (on property and contracts, against monopolies, preventing nega-

tive externalities, and so on) are generally followed. Similarly, my preference for a society where people efficiently allocate resources through market exchanges (given appropriate constraints) will lead to my plural choice for the rules that ensure the proper functioning of a market economy.

10.2.8. Collective Adoption of Acceptance Policies

Collective adoption may also concern cognitive instructions (see Section 1.4 on page 31), and in particular, general and abstract cognitive-instructions, which we may call *acceptance policies*, namely, instructions according to which agents should accept certain propositions, under certain circumstances (for certain purposes and within certain reasoning forms).

Acceptance policies concern, first of all, preconditions of conditioned instructions. Remember that the acceptance of a proposition has an inferential function. It concerns "including that proposition or rule among one's premises for deciding what to do or think in a particular context" (Cohen 1992). By adopting the collective policy of accepting that the preconditions of certain rules are satisfied, under certain conditions, a community can fine-tune its shared application of those rules, according to different circumstances. Assume, for example, that besides accepting the rule

every one, WHEN C, ought to do B

we also adopt the cognitive instruction:

every one, WHEN D OR E, shall endorse C

Applying the latter instruction implies concluding for C under conditions D or E. This finally leads us to conclude for B, according to the first rule, under the same conditions.

As we have seen in Section 3.1.6 on page 96, cognitive instruction are doxified into *non-deontic rules*, namely, rules whose consequent is constituted by a non-deontic qualification. Thus, the cognitive instruction above can be doxified into the non-deontic instruction:

IF D OR E, THEN C

For example, the collective adoption of the rule according to which ⌈one should compensate the damages one causes negligently⌉, may be supplemented by a non-deontic rule according to which ⌈if one does not respect the standard of one's profession, one is negligent⌉ and by further rules specifying what standards concern different professions (for example, by physicians, lawyers, accountants, and so on).

Secondly, collective acceptance may refer to meta-rules. This means that we may collectively adopt the policy of accepting certain types of rules, given

certain conditions. This allows us to lift collective choices at the meta-level: We collectively choose the acceptance policy that we should adopt any rule that is issued in a certain form, within certain bounds, by a certain body. Such a collective choice for the policy of adopting all rules stated by a certain agent j, takes the form of a competence rule, i.e., a collective intention having the content:

we shall accept each rule R such that j has issued R

which can be doxified into the meta-rule (see Section 23.3.4 on page 604):

each rule R such that j has issued R is legally binding

For example, we may share the meta-rule according to which any prescription issued by our Parliament is legally binding, and consequently adopt specific legislative rules.

Thirdly, collective acceptance may concern principles to be used to prioritise rules, so as to be capable of addressing those situations where conflicting rules provide conflicting individual prescriptions. For example, we may collectively accept the priority rule according to which rules issued by a higher normative authority prevail over rules issued by lower authorities, or rules according to which rules issued later prevail over prior ones.

We shall not comment now on higher-level acceptance, but postpone its discussion and exemplification to Chapter 25.

10.2.9. Collective Normative Beliefs

Our discussion of acceptance leads us to a notion of a *normative belief*.

Definition 10.2.1 *Normative belief. A* normative belief *of a unit of agency X is a normative proposition which is adopted (believed) by X.*[12]

For instance, if Fariba's mother believes that ⌈Girls ought to wear the veil⌉, we may say that proposition ⌈Girls ought to wear the veil⌉ is a normative belief of Fariba's mother.

Though one may also speak of individual normative beliefs, for instance, when describing the attitude of Fariba's mother, we are interested in the case when the unit of agency we are concerned with is a collective. Thus, assuming that in Fariba's Legal Community-FLC endorses the belief ⌈Girls ought to wear the veil⌉ (so that this belief plays the appropriate role in legal reasoning and decision-making) we may describe this state of affairs by saying that ⌈Girls ought to wear the veil⌉ is a normative belief of FLC.

When understood in this way, the concept of a normative belief differs from all of the following notions:

[12] Note that when we speak of a normative belief we refer to the believed noemata, rather than to the mental attitude of believing it.

- *normative sentence* and *normative clause*, which refer to the sequence of words expressing a normative noema, rather than to the noema itself;
- *normative speech act*, which refers to an action rather than to a mental state;
- *intention of the issuer of a normative speech act*, which refers a more complex mental state, including in particular the intention of generating a new normative qualification or connection (or the bindingness of a normative proposition);
- *normative proposition*, which identifies a certain kind of noema, regardless of the fact that anybody endorses it;
- *binding normative proposition*, which refers to the idea of bindingness as adoption-worthiness, rather than to the fact of endorsement.

Let us consider this last point. Our notion of a normative belief is purely factual: the proposition $\lceil N$ is a normative belief of $X \rceil$ is satisfied exactly if N plays the cognitive function that is proper to a normative proposition in the functioning of X.

This is also the case when the unit of agency to which we attribute a normative belief is a *collective*, or a *social system*. When saying that normative proposition N is a normative belief of community C, I refer to the social fact that C possesses the cognitive state of adopting N (to the fact that N is the common belief of a sufficient number of people, which are in the appropriate position for implementing N). On the contrary, when I say that N is binding for me, as a member of C, I mean that I should participate in the adoption of N (N is adoption-worthy to me). This is no factual judgement, since it includes a reference to ideal practical cognition (on which adoption-worthiness depends).

Thus, on the one hand, the fact that proposition N currently is a normative belief of my community does not entail that N is binding to me (that I should participate in N, that I should adopt N as a way of participating in the normative reasoning of my community). One, as we have seen, may consistently believe that (*a*) N presently is a normative belief of one's community and that (*b*) N is not binding. Both conditions obtain when one believes that N is so damaging that it is better not to participate in its adoption and implementation.

On the other hand, one may attempt at participating in the collective adoption of a normative proposition N that is not yet a normative belief of one's community, when one thinks that it is likely that N will become, possibly a consequence of one's (reasoned) endorsement, a normative belief of one's community.

This happens first of all when the community does not appear to have any definite cognitive state on a certain matter, either because an issue has not yet been considered (for instance, when a certain legal issue is a "case of first impression," which has not yet been the object of a decision), or because a conflict between different views has not yet been settled.

Secondly, this may happen when there appears to be a communal opinion on a certain matter, but one believes that one's reasoned adoption of a different and better solution is likely to be followed by one's fellows (in the appropriate positions), so as to become the new opinion of the community.[13]

10.3. Sanctions and Assurance

We have so far assumed that agents, when participating in collective intentionality, act according to their collective choices, as inspired by their collective-concerned preferences, their collective conative and epistemic states, their expectations concerning the collective choices their fellows will make. However, one also has private interests, and those may be in conflict with collective interests. Under these circumstance, one may decide to follow one's self-directed perspective, acting against the very determinations one endorses out of one's collective-directed perspective. This leads to the problems we shall discuss in the following paragraphs.

10.3.1. The Possibility of Non-Compliance

I may have the collective-concerned liking for the situation where everybody contributes to public expenses, and I may participate in the collective endorsement of the rule requiring us to pay our dues according to certain criteria. However, the situation where I do not pay any taxes when all others are paying theirs still is at the top of my self-directed preferences.

When this action profile is accessible to me (I am sure my tax-evasion will never be detected), then I have to choose whether to follow my plural choice of the rule or to follow the choice dictated by my self-directed concerns. Moreover I know that I am not the only one who may find oneself in a conflict between self-directed and collective-directed concerns. Also others may be in the same predicament.

The possibility that agents may follow their self-directed concerns, when these conflict with their collective-directed concerns, and also with rules they collectively endorse, is relevant not only when one feels the temptation to give

[13] Our factual notion of a normative belief comes close to the notion of a *norm* as defined by Pattaro, Volume 1 of this Treatise, chap. 6, though he does not address the issue of collective beliefs (and of the beliefs of collective entities). We shall use the full locution "normative belief" to mark the difference between this notion of *norm* and other uses of the term *norm* (and of its translation in various languages). For instance, Italian lawyers frequently use the term *norma* to refer both to normative sentences and to a normative propositions (see Guastini 1990, 15ff.). The use of *norm* for referring to the attitudes expressed through normative speech acts has been advanced in Alchourrón and Bulygin 1981; 1984b, while the notion of a norm as a normative proposition has been defended, for instance, by Weinberger 1984. Finally the use of *norm* for referring only to binding normative propositions can be found in Kelsen 1967, sec. 4b .

precedence to one's self-directed concerns, but also when one is selflessly pursuing the collective interest.

Assume that I am consistently collective-directed (my communal preferences always override my private preferences), and that I am acting in a context where everybody agrees that general compliance with a certain rule would be communally better than the general disregard for it. However, assume also that:

1. some people are likely to disobey the rule when it is against their self-directed concerns, and
2. many others are likely to disobey it when they see others doing so.

In such a situation I may consider the option of not following the rule myself, since the public benefits that would be obtained if everybody were following the rule would not be preserved when only a few are practicing it: In such a case the rule followers would then be exploited and look silly, and this may even discredit rule-following behaviour in general.

Assume for example, that we share a rule according to which we take turns in paying our drinks at the bar (more or less, each one of us pays once a month for everybody). This is a reasonable collective choice for us: We avoid getting annoyed with paying every time we drink and we have a way of expressing our friendship.

Assume, however, that a few of us carefully avoid paying for any drinks. Seeing this behaviour, some others get annoyed and start not paying for drinks either. The few who keep paying for everybody, at the stage when the majority has stopped paying for others, will probably see that it makes no sense for them to continue. Paying for people who are not reciprocating makes payers annoyed (or possibly gives them an inappropriate sense of self-righteousness), makes those who have stopped paying because of other people's free-riding feel uneasy, makes some malevolent people happy at seeing other people's embarrassment.

10.3.2. The Role of Sanctions

The example at the end of previous section shows that, in a context where a rule (which would be collectively beneficial if followed by everybody) is not generally followed, it may be better, even in the collective interest, that "nice" people too stop following it. To use the words of Hume (1975, 177, par. 148):

> Should be a virtuous man's fate to fall into the society of ruffians, remote from the protection of laws and government [...], his particular regard for justice being no longer of use to his safety or that of others, he must consult the dictates of self-preservations alone, without concern for those who no longer merit his care and attention.

Using the game-theoretical model we discussed above, this situation may be seen as an assurance game: It is rational for me to attempt to participate in a collective cognitive state and behave accordingly only when there is sufficient chance that my fellows will reason and behave according to our collective intention.

Therefore, the possibility that self-directed concerns take the lead over collective-directed concerns seems to make the shared adoption of rules impossible (at least in many realistic contexts). The obvious solution to this predicament consists in linking a sanction to the violations of the rule. As a result of the sanction (assuming that it is to be effectively implemented in most circumstances where a violation takes place), any behaviour disregarding the rule would not only be collectively harmful, but also be privately harmful to the violator. This should exclude free riding in the private interest, and increase the appeal of rule-following behaviour to those who are motivated by collective interest (since the general practice of the rule would now be in place and display all its benefits).

Ensuring the matching of self-directed plans and of collective plans seems to be the physiological function of sanctions. However, once the sanctioning apparatus is in place and works efficiently, it can motivate people also without any links to plural action and collective preferences. Assume that sanction S is regularly applied to the violators of the rule ⌈whenever A, then one ought to do B⌉. This social regularity can be experienced by the concerned agents no differently from a physical law: ⌈Whenever condition A is satisfied, if one does not accomplish B, then one is likely to undergo S⌉. From this general "social law," I can infer its instance concerning myself, that is, ⌈whenever condition A is satisfied, if I do not accomplish B, then I am likely to undergo S⌉. If I know that A is indeed satisfied, I may detach the following simpler conditional: ⌈if I do not accomplish B, then I am likely to undergo S⌉

Consequently, we may distinguish different roles for sanctions.

The first situation has been considered above: I would follow the rule if I only had the assurance that you too were acting accordingly. Then the sanctioning connection has the function of providing this assurance, by making so that also your self-directed concerns push you toward following the rule.[14]

The second situation exists when I participate in the collective adoption of the rule ⌈every one shall do B under condition C⌉, but the following conditions hold: (1) out of my self-directed concerns I prefer not doing B to doing it, and (2) I am inclined to act according to my self-directed concerns. The forecast that I may be sanctioned then leads me to do—for the sake of my self-directed

[14] Our account of sanction has been limited to considering the impact of punishment on potential "knavish" violators, motivated by self-interest. There are also other ways of promoting compliance—like preventive screening, appropriate training, ensuring reciprocal cooperation and control, providing regard-based rewards—and an optimal sanctioning systems needs to take into account that spontaneous compliance may be endangered by disruptive punishment (for various interesting considerations on sanctioning, see Pettit 1997 chap. 7, sec. 2).

concerns—what I have plurally chosen as a member of my community: It ensures that the action of mine which follows from my participation in collective intentionality, is also privately advantageous to me. In fact, under condition C, the sanction transforms the choices available to me. If there was no sanction, I would have the choice between the following options:

1. omitting B, and
2. performing B.

Between these options, I would go for (1). However, given that the sanction is likely to follow violation, my choice is limited to the following options:

1. omitting B and undergoing sanction S (NON B AND S), and
2. performing B and avoiding S (B AND NON S).

Between these two option I prefer (2), and thus I shall perform B.

The third situation is the most perplexing one: I believe that the action profile that would be realised through the implementation of the rule (the situation in which each one of us does B under condition C) seriously impairs the common good, and therefore I believe that this profile is not participable to me. The fact that an effective sanctioning connection is in place, however, makes B preferable to me from my private point of view: I prefer, in my private interest the situation where I do B and I am not punished (B^I AND NON B^I), to the situation where I omit B and I get the sanction (NON B^I AND S^I), though I have the opposed preference, when looking at my collective preferences. Consequently, I will behave as to avoid the sanction (i.e., I will perform action B) only in my private interest, though I see my behaviour as damaging our communal good, and not as part of a possible plural choice. Consider, for example, the case of the prisoners in a concentration camp, forced to behave against their fellows, according to the rules of a mechanism designed to produce everybody's moral and physical annihilation.

In large collectives, obviously, the three situations just presented may coexist: Some agents plurally adopt a rule ⌈Each one shall do B under condition C⌉ and follow it regardless of coercion (once that they have a reasonable expectation that others will follow it too), others adopt the rule through a plural choice, but follow it only when they are afraid of being sanctioned, others do not plurally choose the rule, but will behave as it requires for fear of the sanction.

Note that also sanctions can be the object of a collective choice: Not only we collectively adopt a certain rule, but we may also collectively choose that this rule is to be enforced against those who are not going to follow it. More generally, we may collectively establish what rules are to provide reasoning policies to be used in establishing coercible conclusions, and what sanction may follow from the violations of these rules. This represents an important aspect of the passage from general practical reasoning to legal reasoning, which we shall analyse in Chapter 12.

10.4. Plural Legal Intentionality

Let us summarise the account of collective reasoning we have provided in the previous pages.

We have distinguished different types of concerns that an agent, belonging to a certain group or community may have. In particular, we have distinguished one's self-directed concerns (one's concerns for oneself, as a single individual), and one's communal concerns (one's concerns for one's group or community).

We have observed that agents, according to the psychological mechanism of practical rationality, have correspondingly self- and collective-concerned likings, which lead them to adopt self- and collective-concerned desires, which conduce them to choose plans to satisfy those desires and to intend to implement them, and finally to want to execute the actions prescribed by those plans.

We then remarked that one must take into account the fact that the effects of one's action (and more generally of one's adoption of a certain cognitive state) will depend also on the actions of other agents. Thus, one's choice of a plan of action, in an n-person society, tends to be one's solution to an n person coordination game where any other person is also making similar plans. Moreover, those pathological situations that tend to emerge in the interaction of individual autonomous agents (such as prisoner's dilemmas, coordination dilemmas, and assurance dilemmas) also emerge when agents are focusing on their communal interest (but disagree in assessing the latter).

This problem may be solved if one takes a different perspective: Rather than taking an individual perspective, according to which one has a parametric approach to other people's actions, even when one is acting out of collective-directed concerns, one needs to take the plural view. According to this view, one's reasoning is aimed at participating in the formation of the collective intentionality of one's community. One is asking oneself "How can I participate in a shared intentionality, in which my fellows will also want to join (under the expectation that the others are going to do the same)?"

We have also considered in particular those plural cognitive states concerning the adoption of rules, prescribing that all members of one's community behave in a certain way under certain conditions. Each agent forms the intention of adopting such rule and to act accordingly, doing its share, under the assumption that all (or at least most) others do the same.

We have also analysed the role of sanctions, which have an ambiguous relation to normativity. They can support it, by making one's private interest coincide with one's plural choices, but they can also clash against one's choices, by forcing one to act as (one believes) one should not act (in the interest of their community).

Thus, our discussion has identified in the *plural perspective*—that is, in the attempt to participate in collective intentionality—the basis of normativity, and has shown that this perspective has some advantages. In particular, it provides a

solution to the dilemmas that emerge when people tend to act to the disadvantage of their community, though all of them intend to pursue their communal concerns (having different views of these concerns). We have seen that the rational adoption of such a perspective assumes that one believes that the cognitive attitude one is adopting is sufficiently participable, where judgement on participability depends on the likeness of the communal adoption of that cognitive state, combined with the importance that its communal adoption would have.

On the basis of this judgment one participates in conative states one ascribes to one's community (endorsing certain values, intending to execute certain plans of action, wanting to implement the action required by those plans). These conative states (and their doxifications) are experienced by the agent as particular types of feelings: the sense of duty, and in particular, the sense of loyalty to the values, goals and rules of one's community (these are the civic feelings which have been recently revaluated by the current of political philosophy that is called *republicanism*; see Pettit 1997). These feelings may conflict with the conative states that are functional to the agent's self-directed concerns. However, these feelings need not be considered as an expression of irrationality. On the contrary, they may be viewed as resulting from one's rational attempt to participate in collective practical reasoning, that is, into collective rationality.

In the following we hope to convince the reader that some important aspects of legal reasoning can be explained and rationalised as pertaining to the legal reasoner's attempt to participate in the collective intentionality of the legal community, adopting the perspective we have here introduced (on the social dimension of law and morality, see Peczenik, Volume 4 of this Treatise, sec. 4.5.5).

10.4.1. Collective Reasoning and Authoritarianism

Let us conclude this chapter by trying to rebut two possible criticisms to our collectivistic approach to legal reasoning. The first concerns the fact that collectivistic views have often been adopted by illiberal and authoritarian ideologies and regimes. For instance, Art. 1 of the fascist "Carta del lavoro" (Charter of Work) of 1927, says that:

> The Italian Nation is an organism having purposes, life, and means of action that are superior in power and duration to those of its individual members, separated or united in groups. It is a moral, political and economic unit, which realises itself completely in the Fascist State.

We believe that the recognition of agency of collective bodies, like in particular political communities, and the corresponding recognition of the collective dimension of legal reasoning, does not involve at all the acceptance of authoritarian views. There is certainly the need to distinguish clearly between individual freedom of action and participation in collective agency, between what Constant (1988) calls liberty of the moderns (individual self-determination) and

liberty of the ancient (participation in collective choices). However the fact that there is no necessary coincidence between the two aspects of liberty (see also Berlin 1969) does not entail that there is a necessary conflict between them. This is a point that has recently been made within different approaches to political thinking such as liberal communitarianism (Selznick 1992), republicanism (Pettit 1993), and discourse theory (Habermas 1999).

For our purposes, we do not need to address deep issues in contemporary political theory. It is sufficient for us to observe that, on the one hand, the recognition of collective agency entails the possibility that practical rationality is effectively adopted also by collective bodies, a possibility that, in its turn, can only be implemented through unrestricted critical control, which only democratic liberties can ensure. Moreover, as we have observed, the choice to participate in collective action needs to be based upon the belief that collective action is better, with regard to the common good, than one's individual action. When on the contrary, a collective action has detrimental effects, civil disobedience can be the best way in which one can serve one's own community.

10.4.2. Collective Values

The second criticism we need to face regards the idea that a collective-concerned approach needs to focus only on the collective, to view the collective, as opposed to its single members, as the only reference for values, an idea that is brutally expressed by the famous Nazi slogan: "You are nothing, your nation is everything." This idea does not follow from our approach.

We need to distinguish in this regard, having collective-directed concerns, and reasoning from a collective perspective.

When reasoning from the collective perspective one needs obviously to focus on the interest of the collective itself, but the following needs to be considered:

1. The interests of the collective include also the interest of the individual members of the collective or of subgroups included in it. As we have observed in Section 9.1.2 on page 242, one's collective-concerned preferences can and indeed should (also) refer to the well-being (the satisfaction, or flourishing, or capabilities) of the individual members of the collective.
2. The collective may pursue also interests of others. Like an individual, also a collective may have other-direct concerns, and therefore take initiatives to improve the situation of other collectives (for instance, poorer nations) or individuals (deprived people not participating in the collective).[15]

Thus, a collective does not need to be concerned only with its own preservation and power. On the contrary, when approaching an issue from a plural perspec-

[15] On the duties of assistance between peoples, see Rawls 1999b, sec. 16.

tive, one may and should indeed be rather concerned also with the well-being of one's fellows, and more generally with whatever values one believes one's collective should pursue.

We cannot here go to any extent into the philosophy of values. Let us just take from Radbruch (1950b, 146ff. 1959, 27ff.) the distinction between three types of values, *individualistic values* (inherent to single human personalities), *collectivistic values* (inherent to collective bodies), and *transpersonal values* (inherent to the cultural objects, like the outcomes of art and science). To the latter we would also add *naturalistic values*, concerning preserving the environment, ecosystems, and animal life.

All of these values may (and need to) constitute appropriate concerns for a political community and correspondingly may constitute appropriate references for legal decision-making. We cannot even tackle here the issue of what priorities, connections, dependencies exist between these kinds of values: We must leave such issues on the one hand to normative political theory and normative legal philosophy, and on the other hand to doctrinal contributions on specific legal issues. However, any legal reasoner needs to address such issues one time or the other, when taking seriously the goal of understanding (and contributing to develop) the law of his or her community.

Chapter 11

COLLECTIVE COGNITION AND DIALOGUES

In Chapter 3, we concluded that the cognitive bindingness of a normative proposition—and, consequently, the proposition's practical truth and the existence of a corresponding normative state of affairs—depends on the fact that belief in this proposition would result from an ideal inquiry, performed by an unbounded cogniser. Consequently, we have denied that (dialectical) interaction procedures can be constitutive of cognitive optimality: For characterising optimality we need to appeal to ideal cognition, which cannot be viewed as consisting in the maximisation of interactions between bounded cognisers. However, this does not exclude the importance of dialectical interactions, as a way of (partially) overcoming the limitations of individual cognition.

11.1. Dialogues and Cognition

For bounded cognisers, like human beings, cooperating with their fellows, in appropriate ways, is often the only chance they have to approximate ideal cognition. This leads to the following two theses.

The first thesis concerns the necessity of distributing information-processing over different individuals and of enabling them to interact, in order to transfer to others, or to receive from them, cognitive results. This is required on various grounds:

- Different individuals perceive different aspects of the world. In particular, in the practical domain, we need to consider that each one of us has a privileged access to his or her internal attitudes (needs, desires, commitments, and so on).
- Each individual needs to specialise in different areas of knowledge. This is vital nowadays since in modern societies knowledge has grown so much that no individual mind can handle it all.[1]
- Different individuals may provide different heuristic insights, according to the particularities of each one's makeup and experience. This diversity increases the chances that appropriate solutions are discovered.
- Individual cognitive competence results from a process of learning, which is also based on the inputs one receives from one's fellows and on interaction with them.

[1] Though the saying that human life is too short for learning one skill, often cited as *ars longa, vita brevis* goes back to Hippocrates.

The second thesis concerns the ways in which bounded cognisers should interact: To achieve appropriate cognitive results, the structure of their interaction needs to be adequate to the nature of the cognitive task at issue and of the context in which the task is to be carried out.

These premises lead us to reject the view that the rationality (intended as the conduciveness to practical knowledge) of multi-agent cognitive processes can be measured according to the distance between on the one hand the existing patterns of information exchanges and on the other hand an ideal pattern for communicative interaction (as assumed, most famously, by the discourse theory of Habermas 1981). On the contrary, there are multiple forms of cognitive interaction, none of which is abstractly preferable to others: Each one of these forms needs to be evaluated through an instrumental (teleological) assessment, concerning its capacity to provide practical cognition, but also its compatibility with other significant values (like individual dignity and freedom), an evaluation which is dependent upon the concrete circumstances where such interaction is taking place.

Consider for instance how different procedures can be more or less appropriate for different kinds of legal determinations, according to the content of the determination and the context in which it is to take place:

- everybody's equal participation in a decision, as in a referendum;
- debate and voting by an elective body, like in Parliamentary legislation;
- depoliticised decision by an impartial bodies of experts, as in the proceedings of technical commissions;
- a combination of impartial expert-judgement and partisan adversary-debate, as in judicial proceedings;
- open dialogue, where everybody is assumed to bring his or her view, though without commitment to a decision, as in political debate through the media, or amongst citizens, and more specifically in doctrinal debate in the law.

To approach the issue of describing and evaluating cognitive interactions concerning legal issues, we need to introduce a theoretical framework that allows us to analyse and compare different kinds of dialectical exchanges. This will be provided by the theory of *dialectical systems*, which we will briefly present in the next sections.

11.1.1. Dialogues and Dialectical Systems

To understand how legal interactions are structured and to evaluate their merit, we refer to the idea of a *dialectical system*, an idea originally introduced by Hamblin (1970). In general, by a dialectical system, we mean an "organised conversation where two parties (in the simplest case) speak in turn, by asking questions

and giving replies (perhaps including other types of locutions) in an orderly way, taking into account, at any particular turn, what occurred previously in the dialogue" (Walton and Krabbe 1995, 5).

Dialectics, as Hamblin conceives it, has little or nothing to do with the Fichtean, Hegelian or Marxian triadic process of thesis, antithesis and synthesis: It rather identifies in general the study of dialogues, and more specifically of dialectical systems. As Walton and Krabbe (1995, 5) observe, Hamblin's dialectics comprises two branches:

- *Descriptive dialectics*, which studies the rules and conventions currently adopted in actual discussions (parliamentary debates, lawsuits, meetings, and so forth);
- *Formal dialectics*, which sets up "simple systems of precise but not necessarily realistic rules" and studies dialogues conforming to such rules (Hamblin 1970, 256).

We find this way of distinguishing dialectical systems to be confusing, since it merges two different oppositions:

- The first is the opposition between *formal* and *informal protocols*, which concerns the language and the precision through which a dialectical system is specified. It opposes specification through natural language and specification through logical and mathematical formalisms.
- The second is the distinction between *description* and *design*, which concerns the purpose of the specification of a dialectical system. It opposes the aim of describing existing dialectical systems (the systems which are currently practiced by the parties of certain dialogues) and the aim of designing new (or partially new) dialectical systems (as ways to improve interaction in certain contexts).

These oppositions are continuous dimensions, and define a two-dimensional space in which we can try to locate particular dialogue protocols, according to the extent to which they are more or less formal, and to which they reproduce practised protocols or innovate them.

All dialectical systems, regardless of their being formal or informal, and their aiming at description or design, are normative in the sense of including rules specifying how dialogues are to be carried out (if they are to respect the requirements of the dialectical system). However, designed dialogues are also normative in a different sense, concerning the choice of rules rather than their implementation: They suggest what rules ought to be adopted for certain purposes and in certain contexts.

Another notion that needs to be introduced when approaching dialectical systems is the idea of a *dialectical protocol*, by which it is usually meant the rules governing the interaction of the parties in the corresponding dialogues. Here

we will use this notion in a broader sense. We view the protocol of a dialectical system as a *practical theory*—in the sense we introduced in Section 4.1.4 on page 125, that is, as the whole set of assumptions that may provide appropriate guidance to the implementation of the dialectical system in actual dialogues. Thus, a protocol for a dialectical system does not include only rules, but also specifications of values and goals to be achieved, and information concerning opportunities and risks related to the implementation of the dialectical system.

We cannot here provide an account of current research on dialectical systems, elements of which can be found in strands of various disciplines: philosophical studies on argumentation, computer-science research on distributed architectures, artificial intelligence research on the interaction of intelligent agents, models of e-commerce, studies in (electronic) democracy. Let us just observe that at the origins of this theory we can find two main research lines.

The first line of research concerns *formal protocols*, and tries to capture the structure of dialectical system through rigorously defined rules. This was started by Lorenz and Lorenzen's attempt to provide a dialectical reconstruction of deductive logic as a play constrained by formal rules (see Lorenzen 1960; Lorenzen and Lorenz 1978), as well as by the idea of Hamblin (1970; 1971) that formal dialectics could have a broader scope than modelling deduction, an idea that was further developed by Rescher (1977) and MacKenzie (1981; 1990).

The second line of research concerns *informal protocols*, and provides natural language descriptions or specifications of the structure and the requirements of dialogues. Here the most influential contribution is undoubtedly provided by Perelman's rich account of argumentation (see, in particular Perelman and Olbrechts-Tyteca 1969), followed by a number of contributors, among whom we may mention Walton (1990) and van Eemeren and Grootendorst (1992).

As far as research in legal dialectics is concerned, the main inspiration to the study of dialectics has been provided by Alexy (1989), who has devised rules for rational legal argumentation. Recently, various contributions approaching legal dialectics from a formal perspective have been developed within the research on artificial intelligence and law, as we shall see in Section 11.2.4 on page 326.

According to the two lines of research we have just mentioned, dialectical systems can be formally specified, or they can remain informal. Formal dialectical systems can frequently be characterised as *games*, in a strict sense, i.e., according to game theory: The parties have certain *possible moves* (locution types) at their disposal, and under certain conditions the dialogue will *terminate* with certain outputs. Since the parties may assign different values to these outputs, somebody will then *win* or possibly *lose*.

The game-theoretical approach emphasises the *strategic* dimension of dialectical interaction: Each party intends to win as much as possible, but this depends on the other party's moves. Therefore each party, besides respecting the rules of the game, must develop a strategy, and must do this by anticipating the counterparty's strategy. This does not mean that the parties need always to act one

against the other. Some dialogues can indeed be qualified as *non-cooperative games*, where for each winner there is a loser, but others represent *cooperative games*, where parties win or lose together, according to their ability to coordinate their actions and work towards common aims.

One of the most interesting features of the theory of dialectical systems is that it allows for the characterisation of infinite varieties of dialectical systems. At the descriptive level, this enables us to define dialectical systems that can approximate the concrete structure of different social interactions, taking into account the peculiarities of these interactions. At the design level, it allows us to specify what types of interactions would be more appropriate for achieving different purposes, in different contexts. Thus, a design characterisation of an interaction needs not be an idealisation, to wit, it needs not describe what might happen in circumstances that are not to be found in the real world. On the contrary, a dialectical system can be adapted to the concretely available possibilities and to the limitations (in knowledge, competence, time, and so on) that characterise its likely parties, and thus it may provide rules that the parties are capable of respecting.

The features of the theory of dialectical systems we have presented so far make it a useful tool for the study of legal procedures. Legal processes are indeed dialectical interactions, in which different parties play different roles. These interactions are governed by rules establishing what kind of locutions are allowed to each party, in what circumstances, and to what effects. There is much at stake, and there will usually be winners and losers, so that the parties will often develop a strategic interaction, each one anticipating the other's moves. There are various goals to be achieved, which will, and must, be reflected in the complexities of the rules of the game. The players are real persons acting under stringent resource constraints.

11.1.2. How to Characterise Dialectical Systems

A key aspect on the characterisation of a dialogue consists in a set of rules. However, rules are not enough: They make sense only by adopting a purposive, or functional perspective.

By the *function of a dialectical system*, we mean those outcomes of the practice of a dialogue which explain and justify its being practised. This function does not need to be the aim of all participants in the dialogue. Often, the function of a dialogue will rather be achieved through the institutional machinery provided by the dialogue, even if the parties only aim at different particular purposes, corresponding to their individual interests.

For instance, in the typical legal proceedings in civil matters, the parties aim at opposite outcomes: Each one wants to win the case, getting an advantageous outcome at the expense of the other. However, in pursuing their conflicting objectives the parties contribute to a different institutional purpose, that is, achiev-

ing a fair and informed justice while putting an end to their litigation. This difference—between the aims of the parties of a dialogue on the one hand and the function of the dialogue on the other—does not necessarily imply hypocrisy or self-deception: Lawyers defending, legally and loyally, their clients, aim at winning their cases, but at the same time they may correctly believe that they are contributing to justice.

Viewing dialogues from a functional perspective enables us to understand the function of each rule, that is, its contribution to the dialogue's general purposes. This allows us to move from the pure description of the dialogue's rules to an *immanent critique*, and ultimately enables us to move to from description to design: We wonder whether the current rules of the dialogue enable it to perform its function in the best way, and what different rules would improve the functioning of the dialogue.

Beside the function of a dialectical system and the goals of its participants, we also need to identify the side-effects it may have, distinguishing the positive and the negative ones, both when the dialogue achieves its end and when it fails.

To characterise dialogues, we start from the classification schema in Table 11.1 on the next page where we distinguish eight kinds of dialogue: persuasion, negotiation, deliberation, information-seeking, epistemic inquiry, practical inquiry, eristic, reconciliation.[2]

We shall not provide here a detailed comment of our schema, nor claim its exhaustiveness and adequacy. We will rather use it as a tentative pattern for identifying certain features of legal interactions, and thus to emphasise certain similarities and differences between them:

- making a contract or achieving a settled solution to a dispute can be classified as kinds of negotiation;
- parliamentary discussion falls under the heading of persuasion and negotiation, or sometimes of eristic (sometimes there also is an element of inquiry);
- doctrinal exchanges are instances of epistemic or of practical inquiry (sometimes also of persuasion);
- judicial proceedings contain elements of persuasion, information seeking, negotiation and possibly of inquiry and reconciliation.

11.1.3. The Structure of Dialectical Systems

Let us now move from a teleological perspective to a structural analysis, and consider the different types of rules that define the structure of dialogues.

[2] This is a revised version of the model proposed by Walton and Krabbe (1995, 66), which we have modified in two regards: We have added two new types of dialogues, practical inquiry and reconciliation, and also a description of the dangers ensuing from failure.

Type	Subtypes	Initial situation	Main goal	Participant's aims	Beneficial side effects	Implications of main goal	Dangers related to failure	Psychological disposition required
Persuasion	Dispute; discussion of proposals	One party's position not shared	Get to a shared position	Persuade the other(s)	Develop and reveal positions	Opponent commits to the persuader's thesis	Resent lack of understanding	Accept merit of arguments by others
Negotiation	Bargain; make a package deal	Need of cooperation; conflicting interests	Make a deal, possibly stable and fair	Make a deal convenient for oneself	Cooperate; recognise others' interests	All commit to the agreed deal	Resent greed; implement threats	Disposition to keep promises
Deliberation	Board meeting; political decision-making	Need to adopt a (rational) group-position	Good and effective decisions; participation	Favour a decision one views as better	Cooperation	Shared commitment to the decided result	Distrust, uncoordinated action, conflict	Disposition to work for the common good
Information-seeking	Interrogation, expert consultation	Interviewer needs to know; interviewee putatively knows	Spread knowledge; reveal positions	Gain or pass personal knowledge	Agreement; cooperation; prestige	Interviewee commits to statement		Sincerity
Epistemic Inquiry	Scientific investigation; examination	General ignorance	Progress in epistemic knowledge	Find proofs or destroy them	Agreement; cooperation; prestige	Technological ability		Curiosity; passion for reason
Practical inquiry	Moral, political or doctrinal discussion	Uncertainty of what should be done	Progress in practical knowledge	Find arguments or destroy them	Agreement, cooperation, prestige	Ability to act correctly		Curiosity; passion for reason
Eristic	Quarrel; eristic discussion	Conflict; distrust	Reach provisional accommodation	Strike and defeat the other	Vent emotions; reveal positions	Reciprocal recognition	Physical violence; refusal to interact	Combativeness; resilience
Reconciliation	Peace making; restorative justice	Past conflicts; distrust	Build trust; prepare cooperation	Repentance; forgiveness	Shared understanding of the past	Shared commitment to acceptance and cooperation	More struggle and distrust	Recognition; trust; sincerity

Table 11.1: *Types of dialogues*

A dialogue may be viewed as a succession of moves, each of which consists in performing a speech act. Performing one move has certain effects on the dialogue, and in particular on the *commitments* of the parties, that is, on the positions a party is bound to sustain (until the party can validly withdraw them, paying the penalties that are possibly linked to withdrawal). We may say that one party's commitments are those statements the party is bound to recognise (for instance, if I affirm something, I am bound to stick to it), unless the conditions for retraction are satisfied.

Our analysis will be based on the model of Walton and Krabbe (1995), which distinguish the following types of dialogue rules:

- *locution rules*, establishing what moves are available to the parties;
- *structural rules*, indicating when the available moves can be performed;
- *commitment rules*, specifying what effects moves have on commitments of the parties;
- *termination rules*, stating when the dialogue terminates and with what results.

11.1.4. The Persuasion Dialogue: The Structure

To illustrate the notions we have introduced in the previous paragraph, let us analyse the structure of the most studied type of dialectical system, the *persuasion dialogue*, of which we will provide an elementary account. First we characterise the parties:

- there are two parties, let us call them *Proponent* and *Opponent*;
- the Proponent is going to try to persuade the Opponent and the Opponent will resist persuasion.

Let us now consider locution rules and commitment rules (here we combine the two for simplicity) for the persuasion dialogue: We identify what speech acts are available to the parties and specify what effects these acts have on the commitments of the parties. The set of available moves can accordingly be described as follows:

1. Claiming a proposition φ. This commits the speaker to φ. For instance, the Proponent says: "I claim that you have to compensate me for the tear in my jacket."
2. Challenging a claimed proposition φ. This obliges the hearer to give grounds for φ. For instance, the Opponent says: "I challenge your statement that I have to compensate you for the tear in your jacket." This obliges the Proponent to give grounds that support the conclusion that the Opponent has to compensate the damage.

3. Conceding a proposition φ that was claimed by the other party. This commits the speaker to φ. For instance, the Opponent says: "I concede that the tear in your jacket was caused by my fence."
4. Claiming proposition φ to support a previously claimed proposition ψ. This commits the speaker to φ. For instance, assume that the Proponent says: "You have to compensate me, since the fence which caused my damage is your property, and owners are under the obligation to compensate others for damage caused by their properties."
5. Claiming proposition φ as a sub-reason for an asserted proposition ψ. Commits the speaker both to ψ, and to the assumption that ψ can be expanded into a complete reason for φ. For instance, the Proponent rather than stating the complete reason indicated in (4), can only provide a part of it, by saying: "You have to compensate me, since the fence which caused my damage is your property."
6. Challenging subreason φ (in reply to move 5). Obliges the hearer to expand φ with further subreasons. For instance the Opponent says: "I challenge your statement that the fence being my property entails that I have to compensate you for the tear in your jacket."

Let us consider the structural rules, which indicate when the moves we have just described can legitimately be performed:

- The dialogue starts with an initial claim of the Proponent, after which the parties take moves in turn.
- The Opponent may attack (challenge) one of the Proponent's previous statements, or accept it (concede).
- The Proponent may defend (by giving grounds) the attacked statement.
- Those Proponent's statements which the Opponent has not explicitly attacked count as being conceded, until they are explicitly attacked.

Finally, here are the termination rules:

- The dialogue terminates in favour of the Proponent when, after a move by the Opponent, the statements implicitly or explicitly conceded by the Opponent form a valid argument supporting the Proponent's claim.
- The dialogue terminates in favour of the Opponent, when, after a Proponent's move, the statements conceded by the Opponent or yet unchallenged do not form such a valid argument.

The latter rules, in other terms, say that the Proponent wins if the Opponent has explicitly or implicitly conceded all statements of an argument supporting the Proponent's initial claim. On the contrary, the Opponent wins if she has challenged all arguments so far proposed by the Proponent and the latter does not put forward any further arguments supporting his claim.

For instance, the following dialogue is won by the Proponent, since the Proponent concedes (explicitly or implicitly) premises which are sufficient to support the Proponent's request for compensation (the Proponent performs P-labelled statements, and the Opponent, the O-labelled ones):

P_1: I claim that you have to compensate me for the tear in my jacket.
O_1: I challenge your claim.
P_2: You have to compensate me for the tear in my jacket, since the fence that caused this damage is your property.
O_2: I concede that the fence which caused this damage (the tear in your jacket) is my property, but I challenge that this entails that I have to compensate you.
P_3: I claim that owners are under the obligation to compensate others for damages caused by their properties.
O_3: I concede that owners are under the obligation to compensate others for damages caused by their properties.

11.1.5. The Persuasion Dialogue: The Position of the Parties

In a persuasion dialogue the Proponent tries to push the Opponent into a situation where the Opponent will be forced either to fall in contradiction (or in an unsustainable positions) or to concede elements sufficient to establish the claim of the Proponent. Thus, in principle the Opponent enjoys an advantaged position: She may avoid losing just by challenging whatever statement the Proponent puts forward and never committing to anything. In this way, the Opponent will be sure that she will never fall in contradiction (and the Proponent in the end will have to abandon the game).

The position of the Proponent is much more difficult: He must make assertions (and therefore he can fall in contradiction), and must support them by giving grounds.

In a realistic setting the challenge-all trap may be avoided by appealing shared opinions.

First of all, an opinion may be shared by the parties of the dialogue, that is, the Proponent may appeal to ideas that are already adopted by the Opponent— who is committed to these ideas either on personal grounds, or because she has publicly endorsed them.

Secondly, the Proponent may appeal to opinions that are shared in the social setting where the dialogue takes place. These opinions are usually referred to by using the Aristotelian term *endoxa*, which denotes propositions that are normally accepted in the social context in which the dialogue is embedded (for a legal discussion on *endoxa*, see Cavalla 2003). As we have observed in Section 2.3.2 on page 77 *endoxa* may be viewed as defeasible presumptions, to be accepted until refuted. The same holds for the so called *rhetorical places* (*topoi*),

namely, the theses that can be introduced in any discourse (common places) or in particular disciplines (specific places) being generally accepted and acceptable, though being susceptible of limitations, conflicts and exceptions.[3]

Moreover, as we shall see in the following, when a third party participates in a persuasion dialogue (as a judge or a jury) the decisive step consists in appealing to the opinions of the third party. More generally (consider for example a political debate) the proponent's position is strengthened when there is an audience, who can sanction the opponent's refusal to concede what is accepted (and appears to require acceptance) by everybody else.

11.1.6. *Other Kinds of Dialogue: Information Seeking, Negotiation, and Reconciliation*

The pattern of interaction which is required for the purpose of information seeking is different from that of a persuasion dialogue. In an *information-seeking dialogue*, speech acts are not claims, challenges and concessions, but rather *questions* and *answers*. We may also admit the challenge of a query, consisting in questioning its admissibility or its relevance. As a result of such a challenge, the information-seeking dialogue will embed a persuasion dialogue, where the interviewer tries persuade the interviewee (or the observers) of the relevance of her question.

In information-seeking dialogues the interviewer plays safe: She does not need to commit to any assertion. On the contrary, the interviewee gets committed to his statements, and incurs the risk of contradicting himself. However, in a cooperative situation, information-seeking dialogues are win-win games: The interviewer succeeds by accessing the information, the interviewee by transmitting it. On the contrary, in a non-cooperative situation, when one party is interested in coming to know certain facts, where the other does not want to provide information, the interviewer will win if she extracts the information she wants. In a different sense, the interviewer also wins if the interviewee falls into contradiction, and is discredited. As an example of a (usually) cooperative interview, consider a lawyer examining a witnesses he has indicated; as an example of a (usually) non-cooperative interview consider a lawyer examining the witnesses

[3] Among the most famous legal *topoi* we can mention the following: *ne ultra petita* (condemnation cannot go beyond what is requested by the parties), *et audietur altera pars* (also the other party must be heard, which entails that everyone has the right to defend oneself), *in dubio pro reo* (when the commission of the crime is uncertain, the decision must be in favour of the accused), *nemo plus juris in alium transferre potest quam ipse habet* (one can transfer to another only the rights that one has), *casum sentit dominus* (the owner sustains damages resulting from hazard). We will not discuss separately legal *topoi* since, from a logical perspective, they seem to be reducible to the logical structures we have already discussed: defeasible rules, factor-links and values. We will also not address the historical and philological issue of distinguishing between *endoxa*, *topoi*, and *regulae juris*, an issue we must leave to the competence of legal historians (see in particular Stein 1966).

indicated by the other party. Also prosecutorial fact-finding tends generally to assume the pattern of an information-seeking dialogue, though there are significant variations in different legal systems (see Jackson 2004).

Still different rules are required for a *negotiation dialogue*. In such dialogues there is a *negotiation space*, namely, a set of negotiated outcomes that both parties prefer to a non-negotiated solution. However, the parties gain differently from different negotiated outcomes. For example, assume that a prosecutor would prefer trial to an agreed penalty lower than 5 years, and the accused would prefer trial to an agreed penalty higher than 10 years. Within this negotiation space (from 5 to 10 years) the two parties have to find an agreement. Here the moves are the parties' offers. Each party is committed to his or her offers, in the sense that if the offer is accepted by the other party, it will become a binding agreement. Moreover, the subsequent offer of one party must be at least as convenient as the previous offer of that party. The dialogue finishes when an offer is accepted, and thus a deal is made.

In a successful negotiation dialogue both parties win, and the amount of their victory is the difference between the agreed result and the minimum result they were ready to accept (which is determined by the expected value of a non-negotiated solution). In our example, if the agreement is for the accused to plead guilty with a six-year sentence, the prosecutor wins one year ($6 - 5 = 1$) and the accused wins four years ($10 - 6 = 4$). Note that the gains of the two parties may be very different (in a sense, we may also say the party getting the lion's share is the one who really wins). The game also finishes when both parties refuse to make further offers: In this case both parties lose, missing the advantages of cooperation. The loss may even be worse than simple non-cooperation: If in the course of a negotiation threats were issued, now they may need to be implemented, to the detriment of both parties (otherwise the issuer of the threat would lose his or her credibility, and the possibility of using threats in the future).[4]

Still different rules are required for *practical inquiry*, where the parties engage in a common disinterested search for practical knowledge. In these dialogues—a precise account of which has been provided by Alexy's (1991) theory of practical reasoning (see also the formalisation provided in Gordon 1995)—each one can put forward relevant statements, can defend them through arguments, is obliged to justify his or her statements if required to do so, and can challenge the statements and the arguments of any others. In practical inquiry, defining what counts as winning or losing depends on the purposes of each participant, to wit, on whether they want to achieve an agreement, or rather to increase their individual knowledge or practical wisdom through the interaction with other

[4] We hope that the reader will excuse us for this very simplified account of the complex issue of negotiation, on which there is a huge amount of literature (for a classical reference, see Raiffa 1985).

people, or rather to contribute to the enterprise of increasing collective practical knowledge:

- In the first case, everybody wins if a shared conclusion is achieved, to wit, if there is an argument which has been capable of surviving all challenges and attacks. Everybody loses if no such argument can be found.
- In the second case, one wins if one becomes aware of relevant and insightful arguments supporting or attacking a thesis one is interested in. One loses if no increase in one's individual knowledge and wisdom is obtained through the dialogue.
- In the third case, one wins if one contributes to the development of practical knowledge, viewed as a collective enterprise.

Finally, different rules hold for *reconciliation dialogues*. Here the starting situation is where one party is accused of committing certain offences, the performance of which impairs future cooperation, and which reveal a hostile disposition incompatible with cooperation.

Though very often both parties in a reconciliation dialogue may be in the offender's position one towards the other (as is usually the case after a civil war), it is useful, for analytical purposes, to view reconciliation between reciprocal offenders as consisting in two reconciliation processes going in opposite directions, and thus to keep the idea that reconciliation connects an offender and a victim. The accused party has the possibility either of rejecting the accusation, or instead of admitting his past wrongs while rejecting the disposition that led him to commit such wrongs. The rejection of the accusation would possibly determine a shift into a different type of dialogue, possibly an information-seeking or a persuasion dialogue. The admission would determine a situation where the other party, either gives her forgiveness or challenges the change in disposition of the accused. Again this last reply may start a new type of dialogue—possibly an information-seeking or a persuasion dialogue—intended to establish whether such a change has taken place. It is hard to say who wins or loses a reconciliation dialogue, since this largely depends on the psychological attitudes of the parties. We can say that both win if the reconciliation takes place: Both parties are now committed to cooperate, and the wrongdoer has changed for good. Both lose if reconciliation fails, which can lead to an escalation of the conflict.

11.1.7. Combination of Dialogues, Dialogue Shifts, and Inversion of the Burden of Proof

According to Walton and Krabbe (1995), various other aspects become relevant in describing a dialogue, besides those we considered in the previous sections: the type of conflict (more generally, the type of problem) from which a dialogue originates, the nature of the subject discussed, the degree of rigidity of the rules, the preciseness of the procedural description of the dialogue, the commixture

with other types of dialogues. These aspects too need to be discussed with specific reference to different dialectical systems. For instance, an excessive precision of rules and procedures can play a negative role in a reconciliation dialogue, where an excess in formality can may prevent people from sincerely expressing their feelings, while precision can be useful in persuasion dialogues, where it can make interaction quicker and more effective.

The diversity of dialectical systems, and their different ability of coping with different aims and contexts, explains why a *combination of dialogue-types* may be required for handling complex interactions, where more than one purpose is at hand, and parties may take very different attitudes. This is typically the case in legal proceedings.

The basic pattern for reconstructing such proceedings, both in the civil process and in the (accusatorial) criminal process is given by the *persuasion dialogue*. There are indeed many advantages linked to this type of dialogue. It strongly protects the interests of the opponent, and in particular allows him control over his *privacy*, namely, over the decision of what information to disclose at what stage (by conceding the corresponding statement of the proponent). It does not make major psychological demands on the parties: They are fighting one against the other, and there is no need for their having a joint purpose. It may be tightly regulated, since each party reacts to the moves of the other party. Though a persuasion dialogue has these interesting features, it is clear that no legal process could work as pure persuasion.

First, the opponent could always avoid being persuaded (so that he would never lose) simply by challenging every statement of the proponent, even those that are most evident. This can be compensated by introducing in the debate an impartial observer, such as a jury (or a judge), with the task of establishing what statements cannot be undermined by a simple challenge, but must be assumed unless proof to the contrary is provided (when *res ipsa loquitur*). The evaluation of the observer may be anticipated by the proponent, who tries to provide reasons which her auditorium will presumptively accept. The judgement on the presumptive acceptability can also be made directly by the law, by establishing inversions of the burden of proof.

An inversion of the burden of proof, in a persuasion dialogue, starts a new, embedded persuasion dialogue, where the parties switch their places: In relation to a certain proposition, now the original opponent (the defendant) becomes the proponent while the original proponent (the plaintiff) becomes the opponent. For instance, in the example above once the plaintiff has established that the fence has caused the damage, the defendant can still avoid liability by showing that the decisive precondition for the production of the damage was the plaintiff's careless behaviour. In regard to this condition, the burden of proof is upon the defendant: He becomes the proponent of this proposition, and he must push the plaintiff to concede it, or provide evidence that convinces the judge.

For instance, the defendant can prove that the plaintiff tore his jacket while he trying to jump over the fence, rather than entering through the gate.

Another way to avoid the challenge-all trap is to embed inside the persuasion dialogue an information-seeking phase, as when a witness is interrogated, an expert provides his opinion, or when one of the parties takes an oath. Again, such a step will (usually) provide an inversion on the burden of proof, which requires the defendant to take the initiative: What results from the embedded dialogue will be presumed, unless the defendant persuades the other party (or at least the observer) of the contrary.

Finally, there may be the possibility of embedding negotiation into persuasion, though this would rather consist into moving to a completely different dialogue, as when parties negotiate an agreement to end litigation.

Embedding is an aspect of the more general phenomenon of a *dialogue-shift*, which occurs when a dialogue shades into another dialogue type, possibly without the parties being fully aware of this change. For instance, persuasion can become inquiry if the proponent, rather than defending her thesis, confesses her perplexity on the matter, and asks for cooperation in order to solve her predicament. Similarly persuasion can become information seeking, if the persuader starts questioning her opponent. Inquiry can become persuasion when one researcher is so convinced of (or so committed to) her thesis that she just focuses on resisting the challenges against it.

In some contexts, such shifts may have a negative impact, since they imply abandonment or distortion of the original purpose of the dialogue. For instance epistemic inquiry (for example by a committee of experts) can shift to a negotiation when the parties bargain the result of their inquiry (since they can find an outcome which would be more convenient to all of them, then what they believe to true), failing to achieve the epistemic purpose of inquiry (getting to the truth). Similarly, a persuasion dialogue can degenerate into a quarrel, and so miss the purpose of settling a disagreement. It is even worse when reconciliation dialogue shifts into a quarrel: In this case the parties will attack each other, emphasise their differences, and attribute to each other (and exhibit) features and attitudes that make a future cooperation even more difficult.[5]

11.2. Dialogues and Procedures

Dialectical exchanges constitute the essential component of legal procedures. We need, however, to refrain from always imposing a single dialectical model, inspired by an abstract idea of dialectical rationality.

As we shall argue in the next chapter, different procedures serve different

[5] On the works of the South African Truth and Reconciliation Committee, see among the others Christodoulidis 2000, who stresses the tension between legal proceedings and reconciliation, and the dangers of a dialogue-shift toward an adversarial paradigm.

aims, in different contexts, and need therefore to be viewed as implementing different types of dialogue.

11.2.1. *What Dialogues for What Procedures*

Different types of dialogues might contribute to different extents to the different ends which may be pursued through legal processes, as shown in Table 11.2, which lists the performance of different types of dialogue under different regards (the grades indicated just exemplify a very tentative and intuitive assessment).

As it appears from the table, different types of dialogues have different advantages and disadvantages and are thus more or less appropriated for different goals: This implies that for achieving the various goals of a legal procedure we will need a combination of dialogues.

For instance, a criminal process inspired only by *persuasion* would correspond to an extreme versions of the accusatorial system: The accuser is the proponent, the defendant is the opponent, and the jury (or the judge) is an impartial observer. Such a process would have the advantage of maximising the avoidance of wrong condemnations, since the burden of proof would lie on the accuser, but on the other hand it would also minimise the possibility of establishing the liability of the defendant. However, much would depend on what evidentiary strength is required in order that the burden of proof is switched unto the other party, to wit, on what conditions have to be satisfied for a statement to be considered so evident that it needs to be disproved, rather than proved.

A persuasion-based process would not promote cooperation, since the two parties would have conflicting strategies, but on the other hand it would avoid violent clashes, since whatever one party may say, it will be attributed to the "logic of the game," rather than to personal attitudes towards the other party (in other words, this would reduce shifts towards quarrel).

In fact, the antagonistic position of the parties favours their reciprocal recognition as adversaries in a fair contest. This is different from being partners in a cooperative project, but also from one party having an arbitrary power over the other. A legal interaction modelled according to the persuasion dialogue would tend to be characterised as a win-all or lose-all game. Thus an accommodation that is satisfactory for both parties will not usually be achieved.

On the other hand, the persuasion model is self-sustaining, since it builds upon the interested behaviour of the parties. It is also moderately efficient, and it requires minimal psychological attitudes on the parties: They would define their strategies so to maximise the achievement of their opposite interests, without the need of taking an impartial or cooperative perspective.

Let us now move to model of the *information-seeking* dialogue. This seems to characterise the model of the *inquisitorial process*. Here the accuser (the judge or prosecutor) is basically an interviewer, who has the task of putting questions to the accused, who plays the role of the interviewee. The accused is thus forced to take a stand, affirming of denying what he is questioned about. In such a dialogue, the dignity and the privacy of the interviewee are at risk, unless appropriate safeguards are taken. There is even the risk that the questions become threats so that the dialogue shifts into mental or bodily abuse, namely, into *torture*.

Also in an accusatorial process the information-seeking mode is adopted when a person is called to contribute his information (as a witness). The skill of the interviewer consists in facilitating the interviewee in bringing out his entire story, by asking the right questions in the right order. However, if the interviewee is not cooperative, the interviewer may try to force him into contradiction: The interviewee is committed to his answers, in the sense that he is not allowed to provide a contradictory version of the facts. If this happens, the interviewee will have to pay the penalty possibly established for falsehood, and withdraw one of the contradictory statements. Moreover the interviewer will probably assume that the interviewee lied in order to protect his interest (or the interest of the party he is trying to support). Thus the interviewee's falsehood may support the conclusion that the version of the facts that less corresponds to his interests (or to the interest of that party) holds true.

A legal process organised as a pure *negotiation* dialogue would usually take place as an alternative way of resolving a dispute (as when mediation takes place). This also happens in criminal cases when the accused negotiates with the prosecutor the conditions for *pleading guilty*.

There are also some instances of legal proceedings being developed as *recon-*

ciliation dialogues. Here *truth and reconciliation committees* need to be considered, which found their highest example in the South African experience (see Tutu 1999).

In such proceedings, the declaration of one's repentance from one's faults and the forgiveness of the other parties are at the foreground. The focus is on psychological attitudes, since the grounds for future cooperation are at issue.

What would make the process fall apart is the impression that an exploitative view is taken by the parties to be reconciled, and especially by the wrongdoer: He does not really want to start future cooperation on new bases, detaching himself from his past actions, but simply tries opportunistically to avoid punishment for his wrongful behaviour. Here the "defendant," when put before his wrongs, should provide evidence of his change of attitude, his rejection of his past, and his commitment for future cooperation, a commitment that should be trusted by the victim, in first place, and by his other fellows too.

The prosecutor (better, the victim) either is satisfied or asks for further admissions and commitments. However, her request should not be viewed as a way of humiliating the wrongdoer (for stigmatising his person, rather than his action), or even of rewarding him for his past wrongs, but rather as a way to ensure that the wrongful damages are restored and to extract evidence that a real change has taken place within the wrongdoer.

Similar kinds of dialectical interactions partially characterise also models of the criminal process inspired by the idea of *restorative justice* (Braithwaite and Pettit 1990).

11.2.2. Dialogue and Collective Choices

Our discussion of dialogue types in legal debates is by no means intended to provide an exhaustive review. We just meant to clarify how legal reasoning has a collective dimension, in regard to which diverse dialectical patterns are required, according to the goals to be achieved and the context in which they are to be pursued.

Our approach requires therefore detaching the idea of practical cognition fromm the structure of a particular type of interaction. What type of interaction may be more appropriate to practical cognition (and in particular to collective practical cognition, namely, cognition from the perspective of a collective), depends on the type of problems to be faced, on the available resources and skills, and on the existing psychological attitudes.

In many cases, as we have seen above, social cognition only indirectly results from the individual participation in a dialogue. This happens when the aims of the participants do not coincide with the function proper to the dialogue, as is usually the case in judicial proceedings.[6]

[6] This detaches one's individual contribution to social cognition from one's intentions. One's

However, as we have seen in Chapter 9, people also directly and intentionally engage (and should engage) in making collective choices, trying to identify appropriate practical determination from the point of view of their collective, and to converge in such choices with their fellows. For this purpose, a vital requirement is that people may intentionally engage in dialectical interactions with their fellows in order to achieve social cognition and perform social choices. This can take in particular two forms.

The first consists in one's participation in *collective practical cognition*. This is the discursive situation where a collective of reasoners share the purpose of reaching practical cognition, concerning a collective choice—the choice of what values, rules, actions their collective should adopt—through sharing their ideas (on communication and cognition as a collective enterprise, see Tuomela 2002).

The reasoners engaged in collective practical cognition would publicly express their beliefs concerning what best advances the collective's aims and also state their critical observations on views by others. Expressed opinions would become part of a common pool of hypotheses to be tested by the participants in the dialogue, and consequently, accepted or rejected by each one of them. Here the focus is on collective inquiry, on each one's availability to contribute his or her own ideas concerning the common good, and on how to realise it, and on each one's availability to take into account impartially the views of others. Practical inquiry is a very appealing kind of interaction with regard to collective choices, there included legal choices: Not only does practical inquiry allow for shared advances in practical knowledge, but it also emphasises the participants' active citizenship, their dignity (each being considered as a valid contributor and evaluator of ideas concerning the common good) and their sense of community (each being involved in the collective enterprise of practical cognition).

Some philosophers, and notably Arendt (1958) have viewed political action (which is sometimes identified with action tout court, in its fullest sense) as the only domain in which this attractive features can emerge, as opposed to theoretical inquiry or to technological activities. We rather believe that the characterising features of collective practical cognition derive from its being a form of collective cognition, an aspect that it shares with theoretical science and technological research (for instance, in physics or in software engineering), as long as they are developed according to the principles of an open research community. The common purpose of finding the solution to a cognitive problem (be it epistemic or practical, scientific or technologic, theoretical or applied) and the availability to provide and consider (according to its merit and its relevance)

contribution to the function of the dialogue in a way becomes similar to the unintentional contribution to social cognition one may provide in non-linguistic ways: for instance, by showing to one's fellows one's "experiments" of living (see Mill 1991a, 71ff.) that others will imitate or avoid according to the success of these experiments, or by contributing through one's economical activity to building social indicators, like prices (on the cognitive function of prices, the classical reference is Hayek 1977).

any input which may be significant to this purpose are common to any collective cognitive enterprise, both in the epistemic and in the practical domain.

The second situation consists in what we may call *negotiation on the common interest*, where people having different views on what choices most contribute to the public good try to converge with one other into a shared solution, and accept a negotiated outcome that to each (or to most) of them appears to be inferior to the solution he or she would have preferred. For instance, to find an agreement on a law on reproductive technologies, a bargain may be reached which allows for artificial insemination, but only when the request comes from a stable couple (given that some would ban all forms or artificial insemination and other would always admit it), and which allows for modifying genes, but only to prevent hereditary diseases (when some would reject all intervention on the human genome and others would also admit ameliorative interventions). Similarly, in a decision concerning affirmative action, the agreement may consist in admitting it, but only under restricted conditions (no fixed quotas, no single criteria, and so on).

Negotiation on the common interest is different from usual negotiation, where each party aims at maximising his or her gains: Here all parties aim at the common good, though having different views of it. This way of bargaining may take place, for instance, between the political parties forming a coalition government, or between the judges in a panel.

A mostly important kind of such negotiation takes often place when a new constitution is adopted. For instance, when the Italian constitution was adopted after the second world war, different political parties, having very different ideologies (Marxist, Christian-Democrat, Socialist, Liberal-conservative), converged in a constitutional arrangement that represented a compromise between the different values expressed by these ideologies. Each of these parties would have preferred, according to its own ideology (according to its peculiar view of the public good), a different arrangement from the one that was agreed and adopted, but they were able to converge on a satisfactory second best, which was acceptable to all of them.

Such compromises often take place at the international level, where Declarations and Treaties on human rights—and first of all the 1948 Universal Declaration of Human Rights—provide the most significant, and most beneficial, example.

Also negotiation in the common interest presents appealing features: It assumes that participants in the interaction recognise their partners as sincerely expressing their views on the common good, take the views of others seriously, and identify what compromise might be appropriate for convergence.

11.2.3. Deliberation, Democracy and Cognition

With regard to both types of interaction we considered the previous section—collective practical cognition and negotiation on the common interest—the ideal of *deliberative democracy* includes two different requirements: democracy and deliberation.

The aspect of *democracy*, on the one hand, requires the broadest participation of citizens, and their equal chance of influencing the output of the decisional process, both in the inquiry and in the negotiation phase.

The element of *deliberation*, on the other hand, requires that the decisional process tracks practical rationality, that is, expresses the idea that political deliberation should approach the procedure of ideal practical cognition, and deliver correct outcomes.

We cannot here discuss the issue of democracy, and of deliberative democracy in particular (see, among the many contributions dedicated to deliberative democracy, Bohman and Rehg 1997). Let us just observe that there is neither a necessary opposition nor a necessary conciliation between these two requirements.

Participation does not necessarily lead to good deliberation, even when everybody is allowed to provide inputs, under conditions of equality. Consider, for example, the limited cognitive results that are often obtained by non-moderated discussion fora over the Internet. In such fora everybody is allowed to provide his or her contribution, under conditions of perfect equality, and without any violence or undue interference (one may even maintain anonymity if one wishes to do so). However, the results are often poor: Sometimes the discussion degenerates into reciprocal abuse and usually many contributions are not worth reading. Moreover, such fora can be easily hijacked by vocal minorities (or by paid lobbyists), so that their outcome is very different from what the (considered) opinion of the polity should be. In fact, Internet debates are usually more fruitful and interesting when they address specific issues (computing problems, technical matter, hobbies, and so on) rather than when they concern general social and political themes.

The short history of Internet discussions seems therefore to confirm the obvious truth that not all have the resources (in time, competence, motivation) to participate in public debate, or rather that nobody has the resources for participating effectively in all public debates. Such limitations can easily be exploited for having open practical inquiry to shift, possibly without the awareness of its participants, into manipulation and deceit.

Moreover, dialogues very rarely lead everybody to shared outcomes. For providing a deliberation, dialogues would need to be coupled with voting procedures, which may lead to a situation where the majority ignores cognitive inputs provided by the minority, so that "will takes the place of reason" (*stat pro ratione voluntas*).

This should not be understood as a criticism of participatory democracy, nor as a criticism of the use of computer technologies for enhancing political participation.

On the one hand political participation, according to appropriate procedures, not only is an important intrinsic value, it also is a fundamental aspect of practical cognition in the political domain: It enables people's views (on their needs and of the ways of satisfying them) to become influential inputs to political decision-making while making governments responsible for the way in which they take this inputs into account, and it enables people to revise and refine their views (to enter a learning process) by having access to political debate and contributing to it.[7]

On the other hand, information technologies are a powerful tool for distributing information, for communicating, and for interacting. Thus, they can give a huge contribution both to participation and to deliberative quality.

However, the advantages of political participation, supported by information techology, do not follow automatically from giving to all an equal opportunity of voicing their opinions and of voting on them. On the contrary, appropriate procedures, constraints, and facilitations must be in place for improving the quality of the process of collective cognition, through collective practical inquiry.[8] .

Even when deliberation is entrusted to elected representatives, there is no necessary link between discussion (coupled with voting) and practical cognition: Electoral mechanisms may undermine the deliberative quality of decision-making, by having representatives focus on sectional interests, or on the passions of their constituencies rather than on the rational identification of the common good. On the contrary, ensuring the deliberative quality of collective decision requires, in various contexts, its *depoliticisation* (see Pettit 2003). This is particularly significant for judicial decisions (and more generally in the application of the law to individual cases).

We view legal reasoning, and in particular judicial reasoning as an active participation in collective reasoning—both in ordinary application of the law and in constitutional review—and thus as a kind of political activity, in a broad sense. However, we believe that judicial decision making (and more generally the application of the law to specific cases) needs to be depoliticised, in the sense of

[7] See for instance Sen (1999), who attributes to democracy the following virtues: "first, the *intrinsic* importance of political participation and freedom in human life; second, the *instrumental* importance of political incentives in keeping governments responsible and accountable; and third, the *constructive* role of democracy in the formation of values and in the understanding of needs, rights, and duties." On law, democracy, and participation, see also, among the many contributions which address this issue, Nino 1996 (who emphasises the cognitive performance of democracy) and Urbinas 1996.

[8] On the risks of illiberal democracies, with the discussion of examples from recent history, see for all, Zakaria 2003. On e-democracy, see for an interesting application Gordon and Karacapilidis 1997, for a discussion with examples Morison and Newman 2001, for more general considerations Sunstein 2001.

being detached from the direct influx of the political bodies through which direct or representative democracy is exercised.[9] This is needed for a number of reasons: Judicial decision-making needs to refer to legally binding standards, it requires legal expertise, it is exposed to strong partisan lobbying (since judicial decisions have a strong impact on the specific interests of the parties while having little incidence on those who are not directly involved), it may involve protecting minorities against the will of the majority. In other legal choices, on the contrary, political decisions (within constitutional constraints) are undoubtedly most appropriate: Universal referenda are suitable for certain basic political choices concerning a whole community, while the vote of representative bodies is needed for ordinary legislation.

Our rejection of politicised application of the law does not exclude that judicial decision-making should be open to discussion and criticism. In this regard, besides general public discussion (which usually can only concern a few most significant issues) and political debate (which is influenced by the competing interests and biases of the opposed political parties), open doctrinal discussion plays a decisive role. Legal doctrine may give (and does fortunately give, in many cases) a fundamental contribution to making so that legal issues are approached in an informed and rational way, according to the idea of practical inquiry (we agree with Peczenik, Volume 4 of this Treatise, sec. 3.2 on emphasising the role of legal doctrine in legal cognition and decision-making).

In conclusion, how universal participation in collective decision-making, directly or through elected representatives—as is required both by everybody's dignity and by everybody's potential for providing useful inputs (as emphasised by Waldron 1999a)—may be reconciled with the idea of practical cognition depends both on the matter to be decided, and on the implementation of appropriate institutional arrangements. We cannot here consider how this reconciliation might happen (we must leave the discussion to political theory and to the doctrine of constitutional law). We need to content ourselves with the statement that only with regard to determinate substantive issues and institutional frameworks, is it possible to establish precisely what legal decisions can be entrusted to the whole citizenship, to elective bodies, to committees of experts, or to professional judges.

[9] In ancient democracy, the same Assembly had frequently both legislative and judicial functions, as illustrated in literature by Aeschylus's *Orestiad* and by Plato's *Apology of Socrates*. A remnant of this kind of arrangement can be found in the judicial function of the English House of Lords—though, as a matter of fact, Law Lords have evolved into a separate judicial body.

11.2.4. Adversarial Models of Legal Argumentation

In recent research there has been an increasing focus on the procedural aspects of legal argumentation, and in particular, on adversarial disputation, as it typically takes place in judicial cases (for some logical analysis of disputations, see for instance: Gordon 1995; Lodder 1999; Prakken 2001b.

Our work has a broader focus than adversarial disputation: We view legal reasoning as the process through which one attempts at identifying binding (and enforceable) normative conclusions, participating in the viewpoint of one's community. This gives legal reasoning a relevance that goes beyond adversarial disputation, a relevance that goes beyond judicial proceedings: Legal reasoning also takes place in cooperative frameworks, as in doctrinal discussion, and more generally whenever people impartially consider what legal solutions are more appropriate (adoption worthy).

This warning does not exclude the need to find appropriate procedural regulations for adversarial disputations, and to implement them carefully. This aspect is linked both to the bounds of human rationality and to our tendency to focus on our own particular interests and opinions, and to privilege them when they conflict with the interests and the opinions of others. Such regulations are required to avoid the disputation shifting into a quarrel, and never reaching an end.

In analysing adversarial legal procedures, the following features of them need to be taken into account.

Firstly, the outcome of a legal dispute often depends not only on the propositions and arguments exchanged, but also on the dialectical behaviour of the parties involved (such as when a claim was disputed, conceded, or not responded to) and on how the burden of proof is allocated. In legal disputes it is not only important what arguments have been exchanged, but also what premises of these arguments have been disputed, conceded (or withdrawn), and how the burden of proof has been allocated.

Even if we only look at arguments and the statements from which they are composed, procedural law has a lot to say. For instance, there are issues of fairness to be considered: As soon as one party has fulfilled his burden of proof, the dispute is not over but the other party must be given a fair opportunity to provide counterevidence.

Moreover, we need to establish when a dispute has to be terminated. This requires answering the following question: Under what conditions a certain body of information is sufficient to decide the dispute, and under what conditions it is better to search for more information? This issue is partly regulated by procedural law, though procedures usually leave some freedom to the judge, at which point rational criteria for termination are called for.

In particular, the problem of termination concerns the distinction between *inferential justifiability* and *cognitive justifiability* we traced in Section 3.3.2 on page 106, that is, the distinction between what would result from correct infer-

ence from a given set of beliefs (of premises), and would result from a larger inquiry (including the search for new cognitive inputs).

For the outcome of a legal process to be fully acceptable it is not sufficient that this outcome is *inferentially justifiable* with regard to premises that satisfy the existing procedural rules, namely, premises that have been provided in the process, have passed the procedural filters and have been accepted according to the decision-making empowerments which characterise the process. The acceptability of the outcome of a legal process also presupposes a certain degree of *cognitive justifiability* as well: The procedure must have offered the possibility that the adequate cognitive inputs (in the first place, adequate pieces of evidence) were provided, and also must have ensured, or at least promoted, the realisation of this possibility.

In this regard, the ideal of cognitive justifiability must be balanced with the fact that human cognition is bounded. A minimal requirement is that anyone that is directly involved in the dispute is offered a fair opportunity of bringing in his or her beliefs and views and of providing the relevant evidential data.

Summarising, when one wants to reconstruct certain pieces of adversarial reasoning, in the frameworks of legal proceedings, one must also take into account how the legal procedure gives permissions and powers of disputing, conceding or ignoring claims, and how it regulates the admissibility of evidence and counterevidence. Moreover, this process evolves in time: The arguments that pass the procedural filter at a certain stage in a dispute may favour the plaintiff, but the dispute may proceed and a new set of arguments passing the procedural filter at a later stage may favour instead the defendant. Finally, the issue of termination is governed by considerations of fairness, relevance (asking the right questions) and resource limitations, especially time and money.

11.2.5. Formal Analyses of Legal Disputation

The formal analysis of the procedural aspects of legal argumentation is a the object of a promising line of research, which originated in the 1990s, when researchers in artificial intelligence and law applied the theory of dialectical systems to legal disputes, developing formal models of dialectical proceedings.[10] These models establish when certain speech acts may or must be made, which effects they have on the (current) outcome of a dispute, and (sometimes) when a dispute terminates.

Formal models of legal disputes often express a design-stance: They aim at providing protocols for how legal disputes can be conducted and resolved in a fair, rational and effective way.

[10] Among the many contributions recently published, see: Gordon 1995; Hage, Leenes, and Lodder 1994; Lodder 1999; Loui 1998; Bench-Capon, Geldard, and Leng 2000; Prakken 2001b. For two recent overviews see: Hage 2000a; Prakken and Sartor 2002)

- *Plaintiff*: I claim that defendant owes me 500 euro.
- *Defendant*: I dispute plaintiff's claim.
- *Judge*: Plaintiff, prove your claim.
- *Plaintiff*: Defendant owes me 500 euro since we concluded a valid sales contract, I delivered but defendant did not pay.
- *Defendant*: I concede that plaintiff delivered and I did not pay, but I dispute that we have a valid contract.
- *Judge*: Plaintiff, prove your claim that you have a valid contract.
- *Plaintiff*: This document is an *affidavit*, signed by us.
- *Defendant*: I dispute that this document is an *affidavit*.
- *Judge* Defendant, since the document looks like an *affidavit*, prove that it is not.
- *Defendant*: This lab report shows that the notary's signature was forged.
- *Plaintiff*: That evidence is inadmissible, since I received it too late.
- *Judge*: I agree: The evidence is inadmissible.

Table 11.3: *Example of a disputation*

Some of these protocols have also been implemented in computer systems intended to support the interaction of the parties in the corresponding dialogues. Thus, the formal analysis of legal disputation is also related to the area of inquiry sometimes called *computational dialectics*, which is concerned with computer-based support to dialectical interactions.[11]

An example of a disputation regulated by a formal model of disputation is shown in Table 11.3. The example dispute is about contract formation. It contains a claim, concessions and disputations, decisions about the burden of proof, an argument and a counterargument, and a decision that a piece of evidence was illegal.

By engaging in the dialectical exchange of Table 11.3, the plaintiff has constructed the argument in Table 11.4 on the next page while the defendant has constructed the argument in Table 11.5 on the facing page (for simplicity's sake we leave some premises implicit, in particular the general rules). The plaintiff's argument passes the procedural filter, since premise (8) was not replied to by the defendant, premises (3) and (5) were conceded by defendant, while with respect to the remaining premise (7), the burden of proving the opposite was assigned to defendant. The defendant's argument, on the other hand, does not pass the procedural filter, since one of its premises (11) was declared inadmissible evidence.

[11] For examples of computer system aimed at supporting legal debates, see: Gordon 1995; Gordon and Karacapilidis 1997; Lodder 1999; Verheij 2003.

$$\dfrac{\dfrac{(3)\ \textit{I delivered} \qquad \dfrac{\dfrac{(7)\ \textit{affidavit} \quad (8)\ \textit{signed}}{(6)\ \textit{offer}\ \text{AND}\ \textit{acceptance}}}{(4)\ \textit{valid contract}} \qquad (5)\ \textit{you didn't pay}}{(2)\ \textit{breach of contract}}}{(1)\ \textit{you owe me 500}}$$

Table 11.4: *Plaintiff's argument*

$$\dfrac{\dfrac{(11)\ \textit{lab report}}{(10)\ \textit{notary's signature forged}}}{(9)\ \textit{no affidavit}}$$

Table 11.5: *Defendant's argument*

Space limitations prevent us from illustrating formal models of disputation in detail. Our main point here is to highlight that disputational dialogues can be formalised in ways that capture specific dialectical protocols.

In recent years, models of the procedure of legal argumentation have made great progress. However, more work remains to be done, especially on formalising these accounts. Important, and still largely unexamined, research issues concern, for instance:

- what strategies should be adopted in playing a certain role a dialogue, e.g. what are the right questions to ask (see Prakken, Reed, and Walton 2003);
- what are good criteria for termination of disputes;
- how process-based models of legal disputation, which focus on single speech acts, can be combined with coherence-based models of legal reasoning, which are concerned with the holistic evaluation of competing theories (see Chapter 28).

Chapter 12

COGNITIVE AND LEGAL BINDINGNESS

In this chapter we shall apply our model of practical reasoning to the analysis of legal thinking and decision-making. In particular, we shall attempt to map the notion of *legal validity*, in the sense of *legal bindingness*,[1] into the idea of *acceptance-worthiness*, or cognitive bindingness that we have introduced in Section 3.1.1 on page 88. This will be a significant test for the soundness of the approach we have developed, given the ubiquity of the idea of validity and the central role it plays, not only in legal theory, but also in legal practice.

12.1. The Paradox of Legal Validity

The notion of *legal validity* is both a fundamental criterion for identifying mainstream approaches to legal philosophy and a major jurisprudential battleground. For example, natural law theory, positivism, and realism are usually characterised by their different concepts of validity. The first assumes that a rule is valid if it corresponds to the will of God or to the dictates of reason; the second, if it has been issued by the State or, more generally, if it possesses a legally defined pedigree; the third, if it is practised by citizens and officials.

The dialectic between these views on validity has been a major constituent of the history of legal thought. In particular, the contest between natural law and legal positivism has continued from ancient Greece (where it underlies such literary and philosophical masterpieces as Sophocles's *Antigone* and Plato's *Republic*) to the 20th century and still is a central issue of legal philosophy.[2] Similarly, the conflict between positivism and realism has been the focus of legal theory in the last century (see Pattaro 1998). Recently, the conflicts between different approaches to legal theory have left room for more compromising views, but validity still remains in the foreground, since these views (also) present themselves as answers to the question of what constitutes "law" or "valid law" (see, among others: Dworkin 1986; MacCormick and Weinberger 1986; Peczenik 1989; Alexy 1992).

[1] We prefer to use the term *bindingness*, rather than of validity, when considering a status of normative propositions, to avoid confusions with the notion of validity as applicable to actions and procedures, on which see Section 23.4.2 on page 608, and in a more general sense, Pattaro, Volume 1 of this Treatise, chap. 2.

[2] On the connection between natural law and legal positivism see Shiner 1990. For a recent review of the theories of natural law, see Finnis 2002, and Bix 2002.

Even a superficial examination of the validity debate reveals, however, a seeming paradox, or, better, a puzzle. On the one hand, this debate has represented the focus of much jurisprudential effort and is considered to have produced some of the greatest achievements of legal thought. On the other hand, it is not easy to understand what the contest is about, and it is even doubtful whether it addresses any genuine problem. Does the validity controversy only concern the *definition* of the meaning of the term *valid*, namely, the description of the current usage of this term, or the stipulation of a new meaning for it? If this is the case, why not simply admit that this term is polysemous: It has many meanings, so that it can legitimately be used in different senses in different contexts and theoretical frameworks?

In this spirit, it would be very easy to distinguish different notions of validity, which are appropriate for specific purposes. For example, following the suggestion of Wróblewski (1992), we could distinguish *axiological validity* (conformity to evaluative standards), *systemic validity* (conformity to "pedigree" requirements, concerning the procedures for law making), and *operative validity* (conformity to the behaviour, attitudes, and beliefs of certain social actors, typically the judges).

More articulate concepts could be devised, by combining these notions. For example, we could define the notion of *systemic-operative validity* as being systemic validity according to operatively valid pedigree criteria (criteria which are in fact socially accepted). This notion would cover, in particular, Hart's model, in which valid laws are identified by practised rules of recognition (Hart 1961). By adding a further component we can define the concept of *axiological-systemic-operative* validity, according to which a normative content is legally valid if, besides being systemically-operatively valid, it does not (grossly) violate certain axiological standards. This concept would include, in particular, Radbruch's famous formula: Positive law, stated and supported by political power, loses its validity when its injustice becomes *intolerable*, that is, when its injustice outweighs the benefit of legal security (Radbruch 1950a; for a sympathetic approach, see also Fuller 1958, and recently Alexy 1992).

Once we have built a taxonomy distinguishing all notions of legal validity we may want to express, there should be no reason for opposing one notion to the others. Before debating validity, one should clearly state what notion of validity one is using, and what terms one is employing to express this notion. After that, the other participants in the debate would still be allowed to contest the truth, the correctness, or the reasonableness of any statement affirming or denying the validity of a normative proposition. However, it would make little sense to question the use of a term instead of another one, for expressing a certain notion of validity, or to argue that a different meaning should be given to a certain term. Everyone, after declaring what one means by *valid*, should be allowed to go along with his or her preferred terminology.

From this perspective, validity controversies seem susceptible of being ex-

plained away as trivial linguistic misunderstandings. Let us consider, for example, the contrast between Radbruch (1950a) and Hart (1983d) on the evaluation of extremely unjust laws (*leges iniustissimae*), such as those implementing racial persecution in Nazi Germany. Hart, when affirming that even such extremely unjust prescriptions were legally valid, was using the term *legally valid* to mean systemically valid (or, more exactly, operatively-systemically valid). Radbruch, when denying their validity was referring to axiological validity (or, more exactly, to axiological-systemic-operative validity). Had this been made clear, both authors should have easily agreed on a platitude: Those Nazi regulations were both systemically valid and axiologically invalid. The difference between the views of Hart and Radbruch—rather than being based on genuine epistemic or practical disagreement—seems to result from that vice known as essentialism: They mistook the different meanings they were assigning to the term *legally valid* for incompatible assertions concerning the same "essence" (Popper 1966, 31f.).

Such a mistake-theory would offer a simple explanation of the validity puzzle. The jurisprudential debate on validity is puzzling because it is nonsensical: It consists in opposing alternative definitions of the same terms, in misinterpreting definitional stances for substantive ones.

However, this view *prima-facie* seems quite implausible. Can we believe that the most brilliant legal theorists have engaged their best energies in endless discussions about legal validity, though nothing was really at stake? Could such debates only concern the frivolous attempt to impose one use of the term *valid* over another (equally legitimate) application of that same term?

In the following pages we shall try to provide a hopefully more sensible explanation of the validity puzzle, in the framework of the theory of practical reasoning we have developed.

We shall first identify the cognitive function that the notion of validity plays in legal reasoning. This will lead us to assimilate the notion of validity, or at least the most important and controversial use of this notion, to our idea of adoption-worthiness, or bindingness. Then we shall consider how conventional or institutional considerations (assessment of shared attitudes, beliefs, and practices) can affect bindingness (validity) judgements, although such considerations are purely epistemic and such judgements are purely practical. Finally, we shall examine how the cognitive function of bindingness judgments determines the meaning of the term *legally binding*—and of the term *legally valid*, when intended in this sense—and what implications can consequently be derived for the use of these terms in law and in legal theory.

12.2. A Legal Example

Let us first introduce a simple example of legal reasoning and analyse the reasoning patterns occurring in it. This will allow us to verify whether the conceptual

(1) believing John assaulted and battered Mark;
(2) adopting instruction ⌈if one assaults and batters another then one shall be punished⌉

---

(3) adopting instruction ⌈John shall be punished⌉

Table 12.1: *Normative syllogism*

framework we have developed is appropriate to illustrate the conceptual role (function) that the idea of validity (interpreted as bindingness) plays in legal language and thinking.

12.2.1. Prima-Facie *Reasoning*

A judge—let us call her Deborah like the famous woman judge from the Bible (Judges 4: 5)—is facing a difficult case. It concerns John, a police officer, who is accused of having assaulted a citizen, Mark, during an investigation. Mark has complained about the assault, but John denies the charge.

Now that the arguments of counsel in the case have been heard, Deborah is trying to make up her mind. She rehearses the arguments of the parties, by reproducing these arguments in her mind. The first argument that Deborah instantiates is the basic *normative syllogism* to which Mark is appealing: The adoption of the instruction[3] that ⌈John shall be punished⌉ follows from the fact that John assaulted and battered Mark, combined with the general instruction that requires punishing those who assault and batter another (see Table 12.1).

From a doxifying perspective—where one first substitutes adoption with belief in adoptability, and then with belief in a normative propositions (see Section 3.2.1 on page 100)—Deborah's reasoning can be recast as concerning the obligation to punish John, as following from the rule that those who assault and batter another ought to be punished (see Table 12.2 on the next page). Finally, by indicating noemata (propositions) rather than beliefs, we get to the objective formulation of Table 12.3 on the facing page. In this reasoning, the adoption of the normative conclusion ⌈John ought to be punished⌉ is supported by a composite reason, including:

1. the minor premise, which is the specific fact-subreason ⌈John assaulted and battered Mark⌉, and
2. the major premise, which is the general rule-subreason ⌈if one assaults and batters another, then one ought to be punished⌉.

[3] By "adopting the instruction" we mean, as we know, "having the intention of implementing the instruction."

(1) believing that John assaulted and battered Mark;
(2) believing that ⌈if one assaults and batters another then one ought to be punished⌉

---

(3) believing that John ought to be punished

Table 12.2: *Doxified normative syllogism*

(1) John assaulted and battered Mark;
(2) if one assaults and batters another then one ought to be punished

---

(3) John ought to be punished

Table 12.3: *Doxified normative syllogism: objective formulation*

12.2.2. The Adoption (Endorsement) of a Legal Rule

Deborah, *prima facie*, considers this syllogism quite convincing, and feels indeed inclined to adopt its conclusion. However, being a critical cogniser, her reasoning must now move up according to the process we have called *rationalisation* (cf. Section 4.1 on page 121). She needs to consider whether she should adopt the subreasons that led her to conclude that Mark ought to be punished: "Did John really assault and batter Mark, and does assaulting and battering one person imply that the assaulter is to be punished?" In other words, she wonders whether these premises are adoption-worthy to her, in her position as a judge, for the case at hand.

We shall not consider here the issue of the adoption of the fact-subreason, the *minor premise*, of her syllogism (we shall examine this aspect in Section 20.4.5 on page 537), but we shall focus on the rule-subreason, the *major premise*. This is the rule: ⌈if one assaults and batters another, then one ought to be punished⌉. Deborah has to decide whether she should adopt this rule, i.e., whether this rule is *binding* to her (cf. Definition 3.1.1 on page 88).

Her first reasoning-step would consist in a *meta-syllogism*:[4] The rule is binding since it is a *ratio decidendi* of the highest court and such *rationes decidendi* are binding, as you can see in Table 12.4 on the next page.

[4] Remember that a *meta-syllogism* is the inference where one concludes that a particular proposition has a certain qualification, on the basis of (1) a meta-proposition saying that propositions satisfying certain conditions have that qualification and (2) the fact that the particular proposition satisfies these conditions. (see Section 2.1.2 on page 49). In the present case, the qualification at issue is legal bindingness.

(1) *rationes decidendi* of the highest court are binding;
(2) the rule ⌈if one assaults and batters another, then one ought to be punished⌉ is a *ratio decidendi* of the highest court

---

(3) the rule ⌈if one assaults and batters another, then one ought to be punished⌉ is binding

Table 12.4: *Meta-syllogism*

(1) the rule ⌈if one assaults and batters another, then one ought to be punished⌉ is binding

---

(2) if one assaults and batters another, then one ought to be punished

Table 12.5: *De-doxification*

Finally, according to the pattern of reasoning which we have called *de-doxification* (see Section 3.1.2 on page 89), the belief that a certain content is binding (that the corresponding certain cognitive state is adoption-worthy) leads to believe that content. Accordingly, Deborah's belief that the rule ⌈if one assaults and batters another, then one ought to be punished⌉ is binding to her, leads her to adopt that rule, according to the inference in Table 12.5 (which is an instance of schema *de-doxification*, as applied to beliefs, a schema which we shall also call *Binding*-elimination; see Section 23.3.4 on page 604).

Exactly the same type of reasoning, *meta-syllogism* + *de-doxification*, could be used by Deborah when considering whether she should adopt other rules, as subreasons why John ought to be punished or not. For instance, Deborah recalls the rule ⌈police officers cannot be punished unless there is an authorisation from the Minister of Justice⌉, which, since such authorisation was not granted, would lead to John's acquittal. Adoption of this rule could be supported by considering that it was adopted by the Parliament, and that rules adopted by the Parliament are binding, as you can see in Table 12.6 on the next page.

12.2.3. Substantive Adoption Policies

The two pieces of reasoning we have just considered in the previous section deal with cases where the adoption of a rule follows from the adoption of a meta-rule requiring to adopt rules having a certain source (having a certain history). To such *source-based* adoption policies, we can oppose *substantive* adoption policies, where adoption is based upon the fact that the rule has a certain content,

(1) rules issued by Parliament are binding;
(2) the rule ⌈police officers cannot be punished unless there is an authorisation from the Minister of justice⌉ was issued by Parliament

---

(3) the rule ⌈police officers cannot be punished unless there is an authorisation from the Minister of justice⌉ is binding

Table 12.6: *Meta-syllogism + De-doxification*

and in particular *teleological* adoption policies, where adoption is based upon the fact that the application of the rule promotes certain values.

Let us now consider how Deborah will decide whether a rule is adoptable to her on the basis of substantive grounds.

Assume that Mark was hit by John, but he did not suffer any physical damage. Deborah would like her community to adopt the rule ⌈even someone who hits another person without causing physical damage is battering this person⌉, abbreviated into ⌈even harmless hitting is battering⌉, though there is an old precedent against this rule. Deborah believes that general adoption of this rule (its adoption by all judges and citizens) would contribute to her concerns for her society by preventing harm and ensuring freedom from fear. In fact, if all her fellows adopted that rule, they would conclude for punishment also when no physical damage has been produced.

However, the fact that general adoption (and practice) of this rule would produce the social results which Deborah desires (and which correspond, she believes, to the values of her community) is not sufficient for her adoption to count as her community's adoption, and to produce the results that general adoption would produce. She knows that her individual decision is going to contribute little to the indicated objectives. Only general practice of the judiciary (and its broad acceptance by the population) can achieve these results. If she moves alone, her decision is likely to be quashed, and it will only cause otherwise avoidable costs to the parties and uncertainty for everybody.

However, things look different if Deborah can expect that the other judges will share her arguments for change and follow her example. In this case her attempt to overrule the existing judicial practice is likely to lead to a new practice, corresponding to a new, different (and better) opinion of the community in the matter.

This inference too leads to the adoption of a legal rule, though according to teleological reasoning on the basis of a substantive reason (a reason concerning the advantages of the application of a rule, rather than the way in which the rule was produced): The rule⌈even harmless hitting is battering⌉ is binding since its

(1) my community's adoption of the rule ⌈even harmless hitting is battering⌉ would contribute to our concerns for our society and to important legal values;
(2) my adoption of this rule has a sufficient chance of contributing to its general acceptance, in the name of my community

---

(3) the rule⌈even harmless hitting is battering⌉ is binding (adoption-worthy) to me

Table 12.7: *Adoption of a rule on teleological grounds*

collective adoption contributes to advancing legal values, and has a sufficient chance of being collectively adopted (see Table 12.7). The first subreason above corresponds to the idea that, in order to attempt to participate in adopting a collective cognitive state, one must believe that having that cognitive state would be good for one's community, while the second subreason expresses the idea that the cognitive state one is adopting in the name of one's community needs to have a sufficient chance of becoming a cognitive state of one's community.

The reader will easily see that this piece of reasoning by Deborah instantiates the idea of plural reasoning (participability), which we introduced in Definition 10.1.4 on page 278 and discussed at length in Chapter 10. Reasoners involved in legal reasoning are typically engaged in plural reasoning, that is, they are trying to participate in the adoption of cognitive states of their community.

However, one may also develop arguments that lead one to refuse participating in such an attitude. Consider, for instance, the following query: "Should I adopt rule ⌈Police officers cannot be punished unless there is an authorisation from the Minister of Justice⌉?"

To answer this question Deborah may consider an inference that constitutes a negative application of schema *meta-syllogism*: This rule should not be adopted, since it violates human rights and we should not adopt rules violating human rights (see Table 12.8 on the facing page).

12.3. Validity, Bindingness, Adoptability

From the example above, it clearly appears that we propose to translate the word *valid*, as used in many legal contexts, into our notion of *adoption-worthiness* or *bindingness*, as defined in Section 3.1.1 on page 88. Thus, meta-rules stating that certain legal rules are valid under certain conditions can be rephrased as stating that these rules are binding under the same conditions.

According to the perspective we developed in Section 3.1 on page 87, such meta-rules result from the doxification of cognitive instructions, and particularly

(1) rules violating human rights should not to be adopted;
(2) the rule ⌈police officers cannot be punished unless there is an authorisation from the Minister of Justice⌉ violates human rights of the victims of police crimes

---

(3) the rule ⌈police officers cannot be punished unless there is an authorisation from the Minister of Justice⌉ should not to be adopted

Table 12.8: *Negative meta-syllogism: inferring that a rule should not be adopted*

of meta-instructions having the following content: They require that the reasoner forms the intention to endorse certain instructions (the instructions which are qualified as being binding) when appropriate conditions are met. This characterisation holds both for meta-rules recommending adoption for substantive reasons (on the basis of the content of the rule to be adopted), and for meta-rules concerning adoption for source-based reasons (on the basis of the history of that rule).

In the following paragraph we shall investigate how one may come to rationally adopt legal meta-rules, and this will be linked to the notion of plural reasoning (participability into a collective cognitive state), which was discussed in Section 10.1.4 on page 277. This will allow us to investigate rationality conditions for legal reasoning, and find a justification for some attitudes which reasonable lawyers tend to adopt.

12.3.1. The Social Impact of Legal Reasoning

Legal decision-making is aimed at providing solutions to single cases, solutions that can be coercively enforced upon their addressees, if necessary. So, when Deborah, as a judge, achieves a certain conclusion, she is also accepting that this conclusion will be supported by sanctions.

However, legal decision-making has a broader social impact. In settling individual cases, judicial decisions contribute to form a set of *common expectations*. What if one had no expectation that one's life and property would be respected, that one's contracts would be complied with, that road traffic would follow certain patterns, and so on? Some legal realists have ridiculed such certainties: They have observed that legal expectations may be disappointed, and that legal rules may leave room for interpretation, discretion, and negotiation. However, according to Deborah, the fact that these expectations are defeasible and relatively undetermined does not make them less essential to social life. On the contrary, she believes that the advantage that everybody derives from the

preservation of a stable framework of social expectations normally overrides the interests involved in the specific case:

> However single acts of justice may be contrary, either to public or private interest, it is certain, that the whole plan or scheme is highly conducive, or indeed absolutely requisite, both to the support of society and to the well being of every individual. (Hume 1978, 497)[5]

This means that her decision counts as her participation in her community's intentionality under two aspects. On the one hand, what she decides in this case is going to function as the premise of further actions and decisions on account of her community (for example, when enforcement is required). On the other hand, she is participating in the adoption of general rules of behaviour by her community. Under the first regard, it is up to her to express what will count as the determination of her community (until her decision is quashed by a higher judge). Under the second regard, her adoption of a certain rule is not going to count as the view of her community, but only as her contribution to the collective process of judicial law-making.

12.3.2. Legal Reasoning as a Contribution to the Legal Process

When acting as judge, Deborah is not reasoning in her private capacity. She is participating in the decisional process of her community, a decisional process which led in the past to various results: the constitution, the statutes issued by the Parliament, the rulings of the Constitutional Court, the decisions of other judges, the beliefs and the behaviour of the citizens. These results were preceded by certain cognitive states (the intention of those who produced the corresponding acts) and are now viewed in certain ways by people dealing with them (a certain law text is being interpreted in a certain way by the courts and by the citizens), and will be viewed in certain ways in the future.

That Deborah is participating in the reasoning process of her community does not mean that she should take into consideration just the official or authoritative statements. On the contrary, she is also to identify the implicit dimension of legal practice (cf. Fuller 1968; Postema 1994), by which we mean its cognitive background, those cognitive states and processes which lie behind verbal and non-verbal behaviour which is practised in legal contexts. To do that, Deborah needs to move away from behaviourism and adopt what Dennett (1989) calls the *intentional stance*, i.e., to view behaviour as the expression of cognitive states. As Dennett observes, when adopting this perspective:

[5] This idea can also be related—when we view the formation of convergent expectations as a function of the law, rather than as a goal to be pursued by legal agents—to Luhmann's (1985, 82) definition of the law as the "structure of a social system which depends upon the congruent generalisation of normative behavioural expectations" (see Rottleuthner, Volume 2 of this Treatise, sec. 4.2).

First you decide to treat the object whose behaviour is to be predicted as a rational agent; then you figure out what beliefs that agent ought to have, given its place in the world and its purpose. Then you figure out what desires it ought to have, on the same considerations, and finally you predict that this rational agent will act to further its goals in the light of its beliefs. (Dennett 1989, 17)

When we adopt this perspective with regard to the legal behaviour of our community, we need to figure out an intentional interpretation of this behaviour. To do that we must consider what the concerned individuals meant to do, and in particular to what collective cognitive state they intended to participate, how they viewed their own behaviour of producers of new normative texts, judges and arbiters in disputes, followers of rules. But we cannot understand the attitude of the concerned individuals unless we also try to figure out what attitudes these individuals attributed to others, and what attitudes they thought that others would attribute to them. Here is how (Fuller 1969, 194) describes how parties try to make sense of their interaction:

Suppose [...] that *A* and *B* are two persons in conscious and lively interactions with one another. *A* and *B* may, for example, have entered upon some common undertaking. They have not yet settled on the terms of their collaboration, but as the venture gets under way they begin to negotiate, by words explicitly and by actions tacitly, a kind of constitution regulating their relations with one another. Each is orienting his words, signs and actions by what he thinks the other seeks and in part also by what he thinks the other thinks *he* seeks.

According to Fuller the mutual adjustment of expectations is also what allows us to identify the law governing the relationship between the parties:

the quality and terms of the parties' emergent relationship—its "laws" if you will—constitute an important social reality, but it is a reality brought into being and kept alive by purposive effort and by the way each of the parties interprets the purposes of the other. (Fuller 1969, 195)

To Fuller's vivid picture, we add the indication that in normative contexts, as we showed in Chapter 9, coordination may be obtained by the parties converging on values, desires and intentions they adopt from the plural perspective, that is, as a way of participating to the decisional process of their community: Identifying (and integrating) their plural choices is the appropriate way of making sense of the normative constraints of their interactions.

This does not imply that one should always and only aim at pursuing public or collective purposes. Collective indications may, in some domains, only concern normative constraints for individual action (Fuller 1969, 207). Within such normative framework one, like one's fellows, may then autonomously focus on one's individual interests, select one's individual goals and the means of their implementation. There is no contradiction between being a bourgeois and a citizen, if this only means that both of the following conditions are satisfied:

- one endorses, from the collective perspective, and taking into account other people's view, a set of shared (or at least participable) rules, and at the same time
- one pursues one's particular interests, according to one's judgement, within the constraints that are established by such rules.

12.3.3. Participation in Legal Beliefs

When Deborah is involved in legal decision-making, she is not just wondering what cognitive state her community has on the point at issue. She is a member of that community, having an active role to play in determining her community's view, by participating in that view, and in this way, influencing it.

To understand what she is doing, she needs to focus on the point or purpose of her reasoning. Certain grounds may provide sufficient support for adopting a cognitive state for certain purposes, together with certain agents, while failing to support its adoption for other purposes, together with other agents.

For example, Deborah thinks that the rule "nobody ought to eat meat" should be adopted in everyone's prudential (or even moral) reasoning. She is led to adopt that rule (together with her fellow vegetarians) by considerations concerning the healthiness of a vegetarian diet, the need to live in harmony with nature, and the fundamental equality of all beings capable of suffering. However she does not adopt this rule in her judicial reasoning, as a premise to be legally enforced.

Similarly, Deborah may be bound to adopt, in her judicial reasoning, the statement of a jury that a financial advisor did not misappropriate his clients' money, and acquit him consequently. However, she may keep her private belief that the advisor is a crook, and act consequently in her private life (choose a different advisor for herself, and advise her friends to do the same).

A link between the point of a piece of reasoning and the bindingness of a rule also holds for cognitive instructions. Thus, a rule establishing the effects of the so-called legal proofs, or excluding certain types of evidence, while deserving to be adopted by judges, may not deserve to be adopted in a historical investigation, by the community of historians. Similarly, the level of "corroboration" required for using a rule of experience in ascertaining criminal liability may well be superior to that which is required for adopting that rule as a sociological hypothesis, or as a principle governing our private lives.

These considerations seem to confirm our initial idea that, by concluding that a rule is legally valid for certain agents, one is just claiming that this rule is binding in the sense of adoption-worthy, and more specifically that the rule is participable by the concerned agents. Since usually the reasoner is one of the agents the participation of which is at issue, such reasoning takes place from the *internal point of view* (Hart 1961), or better from the *first person plural* (Postema

1995), or, as we said in Chapter 9, from the *plural perspective*. In judicial reasoning there are different *we*'s with whom the judge is trying to participate: the first *we* concerns the collective of the dispute, including, besides the judge, also the parties of the dispute; the second *we* concerns the collective of the judiciary, which forms judge-made law; the third *we* concerns the whole of the legal community (and especially those who are going to be involved in similar cases).

With regard to each one of these communities Deborah is situated in a specific position:

- Her decision is going to be decisive with regard to the first community (whatever she will say will officially count as the view of the law on that case).
- She is in the same position of her fellow judges with regard to the second community (she has the same power of influence that other judges have).
- She has a specific position with regard to the third community, though not a decisive one (citizens may continue to disregard a judge's rulings with which they do not agree and this may lead to new legal developments, for example through legislation).

With regard to every such community she is to determine what cognitive attitudes better suits the common good (if adopted by all, or most, members of it), and her chance of producing a collective cognitive state through her own action.

In particular, since we are considering the cognitive attitude consisting in the adoption of normative propositions, she has to consider whether the *ratio* or her decision is or is likely to become a normative belief of her community (in the sense indicated in Section 10.2.9 on page 292). Remember that by a *normative belief of a community*, we mean a normative proposition which is the common belief (see Definition 9.2.2 on page 252) of a sufficient number of people, in the appropriate positions: This proposition plays the role of a collectively endorsed normative proposition, by influencing the practical reasoning and action of the community and of its members.

12.3.4. Reasoning about Legal Bindingness

As we have seen above, reasoning about the legal bindingness (validity) of a normative proposition tends to take two shapes.

First of all we can reason about *teleological bindingness*. This happens when one concludes that one should endorse a rule, given that the general adoption of that rule would contribute to certain values, and that one's adoption of that rule contributes to its being generally adopted. This can be viewed as an instance of teleological reasoning (see Section 1.3.2 on page 18): One's endorsement of certain value (a goal) and one's belief that a plan of action (the endorsement and practise of the rule) is going to promote that value, lead one to intend to implement the plan.

This is exemplified by Deborah's reasoning concerning the adoption of the non-deontic rule ⌈Even harmless hitting is battering⌉. Remember that she formed the intentions of adopting this rule, since she participated in endorsing the value of freedom from harassment, and believed that the general adoption of that rule would contribute to achieving such value. Moreover, she believed that her attempt to participate in the collective adoption of the same rule would have sufficient chances of being successful.

Reasoning schema: *Teleological bindingness*

(1) V is a collective value;
(2) the collective adoption of normative proposition N is a good way to advance V; AND
(3) my adoption of N has a sufficient chance of contributing to N's collective adoption
——— IS A REASON FOR
(4) N is binding

Besides adopting a rule according to schema *teleological bindingness*, we can also adopt a rule on the basis of its *source-based bindingness*. The second type of reasoning leads to the intention to adopt a rule (to the belief that a rule is binding), on the basis of one's adoption of a content-general cognitive instruction requiring the adoption of all rules which are expressed by, or embedded in certain source-facts. This happened when Deborah adopted the rule ⌈if one assaults and batters another, then one ought be punished⌉ on the basis of the fact that such rule was the *ratio decidendi* of a decision of the highest court. Here is the corresponding reasoning pattern:

Reasoning schema: *Source-based bindingness*

(1) all normative propositions which are expressed by source S are binding; AND
(2) normative proposition N is expressed by source S
——— IS A REASON FOR
(3) N is binding

12.4. Bindingness and Rationality

From our characterisation of the notion of bindingness it appears that bindingness judgements primarily are practical judgements: They express the deliberation (the attempt) to participate in the collective adoption of a rule. Such judgements may be doxified and mimic the shape of epistemic judgement (as every practical judgement can). However, they remain practical judgements, and they can be assigned truth values only by referring to ideal practical cognition: It is

true that a rule is binding to a reasoner exactly when ideal practical cognition would lead that reasoner to endorse the rule from the plural perspective, that is, in the attempt to participate in the collective adoption of that rule.

This idea is at odds with those doctrines which view legal rules and their bindingness (validity) as purely social, or conventional facts, as we shall see below. However, this idea does not exclude that social circumstances can affect bindingness judgements. Both decision-makers and citizens need to take into account also (though not only) existing practices and conventions, in establishing what is legally binding . To show how this may happen, we shall expand the example above, so that Deborah can articulate her perspective.

12.4.1. Convergence as a Ground for Bindingness

Let us consider teleological judgements on bindingness. In such judgments social facts play a decisive, though not exclusive, role.

First of all, one has to establish whether the general practice of a rule would really contribute to realising the values of one's community. This judgement involves an epistemic component, since one needs to rely on causal knowledge for establishing the rule's impact of the relevant values.

Secondly, one needs to consider whether one's attempt to participate in a new rule would really contribute to its general acceptance and practice. The latter judgement is a factual judgement, based upon what normative views are held—or are likely to be held in the future—as a matter of fact, by one's fellows.

Let us now consider the second type of bindingness judgements, which lead to the adoption of a rule according to a meta-rule. In their doxified form, these judgements lead one to infer that a rule is binding since it is qualified as such by the appropriate meta-rule.

For instance, in the inference of Table 12.9 on the next page (an instance of schema *source-based bindingness*) factual feature of rule ⌈if one assaults and batters another, then one is to be punished⌉—the fact that this rule is a *ratio decidendi* of the highest court—supports the conclusion that it is binding. However, the argument's premises also include the meta-rule ⌈*rationes decidendi* of the highest court are binding)⌉, which gives practical relevance to this factual feature.

One may not be satisfied with retrieving such a meta-rule in one's mind, and may attempt to rationalise its adoption, searching for answers to the query "Why should I adopt that meta-rule? (Why is this meta-rule binding?)"

To provide an answer, the reasoner can use a teleological inference (according to the schema *teleological bindingness*): The bindingness of the meta-rule ⌈*rationes decidendi* of the highest court are binding⌉ follows from the positive value-impact of its communal adoption, combined with the chance that it will be collectively adopted, as you can see in Table 12.10 on the following page.

With regard to this piece of reasoning the main question we need to answer

(1) the rule ⌈if one assaults and batters another, then one is to be punished⌉ is a *ratio decidendi* of the highest court;
(2) *rationes decidendi* of the highest court are binding

---

(3) the rule ⌈if one assaults and batters another, then one is to be punished⌉ is binding

Table 12.9: *Source-based bindingness*

(1) my community's adoption of the meta-rule ⌈*rationes decidendi* of the highest court are binding⌉ would be a good way to advance our collective values;
(2) my adoption of meta-rule ⌈*rationes decidendi* of the highest court are binding⌉ has a sufficient chance of contributing to its collective adoption

---

(3) the meta-rule ⌈*rationes decidendi* of the highest court are binding⌉ is adoption-worthy (binding)

Table 12.10: *Teleological bindingness: inferring the bindingness of a meta-rule*

is why one should believe that adopting such meta-rule would contribute to important values of one's community. Deborah remembers from her university course in legal theory a citation by Lon L. Fuller, which may put her on the right track, as we shall see in the next section:

> As we seek order, we can meaningfully remind ourselves that order itself will do us no good unless it is good for something. As we seek to make our own order good, we can remind ourselves that justice itself is impossible without order, and that we must not lose order itself in the attempt to make it good. (Fuller 1958, 657)

12.4.2. Why Share Legal Rules and Meta-Rules

The merit of sharing the adoption of a meta-rule like the one we have just considered is that the meta-rule's collective adoption provides for rule-sharing: It enables judges (and citizens) to form common normative beliefs, that is, to endorse the same rules and be aware that this is the case.

This fact, however, sets the stage for a broader question. We have seen that Deborah's teleological argument for rule-adoption moves from the considera-

tion that sharing certain rules may be a good way of realising certain values. But why should rule-sharing be a good way of realising collective values?

Deborah knows that she is involved in legal decision-making: Her reasoning is going to produce normative conclusions which should be obeyed by the parties of the case, and which can be coercively enforced upon them, if necessary. She also knows that her decision is going to affect the lives of the parties: If she punishes John, John's career in the police will be destroyed; if she acquits John, Mark will feel embittered and disappointed.

However, she also knows that judicial decision-making has a broader social impact. In settling individual cases, judicial decisions contribute to form a set of shared expectations, which allow for coordination (see Section 12.3.1 on page 339).

Deborah also knows that there may be different meta-rules susceptible of producing convergence, if generally practised by their addressees. She can even see that the general practice of some rules would promote certain interests and values better than the general practice of other rules. However, only general practice is going to produce these results. As we have seen in Chapter 9, the practice of a rule by only one individual, while all others are disregarding it, will not produce what the general practice of that rule would have brought about, but it is likely to cause only disruption.

What if one believed, with good reasons, that English drivers would be better off if all of them drove on the right, and therefore one started to drive in this way in England, while no one else adopted this practice? One would not achieve the results one expected (lower car prices, easier travelling abroad, fewer accidents, and so on), but one would instead endanger one's life and that of other people. As we have seen above, game theorists describe this situation as a *coordination game*: Each individual prefers coordination, but there are different possible ways of achieving it (for instance, all driving on the right, or instead all driving on the left). Although the general practice of any of these ways will provide coordination, it will do no good if different individuals practised different ways (one going on the right and the other on the left).

Coordination will only be obtained if each one behaves in the same way (or in coherent ways), choosing what the others also choose (or what is coherent with the others' choices). The concern for coordination is particularly pressing for Deborah since she is a judge, and judges can succeed in providing coordination to society only if they coordinate their own activities, converging into the same rules.

The need that lawyers take into account the beliefs of other lawyers has been addressed by Peczenik, Volume 4 of this Treatise, sec. 4.4.4, who comments on Eng's (2000) view that legal judgements had a double nature, descriptive and normative. According to Eng, this duplicity is shown by the fact that one may react in different ways when one sees that one's legal opinion is not shared by most other lawyers (and in particular by judges): Sometimes one changes one's

mind (which proves that one's legal opinion was prevalently factual), sometimes one persists in one's deviant opinion (which prove that one's legal opinion was prevalently normative).

We agree with Eng on the fact that lawyers can take these two attitudes, when disagreeing with the mainstream legal opinion. From our perspective, however, the fact that a judge (or a doctrinal writer) chooses to align his or her legal opinion with the opinion of others does not imply that legal judgement has a descriptive nature. This attitude rather depends on the normative commitment to achieve legal values through the practice of shared norms: Sometimes one renounces to push forward a normative belief one would like to see generally endorsed, for the sake of coordination (since there is little chance the others will join). This attitude is consistent with the fact that, in other occasions, one may on the contrary push forward such a normative belief, in the expectation that the others will follow.

12.4.3. Participation in Currently Shared Rules

In the previous paragraph we have seen the importance of adopting shared meta-rules. However, we need to address the second sub-reason why Deborah should conclude for participating in sharing a rule: She believes that her adoption of that rule is going to be successful, in the sense that a sufficient number of people will effectively converge in adopting that rule, so that the rule will maintain (or obtain) the status of being a normative belief of her community. In the following we shall identify certain situations where this belief is justified.

The first situation to be considered is the following: The rule Deborah is considering to adopt is currently shared by her colleagues (and by the other citizens). In other words, the rule already is a normative belief of her community, in the sense of Section 10.2.9 on page 292.

In such a case she should be sufficiently confident that she will succeed in participating in a shared normative belief. She would fail to do so only in the improbable case that her community suddenly changed its view. Thus, we can represent her reasoning in the following pattern:

Reasoning schema: *Persistent convergence*

(1) normative proposition N currently is a normative belief of my community; AND
(2) it is very unlikely N will suddenly be abandoned
——— IS A REASON FOR
(3) my adoption of N has a sufficient chance of contributing to N's persistent adoption by my community

The reasoning schema *persistent convergence* allows Deborah to conclude, for example, that her adoption of the rule ⌈if one assaults and batters another, then

one is to be punished⌉ has a sufficient chance of contributing to the collective adoption of this very rule. This schema, plus the belief that the general adoption of this rule would contribute to legal values, would lead her to believing that this rule should be adopted (that it is binding).

Schema *teleological bindingness* leads one to conclude that a normative proposition is binding, given that (1) its collective endorsement promotes certain value, and that (2) one's endorsement is likely to contribute to collective endorsement). By merging it which schema *persistent convergence*, we obtain the following schema, which we may call *present teleological convergence*.

Reasoning schema: *Present teleological convergence*

(1) having normative belief N is a sufficiently good way to advance collective values;
(2) N currently is a normative belief of my community; AND
(3) it is very unlikely that N will suddenly be abandoned

——— IS A REASON FOR

(4) N is binding

This schema can be viewed as an instance of the idea of cooperative virtue (Den Hartog 1998): When coordination is already at work, and one approves its results, one should join in, rather than free ride on others' effort.[6]

Thus, according to this schema, the reasons for preserving a convention do not coincide with its causes, with the reasons why it started. That a rule has come to be generally shared can be explained by various causes, like the following ones: our instinct to imitate other people's behaviour and transform normality into normativity; the performance of social evolution in selecting and spreading the best adapted rules of behaviour; our capacity of finding solutions to collective problems and of mirroring other people's reasoning, so as to converge on the same answers to the same problems; the intervention of political or economical power. Whatever these causes are, the fact that the rule has become a convention (producing a desirable form of coordination), provides, from the moment when this is the case, a new reason why it should be accepted.

Deborah can apply schema *present teleological convergence* at different levels.

Firstly, she may apply it directly to the substantive rules at issue. Let us assume the following: (*a*) Deborah has some evidence that her fellow judges are sharing the rule ⌈if one assaults and batters another, then one is to be punished⌉, and (*b*) she has some evidence that citizens too tend to consider this rule as being appropriate. These two elements are sufficient for her to conclude that this rule is a normative belief of her community. Moreover, she believes that general practice of this rule contributes to some values of her community. Then she can

[6] On the connection between law and coordination see: Finnis 1980, 238ff.; Finnis 1989; Viola and Zaccaria 2003, 27ff.

(1) convergence into meta-rule ⌈*rationes decidendi* of the highest court are adoptable⌉ is a sufficiently good way of promoting collective values;
(2) this meta-rule is currently a normative belief of my community;
(3) it is very unlikely that this normative belief will suddenly be abandoned

---

(4) the meta-rule ⌈*rationes decidendi* of the highest court are binding⌉ is binding

Table 12.11: *Present teleological convergence: inferring the bindingness of a meta-rule*

conclude that she should participate in adopting this rule, i.e., that this rule is binding, since (1) it is a normative belief of her community, (2) the practice of which provides a desirable form of convergence (just substitute the rule for the variable N in the argument pattern above).

Note that schema *present teleological convergence* is reinforced when one mirrors other people's reasoning. Deborah can hope that her colleagues are not going to change their mind (so preserving the first subreasons of the inference above), since they should reason in the same way as she does: Each judge should choose to follow the others, assuming that everybody else will do the same. This is the characteristic circularity of conventions:

- The fact that people share a certain belief provides to each one of them a reason why he or she should accept this belief.
- The fact that people are aware that each one of them has this reason, in its turn, reinforces the conclusion that they share the belief.

Secondly, Deborah may apply schema *present teleological convergence* to shared meta-rules prescribing the acceptance of rules having certain properties. Shared meta-rules contribute to the common good by facilitating coordination: Convergence on meta-rules provides convergence on substantive rules, and so indirectly induces coordinated behaviour. Correspondingly, Deborah can produce the instance of *present teleological convergence* in Table 12.11: She can conclude for the bindingness of the meta-rule ⌈*rationes decidendi* of the highest court are binding⌉, given that this meta-rule—which is collectively endorse (and unlikely to be abandoned)—has a positive value-impact.

Deborah's consequent acceptance of the meta-rule, allows her to build a new meta-syllogism, leading her to accept the substantive rule (see Table 12.12 on the facing page): She conclude for the bindingness of the particular rule ⌈if one assaults and batters another, then one is to be punished⌉, given that this rule is a *ratio decidendi* of the highest court. Now Deborah has two parallel inferences

(1) *rationes decidendi* of the highest court are binding;
(2) the rule ⌈if one assaults and batters another, then one is to be punished⌉ is a *ratio decidendi* of the highest court

---

(3) the rule ⌈if one assaults and batters another, then one is to be punished⌉ is binding

Table 12.12: *Source-based bindingness: inferring the bindingness of a particular substantive rule*

why she should adopt the substantive rule ⌈if one assaults and batters another, then one is to be punished⌉. The first inference moves from the fact that this rule is a normative belief of Deborah's community, and provides for coordination, the second, from the fact that it is a *ratio decidendi*.

The two inferences are distinct, but connected: The second helps the reasoner in establishing the precondition of the first. We have said above that to understand whether a normative proposition is a normative belief of one's community one has to consider whether this normative proposition is the common belief of a sufficient number of people, in the appropriate positions and circumstances. Among these people, the judiciary exercises a particular role. Except in exceptional circumstances (when the legitimacy of the judiciary is gravely contested) the common belief of the judges is sufficient for a normative propositions to be viewed as being endorsed (believed) by the community: The normative proposition is going to determine the decision of individual cases, a decision which is going to be collectively enforced if necessary. Thus to apply schema *teleological convergence* Deborah has to verify whether the normative proposition she is considering currently is a normative belief of her community, which means that she has to check whether this proposition is a common belief of the judges.

This verification, however, is no trivial pursuit. Deborah has little evidence that all judges in her jurisdiction share the rule ⌈if one assaults and batters another, then one is to be punished⌉ and she cannot make any accurate empirical inquiry (it would be inappropriate to mail questionnaires to her colleagues or make telephone polls). However, she can achieve this conclusion by mirroring the reasoning of her colleagues. She knows that all of them accept the metarule ⌈*rationes decidendi* of the highest court are binding⌉, and that all of them are aware that the substantive rule ⌈who assaults and batters another, is to be punished⌉ was stated in a precedent of the highest court. But then, all judges must have come to the conclusion that this rule is binding. Each of them must have consequently accepted this rule and must know that everybody else is accepting it: The rule is a common belief of all judges.

12.4.4. Participation in Future Rules

The prospect of convergence does not necessarily require the upholding of existing collective normative beliefs. Deborah can also consider the possibility of producing future convergence by starting the practice of a new rule. Her attempt will make sense only when she has reasons to believe that her behaviour will trigger a process of learning and imitation, ending up in the general adoption of the same rule (in its becoming a collective normative belief, in the sense of Section 10.2.9 on page 292).

This presupposes that the general practice of the new rule will provide substantial collective benefits, clearly outweighing the costs of change, according to arguments on which most people will agree. These arguments must appeal to reasons that are shared by most people in the relevant circles: Each one of these people, besides being ready to accept the new rule, must be convinced that most other people will accept it. This awareness will make all those who are in favour of the new rule move together towards the new equilibrium. Since these people are the majority, the reluctant few who would prefer to stick to the old ways should follow soon, since this is the only option they have to achieve convergence.

For instance, we may assume that Mark was hit by John, but that he did not suffer any physical damage, and that the current judicial convention says that such instances of hitting do not amount to battering. However, Deborah strongly supports the contrary rule ⌈Even any someone who hits another person without causing physical damage is battering this person⌉, abbreviated into ⌈Even harmless hitting is battering⌉. She backs this rule with the consideration that its implementation will promote important social and legal values: preventing harm, ensuring freedom from fear, and so on.

If this view were destined to remain only hers, she should probably backtrack, by considering that her attempt to participate in the collective adoption of this rule is going to fail, as we observed in Section 12.2.3 on page 336. However, things look different if she can expect that her colleagues will share her arguments for change and follow her example.

Her reasoning in this regard is going to be similar to the reasoning we described in the previous paragraph. The only difference concerns the way in which she gets to the belief that most of her colleagues are going to participate in the rule she is adopting.

There are two types of reasons that may be appealing to her fellows:

- The first type of reasons concerns why they should (learn to) appreciate the collective adoption of rule she is proposing (its collective adoption will contribute to certain collective values they endorse).
- The second type of reasons concerns why each one of them should believe that one's adoption of the rule will lead to its general adoption.

Assume that she believes that when both these preconditions hold, there is a

(1) my fellows are going to share my idea that the general adoption of rule r would contribute to collective values
(2) each one of them is going to believe that his or her adopting r is going to contribute to r's general adoption
(3) for any rule x, if conditions (1) and (2) hold, then my adoption of x has a sufficient chance of contributing to x's general adoption

---

(4) my adoption of r has a sufficient chance of contributing to r's general adoption

Table 12.13: *Syllogism: inferring that one's adoption of a new rule contributes to its general adoption*

sufficient chance that her attempt will be successful. Then Deborah's conclusion that her fellows are going to join her in adopting the new rule ⌈Even harmless hitting is battering⌉, can be based upon a syllogism: This conclusion can be grounded upon the idea that whenever both preconditions hold with regard to a certain new rule, then one's adoption of this rule is likely to lead to its general adoption (see Table 12.13, where we denote the new rule as r). The conclusion of this syllogism, combined with Deborah's belief that the collective adoption rule r would be a good thing (since it would satisfactorily realise certain values) leads her to conclude that she should accept rule r. Thus, according to Deborah, the rule ⌈Even harmless hitting is battering⌉ is binding, though it is not yet accepted nor practised by her fellows, not even by her colleagues.

12.4.5. Coordination and Prioritisation

The fact that the law satisfies collective values through the endorsement and the practice of collective normative beliefs, while providing Deborah with reasons why she should adopt conventional rules (and overrule them only when she has a good chance of starting a new convention), also explains why she should accept that certain rules are stronger than others, so that they can defeat their competitors.

In fact everybody's adoption of the same rules is not yet sufficient to produce *legal coordination*, intended as a situation in which collective decisions (and in particular judicial ones) are in line with the expectations of citizens and of other decision-makers. To achieve coordination through the practice of certain rules, it is necessary that each single person be able to anticipate what everybody else will do (and what they expect others to do) in the relevant circumstances, to wit, in the conditions contemplated by those rules. This requirement is not satisfied when all share the same rules, but they disagree on adjudicating the conflict between each rule and its competitors.

(1) coordination is a collective value;
(2) my community's adoption of the priority ⌈legislation prevails over case law⌉ is a good way to advance coordination;
(3) my adoption of the priority ⌈legislation prevails over case law⌉ has a sufficient chance of contributing to its general adoption

---

(4) the priority ⌈legislation prevails over case law⌉ is binding

Table 12.14: *Teleological bindingness: inferring a preference-proposition*

Let us assume that two judges accept both rules r_1 (whoever assaults and batters another is to be punished) and r_2 (police officers cannot be punished, unless this is authorised by the Minister of Justice), but disagree on which one is stronger. This disagreement will imply that the two judges would decide differently the case of John (he, as we know, is a police officer and has assaulted Mark, but his punishment has not been authorised):

- The first judge ranks r_2 over r_1. Therefore she would acquit John.
- The second judge ranks r_1 over r_2. Therefore he would punish John.

When there are such disagreements in the judiciary, citizens will not be able to anticipate judicial decisions in concrete cases. One's ability of making such forecasts would require indeed that one—besides knowing what rules judges are currently sharing—also knew how every particular judge will adjudicate the conflicts between these rules. This seems to be a diabolical task!

Fortunately, the task is simplified by the fact that people (and judges in particular) also share some meta-rules, which tell them what to do in cases of conflict. Those prioritising meta-rules also contribute to coordination. Therefore they can be supported (if they are in fact shared by most judges, or are likely to be) through coordination-based arguments.

This is certainly the case for the meta-rule that, in Deborah's jurisdiction, adjudicates conflicts between *rationes decidendi* and legislative rules, in favour of the latter. This meta-rule is in fact generally accepted, and therefore Deborah can conclude that it should be accepted (that it is binding), since it contributes to important legal values (first of all the need of certainty, but indirectly also all those other values which can be promoted though legal coordination).

This inference, as you can see in Table 12.14, is just another instance of the *teleological bindingness* schema we considered above. Note that this priority argument may be decisive in Deborah's reasoning. It provides her with a premise for establishing that rule r_2 (police officers cannot be punished, unless this is authorised by the Minister of Justice) prevails over rule r_1, so that she can conclude John is to be acquitted (on rule priorities, see Section 7.1 on page 195).

The application of the coordination pattern can provide even more abstract coordination arguments. For example, one can conclude that:

> we should accept the meta-rule ⌈rules which provide for coordination prevail over other rules⌉

given that this meta-rule is already practised by the judiciary, and given that this practice provides a valuable form of coordination (by increasing existing rule-based coordination).

The extraction of normative conclusions from ongoing practices—while contributing to objectives of convergence and coordination—leads to conformism. Fortunately, the search for convergence does not exhaust legal reasoning.

As the schema *present teleological convergence* shows, there is also the need for convergence to lead to the "common good." Thus, Deborah may well consider to reject a rule (like the rule exempting police officers from punishment, unless there is a political authorisation) by claiming the following: (*a*) rules grossly violating human rights are not binding, and (*b*) this human rights-based proviso defeats the other rules, there included those that are currently practiced.

Moreover, as we have seen in Section 12.4.4 on page 352 conformism is not the only avenue towards coordination: Under appropriate conditions, new rules may also aspire to become the focus of a shared practice, and be endorsed from the plural perspective, in order to participate in a new collective normative belief.

Chapter 13

THE FOUNDATION OF LEGAL BINDINGNESS

Let us summarise the results we have obtained in Chapter 12. First, we have stated the idea that the word *valid*, when applied to an instruction or to a normative propositions, often means *binding*: It expresses the idea of adoption-worthiness or bindingness, by which we mean the cognitive necessity to endorse that normative proposition. Such necessity is relative to the context and the purpose of the reasoning process in which the normative proposition is to be used. When collective adoption is at issue, the idea of adoption-worthiness is specified into the idea of *participability* in a shared norm or value.

Correspondingly, in the discussion above, we substituted the expression "rule r is valid," with the expression "rule r is binding." Hopefully, the reader may by now be convinced that this substitution works well, providing an intuitive account to the role played by the predicate *valid* in legal discourse, when it qualifies a normative proposition.

Secondly, we have seen this notion of bindingness at work in a judicial example, and in particular, in those inferences aimed at establishing what rules count as legally binding. These inferences have exemplified how the normative notion of bindingness allows for the construction of rich conceptions of the law, in which also social facts (legal sources) can be given appropriate recognition, as reasons supporting bindingness conclusions.

According to our notion of bindingness as (cognitive) participability in the collective adoption of a normative proposition, what is binding may vary according to the context and the purpose of the bindingness judgement, but also according the specific position of the author of the judgement. In fact, such circumstances impact on two (sub-) reasons supporting the conclusion that a new rule is binding:

1. the extent to which the general adoption of a new rule would contribute to realising (or impairing) legal values, and
2. the chance that one's adoption of the rule would lead to its collective endorsement.

Considerations concerning the reason (1) explain why the beneficial impact of a new rule may support the adoption of this rule in civil matters (when declaring a private right, or ordering a compensation), but not in criminal matters (where punishment is at issue, and certainty has the highest importance). Considerations pertaining to the reason (2) explain why some judges may be justified in

adopting a new *ratio decidendi*, departing from precedent, while other judges should instead follow precedents. For example, in the British legal system, the precedents of the Court of Appeal are binding for the other judges, except that for the House of Lords.

These dimensions of legal bindingness can be specified by adding further contextual specifications to the word *binding*. Therefore, we may well say that a rule is binding in criminal law but not in private law, or even that it is binding for judge j and not for judge k.

Our notion of bindingness makes it applicable also to factual rules (for instance, rules of experience), and in particular to the interplay of scientific, common sense, and legal criteria in the evaluation of evidence. Since the purpose of the bindingness discourse is to establish whether a certain rule (or more generally, proposition) should be adopted in a certain reasoning process, all relevant standards can dialectically interact in establishing such a conclusion.

Finally, from our perspective, it is no surprise that what might be binding in a historical or scientific argument might be unacceptable in a judicial argument, and vice versa. Similarly it may be well justified to apply stricter proof-standards in criminal cases than in civil ones: For example, certain empirical generalisations (for which there is only probabilistic evidence) can be binding in private law, while not being acceptable in criminal matters.

In the following sections we shall go back to the general idea of bindingness, in order to establish its jurisprudential implications. Firstly, we will consider the nature of bindingness judgements, exploring how they relate to the position of their author, and what function they play in legal cognition. Secondly, we will consider what implications we can derive from this function and sketch the connections between legal bindingness, optimal law, and moral bindingness.

13.1. Definitional and Substantive Issues

When we speak about legal bindingness (validity), we tend to mix two different kinds of issue: (*a*) the definitional issue of providing an appropriate notion of bindingness, and (*b*) the substantive issue of establishing under what conditions something is binding (valid). In the following sections we shall distinguish these two issues and analyse their connections.

13.1.1. Definitions of Legal Bindingness

According to the above analysis, ⌈rule r is legally binding⌉ means ⌈r deserves to be adopted for the purpose of legal reasoning⌉, where legal reasoning may be characterised as the type of reasoning which is meant to derive conclusions that should be complied with, and can be publicly enforced upon the concerned parties.

Gustav Radbruch (1878–1949)

Chaïm Perelman (1912–1984)

Picture from: *Collection Université Libre de Bruxelles.*

This "definition" of the notion of legal bindingness does not include any indication of the grounds upon which a rule may be characterised as being legally binding. In fact, people discussing whether a rule is legally binding may disagree on those grounds.[1] Some may think that only those rules are legally binding (adoptable in legal reasoning) that are issued by a national legislator, or that are "contained" in certain precedents. Others may include also the rules issued by certain international bodies. Others may endorse conventions (customs) existing in the judiciary or in certain professional circles. Others may insist on principles that can be derived from certain religious traditions or political ideologies. Others may exclude the bindingness of those rules which violate human rights, or that are grossly unjust under other criteria. Others may take the anarchical stand that no rule whatsoever is legally binding, excluding that any rule whatsoever can qualify for the purpose of acceptance in legal reasoning, namely, for the purpose of possible public coercion.

To understand how people having different ideas on legal bindingness can entertain a meaningful discussion, we must identify the regions of their dissent and of their agreement. All debaters strongly dissent on "why" something is legally binding, that is, on what features or preconditions enable a rule to be binding, and consequently they disagree on "what" is legally binding. However, they all agree on the meaning of "legal bindingness," to wit, on the conceptual function of legal-bindingness judgements (as judgements intended to support the use of a normative proposition in legal reasoning).

This agreement explains why it matters so much to establish that something is binding, and therefore why there is such fierce dissent on what rules are binding, according to what reasons. This agreement also explains the limits of a definition of legal bindingness—and of legal validity when intended in this way. This definition only provides as an account of the meaning of the term *legally binding*, but it is not sufficient to identify the denotation of this term (to circumscribe all legally binding propositions): It only captures the common use of the term "binding," namely, its function in legal debates, as viewed from the "internal" perspective of the participants in those debates.

13.1.2. Grounds for Bindingness

We must carefully distinguish such a *definition of bindingness* from a *theory of the grounds for bindingness*, by which we mean an account of what properties a rule must enjoy in order to be legally biding. A theory of the grounds for

[1] On the possibility that different people may adopt different rules of recognition (or fundamental rules, *Grundnormen*, in the Kelsenian terminology), see Jori 1985, 235ff.. This thesis is criticised by Catania 1992, on the ground that of that the selection of a rule of recognition is to be constrained and motivated only by the need of recognising the legal nature of effective rules, supported by organised force. For our objections to the latter view, see Sections 13.1.3 on page 362 and 13.2.2 on page 371.

legal bindingness, when applied to appropriate inputs (facts and evaluations) will provide a determination of what rules are legally binding.

Since the concept of bindingness is evaluative ("x is binding" means "x deserves to be adopted"), also any theory of the grounds for bindingness also is evaluative (it is a practical rather than an epistemic theory). The fact that a rule has certain "factual" features is not sufficient to support a bindingness conclusion (unless the argument is an enthymeme): We also need a practical or normative subreason, namely, a meta-rule saying that rules having these features are binding. A theory of the grounds for legal bindingness is indeed mainly constituted by a combination of meta-rules about bindingness:

- positive ones, establishing that a rule is binding if it has certain features, and
- negative ones, establishing that a rule is not binding if it has certain other features.

For example, in the debate of Chapter 12 our judge has affirmed the bindingness of the rules that are issued by the legislator, that are laid down by the highest court, that are the focus of desirable co-operation, and so forth. She has also denied the bindingness of those rules that are not shared by the judiciary, which violate human rights, and so on.

The thesis that facts alone are insufficient to ground a bindingness conclusion may seem to push us towards a Kelsenian approach: The validity (bindingness) of a rule depends on meta-rules, the validity of which needs to be established through further meta-rules, until one reaches a single fundamental normative proposition, the *Grundnorm*, the validity of which is postulated without any further arguments (on Kelsen's *Grundnorm* see also Rottleuthner, Volume 2 of this Treatise, sec. 4.1). One important point of contact between our approach and Kelsen's is indeed the idea that validity (bindingness) expresses a normative notion, an "ought" (as stressed by Nino 1978). However from our perspective, this "ought" is the *cognitive duty* (see Section 3.1.1 on page 88) to accept a rule in legal reasoning, rather than the fact that the rule states an obligation (as we shall see in Section 21.3 on page 563), or that it is the meaning of anybody's real or presupposed act of will (Kelsen 1967, sec. 4.b).

Moreover, the idea of bindingness here developed does not imply that all meta-rules establishing what rules are legally binding also need to be themselves legally binding. In order to use a certain meta-rule as a criterion for bindingness, I do not need to believe that this meta-rule itself is legally binding.[2]

In our approach we may indeed say that the fundamental rules are meta-rules

[2] More precisely, let as assume that I am adopting a set MR of meta-rules, according to which I identify a set BR of legally binding rules. All meta-rules in MR must attribute legal bindingness: Each of them must state that certain rules (which satisfy certain conditions) are legally binding. Nevertheless, those meta-rules do not need to be themselves all legally binding (as Bulygin 1990 assumes): They do not need to be included in BR. Some meta-rules in MR may indeed be legally

that are not qualified as legally binding by any other legal meta-rules. There is no need for arbitrarily "stipulating" or "assuming" or "presupposing" the legal bindingness of these ultimate meta-rules: We should rather adopt them on the basis of various meta-legal (political, ethical, religious, humanitarian, etc.) considerations (combined with the need to plurally converge with our fellows). The ultimate meta-rules provide the core of any theory of the grounds of legal bindingness, by providing the link between legal discourse and other types of practical discourse. There may be just one ultimate meta-rule, or more than one, according to the particular theory of the grounds of bindingness one is adopting.

Correspondingly, our idea of bindingness does not imply the idea that a legal system should be a pyramid ending in a single meta-rule (a single fundamental norm, or rule of recognition), stipulated to be legally binding.

Note that ultimate meta-rules may also be the result of a process of rationalisation (through abduction), where one tries to identify appropriate foundations for a set of rules one is already endorsing, those foundations being abductively validated exactly by the fact that they determine the bindingness of the very rules one already believes to be binding on substantive grounds (since they are part on ongoing practice which one generally approves, as a whole).

More generally, the definition of legal bindingness as "adoption-worthiness in legal reasoning" is neutral with regard to different theories of the grounds of bindingness (of the conditions making so that a rule is adoption-worthy): This definition constrains neither the content of the meta-rules in these theories, nor the sources they are derived from.

It is important to remark that the neutrality of the definition of legal bindingness does not imply that adopting one or another theory of the grounds of legal bindingness is an irrelevant or arbitrary choice. This adoption has weighty practical implications, especially for legal decision-makers: By determining what rules one views as legally adoptable, it affects the conclusions of one's legal reasoning, and hence the decisions one will impose on the parties of legal disputes and possibly enforce upon them against their will. Therefore, proposing such theories and developing arguments for or against them is an important and challenging task for the legal theorist.

binding, since there are meta-rules in MR that say so. Assume, for instance that I accept a meta-rule r_1 saying that all rules issued by the authority j are legally binding, and that a meta-rule issued by j, let us call it r_2, says that rules issued by the authority k are legally valid: Rule r_2 will be included both in MR, since it is a bindingness meta-rule I endorse, and in BR, since it is legally binding, according to rule r_1. However, some other meta-rules in MR may not be characterised as legally binding by any meta-rule in MR (therefore they would not be included in BR).

13.1.3. Terminological Disputes and Substantive Disagreement: The Stance of the Enactment Positivist

To convert the terribly serious problem of determining what rules are binding in legal reasoning into a terminological dispute concerning the meaning of the word *valid* leads to a disastrous misunderstanding. Let us consider, for example, the conflict between *natural law* and *enactment-positivism*, where by *enactment-positivism* we mean those theories according to which all binding legal rules are the content of authoritative enactment-acts.[3]

Why should a rule be adopted in legal reasoning, for its intrinsic justice or for its legislative pedigree? Are enacted rules still binding (do they still deserve adoption in legal reasoning) when they are grossly unjust?

This debate makes sense if we assume that both the enactment-positivist and the naturalist are aware that they are putting forward competing theories of the grounds of legal bindingness, namely, competing normative criteria for establishing what rules are appropriate in legal reasoning, what rules should be publicly obeyed and enforced. It becomes absurd if they are putting forward competing definitions of the same terms (the term *legally binding* or *valid*).

Let us first assume that the enactment-positivist is taking the correct (normative) stance (this point is clearly made by Scarpelli 1965). By simplifying the enactment-positivist's position we may say that he is cognisant that he is putting forward two strict (indefeasible) meta-rules, an affirmative and a negative one:

- The affirmative one states: ⌈If a rule is enacted by the legislator, then it is binding⌉.
- The negative one says: ⌈If a rule is not enacted by the legislator, then it is not binding⌉.

The naturalist is also putting forward two bindingness meta-rules.

- The affirmative one says: ⌈if a rule is required by justice (nature), then it is legally binding⌉.
- The negative one says: ⌈if a rule is unjust, then it is not binding⌉.

When a rule is issued by the legislator and is unjust (according to the naturalist's view of justice), or when although required by justice it was not laid down by the legislator, the enactment-positivist and the naturalist will disagree. The application of their respective meta-rules will achieve conflicting conclusions: The same rule will be legally binding (adoption-worthy in legal reasoning) for the first, and unacceptable for the second.

[3] We specifically speak of *enactment-positivism* rather than of *positivism* tout court, since the word *positivism* is often used, especially in the Anglo-American legal theory, in a broader sense, namely, to cover all theories according to which the existence and content of law only depends on social facts. Intended in this broad sense positivism also covers what we shall call practice-positivism. As classical instances of enactment-positivists, we can mention Jeremy Bentham and John Austin.

Both parties to this debate should therefore try to provide arguments why their meta-rules should be preferred to those of the other party, or why the other party's meta-rules should be rejected.

We may agree with one of the parties in this debate, or with none of them, but we cannot deny that their dialogue makes sense. It deals with the practical problem of determining what rules are be to used in legal reasoning, a choice on which the freedom or the well being of individuals and communities depends.

On the contrary, whole discussion becomes senseless and misleading, when it is understood as concerning the choice of the best definition for the term *legally valid*.[4]

Let us assume, now, that the enactment-positivist adopts a definitional stance. He is not interested in whether a rule should be used or not in legal reasoning (on whether it is binding, in the sense here indicated). He is just working out, for his own cognitive and analytical purposes, a new definition of the term *valid law*, which he thinks has certain conceptual merits. This is why he stipulates that *legally valid* now means "issued by the legislator." So far, so good, but the meaning that the locution "*r* is legally valid" had before the enactment-positivist's stipulation—namely, "*r* should be accepted in legal reasoning"—is not a dispensable one. To bootstrap our reflexive reasoning in the normative domain we need to be able to ask ourselves whether we should accept certain rules or not. This is the cognitive function that is played by the validity discourse.

Thus, we have to understand the enactment-positivist's stipulation as the request that we reserve the formula *legally valid* for the new use he recommends. Consequently, we need to use different terms for expressing the idea that something should be accepted (is adoption-worthy) in legal reasoning. Unfortunately, common language cannot be changed by anybody's fiat. After the enactment-positivist's stipulation, the expression *legally valid* would have preserved its original conceptual function, and will be oscillating ambiguously between the old and the new meaning. Even those who accept the enactment-positivist's "definition," when affirming that a normative proposition is valid, will tend to imply not only that this normative proposition was issued by the legislator, but also that it is binding, to wit, that it should be accepted in legal reasoning.

Moreover, by rephrasing the meta-rule ⌈Whatever is issued by the legislator is valid⌉ into a new definition of validity, the enactment-positivist has succeeded in making this meta-rule unquestionable. Any denial of the validity (in the sense of bindingness) of a rule issued by the political power—the assertion such a rule should not be adopted in legal reasoning, since it is not applied by the courts, it violates human rights, it is intolerably unjust, and so on—would not count as a challenge to the enactment-positivist's stand. Those denials could be dismissed

[4] Definitional approaches to validity are attacked by Dworkin 1986, 31ff.; cf. also Williams 1990, 175. For a critique of Dworkin's view, see Coleman 2002.

as futile and inappropriate attempts to contest his stipulation of the meaning of the expression *valid law*. This definitional stance stifles the validity debate by masquerading substantive arguments into definitional stipulations.

13.1.4. Terminological Disputes and Substantive Disagreement: The Stance of the Practice Positivist

Let us now move to the approach to the legal validity which we can call *practice-positivism*, namely, the view that those rules are valid, which are practised by the courts, the public administration, or by the citizens at large. Also practice-positivism, like enactment-positivism, views legal validity as depending on social facts (and thus it can be considered as a kind of positivism), but it refers to different social facts: It focuses on social practices rather than on authoritative enactments.[5]

Let us first interpret the claim of practice-positivism as a normative theory of the grounds of legal bindingness, by assuming that "rule *r* is legally valid" means "rule *r* is cognitively binding in legal reasoning." The practice-positivist's theory would then consist of two strict (indefeasible) meta-rules concerning legal bindingness:

- a positive one, according to which ⌈if a rule is practised by the courts, then it is binding⌉, and
- a negative one, according to which ⌈if a rule is not practised by the courts, then it is not binding⌉.

Obviously, not everybody will be satisfied with these meta-rules. Some may deny any duty to accept and perpetuate the current practice whatever it is. Others may qualify this duty in the framework of more articulated theories of the conventional grounds of legal validity. Others may put forward competing bindingness rules: ⌈those rules which violate human rights are not binding, even if they are practised by most courts⌉; ⌈those rules which express the will of a democratically elected legislator are binding, even if they are not practised by most courts⌉, and so forth. However, even those who disagree with the practice-positivist's normative stance cannot deny that this stance makes sense as a substantive position in the legal debate.

On the other hand, the practice-positivist may argue that this is not what she is doing. She is not interested in establishing what rules should be accepted in legal reasoning. She is redefining the term *legally valid* so that it becomes useful for her empirical enquiries. Besides wondering why she should bend the term *legally valid* to this new use, rather than choosing a different term, we

[5] To refer to practice-positivism the word *realism* if often used, especially in Continental legal philosophy (as when one speaks of Scandinavian realism), but we prefer to use a less ambiguous and controversial term.

must observe that the practice-positivist's stipulation is also likely to have little success. Even after the practice-positivist's attempt, the expression *legally valid* will have preserved its original conceptual function (expressing the notion of cognitive bindingness, as we have characterised it), and will be oscillating ambiguously between this function and the one assigned by the practice-positivist's stipulation. According to the practice-positivist's "definition," when one labels a rule as valid, one not only means that this rule is practised by the courts, but one also implies that, being valid, this rule should be accepted in legal reasoning, i.e., that the rule is binding in the sense here indicated. By disguising the meta-rule ⌈whatever is practised by the court is valid (should be accepted in legal reasoning⌉, into a new definition of validity (*valid* means "practised by the courts"), the practice-positivist too has succeeded in making this meta-rule unquestionable. The price would be a misleading ambiguity: The practice-positivist herself would be oscillating between the old and the new meanings of validity, as when she says that to be *valid* means to be "accepted as valid."

13.1.5. Terminological Disputes and Substantive Disagreement: The Stance of the Inclusive Positivist

The same critiques we addressed against enactment-positivism and practice-positivism can be directed, we believe, also against the so-called *inclusive positivism* (see: Waluchow 1994; Villa 2000; Himma 2002), also called soft positivism (Hart 1994, 250) or incorporationism (Coleman 1996, 287–88). Inclusive positivists affirm that, in order to identify the valid law of a certain community, one only needs to apply the criteria (the rule of recognition) that are used, as a matter of fact, for this purpose within that community. These criteria may, though need not to, include a reference to morality.

When read in a prescriptive way, this seems to amount to a strict (indefeasible) request of conformism: "Adopt in your legal reasoning exactly those normative propositions which you can qualify as binding according to the bindingness criteria which most (or most influent) people in your community are currently adopting!" This prescription puts these standard out of discussion, and excludes that one may try to contest, or even refine the very standards for legal bindingness that are currently in use. As Moore (2002, 652) affirms "the legal conventionalist, like his relativist cousin in ethics, makes the majority infallible".

The prescriptive version of inclusive positivism seems questionable. For instance, assume that a German jurist, during the Nazi era, had the courage of trying to convince his fellows to reject or to restrict the generally accepted principle that the any wish of Adolf Hitler was legally binding at the highest level (the legal application of the so-called *Führer's Principle*). Such a generous—and rational, though not from a purely self-concerned perspective—attempt would indeed be outlawed by the prescription of inclusive positivism.

On the other hand, the inclusive positivist may claim that he is not interested

in the issue of legal bindingness, as we are intending it. He is just proposing a new definition of the term *valid*: For him *valid* does not mean "legally binding," but rather "qualifiable as legally binding according to the bindingness criteria adopted by most (influent) people in the legal community." This definitional stipulation, however, provides no substitute for the notion of bindingness as we have been describing it, though it may be interesting for certain purposes (for example, in sociological inquiries, or when one is interested in analysing the content and the implications of the most widespread opinions about the law).

13.1.6. The Normativity of Legal Bindingness (Validity)

We can overcome the conceptual puzzles we have described in the previous section by considering that the sentence "rule *r* is legally valid" usually and primarily expresses the proposition that ⌈rule *r* is legally binding⌉. The conceptual function of this proposition is thus limited to the ascription of the elementary normative qualification we denoted as *cognitive bindingness* or *adoption-worthiness*: The sentence above just says that rule *r* is cognitively binding in legal reasoning, namely, that *r* deserves to be adopted for the purpose of legal reasoning.

In the history of legal thinking, different grounds have been put forward to support this normative characterisation: being enacted by the legislator, being included in a sacred book, being accepted by most judges, being accepted by most citizens, being qualifiable as binding according shared rule of recognition, being endorsed by most scholars, being included in the best construction of the political morality of the community, corresponding to the will of God, and so forth. It may be more reasonable to give more importance to one or another of those grounds, to exclude some of them, to consider other facts, but this pertains to a substantive theory of the grounds of legal bindingness, not to the definitional stipulation of the meaning of the term *legally binding*.

Viewing the specification of grounds for legal bindingness (validity) as a definitional stipulation leads us to confuse two different questions. Remember that Moore (1968, 37) urged us to distinguish the question "What is meant by *good*?" from the question "To what things and in what degree does the predicate *good* attach?" Similarly, we need to distinguish the question "What is meant by *legally valid*?" and the question "To what propositions (rules) and in what degree, does the predicate *legally valid* attach?"

Every stipulation of the meaning of *binding law* (and of *valid law*, in this sense) appears to be an answer to the second question, which is presented as a reply to the first one. Therefore it could be attacked by a version of the famous open-question argument proposed by Moore (1968) against naturalistic definitions of the good. Let us consider any possible definitions of *legally binding* (valid), like the following: "What is stated by the legislator," "What is practised by the highest court," "What was ordered by God," "What we expect that other

people will expect." With regard to any of such definition, one may always ask a non trivial question: "But is that (the statements of the legislator, the current practice of the courts, the order of God, the shared expectation, and so forth) legally binding?", by which one means: "But should we accept that in legal reasoning?" The possibility of asking such a question proves that these pseudo-definitions are disguised meta-rules, which can be dialectically questioned and challenged as such.

This implies the failure, not only of the naturalist and positivist definitions, but also of those definitional attempts that build upon institutional or conventional models of the law. As we have seen in the example of Chapter 12, as far as bindingness is concerned, a convention is no different from any brute physical, psychological or historical fact. A convention can provide (in the appropriate circumstances and in the framework of an appropriate theory of the grounds of legal bindingness) a factual ground for a bindingness conclusion, but cannot offer any self-standing notion of bindingness (and of validity so understood).

Thus, as we have rejected inclusive positivism, *a fortiori* we need to reject the so-called *exclusive legal positivism*, namely, the thesis that "legal validity is exhausted by reference to the conventionally identified sources of law" Marmor (2002, 105), or even that "legal norms are products of authoritative resolutions; every legal norm consists of an authoritative directive" (ibid., 117).[6] Obviously we do not deny, as it should emerge from the examples we have discussed in this chapter and in the previous one, that social facts contribute to determine what the law is (remember that here, by the law we refer to the normative propositions which are binding in legal reasoning). Usually we have indeed very good reasons for assuming that normative propositions issued by certain authorities, according to certain procedures are (just on the basis of this fact, though within certain constraints) binding in legal reasoning. Similarly, we have very good reasons for assuming that rules endorsed and practised by the community or by the judiciary are (just on the basis of this fact, though within certain constraints) binding in legal reasoning.

However, this does not mean that the problem of identifying the law coincides with the empirical problem of listing what kinds of facts are generally viewed (by judges and citizens) as generating the legal bindingness of the rules they embed (see Section 25.2.4 on page 657). On the contrary, the opposite holds true: The attempt to solve the genuinely normative problem of identifying what rules are binding in legal reasoning (what rules we should endorse in legal problem-solving) leads us to refer also to certain social facts. Thus, we can assume that these social facts generate the legal bindingness of the corresponding propositions, only according to certain normative grounds. Rather than reducing legal inquiry to the detection of shared practices, we need to ground on

[6] The latter statement seems very strict: It reduces exclusive positivism to what we called *enactment-positivism*, excluding, for instance, the bindingness of customary law.

practical cognition our decision to participate in the existing practices, and in particular our determination of whether and to what extent we can view the outcomes of these practices as providing legally binding propositions.

13.2. Political Conflicts and Legal Bindingness

In the previous chapter, not only did we propose a notion of bindingness as adoption-worthiness, but we also articulated elements of a theory of bindingness, specifying some reasons for adopting or rejecting the propositions that a certain rule is binding.

One may wonder to what extent our theory is neutral, rather than expressing specific grounds for bindingness. We believe that our account is neutral to the extent that the two aspects we have focused on—attempting at promoting the common good, and doing this through the practice of shared normative beliefs—may be considered to be necessary features of the law. These aspects are compatible with the most different ways of viewing the public good and the most different ways of balancing these two requirements.

13.2.1. Legal Bindingness and Optimal Law

Legally binding rules should not be confused with *optimal* (ideal) law. Bindingness and optimality are both normative notions, but are different ones: I can consistently affirm that a rule is adoption-worthy in legal reasoning (the rule is legally binding), and that I would prefer that we were in condition to adopt a better rule (the rule is sub-optimal). In particular, I may believe that we should accept a legislative statement or a judicial ruling, and in the meantime I may also believe that the legislators or the judges were wrong, that they should have taken a different decision.

The possibility of distinguishing what is legally binding from what is legally optimal can indeed be affirmed within different theories of the grounds of bindingness. This option is available, for instance, within a normative version of legal positivism. In fact, the meta-rule ⌈if a rule is enacted by the legislator, then it is binding⌉ does not imply that the legislator only enacts optimal rules. An enactment-positivist judge may consistently believe that he should accept (and implement) a rule (since it was issued by the legislator), and still consider the rule sub-optimal (it would have been better if the legislator had decided differently).

Similarly, a judge endorsing a normative version of practice-positivism may consistently believe that a rule is binding (it deserves being adopted by her in her decision) since it is practised by most of her colleagues, and still consider that this rule is sub-optimal (it would have been better if her colleagues had been following a different practice).

Even from a perspective that is sensitive to the instances of natural law, it is possible to distinguish bindingness from optimality. For instance, we can rephrase the approach of (Radbruch 1950a) as the combination of the following meta-rules:

1. rules stated and supported by the political power are binding, unless they are unbearably unjust,
2. a rule is unbearably unjust when the evil caused by its practice outweighs the contribution that its implementation provides to legal security.

According to this approach, moderately unjust rules issued by an effective legislator are both sub-optimal and binding: They should be adopted in legal reasoning (for the sake of legal security) even though the legislator could and should have decided better (that is, he should have enacted a just rule rather than a moderately unjust one). Only unbearably unjust legislative rules are both sub-optimal and non-binding.

Results similar to those provided by the Radbruch's formula can also be obtained in the terms of the theory of the grounds of legal bindingness here advanced. Let us analyse at some level of detail the piece of reasoning, the mental monologue, in which a legal reasoner (a judge) may articulate his or her reasons for distinguishing bindingness from optimality, that is, for recognising the adoptability of a sub-optimal rule:

"I need to decide whether to participate in a shared rule according to the plural perspective: I am trying to converge with my fellows into a collective attitude. Thus, when expressing bindingness judgements—that is, when considering what rules *we* (I, together with my fellows) should adopt—I am considering what rules each single members of my community (or a sufficient number of them) may adopt, given our shared expectations concerning each other's attitudes.

The subject of such a decision is no ideal *we*, all of whose members, being in the same optimal epistemic-communicative situation, and sharing an identical information-processing procedure (universal ideal rationality), would infallibly converge upon the optimal rules, those supported by the strongest reasons (Habermas 1999). I, like any other citizen (and any other judge), may have my view of what is optimal, defend it in political discourse, and possibly try to implement it through my participation in political institutions, but this view does not need to coincide with my view of what is legally binding.

This is because I know that we, the real members of my community, are separate individuals, each looking at our shared problems and at our common interests from our particular perspectives, as determined by our particular experiences. So we, although being all (to a certain extent and in different ways) rational and sincere, may well end up having very different ideas of what is best for us all, and even an open dialectical interaction, in the existing circumstances, is unlikely to overcome our differences (cf. Rescher 1993; Waldron 1999b).

Thus, even if I sincerely claim that I am right in my identification of what would be the best framework for our interaction, my claim is not sufficient for producing coordination, since other members of my community (and of its judiciary) are raising the same sincere claim in favour of different frameworks. Given such judgmental diversity, my attempt to implement (and enforce upon others) my view of the common best will not achieve it, but will produce conflict, and possibly violence and hatred, so destroying the very basis of our cooperation. A plural view oriented to coordination, on the contrary, assumes our diverse determinations of what is best, and correspondingly tries to establish what we should all recognise as the common focus for a possible participation.

Therefore, what I believe each one of us should accept, as a legally binding rule, may be different from what I believe we should jointly deliberate, agreeing upon the best rule. This plural perspective, by making me adhere, in my legal reasoning, to sub-optimal rules (rules that I think we should not jointly deliberate, if we had access to fully rational collective reasoning), makes participation possible also when we have not yet come, and even when we will never come, to an agreement on what is optimal for us all."

Let us now see how this kind of argument can be applied to a concrete legal issue. Assume, for example, that in a country the legislative rate for high income tax payers is 40%. Two judges, let us call them Libertarian and Egalitarian, would have preferred a different legislative choice: Judge Libertarian would have preferred a lower tax rate (20%), while judge Egalitarian would have cherished a higher one (60%). However, both of them will stick to the legislative rate in their legal inferences: Neither Libertarian would acquit a person who has paid a tax corresponding only to 20% of his revenue, nor would Egalitarian order a person who has already paid a tax corresponding to 40% of her revenue to pay a further 20%.

But why do both of them apply a rule they believe to be sub-optimal (although for different reasons and with regard to different alternatives)? The answer again comes from reflecting upon coordination. Judge Egalitarian's support for the rule establishing a higher income tax is justified by his expectation that it will provide certain public benefits he highly values: more public resources, and therefore better education, health care, and social services, especially for disadvantaged people. Those benefits, however, are not going to be provided by Egalitarian's individual enforcement of the higher-rate rule: Only the general practice of this rule, based upon its shared acceptance, is going to achieve those public objectives. If Egalitarian goes alone in what he considers to be the right direction, against the expectations of everybody else, he would only cause disruption.

Moreover, judges like Libertarian—who have a different view of what is optimal—could view Egalitarian's licence as an authorisation to go themselves

in the direction they prefer (to lower tax rates), which might lead to a drop in total fiscal revenues. In conclusion, since Egalitarian himself can see that his example is not likely to be generally followed, he should adopt a rule he believes to be sub-optimal, but which at least allows for coordination. This conclusion is reinforced though the idea that by disregarding the legislative rule he would jeopardise the convention that legislative rules are and should be respected, a convention which provides a fundamental mechanism for spreading cooperation (and implementing democracy).

Similarly, Libertarian also expects from a lower tax rate certain important public benefits: a vibrant economy, job creation, new opportunities for individual initiative, and an increased sense of each one's responsibility. However, she can see that these public benefits cannot be provided by her action alone. They will accrue only when the lower tax rate is generally applied (and it is generally expected to be so). Libertarian as well, in the impossibility of establishing a better equilibrium through her own action, should stick to the existing one, and apply the 40% rate.

Therefore, both judges can conclude that they should adopt (i.e., consider valid or binding) the legislative rule: This is the only rule they (and their fellows) can share, although for neither of them this rule is optimal.

This conclusion is also confirmed by considerations pertaining a judge's awareness of his or her judicial role, and of the function that the judiciary plays in collective decision making: Disregarding the statements of the legislator (even when one believes that they are "moderately" wrong) would imply jeopardising the correct functioning of the legal process, according to the democratic principle. Though the legislator has no monopoly over the law, the legislator has a vast competence, or prerogative, concerning the formation of new law, a prerogative which must be respected in legal reasoning, and in particular in judicial reasoning, according to the idea of judicial restraint (see Kriele 1976, 60ff.). Similar considerations also apply to judicial review with regard to discretional decisions of administrative bodies.

Note that from our perspective, legally binding normative propositions are not limited to the (probably quite small) set of rules on whose optimality there is an *overlapping consensus*, namely, the rules which all the concerned individuals believe to be optimal: Convergence is rather the result of a process in which each participant needs to focus on a rule which is salient to all participants (typically, since it is generally practiced or it is characterised as binding by a shared meta-rule), even though such a rule may look sub-optimal to some (or even all) of them.

13.2.2. Unacceptability on Substantive Grounds

In the piece of reasoning just presented, Libertarian's and Egalitarian's concern for rule-sharing has allowed them to distinguish bindingness from optimality, in

the sense of admitting the legal bindingness of sub-optimal rules. This, however, does not imply that, from the perspective of our judges, the intrinsic goodness or badness of a rule is irrelevant to its legal bindingness:

1. the assessment of the optimality of a rule, under certain conditions, may justify the assertion of its bindingness even when the rule is not yet generally endorsed and practised, while
2. the assessment of the sub-optimality of a rule, under certain conditions, may justify the denial of its bindingness, even when the rule is currently endorsed and practised.

The first kind of judgement (endorsing an optimal rule which is not yet practised) may take place when one—besides believing that a rule is optimal—is also aware that one's optimality-belief is shared by most of one's fellows, in the relevant circles. As we have seen above, coordination can be obtained not only by following existing practices, but also by starting new practices, under the assumption that others will follow. The common belief on the optimality of a certain rule provides a background in which this assumption may be justified: If one knows that everybody shares one's belief that the general practice of the new rule r_2 would be better than the practice of the old rule r_1, then one may reasonably expect that, once one starts practicing r_2, everybody will follow converging in the new rule.

Moreover (though much more precariously), one may conclude for the bindingness of a rule one believes to be optimal, even when there is no agreement yet on the rule's optimality, but one expects that such an agreement will come about when everybody has heard one's arguments. Among the factors that condition one's chances of success there are also one's institutional role (for instance, one's position as a judge) and the expectations that are aimed at that role (in particular, the fact that one is considered to be entitled to decide legal conflicts, through certain ways of reasoning) .

Our last considerations assume that one's fellows are endorsing a sub-optimal rule only because this is the current convention. One's reasoning would need to be more complex if one's fellows were endorsing that rule (also) since it was characterised as binding by a specific meta-rule (the meta-rule according to which legislative rules are binding). To convince them, one would then also have to propose an exception to this meta-rule, appearing acceptable to all, which excludes the bindingness of the sub-optimal rule.

The second kind of judgement (the negation of the bindingness of a practised rule) takes place when coordination based upon a shared enforceable rule is likely to produce a public evil, which is so big as to outweigh the costs of rejecting that rule. Let us see how a (rational) legal reasoner may approach this difficult issue. Assume that the legal reasoner praises plural participation in shared normative beliefs as the only way of achieving the main public benefits which may be assured through the practice of the law (through the public state-

ment and enforcement of normative conclusions): protection of rights, liberty, security, collection of resources for various social functions, and so on.

Such norm-participation is an instrumental good (it is valuable since it provides these further benefits), but a necessary one (there is no other way of providing these benefits): Unless judges and citizens share a set of common rules, these objectives are not going to be achieved. The need to achieve certain fundamental collective goods through the law gives a moral significance to the conditions under which the law can achieve coordination, conditions which represent "the morality that makes the law possible" or the "internal morality of the law" (as Fuller 1969, 33ff. calls it; see Rottleuthner, Volume 2 of this Treatise, sec. 4.3). Therefore, usually, one should consider as binding any rule that is viewed as binding and consequently practised by a sufficient number of one's fellows, in the appropriate roles (even when this rule is sub-optimal).

However, not every form of coordination based upon common rules achieves the benefits that make the law a valuable enterprise: The fact that coordination is in place is a necessary, but not a sufficient condition for the attainment of those benefits. Norm-participation may indeed be geared towards different and even incompatible purposes (repression of civil liberties, exploitation, slavery, genocide, etc.), purposes which should be publicly contrasted, rather than pursued. If the currently practised rules delivered such results, on should conclude that these rules—though providing the pattern for the ongoing norm-participation—should not be accepted in legal reasoning: These rules though being effective, and possibly also being believed to be binding by most citizens and judges, are not legally binding (cf. Peczenik 1989).

Such a conclusion presupposes a complex balancing exercise. Let us consider the opposed arguments a legal reasoner—and in particular, a judge—needs consider as weights placed on the two pans of a measuring scale. On the one pan, besides the immediate advantage of not applying the evil rule in the specific case, one would also put the probability that others may follow one's example, so that the general practice of that rule could, in the long run, be interrupted or at least questioned. On the other pan, besides the immediate disadvantage of frustrating the expectations of one's colleagues and citizens in the individual case, one would also put the disadvantage of increasing future uncertainty. Moreover, one would need to add the risk of jeopardising the norm-spreading mechanism that made the evil rule into a communal normative belief (the mechanism of legislation) and of discrediting the values underpinning this mechanism (the value of democracy).

In general, what sub-optimal rules—among those generally practised and enforced—one should consider as legally binding depends on what purposes one believes should be collectively pursued (or contrasted) and on how these purposes relate to one's concern for normative participation, in the legal and social context in which one is operating. These premises would determine how much one approves (or disapproves) the currently practised rules, and how

much one fears (or wishes) the "destabilisation" of the existing legal practices. In general, with regard to a legal system that is acceptable as a whole, reason requires that norm-participation is usually viewed as an overriding concern: From this perspective, a reasonable legal decision-maker in order to provide those goods that only coordination can ensure, should adopt the rules that are, or at least are likely to become, shared patterns of a common practice. However, one needs to agree with Radbruch in considering that history has provided many cases where sufficient reasons do indeed exist for rejecting generally practiced rules (for denying their bindingness), even when no alternative rules are likely to provide coordination.

13.2.3. Constitutions and Constitutionalism

In many legal systems the rejection of legislation is facilitated by the common view that certain normative standards—a constitution—prevail over ordinary legislation and thus limit the action of the legislator: In case of a conflict with such standards (there included, in particular, certain individual rights) legislation is not to be applied (according to the mechanism of preferential reasoning we considered in Chapter 7) and possibly can be voided through constitutional review.

When constitutional principles—prevailing over legislation—include basic human rights and respect for fundamental legal values, one may reject a bad legislative rule by referring to the fact that it violates the constitution, rather than directly appealing to its evilness. Appeal to a constitution makes the legal rejection of a piece of legislation much more practicable: One may expect that others will more easily converge with one's belief that a certain piece of legislation should not be viewed as legally binding since they share the endorsement of the constitutionals standards and the idea that they limit the legislative power. Thus, it is true that, in a way, constitutionalism is the successor of natural law, as a legal constraint on political power.[7]

We cannot here consider the many theories of constitutionalism (on constitutions and constitutionalism, see Shiner, Volume 3 of this Treatise, sec. 6), broadly intended as the doctrine of the legal limitations of political power.[8]

[7] The significance of constitutions for legal reasoning has been frequently emphasised in recent times. On constitutionalism, see for instance Alexander 1998, and with regard to the Italian doctrine, Ferrajoli 1990, 348–61, 369–76, Zagrebelsky 1992, and Bongiovanni 2003.

[8] One may locate within constitutionalism, intended in a broad sense, quite opposed ideas, like for instance: Kelsen's idea of a positive constitution, prevailing over ordinary laws (Kelsen 1967, sec. 35.a); Dworkin's idea of fundamental moral-political rights, trumping laws aimed at collective goals (Dworkin 1984); Hayek's idea that the whole law governing interpersonal relationship (as opposed to the organisation of the state's administration) should not be decided upon by legislators (not even when elected through a democratic process), but should rather reflect the autonomous order resulting of spontaneous socio-economic evolution, which judges should understand, clarify and facilitate (Hayek 1973).

We shall thus content ourselves with some common-sense considerations. As reason, according to the natural law theorists, requires humans to abandon the state of nature and endorse a legal order, so reason, we believe, favours a constitutional arrangement: Rationality requires that one participates into the currently adopted constitutional arrangement, when the substantive contents of the currently endorsed constitution appear to be acceptable enough; it also requires that one tries to push forward for such an arrangement if it is not yet in place.

In fact, a realistic analysis of electoral and political processes, and of the decisional practice by elective Parliaments and Governments shows that things can go very wrong: Laws may be issued just to satisfy the hates and fears of the constituency, they may infringe basic liberties, majorities through the government may oppress minorities, lobbies and private interest may dictate the contents of legislation. Thus, constitutional constraints (coupled with their judicial implementation) may contribute to make so that legislation tracks (up to a certain extent) practical cognition: They may prevent major mistakes, limit the tragic risks of an unlimited political power, ensure that everybody can trust that minimal warranties are being preserved.

On the other hand, a realistic appreciation of the decisional practice of judicial decision-making (also in constitutional review) shows that also here things can go very wrong: Judges may protect corporative or individual interests, may impose on society their prejudices (without the feedback provided by electoral mechanisms), may fail to assess the social and economical impacts of their choices, may prevent innovative legal solution from being tested though their implementation and submitted to public debate.

In conclusion, respect for political democracy (for the dignity of legislation, see Waldron 1999a) and awareness of the limited capacity of judges as policy makers (and practical cognisers) require that a large legislative prerogative is left to elected bodies, though within judicially enforced constitutional constraints.

Finally, the collective endorsement of a constitution, and the existence of a constitutional jurisdiction does not exclude that one may criticise and oppose certain contents of the currently endorsed constitution and certain constitutional judgements. Even the rejection of constitutional rules and judgements may indeed be the right thing to do, when contents or judgements are so terribly wrong that they are not adoption-worthy in legal reasoning (they are not legally binding, or, if you prefer, they are legally invalid).

Thus, we need to reject the view that adoption-worthiness with regard to a certain community can be equated with substantive correspondence with the constitution of that community.[9]

This equation is possible only if by the *constitution* of a certain community we just mean the set of all constraints that legislation enacted in that community

[9] For the statement of a strict link between legal validity and respect of substantive constitutional provisions, see for example Ferrajoli 1990, 351–6.

needs to respect in order to be adoption-worthy. On the basis of this understanding of the notion of a *constitution*, we might indeed say that any correct justification of one's choice not to apply a certain legislative rules is a constitutional justification. However, this unfortunately only is a tautology: If constitutions are defined as including all and only the constraints over legislation which are adoption-worthy in legal reasoning, obviously any constitutional content will be adoption worthy in legal reasoning. This definition gives no indication to the legal decision-maker, who needs exactly to establish when there is a correct justification for the choice not to apply a legislative rule.

If, on the contrary, by a *constitution* we refer to a constitutional text, or to the constitutional beliefs currently adopted in a community, this equation does not always hold: One may consistently claim that a piece of legislation respects the constitution of a community, but is not adoption-worthy in that community. There is no logical necessity that a constitution, intended in this sociological or conventionalist way, sufficiently respects human rights: It is perfectly conceivable that a constitutional text admits or even requires racial or sexual discrimination, criminalises dissent on certain political or religious issues, gives unlimited power to a dictator, and so on.

Thus, we need to reject the view that constitutions are binding just because of their general acceptance, just because "they are there": We can think of many cases where a shared constitutional principle is not adoption-worthy. Consider, for instance, the above mentioned *Führer*'s principle, which was indeed a constitutional principle of Nazi Germany, being publicly endorsed and generally assumed to prevail over any other legal source.[10]

The distinction between the bindingness of a constitution and the fact that it is endorsed and applied, does not exclude that, as a matter of fact, there may be a large overlap between binding constraints on legislation and the endorsed and applied constitution.

Firstly, one's rejection of a piece of enacted legislation is rational (with the exception of most tragic cases) only when one forecasts that one's community may (now or in the near future) share this rejection. This results can usually be achieved only when one can appeal to constraints expressed in a constitutional text or endorsed on a customary basis. In fact, we need to distinguish between

[10] This conclusion can be avoided (at least in the worst cases), when the words *constitution* and *constitutionalism* are used to refer only to those arrangement which respect the basic principles which are typical of liberal western society, being intended to limit the power of the State in order to protect individual liberties (see, for instance: McIllwain 1947; Matteucci 1963; Sartori 1993, sec. 9.5). This notion of a constitution is historically and politically very important. For instance, according to Art. 16 of the 1789 Declaration of the rights of man and the citizen "Any society in which no provision is made for guaranteeing rights or for the separation of powers, has no constitution." However, we prefer not to use here this history- and value-laden notion of a constitution, since this would add a level of complexity to our analysis (the need to establish when the basic legal arrangement of a community qualifies as a constitution in this restricted sense), without any significant advantage for our purposes.

optimality and bindingness also with regard to constitutional constraints. On the one hand, an optimal constitutional standard (a constitutional constraint that a certain community should ideally adopt) may not be legally binding for an individual legal reasoner, since there is no chance that this standard will be collectively adopted (see Section 13.2.1 on page 368). On the other hand, even sub-optimal (but already practised) constitutional standards can be binding for the individual reasoner, since they may represent the best choice, among the practicable ones.

Secondly, the tragic history of the last century (and advances in legal and ethical thinking) has led to include, within the currently adopted constitutions, many principles that undoubtedly are adoption-worthy at the constitutional level.

Finally—at least when an unrestrained legal debate can take place—legal cognition focuses on shared constitutions its collective efforts to elaborate theories and principles, producing results which are tested and reviewed through widespread discussions and experiences. This is a further ground for assuming that shared constitutional theories and principles usually provide a good guidance to the legal reasoner, or a least a good starting point for his or her thought.

13.2.4. Law, Power, Sovereignty

The considerations we have been developing so far lead us to reject a strict rule to the effect that all normative propositions produced by the political power (at the statutory level, but also at the constitutional level) are necessarily legally binding. This amounts to rejecting the normative version of enactment-positivism (see Section 13.2.1 on page 368), namely, the proposal to adopt a strict (indefeasible) bindingness meta-rule to the effect that:

> the most obnoxious legislative law, as long as it is produced in a formally correct way, must be recognised as binding. (Bergbohm 1892, 144)[11]

Rejecting this view entail also rejecting the view that the State enjoys an unlimited *legal sovereignty*, that is, the unlimited legal power to make whatever content legally binding: A legal reasoner is thus justified in assuming that certain minimal warranties (like those contained in the UN conventions) limit the State's authority, so that the State has no power of producing binding laws when violating such warranties. Further limitations to the legal sovereignty of a State may depend on the need to cooperate with other legal communities, and to

[11] Quoted in Kaufmann 1984, 76–7, who provides an introduction to the German debate on legal positivism (ibid., 70ff.). The classical reference for a critique of legal positivism is Radbruch 1950a, whose approach has been recently developed by Alexy (1992).

participate in the activity of international organisations, like the UN, or the European Union: Also with regard to such organisation, the legal reasoner may be justified in assuming that incompatible State-rules are not legally binding.

Note that the theses we have just stated are consistent with a milder form of normative legal positivism, which we believe is indeed generally justified (at least when citizen are provided with legal security and a working framework for co-operation, and when a democratic control is in place). This is the adoption of a defeasible meta-rule (a principle) to the effect that the outcomes of political decision-making, according to pre-established procedures, are normally legally binding. We must also admit, however, that this rule is defeated by prevailing exceptions to the contrary (as when constitutional constraints are violated, and in the cases of extreme injustice referred to by Radbruch).

A further corollary of our view of legal bindingness is the rejection of the idea that all binding laws are necessarily produced or authorised by the State. In fact it may well be the case that other sources provide normative contents that are adoption-worthy in legal reasoning: These sources may deserve acceptance in legal reasoning, even if State legislation does not include them, neither explicitly or implicitly, in its list of the recognised sources of law. Among such sources we may mention commercial practice (also at the international level), endorsed customary rules, judicial precedent (also from foreign countries), decisions of international bodies, and so on. The decisive criterion for adopting the rules produced by such sources, the ground of their legal bindingness, is the very fact that these rules work (or are likely to work), through collective practice and enforcement, as the shared basis of valuable forms of coordination.

Such considerations—and reference to values like certainty, cooperation, respect for self-organisation and for shared expectations—may lead, for instance, Italian judges to conclude that the following contents are immediately legally binding, though with various limitations and exceptions: regulations and judgements issued by the institutions of the European Union, *rationes decidendi* of judicial precedents (at least as long as they are not shown to be wrong, see for instance: Galgano 1985; Gorla 1990), rules adopted in international contractual practice and arbitration, rules adopted by Internet bodies, acquiesced upon deliberations of certain international bodies, and so on (we will consider the sources of law in Section 25.2 on page 653).

13.2.5. Legal Bindingness and Moral Bindingness

As legal bindingness can be distinguished from legal optimality (ideality), both notions can be distinguished from moral bindingness. We cannot undertake here a serious attempt at defining the notion of morality, but we may advance the hypothesis that when one says that a rule is morally binding, one means that it should be accepted in moral reasoning, that is, for the purpose of establishing how the members of a community are to behave towards one another, and

consequently, what they are entitled to expect from others, regardless of the possibility of coercion. Obviously, there is no inconsistency in affirming that a rule is both morally binding (we should accept it for the purpose of establishing how we are to behave to one another) and legally unacceptable (we should not view it a justification for coercion).

Even if a rule is morally binding, its coercive enforcement may be inappropriate—too expensive, too obtrusive, and so on. Moreover, the rule's enforcement without a previous enactment may violate the existing constitutional arrangements, and the existing expectations of the citizens. Therefore, there are certain rules that are morally binding, but are not, and should not become, legally binding.

According to our perspective, the distinction between law and morality does not need to be grounded on the subjectivity and indeterminacy of morality.

A deeper ground for distinguishing law and morality can be found in the idea that an essential aspect of moral life and moral choice is autonomy, intended as the freedom of choosing between different goods, but also between good and evil. Thus, this idea of autonomy does not assume moral relativism, and may go beyond the domain where one has may be said to choose between a set of acceptable options, and where one's personal likings and attitudes contribute to establishing what is better for one (as for instance, when one chooses a job, a partner or more generally a style of life).

For the sake of moral autonomy, intended in this broad sense, doing the right thing must be legally facultative (in the sense we will specify in Section 17.3.4 on page 462), rather than legally obligatory, at least to some extent. This requirement may even extend to areas where one may cause damage to others, i.e., in the areas where, according to the traditional liberal doctrine of Mill (1991a), the intervention of the law is legitimate.

Assume that whenever an action impacting on others were morally binding, it were also legally binding: One would be legally bound (under the treat of a sanction) to be generous, helpful towards one's fellows in need, to respect everybody's feelings, and so on. Under such conditions, one would not be able to experience morality, to freely exercise moral self-determination. For the sake of moral life itself, it seems that the law must leave some space for immorality, egoism and greed, so that one can have the chance of autonomously adopting and implementing moral choices. As Radbruch (1950b, 139–40) observes, "the law does serves morality through the obligations it imposes, but rather through the rights it grants [. . .] to individuals, so that they can better satisfy their moral obligation." To offer us the "possibility of morality," the law must also offer us the "possibility of immorality" (ibid., 141).[12]

[12] In the same sense as Radbruch, see for instance von Savigny 1981, sec. 52: "The law serves morality, not by implementing its commands, but by ensuring the free development of the force which is internal to each individual will" (my translation). The idea that "not everything which

13.2.6. Bindingness Propositions

The predicate *legally binding* is primarily used in those meta-propositions having the form ⌈Rule *r* is legally binding⌉, meaning ⌈I (we) should participate into adopting rule *r* in legal reasoning⌉. Such *bindingness-establishing* propositions must be distinguished from the higher-level (meta-meta) propositions embedding them, which we can call *bindingness-embedding propositions*.

Bindingness-embedding propositions may be factual ones, such as those asserting that certain people believe a bindingness proposition: ⌈Most people believe that [rule *r* is binding]⌉. Further levels of embedding are also possible: ⌈All people in our community are aware that [most people in the community believe that [rule *r* is binding]]⌉.

Bindingness-embedding propositions can also express cognitive idealisations. They may affirm that people would come to believe certain bindingness propositions, under certain epistemic circumstances: ⌈People would come to believe that [rule *r* is binding], if they were reasoning correctly, in the awareness of the relevant facts, etc.⌉. The formulation of cognitive idealisations requires vicarious reasoning: One must consider what results other people would achieve given the beliefs that these people are currently having (and assuming that they are able of rationally processing such beliefs).

Bindingness-embedding propositions provide no alternative notions of bindingness: They contain bindingness propositions, and therefore assume the very notion of bindingness expressed by the latter. This is true even when—as in coordination-based arguments—bindingness-embedding propositions (in particular, propositions asserting that most people share or will share the belief that a rule is binding) provide pre-conditions for affirming a bindingness proposition. Thus we may assimilate bindingness-embedding propositions to those statements of the law which are expressed from the *hermeneutical* point of view of MacCormick (1981, 33–40), and possibly also with those statements that are expressed from the *detached* point of view of Raz (1980, 153ff.) (see Rottleuthner, Volume 2 of this Treatise, sec. 2.4.2).

Our notion of bindingness implies that one can make proper bindingness judgements (judgements expressing bindingness propositions) only when one is reasoning from inside a legal system (when one views oneself as a member of the "we" that should accept the rule at issue). There is no detached way of asserting a proper bindingness proposition. Thus, we must conclude that legal reasoning is not reasoning from a detached perspective, it is rather reasoning from a particular perspective, to wit, as a participant in the legal community.

is permitted is honourable" (*Non omne quod licet honestum est*) can be found in *The Digest of Justinian*, 50.17.144. Radbruch's view is rejected by Raz (1986, 381), who affirms that "only very rarely will the non-availability of morally repugnant options reduce a person's choice sufficiently to affect his autonomy." Consequently Raz concludes that "the availability of such options is not a requirement of respect for autonomy."

This is not contradicted by the possibility of affirming that a rule is binding in a foreign or an ancient legal system, since such statements are to be understood as elliptical ways of expressing bindingness-embedding propositions.

For example, the assertion that ⌈rule r was binding in ancient Roman law⌉, where r stands for "masters are permitted to kill their slaves," does not mean ⌈we should have accept rule r for our legal reasoning in ancient Roman law, that is, under the hypothesis that we were members of the Roman legal community⌉. It rather means: ⌈Romans believed rule r to be binding⌉. I may have this belief, and at the same time also believe, that, if I were a Roman jurist (keeping all my current knowledge) I would not view such a rule as legally binding.

One's bindingness-embedding beliefs may approach one's bindingness beliefs through cognitive idealisation. For instance, when cognitive idealisation is pushed far enough (including the Romans' capacity to review their legal and moral theses, and to interpret appropriately their sources), the critical student of Roman law could even conclude that rule r was not binding in ancient Roman law (Romans should not have endorsed it, and they would not had endorsed it if they had fully exercised practical cognition), although, as a matter of fact, most Roman lawyers believed that r was binding.

To substantiate this statement, the critical Romanist scholar needs to present a (hypothetical) cognitive process that starts with the actual (false or incorrect) beliefs of ancient Roman lawyers (and with their sources of the law), but leads them, through reasoning and experiential data, to revise such beliefs.

13.2.7. Legal Reasoning and Detachment

To clarify the distinction between reasoning from a detached perspective and reasoning from a particular perspective, consider the position of an administrator of a firm. The administrator, when acting in his professional competence, has to take decision in the interests of his firm: He will adopt the goals that characterise his firm (goals like providing profits to its shareholders, but also maintaining and increasing its market share, preserving the jobs of the employees, and so on), and devise ways of achieving such goals. His contribution will not be purely passive, he will creatively contribute to the achievement of such goals, but he will also contribute to refine and characterise these goals, according to his understanding of the mission of a commercial firm, and of his understanding of the views of owners and managers.

When doing all of this, the administrator is not engaging in vicarious reasoning, he is not asking himself: "What determinations would mister X adopt if he were the administrator of my company?," or "What determination would I adopt if I were an administrator of my company?," or even "What determination would my company adopt, under the present circumstances?" He is rather reasoning directly, in his professional role, that is, adopting the perspective which corresponds to his identification with, or his participation in, his company. He is

asking himself: "What determination should *I* adopt as the administrator of my company?", which is equivalent to "How should I participate in the decisional process of my company?"

The same kind of reasoning also applies to a civil servant, having some responsibility in managing a State agency. When the civil servant is vested of her professional role, she is taking the perspective of her agency, and doing her best to achieve the public aims of her agency, within the constrains that are proper to her role.

There is nothing mysterious in this phenomenon, which is indeed present in every community and organisation, both in the public and in the private domain, and is ubiquitous in political discourse. Simon (1965, 205) speaks in this regard of *identification*:

> we will say that a person identifies himself with a group when, in making decision, he evaluates the several alternatives of choice in terms of their consequences for the specified group.

This also happens when one is engaging in legal reasoning. Like the administrator of a company (and any of the company's employees) directly gives *his* contribution to the decision-making process of his company, rather than figuring out what another would do in his place, similarly a legal decision-maker (and any citizen) actively participates in the reasoning of *her* legal community, rather than figuring out, from a detached perspective, what somebody else would have believed and thought at her place.

One may, and should, in the appropriate circumstances, also engage in vicarious reasoning, trying to anticipate what rules other people will or would endorse and implement. Not only is this the perspective proper to Holmes's bad man (who looks at the law "only for the material consequences which such knowledge enables him to predict": Holmes 1897, 8), but this is also, as we observed above, an essential step in the process of converging into shared normative beliefs. However, this attitude does not exhaust the stand of the honest legal reasoner, but rather only has, for him or her, a preliminary function: The ultimate issue that one has to address, as a legal reasoner, is what rules oneself has to endorse (view as legally binding) and implement through one's own decisions and actions.

The thesis that legal reasoning consists in detached reasoning may be understood in two quite different ways. One way of understanding detachment stresses the idea that the legal reasoner needs to detach from his or her personal motives, in order to participate in the reasoning process of his or her community, endorsing (but also contributing to shaping) its normative system and its values. The other way of understanding detachment consists in viewing detached reasoning as modelling, simulating or replicating the law's reasoning, without endorsing it, without participating in it.

We accept the first view, and reject the second: Legal reasoning (at least

from the perspective of a judge, or of a loyal citizen) presupposes identifying with (or participating in) the legal community and directly reasoning from this perspective. It seems to us that this also concerns the activity of the doctrinal lawyer: When proposing a certain legal solution, one is considering how one's community should approach a certain kind of legal issues (especially, though not exclusively, at the level of judicial decision-making).

This view only partially matches the reasoning of advocates (barristers or attorneys), who have the task of leading the judge to endorse the legal solution that is more convenient for their clients. Advocates are indeed allowed to "cheat" in the sense of presenting their theses as being the most legally appropriate, even when they do not believe that this is the case.

Consider how this attitude, which is perfectly acceptable in advocates—corresponding to their professional duty toward their clients (within the limits of professional correctness), and to the adversarial mechanism of litigation (see Section 11.1.2 on page 307)—would not be viewed as appropriate with regard to doctrinal writers. We would indeed criticise the insincerity of a writer defending in a scientific article a thesis he or she does not endorse, but which is more convenient to an important client. Such a criticism would not be appropriate towards a thesis expressed by the same person, when acting as an advocate in the course of judicial proceedings.[13]

However, the advocate can achieve its objective (winning the case) only by modelling the reasoning of the judge and by anticipating the judge's reaction to the advocate's suggestions, assuming that the judge is reasoning as we have indicated.[14]

13.2.8. Legal Reasoning and Shared Legal Opinions

Our view of legal reasoning takes us away not only from strict or exclusive legal positivism, but also from *inclusive positivism*. The latter still assumes that all the law can be found in certain social sources, and is *inclusive* only in the sense of including within those source also socially established values, principles and so on. We believe that this view does not provide an adequate description of legal reasoning since fails to recognise that lawyers—rather than only aiming providing an account of current legal beliefs and of their implications—may actively and knowledgeably contribute to forming such beliefs.

When engaging in legal reasoning, one needs to identify with his or her community (rather that take an egocentric-personal stand), to insert one's reasoning in the deliberative process of one's community (and thus take as one's starting point the sources, values and attitudes that may be attributed to that commu-

[13] For a sceptical view of the advocate's task, see Morison and Leith 1992.

[14] We discount illegal conducts, such as bribing the judge, or anyway appealing to the personal interest of the latter.

nity), to take into account the current opinions of one's fellows, in order to converge non-manipulatively (plurally) in a common position. However, this does not confine the legal reasoner to the rehearsal of these sources, values, attitudes, and opinions. We can say—using the words of the Roman jurist Pomponius (*The Digest of Justinian*, 1, 2, 2)—that the lawyer (*juris peritus*), also has the task of contributing to make so that "the law [...] is improved day by day" (*jus* [...] *cottidie in melius produci*; my translation).[15]

Firstly, a (good) lawyer can play a creative role in the legal process. A lawyer (even a doctrinal writer) should be a problem-solver, not limiting his or her activity to describing practical determinations (norms, values, goal, decisions) adopted by others in the past, but extending that activity to the refinement of previous determinations and also to the adoption of new determinations—as long as one can assume that there is a sufficient chance that one's view is going to be collectively adopted (we referred to this aspect by speaking of the *gamble of participation* in Section 10.1.5 on page 279).

In proposing refinements and developments of the current legal practice one often refers to political morality (as observed by Dworkin 1986, 96): One needs to consider what determination should be adopted by one's community, though this reference is constrained by the need to converge with one' fellows and to insert this determination in the framework of the community's reasoning and decision-making.[16]

Secondly, the very need to focus on the values that one's community should pursue may lead one—though still identifying with one's community, and even because of this identification—to deny the legal bindingness (adoption-worthiness) of some determinations one's community is currently endorsing (see Section 13.2.2 on page 371), and of the rules which implement such determinations. For instance, with regard to shared rules that are intended to bring about the genocide of a minority, the elimination of political opponents, engagement in aggressive warfare, or some clear and severe form of injustice (like racial discrimination) rejection and disobedience seem the appropriate choices, in the interest of the concerned political community and even of its law.[17]

The idea that lawyers, there included doctrinal lawyers, need to identify with the legal system—rather than reproduce the reasoning of those who identify

[15] Pomponius also says that unless this task is fulfilled, the law cannot persist (*constare non potest*). See Lombardi Vallauri 1967, 5ff. The fact that lawyers have this task does not entail that they always (or even mostly) fulfil it, as many critics have often observed. For two old, by still very effective, pamphlets against lawyers and legal doctrine, see for instance: Muratori 1958 (on which cf.Pattaro 1974); von Kirchmann 1966.

[16] We discussed this issue in Section 10.1.4 on page 277 with regard to the connection between collective and plural ideality.

[17] As Martin Luther King famously said in his letter from Birmingham Jail (1963) "an individual who breaks a law that conscience tells him is unjust, and who willingly accepts the penalty of imprisonment in order to arouse the conscience of the community over its injustice, is in reality expressing the highest respect for law."

with the legal system—can also be given a psychological explanation. A lawyer, as any problem solver, needs to engage in heuresis for finding imaginative solutions to the legal problems he or she has to face. This requires one's mind to be focused on those problems, in order to devise creative solutions. To perform well in such a heuristic search one needs to directly adopt those problems as one's own problem, rather than to aim at mimicking somebody else's reasoning in facing these problems.

Probably, one would not contribute much to science, if one did not believe in science as a form of cognition and was not engaged in making scientific discoveries, but rather aimed at anticipating what kind of inquiries and discoveries committed scientists would do. Similarly, one would probably be a bad artist if one aimed at reproducing or anticipating the style of some other artists rather than to provide one's own contribution. In the same way, one would probably be a bad legal scholar and decision maker, if one aimed at reproducing or anticipating what other lawyers would think and do, rather than at solving the legal problems one has adopted as one's own problems (or rather as the problems of one's own community).

Possibly we may say that the legal positivist (both of the exclusive and of the inclusive type) tends to assimilate the task of the lawyer, and in particular of the doctrinal lawyer, to the task of the sociologist or historian of science. Sociologists and historians of science should indeed study what scientific theories are accepted in a certain society at a certain time and work out some implications and presuppositions of such theories, there included—if one is an inclusive sociologist of science—shared scientific values, background metaphysical assumption, and so on.

However, it goes beyond the mission of the sociologist of science to try to solve substantive scientific issues, a task which they must leave to real scientists. Thus, if we adopt the positivist perspective, and we view lawyers as sociologists of law, we need to find somebody else who will provide the object of the lawyer-sociologist's studies, not only by solving specific legal issues , but also by developing practical theories that may support legal decision-making.

13.2.9. Overcoming the Paradox of Legal Validity

In the beginning of Chapter 12 we identified a puzzle: How can the validity debate be so important for lawyers and jurisprudes if it only concerns the choice of a definition for *legally valid*? Our explanation is that the puzzle of legal validity arises when a substantive issue (what rules are binding in legal reasoning?) is taken for a definitional one (what is the meaning of *legally valid*?). This is because the term *validity* is usually employed to express the normative notion of *bindingness* that we have here analysed.

We have argued that when one qualifies a rule as legally binding, one just wants to assert that the rule should be adopted in legal reasoning, namely, in the

reasoning that is intended to establish enforceable normative conclusions. The assertion that a rule is legally binding is the conclusion of arguments which support the use of that rule in legal reasoning, while the negation of its bindingness is the conclusion of arguments that reject such use. One needs to be capable of expressing such arguments if one wants to engage in reflexive legal reasoning, that is, to question or support the rules one is using in drawing legal conclusions.

From our assimilation of the idea of validity (in the sense here described, for a different notion, see Pattaro, Volume 1 of this Treatise, chap. 2) to the idea of bindingness, it follows that legal theory has no need to engage in definitions or re-definitions of the notion of legal validity (intended in this way). It has, instead, a large role to play in providing what we have called "theories of the grounds of legal bindingness."

Besides developing normative theories concerning the grounds of legal bindingness, legal theorists (and legal sociologists) should also investigate what views of the law are in fact adopted in legal communities or in sections of those communities. However, these empirical analyses cannot provide any sensible definition of bindingness, not even a lexical one. They only provide a description of how (upon what grounds) the members of the relevant communities usually derive bindingness propositions.

Unfortunately, as we have seen above, legal theorists have frequently merged these legitimate normative or empirical inquiries with the attempt of re-defining the term *legally binding* (or legally valid). This not only has created theoretical confusion, but has also stifled the dialectical exchange between different traditions of legal theory, such as naturalism, positivism, and realism.

Each of those traditions often not directly advocates certain arguments for attributing or excluding bindingness, which can be attacked by counterarguments and need to be correspondingly supported by appropriate reasons and meta-reasons. It rather presents itself as the sponsor of a certain definitional stipulation, which as such does not need any support, and which it would be just silly to question on substantive grounds. To solve the validity puzzle we need to bring the validity discourse, even within legal theory, back to its proper domain, that is, to the normative dialectics of arguments intended to establish what rules should determine legally binding—and thus publicly enforceable—normative conclusions.

Part II

Legal Logic

Chapter 14

LAW AND LOGIC

14.1. Introduction: Logic and Legal Reasoning

The relation between law and logic has been governed, as many of the most intense relationships are, by both a strong attraction and persistent strife. Let us consider first the reciprocal attraction between the two disciplines, then the reasons for their strife, and finally a way to find a possible accommodation.

14.1.1. The Attraction between Law and Logic

On the one hand, law—with its rich and diverse palette of reasoning forms and with its large social relevance—has appealed to logicians as an ideal field for application and experimentation. Law offers a large-scale effective decisional practice, in real-life contexts, frequently accompanied by reasoned justifications. Moreover, legal reasoning represents a middle way between formal inference and commonsense thinking: Even though legal discourse is not formal, it tends to appear in uniform and relatively structured ways, so that its patterns can be made accessible to logical analysis.

On the other hand, logic—with its capability of providing instruments for rational thinking—has appeared to many lawyers as a necessary tool for improving legal reasoning and communication. Since the young Leibniz proposed the transposition of the axiomatic approach to law (Leibniz 1974), by expressing the legal system in a few propositions, from which all legal conclusions could be "geometrically" derived, many lawyers were fascinated by the analogy between the logical deduction of a conclusion from a set of axioms, and the judicial derivation (justification) of a decision from legally binding sources. Reducing judicial reasoning to logical deduction would ensure certainty and testability, it would constrain the arbitrariness of human decision-making.

14.1.2. The Conflict between Law and Logic

However, the relation between law and logic has not always been that of a peaceful cooperation. Both partners have felt, at certain times, deep reciprocal distrust, accompanied sometimes by indifference or open attack. It is no surprise that a lawyer may resent being described as "logical" or "formalist," by which the lawyer may understand "pedantic" and "non-creative," and in the same way a logician may resent being attributed lawyerlike captiousness and verbosity.

More specifically, legal experience may appear to the logician (and more generally to the scientifically trained mind) as dominated by rhetorical appeals, magical conceptions, and unreasoned reliance on authorities: So much is legal practice a mixture of persuasion, superstition, and brute strength, that no canon of rationality can either be derived from, or be applied to it. On the other hand, a lawyer may find logic trivial and barren: Its complex and technical mechanisms just make explicit what is already known, without offering any substantial help to the creative task of constructing legal solutions adequate to new problems (to "the art of the good and the equitable", *The Digest of Justinian*, 1.1.1).[1]

The assumption of a basic, irreconcilable conflict between formal logic and legal reasoning motivated, from the end of the fifties, a number of attempts at grounding an alternative account of legal reasoning in the tradition of rhetoric and argumentation.[2] Legal reasoning often defined itself according to the argumentative technique which Perelman and Olbrechts-Tyteca (1969, 411ff.) call *dissociation*, that is, by pointing to a set of oppositions, which distinguished it from formal logic and were often used as polemical tools, loaded with evaluative connotations:

- Abstraction vs concreteness 1. Logic is abstract, since it only considers those features that are translated into its formal language. Legal reasoning is concrete, since it is capable, by preserving the richness of natural language, to capture the full-blooded content of legal problems.
- Abstraction vs concreteness 2. Logic is abstract, since it extracts the formalised data from the underlying network of beliefs and attitudes that determines the contextual meaning of each piece of information. Legal reasoning is concrete, since it takes into account the social and linguistic background of the audience.
- Closeness vs openness 1. Logic is closed, since it assumes a fixed system of knowledge. Legal reasoning is open, since it moves from assumptions freely chosen from a pool of general ideas, maxims or principles.
- Closeness vs openness 2. Logic is closed, since it blindly derives all consequences of a consistent set of premises. Legal reasoning is open, since it allows for alternative principles to be dialectically harmonised.

[1] The Latin original: "ars boni et aequi."

[2] The main reference is provided by the many contributions by Chaïm Perelman (and in particular Perelman and Olbrechts-Tyteca 1969, and Perelman 1979), but also Viehweg (1965) had a large impact on the legal discussion. The rhetorical tradition was also developed in Italy, for instance by Giuliani 1961 and 1966. More recently, in the German speaking area, legal rhetoric has been a very active area of research, see for example: Ballweg and Seibert 1982; Haft 1990. In the English speaking area, legal rhetoric can be connected to quite different kinds of jurisprudential research. On the one hand there are various approaches to the law based on literary studies, which we shall not be able to examine in this volume (see for instance: Jackson 1985; Fish 1989; Goodrich 1990; for a critical discussion of the application of literary methods to the law, see Posner 1988; for a recent discussion of law and literature from continental Europe, see Ost et al. 2001). On the other hand there are analyses of different kinds of informal arguments and fallacies (see, for instance: Walton 1997 and 2002) and studies of dialectical interactions (see Chapter 11).

- Closeness vs openness 3. Logic is closed, since (in order to be able to solve all legal problems) it assumes that the legal system is complete. Legal reasoning is open since it assumes the incompleteness of any set of sources and it relies on ampliative inferences for filling the gaps.
- Constraint vs persuasion. Logic is constraining, since it is not possible, for any rational being, to refuse assent to a logically valid inference. Legal reasoning is persuasive, since it leads its addressees towards a certain conclusion without forcing upon them the acceptance of that conclusion.
- Formality vs materiality. Logic is formal, since it evaluates inferences only on the basis of their syntactic structure. Legal reasoning is material, since the acceptability of a legal argument depends not only on the form, but also on the substantive value of that argument (that is, on the intrinsic goodness of its premises and conclusions or on their correspondence with social beliefs and attitudes).
- Impersonality vs personality. Logic is impersonal, since its inferences purport to be convincing for every rational being. Legal reasoning is personal, since it has to convince each particular audience, by appealing to the premises and the inferences that would be acceptable to it.
- Monologue vs dialogue. Logic is monological, since its inferences always move from a unique consistent pool of premises. Legal reasoning is dialogical, since it consists in confronting different points of view.
- Objectivity vs evaluation. Logic is objective, since it excludes choices: Either there is a contradiction, so that the whole axiomatic base collapses, or there is consistency, so that no choice is required. Argumentation is subjective (evaluative), since it admits conflicting theses and supports the evaluative choices required to adjudicate between them.
- Positive vs negative reasoning. Logic is a positive form of reasoning, since it supports a conclusion by showing that it is derivable from certain premises. Legal reasoning emphasises negative reasoning, which supports an argument by undermining its competitors.
- Rigidity vs flexibility 1. Logic is rigid, since it does not distinguish between the status of its premises: All axioms are assumed to be true facts, and their conflict determines an insoluble contradiction. Argumentation is flexible, since it admits different types of premises, and in particular it distinguishes facts from presumptions. The latter must be accepted only in so far as there is no evidence to the contrary.
- Rigidity vs flexibility 2. Logic is rigid, since once the premises of a logical inference are accepted as true, all and only their logical implications must also be accepted as true. Legal reasoning is flexible, since it distinguishes multiple ways in which conclusions can be supported by premises, and therefore it allows for different probability degrees of its conclusions.

- Rigidity vs flexibility 3. Logic is rigid, since it finds inferences to be either fully correct or fully incorrect. Legal reasoning is flexible, since arguments may have different degrees of strength.
- Statics vs dynamics. Logic is static, since it is concerned with the eternal relationships between truths. Legal reasoning is dynamic, since it develops in time according to procedural constraints.

The list of oppositions between formal logic and legal reasoning can possibly be further extended and clarified, but our (very open and indeed topical) presentation is maybe sufficient to give a feeling of the dispute that took place in legal theory, especially in the 1960's and 1970's. In this dispute, each party often assumed extreme positions and directed its criticism against the adversary, without much effort to understand the opponent's good points and its own limits.

In the 1970's, the dispute calmed down due to weariness, without reaching a satisfying synthesis. In fact, the "formal" approach—even if extended beyond Aristotelian syllogism (and first-order predicate logic) thanks to the equipment of modal and deontic logics—was incapable of giving a reasonably wide account of legal reasoning. Though legal logic produced valuable analyses of certain contexts, only limited fragments of law texts seemed amenable to a logical formalisation. Moreover the logical application of the law usually required a radical change—with regard to the usual legal practice—both in the formulation of legal knowledge and in the methods of legal inference.

On the other hand, the informal approach—even if extended beyond general rhetorical moves, into specific aspects of legal reasoning—was more successful in pointing to problems than in finding convenient solutions. Its refusal of any formal tools impeded the development of a precise definition of the forms of legal reasoning.

Fortunately, the hostile opposition between logic and argumentation has been largely overcome in the last thirty years, which have seen a fruitful interaction between formal logic and legal reasoning. This started in legal theory, where many scholars have approached legal reasoning adopting an analytical perspective. Some have applied in innovative ways classical and deontic logic to the analysis of legal reasoning,[3] and others have embedded deductive reasoning within broader accounts of legal argumentation.[4] Analytical legal theory has indeed offered a common language for logic and jurisprudence.[5]

[3] See, among the others: Alchourrón and Bulygin 1971; Horovitz 1972; Rödig 1980; Tammelo 1978; Neumann 1984; Golding 2001; Soeteman 1988; Weinberger 1989.

[4] See, among the many volumes which have addressed legal argumentation from an analytical perspective: Taruffo 1975; MacCormick 1978; Tarello 1980; Koch and Rüßman 1982; Neumann 1986; Gianformaggio 1986; Peczenik 1989; Atienza 1991; Wróblewski 1992; Pavčnik 1993; Aarnio 1987; Alexy 1989; Feteris 1999.

[5] There have also been a few attempts to provide an analytical account of the structure of legal norms for the purpose of legislation, rather then for the application of the law. See, for instance: Rödig 1976; Lachmeyer 1977. For a recent account of the relationship between legislation and legal theory, see Wintgens 2002.

More recently, especially in artificial intelligence and law (AI and law), some new logical accounts of legal reasoning have been provided. These accounts preserve the preciseness of deductive logic, but try to further extend the formal analysis of legal reasoning.[6]

These recent results seem to indicate that the conflict between logic and informal accounts of legal reasoning could after all end in a harmonious cooperation.

We hope that the framework we are proposing in this book may contribute to such reconciliation. In the previous pages we have extended our analysis of ratiocination beyond the domain of traditional deductive reasoning, to cover teleological, defeasible, and factor-based reasoning. For each one of these reasoning forms we have identified some basic reasoning patterns. Though there are many important aspects of legal problem-solving that fall outside our analysis—and more generally outside the domain of ratiocination, as we remarked when considering heuresis—the identification of these patterns opens the way to the attempt to provide a formal characterisation of significant aspects of legal reasoning: If these patterns indicate rational ways of reasoning, then their formal characterisation may be called a *logic*, intending by logic the study of the correct forms of reasoning.

We hope to be able to show in the following pages how this kind of extended logical inquiry—an inquiry that goes beyond the boundaries of deductive reasoning—may contribute to the study of legal reasoning. First of all, however, we need to reconstruct briefly the debate on the applicability of logic to the law, to place our attempt in the appropriate context.

14.2. Deduction and Formal Logic in Legal Reasoning

In legal discourse, the words *logical* and *formal* are frequently used in a very loose sense. However, their meaning is somehow related to the ideal of an axiomatic organisation of legal knowledge (Alchourrón 1996, 332), which parallels the implementation of the axiomatic paradigm in mathematics and empirical sciences. As we shall see, both critiques and defences of the use of logic in the law usually refer to a restricted view of logic, that is, to logic viewed as deduction. We shall argue that, instead, a reconciliation between (formal) logic and legal reasoning can only the achieved when the domain of logic (or formal thinking) is extended beyond the domain of deduction.

[6] See, among the published volumes: Gardner 1987; Gordon 1995; Hage 1997; Prakken 1997; Lodder 1999; Branting 2000. Many contributions on logic in the law can be found in the proceedings of the International conference on Artificial intelligence and law (ICAIL), which is held every two years.

14.2.1. The Deductive Model of Legal Reasoning

As it is usually understood, a *logical* approach to the law implies a *deductive* model of legal reasoning. This means that legal reasoning (or at least the justification of legal decisions) should have the following form:

1. the content of a legal decision should be a conclusive consequence of a set of pre-existing factual and normative premises (according to the standards of deductive reasoning), and
2. the normative premises included in this set should be general.

As Alchourrón (1996, 334) observes, this approach to legal reasoning parallels certain theories of empirical sciences, and in particular Carl G. Hempel's model of scientific explanation (Hempel 1966; 1970):

1. the facts to be explained (the *explanandum*) should be the logical consequences of a set of premises (the *explanans*), and
2. the *explanans* should contain general laws, along with specific prior facts.

Besides being supported by this connection with science, the axiomatic model of the law and the deductive model of the application of the law are backed by specific legal values:

- Formal quality. If each case is decided by a deduction from the same set of general rules, cases of the same type will receive the same solution.
- Legal certainty. Citizens, by accessing the law texts and performing deductive inferences, are able to know how the law regulates their behaviour and to foresee the legal effects of their actions.
- Efficiency. When facts can be easily ascertained (and corresponding rules are available), the deductive application of the law is simple and straightforward.
- Testability. It is always possible to check if the deductive procedure has been correctly implemented, and to establish correspondingly whether the ensuing decision is correct.

Different versions of the axiomatic-deductive model of law are possible, according to the origin of the general normative premises. In a legislation-based approach (the approach we called enactment-positivism), all axioms are assumed to be established by the legislator. This view tends to emphasise the principle of the division of powers, by limiting correspondingly the function of the judge to the rigorous application of pre-existing statutory rules. This division of labour may be considered to correspond to a democratic ideal, when the legislature is democratically elected and may be assumed to express the "general will."

In a milder version of positivism, the set of normative axioms may be extended to take into account other sources of the law, such as customs and authoritative *rationes decidendi*.

A further development can be found in the so-called conceptualist approaches to legal science, which assume that legislation (and judge-made law) can be supplemented with conceptual constructions operated by the jurists.

What unifies these approaches—beyond their accent on different legal sources—is the ideal of legal decision-making as a reasoning process rigidly constrained by previously established criteria. This is made clear by Perelman and Olbrechts-Tyteca (1969, 197), in their description of the *logical strategy* of problem solving:

> The first [approach], which may be called logical, is that in which the primary concern is to resolve beforehand all the difficulties and problems which can arise in the most varied situations, which one tries to imagine by applying the rules, laws and norms one is accepting. This is usually the approach of the scientist, who tries to formulate laws which appear to him to govern the area of his study and which, he hopes, will account for all the phenomena which can occur in it. It is also the usual approach of someone who is developing a legal or ethical doctrine and who proposes to resolve, if not all the cases where it applies, at least the greatest possible number of those with which one might be concerned in practice. The person who in the course of his life imitates the theorists we have just referred to is regarded as a logical man, in the sense in which the French are logical and the English are practical. The logical approach assumes that one can clarify sufficiently the ideas one uses, make sufficiently clear the rules one invokes, so that practical problems can be resolved without difficulty by the simple process of deduction. This implies moreover that the unforeseen has been eliminated, that the future has been mastered, that all problems have become technically soluble.

14.2.2. Deduction and Anticipation

From a psychological perspective—moving from our idea that legal rules can be assimilated to (general) instructions, the latter being the content of intentions—Perelman and Olbrechts-Tyteca's (1969) description of the *logical strategy* seems to correspond to what we may call the *anticipatory approach* to problem-solving. According to such an approach, one adopts in advance abstract and general rules and then inflexibly derives one's specific intentions through syllogisms. For instance, assume that I have adopted the following rules:

1. ⌈during all summer, whenever there is a sunny day, I shall go to the sea⌉, and
2. ⌈whenever I receive an e-mail message from my students, I shall immediately reply to it⌉.

Having adopted the first rule will enable me to form the intention of going to the sea today, since it is a sunny summer day (and I am committed to going to the sea on every sunny summer day). Similarly, having adopted the second rule will enable me to form today the intention of answering the mail I have just received today from Mary, one of my students, since she is indeed a student of mine (and I have committed myself to answer students' mails).

When the idea of *logic* is used in this sense, logic is not opposed to rationality, nor to ratiocination, but to a different attitude, which Perelman and Olbrechts-Tyteca (1969, 198) call the *practical approach*:

> Opposed to this approach is that of the *practical man*, who resolves problems only as they arise, who rethinks his concepts and rules in terms of real situations and of the decisions required for action. Contrary to the approach of the theorist, this is the approach of practical men, who do not want to commit themselves more than is necessary, who want to keep as long as possible all the freedom of action that circumstances will permit, who wish to be able to adjust to the unexpected and to future experience. This is the normal attitude of a judge who, knowing that each of his decisions constitutes a precedent, seeks to limit their scope as much as he can, to pronounce his verdicts without giving any more reasons than are necessary as a basis for his decision, without extending his interpretative formulas to situations whose complexity may escape him.

This "practical approach" may be more exactly (and less ambiguously) described as a *responsive approach*, that is, as the approach of a reasoner that prefers to respond to each specific issue at the time when a solution is required, rather than pre-establishing general solutions (common to certain kinds of future issues). The responsive approach may reflect two quite different strategies:

- The *reactive approach*. This consists in eliciting one's intuitive reaction, which, though unconscious, may result from the working of very complex information-processing ways, taking into account the combinations of natural instincts, conditioned learning, and explicit knowledge.
- The *teleological approach*. This consists, as we know from Section 1.3.2 on page 18, in identifying a satisfactory course of action to realise one's goals in the current circumstances.

There is no necessary conflict between logic and rationality on the one hand, and responsiveness of the other hand. Logic and rationality can also be used by a *responsive reasoner*:

- Rationality itself requires that one does not commit oneself to general instructions, when one does not have the information that is required for framing reliable rules of behaviour.
- Rationality itself should recognise the cognitive significance of intuitive reactions (see Section 1.5.3 on page 44).
- Logic is not limited to rule-based syllogisms, but it also includes teleological reasoning[7] and preferential reasoning. Also the process of weighing the factors in a particular case, at the time of its decision, can be subject to logical analysis, to a certain extent (see Section 8.1 on page 221 and Chapter 28).

[7] Teleological rationality and teleological inference correspond indeed to what Weber (1947, sec. 1.1, page 115, and n. 38) calls "rational orientation to a system of discrete individual ends" (*Zweckrationalität*), and to the end-means analysis which is the typical domain of decision theory.

However, for an agent who has adopted an anticipatory style of decision-making, logical reasoning in the specific sense of deductive or conclusive reasoning has a special importance. For such an agent, logical syllogism would be a sufficient guide for a large number of specific decisions, which would reached by applying endorsed general rules to the specific facts of the case. Other forms of reasoning (adoption of goals, teleological reasoning, factor-based reasoning) would be generally confined to the adoption of such general rule.

Much could be said about the comparative advantages and disadvantages of the logical (anticipatory) attitude and of the practical (responsive) attitude.[8]

Let us just remark that the anticipatory style of decision, when adopted in a collective enterprise may also express a division of labour: Some agents (individuals, bodies, and institutions) are charged with defining general rules of actions, and others with applying these rules to specific cases at hand. In this arrangement, choices on what goals to pursue and on how to pursue them are moved higher up in the organisational structure, being entrusted to the rule-definers, while practical reasoning at the lower level is limited to syllogism. This division of labour may improve the use of cognitive resources within the organisation: It ensures that issues common to many decisions, by different decision-makers, are treated just once (when the general rules are adopted) with better competence and higher cognitive investment.

Also in regard to organisations, however, there is no necessary connection between rationality and anticipation. In many circumstances, it is rational for an organisation—in the sense of functional to its operations—to defer teleological choices to the particular agents which deal with specific cases. This happens, in particular, when the following conditions hold: (*a*) many different possible circumstances exist in which different actions are opportune; (*b*) a decision-maker well-acquainted with those circumstances is usually able of making a sufficiently good choice (see Section 5.1.1 on page 146), and (*c*) generating precise general expectations is not the overriding concern. As an example, consider the issue of deciding arrangements on child custody in divorce cases.

14.2.3. The Tension between Legal Logic and Legal Practice

Since the "logical" (but better "anticipatory") ideal is susceptible of being fulfilled to different degrees, the attribute "logical" is normally used in legal contexts as a (muddled and) scalar notion. Possibly we are not very far from the truth if we say that a way of dealing with legal problems is called "logical" by lawyers, in so far as:

- the relevant legal conclusions are inferred from a set of pre-defined premises;

[8] For various considerations on the merits of rule following in legal decision-making, see Jori 1980, 7ff., and Schauer 1991. For a thorough and balanced discussion of the comparative merits of rules and analogies, see Sunstein 1996b, in particular, 244ff.

- inference is deductive (non-ampliative) with regard to those premises;
- the premises can be easily and univocally ascertained;
- the premises have a high degree of generality;
- the premises are consistent.

Correspondingly, lawyers tend to describe as "logical" or "formalistic" not only the activity consisting in inferring (deductively) the solutions to the case at hand from pre-existing premises, but also the activity consisting in pre-defining a set of premises in order to pre-determine future decisional activity. Therefore, legislators are "logical" (in the sense of "anticipatory") in so far as they try to establish a coherent detailed regulation of a wide legal domain, judges are "logical" in so far as they justify their decisions through consistent and wide-scoped *rationes decidendi*, and legal academics are logical in so far as they tend to provide a set of systematic general notions.

In fact, the tension between logic (theory) and practice (experience) which frequently emerges in various legal cultures mostly concerns the degree of generality of legal conceptions (Twining and Miers 1991, 259), and this is linked to how much different kinds of lawyers rely on anticipatory thinking. "Logicians" (usually academics) tend to consider general problems and to treat them with abstract conceptual constructions, intended to be consistently used in different legal domains. "Practitioners" (lawyers and judges) tend to focus on individual cases, to use more specific notions and to emphasise the defeasibility of conceptual constructions. Therefore, the alleged "inconsistency" of legal practice does not necessarily imply speaking nonsense. It may just consist in the tendency to differentiate the meaning of the same expression in different contexts and in admitting that general qualifications may be overridden by specific features of the particular cases at hand.

In any case, it should be clear that this supposed conflict, or inconsistency between "logic" and practice does not directly concern logic intended as the formal analysis of thought, or even ratiocination viewed as a thought procedure: It rather concerns the opposition between anticipatory and reactive approaches to legal decision making. The connection with logic in the strict sense (deduction) only consists in the fact an anticipatory attitude facilitates the use of some basic patterns of deductive reasoning (deductive syllogism).

14.2.4. The Anti-Deductive Critiques

We can possibly distinguish two basic critiques of the deductive model of legal reasoning, which are usually mixed in the anti-formalistic contentions that "the life of the law has not been logic, it has been experience" (Holmes 1881, 1).

The first critique raises, at least *prima facie*, a factual question. It asserts that in the legal domain the preconditions of deductive problem-solving do not

hold: Legal knowledge does not satisfy the conditions required for the solutions to legal problems to be derived from pre-determined rules. When facing a legal problem often we do not have enough rules (our rule-set is incomplete), or we have too many rules (our rule-set is inconsistent), or we have to address indeterminacy (we are uncertain about the content of the relevant rules in our rule-set).

Under this perspective, the deductive model of legal decision making is no real legal methodology (which should suggest what to do in cases of incompleteness, inconsistency, ambiguity, indeterminacy), it is rather a deceptive ideology, which offers a cloak of objectivity and legitimacy for hidden legal policies: The stereotypically "logical" lawyer claims that his or her decision is "deduced" from the legal system, and possibly also refers to certain rules extracted from certain pieces of text, but he or she does not say why those texts were interpreted in such a way as to obtain those rules, why other texts were not taken into consideration, what factors were (or were not) considered, what goals were (were not) promoted, and so on. To cite again Judge Holmes:

> behind the logical form lies a judgement as to the relative worth and importance of competing legislative grounds, often an inarticulate and unconscious judgement, it is true, and yet the very root and nerve of the whole proceedings. (Holmes 1897, 466)

The second critique instead raises a value question. It affirms that the logical approach is inadequate in the legal domain, even when its preconditions hold, to wit, when pre-established standards, sufficient for deriving a legal conclusion for the case at hand, are available. This critique considers that in any real problem-situation the consequences resulting from the (blind or mechanical) application of pre-established rules may turn out to be "iniquitous, inopportune, voidable, unreasonable, that is, unacceptable for one reason or another" (Perelman 1990, 650). According to this view, dealing with concrete cases by means of general pre-established standards only supports some legal values and in particular the ideals of certainty and formal equality, at the disadvantage of other values, which should also inform the application of the law, such as justice and equity.

Both critiques inspired the revival of the old tradition of rhetoric or argumentation: Many authors were indeed united by the attempt to build a non-deductive account of legal reasoning, by rediscovering and developing that tradition.

For example, we can recall the well-known contention of Viehweg (1965), that legal reasoning is topical (rather than logical): It approaches specific problem situations by referring to an open, unordered, inconsistent, undetermined list of *topoi* (points of view, usually expressed in maxims), which address the relevant features of the different situations, rather than by referring to a complete and consistent system of universal axioms (we have shortly addressed legal

topoi in Section 11.1.3 on page 308).[9] The choice among alternative *topoi* is not abstractly determined, but it depends on the features of the individual cases. This contention emphasises that the law does not always provide a determinate solution to a legal problem, but often only presents alternative *prima facie* answers, from which a choice is required. Such an indication may be unsatisfying for those who strive for absolute certainty, but nevertheless it offers some help to the concerned decision maker, by individuating some relevant aspects of the case, and indicating some candidate options for a reasoned choice.

Secondly, we can mention Perelman's contention that legal reasoning is dialectical rather than analytical. It concerns choices and decisions in the domain of uncertainty (probability), that is:

> the means of persuading and convincing through discourse, of criticising the theses of the adversary and of defending and justifying one's own theses, with the help of more or less strong arguments. (Perelman 1979, 2)

According to this contention, most legal inferences are not binding deductions, but rather defeasible arguments whose conflicts must be dialectically adjudicated. Moreover, not all premises of those arguments are made explicit, since explicit assumptions gain their meaning only in the context of the presuppositions and of the presumptions which characterise a certain social context (Perelman 1990, 644).

Thirdly, we can mention the contention of Toulmin (1958), that legal reasoning deals with substantial (ampliative), rather than with analytical (deductive) inference: It introduces new information, not included in the input data. Such reasoning cannot be modelled as a deduction, since it combines different types of elements, each playing a specific logical role:

- the claim, i.e., the statement which is put forward (for example, "Harry is a British subject");
- the data, i.e., the information which supports the claim (Harry was born in Bermuda);
- the warrant, i.e., the rule which allows one to derive the claim from the data (a man born in Bermuda will generally be a British subject);
- the backing, i.e., the information which supports the warrant (The following statutes and legal provisions . . .).

According to Toulmin, the specific logical role of each one of these elements would not be captured by modelling legal reasoning according to deductive

[9] For a discussion of legal *topoi*, see Struck 1971, whose list of *topoi* is also discussed in Perelman 1979, 86ff. Various legal *topoi* can be traced back to the *regulae juris* of Roman law (*The Digest of Justinian*, L), though some *regulae juris* are unacceptable to modern sensibility, and some famous legal maxims have a more recent origin (on *regulae juris*, see Stein 1966).

logic, namely, as the deduction of a conclusion from a set of undifferentiated axioms.

Toulmin also stresses the dialectical procedures in which arguments are constructed. When approaching a legal issue, we do not need to state from the start all relevant premises, but information is to be provided only if needed: A piece of data must be provided only if a claim is challenged; a warrant, only if the challenge concerns the inference of the claim from the data; a backing, only if the challenge moves to the warrant; a rebuttal, only when an argument has to be contested.

14.2.5. Defences of the Axiomatic-Deductive Model

The supporters of the application of the axiomatic-deductive model have responded to the above-mentioned critiques in various ways.

A first response claims that this model is not intended as a description of real legal praxis, but only as an ideal that can be satisfied to different degrees by historical legal systems (Alchourrón 1996, 339).

A second response separates the use of the axiomatic-deductive model from the hypothesis that legal decisions can be determined by pre-existing general rules. What is important, according to this view (see Rödig 1980), is that each individual decision is deduced from a set of premises presented by the judge as a justification for that decision, whatever be the source of this axiomatic base. This would allow legal decisions to be evaluated with reference to their premises, even if the premises are not extracted from pre-existing sources.

A third response consists in delimiting the role of logic on the basis of two distinctions: The distinction between the *context of discovery* and the *context of justification*, on the one hand, and the distinction between the *internal justification* and the *external justification* on the other hand:

- According to the first distinction, legal reasoning involves two separate phases: (*a*) the thought process through which the legal decision-maker conjectures a legal solution (discovery), and (*b*) the subsequently provided explanation of that conclusion (justification).
- According to the second distinction, the justification of legal decisions involves two levels: (*a*) the derivation of the decision from general legal rules (the internal justification), and (*b*) the derivation of these premises from further assumptions (the external justification).

When the legal system is conceived as composed of all legally valid (binding) normative propositions, this second distinction can be supplemented by assigning different methods of reasoning to internal and external justification: Internal (legal) justification is reduced to deduction while external justification is the empire of informal or argumentative justification. Therefore, the role of logic is first

limited to the context of justification, and then is further restricted to the internal justification: Deduction from a consistent set of legal premises is the only task for formal logic in regard to legal reasoning.

It is quite dubious whether any of the three responses just presented succeeds in matching the anti-deductive critiques.

Firstly, it is true that a deductive reconstruction of legal reasoning represents a normative model, rather than a mere description of legal practice. Nevertheless, deduction does not cover essential features of actual legal reasoning (as the theorists of informal logic pointed out), like the ability of dialectically addressing the opposition of conflicting conclusions, alternative interpretations, and competing principles. To eliminate this dimension (in favour of deduction from a set of consistent premises) would require a radical departure from current legal usage, while a normative model can be effective only if it is not too far from the existing practice. Moreover, it is debatable whether this departure would be axiologically acceptable, considering that the legal system is committed to balancing the values of predictability and justice of legal decision-making (Peczenik 1989, 31ff.).

Secondly, the neutral version of deductivism seems to have a limited value: reducing one thesis (the judicial decision) to another set of theses (the axioms from which it is deduced). It makes sense to justify a legal decision as following from a certain normative premises only when these premises are legally binding, because they were expressed through authoritative statements (of legislators or judges), or because they are customarily endorsed and practised, or because their content deserves legal recognition (as for fundamental legal principles, like those concerning human rights), or because they can be supported by other legal contents, according to the processes of rational cognition, like teleological reasoning or rationalisation (we considered the issue of legal bindingness in Chapters 12 and 13 and we shall address the notion of a legal source in Chapter 25). Unfortunately, since legal authorities, customs and principles can be conflicting, debatable, defeasible, it may be doubted that straightforward deduction is the right way of dealing with them.

Thirdly, limiting logic to internal deductive justification has the effect of pushing all most significant aspects of legal reasoning outside the competence of logic, in the undetermined domain of second order justification. So, it is no surprise that even the most radical adversaries of formal legal reasoning could agree with this approach, which allows to separate formal logic (having a negligible role) from the theory of informal legal argumentation. In such a perspective, the theory of legal argumentation—rather then formal logic—becomes the only significant methodology of legal reasoning. Thus it becomes the only referent of the expression *legal logic*, used in a wide sense as denoting the (real) technique for legal reasoning:

There is nothing wrong, ultimately, in presenting judicial reasoning in the form of a syllogism, but

this form gives no guarantee of the value of the conclusion. If this is socially unacceptable, it means that the premises have been accepted lightly. Now, let us not forget that the whole of judicial debate and the whole of legal logic only concern the choice of the premises which would be better justified and which would raise the fewest objections. It is the role of formal logic to make the conclusion cohere with the premises, but it is that of legal logic to show the acceptability of the premises. This results from the confrontation of pieces of evidence, of arguments and values which are opposed in the litigation; the judge must arbitrate in order to take a decision and to justify his/her judgement. (Perelman 1979, 176; my translation)

14.2.6. Legal Logic Beyond Deduction

In the following we shall try to sketch a possible reply to Perelman. Our main contention will be that, even if deduction cannot provide a satisfactory structural analysis of legal reasoning, other formal tools can be applied to the various aspects of legal cognition we described in Part I. We will do that by introducing such tools, exemplifying their application, and hopefully convincing the reader of their potential usefulness.

Thus, the next chapters will provide a formal analysis of the structures of legal knowledge and of the forms of legal reasoning we informally introduced in Part I of this volume.

Our discussion will be inspired by the idea that logical forms are embedded into common-sense ways of reasoning. Logical analysis, rather than an alternative to natural reasoning, is a technique for studying and refining it. As Russell (1914, 44) puts it:

> Some kind of knowledge of logical forms, though with most people it is not explicit, is involved in all understanding of discourse. It is the business of philosophical logic to extract this knowledge from its concrete integuments, and to render it explicit and pure.

According to Russell's idea, we shall adopt the following strategy.

First we shall provide a discursive introduction to the legal concepts we are studying and we shall exemplify the various ways in which they are usually expressed.

Secondly, we shall try to provide an informal canonical definition of them (using the linguistic formulas we deem to be more appropriate).

Thirdly, we shall provide an elementary formal reconstruction. In doing that, we shall use *formal logic*, to which we refer by using the expression "logic" *tout court*.

We will not supply a complete logical characterisation, in order to preserve simplicity and readability. In fact, we only aim at specifying the logical properties that legal notions need to possess, in order to play their role in legal reasoning. This characterisation may be compatible with different full formalisations and different formal semantics.

Our formal results will generally be consistent with the ideas we informally introduced in Part I. However, when our logical formalism allows us to provide a better characterisation of concepts we have already introduced, we shall not refrain from redefining these concepts.

In the following, unless otherwise specified, we shall always refer do the doxified version of legal reasoning. In fact an advantage of doxification, as we said above, is to allow one to use the methods that are available for epistemic reasoning also within practical reasoning. This opportunity has indeed been frequently exploited by legal logicians, who have applied in the legal domain methods originally developed for epistemic reasoning.

Chapter 15

CLASSICAL LOGIC AND THE LAW

Under the heading "classical logic and the law," we shall consider the application to the law of the fundamental core of logic, namely *first-order classical logic*. This is the most well-known and widely-used logical formalism. It has represented for more than a century the gravity centre of logic.[1] Though various alternatives and innumerable extensions to classical logic have been proposed, none has yet succeeded in questioning its domination. Thus, it is no surprise that many attempts to apply formal methods to the law have been centred upon using first-order classical logic.

In the following we shall consider some such attempts: First we shall examine propositional logic, then we shall move to predicate logic, and finally we shall focus on the representation of time.[2]

15.1. Propositional Logic

Propositional logic constitutes the undisputed foundation of logic, also in the legal domain. Any further levels of logic, though providing for higher levels of expressivity (and complexity), are still based upon the basic constructs provided by propositional logic.

Therefore, we cannot refrain from a simple introduction to propositional logic, which will provide us with the basic ideas for any deeper logical analysis, and with the building blocks for any higher logical construction.

[1] First-order classical logic was established by mathematicians such as George Boole, Gottlob Frege, and Bertrand Russell, between the end of the 19th century and the beginning of the 20th, though the first textbook which included the whole of first order logic and distinguished it from other logical formalisms was probably Hilbert and Ackermann 1927. The power and the limitations of this formalism were properly circumscribed in the first half of the 20th century, by the work of other great mathematicians, such as Alfred Tarski and Kurt Gödel.

[2] We cannot here examine in any detail classical logic. For an introduction, we refer the reader to any of the many good handbooks that are available on this subject. Two traditional references are Copi 1961, for a very basic account, and Mendelson 1990, for a more in-depth analysis. For a deeper and more problematic presentation of first-order classical logic, cf. Gabbay and Günthner 1983 and, in particular, Hodges 1983. On alternatives to classical logic, like intuitionistic logic, see Gabbay and Günthner 1986. For a recent basic introduction to logic, cf., for instance, Sainsbury 2001.

15.1.1. Propositional Formalisation

When we analyse knowledge by using propositional logic, we need to stop at the level of *atomic propositions* (propositions that cannot be decomposed in a combination of smaller propositions). In fact, in propositional logic, each atomic proposition needs to be represented by a separate propositional constant, namely, a syntactic object that cannot be further analysed, whose content does not matter to representation and inference through propositional logic.

To exemplify the limitations of propositional logic, let us assume that legislation concerning Italian nationality includes the following rule, which expresses the idea of the so-called *jus soli*:[3]

1. if [one is born in Italy][4] then [one is an Italian citizen]

Let us then represent as follows some specific propositions in this domain:

2. [John is born in Italy]
3. [John is an Italian citizen]

In propositional logic there is no connection between propositions (1), (2), and (3). In particular, it is not possible to infer proposition (3) from propositions (1) and (2): From the point of view of propositional logic, those are different propositions, and there are no structural connections between them.

This becomes clearer if we represent every proposition with a label (using the same label when the proposition is exactly the same):

a: [one was born in Italy]
b: [one is an Italian citizen]
c: [John was born in Italy]
d: [John is an Italian citizen]

By expressing propositions with labels we get the following representation:

1. if a then b
2. c
3. d

This shows how in propositional logic we cannot express the obvious connection between propositions (1), (2), and (3), that is, we cannot formally express normative syllogisms like the following:

[3] The *law of the soil*, namely, the legal principle that one's nationality is determined by that one's place of birth.

[4] We use the square brackets "[" and "]", as delimiters for textual clauses (while we keep using "⌈" and "⌉" to denote the proposition expressed by the included text).

Reasoning instance: *Syllogism*

(1) if one was born in Italy then one is an Italian citizen;
(2) John was born in Italy
———— IS A REASON FOR
(3) John is an Italian citizen

To formally express such inferences, we have to move to the level of predicate logic. This, however, is not the only difficulty we find in modelling legal reasoning through classical logic, as we shall see in the following paragraphs.

15.1.2. Propositional Connectives

Knowledge represented in propositional logic consists of two elements:

1. atomic propositions, each atomic proposition being represented by a different atomic symbol, that is, by a different propositional constant, and
2. propositional connectives.

Propositional connectives specify relationships between propositions, with the help of parentheses that delimit the scope of the connectives. In this way we express the *propositional structure* of knowledge, to wit, the formal structure that supports the inferences of propositional logic.

For representing such structure in a rigorous way, but using a language that can be understood also by a reader untrained in logics, we shall borrow some ideas advanced by Allen (1957; 1979; 1982), in the framework of his *normalisation* technique.

Normalisation is a method for representing legal information in such a way as to eliminate syntactic ambiguities. Its main aspect consists in substituting logical connectives to ambiguous connectors of natural language (like "and," "or," "if ... then," "unless," and so on):

- Logical connectives are expressed by using the wording of the corresponding expressions in natural language. Their logical meaning is signalled though an appropriate typographical style, such as capsizing. For instance, the logical conjunction, which corresponds to "and" in natural language, can be expressed as "AND."
- The scope of logical connectives is precisely delimited by using parentheses or indentation.

Let us introduce the most frequently used logical connectives. As usual, we characterises logical connectives through their *truth conditions*, that is, by specifying when a proposition containing such connectives is true.

Negation

NON represents negation: Proposition ⌈NON A⌉ is true iff[5] proposition A is false. For example:

NON [Tony stole John's bicycle]

is a proposition which is true iff proposition [Tony stole John's bicycle] is false, i.e., if Tony did not steal John's bicycle.

Note that in natural language negation goes inside the sentence to which it applies, which is not the case in usual logical language. This corresponds to a general feature of logical syntax: It is *compositional*, in the sense that it allows to build larger units by combining smaller units, without modifying the latter (the context where a certain syntactic structure appears does not modify its form).

This contributes to making logical syntax much simpler than the syntax of natural language, more precise and easier to control. On the other hand, this leads to awkward and redundant expressions. More generally, logical formalism tends to be more rigid than natural language, but it often enables us to achieve more clarity and sometimes it facilitates the expression of ideas that it would be very difficult to articulate in natural language.

Conjunction

The symbol AND represents conjunction: Proposition ⌈A AND B⌉ is true iff both A and B are true. For instance:

[Tony stole John's bicycle] AND [Tony sold John's bicycle to Laura]

is true if both [Tony stole John's bicycle] and [Tony sold John's bicycle to Laura] are true, i.e., if Tony both stole and sold John's bicycle.

Disjunction

The symbol OR represents disjunction: Proposition ⌈A OR B⌉ is true iff either A or B, or both of them, are true. For instance:

[Tony stole John's bicycle] OR [Tony sold John's bicycle]

is true in any of the following three cases: (1) Tony stole John's bicycle though he did not sell it; (2) Tony sold John's bicycle, though he did not steal it; (3) Tony both stole and sold the bicycle.

[5] We write *iff* to abbreviate *if and only if*.

Material Conditional

The symbol IF ... THEN^m represents material conditional, also called material implication (we use, here and in the following, superscripts to distinguish different types of conditionals). Proposition ⌈IF A THEN^m B ⌉ is true iff (1) A is false or (2) B is true. This also includes the case where both A is false and B is true, so that we can also say that, IF A THEN^m B is false only when A is true and B is false. For instance:

> IF [Tony stole Mary's bicycle]
> THEN^m [Tony must return Mary her bicycle]

is a proposition which is true if any of the following two conditions is satisfied: (*a*) Tony did not steal Mary's bicycle or (*b*) Tony must return it. This explanation of the meaning of the material conditional clarifies how material conditional is equivalent to a disjunction:

> IF A THEN^m B = (NON A) OR B

Thus, in principle we could avoid using material conditionals altogether, and substitute them with disjunctions.

15.1.3. Normalisation

The use of propositional logic for representing legal texts has been advocated by Allen (1957; 1979). This author has argued that the syntax of propositional logic would enable legal drafters to avoid unintended syntactical ambiguities, and so prevent litigation. As an example of avoidable litigation Allen (1982, 386ff) discusses the case *Brekken vs Reader's Digest Special Products Inc.* (US 7th-Circuit, 1965). It concerned the interpretation of the following contractual clause:[6]

> [a: this agreement shall be effective from the date of execution] and [b: this agreement shall remain in effect for a period of twelve months] and [c: this agreement will be automatically renewed for twelve-month terms] unless [d: this agreement is sooner terminated]

Brekken, who had been dismissed within the first year of employment, argued that early termination only concerned renewal after the first year, while Reader's Digest argued that it also concerned continuation of work during the first year. In other words (reading "unless" as IF NON), Brekken interpreted the clause as:

[6] Following Allen's example, we use *labels* as names for atomic clauses.

1. [a: this agreement shall be effective from the date of execution] AND
2. [b: this agreement shall remain in effect for a period of twelve months] AND
3. A. IF NON [d: this agreement is sooner terminated]
   B. THEN [c: this agreement will be automatically renewed for twelve-month terms]

Table 15.1: *Brekken's reading of the contract clause*

1. [a: this agreement shall be effective from the date of execution] AND
2. A. IF NON [d: this agreement is sooner terminated]
   B. THEN
      i. [b: this agreement shall remain in effect for a period of twelve months AND]
      ii. [c: this agreement will be automatically renewed for twelve-month terms]

Table 15.2: *Readers Digest's reading of the contract clause*

a AND b AND (IF NON d THEN c)

Using the full text of the propositions in the clause, this becomes the normalised statement in Table 15.1.

Reader's Digest understood the contractual clause in a different way:

a AND (IF NON d THEN (b AND c))

Using the full text of the propositions in the clause, this becomes the rule in Table 15.1.

The judges chose the second interpretation, so that Reader's Digest won the case.

Allen's contention is that, if the contract had been written using normalisation, and so unambiguously specifying its propositional structure, the litigation could have been prevented, whatever content the parties decided to give to their contract.

As another example of avoidable ambiguity, we consider Art. 615 *ter* of the Italian criminal code, concerning unauthorised access to a computer system. The text of this provision reads as follows:

Whoever enters a computer or telecommunication system which is protected by security measures or remains in such a system against the will of the person who is entitled to exclude him, shall be punished with detention up to three years.

1.	IF	A.	i.	[a: the individual abusively enters the computer or telecommunication system (named cts)] AND
			ii.	[b: the cts is protected by security measures] OR
		B.	i.	[c: the individual remains in the cts] AND
			ii.	[d: there is the contrary will of the person who is entitled to exclude the individual]
2.	THEN	[e: the individual is punished with detention up to three years]		

Table 15.3: *First interpretation of art. 615*

There have been many discussions as to whether the two elements forming the antecedent condition of this rule—the protection by security measures and the contrary will of the person in charge of the system—are both required for the commission of the crime, or are alternatively required, or whether the first element is required when entering and the second when remaining in the system.

This issue includes two aspects. One aspect concerns identifying what is meant by "such a system": Does this only refer in general to a computer or telecommunication system, or more specifically to a computer or telecommunication system protected with security measures? The other aspect concerns establishing the scope of "against the will of the person who is entitled to exclude him": Does this apply only to the last clause (remaining in the system) or does it refer the whole disjunction (entering or remaining)?

Let us try to disambiguate Art. 615, by using Allen's methodology. First we need to extract from the text the atomic propositions. Assume that we obtain the following result:

> If [a: the individual enters the computer or telecommunication system (named cts)] and [b: the cts is protected by security measures], or [c: the individual remains in the cts] and [d: there is the contrary will of the person who is entitled to exclude the individual], then [e: the individual shall be punished with detention up to three years]

We can represent as follows the different interpretations of Art. 615 we identified above (which you can see in Tables 15.3, 15.4, and 15.5):

1. IF $\{(a \text{ AND } b) \text{ OR } (c \text{ AND } d)\}$ THEN e
2. IF $\{(a \text{ OR } c) \text{ AND } (b \text{ AND } d)\}$ THEN e
3. IF $\{(a \text{ OR } c) \text{ AND } (b \text{ OR } d)\}$ THEN e

There can be arguments in favour of each one of these three interpretations of art. 615. As a matter of fact, it seems that Italian judges are inclined to adopt interpretation 3 (though there have been different decisions) or rather

1.	IF	A.	i.	[a: the individual abusively enters the computer or telecommunication system (named cts)] OR
			ii.	[c: the individual remains in the cts] AND
		B.	i.	[b: the cts is protected by security measures] AND
			ii.	[d: there is the contrary will of the person who is entitled to exclude the individual]
2.	THEN	[e: the individual is punished with detention up to three years]		

Table 15.4: *Second interpretation of art. 615*

1.	IF	A.	i.	[a: the individual abusively enters the computer or telecommunication system (named cts)] OR
			ii.	[c: the individual remains in the cts] AND
		B.	i.	[b: the cts is protected by security measures] OR
			ii.	[d: there is the contrary will of the person who is entitled to exclude the individual]
2.	THEN	[e: the individual is punished with detention up to three years]		

Table 15.5: *Third interpretation of art. 615*

they tend to view the contrary will of the owner of the system as the decisive element (while security measures are only a clue for presuming such will). So their reading seems to correspond to the following combination of rules:

a. IF $\{(a$ OR $c)$ AND $d\}$ THEN e
b. IF b THEN it is presumed that d

Using normalisation rules (*a*) and (*b*) are expressed in the text in Table 15.6 on the next page.

There have been some attempts to use normalisation in legislation and in contracts (see, for instance, Gray 1985), but in general Allen's proposal has not been practically successful. Lawyers' ignorance of logic can provide a partial explanation, but, as our examples suggest, there are further reasons.

Firstly, propositional logic forces the representation of legal knowledge into too straight a jacket, leading to formulations that are awkward and difficult to grasp. Secondly, only a very small fragment of legal knowledge is captured by the logical structures of propositional logic.

These difficulties do not exclude that logical connectives can be used in legal drafting. For this purpose, Allen proposes some typographic conventions (like indenting and labelling) for embedding logical forms in legal texts, while preserving their readability. In the following we shall use some of his suggestions.

First rule

1. IF A. i. [a: the individual abusively enters the computer or telecommunication system (named cts)] OR
   ii. [c: the individual remains in the cts] AND
   B. [d: there is the contrary will of the person who is entitled to exclude the individual]
2. THEN [e: the individual is punished with detention up to three years]

Second rule

1. IF [b: the cts is protected by security measures]
2. THEN [d: it is presumed that there is the contrary will of the person who is entitled to exclude the individual]

Table 15.6: *Fourth interpretation of art. 615*

15.1.4. Inference Rules for Propositional Logic

We shall not provide here an in-depth analysis of the inferential machinery of propositional logic. Let us just introduce the basic rules for reasoning with propositional connectives. Both the preconditions and the postconditions of these rules concern beliefs, and therefore, we shall refrain from explicitly expressing mental attitudes, i.e., we shall present our schemata as concerning propositions. Let us see inference rules for AND, NON, OR and IF ... THEN^m.

The first inference rule, concerning the introduction of connection AND is quite obvious: When we believe two propositions, we may also believe their conjunction.[7]

Reasoning schema: AND *introduction*

(1) A;
(2) B
——— IS A CONCLUSIVE REASON FOR
(3) A AND B

[7] When representing reasoning schemata whose reason including multiple subreasons, we have so far used an AND connective between the last two of these subreasons, to indicate that all subreasons are to be viewed as conjunctive components of the reason of the schema, rather than as independent grounds for deriving the schema's conclusion. From now on, to avoid confusion between the AND used within subreasons (to specify conjunction in propositional logic) and the AND used between subreasons, we shall avoid indicating the latter. However, our understanding of the relation between the subreasons of a schema remains unchanged.

Here is an instance of this reasoning pattern:

Reasoning instance: AND *introduction*

(1) [Tony stole John's bicycle];
(2) [Tony sold John's bicycle to Mary]
——— IS A CONCLUSIVE REASON FOR
(3) [Tony stole John's bicycle] AND [Tony sold John's bicycle to Mary]

Also the rule for the elimination of the conjunction is quite uncontroversial. From the belief that one conjunction is true one should be able to move into the belief that each conjunct is true.

Reasoning schema: AND *elimination (1)*

(1) A AND B
——— IS A CONCLUSIVE REASON FOR
(2) A

Similarly

Reasoning schema: AND *elimination (2)*

(1) A AND B
——— IS A CONCLUSIVE REASON FOR
(2) B

Here is an instance of this reasoning pattern:

Reasoning instance: AND *elimination*

(1) [Tony stole John's bicycle] AND [Tony sold John's bicycle to Mary]
——— IS A CONCLUSIVE REASON FOR
(2) [Tony stole John's bicycle]

Let us now consider the introduction of disjunction: When we believe a proposition we may also believe its disjunction with any arbitrary proposition.

Reasoning schema: OR *introduction*

(1) A
——— IS A CONCLUSIVE REASON FOR
(2) A OR B

Here is an instance of this reasoning pattern:

Reasoning instance: OR *introduction*

(1) [Tony stole John's bicycle]
——— IS A CONCLUSIVE REASON FOR
(2) [Tony stole John's bicycle] OR [The sun was shining]

The disjunction rule can leave the reader quite perplexed. It is obviously correct, since a stronger belief implies a weaker one, but it seems quite silly to reason this way: There is a loss of information since the premise is more meaningful than the conclusion. However, this kind of reasoning is quite common in the legal domain. In fact, legal rules frequently have a disjunctive antecedent: They make a certain legal effect depend upon a disjunction of conditions. In such a case one's knowledge that a condition is true allows one to infer that the disjunctive rule-antecedent including that condition is satisfied, which leads one to conclude that the rule's effect takes place.

Let us now consider an inference rule concerning negation. This is the familiar rule for eliminating *double negation*.

Reasoning schema: *Double-negation elimination*

(1) NON NON A
——— IS A CONCLUSIVELY REASON FOR
(2) A

This rule needs little explanation: Denying the negation of a proposition amounts to affirming that proposition. Believing that it is not the case that Mary did not steal my bicycle amounts to believing that she stole it.

Reasoning instance: *Double-negation elimination*

(1) NON NON [Mary stole John's bicycle]
——— IS A CONCLUSIVE REASON FOR
(2) [Mary stole John's bicycle]

The inference rule for eliminating disjunction is called OR *elimination* or *unit resolution*: If we know that the disjunction of two propositions is true and we also know that the first proposition is false, we can conclude that the second proposition is true.

Reasoning schema: OR *elimination (1)*

(1) A OR B;
(2) NON A
——— IS A CONCLUSIVE REASON FOR
(3) B

Similarly, if we believe that the second proposition in a disjunction is false, we can endorse the first proposition.

Reasoning schema: OR *elimination (2)*
(1) A OR B;
(2) NON B
——— IS A CONCLUSIVE REASON FOR
(3) A

Here is an instance of OR *elimination*.

Reasoning instance: OR *elimination*
(1) [Tony stole John's bicycle] OR [Mary stole John's bicycle];
(2) NON [Tony stole John's bicycle]
——— IS A CONCLUSIVE REASON FOR
(3) [Mary stole John's bicycle]

The latter rule—remembering that NON NON A is equivalent to A, and that (NON A) OR B can also be expressed as IF A THEN^m B—leads to the schema for the elimination of the conditional, also called *detachment*:

Reasoning schema: *Detachment* (IF ... THEN^m *elimination)*
(1) IF A THEN^m B;
(2) A
——— IS A CONCLUSIVE REASON FOR
(3) B

Here is an instance of this reasoning pattern:

Reasoning instance: *Detachment*
(1) IF [Tony steals John's bicycle] THEN^m [Tony commits a crime];
(2) [Tony steals John's bicycle]
——— IS A CONCLUSIVE REASON FOR
(3) [Tony commits a crime]

The second variant of the OR elimination rule is called *modus tollens* when taking the following form:

Reasoning schema: *Modus tollens*

(1) (NON A) OR B;
(2) NON B
——— IS A CONCLUSIVE REASON FOR
(3) NON A

which, can also be expressed as:

Reasoning schema: *Modus tollens*

(1) IF A THEN^m B;
(2) NON B
——— IS A CONCLUSIVE REASON FOR
(3) NON A

Consider for example the following instance:

Reasoning instance: *Modus tollens*

(1) IF [Tony stole John's bicycle] THEN^m [Tony was in Bologna];
(2) NON [Tony was in Bologna]
——— IS A CONCLUSIVE REASON FOR
(3) NON [Tony stole John's bicycle]

We also have a rule for the introduction of new conditionals, which we can call *transitivity of the conditional*, or *general resolution* (this name is used when conditionals are represented in their disjunctive form).

Reasoning schema: IF ... THEN^m *introduction*

(1) IF A THEN^m B;
(2) IF B THEN^m C
——— IS A CONCLUSIVE REASON FOR
(3) IF A THEN^m C

Here is an instance of this reasoning pattern:

Reasoning instance: IF ... THEN^m *introduction*

(1) IF [Tony steals John's bicycle] THEN^m [Tony commits a crime];
(2) IF [Tony commits a crime] THEN^m [Tony is liable to punishment]
——— IS A CONCLUSIVE REASON FOR
(3) IF [Tony steals John's bicycle] THEN^m [Tony is liable to punishment]

15.2. The Application of Propositional Logic to the Law

Even the simple formalism of propositional logic originates some very difficult problems for legal theory.

First of all, some inferences we can perform according to inference schemata of classical propositional logic appear absurd in the legal domain. This concerns in particular the treatment of conditionals and contradictions (as we shall see in Section 15.2.1 and Section 15.2.2 on the next page).

More generally, it has often been affirmed that it does not make sense to apply the truth-preserving inferences of classical propositional logic to normative propositions, which cannot be true or false (this objection will be considered in Section 15.2.3 on page 420).

15.2.1. Material Conditional and Hypothetical Propositions

One of the most difficult issues in philosophical logic concerns the nature of conditional connections. In particular, we need to consider whether the material conditional, as provided by propositional logic, covers all, or most, senses in which we use the words "if ... then ... " in common and legal language. When we say "if A then B" in a legal context, do we always mean "A is not the case or B is the case"?

Many logicians have answered negatively to this question: While the logical connectives AND, OR, and NON provide good approximations of the meaning of the corresponding expressions (and, or, not) in natural language, material conditional "IF ... THEN^m ..." fails to capture the intuitive meaning of "if ... then ..."

One first source of apparent absurdities is the fact that ⌈IF A THEN^m B⌉ is equivalent to ⌈(NON A) OR B⌉, and thus, for a conditional to be true is sufficient that its antecedent condition is false. For example, the fact that Mary has brown eyes—so that the proposition ⌈Mary has blue eyes⌉ is false—makes it true that:

IF [Mary has blue eyes]
THEN^m [I am obliged to give Mary € 1,000,000,000]

Similarly, the fact that John has not stolen Tony's car, makes it is true that:

IF [John has stolen Tony's car]
THEN^m [John is entitled to keep it]

The source of these problems is the fact that a material conditional cannot express a hypothetical proposition: It cannot express that under the hypothesis A, B would be the case. When endorsing such a hypothetical proposition, one does not take a stand on whether A is the case or not, but one takes a stand on what would be the case if A were to be the case.

Thus, the truth of a hypothetical proposition should be independent from the truth or the falsity of its antecedent. For instance, the fact that Tony has not stolen John's car is no reason for Tony to believe the hypothetical proposition that ⌈if he had stolen the car, then he would be allowed to keep it⌉. Unfortunately, this is exactly what happens by using propositional logic (if one understands the IF ... THEN^m connective of classical logic as a synonym of the "if ... then" of natural language). For example, the proposition:

NON [Tony has stolen John's car]

entails, in classical propositional logic, that:

IF [Tony has stolen John's car]
THEN^m [Tony is allowed to keep John's car]

This shows that the "if ... then ... " connections we can find in natural language (and that we use in normative propositions) do not coincide with the material conditional "IF ... THEN^m ..." To find an appropriate notion of a normative conditional, we shall have to look for additional logical tools, as we shall do in Chapter 20.

Some authors have tried to avoid the problems of material conditionals by using, rather than classical logic, other logical systems, which provide for different types of conditionals. For example, Allen and Saxon (1991) use the *relevance logic* of Anderson and Belnap (1975), a logical system which requires, for a conditional to hold, that the antecedent is relevant to establishing the consequent. Others have been using the idea of a *strict conditional* as provided by modal logic: Strict conditionals express the idea of a necessary connection between their antecedent and their consequent (see, for all, Alchourrón 1991). Neither relevant conditionals nor strict conditionals hold only on the basis of the falsity of their antecedent.

We shall not consider here such attempts, since this will require us to discuss logical technicalities going beyond the scope of this book: Having rejected material conditional, we shall try to establish the minimal requirements that normative conditionals need to satisfy, requirements that are consistent with different logical formalisms (see Chapter 20).

15.2.2. Ex Falso Sequitur Quodlibet *in Legal Reasoning*

In classical propositional logic, we can infer whatever conclusion from a contradiction (from a falsity anything follows, in Latin *Ex Falso Sequitur Quodlibet*). This can be done by combining schema OR *introduction* and schema OR *elimination*.

According to the first schema, any contradiction C (as any other proposition) allows one to infer⌈C OR A⌉, where A is any arbitrary propositions.

According to the second schema, from ⌈C OR A⌉ and NON C (we can assume the latter proposition, since we know that the contradiction is false), we can conclude that A. For instance, assuming that ⌈Mark both is a man and is not a man⌉, we can conclude the following disjunction:

[Mark both is a man and is not a man] OR
[Mark is one thousand years old]

From this, knowing that NON [Mark both is a man and is not a man], we can conclude that:

[Mark is one thousand years old]

As this example shows, in propositional logic contradictions do not remain isolated: They sprawl arbitrary conclusions. On the contrary, in the law we must find ways of keeping contradictions local, and of solving them without getting to further absurdities.

15.2.3. Logical Inference and Truth-Preservation

We conclude our discussion of propositional logic by mentioning an important feature of all inference rules we have just presented. They are *truth-preserving*, to wit, it is impossible that their premises are true and their consequences are false (see Definition 2.2.3 on page 56). This property follows easily from the truth-functional definition of logical connectives we provided above (in Section 15.1.2 on page 407).

This corresponds to the traditional view that logic is limited to truth-preserving reasoning. We have already considered, in Section 2.2.1 on page 56, one significant implication of this view, namely, the idea that only conclusive reasoning can be a proper object of logic. We need now to consider a further implication, the idea that it is useless or even absurd to apply logic to objects that are not susceptible of being true or false.

This has led many legal theorists into an unpleasant quandary, the so-called Jörgensen dilemma (from the name of the Danish legal theorist who discussed it; see Jörgensen 1938). The dilemma consists in the supposed necessity of making the following choice: Either one rejects using logic in the law (and, more generally, in practical reasoning) or one has to admit that legal contents (practical noemata) can be true or false. Said otherwise, it makes sense to apply logic to the law only under the assumption that normative contents can be assigned truth-values.

The dilemma was particularly perplexing for those thinkers that supported the use of logic in the practical domain, but wanted to maintain a clear distinction between epistemic and practical reasoning. Many of these authors agreed on the need to find some ways out of the dilemma, though they expressed different views concerning the matter of normative reasoning: For some norma-

tive reasoning concerned mental attitudes such as desires and wants, for others prescription viewed as the content of speech acts of commanding, for others propositions expressing rules, values rights and obligations.

As an attempt to find a solution to the Jörgensen dilemma which is neutral with regard to the nature of normative premises, we can mention Alchourrón and Martino's (1990) claim that the central notion of logic is the idea of *inference*, rather than the idea of truth. Therefore, according to these authors, we can apply logic—seen as a set of correct inference methods—to normative contents even if such contents cannot have truth-values.

Others, like Tammelo (1978) have affirmed that for applying logic it is sufficient that we assign any binary values—which can be 1 and 0 rather than *true* or *false*—to thought contents, and that we ensure that logical reasoning preserves positive values (leads to positively valued conclusions whenever the premises have positive value), though we can interpret such values in different ways (for instance, as referring to acceptability or legal validity rather than to truth).

We do not need here to discuss this issue any further, since from our perspective the Jörgensen dilemma does not represent a real problem.

First of all, we do not view logic (and rational reasoning) as being limited to truth-preserving reasoning. As a matter of fact, non truth-preserving reasoning plays an important role also in epistemic reasoning, as we have seen when considering defeasible reasoning (see Sections 2.2 on page 55 and 2.2.2 on page 57).

Secondly, we view doxified practical reasoning (once it is properly understood, according to its cognitive function) as a fully acceptable way of approaching practical issues, so that we admit that truth values can be assigned to doxified practical contents, and in particular to practical propositions.

Thirdly, and independently from our second observation, we believe that the most important structures of legal reasoning—such as the connection between the antecedent and the consequent of a rule—cannot be expressed by using truth-preserving classical logic (as we said above, material implication is not the appropriate way of expressing such connections). On the contrary, the most common legal inferences are defeasible, and can only be modelled through ways of reasoning that are not truth-preserving, as we shall see in the following.

15.3. Predicate Logic and the Law

Let us now address *predicate logic*, the logical formalism that is so important, so ubiquitous, so powerful (compared to its relative simplicity) that it constitutes the paradigm of logic, provides the common language of formal sciences, and offers the basis for any further development in logical analysis.

15.3.1. Predicates and Terms

Predicate logic is built on the top of propositional logic, to which it adds the possibility of analysing the formal structure of atomic propositions. Atomic propositions can be looked into only when we take the microscope of predicate logic (to use the well-known metaphor of Frege 1970).

In particular, using predicate logic, we can distinguish the following elements of a sentence: (*a*) *predicates*, which express actions, properties and relationships, and (*b*) *terms*, which indicate the objects to which predicates refer. For instance, in the propositional formula:

Tony steals *Mary's bicycle*

predicate logic allows us to distinguish the predicate:

[1] steals [2]

a predicate having two arguments, indicated by the numbered place-holders, and terms *Tony* and *Mary'sbicycle*. By substituting the terms for the place-holders in the predicate, we obtain a propositional formula (we take the idea of using numbers as place-holders for terms from Quine 1974).

The decision on what is a predicate and what is a term is to be taken according to considerations of opportunity: It depends on what propositional contents one wants to reason about. If the stolen object were fixed (since we were only interesting in establishing someone's liability with regard to the theft of Mary's bicycle), then we could have used the following predicate

[1] steals Mary's bicycle

The use of long predicates is particularly common in building the knowledge base for *logic-based expert systems*, namely, computer systems which can automatically perform logical inferences. In building the knowledge base of such system, one needs to include in a predicate only those parts of the natural language expressions one considers not to be relevant for the automated application one is considering. For example in the seminal application of logic programming to the British Nationality Act of Sergot et al. (1986), which inspired much subsequent work in logic-based legal information systems, predicates were used like the following:

[1] acquires British citizenship on date [2] by sect. [3]

This was appropriate for that application, since the only elements to reason about were: (1) the identity of the person applying for citizenship, (2) the date in which citizenship was to be acquired and (3) the section to be applied. Thus, it was appropriate to include the word "British" within the predicate. On the contrary, it would be necessary to have a separate term for indicating British citizenship if one wanted to reason about the possibility of acquiring the citizenship of different States. We would then have the following predicate:

[1] acquires [2] citizenship on date [3] by sect. [4]

where the placeholder [2] can be substituted with different terms indicating the different nationalities ($British$, $French$, $Italian$ ...).

We need to distinguish two basic kinds of terms in propositional logic: *constants* and *variables*. Constants refer to specific individuals, while variables refer to any object within the domain of discourse. We distinguish terms (both constants and variables) by using *italics*. We denote variables with letters x, y, w, z, and if we need further variables we add subscripts. For instance,

x steals y

is a formula expressing that an undetermined individual, referred to as x, stole an undetermined object, referred to as y.

As the example shows, a formula like this does not express a proposition (an entity which can be truth or false), since we cannot establish whether the formula is true or false until we have established who the individuals involved are. For instance, the formula can be true if x is Tom and y is $Mary$, it is certainly false if x is $Giovanni\ Sartor$ and y is $Prof.\ Peczenik's\ bicycle$ (you can believe me, I never stole Prof. Peczenik's bicycle).

To transform a formula containing variables into a propositional formula we need to substitute individual names for the variables, as in the following example:

Tom steals $Mary's\ bicycle$

15.3.2. Quantifiers

There is a second way to obtain a propositional formula out of an expression containing variables. This consists in using two typical constructs of predicate logic, the universal quantifier FORANY and the existential quantifier FORSOME.

Let us consider first the universal quantifier . For example the very general proposition expressing that any object is a being can be expressed as follows:

FORANY (x) [x is a being]

Obviously, very little can be said in general of all possible objects. More interesting assertions can be obtained by using universal quantification over conditionals. In this case we are able of specifying that all objects which satisfy a certain condition have certain properties:

FORANY (x) (IF [x is human being]
THEN^m [x has human rights])

meaning that everyone who is a human being has human rights.[8]

The existential quantifier FORSOME is used to express the idea that there exists at least one individual that satisfies a certain predicate (or that some individuals satisfy the predicate, where also one counts as some). For example:

FORSOME (x) [x is a parent of Tom]

expresses the idea that there is at least one entity, which is a parent of Tom (Tom has at least one parent). The following proposition:

FORANY (y)
IF [y is a person]
THEN^m FORSOME (x) [x is y's mother]

shows how one can combine the two quantifiers. It is to be read as: ⌈For any entity, if that entity is a person then some other entity is the mother of that person⌉, or more simply, ⌈every person has a mother⌉.

15.3.3. Inference Rules for Predicate Logic

As we did for propositional logic, let us introduce reasoning schemata for predicate logic. We shall only present two schemata, which are most relevant for legal reasoning, and will be used in the following.[9] The first such schema concerns the elimination of the universal quantifier, which we may also call *specification*.

Reasoning schema: FORANY *elimination (specification)*
(1) FORANY (x) $A[x]$
——— IS A CONCLUSIVE REASON FOR
(2) $A[x/a]$

where $A[x]$ is a formula containing variable x, and $A[x/a]$ is the expression which is obtained by substituting every occurrences of term x with term a.[10] Here is an example;

[8] In the following formulas, we drop parentheses when using indentation, assuming that the quantifier's covers all expressions which are indented below the quantifier.

[9] These two schemata do not provide the full power of predicate logic. For an introduction to the whole of predicate logic, we need to refer the reader to any introductory book on logic, like the ones we mentioned in footnote 2 on page 405.

[10] To achieve the right result, we need to substitute only the free occurrences of variable x, namely, those occurrences which do not fall within the scope of other quantifiers. Moreover, we need to assume that the domain of quantification is not empty, namely, that that there is at least one object we can speak about.

(1) FORANY (x)
IF [x is a human being] THEN^m [x has human rights])

---

(2) IF [*Tony* is a human being] THEN^m [*Tony* has human rights]

As this example shows, this inference schema allows one to pass from universal propositions to individual propositions. If a universal proposition holds, then certainly all of its specifications hold as well.

The second schema concerns the introduction of the existential quantifier FORSOME:

Reasoning schema: FORSOME *introduction*
(1) $A[a]$
——— IS A CONCLUSIVE REASON FOR
(2) FORSOME (x) $A[a/x]$

Schema FORSOME introduction says that if a proposition holds for one specific individual, then we may infer than there exists some individual for which it holds.

(1) [*Tony* steals *John's bicycle*]

---

(2) FORSOME (x) [x steals *John's bicycle*]

15.3.4. Normative Syllogism

Predicate logic includes propositional logic, so that inferences of propositional and predicate logic can be joined together. In this way we obtain, in particular, the schema *syllogism*, which we need to consider with a particular attention, since it plays a fundamental role in legal reasoning.

Before analysing syllogism, let us introduce in general the idea of a *combined reasoning schema*. Let us assume the following:

- according to schema (1), A is a reason for B, and
- according to schema (2), $\lceil B$ and $C\rceil$ is a reasons for D.

Whenever these two conditions are satisfied, we can combine schemata (1) and (2) into a new reasoning schema (3), according to which A and C is a reason for D.

The rationale for such a step is obvious. As we can move from A to B, and we can move from [B and C] to D, we can also jump directly from [A and C] to D. The practical justification is also obvious: When one performs such

inferences frequently, it can be convenient to economise one's mental resources and perform them just in a single step.

In particular, as we have just seen, reasoning schemata *specification* and *modus ponens* operate as follows:

1. the first enables us to move from a universal conditional, to a specific conditional;
2. the second enables us to move from a conditional and its antecedent, to the conditional's consequent.

By merging the two inferences we obtain schema *syllogism*: Given a universal conditional and a specific instance of its antecedent, we achieve a corresponding instance of the conditional's consequent.

Let us consider more precisely how this happens. Remember that $A[x/a]$ is the result we obtain substituting within formula A every occurrence of x with a. Clearly, performing such substitution in both the antecedent and the consequent of a conditional is the same as performing it on the whole conditional:

$$A[x/a] \text{ THEN}^m \ B[x/a]$$

is the same as:

$$(A \text{ THEN}^m \ B)[x/a]$$

Thus, when we have beliefs:

1. FORANY x (IF A THEN^m B)
2. $A[x/a]$

we can do the following. First, according to a *specification* we make the following inference:

(1) FORANY x (IF A THEN^m B)

---

(2) IF $A[x/a]$ THEN^m $B[x/a]$

Then, according to *modus ponens* we proceed with the following:

(1) IF $A[x/a]$ THEN^m $B[x/a]$;
(2) $A[x/a]$

---

(3) $B[x/a]$

By combining the two inferences we get the following combined reasoning schema:

First inference (*specification*)

(1) FORANY (x)
IF $[x$ is a human being] THEN^m $[x$ has human rights]

---

(2) IF [*Tony* is a human being] THEN^m [*Tony* has human rights]

Second inference (*detachment*)

(1) IF [*Tony* is a human being] THEN^m [*Tony* has human rights];
(2) *Tony* is a human being

---

(3) *Tony* has human rights

Combined inference (*conclusive syllogism*)

(1) FORANY (x)
IF $[x$ is a human being] THEN^m $[x$ has human rights];
(2) *Tony* is a human being

---

(3) *Tony* has human rights

Table 15.7: *Separate inferences and their combination in a syllogism*

Reasoning schema: *Conclusive syllogism*
(1) FORANY x IF A THEN^m B;
(2) $A[x/a]$
——— IS A CONCLUSIVE REASON FOR
(3) $B[x/a]$)

According to schema *conclusive syllogism*—which we informally introduced in Chapter 2—rather than performing the first two inferences in Table 15.7 (*specification* and *detachment*), we can just perform the third inference in the same Table (*conclusive syllogism*), an inference which combines the first two. As this example shows, according to *conclusive syllogism*, from (1) a specific condition A (referring to individual j) and (2) a general conditional (having variable x at places where the individual name "j" is), one can infer (3) the specific conclusion B, also referring to the individual j.

Note that when syllogisms are represented in predicate logic, they take a

form which looks different from the most common way of expressing them in natural language, where we tend to use instead the typical syllogistic patterns of Aristotelian logic (we adopted the Aristotelian form in Section 2.1.2 on page 49). However, the translation from Aristotelian to modern logic is immediate. Given an Aristotelian syllogism:

Reasoning schema: *Aristotelian syllogism*

(1) all P's are Q's;
(2) a is P
——— IS A REASON FOR
(3) a is Q

we simply transform the major premise in a universal conditional, where the universal terms (combined with the copulative verb) are predicates applied to the quantified variable. In this way we obtain a species of our syllogistic schema:

Reasoning schema: *Aristotelian syllogism in modern form*

(1) FORANY (x) IF $[x$ is $P]$ THEN^m $[x$ is $Q]$;
(2) $[a$ is $P]$
——— IS A REASON FOR
(3) $[a$ is $Q]$

This idea of a syllogism can be generalised so that rather than substituting only one variable we substitute a sequence of variables, specifying a universal propositions with multiple variables in one step. Here is an example:[11]

(1) FORANY (x, y)
IF $[x$ causes an unjust damage to $y]$
THEN^m $[x$ is due to compensate $y]$;
Tony causes an unjust damage to *John*

———

(2) *Tony* is due to compensate *John*

Conclusive syllogism is the kind of reasoning that is usually assumed to correspond to the so-called judicial syllogism.[12] Here is another example of such syllogisms, adapted from Klug (1966, 55).

[11] We write FORANY $(x_1, \ldots, x_n)$ as an abbreviation for FORANY (x_1),..., FORANY (x_n).

[12] In the following we shall argue that this is not exactly the case—since judicial syllogism rather corresponds to what we shall call defeasible syllogism—but we can temporarily assume that conclusive syllogism can do the job.

(1) FORANY (x)
IF [x is a receiver of stolen goods]
THEN^m [x is to be punished with detention up to a maximum of 10 years];
(2) *Tony* is a receiver of stolen goods

---

(3) *Tony* is to be punished with detention up to a maximum of 10 years

One further way of merging inferences is obtained by joining schema AND *introduction* and schema *conclusive syllogism*, the first schema being applied as many times as needed. This allows to derive in one step the consequent of a general conditional having a conjunctive antecedent (when all elements of the antecedent are satisfied):

Reasoning schema: *Conjunctive syllogism*
(1) FORANY x IF A_1 AND ... AND A_n THEN^m B;
(2) $A_1[x/a]$;
...;
(n) $A_n[x/a]$
——— IS A CONCLUSIVE REASON FOR
(n+1) $B[x/a]$

Here is an example of conjunctive syllogism.

(1) FORANY (x)
IF [x is born in Italy] AND [x's parents are Italian]
THEN^m [x is Italian];
(2) *Mario* is born in Italy;
(3) *Mario*'s parents are Italian

---

(4) *Mario* is Italian

This single inference corresponds to the following sequence of applications of our elementary reasoning schemata, as you can see in Table 15.8 on the next page. Another useful combination of inference schemata is given by schema *disjunctive syllogism*, which is obtained by combining schemata OR *elimination* and *syllogism*.

1. FORANY (x)
   IF $[x$ is born in Italy$]$ AND $[x$'s parents are Italian$]$
   THEN^m $[x$ is Italian$]$ ⟨initial belief⟩
2. *John* is born in Italy ⟨initial belief⟩
3. *John*'s parents are Italian ⟨initial belief⟩
4. [*John* is born in Italy] AND [*John*'s parents are Italian]
   ⟨from (1) and (2), by AND introduction⟩
5. IF [*John* is born in Italy] AND [*John*'s parents are Italian]
   THEN^m [*John* is Italian] ⟨from (1), by specification⟩
6. *John* is Italian ⟨from (4) ad (5), by detachment⟩

Table 15.8: *Conjunctive syllogism: analytical description*

Reasoning schema: *Disjuntive syllogism*

(1) FORANY (x) IF A_1 OR ... OR A_n THEN^m B;
(2) $A_i[x/a]$
——— IS A CONCLUSIVE REASON FOR
(3) $B[x/a]$

where i is one of $1 \ldots n$. This allows to infer the consequent of a rule having a disjunctive antecedent by establishing just one of the disjuncts. Here is an example taken from Roman law:

every obligation is dissolved by the payment of the thing due, or of something else given in its place with the consent of the debtor. (*Institutes of Justinian*, III, 29) [13]

which provides the major premise for the disjunctive syllogism in Table 15.9 on the facing page.

15.4. Time in Predicate Logic

Classical logic does not provide specific facilities for expressing time. In fact, modern logic was born as a tool for mathematical reasoning, where we do not usually need to worry about time and change (remember that for Plato mathematical objects inhabit the eternal and unchanging world of ideas).

[13] The Latin original: "Tollitur autem omnis obligatio solutione eius quod debetur, vel si quis, consentiente creditore, aliud pro alio solverit." The English version of this citation from the *Institutes of Justinian* is taken from the translation by Sandars (1941), which we shall adopt in all our citations from the *Institutes*.

(1) FORANY (x, y, z)
IF [the due thing, x, was delivered to creditor y] OR
[some other thing, z, was delivered to creditor y in place of the due thing x, with y's consent]
THEN^m [the obligation to give x to y is dissolved];
(2) some other thing, *5 cows*, was delivered to creditor *Marcus*, in place of the due thing, *10 sheep*, with *Marcus*'s consent

---

(3) the obligation to give *10 sheep* to *Marcus* is dissolved

Table 15.9: *Disjunctive syllogism*

On the contrary, natural language and common sense reasoning embed various, very deep and articulate, ways for dealing with time and change, which have not yet been captured even in most advanced studies in logic and language (see Gabbay and Günthner 1989). Consider, for instance, how natural language enables us to express temporal relationships by using verbal forms, temporal adverbs, and prepositions.

The huge superiority of natural reasoning and natural language over any formal attempt at dealing with time should not come as a surprise. Humans are adapted to their environment and have the (inborn and cultural) skills that are needed in their environment, which is undoubtedly a temporal and spatial environment.

As no logic of perception can hope to fully capture the ways in which we process perceptual inputs, so no logic of time can hope to fully capture our ways of processing temporal information. This does not mean that logic is useless in dealing with time. On the contrary, as in other domains, it can provide useful ways of integrating and controlling the use of our natural abilities, and the products of our cultural evolution.

To emphasise the need to represent temporal references, in some of our previous examples we have used the simple form of the verb (for instance, steals) also in cases when natural language would have had the past or the continuous form. In fact, classical logic provides no way for connecting the verbal form "stole," used to refer a specific instance of stealing which happened in the past, to the verbal form "steals," used in the general rule stating that if one steals something then one is to be punished. Similarly, classical logic offers no way of capturing the distinction between continuous and simple verb forms.

However, as we shall see in the following sections, predicate logic is not completely helpless in dealing with time. Its structures, and in particular, the

universal quantifier, offer us a way of expressing temporal references, though we shall argue that predicate logic does not model adequately temporal reasoning.

15.4.1. Propositions and Fluents

As we observed above, from the perspective of classical logic, a proposition is something that holds true or false. Unfortunately, formulas like the ones we have been using above to represent events and states of affairs (Tom steals $Mary's$ $bicycle$, $John$ is an Italian citizen) cannot properly express propositions, since they do not include any temporal and spatial specifications.

A formula with no space and time reference is indeterminate: We need to know to what occasion the speaker is referring to, in order to establish whether this proposition is true or false.

Assume all of the following:

a. Tom stole Mary's bicycle at 10 o' clock, on 10.10.2003,
b. this was the first time he did it, and
c. he never did it again.

According to propositions from (*a*) to (*c*), it is true that ⌈Tom steals $Mary's$ $bicycle$ at 10 o' clock, on 10.10.2003⌉, but it is false that he did steal her bicycle at any other time.

Let us consider a larger example, to clarify the power and the limits of classical logic in temporal reasoning. Assume that there is a rule saying that:

1. FORANY (x, y)
   IF [x is y's boss] AND
   [x mobs y]
   THEN [x is due to compensate y's moral damage]

To apply this rule to the relationship between Mary and Tom, first we need to establish whether she is his boss.

Assume all of the following:

a. Mary was Tom's boss since 1995,
b. Tom moved into another unit on 1997,
c. Tom was again assigned to Mary's unity on 1999.

The formula

2. $Mary$ is Tom's boss

expresses a relationship between Mary and Tom, but it does not specify the time in which this relationship holds.

This shortcoming would not be significant, if being one's boss was a necessary and eternal relationship (like for number 2 being smaller than number 3).

However, this is not the case: Mary has been Tom's boss at certain times, while not being his boss at other times. In particular, it is true that Mary was Tom's boss in 1996, while it is false that she was his boss in 1998.

Therefore, it is impossible to state whether the timeless formula (2) above is true or false, unless one specifies, explicitly or implicitly, to what time this formula refers.

Against this conclusion, it may be objected that timeless formulas always refer to the present time, so that determining temporal reference involves no real problem (when I say "it is hot," I am really saying "now it is hot"). However, this is not always the case, and most importantly, this is not the case with regard to formulas embedded into general conditionals. For instance, in expression "x is y's boss" contained in the rule (1) above, variable x clearly does not only refer to people that are now the boss of the mobbed person y (in the moment when one is applying the rule). If this was the case, Mary could avoid punishment on the basis of the fact that she is no longer Tom's boss.

15.4.2. From Fluents to Propositions

Following John McCarthy (1987), one of the founders of Artificial Intelligence, we say that expressions such as

$Mary$ is Tom's boss

do not express propositions, but *fluents*. A *fluent* is a noema that cannot be said to be true or false *tout court*, but only when it is associated with a time reference. This association transforms the fluent into a proposition. For instance, according to what we said in the previous section, proposition:

$Mary$ is Tom's boss, in 1996

is true, while proposition:

$Mary$ is $Tom's\ boss$, in 1998

is false.

Besides fluents that are *temporally contingent*—in the sense that they may hold at certain times and not at other times—there are also *spatially-contingent* fluents: At the same time, they hold in certain places and not in other places. When a fluent is both temporally and spatially contingent, to transform it into a proposition we need to add both a temporal and a spatial specification.

Consider for example the proposition ⌈the radioactivity level is above the admissible limit⌉. We cannot say whether this proposition is true or false, until we add both a time (on 1.1.2002) and a place (in Chernobil).

To keep things simple, in the following we omit to consider the specification of place, and focus on the representation of time: We assume that the fluents we

are concerned with only are temporally contingent, so that indicating a time is sufficient to transform them into propositions.

The most immediate way of expressing time is to extend every predicate, incorporating in it a temporal reference. For instance, rather that having a predicate:

[1] is [2]'s boss

which leads to propositions like:

Mary is *Tom*'s boss

we have predicates like:

[1] is [2]'s boss, at time [3]

which leads to propositions like the following:

Mary is *Tom*'s boss, at time 1996

Similarly , we would have a predicate ⌈[1] steals [2], at time [3]⌉, which can be instantiated into propositions like ⌈*Tom* steals *Mary's bicycle*, at time 10 o' clock on 1.6.2003 ⌉ (for this idea see Quine 1960; 1974).[14]

This approach, however, requires that we modify each predicate, adding an additional term to it. We prefer to adopt a different solution, which allows us to keep every predicate in its original form, and moreover to distinguish events from states of affairs, a solution which we borrow from the event calculus of Kowalski and Sergot (1986), though we do not provide here an account of the underlying logic-programming framework (for a legal application of the event calculus, see Hernandez Marín and Sartor 1999).

To express that a certain property or relation holds at a certain time, we use the expression:

[1] *holds at time* [2]

where [1] is a property and [2] is a temporal reference.[15] For example, to say Mary is Tom's boss, on date 10.5.1996, we write:

[*Mary* is *Tom*'s boss] *holds at time* 10.5.1996

Similarly, to express that a certain event happens at a certain time we use the expression:

[14] For simplicity's sake we keep our notions informal, without specifying the granularity of our representation of time (what are the time instants we are referring to, by way of temporal variables), and how we deal with durations (e.g., one year) rather that with time instants.

[15] We use the locution *holds at time* to introduce any time reference: a time instant (1:56 pm, on 04.05.2003), an hour (1 pm, on 04.05.2003), a day (04.05.2003), a year (2003).

$\boxed{1}$ *happens at time* $\boxed{2}$

where $\boxed{1}$ is an event and $\boxed{2}$ is a time reference. For example, to express that Mary mobbed Tom at time 10.5.1996 we write:

[$Mary$ mobbed Tom] *happens at time* 10.5.1996

15.4.3. *Representing Temporally-General Rules*

The representational technique we introduced in the previous section enables us to express temporally-general rules—intended as rules referring to events or situations happening at any time—by using the universal quantifier. For instance, the mobbing rule could be expressed as:

FORANY (x, y, t)
  IF [x is y's boss] *holds at time* t AND
    [x mobs y] *happens at time* t
  THEN^m [x is due to compensate y's moral damages] *holds at time* t
(for any persons x and y, and any time t, if x is y's boss at time t . . .)

We can then apply inference schema *conclusive syllogism* to infer temporally specific propositions, as in the following inference.

(1) FORANY (x, y, t)
  IF [x is y's boss] *holds at time* t AND
    [x mobs y] *happens at time* t
  THEN^m [x is due to compensate y's moral damages]
    holds at time t;
(2) [$Mary$ is Tom's boss] *holds at time* 10.5.1996;
(3) [$Mary$ mobs Tom] *happens at time* 10.5.1996

---

(4) [$Mary$ is due to compensate Tom] *holds at time* 10.5.1996

We can reason in the same way with regard to the theft of John's bicycle:

(1) FORANY (x, y, t)
    IF [x steals y] *happens at time* t
    THEN [x is liable to punishment] *holds at time* t;
(2) [$Tony$ steals $John'sbicycle$] *happens at time* 1.6.2003

[$Tony$ is liable to punishment] *holds at time* 1.6.2003

The representation of time we have just provided is simple and powerful, but has a serious limitation: It leads one to infer that a conclusion only holds at the indicated time (the time when the causing event happened), but not at a later time.

For instance, we may establish, on the basis of the rule above, that Mary is due to compensate Tom on 10.5.1996, but we are unable to say that she is still due to compensate him on the following day.

Similarly we can infer that Tom is liable at time 1.6.2003, but we are unable to conclude that he still is liable subsequently.

Thus, it seems that a wrongdoer must always be acquitted since a judge would never be able to establish that the wrongdoer is still liable at the time of the judgement (acquittal seems required also when one is tried on the spot, since also in this case the judgement will come after the wrongful act is committed). Common-sense reasoning, on the contrary includes the idea of *persistence*, both in the natural word and in the legal world: When a property starts to hold it continues so, unless something relevant happens. For instance, if one started being liable when one performed an unlawful act, then, unless liability was terminated by a subsequent event, one would still be liable for that act at the time when one is tried. This kind of reasoning, unfortunately, is not available in the static framework of classical logic. We shall introduce it in Section 21.4 on page 566, when analysing normative conditionals, in the framework of defeasible reasoning.

15.5. Conclusions on Predicate Logic in the Law

Predicate logic provides the foundations of logics, and provides the basic ideas for any further development of logical analysis. Also in the legal domain, predicate logic has been frequently used for representing legal contents, often with interesting results.[16] However, the use of predicate logic in the law raises some difficult problems.

Firstly, as we have just seen above, conditional rules cannot be viewed as material conditionals: If we assimilated normative conditional to material conditionals, the normative words would be populated with rules establishing the wildest consequents for any false antecedents.

Secondly, the inference rules of propositional logic (which, as we know, are included in predicate logic) allow for the principle that any arbitrary proposition follows from a contradiction (*ex falso sequitur quodlibet*).

Thirdly, classical predicate logic does not allow for defeasible reasoning. It only provides us with conclusive results. On the contrary, as we shall see, in the

[16] For significant examples of the formalisation of legal contents in predicate logic—sometimes integrated with the basic deontic modalities—see, among others: Klug 1966; Ferrajoli 1970; Yoshino 1978; Tammelo 1978; MacCormick 1978; Alexy 1980; Rödig 1980; Koch and Rüßman 1982; Golding 2001.

law one needs to take into account the possibility of defeat: Legal inference may be defeated by stronger reasons requiring a different solution, or making a rule inapplicable.

Fourthly, classical predicate-logic does not take into account the specific constituents of practical knowledge: actions, duties, rights and permissions.

Fifthly, classical predicate-logic does not provide satisfactory ways for dealing with time, and in particular for subsuming concrete events into temporally-general rules, and for obtaining persistent legal consequences.

To synthesise the limitations of classical predicate-logic when applied in the legal domain, we may say that classical predicate-logic is a tool which enables us to derive truth-preserving implications out of a consistent body of epistemic knowledge, which is assumed to describe a definite state of the world. When one wants to move beyond truth-preserving reasoning—to consider the possibility of contradictions, to allow for hypothetical reasoning, to use normative concepts—one needs to consider further logical tools. This is what we are going to do in the next chapters.

However, this does not mean that we must renounce the power of classical first-order predicate logic, which still provides the foundation of all logical thinking, but rather that we should attempt at integrating classical logic with tools that are appropriate to the different areas of reasoning we are considering.[17]

[17] We shall not examine here the attempts to substitute classical logic with alternatives to it. Though some of such attempts are very interesting, considering them would require bringing in a very complex logical machinery, without solving the problems we have just indicated. Among such alternatives, we may mention the following: (*a*) *intuitionistic logic*, whose application in the legal domain was proposed by Philipps (1964) and was investigated, with applications to computing, by McCarty (1989); (*b*) *relevance logic*, which is used for representing legal concepts in Allen and Saxon (1991); (*c*) *multi-valued logic*, which provide the semantics for the theory of deontic modalities proposed in Kalinowski 1953. For a technical presentation of all main alternatives to classical predicate logic, see Gabbay and Günthner 1986. For a philosophical introduction to classical logic and its alternatives, see Haack 1978.

Chapter 16

ACTIONS

Now that we possess the basic toolkit for logical analysis, namely, first-order classical logic, we can move forward, and approach the logical notions that are specific to practical reasoning. The notion of an *action* will provide our starting point, since legal reasoning (as practical reasoning in general) is concerned with governing action.

16.1. The Characterisation of Actions

Usually, two components are identified in an action: the *behaviour* of the agent, and *consequences* of that behaviour.[1] Correspondingly, there are two ways in which we can characterise actions:[2]

- A *behavioural* characterisation, which consists in describing the type of behaviour that an agent j is holding, abstracting from the consequences of such behaviour.
- A *productive* characterisation, which consists in describing the results which j's behaviour produces, abstracting from the behaviour which produced those results.

For example, ⌈Tony is smoking⌉ is a behavioural characterisation, while ⌈Tony causes damage to his health⌉ is a productive characterisation.

This distinction is a familiar one in the theory of action. For instance, von Wright (1983b, 107) views this distinction as concerning the relation between two aspects of action, *process* and *achievement*, which may be present in every action, to different extents. In order to provide for both the behavioural and the productive characterisation, we distinguish two types of actions:

- *Behavioural actions*, which are described by indicating the type of behaviour in which they consist. They are realised iff the concerned agent realises an instance of the indicated type of behaviour;

[1] We use the term *action* in a very general sense, and shall not explore the more specific ways in which this terms is used by some authors, who relate to the Aristotelian distinction (see *Nicomachean Ehics*, 1140b) between *poiesis* (productive activity, aiming at an external outcome, like the production of an object or the bringing about of a state of affairs) and *praxis* (the action which is done for its own sake, which is itself an end). See for instance Arendt 1958, where the scope of action is limited to to the political sphere, with the exclusion of labour and work.

[2] Both ways are covered by what Pattaro (Volume 1 of this Treatise, sec. 6.2) calls a "type of action."

- *Productive actions*, which are described by indicating the type of result they produce. They are realised iff the concerned agent produces an instance of that type of result.

The same series of events, where one behaves in a certain way and one's behaviour causes certain consequences, realises both types of actions. Consider, for example, the case of Mary, who studies for an exam, and gets an A mark. The sequence:

$$\langle \text{Mary studying; Mary getting an } A \text{ mark} \rangle$$

realises both the behavioural action of studying and the result action of getting the A mark. Observe that Mary would have equally performed the action of studying even if she had obtained a different result (failing the exam), and that Mary would have equally performed the action of getting the A mark, even if she had obtained that result without studying (for example, by copying her assignment, or bribing her teacher).

We prefer to preserve in our formalisation this fundamental distinction, since it is frequently used in approaching various domains of the law. For instance, in criminal law we usually distinguish between crimes consisting in behaving in a certain way (for example, the unauthorised access to another's residence, or computer system) and crimes including the causation of an event (for example, homicide). Similarly, in tort law, we may need to distinguish the behaviour of an agent from the effects of that behaviour, a distinction that is particularly relevant when causality is at issue. For instance, we may distinguish a doctor's action of prescribing a certain drug to a patient, from the damaging effect of this action, namely, the patient's death which followed the wrong prescription.

16.2. Logical Analysis of Action

We shall use some elementary logical tools to analyse the structure of action. Firstly, we introduce two operators for representing univocally behavioural and productive actions. Secondly, we characterise their logical behaviour.

16.2.1. Two Action-Operators

For behavioural actions, we use the *Does* operator, followed by the indication of agent (subscript), and by the description of the action (between square brackets).

Thus, the canonical way of saying that Tom is now smoking

$$Does_{Tom}[\text{smoke}]$$

to be read as "*Tom* does smoke" or "*Tom* is smoking" (our representation does not distinguish between simple and continuous verbal forms).

For result actions, we use with the operator $Brings$, to be read as "brings it about that" or "sees to it that." This operator is followed by the indication of the agent (subscript) and by the description of the state of affairs resulting from the action (between square brackets).[3] Thus, the canonical way for expressing that Alex (who owns a powerful, but stinky, car) pollutes the air is the following one:

$Brings_{Alex}$[the air is polluted]
($Alex$ brings it about that the air is polluted)

We cannot here consider more deeply the notions of a productive action, and in particular state precisely what we mean by an agent producing a certain result.

There are even some paradoxes linked to this notion. Consider, for example, the famous example concerning a person who died of thirst in the desert, after that (*a*) one killer put poison in the victim's bottle to poison him, and (*b*) another killer independently made a hole in the bottle to let the victim die of thirst. In such a case, we may wonder who brought it about that the victim died: the first killer, who was prevented from poisoning the victim, or the second, who saved the victim from being poisoned, and so postponed the victim's death.

In analysing the idea of a productive action, we could view causality as our only primitive notion, and define the notion of a productive action accordingly. Thus, when we say that an agent j brings about a state of affairs, we would just mean that j causes this state of affairs to hold. This would lead us to conclude that in general an agent j performs the action $Brings_j A$ exactly when j's behaviour (bodily movement) causes A. This raises a number of philosophical issues. First of all, we may wonder whether any type of causation by an agent's bodily movement (for example, a movement done while sleeping, or in the course of an epileptic attack) can properly be said to realise an action.[4] Secondarily, one may want to discuss the relation between causation and the more general idea of *generation* (Goldman 1970) or *determination* (see Section 20.2 on page 523).

Following the indication of Peczenik (Volume 4 of this Treatise, sec. 3.2.4), that "legal theory should fight shy of controversial philosophical problems as much as possible," we shall not address these deep philosophical issues. We shall limit ourselves to saying that we adopt a very broad view of a productive action, which tends to include any form of causation by an agent, and a very broad notion of causation, which approximates the idea of generation or determination.

[3] We do not distinguish between the two agentive expressions "bringing about that" and "seeing to it that," since we do not address the connection between action and intention (which is suggested by the latter one).

[4] For a reference to the philosophical discussion on the relationship between agency and causation see Herrestad 1995. For logical models of action that focus on the productive aspect, see in particular: Belnap and Perloff 1989; Pörn 1977, 6ff.; Pörn 1989, 554ff.

Our choice does not exclude that for specific particular purposes, one may need more specific notions of production and causality. For instance, in certain contexts, we may require a connection between the agent's intentionality and the state of affair resulting from the agent's behaviour (excluding unintended effects, or at least the effect of involuntary behaviour), or we may require that the agent's behaviour is generally or normally susceptible of determining that result (excluding effects resulting from exceptional concurring factors).

16.2.2. The Logic of Action

Logicians have provided various characterisations of the logic of action, and many further attempts have been accomplished by computer scientists.[5]

The logic of action is indeed a very complex and unsettled area of philosophical logic, where conflicting proposals, based upon conflicting intuitions, clash against each other. Fortunately, we do not need to provide here a full logical characterisation of our action predicates. We shall just specify three inference schemata.

The first couple of schemata state that, for both behavioural and productive actions, doing separate actions entails doing their combination.

For behavioural actions, we have the following reasoning schema:

Reasoning schema: *JBA-junction of behavioural action*

(1) $Does_j A$ AND $Does_j B$

——— IS A CONCLUSIVE REASON FOR

(2) $Does_j(A \text{ AND } B)$

For instance, if Joan does the action of twisting and does the action of shouting, she performs the conjunctive action of twisting and shouting.

(1) $Does_{Joan}$[twist] AND $Does_{Joan}$[shout]

---

(2) $Does_{Joan}$([twist] AND [shout])

Similarly, for productive actions:

[5] The approach here developed is based, in particular, on the formalisation of productive action that was originally provided by Kanger (1971; 1972) and was further developed, and combined with other normative and social concepts, by Pörn (1977). Among the logical analyses of action, see also: von Wright 1963, 1983b; Belnap and Perloff 1989. The logic of action has also been studied in computer science, where in particular dynamic logic—the logic used for analysing the behaviour of computer programs—has been used (for an application of dynamic logic to normative reasoning, see Meyer 1988).

Reasoning schema: *JPA-junction of productive action*

(1) $Brings_j A$ AND $Brings_j B$

——— IS A CONCLUSIVE REASON FOR

(2) $Brings_j$ $(A$ AND $B)$

For instance, assume that, when colliding against John's car with her scooter, Mary makes so that John's car is dented and that her scooter is broken, we may say that she performs the conjunctive action of making it so that both John's car is dented and her scooter is broken.

(1) $Brings_{Mary}$[John's car is dented] AND
$Brings_{Mary}$[Mary's scooter is broken]

---

(2) $Brings_{Mary}$([John's car is dented] AND
[Mary's scooter is broken])

Note that our idea of a conjunctive action requires no connection between the involved behaviours or states of affairs. Thus we may say that Napoleon did the conjunctive behavioural action of invading Spain and escaping from the island of Elba, and that he did the conjunctive productive action bringing it about that Russia was invaded and that he himself was proclaimed Emperor.

This unrestricted way of joining actions can be counterintuitive in some cases, since often we tend to assume that some connections (causal, temporal, functional, and so forth) exist between conjunctive actions. However, this seems to be what Grice (1989, 22) calls an *implicature*, to wit, an assumption which usually accompanies a speech act (or a belief) rather than a feature of the logic of action. Thus, we shall assume that the schemata above can always be legitimately used.

One may wonder whether the opposite entailment also holds, that is, whether doing a conjunctive action involves doing the corresponding elementary actions:

1. Given that j did action $\lceil A$ AND $B\rceil$, can we infer that j did action A and that j did action B? In formulas, is it the case that proposition $Does_j(A$ AND $B)$ entails each of $Does_j A$ and $Does_j B$?
2. Given that j brought about state of affair $\lceil A$ AND $B\rceil$, can we infer that j brought about A and that j brought about B? In formulas, is it the case that proposition $Brings_j(A$ AND $B)$ entails each of $Brings_j A$ and $Brings_j B$?

It seems to us that we need to answer these questions negatively with regard to both productive and behavioural actions.

Let us first consider conjunctive productive actions. It is easy to observe that producing a conjunctive result does not entail producing each element of

the conjunction: One achieves a conjunctive result also when one directly produces only one element the a conjunctive state of affairs, while the other element obtains independently. For instance, the fact that John, the Good Samaritan, brings it about that Mary, while she is injured (since she has been hit by a runaway car), receives appropriate medication may be represented in logic as follows:

> $Brings_{John}$([Mary is injured] AND [Mary receives medication])
> (John (by giving medication to Mary who is injured) realises the state of affairs that ⌈Mary is injured and she receives medication⌉)

This fact, certainly does not entail that he made her injured:

> $Brings_{John}$([Mary is injured])
> (John brings it about that Mary is injured)

Similarly, the fact that one performs a conjunctive behavioural action having a conjunctive description does not entail that one performs each element of the conjunction: Some elements of the conjunctive description may indicate the context where the behaviour of the agent takes place (rather than the components of that behaviour). For instance, my walking while it is raining does not entail that I perform the action of raining.

The problems we have just mentioned could be addressed by conveniently restricting the legitimate content of our action operators, but we prefer to refrain from adopting a general inference schema for splitting conjunctive actions. This possibility will only be allowed for specific types of conjunctive actions, when all conjuncts may be viewed as behaviours of the agent, or as direct results of the agent's activity, as for the actions described in Section 23.4.4 on page 610.

The third reasoning schema we accept for actions says that performing a productive action conclusively entails the existence of the corresponding result. We may express this idea by saying that a productive action is *necessarily successful*: It does not count as being performed unless its result is realised. If the result is not realised, the productive action has failed to take place. At most we may say that it has been attempted.

> **Reasoning schema**: *SPA-Success of productive actions*
> (1) $Brings_j A$
> ——— IS A CONCLUSIVE REASON FOR
> (2) A

For instance, if Mary performs the action of bringing it about that John's car is dented, when she has performed that action, it must be true that John's car is dented.

(1) $Brings_{Mary}$[John's car is dented]

---

(2) [John's car is dented]

As we have just seen, we may build complex actions by combining more atomic actions through logical connectives. Let us call *atomic action-descriptions*, those *action-descriptions* that do not contain any logical connective. For example:

$Does_j$[drives j's car]
(j drives his car)

is an atomic action-description, as also:

$Brings_j$[the air is polluted]
(j brings it about that the air is polluted)

On the contrary:

$Brings_j$([the air is polluted] AND [k has a cough attack])
(j brings it about that the air is polluted and that k has a cough attack)

is not an atomic action description.

16.2.3. Actions-Descriptions as Propositions and as Terms

Actions and their descriptions play a dual role.

On the one hand, an action may be viewed as the happening of an event, namely, the performance of the action (which may be seen as a temporary dynamic state of affairs). This happening may be described through a proposition, an *action-proposition*, which may be expressed through an *action-sentence*.[6] When we view actions as happenings, we tend to represent them through finite verbal forms. For instance, the sentence "Mary is sleeping during John's talk" expresses the proposition that describes the fact that Mary is sleeping (during John's talk).

On the other hand, an action may be viewed as an object we speak about, and to which we refer through an appropriate name, an *action-designator*. When we adopt this view, we tend to represent actions through verbs in the infinite form. For instance, in the sentence "Mary's sleeping during John's talk was very unfortunate," the locution "Mary's sleeping during John's talk" is the name (the definite description) of the action it designates: It is the action-designator of the action consisting in Mary's sleep (during John's talk).

In our analysis, we express both action-sentences and action-designators trough the following forms:

[6] The distinction between using a certain expression for describing certain states of affairs and for naming them is extensively discussed in Hage 1997.

- $Does_j A$, for behavioural actions, and
- $Brings_j A$, for productive actions.

However, when we need to specify that we are using an action name, we shall occasionally use the following action-designators:

- $ToDo_j A$, for referring to behavioural actions, and
- $ToBring_j A$, for referring to productive actions.[7]

For instance, to express our view about Mary's behaviour during John's talk, we may use the following formulation:

$ToDo_{Mary}$[sleep during John's talk] was unfortunate
(the action of Mary to sleep during John's talk was unfortunate)

The relationship between the two views on action is captured by the following equivalence:

$Does_j A = (ToDo_j A)$ *happens*
($\lceil j$ does action $A\rceil$ is equivalent to $\lceil j$'s action to do A happens$\rceil$)

For instance, Mary sleeps exactly if her sleeping happens.

$Does_{Mary}$[sleep] $=$ ($ToDo_{Mary}$[sleep]) *happens*
($\lceil Mary$ does sleep$\rceil$ is equivalent to $\lceil$the action of Mary to sleep happens$\rceil$)

In the following we shall use the predicate:

$\boxed{1}$ *happens*

which indicates the taking place of a named event, also to express the performance of an action. For instance, to say that the performance of a certain action takes place at a certain time t we can write:

$(ToDo_j A)$ *happens at time* t

However, in most circumstances no confusion arises, so that we can safely use the form $Does_j A$ also as an action-designator, and express the happening of an action as:

$(Does_j A)$ *happens at time* t

For instance, to say that Mary slept during John's speech, at 3 pm on 10.03.2003, we can write:

($Does_{Mary}$ [sleep during John's speech])
happens at time 3 pm, 10.03.2003

[7] We shall also use the expression $ToDo$ ($ToBring$) to express the action to do (to produce) A without explicitly indicating its agent. This will be useful when we want to approximate the use of infinitive action clauses in natural language.

16.2.4. Connections Between Behavioural and Productive Actions

Though we have based our presentation on the distinction between behavioural and productive action, we need to observe that it is impossible to draw a sharp distinction between these two types of action: The difference does not concern so much the actions in themselves, as the aspects of them on which our analysis is focused.

For example, the action consisting in Ms. White making a dent on Mr. Black's car can be viewed both as the behavioural action:

$Does_{White}$[make a dent in Black's car]
(White makes dent in Black's car)

and as the productive action:

$Brings_{White}$[a dent exists in Black's car]
(White brings it about that a dent exists in Black's car)

It would indeed be possible to adopt just one of the two representations as our basic formalism for actions. On the one hand we could view productive actions as a particular kind of behavioural actions, according to the following definition:

$Brings_j A \equiv Does_j$ [bring about that A]
($\lceil j$ brings it about that $A\rceil$ is equivalent by definition to $\lceil j$ does the action (holds the behaviour) of bringing about that $A\rceil$)

On the other hand, we could view behavioural action as a particular kind of productive actions, where the author of the action produces his or her own activity:

$Does_j A \equiv Brings_j$[j does A]
($\lceil j$ does $A\rceil$ is equivalent by definition to $\lceil j$ brings it about that j does $A\rceil$)

We shall not discuss here these reductions, and what axioms may justify them. We prefer do adopt the two distinct operators for actions, without assuming that one is reducible to the other. In the following, however, we shall avoid duplicating all or our logical definitions of normative notions (having one definition for behavioural action and one for productive actions): When using the operator for behavioural actions we shall implicitly refer to also to productive actions.

16.3. Omission

We need to consider one of the most difficult notions, both in social theory and in law, namely, the notion of an *omission*, by which we mean the non-performance of an action.

16.3.1. The Notion of an Omission

Let us start with a truism: Omitting an action simply means not doing it, and this holds for both behavioural and productive actions. From this perspective, saying that agent j has omitted an action simply means affirming that j has not accomplished that action. In particular, if φ is an action description, we write:

$$\text{NON } \varphi$$

for affirming that action φ has not taken place.

We need to carefully distinguish an *omissive action*, like:

$$\text{NON } (Brings_j[k \text{ is injured}])$$

(j does not bring it about that k is injured)

from the a *negative action*, like:

$$Brings_j(\text{NON } [k \text{ is injured}])$$

(j brings it about that k is injured)

The difference between omission and negative action can be stated as follows:

- for the omissive action NON ($Brings_j[k$ is injured]) to take place it is sufficient that j did not cause k's injury;
- for the negative action $Brings_j$(NON [k is injured]) to take place it is rather required that j prevents that k is injured (which presupposes that without j's intervention k would have been injured).

We consider this distinction to be sufficiently intuitive, though its analysis would require various philosophical considerations and distinctions.[8] Let us just remark that it is difficult to distinguish negative actions from omissions with regard to purely behavioural actions: This would require distinguishing cases when the agent behaves in such a way as to avoid performing a certain action, and cases where he simply does not perform that action. This distinction is clearer for productive actions, when we need to consider the following cases:

1. event A *does take place*, *consequently* of j's behaviour (without j's behaviour A would not have happened),
2. event A *does take place*, *independently* of j' behaviour (without j's behaviour A still would have happened),
3. event A *does not take place*, *consequently* of j's behaviour (without j's behaviour A would have happened)

[8] Like, for example, the distinction between actions which produce a new state of affairs and actions that impede an existing state of affairs from ceasing. See, for instance, von Wright 1983b, and, for a recent formalisation, Sergot and Richards 2001.

4. event A *does not take place*, *independently* of the behaviour of j (without j's behaviour A still would not have happened)

In case (1), we can say that j produces A (and thus he fails to omit to produce A). In cases(2), (3), and (4), we can say that j has omitted to produce A: In all these three cases the omissive action has been performed. Only in the case (4) can we affirm j has prevented A: Only in the case (4), besides omitting to produce A, j has performed the negative action of producing NON A.

Finally, it must be observed that sometimes the term *omission* seems to have a stronger meaning: It denotes non-performance only in those cases when the author of the action had the opportunity (and possibly also the ability) of performing it (cf. von Wright 1983b, 109f.). For example, it is quite odd to say that today I have omitted to fly at the speed of light, or that I have omitted to play in the national football team.

However, we shall not define omission in this way, though we agree that in certain contexts a more restricted notion of omission would make sense and would capture more precisely the linguistic usage. Simplicity requires that we maintain our weak idea of omission: Omission for us simply means non-performance, and the fact that j omits action φ does not imply that φ is possible.

16.3.2. Logical Analysis of Omission

For providing a logical characterisation for omission, we just need to recall that double negation gets cancelled: NON NON (φ) is equivalent to φ. Therefore, by denying that there was an omission, we affirm that there was the complementary positive action. Thus, that one omitted to omit to do something, just means that one did it.

This leads us to the following definition, where the omission of an action is characterised as the realisation of its complement.

Definition 16.3.1 *Omission. The omission of action φ—written Omitted φ, where φ is a positive or negative action description— is the complement of φ:*

$$\mathit{Omitted}\ \varphi \equiv_{def} \overline{\varphi}$$

In general, remember that for any proposition ψ, its *complement* $\overline{\psi}$ is obtained:

- by prefixing a negation, when the proposition is positive ($\overline{\phi}$ = NON ϕ), and
- by eliminating the negation, when the proposition is negative ($\overline{\text{NON}\ \phi} = \phi$).

Thus, on the one hand:

$$Omitted\ Does_j A = \text{NON}\ Does_j A$$
(⌈it is omitted that j does A⌉ is equivalent to ⌈j does not do A⌉)

and on the other hand:

$$Omitted\ \text{NON}\ Does_j A = Does_j A$$
(⌈it is omitted that j does not do A⌉ is equivalent to ⌈j does A⌉)

16.3.3. Some Abbreviations for Representing Actions

To indicate generically that a certain action is performed by an agent—without specifying whether it is a positive action or an omission, and whether it is a behavioural or a productive action—we shall use the *generalised action operator* $Does{*}_j A$, which indicates any one of the following: (1) $Does_j A$, (2) NON $Does_j A$, (3) $Brings_j A$, (4) NON $Brings_j A$.

Similarly, we write $ToDo{*}_j A$ to indicate any of the following (1) $ToDo_j A$, (2) NON $ToDo_j A$, (3) $ToBring_j A$, (4) NON $ToBring_j A$.

Finally, we write $Done{*}\ A$ to indicate any of the following: (1) A is done, (2) A is produced, (3) A is not done, (4) A is not produced. When reading a formula containing such expressions, we may choose any of these interpretations for its action operators, though this interpretation must be consistent: All occurrences of $Does{*}_x A$ and $ToDo{*}\ A$ within the formula are to be read in the same sense. For instance, the formula:

$$Does{*}_j A\ \text{AND}\ [ToDo{*}_j A\ \text{was wrong}]$$

subsumes any of the following:

1. $Does_j A$ AND [$ToDo_j A$ was wrong];
2. $Brings_j A$ AND [$ToBring_j A$ was wrong];
3. NON $Does_j A$ AND [NON $ToDo_j A$ was wrong];
4. NON $Brings_j A$ AND [NON $ToBring_j A$ was wrong]

but it does not subsume mixed expressions like:

$$Does_j A\ \text{AND}\ [ToBring_j A\ \text{was wrong}]$$

Accordingly, when referring to the generalised action operator, we shall speak of "doing" in a generic sense, which also includes producing and omitting.

We also introduce the following abbreviations:

$$Omits_j\, ToDo{*}\ A \equiv_{def}\ Omitted\ Does{*}_j A_i$$
("j omits doing A" means that "it is omitted that j does A")

For instance, the omission of action:

$Does_j$ [smoke]
(j smokes)

which consists in the fact that:

NON $Does_j$ [smoke]
(it is not the case that j smokes)

can also be expressed as:

$Omits_j$ $ToDo$ [smoke]
(⌈j omits to do the action of smoking⌉, that is, more simply ⌈j omits to smoke⌉)

Correspondingly, the omission of the non-performance:

NON $Does_j$ [smoke]

which consists in the fact that the action is performed, i.e., that:

$Does_j$ [smoke]

can also be expressed as:

$Omits_j$ NON $ToDo$ [smoke]
(j omits not to smoke)

Corresponding abbreviations ($Omits_j$ $ToBring$ A, $Omits_j$ NON $ToBring$ A) can be used also for the omission of productive actions.

Chapter 17

DEONTIC NOTIONS

In this chapter we shall focus on the basic building blocks of normative knowledge: obligations, prohibitions and permissions. Being obligatory, being forbidden and being permitted are indeed the three fundamental *deontic statuses* of an action, upon which we shall build more articulate normative concepts.

In analysing deontic statuses, we shall consider some results obtained in *deontic logic*, the branch of philosophical logic that is specifically concerned with obligations, prohibitions and permissions (the term *deontic* derives from the Greek verb *deomai* which means being due or obligatory).

Though some philosophers and legal theorists, such as Wilhelm F. Leibniz, Jeremy Bentham, and Wesley N. Hohfeld, anticipated many aspects of deontic logic (and one may even go back to Ancient philosophy, in particular to Aristotle)[1] the birth of modern deontic logic can be traced back to the beginning of the 1950s.[2] In the following years deontic logic achieved a very high level of technical complexity, being generally approached in the rich framework provided by *modal logic*, the logic originally intended to deal with necessity and possibility.[3]

Here we shall not discuss the connection of deontic logic with other areas of

[1] On Aristotelian deontic reasoning, see for instance, Kalinowski (1972, 35ff.), who considers various normative syllogisms in *Nicomachean Ehics* and in *De motione animalium*. According to Knuttila 1971, on the contrary, the theory of deontic thinking originated only in the middle ages.

[2] When three important works were independently published: von Wright 1951, Becker 1952, and Kalinowski 1972. However, the first formal analysis of the deontic notions was provided by Mally 1926. His systems, unfortunately, fails to distinguish alethic and deontic notions: It entails that whatever is the case is obligatory and vice versa (in Mally's system A is equivalent to ⌈it is obligatory that A⌉).

[3] For a discussion of deontic logic within the framework of modal logic, see Chellas 1980, 190ff., which also provides an excellent presentation of propositional modal logic. For an introduction to modal logic, see also Hughes and Cresswell 1984. For an introduction to deontic logic, see: Hilpinen 1971; al Hibri 1978; Åqvist 1984 and 1987; Meyer and Wieringa 1993b and 1993a; Jones and Carmo 2000. On deontic logic in legal reasoning, see Alexy 1985, 182ff. For a discussion of the limits of deontic logic, see Mazzarese 1989. For a recent discussion of some important aspects of it, cf. Artosi 2000. For an attempt to capture aspects of deontic logic using logic programming (with constraints), see Alberti et al. 2004. Excellent contributions to deontic logic are contained in Hilpinen 1971 and 1981. More recent contributions can be found in the proceedings of the DEON workshop (International Workshop on Deontic Logic in Computer Science), which is held every two years (for the proceedings of the last DEON workshop, see Lomuscio and Nute 2004). DEON also addresses the application of deontic logic through computer systems and its use in computer science (for instance, to specify the desired behaviour of computer systems).

logic—in particular, with the many axiomatic or semantic characterisations of modal logic[4] —though this connection represents nowadays the starting point of most formal analyses of deontic logic: To keep our presentation simple we shall only consider the deontic properties that are most useful in modelling legal reasoning, and we shall refrain from addressing the logical background which may provide a foundation for these properties.

17.1. Obligation

To say that an action is *obligatory* is to say that the action is due, has to be held, must be performed, is mandatory or compulsory. It is very difficult to clarify the intuitive meaning of the notion of obligatoriness through definitions and conceptual analyses, since this notion is not reducible to other, simpler or more familiar, ideas.

In Chapter 3 we tried to provide such a clarification by taking a different approach, that is, by examining the cognitive function of the idea of an *obligation*. In particular, we viewed this idea as emerging from the doxification of intentions. Consequently we assumed that the proposition expressing the obligation to perform a certain action has the following truth conditions: Such a proposition is true whenever optimal practical cognition (possibly restricted to certain specific concerns) would lead one to have the intention of accomplishing that action. Here we shall rely on this functional analysis of obligations, in characterising their logical behaviour.

17.1.1. The Representation of Obligations

We shall represent obligations by formulas having the following structure:

Obl A
(it is obligatory that A)

where A is any (positive or negative) action description, and ***Obl*** is the deontic operator for obligation, to be read as “it is obligatory that.” Obligations can concern both behavioural actions, as in the following formula stating that j has the obligation to lecture:

Obl $Does_j$[lecture]
(it is obligatory that j lectures)

and productive actions, as in the following formula stating that j has the obligation to cancel k’s personal data:

[4] Among the many modal axiomatisations and semantics for deontic logic, see: Chellas 1980, Jones and Pörn 1985; McCarty 1986; Alchourrón 1991.

Obl $Brings_j$[k's personal data are cancelled]
(it is obligatory that j bring it about that k's personal data are cancelled)

With regard to the logical behaviour of obligations, we assume the following reasoning schema *JO-junction of obligations*, according to which having separate obligations to do certain action leads to have the obligation to do the conjunction of these actions.

Reasoning schema: *JO-junction of obligation*
(1) ***Obl*** A AND ***Obl*** B
——— IS A REASON FOR
(2) ***Obl*** (A AND B)

For instance, given that John, a university professor, has towards his employer both the obligation to teach and the obligation to do research, we can conclude the he has the obligation both to teach and to do research.

(1) ***Obl*** [John teaches] AND ***Obl*** [John does research]

---

(2) ***Obl*** ([John teaches] AND [John does research])

17.1.2. Positive and Negative Obligations

Elementary obligations can be distinguished between:

- *elementary positive obligations*, which concern positive elementary actions;
- *elementary negative obligations*, which concern negative elementary actions.

For example, the following formula expresses an elementary positive obligation, the obligation that j pays his debt:

Obl $Brings_j$[j's debt is paid]
(it is obligatory that j brings it about that his debt is paid)

The following formula expresses an elementary negative obligation, j's obligation not to smoke, which amounts to j's obligation to omit smoking (on this way of expressing omission, see Section 16.3.3 on page 450):

Obl (NON $Does_j$[smoke]) $\equiv$ ***Obl*** ($Omits_j$ $ToDo$ [smoke])
(⌈it is obligatory that j does not smoke⌉ is equivalent to ⌈it is obligatory that j omits to smoke⌉)

17.2. Prohibition

The idea of an obligation is paralleled by the idea of a prohibition. Being forbidden or prohibited is the status of an action that should not be performed. In common language (and in legal language as well) prohibitive propositions are expressed in various ways. For example one may express the same idea by saying: "It is forbidden that John smokes," "John must not smoke," "There is a prohibition that John smokes," and so on.

17.2.1. The Representation of Prohibitions

We represent prohibitions by using the symbol ***Forb***, to be read as "it is forbidden that." Here are two examples. The first formula, concerning a behavioural action, states that j is forbidden to smoke:

> ***Forb*** $Does_j$[smoke]
> (it is forbidden that j smokes)

The second, concerning a productive action, states that j is forbidden to damage other people's health:

> ***Forb*** $Brings_j$[other people's health is damaged]
> (it is forbidden that j brings it about that other people's health is damaged)

We do not need to say much about prohibitions, since a prohibition can be viewed as an obligation to omit (as it will appear in the next Section), so that our analysis of obligations can be transferred to prohibitions.

This does not exclude that the idea of prohibition plays a pivotal role in normative thinking, especially in the legal domain. There is a long philosophical history for the idea that the law basically consists of prohibitions.

Just remember the idea of Thomasius (1963) that the law's task is that of specifying the prohibition "what you do not want to be done to you, you shall not do to others" (*quod tibi non vis fieri, alteri ne feceris*) or Kant's idea that the law's business is that of limiting each one's liberty in order to ensure its coexistence with the liberty of everyone else according to universal rules (Kant 1996, B.4).

We cannot discuss here the comparative social and legal importance of obligations and prohibitions, since we need to focus on the logical representation of prohibitions rather than on their philosophical relevance or their social function. Let us just remark that within deontic logic, the idea of the primacy of prohibitions can possibly be found in those approaches that found deontic logic upon the idea of a sanction. In particular, Anderson (1958a; 1958b) reduced deontic logic to alethic modal logic (the logic which deals with possibility and necessity), by assuming that "A is forbidden" just means ⌈if A takes place, then necessarily a sanction will ensue⌉. From this perspective, prohibition appears

to be the primitive normative notion, on the basis of which the other normative ideas—and in particular those of an obligation and a permission—are to be defined.[5]

Here we shall take a different perspective, since in our model the notion of obligation is not dependent on the idea of a sanction (it is rather connected to the idea of an intention), nor is legal reasoning primarily intended to avoid sanction (it is rather connected to participation in collective intentionality), though we admit that sanctions play a fundamental role in the law (see Section 10.3 on page 294).

17.2.2. Connections between Obligation and Prohibition

Most approaches to deontic logic agree in assuming that, for any action A, the prohibition of A amounts to the obligation not to do action A: This is the axiom we denote as FON:

$$FON\text{:}\quad \textbf{\textit{Forb}}\ A \equiv \textbf{\textit{Obl}}\ (\text{NON}\ A)$$

(FON (Forbiddenness is Obligatoriness): ⌈it is forbidden that A⌉ is equivalent to ⌈it is obligatory that NON A⌉)

For example, j's being forbidden to discriminate her employees on the basis of their age, amounts to her being obliged not to do that:

$$\textbf{\textit{Forb}}\ Does_j[\text{discriminate } j\text{'s employees on the basis of their age}] \equiv \textbf{\textit{Obl}}\ (\text{NON}\ Does_j[\text{discriminate } j\text{'s employees on the basis of their age}])$$

which we read as ⌈it is forbidden that j discriminates j's employees on the basis of their age⌉ is equivalent to ⌈it is obligatory that j does not discriminate j's employees on the basis of their age⌉.

On the basis of the equivalence of NON A and *Omitted* A we introduced in Section 16.3 on page 447, we can use interchangeably NON A and *Omitted* A. Thus, we can also say that:

$$\textbf{\textit{Forb}}\ A \equiv \textbf{\textit{Obl}}\ (Omitted\ A)$$

(⌈it is forbidden that A⌉ is equivalent to ⌈it is obligatory that A is omitted⌉)

Moreover, an omission being forbidden amounts to the corresponding positive action being obligatory (though qualifying an omission as being forbidden in order to express an obligation seems a useless complication).

$$\textbf{\textit{Forb}}\ Omitted\ A \equiv \textbf{\textit{Forb}}\ \text{NON}\ A \equiv \textbf{\textit{Obl}}\ A$$

(⌈it is forbidden that A is omitted⌉ is equivalent to ⌈it is forbidden that NON A⌉, which is equivalent to ⌈it is obligatory that A⌉)

[5] The Andersonian approach has been recently adopted in some attempts to provide formal definitions of deontic notions. See for instance Meyer 1988, and Boella and Lesmo 2002.

Here is an example of this equivalence:

$$\textit{\textbf{Forb}}\ \ Omitted\ \ Does_k[\textsf{pay taxes on } k\textsf{'s fees}] \equiv$$
$$\textit{\textbf{Forb}}\ (\textsc{non}\ \ Does_k[\textsf{pay taxes on } k\textsf{'s fees}]) \equiv$$
$$\textit{\textbf{Obl}}\ \ Does_k[\textsf{pay taxes on } k\textsf{'s fees}]$$

(⌈it is forbidden that k omits to pay taxes on her fees⌉ is equivalent to ⌈it is forbidden that that k does not pay taxes on her fees⌉, which is equivalent to ⌈it is obligatory that k pays taxes on k's fees⌉)

Since the omission of action φ consists in accomplishing action NON φ, and the omission of the omissive action NON φ consisting in accomplishing action φ, we may say that in general an action being forbidden amounts to its omission being obligatory. This subsumes the two cases we have just considered, and may be taken as a definition of the notion of "forbidden," so that ***Forb*** does not need to be counted among our primitive deontic notions. This leads us to redefine the notion of forbiddenness as follows:

Definition 17.2.1 *Forbiddenness. That action A is* forbidden *means that that A's omission is obligatory:*

$$\textit{\textbf{Forb}}\ \ A \equiv \textit{\textbf{Obl}}\ \ (Omitted\ \ A)$$

(⌈it is forbidden that A⌉ is equivalent to ⌈it is obligatory that A is omitted⌉)

17.3. Permission

The third basic deontic status, besides obligation and prohibition, is *permission*. According to the idea we advanced in Section 3.2.2 on page 101, we view permissions as resulting from the doxification of a *may-intention*, by which we mean one's intention that something may be done. This intention consists in one's acceptance that something is performed, or also one's exclusion of one's intention that something shall not be done.

17.3.1. The Representation of Permissions

Permissive propositions are expressed in many different ways in natural language. We say, for example, that "Tom is permitted to speak", that "he has the faculty of speaking," that "he can speak," that "it is licit that he speaks," that "he is allowed to speak," that "he is has the power of speaking," that "he is empowered to speak," and so on.

To express permissions in a uniform way, regardless of the various formulations being used in natural language, we use the operator ***Perm***. For example, to indicate that Tony is permitted to speak we write:

$$\textit{\textbf{Perm}}\ \ Does_{Tony}[\textsf{speak}]$$

(it is permitted that *Tony* speaks)

Similarly, for affirming that Tony is permitted to build a house in his land, we write:

Perm $Brings_{Tony}$[a house is built on $Tony$'s land]
(it is permitted that $Tony$ brings it about that that a house is built on his land)

17.3.2. Positive and Negative Permission

Permissions can be positive or negative according to whether they concern actions or omissions. For example, assume that Tony is given the following information concerning a dinner party he has been invited to: (1) he is permitted to wear trainers, and (2) he is permitted not to wear a tie. The first normative proposition would be expressed as:

Perm $Does_{Tony}$[wear trainers]
(it is permitted that $Tony$ wears trainers)

and the second as:

Perm (NON $Does_{Tony}$[wear a tie])
(it is permitted that $Tony$ does not wear a tie)

or equivalently, according to our definition of an omission, as:

Perm ($Omits_{Tony}$ $ToDo$ [wear a tie])
(it is permitted that $Tony$ omits to wear a tie)

17.3.3. Connections between Obligations, Prohibitions, and Permissions

Let us now consider the logical connections between the deontic notions we have so far introduced. First of all, we need to observe that when one believes that an action is obligatory then one can conclude that the same action also is permitted.

This is expressed by the following conclusive reasoning pattern:

Reasoning schema: *OP-Permissibility of obligatory action*
(1) ***Obl*** A
——— IS A CONCLUSIVE REASON FOR
(2) ***Perm*** A

For example, if one (like Antigone herself; see Section 4.3 on page 136) believes that Antigone has the obligation to bury her brother Polynices, one may conclude that she is permitted to do that.

(1) ***Obl*** $Does_{Antigone}$[bury Polynices]

---

(2) ***Perm*** $Does_{Antigone}$[bury Polynices]

This does not exclude that from a different point of view (for example. Creon's point of view) Antigone may be forbidden to bury Polynices. One may also view Antigone's case as involving a conflict of obligations, as we shall see when considering defeasible reasoning. However, even this view does not exclude that obligation implies permission: The conflict between two obligations will rather lead also to a conflict between permissions and obligations (for instance, between Antigone's being permitted to bury the body and her being forbidden to do it).

It is true that it may seem quite strange to affirm that one has the permission to behave in a certain way, when one is obliged to behave so. Thus, we would not say that Antigone believes that she is permitted to bury Polynices, when she believes that she is obliged to do.

Similarly, to consider a more mundane example, it is strange to say that I am permitted to wear a tie at the party when I am obliged to do that.

However, the oddness of saying that something is permitted when something is obligatory is consistent with, and even explained by, the fact that being obligatory entails being permitted (so that "obligatory" is more informative than "permitted"). This oddness reflects indeed the well-known conversational maxim that one should make one's assertions as informative as required, which Grice (1989) called the "maxim of quantity." In particular, in contexts like the ones we are considering, the utterance of a sentence usually "conversationally implicates" (as Grice would say) that the speaker does not believe related propositions which are higher in the scale of informativeness.

Thus, my statement that ⌈I am permitted to wear a tie⌉ usually *implicates* that I do not believe that ⌈I am obliged to wear a tie⌉: If I believed that ⌈I am obliged to wear a tie⌉ (a more informative proposition), I should state my obligation to do that, rather than just saying that I am permitted. However, this only is an implicature (a conversational presupposition), it is no logical implication.

Since A's obligatoriness entails A's permittedness, ***Obl*** A is incompatible the fact that A is not permitted:

Obl A **incompatible** NON ***Perm*** A
(⌈it is obligatory that A⌉ is incompatible with ⌈it is not permitted that A⌉)

The connection between the obligatoriness of A and the permittedness of A is replicated in the connection between the forbiddenness of A and the permittedness of A's omission: An action being forbidden entails the permission to omit it.

(1) ***Forb*** A

---

(2) ***Perm*** (NON A)

In particular, when a positive action is prohibited, we may conclude that its negation (its omission) is permitted. For example, if I believe that it is forbidden that Tom smokes, then this leads me to believe that he is permitted not to smoke.

(1) ***Forb*** $Does_{Tom}$[smoke]

---

(2) ***Perm*** (NON $Does_{Tom}$[smoke])

Similarly, when an omission is prohibited then the corresponding positive action is permitted. For instance, that George is forbidden to omit wearing a tie, entails that he is permitted to wear it.

(1) ***Forb*** NON ($Does_{George}$[wear a tie])

---

(2) ***Perm*** $Does_{George}$[wear a tie]

As we have just observed, an action A being forbidden entails that the omission of A is permitted. Thus, there is a contradiction between an action being forbidden and the omission of that action not being permitted.

Forb A **incompatible** NON ***Perm*** (NON A)
(⌈it is forbidden that A⌉ is incompatible with ⌈it is not permitted that A is omitted⌉)

For instance, there is a contradiction, and therefore an incompatibility, between j being prohibited to smoke and his not being permitted to omit smoking (or between his being prohibited to omit wearing a tie, and his not being permitted to wear the tie).

1. ***Forb*** $Does_j$[smoke] **incompatible**
   NON ***Perm*** (NON $Does_j$[smoke])
2. ***Forb*** (NON $Does_j$[wear a tie]) **incompatible**
   NON ***Perm*** ($Does_j$[wear a tie])

All the logical relations between deontic notions we have just described are synthesised in Table 17.1 on the next page. The schema shows that there is an opposition between being obliged and being prohibited: If an action A is obligatory, then its performance is permitted, which contradicts that A is forbidden.

Similarly, if an action A is forbidden, then its omission is permitted, which contradicts that A is obligatory.

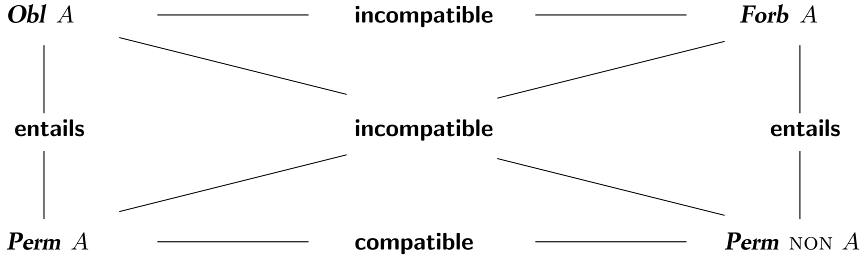

Table 17.1: *The first deontic square*

It is instead compatible that both an action A is permitted and its omission NON A also is permitted. In such a case, A would be neither obligatory nor permitted, but *facultative*, as we shall see in the next section.

17.3.4. A Fourth Deontic Status: Facultativeness

The deontic qualifications "obligatory" and "forbidden" are complete, in the sense that they determine the deontic status of both the action they are concerned with, and the complement of that action. In fact, on the basis of the equivalence:

Obl $\varphi \equiv$ ***Forb*** NON φ

we get the following two equivalences, the first concerning the case where φ is a positive action A, the second concerning the case where φ is the omissive action NON A (remember that double negations get cancelled):

1. ***Obl*** $A \equiv$ ***Forb*** NON A
2. ***Obl*** NON $A \equiv$ ***Forb*** A

According to equivalence (1), saying that j's action of wearing a tie is obligatory amounts to saying that j's omission to wear a tie is forbidden:

Obl $Does_j$[wear a tie] $\equiv$ ***Forb*** (NON $Does_j$[wear a tie])

Similarly, according to equivalence (2) saying that j's action of carrying a gun is forbidden amounts to saying that j's omission to carry a gun is obligatory.

Forb $Does_j$[carry a gun] $\equiv$ ***Obl*** (NON $Does_j$[carry a gun])

On the contrary, when we only know that an action is permitted, we do not know the status of its complement. In particular, when a positive action is permitted,

country	wearing the veil (V)	not wearing the veil (NON V)
France	***Forb*** V	***Obl*** NON V, ***Perm*** NON V
Iran	***Obl*** V, ***Perm*** V	***Forb*** NON V
UK	***Perm*** V	***Perm*** NON V

Table 17.2: *Complete deontic qualifications*

then its omission can be either permitted as well, or forbidden (this will be the case when the action besides being permitted, also is obligatory).

Consider for example, the action of a girl wearing a veil when going to school, which we denote as V. Action V is permitted in the UK, it is obligatory in Iran, it is forbidden in France. Consider now the omission of the veil, namely, action NON V. Action NON V is permitted as well in in the UK, but it is forbidden in Iran, and is obligatory in France. From Table 17.2 it appears that to express the normative qualification of the action of wearing a veil by a girl going to school in Iran or in France, it is sufficient to say that in Iran wearing the veil is obligatory while in France it is forbidden. In fact, the deontic propositions ⌈***Obl*** V in Iran⌉ and ⌈***Forb*** V in France⌉ entail all other deontic propositions that are indicated on the table with regard to Iran and France:

1. wearing the veil is permitted in Iran (since ***Obl*** V entails ***Perm*** V);
2. not wearing the veil is obligatory, and thus permitted, in France (since ***Forb*** V, is equivalent to ***Obl*** NON A, and ***Obl*** NON A entails ***Perm*** NON A) and it is forbidden in Iran (since ***Obl*** V is equivalent to ***Forb*** NON V).

On the contrary, saying that V is permitted in the UK is not sufficient to fully specify V's normative status in these countries: The permission to wear a veil (***Perm*** V) is consistent both with the permission not to wear it (***Perm*** NON V) and with the prohibition not to wear it (with ***Forb*** NON V), that is. with the obligation to wear it (with ***Obl*** V).

Thus, to provide a complete deontic specification, we need to specify whether not wearing the veil is forbidden, or whether this is forbidden. In the UK, wearing a veil is permitted (like in Iran, and contrary to what is the case in France), but also not wearing the veil is permitted too (like in France, and contrary to what is the case in Iran).

In conclusion, besides an action being obligatory (and its omission being forbidden), and besides an action being forbidden (and its omission being obligatory), there is a third way for the deontic status of an action to be fully specified: This consists in both the action and its negation being permitted.

In common language, when one says "permitted" one usually refers to this third option (according to the above mentioned Grician principle of quantity). We prefer to use the specific term *facultative*—abbreviated as ***Facult*** —to express this notion.[6]

Definition 17.3.1 *Facultative. An action A is* facultative *when both A and A's omission are permitted:*

> ***Facult*** $A \equiv$ (***Perm*** A) AND (***Perm*** NON A)
> *(⌈it is facultative that A⌉ is equivalent to ⌈it is permitted that A* AND *it is permitted that* NON *A⌉)*

For example, saying that ⌈in the UK, for a girl going to school, it is facultative to wear the veil⌉ amounts to saying that ⌈she is is permitted both to wear it and not to wear it⌉.

17.3.5. Commands and Deontic Statuses

We need to carefully distinguish the *deontic statuses* and the *speech acts* which may produce them, though common language is not very helpful in this regard. In particular, while the word *obligation* is quite univocal (it refers to the fact of being obligatory, rather than to the act of issuing a command), the expressions *prohibition* and *permission* are ambiguous, referring to both the state of being prohibited or permitted, and to the acts of prohibiting or permitting.

We have used the expressions *obligation*, *prohibition* and *permission* always to refer to the fact that something is obligatory, forbidden or permitted. Being forbidden or obligatory are *normative statuses*: They should not be confused with the speech acts that may produce such statuses. Thus, from our perspective, the act consisting in John's stating "You are allowed to smoke a cigarette, if you want" (in reply to Mary's request "May I smoke a cigarette?") is not a permission, but a permissive act. Similarly Lisa's statement "Not in my house!" (in reply to Tom's request: "May I smoke a cigar?") is not a prohibition, but a prohibitive act.

We admit that often one concludes (and believes) that an action is obligatory, forbidden, or permitted on the basis of the fact that somebody has performed a prescriptive, prohibitive, or permissive act. However, this is not necessarily the case: Such conclusions can be drawn on the basis of different grounds, such as the goals and the values one attributes to the institution or the community one is serving, or the normative customs one shares, and believes one ought to share with one's fellows (see Chapter 9).

[6] For a discussion of this notion, and for references to the literature, see Alexy (1985, 203ff.), who refers to it by using the expression *unprotected freedom* (*unbewehrte Freiheit*).

In general, even when the ground for believing that an action is obligatory or forbidden is a previous act of prescribing that action, we need to clearly distinguish two propositions:

1. the proposition asserting that an act of prescribing or forbidding a certain action took place;
2. the proposition asserting that this action is obligatory or forbidden.

As we shall see in Chapter 25, proposition (1) may be a component (a subreason) of a reason leading to endorsing proposition (2). However, to obtain a complete reason for adopting proposition (2), proposition (1) must be accompanied by further premises. In particular, when adopting a stated normative proposition as a legal authority we must assumed a meta-rule to the effect that whatever is stated in certain ways is legally binding.

It is true that according to certain theorists, whom we have called *enactement positivitists* (see Section 13.1.3 on page 362), the status of legal obligatoriness can only be produced through authoritative statements (an in particular through commands). However, this is not the view that is developed here.

Moreover, even enactment-positivitists need to distinguish conceptually (*a*) obligatoriness as a deontic status and (*b*) the fact that something has been commanded. If they were unable to trace this conceptual distinction, their substantive legal position (every obligation is produced though a command) would be reduced to a trivial tautology.

Finally, we need to observe that our definition of *forbidden* as meaning "what is obligatory to omit" does not necessarily imply that being obligatory is more basic or more fundamental that being forbidden: It just means that the two notions are interdependent. As far as logic is concerned, we might equally start with the notion of *forbidden*, and define "obligatory" as meaning "what is forbidden to omit."

However, since our psychological perspective leads us to view obligations as the doxification of intentions, we need to consider prohibitions as being the doxification of negative intentions (intentions that not to do), and therefore as being reducible to negative obligation (obligation not to do).

17.4. An Axiomatisation for Deontic Reasoning

In this section we shall synthesise the content of the ideas we have been discussing so far. First we shall provide a precise account of the connection between obligations, prohibitions and permissions. Then we shall review all axioms and inference schemata we have introduced in this chapter.

17.4.1. Relationships between Obligations and Permissions

In analysing the logical connections between obligation and permission, we need to start with the fact that, as we know, believing that an action is permitted amounts to believing that it is not forbidden.

PNF: ***Perm*** $A \equiv$ NON ***Forb*** A
(PNF (Permission is Non-Obligation): ⌈it is permitted that A⌉ is equivalent to ⌈it is not forbidden that A⌉)

This means that not being permitted amounts to being forbidden (just negate both formulas, and cancel double negations):

NON ***Perm*** $A \equiv$ ***Forb*** A
(⌈it is not permitted that A⌉ is equivalent to ⌈it is forbidden that A⌉)

For instance, believing that smoking is not permitted (that it is excluded that smoking is permitted) amounts to believing that it is forbidden to smoke. From this follows that an action being permitted contradicts that action being prohibited:

Perm A **incompatible** ***Forb*** A
(⌈it is permitted that A⌉ is incompatible with ⌈it is forbidden that A⌉)

Similarly, believing that an action is obligatory amounts to excluding that its omission is permitted:

Obl $A \equiv$ NON (***Perm*** NON A)
(⌈it is obligatory that A⌉ is equivalent to ⌈it is not permitted that not A⌉)

For example, believing that it is obligatory to wear a tie amounts to believing that it is not permitted to omit wearing a tie. Correspondingly, the obligatoriness of an action (entailing the permission to perform it) contradicts the permittedness of its omission:

Obl A **incompatible** ***Perm*** NON A
(⌈it is obligatory that A⌉ is incompatible with ⌈it is permitted that NON A⌉)

The formulas we have just being considering are summarised in the second square of deontic notions, in Table 17.3 on the facing page.

17.4.2. Reasoning Schemata for Action Logic and Deontic Logic

The set of reasoning schemata and equivalences in Table 17.4 on the next page synthesises our analysis of the logical properties of action operators and deontic qualifications (remember that $\vdash$ means "entails").

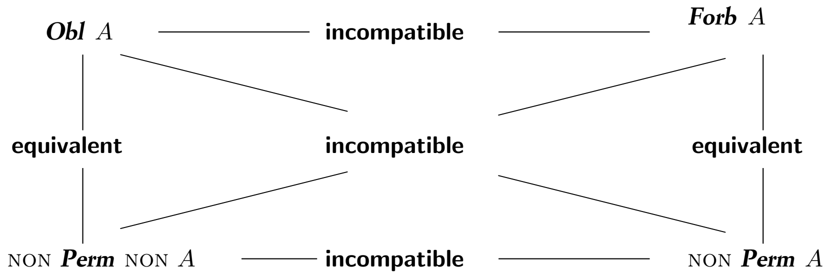

Table 17.3: *The second deontic square*

Action logic
- SPA: $Brings_j A \vdash A$
- JBA: $(Brings_j A$ AND $Brings_j B) \vdash Brings_j(A$ AND $B)$
- JPA: $(Does_j A$ AND $Does_j\ B) \vdash Does_j(A$ AND $B)$

Deontic logic
- FON: ***Forb*** $A \equiv$ ***Obl*** (NON A)
- OP: ***Obl*** $A \vdash$ ***Perm*** A
- PNF: ***Forb*** $A \equiv$ NON (***Perm*** A)
- JO: (***Obl*** A AND ***Obl*** B) $\vdash$ ***Obl*** (A AND B)

Table 17.4: *Inference schemata and equivalences for action logic and deontic logic*

We believe that this set provides an adequate formalisation of the basic properties of normative concepts, and identifies the core of deontic logic. This core is included indeed in most systems of deontic logic, which also include, however, some further, more questionable, logical principles, as we shall see in Section 17.7 on page 473.

17.5. Negative Corollaries on Permission

In the conceptual framework we have provided, saying that an action A is permitted just means the A's omission is forbidden. This simple characterisation allows us to state some negative corollaries concerning the meaning and the function of permissions, that is, to specify what is *not entailed* by the notion of permission. In this way—that is, by clarifying what permission is not—we shall try to disentangle the concept of permission from other ideas that are frequently associated with it.

17.5.1. Permission Does Not Entail Facultativeness

First of all, being permitted does entail being facultative. In fact, according to the definition we have introduced in Section 17.3.4 on page 462, ***Facult*** A is equivalent to the following conjunction:

Perm A AND ***Perm*** NON A

Thus, for action A to be facultative it is not sufficient that A is permitted: It is also necessary that A's omission also is permitted.

For example, for wearing a tie to be facultative, it is not sufficient that it is permitted to wear a tie, it must also be permitted not to wear it: If I am obliged to wear a tie at the party, then wearing it is permitted, but it is not facultative (since I am not permitted to abstain from wearing it).

Thus, we may express the connection between permittedness and facultativeness, by stating that, on the one hand, an action being permitted does not entail that it is facultative:

Perm A $\nvdash$ ***Facult*** A
(⌈A is permitted⌉ does not entail ⌈A is facultative⌉)

while, on the other hand, an action being facultative entails that it is permitted:

Facult A $\vdash$ ***Perm*** A
(⌈A is facultative⌉ entails ⌈A is permitted⌉)

17.5.2. Permission Does not Entail Prohibition to Prevent

That I am permitted to do an action does not entail that other people are forbidden to prevent me from doing that action. For example, I am permitted to park on the side of my street, though I am frequently prevented to do that by the fact that other cars have already taken all the available space.

Frequently, however, when one prevents another from performing permitted actions, one violates certain obligations that one has, though these obligations are not directly connected with the permission. Assume for example that I am permitted to park on the side of my street, and that I indeed leave my car there. Then the action of somebody who removed my car from the parking place would be illegal. However this would not follow from the violation of my permission to park, but rather from the violation of my ownership right over my car (which entails that others are obliged to not to interfere with my car without my authorisation).

Similarly, the fact that George is permitted to smoke does not imply that others are forbidden to prevent him from smoking. They may succeed in preventing his smoking in ways that do not involve the violation of any obligation: They may buy the last cigarette box available in the tobacco shop and destroy

it, they may refuse to lend George their lighter, they may threaten that they will leave the room if he smokes, and so on.

On the other hand, the others are forbidden to do various actions that would interfere with George's ability to smoke, such as stealing his cigarettes, threatening to hurt him if he smokes, throwing a bucket of water at him. However, the forbiddenness of such actions does not follow from the fact that George is permitted to smoke: It rather follows from the fact that he is the owner of the cigarettes, that all are forbidden to cause or threaten physical damage to others, and so forth.

Consider, for instance, Mary's action of taking the only packet of cigarettes that is on table, an action that has the effect of preventing George from doing something he is permitted to do, namely, smoking. Whether this action is legal or illegal does not depend on its impact on George's ability to perform what he is permitted to do, but on whether the cigarettes belong to Mary or to George.

In conclusion, we need to clearly distinguish the permission that j does A from the prohibition that another (or all others) prevents j from doing A: It is possible (and very common indeed) that one is permitted to do actions that others are also permitted to prevent.

However, there are general prohibitions upon others that—by limiting in general their action—proscribe certain ways of interfering upon the holder of the permission, and thus indirectly provide a certain legal protection to the holder's possibility of doing what he or she is permitted to do. As Hart (1982, 171) puts it:

> at least the cruder form of interference, such as those involving physical assault or trespass, will be criminal or civil offences or both, and the duties or obligations not to engage in such modes of interference constitute a protective perimeter behind which liberties exist and may be exercised.

Thus, for instance, George's possibility of exercising his permission to smoke is protected by the prohibition of assaulting him and by his property right over his cigarettes, though, as we observed, Mary is allowed to use other means to prevent him from smoking.

There are also cases where one's permission is coupled to another's prohibition to prevent exactly the permitted action, or at least by the prohibition to prevent it on purpose. These are the case to which Alexy (1985, 208ff.) refers by speaking of *freedoms* which are *directly protected* by corresponding prohibitions to interfere. Among such freedoms, there are the negative liberties one has towards the State in liberal countries (for instance, freedom of speech, of professing a religion, and so on).

17.5.3. Permission Does Not Presuppose Prohibition

It has been often affirmed that every permission is an exception to a prohibition, and therefore presupposes a prohibition. We reject this thesis, which we call the *exception-theory of permission*, as we shall see in the following, where we consider different versions of it.

The first version of the exception-theory of permission concerns the formation of normative belief. It consists in the thesis one can rationally come to believe that action A is permitted only in those cases where, unless one had this belief (and the information for obtaining it) one would believe that A is forbidden.

According to this view, the formation of permissive beliefs has the specific psychological function of countering prohibitive beliefs one already has (or would have, on the basis of one's current state of mind): Permissive beliefs only exist when they rebut prohibitive conclusion. From this perspective, it makes sense for me come to have the belief that I am permitted to walk in the park, only under the condition that, unless I had performed the inquiry which led me to this conclusion, I would have believed that I was forbidden to walk in the park.

This idea does not seem plausible. In many cases one adopts permissive beliefs as a result of an inquiry which starts with one's need to determine the normative status of an action. For engaging in this inquiry one does not need to have information leading to the conclusion that the considered action would be forbidden (unless prevailing reasons to the contrary existed).

It is true that, like any other beliefs, the belief that something is permitted may be in conflict with other beliefs. In particular, it may be in conflict with the belief that something is forbidden. However, this conflict is not necessary, since one may believe an action A is permitted also when one has no reasons for believing that A is forbidden. Moreover, also when one has such reasons, the permission does not necessarily prevail over the prohibition. In fact, to establish which belief prevails, one needs to establish which belief is preferable, and this can be done, as we have seen in Chapter 7, according to various criteria.

Thus, we need to reject the first version of the exception-theory of permission: It is not the case that every permissive belief presupposes a preexisting prohibitive belief, having a wider scope.

The second version of the exception-theory of permission does not concern permissive beliefs, but rather permissive speech acts—that is, acts through which one proclaims that something is permitted (see Section 23.4.1 on page 607) in order to achieve such result. This version of the exception-theory states that all permissive acts have the same function: They bring it about that something becomes permitted, which would otherwise be prohibited. Thus, a permission is useless unless it overrides a pre-existing prohibition.

We agree that permissive acts are frequently intended to provide permis-

sive information that will defeat inferences leading to a prohibitive conclusion. However, we reject the view that this function provides the necessary motivation of all permissive acts: There are permissive acts that do not have this motivation.

For instance, when I tell my son "You may watch television tonight!" I may have the objective of making a precise transition take place: I intend that the deontic status of his watching television passes from prohibited into permitted. However, this is not necessarily the case. Very frequently, when one performs a permissive act, one has the intention to remove uncertainties concerning the deontic status of this action, by providing a new reasons for endorsing a permissive proposition which may already follow from other reasons. For example, I may issue the permission to watch television though I believe that, in the current circumstances, my son is already allowed to watch television. Assume, for instance that he is too tired for reading and has no homework to do, so that watching television is the best thing for him to do, if this is what he likes: Even before issuing the permission, I (and also my son) can exclude that he is forbidden to watch television, given the values and principles that underlie our family.

The third version of the exception theory of permission also concerns permissive acts, and views the essential function of these acts in countering prohibitions. However, it affirms that permissive acts, besides changing the normative status of currently forbidden actions, have a further, forward-looking, function: They prevent the operation of future forbidding acts. Consider, for instance, Constitutional provisions granting the so-called civil liberties: I am permitted to move around, to express my opinions, to communicate with other people, and so on. These provisions lead to the bindingness of permissive propositions that are able to defeat future legislative prohibitions.

This preventive function is indeed an important motivation to the performance of permissive speech acts (Bulygin 1986). However, we need to reject also this third version of the exception-theory of permissions: We deny that it provides the universal rationale of all permissive acts. When telling my child that he is allowed to watch television, I may have the intention of making it so that future prohibitions to watch television—issued by authorities that are lower than me in the family hierarchy, like my older daughter—are ineffective, but I may simply want to deny that my child is now prohibited to watch television.

17.6. General Deontic Propositions

So far we have considered *individual deontic propositions*, namely, deontic propositions concerning the action of determined individuals. However, many normative propositions, both in law and in morality, express *personally-general* deontic propositions, namely, propositions concerning all individuals.

Within general deontic propositions, we shall first consider the *categorical* ones, namely, the propositions that unconditionally qualify a certain action as obligatory, prohibited, or permitted for everybody (everybody is prohibited

from smoking, everybody is obliged to pay the ticket, everybody is permitted to walk in the park, etc.).

It may be doubted that these propositions really are unconditioned. Usually in fact there are contextual conditions that remain implicit, as the fact that only human agents are considered. Moreover it would be easy to recast any unconditioned proposition in a conditional form, by transforming the characterisation of the action to be performed into a precondition of performing a generic action: The categorical proposition ⌈it is permitted to walk in the park⌉, can be transformed into the synonymous conditional proposition ⌈if one performs in the park an action which consists in walking, than that action is permitted⌉.

However, we do not need to be worried by this apparent semantic equivalence between categorical and conditional propositions: This equivalence only concerns alternative ways of representing the same normative contents, and has no substantive impact on the analysis of legal reasoning. For it to be worthwhile to consider general deontic propositions that are specifically categorical, it is sufficient that it is possible (and useful) to express certain normative contents in a categorical form.

17.6.1. The Representation of Categorical Deontic Propositions

In natural language general deontic propositions are expressed in various ways. For example, to state categorically the forbiddenness of smoking, we may use any of the following locutions: "It is forbidden to smoke," "Nobody shall smoke," "No smoking allowed," "No smoking!," "Please, do no smoke!"

For expressing in a uniform way general deontic propositions having a categorical content we shall use some resources of predicate logic: variables x, y, w, and the universal quantifier FORANY. This enables us to formulate different kinds of such propositions in the following forms.

A general (categorical) obligative propositions has the form:

FORANY (x) ***Obl*** $Does{*}_x A$
(for any x, it is obligatory that x does A)

For example:

FORANY (x) ***Obl*** $Does_x$[pay taxes]

means that ⌈any x must pay taxes⌉, or more simply that ⌈everybody must pay their taxes⌉.

A general (categorical) prohibitive propositions has the form:

FORANY (x) ***Forb*** $Does{*}_x A$
(for any x, it is forbidden that x does A)

For example:

FORANY (x) ***Forb*** $Does_x$[smoke]

means, that ⌈any x is forbidden to smoke⌉, or more simply that ⌈everybody is forbidden to smoke⌉.

A general (categorical) permissive proposition has the form:

FORANY (x) ***Perm*** $Does*_x A$

For example:

FORANY (x) ***Perm*** $Does_x$[express x's opinion]
(for any x, it is permitted that x does A)

means that any x is permitted to express x's opinion, or more simply that everybody is permitted to express his or her opinion.

17.6.2. Personally-General and Specific Deontic Propositions

The most common reasoning one may do with personally-general categorical propositions is to infer personally-specific categorical propositions. This can be done according to the schema FORANY *elimination* or *specification*, which we borrow from predicate logic (this inference consists in dropping the universal quantifier and in substituting the quantified variable with and individual name).

Here are three examples of such inferences. The first inference concludes that John is obliged to pay taxes, given the premise that everybody is obliged to pay taxes. The subsequent ones are to be read similarly.

(1) FORANY (x) ***Obl*** $Does_x$[pay x's taxes]

---

(2) ***Obl*** $Does_{John}$[pay *John*'s taxes]

(1) FORANY (x) ***Forb*** $Does_x$[smokes]

---

(2) ***Forb*** $Does_{Mary}$[smokes]

(1) FORANY (x) ***Perm*** $Does_x$[express x's opinions]

---

(2) ***Perm*** $Does_{Claire}$[express *Claire*'s opinion]

17.7. Standard Deontic Logic and Deontic Paradoxes

In this section we shall move beyond our formalisation of deontic logic, and connect it to other analyses of deontic reasoning, and in particular, to the so-called *standard deontic logic*. First we shall consider some controversial schemata

for deontic reasoning, and then we shall address the deontic paradoxes that are originated by these schemata.

The comparison of different deontic systems will require us to use some logical notation. The reader who prefers to shun logical formalism can safely jump to the next chapter.

17.7.1. Standard Deontic Logic

The schemata of our formalisation (see Table 17.4 on page 467) do not exhaust the inferences that are usually enabled by most common action-logics and deontic logics.

For example, to obtain the so-called *old system* of deontic logic (originally proposed by von Wright 1951) we need to add one further reasoning schema. This schema, which we call *DO-distribution of obligations*, allows us to infer the obligation to do separate actions, given the obligation to do their conjunction.

$$DO\text{:}\ \ \textbf{\textit{Obl}}\ (A \text{ AND } B)\ \vdash (\textbf{\textit{Obl}}\ A \text{ AND } \textbf{\textit{Obl}}\ B)$$

The so-called *standard deontic logic* (see Hansson 1971; Hilpinen 1971, 13ff.) extends von Wright's system with a further logical principle, the axiom schema *OT-obligatoriness of tautologies*:

$$OT\text{:}\ \ \textbf{\textit{Obl}}\ (A \text{ OR NON } A)$$

Schema OT says that for any propositions A, it is obligatory that A holds or that it does not hold.

Note that while von Wright's system (like in our formalisation) deontic operators apply to actions, in standard deontic logic they apply to any kind of proposition: The deontic operator ***Obl*** in standard deontic logic expresses the idea that a state of affairs ought-to-be (in German, *Sein-sollen*), rather than the idea that someone ought-to-do an action (*Tun-sollen*).

Axiom OT more generally entails (if one admits the substitution of equivalent propositions), the obligatoriness of any *tautological* combination of actions, namely, any combination that logically cannot fail to exist, that holds in every logically possible situation (for instance, it is a logical necessity that either A is performed or it is not performed).[7]

Finally, we obtain the usual axiomatisation of standard deontic logic, by substituting DO with the following schema *DD-deontic detachment*:

$$DD\text{:}\ \ \textbf{\textit{Obl}}\ (\text{IF } A \text{ THEN}^m\ B)\ \vdash \text{IF } \textbf{\textit{Obl}}\ A \text{ THEN}^m\ \textbf{\textit{Obl}}\ B$$

[7] Various logicians and legal theorists have rejected OT, on account that it unduly connects alethic and deontic modality (by deriving obligation from logical necessity). For instance, von Wright (1951, 10) refuses this axiom, in the name of what he calls the *principle of deontic contingency*: "A tautologous act is not necessarily obligatory, and a contradictory act is not necessarily forbidden."

17.7.2. Paradoxes of Standard Deontic Logic

Standard deontic logic has a number of implications that many authors find weird or unacceptable. Some of these implications are indeed counted among the *deontic paradoxes*.

Some of these paradoxes are linked to the fact that in standard deontic logic, the following holds: whenever (1) IF A THEN^m B is a theorem,[8] which we abbreviate as $\lceil \vdash$ IF A THEN^m $B\rceil$, and (2) we know that A is obligatory, then (3) we can conclude that also B is obligatory. This means that the obligation to realise a state of affair A entails the obligation to realise any state of affairs B that is more generic (less specific) than A,[9] as the following reasoning schema OG indicates:

Reasoning schema: OG*-obligation generic-making*

(1) $\vdash$ IF A THEN B;
(2) ***Obl*** A
——— IS A REASON FOR
(3) ***Obl*** B

OG, which results from a combination of reasoning schemata for standard deontic logic, tells us the following: Whenever A is more specific than B,[10] the assumption that A is obligatory justifies the conclusion that also B is obligatory.

A first instance of this inference is the famous Ross's paradox (Ross 1941) of the derived obligation. Assume the following obligation, which concerns posting a letter, abbreviated as $Post$.

$R1$: ***Obl*** $Post$
(it is obligatory to post the letter)

For any proposition A, it is a logical theorem (and a logical truth) of propositional logic that IF THEN^m (A OR B) (this follows from OR *introduction*). Thus for instance:

$R2$: $\vdash$ IF $Post$ THEN^m $Post$ OR $Burn$
(it is a logical theorem that ⌈if ⌈the letter is posted⌉ THEN^m ⌈the letter is posted or burned⌉⌉)

Thus, according to schema OG, from ($R1$) and ($R2$) we draw the following conclusion:

[8] A theorem is a proposition we can conclusively establish just on the basis of the logical form of A and B, without the need to appeal to any premise.

[9] We assume that a proposition B is more generic than (more exacly, at least as generic as) a proposition A, if it is logically necessary (it is a theorem) that if A obtains, than also B obtains, i.e., if IF A THEN B is a theorem.

[10] When it can be conclusively established that whenever A is true also B is true.

$R3$: ***Obl*** ($Post$ OR $Burn$)
(it is obligatory that the letter is posted or burned)

Thus, the premise that it is obligatory to post a letter entails the conclusion that it is obligatory to post it or to burn it.

An even more absurd instance of schema OG is exemplified by so-called paradox of the *Good Samaritan*: Having the obligation to help an injured person implies that it is obligatory to injure this person. For instance, let us assume that it is obligatory that Tom acts as the Good Samaritan toward Mary, to wit, that he helps Mary who is injured (we abbreviate ⌈Tom helps Mary⌉ with *Help* and ⌈Mary is injured⌉ with *Injured*):

$S1$: ***Obl*** ($Helps$ AND $Injured$)
(it is obligatory that John helps Mary who is injured)

According to schema AND *elimination* we obtain the following obvious logical theorem (and logical truth):

$S2$: $\vdash$ IF $Help$ AND $Injured$ THEN^m $Injured$
(it is a logical theorem that ⌈if ⌈Tom helps Mary who is injured⌉, then ⌈Mary is injured⌉⌉)

Propositions ($S1$) and ($S2$) lead us to conclude, according to OG, that:

$S3$: ***Obl*** $Injured$
(it is obligatory that Mary is injured)

Thus, if we believe that it is obligatory that Tom acts as a Good Samaritan (that he helps Mary who is injured), we must conclude, according to standard deontic logic, that it is also obligatory that Mary is injured.

Another disquieting instance of the OG schema concerns the notion of knowledge, and is called *paradox of the knower*, or paradox of *epistemic obligation* (Åquist 1967). Assume that a person, let us call him John, has the task of watching customers in a supermarket. John must pay attention, so that he is aware of any illegal activities going on: If somebody steals, it is obligatory that John knows that this persons is stealing (and inform the direction). Assume that Mary is stealing. According to schema *syllogism* we can establish the following conclusion, which provides the premise of our paradoxical inference:

$E1$: ***Obl*** $Knows_{John}$[Mary is stealing]
(it is obligatory that John knows that Mary is stealing)

For any proposition A, it is a logical theorem that, if we know A, A is true (in the logic of knowledge, for a belief to be knowledge, it must concern a true proposition):

$E2$: $\vdash$ IF $Knows_{John}$[Mary is stealing] THEN^m [Mary is stealing]
(it is a logical theorem that ⌈IF ⌈John knows that Mary is stealing⌉ THEN^m ⌈Mary is stealing⌉⌉)

According to OG, we can draw from ($E1$) and ($E2$) an absurd conclusion:

$E3$: ***Obl*** [Mary is stealing]
(it is obligatory that Mary is stealing)

Thus, the premises that John ought to know that Mary is stealing surprisingly entails, in standard deontic logic, that Mary ought to steal.

Finally, let us address the most famous puzzle of standard deontic logic, the so-called Chisholm's paradox (Chisholm 1963). Assume all of the following propositions (the example is taken from Castañeda 1981):

$C1$: ***Obl*** $AttendCeremony$
(it is obligatory that Jones attends the June commencement ceremony)

$C2$: ***Obl*** (IF $AttendCeremony$ THEN^m $WearRegalia$)
(it is obligatory that ⌈if Jones attends the June commencement ceremony, then he wears academic regalia⌉)

$C3$: IF NON $AttendCeremony$ THEN^m NON ***Obl*** ($WearRegalia$)
(if Jones does not attend the June commencement ceremony, then it is not obligatory that he wears academic regalia)

$C4$: NON $AttendCeremony$
(Jones does not attend the June commencement ceremony)

From premise ($C2$) according to schema DD, we can infer:

$C5$: IF ***Obl*** $AttendCeremony$ THEN^m ***Obl*** $WearRegalia$
(If it is obligatory that Jones attends the June commencement ceremony, then it is obligatory that he wears the regalia)

Given ($C1$) and ($C5$), we can establish, according to *detachment*, the following result:

$C6$: ***Obl*** ($WearRegalia$)
(it is obligatory that Jones wears the regalia)

On the other hand, from premises ($C3$) and ($C4$) according to schema *detachment*, we can infer conclusion $C7$, which contradicts $C6$:

$C7$: NON ***Obl*** ($WearRegalia$)
(it is not obligatory that Jones wears the regalia)

The paradoxality of Chisholm Paradox consists indeed in the fact that apparently sensible and consistent premises (the set $C1$–$C4$), lead us to contradictory conclusions.

The Chisholm Paradox is also called the paradox of *contrary-to-duty* imperatives, since it originates from the combination of two obligations: The first requires an action A to be performed; the second requires an incompatible action B to be accomplished, in the event that A is not performed (in the case that the obligation to do A is violated). It has been argued that this paradox shows how standard deontic logic fails to provide a genuine notion of *derived obligation*: Deontic logic tells us what would be the case if all obligation were fulfilled, but fails to tell us would we ought to do in the real word, where obligations can be violated.

17.7.3. How to Avoid Deontic Paradoxes

We cannot here discuss any further the deontic paradoxes, since this would require a detailed technical discussion, going beyond the scope of the present volume, in order to analyse and compare different intuitions, formalisation, and logical systems.[11] Let us just observe that the deontic paradoxes do not arise in our account of deontic reasoning, which is more restrictive than standard deontic logic in two regards:

- we reject all of the axioms and inference schemata which originate the paradoxes, like DO (distributivity of obligation), OT (obligatoriness of the tautology), DD (deontic detachment) and OG (obligation generic-making);
- we apply deontic operators only to action-descriptions.

Our logical parsimony enables us not only to avoid paradoxes, but also to omit addressing many controversial issues of deontic logic. This does not exclude that for certain domains or applications a stronger deontic logic may be needed, whose adequate formalisation requires paradoxes and controversies to be carefully addressed. This, however, we can leave to specialised research on deontic logic.

[11] For a list of the main paradoxes of deontic logic, see Meyer and Wieringa 1993b, sec. 1.3. For a discussion of some of them see Castañeda 1981. There are also interesting paradoxes of normative reasoning which are not related to deontic logic, like in particular Ross's paradox of the self-amending legislation (Ross 1969), which concerns the possibility of amending the rule which confers the power to make constitutional amendments (we shall address this paradox in Section 27.3.4 on page 713).

Chapter 18

NEGATION, PERMISSION, AND COMPLETENESS

In this chapter we shall address an important and still very controversial issue of deontic logic: the *negation of deontic propositions*. In particular, we need to understand the connection between the negation of the forbiddenness of action A (which we express as NON ***Forb*** A) and the permission of A (which we express as ***Perm*** A).

The discussion of this issue will lead us into a more general problem: the meaning and logical function of *negative legal propositions*. Finally, this will lead us into an even broader subject, the subject of the *completeness of the law* (or, seen from the complementary perspective, the problems of *gaps in the law*). Though we will be unable to consider adequately the huge philosophical and doctrinal debate on this subject, we will state our view on whether, and in what sense, the law (and legal cognition) may be said to be complete.

18.1. Permission, Ignorance, Non-Derivability

We shall distinguish two different aspects usually merged in discussing the notion of permission. The first concerns the distinction between being permitted and not being prohibited. The second concerns the distinction between having the information that a certain deontic status does not hold, and not having the information that it does hold.

18.1.1. Being Permitted and Not Being Prohibited

We need first to consider whether proposition:

> NON ***Forb*** B
> (it is not forbidden that B)

can be considered to be equivalent to proposition:

> ***Perm*** B
> (it is permitted that B)

This issue can be cast in epistemic terms: Is believing that B is not forbidden the same as believing that B is permitted?

Our answer to this question is positive. In general, as we have seen in Section 3.2.2 on page 101, the belief in the negation of the obligational proposition ***Obl*** A, namely, the belief that:

NON ***Obl*** A
(it is not obligatory that A)

corresponds to the doxification of a negative intention, i.e., to the state of mind of *excluding* the intention to do A. In particular, the negation of the prohibition to do A, that is:

NON ***Forb*** A
(it is not forbidden that A)

or equivalently:

NON (***Obl*** NON A)
(it is not obligatory that NON A)

doxifies the state of mind of an agent which excludes to adopt the instruction that action A shall be omitted. This is exactly the state of mind corresponding to having the intention that action A may be done, which (see Section 3.2.2 on page 101) can be doxified as:

Perm A
(it is permitted that A)

Therefore, we may conclude that the belief that A is not forbidden coincides with the belief that A is permitted. This conclusion corresponds to the following statement of von Wright (1983a, 187), though he speaks of norms, rather than of normative beliefs:

> [T]he negation norm of an obligating norm permits the omission of the thing to which the obligating norm obliges—and the negation norm of a permissive norm makes obligatory the omission of the thing which the permissive norm permits.

Before addressing non-forbiddenness we need to insist on the distinction between forbiddenness as a deontic status and prohibitive acts (acts of forbidding). On the one hand, A may be forbidden on the basis of grounds that have nothing to do with acts of prohibiting (in other words, it may be the case that A is forbidden though nobody has prohibited it). For instance, we may conclude that A is forbidden according to teleological reasoning, that is, since A's omission is required for achieving some important legal values. On the other hand, A may not be forbidden, though somebody has performed an act aimed at prohibiting A: The prohibitive act may not succeed in bringing about that A is now forbidden, since it has been issued invalidly, or since it has been repealed, or since it conflicts with a more important or more special permission.

Thus, when saying that A is not forbidden, we do not mean that nobody has prohibited A, but rather that A does not possess the status or property of

forbiddenness (illicitness). This equivalence between being permitted and not being forbidden leads us to the following definition of permission (in the sense of permittedness).

Definition 18.1.1 *Permission. Action A is* permitted *iff it is not the case that A is forbidden:*

$$\textbf{\textit{Perm}}\ Does_j A \equiv \text{NON}\ (\textbf{\textit{Forb}}\ Does_j A)$$

(⌈it is permitted that j does A⌉ is equivalent by definition to ⌈it is not forbidden that j does A⌉)

Remembering the connection between forbiddenness and obligatoriness, we may equally provide the following alternative definition:

Definition 18.1.2 *Permission. Action A is* permitted *iff it is not the case that A's omission is obligatory:*

$$\textbf{\textit{Perm}}\ Does_j A \equiv \text{NON}\ (\textbf{\textit{Obl}}\ \text{NON}\ Does_j A)$$

(⌈it is permitted that j does A⌉ is equivalent by definition to ⌈it is not obligatory that j does not do A⌉)

Having defined *permitted* as "not forbidden" or "not obligatory to omit" does not necessarily imply that forbiddenness or obligatoriness are more basic normative statuses than permittedness. As far as logic is concerned, we might as well have started with permittedness, and defined the other deontic statuses in the term of it (this was done, for instance, by von Wright 1951).

However, from our psychological perspective—since obligation doxifies intention, and permission doxifies the rejection of an intention—we may view obligatoriness as being prior to permission, and we are thus justified in adopting a corresponding definitional strategy.

18.1.2. Permission as Ignorance

Having established that permission amounts to non-forbiddenness, we need now to consider whether having the information that A is permitted may be equated to not having the information that A is forbidden.

This issue is confusing since it is not so clear what we mean by (not) having the information that something holds.

In a first, and quite plausible sense, having information about something means having a belief (or having knowledge, when the information is true). From this perspective, we need to assess whether believing that action A is permitted—or, which is the same, that A is not forbidden—amounts to not believing that A is forbidden.

It seems to us that such view cannot be maintained, since there is a substantial difference between the following mental states:

- having the belief that A is permitted, or which is the same, having the belief that A is not forbidden;
- not having the belief that A is forbidden.

In the first case, one is convinced that action A has the property of being permitted—or, which is the same, one is convinced that A does not have the property of being forbidden. In the second case, one simply does not have the belief that A is forbidden, and may not have either the belief that A is not forbidden. To express this idea more clearly, let us write:

$\mathit{Believes}_j A$
(j believes that A)

to mean that j believes proposition A.

Let us first observe that in general (and obviously) believing in a negation is different from not believing in the negated proposition

1. $\mathit{Believes}_j(\text{NON } A) \not\equiv \text{NON } \mathit{Believes}_j(A)$
($\lceil j$ believes that NON $A\rceil$ is not equivalent to $\lceil j$ does not believe that $A\rceil$)

For instance, having the belief that Mary has not arrived, is different from not having the belief that she has arrived. The second state of mind, but not the first, also exists when I do not know whether she has arrived or not. According to (1), we may state that having the belief that A is not forbidden is different from not having the belief that A is forbidden:

2. $\mathit{Believes}_j(\text{NON } \textbf{\textit{Forb}} \ A) \not\equiv \text{NON } \mathit{Believes}_j(\textbf{\textit{Forb}} \ A)$
($\lceil j$ believes that A is not forbidden$\rceil$ is not equivalent to $\lceil j$ does not believe that A is forbidden$\rceil$)

Considering that, as we know, being permitted amounts to not being forbidden:

3. $\textbf{\textit{Perm}} \ A \equiv \text{NON } \textbf{\textit{Forb}} \ A$

we get that believing that A is permitted amounts to believing that A is not forbidden:[1]

4. $\mathit{Believes}_j(\textbf{\textit{Perm}} \ A) \equiv \mathit{Believes}_j(\text{NON } \textbf{\textit{Forb}} \ A)$
($\lceil j$ believes that A is permitted$\rceil$ is equivalent to $\lceil j$ believes that A is not forbidden$\rceil$)

Finally, given that believing that action A is not forbidden is different from not believing that A is forbidden, according to (2), we are lead to conclude that believing that A is permitted is also different form not believing that A is forbidden:

[1] To fully validate this inference we should address the difficult issue of the intensionality of the notion of belief, and discuss under what conditions belief in a proposition entails belief in logically equivalent propositions. For our purpose, however, it is sufficient to rely on commonsense, and assume that such entailment holds at least when the reasoner is aware of the equivalence.

5. $\mathsf{Believes}_j(\textbf{Perm}\ A) \not\equiv$ NON $\mathsf{Believes}_j(\textbf{Forb}\ A)$

(⌈j believes that A is permitted ⌉ is different from ⌈j does not believe that A is forbidden⌉)

18.1.3. The Case of Socrates, the Judge Who Knows That He Does not Know

Let us develop an example to clarify the distinction between believing that something is permitted and not believing that it is forbidden. Consider that only in the last 20 years have most countries introduced laws extending copyright protection to software. In the United States this was done with the Computer Copyright Act in 1980, while in Italy it was done only in 1992, according to the 1991 European directive on software protection.

Before these acts were enacted, there was a considerable debate, where some authors (and some judges) affirmed that copyright protection extended to software, so that unauthorised duplication of computer programs was forbidden, while others affirmed that this was not the case.

Assume that a judge approached the issue of the unauthorised duplication of computer programs in the late 1960s.

We call him *Socrates*, since we want to construct him as an exemplar of epistemic self-awareness. As opposed to Dworkin's Hercules—which is an exemplar of superhuman legal skills—Socrates is (like all humans) a bounded cogniser: He has limited cognitive capacities, in perception, ratiocination, heuresis, analogy, and experimentation. Socrates however—differently from many humans—has a clear awareness of his cognitive limitation: He knows that his cognition only provides fallible outcomes, on the basis of limited input information and constrained processing capabilities. Rephrasing, in an attenuated form, the famous motto which is attributed to the ancient Socrates (according to Diogenes Laertius, *Life of the Philosophers*, 2, 32), our judge knows that there is much he does not know. Judge Socrates, however, does not view this motto as a profession of scepticism, but rather as a statement of the condition which justifies his cognitive efforts, and his tendency to criticise, refine and review his past cognitive achievements.

Assume that, when starting to consider the matter, Socrates has no idea concerning the deontic status of unauthorised duplication of computer programs (probably he, like most people in the 1960s, does not even know what a computer program is).

In other words, when starting his inquiry, neither Socrates believes that it is forbidden to duplicate software, nor does he believe that it is not forbidden (that it is permitted). Correspondingly, we may describe his state of mind as follows:

NON $\mathsf{Believes}_{Socrates}(\textbf{Forb}$ [software is duplicated]$)$ AND
NON $\mathsf{Believes}_{Socrates}($NON $\textbf{Forb}$ [software is duplicated]$)$

At this stage, it would be unreasonable for Socrates to infer that it is not forbidden (that it is permitted) to duplicate software from the simple fact that he does not have the belief that duplication is forbidden. Whether duplication is forbidden or not is what he needs to establish through a legal inquiry: He cannot infer non-forbiddenness from his own present state of uncertainty (ignorance). Thus the proposition that Socrates does not have the belief that duplication if forbidden (which is true) is different from the proposition that Socrates believes that duplication is not forbidden (which is false).

$$\text{NON } \mathit{Believes}_{Socrates}(\textbf{\textit{Forb}} \text{ [software is duplicated]}) \neq$$
$$\mathit{Believes}_{Socrates}(\text{NON } \textbf{\textit{Forb}} \text{ [software is duplicated]})$$

Finally, from the equivalence between not being forbidden and being permitted, we conclude that, with regard to Socrates, not having the belief that unauthorised duplication is prohibited is different from having the belief that it is permitted.

$$\text{NON } \mathit{Believes}_{Socrates}(\textbf{\textit{Forb}} \text{ [software is duplicated]}) \neq$$
$$\mathit{Believes}_{Socrates}(\textbf{\textit{Perm}} \text{ [software is duplicated]})$$

In conclusion, we need to reject the view that ⌈believing that an action A is permitted⌉ can be assimilated to ⌈not believing (or not knowing) that A is forbidden⌉: Permission cannot be equated with uncertainty or ignorance about a prohibition.

18.1.4. Permission as Non-Derivability

Now that we have rejected the view that believing that action A is permitted amounts to not having the belief that A is forbidden, we need to consider whether we can recast the link between permission and lack of information on prohibition in a different way: This is the idea that A is permitted, in situation circumstances Cs, if A's prohibition (its forbiddenness) in Cs is not derivable from the law with regard to Cs.

Let us first specify our use of the term *situation* and of the related term *circumstance*.

Definition 18.1.3 *Situation. By a* situation*, with regard to a proposition φ, we mean all states of affairs that are that are relevant to the establishment of whether φ holds. By a* circumstance *of a situation, we mean a proposition describing any of such states of affairs. By* situation circumstances*, we mean the set of all circumstances of a situation.*[2]

[2] A *situation* is often identified as possible state of the world: The full description of a situation S requires specifying whether any possible (atomic) proposition P holds or does not hold in S. From this perspective, we may thus view the description of a situation as a complete set of

A situation may be present (its circumstances obtain now), past (its circumstances obtained at certain time-points in the past), or only hypothetic (it includes circumstances which would hold under certain conditions).

To understand the connection between permission and non-derivability of prohibition, we need to consider how we should in general understand expressions of the form ⌈it is not derivable from the law that ⌈φ in situation circumstances Cs⌉⌉, where φ is any normative proposition.

First of all, we need to observe that the statement of φ's non-derivability from the law is very imprecise, unless we specify what set of premises we include in "the law" and what patterns of reasoning we use to derive conclusion from such premises: A proposition φ may be derivable from certain sets of premises and not from certain other ones, according to certain inference schemata, and not according to other schemata.

Let us first clarify that we say that a proposition φ is obtainable from a certain set of legal contents (noemata), with regard to a situations, when φ is derivable from the premises set we obtain by combining the legal propositions and the (circumstances of the) situation. Now, the question we need to ask, with reference to legal contents Ls, situation circumstances Cs and reasoning schemataRs is the following: "What conclusion can one derive from Ls with regard to Cs, by using Rs?"

This question can more exactly be expressed as "What propositions are derivable from $Ls \cup Cs$, according to Rs?"[3] or also as "What propositions does set Ls entail according to Rs, with regard to circumstances Cs?"

Let us address this question by considering a specific example. Assume all of the following, with regard to Socrates, the judge in the software case we considered in the previous section:

- he can find in the copyright statute the set Ls_1 of legal contents in Table 18.1 on the next page;
- he is aware of all relevant circumstances Cs_1 in Table 18.2 on the following page;

circumstances Cs, where each circumstance c in Cs is an atomic proposition or negation of such a proposition. This idea was originally developed in Carnap 1950 and 1956. It was applied to the law by Alchourrón and Bulygin (1971, 21ff), who use the term *case* to refer to what we call a *situation*. It also corresponds to the idea of a *world* in possible-words semantics for modal logic, according to the approach introduced in Kripke 1963. For our purposes we need to relax this notion of a situation, since the relevant circumstances may include states of affairs holding at different time points (for instance, ⌈Jane married Mark⌉, one year after ⌈Jane had an affair with Andrew⌉, two years after ⌈Jane was no longer married to Mark⌉), and non truth-functional connections between states of affairs (for instance, ⌈Jane having this affair caused the breakdown of her marriage⌉).

[3] We use the expression $Ls \cup Cs$ for referring to the *set-theoretical union* of sets Ls and Cs, which is the set of all elements contained either Ls or in Cs. In our example, this is the set of all propositions listed in Tables 18.1 and 18.2.

a_1: FORANY (x)
IF $[x$ is a literary work$]$ AND NON $[x$ is in the public domain$]$
THEN ***Forb*** $[x$ is duplicated$]$
a_2: FORANY (x)
IF $[x$ is a work of fiction$]$ OR $[x$ is a scientific contribution$]$
THEN $[x$ is a literary work$]$
a_3: FORANY (x)
IF $[x$ is in the public domain$]$
THEN ***Perm*** $[x$ is duplicated$]$

Table 18.1: *Legal contents Ls_1*

b_1: *Tom's code* is a computer program
b_2: *Great Gatsby* is a work of fiction
b_3: *War and Peace* is a work of fiction
b_4: NON [*Great Gatsby* is in the public domain]
b_5: NON [*Tom's code* is in the public domain]
b_6: *War and Peace* is in the public domain

Table 18.2: *Situation circumstances Cs_1*

- he proceeds according to a set of reasoning schemata Rs_1, including all inferences for classical logic (all schemata we introduced in Chapter 15).

In our example, we may say that the legal propositions in set Ls_1 entail the prohibition to duplicate *Great Gatsby*, with regard to situation circumstances Cs_1. Given the premises in $Ls_1 \cup Cs_1$, according to Rs_1, Socrates can indeed infer the following proposition:

Forb [*Great Gatsby* is duplicated]

He can achieve this result according to the inference in Table 18.3 on the next page.

Similarly, Socrates can infer a permission with regard to *War and Peace*:

Perm [*War and Peace* is duplicated]

With regard to Tom's program, he has no way (according to Rs_1) to infer from $Ls_1 \cup Cs_1$ neither:

Forb [*Tom's code* is duplicated]

nor:

1. b_2: *Great Gatsby* is a work of fiction
2. a_3: FORANY (x)
   IF [x is a work of fiction] OR [x is a scientific contribution]
   THEN [x is a literary work]
3. *Great Gatsby* is a literary work ⟨from 1 and 2, by *syllogism*⟩
4. b_5: NON [*Great Gatsby* is in the public domain]
5. a_3: FORANY (x)
   IF [x is a literary work] AND NON [x is in the public domain]
   THEN ***Forb*** [x is duplicated]
6. ***Forb*** [*Great Gatsby* is duplicated] ⟨from 3, 4 and 5, by *syllogism*⟩

Table 18.3: *Inference from* $Ls_1 \cup Cs_1$*, according to* Rs_1

NON (***Forb*** [*Tom's code* is duplicated])

To express in general the idea that a set of premises Ps entails a proposition φ, according to reasoning schemata Rs, we write:

$$Ps \ \vdash_{Rs} \varphi$$

With reference to the example above, Socrates should affirm that premise set $Ls_1 \cup Cs_1$ *entails* the prohibition to duplicate *Great Gatsby*, according to reasoning schemata Rs_1. Socrates's statement to that effect can be formally expressed as follows:

$$Ls_1 \cup Cs_1 \ \vdash_{Rs_1} \textbf{\textit{Forb}} \ [\textit{Great Gatsby} \text{ is duplicated}]$$

Similarly, to express in general the idea that a premises set Ps does not entail a proposition φ, according to reasoning schemata Rs, we write:

$$Ps \ \nvdash_{Rs} \varphi$$

With reference to the example above, Socrates would affirm that premises set $Ls_1 \cup Cs_1$ *does not entail*, according to Rs_1, the prohibition to duplicate Tom's code:

$$(a) \ Ls_1 \cup Cs_1 \ \nvdash_{Rs_1} \textbf{\textit{Forb}} \ [\textit{Tom's code} \text{ is duplicated}]$$

Equally, such premises set *does not entail* that it is not forbidden (that it is permitted) to duplicate the code with regard to situation circumstances Cs_1:

$$(b) \ Ls_1 \cup Cs_1 \ \nvdash_{Rs_1} \text{NON } \textbf{\textit{Forb}} \ [\textit{Tom's code} \text{ is duplicated}]$$

Propositions (a) and (b) are perfectly consistent. Socrates, after looking into premises set $Ls_1 \cup Cs_1$, is aware that he cannot conclude either that it is forbidden or that it is not forbidden (that it is permitted) to duplicate software.

In fact, premises set $Ls_1 \cup Cs_1$ does not tell him anything about the deontic status of the duplication of computer software. To establish this status Socrates needs to consider further legal and factual information, and to deploy other ways of reasoning.

This further effort may lead him to conclude that the duplication is permitted or that it is forbidden, depending on what information he finds and on how he processes it (as we said at the end of the sixties and in the early seventies judges reached different conclusions with regard to the duplication of software).

18.2. Completeness of the Law

According to the conclusion we achieved in the previous section, we must reject the idea that the non-derivability (from a limited set of normative premises) of the prohibition of action A, amounts to A's permission.

We may however wonder whether this idea can be accepted in the limit case, that is, when the whole law is considered. Can we say that A is permitted in a situation S when A's forbiddenness is not derivable from the whole law, with regard to situation S, according to any rational inference methods? And more generally, can we say that for any legal proposition φ and any situation S, φ holds in S, whenever a ideal legal cogniser would fail to derive NON φ with regard to S?

By answering these questions we will be able to take a stand regarding the controversial issue of the completeness of the law and of legal cognition.

18.2.1. The Completeness of Legal Cognition: A Noble Dream?

The failure to derive the negation of a legal proposition NON φ may be considered as a proof of φ only if we lift any *a priori* limitations concerning both what information can be taken into account and what rational reasoning methods are to be applied. Any limitation in these regards can lead Socrates—when assimilating non-derivability of ***Forb*** A to ***Perm*** A—to wrong conclusions.

For instance, Socrates cannot assume that the law does not contain the prohibition to duplicate of software, on the basis of the only fact that legislation does not entail this prohibition. He is aware that there is also the possibility that the prohibition is derivable from further legal sources, like precedents. Thus, it would be wrong for him to jump to the conclusion that duplicating software is not forbidden (and thus permitted), on the basis of the only fact that legislation does not forbid it.

Similarly, Socrates cannot conclude that the law does not contain the prohibition to duplicate software, on the basis of the only fact that conclusive (deductive) inferences do not provide this result: It is possible that the prohibition can be obtained through defeasible inferences or analogies. In fact, before statutes on software protection were issued, many lawyers (and judges), in various coun-

tries, affirmed that, on the basis of an analogy with literary works, it was possible to conclude that it was forbidden to duplicate software.

Socrates—being aware of his own cognitive limitations—does not in general assimilate his inability to derive a certain proposition to the derivation of the negation of that proposition. He does that only under restricted circumstances, that is, when all of following conditions are satisfied:

1. The domain he is considering is characterised by *bivalence*: For any proposition concerning this domain either this proposition or its negation is the case, i.e., there are no undetermined propositions.
2. The information (and the cognitive tools) he already has at his disposal is complete: It enables him to obtain exactly every positive proposition which holds in that domain.

Only when both such conditions hold, can he view his inability to establish that ⌈***Forb*** φ⌉ as a decisive reason for concluding that ⌈NON ***Forb*** φ⌉, which amounts to ⌈***Perm*** φ⌉. Let us consider whether both conditions hold with regard to the law.

Possibly we may accept condition (1) in the normative domain: It is necessarily the case that, for any legal proposition φ and any possible situation S, either φ or NON φ holds in S (for a recent discussion, see Golding 2003). This means—according to the connection we established between practical truth and optimal practical cognition (see Section 3.3 on page 102)—that for any proposition φ and any possible situation S, perfect legal cognition would lead us either to endorse φ or to endorse NON φ. This seems to be what is claimed by Dworkin (1977a; 1985a), when saying that there is one right solution even for hard cases, and that this is the solution that judge Hercules, the perfect legal cogniser, would find.

We may indeed give the assumption of bivalence an epistemic form, by saying that ideal legal cognition as a whole is complete, or has no *gaps*: A complete (an ideal) rational inquiry, which takes into account all relevant normative and factual information, would lead an ideal cogniser to reach a determinate outcome with regard to every issue having the form "Is it the case that φ in S?," where φ is any legal proposition and S is any situation. Such a reasoner would, for any legal proposition φ and any situation S, either endorse ⌈φ in S⌉ (exactly in case that φ is the case in S) or endorse ⌈NON φ in S⌉ (exactly in case that φ is not the case). Thus an unbounded reasoner could view his or her inability to establish φ as a proof that φ is not the case.[4]

Note that when the notion of legal cognition is broadly understood (putting no constraints on the inputs to legal cognition and on the rational ways of processing them), the "noble dream" (as Hart 1983a would say) of the completeness

[4] This statement needs to be qualified with regard to Gödel's incompleteness theorem, according to which there are true but non-provable propositions.

of legal cognition becomes a very modest idea, having little practical importance: This is the idea that there are no (or few) *Buridan's ass issues* in legal reasoning. According to this idea, namely, there are no (or few) issues such that alternative incompatible solutions to these issues would be equally delectable (equally adoption-worthy) to an ideal legal cogniser.

The noble dream would indeed be an impossible fantasy (or at most a very remote, and questionable, political ideal, see Section 14.2.1 on page 394) if we were setting to ourselves the following restrictions:

- our cognitive inputs were limited to the currently shared rules of our community (or to the rules which have been expressly stated by a legislator), and
- our ways of reasoning were limited to deductive inference (or also to the patterns for rule-based defeasible inference).

The "dream" becomes instead a possibly controversial, but quite reasonable (and even trivial) assumption, if one abandons both limitations, that is, if one assumes that completeness concerns ideal legal cognition, having perfect unbounded cognitive resources, with regard to both the available inputs and the ways of processing them.[5]

Under this condition, indeed, the dream of completeness has limited practical implications for a reasoner like Socrates, who is (and is aware to be) a bounded cogniser. Even if Socrates believed that necessarily either φ of NON φ is the case (and that Hercules necessarily either would conclude for φ of for NON φ), he would not view his failure to establish φ as a proof of NON φ. This fact is independent from the principle of bivalence: Socrates knows that it is possible that φ is the case, also when he is unable to establish this conclusion.[6]

For instance, assume that Socrates accepts the principle of bivalence, also its epistemic version: He believes that duplicating software either is legally forbidden or is legally permitted, and he accepts that Hercules would know which one of the two is the case. However when starting his inquiry, he is aware that he is no Hercules: He does not know whether the duplication is forbidden or permitted, and he has no warranty that when he forms a belief on this matter, this belief will be correct.

[5] This claim still is possibly controversial, since it may be argued that there are many Buridan's-ass issues in legal reasoning, or even that most (serious) legal issues are Buridan's-ass issues, with regard to legal cognition. However, this would entail a conclusion which many lawyers would not find very plausible: A large area of legal decision-making—at least so long as it pretends to be rational—is a lottery in disguise.

[6] We cannot here tackle the problem of gaps in the law in general terms, which would require us to address technical aspects of meta-logics (concerning the notion of derivability and decidability), to examine specific areas of substantive law, and to discuss the huge literature on this subject. On gaps in the law, see, for instance: Zitelmann 1903; Bobbio 1960; Conte 1962; Conte 1966; Kelsen 1967, sec. 35.g 245ff.; Alchourrón and Bulygin 1971, secs. 5 and 6.

Under such conditions, Socrates should try to find reasons in favour or against the prohibition to duplicate software, using all materials and all ways of reasoning at his disposal, rather than drawing inferences from his current ignorance of the matter.

18.2.2. Completeness of Sections of the Law

The idea that the optimal legal cognition has no gaps, besides being consistent with one's awareness of one's ignorance, also is consistent with the view that limited sets of legal information may have gaps. Thus, this idea is consistent with the view that a certain particular set Ls^* of legal information (a set of legislative rules, a set of cases, of customs, and so on) when combined with certain reasoning procedures Rs^* is incomplete, namely, with the idea that Ls^* fails to provide a solution to some legal issue in some situation. More exactly, this idea is consistent with the view that there exists at least one legal proposition φ and one situation Cs^*, such that $Ls^* \cup Cs^*$ does not entail, according to Rs^*, neither φ nor NON φ:

$$(Ls^* \cup Cs^* \;\nvdash_{Rs^*} \varphi) \text{ AND } (Cs^* \cup Ls^* \;\nvdash_{Rs^*} \text{NON } \varphi)$$

In particular, the completeness of ideal legal cognition is consistent with the incompleteness of the set of all current legal beliefs of certain community c, namely, the set of all legal propositions that are currently endorsed by c.

The latter form of incompleteness consists more precisely in the fact that the set LBs_c of the *legal beliefs* of that community (with are kind of normative beliefs in the sense of Section 10.2.9 on page 292) is not complete, with regard to reasoning schemata for conclusive reasoning (CRs) and for defeasible reasoning (DRs). This means that there exist a legal proposition φ and situation Cs^* such that:

$$(LBs_c \cup Cs^* \;\nvdash_{\{CRs,DRs\}} \varphi) \text{ AND } (LBs_c \cup Cs^* \;\nvdash_{\{CRs,DRs\}} \text{NON } \varphi)$$

This is indeed a situation that often happens when a new issue emerges: Consider for instance human cloning, genetic engineering, and so on

However, the incompleteness of the normative beliefs currently endorsed by the legal community entails neither the incompleteness of legal cognition, nor the incompleteness of the law (intended as the set of normative noemata that are adoption worthy in legal reasoning). A legal reasoner even when his or her community has not yet adopted a rule establishing whether φ or NON φ is legally the case, may be able to opt for one of the two alternative solutions, and view his or her choice as legally binding (as being part of the law). For instance, we can achieve this result according to teleological reasoning or to analogies.

Obtaining specific conclusions may require adopting new general propositions, propositions that are not yet endorsed by one's community, but which one hopes and believes will become normative beliefs of one's community. The

ground for viewing such general propositions as legally binding may consist in their inferential connections with contents which are known to be legally binding (and in particular in teleological connections with legal values). Moreover, such propositions can be viewed as legally binding on the basis of the preferability of a legal theory containing them to a legal theory excluding them, a preferability to be measured according the criteria which we included in the idea of legal coherence (see Section 4.1.4 on page 125), subject to the requirement of plural adoptability (see Section 10.1.3 on page 274).

From our perspective, we can say that a particular legal conclusion follows from the law even when we reach this conclusion on the basis of normative propositions we have devised according to heuresis and we have endorsed (as being legally binding) on the basis of coherence evaluations (in particular, according to the reasoning model we shall expound in Chapters 28 and 29).

This is because for us *the law* includes all practical noemata which are legally binding (adoption-worthy in legal reasoning), and a general proposition can be legally binding exactly because of its coherentist preferability: We (as bounded cognisers) may be wrong in believing that a certain noema is legally binding, but we are necessarily right (according to our approach) in assuming that all legally binding propositions belong to the law.

18.2.3. Closure Meta-Rules

A legal system can contain meta-rules establishing that certain legal conclusions hold unless certain other legal conclusions can be obtained in certain ways from certain kinds of premises. For instance, many legal systems contain the principle *nulla poena sine lege* (no criminal punishment without a law), which we interpret (according to the civil law tradition) as the requirement that all crimes have to be specified through legislation. This means that we need to assume that an action is no crime, unless the legislative provisions entail that it is a crime.

In our framework, if $LegRs$ is the set of the legislative rules (as constructed according to legal interpretation), Cs is a set of situation circumstances, CRs is the set of conclusive (deductive) reasoning schemata, and DRs is the set of the defeasible reasoning schemata, we can recast such a meta-rule for the criminal law as follows:

FORANY (A, Cs)
IF $(LegRs \cup Cs) \nvdash_{CRs,DRs} [A \text{ is a crime in } Cs]$
THEN NON $[A \text{ is a crime in } Cs]$

(for any action A and situation circumstances Cs, if the set of legislative rules $LegRs$, combined with Cs, does not lead, according to conclusive and defeasible reasoning, to the conclusion that action A in circumstances Cs is a crime, then A is no crime in Cs[7])

Rules linking the negation of a proposition φ to the non-derivability of φ can be called *closure rules*, since they ensure that a conclusion is always obtainable:

[7] In this and in the following formulas, by "φ in Cs," where φ is a proposition and Cs is a

When we adopt a closure rule, then in every possible case either φ is derivable, or NON φ is derivable (for specific reasons or anyway according to the closure rule).

18.2.4. Strong Permission and Weak Permission

The link between non-derivability and substantive legal conclusions has often been addressed with regard to the connection between prohibition and permission.

In particular, it has been much discussed whether the non-derivability that an action A is forbidden necessarily leads to the conclusion that A is permitted. If this were the case, then all legal systems would be complete or *closed*:[8] Given a legal system LS, we would always be able to conclude for any action A and situation Cs, either that A is forbidden in Cs or that A is permitted in Cs.[9] In fact, according to the assumption that non-derivability of forbiddenness entails permittedness, one of the following two conditions must necessarily hold, with regard to LS:

1. either we can derive that ***Forb*** A;
2. or we can conclude that ***Perm*** A (on the basis of the fact that we cannot derive that ***Forb*** A).

To avoid the assimilation of permission to non-derivability of prohibition, while retaining some connection between non-forbiddenness and permittedness some authors have distinguished between two distinct notions of permission:

- A's *weak permission*, that is, the non derivability of A's forbiddenness and
- A's *strong permission*, that is, the derivability of A's permittedness.[10]

In particular, some authors have wondered whether every legal system LS necessarily includes a *closure rule* r_{clos}, stating that whenever a behaviour is not weakly permitted according to the rest of the legal system $(LS - r_{clos})$,[11] then this behaviour is strongly permitted (for a thorough discussion of this issue, see Alchourrón and Bulygin 1971, chap. 7, sec. 2).

set of situation circumstances, we express that φ holds in Cs. This means that when Cs is the case (when every circumstance in Cs obtains) φ also is the case, which we can express conditionally as: IF Cs THEN^m φ.

[8] The term *closed* is used in this sense by von Wright 1968: "A normative system is closed when every action is deontically determined in this system [...]. A system which is not closed is called open." See also Alchourrón and Bulygin 1971, chap. 7, sec. 1.

[9] For a discussion of this complex issue see Alchourrón and Bulygin 1971, chap. 6, sec. 2.

[10] On the controversial issue of the distinction between strong and weak permission, see: von Wright 1963; von Wright 1968; Alchourrón and Bulygin 1971; von Wright 1983a; Opalek and Wolenski 1973, Alchourrón and Bulygin 1984a; Bulygin 1986; Opalek and Wolenski 1991; von Wright 1991. For a recent review, see Mazzarese 2000.

[11] $LS - r_{clos}$ denotes the result we obtain subtracting (cancelling) r_{clos} from LS.

r_{clos}: FORANY (A, Cs)
IF $((LS - r_{clos}) \cup Cs) \nvdash$ ***Forb*** A
THEN ***Perm*** A in Cs

(for any action A and situation circumstances Cs, if the normative system $LS - r_{clos}$ (the legal system LS minus r_{clos}), combined with Cs, does not entail, according to conclusive and defeasible reasoning, that action A is forbidden in situation circumstances Cs, then A is permitted in Cs)

18.2.5. Closure Rules and Bounded Legal Cognition

The real relevance of a closure rule, like r_{clos}, cannot be stated in general terms: It depends on what contents one includes in one's concept of the law, and what ways of reasoning one includes in one's concept of entailment.

Let us consider first a *most-liberal closure-rule*, that it, a closure rule which assumes the broadest understanding of both law and entailment:

- the law includes all practical contents (rules, values, factors-links) that are adoption-worthy in legal reasoning, whatever their source;
- entailment includes all rational ways of processing the law; and
- there are no limit in the time and effort to be used for identifying and processing the law.

Under these assumptions, a closure rule is likely to be useless, or almost so.

A most-liberal closure-rule is perfectly useless if "there is always a right answer," that is, if (*a*) legal knowledge is bivalent and (*b*) optimal legal cognition is assumed to be able to find the right answer.[12] If this is the case, a right answer exists for any question of the type "is it the case that A is permitted or is the case that A is forbidden?," and it consists either in stating that A is permitted or in stating that A is forbidden.

Thus the closure rule would be irrelevant to an optimal cogniser: Whenever an optimal cogniser does not reach the conclusion that A is forbidden, the cogniser must be able to reach the conclusion that A is permitted, regardless of the closure rule.

The closure rule would on the other hand be misleading to a bounded cogniser: The fact that such a cogniser is unable to establish A does not exclude that A is the case, and thus such inability is no proof of NON A.

A most-liberal closure rule is almost, but not completely, useless if we assume that there are legal issues that are fully indeterminate, that is, if we assume there are legal issues with regard to which even an optimal cogniser would be in the position of the Buridan's ass: There are no superior legal grounds for preferring

[12] As we shall see in Chapter 28, this requirement can be understood in a very weak sense: An outcome is the right one, when the theory supporting it is preferable to theories supporting incompatible outcomes.

the conclusion A is permissible to the conclusion that A is forbidden, and vice versa.

However, also under the assumption that there are Buridan's-ass cases in legal reasoning, the most-liberal closure-rule would still be misleading for a bounded cogniser: A bounded cogniser would never be sure whether his or her inability to establish A depends on the fact that optimal cognition too would fail to establish A (the cogniser is facing a Buridan's-ass case), or depends on his or her cognitive limitations.

A closure rule becomes really meaningful only when it includes some restrictions either on the premises to be considered, or on the way of processing them, or on the available time. Under this condition, the closure rule becomes useful also to a bounded cogniser. However, a restricted closure-rule is a substantive legal rule, to be accepted or rejected on specific grounds, a rule whose effect consists in precluding certain legal contents, or certain ways of reasoning, from entering into legal decision-making.

For example, we can recast the closure-rule concerning criminal law as follows (by assimilating being a crime and being criminally prohibited):

> FORANY (A, Cs)
> IF $(CriminalRules \cup Cs) \nvdash_{r_{clos},DR}$ ***Forb*** A
> THEN ***Perm*** A in Cs, according to criminal law
>
> (if the set of the statutory criminal rules, $CriminalRules$, combined with the circumstances Cs of the case, does not lead, according to conclusive and defeasible reasoning, to conclude that A is forbidden, then A is permitted according to criminal law)

We need to specify that the permissive conclusion only holds with regard to criminal law, since it may still happen that the same behaviour is prohibited according to private law. For instance, various Italian judges concluded, before a law on software protection was issued, that duplicating software was no crime (was not criminally forbidden, and thus was criminally permitted), since no statute prohibited it (and crimes require a statutory provision). However, the same judges held that duplication was a tortious action, forbidden according to private law, on the basis of an analogy with the prohibition to duplicate literary work.

The practical significance of the closure rule *nullum crimen sine lege* consists therefore in disabling analogical reasoning and also teleological reasoning (unless used in the interpretation of legislation). In fact, these ways of reasoning are usually appropriate only when a solution cannot be derived though rule-based reasoning, according the available legislative, judicial or customary rules. The closure rule above, by allowing a conclusion to be derived through rule-based reasoning in any case (either via a specific rule, or via the closure rule), prevents teleological or analogical reasoning from being used.[13]

[13] On the possible conflict between a permissive closure rule (a rule asserting that any ac-

The existence of explicit closure-rules like the *nullum crime sine lege* one—which make a legal conclusion dependent on the fact that a different result does not follow from a limited set of legal information or of ways of processing it—does not contradict the assumption of the completeness of optimal legal cognition (the thesis that there is always a right answer for any legal issue).

Under this assumption, an optimal legal cogniser would have achieved a determined result even without the closure rule. However, such a closure rule—differently from the most-liberal closure-rule we considered above—is not irrelevant to an optimal cogniser: It is an additional substantive premise, which may lead an optimal cogniser to a result which is different from the result the cogniser would have achieved without the meta-rule.

18.2.6. Ignorance and Autoepistemic Inferences

We have asserted—in general and with specific regard to the connection between prohibition and permission—that a bounded cogniser cannot view his or her inability to establish a legal conclusion as a proof of the negation of that conclusion. This does not exclude that in certain contexts one can draw consequences from one's own ignorance.[14]

Such inferences can be drawn only when one can make the so-called *closed-world assumption*, namely, the assumption that one's information allows one to infer all positive propositions that hold in the chosen domain, an assumption that is sometimes useful in computer databases and inference systems (see Reiter 1978, and Clark 1987). This assumption, however, needs to be justified with reference to specific circumstances, it cannot be taken for granted.

There are certain contexts and situations (in particular, in legal proceedings) where the law allows or requires one to draw certain negative conclusions from the fact that other facts (or legal conclusions) could not be established in certain ways. In particular, this is connected to the application of the rules on the burden of proof: One party's failure to prove a certain fact may licence inferences based on the assumption that this fact does not hold.

For instance, if the prosecutor fails to prove that a crime has taken place, the judge should indeed assume that the crime has not take place, and absolve the accused person. Similarly, in a civil lawsuit, if the plaintiff fails to show that the defendant has violated the plaintiff's rights, the judge should assume that no violation has taken place, and decide accordingly.

This, however, only concerns specific legal conclusions and specific decisional contexts. It cannot be viewed as providing the general way in which the law deals with negations of legal propositions (and, in particular, with the negation of prohibitions, that is, with permissions).

tion which is not explicitly prohibited is permitted) and the outcomes of analogical reasoning, see Bobbio 1960, 152–7.

[14] This is the reasoning pattern which characterises *autoepistemic logic* (see Moore 1987, and Levesque 1990).

18.2.7. Some Conclusions on Negation, Permission, and Completeness

Our discussion of the issues of negation, permission, and completeness has led us to the following conclusions.

We retain the equivalence between permitted and non-forbidden, that is, between ***Perm*** A and NON ***Forb*** A.

However, the negation NON in the locution NON ***Forb*** A, is not to be understood as non-derivability: We cannot assimilate legal negation to non-derivability from any fixed set of legal premises. This is because in principle legal cognition can adopt whatever premises appear to be adoption-worthy in legal reasoning, and can process these premises according to any rational ways of processing information.

According to our broad notion of legal cognition, though limited sets of legal premises have gaps, it is doubtful whether legal cognition as a whole has gaps: The existence of gaps would require that there is a legal propositions φ, such that there is no legally relevant reason for preferring a legal theory (in the sense specified in Section 4.1.4 on page 125; see also Chapter 28) entailing φ to a legal theory entailing NON φ. Similarly (and equivalently) it is doubtful whether the law as a whole has gaps, where by "the law as a whole" we mean the set of normative contents (noemata) that are adoption-worthy in legal reasoning.

In any case—whatever solution we give to the theoretical issue of the completeness of legal cognition— logic alone does not allows us to assimilate A's permission to the failure to establish A's prohibition from any specific set of premises (for example, from statutory rules). We can do that only when there are appropriate closure rules, which, however, are substantive (contingent) rules: They are to be appropriately justified, with regard to a specific legal system, to be legally binding.

Chapter 19

OBLIGATIONAL CONCEPTS

The basic deontic qualification—obligatory, forbidden, permitted and facultative—need to be integrated with further components to capture the fundamental normative notions of legal language, such as, in particular, the notion of a right.

In this chapter we shall make a first step in this direction, providing an account of those legal concepts, the *obligational concepts*, that are based upon the notion of an obligation. These include, in particular, the first four *Hohfeldian concepts*: duty, right, noright, and privilege.[1]

19.1. Teleology of Normative Propositions

Before addressing the obligational concepts, we need to introduce a more general idea. This is the idea that normative propositions are intended to satisfy certain *purposes*, namely, certain final or instrumental values.[2]

19.1.1. The Teleological Stance toward Normative Propositions

We often need to adopt a teleological stance with regard to normative propositions: We need to view the endorsement and practice of normative propositions as being aimed at serving certain communal purposes (goals and values). In particular, this is required to articulate the content of a such propositions, and to adjudicate their conflicts.

First of all, we need to adopt this attitude with regard to general rules. This does not concern only the rules that we have directly derived from values according to teleological reasoning, but it also the content of authoritative statements:

[1] As we shall see in Section 19.4 on page 510. We shall examine the remaining Hohfeldian concepts, the power-based or *potestative* concepts, in Chapter 22.

[2] Under the notion of a purpose, we include not only ultimate values, but also instrumental values, that is, the *goals* that have an instrumental role with regard to the achievement of further values. Consider, for instance, goals like reducing the speed of cars, promoting the use of a certain technology, reducing the consumption of tobacco, and so forth. We could also use the expression *interest*, in the comprehensive sense in which it is used by the so called jurisprudence of interests (*Interessenjurisprudenz*), through it may be argued that the purposes of a rule do not include all interests at stake in the rule's adoption and practice: The purposes of a rule only include the interests advanced by the rule, to the exclusion of the interests impaired by its adoption (Heck 1968a, sec. 4, 155).

Whenever we engage in rationalising our normative system (see Section 4.1 on page 121), we need to ascribe communal purposes also to legislative and judicial rules, in order to explain and justify their adoption and persistence (as components of the practical theory our community is using in legal decision-making).

Secondly, purposes can be attributed also to the specific propositions that are derived from general rules through syllogisms, since such propositions inherit their purposes from the corresponding general rules.

The purpose of a rule should not be mistaken for the aim (possibly a self-interested one, or also an illegal one) that is pursued by the individual members of the legislative body when voting for that rule. This issue has been famously addressed by von Jhering (1924, III, 35), who distinguished the purpose of a duty (the interest it is intended to serve, according to the point of view of the legal system, or of the legal community), from its various side-effects (reflex-effects, *Reflexwirkungen*).

Jhering considers, for instance, the case (quite frequently occurring also nowadays) that a law prohibiting the import of certain goods is enacted by persons having in mind the objective of favouring a particular domestic producer (who has lobbied for achieving this result). He argues that this fact does not imply that this law confers a right to that manufacturer, since his advantage is only to be viewed as a side effect.

The identification of what valuable goals a certain rule is intended to serve is rather the result of an exercise in rationalisation, through which one attempts at finding what effects of the practice of a rule can be viewed as reasons for its communal adoption and persistent endorsement.

In some cases, it may be difficult to identify what communal aims are served by a certain normative proposition: The proposition may only be useless or damaging. Consider, for instance, a case where it clearly appears that the ruling political party has issued a new regulation, in order to make it more difficult for its leaders to be convicted of certain offences (for instance, by prohibiting the use of certain kinds of documents, which would prove such offences, by limiting the time in which prosecution can take place, and so on). In such a case the search for a communal goal or aim is likely to fail to provide any acceptable result. One may then frankly admit that this is the case: There are no substantive grounds for the communal endorsement of such regulations. The only reason for adopting the regulation is the fact that it has been stated by the legislative power.

In other cases, it may be very difficult to disentangle the various effects that a certain normative proposition can produce, and to identify what effects may be viewed as the purposes of that proposition. Consider, for instance, the permission of having abortions. It may be seen as having, among others, the following effects:

1. preventing deaths or health damage caused by illegal abortions;

2. reducing abortions (under the assumption that, once abortion is legalised, it can be prevented through contraception);
3. attributing women the freedom of choosing not to become mothers, even after being pregnant;
4. enabling people to have control over their reproduction;
5. population control (reducing the total number of births);
6. selective population control (assuming that legalised abortion induces a reduction of births in the poorest portions of population, not having easy access to illegal abortion and to contraception);
7. savings in social security, due to a reduction of costs involved in taking care of unwanted children;
8. reduction of criminality, under the assumption that unwanted children have a stronger tendency to develop criminal behaviour.[3]

This is not the place for considering whether the legalisation of abortion really has all the effects we have listed. It is sufficient for us to observe that, even if this were true, not all such effects could be seen as valuable goals for a community which has legalised abortion, but respects everyone's dignity and has no pressing overpopulation problems. While the first four effects (or at least some of them) may possibly be viewed as teleological grounds supporting a permission to abort, that is, as purposes of a permissive regulation, the subsequent ones should rather be viewed as side-effects.

Obviously the possibility of finding some valuable goals that are served by a certain normative proposition does not imply finding a convincing teleological rationalisation for that proposition: It may happen that adopting that proposition leads to negative effects that outweigh its positive effects.

For instance, an opponent of the legalisation of abortion, though accepting that legalisation has certain positive impacts, may believe that its negative impacts (and, first of all, its impact on the life of legally aborted foetuses) outweigh its positive impacts.

19.1.2. A Notation for Normative Teleology

Let us propose the following way to indicate that a certain normative proposition serves certain goals or purposes. We write:

$$Prop{\Uparrow}^{G}$$

to indicate that the adoption of $Prop$ advances the goal (or the set of goals) G. For instance, assume that we believe that (all instances of) the rule that gives the general permission to abort has the goal of protecting public health (by preventing health risks from illegal abortion). We can express this idea as follows:

[3] This is the controversial thesis advanced by Donohue and Levitt 2001.

$\text{FORANY}\ (x)\ (\textbf{\textit{Perm}}\ [x\ \text{aborts}])\Uparrow^{Public\ Health}$

(for any x, it is permitted that x aborts in order to advance public health)

Often the purpose of (the adoption of) a normative proposition is to protect the interest of certain persons, though this interest may take different contents (within certain ranges). This is the case, in particular, for normative propositions attributing rights.

In such cases, we write:

$Prop\Uparrow^{G_j}$

($Prop$, in order to to advance j's goal G)

where G_j is the particular interest of j which is meant to be furthered by the adoption of the normative proposition $Prop$. For instance, if one believes that the permission to abort, rather than being aimed at promoting public health in general, is aimed at promoting the health of the particular individuals that are going to have abortions, then one needs to rewrite the proposition above as:

$\text{FORANY}\ (x)\ ((\textbf{\textit{Perm}}\ [x\ \text{aborts}])\Uparrow^{Health_x})$

(for any x, it is permitted that x aborts, in order to advance x's health)

The specification of what interest is advanced by (the adoption of) a normative proposition allows us to distinguish:

- the normative propositions that are aimed at advancing some collective goals or values (like public health), and
- the normative propositions which are aimed at advancing goals or values of individual persons (like the health of those individuals).

For instance, from the proposition above, one may infer that Mary's permission to abort has the purpose of protecting her individual health (rather than public health):

$(\textbf{\textit{Perm}}\ [Mary\ \text{aborts}])\Uparrow^{Health_{Mary}}$

(Mary is permitted to abort, in order to advance her health)

Finally, when a proposition is aimed at advancing the interests of an individual, but it is not necessary to specify what interests, we say that the proposition has the purpose of advancing that individual, and we write:

$Prop\Uparrow^{j}$

($Prop$, in order to advance j's interests)

where j is the individual at issue. For instance, Tom's obligation to pay Mary a professional fee of € 1,000 is aimed at protecting her unspecified interests, so that we may say:

$(\textbf{\textit{Obl}}\ Does_{Tom}[\text{pay}\ Mary\ €\ 1{,}000])\ \Uparrow^{Mary}$

(it is obligatory that Tom pays Mary € 1,000, in order to advance Mary's interests)

19.2. Directed Obligations

Our analysis of the connections between normative propositions and purposes allows us to provide a precise characterisation of the direction of an obligation, which will enable us to introduce a set of obligational legal concepts, as we shall see in the following sections.

19.2.1. Other-Directed Obligations

Our starting point for the analysis of obligational concepts will be the notions of a *other-directed obligation*. By this we mean an obligation of an agent having the function of satisfying the interest of another (for a discussion of this notion, see Herrestad 1995, and Krogh and Herrestad 1996).

This is what typically happens in private law: One's obligation is intended to satisfy the interest of a specified individual, which is called the *beneficiary* of the obligation.

In other words, we are concerned with those cases when one's obligation can be explained or justified by the fact that this obligation contributes to promoting the interests of another person. This is not to be viewed as a side-effect of that obligation: It rather is an essential element of it, its *intentional justification*.

We need to consider whether all obligations are other-directed, or whether there are obligations to which this qualification does not apply. It seems that there are indeed non-other-directed obligations, like those that are only justified on paternalistic grounds, those that are intended to satisfy the interests of non-organised groups, and possibly those that are intended to satisfy non-human interests (animals, ecosystems, and so on).

Let us first consider *paternalistic obligations*, namely, the obligations that are intended to safeguard the interests of the obliged person, rather than the interest of others. There have been various legal and political theories arguing that such obligations should not be legally enforceable, but should rather pertain to individual morality (or rather to the specification of individual life-styles).

We can mention, for instance, Thomasius's (1963, 1.4.40–2) idea that the principle of the *right* or *lawful* (in Latin *justum*, from *jus* "law") consists in the prescription not to harm others (*quod tibi non vis fieri, alteri ne fecieris*, "what you do not want to be done unto you, do not do unto others"). This principle is to be distinguished from the principle of the *honourable* (in Latin *honestum*, from *honor*, "honour"), concerning one's behaviour toward oneself (*quod vis, ut alii sibi faciant, tute tibi facies*, "what you do want that other do unto themselves, do it unto yourself").[4] More recently and more famously, the idea that the

[4] Thomasius also introduces a third principle, the principle of the *decorous* or *becoming* (in Latin *decorum*, from *decus*, "moral dignity" or "virtue"), concerning the active promotion of the interests of others (*quod vis ut alii tibi faciant tu ipse facies*, "what you do want that other do unto you, do it unto them").

proper domain of the law only includes obligations unto others was promoted by John Stuart Mill, who expressed it in the following famous statement:

> the only purpose for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. (Mill 1991a, 14)

We do not need here to discuss these theories, nor the opposed views that the law may legitimately impose also obligations which are not aimed at protecting the interests of others (the classical debate on these and related matters is provided by Hart 1963, and Devlin 1965).

For us it is sufficient to observe that various legal systems contain non-other-directed obligations. Consider for instance the prohibition to use narcotics, the obligation to wear belts in cars, the prohibition of suicide or consented euthanasia.

We apply the idea of other-directed obligations also to cover duties aimed at preserving some communal or collective good—such as prohibitions to pollute the environment, to damage the cultural heritage, or to endanger national security. However this can be done only when the protected collective interest can be attributed to a unit of agency. In such cases this entity may be viewed as the particular individual agent whose interest is intended to be protected, even when this individual agent is a collective entity (for example, when the community concerned is organised into an association, an administrative body, and so on).

19.2.2. The Representation of Other-Directed Obligations

Following the approach we adopted in Section 19.1 on page 499, we represent obligations aimed to advance another's interest, in the following form:

$(\boldsymbol{Obl}\ Does{*}_j A){\Uparrow}^k$
(it is obligatory, that j does A, in order to advance the interest of k)

where obviously, k and j need to be different.[5]

This leads us to define accordingly the notion of an *other-directed obligation*.

Definition 19.2.1 *Other-directed obligation. It is* obligatory, toward *k, that j does A* ($\mathbf{Obl}^k Does{*}_j A$) *iff it is obligatory, that j does A, in order to advance the interest of k* (($\mathbf{Obl}\ Does{*}_j A){\Uparrow}^k$)*:*

[5] This formula does not concern only to positive actions, having the form $Does_j A$. It also applies to negative actions (omissions), having the form NON $Does_j A$. Moreover, it also concerns productive actions, having the form $Brings_j A$ or NON $Brings_j A$. This is indicated by the use of the generic action operator $Does{*}_j A$, which covers both positive and negative actions, both of the behavioural type and of the productive type (see Section 16.3.3 on page 450).

$$\textbf{\textit{Obl}}^{k} Does*_j A \equiv (\textbf{\textit{Obl}}\ Does*_j A)\Uparrow^{k}$$

The notion enables us to express normative propositions like the following, for positive action:

$\textbf{\textit{Obl}}^{Mary} Does_{Tom}$[pay € 1,000 to $Mary$]
(it is obligatory, toward Mary, that Tom pays € 1,000 to $Mary$)

or like the following, for negative actions:

$\textbf{\textit{Obl}}^{Tom}$ NON $Does_{Mary}$[communicate to others Tom's trade secrets]
(it is obligatory, toward Tom, that $Mary$ does not communicate to others Tom's trade secrets)

Usually the beneficiary of the duty is also the addressee of the action to be performed. However, this is not always the case.

For instance, assume that Mary, in order to provide € 10,000 to her father John who is in need, makes a contract with Mark, according to which Mark will deliver that amount directly to John. According to this contract, Mark is obliged, in the interest of Mary, to pay the € 10,000 to John: Mary if the beneficiary of the obligation, which John is the addressee of her action. This would be simply represented as:

$\textbf{\textit{Obl}}^{Mary} Does_{Mark}$[pay € 10,000 to $John$]
(it is obligatory, toward $Mary$, that $Mark$ pays € 10.000 to $John$)

Besides direct obligation, we may also have directed forbiddenness. Consider for example, how Mary may be forbidden to raise a building taller than 10 meters on her land, in the interest of her neighbour Tom (assume that the contract through which she bought the land from Tom included a term to this effect). We express this normative position as follows:

$\textbf{\textit{Forb}}^{Tom} Does_{Mary}$[raise a building taller than 10 meters]
(it is forbidden, toward Tom, that $Mary$ raises a building taller than 10 meters)

19.2.3. Other-Directed Permissions

In Chapter 17 we have seen that the notion of permission corresponds to the negation of forbiddenness (prohibition), and thus corresponds to the negation of an obligation concerning the complementary action:

$$\textbf{\textit{Perm}}\ Does*_j A \equiv \text{NON}\ \textbf{\textit{Forb}}\ Does*_j A \equiv \text{NON}\ \textbf{\textit{Obl}}\ \text{NON}\ Does*_j A$$

(⌈it is permitted that j does A⌉ is equivalent to ⌈it is not forbidden that j does A⌉ which is equivalent to ⌈it is not obligatory that j omits to do A⌉)

Correspondingly, by denying other-directed prohibitions, we get other-directed permissions. This leads to the following equivalences:

$\textbf{\textit{Perm}}^k Does{*}_j A \equiv$ NON $\textbf{\textit{Forb}}^k(Does{*}_j A) \equiv$
NON $\textbf{\textit{Obl}}^k$NON $Does{*}_j A$

(⌈it is permitted toward k that j does action A⌉ is equivalent to ⌈it is not forbidden toward k that j does A⌉ which is equivalent to ⌈it is not obligatory, toward k, that j omits to do A⌉)

For example, assume that Mary and Tom make a new agreement, according to which she is permitted to raise a building up to 15 meters high. We may then say that:

$\textbf{\textit{Perm}}^{Tom} Does_{Mary}$[raise a building up to 15 meters high]
(it is permitted, toward Tom, that $Mary$ raises a building up to 15 meters high)

There is no contradiction between having a permission toward one person and not having the same permission toward another.

Assume for instance that Mary has another neighbour, let us call her Lisa, and that Mary has also undertaken toward Lisa the obligation to remain below 10 meters, but that Lisa does not want to give Mary the permission to raise her building higher than that.

Under such conditions, we may consistently say the following:

$\textbf{\textit{Perm}}^{Tom} Does_{Mary}$[raise a building up to 15 meters high] AND
NON ($\textbf{\textit{Perm}}^{Lisa} Does_{Mary}$[raise a building up to 15 meters high])
($Mary$ is permitted, toward Tom, to raise a building up to 15 meters, though being not permitted (being forbidden) to do that toward $Lisa$)

Thus, permission toward a person is compatible with prohibition toward another.

19.2.4. Reasoning with Directed Obligations

We do not need to introduce specific reasoning schemata for other-directed obligations and other-directed permissions, since these normative positions just inherit the reasoning schemata we introduced for obligations and permissions in general. For example, the reasoning schema:

(1) $\textbf{\textit{Obl}}\ A$

---

(2) $\textbf{\textit{Perm}}\ A$

according to which the obligatoriness of action A entails A's permittedness, is paralleled by the schema:

(1) $\textbf{\textit{Obl}}^j A$

---

(2) $\textbf{\textit{Perm}}^j A$

according to which the obligatoriness of action A toward j entails A's permittedness toward j.

19.3. Obligational Rights

The notion of an other-directed obligation leads us to the idea of an *obligational right*. Whenever a person j has an obligation that is directed toward another person k (the obligation is intended to promote the interest or the benefit of k) we say that k has a *right* toward j. We call this right an *obligational right*, to mean that it consists in the fact that the obligation has the purpose of satisfying the interest of the right holder.[6]

19.3.1. Representation of Obligational Rights

Obligational rights may be defined as follows:

Definition 19.3.1 *Obligational right. k has the* obligational right *that j does A iff it is obligatory, toward k, that j does A:*

$$\textbf{\textit{OblRight}}_k Does{*}_j A \equiv \textbf{\textit{Obl}}^k Does{*}_j A$$

For example, to say that:

$$\textbf{\textit{OblRight}}_{Tom} Does_{Mary}[\textsf{pay} \text{ € } 1{,}000 \textsf{ to } John]$$

(Tom has the obligational right that $Mary$ pays € 1,000 to $John$)

means that:

$$\textbf{\textit{Obl}}^{Tom}(Does_{Mary}[\textsf{pay € 1,000 to John}]$$

(it is obligatory, toward Tom, that $Mary$ pays € 1,000 to $John$)

Similarly, to say that

$$\textbf{\textit{OblRight}}_{Tom} (\text{NON } Does_{Mary}[\textsf{raise a building taller than 10 meters}])$$

(Tom has the obligational right that $Mary$ does not raise a building taller than 10 meters)

means that

[6] Our account of legal rights (in this chapter and then in Chapter 22), will only consider the logical structure of various kinds of rights. We will not even address the issues concerning the social and institutional function, or the moral foundations of rights. On this issues, see, among this others: Luhmann 1965; Nozick 1974; Nino 1991; Rawls 1993, lecture viii; Waldron 1993; Habermas 1999, 118ff; Palombella 2002; Kamm 2002.

$$\textit{\textbf{Obl}}^{\,Tom}\ (\text{NON } Does_{Mary}[\text{raise a building taller then 10 meters}])$$

(it is obligatory, toward *Tom*, that *Mary* does not raise a building taller than 10 meters)

which we can also express by saying "Mary is obliged toward Tom not to raise a building taller than 10 meters."

19.3.2. The Benefit Theory of Rights

Our notion on an obligational right expresses a very common and intuitive idea of a right (subjective right), which can be traced back to Bentham (1970) and von Jhering (1924): To say that a person is the holder of a right means that another person has a duty which is intended to benefit the first person.[7]

In this connection, by a duty being intended to satisfy a certain interest we mean that satisfying this interest is the *aim* or *purpose* that is intended to be satisfied by the existence of the duty, to wit, that it provides an appropriate *intentional justification* (*explanation* or *rationalisation*) of the collective intention to have this duty, as we observed in Chapter 9.

Other authors have contested the idea of a right as a protected interest (or rather as consisting in the protection of the rightholder's interest through somebody else's duty), arguing that the idea of a right needs rather to be based upon the idea of a *power*. For instance (Kelsen 1967, sec. 29.c, 133) affirms that:

> [T]he right of the creditor [. . .] protected by the legal obligation of the debtor [. . .] is nothing but this legal obligation of the debtor.

According to the same author:

> [T]he essence of the right that is more than a mere reflex of a legal obligation consists in the fact that a legal norm confers upon an individual the legal power to bring about by a law suit the execution of a sanction as a reaction against the non-fulfilment of the obligation. (Kelsen 1967, sec. 29.d, 136)

Similarly Hart (1982, 174ff.) argues that the idea that a right is the position of the beneficiary of somebody else's duty is useless: This legal situation can be better described by only using the notion of a duty. He thus proposes to understand a right relative to an obligation as:

> a special case of a legal power in which the right holder is at liberty to waive or extinguish or to enforce or leave unenforced another's obligation. (Hart 1982, 188)

We agree with Kelsen and Hart in considering that the notion of a power is normally a fundamental component of the notion of a right, as it is usually employed

[7] For a survey of theories of rights, see: Waldron 1984; Herrestad 1995; Kamm 2002.

in legal contexts, though this is not the case when one speaks of children's or animals' rights, as Hart (1982, 189) admits (we shall extensively discuss the notion of a power in Chapter 22).

However, we believe that both Kelsen and Hart fail to recognise adequately that the idea of an obligational right does not parallel the simple idea of a duty, but rather it parallels the idea of a *other-directed duty*: Saying that k has the obligational right that j performs a certain action A is not equivalent to saying that j has the obligation to perform A.

The idea of an obligational right includes indeed an additional content, which is expressed exactly by saying that not only j has an obligation:

$$\textbf{\textit{Obl}}\ Does*_j A$$
(j has the obligation to do A)

but rather he has an obligation toward a specific person (k):

$$\textbf{\textit{Obl}}^k Does*_k A,$$
(j has, toward k, the obligation to do A)

The latter obligational proposition (but not the first one) is equivalent to the following statement:

$$\textbf{\textit{OblRight}}_k Does*_j A$$
(k has the obligational right that j does A)

According to our idea of the purpose of a normative proposition (see Section 19.1 on page 499), being the beneficiary of a duty (the holder of the obligational right) has to be distinguished from being advantaged by the fulfilment of the duty. If j is obliged in the interest of k to give a sum of money to l, then only k is the holder of the obligational right. It is true that l is going to profit from the execution of the obligation, but this is only, as Jhering would say, a reflex of the implementation of k's right (of the execution of the corresponding obligation).

From our perspective, which recognises and emphasises the importance of intentional notions, also when applied to collective entities and institutions (see Chapter 9), the use of teleological concepts (as that of a duty being intended to benefit a certain person) does not violate any scientific commitment to neutrality. There is no particular mistake or "impurity" (as Kelsen 1967 might say) in describing the law by making use of teleological concepts, that is, in viewing the law as a "purposeful enterprise," as remarked by authors such as von Jhering (1913) and Fuller (1969).

The two basic components of the notion of a right—obligational protection of an interest and powers—need to be separately studied, in order to understand their connections and the ways in which they can be combined (on the need to preserve the two ideas, cf. MacCormick 1977).

In particular, there is usually a teleological connection between the two components of the notion of a right: The right-holder's powers over a duty have the purpose of ensuring the satisfaction of right-holder's interest which the duty is meant to serve.

On the basis of this connection, we may frequently move from one idea to the other. On the one hand, the fact that a duty is intended to serve another's interest may lead us to infer (abduct) that this person has powers in relation to the exercise, the enforcement, and the persistence of such a duty (those powers also being functional to the satisfaction of the interest of this person). On the other hand, the fact that one has particular powers in relation to a certain duty may lead us to infer (abduct) that this duty is intended to satisfy one's interest, to wit, that one holds the related obligational right.

According to the teleological connections we just mentioned, both components of a right tend to coexist on the head of the same agent: The holder of the protected interest usually possesses the powers which are meant to ensure the protection of that interest (and in this case we may speak of a subjective right in the fullest sense to denote the combination of an obligational right and a potestative right). However, in other cases the two components may be split, being allocated to different agents. This happens, for instance, when a child's interest is protected by attributing certain powers to the child's parents, or to certain public-agencies.

19.4. A Formalisation the Hohfeldian Obligational Set

The notion of other-directed obligation allows us to express the first quartet of the fundamental legal concepts introduced by Hohfeld (1913; 1917), which we shall call the *Hohfeldian obligational concepts*.[8]

19.4.1. The Hohfeldian Obligational Set: Original Formulation

Hohfeld did not provide a logical definition of the legal concepts he introduced, but discussed them through example. For instance he says that:

> if X has a right against Y that he shall stay off the former's land, the correlative (and equivalent) is that Y is under a duty toward X to stay off the place [...] whereas X [...] has the privilege of entering on the land; or, in equivalent words, X does not have a duty to stay off. (Hohfeld 1964, 38–9)

[8] These contributions have been collected, with minor changes, in Hohfeld 1964, to which we shall refer in the following.

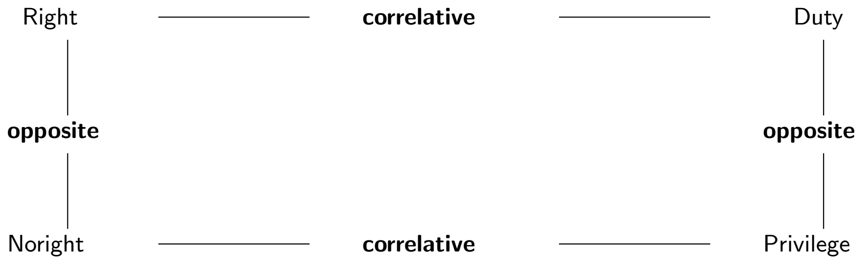

Table 19.1: *The first Hohfeldian square*

Hohfeld expressed the relationships between fundamental legal concepts in the square of jural opposites and correlatives of Table 19.1.[9] In the following paragraph we shall define the Hohfeldian concepts through the notions we have just introduced.

19.4.2. The Hohfeldian Obligational Set: Logical Reformulation

The Hohfeldian notion of a *right* corresponds to our obligational right, while the Hohfeldian notion of a *duty* corresponds to our notion of an other-directed duty. Therefore the Hohfeldian correlation between right and duty becomes our equivalence between obligational right and other-directed duty.

The Hohfeldian notion of a *privilege* can be expressed through our notion of other-directed permission: To say that j has a privilege toward k with regard to A means that j is permitted, toward k, to omit A. Therefore the notion of a Hohfeldian privilege is captured by the following definition:

Definition 19.4.1 *Privilege. j has a* privilege *toward k, with regard to action A iff it is permitted toward k that j omits to do A:*

$$\textbf{\textit{Privilege}}^k(Does*_j A) \equiv \textbf{\textit{Perm}}^k(\text{NON } Does*_j A)$$

(⌈j has, toward k, a privilege with regard to doing A⌉—literally, ⌈there is a privilege toward k, that j does A⌉—is equivalent by definition to ⌈it is permitted, toward k, that j omits to do A⌉)

According to this definition, a privilege with regard to a positive action $Does_j B$ amounts to the other-directed permission to omit doing B, while a privilege

[9] For an introduction to the Hohfeldian concepts and a discussion of the literature, see, among the others: Ross 1968, 118ff., and Alexy 1985, 185ff. On their formalisation, see: Lindahl 1977, 25ff.; Makinson 1986; Allen and Saxon 1991; Sergot 2001.

with regard to a negative action NON $Does_j B$ amounts to the other-directed permission to omit doing non B, that is, to the permission to do B.

On the basis of Definition 19.4.1 on the preceding page, affirming that j has, toward k, a privilege with regard to A, amounts to denying that j is obliged toward k to do A, i.e., it amounts to saying that k has no obligational right that j does A.

$$\textbf{\textit{Privilege}}^k(Does_j A) \equiv \text{NON } \textbf{\textit{Obl}}^k(Does*_j A) \equiv$$
$$\text{NON } \textbf{\textit{OblRight}}_k(Does*_j A)$$

(⌈j has a *privilege* to do A, toward k⌉ (literally, ⌈there is a privilege toward k that j does A⌉) is equivalent to ⌈it is not obligatory toward k that j does A⌉, which is equivalent to ⌈k has no obligational right that j does A⌉)

The notion of a privilege makes sense, and is logically coherent with the Hohfeldian framework, but has the defect of not being very intuitive, and indeed has frequently been misunderstood, a privilege with regard to A being sometimes correctly read as the permission to do NON A, and sometimes as a permission to do A. Therefore, our advice is to substitute the notion of a privilege to do A with the clearer notion of other-directed permission to omit A.

Following Hohfeld, we may use the less controversial expression *noright* to express that one does not have the obligational right that another does a certain action, that is, to denote the situation when the latter is permitted toward the first to omit that action:

Definition 19.4.2 *Noright. k has a* noright *that j does A iff j is permitted, toward k, to omits A:*

$$\textbf{\textit{NoRight}}^k(Does*_j A) \equiv \textbf{\textit{Perm}}^k(\text{NON } Does*_j A)$$

(⌈k has a noright *that j does A⌉ is equivalent by definition to ⌈it is permitted, toward k, that j does not do A⌉)*

Note that, according to Definitions 19.4.1 on the page before and 19.4.2 the proposition that ⌈j has a *privilege* to do A, toward k⌉ is equivalent to the proposition that ⌈k has a *noright* that j does A⌉: Both propositions are equivalent to ⌈it is permitted, toward k, that j does not do A⌉. Thus, according to our definitions, we obtain the formalisation of the Hohfeldian square that is represented in Table 19.2 on the next page.

Assume for instance that Mary, a writer, has made a contract with Tom, a publisher, and has committed herself to write a novel for him. Under such conditions, we can say Tom has the obligational right that Mary writes the novel, which amounts to saying that Mary is obliged, toward Tom, to write the novel. Tom's right is incompatible with Mary having a privilege, toward Tom, concerning writing the novel. Such a privilege would consist in the Mary having permission toward Tom not to write the novel, a normative situation which could also be described as Tom's noright that Mary writes the novel.

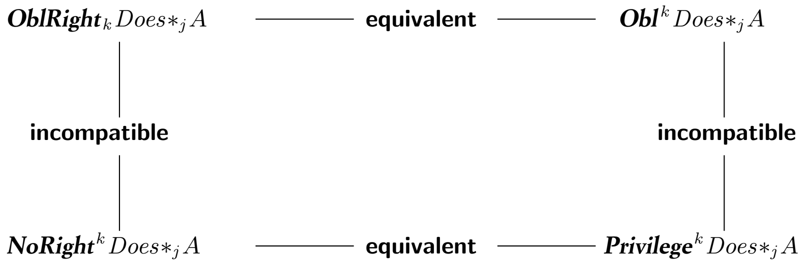

Table 19.2: *Formalisation of the Hohfeldian obligational set*

Similarly, with regard to omissions, assume that Mary has the obligational right that Tom does not change the content of her novel. This amounts to saying that Tom is obliged, in the interest of Mary, not to change the content of her novel. This obligation is incompatible with Tom having the privilege, toward Mary, to change the content of her novel. Such a privilege would consist in Tom having the permission toward Mary to change the content of her novel, a normative situation that could also be described as Mary's noright that Tom does not change the content of her novel.

19.5. Further Kinds of Rights

By using the notions of other-directed obligation and other-directed permission, we shall specify further aspects of the idea of a right, which complement or specify the basic notion of an obligational right.

19.5.1. Permissive Rights

The idea of a directed permission offers us the basis for providing a notion of a *permissive right*, which is a directed permission aimed at satisfying the interest of the permitted person.

Definition 19.5.1 *Permissive right. A person j has, toward a person k, the* permissive right *of doing A* (**PermRight**^{k} $Does*_j A$) *iff it is permitted toward k, in the interest of j, that j does A:*

$$\textbf{\textit{PermRight}}^k\, Does*_j A \equiv (\textbf{\textit{Perm}}^k\, Does*_j A)\Uparrow^j$$

(($\ulcorner$there is a permissive right toward k, that j does A$\urcorner$ is equivalent by definition to $\ulcorner$it is permitted toward k, in the interest of j, that j does A$\urcorner$)

Note that the holder of a permissive right, in the sense of its beneficiary, is the author of the permitted action, rather than the person toward which this permission exists: In a permissive right $\boldsymbol{PermRight}^k\, Does{*}_j A$, j is the beneficiary of the right, while k, the addressee of the permission, bears the burden of it (in the sense that k's interest is not protected by means of a prohibition that j does A). For instance, to express that Mary has the permissive right toward Tom to raise a building up to 15 meters, we write:

$$\boldsymbol{PermRight}^{Tom}\, Does{*}_{Mary}[\text{raise a building up to 15 meters}]$$

Similarly, to express that Ali, a Muslim worker, has the permissive right to abstain from work on Fridays, against his employer Mary, we write:

$$\boldsymbol{PermRight}^{Mary}(\text{NON } Does_{Ali}[\text{work on Friday}])$$

Note that distinction being one's permission to do A and another's prohibition to prevent A (see Section 17.5.2 on page 468) also applies to permissive rights: $\boldsymbol{PermRight}^k\, Does{*}_j A$ does not entail that k is prohibited from preventing A.

$$\boldsymbol{PermRight}^k\, Does{*}_j A \;\nvdash\; \boldsymbol{Forb}\;\, Brings_k(\text{NON } Does{*}_j A)$$

($\lceil j$ has the permissive right toward k to do $A\rceil$ does not entail that $\lceil k$ is forbidden to bring it about that j does not do A$\rceil$, i.e., it does not entail that $\lceil k$ is forbidden to prevent j from doing $A\rceil$)

When this is the case—when we have both a permissive right and the prohibition to prevent its exercise—we can speak of a *protected permissive right*.

Permissive rights are the classical liberal rights: Having such a permissive right to do an action only means that one is not forbidden to abstain from it. A permissive right does not entail that its holder has the ability of doing the permitted action. For example, having the permissive right to have the education one chooses, means that one is not forbidden from educating oneself as one chooses. Still one may not have the means for doing that (being unable to bear the costs of the education, or not having the intellectual potential for the type of education one would like to have). Similarly, one may be permitted to have the medical care one prefers, but be unable to bear the ensuing medical costs.

In socially-oriented political communities one's permissive rights (or some of them) tend to be coupled with obligational rights upon others, to provide some of the means which enable one to practice what one is permitted to do (providing, for instance, everybody with access to education, health care, and so on).

19.5.2. Absolute and Relative Rights

Until now we have only considered obligations (and obligational rights) toward a determined person. However, the notions we have so far provided allow us to specify also rights toward everybody (absolute rights).

Definition 19.5.2 *Absolute obligational right. k has the* absolute obligational right *that A is done iff k has, toward any x, the obligational right that x does A:*

$\boldsymbol{AbsoluteOblRight}_k Done{*}\ A \equiv$
$\text{FORANY}\ (x)\ \textbf{OblRight}_k Does{*}_x A$

That k has the obligational right that x does A means that x is under the obligation to do A for the benefit of k. By substituting the obligational right with the corresponding directed obligation in the last above we obtain:

$\boldsymbol{AbsoluteOblRight}_k Done{*}\ A \equiv$
$\text{FORANY}\ (x)\ \boldsymbol{Obl}^k Does{*}_x A$

(⌈k has the absolute obligational right that A is done⌉ is equivalent to ⌈for any x, x is obliged, toward k, to do A⌉)

For example, Mary, who is the author of a novel, has an absolute obligational right that nobody copies her novel. This means that, toward every person x, she has the obligational right that x does not copy her novel, which means that any person x has the obligation, toward Mary, not to copy her novel.

Given that Mary has that absolute obligational right, according to FORANY *elimination*, we can (defeasibly) infer that she has the obligational right that Tom does not copy her novel, which means that Tom is obliged, toward Mary, not to copy her novel:

(1) $\boldsymbol{AbsoluteOblRight}_{Mary}\text{NON}\ Done$ [copy $Mary$'s novel]

---

(2) $\text{FORANY}\ (x)\ \boldsymbol{OblRight}_{Mary}\text{NON}\ Does_x$[copy $Mary$'s novel]

---

(3) $\boldsymbol{OblRight}_{Mary}\text{NON}\ Does_{Tom}$[copy $Mary$'s novel]

---

(4) $\boldsymbol{Obl}^{Mary}\text{NON}\ Does_{Tom}$[copy $Mary$'s novel]

The same holds for other absolute rights Mary has, such as her right to life (that nobody takes her life), to privacy (that nobody interferes with her privacy), to personal integrity (that nobody harms her), and her property rights.

Besides absolute obligational rights there may be absolute permissive rights, which we define similarly:

Definition 19.5.3 *Absolute permissive right. k has the* absolute permissive right *of doing A iff k has toward any x the permissive right of doing A:*

$\boldsymbol{AbsolutePermRight}_k ToDo{*}\ A \equiv$
$\text{FORANY}\ (x)\ \textbf{PermRight}^x Does_k A$

For instance, we may assume that Mary, who is living in a liberal country, has absolute permissive rights to express her opinion, to have the private life she chooses to have, to use her property as she likes, to belong to a union, to use contraception, and so on.

19.5.3. Exclusionary Rights

The idea of an obligational rights takes a peculiar shape when it concerns the prohibition of performing certain inferences, or of using a certain kind of premises for certain purposes, in the interest of a particular person.

This is especially the case of anti-discrimination rules. These rules establish no unconditioned prohibition to perform certain actions (like dismissing an employee or refusing to appoint somebody), but rather prohibit to decide for a certain course of action—that is, to intend to perform that action—on the basis of a certain reason (a certain mental content): They prohibit the process which concerns (*a*) forming the intention to act in a certain way of the basis of that reason and (*b*) implementing the intention.

For instance, in many legal systems employers are prohibited to adopt any decision having a negative impact on their employees on the basis of race or sex, and this prohibition, though also serving some collective purposes, is primarily aimed at promoting the employee's interest.

FORANY (x, y)
IF [x is y's employer]
THEN^n
(***Forb*** [x intends to impairs y's work situation on the basis of y's race or sex])$\Uparrow^y$

This is a cognitive obligation, namely, the obligation not to adopt a certain mental state as a premise (a reason) of a certain kinds of reasoning. Therefore, reason itself can take care not only of its endorsement, but also of its implementation. Thus, the rational employer endorsing the above rule is prevented from forming the corresponding intention: The rule operates as an undercutter for the inference leading to forming the prohibited intention.

Obviously, we may re-express this rule as concerning an obligational right.

FORANY (x, y)
IF [x is y's employer]
THEN^n
OblRight$_y$ [x DOES NOT intend to impairs y's work situation on the basis of y's race or sex]

There may be similar exclusionary rights with regard to religious beliefs: One has a right that one's position is not impaired on the basis of the fact that one does or does not share a certain religious faith.

It may be wondered whether there is a more content-general exclusionary right concerning religious matters, namely, the right that no political decision is taken on religious grounds (on premises which partake to the dogmas of a certain religious persuasion).

FORANY (x)
OblRight$_x$ [political decisions impacting on x are NOT adopted on the basis of religious grounds]

We shall not consider whether this rule is binding in certain legal systems, since we do not want to enter the difficult debate on neutrality, tolerance, and public reason in religious matter. For our purposes, it suffices to have shown that this rule has the logical form we have just analysed.

19.6. Rights and Norms

Our characterisation of the notion of a right is based upon the view that certain normative situations are intended to serve the interest of particular individuals.[10]

This feature of rights allows us to understand why authoritarian legal systems, besides curtailing specific rights have also attacked the idea of a right, arguing that all normative positions are aimed at protecting collective interests.

However, we must distinguish the correct idea that there is a conflict between the idea of a right and the most radical forms of collectivism from the idea that there is a conflict between rights on the one hand and the view that the law consists of "norms", these being intended as obligations or normative propositions or authoritatively-stated propositions. We shall argue in the following sections that the idea that there is such a conflict is largely based upon conceptual confusion.

19.6.1. Rights in Authoritarian Legal Systems

There is a tension between the authoritarian assumption that an individual has no worth in him/herself (that the individual person is nothing, and the nation is all, as the Nazis used to say), and the idea that individual interests provide the intentional justification purpose of a normative position. It is true that the case for a certain degree of (instrumental) recognition of individual rights can be made even within radically collectivistic ideologies (once we assume, for instance, that market economy or freedom of research are the best ways to promote certain collective goods, such as economical efficiency and technological power).

[10] This is the case for both obligational and permissive rights, and also for potestative rights. As we shall see in Sections 22.1.4 on page 581 and 22.1.5 on page 583, potestative rights correspond to purpose-oriented conditional connection between an action and a normative effect.

However, expressing and honouring the principles of these ideologies—and in particular the idea that the single person is worthless compared with a certain social entities, like the nation, the race, the working class and so on—usually requires individual rights to be downplayed or suppressed, much beyond what is necessary to advance collectivistic goals.

19.6.2. The Supposed Conflict between Rights and "Norms"

The tension between rights and authoritarian political ideologies does not enable us to assume a general or conceptual opposition between rights on the one hand and norms on the other (see for instance by La Torre 1988, who considers rights in Nazi legal doctrine). Let us consider different meaning in which the ambiguous term "norm" can be understood: an obligation (a normative proposition expressing an obligation), a binding normative proposition, the content of an (effective) authoritative statement.

Let us first consider the opposition between rights and obligations. There can indeed be an conflict between certain rights and certain obligations. This may hold in particular, for permissive rights: the permission to accomplish action A is certainly incompatible with A's prohibition. However, this possible conflict does not exclude that in a certain sense one may speak of a logical primacy of the notion of an obligation, since, as we know, a permission is the exclusion of a prohibition, that is, of an obligation to omit. Moreover, there cannot be any opposition between the idea of an obligational right and the idea of an obligation, since an obligational right exactly consists in the obligation of others in the interest of the right holder. There also is no opposition between the notion of a right as a power and the notion of an obligation. On the contrary, the exercise of powers frequently determines the creation of new obligations, like the obligations stated in a contract, or the obligation of the judge to decide the issues submitted by a plaintiff.

Let us now consider the oppositions of rights and normative propositions: The idea that rights are a fundamental component of the law has been opposed to the idea that the law is made of normative propositions, and thus to normativistic models of legal systems. It seems to us that this opposition seems to be based upon the deeply entrenched conceptual confusion of three distinct ideas: a binding normative proposition, a normative act, and an obligation. This confusion is indeed quite common in legal thinking and probably is connected with Kelsen's (1992; 1967) use of the term *norm* do denote all of the following: a binding normative propositions, the meanings of positive acts of will, and an ought, the latter concept merging the ideas of obligation and of normative conditionality (as we shall see in Chapter 20). This confusion is also increased by merging the idea of a *cognitively-binding* proposition (a proposition which deserves to be endorsed, which is adoption-worthy) with the idea of an *obligational* proposition (a proposition which says that somebody has the obligation

to behave in a certain way). Once that appropriate conceptual distinctions are introduced the supposed conflicts between rights and norms can be overcome.

First of all, there is no necessary conflict between *rights* and norms, intended as *normative propositions*: Normative propositions can have a wide range of contents: obligations, possibly for the benefit of specific persons, but also permissions, powers, and various other legal qualifications. In particular, also the proposition that ⌈somebody, under certain conditions, has a right⌉ is a normative proposition. Obviously there can be conflict between different normative propositions, and a normative proposition expressing a right can conflict against other normative propositions, expressing permissions, obligations, or other rights.

Secondly, there is no necessary conflict between *rights* and norms, intended as *binding normative propositions*, if by bindingness we mean cognitive bindingness (rather than obligation), that is, adoption-worthiness. Our assertion that certain persons have a certain right, expresses indeed what we view as a binding normative proposition (a proposition which we view as adoption-worthy in legal reasoning), namely, the proposition that these persons have that right. There are indeed many binding normative propositions whose content is a right. Some of these propositions express universal human rights, and are thus binding with regard to any modern legal system (in any context in which legal reasoning is used), others are only binding with regard to specific legal systems (with regard to specific territorial and institutional frameworks). Some of these propositions express permissive rights, like the propositions that every one is permitted to express one's own opinion, that everyone is permitted to associate with one's fellows, and so on. Other binding normative propositions express obligational rights, like the proposition that every one has the obligational right not to be tortured (that it is forbidden, in there interest of the concerned human being, that he or she is not tortured).

Similarly, it makes little sense to oppose in general terms *rights* and norms intended as *authoritative propositions*, that is, normative propositions stated by a normative authority (a legislator).

It is true that there are rights (but also obligations) that exist independently of authoritative enactment-acts (even when among such acts we include also the production of constitutional texts). These rights having a non-enacted foundation include not only human rights, but also any other rights resulting from normative propositions that are binding on non-enacted grounds (for instance, on the basis of precedent or custom).

It is also true that normative propositions stated by a normative authority can impinge upon individual rights by prohibiting what was permitted in the interest of the right holders (for instance, forbidding free speech or free movement). However, authoritative statement can impinge upon rights also by permitting and empowering what was forbidden in the interest of right holders (for instance, by empowering employers to sack their employers, by permitting fac-

tories to pollute the environment, by permitting local communities not take care of their schools).

Finally, normative propositions stated by a normative authority frequently favour rather than impair rights: They introduce or extend rights, both of the permissive and the obligations type, or provide the precondition for their enjoyment. This concerns permissive rights like the permission to use certain public spaces, to have contraception, to take maternity leave, but also obligational rights like the workers' right to be paid an insurance by their employer or the citizens' right that their personal data are not processed without their consent.

It is misleading therefore to oppose in general terms rights and legislation. The potential conflict between non-enacted rights and legislative provisions rather concerns the distinctions between natural and positive law, between constitution and legislation, between "social" and institutionalised sources of the law.

Chapter 20

NORMATIVE CONDITIONALS AND LEGAL INFERENCE

In Section 15.2.1 on page 418 we have seen that material conditionals, as provided by classical propositional logic, are inappropriate, under various regards, to express conditional normative propositions. Here, we shall provide an alternative formalisation, which hopefully will help us in understanding the logical structure of normative conditionals and their function in legal reasoning.

Our inquiry will start with the analysis of the cognitive function of normative conditionals. This will enable us to establish which inferences are applicable to them, and which inferences are not applicable.

20.1. The Cognitive Function of Normative Conditionals

Before providing a formal analysis of normative conditionals, we need to investigate their cognitive function.

This requires us firstly to consider their connection with conditional instructions (see Section 1.4 on page 31), and secondly to distinguish different types of normative conditionals.

20.1.1. Conditional Instructions and Propositions

Conditional normative propositions can be viewed as expressing the doxification of *conditioned instructions*, namely, instructions requiring that, under certain conditions, certain actions shall or may be taken, or certain mental states shall or shall not be adopted.

For example, the conditioned instruction:

(a_1) When I wake up, I shall phone Mary

becomes the normative proposition:

(a_2) When I wake up, then I ought to phone Mary

Correspondingly, my intention to execute instruction (1) is coupled by my belief that proposition (2) is true.

For instance, an intention-based formulation is used in the first of the twelve tables, the most ancient text of Roman law, to express the general instruction:

(b_1) If one summons another into court, the latter shall go[1]

which may be doxified into the normative proposition:

(b_2) If one summons another into court, then the latter is ought to go

This general rule can be expressed, using our formalism, as follows:

(b_3) FORANY (x, y)
IF [x summons y into court]
THEN ***Obl*** $Does_y$[go]

(for any persons x and y, if x summons y into court then it is obligatory that y goes)

As a more modern example, consider a term in the contract between Tom and Mary, saying that if she is late in delivering the merchandise, she is to pay a penalty of € 1,000. In such cases, the parties have the intention that the following conditioned instruction is executed:

(c_1) If Mary is late, then she shall pay a penalty of € 1,000

which may be doxified as:

(c_2) If Mary is late, then she ought to pay a penalty of € 1,000

and which we also express as:

(c_3) IF [$Mary$ is late]
THEN ***Obl*** $Does_{Mary}$[pay a penalty of € 1,000]

20.1.2. Kinds of Normative Conditionals

As the previous examples show, conditioned normative propositions express that under certain conditions a certain normative conclusion holds. Such propositions may be formulated in various ways, especially when they have a general content. Here are some examples:

- "Everyone charged with a penal offence has the right to be presumed innocent until proved guilty" (Article 11 of the Universal Declaration of Human Rights), which can be conditionally expressed as "if one is charged with a penal offence, then one has the right to be presumed innocent until proved guilty."
- "Everyone who works has the right to just and favourable remuneration" (Article 23, number 3, of the Universal Declaration of Human Rights), which can be conditionally expressed as "if one works, then one has the right to just and favourable remuneration."

[1] The Latin original: "Si in ius vocat, ito."

- "Who receives an undue payment, has the duty to return it to the true creditor" (from the Italian civil code), which can be conditionally expressed as "if one receives an undue payment, then one has the duty to return it to the true creditor."
- "Corporeal things are those which are by nature tangible, as land, a slave, a garment, gold, silver, and other things innumerable" (*Institutes of Justinian*, 2.1), which can be conditionally expressed as "if a thing is a piece of land, a slave, a garment, gold, silver, or another innumerable matter, then it is corporeal."[2]

In the following, we shall provide a canonical representation for conditioned normative propositions, which enables us to represent in uniform ways the different contents that are stated so diversely in ordinary legal language.

20.2. Specific and General Normative Conditionals

We usually conceive normative conditionals as general propositions, having the following content: If a certain kind of situation exists, or a certain kind of person has performed a certain kind of action, then a certain kind of normative effects shall follow.

However, we sometimes also reason according to specific normative conditionals (conditionals referring to specific subjects and objects). Since we shall develop the logical analysis of general conditionals by considering the specific conditionals that can be inferred from them, we need first to consider specific conditionals. Then we shall discuss general conditionals.

20.2.1. Specific Normative Conditionals

Specific normative conditionals are frequently expressed by contractual terms. Consider for example the following:

> *if* Tom does not pay the whole price by 10.01.2004,
> *then* he must pay a penalty of € 1,000.

In such a proposition we may distinguish an antecedent (a pre-condition):

> Tom does not pay the whole price by 10.01.2004.

and a consequent (a post-condition):

> Tom must pay a penalty of € 1,000.

Our canonical representation of a specific conditional proposition is the following:

[2] The Latin original: "Corporales eae sunt, quae sui natura tangi possunt, veluti fundus, homo, vestis, aurum, argentum et denique aliae res innumerabiles."

IF *Antecedent*
THEN *Consequent* IS NORMATIVELY DETERMINED

where by saying that the consequent IS NORMATIVELY DETERMINED by the antecedent we indicate that the antecedent causes or at least enables the verification of the consequent. Normative conditionality is more than the simple cooccurrence of antecedent and consequent: The antecedent *determines* the dependent realisation of the consequent.[3]

20.2.2. Normative Conditionals and Causality

Rather than saying that the antecedent determines the consequent, we could say that the antecedent *causes* the consequent, but we prefer to use a more neutral language, to avoid equivocations with natural causation, though we basically view legal conditionality as a form of causality. In fact, a causal view of legal rules not only has a long tradition, but is also reflected in common language, like when we speak of "legal effects" or "legal consequences"[4] .

Besides the idea of causality, various metaphors have been used to express the dependence between legal conditions and legal effects. For instance, the biological metaphor of legal effects being generated, or being born, has a long history. For example, Roman lawyers used to say that obligations "are born from contract"(*ex contractu nasci*, *Institutes of Justinian*, 3.27).

Another very ancient way of expressing the idea of legal conditionality is the cosmic metaphor of rising, which we can find, for instance, in the legal saying that "the law (any legal entitlement) rises from the facts" (*ex facto oritur jus*).

A further metaphor (though now no longer perceived as such) consists in the originally spatial idea of *constituting* (from Latin *constituere*, having the basic meaning of putting, placing, establishing, erecting). It is said that all (or some) legal rules are constitutive: Their antecedents are constitutive facts, which indeed constitute their effects (see Section 21.1.2 on page 551).

This is not the place either for going through the many metaphors that express the notion of normative conditionality, or for examining their relative merit. In fact, though the discussion of these metaphors may be interesting, it would not be useful for our purpose of providing a sufficiently precise logical characterisation: All these different formulations are just different ways of

[3] Out notion of *determination* can be related to the notion of *generation*, as described by Goldman 1970. By speaking of determination, generation, or causality we do not intend to commit ourselves to specific logical axiomatisations of these notions. For instance, we do not commit ourselves in general to the constraint of the rejection of identity (the idea that *A* cannot determine *A* itself), as Shoham 1990 does, with regard to causality. We rather view normative determination as a general kind of counterfactual dependency.

[4] For a discussion a causal views of normative conditionals, with particular reference to the Italian and German doctrines, cf. Falzea 1985, who goes back to Zitelmann 1879, 204, and Carcaterra 1990, who draws from Reinach 1913. On legal conditionality, see also Vida 2001.

pointing to the relation of dependence between antecedent and consequent in normative conditional.

All of these ways of referring to legal conditionality—there included the idea of legal causality—should be only be viewed as useful metaphors, that direct to some similarities between legal conditionality and other forms of conditionality, and stimulate inquiries intended to explore commonalities and differences.

For example, some have observed the following difference between legal conditionality and natural causality: Contrary to what happens with regard to natural causality, where an event cannot be viewed as a cause of something that already independently exists, a legal effect which has already been determined can still be determined by a new precondition of it. For instance, one's ownership of a thing may be determined by a valid purchase contract and, at a later time, by usucapion (by possessing the thing for 20 years): When ownership is at issue, if usucapion can be established it is useless to inquiry on the validity of the contract. We cannot here address this issue of doubly produced legal effect. Let us just remark that accepting the view that legal effects can be doubly (or multiply) determined, by independent preconditions, is consistent with continuing to speak of *legal causality*, in the sense in which we use the term *causality*.[5]

Another interesting difference between physical causality and normative conditionality pertains to *retroactivity*. Physical effects cannot precede their causes, while legal effects can retroact to a time that precedes the happening of the event determining the effects. For instance, when a contract is ratified (or voided), usually this retroacts to the time when the contract was stipulated. Thus it is assumed that the contract was effective (or ineffective) from the time of its stipulation.

To emphasise the dependence between antecedent and consequent in normative conditional, we could express conditional norms though a language that directly expresses the idea of determination. For instance rather than writing:

IF A THEN B

we may write:

A DETERMINES B

However, we prefer to stick to the traditional "if ... then" language, and express the conditionality between Tom's omission to pay, and his obligation to pay a penalty simply as:

IF [Tom does not pay the whole price by 10.01.2004]
THEN [Tom must pay a penalty of € 1,000]
IS NORMATIVELY DETERMINED

In general, when writing:

[5] For a discussion of this issue, with reference to the literature, and more generally for a critical discussion of causal views of legal conditionals, see Engisch 1968b, chap. 2.

IF A THEN^n B

we shall be meaning

IF A THEN B IS NORMATIVELY DETERMINED

that is, we shall be referring to normative determination. We shall use the superscripts n and m to distinguish the normative conditional IF ... THEN^n and the material conditional IF ... THEN^m.

20.2.3. *General Normative Conditionals*

Let us now examine general normative conditionals. Consider for example the following rule:

Those below 18 years are forbidden to buy alcoholic drinks

which we conditionally represent as:

FORANY (x)
IF [x is below 18 years]
THEN^n ***Forb*** $Does_x$[buy alcoholic drinks]
(for any x, if x is below 18 years, then it is forbidden that x buys alcoholic drinks)

As this example shows, normative *generality* is captured by universal quantification. When quantification concerns refers to persons (and in particular to holders of normative positions, or authors of actions), we speak of *personal generality*. When quantification concerns different elements of a normative proposition, we can speak of *content-generality*.[6] Let us take another example, this time from classical natural law.

By a wrong here we mean every fault, whether of commission or of omission, which is in conflict with what men ought to do, either from their common interest or by reason of a special quality. From such a fault, if damage has been caused, by the law of nature an obligation arises, namely, that the damage should be made good. (Grotius 1925, sec. 17.1.1)

We may synthesise the Grotian principle—which was adopted, with some adaptations, in continental civil codes[7] —into the rule that whoever culpably causes an unjust damage to another is obliged to compensate the damaged person. This rule is both personally-general (with regard to the author x and victim y) and content-general (with regard to damage d).

[6] This aspect is frequently referred to by using the term “abstractness.” To avoid distinguishing between generality and abstractness, we prefer to speak of generality in both cases.

[7] See Art. 1382 of the French code: “Every act whatever of man which causes damage to another obliges him by whose fault the damage occurred to repair it.” Also Art. 2043 of the Italian civil code uses similar words.

FORANY (x, d, y, t)
IF $Does_x$[cause damage d to y] AND
[x's behaviour is culpable]
THEN^n ***Obl*** $Does_x$[compensate y for d]

(for any persons x and y and damage d, if x causes damage d to y and x's behaviour is culpable, then x is obliged to compensate y for d)

20.2.4. Operative Facts, Precondition-Types and Tokens

Any element that contributes to determine a normative effect according to a normative conditional—that is, any element which contributes to instantiate the antecedent of the conditional—can be called an *operative fact*, according to the suggestion of Hohfeld (1964, 32):

Operative, causal, or constitutive facts are those which, under the general legal rules that are applicable, suffice to change legal relations, that is, either to create a new relation, or to extinguish an old one, or to perform both these functions simultaneously.

For instance, we may say, with reference to the liability rule above, that both causing an unjust damage and being culpable are operative facts. For referring to the abstract characterisation of all operative facts that can be found in the antecedent (the precondition) of a general or abstract normative conditional, the German word *Tatbestand* is often used (see, for instance, Larenz 1992, 159), which we translate as *precondition-type*.[8] Thus, a *Tatbestand* is a set—or better a logical combination—of operative facts that is sufficient for producing a legal effect.

Definition 20.2.1 *Precondition type. A* precondition-type *is the antecedent of an abstract or general normative conditional. More exactly, given a conditional:*

FORANY $(x_1 \ldots x_n)$ IF $A(x_1 \ldots x_n)$ THEN^n $B(x_1 \ldots x_n)$

where $A(x_1 \ldots x_n)$ *and* $B(x_1 \ldots x_n)$ *are formulas containing some variables* $x_1 \ldots x_n$*, the corresponding precondition-type is :*

$A(x_1 \ldots x_n)$

Thus, with regard to the rule above, the precondition-type would be represented by:

[8] Note that the word *type* is here used in the sense of a generic characterisation. We are not using it to mean a *prototype*, which comes close to the meaning in which the word *Typus* is used in German legal theory (see Section 6.2.7 on page 191).

(T1) $Does_x$[cause damage d to y] AND
[x's behaviour is culpable]

To emphasise the idea that variables just are place holders, we substitute them with numbered boxes, as we did in Section 15.3 on page 421. We thus may represent the above precondition-type as:

(T1) $Does_{\boxed{1}}$[cause damage $\boxed{2}$ to $\boxed{3}$] AND
[$\boxed{1}$'s behaviour is culpable]

Since a precondition-type is a general representation (in our example, both personally general and content-general) we can have many different concrete instances or tokens of it (on types and their tokens, see Pattaro, Volume 1 of this Treatise, sec. 2.1). Thus we need to distinguish the *precondition-type* as an abstract characterisation from the specific description of one of its instances, to which we can refer by using the expression *precondition-token* (corresponding to the German the word *Tatsache*) .

Definition 20.2.2 *Precondition-token. A* precondition-token *is the concrete instance of a precondition-type.*

For example:

(T2) $Does_{Tom}$[cause damage *dent in the car* to *Mary* on 13.06.2003] AND
[*Tom*'s behaviour is culpable on 13.06.2003]

is an instance of the precondition-type above, and thus a precondition-token.

The passage from a precondition-type to one of the corresponding precondition-tokens requires supplementing the precondition-type with elements of a particular case. In this way, we obtain a description that matches just one particular situation (on the notion of a situation, see Definition 18.1.3 on page 484), as we shall see in the following pages, when we shall address the notion of subsumption.

Usually this is done by substituting the variables (the pronouns) in the rule antecedent (precondition-type) with the name of particular entities (persons or things). This is sufficient when the precondition-type is concerned with events that can happen just once, with regard to particular entities (typically, birth or death).

In case of events that may take place more that one time with regard to the same entities, we need further specifications. For example, we may need to distinguish the fact that Tom parked on the left side of his street on 13.06.2003 from the fact that he parked there on 14.06.2003. For making this distinction,

we need to provide a specification of the spatial-temporal situation where the precondition-token has taken place (usually the indication of a time would be sufficient, unless we are concerned with events which can happen at different places at the same time).

For instance, Tom may park in more than one occasion on the left side of his street, where parking is forbidden. When fining him, the police officer needs to identify the particular instance of the antecedent-type ⌈x parks in a forbidden place p⌉ that has taken place. For this purpose, it is not sufficient to refer to the fact that Tom has parked on the forbidden left side of his street; it is also necessary to mention the time when this has taken place.

Note that from the point of view here developed, not every sentence in a law text having a conditional form provides, in its antecedent, the complete characterisation of a precondition-type. Our notion of a precondition-type is a semantic, rather than a syntactic, notion. It refers to the antecedent of a normative conditional, that is, to the set of facts that are normally (defeasibly) susceptible of producing a certain legal result.

These are many ways in which, when using natural language, we can specify the content of a normative conditional.

We can do that through just one sentence, which specifies both the antecedent and the consequent of the conditional. Or we may state separately the various conditions that need to take place jointly to produce the legal effect.

For instance, rather than saying ⌈if one causes to another an unjust damage, with negligence or intention, one is obliged to compensate it⌉, we may say all of the following:

- if one causes to another a damage, one is obliged to compensate it;
- the damage must be unjust (for determining the obligation to compensate it);
- it must be caused with negligence or intention (for determining the obligation to compensate it).

The "must" which occurs in the above clauses (2) and (3) should not be taken for an expression of obligatoriness: It rather expresses the necessity (the need) that a certain circumstance takes place for the legal effect to be determined—according to a certain determining connection, that is, according to a certain precondition type—as we shall see in the following section.

20.2.5. Must and Relative Necessity

In many cases, when a legal text uses the words *must*, *ought*, *may*, or *can* it does not express obligations or permissions in the precise sense we discussed in Chapter 17. Consider for example, when the law says that a petition or contract must or must not be done in a certain ways, or that it can or cannot contain certain terms.

In these cases, the law establishes what we may call a *relative necessity*: It establishes that certain requirements need (or need not) be satisfied for a certain legal result to be obtained in a certain way, i.e., for the realisation of a certain precondition-type. Often the specification of this result is left to further normative propositions.

For instance, assume that in a law text, after the rule that whoever appropriates property of others is going to be punished as a thief, there is the statement that the appropriator *must* have the intention of getting permanent possession of the stolen object. Clearly, there is no legal obligation to have such intention. The *must* signals a necessity, relative to the precondition-type "theft," that is, relative to the precondition which determines subjection to punishment for theft. It indicates that the elements explicitly contained in the antecedent of the theft rule are not really sufficient to produce the effect indicated in that rule: A further element, which is, the intention to appropriate is also required to provide the full antecedent (to instantiate the precondition of the rule).

We may use the term *anancastic*—from the Greek word *ananke*, necessity—to characterise the (anancastic) propositions expressing this kind of necessity. We may also say that these propositions express an anancastic connection between a certain antecedent element and a legal precondition, that is, the necessity of that element for completing the precondition. In particular, we speak of *anancastic rules* for referring to general or abstract propositions of this type. Note that from our approach, that sharply distinguishes propositions and speech acts, we need to distinguish the anancastic proposition in itself and the speech act that states or proclaims it (see Section 23.2 on page 593), determining its bindingness.[9]

As we may have normative propositions expressing anancastic connections, we may also have propositions denying (excluding) such connections. For instance, assume that a law text states the following proposition: ⌈a thief *does not have to* intend (or *may not* intend) to appropriate the stolen object directly, the thief *can* also have the intention to provide possession to another⌉. In this context, the locution *does not have to* (or *may not*) does not express lack of obligation, but the lack of the above indicated necessity, and *can* does not express permission, but rather signals an alternative possibility: Also the intention to provide possession to another is a sufficient way to satisfy the intention requirement for theft. As a result of the enactment of this law-text (of the bindingness of the propositions it expresses), the intention to appropriate for oneself is no longer a necessary element of the precondition of theft: It may be substituted with the intention to provide possession to another (it is now only necessary is

[9] On anancastic rules, see Conte 1985, 360ff., and Azzoni 1992; 1997. This terminology was anticipated by von Wright (1963, 10), who defines an "anakastic statement" as a "statement to the effect that something is (or is not) a necessary condition of something." The *anancastic* use of the word *must* is also is discussed in legislation technique, though under other descriptions (see, for instance, Haggard 1996, 239).

that there is either the intention to appropriate for oneself or the intention to appropriate for another).

The word *must* is most frequently used in an anancastic sense when:

- the condition to be realised is dependent upon the action of a person, and
- the satisfaction of the condition contributes to determining an entitlement of this person, or in any case a result that the person normally would like to produce.[10]

Consider, for example, the case when a statute or a contract says that a certain act must be done in writing, or that a certain notice must be given before a certain date.

When the two conditions above are satisfied, must-statements—besides stating the relative necessity of a certain condition, and indeed on the basis of this necessity—may be viewed as implying a *technical* or *hypothetical imperative*: Given that the realisation of the condition is necessary for determining an advantageous result (according to a certain rule), we may say that ⌈If one wants to achieve the conditioned legal result, one must realise the condition⌉.

When the action to be performed has a cost for its agent, we may also say that the must-proposition puts a *burden* or an *onus* upon the person that would benefit for the realisation of the conditioned legal result: Given that the realisation of the condition represent a necessary cost (burden or onus) to be sustained for determining the result in a certain way, we may say that: ⌈If one wants to achieve the conditioned legal result in that way (that is, as resulting from a certain precondition-type), one must bear the cost (burden or onus) of realising the additional condition⌉.

However, the basic and constant meaning of the anancastic *must* consists in what we called *relative necessity*, which can possibly be characterised by saying that the combination of the following propositions (1) and (2):

(1) if A then B
(2) C *must* be realised for B to be determined according to (1)

may be assumed to be equivalent to following proposition (3):

(3) IF A AND C THEN^n B

Similarly the combination of the following propositions (1) and (2):

(1) if A and C then B
(2) rather than C, D *can* be realised for B to be determined according to (1)

may be assumed to be equivalent to:

[10] Note that these conditions, though being usually satisfied are not necessary for the occurrence of this kind of *must*. For instance the second condition is not satisfied in the theft example we have just presented.

(3) IF A AND $(C$ OR $D)$ THEN^n B

Though these equivalences seem to capture correctly the semantic function of anancastic propositions, we need to observe that the word "must" is often also used in related but weaker senses.

Often, rather than indicating that an elements partakes to the operative facts of a certain normative conditional, the word "must" signals that the concerned element represents the absence (non verification) of circumstances which either would impede (*impeditive* facts) the conditioning facts from producing their effect or would eliminate the effect (extinctive facts). For instance, with regard to the existence of an obligation to compensate a damage, the wilful or negligent causation of an unjust damage is to be viewed as the operative fact (the fact determining the legal effect, according to the corresponding normative conditional), while the state of necessity and the incapability of the author represent impeditive facts. This is what we may elliptically express, though a bit improperly, when saying that the author a tort must be capable and must not be in a state of necessity.

The distinction between operative facts, on the one hand, and absence of impeditive or extinctive facts, on the other hand, is relevant in particular with regard to the discipline of the burden of proof: Usually once the determining facts have been established, the judge is to derive their legal effect, unless any impeditive or extinctive facts are also established. Thus, legal reasoning with impeditive facts corresponds to the model of defeasible reasoning, as we shall see in Chapters 26 and 27.

Finally, when saying that certain circumstances "must" occur with regard to a certain result, we sometimes mean that they consist in the absence of facts that would make that result unsafe (voidable). For instance, when saying that a contract must not be due to duress or deceit, we may imply (though a bit improperly) that duress or deceit would determine the voidability of the contract.

20.3. The Negation of Normative Conditionals

As in Chapter 17 we considered the negation of actions and deontic statuses (and the corresponding link between obligation and permission), and in Chapter 19 we considered the negation of Hohfeldian positions, now we shall deal with the negation of normative conditionals.

We shall approach the latter issue on the basis of our idea that normative conditionality can be viewed as a type of causation, or *determination*. Therefore, the negation of the normative conditional:

IF A THEN^n B

which we express as:

NON (IF A THEN^n B)

is to be read as the negation that A determines B, that is, as the proposition expressing that A is unable to determine B:

NON (IF A THEN^n B) $\equiv$ A DOES NOT DETERMINE B

For instance, the following negated conditional:

NON
IF [Tom does not pay the whole price by 10.01.2004]
THEN^n [Tom must pay a penalty of € 1,000]

is to be read as meaning that:

[Tom does not pay the whole price by 10.01.2004]
DOES NOT DETERMINE
[Tom must pay a penalty of € 1.000]

We cannot here pursue in any detail the issue of the negation of normative conditionals, and in particular, we cannot adequately address the negation of general normative conditionals. Let us just observe that we need to distinguish two ways of applying negation to such normative conditionals:

- When negation comes before the universal quantifier, it expresses that some instances of the antecedent do not determine the consequent.
- When negation comes after the universal quantifier, it expresses that no instances of the antecedent determine the consequent.

Compare, for instance, the following two formulas:

(*a.*) NON
FORANY (o)
IF you commit adultery on occasion o
THEN^n you are responsible for divorce

and

(*b.*) FORANY (o)
NON
IF you commits adultery on occasion o
THEN^n you are responsible for divorce

Formula (*a*) says that not on all occasions, if you commit adultery are you responsible: There are some occasions when committing adultery does not determine responsibility for divorce.

Formula (*b*) is the stronger assertion that in every occasion, it is not the case that if you commit adultery you are responsible: Committing adultery never determines responsibility for divorce.

(1) Tom does not deliver the merchandise by 10.01.2002;
(2) IF [Tom does not deliver the merchandise by 10.01.2002] THEN^n [it is obligatory that Tom pays € 1,000 to Mary]

---

(3) it is obligatory that Tom pays € 1,000 to Mary

Table 20.1: *Instance of* normative detachment

20.4. Inferences for Normative Conditionals

For identifying the basic logical inferences concerning normative conditionals, we need to start with our commonsense intuitions. For this purpose, we shall rely on examples, but also on the idea that normative propositions are reducible to (the doxification of) conditional instructions, and thus to conditional intentions. Thus, we shall assume that the same inferences are applicable to both conditional intentions and conditional normative propositions.

This approach will enable us to specify what inferences, among those that are licensed by material conditionals, also apply to normative conditionals, and what inferences, on the contrary, are inappropriate to the normative domain.

20.4.1. Detachment

First of all, normative conditionals (like conditioned instructions) should allow for detachment, similarly to material conditionals. Contrary to *syllogism* in classical logic, normative detachment is defeasible.

Reasoning schema: *Normative detachment*
(1) A;
(2) IF A THEN^n B
——— IS A DEFEASIBLE REASON FOR
(3) B

According to *normative detachment*, for instance, we can perform the inference in Table 20.1.

20.4.2. Specification and Universal Conditionals

Normative premises, as we observed above with regard to categorical normative propositions, allow for *specification* (FORANY *elimination*). This also holds when general conditional propositions are at issue. Note that the schema *normative specification* (contrary to classical detachment) is defeasible.

(1) FORANY (x, d, y)
IF [x unlawfully causes damage worth d to y]
THEN^n ***Obl*** $Does_x$[pay d to y]

---

(2) IF [Tom unlawfully causes damage worth € 2,000 to $Mary$]
THEN^n ***Obl*** $Does_{Tom}$ [pay € 2,000 to $Mary$]

Table 20.2: *Instance of* normative specification

Reasoning schema: *Normative specification*
(1) FORANY (x) $A(x)$
——— IS A DEFEASIBLE REASON FOR
(2) $A(x/a)$

For example, from the general and abstract rule that ⌈if one illegally causes a damage, then one has to pay the value of the damage to the damaged person⌉, it may be inferred that ⌈if Tom causes a damage of € 2,000 to Mary, then he will have to pay that sum to her⌉, as you can see in Table 20.2.

20.4.3. Normative Syllogism

We have seen that in classical predicate logic, by combining *specification* and *detachment*, we get *syllogism*. This combination can also be applied in normative inferences, so that, by combining *normative specification* and *normative detachment*, we obtain a compound defeasible inference schema, which we call *normative syllogism*.

Reasoning schema: *Normative syllogism*
(1) FORANY (x) IF $A(x)$ THEN^n $B(x)$;
(2) $A(x/a)$
——— IS A DEFEASIBLE REASON FOR
(3) $B(x/a)$

where x is the list of all (free) variables appearing in A and in B, a is a list of terms referring to individual persons or objects, $A(x/a)$ and $B(x/a)$ are the results we obtain by uniformly substituting, within A and B, all variables in x with constants in a. According to this reasoning schema, we can perform the inference in Table 20.3 on the following page.

(1) FORANY (x, d, y)
IF [x unlawfully causes a damage worth d to y]
THEN^n ***Obl*** $Does_x$ [pay d to y];
(2) Tom unlawfully causes a damage worth € 2,000 to $Mary$

---

(3) ***Obl*** $Does_{Tom}$ [pay € 2,000 to $Mary$]

Table 20.3: *Instance of* normative syllogism

20.4.4. Chaining Syllogisms

Normative syllogisms can be performed one after the other. Thus they form a chain, where the conclusions of earlier syllogisms provide preconditions for further syllogisms.

This is what is usually meant by a logical reconstruction of legal reasoning by most writers who have tried to use predicate logics in formalising the law.[11]

Let us consider, for instance the famous scene that opens Malraux's *La condition humaine* (Malraux 1946, 9ff.). The scene takes place in Shanghai, on 21st March 1927. Tchen, a communist revolutionary is waiting in the dark beside the bed where a man is sleeping, under a mosquito net. The man is a trader in weapons who is going to deliver guns to the government. This delivery would possibly compromise the success of a plan for insurgency. Malraux admirably describes the thoughts and feelings of Tchen before the strike, until he suddenly plunges his dagger in the body of his victim, who passes inadvertently from sleep to death.

By applying to Tchen's case the analysis provided by Alexy (1989), we obtain the inference in Table 20.4 on the next page (we discount possible legal issues concerning the applicable laws with regard to the time and place of the event):

This example shows why *judicial syllogism* (a sequence of chained syllogisms) is said to provide only a superficial view of legal reasoning. The syllogistic model of legal reasoning is based upon the reasoner's endorsement of specific factual conditions and general normative conditionals, like those we labelled as premises in Table 20.4 on the facing page, but it does not include inferences leading to the adoption of the rules one is using. To provide a sufficiently broad picture of legal reasoning we need to model also these higher-level inferences.

In Chapter 25, we shall consider inferences that lead to the endorsement of rules that are expressed by, or embedded in, a source of law. In the following

[11] Examples of this way of modelling legal reasoning can be found, for example, in the following contributions: Ferrajoli 1970; MacCormick 1978; Hernandez Marín 1989; Golding 2001; Alexy 1989.

1. *Tchen* kills a sleeping person in the absence of any special defensive precaution taken by the victim ⟨premise⟩
2. FORANY (x)
   IF [x kills a sleeping person in the absence of any special defensive precaution taken by the victim]
   THEN^n [x knowingly takes advantage of the victim's unsuspected and defenceless condition, to kill him or her] ⟨premise⟩
3. *Tchen* knowingly takes advantage of the victim's unsuspected and defenceless condition, to kill him or her ⟨from 1 and 2, by *syllogism*⟩
4. FORANY (x)
   IF [x knowingly takes advantage of the victim's unsuspected and defenceless condition, to kill him or her]
   THEN^n [x treacherously kills a human being] ⟨premise⟩
5. *Tchen* treacherously kills a human being ⟨from (3) and (4), by *syllogism*⟩
6. FORANY (x)
   IF [x treacherously kills a human being]
   THEN^n [x commits murder] ⟨premise⟩
7. *Tchen* commits murder ⟨from (5) and (6), by *syllogism*⟩
8. FORANY (x)
   IF [x commits murder]
   THEN^n [x is to be punished with life imprisonment] ⟨premise⟩
9. *Tchen* is to be punished by life imprisonment ⟨from (7) and (8), by *syllogism*⟩

Table 20.4: *Chain of syllogisms*

section, we shall focus on rules (see statements 2, 4, and 6 in Table 20.4) which are used in subsumption, that is, for bridging the distance between the facts of a case and the rule-antecedent (the precondition-type).

20.4.5. Syllogism and Subsumption

Syllogistic representations of legal reasoning are often accused of failing to represent adequately the *subsumption* process, namely, the way in which a reasoner matches the perception of certain events (or a lower level linguistic representation of such events) with the antecedent of a rule.

In fact, when one makes a syllogistic inference one must have already solved the subsumption problem, since *syllogism* assumes that the current situation is categorised using the terms that occur in the rule-antecedent: Exactly the same predicate must occur both in the antecedent of the universal rule (the *major premise*) and in the description of the situation to which the rule is to be applied (the *minor premise*).

However, when one starts considering a new case, usually one has not yet categorised its aspects so that they perfectly match a rule one has in mind.

Consider again Tchen's case, which we introduced in the previous section. Let us assume that we approach this case by reading Malraux's pages, and having in mind the following rule:

(1) FORANY (x)
IF $[x$ commits murder$]$
THEN^n $[x$ is to be punished with life imprisonment$]$

The simple fact of remembering this rule does not provide us with a full reason to conclude, according to *syllogism*, that Tchen is to be punished with life imprisonment. This is because rule (1)—the major premise—can be syllogistically applied only if one also believes the corresponding minor premise:

(2) *Tchen* commits murder on 21 March 1927

Only by combining the rule (1) with the specific factual-proposition (2) we obtains the reason of schema *syllogism*, and we can therefore derive the rule's conclusion.

Unfortunately, in Malraux's pages we cannot find the explicit statement of premise (2): these pages do not contain at all the word "murder." We can find only the train of Tchen's thoughts and feelings before the killing, and the description of his stroke and of the ensuing death of this victim. Thus, we still have to establish whether this sequence of events represent an instance of murder.

In general, establishing the minor premise of the syllogism is the result of the reasoning process of *subsumption*. In the legal domain, subsumption consists in establishing whether a certain *concrete situation* matches the *antecedent* of a general normative conditional (a *precondition-type*, see Section 20.2.4 on page 527) and thus determines the corresponding legal effect: Subsumption requires establishing the relevant facts, finding a corresponding (general) conditional, and comparing the facts and the antecedent of the conditional.

The successful result of this comparison is finally expressed in a proposition (the minor premise) that instantiates the antecedent of the conditional (the precondition-type) with reference to the individuals and the spatial-temporal context of the established factual situation. In our case, this would consist in proposition (2) above, saying that Tchen, on 21 March 1927, committed murder.

The information concerning the factual situation (the precondition-token) can be provided by perception. Consider, for instance, a police officer that sees a car that is parked near a crossing: Immediately, without verbalising (even in his thoughts) the situation, the officer forms the belief that he should fine that car.

In other cases, we find the factual information in linguistic form, as a result of a categorisation produced by ourselves or by others. This happens, for instance to a reader of *La condition humaine* who reconstructs Tchen's action on the basis of Malraux' s words. Similarly, when a judge reads a report of the police or listens to testimony, he or she reconstructs the events on the basis of a verbal account.

Nowadays (though this could not happen in the 1920's), the linguistic description of relevant facts can also be provided by some technological device, which stores the results of previous categorisations (like a police database containing information on precious convictions, or on the results of current investigations). In some cases, the information may also be automatically perceived and categorised (as it happens when automatic devices detect certain violations of traffic rules).

Some information concerning a specific case can also be inferred by a reasoner, from other information that is already at his or her disposal. Consider for instance, how a judge may form a belief concerning a crime on the basis of evidential inferences (for instance, the author's identity can be inferred from the shape of fingerprints or from DNA traces).

Whatever the way in which a reasoner obtains information on the facts of a case, he or she must find out what normative conditionals may apply to these facts. This search is influenced by the factual descriptions which are available to the reasoner, by their level of abstraction, and their connection with the precondition-types in the relevant normative conditionals.[12]

For instance, assume that one is provided with the following description of Tchen's action: "Tchen willingly caused the death of a sleeping arms-merchant by stabbing him in the stomach." Given this description, one can perform further steps toward abstraction, leading to further descriptions of the same event: "Tchen killed a sleeping man by stabbing him in the stomach," "Tchen killed a sleeping man by stabbing him," "Tchen killed somebody," and so forth.

We cannot here even address the working of perception and in particular the way in which humans, when given certain perceptual inputs, produce a conceptual categorisation and a corresponding linguistic representations (see Section 1.2.1 on page 8). Let us just remark that this is largely an unconscious process, the results of which we need to accept as appropriate inputs to out reasoning (unless we have specific reasons to doubt the working of our natural faculties, or there is a disagreement with other observers of the same facts).

What shall focus on the connection between different linguistic representations that aim at capturing the (relevant features of the) same event, and in particular between:

[12] Nowadays retrieval of legal materials is increasingly dependant upon computer technology. For a discussion of the theoretical issues involved in legal information-retrieval, see Bing 1984; for a recent review of the main trends, see Bing 2003.

- the categorisation which one forms after perceiving the event (or after being told a narrative concerning that event), and
- the categorisation that one may find by interpreting a law text.

Usually, one would start with a low level categorisation of the relevant facts, and try to find a normative conditional that matches this categorisation. For instance, assume that a reasoner is given the factual description ⌈Tchen stabbed a sleeping man causing his death, on 21st March 1927⌉. The reasoner may then do the following:

1. find (retrieve or construct) the rule ⌈if one commits murder, then one ought to be punished with life imprisonment⌉, and
2. subsume the facts that have been so described under the antecedent of the rule.

Completing the subsumption under the rule means coming to endorse the view that the particular facts referred to by the factual description are an instance of the antecedent of the rule. Thus, the positive outcome of the process of subsumption can be characterised by specifying the normative antecedent with regard to the entities and the spatial-temporal circumstances that characterise the particular facts under examination. For instance, with regard to Tchen's case, the subsumption's outcome can be expressed as follows:

$Tchen$ commits murder on 21st March 1927

20.4.6. Subsumption Rules

The conclusion that the antecedent of a certain rule is satisfied may be obtained, or at least justified, through what we call *subsumption rules*. By a subsumption rule, we mean a rule saying that all facts satisfying a certain description satisfy a certain other description, which provides the antecedent (the precondition-type) for a normative conditional.

Subsumption rules are a particular kind of *non-deontic rules*: They may be viewed as expressing *non-deontic emergence* or a *counts-as* connection (for these notions, see Section 21.1.1 on page 549). For instance, when examining Tchen's case, one may adopt the following subsumption rule:

FORANY (x)
IF x stabs another causing his or her death
THEN^m x commits murder

Note that the adoption of a subsumption rule only is a fallible hypothesis. For example, one may criticise the rule above, on account that it makes causing death by stabbing a sufficient precondition of murder. One may indeed argue

that causing another's death (even through stabbing) is not sufficient to produce a murder: The killing must also be intentional.

When examining a possibly relevant rule, one may discover that the rule's antecedent specifies some features that one has not yet considered. Then one needs to look again at the facts, to check if they really possess these additional features.

For instance, assume that when examining the murder-rule, we discover that only an intentional killing can qualify as a murder. Then we need to inquire whether Tchen had the intention of causing the death of his victim: Only if this is the case, shall we be able to apply the murder rule. Thus, we need to go back to the facts, and examine whether they satisfy this additional feature (whether Tchen had a murderous intention). In Tchen's case, by reading Malraux's account, we can without any doubt be satisfied that had indeed the intention of killing his victim. Thus we may reframe our subsumption rule as saying that:

FORANY (x)
IF x stabs another *intentionally* causing his or her death
THEN^m x commits murder

This rule allows the reasoner to infer—since ⌈*Tchen* stabs another *intentionally* causing his death on 21st March 1927⌉—that ⌈*Tchen* commits murder on 21st March 1927⌉.

The examination of the case at hand may lead the reasoner to reshape the normative conditionals he or she is endorsing (as legally binding) or hypothetically considering (for instance, as expressing a plausible interpretations of certain law texts, see Section 12.4.4 on page 352).

In particular, the reasoner may broaden or restrict the antecedent of a normative conditional according to teleological considerations, namely, according to whether a broader of more restricted shaping of the antecedent of the normative conditional will contribute to reach certain values in the case at hand and in similar cases (as we shall see in Section 25.1 on page 637). For instance, we may claim that the notion of murder needs to be extended also to cases where one (though not having the intention of killing) intentionally causes a serious bodily injury which leads to death.

On the other hand the analysis of the features of the case at hand may lead us to establish that the rule we are considering does not apply to that case (and to similar ones). For instance, a revolutionary tribunal may assume that it is absurd or unreasonable to view Tchen as a murderer, since his action was commanded by supreme necessities of revolution. More generally this tribunal may assume that political killings executed for the revolution's sake, against the enemies of the revolution, do not count as murders, but are rather to be viewed as capital sentences.

This is the process with regard to which the German doctrine speaks of "moving to and from of the glance" (*hin und her-wenden des Blickes*), between

factual and normative categorisations: We need to look at the facts, in order to investigate whether there is any rule which may be applied to them, but we also need to look at the rules to establish whether and under what conditions the facts are legally relevant, and to what effects (see, for all, Kriele 1976, 197ff, and Kaufmann 1965, 31).

In most complex cases, rather than using a single subsumption-rule to link the description of the facts and the rule's antecedent, we may provide a set of such rules, operating at different level of abstraction. Accordingly, we can construct a chain of syllogisms, where each step uses a subsumption rule to establish the minor premises for the subsequent step, as you can see in Table 20.4 on page 537. In this way, a sequence of smaller inference steps justifies the transition from the intuitive low-level perception of the facts to their categorisation as an instance of a rule-antecedent, that is, as a precondition-token (for a computational analysis of this process, see Branting 1994).

20.4.7. Subsumption and Learning

When set in a syllogistic form, subsumption may appear to be reducible to logical deduction: To perform a subsumption one just needs to retrieve the required subsumption rules and arrange them in a syllogistic chain.

However, this view fails to consider that very frequently we have to face the following difficulties: (*a*) we do not have access in advance to all subsumption-rules we need in order to pass from the intuitive *prima-facie* perception of the facts into an instance of a rule-antecedent, and (*b*) even if we can find an applicable rule among those which others have applied in the past, this rule may appear to be wrong or inappropriate (taking into account the present needs, attitudes, and values). Thus, we very often need to refine or create the applicable rules at the time when we are considering a new case, having in mind the legal outcome which we view as being appropriate to that case (we shall consider some aspects of rule-creation in Chapter 28). As a matter of fact, usually a legal reasoner would first produce an intuitive categorisation of the case (by using the resource of non-ratiocinative implicit cognition), and then would try to rationalise his or her intuition according to existing rules or to new ones.

Subsumption rules are typically stated in judicial decision, or are constructed by interpreters when trying to make sense of such decisions (they are an essential component of case law, both in common-law and in civil-law jurisdictions). They are made precise in the process of *distinguishing*,, namely, when one needs to explain why the particular features of the present case require it to be decided differently from similar precedents.

By establishing that the antecedent of a certain general normative conditional is satisfied by certain facts (or by certain kinds of facts, according to subsumption rules) the lawyer often contributes to partially specifying (to making concrete or positive) the content of that conditional.

Simplifying (and trivialising) a very complex legal and philosophical discussion that we cannot address here, we may just say that determinations adopted with regard to particular cases contribute to the inferential meaning of the applied rule: They expand the results one can obtain by applying that rule through inferences.

In fact, by combining a general rule with the proposition that certain kinds of facts match (instantiate) the antecedent of the rule, we supplement the rule with further information. This information allows us to infer the conclusion of the rule whenever instances of these kinds of facts take place, a result that possibly would not be achieved (or not so easily) on the basis of the rule alone. This information, obviously, is more relevant when it results from a binding precedent, or from a decision that has lead to the formation of significant social expectations.

Thus, we may say that the process of the application of a legal theory (intended as set of general legal premises) tends to be, in many cases, also a process of *theory construction*: The very theory being used is refined and extended, in particular, by reshaping pre-existing subsumption rules or by producing new ones. This learning process achieves a collective dimension when decisions of individual cases are supported by appropriate opinions, which are the object of judicial and doctrinal discussion.[13]

The fact that the application of the law also is a collective learning-process raises interesting questions concerning the application of the law with the help of computer systems, and in particular of computer systems which are able to directly apply, when given appropriate factual inputs, the relevant rules.[14] These systems, which recently are starting to achieve substantial results in a number of domains,[15] tend often to include detailed subsumption rules, so that the contribution of the person providing using such systems for deciding cases is facilitated, but also limited.

There are important questions to be answered with regard to subsumptions performed through such systems. Will such systems hinder the decentralised learning process which takes place in the application of the law, leading to a mechanical application by an indifferent computer operator? Or will they facilitate (collective) learning processes, by enabling an easier understanding of complex

[13] This aspect has been addressed in particular by the German legal doctrine, which describes it as the concretisation or *positivisation* (*positivisierung*) of the law through the decision of individual cases (see: Engisch 1968a; Esser 1974; Zaccaria 1990, 175ff..)

[14] For a very early discussion of the connection between law and computerisation, which captures the essential aspects of the problem, see Luhmann 1966.

[15] For the presentation of successful commercial systems which provide (or assist in) the rule-based determination of legal effects, see: Dayal and Johnson 1999, and van Engers and Boekenoogen 2003. For a review of knowledge-based systems for legal practice, see Kennedy et al. 2002. For a discussion of the role of these systems in the functioning of the law, see: Susskind 1996; Gordon 2003. On the logical foundation of such systems, see Kowalski and Sergot 1990. As examples of early prototypes, see among the others: Sergot et al. 1986; Biagioli et al. 1987.

combinations of legal rules, and a continuous critical scrutiny of their content and their implications?

We believe that the answer depends firstly on the technology used in developing such systems. A computer system may facilitate collective learning when it enables an easy understanding of the legal information that it embodies, and it allows us to experiment with the modification and extension of this information.

Secondly, the answer depends on the organisational context in which such systems are going to be applied. A computer system may allow and even facilitate decentralised collective learning when its users have a certain degree of autonomy, there is cooperation and trust between them, and appropriate channels of communication and feedback are in place (on the automatic application of the law, see Sartor 1993a).

20.5. Inapplicable Inferences

In Section 20.4 on page 534, we considered some important inferences of predicate logic that are also admissible with regard to normative conditionals. However, we cannot fully assimilate normative conditionals to material conditionals of classical logic, since other inferences of classical predicate logic are very questionable, when transferred to the normative domain.

20.5.1. Inferring a Conditional from a Falsity

The first questionable inference consists in passing from any proposition NON A to the material conditional IF A THEN^m B:

(1) NON A

---

(2) IF A THEN^m B

The logical validity of this inference (according to classical logic) depends on the fact that, according to the OR *introduction* schema, NON A entails NON A OR B, which is exactly equivalent to IF A THEN^m B. Transferring this schema to normative conditionals, we would obtain quite a weird way of reasoning.

Assume that now it is daytime (it is not nighttime). From this it follows that if it is nighttime, then it is permitted to torture children.

(1) NON [it is nighttime]

---

(2) IF [it is nighttime] THEN^m ***Perm*** [to torture children]

Obviously, a defender of material conditional can replicate that this inference is perfectly right, once we understand exactly its premises. When we say that ⌈if it

is nighttime then it is permitted to torture children⌉, and we read the "if ... then ... " as a material conditional, we are just saying that ⌈either it is not nighttime or it is allowed to torture children⌉. Undoubtedly, this disjunctive proposition is currently true, since it is now daytime (it is not nighttime), regardless of what may (or may not) be done to the children. In fact, for a disjunctive proposition to be true, it is sufficient that one of its component propositions is true. When this is the case, it is irrelevant that the other component proposition is true or false: The conditional is true either way. Through a material conditional we are simply describing the word as it is now, we are not saying anything about what would be the case in a different situation (that is, if the first component proposition were false).

However, such defences of material conditional can be rebutted by replying that the *prima facie* apparent absurdity of this inference proves that when one says "if ... then ... " in a normative context, one is not expressing a material conditional. One is rather expressing a kind of counterfactual conditional: One is considering what would be the case (what would be determined) if the antecedent were true (regardless, and possibly without knowing, whether it will really become true).

Therefore to establish whether it is the case that ⌈if it is nighttime, then it is permitted to torture children⌉, one should not look at what is the case now (and be satisfied by ascertaining that now it is not nighttime, i.e., that now it is daytime). One needs rather to consider the hypothesis that it were nighttime. Only in the case that under such circumstances (under the hypothesis that it were nighttime) it would be allowed to torture children, one might say that ⌈if it nighttime then it is permitted to torture children⌉. Since this is not the case (even if it were nighttime it would still be forbidden to torture children), then the conditional does not hold (on hypothetical reasoning, see, for all, Rescher 1964).

Note that the same absurdity would emerge if we were reasoning with conditional intentions rather than with normative conditional:[16] : The belief that a certain proposition is false, should nor lead one to adopt the intention to perform any absurd action in case such proposition was true. Adopting such an intention would indeed be irrational.

Assume, for instance, that I am driving home and that I desire to get there as soon as possible, but without damaging my car or myself. Since I am about one kilometre from my house, and I believe that there is enough petrol in my car to reach my destination, I decide to go on without stopping for fuel. Under such conditions—that is, given my belief that ⌈the car will not stop for lack of petrol⌉ (and certain other beliefs which I have)—I may rationally form the intention that ⌈if, contrary to my expectations, the car stops for lack of petrol, then I shall go

[16] It seems that this parallel confirms our idea that normative conditionals doxify conditional intentions

to the nearby garage asking for help⌉. However, my belief that the car will not stop for lack of petrol, does not license whatever absurd conditional intention, like, for instance, the intention that ⌈if the car stops for lack of petrol, I shall drive it into the nearby river⌉.

20.5.2. Normative Conditionals and Contraposition

A second questionable inference concerns the use of the *modus tollens* schema:[17]

(1) IF A THEN B;
(2) NON B

---

(3) NON A

Modus tollens inferences are sound when applied to epistemic propositions, and especially when reasoning with natural causation. Consider the following piece of epistemic reasoning:

(1) IF [it has rained recently] THEN [the ground is wet];
(2) the ground is not wet

---

(3) it has not rained recently

This piece of reasoning clearly makes sense. I may execute it when I have some autonomous evidence (in particular, perceptual evidence), which leads me to believe that the ground is not wet (subreason 2 in the above inference). This belief contradicts the consequent of the conditional (subreason 1 in the above inference), and leads me to conclude that the antecedent of the conditional is false (that it has not rained). In fact if the antecedent were true, then the ground would be wet, which I know it is not the case.

Unfortunately, *modus tollens* inferences become very weird in the normative domain. Consider for instance the piece of normative reasoning in Table 20.5 on the next page: The conclusion that Tom has delivered the merchandise in time is derived from the fact that he is not obliged to pay the penalty for late delivery. This piece of reasoning is a sound application of the schema *modus tollens*, but nevertheless it appears very strange, if not absurd.

[17] The full name for this inference schema was, in medieval logic, *modus tollendo tollens*, meaning "the removing (denying) method." This reasoning schema is linked to *contraposition*, which is the possibility of deriving from a conditional IF A THEN B, a conditional IF NON B THEN NON A. In fact, *modus tollens* is just contraposition combined with *detachment* (*modus ponens*). Thus often the terms *modus tollens* and *contrapositive inference* are used interchangeably.

(1) IF [Tom has not delivered the merchandise in time]
THEN^n [Tom is obliged to pay a penalty of € 1,000];
(2) Tom is not obliged to pay a penalty of € 1,000

---

(3) Tom has delivered the merchandise in time

Table 20.5: *Normative* modus tollens

The reason for such weirdness seems to be the following. Normative properties are not perceivable through our senses. There cannot be any perceptible evidence that directly leads us to believe that normative properties hold or do not hold. We can come to conclude that a normative property does not hold (for a certain individual or a certain object) only when we believe that none of the reasons that may determine that property is to be endorsed, or that all such reasons are defeated.

Therefore, my believing that Tom is not obliged to pay € 1,000, presupposes that one the following alternative conditions holds:

- I already believe, before making the inference, that Tom has delivered the merchandise in time. This belief makes the inference in Table 20.5 useless, since I already believe the conclusion of that inference.
- I believe that there are prevailing reasons for concluding that Tom is not obliged to pay the penalty, even when he did not deliver the merchandise (for instance, Mary, who was supposed to pay the price in advance has not yet paid, so that Tom would be justified in withholding the delivery). This belief makes the inference in Table 20.5 wrong (since it leads me to believe that Tom delivered the merchandise even when he did not).

The idea that *modus tollens* inferences do not make much sense in the legal domain can be confirmed by considering the corresponding direct (non doxified) practical reasoning.

Assume that my wife has the following intention: ⌈if my husband is late, I shall go on my own⌉. Assume that she is aware that she has not yet gone on her own (she is nervously waiting at the place where we were supposed to meet). Is this a reason for her to conclude that her husband is not late? Would the following reasoning be sensible?

(1) I have the intention that if my husband is late then I shall go on my own;
(2) I am aware that I have not yet gone on my own

---

(3) I believe that my husband is not late

Though many people would be very happy to have their partners reasoning this way, this can hardly be seen as a paradigm of rationality.

According to our idea that doxified practical reasoning needs to track direct practical reasoning, the weirdness of applying *modus tollens* to conditioned intentions explains the weirdness of applying it to conditioned normative propositions.

There has been a significant debate, especially within research on artificial intelligence and law, as to whether legal rules allow for *modus tollens*. Some formalisms—as the logic adopted in Gordon's *Pleadings Game* (Gordon 1995)—admit this type of inference. However, Prakken (1993; 1997) has convincingly argued that contraposition makes arguments possible that would never be considered in actual legal practice.

An explanation that is similar to ours—though based upon ontological, rather than upon epistemological consideration—is provided by Hage's idea that any legal rule has to be applied, in order to produce its consequent, and lawyers never apply rules contrapositively (Hage 1996; 1997).

In artificial intelligence, *modus tollens* is also rejected when defeasible rules are modelled as *inference licences* or *inference policies* (Loui 1998), and sometimes also with regard to certain kinds of causal reasoning (Geffner and Pearl 1992).

Finally, *modus tollens* is also invalid in *extended logic programming*, where one represents conditionals as uni-directional rules, rejecting contraposition (Kowalski 1979).

Chapter 21

VARIETIES OF NORMATIVE CONDITIONALS

In this chapter we shall analyse different kinds of normative conditionals, which will enable us to address some issues concerning legal language and the structures of legal knowledge.

We shall focus in particular on the cognitive role of intermediate, non-deontic, normative qualifications (like being a citizen, being an owner, having certain powers), a role which is essentially dependant on normative conditionality: These qualifications depend upon certain conditional antecedents, and allow, through further normative conditionals, further, deontic or non deontic, conclusions. We shall also critically discuss some views on legal conditionality, and in particular Hans Kelsen's theory of it.

Finally, we shall extend our analysis to the temporal aspects of legal conditionality and to the negation of normative conditionals.

21.1. Types of Normative Conditionals

In Chapter 20 we have focused on the commonalities among normative conditionals, indicating their shared function and logical structure, and specifying what inferences are appropriate or inappropriate with regard to any normative conditional. In the following, we shall consider differences: There are different types of normative conditionals, and some of them require a specific logical treatment.

21.1.1. Different Kinds of Normative Determination

Though normative conditionals are always concerned with an antecedent condition determining certain normative results, this may take different forms. Let us analyse the conditional propositions listed in Table 21.1 on the following page:

1. The first proposition expresses what we may call *deontic initiation*. An event determines the initiation of a deontic state of affairs (the obligation to pay the penalty), and this state of affairs continues also after the event that has started it.
2. The second proposition expresses what we may call *negative deontic initiation* or *deontic termination*. An event determines the termination of a deontic position, that is, it makes so that this position does not hold any

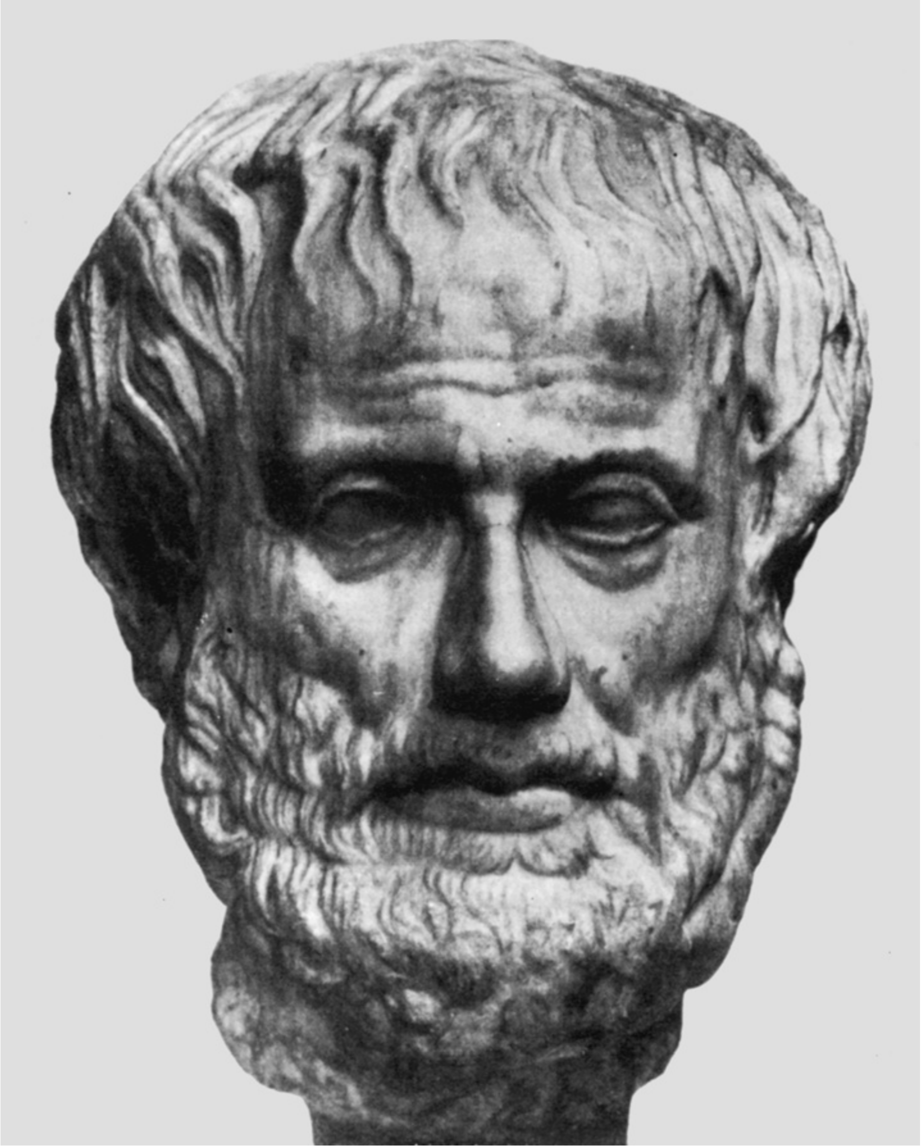
(1) IF [Tom does not deliver the merchandise in time]
THEN^n Tom becomes obliged to pay a penalty of € 1,000]
(2) IF [Mary renounces to the payment of the penalty]
THEN^n [Tom ceases to be obliged to pay it]
(3) IF [Tom is inside a mosque]
THEN^n [Tom is forbidden to wear shoes]
(4) IF [Tom is born in Italy]
THEN^n [Tom becomes an Italian citizen]
(5) IF [Tom acquires another citizenship]
THEN^n [Tom ceases to be an Italian citizen]
(6) IF [an object is permanently attached to the soil]
THEN^n [the object is an immovable good]
(7) IF [Tom drives while being drunk]
THEN^n [Tom commits a criminal offence]

Table 21.1: *Examples of normative conditionals*

longer (the obligation to pay the penalty), and this continues after the terminating event.

3. The third proposition expresses what may be called *deontic emergence*. The holding of the antecedent state of affairs (Tom is inside the mosque), determines the co-occurrence of a normative position (he is under the obligation not to wear shoes). As soon as the antecedent state of affairs ceases, also the consequent state of affairs ceases.
4. The fourth proposition expresses what we may call *non-deontic initiation*. An event (being born in Italy) determines the initiation of a non-deontic state of affairs (Tom's citizenship). As in the first case (deontic initiation), this state is assumed to persist after the event that has started it.
5. The fifth proposition expresses what we may call *non-deontic negative initiation* or *non-deontic termination*. An event (getting a different nationality) makes so that non-deontic state of affairs does not hold (that Tom is no longer a citizen). As is the previous case, this is assumed to persist after the terminating event.
6. The sixth proposition expresses what we may call *non-deontic emergence*. The persistence of the antecedent state of affairs (being attached to the soil) as long as it holds, determines the persistence a non-deontic qualification (being an immovable object).
7. The seventh proposition is similar to the sixth one, but consists in the emergence of an event over another event, let us call it *event-emergence*. The emerging event happens when the conditioning event takes place.

We can understand the function and the working of each of these types of conditionals by considering what instructions they doxify.



Aristotle (384–322 B.C.)

Georg Henrik von Wright (1916–2003)

Normative initiation doxifies the intention to perform backward-looking behavioural instructions. These instructions require certain behaviour to take place in case a certain event has previously taken place. As examples of such instructions, consider the following: ⌈If the car remains without gas, I shall walk to the gas station⌉ or ⌈If tomorrow you get a bad mark, then you shall stay at home to study⌉.

Deontic emergence doxifies the while-type of behavioural instructions, namely, instructions requiring certain behaviour to take place as long as (while) a certain condition obtains. Here are two examples of these instructions: (*a*) ⌈While I have some energy left, I shall keep running⌉, (*b*) ⌈While it is sunny, you shall wear your hat⌉.

Non-deontic initiation doxifies the intention that if a certain event has taken place at a certain time, then one shall accept that a state of affairs has started to exist (and this state of affairs will continue even after the originating event took place, unless the state of affairs is terminated). As instances of (the noemata expressed by) such intentions, consider the following instructions: (*a*) ⌈If you are late again, then I shall believe that you are completely unreliable⌉, (*b*) ⌈if you have registered for this school, then I shall assume that, from January 1, you are a member of the class⌉. As we saw above, one may also view such instructions as concerning the intention to unconditionally endorse a conditioned proposition: I shall accept that ⌈if you have registered for this school, then, from January 1, you are a member of the class⌉. The initiating time for the conditioned state of affairs usually coincides with the time when the conditioning event is completed, but in some cases, as the last example shows, it can be different.

Non-deontic emergence doxifies one's intention to accept that if a certain state of affairs (event) is taking place, then another state of affairs (event) is also taking place. The cognitive function of these instructions is to enable moving from the belief in the existence of the first state of affairs (event) into the belief in the existence of the second state of affairs (event), the two being viewed as happening at the same time. Here are two examples, the first concerning the non-deontic emergence of a situation and the second concerning the non-deontic emergence of an event: (*a*) ⌈We shall assume that while you keep smoking, you are an intruder⌉; (*b*) ⌈We shall assume that if the ball falls over the line, then it falls inside the tennis court⌉.

21.1.2. Counts-as Connections and Constitutive Rules

Some authors have affirmed that there exists a further specific and fundamental type of normative connection, which they have expressed through the idea of *counts-as*. This idea was made popular by Searle (1969), who has recently reaffirmed it (Searle 1995, 28), asserting that counts-as rules have the following form:

"X counts as Y" or "X counts as Y in context C"

He calls such rules *constitutive* and gives them a pivotal role in the construction of social and legal reality.[1]

Similarly, Jones and Sergot (1996) view counts-as connections as providing the bridge between brute and institutional facts.

We prefer not to provide a specific representation for counts-as connections, but rather to view them as an instance of the type of normative determination which we called *emergence*. This notion is broader than the notion of counting-as in the sense that it covers also the emergence of deontic qualifications, for which talking of counting-as would not make such sense: For instance, it would be quite weird to say that ⌈staying in this room counts-as being forbidden to smoke⌉. Moreover we maintain that normative effects emerge not only from brute facts, but also from other normative qualifications (for a formalisation that takes into account this double function of normative connections, see: Gelati et al. 2002a; Gelati et al. 2002b).

With regard to characterising counts-as connections as constitutive rules, we need to observe that, in a certain sense, the meaning of any legal qualification is determined or constituted by certain rules: These are the rules establishing under what conditions the qualification emerges or initiates, and what further effects follow it.

Correspondingly, a constitutive nature, intended in a broad sense, must be recognised to all rules establishing legal effects. This very general sense of *constitutive* seems indeed to be the commonly used in traditional legal language, where the term *constitutive facts* tends to cover any operative fact (see Section 20.2.4 on page 527). Accordingly, any normative conditional appears to be constitutive with regard its effect, and the notion of *constituting* tends to coincide with our notion of *determining*.[2]

Thus, all of the following rules seem to be equally constitutive of European citizenship:

- ⌈one's Italian citizenship determines one's European citizenship⌉ (non-deontic emergence);
- ⌈birth in a European country determines European citizenship⌉ (non-deontic initiation);

[1] For a detailed distinction of different types of constitutiveness, see Conte 1995. Pattaro (Volume 1 of this Treatise, sec. 2.1) understands constitutiveness in a different, more general way, that is, as consisting in the relation between a concept (a "type") and its instances (in the sense that adopting a concept or a type as a component of one's conceptual framework, leads one to viewing certain entities and situation as instances of the concept). From Pattaro's viewpoint, one may also say that all kinds of rules we have mentioned are constitutive: Such rules, by determining the meaning of such concepts or types, contribute to "constituting" their instances, either by identifying such instances or by linking to them certain normative properties.

[2] See Hohfeld (1964, 32) where the terms *operative*, *casual* and *constitutive* are used synonymously. For this broad idea of constitutiveness, see recently Carcaterra 1979.

- ⌈one's European citizenship determines one's rights to move across the European Union, and not to be discriminated relative to other European citizens⌉ (deontic initiation).

In fact, as we will argue in next paragraph, the appropriate semantics for *intermediate legal concepts* is an inferential semantics, where the meaning of such concepts is given by the network of inferences leading to them or departing from them. This assumption will lead us to state that all kinds of rules we have been introducing—regardless of whether we can express them using the counts-as language—are constitutive of the concepts appearing in their consequents or in their antecedents.

21.2. Intermediate Legal Concepts

The idea that legal rules are constitutive has been advanced in particular with regard to non-deontic or *intermediate* legal concepts, like those of citizenship, ownership, real property, contract, sale of goods, namely, those legal concepts that do not immediately express an obligation or a permission, and thus differ from the basic deontic modalities of Chapter 17 and from the obligational notions of Chapter 19. We need therefore to have a look into the logical and cognitive role played by such concepts.

21.2.1. Alf Ross's Theory of Legal Concepts

The classical starting point for the analysis of intermediate legal concepts is provided by the story presented in Ross 1957. Ross imagines a population, the Noît-cif tribe, which endorses two kinds of rules:

1. rules stating under what conditions something is (or starts to be) a tû-tû, and
2. rules stating further normative qualifications or positions are determined by having or acquiring the tû-tû quality.

These two types of rules as exemplified by the following rules:

(1) If some person has eaten of the chief's food, he is tû-tû;
(2) If a person is tû-tû, then he shall be subjected to a ceremony of purification. (Ross 1957)

According to Ross, to understand how the word tû-tû is used by the Noît-cifonians we just have to know all rules of the two kinds just mentioned, that is, all rule which establish:

1. when something is qualified as a tû-tû, or

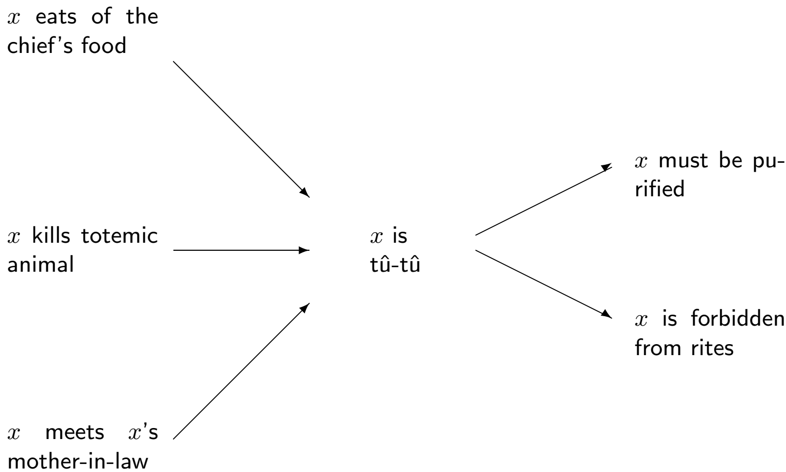


Table 21.2: *Tû-tû, an intermediate normative concept*

2. what further normative qualifications or positions are determined by having or acquiring the tû-tû quality.

Note that the Noît-cifonian population may endorse many rules concerning both the determination of the tû-tû quality (for instance, rules stating that that killing a totemic animal determines the tû-tû-ness of the killer, or that meeting one's mother-in-law determines one's tû-tû-ness), and what effects tû-tû-ness determines (for instance one's tû-tû-ness may determine one's prohibition of participating in certain ritual activities, and one's obligation to undergo a purification ceremony). Thus we get the normative information which is represented in Table 21.2, where each arrow-connection represents a general rule.

For instance the arrow between ⌈x eats of the chief's food⌉ and ⌈x is tû-tû⌉ stands for the rule:

FORANY (x) IF x eats of the chief's food THEN^n x is tû-tû

The members of the tribe, who endorse rules concerning the initiation of tû-tû and rules establishing tû-tû's effects, need two inference steps for obtaining deontic conclusions, as you can see in Table 21.3 on the next page: The first step is concerned with establishing that a persons is tû-tû, and the second step is concerned with establishing a deontic implication of tû-tû-ness.

Ross affirms that the tû-tû concept is superfluous, in the sense that the same deontic conclusions which are licensed by tû-tû-based inferences can also be ob-

1.	Tom meets Tom's mother-in-law	⟨premise⟩
2.	FORANY (x) IF x meets x's mother-in-law THEN^n x is tû-tû	⟨premise⟩
3.	Tom is tû-tû	⟨from 1 and 2, by *syllogism*⟩
4.	FORANY (x) IF is tû-tû THEN^n x must be purified	⟨premise⟩
5.	Tom must be purified	⟨from 3 and 4, by *syllogism*⟩

Table 21.3: *Two-step inference, using tû-tû*

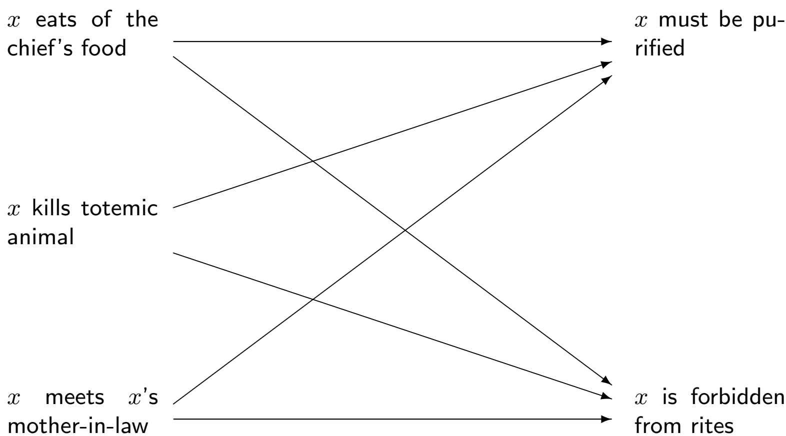

Table 21.4: *The elimination of tû-tû*

tained through rules directly connecting facts and deontic qualifications. If the members of the tribe would forget about tû-tû and learn the rules in Table 21.4, they would have lost no real normative information: They would be still able to derive the same deontic conclusions they could derive before (when they still used the tû-tû notion), in the same situations.

Ross argues that non-deontic legal qualifications, such as the notion of ownership are logically no-different from tû-tû-ness: Their function is limited to being relay-nodes between factual preconditions and normative effects, as you can see in Table 21.6 on the next page.

Like tû-tû-ness, also ownership can be eliminated without deontic loss: Just substitute the set of rules in Table 21.6 on the following page, with the set in Table 21.7 on page 557.

1.	Tom meets Tom's mother-in-law	⟨premise⟩
2.	FORANY (x) IF x meets x's mother-in-law THEN^n x must be purified	⟨premise⟩
3.	Tom must be purified	⟨from 1 and 2, by *syllogism*⟩

Table 21.5: *One-step inference, without using tû-tû*

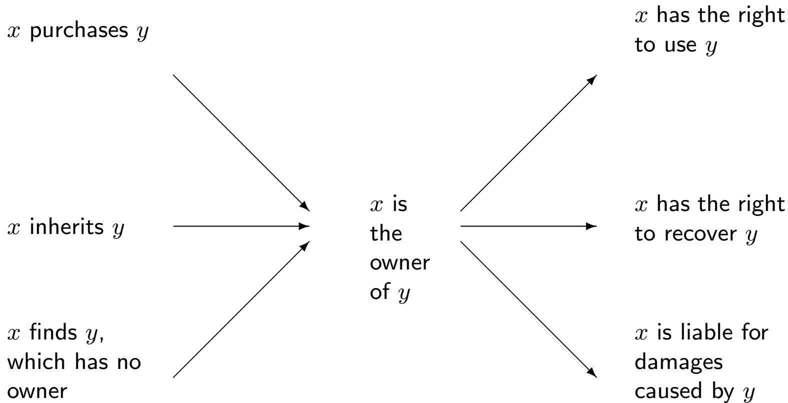

Table 21.6: *Ownership: an intermediate legal concept*

The result we obtain by eliminating the notion of ownership is a more complex knowledge representation: In Table 21.7 on the facing page we have nine connections, that is, nine rules rather than the six rule of Table 21.6.

On the other hand, as we have seen with regard to the tû-tû concept, after eliminating ownership we can derive deontic conclusions in one step, rather than in two steps. For instance, rather than performing the inference in Table 21.8 on the facing page, we can perform the shorter inference in Table 21.9 on page 558.

Thus, Ross correctly remarks that ownership can be eliminated—through a conceptual revision of all the original ownership-based rules—in such a way that the possibility is preserved of inferring the same deontic conclusions in the same factual situations.

From this fact, which he so clearly describes, however, Ross moves to questionable conclusions. In particular, he makes the following claim:

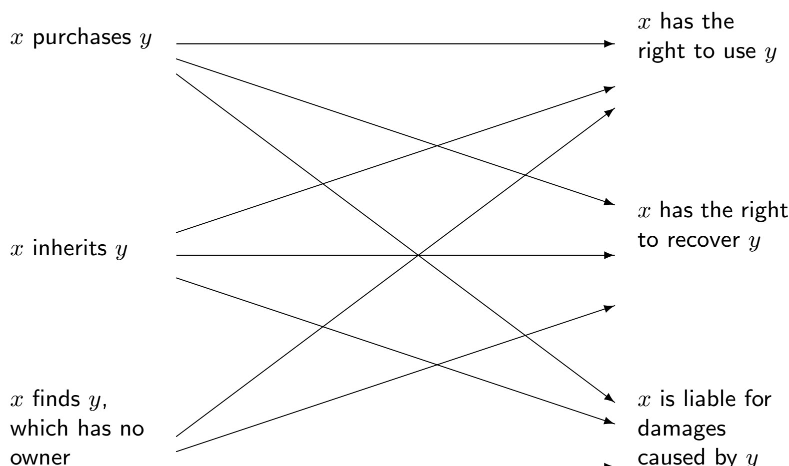

Table 21.7: *The elimination of ownership*

1.	*Tom* has purchased *this CD*	⟨premise⟩
2.	FORANY (x, y) IF x purchased y THEN^n x is the owner of y	⟨premise⟩
3.	*Tom* is the owner of *this CD*	⟨from 1 and 2, by *syllogism*⟩
4.	FORANY (x, y) IF x is the owner of y THEN^n x has the right to use y	⟨premise⟩
5.	*Tom* has the right to use *this CD*	⟨from 3 and 4, by *syllogism*⟩

Table 21.8: *Two-step inference, using ownership*

[T]he "ownership" inserted between the conditioning facts and the conditioned consequences is in reality a meaningless word without any semantic reference whatever, serving solely as a means of presentation. (Ross 1957)

Therefore, Ross's view of the function of intermediate legal concepts—they enable us to simplify the representation of normative contents—leads Ross to a conclusion concerning the semantics of these concepts: They are just meaningless dummies. In the following, while accepting that legal concepts have (also) the inferential function that Ross attributes to them, we shall reject Ross's conclusion on legal semantics.

1. Tom has purchased $this\ CD$ ⟨premise⟩
2. FORANY (x, y) IF x purchased y THEN^n x has the right to use y ⟨premise⟩
3. Tom has the right to use $this\ CD$ ⟨from 3 and 4, by *syllogism* ⟩

Table 21.9: *One-step inference, without using ownership*

21.2.2. The Inferential Meaning of Intermediate Legal Concepts

The fact that a term can be eliminated from a body of rules, without loss of deontic conclusions, does not prove that this term is meaningless. On the contrary, the very fact that we need to reformulate our rules, to achieve this result, proves that such term had a meaning: The reformulation is required exactly to express the meaning of that term in a different way.

Moreover, the fact that a term had no meaning before being inserted in a body of information does not prove that the term has no meaning after having been included within such body or information, and being connected through rule-based links to other pieces of such information.

With regard to terms expressing legal qualifications, we should rather say that such terms have an *inferential meaning*. The *meaning* of legal qualification Q—intended as Q's *conceptual function*—is given by two sets of rules:

a. the rules stating what conditions determine qualification Q (Q-determining rules), and
a. the rules linking further properties to the possession of qualification Q (Q-conditioned rules).

Therefore, knowing the meaning of qualification Q requires knowing from what conditions Q is determined (according to Q-determining rules), and what follows from the possession of Q (according to Q-conditioned rules). It is exactly this meaning that enables us to refer to legal qualifications in deriving certain deontic conclusions from certain facts, and that allows Ross to eliminate such qualifications the way he does.

Our analysis of how Q-determining and Q-conditioned rules contribute to specify the meaning of qualification Q—that is, our analysis of the conceptual function of being a Q—leads us to some corollaries concerning the "constitutiveness" of such rules.

First of all, though trivially, we can say that such Q-determining and Q-conditioned rules *constitute* Q's inferential meaning, since they determine what inferences lead to Q and what inference depart from it. For instance, we can say that:

a. ownership-determining rules contribute to constitute the notion of ownership, by establishing that ownership is acquired under certain conditions, while

b. ownership-conditioned rules contribute to constitute the notion of ownership, by establishing the rights and duties of owners.

Secondly, such rules determine when Q applies to particular individual entities and what further properties Q-qualified entities have. Therefore, those rules may be said to *constitute* the fact that certain individuals are Q's, as well as the normative consequences of this fact. For instance, we may say that the following:

a. ownership-determining rules contribute to constitute the ownership of current owners of certain things, by having enabled the generation of their ownership of those things (as resulting from the conditions which determine ownership, according to such rules), while

b. ownership-conditioned rules contribute to constitute the ownership of current owners, by enabling the generation of the normative entitlements owners have with regard to their possessions (as resulting, according to such rules, from ownership of these possessions).

Our analysis of the connection between inferential meaning and rules also applies to non-legal terms. Consider for example offside in football: There are certain rules of football which establish that certain situations determine a state of offside (offside-determining rules), and there are other rules of football which establish that being in a state of offside determines certain normative consequences (offside-conditioned rules). Thus, the meaning of the notion of offside seems to be reducible to its inferential role, according to both sets of rules. Consequently, we may say that such rules constitute the notion of offside, and also that they constitute the "offsideness" of those particular situations which, on any football pitch, happen to instantiate the notion of an offside.

21.2.3. Cognitive Function of Non-Deontic Legal Concepts

According to the thesis we presented in the last section, we may conclude that non-deontic legal qualifications have a meaning, and in particular an inferential meaning. This meaning is determined by the rules concerned with determining (*a*) when these qualifications apply and (*b*) the consequences of having this qualifications. This is the meaning one gets acquainted with when one learns such rules.

We need now to establish whether such an inferential meaning exhausts the significance of non-deontic legal concepts. We will start considering the above-mentioned view of Alf Ross: Legal concepts only have the function of enabling a simpler representation of the legal material.

As Lindahl (2003, 186, 193ff.) observes, ideas similar to those of Ross were advanced, in the same years, by Wedberg (1951). According to Wedberg, the use of "meaningless expressions" has—not only in the law, but also in natural science—the function of reducing the number of rules that are needed for

licensing certain conclusions. When we have m sentences $A_1 \dots A_m$, and n sentences $B_1 \dots B_n$ and we want to be able to infer from each A_i all of the $B_1 \dots B_n$, we has two choices.

The first consists in having, for each A_i, n rules connecting A_i to each of the $B_1 \dots B_n$. This implies having $m * n$ rules altogether (this is the situation we have represented in Tables 21.4 on page 555 and 21.7 on page 557).

The second choice consists in introducing "a meaningless symbol Z" and in having the following rules: (*a*) for each A_i, just one rule connecting A_i to Z, and (*b*) for each B_j, just one rule connecting Z to B_j. This implies having only $m + n$ rules altogether, a number of rules much smaller that $m * n$ (when m and n get big enough), as you can see in Tables 21.2 on page 554 and 21.6 on page 556.

We agree with Ross and Wedberg in attributing to intermediate concepts the function of enabling a more compact representation of knowledge. However, we also believe that intermediate legal concepts have a broader range of functions to play with regard to practical cognition.

Here is the list of some cognitive roles of concepts according to Thagard (1992, 22), who uses the concept *whale* as an example:

1. *Categorization*. Our concept *whale* enables us to recognize things as whales.
2. *Learning*. Our concept *whale* must be capable of being learned, perhaps from examples, or perhaps by combining other existing concepts.
3. *Memory*. Our concept *whale* should help us remember things about whales, either in general or from particular episodes that concern whales.
4. *Deductive inference*. Our concept *whale* should enable us to make deductive and inductive inferences about whales, for example, enabling us to infer that since Gracy is a whale she has fins.
5. *Explanation*. Our knowledge about whales should enable us to generate explanations, for example saying that Gracy swims *because* she is a whale.
6. *Problem solving*. Our knowledge about whales should enable us to solve problems, for example how to get an errant whale out of the harbour.
7. *Generalization*. Our concept *whale* should enable us to learn new facts about whales from additional examples, for example to form new general conclusions such as that whales have blubber under their skin.
8. *Analogical inference*. Our concept *whale* should help us to reason using similarities: If you know that dolphins are quite intelligent and are aquatic mammals like whales, then whales are perhaps intelligent too. The metaphor should also be supportable by the concept, as when we say that someone had a whale of an idea.

It seems to us that all such roles are played also by legal concepts, such as owning something, being a citizen, or being drunk (this being determined by having a certain level of alcohol in the blood, and determining such conclusions as being prohibited to drive). This is exemplified in the following list, where the conceptual roles identified by Thagard are applied to legal concepts:

1. *Categorisation*. Things are categorised according to who owns them (for instance, by tax officers), and people are categorised according to their

citizenship (by immigration officers) or are qualified as being drunk or sober (by police officers).

2. *Learning*. We learn the concepts of ownership, citizenship, or drunkenness when we are children, and if we become lawyers we refine and expand our understanding in the law school, where we merge our intuitive understanding with the knowledge of how such properties are legally determined, what they determine, and for what purposes.
3. *Memory*. We use these legal concepts for storing and synthesising information, which may have been extracted from specific rules, though we cannot tell which ones.
4. *Deductive inference*. We use the information that is linked to legal concepts for drawing inferences, for example, about rights and duties of owners, citizens, and drunk people.
5. *Explanation*. We make explanations according to our conceptual model of the law. For instance, we may explain judicial decisions concerning certain persons with the fact that they were owners, citizens, or drunk drivers.
6. *Problem solving*. Our knowledge of what it means (for the law) to own something, to be citizen, or to be drunk provides us with clues on how to approach situations where ownership, citizenship, or drunkenness are at issue.
7. *Generalisation*. Our notions of ownership, citizenship, or drunkenness, enable us to consider at a glance all different situations falling under such concepts, perceiving their commonalities and differences.
8. *Analogical inference*. Our notions of ownership, citizenship, or drunkenness, enable us to make analogies. For instance, they enable us to wonder whether intellectual property or privacy rights over one's data are so similar to ownership that some of the ownership-related normative positions can be extended to them or not, or whether drug addition may be assimilated to drunkenness.

The meaning of a legal concept—such as ownership, tort or contract, or even drunkenness—is not fully reducible to its inferential function, established by a fixed set of rules, though this inferential function, as constituted by these rules, is an essential aspect of such a meaning.

In fact, the study of a legal concept—or better the study of the legal regime which is identified by a certain concept, what the Germans call a *Rechtsinstitut* (legal institute, see von Savigny 1981, sec. 5)—consists in bringing together not only the rules directly related to the concept (the rules which determine the qualification according to the concept, or that establish the consequences of this qualification), but also further normative, empirical and evaluative knowledge concerning the application of these rules. We build theories of *Rechtsinstitute* and these theories need to be as good (as a cognitive and decisional tool) as

possible, given the input material at one's disposal. This material may include conflicting rules, factors, and values: This does not exclude that when organising such material one should aim at coherence, that is, at shaping it in such a way to make it usable in legal problem-solving.

Some critical approaches to legal studies (on which see, for instance, Kennedy 1976; Unger 1986; Kennedy 1997) often jump too quickly from the recognition that the law expresses conflicting values, policies, rules to denying that it makes sense to accommodate all of this information within a comprehensive picture. We should indeed criticise attempts at building coherence by cancelling realities or experiences (this would indicate a psychotic personality, rather than a cognitive attitude), and one may rightly choose to focus one's efforts into bringing to the fore aspects of the law that others fail to recognise. However, the fact that legal materials are conflicting and that one views one's mission as that of studying and emphasising such conflicts, should not prevent one from recognising the merit of attempts to try to organise as well (as coherently) as possible this material, using it to construct an adequate practical theory.[3]

It seems to us that lawyers approaching the study of particular legal concepts and institutes (*Rechtsinstitute*) should engage in *local theory-construction* (see Chapter 28): They should try to build legal theories of the particular domains of their inquiry, theories which—though having their starting point in rules which appear to be binding in a certain domain, and cases where they have been applied—end up with broader claims, concerning the contents of such rules, the values to which they are related, the ways in which such values may be achieved within legal practice.

Thus, in studying legal concepts, besides collecting sets of rules having the same qualification as a consequence or as an antecedent, one needs to consider how such rules are to be understood, whether they are liable to exception, or even whether one needs to expand the available rule-set with new rules, as required by analogies with existing material, by values to be pursued, by the existing socio-economic conditions. Rather than only listing such rules, one needs to articulate the information according to which it may be possible to identify, understand, use, integrate them.[4]

The task of designing appropriate conceptual structures for legal thinking is

[3] This idea comes close to the view of legal doctrine that is advanced by Dworkin (1986), though he prefers to speak of integrity rather than of coherence, and focuses on moral-political requirements rather than on cognitive-epistemological standards, as we do (this is also the approach which is adopted in Peczenik, Volume 4 of this Treatise, chap. 5). Dworkin's approach has stimulated a vast debate (see for instance Cohen 1984), where Dworkin's views of legal reasoning have met both criticism and support, in different legal traditions (as Italian examples of these different attitudes, see: Pintore 1990, 143ff, and Bongiovanni 1999).

[4] A presentation and critical examination of legal doctrines, which well exemplifies how one can build local theories of the law, centred on a particular legal concept or institute, can be found in Peczenik, Volume 4 of this Treatise, chap. 2.

a fundamental task for legal doctrine, a task through which one contributes to the growth of legal knowledge and to the refinement of the techniques for legal problem-solving.

In performing this task, a doctrinal lawyer needs to take into account the multiple and often conflicting needs of the legal practice. Moreover he or she is constrained by the existing conceptual framework (as provided by legislative language, and by prevailing judicial and doctrinal conceptions). One cannot get too far from that framework, to avoid being ignored by the legal community: Also in redefining legal concepts, or in proposing new ones, the legal reasoner is contributing to the legal theory of his or her community and has to face what we have called "the gamble of participation."

However, some bold attempts to provide new conceptual frameworks for established domains of the law have been successfully (though controversially) advanced, with the intention of complementing, subsuming, or even substituting some traditional conceptual structures. Consider for example how students in law and economics have proposed to broaden the concept of property rights, so as to cover all cases when an entitlement cannot be taken away without the owner's consent. Thus, on this understanding, property rights also include certain contractual rights against specific persons, namely, and in particular a creditor's right to specific performance. Correspondingly, they have extended the notion of liability, to include any case in which an entitlement can be taken away by paying a compensation.[5]

Thus, we may conclude our analysis of legal concepts by saying that though such concepts are constituted also by rules, there is a sense in which theories of legal concepts contribute to law-making, by framing the very rules in which such concepts occur.[6] The often-ridiculed pretension of conceptualist lawyers that they can turn concepts into binding rules has probably more truth than it is usually assumed to have.[7]

21.3. Kelsen's View of Legal Conditionality

Our causal-like approach to normative conditionals comes close to the view of normative conditionals advanced by Hans Kelsen. In the following sections we will critically review Kelsen's model, relate it to our approach, and identify commonalities and differences.

[5] For this distinction, see Calabresi and Malamed 1972. For some critical considerations on the conceptual strategy of law and economics, see Fletcher 1996, 155ff.

[6] Lindahl (2003; 2004) has recently affirmed that legal concepts, or at least some of them, should not be constructed arbitrarily, but having in mind their cognitive function in legal reasoning, and particularly the need to use them in coherent justifications.

[7] For an extreme statement of this pretension, see von Jhering 1857, though Jhering himself satirised his earlier views in his later writings (see von Jhering 1964).

21.3.1. Causality and Imputation

Kelsen affirms that the normative domain is characterised by a special type of causal-like connection, which he calls *imputation* (*Zurechnung*).

> Just as laws of nature link a certain material fact as cause with another as effect, so positive laws [in their basic form] link legal condition with legal consequence (the consequence of the so-called unlawful act). If the mode of linking material facts is causality in the one case, it is imputation in the other, and imputation is recognised in the Pure Theory of Law as the particular lawfulness, the autonomy, of the law. (Kelsen 1992, sec. 11.b, 23)

As is well known, Kelsen (1992, sec. 11.b, 24-25) describes imputation as consisting in an *ought-to-be* link, implementing what he calls the *ought* (*Sollen*) category:

> Laws of nature say "if *A*, then *B* must be." Positive laws say: "if *A*, then *B* ought to be." The "ought" designates a relative a priori category for comprehending empirical legal data. In this respect, the "ought" is indispensable, lest the specific way in which the positive law connects material facts with one another not be comprehended or expressed at all.

Therefore, in Kelsen's view, while causal connections have to be described as:

IF *A*, THEN *B* MUST BE

imputation connections have the form:

IF *A* THEN *B* OUGHT TO BE

where THEN ... MUST BE and THEN ... OUGHT TO BE express respectively physical causation and normative causation. This view, combined with Kelsen's idea that each norm establishes a sanction, leads Kelsen to believe that each norm has the form:

IF *Action* THEN *Sanction* OUGHT TO BE

21.3.2. Problems with the Kelsenian Conditionality

Kelsen views his representation of normative conditionality as eliciting the typical structure of legal rules, and even as expressing the necessary form, the *basic category* of legal knowledge (as he says, inspired by neokantian philosophy).

Unfortunately, we cannot share this view: The Kelsenian model, at least when literally understood, fails to capture the structure of legal rules, and risks being very confusing. This is because the words "ought to be" are normally used to express the notion of obligatoriness, rather than the connection between the antecedent and the consequent of conditional rules. Consequently, at least in conditional normative propositions expressing obligations, Kelsen's representation of normative conditionality leads to confusing two aspects:

- The common nature of all normative conditionals, namely, the fact that they are concerned with determining normative effects (we expressed this fact by adding the n superscript to the THEN connective).
- The specific normative qualification of obligatoriness, which is only established by those normative conditionals which determine (establish) obligations (we express this qualification through the ***Obl*** operator).

We believe that these two aspects need to be carefully distinguished to obtain a proper understanding of legal conditionality. Consider for example the following rule:

> IF [one is below 18 years]
> THEN^n ***Obl*** [one does not buy alcoholic drinks]
> (if one is below 18 year, then one is obliged not to buy alcoholic drinks)

A Kelsenian representation of this rule would require the following rewriting:

> IF [one is below 18 years]
> THEN [one does not buy alcoholic drinks] OUGHT TO BE

It is clear that in the Kelsenian representation OUGHT TO BE not only signals normative determination (rather than physical causality), but also expresses the deontic qualification "it is obligatory," that is, it includes the deontic operator ***Obl***. In other words, the Kelsenian representation of conditionals establishing obligations, merges our connective for normative conditionals IF ... THEN^n ... and our obligational qualification ***Obl***, into the connective IF ... THEN ... OUGHT TO BE.

This way of expressing normative rules fails to be applicable whenever a rule's consequent expresses a qualification that is different from obligatoriness, like, for instance, permission.

Consider for example the following rule:

> IF [one is above 18 years]
> THEN^n ***Perm*** [one buys alcoholic drinks]
> (if one is above 18 year, then one is permitted to buy alcoholic drinks)

The Kelsenian strategy of leaving the deontic qualification implicit into the normative conditional IF ... THEN ... OUGHT TO BE here cannot work, since it forces us to lose the information that this is a permissive rule. One would in fact obtain:

> IF [one is above 18 years]
> THEN [one buys alcoholic drinks] OUGHT TO BE

which would be probably be read as stating the obligation of buying drinks (rather than the permission of doing that) when one is above 18. Nor can we

collapse IF ... THEN ... OUGHT TO BE and ***Perm*** into IF ... THEN ... ***Perm***, obtaining rule:

> IF [one is above 18 years]
> THEN [one buys alcoholic drinks] ***Perm***

since in this way one would lose the information that we have a normative connection (which is signalled by the locution OUGHT TO BE), rather than an instance of natural causality.

Moreover, following the latter suggestion, one would lose the possibility of expressing in a uniform way the idea of a normative connection between a determining condition and the determined result, regardless of the particular content of such result. This confusion clearly emerges in the later thought of Hans Kelsen, who says that:

> The man to whom the command, permission, authorisation is directed *ought to*. The word "ought" is used here in a broader then the usual sense. According to customary usage, "ought" corresponds only to a command, while "may" corresponds to a permission, and "can" to an authorisation. But in the present work the word "ought" is used to express the normative meaning of an act directed toward the behaviour of others, this "ought" includes "may" and "can." (Kelsen 1967, sec. 4.b, 5)

To get out of this difficulties and ambiguities, we need to clearly distinguish the two aspect which are merged by Kelsen:

- the way in which we signal normative determination, that is, the connection existing between the antecedent and consequent of a normative conditional, and
- the way in which we express the particular normative qualification which is expressed by the consequent of the conditional.

For this purpose, we shall use the pattern IF ... THEN^n to express normative conditionality, where the superscript n signals normativity, and we shall use different operators (like ***Obl*** and ***Perm***) to specifically express different conditioned normative qualifications.

21.4. Normative Conditionals and Time

Normative determination is an historical phenomenon, which takes place along the axis of time: Normative preconditions hold or happen in certain temporally characterised occasions, and consequently their effects too hold or happen within temporal bounds. In providing an analysis of normative conditionality, we cannot refrain from introducing some temporal notions, though avoiding as much as possible the complexities of temporal logics.

21.4.1. *Temporal Predicates*

For expressing temporal propositions we shall use the temporal predicates we introduced in Section 15.4.2 on page 433:

$\boxed{1}$ *holds at time* $\boxed{2}$

and

$\boxed{1}$ *happens at time* $\boxed{2}$

where $\boxed{1}$ is a fluent and $\boxed{2}$ is a time reference. In addition we will use the temporal predicate:

$\boxed{1}$ *initiates at time* $\boxed{2}$

to express that fluent $\boxed{1}$ starts to hold at time $\boxed{2}$, and continues so, until its persistence is terminated. We also use the abbreviation *terminates*, to express that a fluent initiates not to hold (terminates):

$\boxed{1}$ *terminates at time* $\boxed{2}$ $\equiv$ (NON $\boxed{1}$) *initiates at time* $\boxed{2}$

For instance, proposition:

[Tom is obliged to pay the penalty of € 100]
initiates at time 12.06.2003

means that Tom's obligation to pay that penalty initiates at 12.06.2003 and persists after that, until a terminating event takes place. Similarly, the proposition:

[Tom is obliged to pay the penalty of € 100]
terminates at time 12.07.2003

means that Tom's obligation to pay that penalty terminates at 12.07.2003 (for example, since he has paid the penalty, or since he has succeeded in having it revoked) and its non-existence persists after that.

21.4.2. *Temporally Specific Normative Initiation*

Let us use the temporal predicates we introduced Section 21.4.1 for formalising *most-specific conditionals*, namely, conditionals which not only concern determined persons and objects but which also refer to specific time instant. For example, assume that there is a contract clause according to which if Tom fails to deliver his merchandise at 10 o' clock on 12.06.2003, then at that time he will start being obliged to pay the penalty of € 100. We can express this through the following formula:

IF NON([Tom delivers the merchandise]
happens at time 12.06.2003)
THEN^n
[Tom is obliged to pay the penalty of € 100]
initiates at time 12.06.2003

This representation is sufficient for our purposes, though the temporal connections between an antecedent and a consequent may include further aspects, which we cannot consider here, for the sake of simplicity. For instance, in certain cases, the consequent state of affairs does not start at the moment when the antecedent event happens, but sooner or later than that (for an attempt to approach this issue, see Hernandez Marín and Sartor 1999).

21.4.3. Temporal Generality and Normative Initiation

Let us now consider how we can represent normative initiation with regard to *temporally-general rules*, namely, rules that concern events happening at any time (though possibly within a certain interval). This concerns first of all *personally-general rules*, which are usually general also regard to time. However, even rules that specifically concern determined persons and objects, often are general with regard to their time frame. Consider, for example, a contractual clause saying that if a fault is discovered (at any time) then it will have to be communicated to the seller within a week (from that time).

In principle, we may treat temporal generality by applying the universal quantifier also to a temporal variable, as in the following example:

FORANY (x, y, w, t)
IF $[x$ causes an illegal damage worth w to $y]$ *happens at time* t
THEN^n (***Obl*** $[x$ pays compensation w to $y]$) *initiates at time* t

(for any persons x and y, and amount w, if person x causes an illegal damage worth w to person y at a time t, then the obligation that x pays compensation w to y initiates at that time)

The reasoning schema *specification* allows us to infer instances of this rule concerning not only determined persons and damages, but also determined time points. For instance, given the rule above, we may infer the following conditional, concerning what happens if Tom, by hitting Mary's car at 9:25 on 01.05.2003, causes her damage worth € 1,000.

IF
[*Tom* causes illegal damage worth € 1,000 to *Mary*]
happens at time 9:25 on 01.05.2003
THEN^n
(***Obl*** [*Tom* pays compensation € 1,000 to *Mary*])
initiates at time 9:25 on 01.05.2003

If we know that indeed Tom has caused such damage:

[Tom causes illegal damage worth € 1,000 to $Mary$]
happens at time 9:25 on 01.05.2003

then we may apply schema *detachment* to obtain:

(***Obl*** [Tom pays € 1,000 to $Mary$])
initiates at time 9:25 on 01.05.2003

The two inferences (*specification* and *detachment*), can be merged, as we have seen in Section 15.3.4 on page 425, into schema *normative syllogism*, leading to the following application of that schema:

(1) [Tom causes illegal damage worth € 1,000 to $Mary$]
happens at time 9:25 on 01.05.2003
(2) FORANY (x, y, w, t)
IF [x causes an illegal damage worth w to y]
happens at time t
THEN^n (***Obl*** [x pays w to y]) *initiates at time* t

---

(3) ***Obl*** [Tom pays € 1,000 to $Mary$]
initiates at time 9:25 on 01.05.2003

Thus we conclude that Tom's obligation has initiated at time 9:25, on 01.05.2003.

21.4.4. Temporal Persistence

The inference we have just considered in the end of the section Section 21.4.3 on the preceding page, allows us to conclude that Tom's obligation has initiated at time 9:25, on 01.05.2003. However, it does not tell us that the obligation also holds in subsequent times, for instance, on 01.06.2003.

For this purpose, one further inference step needs to be performed: From the fact that a state of affairs has been normatively initiated at a certain time t_1, we need to infer that this normative situation also holds at any subsequent time t_3, until the persistence of that situation is interrupted by a new event, at a time t_2. This is the so-called the law of *temporal inertia* or *temporal persistence*, which seems to apply to both physical and normative situations.

Obviously, according to the law of inertia, we can only make defeasible inferences: Given that a normative state of affairs has started, the conclusion that it still holds at a subsequent time is defeated, if it appears that this state of affairs has already been terminated. For instance, the knowledge that Tom has compensated the damage (so terminating his obligation) would lead us to refrain from concluding that he is still obliged to compensate it.

The two following inference schemata capture the functioning of the law of inertia. The schema *temporal persistence* tells us that when a normative situation is initiated, then it continues to hold in the future, until some new event makes a change:

Reasoning schema: *Temporal persistence*
(1) A *initiates at time* t_1;
(2) t_3 is subsequent to t_1
——— IS A DEFEASIBLE REASON FOR
(3) A *holds at time* t_3

There is an undercutting defeater for this schema, which is provided by the defeating schema *interruption*:

Defeating schema: *Temporal interruption*
(1) A *terminates at time* t_2;
(2) t_2 is between t_1 and t_3
——— IS AN UNDERCUTTING DEFEATER AGAINST
(3) (a) A *initiates at time* t_1;
(b) t_3 is subsequent to t_1
——— IS A REASON FOR
(c) A *holds at time* t_3

The defeater says that when a state of affairs A is terminated (remember that the termination of A consists in initiation of NON A), then the previous initiation of A is no a reason for believing that A holds after the termination time.[8]

Here is an example of how these reasoning schemata work. According to schema *temporal persistence*, from the fact that Tom's obligation started on the 01.05.2003, we can infer that he still was obliged on 01.07.2003:

(1) [Tom is obliged to pay € 1,000 to $Mary$] *initiates at time* 01.05.2003;
(2) 01.07.2003 is subsequent to 01.05.2003
———
(3) [Tom is obliged to pay € 1,000 to $Mary$] *holds at time* 01.07.2003

However, the fact that Tom's obligation started on 01.05.2003 is no reason to conclude that he is still obliged at a time (for instance, 01.07.2003) which is

[8] These ideas are captured by various formalisms for expressing temporality within artificial intelligence. In particular, our treatment of temporality is inspired by the *situation calculus* (McCarthy 1987), and the *event calculus* (Kowalski and Sergot 1986).

posterior to the time when Tom's obligation was terminated (assume that he paid his debt on 01.06.2003).

Defeating instance: *Temporal interruption*

(1) [*Tom* is obliged to pay € 1,000 to *Mary*]
terminates at time 01.06.2003;
(2) 01.06.2003 is between 01.05.2003 and 01.07.2003
——— IS AN UNDERCUTTING DEFEATER AGAINST
(3) (*a*) [*Tom* is obliged to pay € 1,000 to *Mary*]
initiates at time 01.05.2003;
(*b*) 01.07.2003 is subsequent to 01.05.2003
IS A REASON FOR
(*c*) [*Tom* is obliged to pay € 1,000 to *Mary*]
holds at time 01.07.2003

21.4.5. Temporalised Normative Syllogism

In the following, when representing temporally-general conditionals (conditionals concerning any time) whose consequent initiates exactly at the time when the antecedent event happens, we adopt a simplified syntax: We leave time references implicit, assuming the temporal predicates apply to a temporal variable and that a universal temporal quantifier applies to all instances of that variable. In other words, instead of writing:

FORANY (t)
IF *Event* *happens at time* t
THEN^n *State* *initiates at time* t

we use the simplified formula:

IF *Event* *happens*
THEN^n *State* *initiates*

Accordingly, we can express to temporalised normative syllogisms in the following way:

Reasoning schema: *Temporalised normative syllogism*

(1) *Event* *happens at time* t_0;
(2) IF *Event* *happens*
THEN^n *State* *initiates*
——— IS A REASON FOR
(3) *State* *initiates at time* t_0

Here is an instance of a corresponding inference:

(1) [Tom causes $Mary$ illegal damage worth € 1,000]
happens at time 01.10.2003; AND
(2) FORANY (x, y, w)
IF [x causes y illegal damage worth w] *happens*
THEN^n [x is due to pay w to y] *initiates*

---

(3) [Tom is due to pay € 1,000 to $Mary$]
initiates at time 01.10.2003

Finally, note that the *happens* predicate in not necessary when we are dealing with action, since the performance of an action can be viewed indeed as the happening of an event. Thus we can also express the last rule in the following form:[9]

FORANY (x, y, w)
IF $Does_x$[cause y illegal damage worth w]
THEN^n [x is due to pay w to y] *initiates*

21.4.6. Time and Normative Emergence

After considering normative initiation, let us analyse the temporal aspects of *normative emergence*. We can express *state-emergence*—namely, the normative emergence of states of affairs—through formulas having the form:

FORANY (t)
IF $State_1$ *holds at time* t
THEN^n $State_2$ *holds at time* t

for states of affairs. Similarly, we can express the *event-emergence*, namely, the normative emergence of events (there included actions) as follows:

FORANY (t)
IF $Event_1$ *happens at time* t
THEN^n $Event_2$ *happens at time* t

Let us consider two examples of normative emergence. The first one, exemplifying state emergence, corresponds to Art. 812 of the Italian civil code:

[9] In the rule we use the behavioural form of action which we could also represent as a productive one, namely, as $Brings_x[y$ suffers illegal damage worth $w]$

(a) FORANY (x, t)
IF [x is a piece of land, water source, a tree, a building, or is anyway permanently attached to the land] *holds at time* t
THEN^n [x is an immovable good] *holds at time* t

The second example, dealing with event-emergence, corresponds to Art. 1136 of the Italian civil code:

(b) FORANY (x, t)
IF [x makes an offer to the public, containing all terms of the contract it concerns] *happens at time* t
THEN^n [x makes a contractual offer] *happens at time* t

Normative syllogism also applies to normative emergence, both to state-emergence and to event-emergence. Here is an example of *state-emergence*:

(1) [$John's\ living\ place$ is a building] *holds at time* 13.4.2002
(2) FORANY (x, t)
IF [x is a building] *holds at time* t
THEN^n [x is an immovable good] *holds at time* t

---

(3) [$John's\ living\ place$ is an immovable good] *holds at time* 13.4.2002

Here is an example for *event-emergence*:

(1) [Tom makes an offer to the public, containing all terms of the contract it concerns] *happens at time* 13.3.2003;
(2) FORANY (x, t)
IF [x makes an offer to the public, containing all terms of the contract it concerns] *happens at time* t
THEN^n [x makes a contractual offer] *happens at time* t

---

(3) [Tom makes a contractual offer] *happens at time* 13.3.2003

We use a convenient abbreviation for normative emergence, whenever the time in which the emergent state holds coincides with the time of the conditioning state, or the time in which the emergent event happens coincides with the time of the conditioning event.

In particular, for state-emergence, rather than:

FORANY (t)
IF $State_1$ *holds at time* t
THEN^n $State_2$ *holds at time* t

we also write:

IF $State_1$ *holds*
THEN^n $State_2$ *holds*

For instance the rule above stating that buildings are immovable goods, can be rewritten as:

FORANY (x)
IF [x is a building] *holds*
THEN^n [x is an immovable good] *holds*

For event-emergence, rather than:

FORANY (t)
IF $Event_1$ *happens at time* t
THEN^n $Event_2$ *happens at time* t

we write

IF $Event_1$ *happens*
THEN^n $Event_2$ *happens*

For instance, the rule above concerning offers can be rewritten as:

FORANY (x)
IF [x makes an offer to the public, containing all terms of the contract it concerns] *happens*
THEN^n [x makes a contractual offer] *happens*

21.4.7. Temporalised Counts-As

Our analysis of state and event emergence provide us the ingredients for introducing appropriate abbreviations for those who want to follow Searle (1995, 28), in using the counts-as terminology. For state-emergence we can introduce the following definition.

Definition 21.4.1 *Counting-as state. State A* counts-as state *B, if A's holding determines B's holding (B's holding emerges upon A's holding):*

State A COUNTS-AS *State* $B \equiv$
IF A *holds* THEN^n B *holds*
(⌈state A counts as state B⌉ is equivalent to ⌈A's holding determines that B holds⌉)

Definition 21.4.2 *Counting-as event. Event A* counts-as event *B, if A's happening determines B's happening (B's happening emerges upon A's happening):*

Event A COUNTS-AS *Event* $B \equiv$ IF A *happens* THEN^n B *happens*
(⌈event A counts as event B⌉ is equivalent by definition to ⌈A's happening determines that B happens⌉)

For example, assume that Tom owns an e-business company and has advertised on line the offer of a set of CDs, indicating all terms of the offer, among which a very cheap price, which he now thinks was too low. Since Tom's offer determines a contractual offer—or if you prefer, since his offer "counts as" a contractual offer—he is bound toward those who have accepted the offer, as we shall see in the following chapter.

This piece of reasoning can be expressed equivalently in two different forms. The first form uses the determination terminology (as applied to events):

(1) FORANY (x)
IF [x makes an offer to the public, containing all terms of the contract it concerns] *happens*
THEN^n [x makes a contractual offer] *happens*;
(2) [Tom makes an offer to the public, containing all terms of the contract it concerns] *happens at time* 13.3.2003

---

(3) [Tom makes a contractual offer] *happens at time* 13.3.2003

The second form uses the counts-as terminology (as applied to events):

(1) FORANY (x)
Event [x makes an offer to the public, containing all terms of the contract it concerns]
COUNTS-AS
Event [x makes a contractual offer];
(2) [Tom makes an offer to the public, containing all terms of the contract it concerns] *happens at time* 13.3.2003

---

(3) [Tom makes a contractual offer] *happens at time* 13.3.2003

Our preference goes for the first form, using the determination-based terminology, which we find more direct and less misleading, but readers should feel free to adopt the counts-as language, if they find it more intuitive.

Chapter 22

POTESTATIVE CONCEPTS

Our extensive analysis of normative conditionals (see Chapters 20 and 21) enables us to introduce a new family of normative concepts, which we call *potestative* concepts (from the Latin word *potestas*, “power”) since they are based on the notion of a *normative power*.

We need first to examine carefully this notion, and distinguish different meanings in which we may speak of a *normative* or *legal* power. In fact the concept of a normative power plays a fundamental role in normative reasoning, but has often been misunderstood and confounded with other normative concepts, such as those of a permission and an obligational right, or with factual powers, such as the ability to use physical force or persuasion.[1]

Here we shall only consider *normative power*, namely, the power that directly concerns the production of normative results. Thus, we shall refer to normative power when speaking of *power tout court*. When, on the other hand, we need to refer to the ability of producing certain physical (or psychological) states of affairs, we shall indicate it explicitly.

On the basic of our analysis of the notion of normative power we shall distinguish different potestative concepts, and in particular, we shall articulate four additional Hohfeldian concepts, which complement the obligational concepts we introduced in Section 19.4 on page 510.

22.1. Powers and Potestative Rights

Normative conditionality is the basic ingredient for constructing the idea of a normative power, an ingredient that is shared by all notions of power we shall consider. On the basis of this idea we shall also construe the idea of a potestative right, namely, the right consisting in the possession of a normative power.

22.1.1. Generic Power

The simplest and most general kind of such power—which we call *generic power*—is the direct reflex of normative conditionality. Whenever a normative

[1] The notions we shall present in this chapter and in the following are in part the development of ideas that were presented in: Gelati, Rotolo, and Sartor 2002, and Gelati et al. 2002a. On the notion of power, see also: Makinson 1986; Allen and Saxon 1991. For a formalisation based upon modal semantics, see: Jones and Sergot 1996, and Artosi 2002, who refer to Elgesem 1997.

conditional IF A THEN^n B holds, then one has the generic normative power of making so that the consequent B takes place, by bringing about the antecedent A.

Consider the Grotian rule (see Section 20.2.3 on page 526), according to which whoever culpably causes damage, is obliged to compensate it (Grotius 1925, sec. 17.1.1). On the basis of such a rule, we can say that Helen has the generic power of making so that Tom acquires the obligation to compensate Mary. Helen could "exercise" this generic power by inducing Tom to damage Mary. For instance, she could remind Tom how much Mary has been nasty to him, by suggesting that he takes revenge by cutting the tyres of Mary's car, and so she could convince him to perform a tortious action.

The same situation also happens with regard to non-deontic conditionality. Assume that there is a rule saying that whoever is born in the territory of country c, acquires c's citizenship. On the basis of this rule, we may say that Mary, who is pregnant, has the power to make her child become c's citizen, by travelling to country c and waiting there for the birth of her child.

The idea of a generic power can be defined as follows:

Definition 22.1.1 *Generic power. We say that there is the* generic power *to achieve B via A, and write* **GenericPower**(B VIA A)*, whenever B is normatively determined by A:*

$$\textbf{\textit{GenericPower}}(B \text{ VIA } A) \equiv \text{IF } A \text{ THEN}^n\ B$$

(⌈there is the generic power of achieving B via A⌉ is equivalent to ⌈if A is the case then B is normatively determined⌉)

In this definition A can be the happening of an event, or the initiation or the holding of a situation, since the idea of normative determination, as we have seen in Section 20.1.2 on page 522, covers all types of conditionality (initiation and termination, in the deontic and non-deontic forms, according to state emergence and event emergence).

Note that our notion of a generic power to produce normative effect B by bringing about A abstracts from the fact that those who are interested in achieving B have the factual ability of bringing about A. By adding this requirement, we could obtain a more restricted notion of power, which joins in sequence factual ability and normative conditionality (having the power to achieve B via A would mean having the physical ability of realising A, which normatively determines B).

However a precise characterisation of such a mixed (physical-normative) notion of power would require us to introduce a whole range of new notions (like factual possibility and necessity, and various related notions, such as ability and competence). Moreover we would need to engage in complex considerations pertaining to the connection between factual (or natural, as it is often called) and normative ability. Since this is not required for the development of our

analysis, we prefer to remain only at the normative level, and refrain from considering factual powers.

22.1.2. Action-Power

A more interesting and more specific notion of power exists when the antecedent of a normative connection is formed by the *action* of an agent. This is what we call a *action-power*.

Definition 22.1.2 *Action-power. We say that j has the* action-power *of achieving B by doing A, and write* **ActionPower**$_j$(B VIA A) *whenever B is normatively determined by j's doing A:*

$$\textbf{\textit{ActionPower}}_j(B \quad \text{VIA} \quad A) \equiv \text{IF } Does{*}_jA \text{ THEN}^n \ B$$

For instance, in Roman law, the following rule holds:

Wild beasts, birds, fish, that is, all animals, which live either in the sea, the air, or on the earth, so soon as they are taken by any one, immediately become by the law of nations the property of their captor; for natural reason gives to the first occupant that which had no previous owner. (*Institutes of Justinian*, 2.1) [2]

A simplified version of this rule (if one captures an animal that does not belong to anybody, then one becomes the owner of that animal) can be formalised as follows:

FORANY (x, y)
WHEN [animal y does not belong to anybody]
THEN^n IF $Does_x$ [capture y]
THEN^n ([x is the owner of y] *initiates*)

We can rephrase the last rule by according to the above definition of an action-power: When an animal does not belong to anybody, then one has the action-power of initiating one's own ownership of the animal, by capturing it:

[2] The Latin original: "Ferae igitur bestiae et volucres et pisces, id est omnia animalia quae in terra mari caelo nascuntur, simulatque ab aliquo capta fuerint, iure gentium statim illius esse incipiunt: quod enim ante nullius est id naturali ratione occupanti conceditur."

[2] For readability's sake we take the liberty of substituting in some formulas, like the following one, the bare infinitive (like "capture") with the gerund ("capturing"), assuming that the expressed propositional component remains the same. Said otherwise, for us [capture y] and [capturing y] are synonymous ways of expressing the same meaning.

FORANY (x, y)
WHEN [animal y does not belong to anybody]
THEN^n ***ActionPower***$_x$[x is the owner of y] *initiates*
VIA
[capturing y]

(for any person x and animal y, if y does not belong to anybody, then x has the action-power of initiating x's ownership of the animal, by capturing y)

Note that the general idea of an action-power does not only concern the situation where the author of the action intends to achieve the normative result which is determined by that action. For instance, this idea is also applicable to the Grotian rule that whoever culpably causes a damage to another is obliged to compensate the damaged person:

FORANY (x, w, y)
IF $Does_x$[cause damage w to y by fault]
THEN^n (***Obl*** [x compensates y for w] *initiates*)

Our definition of an action-power allows us to say (though this seems quite weird) that one has the action-power of initiating one's own obligation to make a damage good, by causing that damage through one's fault.

FORANY (x, w, y)
ActionPower$_x$
Obl [x compensate damage w to y] *initiates*
VIA
[causing damage w to y by fault]

(for any persons x and y, and damage w, x has the action-power to bring it about the initiation of x's obligation to compensate damage w to y, by causing damage w to y by fault)

So far we have only considered cases where the action-power consists in the ability to initiate new normative situations. An action-power can also consist in one's ability to make certain events happen, by making them emerge upon one's behaviour.

For instance, assume that a contract clause says that if party j does not deliver the merchandise in time, then party k can terminate the contract by communicating the intention to do so (k's communication determines the emergent event of the cancellation of the contract).

WHEN NON $Does_j$[deliver the merchandise in time]
THEN^n IF $Does_k$[declare that the contract is cancelled]
THEN^n ([the contract is cancelled] *happens*)

On the basis of this normative connection, we may say that if j does not deliver in time, k has the action-power of terminating the contract, by declaring to do so.

$$\text{IF NON } Does_j\text{[deliver the merchandise in time]}$$
$$\text{THEN}^n\ \textbf{\textit{ActionPower}}_k$$
$$\text{[the contract is cancelled] } \textit{happens}$$
$$\text{VIA}$$
$$\text{[declaring that the contract is cancelled]}$$

(If j does not deliver the merchandise in time, then k has the action-power to produce the event that contract is cancelled by declaring that the contract is cancelled)

This is an instance of the notion of *proclamative power*, the power to create a legal result through a corresponding declaration or proclamation, which we shall extensively describe in Chapters 23 and 24.

22.1.3. Abstract Action-Power

In some cases, we want to make a reference to the fact that an agent has the action-power to achieve a certain result, though omitting to specify what action would cause that result. By saying that agent j has the power to achieve a certain result, we mean that there exists some action, by agent j, which, if it was performed, would produce the indicated result.

We call this normative situation an *abstract action-power*, and we define it as follows.

Definition 22.1.3 *Abstract action-power. We say that j has the* abstract action-power *to achieve B, and write* **AbstractPower**$_j B$*, when there exists an action A whose performance by j normatively determines B. More precisely:*

$$\textbf{\textit{AbstractPower}}_j B \equiv \text{FORSOME}\,(A)\ (\text{IF } Does_j A \text{ THEN}^n\ B)$$

According to this definition, we can affirm that both the debtor and the creditor have the abstract action-power to extinguish the debtor's obligation toward the creditor (or, which is equal, the creditor's right toward the debtor): The debtor has the power of doing that by fulfilling his obligation, and the creditor by renouncing to her credit.

22.1.4. Enabling Power

The idea of an action-power, as described above, is still too general to be useful in legal contexts. We tend to use the notion of a power only to cover those cases where the law, by linking a certain result to one's action, aims at enabling one to achieve that results. Consequently, we do not speak of a "power" to refer to cases where the law links a disadvantageous outcome (a sanction) to a certain action to deter or punish its performance.

To appropriately circumscribe the notion of power—so that it matches our intuitions—we need to refer to a teleological view of the corresponding normative connection. It is true that some authors, and most famously Kelsen (1992;

1967) hoped to expel teleological considerations from legal theory, to achieve some kind of "purity." However, we view such attempts as being misguided: Even the most basic normative notions cannot be specified without appealing to teleological ideas.

Thus, we shall not refrain from adopting a teleological perspective—that is, from viewing the law from the *intentional stance*—also when dealing with powers. Let us state our basic idea: A normative connection between one's action and a normative result can be said to create one's legal power to achieve that result only when such connection has the purpose of enabling one to achieve that result, by performing the indicated action (if one so decides).

Such an "enablement" can, in its turn, be aimed at facilitating the pursuit of different interests, pertaining to different subjects:

- the interests of the power holder (as it is usually the case in private law, for instance with regard to the powers of the creditor over the debtor);
- the interests of other people (as for powers that are conferred to parents with regard to their children and to tutors with regard to their tutees); or
- the interests of a community (as for public powers).

All such cases are covered by our notion of *enabling power*. On the contrary, we cannot say that one has the enabling power of creating one's obligation to compensate a person by causing an unlawful damage to this person, or that one, by murdering another, has the enabling power of creating the judge's obligation to condemn one to 30 years of detention. This statements are false, since neither is civil liability aimed at offering people the opportunity to acquire an obligation to restore damages, nor is the murder rule aimed at offering people the chance of getting a long-term sentence.

Definition 22.1.4 *Enabling power. We say that j has the* enabling-power *to achieve B by doing A, and write* $\textbf{EnablingPower}_j(B \text{ VIA } A)$*, to mean that j's performance of A normatively determines B, in order to enable j to achieve B:*[3]

$$\textbf{\textit{EnablingPower}}_j(B \quad \text{VIA} \quad A) \equiv (\text{IF } Does_j A \text{ THEN}^n \ B)\Uparrow^{Enable:Brings_j B}$$

The idea of an enabling power can be given an abstract formulation, that is, it can be used without referring to the action through which the power is to be exercised.

Definition 22.1.5 *Abstract enabling-power. We say that j has the* abstract enabling-power *to achieve B, and write* $\textbf{AbstractEnablingPower}_j B$*, when there exists an action A whose performance by j normatively determines B, in order to enable j to achieve B. More precisely:*

[3] We use the upward arrow to express the purpose of the preceding normative proposition.

$$\textbf{\textit{AbstractEnablingPower}}_j B \equiv$$
$$\text{FORSOME}\,(A)\ (\text{IF } Does_j A \text{ THEN}^n\ B)\Uparrow^{Enable:Brings_j B}$$

When we say that j has the power to achieve a certain result without mentioning the action through which it is exercised, we refer to our notion of abstract enabling-power. This is what we mean when we say, for example, that the debtor has the power of extinguishing his debt.

22.1.5. Potestative Right

The most significant instance of the idea of enabling power is what we call a *potestative right*. This is an enabling power that is intended to further the interest of the power holder:

Definition 22.1.6 *Potestative right. We say that agent j has the* potestative right *of achieving B by doing A, and write* **PotestativeRight**$_j$*(B* VIA *A), to express that j has the enabling power of achieving B by doing A, in order to further j's own interests:*[4]

$$\textbf{\textit{PotestativeRight}}_j(B\ \text{VIA}\ A) \equiv (\textbf{\textit{EnablingPower}}_j B\ \text{VIA}\ A)\Uparrow^j$$

In such a case, therefore, the normative connection IF $Does_j A$ THEN^n B is intended to enable j to achieve B (***EnablingPower***$_j B$ VIA A), but this enablement, in its turn, has the function of enabling j to pursue his or her own interests. Similarly, we can have abstract potestative rights, where we omit the reference to the action through which the power is to be exercised.

$$\textbf{\textit{PotestativeRight}}_j B \equiv (\textbf{\textit{AbstractEnablingPower}}_j B)\Uparrow^j$$

The notion of ***PotestativeRight*** expresses the idea of a right as a power: It identifies a way of protecting the interest of the right-holder (the power to determine certain legal results) which complements the idea of an obligational right, which we discussed in Section 19.3 on page 507.

As examples of potestative rights, consider the following ones: the creditor's power to free the debtor or to bring the debtor to court; an owner's power to sell his or her property; a student's power of choosing, within certain constraints, what subjects to take exams on.

22.1.6. Powers and Permissions

It is very important to distinguish clearly the notion of a power from the notion of a permission. This is most clearly expressed in the following passage of Alois Brinz, a German jurist of the 19th century:

[4] As before, the upward arrow to expresses the purpose of the preceding normative entitlement, but we abbreviate as j the proposition $\lceil j$ better pursues j's own interests$\rceil$. Note that by interest we mean whatever (legitimate) goals j may choose to pursue, not only j's egoistic goals.

> Legal permission and legal ability (*licere*, *posse*), though linguistically indistinct, are different from each other. Permission, or licence, is something that occurs in both kinds of acts, ordinary acts and acts-in-the law;[5] legal ability, or legal power, on the other hand, occurs only in acts-in-the-law, i.e., in the widest sense of the word, only in such acts which are imposed or adopted by the law for achieving its invisible legal effects. Where the legal power exists for an act-in-the-law, there usually is also a license for it, yet, sometimes the former exists where the latter is missing. Physical ability is different both from permission and from ability in our sense, though neither the latter nor the former can be made use of without permission (*vi, clam facere, delict*); acts-in-the-law without legal power are null and void. (Brinz 1873, 211, as translated in Lindahl 1977, 211)

Also according to our analysis there is no necessary conceptual connection between permission and power.

In our framework, an action is permitted exactly if that action is not forbidden, that is, exactly if it is not obligatory to abstain from that action (see Section 17.3 on page 458). Thus, one's permission to do A does not require that a normative conditional holds according to which, by performing another action B, one achieves the result of performing A.

For instance, I am certainly permitted to sell one of my kidneys, in the sense that it is not the case that I am forbidden to do that. However, I have no power of doing that, in the sense that I am unable to achieve, by making a contractual declaration, the normative result which characterises a valid sale contract (in this case, acquiring the duty to deliver the kidney and the right to be paid the agreed amount).

On the other hand, I may be forbidden from doing something though having the power of doing it. For instance when buying a house one may undertake the obligation not to sell the house to a third party, before a certain term. Under such a circumstance, according to Italian law, one is forbidden to sell the house (and the violation of the prohibition is punished, as being a breach of contract), but one still has the power of doing that. This means that the sale will be effective (the house will be transferred to the new buyer, who will acquire it), but illicit (so that a compensation has to be paid).

The conceptual distinction we have just drawn does not exclude that there is a connection between permission and power. This connection results from the intentional interpretation of the acts through which a power is granted. Using the Grician notion of implicature (see Section 16.2.2 on page 442) we may say that the act that grants a person the power to achieve a certain result usually implicates giving the permission to exercise that power. In fact, usually it makes little sense to confer a power and to prohibit its exercise. Thus we usually assume that a power and the permission to exercise it go together (unless we are told that this is not the case). In fact, in legal language the word "can" is frequently used to express both a permission and a power.

[5] The term *act-in-the-law* is a translation of the German word *Rechtsgeschäft*, which we shall render as *legal transaction* (see Chapter 23).

This does not exclude that there may be special cases when power and permission are detached:

- one might be permitted to attempt at achieving a certain result, but have no the power of achieving it (so that the result would not be produced); or
- one might be forbidden from achieving a certain result, but have power of achieving it (so that one would achieve the result while violating the prohibition to realise it).

22.2. A Formalisation of the Hohfeldian Potestative Set

The conceptual framework we have just introduced enables us to introduce and formalise a second set of Hohfeldian concepts, the set of the four *potestative concepts*.

22.2.1. The Hohfeldian Potestative Set: Original Formulation

Hohfeld introduced through examples the potestative notions in Table 22.1 on the following page, without providing formal definitions. For instance, he presents the concept of power as follows:

> X, the owner of ordinary personal property "in tangible object" has the power to extinguish his own legal interest (rights, powers, immunities, etc.) though the totality of operative facts known as abandonment; and—simultaneously and correlatively—to create in other persons privileges and powers relating to the abandoned object—e.g., the power to acquire title to the latter by appropriating it. Similarly, X has the power to transfer his interest to Y—that is, to extinguish his own interest and concomitantly create in Y a new and corresponding interest. So also X has the power to create contractual obligations of various kinds. (Hohfeld 1964, 51-2)

We shall characterise the Hohfeldian potestative square of concepts on the basis of our notion of abstract enabling-power (***AbstractEnablingPower***).[6]

22.2.2. The Hohfeldian Potestative Set: Logical Reformulation

Following Hohfeld's approach, we are interested in powers concerning normative positions. Let us write $\boldsymbol{Pos}_j$ to refer in general to any normative position which concerns agent j: It may be an obligation $\boldsymbol{Obl}\ Does{*}_j A$, a permission $\boldsymbol{Perm}\ Does{*}_j A$, an obligational right $\boldsymbol{OblRight}_j\, Does{*}_k A$, a permissive right $\boldsymbol{PermRight}^j\, Does{*}_j A$ or even a power $\boldsymbol{EnablingPower}_j A$.

[6] A different characterisation of the Hohfeldian notions, probably nearer to the original meaning of these notions can be obtained in terms of the more general notion of an action-power: Just substitute ***ActionPower*** for ***AbstractEnablingPower***in Table 22.2 on page 587 (and in the definitions for subjection, disability, and immunity).

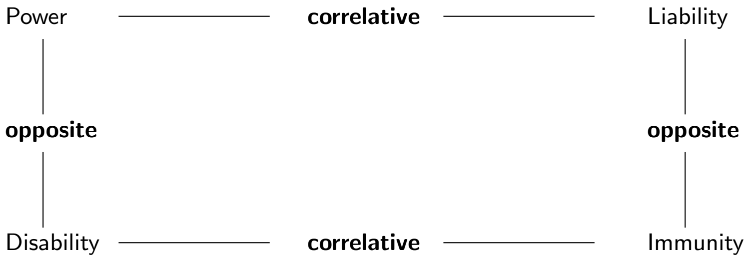

Table 22.1: *The second Hohfeldian square*

To refer to the normative position that Hohfeld denotes as *liability*, we shall use the term *subjection*, to avoid confusion with the notion of liability, as used in tort law. The notion of subjection can then be defined through our notion of abstract enabling-power.

Definition 22.2.1 *Subjection. That k is in a state of* subjection *toward j, with regard to normative position* **Pos***, means that j has the abstract enabling-power of determining* **Pos** *in the head of k:*

$$\boldsymbol{Subjection}_k^j\boldsymbol{Pos} \equiv \boldsymbol{AbstractEnablingPower}_j\boldsymbol{Pos}_k$$

For instance, debtor k is subject to creditor j in relation to j's power of freeing k from j's obligation.

The normative position of *disability* results from denying the concept of ***AbstractEnablingPower***.

Definition 22.2.2 *Disability. j has a* disability *toward k, with regard to the creation of position* **Pos** *exactly if it is not the case that j has the abstract enabling-power of creating* **Pos** *in the head of k:*

$$\boldsymbol{Disability}_j^k\boldsymbol{Pos} \equiv \text{NON}\ (\boldsymbol{AbstractEnablingPower}_j\boldsymbol{Pos}_k)$$

Also, the idea of an *immunity*, being equivalent to a disability, results from denying abstract enabling-power.

Definition 22.2.3 *Immunity. k has an* immunity *toward j with regard to the creation of position* **Pos** *in the head of k, exactly if is not the case that j has that power:*

$$\boldsymbol{Immunity}\ _k^j\boldsymbol{Pos} \equiv \text{NON}\ (\boldsymbol{AbstractEnablingPower}_j\boldsymbol{Pos}_k)$$

Given the connections between power, subjection, and disability, and immunity, we have the following equivalences:

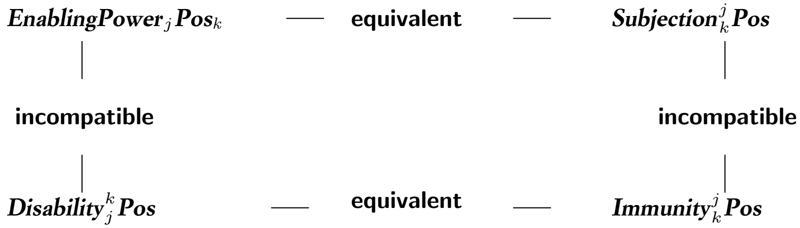

Table 22.2: *The second Hohfeldian square formalised*

$\textbf{\textit{Immunity}}\ {}^j_k\textbf{\textit{Pos}} \equiv \textbf{\textit{Disability}}^k_j\textbf{\textit{Pos}} \equiv \text{NON}\ \textbf{\textit{Subjection}}^j_k\textbf{\textit{Pos}}$
(⌈k has an immunity toward j with regard to ***Pos***⌉ is equivalent to ⌈j has a disability toward k with regard to ***Pos***⌉, which is equivalent to ⌈k has no subjection to j, with regard to ***Pos***⌉)

These definitions lead us to the result that is represented in Table 22.2.

Just to illustrate with an example the above definition, consider the power of a creditor j of releasing his debtor k from her obligation to do to A (i.e., j 's power of terminating k's obligation).

If j has this power we would say that:

$\textbf{\textit{EnablingPower}}_j([\textbf{\textit{Obl}}^j\, Does{*}_k A]\,\mathsf{terminates})$
(j has the power to terminate k's obligation toward j, to do A)

which amounts to say that:

$\textbf{\textit{Subjection}}^j_k([\textbf{\textit{Obl}}^j\, Does{*}_k A]\ \mathsf{terminates})$
(k has a subjection to j with regard to the termination of k's obligation toward j to do A)

To deny that such a power exists (as is the case when the debtor has a specific interest in executing the obligation), we would say that:

$\text{NON}\ (\textbf{\textit{EnablingPower}}_j([\textbf{\textit{Obl}}^j\, Does{*}_k\ A]\,\mathsf{terminates}))$
(j has no power to terminate k's obligation toward j to do A)

which can also be expressed as

$\textbf{\textit{Immunity}}\ {}^j_k([\textbf{\textit{Obl}}^j\, Does{*}_k\ A]\ \mathsf{terminates})$
(k has an immunity toward j with regard to the termination of k's obligation toward j to do A)

Chapter 23

PROCLAMATIONS

Often the law enables us to achieve normative results through a *declaration of intention*, that is, by expressing our intention to achieve such results, exactly in order to achieve them. After presenting this phenomenon, we shall introduce the notion of a *proclamation*, which expresses the general idea of the intentional production of normative results.

We shall argue that this idea, though being especially familiar to continental lawyers, has a broader application, since it expresses a feature that needs to be present in all advanced normative systems. Lastly, we shall provide a logical analysis of this notion, and of its function in legal reasoning.

23.1. The Intentional Production of Legal Results

Enabling individuals and collectives to achieve the legal results they want corresponds generally to the requirements of a market economy, but also to the value of individual and collective autonomy, as we shall see in the following. Thus, we shall argue, the intentional production of normative effects is a general aspect we can find in all legal systems, even in those which do not dedicate a particular attention to its doctrinal analysis and conceptualisation.

23.1.1. Rechtsgeschäft *and Contract*

The German legal doctrine refers to the intentional production of legal results through the general term *Rechtsgeschäft*.[1] Here is how Bernard Windscheid, a leading 19th-century German jurist, introduces this notion:

> A *Rechtsgeschäft* is a private declaration of will (*Willenserklärung*) directed at the production of a legal effect. A *Rechtsgeschäft* is a declaration of will. It declares the will that a legal effect should take place, and the legal system lets this legal effect take place, since this is wanted by the author of the *Rechtsgeschäft*. (Windscheid 1900, 266–7, my translation)

Some legal systems do not provide a general regulation for all kinds of declarations of will: They prefer to focus on the most important type of them, namely,

[1] *Rechtsgeschäft* is rendered in various ways in other languages. For instance, the Italian doctrine uses the expression *negozio giuridico*, while in English legal doctrine we find formulations like *juristic act*, *legal transaction*, or *act in the law*.

contract, and extend to other acts the discipline of contracts. This is the strategy adopted by French and Italian civil codes, and by common-law systems, as opposed to the German tradition.

However, the idea of the intentional production of legal effects undoubtedly describes something that is very common and extremely important in all legal systems. In fact, also in legal systems where this general idea is not usually expressed through a specific term, it is often approximated by enlarging the notion of a contract, so as to cover any kind of agreement, and even unilateral declarations (such as the promise to provide a certain reward to the person who will accomplish a certain action, like getting the best mark in the bar exam, or finding a lost pet).

Pollock (1961) uses the term *acts in the law*—as opposed to *acts of the law*—to mark the cases where the results one obtains are established by oneself, rather than by the law: In such cases the law does not directly establish the outcome of the agent's declaration of intention, but rather provides for the realisation of that intention.

> The rules leave a wide freedom to the parties of appointing at their own pleasure what the result shall be; the law makes itself, in fact the instrument of their intentions, and in a manner stands aside. (Pollock 1961, 78)

As this author observes, this idea has a long tradition, and is powerfully expressed even in the first written memory of Roman law, the twelve tables, which say (at table 6.1) that "when a party makes bond or conveyance, what he has named by word-of-mouth that shall hold by law."[2] Alf Ross uses in the same sense the French term *act juridique*:

> Competence is the legally established ability to create legal norms (or legal effects) through and in accordance with enunciations to this effect [...] Those enunciations in which competence is exercised are called *acts juridiques*, or acts-in-the-law, or, in private law, dispositive declarations. (Ross 1968, 130)

In the last decades the theory of *Rechtsgeschäfte* has undergone various criticisms, even in the legal systems that have traditionally adopted it. In particular, it has been observed that the notion is too broad: There so are many different kinds of acts falling under it (promises, contracts, marriages, wills) that it is difficult to find a general discipline for all of them. Such acts have so different social functions that it is impossible to bring them under the same rationale, so that treating them in a unitary way may lead to inappropriate legal conclusions (see, among the others, Galgano 1977, and Zweigert and Kötz 1992, 352). Some authors also raised some politically oriented objection—often linked to

[2] The Latin original: "Cum nexum faciet mancipiumque, uti lingua nucupassit, ita ius esto."

the Marxist criticism of bourgeois ideologies—against the notion of a *Rechtsgeschäft*. They have observed that lumping all acts aimed at the producing legal results under the same heading has the ideological function of providing a general justification for all of them (as instruments for normative autonomy), and of hiding the different economic and social functions they play in a capitalistic system.

Contrary to these critiques, we believe that the general idea of an act that produces intended legal effects can represent a useful analytical tool for lawyers and legal theorists, without having any particular ideological implication, once it is distinguished from specific subtypes of it, and its content and logical function is clarified and separated from connotations that are only appropriate to certain domains and contexts.

23.1.2. Contracts and Autonomy

Empowering agents to establish what normative relations will hold between them corresponds to the needs of any complex and dynamic society, especially in the framework of a market economy. Under such conditions it must be left to private agents themselves (both individual and corporate ones) to decide what normative relations are appropriate to their needs, or required for the fulfilment of their tasks.

This is a fact that has frequently been brought to the lawyers' attention by historians and sociologists, and most famously by Maine (1912). According to this author, a fundamental aspect of social evolution consisted in the passage from *status* to *contract*, that is, in the move from a social arrangement where anyone's legal entitlements are fixed, being permanently pre-established according to one's societal position and role, into a social arrangement where legal entitlements are dynamic, being created, terminated or modified by agreements between the involved parties.

In fact, contracts are the main form of normative self-organisation. Typically, a contract may be viewed as a statement jointly performed, or accepted, by all parties whose legal positions are going to be changed by that statement. For example, the Italian civil code Art. 1321 establishes that "the contract is the agreement between two or more parties to create, regulate, or terminate [...] legal relationships between them" (my translation). This means that, through a contract, the parties can create new legal positions (duties, powers or rights), they can extinguish such positions, and they can transfer them (for example, property rights) from one party to another.

Note that the law does not establish what changes a contract will make to the legal positions of the parties. It is up to the parties to establish these changes, and the law will in principle recognise their will. This means that the contract will in principle produce the results that the parties stated in their contractual terms, though the law may void, integrate, or modify these results for reasons

of general interest, or when one of the parties is not in a condition to evaluate properly the content of the contract, or may be exploited by the other party.

The idea of *contractual autonomy*, also called *freedom of contract*, finds a larger expression in certain domains rather than in others (for example, it is usually very limited in work and consumer contracts), but still expresses an important general principle.

The legal recognition of the autonomy of the parties explains, for example, why single contracts frequently do not instantiate only one of the types of acts which the theories of performative acts usually distinguish (commissive, commands, declarations, and so on; for a classification, see Searle and Vandervecken 1985, chap. 9): A single contract usually, at once, establishes new duties (for example, the obligation to pay the price), creates new rights (for example, the right to receive the price, or to be delivered the goods), transfers existing rights (for example, the property of the goods), and so forth.

The fact that the effects of a contract are determined by the contract itself marks the main difference between contracts and other actions through which one may exercise a power (like, for instance, the power of obtaining ownership of a wild animal, by catching it).

In ancient law, as a matter of fact, contracts were more similar to other power-exercising acts, since to achieve a specific legal result (obligation, transfer of good, etc.) one had to go through specific forms (saying specific words, making appropriate gestures, and so forth), which would bring about the legal effect linked to those forms regardless of the intentions of the speaker and of the way in which the speaker's words were understood by the counterparty.

This view, however, was overcome in developed legal systems, how the *Institutes of Justinian* tell us, with regard to the conclusion of contracts through spoken words:

> Once the words used in making this kind of contract were as follows: "*Spondes*? Do you engage yourself? *Spondeo.* I do engage myself" [...] Anciently indeed it was necessary to use the formal words just mentioned, but the constitution of the Emperor Leo was afterwards enacted which, removing formalities of expression, requires only that the parties understand one another, and mean the same thing, no matter what words they use. (*Institutes of Justinian*, 3.15)[3]

This does not exclude that the parties may want to establish—for reasons of precision and security of their contractual relations, and for preventing litigation—that in their contractual interactions certain contents need to be expressed in certain ways. This happens to the highest degree in automatic contracting, executed by computer systems, where the way in which contractual clauses are to be

[3] The Latin original: "In hac re olim talia verba tradita fuerunt: Spondes? Spondeo, [...] haec sollemnia verba olim quidem in usu fuerunt: postea autem Leoniana constitutio lata est, quae, sollemnitate verborum sublata, sensum et consonantem intellectum ab utraque parte solum desiderat, licet quibuscumque verbis expressus est."

formed and understood is minutely regulated, in order to enable the automatic production and processing of such clauses.

The fact that the effects of a contract are established by the contract itself makes contracts similar to legislation. Also the legal effects of an act of Parliament are exactly those effects which are stated in that act: To determine what rules and legal positions have been brought into existence by an act of Parliament, we need to look at the content of the act. As we shall see in the next chapter, this has lead some authors[4] to consider contracts—and more generally *Rechtsgeschäfte*—as pertaining to normative production. Here is how (Kelsen 1967, sec. 35.h, 257) introduces contracts:

> The legal order, by instituting the legal transaction (*Rechtsgeschäft*) as a law creating fact, authorizes the individuals subject to the law to regulate their mutual relations within the framework of general legal norms created by legislation or custom, by norms created by way of legal transactions.

23.2. The Notion of a Proclamation

We use the term *proclamation* for expressing in general the intentional production of normative effects.[5] In the following we shall first provide a precise definition of this notion, and then we shall analyse how proclamations connect psychological attitudes and linguistic utterances to legal results.

23.2.1. The Definition of a Proclamation

Our definition of a proclamation is centred upon their function, that is, on the functional link between what one expresses and what one achieves.

Definition 23.2.1 *Proclamation. We say that j* proclaims *A, and write $Procl_j A$, to mean the following:*

1. *j states A, and*
2. *this statement has the function to realise A, through the very action of stating A.*

We view proclamations as behavioural actions, so that $Procl_j A$ may be viewed as an abbreviation for:

$$Does_j[\text{proclaim } A]$$

As we did for actions in general, we use the same expression $Procl_j A$, both to express the propositions describing the performance of a proclamation, and to name that proclamation.

[4] For the doctrinal debate in this matter, see Rotolo, Volume 3 of this Treatise, sec. 7.3.1.1.

[5] We could also have used other terms, such as, for example, "declaration," but we prefer to use a new term to avoid confusion with other senses in which other words have been used.

Our notion of a proclamation covers any acts by which a subject may state a certain normative result, in order to achieve that result. For example, when I say to you "I donate this watch to you" or when I say "I cancel your obligation to pay me € 1,000," I am stating a certain transition (the passage of the watch's ownership from me to you, or the termination of your obligation toward me) exactly in order to perform that transition. This general notion is expressed by Larenz (1992, 186) as follows:

> The legal declaration of will does not only contain the announcement of a certain opinion or intention; it is, according to its meaning, a declaration of validity, namely, an act that aims to bring a certain legal effect into validity. (my translation)

As we shall see in next sections, Larenz's definition of a *legal declaration of will* matches our notion of a proclamation, if only we interpret the term *validity* as meaning *legal bindingness*, in the sense of cognitive bindingness (adoption-worthiness in legal reasoning), according to the ideas we developed in Chapter 12.

23.2.2. Proclamations and Intentions

The idea of a proclamation is neutral with regard to the distinction between theories of speech-act that are based upon intentional (psychological) notions (see, for all, Grice 1989) and those that are based upon institutional (social) notions (see, for all, Searle 1969; Searle and Vandervecken 1985).

In fact, by saying that *j*'s statement has the function to achieve *A*, we do not specify how *A*'s meaning is to be construed: This meaning may be determined by the intention of the speaker, by the intention attributed to the speaker by its interlocutor, by the meaning that the act has according to a public convention, and so on. What suffices, here, is that *A*'s performance has a *word-to-world direction of fit* (Searle and Vandervecken 1985, 52–3), namely, that it has the function of changing the current normative situation in such a way as to make it correspond to content of the act.

Thus, we need not enter into the debate concerning whether and to what extent the effect of a proclamation is determined by the intentions of its authors or by the public behaviour of the latter. It is up to the different legal systems (and to the different doctrinal opinions existing within them) to establish what relevance is to be given to various potentially relevant aspects: (*a*) the states of mind of the party making the proclamation, (*b*) the states of mind which are attributed to that party by the other party, (*c*) the standard linguistic meaning of the words that are used, (*d*) the extra-verbal context in which these words are stated, (*e*) the economical or social function proper to the proclaimed transaction, and so forth.

Thus, our model is also consistent with approaches to the *interpretation of*

contracts which affirm that to establish the content of a contractual term we should usually look only at how that term would be understood by an observer having an appropriate social and linguistic knowledge, rather than investigating how the term was understood by the parties in the particular context in which they were interacting.[6]

23.2.3. Proclamations as Attempts

The proclamation of a result A may be viewed as an *attempt* to achieve A, an attempt which is not necessarily successful. For the proclamation to be successful (for it to produce its result), it is necessary that the normative system *recognises* the proclamation, namely, that it provides for what is proclaimed to take place, as an outcome of the proclamation.

The result a proclamation attempts at producing may be characterised in different ways. It may consist in any of the following:

- the initiation of a normative state of affairs (for instance, I proclaim that I undertake an obligation, or that you are now my partner in a certain business, or that this object now belongs to you);
- the termination of a normative state of affairs (I proclaim that your debt is cancelled, or that your lease is terminated); or
- the emergence of an action (I proclaim that I donate something to you).

In any case, saying that a normative system recognises a proclamation $Procl_j A$ simply means that, according to this normative system, the performance of a proclamation, which we denote as:

$(Procl_j A)$ *happens*
(it happens that j proclaims that A)

or simply as:

$Procl_j A$
(j proclaims that A)

would realise the proclamation's content A (or rather, as we shall see, would make this content legally binding).

A proclamation that is not legally recognised is unable realise its content (it only is an unsuccessful or void attempt to produce that result).

For example, assume that Tony and Mary make a contract (under Italian law) according to which Tony undertakes the obligation to provide Mary with one of his kidneys, and she undertakes the obligation to give him € 10,000. This

[6] These approaches are particularly popular in common-law jurisdictions; see, for instance, Devlin 1962.

is still a contract (a bilateral proclamation), but it is a non-effective (void) one: Tony and Mary's have tried to create the reciprocal obligations they proclaim, but they have failed to do so.

To give a more general example of an unsuccessful proclamation, consider that there is a tradition going back to Roman law, according to which the obligations one undertakes without getting any advantage (*nuda pacta*) are not legally binding, unless under certain restricted conditions and forms which we cannot consider here: "A naked promise does not bear an obligation"(*The Digest of Justinian*, 7.5).[7]

This tradition corresponds to the modern assumptions that a contract, to be legally binding, needs to have a *cause* (as in certain civil law systems) or a *consideration* (as in common-law systems).

We cannot examine here the notion of cause or consideration (or other indications of seriousness in the commitments of the parties), which would require us to discuss the foundations of different systems of private law (for some indications, cf. Zweigert and Kötz 1992, chap. 36). For us it is enough to observe that according to various legal systems proclaiming that one undertakes an obligation is not sufficient for initiating the obligation: When the promisor has no reasonable interest in undertaking the obligation, his promise is an attempted commitment, but no effective one.

23.2.4. Proclamation Rules

The law does not predetermine the content of a legally effective proclamation (though constraining it), but it needs to indicate what proclamations are successful—to specify the success conditions for an act of proclaiming—through general *proclamation rules*. Such rules govern any proclamation having certain features, and thus they abstract from the precise content of each proclamation.

No legislator, for instance, would state rules like the following:

- if two agents proclaim that one has the obligation to mow the other's garden, and that the other has the obligation to pay the first one € 10, then they will acquire those obligations,
- if two agents proclaim that one is permitted to use the other's garage, and that the other is bound to pay the first one € 15 per month, then the first one will acquire that permission and the other will acquire that obligation.

Using this legislative technique would lead us to stating and infinite number of rules, in order to specify the contents of all possible proclamations. On the contrary, we need to be able to express *content-general proclamation-rules*. These rules should state that, under certain constraints and given certain conditions,

[7] The Latin original: "Nuda pactio obligationem non parit."

whatever proclamation of a normative proposition realises the content of this proposition.

As we shall see in the following sections, there are various linguistic, logical and philosophical issues that need to be solved in order to precisely express proclamation rules, in ways that are both logically correct and easily understandable.

23.3. The Logic of Proclamation-Based Inference

In this section we shall discuss the logical structure of proclamation rules and of proclamation-based inferences. Our discussion will lead us to provide a model for the representation of such rules and a corresponding schema for executing *meta-syllogisms*, namely, the inferences leading to the endorsement of proclaimed propositions. The reader who does not want to follow step by step our analysis (which includes some logical technicalities), and prefers to go directly to our solution, is advised to jump directly to Section 23.3.4 on page 604.

23.3.1. The Naive Formulation

The most direct way for expressing content-general proclamation-rules consists in directly expressing the idea of normative determination: Under certain conditions, if any person x proclaims a proposition $\lceil\varphi\rceil$, then this will determine the state of affairs φ.[8] This idea is specified by the following formula:

FORANY (x, φ)
  WHEN $Conditions$
  THEN^n IF $Procl_x \varphi$
    THEN^n φ

(for any x and φ, when the conditions are satisfies, if x proclaims φ then φ)

where x is the individual or the group of individuals making the proclamation, and "φ" is the proclaimed proposition.

For example, a general rule stating that whatever is established by the parties in a contract (without violating the law) holds, as far as they are concerned, could be expressed as follows:[9]

[8] Logical precision would require that we use the expression "$\lceil\varphi\rceil$", to denote the proposition which is expressed by the symbol "φ", while using "φ" to describe the state of affairs corresponding to that proposition. However, when no confusion arises, we shall use simply "φ" also to denote to the proposition.

[9] As we shall see in Section 23.4.3 on page 609, we view a contract as an agreed, or consented proclamation.

(1) FORANY $(\{x, y\}, \varphi)$
WHEN φ does not violate the law AND
φ only concerns x and y
THEN^n IF $Procl_{\{x,y\}}\varphi$
THEN^n φ

(for any two persons x and y, and any normative proposition φ, when φ does not violate the law and φ concerns x and y, if x and y jointly proclaim that φ, then φ)

Let us observe that this rule is quite odd. Not only is the rule badly formed according to the usual syntax of predicate logic—since φ plays a double role, it is a quantified variable and also a component proposition—but it is also difficult to parse (to analyse syntactically).

The oddness remains if we consider the natural language version of this rule:

(2) For any parties x and y, and any normative proposition φ,
when φ not violate the law and φ only concerns x and y,
then if x and y agree on φ,
then φ

By substituting pronouns for variables, we obtain:

(3) Whenever something does not violate the law and only concerns two persons
then if these two persons agree on it
then it

23.3.2. The Problem of Substitutional Quantification

The oddness of the three formulations we have just presented depends on the fact that they mix the use and the mention of a proposition. Proposition φ (in the last example represented by the pronouns "something" and "it") is both an object the proclamation rule speaks about (in the rule's antecedent) and a propositional component of that rule (in the rule's consequent):

- The antecedent of the rule speaks about a generic proposition φ. It presents the hypothesis that proposition φ has certain properties, such as not being against the law and being what two persons have agreed upon.
- The consequent of the rule, on the other hand, is constituted by proposition φ. It does speak about φ, but it is φ itself.

Natural language—like most formalised languages—does not allow us to substitute pronouns (variables) for propositions: Pronouns stand for the names of the things one speaks (or reasons) about, they cannot substitute the propositions one uses to speak (or reason) about such things. Violating this constraint

leads to the kind of awkwardness that is usually referred to under the heading of *substitutional quantification* (cf., for all, Haack 1978; Horwich 1998, 25ff.).

The awkwardness of substitutional quantification makes it difficult to express the type of reasoning that leads us to endorse certain propositions on the basis of the fact that these propositions have certain properties. This kind of reasoning, which we call *meta-syllogism*, can take place both in epistemic and in practical reasoning.

The most immediate way of performing a meta-syllogism reproduces what we have called the "naive formulation" (and corresponds closely to usual syllogism):

Reasoning schema: *Meta-syllogism (naive version)*

(1) proposition A satisfies predicate P;
(2) FORANY (φ),
IF proposition φ satisfies predicate P
THEN^n φ
——— IS A REASON FOR
(3) A

where φ is a variable ranging over propositions, and by "proposition A satisfies predicate P" we refer to a meta-proposition that applies predicate P to proposition A. For instance, if P is predicate:

[1] has been issued by the legislator

and A is proposition:

It is forbidden to smoke in public offices

then "proposition A satisfy predicate P" becomes:

⌈It is forbidden to smoke in public offices⌉ satisfies the predicate
⌈[1] has been issued by the legislator⌉

or more simply:

⌈It is forbidden to smoke in public offices⌉
has been issued by the legislator

The schema above can correspondingly be instantiated by the following inference:

(1) ⌈It is forbidden to smoke in public offices⌉ has been issued by the legislator;
(2) FORANY (φ)
IF ⌈φ⌉ is issued by the legislator
THEN φ

---

(3) It is forbidden to smoke in public offices

As an epistemic example of such a way of reasoning, consider how one, having the belief that a person says the truth (which we naively express as ⌈if a person states a proposition, then it⌉), and that this person has stated a proposition, is led to conclude believing this proposition. Assume for example, that Martin, a police officer, affirms that Mary has crossed while the red light was on, and Mary denies the charge, so that the case is brought to court. The reasoning that leads the judge to accept what Martin says can be described as follows:

(1) Martin says that ⌈Mary crossed while the red light was on⌉;
(2) FORANY (φ)
IF Martin says that ⌈φ⌉
THEN φ

---

(3) Mary crossed while the red light was on

According to this piece of reasoning, given the premises (1) and (2) above, the judge concludes endorsing the reasonable belief that ⌈Mary crossed while the red light was on⌉. This is indeed a reasonable conclusion, but it is obtained through an awkward way of reasoning.

Similarly, assume that Mary and Martin made a contract according to which Mary gives Martin permission to park his car in her garage and Martin undertakes the obligation to pay Mary € 10 per month. Assume also that they believe that agreements are generally effective. This means that they endorse the meta-rule that ⌈if two people proclaim some normative propositions φ, then this proposition is realised (the corresponding normative situation is generated)⌉. By using the naive representation this meta-proposition can be expressed by saying that ⌈if two persons proclaim a normative proposition, then it⌉.

FORANY (φ)
IF $Procl_{\{x,y\}}\varphi$ THEN^n φ
(for any person x and y, and proposition φ, if x and y proclaim φ, then φ)

The reasoning leading Mary and Martin to conclude that they now hold the normative positions they have agreed upon, takes the following form:

(1) $Procl_{\{Mary, Martin\}}$
Perm [Martin parks] AND ***Obl*** [Martin pays € 10];
(2) FORANY $(\{x, y\}, \varphi)$
IF $Procl_{\{x,y\}}\varphi$ THEN^n φ

---

(3) ***Perm*** [Martin parks] AND ***Obl*** [Martin pays € 10]

Meta-syllogism, in both its epistemic and its practical applications, seems to be a sound pattern of inference: It leads us to conclusions which appear to be supported by its premises. However, when expressed the form we have just used, *meta-syllogism* looks logically awkward: In its major premise the same variable occurs both as an object one speaks about and as a constituent proposition.

Note that these hybrid major premises express the peculiar subreason which enables meta-syllogisms: They express the endorsement of all propositions having certain properties (for any φ, if Martin has said φ, then φ; for any φ, if Martin and Mary have agreed on φ, then φ; and so forth).

Correspondingly, these badly formed major premises play the pivotal function in the naive representation of meta-syllogism: They allow one to move along the conceptual-linguistic ladder. At the conceptual level they enable us to pass (through detachment) from having beliefs about propositions into believing those very propositions. At the linguistic level they enable us to pass from speaking about propositions into stating them.

Thus, if we want to provide a better way of conceptualising meta-syllogisms we need to find a better way of representing their major premises.

23.3.3. How to Climb Ramsey's Ladder

A less awkward way of expressing the major premise of a meta-syllogism consists in having a meta-predicate M which applies to a proposition A exactly when that proposition holds. In other words, we need to assume all instances of the following schema:

$M(A)$ IFF A

Accordingly, when we view a proposition as an object we are speaking (reasoning) about, we can apply predicate M to it: We write $M(A)$, rather than A.

In the epistemic domain, the predicate that usually performs this function is the predicate *true*. In particular, according to the so-called disquotational theories of *truth* the proposition

[9] We should write $M(\ulcorner A \urcorner)$, to specify that the meta-level property which is expressed by predicate M concerns proposition $\ulcorner A \urcorner$, rather than the state of affairs A which is represented by that proposition. Others, who view such meta-level properties as concerning sentences, rather than propositions, would prefer the formulation $M(\text{“}A\text{”})$. For simplicity's sake, however, we just write $M(A)$.

A is true

expresses the same content which would be expressed directly by proposition A.

More modestly, but sufficiently for our purposes, deflationary or minimalist theories affirm, for any proposition A, the logical equivalence between ⌈A is true⌉ and A. We do not need to distinguish these approaches, both of which have their origins in the work of Frank Ramsey (a new understanding of which is provided by the new edition of his manuscript materials; see Ramsey 1991). It is rather sufficient that we endorse, for any proposition A, the following equivalence:

IT IS TRUE THAT A IFF A

Accordingly, we can move from expressing (thinking) meta-proposition:

IT IS TRUE THAT ⌈Mary crossed while the light was red⌉

into saying directly proposition:

Mary crossed while the light was red

More generally, according to the deflationary view, we make no substantial progress, we express no new content is expressed, when we move down this ladder:

(1) A
(2) IT IS TRUE THAT A
(3) IT IS TRUE THAT ⌈IT IS TRUE THAT A⌉
(4) and so on.

Therefore, using this understanding of the notion of truth, there should be no problem in applying the predicate *true* also to normative propositions.

In fact, by stating that a normative proposition A is true one would simply convey proposition A. Thus, stating that ⌈A is true⌉ should be as legitimate as stating that A, and it should imply no additional ontological assumption, and in particular no assumption concerning the existence of normative states of affairs.[10] The same holds when, rather than using the predicate *true*, we use other expressions sharing with *true* the property that their application to a proposition only produces a restatement of that proposition.

As Blackburn (2002) observes (see also Blackburn 1998, 294–7):

[10] This is the characteristic assumption of deflationary or minimalist ideas of truth, on which see Horwich 1998, and for an application to norms, cf. Volpe 1999.

Ramsey's minimalism comes out in the view that a certain apparent progress in fact takes us nowhere. I call the progress Ramsey's ladder, and the doctrine is that the ladder is horizontal.

> p
> True p
> Really True p
> A fact that Really True p
> Really a fact that Really True p
> In registering p our minds resonate with the objective and absolute norms that govern the reason of things.

All this takes us no further than p.

The discussion on the philosophical relevance of the flattening of Ramsey's ladder would take us far away, as shown by the interesting debate between Dworkin (1996) and Blackburn (1996). For our purpose it is sufficient to draw from it two conclusions.

The first is a negative one. Once we have agreed on using predicate *true* (or a similar one) only as a useful dummy, it makes sense to use it only to the extent that this helps in better expressing our ideas (for instance for avoiding substitutional quantification).

The second is a positive one. Since there are no metaphysical or ontological commitments in using predicate *true*, it seems that we can use it whenever it is useful. Though minimalist theories of truth (together with deflationary, disquotational, or redundancy theories) seem to be gaining an increasing recognition, they are still competing in the philosophical discussion with other important ideas, such as those founding the notion of truth upon the ideas of correspondence, verification, coherence, or utility. This debate has a huge philosophical relevance, but it does not matter for our current purposes, since we are only interested in finding a linguistic device that allows us climb Ramsey's ladder.

Moreover, for our limited concerns even the minimalist equivalence:

$M(A)$ IFF A

is too much.

For our purposes, it is sufficient that we have a predicate M such that for any proposition A, one may endorse any conditional having the following form:

IF $M(A)$ THEN A

Then, by applying a simple detachment step,

(1) $M(A)$;
(2) IF $M(A)$ THEN A

---

(3) A

we can move up the ladder from $M(A)$ to A.

For this purpose, as we shall se in the following section, we already have a solution at hand, namely, the notion of cognitive bindingness, which we introduced and discussed in Chapter 3.

23.3.4. Our Representation of Meta-Syllogism

By saying that a certain content is cognitively binding or adoption-worthy (see Section 3.1.1 on page 88) or *Binding* (see Section 3.1.5 on page 93), we mean that this content deserves to be adopted in our practical reasoning: We are *bound*, or *due* to adopt it.

As we have seen in Section 3.1.2 on page 89, a rational reasoner should move from the idea that a certain content is binding, into endorsing this content. This is the inference which is authorised by the schema we called *de-doxification*. When one is dealing with beliefs (as is the case also for doxified practical reasoning), *de-doxification* acquires the following specific form:

Reasoning schema: *Binding-elimination*
(1) believing $\lceil$*Binding* $A\rceil$
——— IS A CONCLUSIVE REASON FOR
(2) believing $\lceil A\rceil$

This reasoning schema may also be viewed as implicitly containing detachment step, assuming that for any proposition A, the reasoner endorses the conditional:

IF *Binding* A THEN A

Given this assumption, the schema *Binding-elimination* becomes indeed the abbreviation of the following detachment-step:

Reasoning instance: *Detachment*
(1) believing $\lceil$*Binding* $A\rceil$;
believing $\lceil$IF *Binding* A THEN $A\rceil$
——— IS A CONCLUSIVE REASON FOR
(2) believing $\lceil A\rceil$

Using the idea of bindingness, we can view proclamation rules as normative conditionals having the following content: If a certain proposition is proclaimed, then that proposition is binding.[11] For instance, the rule above concerning the efficacy of bilateral contracts, becomes:

FORANY $(\{x, y\}, \varphi)$
IF $Procl_{\{x,y\}}\varphi$ THEN^n *Binding* φ
(for any person x and y, and proposition φ, if x and y proclaim φ, then φ is binding)

Meta-syllogism can then be performed in two steps.

The first step consists in inferring that a certain normative proposition is binding. This inference step takes place according to usual syllogism. For instance, assume that Mary and Martin have agreed that Martin is allowed to park his car in Mary's garage, and that he will pay her € 10. Using the rule above we can perform the following inference:

(1) $Procl_{\{Mary,Martin\}}$
Perm [$Martin$ parks] AND
Obl [$Martin$ pays $Mary$ € 10];
(2) FORANY $(\{x, y\}, \varphi)$
IF $Procl_{\{x,y\}}\ \varphi$ THEN^n *Binding* φ

---

(3) *Binding*
Perm [$Martin$ parks] AND
Obl [$Martin$ pays $Mary$ € 10]

The second step consists in eliminating the predicate *Binding*, that is, in moving from believing that a normative proposition is cognitively binding (that it is adoption-worthy, that it requires being adopted), into believing that normative proposition.[12] This can be done through schema *Binding-elimination*, as we have just seen:

[11] The efficacy of the proclamation may depend to various conditions. For example a term in a contract is only effective if it concerns the contracting parties, which usually cannot modify the legal entitlements of others. For simplicity's sake, we omit including such conditions in the following examples.

[12] A similar approach, though using the term *validity* rather than *bindingness*, has been proposed by Yoshino 1995.

(1) *Binding*
  Perm [Martin parks] AND
  Obl [Martin pays Mary € 10]

---

(2) ***Perm*** [Martin parks] AND
  Obl [Martin pays Mary € 10]

By merging the two inferences, we get the following reasoning schema for meta-syllogism with proclamations:

Reasoning schema: *Meta-syllogism with proclamations*
(1) $Procl_j A$;
(2) FORANY (ϕ)
  IF $Procl_j \phi$
  THEN^n *Binding* ϕ
——— IS A REASON FOR
(3) A

This schema indicates that when one believes that j has proclaimed a proposition A, and that whatever proposition is proclaimed by j is binding, one may conclude by believing proposition A. This schema is exemplified in the following inference:

(1) $Procl_{\{Mary,Martin\}}$
  Perm Martin parks AND
  Obl Martin pays Mary € 10;
(2) IF $Procl_{\{x,y\}}\phi$ THEN^n *Binding* ϕ

---

(3) ***Perm*** ⌈Martin parks⌉ AND
  Obl ⌈Martin pays Mary € 10⌉

Through this inference, given that Mary and Martin have agreed that Martin may park in Mary's garden and that he shall give her € 10, and given that agreements (joint proclamations) are binding, we can conclude that indeed he may park in her garden, and shall give her € 10.

23.4. The Analysis of Proclamations

In the previous sections we have identified the idea of a proclamation as the pivotal notion in our model of the intentional production of normative results. In the next pages we shall provide an account of some significant aspects of

proclamations: their content, their effectiveness, their (multiple) authors, their logic.

23.4.1. The Content of Proclamations

The idea of a proclamation is neutral in regard to what is proclaimed. So *Procl* can play the function vested by different speech acts, as they are usually classified by speech act theory (for example, in the taxonomy of Searle and Vandervecken 1985):

1. $Procl_j$([**Obl** $Does*_j A$] *initiates*): j proclaims that her own obligation to do A initiates.
2. $Procl_j$([**Obl** $Does*_k A$] *initiates*): j proclaims that k's obligation to do A initiates.
3. $Procl_j$([**Obl** $Does*_j A$] *terminates*): j proclaims that her own obligation to do A terminates.
4. $Procl_j$([**Obl** $Does*_k A$] *terminates*): j proclaims that k's obligation to do A terminates.

According to the usual classifications:

- (1) is j's attempt to commit herself to do action A (it is making a promise);
- (2) is j's attempt to command k to do A (it is issuing an order);
- (3) is j's attempt to free herself from the obligation to do A (it is the withdrawal of a promise);
- (4) is j's attempt to free k from his obligation to do A (it is the withdrawal of an order).

Obligations can be created toward specific persons, by using the device of directed obligations and rights (see Chapter 19).

Note that rather than proclaiming a result, one may also proclaim that one is performing an action (like selling a book). The two ideas are indeed equally subsumed by our notion of proclaiming. Thus, to obtain the result that John's exemplar of the *Brothers Karamazov* belongs to Mary, John could act in two ways. The first consists in John's proclaiming that it now initiates that the books belongs to Mary:

P_1: $Procl_{John}$
  [$Brothers\ Karamazov$ belongs to Mary] *initiates*

The second consists in John proclaiming that he brings it about that that the book now initiates belonging to Mary

P_2: $Procl_{John}$
  $Brings_{John}$
    [$Brothers\ Karamazov$ belongs to Mary] *initiates*

In both cases, if the enabling rule holds, John will achieve the result he intends to achieve through his proclamation (the result that his exemplar of *Brothers Karamazov* becomes Mary's). Assume that the enabling rule is a general empowerment to make small gifts:

$$\begin{aligned} R\text{:}\ & \textsc{forany}\ (\varphi, x) \\ & \quad \textsc{when}\ [\mathit{Procl}_x\varphi \text{ concerns making a small gift}] \\ & \quad \textsc{then}^n\ \textsc{if}\ \mathit{Procl}_x\varphi\ \textsc{then}^n\ \textsf{\textit{Binding}}\ \varphi \end{aligned}$$

For our purposes, we do not need to investigate what making a small gift is: We assume that it consists in transferring to another a property having a modest value, without any reward. We also assume that both proclamations P_1 and P_2 concern making small gifts.

Then, according to schema *meta-syllogism*, the performance of proclamation P_1 (together with rule R) entails the following conclusion:

$$C_1\text{: } [\mathit{Brothers\ Karamazov} \text{ belongs to Mary}]\ \ \textsf{\textit{initiates}}$$

Similarly, according to the same schema *meta-syllogism*, the performance of the proclamation P_1 leads to the conclusion:

$$C_2\text{: } \mathit{Brings}_{John}([\mathit{Brothers\ Karamazov} \text{ belongs to Mary}]\ \ \textsf{\textit{initiates}})$$

However, according to schema *success of productive actions*, $\mathit{Brings}_j A$ entails A, since completed productive actions necessarily deliver their results. Therefore, also C_2 entails C_1. In conclusion, both proclamations P_1 and P_2 lead to the same conclusion:

$$[\mathit{Brothers\ Karamazov} \text{ belongs to Mary}]\ \ \textsf{\textit{initiates}}$$

23.4.2. Effective and Void Proclamations

The notions we have introduced above enable us to precisely characterise what it means for a proclamation to be effective.

Definition 23.4.1 *Effectiveness of a proclamation. A proclamation is* effective *if its performance would determine the bindingness of its content. More exactly,* $\mathit{Procl}_j A$ *is* effective *when it holds that:*

$$\textsc{if}\ \mathit{Procl}_j A\ \textsc{then}^n\ \textsf{\textit{Binding}}\ A$$

In this definition, A may consist in any type of legal proposition. It may express the initiation or the termination of a new legal position, the happening of an action, or even the holding of a normative conditional.

By denying the effectiveness of a proclamation, we obtain the notion of its ineffectiveness.

Definition 23.4.2 *Ineffectiveness of a proclamation. A proclamation is* ineffective *when it is unable to realise its content. More exactly* $Procl_j A$ *is* ineffective *when it holds that:*

$$\text{NON } (\text{IF } Procl_j A \text{ THEN}^n \textsf{ Binding } A)$$

In fact, proposition:

$$\text{NON } (\text{IF } Procl_j A \text{ THEN}^n \textsf{ Binding } A)$$

expresses the negation of the normative conditional:

$$\text{IF } Procl_j A \text{ THEN}^n \textsf{ Binding } A$$

which, according to the analysis we provided in Section 20.3 on page 532, indicates the antecedent A normatively determines consequent $\textsf{Binding } A$. Thus, the negative proposition can also be expressed as:

$$Procl_j A \text{ DOES NOT DETERMINE } \textsf{Binding } A$$

The performance of an ineffective proclamation is thus the act through which one person proclaims that he is achieving a certain result, but fails to achieve this result: It is a failed attempt to achieve that result.

When a proclamation is ineffective we also may say that it is *void*, though some doctrinal writers would prefer to speak of voidness only when the ineffectiveness does depend on a defect of the proclamation (rather than on the fact that some preconditions of its effectiveness do not obtain yet).

It is more difficult to specify what it means for a proclamation to be valid or invalid. Usually, the difference between effectiveness and validity is affirmed with regard to voidable contracts, which though producing what they proclaim (and thus being effective), are said to be invalid. By qualifying such contracts as invalid we mean that they are indeed defective and their defect is so serious that it may lead to their annulment (if the party which is entitled to request the annulment decides to ask for it). Typically, annulment will be provided by a judicial decision, though in some cases other procedures may be sufficient.

For example, if I bought a ring believing that it was made of silver, while it was made of copper, and the seller knew of my mistake, then the contract is voidable. This means that I become the owner of the ring and have the obligation to pay the price, though I also have the power (by requesting the annulment) of putting the judge under the obligation to cancel these normative positions.

23.4.3. Multi-lateral Proclamations (Agreements)

A proclamation may be collectively performed by two or more parties. When this is the case, we call such a proclamation an *agreement* or also a *con-*

tract.[13] This notion seems to correspond to a famous definition of a contract by Friedrich von Savigny:

> [A] contract is the union of two or more people in an agreed declaration of intention directed to altering their legal relations. (Quoted in Zweigert and Kötz 1992, 352)

For example, consider a contract through which j takes the obligation toward k to provide an exemplar or the CD "The Beatles" and k undertakes the obligation toward j to pay the price of € 10. This contract corresponds to the following proclamation:

$$\begin{array}{l} \mathit{Procl}_{\{j,k\}} \\ \quad \boldsymbol{Obl}^{k}\,\mathit{Does}_j[\text{deliver "The Beatles" to } k] \text{ AND} \\ \quad \boldsymbol{Obl}^{j}\,\mathit{Does}_k[\text{pay € 10 to } j] \end{array}$$

When such a proclamation is recognised by the legal system (when conditions established for it to be effective exist), then the proclaimed results will take place.

23.4.4. The Logic of Proclamations

We shall assume that proclamations have certain logical properties, which we shall use in Chapter 24.

First of all, we assume that proclaiming a conjunction of contents involves making separate declarations concerning each of the conjunct contents:

$$\frac{(1)\ \ \mathit{Procl}_j(A \text{ AND } B)}{(2)\ \ (\mathit{Procl}_j A) \text{ AND } (\mathit{Procl}_j B)}$$

This is a questionable assumption, since as we have seen in Section 16.2.2 on page 442 the logic of action does not always allow us to split conjunctive actions. However, this inference seems to be intuitively correct with regard conjunctive proclamations, which may be viewed as including the proclamation of each conjunct.

In addition, we assume that, when a group of agents X jointly proclaim that A, then each agent j belonging to group X ($j \in X$) makes such a proclamation:

[13] Though the notion of a contract, as used in law texts (like the Italian civil code) or in legal doctrine is often limited to agreements having an economic function, and is sometimes extended it to certain unilateral proclamations.

$$\frac{(1)\ Procl_X A \quad (2)\ j \in X}{(3)\ Procl_j A}$$

This is also a debatable inference. It might indeed be argued that this entailment only holds when the proclamation of a set of agents consists of a set of identical utterances. However, it seems to us that when we focus on the meaning of the proclaimers' utterances—rather than on the syntax of such utterances—we can accept this inference: When I say "yes" in reply to your proposal, we can view our proclamations as concerning the same proposition, though we have used different words.

Note that the converse of the above inference does not hold: Making a set of individual proclamations does not entail in general making a collective proclamation: A joint declaration is more than a set of parallel declarations having the same content.

Chapter 24

PROCLAMATIVE POWER

The notion of a proclamation leads us to the general idea of a *proclamative power*, namely, the power to achieve, through a proclamation, exactly what one is proclaiming.

In this chapter, we shall examine this notion, its inferential role, and its applications in different domains of the law.

24.1. The Notion and the Inferential Role of Proclamative Powers

The notion of a proclamative power expresses the link between an effective proclamation and its binding content, that is, the fact that the performance of such a proclamation would normatively determine the bindingness of its content (and thus the corresponding normative state of affairs). Under such circumstances, we say that the author of the proclamation has the *proclamative power* of realising the content of the proclamation.

Definition 24.1.1 *Proclamative power. We say that j has the* proclamative power *of realising A, abbreviated as* $\mathbf{ProclPow}_j A$*, when j would make A binding by proclaiming A. More precisely:*

$$\boldsymbol{ProclPow}_j A \equiv \text{IF } Procl_j A \text{ THEN}^n \textsf{ Binding } A$$

([j has the proclamative power of realising A] is equivalent to [if j proclaims A then A is binding])

The idea of a proclamative power plays an important inferential function in legal discourse, as we shall see in the following sections.

Before that, we need to go into some terminological considerations, since different terms have been used to denote the specific kind of power that is exercised through proclamations.[1]

For example, the German jurist Ernest Rudolf Bierling (like Alois Brinz, which we mentioned in Section 22.1.6 on page 583) expresses the same concept by using the term *juristische Können*, which we may translate as *legal power* or *legal ability*:

Beside the simple legal permission [*das einfache rechtliche Dürfen*], the content of which is, in essence, purely negative, [i.e.,] not being legally forbidden [. . .] stands, according to the prevailing

[1] For a discussion of various theories concerning what we call a *proclamative power*, see Lindahl 1977, chap. 6.

opinion, the so-called legal ability [*das rechtliche Können*], i.e., the ability, following from some provisions of positive law, to produce certain legal effects by acts-in-the-law. (Bierling 1883, 211, as translated in Lindahl 1977, 196)

To convey a similar idea, Hans Kelsen uses the term *Ermächtigung in engsten Sinnen*, which we may translate as *authorisation (or empowerment) in strict sense*, to refer to the "ability [*Fähigkeit*] to produce and apply legal norms" (Kelsen 1960, sec. 30c, 156, my translation).

Similarly, Alf Ross uses the term *competence* to refer to the "legally established ability to create legal norms (or legal effects) through and in accordance with enunciations to this effect" (Ross 1968, 130).

Given that many diverse terms have been used to denote the specific kind of power that is exercised through proclamations—though with different shades of signification, also depending on the fact that some of these terms, like *competence* or *authorisation* already have established meanings in the legal discourse—we prefer to introduce here the neologism *proclamative power* to refer unambiguously to this idea.[2]

24.1.1. Proclamative Power and Legal Inference

When we believe that:

- j has the proclamative power of achieving A, that is, $\textbf{\textit{ProclPow}}_j A$, and
- j has exercised this power through an appropriate proclamation $Procl_j A$,

we can infer that the content of the proclamation is binding, that is, $\mathsf{Binding}\ A$, which leads us to conclude endorsing A.

This inference results from merging three ingredients (see Table 24.1 on the next page): (*a*) the definition of ***ProclPow***, (*b*) the schema *detachment*, and (*c*) the schema $\mathsf{Binding}$-*elimination*. We synthesise this inference pattern through the following reasoning schema, where given that a subject j has the proclamative power of realising a proposition A, and that j has performed the proclamation, we conclude by endorsing A:

Reasoning schema: *Power application*

(1) $\textbf{\textit{ProclPow}}_j A$;
(2) $Procl_j A$
——— IS A REASON FOR
(3) A

[2] In Gelati et al. 2002b, the locution *declarative power* denotes what we here prefer to call *proclamative power*.

1.	$\textbf{\textit{ProclPow}}_j A$	⟨premise⟩
2.	$Procl_j A$	⟨premise⟩
3.	IF $Procl_j A$ THEN^n *Binding* A	⟨from 1, and Definition 24.1.1⟩
4.	*Binding* A	⟨from 2 and 3, by *detachment*⟩
5.	A	⟨from 4, by *Binding-elimination*⟩

Table 24.1: *Inference concerning the exercise of power*

Here is an example. We start with the following beliefs: (1) Tom proclaims that Mary's obligation to pay him € 1,000 terminates and (2) Tom has the power of terminating Mary's obligation towards him. From these premises we can infer that indeed Mary' obligation is terminated.

(1) $\textbf{\textit{ProclPow}}_{Tom}$
($\textbf{\textit{Obl}}^{Tom} Does_{Mary}$[pay Tom € 1,000])*terminates*;
(2) $Procl_{Tom}$
($\textbf{\textit{Obl}}^{Tom} Does_{Mary}$ [pay Tom € 1,000]) *terminates*

---

(3) ($\textbf{\textit{Obl}}^{Tom} Does_{Mary}$ [pay Tom € 1,000]) *terminates*

One further inference step can be added to *power application*. The premise of this inference step consists in a general power-proposition:

FORANY (φ) $\textbf{\textit{ProclPow}}_j A[\varphi]$
(for any proposition φ, j has the proclamative power of realising $A[\varphi]$)

where $A(\varphi)$ indicates that the propositional content of the power contains variable φ. The conclusion, which is obtained through schema *specification* is a specific power-proposition:

$\textbf{\textit{ProclPow}}_j A[\varphi/p]$
(j has the proclamative power of realising $A[\varphi/p]$)

where $A[\varphi/p]$ denotes the result we obtain substituting, within A, variable φ with p. By embedding this inference into schema *power application* we obtain the following reasoning schema:

Reasoning schema: *General-power application*

1. FORANY (φ) $\textbf{\textit{ProclPow}}_j A[\varphi]$;
2. $Procl_j A[\varphi/p]$

——— IS A REASON FOR

3. $A[\varphi/p]$

For instance, assume that we endorse the belief that ⌈Tom has the power of terminating the obligations of his debtors⌉:

FORANY (x, φ)
$\qquad$ ***ProclPow*** $_{Tom}$
$\qquad\qquad$ (***Obl*** $^{Tom}Does_x\varphi$) *terminates*

(for any person x, and any action φ, Tom has the power of terminating x's obligation toward Tom to do φ)

and that ⌈Tom has proclaimed the termination of $Mary$'s obligation, toward him, to pay him € 1,000⌉

$Procl_{Tom}$
$\qquad$ (***Obl*** $^{Tom}Does_{Mary}$ [pay Tom € 1,000]) *terminates*

From these beliefs, we can infer—according to *general-power application*—that Mary' obligation to pay Tom such sum has indeed terminated.

(1) FORANY (φ, x)
$\qquad$ ***ProclPow*** $_{Tom}$
$\qquad\qquad$ (***Obl*** $^{Tom}Does_x\varphi$) *terminates*);

(2) $Procl_{Tom}$
$\qquad$ (***Obl*** $^{Tom}Does_{Mary}$ [pay Tom € 1,000]) *terminates*

---

(3) (***Obl*** ^{Tom}($Does_{Mary}$ [pay Tom € 1,000]) *terminates*

If we substitute ***ProclPow*** with its conditional *definiens*, we can easily see that schema *general-power application* is an instance of the schema *meta-syllogism*. In fact, it allows us to infer a proposition, from the fact that the proposition has a certain property (the property of having been proclaimed by a certain agent).

24.1.2. Proclamative Power and General Inferences

The schema *power application* can also be combined with the schema *syllogism*, which allows us to move from a general power-rule to a specific power-rule.

For instance, consider a rule attributing to every worker the power of terminating his or her employment-contract:[3]

FORANY (x)
$\qquad$ IF [x is a worker]
$\qquad$ THEN^n ***ProclPow*** $_x$[x's employment-contract terminates]

(for any x, if x is a worker, then x has the power of making so that his or her employment-contract terminates)

[3] Usually this power is conditioned to particular circumstances, such as giving a timely notice, which we do not consider for simplicity's sake.

If we know that John is a worker, we can infer (according to *syllogism*) that he has the power of terminating his own employment-contract:

$\textbf{\textit{ProclPow}}_{John}[John\text{'s employment-contract terminates}]$

Finally, if we know that this power has been exercised through an appropriate proclamation:

$Procl_{John}[John\text{'s employment-contract terminates}]$

then according to schema *power application* we can conclude with endorsing the content of the proclamation:

$John\text{'s employment-contract terminates}$

24.2. Kinds of Proclamative Power

Let us briefly consider some general powers that are usually available to everybody, in most legal systems. We shall characterise these power through general power-propositions.

24.2.1. The Power to Create and Terminate Obligations

There seems to exist, in most legal systems, a general power to undertake (initiate) obligations concerning oneself, whenever one has a cause or a consideration (an interest) for doing so. We may characterise this as follows:

FORANY (x, ϕ)
WHEN x has an interest in undertaking $\textbf{\textit{Obl}}\ Does{*}_x\varphi$
THEN^n $\textbf{\textit{ProclPow}}_x$
$(\textbf{\textit{Obl}}\ Does{*}_x\varphi)$ *initiates*

(whenever a person x has an interest in undertaking the obligation to do an action φ, then x has the power of initiating x's obligation to do φ)

For instance, assume that John has an interest in undertaking the obligation to give € 1,000 to the person who will find his beloved dog Fido (who is been missing for some time):

$John$ has an interest in undertaking
$\textbf{\textit{Obl}}\ (Does_{John}[\text{give € 1,000 to the finder of Fido}])$

(John has an interest in initiating his obligation to give € 1,000 to the finder of Fido)

This leads us, according to schema *normative syllogism*, to conclude that John has the proclamative power of undertaking this obligation:

$\textbf{\textit{ProclPow}}_{John}$
$(\textbf{\textit{Obl}}\ Does_{John}$[give € 1,000 to the finder of Fido]) *initiates*
(John has the proclamative power of initiating his obligation to give € 1,000 to the finder of Fido)

Assume that John makes the following proclamation:

$Procl_{John}$
$(\textbf{\textit{Obl}}\ Does_{John}$[give € 1,000 to the finder of Fido]) *initiates*
(John proclaims the initiation of his obligation to give € 1,000 to the finder of Fido)

According to schema *power application*, we may then conclude that he is under that obligation:

$(\textbf{\textit{Obl}}\ Does_{John}$[give € 1,000 to the finder of Fido]) *initiates*

One has also in general the power to terminate other people's obligations towards oneself, that is, to release them from their debts:

FORANY (x, y, ϕ)
$\textbf{\textit{ProclPow}}_x$
$(\textbf{\textit{Obl}}^x Does{*}_y \phi)$ *terminates*
(for any persons x and y, and any action φ, x has the power of terminating y's obligations towards x concerning action φ)

Since, as we know, an obligation directed towards a person can also be viewed as an interest-right of that person. The principle above can also be stated as asserting that one can terminate one's own rights:

FORANY (x, y, ϕ)
$\textbf{\textit{ProclPow}}_x$
$(\textbf{\textit{OblRight}}_x Does{*}_y \phi)$*terminates*
(for any persons x and y, and action φ, x has the power of terminating x's obligational right that y does action φ)

24.2.2. The Power to Confer Permissions

As a general principle, it seems that in modern legal systems one has the proclamative power to make it permitted that other people perform any action upon oneself, even when this action would be forbidden without one's permission (like parking in one's garden, engaging in intimate contact with one, copying one's intellectual property, and so on):

FORANY (x, y, φ)
$\textbf{\textit{ProclPow}}_x$
$(\textbf{\textit{Perm}}^x Does_y \varphi)$ *initiates*
(for any persons x and y, and any action φ, x has the proclamative power of initiating the permission, toward x, that y does action φ)

This principle has some limitations with regard to certain rights, the so-called *inalienable* rights, such as the right to life, or the right to physical integrity. For instance one's consent is not sufficient to remove the prohibition that other people harm one (unless, at least according to some opinions and some legal systems, under special conditions, such as when euthanasia, violent sports, or masochism are at issue).

However, the principle that one's permissive acts can override others' obligations towards oneself has a large application: It includes economic relationships but also extends beyond them.

As a recent example of such a power to permit, consider the consent to access and process one's personal data, which is a precondition for the permissibility of such operations, according to EC data protection legislation (though this power also has some limitation, for instance with regard to sensitive data). Thus, though in principle agent j has the obligation towards k not to process information concerning k, k has the power of making it permitted that j processes the information, according to the formula above.

On the contrary, there cannot exist, in any reasonable legal system, a general principle according to which one has the power of creating permissions for oneself upon others. This would make obligations useless: Whenever one does not want to comply with an obligation, one could initiate a permission to omit the obligatory action, which amounts to terminating the corresponding obligation.

24.2.3. Empowerment to Command

A proclamative power of commanding consists in the power of creating obligations upon other people by proclaiming that they have (or acquire) these obligations. Consider, for instance, the following examples:

- a parent tells his teenage child: "You are obliged to stay at home tonight!";
- a judge issues the order that an Internet provider is obliged to cancel some pornographic information from its web-server;
- a tribunal decides a case by stating that an employer is obliged to take measures to stop one of her workers being mobbed by his colleagues;
- an employer tells one of her employees to perform a certain task.

Among private persons the normal situation (or at least the starting point) is that of legal equality: According to Art. 1 of the Universal declaration of human rights, "All human beings are born free and equal in dignity and rights." Since it does not make sense that equality should consist in everyone being able to unilaterally create obligations over everybody else (chaos would result immediately), it must be the case that none has such a power, unless special conditions obtain.

In particular a power to command may be established with the consent of the person who is subjected to this power (for example, when one enters an employment contract one accepts a certain power to command of one's employer). Such a power can also be established or by the law itself, for the benefit of the subjected person (as for parents' powers over their children).

Public authorities usually have a certain power of commanding, within their competence. For example, a traffic officer has the power of creating obligations, concerning a driver's behaviour in the road, in order to govern the traffic:

FORANY (j, k, A)
IF [action A concerns the driving behaviour of k] AND
[j is a police officer]
THEN ***ProclPow***$_j$
(***Obl*** $Does_k A$) *initiates*

24.2.4. Empowerment to Renounce a Power

As one can renounce one's interest-rights, so generally one can renounce one's powers toward other persons. Thus in general terms we may say that one has the power or renouncing one's potestative rights:

FORANY (x, φ)
ProclPow$_x$
(***PotestativeRight***$_x \varphi$) *terminates*

(for any person x and any proposition φ, x has the proclamative power of terminating x's potestative right to realise φ)

This only is a defeasible principle, since there are non-renounceable powers. For instance, one cannot usually renounce those powers that one is granted in the interest of other people, like a parent's powers over his or her children.

24.2.5. Power to Transfer Property

We do not usually have the proclamative power to transfer the ownership of a thing to another person without the consent of the latter, and in some cases without special formalities (for some goods, for example, a written contract may be required). In some legal systems, moreover, under certain circumstances, for the ownership of a chattel to be transferred it is also required that the new owner acquires the possession of the thing.

Abstracting from these special conditions, however, we may endorse a general normative proposition according to which one can transfer one's ownership of a thing to another through an agreement with the latter. Usually an interest is required in the owner, unless the conditions for donations are satisfied:

FORANY (x, y, w)
IF $[x$ owns $w]$ AND
$[x$ has an interest in transferring w's ownership to $y]$
THEN^n ***ProclPow***$_{x,y}[w$'s ownership is transferred from x to $y]$
(for any persons x and y, and any object w, if x owns w and x has an interest in transferring w's ownership to y, then x has the proclamative power of transferring w's ownership to y)

where by $\lceil w$'s ownership is transferred form x to $y\rceil$ we mean that:

$([x$ owns $w]$ *terminates*) AND $([y$ owns $w]$ *initiates*)

24.3. Empowerment to Empower

A flexible arrangement of legal relationships is facilitated, if people have the *power of conferring their powers* to other people. This meta-level power is the starting point for analysing some important legal notions and, in particular, for introducing the fundamental idea of *representation*.

24.3.1. Conferring Powers

Let us start with the idea that a person can proclaim that another person has the power of achieving a certain legal result. Assume, for instance, that Tom proclaims that Mary—who will be staying in his house while he is away on holiday—has the power of permitting other people to visit his house, if she wishes so:

$Procl_{Tom}$
FORANY (x)
ProclPow$_{Mary}$
Perm $(Does_x$[visit Tom's house]$)$ *initiates*
(Tom proclaims that for any person x, Mary has the power of bringing it about that x is permitted to visit Tom's house)

Usually, entering one's house without one's consent would be illegal and even a crime, but if Tom's proclamation is effective, then entering with Mary's consent will not be illegal. The effectiveness of Tom's proclamation may be explained by assuming that any one (x) has the power of giving to any other person (y) the power of initiating permissions towards oneself, an assumption that can be expressed as follows:

FORANY (x, y, w, φ)
ProclPow$_x$
ProclPow$_y$
$[$***Perm***$^x Does_w \varphi]$ *initiates*
(for any persons x, y, and w, and any action φ, x has the proclamative power to create the proclamative power of y to realise that w is permitted toward x to do φ)

What kinds of powers is one empowered to allocate to others, according to a general principle? A very liberal choice would consist in stating that each person x has the proclamative power of giving any other agent y any powers x has. Such a general empowerment to empower seems to be a general principle of modern private law, at least for powers that are intended to serve the interest of the power-holder, namely for what we called *potestative rights*. Usually, on the contrary, this does not hold with regard to powers that are to be used for the benefit of another. Thus we can assume the following personally-general attribution of legal meta-power.

FORANY (x, y, φ)
IF ***PotestativeRight***$_x \varphi$
THEN^n ***ProclPow***$_x$([***EnablingPower***$_y \varphi$] *initiates*)

(for any persons x, y, and any proposition w, if x has the potestative right of realising φ, then x has the proclamative power of initiating y's enabling power to realise φ)

A general empowerment to transfer powers was not recognised by ancient legal systems. In Roman law (but also in ancient Anglo-Saxon law) personal rights could not be transferred to others: This means that the creditor could not transform the debtor's duty into a duty towards an assignee, and transfer to the assignee his powers related to that duty. More specifically, ancient legal systems did not know the idea of representation. According to ancient Roman law "no one can stipulate for another" (*Institutes of Justinian*, 3.19).[4]

The possibility to transfer rights to others, and in particular to confer powers on them, on the other hand, represents a critical aspect of modern legal systems. Let us now focus on the idea of conferring one's proclamative powers to other people.

For instance, assume that Tom wants his CD-player to be sold, but cannot do this personally since he is leaving for another country. To achieve this result indirectly he chooses to confer to Lisa his power of selling his CD-player. According to the principle above, he performs this power-conferral by performing the following proclamation:

$Procl_{Tom}$
FORANY (x)
ProclPow$_{\{Lisa,x\}}$ [Tom's CD-player is sold to x]

(Tom proclaims that, for any buyer x, Lisa has the proclamative power of bringing it about that Tom's CD-player is sold to x)

where x refers to any buyer Lisa may find for Tom's CD-player.

Consequently, when Lisa and Mary (the buyer) perform the following proclamation:

$Procl_{\{Lisa,Mary\}}$ [Tom's CD-player is sold to Mary]

[4] The Latin original: "Alteri stipulare [. . .] nemo potest."

it will happen that the CD-player is effectively sold (transferred) to Mary.

One's ability to confer one's powers to others may lead to chains of power-conferrals. This happens when x, confers to y both of the following powers:

1. the power of performing a certain proclamation
2. the power of transferring to others the same powers y has received from x.

For instance, assume that Tom transfers to Lisa both of the following proclamative powers:

1. the power to sell Tom's old CD-player, and
2. the power to transfer powers (1) and (2) to others (in case Lisa is unable to sell the CD-player).

Then, if Lisa is unable to sell the CD-player, she can transfer these powers to Martin, who will be in the following situation:

a. using power (1) Martin can sell the CD-player to another, and
b. using power (2), can transfer both powers (1) and (2) to another.

The chain of power transfers, enabled by power (2), can continue until one of the transferees finally sells the CD-player.

24.3.2. Representation

In the previous section, we have seen how one can to confer to another the power to perform a proclamation, rather than performing it directly. This leads us to the idea of *representation*. As is well known, representation basically concerns the situation "where a principal is held to declarations, especially contracts, made on his behalf" (Zweigert and Kötz 1992, 460–1).

This idea that was rejected by ancient legal systems, and in particular by Roman law. In such systems one could perform legal actions only in one's own name (or in the name of the group to which one belongs). On the contrary, modern legal systems allow to everybody the ability to give to others (their representatives), a power of action in their name.

It is usually said that the essential aspect of representation consists in the conferral of an *authority* (of a *proclamative power*): The representative's declarations directly bind the principal, since they count as if they were the principal's declarations (contrary to the fact that one person's declaration normally can only bind that person).

In most cases, one confers one's representation to another by accompanying it with a *mandate*, namely, the obligation, of exercising (in a certain way) the power of representation. So, the idea of mandate concerns the situation where the mandatee is obliged towards the the mandator to perform a certain act in a certain manner.

Usually a mandate presupposes that the mandator has a power to command over the mandatee (according, for instance, to an employment contract), or that a contract has been signed between them for the execution of a specific business: The command of the mandator or the contract between mandator and mandatee has established the mandatee's duty to act in a certain way, in order to achieve the goals of the mandator.

It is often remarked that in common-law systems representation and mandate tend to conflate into the idea of *agency* (intended as the situation when one is acting in the interest of another), whereas in the civil law tradition the distinction between representation and mandate has become commonplace since the XIX century, when German legal doctrine introduced it (Zweigert and Kötz 1992, 461ff.). The distinction, however, is perceived also by common lawyers, though it is not reflected in a precise terminology. As Salmond and Williams (1945) say:

> We are here concerned with agency not in its aspect as a relationship or contract between principal and agent imposing and conferring rights and obligations between the parties, but in its aspect as a grant by the principal to his agent of authority to represent him in the exercise of his power of making contracts with third persons.

In our framework, both the conferral to k of the power of representing j, and the mandate that k exercises this power in a certain ways, specified by j, can be viewed as resulting from proclamations. We do not need to specifically discuss the idea of a mandate, since this is a contract that establishes obligations for the mandatee and possibly for the mandator, according to the principle that one can undertake obligations concerning oneself. Let us focus on the notion of representation.

The first element of the notion of representation is the following: When k represents j, then k's power was conferred by j, with regard to a legal result that j could achieve by himself (and that k could not achieve without j's conferral).[5] For instance, given that Tom has the power of selling his CD-player to anybody, the following statement would represent a (attempted) conferral of representation to Lisa.

$Procl_{Tom}$
FORANY (x)
ProclPow$_{\{Lisa,x\}}$ [Tom's stereo is sold to x]

(Tom proclaims that, for any buyer x, Lisa ha the proclamative power, together with the buyer x, of bringing it about that Tom's CD-player is sold to x)

Such a conferral will in general be effective only when the person conferring

[5] For simplicity's sake we do not consider the cases where the power to performs legal acts having legal effects upon another's entitlements is conferred by the law (consider for instance the case where parents manage the assets of her underage children).

representation (Tom) was empowered to transfer his power to the representative (Lisa).

We may wonder whether this is really a satisfactory notion of representation. It seems that for k to represent j it is not sufficient that k achieves a legal result that j could achieve on his own. It is also required that k *acts in the name* of j, namely, that k's action is viewed as if it were j's action.

Thus, a more appropriate formalisation of the idea of representation can be obtained by viewing it as being the representative's power to bring it about that her actions count as the actions of the represented person. In general we may provide the following definition of representation:

Definition 24.3.1 *Representation. A person j* represents *a person k, with regard to action A, whenever j has the proclamative power of bringing it about that j's performance of A normatively determines k's performance of A, that is, whenever:*

ProclPow$_j$
IF $Does{*}_j A$ THEN^n $Does{*}_k A$
(j has the proclamative power of bringing it about that ⌈IF ⌈*j does A*⌉ *then normatively* ⌈*k does A*⌉⌉*)*

Thus a representative is a person that by proclaiming that she is acting in the name of the represented person would achieve the result of effectively acting in the name of the represented person (of realising an action of the represented person through her own action). With regard to the terminology we introduced in Section 21.1.1 on page 549, this notion of representation is an instance of *event-emergence*: The action of the represented person emerges upon the action of his representative. Using the *counts-as* terminology, we may also say j is k's representative with regard to action A whenever:

ProclPow$_j$
$Does_j A$ COUNTS-AS $Does_k A$
(j has the proclamative power of binging it about that j's doing A counts as k's doing A)

From the latter perspective, Lisa's power to sell Tom's stereo (to participate in the sale, in the name of Tom) can be represented as follows:

FORANY (x) ***ProclPow***$_{Lisa}$
$Procl_{\{Lisa,x\}}$ [Tom's CD-player is sold to x]
COUNTS-AS
$Procl_{\{Tom,x\}}$ [Tom's CD-player is sold to x]
(for any buyer x, Lisa has the proclamative power of bringing it about that ⌈her proclamation (together with x) that Tom's CD-player is sold to x⌉ counts as ⌈Tom's proclamation (together with x) that Tom's CD-player is sold to x⌉)

According to this way of understanding the notion of representation, that Lisa has the power of representing Tom means that she has the proclamative power

of realising the following: Her declaration that Tom's stereo is sold determines (counts as) Tom declaration that his stereo is sold. After having issued this proclamation (that is, after having declared that she is acting in the name of Tom), her subsequent proclamation that she is selling the stereo will determine Tom's proclamation, and thus succeed in transferring the stereo (which can be sold only by its owner).

Lisa in general will have the power of representing Tom only if he has given this power to her. More precisely, to create her power of representation, Tom must have issued the following proclamation:

$Procl_{Tom}$
FORANY (x)
ProclPow$_{Lisa}$
$Procl_{\{Lisa,x\}}$ [Tom's stereo is sold to x]
COUNTS-AS
$Procl_{\{Tom,x\}}$ [Tom's stereo is sold to x]

24.3.3. Limitations to Individual Legal Autonomy

In the previous pages we have considered the logic of individual legal autonomy, intended as the possibility that individuals shape their normative environment through their own proclamations.

In doing this, we have sketched the constitution of a liberal, or better a libertarian society, where every agent is able to look after his or her interests, and where any normative relation can be created via the consent of the interested parties. This society is characterised by the principle of *freedom of contract* or *contractual autonomy*: The individuals by themselves can establish what normative propositions shall be binding upon them (more generally, we can speak of *proclamative autonomy*, since this power also concerns unilateral proclamation).[6]

The recognition of contractual autonomy has the effect that the content of contracts is determined by the skill and bargaining powers of the parties involved, according to the information they have, their need to enter the contract, and the alternative opportunities that are available to them. Contractual autonomy often leads to arrangements with are acceptable also with regard to collective interests, especially in the framework provided by a competitive market economy. However there are many contexts where contractual autonomy needs to be restrained.

In all legal systems various limitations to individual legal autonomy are provided, for a number of reasons: preventing frauds, protecting the weaker party,

[6] The original meaning of the word *autonomy* (from the Greek words *auto* "self" and *nomos* "law") is indeed *self-regulation*.

preventing mistakes, avoiding exploitation, limiting monopolistic dominance. Unfortunately, there is not much that we can say in general with regard to the content of such limitations, without entering the details of specific areas of the law (labour law, consumer protection, anti-trust and so on), in particular legal systems.

Let us just observe such exceptions to the principle of contractual autonomy are often opportune and sometimes necessary. Thus, we do not side with Jeremy Bentham in assuming that the advantages of the unlimited recognition of contractual autonomy—even to such extremes as usury—would always surpass their social costs (Bentham 1787). We rather agree with von Jhering (1913, chap. 7, sec. 3) in considering that "an unlimited freedom in commerce is a patent of immunity for blackmailing," a "hunting permission for robbers and pirates, with a right of free capture over those who fall into their hands: woe to the vanquished."

However, we believe that contractual autonomy is a fundamental aspect of individual liberty and self-determination (and a prerequisite for the development of a market economy): Its limitations though opportune and necessary should be viewed as exceptions to a generally valuable principle (we shall discuss how to represent exceptions and how to reason with them in Chapter 26).

24.4. Public Powers as Proclamative Powers

In the previous examples, we have applied our model of proclamations and proclamative powers to private autonomy, and in particular to contracts. However, our analysis is also applicable to various statements of public agencies, from judicial decisions, to administrative acts, to legislative acts.

All such statements appear to have the function of intentionally creating normative positions and connections: They state certain normative propositions, and in order to realise them. Thus, also many public powers can be viewed are instances of the general concept of a proclamation.

Let us consider, for example, the principle that is stated in the *Institutes of Justinian*, 1.2, which is usually considered to express the idea of absolutism:

> That which seems good to the emperor has [...] the force of law.[7]

We may express the absolutist principle as follows: The Emperor has the power to make legally binding (and thus to realise) any normative content, by proclaiming it.

$\text{FORANY } (\varphi) \; \boldsymbol{ProclPow}_{Emperor}[\varphi]$
(for any propositions φ, the Emperor has the proclamative power of realising φ)

[7] "[Q]uod principi placuit legis habet vigorem."

Assume, for instance, the following: (1) Publius, a judge in ancient Rome, believes that the emperor has an absolute proclamative power (as expressed by the principle we just mentioned), and (2) Publius knows that the Emperor has proclaimed a particular rule, for instance, the rule that ⌈masters killing their slaves are to be punished for homicide⌉.[8] According to these premises, Judge Publius would conclude that masters behaving in this way ought indeed to be punished for homicide:

(1) FORANY (φ) $\textbf{\textit{ProclPow}}_{Emperor}[\varphi]$;
(2) $Procl_{Emperor}$[masters killing their slave are to be punished for homicide]

---

(3) masters killing their slaves are to be punished for homicide

24.4.1. Proclamations and the Dynamics of the Law

Our idea of a proclamation rule, and the logic of its application, enable us to understand the dynamic functioning of legal institutions, as conceptualised in Hans Kelsen's theory of the dynamics of law.[9]

Assume that I endorse the following propositions, according to which the Constitutional Assembly has the proclamative power or realising whatever normative content (or making any content binding by proclaiming it).

1. FORANY (φ)
   IF $Procl_{Assembly}[\varphi]$
   THEN *Binding* $[\varphi]$

(for any normative proposition φ, if the Assembly proclaims φ then φ is binding)

which, as we know, can also be expressed as

2. FORANY (φ) $\textbf{\textit{ProclPow}}_{Assembly}[\varphi]$

(for any normative proposition φ, the Assembly has the proclamative power of realising φ)

Assume that, besides believing (1), I know that the Constitutional Assembly has proclaimed that the Parliament has the proclamative power of realising any normative content, that is, I know that the Constitutional Assembly has performed the following proclamation:

$Procl_{Assembly}$
FORANY (ψ) $\textbf{\textit{ProclPow}}_{Parliament}[\psi]$

[8] This rule was indeed issued by emperor Antoninus, derogating the previous Roman law (which allowed masters to do whatever they wished with their slaves).

[9] See, in particular, the fourth chapter of Kelsen 1967, which is dedicated to the "dynamic aspect of law," or more literally, to the dynamics of law (*Rechtsdynamik*).

This allows me to perform the following inference (by applying first schema *specification* and then schema *power application*) and conclude for the existence of a general parliamentary power (a parliamentary power of efficaciously proclaiming any proposition φ).

(1) FORANY (φ) $\textbf{\textit{ProclPow}}_{Assembly}[\varphi]$;
(2) $Procl_{Assembly}$
FORANY (ψ) $\textbf{\textit{ProclPow}}_{Parliament}[\psi]$

---

(3) FORANY (ψ) $\textbf{\textit{ProclPow}}_{Parliament}[\psi]$

Similarly, assume that I know that the Parliament has proclaimed that, in every city, the city council (abbreviated as *Council*) has the power of regulating the traffic: for any city x, when any normative proposition φ concerns traffic in x, then $x's\ Council$ has the proclamative power of realising φ. This would allow me to conclude that city councils, have indeed such power:

(1) FORANY (ψ) $\textbf{\textit{ProclPow}}_{Parliament}[\psi]$;
(2) $Procl_{Parliament}$
FORANY (φ, x)
IF [φ concerns traffic in city x]
THEN^n $\textbf{\textit{ProclPow}}_{x's\ Council}[\varphi]$

---

(3) FORANY (φ, x)
IF [φ concerns traffic in city x]
THEN^n $\textbf{\textit{ProclPow}}_{x's\ Council}[\varphi]$

Finally, assume that I believe that the proposition ⌈any driver entering Bologna is obliged to pay € 10⌉ concerns traffic, and that the City Council of Bologna has proclaimed this proposition. This allows me to conclude that ⌈any driver entering Bologna is obliged to pay € 10⌉ (see Table 24.2 on the next page).

In conclusion, a reasoner which (1) endorses the proposition the Constitutional Assembly has the proclamative power of realising whatever normative proposition, and (2) believes that various proclamations have taken place (by the assembly, the Parliament, the municipality), will conclude (3) endorsing a substantive normative proposition (⌈any driver entering Bologna is obliged to pay € 10⌉). The whole of this Kelsenian inference-chain is represented in Table 24.2 on the following page.

Through a further syllogism step, and adding the specific belief that ⌈Mary is a driver entering Bologna⌉, the reasoner can conclude that Mary has to pay € 10.

1. $\text{FORANY}\ (\varphi)\ \textbf{\textit{ProclPow}}_{Assembly}\varphi$ ⟨normative premise⟩
2. $Procl_{Assembly}(\text{FORANY}\ (\varphi)\ \textbf{\textit{ProclPow}}_{Parliament}\varphi)$ ⟨factual premise⟩
3. $\text{FORANY}\ (\varphi)\ \textbf{\textit{ProclPow}}_{Parliament}\varphi$
   ⟨from 1 and 2, by *general-power application*⟩
4. $Procl_{Parliament}$
   $\text{FORANY}\ (\varphi, x)$
   IF [φ concerns traffic in x]
   $\text{THEN}^n\ \textbf{\textit{ProclPow}}_{x's\ Council}\varphi$ ⟨factual premise⟩
5. $\text{FORANY}\ (\varphi, x)$
   IF [φ concerns traffic in x]
   $\text{THEN}^n\ \textbf{\textit{ProclPow}}_{x's\ Council}\varphi$ ⟨from 3 and 4 by *general-power application*⟩
6. [any driver entering Bologna is obliged to pay € 10]
   concerns traffic in *Bologna* ⟨factual premise⟩
7. $\textbf{\textit{ProclPow}}_{Bologna's\ Council}$
   [any driver entering Bologna is obliged to pay € 10]
   ⟨from 5 and 6, by *Syllogism*⟩
8. $Procl_{Bologna's\ Council}$ [any driver entering Bologna is obliged to pay € 10]
   ⟨factual premise⟩
9. [any driver entering Bologna is obliged to pay € 10]
   ⟨from 7 and 8 by *general-power application*⟩

Table 24.2: *Kelsenian inference*

Note that the only normative assumption is here given by premise 1 (the *Grundnorm*, as Kelsen would say). All other lines of the Table 24.2 are either facts or conclusions derived from previous lines of the inference.

24.4.2. Legal Dynamics and the Applicability of Logic to the Law

Our discussion of the Kelsenian inference in Section 24.4.1 on page 628 seems incompatible with the view that logic is not applicable to the law, a view which was defended by Hans Kelsen in his last contributions.[10]

The idea that logic is not applicable to the law is linked to another famous Kelsenian distinction, which also appears in previous contributions by Kelsen, namely, the distinction between *static normative systems* and *dynamic normative systems*:[11]

According to the nature of the reason for the validity two types of norm systems may be distinguished: static and dynamic ones. The norms of the order of the first type are valid on the strength of their content: because their validity can be traced back to a norm under whose content the

[10] This view is extensively discussed in Kelsen 1979, published posthumously.

[11] This distinction has generated a considerable debate in legal philosophy. For a collection of recent contributions, see Gianformaggio 1991.

content of the norms in question can be subsumed as the particular under the general. Thus, for example, the validity of the norms "do not lie," "do not give false testimony," "do fulfil a promise" can be derived from a norm that prescribes to be truthful [. . .] by way of a logical operation, namely a conclusion from the general to the particular.

The dynamic type is characterised by this: the presupposed basic norm contains nothing but the determination of a norm-creating fact, the authorisation of a norm-creating authority, or (which amounts to the same) a rule that stipulates how the general and individual norms of the order based on the basic norms ought to be created. For example a father orders his child to school. The child answers: Why? The reply may be: Because the father ordered and the child ought to obey the father. If the child continues to ask: Why ought I to obey the father, the answer may be: Because God has commanded "Obey Your Parents" and one ought to obey the commands of God. [. . .] [T]he basic norm is limited to authorize a norm-creating authority, it is a rule according to which the norms of this system ought to be created. The validity of the norm that constituted the starting point of the question is not derived from its content; it cannot be deduced from the basic norm via a logical operation. (Kelsen 1967, sec. 34.b, 196–7)

Kelsen's extract seems to imply that logic can only be used to derive normative propositions (norms, as Kelsen calls them) in static normative systems, through a deduction which produces new normative propositions on the basis of other normative propositions. It seems that, according to Kelsen, logic is useless in dynamic systems, where new rules need to be stated by a norm-giver (though in accordance with the authorisation of a higher norm).

We agree with Kelsen that certain normative systems, the ones he calls *dynamic*, recognise certain facts—and in particular, certain proclamations—as sources of new binding normative proposition. This is undoubtedly an important feature of such normative systems (among which legal systems are to be included), a feature which distinguishes them from those other systems, the ones he calls *static*, that happen not authorise such ways of creating new binding rules. However, we do not believe that this distinction entails the implications that Kelsen derives from it. On the contrary, both kinds of systems require logical inference, and both need to take into account factual information.

First of all, logic is also required with regard to dynamic normative systems. The type of reasoning which, according to Kelsen characterises dynamic normative systems results from the adoption of what we called proclamation rules. Such rules enable legal reasoners to perform what we called *meta-syllogism*, in particular, according to schema *general-power application*. They enable the derivation of new normative propositions on the basis of two premises:

1. somebody proclaims these propositions,
2. the proclaimer has the proclamative power of realising this kind of propositions.

Therefore, Kelsen's idea that logical reasoning is inapplicable to dynamic normative systems seems to be self-defeating. Logical inference is indeed required for establishing what rules are binding in (belong to) such systems: Logical inference enables us to endorse proclaimed proposition (to view it as belonging

to a dynamic system) on the basis of premises (1) and (2) above (this idea is extensively discussed in Weinberger 1981).

Secondly, also with regard to what Kelsen calls static normative systems, normative propositions are not the only input to normative reasoning. To conclude that Tom is forbidden to tell Mary that he passed the exam, it is not sufficient that I adopt the rule that everyone is forbidden to tell falsities. I must also know that Tom has not passed the exam (that it is false that he passed the exam). Moreover, also a static normative system is not really static: it can change as society changes and new technologies become available, so that the values which characterise such a system have to be pursued in different ways. For instance, it can be argued that hunting certain animal species nowadays (like for instance whales)—when alternative sources of food are available and these species are on the verge of extinction—is morally wrong (forbidden), while doing the same thing two hundred a years ago was irreproachable. Similarly, it may be argued that now, when sufficient resources are available, it is morally obligatory that a community intervenes to remove certain severe deprivations (providing, for instance, health care and education), which the same community would be permitted to tolerate two hundred years ago.

Finally, contrary Kelsen' view, legal system are both dynamic and static: They enable logical syllogisms and other logical inferences not only with regard to proclamation rules and acts of proclamation (this provides their dynamic aspect), but also with regard to substantive rules and their preconditions (this is their static aspect). In fact, once we admit the application of inference schemata such as specification and detachment with regard to proclamation rules (these inference steps are included in *general-power application*), it would be odd to reject these very inference schemata with regard to other kinds of normative propositions (such as the proposition that ⌈anyone driving into Bologna ought to pay € 10⌉). For instance, it will be odd to be ready to perform all inferences in Table 24.2 on page 630, while rejecting the following one:

(1) FORANY (x)
    IF [x is driver entering Bologna]
    THEN^n [x is obliged to pay € 10];
(2) [$Mary$ is a driver entering Bologna]

---

(3) [$Mary$ is obliged to pay € 10]

As we shall see, normative syllogism only leads to defeasible conclusions, but this holds both when the major premise is a proclamation rule and when it is a substantive legal rule.

In conclusion, Kelsen's analysis of static and dynamic normative system is deeply misleading since it conceptualises the distinction between two compat-

ible ways of establishing that a normative proposition is binding, as being the distinction between two mutually-exclusive kinds of normative system.

Let us use the locution *source-based derivation* to refer to the kind of inference which Kelsen associates to dynamic normative systems. A *source-based derivation* consists in concluding that a certain normative proposition is legally binding since it was expressed by (it was embedded in) a certain social fact, the source-fact. A source-fact, as we shall see when analysing the sources of the law in general terms (see Section 25.2.4 on page 657) can consist not only in an authoritative proclamation, but also in a different kind of fact, like the adoption of a certain *ratio decidendi* by a court, or the existence of a customary practice. However, the paradigmatic reasoning in source-based derivation results from the adoption of what we called proclamation rules and in their syllogistic application (according to schema *meta-syllogism*).

We can instead speak of *non-source-based derivation* to refer to the reasoning Kelsen associates to dynamic normative systems. A non-source-based derivation leads us to conclude that a normative propositions is binding on the basis of our previous endorsement of other normative propositions and our belief that certain facts exists (though these facts do qualify as sources of the law). As examples of non-source-based derivations, we can consider the specification of a general rule (schema *normative specification*), the detachment of the conclusion of a normative conditional (schema *normative detachment*), or the endorsement of a normative proposition according to teleological reasoning (schema *teleological bindingness*). Also in non-source-based derivations there may be factual components: the fact that the conditional's antecedent is satisfied, with regard to *normative detachment*; the fact that the endorsement of a certain normative proposition would advance certain legal values, with regard to *teleological bindingness* (an additional factual element may be represented by the chance that one's endorsement would contribute to general endorsement).

These two ways of deriving legal conclusion—source-based derivation and non-source-based derivation—can and do indeed coexist in many normative systems, and in particular they coexist in all legal systems. Moreover, both ways can be qualified as logical procedures, and in particular, both of them consist in defeasible inferences.

24.4.3. Judicial Powers and Logic in the Law

One further objection against the use of logic in the law is connected to the idea that only judges have the power of deciding individual cases. This power is confined to the specific issues that are submitted to the judges, but is not conditioned to the substantial correctness of their decision: Whatever specific normative conclusions judges reach in a case, these conclusions are binding for the parties of that case. Judges have the duty of deciding cases according to the law, but the mere fact that they proclaim a certain decision of a case, within

certain formal and procedural constraints, makes the content of that decision binding (at least when no further appeal is available, or when the legal system establishes that the decision can be enforced, though appeals are still pending).

We agree with this analysis of judicial powers, but we deny that it entails that logic cannot be applied to the law.

From our perspective, the fact that a proposition is the content of a judicial decision is a (defeasibly) *sufficient* but *not a necessary* condition the proposition to be legally binding. This is expressed by the following proclamation rule, which states that judges have the power of taking whatever decision in a case submitted to them (within the boundaries of their competence):

FORANY (x, φ)
IF [x is a judge] AND
[φ is the decision of a case submitted to x]
THEN^n ***ProclPow***$_j[\varphi]$

We need to endorse a rule of this kind, if judicial decisions are to play the function of definitively solving legal disputes. If the bindingness of a judicial decision were conditioned to its substantive correctness, then any dispute concerning a substantive legal conclusion would automatically transform into a dispute concerning the bindingness of the corresponding judicial decision.

However, we deny that a judicial decision is necessary for a specific normative proposition to be binding, in the sense in which we are her using the notion of bindingness, namely, in the sense of "adoptable in legal reasoning." The contents of judicial decisions are legally binding (according to the rule above), but so are also the conclusions one can infer from legally binding rules.

Therefore, there are two main ways by which one can come to endorse a specific normative proposition:

1. through applying normative meta-syllogism to the proclamation-rule empowering judges, and the factual proposition that a judge proclaimed a certain proposition;
2. through applying normative syllogism to a general substantive rules and specific factual propositions which satisfy the rule's antecedent.

This double way of coming to legal conclusions leads to a contradiction whenever the judge's decision of a case is different from what would be the conclusions following from the substantive rules one endorses and the facts one knows to be true.

Such conflicts are to be solved by giving priority to the decision of the judge (when all remedies against such decision have been tried in vain), even when the judge's decision is wrong, that is, when a different normative proposition could be correctly derived before the judge adopted its decision. However, this does not prove that it is wrong to derive legal conclusions from substantive rules: It

only proves that such conclusions may be overridden by judicial decisions to the contrary.

Consider, for example, the following story. Lisa buys a new expensive high-definition monitor from Martin's computer-shop. While she is bringing the monitor to her house, she inadvertently drops it on the floor. She then brings the monitor back to the shop and tells Martin that the screen is not working owing to a fault, and asks to have her money back. Martin refuses and the case goes to court. The judge believes Lisa's story and orders Martin to give the money back to Lisa.

Given these circumstances, we can say that Martin, before the decision of the judge, had no obligation to give the money back to Lisa: He had correctly performed his obligation, by delivering a faultless product, and the law permitted him to keep Lisa's money. Thus, his conclusions were correct with regard to both the facts of his case and the binding normative propositions applicable to these facts.

Unfortunately, this is no longer the case after the judge's decision: Martin is now under the obligation to give the money back, on the basis of the wrong decision of the judge, which provides a new binding normative proposition.

Thus, the definitiveness of this judicial decisions does not entail that Martin was wrong in deriving a substantive legal conclusion through his own reasoning, and in viewing this conclusion as legally binding: It only shows that judicial decisions may override the outcome of substantive syllogisms, even when such syllogisms are correct.

Chapter 25

NORMATIVE TEXTS AND SOURCES OF LAW

In this chapter we shall provide some applications and extensions of the notion of a *proclamative power*. We shall first consider that a proclamative power—besides being the ability to realise (determine) certain results—also consists in the ability to make certain normative texts become binding. This will lead us to address briefly the notion of *legal interpretation*. Then we shall try to develop a broad notion of *sources of law*, which goes beyond the exercise of a proclamative power.

25.1. Proclamations and Their Interpretation

We shall focus on the process through which proclamations produce normative results. This will allow us to distinguish in particular, the production of textually binding sentences, and the production of binding propositions.

25.1.1. The Efficacy of Proclamations

In the previous pages the process through which a proclamation produces its effect has been viewed as consisting in a three-step sequence:

1. the *proclamation of a proposition*, which determines
2. (belief in) the *bindingness of the proclaimed proposition*, which determines
3. (belief in) the *realisation of the normative content* expressed by that proposition.

For instance, when Tom gives his girlfriend Lisa a bracelet, saying "I donate this bracelet to you," or more simply, "this is yours," the following happens:

1. Tom proclaims the proposition that ⌈the bracelet now belongs to Lisa⌉, which determines
2. the bindingness of this proposition, which determines
3. the normative state of affairs consisting in the fact that the bracelet now belongs to Lisa.[1]

This three-step process corresponds to the inference in Table 25.1 on the next page.

[1] This three-step process is compressed into a two step process according to the reasoning

(1) ***ProclPow***$_{Tom}$[the bracelet now belongs to Lisa];
(2) *Procl*$_{Tom}$[the bracelet now belongs to Lisa]

---

(3) *Binding* ⌈the bracelet now belongs to Lisa⌉

---

(4) the bracelet now belongs to Lisa

Table 25.1: *From proclamations to legal effects: the three-steps process*

According to the detailed inference we have just represented, all effective proclamations determine both of the following outcomes:

a. a direct outcome, the bindingness of a normative proposition, and
b. an indirect outcome, the existence of a normative state of affairs (this being, as we saw in Section 3.2 on page 99 the "ontological" counterpart of the normative proposition).

25.1.2. The Double Effect of Proclamations

When looking at different types of proclamations we tend to emphasise sometimes outcome (*a*) and sometimes outcome (*b*).

Outcome (*a*) is normally emphasised when a public authority proclaims a general conditional proposition. Consider for instance the case when the mayor of a city issues the traffic order: "Whenever one enters the city with a car, one is obliged to pay a fee of € 10." We tend to view this order as directly producing the legal bindingness of the proposition (the rule) that ⌈Whenever one enters the city with a car, one is obliged to pay a fee of € 10⌉. The fact that people are now obliged to pay a fee for entering the city is viewed as resulting from the bindingness of this proposition (from the "existence" of this rule).

Outcome (*b*) is normally emphasised when an individual proclaims a specific unconditioned proposition. Consider for instance, the utterance of the following sentences: "I renounce my credit," "I sell you my old camera for € 50," "I donate you this ring." In all these cases, we focus on the change on the resulting normative situation (the fact that I lose my credit, transfer the camera for the money, transfer the ring without a consideration) and view this situation as a direct outcome of the proclamation, forgetting about the bindingness of the proposition representing this situation.

There are cases where one is uncertain about what outcomes to emphasise.

schema *power-application*, where, as we have seen, the belief that a power has been exercised by proclaiming a proposition, directly leads to endorsing that proposition.

This happens in particular when a contract proclaims content-general normative propositions concerning particular individuals.

Assume, for example, that a contract between j and k contains the following clause: "j will deliver 20 litres of milk to k's café every morning, and k will pay j € 200 every month."

When we focus on outcome (*a*), namely binding normative propositions, we view this contract as providing for the bindingness of the following two rules:

1. whenever morning comes, j is obliged to deliver litres 20 of milk to k's café;
2. whenever the end of month comes, k is obliged to pay € 200.

When we focus on aspect (*b*), namely normative states of affairs, we view the same contract as realising a causal-like determinative connection between the coming of morning and j's obligation to deliver the milk, and between the coming of the end of the month and k's obligation to pay the price.

When a contract proclaims propositions that are both content-general and personally-general, we tend to focus more on aspect (*a*).

Consider for instance the following contractual clause between a union and an employer: "Any member of the union is entitled to an additional payment of € 10 per hour, when working after hours." This clause is likely to be viewed as directly producing the bindingness the corresponding normative proposition:

FORANY (x, n)
WHEN [x is a member of the union]
THEN^n IF [x has worked n extra hours]
THEN^n [x's pay is increased by € 10 per n]

rather than a causal-like connection between the fact of being a member of the union that has worked extra hours and the pay increase.

We are uncertain whether to focus on binding propositions or on normative states of affairs, with regard to statements issued by legislative bodies, but only concerning particular individuals. Assume, for instance, that the Parliament proclaims that ⌈Company c in entitled to a subsidy of € 100,000⌉. In this case, do we emphasis the bindingness of the parliamentary proposition, or the fact that the company is now entitled to the subsidy?

The distinction between focusing on the (belief in the) bindingness of a proposition, rather than on the (belief in the) realisation of its normative content, has lead some doctrinal writers to distinguish two kinds of proclamations:

1. proclamations that are sources of the law (which produce binding normative propositions), and
2. proclamations that directly produce substantive normative results.

In particular, only proclamations of the first type are said to have a normative character, to produce norms (on this aspect, see Rotolo, Volume 3 of this Treatise, sec. 7.3.1).

Unfortunately, it is not clear how this distinction can be drawn: Sometimes it is based on the content of the stated proposition (a proclamation is normative only if it states personally-general rules), sometimes on the identity of the author of the proclamation (a proclamation is normative only if it is adopted by a public authority).

It seems to us that the failure to find a satisfactory test for distinguishing between normative and non-normative proclamations proves that this distinction is basically ill-conceived. All effective proclamations produce binding normative propositions (they all are normative, in the sense of determining the bindingness of normative propositions) and all of them produce the corresponding states of affairs (in the sense indicated in Section 3.2 on page 99). It is true that we tend to focus on one aspect or on the other, according to the way in which a proclamation is performed and according to its content, but this seems to be a psychological tendency which does not have an analytical significance.

It is true that some legal systems label certain kinds of proclamation as *sources of law*, and treat them in a particular way on the basis of this qualification (for example, allowing or disallowing certain kinds of judicial reviews). Such distinctions however, seem to be significant only within the legal system that has introduced this classification, and only for the specific purposes for which the classification has been introduced. The fact that the label *source of law* is used in legislation or in doctrinal writings in this way does not license, we believe, drawing significant theoretical distinction between the so-labelled proclamations and other proclamations.

25.1.3. Proclaimed Sentences

Our analysis of proclamations has so far omitted to consider a very important issue: How shall we establish what propositions are expressed by a certain proclamation?

In a telepathic society, where each agent had access to the minds of all others, the problem would be easily solved by looking into the proclaimer's mind and accessing the proposition the proclaimer intended to express (or what meaning he intends now that his past proclamation expresses). In case of collective proclamations, all proclaimers would unify their minds into having a shared intention, and this shared intentions will accessible to all those who are interested in understanding it.

Unfortunately,[2] this only happens in science fiction (see, for instance, Asimov 1968). In our world, we only have direct access to observable behaviour, and we can read other people's minds only in the sense that we make hypotheses concerning the mental states of other people on the basis of the behavioural elements to which we have access. This does not imply behaviourism—so long

[2] Or fortunately, since shared access to everybody's minds would mean the end of individuality.

as the behaviour of others is seen as providing clues for building models of their minds—but requires us to focus on observable behaviour.

Among the various ways in which a proclamation may be expressed, linguistic behaviour usually plays a dominant role: The problem of attributing an intentional meaning to a proclamation tends to be transformed into the problem of establishing the correct interpretation of the statement through which the proclamation has been expressed.

Consequently, it seems that a proclamation does not directly produce the bindingness of the proclaimed proposition. Rather, its direct effect consists in making so that the proclaimed words become what we call a *textually binding statement*, which we can define in a way which is derivative upon the idea of a binding proposition.

Definition 25.1.1 *Textual bindingness. We say that a statement is* textually binding *when it determines the bindingness of the propositions it expresses.*

From this perspective, Tom's proclamation that the bracelet belongs to his girlfriend Lisa still results in her ownership of the bracelet, but this would be the outcome of a four-step process:

1. Tom's *proclamation of the statement* "this bracelet is yours," which determines
2. the *textual bindingness of this statement*, which determines
3. the *bindingness of the proposition* which is expressed by that statement, i.e., the proposition that ⌈the bracelet now belongs to Lisa⌉, which determines
4. the *realisation of the state of affairs* which is expressed by that proposition (the fact that now the bracelet belongs to her).

In front of this proliferation of entities (proclamations, textually binding statements, binding propositions, normative states of affairs) one may wonder whether Occam's razor—the parsimonious prescription that entities are not to be multiplied beyond necessity—might be a useful device. However, it seems to us that all such entities are needed, since each one of them plays a distinctive cognitive role in legal reasoning. Thus we shall adopt the corresponding ontology, according to the so-called *anti-razor*: Entities are to be multiplied according to necessity.

25.1.4. The Bindingness of Proclaimed Sentences

Let us try to analyse more carefully the logical passages that are involved in the inference we sketched in the last section.

The first passage consists in moving from the fact that a token-sentence was proclaimed (by a certain person, in a certain context, after certain other events,

though certain procedures) to the conclusion this token-sentence is textually binding. This passage presupposes a proclamation rule (see Section 23.2.4 on page 596) to the effect that a proclamation of that type determines the textual bindingness of what it states.

This leads to a second view of proclamation rules, that is, as rules establishing the textual bindingness of proclaimed sentences, under certain conditions: Such rules state that if a certain proclamation is performed (under the appropriate conditions), then the proclaimed sentences will be textually binding. We can represent the structure of textually-oriented proclamation-rules as follows:

FORANY (ψ)
  WHEN $[Conditions$ for $TextuallyProcl_j[\psi]$ are satisfied$]$
  THEN^n IF $TextuallyProcl_j[\psi]$
    THEN^n $\mathit{BindingText}[\psi]$

(for any sentence ψ, when the appropriate requirements $Conditions$ are satisfied, if j textually proclaims that ψ, then ψ becomes textually binding)

where $TextuallyProcl_j[\psi]$ is the action through which j proclaims sentence ψ and $\mathit{BindingText}[\psi]$ means that ψ is textually binding.

This kind of rules enables us, given appropriate preconditions, to conclude that a statement is textually binding though schema *syllogism*. More exactly, we can conclude that a sentence is textually binding on the basis of the following assumptions:

1. the endorsement of a rule stating that under certain conditions the proclamation of a sentence determines its textual bindingness,
2. the belief that those conditions are satisfied, and
3. the belief the proclamation was performed.

This transition is expressed by schema *textual bindingness*:

Reasoning schema: *Textual bindingness*

(1) FORANY (ψ, x)
  WHEN $[Conditions$ for $TextuallyProcl_j[\psi]$ are satisfied$]$;
  THEN^n IF $TextuallyProcl_x[\psi]$
    THEN^n $\mathit{BindingText}\ [\psi]$;
(2) $Conditions$ for $TextuallyProcl_j[\psi]$ are satisfied;
(3) $TextuallyProcl_j[\psi]$
——— IS A REASON FOR
(4) $\mathit{BindingText}[\psi]$

For example, the inference leading one to conclude that for the textual bindingness of a particular clauses in a statute issued by the Parliament, presupposes

(1) FORANY (ψ)
IF $TextuallyProcl_{Parliament}[\psi]$
THEN^n *BindingText*$[\psi]$)
(2) $TextuallyProcl_{Parliament}$ [Art. 171 bis. Whoever abusively duplicates a computer program to obtain a gain from it [...] is punished with detention from six months up to three years]

---

(3) *BindingText* [Whoever abusively duplicates a computer program to obtain a gain from it [...] is punished with detention from six months up to three years]

Table 25.2: *The derivation of textual bindingness: a statutory rule*

one's adoption of the rule that the Parliament makes any statement, this statement is binding (we omit for simplicity to specify the preconditions for this to hold, which include the requirements concerning the legislative procedure):

FORANY (ψ)
IF $TextuallyProcl_{Parliament}[\psi]$
THEN^n *BindingText*$[\psi]$)

Let us consider for example, the rule issued in 1992 (Legislative decree n. 518/1992) by the Italian Parliament, which introduced in the Italian copyright law the following text:

Art. 171 bis, Section 1. Whoever abusively duplicates a computer program to obtain a gain from it [...] is punished with detention in the range from six months up to three years [...]

Knowledge that this statement has been proclaimed leads the legal reasoner to perform the inference in Table 25.2, and conclude that Art. 171 bis is textually binding.

Let us consider a constitutional rule, Art. 3 of the Italian Constitution:

Art. 3, Section 1. All citizens possess an equal social status and are equal before the law, without distinction as to sex, race, language, religion, political opinions, and personal or social conditions.

We assume to adopt a general rule to the effect that the proclamations of the Italian Constitutional Assembly are textually binding. Since the Assembly has adopted Art. 3, this article is textually binding, according to the inference in Table 25.3 on the following page.

This same analysis also applies to contracts and international treaties, both of which fall under our notion of a proclamation. Let us consider, for instance, Art. 2, Section 3 of the UN Convention:

(1) FORANY (ψ)
IF $TextuallyProcl_{Assembly}[\psi]$
THEN^n *BindingText*$[\psi]$;
(2) $TextuallyProcl_{Assembly}$ [Art. 3. All citizens possess an equal social status and are equal before the law, without distinction as to sex, race, language, religion, political opinions, and personal or social conditions]

---

(3) *BindingText* [Art. 3. All citizens possess an equal social status and are equal before the law, without distinction as to sex, race, language, religion, political opinions, and personal or social conditions]

Table 25.3: *The derivation of textual bindingness: a constitutional rule*

(1) FORANY (ψ)
IF $TextuallyProcl_S[\psi]$
THEN^n *BindingText*$[\psi]$
(2) $TextuallyProcl_{UN\ members}$ [Art. 2, Section 3. All Members shall settle their international disputes by peaceful means in such manner that international peace, security, and justice are not endangered]

---

(3) *BindingText* [Art. 2. Section 3. All Members shall settle their international disputes by peaceful means in such manner that international peace and security, and justice are not endangered]

Table 25.4: *The derivation of textual bindingness: an international rule*

Art. 2, Section 3. All Members shall settle their international disputes by peaceful means in such manner that international peace, security, and justice are not endangered.

Let us assume the principle that international agreements are to be observed (*pacta sunt servanda*), which we express by saying that if a set of agents S (here meant as States) makes a joint proclamation, then the proclaimed sentence is binding for them. This principle, in combination with the fact that a particular proclamation was performed—namely, the proclamation of Art. 2, Section 3 of the UN Convention—leads us to conclude that Art. 2. Section 3 is textually binding, as shown by the inference in Table 25.4.

The common core of these examples can be expressed through the general idea of textual proclamative power (***TextualProclPow***), by which we mean the

power of issuing binding normative sentences. This is the proclamative power of obtaining the textual bindingness of the sentences one is proclaiming, according to the following definition.

Definition 25.1.2 *Textual proclamative power. j has the* textual proclamative power *of issuing sentence ψ iff j's proclamation of sentence ψ determines ψ's bindingness:*

$$\textbf{\textit{TextualProclPow}}_j[\psi] \equiv$$
$$\text{IF } \textit{TextuallyProcl}_j[\psi] \text{ THEN}^n \; \textsf{\textit{BindingText}}[\psi]$$

(⌈j has the textual proclamative power *of issuing sentence ψ⌉ is equivalent by definition to ⌈if j textually proclaims ψ then ψ is textually binding⌉)*

A textual proclamative power can be conditioned to various circumstances concerning the content of the proclaimed text, the quality of the author of the proclamation and of its addressees, and so forth. For example, we can express as follows the rule that every head of a university has the textual proclamative power of issuing regulations concerning the functioning of his or her University:

$$\begin{aligned}&\text{FORANY } (x, y, \psi)\\&\quad \text{IF } [x \textsf{ is the head of university } y] \text{ AND}\\&\quad\quad [\psi \textsf{ concerns the functioning of } y]\\&\quad \text{THEN}^n \; \textbf{\textit{TextualProclPow}}_x[\psi]\end{aligned}$$

(for any person x, any university y, and any sentence ψ, if x is the head of the university y and ψ concerns the functioning of that university, then x has the textual declarative power of issuing sentence ψ)

A more general power of this kind pertains to other normative bodies, like a national Parliament, a power concerning any possible content (for simplicity's sake, we do not consider constitutional limitations to the competence of the Parliament):

$$\text{FORANY } (\psi) \; \textbf{\textit{TextualProclPow}}_{Parliament}[\psi]$$

The determination of the textual sentences to be taken into account may sometimes require a further step, which we cannot consider here: taking into account the changes a textual unit has undergone. As a matter of fact, the name of a textual unit, like Section x of Statute y does not identify a fixed textual content, but it rather identifies, with regard to a given time, the result of all textual modifications which have been performed up to that time upon the original textual content of Section x. Moreover, one also needs to consider rules establishing that a certain textual unit is or is not to applied within a certain time-frame.[3]

[3] On textual modifications and on the determination of the time-frame for the application of legislative sentences or propositions, see Sartor 1996.

25.1.5. The Interpretation of Proclamations

Let us now consider the next inference step: The belief that a statement is textually binding leads us to the belief that a particular proposition expressed by that statement is binding. Let us first introduce the following definition.

Definition 25.1.3 *Interpretation and interpretant. By the* interpretation *of a sentence ψ we mean the set of propositions which ψ (conjunctively) expresses, and by an* interpretant[4] *of ψ we mean any such proposition.*

The rule below (which follows from the very definition of what it means for a text to be binding) says that whenever a statement is textually binding, and a certain proposition is a *binding interpretant* of that statement, then that proposition is binding:

FORANY (ψ, φ)
IF *BindingText*$[\psi]$ AND
$[\varphi$ is a *binding interpretant* of $\psi]$
THEN *Binding* $[\varphi]$

Note that by requiring that a proposition is a *binding interpretant* (rather than an *interpretant tout court*), we clarify that we are not concerned with linguistically possible meanings, but with *binding meanings*, namely, those meanings that would be ascribed to the statement (taking into account its function) by optimal practical cognition. According to the notion of cognitive bindingness we developed in Section 3.1.5 on page 93, proposition $\lceil B \rceil$ is a *binding interpretant* of a sentence A, if it is cognitively binding that $\lceil B \rceil$ is an interpretant of A, i.e., if optimal cognition would lead to accept proposition $\lceil B \rceil$ as a component of A's meaning.

Note that also in this regard, we must consider that practical cognition is situated in a particular context. Its *situatedness* does not consist in the contingency of its inferential procedures (which, we believe, correspond to the universal idea of rationality), but in the fact that its inputs are not restricted to the particular circumstances of the case: They also include customs, conventions, attitudes, decisions which characterise the particular community within which, and for the purposes of which, practical cognition is exercised.

Thus the universality of practical reason is consistent with the fact that, for instance, different results may be obtained, in the interpretation of the same contract in the English system, which construes the parties' intentions by focusing primarily on the text of the contract, and in continental systems, which

[4] We take the liberty of using the Peircian expression *interpretant* to refer to propositions, though Peirce uses it to refer more generally to the "proper significate outcome of a sign" (Peirce 1966, vol. 5, par. 473), namely the meaning of the sign, or also its effect on the mind of the interpreter, or also a further sign to which the first sign refers (the latter notion is endorsed and developed for instance by Eco 1975).

consider to a larger extent the behaviour of the parties (for a clear discussion of this issue, see Devlin 1962). Similarly, the universality of practical reasoning is consistent with the possibility of obtaining significantly different results, in various areas of the law (like family law, or bank law), in Western legal systems and in Islamic ones.

25.1.6. Problems in Legal Interpretation

We cannot here consider in general terms the problems of legal interpretation.[5] We shall just exemplify our definitions by considering two examples. The first example concerns the interpretation of certain Italian laws concerning software protection, and in particular, the issue of whether duplicating software in order to make a profit constitutes a crime.

In Italy copyright protection of computer programs was established by Act (legislative decree) n. 528 of 1992 (implementing European directive 91/250 CE), which explicitly affirms that "computer programs are protected as literary works." Before the enactment of this law there were many discussions concerning the application of Italian copyright act (n. 633 of 1941) to the unauthorised duplication of computer programs. In particular, the debate concerned Art. 171 of the Italian copyright law, stating the following rule:

Art. 171. Whoever, without being entitled to it, duplicates [...] a work belonging to another [...] is to be punished with a fine [...]

The Italian copyright act provided the following textual clues:

- Art. 1 characterises the notion of a *protected work* as including "creative works belonging to literature, music, figurative arts, architecture, theatre and cinematography."
- Art. 2 specifies that "literary, dramatic, scientific, didactic, religious works, both in written and in oral form, are included within protected works."

Different opinions emerged with regard to computer programs. Most judicial decisions excluded that the expression "protected work" had to be interpreted in such a way as to include also computer programs, when criminal punishment was at issue.

However, the *Corte di Cassazione* (the Italian highest Court for civil and criminal cases), on 24 July 1986, adopted a different view. It affirmed that:

[5] Legal interpretation is extensively discussed in Peczenik, Volume 4 of this Treatise, sec. 1.4, 1.5. For a comparative discussion of the methods of legal interpretation, see MacCormick and Summers 1991. For a recent concise account and for some references to the vast literature on this subject, see also Greenawalt 2002.

1.	*BindingText* [Art. 1]	⟨premise⟩
2.	⌈computer programs qualify as protected literary works⌉ is a *binding interpretant* of Art. 1	⟨premise⟩
3.	FORANY (ψ, φ) IF *BindingText*$[\psi]$ AND [φ is a *binding interpretant* of ψ] THEN *Binding* φ;	⟨premise⟩
4.	*Binding* ⌈computer programs qualify as protected literary works⌉	⟨from 1, 2, and 3, according to *meta-syllogism*⟩
5.	computer programs qualify as protected literary works	⟨from 4, by *Binding-elimination*⟩

Table 25.5: *Meta-syllogism: interpretative inference*

computer programs are protected according to civil and criminal copyright law, since they belong to sciences and are expressed in a technical language that can be conceptually assimilated to the alphabet.

According to this interpretation of Art. 1 and 2 of the copyright law—an interpretation including the *interpretant* that computer programs qualify as protected literary works—the *Corte di Cassazione* concluded that the duplication of computer programs was punished, according to Art. 171. In Table 25.5 we represent this reasoning as based upon schema *meta-syllogism*.

Other judges and most legal scholars (and the same *Corte di Cassazione*, in other cases) held different views, and concluded that computer programs were not to be considered as being literary works. The two opposed conclusions were supported by different arguments, referring to the literal meaning of the expression "literary work," to the purposes of Art. 1 and Art. 121 of the Italian copyright act, to the function of copyright protection, to the solution adopted in other countries and in particular in most EC-Member States (which had already extended copyright protection to computer programs), to the fact that criminal provisions (like Art. 171 of the copyright act) cannot be analogically extended. In our framework, all of these considerations would appear as factors for or against including in the interpretation of Art. 2 the proposition that computer programs qualify as literary works.

This interpretative controversy was in the end solved by the legislator, who expressly stated that computer programs are protected by copyright as literary works (so confirming the interpretation adopted by the *Corte di Cassazione*), and moreover introduced a specific sanction concerning the duplication of computer programs (Art. 171 bis of the Italian copyright law):

(1) *BindingText* [*Art. 171 bis*];
(2) ⌈if one duplicates a computer program for saving costs within a commercial activity, then one duplicates the program in order to obtain a gain⌉ is a binding interpretant of *Art. 171 bis*;
(3) FORANY (ψ, φ)
    IF *BindingText*[ψ] AND
      [φ is a *binding interpretant* of ψ]
    THEN *Binding* φ

---

(4) if one duplicates a computer program for saving costs within a commercial activity, then one duplicates the program in order to obtain a gain

Table 25.6: *Interpretative statement and substantive conclusion: a statutory rule*

Art. 171 bis. Whoever, without an authorisation, duplicates computer programs in order to obtain a gain,[6] [. . .] is subject to a penalty of detention from 6 months to 3 years, plus a fine from € 2,582 to € 15,493.

This provision too raised many interpretative doubts.

First of all, since the new rule only concerned duplication intended to obtain a gain, there was the problem of understanding whether duplication that was not intended to obtain a gain was still punished with the fine introduced by the old Art. 171 (establishing a small fine for the duplication of any protected work).

Moreover, there was a discussion concerning whether unauthorised duplication of computer programs taking place within a business unit, for the purpose of using the software in multiple copies (while saving the cost of buying multiple licences), rather than for reselling the copies, was performed "in order to obtain a gain."

With regard to this second issue, the *Corte di Cassazione* affirmed that also duplication performed for the purpose of saving purchase costs (rather then for reselling), within a commercial unit, was to be understood as being performed "in order to obtain a gain." From this interpretative assertion (this statement concerning a binding interpretant of a Art. 171 bis) the judges derives the corresponding substantive conclusion, according to the pattern we have outlined above, as you can see in Table 25.6.

Also in this case, the Italian legislator (pressed by the lobby of software producers) intervened to put an end to this legal debate, by confirming the interpretation that had been adopted by the *Corte di Cassazione*. In particular, the

[6] The locution used in the Italian text for "in order to obtain a gain" is "a scopo di lucro."

(1) *BindingText* [*Art. 2, Section 3 of the UN treaty*];
(2) proposition ⌈any State is forbidden to wage preventive war⌉ is a *binding interpretant* of *Art. 2, Section 3 of the UN treaty*;
(3) FORANY (ψ, φ)
    IF *BindingText*$[\psi]$ AND
        $[\varphi$ is a *binding interpretant* of $\psi]$
    THEN *Binding* φ

---

(4) any state is forbidden to wage preventive war

Table 25.7: *Interpretative statement and substantive conclusion: an international rule*

legislator substituted, in the text of Art. 171 bis, the word "gain" (*lucro*) with the word "profit" (*profitto*).

A problem of interpretation does not arise only for legislation, but also for treaties and contracts. Consider for instance the problem on interpreting Art. 2. Section 3 of the Charter of United Nations:

Art. 2, Section 3. All Members shall settle their international disputes by peaceful means in such a manner that international peace and security, and justice are not endangered.

Does the interpretation of this sentence include the *interpretant* that any war waged by a member State against another member State (except in case of self-defence) is prohibited?

We cannot here discuss this question, which we need to leave to students of international law. However, we can observe that, if its answer is positive, we have to conclude that any preventive war is a violation of the UN treaty, according to the inference in Table 25.7.

Our analysis of interpretative reasoning allows us to establish a connection between the notion of *proclamative power* and the notion of *textual proclamative power*, according to which textual proclamative power is prior to proclamative power: The proclamative power of realising a normative proposition φ may be viewed as the textual proclamative power of making a statement ψ having proposition φ as its binding interpretant.

$$\textbf{\textit{ProclPow}}_x\ \varphi \equiv \text{FORSOME}\,(\psi)\ \textbf{\textit{TextualProclPow}}_x\ \psi\ \text{AND}\ \varphi \text{ is a } \textit{binding interpretant} \text{ of } \psi$$

(⌈x has the proclamative power of realising proposition φ⌉ is equivalent to ⌈there is a sentence ψ such that x has textual declarative power of making ψ binding, and φ is a binding *interpretant* of ψ⌉)

25.1.7. Criteria for Interpretation

The distinction between proclaimed sentences and their binding meaning (*interpretant*) is important, since determining what propositions are expressed through (the correct interpretation of) a certain statement is no trivial issue.

A person unacquainted with the law may assume that the correct interpretation of a legal statement needs to be the real intention of the issuer of that statement, as it can be identified on the basis of all existing behavioural clues (regardless of whether these clues were accessible to the addressee of the statement or to others at the time of when the statement was performed).

However, we know that this is not always a sensible choice from the legal perspective, since one has to consider also the interests of the people who have relied upon the fact that the proclamation had a certain meaning on the basis of the only clues that were accessible to them, and thus have expected that it would create a corresponding legal effect.

Moreover, in the case of a collective declaration, the proclaimers may have wrongly believed that they were expressing the same intention: They uttered the same words, wrongly assuming that they were sharing the same thought. Thus, even when we can identify the real intentions of all authors of a proclamation, this may be insufficient to assign a unique meaning to the proclamation.

In general, when identifying the correct interpretation of a proclaimed statement one has to consider, in a legal context, various aspects. We may say that a certain *interpretant* of a statement is favoured to the extent that it presents the following features:

1. It corresponds to the intention of the issuer of the statement, that is, to the proposition the issuer meant to express through that statement (when there is more then one issuers, as it normally the case for contracts and legislation, one needs to consider their possibly different intentions);
2. It corresponds to the literal sense of the words and grammatical connections in the stated sentences, abstracting from the extra-linguistic context in which the statement was issued;
3. It is coherent with the extra-textual context in which the statement took place (previous commercial relationships between the parties, for contracts; parliamentary debates for legislation, and so on);
4. It is coherent with the set of normative propositions (the normative system, or a specific section of it) in which the *interpretant* is to be included;
5. It is coherent with practices, beliefs, goals, and attitudes of its addressess;
6. It enables the application of the statement to achieve the specific goals it should serve, according to the intentions of the issuers, or to values inherent to the legal system.

Besides these primary grounds, we may also say that, for the sake of coordination (and also for the consideration due to tradition and to the cognitive merits

of social cognition), an interpretation of a proclaimed statement is favoured to the extent that it corresponds to the meaning which was generally attributed to the statement by third parties (by judges, doctrinal writers, citizens), taking into account their role in legal decision-making and their cognitive competence. In this regard, one has further to distinguish between the third party's interpretation:

- at the time when the statement was issued;
- at a later time (precedent has a special importance in this regard);
- at the present time.

We cannot here analyse any further this list of factors (which has no pretension of being exhaustive), since this would lead us to address the very difficult problem of the interpretation of different kinds of legal texts (contracts, laws, international treaties, and so on), nor can we address the connection between this list of factors and other proposals of criteria for legal interpretation.[7] Let us just observe that, from a logical perspective, these factors are to be viewed as *dimensions*, increasingly favouring the adoption of the *interpretant* implementing them.

This leaves us with the task of establishing how we should compromise such different dimensions. We believe that not much can be said in general with regard to this evaluation, which is context-dependant to the highest degree. In this evaluation, different goal and values need to be considered, which underlie the factors we have just listed: Enabling the proclaimer to achieve the intended state of affairs, protecting those who have relied upon the assumption that a certain content was conveyed, preserving current conventions, encouraging proclaimers to be clear and precise, avoiding difficult psychological and contextual inquiries, preventing exploitative behaviour, achieving the particular legal goals at issue and the general values of the legal system, and so forth.

Moreover, besides the problem of balancing different dimensions, there is also the problem of taking their interference into account. For example, the idea that a statement is to be understood in such a way as to ensure that certain goals are promoted, takes us back to the idea that a statement is to be understood according to the intention of its issuer, whenever the goal to be promoted is

[7] For a detailed lists of interpretation criteria, see for example Tarello 1980, 341ff., which lists various interpretation arguments: *a contrario*, analogical, *a fortiori*, from completeness, from coherence, from the intention of the legislator, from historical persistency, *reductio ad absurdum*, teleological, from non redundancy, from example or precedent, systematic, from the nature of things, from general principles (on these arguments, see also Lazzaro 1970, and Perelman 1979, sec. 33). Another list is provided in Wróblewski 1992, 97ff., which distinguishes the three categories of linguistic, systemic and functional interpretations, and specifies a set of interpretation directives for each one of them. Bobbitt (1982) distinguishes, with regard to constitutional law, historical, textual, structural (from institutional requirements), prudential (teleological), doctrinal, and ethical arguments.

the self-determination of the issuer of that statement (which may be the self-determination of individuals with regard to contract, or the self-determination of a political body with regard to legislation). Similarly, the idea of interpreting statements according to the understanding of their addressees takes us back to the intention of the issuer, when the addressee's understanding was determined by the addressee's attempt to construe the issuer's intention.

These considerations seem to underlie the following statement:

> The argument from the intention of the law-giver [. . .] is transcategorical in the sense that the *objects* of intentions [. . .] include all of the objects—language use, systemic context, purpose, and value—that figure in the other major categories of argumentation. (MacCormick and Summers 1991, 27)

In conclusion, it seems that it is not useful to transform interpretative factors into rules, nor that it makes much sense to find meta-rules establishing what combinations of interpretative factors prevail in what circumstances. With regard to conflicts between criteria of interpretation, we need to accept the uncertainties of factor- (and dimension-) based reasoning. This fact may be viewed as a failure of legal method, which appears to be unable to pre-determine the outcome of legal reasoning through precise rules (and meta-rules). However, it may also be viewed as a significant (though constrained) opportunity for normative reflection, for the critical examination of legal values, for a reassessment of their relative importance and the merit of the ways of implementing them (for a favourable view of conflicts between criteria of interpretation, see for instance Bobbitt 1991, 184, and Zagrebelsky 1992, chap. 7, sec. 2).

25.2. Sources of Law

As we have seen above, proclamations have a particular feature: They produce the normative situation they express (though this takes place through the mediation of an interpretation). This feature, however, does not pertain only to proclamations; it also concerns, for instance, custom, precedent, and more generally any sources of law. On the basis of the analysis of this feature we shall characterise in general terms the notion of a *source of law*.

25.2.1. Custom

Let us consider the following statement, which opens the page that is dedicated to customary humanitarian law on the web site of the International Commission of the Red Cross:

> Unlike treaty law, customary international law is not written. To prove that a certain rule is customary one has to show that it is reflected in State practice and that there exists a conviction in the

international community that such practice is required as a matter of law. In this context, "practice" relates to official State practice and therefore includes formal statements by States. A contrary practice by some States is possible because if this contrary practice is condemned by other States or denied by the government itself the original rule is actually confirmed. (Henckaerts 1999)

This idea seems to correspond to the traditional notion of custom as resulting from two elements, a psychological element, the *opinio juris ac necessitatis*, and a practice element (on custom, see also: Pattaro, Volume 1 of this Treatise, sec. 6.1; Shiner, Volume 3 of this Treatise, chap. 4). We believe that this traditional characterisation is indeed appropriate.

However, the necessity that is mentioned here, is not the opinion that a certain action is obligatory or legally obligatory. The necessity concerns the broader idea of legal bindingness we have discussed in Chapter 12, namely, the idea that a certain normative proposition *is adoption-worthy* (deserves to be adopted) in legal reasoning. In fact many customary rules do not express obligations, but rather permissions or powers. We may thus provide the following (quite crude, but sufficient for our purposes) definition of a custom.

Definition 25.2.1 *Custom. A normative proposition φ is a* custom *(a customary rule) in community C if most members of C:*

1. *have the common belief that φ is legally binding and*
2. *usually act on the basis of such belief.*

Accordingly, the idea that custom is a source of law can be expressed in the following way:

FORANY (φ)
IF [φ is a national or international custom]
THEN^n *Binding* φ

Let us consider, for example, the prohibition of the use of chemical weapons, which seems to have finally become an international custom (though there are still tragically significant violations). On the basis the assumption that this is the case, we may draw the following inference (according to schema *metasyllogism*):

(1) FORANY (φ)
IF [φ is the content of an international custom]
THEN^n *Binding* φ
(2) [everybody is forbidden to use chemical weapons] is the content of an international custom

---

(3) everybody if forbidden to use chemical weapons

(1) FORANY (φ)
IF [φ is the content of a contractual custom]
THEN^n *Binding* φ;
(2) [compound interests are to be paid, for overdue bank-loans] is the content of a contractual custom

---

(3) compound interests are to be paid, for overdue bank-loans

Table 25.8: *Meta-syllogism: the endorsement of custom*

The same type of inference can also be applied to domestic customs. For instance, the Italian *Corte di Cassazione Civile* observed (in *Calistro vs Banco Sicilia* 1987) that:

in relations between banks and their clients, anatocism (compound interest) is generally applied through the behaviour of the generality of the interested parties, with the belief of fulfilling a legal precept.

From this premise, given that custom, according to Italian law, is binding for parties in contracts, the judges concluded that compound interests are to be paid upon overdue interests. Again, this inference can be recast according to schema *meta-syllogism*, as you can see in Table 25.8.

25.2.2. Precedent

The inference schema *meta-syllogism* is also applicable to precedent: If we assume that certain precedents are binding, then we can conclude by endorsing their *rationes decidendi*.

For example, assume that we adopt the view that (as in common-law jurisdictions) *rationes decidendi* of appeal and higher courts are binding.

As a classical example, consider the famous case *Donoghue vs Stevenson* (1932). Assume that the *ratio decidendi* of that case is expressed by the concluding statement of Lord Atkin:

[A] manufacturer of products, which he sells in such a form as to show that he intends them to reach the ultimate consumer in the form in which they left his premises with no reasonable possibility of intermediate examination and with the knowledge that the absence of reasonable care in the preparation or putting up of the products will result in an injury to consumer's life and property, owns a duty to the consumer to take responsible care. ([1932] A.C. 599)

which we can crudely synthesise as:

(1) FORANY (φ)
IF φ is a *ratio decidendi* of the House of Lords;
THEN^n *Binding* φ
(2) ⌈a manufacturer of products [...] owns a duty to the consumer to take responsible care⌉ is a *ratio decidendi* of the House of Lords

---

(3) a manufacturer of products [...] owns a duty to the consumer to take responsible care

Table 25.9: *Meta-syllogism: the endorsement of a* ratio decidendi

[A] manufacturer of products [...] owns a duty to the consumer to take responsible care.

An English lawyer, for whom *rationes decidendi* of the house of Lords are binding, will then reason according to *meta-syllogism*, as you an see in Table 25.9.

25.2.3. Legal Doctrine as a Source of the Law

The idea of *meta-syllogism* can also be applied to the opinions of legal scholars, when these are sources of the law. This was the case, for example, in Roman law:

[A]nciently it was provided that there should be persons to interpret publicly the law, who were permitted by the emperor to give answers on questions of law. They were called jurisconsults; and the authority of their decisions and opinion, when they were all unanimous, was such, that the judge could not, according to the constitutions, refuse to be guided by their answers. (*Institutes of Justinian*, 1.2) [8]

This would be expressed through the following rule:

FORANY (φ)
IF ⌈φ is an unanimous opinion of all jurisconsults⌉
THEN^n *Binding* φ

which can be applied through schema *meta-syllogism*.

Similar notions were also part of medieval law, which developed the idea that a view which was shared by all legal scholars or by a qualified majority of them

[8] The Latin original: "Antiquitus institutum erat, ut essent qui jura publicae interpretarentur quibus a Caesare jus respondendi datum est, qui jurisconsulti appellabantur. Quorum omnium sententiae et opiniones eam auctoritatem tenebant, ut judici recedere a responso eorum non liceret, ut est constitutum."

(*communis opinio*) was binding upon judges, and was indeed to be "observed as a statute, and as part of the law" (*pro lege et tamquam ius servatur*, Coratius III, tit. XII, n. 10, quoted in Lombardi Vallauri 1967, 180), though it would be overridden by a contrary statute or custom (ibid., 177ff.).

Similar ideas concern today the so-called *soft law*, which is particularly important in the international domain, and includes sources like the following ones: resolutions of the United Nations and other international bodies, international agreements which do not qualify as treaties, rules adopted by international chambers of arbitration, codes of conduct, and so forth.

It is true that some authors believe that such rules are only binding when they satisfy the conditions which are required for the bindingness of customary rules, that is, when they qualify as customary rules. However, others affirm that the bindingness of soft laws may result from different (and quicker) processes, which do not require the degree of compliance and acceptance that would be ordinarily required for the formation of a custom. For instance, the adoption of a certain non-binding resolution by an international organisation, accompanied by the acquiescence of the concerned parties, may substitute continued practice and *opinio juris*.

This is not the place for taking a doctrinal position on soft law at the international level (this is a task which we must leave to experts in international law). What we shall try to do in next section is instead trying to provide a general notion of a *source of law*.

25.2.4. The General Idea of a Source of Law

Our discussion of various sources of law—legislation (more generally, proclamations), custom, precedent, doctrinal opinion, soft law—leads us towards a general notion of a *source of law*.

Definition 25.2.2 *Source of law. By a* source of law *we mean any fact that embeds normative propositions, and determines the bindingness (adoption-worthiness) of these propositions, by virtue of such an embedment.*

The link between the source-fact and the embedded propositions may be different: These propositions may consist in what is expressed by a proclamation (as in legislation or contracts), in what is practised and considered binding (as in customary law), in what justifies a judicial decision (as in case law), in what is affirmed by most, or most authoritative, jurists (as in doctrinal law), in what is stated in a non-binding but acquiesced upon international resolution, and so on.

This leads us to the problem of establishing what facts have the property of being sources of law, that is, the ability of determining the bindingness of the propositions they embed.

Let us first observe that, according to our definition, establishing what is a source of law is no factual issue. It is a normative issue (we need to establish what facts produce adoption-worthy normative propositions), but a normative issue that may only be answered by taking into account the relevant factual information. Since we have already extensively discussed this matter in Chapter 12, we shall now just recall the main results we achieved there. We have observed that the adoption of a legal rule can be based upon the following piece of teleological reasoning:

Reasoning schema: *Teleological bindingness*

(1) v is a set of communal values;
(2) my community's endorsement of rule r as legally binding is a sufficiently good way to advance values v;
(3) my adoption of rule r has a sufficient chance of contributing to r's adoption by my community

——— IS A REASON FOR

(4) rule r is legally binding

This pattern of teleological reasoning can lead us to recognise certain facts as sources of law, that is, to endorse meta-rules establishing the legal bindingness of all rules (more generally, all normative propositions) which are embedded in certain ways in certain kinds of facts.

Let us consider the three items which provide the pre-conditions for the reasoning schema *substantive bindingness*, and examine, for instance, whether this schema may support the conclusion that acquiesced-upon UN-resolutions are legally binding in international law.

Item (1) is purely normative: It concerns the evaluation of certain results (state of affairs) as communal values to be pursued. For instance, the values involved may be peace, international co-operation, protection of human rights.

Item (2) is teleological: It concerns the assessment that the practice of a certain rule is a sufficiently good way to achieve those values. This is the Kantian issue of establishing whether one may want a rule (in this case a meta-rule) to become a universal law. For instance, we may consider whether the fact that UN-resolutions where considered legally binding by all States would be a good way to achieve the values we just mentioned

Item (3): It concerns the chance that by individually adopting this rule one may contribute to its general adoption. This concerns the feasibility of the Kantian assumption, namely, whether the rule has any chance of really becoming a universal law (more modestly, of being adopted by the community ad issue). For instance, we need to consider whether there is any chance that all or most States become committed to endorse UN-resolutions as being legally binding.

From our perspective, the Kantian pre-condition (item 2) is a necessary, but insufficient for deriving a bindingness conclusion, since the solitary adoption

of a rule (and of a meta-rule) can be disruptive, even when its universal adoption would be beneficial. For example, if nobody accepts the idea that UN-resolutions are binding, the solitary attempt (by one or more states) to implement a resolution against its violators may result in war and disaster.

Similar considerations, though in a less dramatic context, may apply to a civil lawyer who has to establish whether precedents are to be considered binding within his or her jurisdiction. In a common law country, following a precedent which one considers to have been badly decided (though not so badly as to justify overruling) may be a good practice, which contributes to generate certainty, maintain the institution of precedent, and stimulate a legislative change of the law.

Doing the same in a country where most judges feel free to depart from badly decided precedents might on the contrary contribute to legal uncertainty, by violating existing expectations (since citizens and lawyers expect that judges will depart from precedents that appear to have been badly decided).

In concluding our discussion of legal sources, we need to observe that according to our model not all legally binding propositions need to be the content of a legal source: The judgement that a normative proposition is legally binding may be directly based upon teleological considerations concerning the value-impact of the collective endorsement of a certain propositions, and on the chance that collective endorsement will be obtained. Finally, also when one is referring to a legal source, the data provided by the source may need to be integrated with further components, which may not be (fully) determined by other sources (this is what generally happens in legal interpretation).

25.3. A Logic for Legal Pluralism

In the following section, we shall provide a *pluralist extension* of legal logic, in order to enable a legal reasoner to deal with the interactions between different legal systems, through a unitary reasoning process. First we shall explain why this extension is needed and how we can index normative propositions to different normative systems. Then we shall present an example, and will identify some basic reasoning patterns that are required for *pluralist legal reasoning*.

25.3.1. The Need for a Pluralist Legal Logic

In our increasingly interconnected world, lawyers need frequently to take into consideration different normative systems.

First of all, we need to deal with different national legal systems. In particular, according to the rules of the conflict of laws, domestic judges are bound to apply foreign laws in many circumstances.

Secondly, there are various form of transnational or international law: rules produced by various international organisations (the United Nations, the Word

Trade Organisation, the European Community, and so on), various forms of transnational customary or soft law (Internet law, *lex mercatoria*, and so forth).

Thirdly, there are various kinds of subnational laws: laws of autonomous member States and regions, of tribal or ethnic communities, of religious persuasions, and so on.

One may wonder to what extent one may properly speak of laws with regard to such diverse normative materials. We do not need to enter into the old discussion concerning legal pluralism, and consider whether only State law is real law, or whether any social organisation has its own "legal system".[9] What matters for us is that when one engages in legal reasoning—in a situation where different normative systems overlap, interact, and sometimes compete—one must be able to distinguish different normative systems, to explore the perspective peculiar to each one of them, but also to understand their interactions, namely, the ways in which each normative system takes into account the content and implications of other normative systems.

In other terms, we need a way of modelling both the reciprocal closure and openness of different normative systems: How a normative system may disregard the normative qualifications determined by other normative systems, or may on the contrary accept such qualifications, replicate them within itself, and use them as premises for further inferences.

Finally, we need a way of showing how each normative system not only takes into account its own conclusion, but is also able to recognise empirical evidence, and link legal effects to events in the world: All normative systems share the same empirical and social world and may thus take into account the same events, though possibly linking to such events different normative qualification.

It seems that we have outlined a tremendous task for legal logic. However, in the following we hope to show that a simple solution is available, at least for our limited concerns.

In representing normative propositions belonging to different systems, we shall use the symbol $\odot$ as an abbreviation for the locution *relatively to* (or, if you prefer, an abbreviation for "from the perspecive of," or "from the viewpoint of", as the eye-like shape $\odot$ indicates). Thus, to specify that proposition φ holds relatively to the normative system (relatively to the perspective) S we write:

$$\varphi_{\odot S}$$

When φ is a long formulas, written in more then one line, we shall prefix the locution $\odot S$, and write;

$$\begin{array}{l}\odot S \\ \quad \varphi\end{array}$$

[9] As claimed for instance by Romano (1977), whose pluralist views had a significant impact on the Italian legal culture. In particular, the idea that the customs of Sardinian shepherds, with regard to revenge, could be viewed as a legal system was developed by Pigliaru 1959.

As we shall see in the following example, we shall allow a proposition of a normative system to include propositional constituents which hold relatively to a different normative system, and which are to be established accordingly. Thus, to express that, relatively to system S_1, the fact that antecedent A holds relatively to system S_2 determines consequent B, we write:

$(\text{IF } \mathsf{A}_{\odot S_2} \text{ THEN } B)_{\odot S_1}$

or equivalently

$\odot S_1$
IF $\mathsf{A}_{\odot S_2}$
THEN B

25.3.2. *An Example in Pluralist Normative Reasoning*

For exploring pluralist legal thinking, we shall consider an example concerning the interaction between Canon law (the law of the Catholic church) and Italian law. For simplicity's sake, we shall provide very rough approximations of the rules of such normative systems.

Canon law includes a rule according to which the expression of intention of the spouses plus the declaration of a priest determines marriage:[10]

$\odot$*Catholic*
FORANY (x, y)
IF [x and y declare that they intend to be married]
AND
[a priest proclaims that x and y are married]
THEN^n [x and y are married]

Similarly, there is a rule of Italian law to the effect that if two people declare that they are married, and the city mayor proclaims their marriage, then they are married (other countries give this power to other officials, such as justices of peace, but this is not relevant to our example):

$\odot$*Italian*
FORANY (x, y)
IF [x and y declare that they intend to be married]
AND
[the city mayor proclaims that x and y are married]
THEN^n [x and y are married]

Moreover, there is rule for Catholic marriage saying that married people have the obligation to try to have children (or at least not to prevent this from happening).

[10] to keep our example simple, we omit many preconditions of Catholic marriage, such as the spouses having different sexes, not having certain kinds of family links, and so on.

$\odot$*Catholic*
FORANY (x, y)
IF [x and y are married]
THEN^n [x and y must try to have children]

There is also a rule of Italian law saying that a Catholic marriage (the fact that two people are married according to the Canon law) is recognised as an Italian marriage (under certain conditions that we omit here):

$\odot$*Italian*
FORANY (x, y)
IF [x and y are married]$_{\odot Catholic}$
THEN^n [x and y are married]

This is a case of *non-deontic emergence*: Being married relatively to the Catholic Church determines being married relatively to the Italian state, according to Italian law.[11]

Finally, there is also a rule of Italian law saying that marriage can be dissolved by divorce:

$\odot$*Italian*
FORANY (x, y)
IF [x and y are married]
THEN^n [x and y can divorce]

The intuitive implications that a legal reasoner should derive according to the above-mentioned rules are clear. Assume that two persons—let us call them *John* and *Mary*—have gone through a Catholic marriage.

One should be able to conclude all of the following:

- they are married relatively to Catholic law;
- they are married relatively to Italian law;
- they have the obligation to try to have children (only) relatively to the Catholic law; and
- they their marriage can be terminated through divorce (only) relatively to Italian law.

25.3.3. An Analysis of Pluralist Normative Reasoning

To approach pluralist reasoning we need to differentiate two ways in which a reasoner can endorse a proposition.

[11] More exactly, we may say that this is a case of *non-deontic initiation*: Getting married relatively to the Catholic church starts being married relatively to the Italian state, but being married relatively to the Italian state can be terminated (by divorce) when one still is married relatively to the Catholic church.

First of all, a reasoner can endorse a proposition *absolutely*, that is, without linking one's endorsement to a particular point of view in which one is participating (or may participate). When one is absolutely endorsing a proposition, one may use this proposition in whatever inference one is performing, from whatever perspective, unless one has specific reasons to not to use it: We view absolute endorsement as being *defeasibly universal*.

This is usually the case for epistemic propositions, though also with regard to epistemic proposition one may distinguish the results one obtains according to different probatory standards, pertaining to different perspectives one is adopting (for instance one may distinguish conclusions obtained according to science or religious faith). To remark that a proposition is absolutely endorsed, we add to it the prefix or the suffix *absolute*.

Secondly, one may endorse a proposition *relatively*, that is, with regard to a specific point of view one takes (one participates in). This is usually the case for normative propositions. We have remarked how one may have different roles (a self-centred individual, a member of a family, an employee, a citizen, a member of humanity, and so forth), and how one may reach different practical conclusions when reasoning in each one of these capacities.

Similarly, one may reason according to different legal systems. With regard to each different system one is considering, one needs to adopt premises suitable to that particular system and reach conclusion that are relative to that system.[12]

Let us now consider how absolutely and relatively endorsed propositions can be combined in reasoning. Assume that the reasoner j believes that the normative conditional $\lceil$IF A THEN^n $B\rceil$ holds relatively to the normative system S_1. In other words j endorses the relativised normative conditional:

$$(\text{IF } A \text{ THEN}^n\ B)_{\odot S_1}$$

We need to distinguish three different ways in which j may endorse the precondition A of this conditional, and consider what inferences are correspondingly licensed:

1. j endorses A *absolutely*. On the ground (the reason) that (*i*) $\lceil$IF A THEN^n $B\rceil$ holds relatively to S_1 and (*ii*) A holds absolutely, j *can* conclude that (*iii*) B holds relatively to S_1.
2. j endorses A holds *relatively to* S_1. On the ground that both of (*i*) $\lceil$IF A THEN^n $B\rceil$ and (*ii*) A hold relatively to S_1, j *can* conclude that (*iii*) B holds relatively to S_1.
3. j endorses A *relatively to a different normative system*, let us call it S_2. In this case, on the ground that (*i*) IF A THEN^n $B\rceil$ holds relatively to

[12] Note that our notions of *absolutely endorsed proposition* and *relatively endorsed proposition* may be connected to notions of *brute fact* and *institutional fact*, which one can find in Searle (1969; 1989). We prefer our notions, since they are more general and have an epistemic, rather than an ontological characterisation.

(1) [$John$ and $Mary$ declare that they intend to be married]$_{\odot absolute}$;
(2) [a priest proclaims that $John$ and $Mary$ are married]$_{\odot absolute}$;
(3) $\odot Catholic$
FORANY (x, y)
IF [x and y declare that they intend to be married] AND [a priest proclaims that x and y are married]
THEN^n [x and y are married]

---

(4) [$John$ and $Mary$ are married]$_{\odot Catholic}$

Table 25.10: *Relative conclusion on the basis of mixed (relative and absolute) preconditions*

S_1 and (*ii*) A holds relatively to S_2, j *cannot* conclude that (*iii*) B holds relatively to S_1.

The inference that is licensed according to item (1)—the relative endorsement of a rule, and the absolute endorsement of the rule's antecedent lead to the relative endorsement of the rule's conclusion— is exemplified in Table 25.10: On the basis of the relative endorsement of the rule on Catholic marriage, and of the absolute belief that the rule's preconditions are satisfied we conclude that that two spouses are married relatively to the Catholic Church.[13]

Table 25.11 on the next page exemplifies the inferences that are licensed according to item (2). The endorsement of a rule relatively to a system and the endorsement of the rule's antecedent relatively to the same system lead to the relative endorsement of the rule's conclusion: On the basis of the Catholic endorsement of the rule that spouses have the obligation to try to have children and of the Catholic belief that John and Mary are married, we can conclude that they have the obligation to try to have children, relatively to the Catholic Church.

According to item (3), inferences are not licensed by premises being endorsed relatively to different systems. For instance, being married according to the Italian law does not determine the procreative obligation between spouses according to Catholic law. Canon law attributes this obligation to people that count as spouses from the perspective of Canon law, and, according to Canon law, being married according to Italian law does not determine marriage.

Thus, the fact that a certain normative qualification Q (John and Mary are married) holds relatively to a normative system S_1 does not determine the ef-

[13] This is an instance of non-deontic initiation, but for simplicity's sake we omit specifying this by using temporal and deontic predicates.

(1) [$John$ and $Mary$ are married]$_{\odot Catholic}$;
(2) $\odot Catholic$
FORANY (x, y)
IF x and y are married
THEN^n ***Obl*** [x and y try to have children]

---

(3) [***Obl*** x and y try to have children]$_{\odot Catholic}$

Table 25.11: *Relative conclusion on the basis of relative preconditions*

fects that another normative system S_2 links to the same qualification Q. These effects are only generated when S_2 specifically recognises Q relatively to S_1, that is, when a rule of S_2 states that Q's holding relatively to S_1 determines Q's unqualified holding. In our example, this is done by the rule of Italian law that recognises Catholic marriage, while there is no corresponding rule of Canon law recognising Italian marriages.

For providing a logical account of this way of reasoning, we introduce three reasoning schemata which you can see in Table 25.12 on the following page. The first schema in Table 25.12 on the next page, *relativisation*, deals with absolute endorsement. It says that when one absolutely believes a proposition, then one may (defeasibly) endorse that proposition relatively to any specific point of view or perspective (in particular, any normative system). Note that we write "believing that $A_{\odot absolute}$" to mean ⌈believing A relatively to the absolute perspective⌉, and "believing that $A_{\odot S}$" to mean ⌈believing A relatively to the perspective of system S⌉.

The second reasoning schema in Table 25.12 on the following page, *relativised detachment*, states that, when believing both a relativised conditional and a relativisation of its antecedent, one may endorse a relativisation of its consequent. Note that we write "believing that S: IF A_1AND ... AND A_nTHEN^n B" to mean ⌈believing that ⌈IF A_1AND ... AND A_nTHEN^n B⌉ relative to the perspective of system S."

By combining *specification* with *relativised detachment* we obtain the third reasoning schema in Table 25.12 on the next page, *relativised syllogism*.

This is not the only possible formalisation of the logical interactions between normative systems.[14] However it seems to us that our approach is sufficiently

[14] An alternative approach consists in assuming that from a relativised conditional connection ⌈S: IF A THEN^n B⌉ one may infer a non-relativised conditional connection between relativised proposition, ⌈IF $A_{\odot S}$ THEN^n $B_{\odot S}$⌉. Then one can reason using the latter proposition and detach $B_{\odot S}$ according to usual syllogism. The issue of the logical connections between different normative systems is also discussed, though adopting different formalisations, in Jones and Sergot 1996, and Gelati et al. 2002b.

Reasoning schema: *Relativisation*

(1) believing that $A_{\odot absolute}$

——— IS A DEFEASIBLE REASON FOR

(2) believing that $A_{\odot S}$

Reasoning schema: *Relativised detachment*

(1) believing that (IF A_1 AND ... AND A_n THEN^n $B)_{\odot S}$;

(2) believing that $(A_1)_{\odot S}$, ..., $(A_n)_{\odot S}$

——— IS A DEFEASIBLE REASON FOR

(3) believing that $(B)_{\odot S}$

Reasoning schema: *Relativised syllogism*

(1) believing that

(FORANY (x) IF A_1 AND ... AND A_n THEN^n $B)_{\odot S}$;

(2) believing that $(A_1[x/a])_{\odot S}$, ..., $(A_n[x/a])_{\odot S}$

——— IS A DEFEASIBLE REASON FOR

(3) believing that $(B[x/a])_{\odot S}$

Table 25.12: *Reasoning schemata for pluralist normative reasoning*

intuitive and general. In particular, it can be viewed as an application of the logic of beliefs in a multi-agent framework, where each perspective counts as a different reasoner (in the logic of belief, from j believes that A, and j believes that IF A THEN B, one usually infers that j believes that B). Thus, the reasoning of a single agent—who is considering different perspectives and taking in account their connections—proceeds like the reasoning of different persons who take into account the beliefs of others. Unfortunately we cannot now develop further this idea, going into the logical technicalities of multi-agent reasoning.

Let us content ourselves with an application of these reasoning schemata to our marriage example, as you can see in Table 25.13 on the facing page. The table shows why John and Mary, who made a Catholic marriage, can now divorce according to Italian law.

We hope that this example suffices to show how our approach enables a reasoner to adopt the perspective of different legal systems (to identify with each one of them), but also to take into account their differences and their connections.

Our model does not only apply to the connection between the law of a state and another kind of normative system (like Canon law, or Muslim law). It also applies when a conflict of state laws is at issue.

1. $[John$ and $Mary$ declare that they intend to be married$]_{\odot absolute}$
2. $[John$ and $Mary$ declare that they intend to be married$]_{\odot Catholic}$
   ⟨from 1, by relativisation⟩
3. [a priest declares that $John$ and $Mary$ are married$]_{\odot absolute}$
4. [a priest declares that $John$ and $Mary$ are married$]_{\odot Catholic}$
   ⟨from 3, by relativisation⟩
5. $\odot Catholic$
   FORANY (x, y)
   IF [x and y declare that they intend to be married] AND
   [a priest proclaims that x and y are married]
   THEN^n [x and y are married]
6. $[John$ and $Mary$ are married $]_{\odot Catholic}$
   ⟨from 2, 4 and 5, by relativised detachment⟩
7. $\odot Italian$
   FORANY (x, y)
   IF [x and y are married$]_{\odot Catholic}$
   THEN^n [x and y are married$]_{\odot Italian}$
8. $[John$ and $Mary$ are married $]_{\odot Italian}$
   ⟨from 6 and 7, by relativised detachment⟩
9. $Italian$:
   FORANY (x, y)
   IF [x and y are married$]_{\odot Italian}$
   THEN^n [x and y can divorce$]_{\odot Italian}$
10. $[John$ and $Mary$ can divorce$]_{\odot Italian}$
   ⟨from 8 and 9, by relativised detachment⟩

Table 25.13: *Catholic marriage and Italian divorce*

Consider for example the domain of contract law, where the parties have the possibility of choosing what law should govern their relationship. Assume that an Italian and a US company agree that Italian law applies to their contract. Then the US judge will have to apply Italian rules, like for instance the rule saying that any clause stating that one is not liable in case of serious negligence is void. This means that the qualification established by the Italian law in such a case (the voidness of the clause) will determine the same qualification according to US law.

Chapter 26

ARGUMENTATION FRAMEWORKS

In this chapter we shall integrate the logical tools we have so far introduced in order to provide a broader picture of *inferential legal argumentation*, namely, the ratiocinative process through which a reasoner reaches justified legal conclusions.[1]

We shall focus on what we called *inferential justifiability* (see Definition 3.3.1 on page 106), referring justification to the reasoner's current beliefs. Our purpose is to establish what legal conclusions one is rationally licensed to endorse, through ratiocination, on the basis of the information one currently has.

This means that when considering what conclusions are justified we shall abstract from the possibility that one uses non-ratiocinative processes (heuresis) for expanding one's beliefs, and that one gets new cognitive inputs through perception or interaction with others. Consequently, our analysis of inferential justification will not address the appropriateness of the process through which the reasoner has acquired the cognitive inputs he or she is processing according to ratiocination.[2]

Obviously, we do not exclude that non-ratiocinative processes take place. On the contrary, we view heuresis, perception, and interaction as the key aspects of cognition, since they provide the necessary inputs to ratiocination. However, for any set of such inputs, it is up to ratiocination to build inferential derivations, according to its own methods. Such derivations will need to be computed again when new relevant inputs are provided.

[1] This chapter is based upon joint work with Henry Prakken. In particular various sections are adapted from the following contributions: Prakken and Sartor 1995; Prakken and Sartor 1996; Prakken and Sartor 1997. I am very grateful to Henry for his generosity in allowing me to make use of the outcomes of our effort. I must take responsibility for the modifications I have made in order to embed our model of defeasible reasoning into the overall framework of this book, and in order to simplify its presentation avoiding as much as possible logical technicalities. In general in the account here presented we have favoured simplicity over rigour. The reader who wants to have a full formal introduction is advised to go back the contributions we have just mentioned. In the last years there has been a large number of contributions to defeasible reasoning based upon the idea of argumentation. See for instance: Simari and Loui 1992; Dung 1993; Dung 1995; Gordon 1995; Kowalski and Toni 1996, Hage 1997; Bondarenko et al. 1997; Governatori and Maher 2000. For a review of defeasible logics, see Prakken and Vreeswijk 2002.

[2] We have considered this issue, to some extent in Section 11 on page 303, in particular when addressing dialectical models of legal procedures.

26.1. From Inference Steps to Arguments

While in the previous chapters we have only focused on single reasons and inference schemata, now we want to capture broader forms of reasoning. We shall do that by combining inference steps into arguments.

26.1.1. The Notion of an Argument

By an *inferential argument* we mean a sequence of inference steps, where each step is the application of a reasoning schema, that is, the transition from a reason to a corresponding conclusion. More precisely, focusing on the propositional contents forming the preconditions and the postconditions of these inference steps, we can provide the following definition.

Definition 26.1.1 *Inferential argument. An* inferential argument *is a sequence of propositions that satisfies the following conditions:*

1. *each proposition is either a premise or a conclusion derived from previous propositions in the argument, according to a defeasible or conclusive inference schema;*
2. *no proposition is repeated;*
3. *all propositions, except the last one, provide a subreason for the derivation of a subsequent conclusion in the argument.*

Condition (1) requires an inferential connection between the components of an argument. With regard to conclusive schemata, we are going to use all inference schemata we have introduced for classical logic. With regard to defeasible inference schemata, we shall mainly employ schemata *normative specification* and *normative detachment*, and their combination into *normative syllogism*. In the following sections, we shall start by studying arguments that only contain defeasible inferences, and then consider how to accommodate also conclusive inferences.

Condition (3) ensures relevance. It requires that an argument does not contain information that is irrelevant to establishing the argument's final conclusion.

When no ambiguity arises, we shall use the term *argument* to mean *inferential argument*, though the term *argument* is often used in a broader sense, also including heuresis or multi-agent disputations (as observed, for instance, by McCarty 1997).

Moreover, we shall use the term *discourse* to mean any *set of arguments*, though this term too is used in different senses both in common and in theoretical language (like in the so-called discourse-theory, where it rather refers to dialectical interaction, see Section 11 on page 303).

26.1.2. Some Notational Devices

Since in this chapter we are going to use many formulas, it is opportune to introduce some terminology and some notation, which are exemplified in Table 26.1 on page 673.

The premises of our arguments are taken from *premise sets*, which we denote through lowercase Greek letters ($\alpha, \beta, \ldots$). In general, a premise set contains the information, or the noemata, that one endorses as being relevant to a certain issue, and which one is ready to use when reasoning about that issue. As one may (and usually does) endorse conflicting reasons, a premise set can contain premises that allow the construction of different, and often incompatible arguments.

A premise belonging to a certain premise set is denoted by a label combining the name of the premise set and a serial number. For instance, the first premise in premise set α is denoted by label α_1, the second premise, by α_2, and so on (Table 26.2 on page 673). The possibility of naming linguistic entities is particularly important in the legal domain, since it allows us to refer to such entities, and also to give different names to different tokens of the same abstract linguistic object (for instance, to different instances of the same sentence, included in different legal sources).

We adopt the following convention: Each proposition in an argument is preceded by a number indicating the proposition's place in the argument (see, for instance, argument $\mathcal{A}^\alpha$, in Table 26.1 on page 673).

With reference to a labelled quantified proposition

$$p\text{:} \quad \text{FORANY}\ (x_1, \ldots, x_n)\ A$$

we denote as $p(a_1, \ldots, a_n)$ the formula we obtain by specifying the universal proposition p with regard to individuals named $a_1, \ldots, a_n$. This formula is the result we obtain by dropping the universal quantifier and substituting all occurrences of variables $x_1, \ldots, x_n$ in p with individual names $a_1, \ldots, a_n$.[3] For instance, given premise:

p_1: FORANY (x, y)
IF x is the owner of y
THEN x is responsible for y

which expresses the fundamental principle of the owner's responsibility, the expression $p_1(Tom, Fido)$ refers to the application of the universal proposition p_1 to Tom and his dog $Fido$, that is, to the proposition:

[3] The idea of substitution (a concept which also plays a fundamental role in logic programming, see Lloyd 1987, sec. 4) could be made more general and precise, but this characterisation is sufficient for our purposes.

$p_1(Tom, Fido)$:
IF [Tom is the owner of $Fido$]
THEN [Tom is responsible for $Fido$]

Some further notational devices will be used in symbolic formulas.

As is usually done in formal logic, we write $Pr(a)$ to mean that entity a has property Pr, namely, that a is a Pr. Similarly, we write $Rel(a, b)$ to mean that a and b are in relation Rel. For instance $dog(Fido)$ will be read as the proposition that ⌈Fido is a dog⌉ and $owns(Tom, Fido)$, as the proposition that ⌈Tom owns $Fido$⌉.

Moreover, besides expressing normative conditionals in the form we have adopted so far:

IF A THEN^n B,

we shall also use the following abbreviation, whenever a more compact notation is convenient:

$A \Rightarrow B$

Finally, we assume that connectives AND and OR have the highest priority, followed by IF ... THEN^n and finally by the quantifiers FORANY and FORSOME. This means that:

FORANY (x) IF A AND B THEN^n C

will be read as:

FORANY (x) (IF (A AND B) THEN^n C)

All these notational stipulations are used in the sequence of symbolic formulas in Table 26.1 on the next page. This sequence satisfies all conditions indicated in Definition 26.1.1 on page 670, and thus qualifies as an argument.

26.1.3. The Lebach Example

Let us now apply the notion of an argument in an extensive example. We shall analyse a judgement of the German Constitutional Court, the *Lebach Urteil* (1973), to which debate on legal argumentation has frequently referred, following the discussion in Alexy 1980. This decision concerned a television documentary about a serious crime, the murder of four soldiers during an attack to a munitions deposit of the German army, in the city of Lebach. The documentary mentioned the names of participants in the crime and showed their photos. One participant (who had a minor role in the offence) affirmed that the documentary violated his privacy and compromised the chances of his social rehabilitation, and therefore violated his personality right (right to the free development of the

Argument $\mathcal{A}^{\alpha}$

1.	α_1:	$p_1(a)$	⟨premise⟩
2.	α_2:	$p_2(a)$	⟨premise⟩
3.		$p_1(a)$ AND $p_2(a)$	⟨from 1 and 2, by AND *introduction*⟩
4.	α_3:	FORANY (x) $p_1(x)$ AND $p_2(x) \Rightarrow p_3(x)$	⟨premise⟩
5.	$\alpha_3(a)$:	$p_1(a)$ AND $p_2(a) \Rightarrow p_3(a)$	⟨from 4, by *specification*⟩
6.		$p_3(a)$	⟨from 3 and 5, by *detachment*⟩
7.	α_4:	FORANY (x) $p_3(x) \Rightarrow p_4(x)$	⟨premise⟩
8.	$\alpha_4(a)$:	$p_3(a) \Rightarrow p_4(a)$	⟨from 7, by *specification*⟩
9.		$p_4(a)$	⟨from 6 and 8, by *detachment*⟩

Table 26.1: *Symbolic argument*

Premise set α

α_1: $p_1(a)$
α_2: $p_2(a)$
α_3: FORANY (x)
$p_1(x)$ AND $p_2(x) \Rightarrow p_3(x)$
α_4: FORANY (x)
$p_3(x) \Rightarrow p_4(x)$
α_5: $p_5(x)$
α_6: $p_5(x) \Rightarrow$ NON $p_3(x)$

Table 26.2: *Symbolic premise-set*

personality), protected by the German Constitution. The German Federal Constitutional Court (*Bundesverfassungsgericht*) prohibited the broadcast. As Alexy (1980) observes, the constitutional judges ground their decision in three steps:

1. They admit that in the Lebach case a comparative evaluation is necessary, since two conflicting constitutional propositions are applicable: (*a*) the right to privacy, excluding the publication of personal information, and (*b*) the right to communication, granting the liberty of propagating information. Moreover, they observe that neither of these rights is to be unconditionally preferred to the other. Only the particular circumstances of a case allow a choice to be made.
2. They affirm that the interest of the public in being informed by television about crimes usually outweighs the serious violation of privacy regularly caused by television programmes concerning criminal offences. This predominance, nevertheless, is not to be recognised when these offences are no longer actual.

Argument $\mathcal{A}^{\beta}$

1. β_1: *Lebach documentary* is a television programme ⟨premise⟩
2. β_2: *Lebach documentary* mentions *Tom* as the author of a criminal offence ⟨premise⟩
3. β_3: FORANY (x, y)
   IF [x is a television programme] AND
   [x mentions y as the author of a criminal offence]
   THEN^n [x violates y's privacy] ⟨premise⟩
4. [*Lebach documentary* violates *Tom*'s privacy]
   ⟨from 1, 2, 3, by *extended syllogism*⟩
5. β_4: FORANY (x, y)
   IF [x violates y's privacy]
   THEN [y has the (absolute obligative) right that x is not broadcast]
   ⟨premise⟩
6. *Tom* has the (absolute obligative) right that *Lebach documentary* is not broadcast ⟨from 4 and 5, by *syllogism*⟩

Table 26.3: *Privacy argument*

3. They conclude that it is not permissible to broadcast a documentary concerning a no-longer actual criminal offence (as the Lebach murder), if this can cause a new or additional prejudice to the offender.

In the following, we take the liberty of developing the Lebach example freely, without concerns for historical truth. In particular—and also in order not to violate the very privacy regulations we are discussing—we denote the involved persons through fictitious names.

A simple argument (in declarative form) we can extract from the reasoning of the German court is indicated in Table 26.3. The reader can check that the sequence of propositions in Table 26.3 qualifies as an argument, by satisfying the conditions of Definition 26.1.1 on page 670.

Similarly (we are now developing the Lebach example, without reference to the real facts of the case), we can build an argument for the right to broadcast the program on the head of Mary, the author of the television program (or on the head of the company for which she works), as shown in Table 26.4 on the facing page.

26.1.4. Arguments and Premise Sets

By a *premise* of an argument we mean any proposition (more generally, any noema) that is contained in the argument, without following from other propositions in the argument.

Argument $\mathcal{B}^\beta$

1.	β_5:	*Lebach documentary* reports factual information	⟨premise⟩
2.	β_6:	FORANY (x) IF $[x$ reports factual information$]$ THEN^n $[x$ can contribute to informing the public$]$	⟨premise⟩
3.		*Lebach documentary* can contribute to informing the public	⟨from 1,2, 3, by *extended syllogism*⟩
4.	β_7:	$[Mary$ is the author of the *Lebach documentary*$]$	⟨premise⟩
5.	β_1:	*Lebach documentary* is a television programme	⟨premise⟩
6.	β_8:	FORANY (x, y) IF $[x$ is the author of $y]$ AND $[y$ is a television programme$]$ AND $[y$ can contribute to informing the public$]$ THEN $[x$ has the (absolute permissive) right to broadcast $y]$	⟨premise⟩
7.		$Mary$ has the (absolute permissive) right to broadcast *Lebach documentary*	⟨from 5, 1, 4 and 6, by *syllogism*⟩

Table 26.4: *Freedom-of-information argument*

In our examples, arguments are built with premises that are extracted from premise sets and are labelled accordingly. When all premises of an argument are taken from a premise set, we say that the argument is *based upon* that premise set.

Definition 26.1.2 *Argument based upon premise set. An argument $\mathcal{A}$ is* based upon *the premise set θ iff every premise of $\mathcal{A}$ is contained in θ.*

For any premise set θ, we shall use the expression $\widehat{\theta}$ to denote the set of all arguments based on θ. Thus, rather than saying that argument $\mathcal{A}$ is based upon θ we may also say that $\mathcal{A}$ is contained in $\widehat{\theta}$ (abbreviated as $\mathcal{A} \in \widehat{\theta}$).

We also use the convention of denoting arguments with labels having the form $\mathcal{A}^\theta$, where θ is the premise set the argument is based upon. For instance, both arguments $\mathcal{A}^\beta$ and $\mathcal{B}^\beta$ (Table 26.4 and Table 26.3 on the facing page) are based upon premise set β (Table 26.5 on the next page), since both belong to $\widehat{\beta}$.

We shall always assume that arguments are based upon particular premise sets, though we shall mention this only when necessary to avoid ambiguities. In our psychology-based perspective, we may say that the premise set θ is a portion of the memory of the reasoner, possibly integrated by external sources of information (books, computers, etc.).

Thus, selecting a proposition as a premise amounts to inferring it from one's memory, or from that portion of one's memory that reflects a specific concern or a specific position of the reasoner.

One's premises also include the hypotheses one provisionally adopts as the

Premise set β

β_1: *Lebach documentary* is a television programme;
β_2: *Lebach documentary* mentions *Tom* as the author of a criminal offence
β_3: FORANY (x, y)
  IF [x is a television programme] AND
   [x mentions y as the author of a criminal offence]
  THEN^n [x violates y's privacy]
β_4: FORANY (x, y)
  IF [x violates y's privacy]
  THEN [y has the (absolute obligational) right that x is not broadcast]
β_5: *Lebach documentary* reports factual information
β_6: FORANY (y)
  IF [y reports factual information]
  THEN^n [y can contribute to informing the public]
β_7: Mary is the author of *Lebach documentary*
β_8: FORANY (x, y)
  IF [x is the author of y] AND
   [y is a television programme] AND
   [y can contribute to informing the public]
  THEN ⌈x has the (absolute permissive) right to broadcast y

Table 26.5: *The Lebach premise-set*

basis for further inquiries possibly leading to their confirmation (or to their refutation).

26.1.5. Subarguments

To complete the basic notions we need for analysing argumentation, we have to introduce subarguments:

Definition 26.1.3 *Subargument.* $\mathcal{A}^*$ *is a* (proper) subargument *of argument* $\mathcal{A}$ *iff:*

1. $\mathcal{A}^*$ *is an argument,*
2. $\mathcal{A}^*$ *is (strictly) included in* $\mathcal{A}$*, and*
3. *the order of the premises in* $\mathcal{A}^*$ *matches their order in* $\mathcal{A}^*$*.*

By "$\mathcal{A}^*$ is included in $\mathcal{A}$," which we abbreviate as $\mathcal{A}^* \subseteq \mathcal{A}$, we mean, as usual, that all elements in $\mathcal{A}^*$ are also in $\mathcal{A}$ ($\mathcal{A}^*$ is a subset of $\mathcal{A}$). Similarly, by "$\mathcal{A}^*$ is strictly included in $\mathcal{A}$", which we abbreviate as $\mathcal{A}^* \subset \mathcal{A}$, we mean that all elements in $\mathcal{A}^*$ are in $\mathcal{A}$, but some elements in $\mathcal{A}$ are not in $\mathcal{A}^*$ ($\mathcal{A}^*$ is a strict subset of $\mathcal{A}$). By "the order of the premises in $\mathcal{A}^*$ matches their order in $\mathcal{A}^*$"

Subargument of $\mathcal{A}^{\alpha}$

1.	α_1:	$p_1(a)$	⟨premise⟩
2.	α_2:	$p_2(a)$	⟨premise⟩
3.		$p_1(a)$ AND $p_2(a)$	⟨from 1 and 2, by AND *introduction*⟩

Table 26.6: *Symbolic subargument*

Subargument of $\mathcal{B}^{\beta}$

1.	β_5:	*Lebach documentary* reports factual information	⟨premise⟩
2.	β_6:	FORANY (x) IF [x reports factual information] THEN^n [x can contribute to informing the public]	⟨premise⟩
3.		*Lebach documentary* can contributes to informing the public	⟨from 1,2, 3, by *extended syllogism*⟩

Table 26.7: *Substantive subargument*

we mean that whenever a proposition B_1 precedes a proposition B_1 in $\mathcal{A}^*$, then B_1 must precede B_2 also in $\mathcal{A}$.

As you can see in Table 26.6, a strict subargument of $\mathcal{A}^{\alpha}$ (Table 26.1 on page 673) and in Table 26.7 a strict subargument of $\mathcal{B}^{\beta}$ (Table 26.4 on page 675).

26.2. Meta-Level Arguments

It has often been affirmed that logical reasoning can only provide *first-level* or *internal justifications* of legal decisions: According to this opinion, logic can justify the results that are obtained by applying rules but it cannot justify the applied rules (see Section 14.2.5 on page 401).

Our logical model does not have this limitation, since it includes the logical derivation of rules (see Section 23.3.2 on page 598). In particular, we provide higher-level logical justifications according to schema *meta-syllogism*, which is a compound inference rule combining reasoning schemata *syllogism* (which includes, in its turn, *detachment* and *specification*) and *de-doxification* (in particular, *Binding-elimination*).

In our model, consequently, one can build arguments that combine the inference of rules and the use of the inferred rules.

Premise set γ

γ_1: FORANY (ϕ)
IF $[Procl_{Parliament}\phi]$
THEN^n [*Binding* ϕ]
γ_2: $Procl_{Parliament}$
r_1: FORANY (x)
IF [x is on public premises]
THEN^n [x must not smoke]
γ_3: Tom is on public premises

Table 26.8: *Premise set for meta-reasoning*

Argument $\mathcal{A}^\gamma$

1. γ_1: FORANY (ϕ)
IF $[Procl_{Parliament}\ \phi]$
THEN^n [*Binding* ϕ] ⟨premise⟩
2. γ_2: $Procl_{Parliament}$
r_1: FORANY (x)
IF [x is on public premises]
THEN^n [x must not smoke] ⟨premise⟩
3. r_1: FORANY (x)
IF [x is on public premises]
THEN^n [x must not smoke] ⟨from 1 and 2, by *meta-syllogism*⟩
4. γ_3: *Tom* is on public premises ⟨premise⟩
5. *Tom* must not smoke ⟨from 3 and 4, by *syllogism*⟩

Table 26.9: *Meta-syllogism argument (synthetic version)*

26.2.1. A Meta-Level Argument

Assume that Tom endorses all propositions in premise set γ (Table 26.8):

- he believes that the Parliament has the power of issuing rules,[4]
- he believes that the Parliament has issued the rule that ⌈any one is forbidden from smoking when one stays on public premises⌉, and
- he is aware that he is now staying on public premises.

Using only the information in premise set γ, Tom can build argument $\mathcal{A}^\gamma$ (see Table 26.9) and conclude that he must not smoke.

[4] Remember that, according to the ideas we presented in Chapter 23, we use the locution $Procl_j\varphi$ to mean that j has proclaimed proposition φ. Thus $Procl_{Parliament}A$, it to be read as "Parliament proclaims that A," to wit, as "Parliament issues A."

26.2.2. Synthetic and Analytic Arguments

In Table 26.9 on the facing page, argument $\mathcal{A}^\gamma$ is presented in synthetic form, that is, using compound inferences. In Table 26.10 on the next page, we reproduce the same argument indicating all elementary inference steps composing the compound schemata *normative meta-syllogism* and *normative syllogism*.

In the following, to avoid excessive detail (which will compromise readability), we shall only provide a synthetic representation of arguments, leaving the reader the task of unpacking compound inferences.

However, it is important that we remember that compound inference schemata are only abbreviations of the combination of their component elementary schemata. As we shall see, a compound inference can is also impaired when a component elementary inference is attacked, and in such a case we may need to unbind the compound inference to precisely locate the conflict.

26.2.3. Another Meta-Level Argument

To conclude our discussion of meta-inferences, let us address again the Lebach example. Assume for instance that the premise set concerning the Lebach case (Table 26.5 on page 676)—rather than directly containing premise 3 (rule β_3)—contains premises 3.1 and 3.2 in subargument $\mathcal{A}_2^\beta$ (Table 26.11 on page 681), stating that rule β_3 is the *ratio decidendi* of a precedent, and that *rationes decidendi* are binding.

The reasoner endorsing such premises would still be able to derive the conclusion of argument $\mathcal{B}^\beta$ (Table 26.3 on page 674), but through a modified argument, where rule β_3, rather than being inputted as a premise, is derived according to subargument $\mathcal{A}_2^\beta$.

26.3. Collisions between Arguments

We now need to go back to our analysis of collisions between reasons (Section 2.2 on page 55), and extend it to collisions between arguments. First of all we need to define a general notion of a collision between arguments.

26.3.1. The Idea of a Collision between Arguments

Let us recall that in Section 2.2.5 on page 62 we distinguished two kinds of collisions:

1. *rebutting collision*, where two reasons support incompatible conclusions;
2. *undercutting collision*, where one reason leads to the conclusion that another reason is unable to support its own conclusion.

Argument $\mathcal{A}^{\gamma}$

1.	γ_1:	FORANY (ϕ)	
		IF $Procl_{Parliament}\phi$	
		THEN^n *Binding* ϕ	⟨premise⟩
1.1.		IF $Procl_{Parliament}$	
		(r_1: FORANY (x)	
		IF [x is on public premises]	
		THEN^n [x must not smoke])	
.		THEN^n	
		Binding	
		(r_1:FORANY (x)

Table 26.10: *Meta-syllogism argument (analytical version)*

We have also observed that in rebutting collisions the stronger reason prevails, while in undercutting collisions the undercutter prevails, regardless of its comparative strength.

These ideas can be directly transferred to arguments, considering that an argument is a sequence of inferences, where each inference is a transition from a reason to its conclusion: All propositions in an argument are sub-reasons or conclusions of inferences in the argument. Remember a *reason* is a set of preconditions which is sufficient to support a conclusion, according to a reasoning schema. Thus, when a reasoning schema requires the joint combination of certain propositions, for establishing a conclusion, each of such proposition is not a reason, in relation to that inference schema, but only a *subreason*.

Subargument $\mathcal{A}_2^{\beta}$

3.1. $\beta_{3.1}$: FORANY (φ)
IF [rule φ is a *ratio decidendi* of the Supreme Court]
THEN^n *Binding* φ ⟨premise⟩
3.2. $\beta_{3.2}$: (rule β_3:
FORANY (x, y)
IF [x is a television programme] AND
[x mentions y as the author of a criminal offence]
THEN^n [x violates y's privacy])
is a *ratio decidendi* of the Supreme Court
⟨premise⟩
3.3. β_3: FORANY (x, y)
IF [x is a television programme] AND
[x mentions y as the author of a criminal offence]
THEN^n [x violates y's privacy]
⟨from 3.1. and 3.2, by *meta-syllogism*⟩

Table 26.11: *Meta-syllogism subargument*

In particular, in our model:

- Any premise φ in argument $\mathcal{A}^{\theta}$ may be viewed as a reason supporting itself, that is, both as a reason and a conclusion. More exactly, the presence of φ in premise set θ (this is what we express by qualifying a proposition as a premises from θ) is the reason why we adopt φ as a premise in any argument based upon θ.
- The reason for a derived conclusion ψ, with regard to argument $\mathcal{A}$, is the set of propositions which, within argument $\mathcal{A}$, directly leads to ψ.

We say that an argument rebuts another argument when the two arguments contain reasons leading to incompatible conclusions (reasons rebutting each another).

Definition 26.3.1 *Rebutting collision between arguments. Argument $\mathcal{A}_1$* rebuts *argument $\mathcal{A}_2$ iff*

1. *$\mathcal{A}_1$ contains a reason having conclusion φ_1,*
2. *$\mathcal{A}_2$ contains a reason having conclusion φ_2, and*
3. *φ_1 and φ_2 are incompatible.*

Similarly, we say that an argument undercuts another argument when the first argument contains a reason concluding that a reason in the other does not support its conclusion (so that the first reason undercuts the second).

Definition 26.3.2 *Undercutting collision between arguments. Argument $\mathcal{A}_1$* undercuts *argument $\mathcal{A}_2$ iff*

Argument $\mathcal{C}^{\alpha}$

1.	α_5:	$p_5(a)$	⟨premise⟩
2.	α_6:	FORANY (x)	
		$p_5(x) \Rightarrow$ NON $p_3(x)$	⟨premise⟩
3.		NON $p_3(a)$	⟨from 1 and 2, by *syllogism*⟩

Table 26.12: *Symbolic counterargument*

1. *$\mathcal{A}_2$ contains reason R_2, having conclusion φ, and*
2. *$\mathcal{A}_1$ contains reason R_1 concluding that R_2 does not support φ.*

To cover both rebutting and undercutting between arguments, we introduce the notion of an attack.[5]

Definition 26.3.3 *Attack and counterargument. Argument $\mathcal{A}_1$* attacks *(is a* counterargument *to) argument $\mathcal{A}_2$ iff*

- *$\mathcal{A}_1$ undercuts $\mathcal{A}_2$, or*
- *$\mathcal{A}_1$ rebuts $\mathcal{A}_2$.*

26.3.2. Rebutting Collisions

As an example of rebutting, consider arguments $\mathcal{A}^{\alpha}$ (in Table 26.1 on page 673) and $\mathcal{C}^{\alpha}$ (in Table 26.12): Proposition (3) in $\mathcal{C}^{\alpha}$ contradicts proposition (6) in $\mathcal{A}^{\alpha}$.

Similarly, argument $\mathcal{A}^{\beta}$ (Table 26.3 on page 674) rebuts argument $\mathcal{B}^{\beta}$ (Table 26.4 on page 675). This is also an instance of rebutting, since the conclusions of the two arguments are incompatible: ⌈Tom has the right that the documentary is not broadcast⌉ contradicts ⌈Mary has the right to broadcast the documentary⌉. In this case, the incompatibility between the two conclusions does not immediately emerge as a logical contradiction.

To obtain a plain contradiction (to derive both propositions A and NON A) we need to extend the two arguments through conclusive inferences, based upon the deontic notions we defined in Chapter 17 and 19, as we shall see in Section 27.4.3 on page 732.

26.3.3. Undercutting Collisions

In the normative domain *undercutting* is usually based upon the *inapplicability* of a general rule. By saying that a rule is inapplicable to certain entities, we

[5] Our notion of an attack corresponds to that of Prakken and Sartor 1997. Some argumentation theorists have used the word “attack” in a different sense, that is, to denote what we call *defeat* (see Dung 1993 and 1995).

Argument $\mathcal{C}^{\beta}$

1. β_9: Tom agreed to the transmission of $Lebach\ documentary$ ⟨premise⟩
2. β_{10}: FORANY (x, y)
   IF [x agreed to the transmission of y]
   THEN^n [β_3 *is* NOT *applicable to* x and y] ⟨premise⟩
3. β_3 *is* NOT *applicable to* Tom and $Lebach\ documentary$
   ⟨from 1 and 2, by *syllogism*⟩

Table 26.13: *Undercutting counterargument*

precisely claim that we are not authorised to infer the instances of that rule which concern these entities.

Thus, an inapplicability argument directly undercuts the inference specifying the general propositions, as we shall see in Section 26.3.4 on the following page. Accordingly, it also undercuts the syllogism that embeds the specification.

This is exemplified by the collision between $\mathcal{A}^{\beta}$ (in Table 26.3 on page 674) and $\mathcal{C}^{\beta}$ (in Table 26.13).

Undercutting happens according to the defeating schema *inapplicable syllogism*, where v is a sequence of variables, σ is a sequence or terms, and $A(v/\sigma)$ is instance of A which is obtained by substituting in A all occurrences of variables in v with terms in σ.

Defeating schema: *Inapplicable syllogism*

(1) r *is* NOT *applicable to* σ

——— IS A UNDERCUTTING DEFEATER AGAINST

(2) (*a*) r: FORANY (x)
   IF A
   THEN^n B;
   (*b*) $A(v/\sigma)$
   ——— IS A REASON FOR
   (*c*) $B(v/\sigma)$

You can see an instance of this defeat-schema in Table 26.14 on the next page.

This kind of undercutting does not correspond exactly to the original idea of undercutting as introduced in Pollock 1995 (we have presented Pollock's views in Section 2.2.7 on page 65), where undercutting follows from general epistemological principles.

However, we believe that undercutting on the basis of inapplicability conclusions can be added to undercutting on the basis of general epistemological principles.

This way of reasoning corresponds not only to the peculiarities of legal reasoning, but also to the way of proceeding of a critical reasoner, who is able to

Defeating instance: *Inapplicable syllogism*

(1) β_3 *is* NOT *applicable to* ($Lebach\ documentary$, Tom)

——— IS AN UNDERCUTTING DEFEATER AGAINST

(2) (*a*) β_3 : FORANY (x, y)
IF x is a television programme AND
x mentions y as the author of a criminal offence
THEN^n x violates y's privacy;

(*b*) $Lebach\ documentary$ is a television programme;

(*c*) $Lebach\ documentary$ mentions Tom as the author of a criminal offence

——— IS A REASON FOR

(*d*) $Lebach\ documentary$ violates Tom's privacy

Table 26.14: *Defeating by undercutting*

question the appropriateness (the reliability) of his or her single inference steps, according to the context in which these steps take place, and the premises they include.

In the following section, we shall discuss how a syllogism is defeated by undercutting its implicit specification-step. The reader who is not interested in logical technicalities can jump directly to Section 26.4 on the next page.

26.3.4. Locating Undercutting Attacks

To locate $\mathcal{C}^\beta$'s undercutting attack against $\mathcal{A}^\beta$, we need to unpack the inference we performed in $\mathcal{A}^\beta$ according to the compound schema *syllogism*, that is, we need to rewrite the first part of the argument, using the combination of *specification* and *detachment*, as is shown in Table 26.15 on the facing page).

The analytical representation of Table 26.15 on the next page shows proposition 3.1, which specifies premise β_3 with regard to Tom and $Lebach\ documentary$. It is exactly the inference of 3.1 from 3 (by *specification*) which is undercut by the conclusion that premise β_3 is not applicable to such entities.

Undercutting attack takes place according to the defeating schema *inapplicable specification*, which says that any reason for the inapplicability of a proposition to certain entities is a defeater against the specification of that proposition with regard to such entities.

Defeating schema: *Inapplicable specification*

(1) r *is* NOT *applicable to* y

——— IS AN UNDERCUTTING DEFEATER AGAINST

(2) (*a*) r: FORANY (x) φ

——— IS A REASON FOR

(*b*) $\varphi(x/y)$

Analytical subargument of argument $\mathcal{A}^{\beta}$

1. β_1: *Lebach documentary* is a television programme ⟨premise⟩

2. β_2: *Lebach documentary* mentions *Tom* as the author of a criminal offence ⟨premise⟩

2.1. [*Lebach documentary* is a television programme] AND [*Lebach documentary* mentions *Tom* as the author of a criminal offence] ⟨from 1 and 2, by AND *introduction*⟩

3. β_3: FORANY (x, y)
   IF [x is a television programme] AND
   [x mentions y as the author of a criminal offence]
   THEN^n x violates y's privacy ⟨premise⟩

3.1. β_3 (*Lebach documentary*, *Tom*):
   IF [*Lebach documentary* is a television programme] AND
   [*Lebach documentary* mentions *Tom* as the author of a criminal offence]
   THEN^n [*Lebach documentary* violates *Tom*'s privacy]
   ⟨from 3, by *specification*⟩

4. *Lebach documentary* violates Tom's privacy
   ⟨from 2.1 and 3.1, by *detachment*⟩

Table 26.15: *Analytical inference*

Defeat schema *inapplicable specification* is particularly significant with regard to rules: It defeats the application of a rule to particular cases (that is, its application with regard to certain particular individuals, entities and occasions). By undercutting the specification-step we also undercut the syllogism embedding the specification step, as you can see in Table 26.16 on the following page, concerning the inference of propositions (4) from propositions (1), (2), and (3), in $\mathcal{A}^{\beta}$, by schema *normative syllogism*.

26.4. Argument Defeat

As we saw in Section 2.2.5 on page 62, attack (collision) leads to *defeat*: When one inference attacks another inference, necessarily at least one of them is defeated. Since defeat of an inference leads to the defeat of the argument containing such inference, we may transfer the notion of defeat to arguments.

The notion of *argument defeat* provides us with a way of adjudicating conflicts between two arguments. This is still insufficient for determining the final status of an argument, since other arguments may interfere: In particular, as we shall see, a defeated argument can be reinstated when its defeater is strictly defeated by another argument.

Defeating instance: *Inapplicable specification*

(1) β_3 *is* NOT *applicable to* $\langle Lebach\ documentary, Tom\rangle$

——— IS AN UNDERCUTTING DEFEATER AGAINST

(2) (a) β_3:

FORANY (x, y)

IF [x is a television programme] AND
[x mentions y as the author of a criminal offence]

THEN^n [x violates y's privacy]

——— IS A REASON FOR

(b) β_3 $(Lebach\ documentary, Tom)$:

IF [$Lebach\ documentary$ is a television programme] AND
[$Lebach\ documentary$ mentions Tom as the author of a criminal offence]

THEN^n [$Lebach\ documentary$ violates Tom's privacy]

Table 26.16: *Defeating by undercutting: inapplicability of the specification of a rule*

26.4.1. The Notion of Argument Defeat

In Section 2.2.4 on page 61 we have introduced the notion of *defeat*: A reason R_1 defeats a reason R_2 when the endorsement of R_1 prevents the endorsement of R_2's conclusion. We have observed that this happens in the two kind of conflicts or collisions we have just considered, *undercutting* and *rebutting*.

We also observed that undercutting reasons always prevail over the undercut reasons. On the contrary, in the case of a rebutting collisions, we need to examine whether we can establish that one rebutter prevails over the other:

- if our preferential information leads us to establish that one rebutter outweighs the other, then only the latter is defeated;
- if we cannot achieve any relevant preferential conclusion, then we must view both rebutters as being defeated.

As an example of a rebutting collision, consider arguments $\mathcal{A}^\delta$ and $\mathcal{B}^\delta$ (Table 26.17 on the next page).

Also argument $\mathcal{A}^\beta$ (Table 26.3 on page 674) and argument $\mathcal{B}^\beta$ (Table 26.4 on page 675) rebut one another, and thus they defeat one another, unless preferential information is provided.

Our analysis of the notion of defeat leads us to Definition 26.4.1 on the facing page.

	Argument $\mathcal{A}^\delta$			Argument $\mathcal{B}^\delta$	
1.	δ_1:	A	1.	δ_5:	D
2.	δ_2:	$A \Rightarrow B$	2.	δ_6:	$D \Rightarrow$ NON B
3.		B	3.		NON B
4.	δ_3:	$B \Rightarrow C$			
5.		C			

Table 26.17: *Two mutually rebutting arguments*

Definition 26.4.1 *Defeat. Argument $\mathcal{A}_1$* defeats *argument $\mathcal{A}_2$, relatively to a discourse (a set of arguments) Σ, in the following two cases:*

1. Defeat by undercutting*: $\mathcal{A}_1$ defeats $\mathcal{A}_2$ by undercutting iff $\mathcal{A}_1$ contains a reason R_1 which undercuts a reason R_2 in $\mathcal{A}_2$.*
2. Defeat by rebutting*: $\mathcal{A}_1$ defeats $\mathcal{A}_2$ by rebutting iff:*
   (a) $\mathcal{A}_1$ contains a reason R_1 which rebuts a reason R_2 in $\mathcal{A}_2$;
   (b) Σ does not justify the conclusion that $\lceil R_2$ outweighs $R_1 \rceil$;
   (c) $\mathcal{A}_1$ is not undercut by $\mathcal{A}_2$.

By saying that discourse Σ does not justify the propositions that $\lceil R_2$ outweighs $R_1 \rceil$, we mean that this proposition is not the conclusion of any argument in Σ which is justified relatively to Σ.

By requiring that $\mathcal{A}_2$ does not undercut $\mathcal{A}_1$, we indicate that undercutting prevails over rebutting: When we have reasons to conclude that one inference is unreliable, then this inference cannot be used to attack these very reasons.

Note that defeat by undercutting is independent of preferences (and more generally it is independent on the content of Σ). On the contrary, defeat by rebutting relatively to Σ is dependent on preferences, as established by discourse Σ: Argument A_1 fails to defeat argument A_2 (there is no defeat) if A_1's rebutting reason is outweighed by the incompatible reason in A_2, according to Σ. Thus, defeat by rebutting is dependent on Σ's content, and more exactly, on the fact that a certain piece of preferential information is no justified conclusion of Σ.

On the basis of the notion of defeat, we may understand *strict defeat* as consisting in the fact that an argument defeats another argument without being defeated by it (see Section 2.2.8 on page 66).

Definition 26.4.2 *Strict defeat. We say that $\mathcal{A}_1$* strictly defeats *$\mathcal{A}_2$, relatively to discourse Σ, under the following conditions:*

1. *$\mathcal{A}_1$ defeats $\mathcal{A}_2$ relatively to Σ, and*
2. *$\mathcal{A}_2$ does not defeat $\mathcal{A}_1$ relatively to Σ.*

	Argument $\mathcal{A}^\delta$			Argument $\mathcal{B}^\delta$			Argument P_1^δ	
1.	δ_1:	A	1.	δ_5:	D	1.	δ_4:	$\|1, 2$ for 3 in $\mathcal{A}^\delta\|$
2.	δ_2:	$A \Rightarrow B$	2.	δ_6:	$D \Rightarrow$ NON B			OUTWEIGHS
3.		B	3.		NON B			$\|1, 2$ for 3 in $\mathcal{B}^\delta\|$
4.	δ_3:	$B \Rightarrow C$						
5.		C						

Table 26.18: *Rebutting defeat: symbolic example*

Argument $\mathcal{P}_1^\beta$

8.	β_9:	$\|4, 5$ for 6, in $\mathcal{A}^\beta\|$
		OUTWEIGHS
		$\|1, 4, 5, 6$ for 7, in $\mathcal{B}^\beta\|$

Table 26.19: *Substantive preference*

An example of defeat is provided in Table 26.18, where we adopt the following conventions:

- We refer to a reason for a conclusion (within an argument), by listing the numbers of the propositions that constitute the reason (in that argument), followed by the number of the corresponding conclusion. For instance, the fact that propositions (1) and (2) constitute the reason for endorsing proposition (3) in argument $\mathcal{A}$, is represented as $\|1, 2,$ for 3 in $\mathcal{A}\|$.
- We write R_1 OUTWEIGHS R_2 to express that reason R_1 is preferable to reason R_2.

According to the preferential argument $\mathcal{P}_1^\delta$, the reason (for conclusion B) constituted by propositions (1) and (2) in argument $\mathcal{A}^\delta$ outweighs the reason (for conclusion NON B), which is formed by combining propositions (1) and (2) in argument $\mathcal{B}^\delta$.

Similarly, argument $\mathcal{A}^\beta$ (Table 26.3 on page 674) strictly defeats argument $\mathcal{B}^\beta$ (Table 26.4 on page 675), according to preference argument $\mathcal{P}_1^\beta$ (Table 26.19).

A preferential argument can consist in a multi-step structure. In particular, a preferential proposition may be derived on the basis of considerations pertaining to the nature and the content of the competing reasons. For instance, according to preferential argument $\mathcal{P}_2^\beta$ (Table 26.20 on the facing page), reason $\|4, 5$ for 6, in $\mathcal{A}^\beta\|$ outweighs reason $\|1, 4, 5, 6$ for 7, in $\mathcal{B}^\beta\|$, since reasons based upon privacy outweigh reasons based upon the right to information.

Argument $\mathcal{P}_2^\beta$

1. β_{10}: reason $\|$4, 5 for 6, in $\mathcal{A}^\beta\|$ is based upon privacy
2. β_{11}: reason $\|$1, 4, 5, 6 for 7, in $\mathcal{B}^\beta\|$ is based upon the right to information
3. β_{12}: FORANY (φ, ψ)
   IF [reason φ is based upon privacy] AND
   [reason ψ is based upon the right to information]
   THEN [φ OUTWEIGHS ψ]
4. $\|$4, 5 for 6, in $\mathcal{A}^\beta\|$
   OUTWEIGHS
   reason $\|$1, 4, 5, 6 for 7, in $\mathcal{B}^\beta\|$
   ⟨from 1, 2, and 3, by *syllogism*⟩

Table 26.20: *Derivation of a preferential proposition*

26.4.2. *Decisive Subreasons and the Evaluation of Colliding Reasons*

The issue we need now to address is how to evaluate colliding rebutters, so as to establish which reason outweighs its competitor. This problem is particularly difficult, and intrinsically controversial, for compound reasons, including multiple subreasons.

Various alternative techniques to perform this comparative evaluation have have been proposed, and choosing one of them seems to be quite arbitrary. For instance, we may assume that the strength of a reason corresponds to the strength of the weakest of its sub-reasons, or alternatively that it is a numerical value to be computed on the basis of the numbers that are assigned to each subreason (as in probability calculus).

Fortunately, it seems that in the legal domain this problem can be simplified and made tractable, with regard to *syllogism* (or *detachment*), by focusing on normative conditionals, rather than on their antecedents.

This seems to be the way in which common-sense reasoning (and in particular normative reasoning) proceeds, when applying rules. After establishing whether the preconditions of a rule are satisfied, we move to applying the rule, without questioning any longer its preconditions: If we have reasons against endorsing the rule's conclusion, we usually assume that these reasons question the application of the rule, rather than the satisfaction of its preconditions. Thus, reasons contradicting the consequent of a rule need to be matched against the strength of the rule, rather than against the strength or its antecedent preconditions.[6]

For instance, our conclusion that Mary has the right to broadcast the Lebach

[6] This idea was adopted by Prakken 1991 and subsequently in the logic of Prakken and Sartor 1997 (for an early discussion, see also Sartor 1992).

documentary should lead us to question the application of the privacy rule that ⌈a television program that violates one's privacy, by mentioning one's name in connection with a crime, ought not to be broadcast⌉. This conclusion should not lead us to deny that the program violates privacy, or to deny that it mentions the name of the author of a crime.

Thus, in the following we shall assume that the decisive element for comparing compound reasons in normative reasoning is represented by certain specific propositions in these reasons, which we call *decisive subreasons*. This is detailed in the following definitions.

Definition 26.4.3 *Decisive subreasons. Proposition φ in reason R ($\varphi \in R$), is the* decisive subreason *of R iff:*

1. *φ is the only proposition in R, or*
2. *φ is the specific conditional* IF A THEN^n B*, and R is reason* $\{$IF A THEN^n B; $A\}$*, leading to conclusion B according to schema* normative detachment*;*
3. *φ is the general conditional* FORANY (x) IF A THEN^n B*, and R is reason* $\{$FORANY (x) IF A THEN^n B; $A(x/a)\}$*, leading to conclusion $B(x/a)$ according to schema* normative syllogism*.*

Definition 26.4.4 *Preferences between reasons. Reason R_1* OUTWEIGHS *reason R_2 if R_1's decisive subreason* is stronger *than R_2's decisive subreason.*

According to these definitions, the comparative strength of certain particular sub-reasons (the decisive ones) allow reasoners to determine what reasons outweigh their competitor and thus what arguments preferentially rebut other arguments. This determination (the passage from preferences between conditionals to preferences between the reasons containing these conditionals) may indeed be viewed as an additional inference step, though we shall prefer to leave it implicit when representing arguments, unless it is necessary to spell it out.

Reasoning schema: *Decisive subreason*

(1) s_1, the decisive subreason of R_1, is stronger than s_2, the decisive subreason of R_2

——— IS A CONCLUSIVE REASON FOR

(2) R_1 OUTWEIGHS R_2

Obviously, we assume that one is able to know whether a reason is a decisive subreason by inspecting one's own reasons, without the need to input this information from a premise set (this follows from the idea that we are dealing with reflexive reasoners, which are able to access their mental states and reasoning processes).

26.4.3. The Preference Relation over Reasons

We use the symbol $\succ$ to express comparative evaluations of propositions (subreasons). We write

$x \succ y$
(x is stronger than y)

to mean that proposition x is preferable to (stronger than) proposition y. As usual, we view the $\succ$ relations as being a strict partial order, that is, as enjoying the properties of transitivity and asymmetry:

$trans$: FORANY (x, y, w)
IF $(x \succ y$ AND $y \succ w)$ THEN^m $x \succ w$
$asymm$: FORANY (x, y)
IF $x \succ y$ THEN^m (NON $y \succ x$)

These general axioms do not express normative determination: They are material conditionals (IF ... THEN^m), rather than normative conditionals (IF ... THEN^n). Thus, they enable conclusive inferences, according to classical logic.

Let us go back to the examples we have considered in the previous section, and rephrase them on the basis of the idea that preferences between reasons can be inferred from the comparative strength of their decisive subreasons.

Consider first the example of Table 26.21 on the next page, which extends the example of Table 26.18 on page 688. Observe that argument $\mathcal{P}_2^\delta$ differs from argument $\mathcal{P}_1^\delta$, since its first line now concerns preferability of subreason δ_2 (in A^δ) over subreason δ_6 (in $\mathcal{B}^\delta$). The preferability of the corresponding reason is inferred in the second line.

Also in Table 26.22 on the next page—extending Table 26.19 on page 688—we infer a preference between reasons from a preference between subreasons. However, in this case, even the preference between the involved subreasons is inferred from further premises. These include:

- the fact-proposition that the crime is not actual (β_{10}),
- the value-proposition that when a crime is not actual, then the pro-privacy rule β_4 has a better value impact[7] than the pro-information rule β_8,
- and the general preference-rule saying that propositions having a better value impact are preferable (the principle of axiological preference, pr_{axio}).[8]

[7] (On the notion of value-impact, see Section 7.2.6 on page 208.

[8] We shall freely introduce in our inference some general preference principles, denoted as pr_n, where n is name with distinguishes one preference principle from another. We assume that these principles are available to any reasoner or, if you prefer, that they are implicitly included in any premise set.

Argument $\mathcal{A}^\delta$			Argument $\mathcal{B}^\delta$		
1.	δ_1:	A	1.	δ_5:	D
2.	δ_2:	$A \Rightarrow B$	2.	δ_6:	$D \Rightarrow$ NON B
3.		B	3.		NON B
4.	δ_3:	$B \Rightarrow C$			
5.		C			

Argument $\mathcal{P}_2^\delta$

1.	δ_4:	$\delta_2 \succ \delta_6$
2.		$\|1, 2$ for 3 in $\mathcal{A}^\delta\|$ OUTWEIGHS $\|1, 2$ for 3 in $\mathcal{B}^\delta\|$ ⟨from 1, by *decisive subreason*⟩

Table 26.21: *Extended rebutting-defeat: symbolic example*

Argument $\mathcal{P}_2^\beta$

1.	β_{10}:	the crime is not actual	⟨premise⟩
2.	β_{11}:	IF [the crime is not actual] THEN^n [β_4 has a better value impact than β_8]	⟨premise⟩
3.		β_4 has a better value impact than β_8	⟨from 1 and 2, by *detachment*⟩
4.	pr_{axio}:	FORANY (φ, ψ) IF [φ has a better value impact than ψ] THEN^n $\varphi \succ \psi$	⟨premise⟩
5.		$\beta_4 \succ \beta_8$	⟨from 3 and 4, by *syllogism*⟩
6.		reason $\|4, 5$ for 6, in $\mathcal{A}^\beta\|$ OUTWEIGHS reason $\|3, 4, 5, 6$ for 7, in $\mathcal{B}^\beta\|$	⟨from 9.5, by *decisive subreason*⟩

Table 26.22: *Extended rebutting-defeat: substantive example*

This argument (see Table 26.22) completes our formalisation of the judges' reasoning in the Lebach case.

26.4.4. The Reinstatement of Defeated Arguments

As we have observed above, the fact that an argument A_1 defeats or is defeated by another argument A_2 does not yet determine the final status of these arguments, since other arguments may interfere.

In particular, a defeated argument can be *reinstated* (see Section 2.2.9 on page 68) when its defeater strictly defeated by another argument.[9]

[9] For a discussion of reinstatement in logical systems for defeasible reasoning, see Horty 2001.

This situation is exemplified in Table 26.23 on the following page. Observe the defeat relations:

a. $\mathcal{A}^{\delta}$ strictly defeats $\mathcal{B}^{\delta}$, by preferentially rebutting it according to $\mathcal{P}_1^{\delta}$, and
b. $\mathcal{C}^{\delta}$ strictly defeats $\mathcal{A}^{\delta}$, by preferentially rebutting it according to $\mathcal{P}_2^{\delta}$.

The defeat relation of item (*a*) is due to the fact that $\mathcal{A}^{\delta}$ contains reason $\|1, 2$ for $3\|$, which collides with, and outweighs, reason $\|1, 2$ for 3 in $\mathcal{B}^{\delta}\|$, according to $\mathcal{P}_1^{\delta}$. The outweighing takes place since $\mathcal{A}^{\delta}$'s decisive subreason, δ_2, is stronger than δ_6, the decisive subreason of $\|1, 2$ for 3 in $\mathcal{B}^{\delta}\|$.

The defeat relation of (*a*) is due to the fact that $\mathcal{C}^{\delta}$ contains reason $\|1, 2$ for $3\|$, which collides with, and outweighs, reason $\|1$ for 1 in $\mathcal{A}^{\delta}\|$. This happens since $\mathcal{C}^{\delta}$'s decisive subreasons, δ_8, is stronger than δ_1.

We need now to establish what is the outcome that one should rationally endorse, given all arguments in Table 26.23 on the next page. Our intuition tells us that we should endorse both arguments $\mathcal{B}^{\delta}$ and $\mathcal{C}^{\delta}$, and reject argument $\mathcal{A}^{\delta}$. It is true that $\mathcal{B}^{\delta}$ is preferentially rebutted by $\mathcal{A}^{\delta}$, but the latter argument is ruled out by $\mathcal{C}^{\delta}$, and thus $\mathcal{B}^{\delta}$ (having been freed from its only defeater) should regain its credibility, that is, should be reinstated.

For reinstatement in our Lebach example, consider, for instance, arguments $\mathcal{A}^{\beta}$ (Table 26.3 on page 674), $\mathcal{B}^{\beta}$ (Table 26.4 on page 675) and $\mathcal{C}^{\beta}$ (Table 26.13 on page 683), and the preferential argument $\mathcal{P}_2^{\beta}$ (Table 26.20 on page 689). Also in this case, the intuitive result emerging from the interaction of our four arguments seems to be clear:

1. Given that Tom's crime is not actual, argument $\mathcal{A}^{\beta}$, concluding for Tom's right that the documentary is not broadcast, outweighs argument $\mathcal{B}^{\beta}$, concluding for Mary's right that the documentary is broadcast, according to preferential argument $\mathcal{P}_2^{\beta}$. Thus, the first argument strictly defeats the second, by rebutting it and outweighing it according to argument $\mathcal{P}_2^{\beta}$. Thus it seems that we must conclude that Tom has the right that the documentary is not broadcast.
2. However, argument $\mathcal{C}^{\beta}$ says that, since Tom agreed to the broadcast of the Lebach program, then the rule that ⌈the broadcast determines the violation of Tom's privacy⌉ is inapplicable. This inference strictly defeats (by undercutting) the inference that, within argument $\mathcal{A}^{\beta}$, concludes that the broadcast violates Tom's privacy. Thus argument argument $\mathcal{A}^{\beta}$ is ruled out.
3. Argument $\mathcal{B}^{\beta}$, having been freed of its only defeater, regains its believability. Thus we are to endorse its conclusion, that is, we are to conclude that Mary has the right that the documentary is broadcast.

In Chapter 27 we shall analyse in detail the logic of reinstatement, providing a full account of the kind of reasoning we have just exemplified.

Argument $\mathcal{A}^\delta$			Argument $\mathcal{B}^\delta$			Argument $\mathcal{C}^\delta$		
1.	δ_1:	A	1.	δ_5:	D	1.	δ_7:	E
2.	δ_2:	$A \Rightarrow B$	2.	δ_6:	$D \Rightarrow$ NON B	2.	δ_8:	$E \Rightarrow$ NON A
3.		B	3.		NON B	3.		NON A
4.	δ_3:	$B \Rightarrow C$						
5.		C						

Argument $\mathcal{P}_1^\delta$			Argument $\mathcal{P}_2^\delta$		
1.	δ_4:	$\delta_2 \succ \delta_6$	1.	δ_9:	$\delta_8 \succ \delta_1$
2.		$|$1, 2 for 3 in $\mathcal{A}^\delta\|$ OUTWEIGHS $|$1, 2 for 3 in $\mathcal{B}^\delta\|$ $\langle$from δ_4, by *decisive subreason*$\rangle$	2.		$|$1, 2 for 3 in $\mathcal{C}^\delta\|$ OUTWEIGHS $|$1 for 1 in $\mathcal{A}^\delta\|$ $\langle$from δ_9, by *decisive subreason*$\rangle$

Table 26.23: *Reinstatement*

Chapter 27

ARGUMENT LOGIC

In Chapter 26 we have analysed the notion of an argument and we have discussed various possible interactions between arguments. In particular, we have seen that arguments may collide, that collisions may determine defeat, and that further collisions may reinstate the defeated arguments.

However, we have not yet provided a precise way for determining the cognitive outcome of a set of interacting arguments: What arguments and what conclusions should a rational reasoner (defeasibly) endorse when his or her beliefs allow the construction of colliding arguments?

This is the issue we shall tackle in this chapter, and our answer will consist in providing an *argument logic*, which determines what outcomes are justified relatively to sets of possibly conflicting arguments.

27.1. The Status of Arguments

When we face interacting arguments, our intuitions are usually clear—at least as to the type of conflicts we are likely to find in real life—and reasonable people tend to converge on the same evaluations. Thus, evaluating arguments may appear to be a natural competence, which is part of our reasoning endowment.

However, it is not easy to provide a precise theoretical reconstruction of this competence. It may seem that it is sufficient to state that an argument is inferentially justified when all of its defeaters are defeated by justified arguments. This statement if true, but unfortunately it provides a circular definition: To establish whether $\mathcal{A}$ is justified, we need to establish whether each of $\mathcal{A}$'s defeaters are justified, which may depend on whether $\mathcal{A}$ is justified.

By an *argument logic* we mean a formalism that hopefully can explain and rationalise our intuitive argument-evaluations.

27.1.1. Requirements of an Argument Logic

Our argument logic needs to take into account the fact that defeating arguments can in turn be defeated by further arguments: Comparing arguments by pairs is not sufficient to find out what arguments are to be rationally endorsed.

We rather need to provide a way of determining the *status of an argument* on the basis of all ways in which all relevant arguments interact.

In particular, our model should allow for reinstatement of defeated argu-

ments, when their defeaters themselves are (strictly) defeated by further arguments.

Moreover, the model should respect the *weakest-link principle*: An argument cannot be justified unless all of its subarguments are justified.

27.1.2. Justified, Defensible, and Overruled Arguments

The notion of the status of arguments will be the central element of our argument logic. We shall divide all arguments in certain *discourse* (by a discourse we mean in general any set of arguments) into three classes, according to their status in the discourse, the justified, the defensible, and the overruled ones:

1. *Justified arguments* have no viable attackers in the discourse.
2. *Overruled arguments* are attacked by justified arguments and therefore are deprived of any relevance in the discourse.
3. *Defensible arguments* are undecided, since their attackers are neither justified nor overruled.

From our point of view, the status of an argument in a discourse does not depend on the intrinsic qualities of the argument. It rather depends on whether other arguments in the discourse attack the argument we are considering, and in particular on whether these attackers succeed in defeating that argument. This implies that arguments are defeasible, in a double sense.

First there is *internal defeasibility*, or defeasibility *in a discourse*, that is, relatively to a given set of arguments. An argument $\mathcal{A}$ is defeated in a discourse, when other arguments in the discourse defeat $\mathcal{A}$, relatively to the discourse, and no further arguments in the discourse provide for $\mathcal{A}$'s reinstatement. Thus, the status of an argument cannot be decided by looking at that argument alone. We must rather consider all relevant arguments in the discourse, through a dialectical process that goes from the thesis (the argument) to the antitheses (its defeaters), to the antitheses of the antitheses (the defeaters of the defeaters), and so on. Each step in this process may overturn the results that were obtained in the previous step, and only when the process is over, and no further relevant argument is to be considered, we can express our final judgement.

Thus, internal defeasibility does not prevent us from achieving a unique evaluation for every argument in a given discourse: We just need to consider all arguments of the discourse (so that we shall be sure that no additional argument in it can modify our evaluation).

However, besides internal defeasibility, we also need to consider *external defeasibility*, namely, defeasibility *of a discourse*. What is justified in a discourse Σ_1 may not be justified in a larger discourse Σ_2, which is obtained by adding further arguments to Σ_1: These further arguments may defeat discourse Σ_1, in the sense that they may undermine some arguments which were justified in Σ_1. External defeasibility prevents the possibility of ever obtaining safe conclusions.

We can never exclude that further arguments are put forward which question the results so far obtained.

The possibility of defeat does not exclude that rationality requires endorsing defeasible conclusions, according to their degree of justification. Rational endorsement depends on the combined outcome of all cognitive processes we have been describing: extracting relevant information from the environment, making heuristic hypotheses, constructing arguments, and comparing the available arguments. However, we need to distinguish such aspects, when we look at practical cognition from an analytical perspective.

In particular, with regard to external defeasibility, we need to distinguish whether the new arguments originate from premises (beliefs) that already are endorsed by the reasoner, or whether they include new external inputs obtained through perception (there included the perception of other people's utterances).

Here we shall focus on the justification of an argument relatively to a set of available argument. We shall extend this idea to consider all arguments that can be built on the basis of a certain premise sets, so as to provide a formalisation of the notion of *inferential justifiability*, as defined in Definition 3.3.1 on page 106. Therefore, when we say that an argument is *justified*, relatively to a certain premise set, we mean that we are required to endorse the argument, if we endorse the premise set: The only way to cast doubt on a justified argument (without rejecting is premises) is by providing additional premises, giving rise to new, defeating counterarguments.

After defining when an argument is inferentially justified, we shall characterise the losing, or *overruled* arguments, and the undecided or *defensible* arguments.

27.1.3. Semantics and Proof Theory

We shall present our notion of a justified argument in two versions: The first versions will be based upon a semantics for premise sets; the second version, upon a proof-theory.

By the *semantics* of a premise set θ, we mean here the characterisation of the set of arguments, constructed with premises in θ, that are inferentially justified relatively to θ: This set of arguments expresses the meaning we can extract from θ, being supported by θ. By a *proof theory* we mean a method for determining whether an individual argument is a member of this set.[1]

Since our semantic and proof-theoretic characterisations are proved to be equivalent (see Prakken and Sartor 1997), and the first one requires some formal

[1] Others, like Loui and Norman 1995, rather than distinguishing between semantics and proof theory, prefer to use the similar distinction between *declarative* and *procedural* systems. Note that our adoption of an inferential semantics for premise sets is consistent with the adoption of a model-theoretic semantics for single arguments; for some considerations in this regard, see Prakken and Sartor 1997.

analysis, the reader who prefers to avoid logical formalisms, is advised to jump to Section 27.3 on page 704, just after reading Section 27.2.1.

27.2. The Semantics of Inferential Justifiability

Our semantics is based on the notion of *acceptability*, originally defined by Dung (1993). This notion captures the idea of *relative justification*, namely, the idea of being justified with reference to a certain set of argument: That an argument $\mathcal{A}$ is acceptable, relatively to a set of arguments Σ, means that any critique (any counterarguments) against $\mathcal{A}$ can be defeated on the basis of arguments in Σ.

We aim at identifying what consistent set of arguments one can endorse, out of all the arguments one can construct with the information at one's disposal. Thus, the arguments which one uses as a standard for evaluating the acceptability of other argument must be mutually consistent: When we consider whether an argument is justified relatively to a set Σ, we assume that Σ is *conflict-free*, namely that it does not include arguments attacking one another (by undercutting or rebutting).

From the notion of acceptability, we shall then move to the idea of *admissibility*, a qualification that does not apply to individual arguments, but to sets of them. To be admissible, a conflict-free set of arguments must be capable of strictly defeating, according to its own standards (its own preference arguments), any criticism against any of its components.

By referring to the notions of acceptability and admissibility, we shall be able to capture the notion of *inferential justifiability*, that is, to identify what arguments and conclusions one should endorse, given that one endorses a certain set of premises.

27.2.1. Prima-facie *defeat*

The notion of defeat we introduced in Definition 2.2.5 on page 63 (and we specified in Definition 26.4.1 on page 687) is inappropriate for providing the basis for a formal definition of inferential justification, since it presupposes the notion of a justified inference.

In fact, the assessment provided by defeat is dependent, with regard to rebutters, on *justified preferential information* (see condition (2 (b)) in Definition 26.4.1 on page 687): When two argument A_1 and A_2 rebut one another, but $\lceil A_1$ outweighs $A_2 \rceil$ is a justified conclusion, then only the weaker argument (A_2) is defeated. However, to assess whether $\lceil A_1$ outweighs $A_2 \rceil$ is a justified conclusion, we need to use all our reasoning resources, according to the notion of an inferential justification (we need to take into account that also preferential arguments can be attacked, defeated, and reinstated).

For providing a non-circular formal definition, we need to have a less demanding way of looking at rebuttals. This less demanding way consists in deter-

mining whether one rebutter outweighs its competitor according to *any* particular preferential argument, regardless of whether this preferential argument is justified (or rather impaired by arguments to the contrary).

This leads us to the idea of *prima-facie defeat.*

Definition 27.2.1 *Prima-facie defeat. We say that* $\mathcal{A}_1$ prima-facie defeats *argument* $\mathcal{A}_2$*, relatively to a discourse* Σ*, in the following two cases:*

1. Prima-facie defeat by undercutting*:* $\mathcal{A}_1$ prima-facie *defeats* $\mathcal{A}_2$ *by undercutting iff* $\mathcal{A}_1$ *undercuts* $\mathcal{A}_2$*.*
2. Prima-facie defeat by rebutting*:* $\mathcal{A}_1$ prima-facie *defeats* $\mathcal{A}_2$ *by rebutting iff:*
   (a) $\mathcal{A}_1$ *contains a reason* R_1 *which rebuts a reason* R_2 *in* $\mathcal{A}_2$*:*
   (b) *no argument in* Σ *concludes that* R_2 *outweighs* R_1*;*[2]
   (c) $\mathcal{A}_1$ *is not undercut by* $\mathcal{A}_2$*.*

Note that only condition (*2 (b)*) makes a difference between *prima-facie* defeat and defeat tout court (as introduced in Definition 26.4.1 on page 687). However, this is a significant difference: Some preferences which prevent defeat according to *prima-facie* defeat may not be available according to defeat *tout court* (which only takes into account justified preferences, as impediments to defeat). Thus, some arguments will succeed in defeating their competitors, though they do not *prima-facie* defeat the latter.

On the basis of the notion of *prima-facie defeat*, we can introduce the notion of *strict prima facie defeat*.

Definition 27.2.2 *Strict prima-facie defeat. We say that* $\mathcal{A}_1$ strictly prima-facie defeats $\mathcal{A}_2$*, relatively to discourse* Σ*, under the following conditions:*

1. $\mathcal{A}_1$ prima-facie *defeats* $\mathcal{A}_2$*, relatively to* Σ*, and*
2. $\mathcal{A}_2$ *does not* prima-facie *defeat* $\mathcal{A}_1$*, relatively to* Σ*.*

27.2.2. Acceptability of Arguments

The first notion we need is the Θ-acceptability of an argument $\mathcal{A}$, relatively to a discourse Σ, were Θ is the *reference-discourse*, including all arguments one is examining and Σ is a subset of Θ. By saying that an argument $\mathcal{A}_1$ is Θ-acceptable relatively to Σ, we mean that a reasoner who already endorses all arguments in Σ, should also endorse $\mathcal{A}_1$. This holds under the conditions that are specified in Definition 27.2.3 on the next page.

[2] This notion can be refined to take into account preferences which are not established by arguments in Σ, but follow from other preferences in Σ, according to transitivity (if $x \succ y$ and $y \succ z$, then $x \succ z$). See Prakken and Sartor 1997, where a refined version of what we call here *prima-facie defeat* is called *Args-defeat*.

Definition 27.2.3 *Acceptability of an argument. An argument* $\mathcal{A}_1$ *is* Θ-acceptable *relatively to a* conflict-free *discourse* Σ *iff for every argument* $\mathcal{A}_2$ *in* Θ *attacking* $\mathcal{A}_1$*, one of the following conditions is satisfied:*

- $\mathcal{A}_1$ *strictly* prima-facie *defeats* $\mathcal{A}_2$ *relatively to* Σ*; or*
- *there is an argument* $\mathcal{A}_3$ *in* Σ *that strictly* prima-facie *defeats* $\mathcal{A}_2$ *relatively to* Σ.

The rationale of the notion of acceptability (Definition 27.2.3) is the idea that arguments can help one another. Assume that an argument $\mathcal{A}_1$ is attacked by another argument $\mathcal{A}_2$, which is in Θ but not in Σ. $\mathcal{A}_1$ can still be acceptable, relatively to Σ, when:

1. $\mathcal{A}_1$ itself counters the attack and strictly defeats $\mathcal{A}_2$ (possibly with the help of preferential arguments from Σ); or
2. Σ contains a different argument $\mathcal{A}_3$ that strictly defeats $\mathcal{A}_2$, relatively to Σ.

In both cases we may say that, on the basis of the information in Σ, every counterargument to $\mathcal{A}_1$ is taken care of (is strictly defeated relatively to Σ, by arguments in $\Sigma \cup \mathcal{A}_1$), and thus we are in a condition to accept $\mathcal{A}_1$ (assuming that we already endorse all arguments in Σ).

An interesting aspect of our notion of acceptability is that it refers to the simpler notion of *prima-facie defeating*, rather than to the notion of defeating *tout court* (which embeds the notion of a justified argument). This is made possible by the fact that the two notions coincide with regard to a *conflict-free* set, namely, a set of arguments which do not attack one another. In fact, Σ being conflict free means that, when an argument in Σ establishes that $\mathcal{A}_1$ outweighs $\mathcal{A}_2$, this conclusion cannot be further questioned by any other arguments in Σ: It is a justified conclusion relatively to Σ. Thus, to check that $\mathcal{A}_1$ succeeds in strictly defeating $\mathcal{A}_2$ through rebutting—with regard to incompatible reasons R_1 in $\mathcal{A}_2$ and R_2 in $\mathcal{A}_2$—it is sufficient that we have any preferential argument in Σ concluding that R_1 outweighs R_2.[3]

More generally, focusing on a conflict-free discourse Σ (rather than on the whole reference discourse Θ), allows us to set aside the problem of reinstatement, with regard to the determining the justified conclusions of Σ. When an argument $\mathcal{A}_1$ in Σ strictly defeats another argument $\mathcal{A}_2$, relatively to Σ, $\mathcal{A}_2$ cannot be reinstated, relatively to Σ: Reinstatement requires that an argument in Σ attacks another argument in Σ (either $\mathcal{A}_1$, or a preferential argument favouring $\mathcal{A}_1$), and the arguments in Σ do not attack one another.

[3] The analysis needs to be slightly more complex if we consider arguments having multiple collisions. In this case, to achieve strict defeat through rebutting the winning argument needs to prevail in all collisions. Thus, it must be the case that, for every rebutting collision between R_1 in $\mathcal{A}_1$ and R_2 in $\mathcal{A}_2$, R_1 outweighs R_2 according to an argument in Σ.

Assume for example that the discourse under consideration is

$$\Sigma_\delta = \{\mathcal{A}^\delta,\ \mathcal{B}^\delta,\ \mathcal{C}^\delta,\ \mathcal{P}_1^\delta,\ \mathcal{P}_2^\delta\}$$

which contains all arguments in Table 26.23 on page 694. First of all, we need to observe that, relatively to the empty discourse $\emptyset$, only the preferential arguments $\mathcal{P}_1^\delta$ and $\mathcal{P}_2^\delta$ are Σ_δ-acceptable: They have no attackers in Σ_δ.

Let us now consider what arguments are acceptable relatively to the set of these two arguments, which we already know to be acceptable. You can easily check that relatively to $\Sigma_1 = \{\mathcal{P}_1^\delta, \mathcal{P}_2^\delta\}$, also $\mathcal{C}^\delta$ is Σ_δ-acceptable: It strictly defeats its only counterargument $\mathcal{A}^\delta$ according to $\mathcal{P}_2^\delta$, which belongs to Σ_1.

Note that relatively to Σ_1, neither $\mathcal{A}^\delta$ nor $\mathcal{B}^\delta$ are acceptable:

- the first fails to strictly defeat its attacker $\mathcal{C}^\delta$, according to any preferential argument in Σ_1, and the second similarly fails to strictly defeat its attacker $\mathcal{A}^\delta$;
- none of theirs attackers is strictly defeated by arguments already in Σ_1.

However, when we expand Σ_1 with $\mathcal{C}^\delta$, we obtain $\Sigma_2 = \{\mathcal{P}_1^\delta, \mathcal{P}_2^\delta, \mathcal{C}^\delta\}$. With regard to Σ_2 also $\mathcal{B}^\delta$ is acceptable, since $\mathcal{A}^\delta$, its only attacker, is preferentially rebutted by $\mathcal{C}^\delta$, which belongs to Σ_2. Thus we have come to recognise the acceptability of all arguments in $\Sigma_3 = \{\mathcal{P}_1^\delta, \mathcal{P}_2^\delta, \mathcal{C}^\delta, \mathcal{B}^\delta\}$, and to reject $\mathcal{A}^\delta$.

27.2.3. Admissibility of Sets of Arguments

Discourse Σ_3, in the last paragraph of the previous section, has an interesting peculiarity: All arguments in Σ_3 are acceptable relatively to Σ_3. Thus Σ_3 identifies a discourse which is in a way self-sufficient: When one is endorsing Σ_3, one is justified in maintaining the acceptance of each argument in Σ_3, without the need to appeal to arguments external to Σ_3. This idea is captured by the notion of admissibility.[4]

Definition 27.2.4 *Admissibility of a set of arguments. A conflict-free discourse* Σ *is* Θ-admissible *iff all arguments in* Σ *are* Θ*-acceptable relatively to* Σ.

Thus, an admissible set Σ is a discourse which satisfies the following conditions:

1. it is internally coherent (there are no collisions between its arguments), and
2. it succeeds in strictly defeating every attacker (in the reference set Θ) against any of its arguments.

[4] The related notions of acceptability and admissibility were introduced in Dung 1995, but our definitions deviate from Dung's, in order to take into account priority arguments (see, for a more rigorous analysis, Prakken and Sartor 1997).

The reader can check that besides Σ_3, also Σ_2 and Σ_1 are Σ_δ-admissible (as obviously is $\{\varnothing\}$).

For a substantive example of admissibility, consider the connections among arguments $\mathcal{A}^\beta$ (Table 26.3 on page 674), $\mathcal{B}^\beta$ (Table 26.4 on page 675), $\mathcal{C}^\beta$ (Table 26.13 on page 683) and $\mathcal{P}_2^\beta$ (Table 26.22 on page 692). Remember that the symbol formed by the name of a premise set with a hat above refers to all arguments which can be constructed with premises taken from that premise set: For instance $\widehat{\beta}$ refers to all arguments which can be constructed with premises in β (see Table 26.5 on page 676).

The reader can check that the set of argument $\{\mathcal{A}^\beta, \mathcal{C}^\beta, \mathcal{P}_2^\beta\}$ is $\widehat{\beta}$-admissible, since $\mathcal{B}^\beta$, the attacker of $\mathcal{A}^\beta$, is undercut by $\mathcal{C}^\beta$.

On the contrary, the set $\{\mathcal{A}^\beta, \mathcal{B}^\beta\}$ is not $\widehat{\beta}$-admissible, since it is not conflict-free (its two arguments defeat each other). Similarly, the set $\{\mathcal{A}^\beta\}$ is not $\widehat{\beta}$-admissible: $\mathcal{A}^\beta$ is rebutted by $\mathcal{B}^\beta$, which $\mathcal{A}^\beta$ is unable to strictly defeat relatively to $\{\mathcal{A}^\beta\}$ (which does not contain preferential arguments).

27.2.4. Justified Arguments

We shall now investigate how we can expand as much as possible the set of arguments we endorse, without making vicious circles (that is, without making our endorsement an argument, dependant upon the assumption of that argument). The way to achieve this goal is to start from scratch, and progressively extend acceptance to all arguments that are acceptable relatively to the arguments we have already accepted.

Therefore, at the start the set of arguments we view as justified, with regard to the reference set Θ, will be empty: Our initial set, J_0, will contain no argument ($J_0 = \varnothing$). We shall then progressively accept any arguments in Θ that are acceptable relatively to the arguments we have already accepted as being justified, until no further arguments can be added:

- Firstly, we add to $J_0 = \varnothing$ the arguments which have no counterarguments in Θ, and obtain set J_1;
- Secondly, we add to J_1 the arguments which are Θ-acceptable relatively to J_1 and obtain J_2;
- Thirdly, we add to J_2 the arguments which are Θ acceptable relatively to J_2, and obtain J_3, and so on.

This constructive process terminates when it provides a set J_n of arguments that cannot be further Θ-extended (this is what mathematicians call a *fixpoint*, see Section 27.2.5 on the next page). This set contains all arguments which are justified (relatively to Θ). We shall refer to is as $JustArg^\Theta$.

This idea is particularly interesting when the set Θ is constituted by all arguments that can be constructed out of a given premise set θ, which we denote as

$\widehat{\theta}$. Then $JustArgs^{\widehat{\theta}}$ includes all arguments constructible from θ that appear to be justified in the framework of all arguments constructible from θ.

Having identified the set $JustArgs^{\widehat{\theta}}$, we can distinguish justified, overruled and defensible arguments.

Definition 27.2.5 *Statuses of arguments. For any premise set θ and argument $\mathcal{A}$ we say that with regard to θ:*

1. *$\mathcal{A}$ is* justified *iff $\mathcal{A}$ is in $JustArgs^{\widehat{\theta}}$;*
2. *$\mathcal{A}$ is* overruled *iff $\mathcal{A}$ is attacked by a justified argument;*
3. *$\mathcal{A}$ is* defensible *iff $\mathcal{A}$ is neither justified nor overruled.*

Only justified arguments have the capacity of establishing justified conclusions, on the basis of the premise set we are considering, that is, conclusions that are supported or entailed by the information contained in that set. Defensible arguments are uncertain: They cannot be relied upon, but can effectively defeat other arguments, so preventing the latter from being justified. Overruled arguments, finally, are useless, having been defeated by stronger arguments, which are justified.

On the basis of the status of an argument (relatively to a premise set), we can also qualify its conclusions.

Definition 27.2.6 *Status of a conclusion. A proposition is*

1. justified *if it is a conclusion of a justified argument;*
2. defensible *if it is not justified and it is a conclusion of some defensible argument;*
3. overruled *if it is neither justified nor defensible, and it is the conclusion of an overruled argument.*

If the reader is interested in having a precise mathematical characterisation of these ideas, we invite him or her to read the following section, which may be safely skipped if one does not have this cognitive desire.

27.2.5. A Formal Characterisation of Inferential Justifiability

Justified arguments can be precisely identified by an operator that returns, for each set of arguments, all arguments that are acceptable relatively to that set. Since the operator is *monotonic*,[5] we can define the set of justified arguments as the least fixpoint of this operator.[6]

[5] An operator is monotonic when for a larger input it provides a larger output. More exactly, for a monotonic operator F, whenever $S_1 \subseteq S_2$, then also $F(S_1) \subseteq F(S_2)$

[6] This operator is introduced by Dung (1995), who calls it the *characteristic function* of an ordered theory.

Definition 27.2.7 *Characteristic function over sets of arguments. Let θ be a premise set and Σ be any subset of $\widehat{\theta}$. The* characteristic function *of θ is defined as follows:*

1. $F_\theta : Powerset(\widehat{\theta}) \longrightarrow Powerset(\widehat{\theta})$*; and*
2. $F_\theta(\Sigma) = \{\mathcal{A} \in \widehat{\theta} \mid \mathcal{A}$ *is acceptable relatively to* $\Sigma\}$.

The first item of Definition 27.2.7 simply says that function F_θ, given one set of arguments in $\widehat{\theta}$, returns a similar set ($Powerset(\widehat{\theta})$ denotes the family of all subsets of $\widehat{\theta}$).

The second item says for any input set Σ of such arguments, the output provided by F_θ will be constituted by all those arguments in $\widehat{\theta}$ which are acceptable relatively to the input set Σ.

In this definition, the notion of acceptability captures reinstatement: Even when an argument $\mathcal{A}$ is defeated by a counterargument $\mathcal{B}$, $\mathcal{A}$ can still be included in the justified arguments, when $\mathcal{A}$ is acceptable relatively to the arguments that are already known to be justified. This happens exactly when $\mathcal{B}$ is strictly defeated by one of these arguments.

For circumscribing what argument one should rationally endorse (among those in $\widehat{\theta}$), we need to find a a set of argument (a discourse) Σ that only includes acceptable arguments (relatively to Σ itself), and which cannot be extended with further acceptable arguments in $\widehat{\theta}$. This idea is mathematically characterised through the notion of a fixpoint of the function F_θ, namely, a value v such that, F_θ, when applied to input v returns v again as its output. To say that set Σ is a fixpoint of F_θ means that all arguments in F_θ are $\widehat{\theta}$-acceptable relatively to Σ, and no further argument in $\widehat{\theta}$ is $\widehat{\theta}$-acceptable relatively to Σ.

Since monotonic operators are guaranteed to have a least fixpoint, we can assume that F_θ's least fixpoint identifies the set of all justified arguments, and we can define the notion of a justified argument as follows.

Definition 27.2.8 *Justified argument. For any premise set θ and argument $\mathcal{A}$, $\mathcal{A}$ is* justified *on the basis of θ iff $\mathcal{A}$ is contained in the least fixpoint of F_θ, denoted by $JustArgs^{\widehat{\theta}}$.*

27.3. A Proof-Theory for Inferential Justifiability

The semantic characterisation we have just presented provides a precise definition of justifiability, but it does not provide a workable method for evaluating arguments.

In fact, to establish whether an argument is justified, we should first build the set of all justified arguments, and then check if our argument is included in this set. This is an unfeasible task, even for relatively small premise sets.

Fortunately, there is an easier way to establish justifiability, as we hope to show in next sections, where we shall provide a method for proving justifiability, and thus an inferential notion of justifiability. The basic idea is that an argument is justified if there is a proof of its ability to sustain all possible attacks. The correctness of this method is guaranteed by its correspondence with the semantic notion of justifiability we have introduced in the previous pages: All and only the arguments for which we can build such a proof are included in the set of the semantically justified ones.

27.3.1. Proof Trees

Proving inferential justifiability of a statement requires a two-levels proof-procedure:

1. at the lower level, conclusions are supported through arguments;
2. at the higher level, arguments are supported by being proved to be justified.

Our proof that an argument is justified refers to the discourse (the set of arguments) we are considering. With regard to a premise set θ, the discourse we are referring to is constituted by $\widehat{\theta}$, that is, by all arguments such that their premises are taken from θ.

The proof that an argument is justified relatively to a certain discourse Σ takes the form of an inverted tree of arguments from Σ, where each node attacks its predecessor, and each node has a certain *level*, the level of a node being its distance from the root, which is node level 0 (nodes directly connected to the root are at level 1, their immediate successors are at level 2, and so on). Nodes located at an odd level attack, directly or indirectly (that is, by attacking its supporters), the root argument. Nodes located at an even level indirectly (that is, by attacking its attackers) support the root node.

Let us qualify each argument in the tree as follows:

- The argument is a *pro-node*, abbreviated as *p-node*, if it located at an even level in the tree, and thus it supports the root argument, by countering the direct or indirect challenges against it. Additionally, the root argument (the 0-level argument) itself is a *pro*-node.
- The argument is a *con-node*, abbreviated as *c-node*, if it is located at an odd level, and thus it challenges, directly or indirectly, the root argument.

This characterisation of the nodes in an argument-tree leads us to the following definition of a *proof tree*.

Definition 27.3.1 *Proof tree.* *A* proof tree *for an argument $\mathcal{A}$, relatively to a discourse Σ, is a tree of arguments from Σ that satisfies the following conditions:*

1. *$\mathcal{A}$ is the 0-level node (the root);*
2. *each pro-node A_i is followed by all of A_i's attackers;*
3. *each con-node A_i is followed by one of the following:*
   (a) *nodes $A_{j_1}, \ldots, A_{j_n}$ such that A_{j_1} strictly* prima-facie *defeats A_i relatively to $\{A_{j_2} \ldots, A_{j_n}\}$ or*
   (b) *nodes $A_{j_1} \ldots, A_{j_n}$ such that A_i's parent node A_p strictly* prima-facie *defeats A_i relatively to $A_{j_1} \ldots, A_{j_n}$;*
4. *pro-nodes are not repeated in the same branch of the tree.*[7]

Let us consider condition (*1 (a)*) in Definition 27.3.1 on the preceding page which subsumes different cases. The main ones are those when there is just one collision between A_{j_1} and A_i.

- the case when A_{j_1} undercuts A_i. In this case no preferential argument is required. Thus $A_{j_1}, \ldots, A_{j_n}$ will consist of A_{j_1} alone.
- the case when A_{j_1} rebuts A_i. In this case a preferential argument A_{j_2} is required according to which A_{j_1} rebuts A_i

When there are more then one rebutting collisions between A_{j_1} and A_i, then A_{j_1} needs to be accompanied by more than one preferential argument.

The conditions for inserting a *pro*-node in the tree are more stringent than those required for inserting a *con*-node. A *pro*-node, for contributing to the proof must be certain: Whenever the *pro*-node has a rebutter, there must be preferential information according to which it prevails over the rebutter. This information can be provided at the time when the *pro*-node, is inserted (according to item 3 (*b*) in Definition 27.3.1 on the page before), or subsequently (according to item 3 (*c*) in Definition 27.3.1 on the preceding page). A *con*-node just needs to defeat a *pro*-node, regardless of preferential information. This is indeed sufficient to make the rebutted *pro*-node not justified, so that it cannot contribute to the proof (unless preferential information is provided by the subsequent *pro*-node).

Table 27.1 on the next page displays an argument tree and a proof tree. Note that all branches in the proof tree terminate with a *pro*-$\mathcal{A}$ node. This means that $\mathcal{A}$ is safe (justified): All its (direct and indirect) attackers have been strictly defeated.

27.3.2. The Proof of an Argument

On the basis of the notion of a proof tree, we can view the *proof of an argument* as being provided by proof tree where no attack against the root argument $\mathcal{A}$ is

[7] By a *branch of a tree* we mean a sequence of nodes (a path) that starts from the top (the root) of the tree and reaches its bottom (a leaf), always passing from a node to one of its immediate successors. Thus the requirement of item (4) in Definition 27.3.1 on the page before is that there are not two *pro*-nodes with the same content among the same branch.

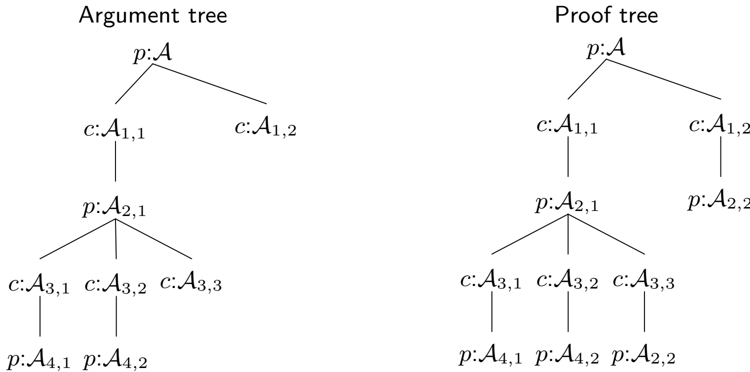

Table 27.1: *Argument trees*

successful. This is the case when every branch of the tree terminates with a *pro*-node, that is, either with $\mathcal{A}$ itself (which is unchallenged) or with an odd-level argument, and no further attacks are possible.

Definition 27.3.2 *Proof of an argument. A proof tree for $\mathcal{A}$, relatively to a discourse Σ is a* proof *of argument $\mathcal{A}$, relatively to Σ, iff it satisfies the following conditions:*

1. *each branch of the tree terminates with a pro-node, and*
2. *it is not possible to add further nodes.*

The notion of a justified argument can be defined on the basis of the notion of a proof.

Definition 27.3.3 *Justified argument. An argument $\mathcal{A}$ is* justified *relatively to a discourse Σ iff there is a proof for $\mathcal{A}$ relatively to Σ.*

For instance, let us consider the discourse $\Sigma_\delta = \{\mathcal{A}^\delta, \mathcal{B}^\delta, \mathcal{C}^\delta\}$ of Table 27.2 on the following page. The reader can check that relatively to Σ_δ, the tree of Table 27.2 on the next page is indeed a proof tree. This exemplifies the idea of *reinstatement*: Argument $\mathcal{B}^\delta$ is justified, since the *con*-argument (defeater) $\mathcal{A}^\delta$ is strictly defeated by the p-argument $\mathcal{C}^\delta$.

Let us consider a further variation on the Lebach example. Remember that we had:

- argument $\mathcal{A}^\beta$, concluding that Tom has the right to prohibit the broadcast of the documentary, since the broadcast would represent a violation of privacy;
- argument $\mathcal{B}^\beta$, concluding that Mary has the right to broadcast it since this contributes to information;

Table 27.2: *Proof tree: reinstatement*

Argument $\mathcal{D}^\beta$

1. β_{11}: *Tom* was incapable when agreeing to the transmission of *Lebach documentary* ⟨premise⟩
2. β_{12}: FORANY (x, y)
   IF [x is incapable when agreeing to the transmission of y]
   THEN^n [β_{10} *is* NOT *applicable to* x, y] ⟨premise⟩
3. β_{10} *is* NOT *applicable to Tom*, *Lebach documentary*
   ⟨from 1 and 2, by *syllogism*⟩

Table 27.3: *New counterargument*

- argument $\mathcal{C}^\beta$, concluding that the prohibition to broadcast for privacy reasons does not apply when the concerned person agrees to the broadcast.

The reader can check that the proof of argument $\mathcal{B}^\beta$, relatively to discourse $\{\mathcal{A}^\beta, \mathcal{B}^\beta, \mathcal{C}^\beta\}$, is also a proof with regard to $\widehat{\beta}$, since it includes all the relevant arguments constructible from that set. That this is a proof follows from the fact that the bottom nodes of the tree (its leaves) are all *pro*-nodes. This shows that all attacks against argument $\mathcal{B}^\beta$ are strictly defeated.

Let us now consider an extension of Lebach. Consider the following argument:

1. Tom was incapable of understanding what he was doing when he gave his agreement to the broadcast (and Mary profited from such situation);
2. these circumstances determine the inapplicability of the rule that agreement prevents violations of privacy;
3. thus, this rule is inapplicable.

This argument—let us call it $\mathcal{D}^\beta$ (Table 27.3)—would strictly defeat $\mathcal{C}^\beta$ by undercutting it. Consequently $\mathcal{C}^\beta$ would be unable to attack effectively $\mathcal{A}^\beta$, so that $\mathcal{A}^\beta$, would still be able prevent the justification of $\mathcal{B}^\beta$. If we add to premise set β the premises in argument $\mathcal{D}^\beta$, the justification of $\mathcal{B}^\beta$ is bound to fail.

Relatively to the extended set of arguments $\{\mathcal{A}^\beta, \mathcal{B}^\beta, \mathcal{C}^\beta, \mathcal{D}^\beta, \mathcal{P}_1^\beta, \mathcal{P}_2^\beta\}$ we can build a proof for argument $\mathcal{A}^\beta$, and cannot build a proof for argument

Table 27.4: *Successful and failed proof*

$\mathcal{B}^\beta$ (Table 27.4). This happens because there is no argument which can attack argument $\mathcal{D}^\beta$.

This general idea can be given a more dialectical flavour by viewing *pro* and *con* arguments as being put forward by two parties (or by the same reasoner, playing two roles): the *Proponent* and the *Opponent* of the argument (see Section 11.1.3 on page 308). Then the definition we have just presented may be interpreted as the protocol for a dialogue between these two parties (for this approach, see: Prakken and Sartor 1997; Prakken 1997).

27.3.3. Applications of the Proof-Method

In this section, we shall apply our method for proving justifiability to some examples.

First we propose a systematic way of formalising preferential reasoning about the multiple orderings or preferences we introduced in Chapter 7. The usual three general priority principles for solving legal collisions can be represented as follows:

1. *Superiority.* Superior laws prevail over inferior ones (*lex superior derogat legi inferiori*), denoted as pr_{sup}.
2. *Specificity.* More special (specific) laws prevail over more general ones (*lex specialis derogat legi generali*), denoted as pr_{spec}.
3. *Posteriority.* Subsequent (posterior) laws prevail over earlier ones (*lex posterior derogat legi anteriori*), denoted as pr_{post}.

To these traditional principles we add the two further principles we examined in Chapter 7:

4. *Exceptionality.* Exceptions prevail over the norms they refer to, denoted as pr_{exc}.

pr_{sup}:	FORANY (φ, ψ) IF [φ is superior to ψ] THEN $\varphi \succ \psi$
pr_{spec}:	FORANY (φ, ψ) IF [φ is more specific than ψ] THEN $\varphi \succ \psi$
pr_{post}:	FORANY (φ, ψ) IF [φ is later than ψ] THEN $\varphi \succ \psi$
pr_{exc}:	FORANY (φ, ψ) IF [φ is an exception to ψ] THEN $\varphi \succ \psi$
pr_{axio}:	FORANY (φ, ψ) IF [φ is has a better value-impact than ψ] THEN $\varphi \succ \psi$

Table 27.5: *Priority rules*

sup1:	FORANY (φ, ψ) IF [φ is a constitutional proposition] AND [ψ is a statutory proposition] THEN^n [φ is superior to ψ]
spec1:	FORANY $(\varphi, \psi, A, B, C, D)$ IF [φ has content ⌈IF A THEN^n B⌉] AND [ψ has content ⌈IF C THEN^n D⌉] AND [A entails C] AND NON [C entails A] THEN^n [φ is more special than ψ]
post1:	FORANY $(\varphi, \psi, t_1, t_2)$ IF [φ was issued at time t_1] AND [ψ was issued at time t_2] AND $t_1 > t_2$ THEN^n [φ is later than ψ]
exc1:	FORANY (φ, ψ, A, B, C) IF [φ has content ⌈IF A THEN^n B⌉] AND [ψ has content ⌈IF C THEN^n NON B⌉] THEN^n [ψ is an exception to φ]

Table 27.6: *Priority-conditioning rules*

5. *Axiology*. Laws having a better value impact prevail over laws having a worse value impact, denoted as pr_{axio}.

These five principles can be expressed through the rules in Table 27.5 Other rules, like those in Table 27.6, indicate when the antecedents of the priority-rules hold: They specify when the conditions of a certain kind of priority obtain. These priority-conditioning rules do not provide necessary conditions for a priority to exist, but only sufficient ones. Thus further rules may provide for further cases, for instance, of superiority and exceptionality.

In our model, we may apply preferences also to preference principles, specifying for instance that superiority prevails over specificity, and specificity prevails over posteriority, according to the meta-priority rules of Table 27.7 on the next page.

Let us now formalise an example taken from Italian law, which concerns a

$meta_{pref1}$: FORANY (φ, ψ) $pr_{sup}(\varphi, \psi) \succ pr_{spec}(\varphi, \psi)$
$meta_{pref2}$: FORANY (φ, ψ) $pr_{spec}(\varphi, \psi) \succ pr_{post}(\varphi, \psi)$

Table 27.7: *Meta-priority rules*

Premise set ϵ

ϵ_1: $Villa_0$ is a protected building
ϵ_2: $Villa_0$ needs restructuring
ϵ_3: FORANY (x)
IF $[x$ is a protected building$]$
THEN^n $[x$'s exterior may NOT be modified$]$
ϵ_4: FORANY (x)
IF $[x$ needs restructuring$]$
THEN^n $[x$'s exterior may be modified$]$
ϵ_5: ϵ_3 concerns the protection of artistic buildings
ϵ_6: ϵ_4 concerns town planning
art_{pref}: FORANY (φ, ψ)
IF $[\varphi$ is concerns the protection of artistic buildings$]$ AND
$[\psi$ concerns town planning$]$
THEN^n $\varphi \succ \psi$
pr_{post}: FORANY (φ, ψ)
IF $[\varphi$ is later than $\psi]$
THEN $\varphi \succ \psi$
$postArt$: art_{pref} is later than pr_{post}

Table 27.8: *The town-planning premise-set*

conflict between a rule saying that ⌈if a building needs restructuring, its exterior may be modified⌉, and an earlier rule saying that ⌈if a building is on the list of protected buildings, its exterior may not be modified⌉.

When trying to apply priority rules to solve this conflict, we are led into a new conflict, that is, a conflict between the *posteriority* principle that ⌈later rules have priority over the earlier ones⌉ and a particular priority-rule of the law of cultural heritage ⌈rules protecting artistic building prevail over land-planning rules⌉ (see Table 27.8).

Interestingly, this conflict can be solved again according to posteriority, which can be applied to the conflict between itself (more correctly, one instance of itself) and other priority rules: The specific priority rule (preference for rules protecting artistic buildings) prevails over the posteriority principle, being posterior to the latter. The reasoning leading to this conclusion proceeds as follows:

- Let us start with argument $\mathcal{A}^{\epsilon}$ (Table 27.9 on the next page), which establishes the substantive conclusion that ⌈ $Villa_0$'s exterior may NOT be modified⌉.

Argument $\mathcal{A}^\epsilon$

1.	ϵ_1:	*Villa₀* is a protected building	⟨premise⟩
2.	ϵ_3:	FORANY (x) IF $[x$ is a protected building$]$ THEN^n $[x$'s exterior may NOT be modified$]$	⟨premise⟩
3.		$Villa_0$'s exterior may NOT be modified	⟨from 1 and 2, by *syllogism*⟩

Table 27.9: *Argument for modification*

Argument $\mathcal{B}^\epsilon$

1.	ϵ_2:	$Villa_0$ needs restructuring	⟨premise⟩
2.	ϵ_4:	FORANY (x) IF $[x$ needs restructuring$]$ THEN^n $[x$'s exterior may be modified$]$	⟨premise⟩
3.		$Villa_0$'s exterior may be modified	⟨from 1 and 2, by *syllogism*⟩

Table 27.10: *Argument against modification*

- Unfortunately, argument $\mathcal{A}^\epsilon$ is rebutted by argument $\mathcal{B}^\epsilon$, establishing the contradictory substantive conclusion that ⌈$Villa_0$'s exterior may be modified⌉ (Table 27.10).
- Argument $\mathcal{A}^\epsilon$ is helped by the preference argument $\mathcal{P}_1^\epsilon$ (Table 27.11 on the next page), according to which argument $\mathcal{A}^\epsilon$ prevails over $\mathcal{B}^\epsilon$, because of the specific preference rule art_{pref}.
- However, argument $\mathcal{P}_1^\epsilon$ is rebutted by argument $\mathcal{P}_2^\epsilon$ (Table 27.12 on the facing page), according to which $\mathcal{B}^\epsilon$ prevails over $\mathcal{A}^\epsilon$, because of pr_{post}.
- The question becomes which one of $\mathcal{P}_1^\epsilon$ and $\mathcal{P}_2^\epsilon$ prevails. The answer is provided by the meta-priority argument $\mathcal{P}_3^\epsilon$ (Table 27.13 on page 714), which states that $\mathcal{P}_1^\epsilon$ wins out, because of pr_{post}.
- Thus argument $\mathcal{A}^\epsilon$ is proved to be inferentially justified: Argument $\mathcal{P}_3^\epsilon$ is justified having no couterarguments, and according to $\mathcal{P}_3^\epsilon$'s evaluation $\mathcal{P}_1^\epsilon$ strictly defeats its only counterargument $\mathcal{P}_2^\epsilon$; thus $\mathcal{P}_1^\epsilon$ is also justified, and according to $\mathcal{P}_1^\epsilon$'s evaluation $\mathcal{A}^\epsilon$ strictly defeats its only counterargument $\mathcal{B}^\epsilon$; thus argument $\mathcal{A}^\epsilon$ is also justified, and so is its conclusion that ⌈$Villa_0$'s exterior may NOT be modified⌉.

The dialectical interaction of all these arguments is represented in Table 27.14 on page 714 which provides the inferential justification of argument $\mathcal{A}^\epsilon$.

Argument $\mathcal{P}_1^\epsilon$

1.	ϵ_5: ϵ_3 concerns the protection of artistic buildings	⟨premise⟩
2.	ϵ_6: ϵ_4 concerns town planning	⟨premise⟩
3.	pr_{art}: FORANY (φ, ψ) IF [φ concerns the protection of artistic buildings AND [ψ concerns town planning] THEN^n $\varphi \succ \psi$	⟨premise⟩
4.	$\epsilon_3 \succ \epsilon_4$	⟨from 1, 2, and 3, by *syllogism*⟩
5.	$\|1, 2, \text{for } 3 \text{ in } \mathcal{A}^\epsilon\|$ OUTWEIGHS $\|1, 2, \text{for } 3 \text{ in } \mathcal{B}^\epsilon\|$	⟨from 4, by *decisive subreason*⟩

Table 27.11: *First priority argument*

Argument $\mathcal{P}_2^\epsilon$

1.	ϵ_7: ϵ_4 is later than ϵ_3
2.	pr_{post}: FORANY (φ, ψ) IF [φ is later than ψ] THEN $\varphi \succ \psi$
3.	$\epsilon_4 \succ \epsilon_3$
4.	$\|1, 2, \text{for } 3 \text{ in } \mathcal{B}^\epsilon\|$ OUTWEIGHS $\|1, 2, \text{for } 3 \text{ in } A_2^\epsilon\|$

Table 27.12: *Second priority argument*

27.3.4. Ross's Paradox of the Self-Amending Constitution

Ross (1969) proposed an interesting paradox to the attention of legal theorists. Ross invites us to endorse the following reasonable assumptions:

- provision p_1, in constitutional text T, establishes that T can only be amended according to procedure pr_1;
- a new provision p_2, is issued, according to procedure pr_1; and
- p_2 says that constitutional text T can only be amended according to a procedure pr_2, which is different from procedure pr_1.

These reasonable assumptions unfortunately seem to lead us to paradoxical conclusions:

1. being a constitutional amendment, provision p_2 is valid if and only if it is issued according to provision p_1, to wit, according to procedure pr_1;
2. if p_2 is valid having been issued according to procedure pr_1, then it succeed in derogating p_1, and in substituting the old procedure pr_1 with the new procedure pr_2;
3. however p_2 itself has not been issued according to the new procedure pr_2, and thus it is not valid.

Argument $\mathcal{P}_3^\epsilon$

1.	ϵ_8:	pr_{art} is later than pr_{post}	⟨premise⟩
2.	pr_{post}:	FORANY (φ, ψ) IF [φ is later than ψ] THEN $\varphi \succ \psi$	
3.		$pr_{art} \succ pr_{post}$	⟨from 1 and 2, by *syllogism*⟩
4.		$\lVert$1, 2, for 3 in $\mathcal{P}_1^\epsilon \rVert$ OUTWEIGHS $\lVert$1, 2, for 3 in $\mathcal{P}_2^\epsilon \rVert$	⟨from 3, by *decisive subreason*⟩

Table 27.13: *Meta priority-argument*

Table 27.14: *Proof through meta-preference*

In conclusion, it seems that if provision p_2 is valid then it is not valid.

This normative puzzle seems to correspond to the well-known epistemic *paradox of the liar*. The latter paradox, according to tradition, is due Epimenides, the Cretan, who kept logicians busy by uttering the statement [s: I am lying].[8] The question that we need to answer is the following: Is statement s true or false? Given that lying means to utter a false statement, we can make the following considerations. Clearly, if statement s is true (Epimenides is lying), then the statement is false (because Epimenides is not lying: He is uttering a true statement, namely the statement s that he is lying). On the contrary, if statement s is false (Epimenides is not lying), then this statement is true (because Epimenides is lying: He is uttering a false statement, namely, the statement s that he is lying).

We shall not here investigate the connection between Ross's paradox and the paradox of the liar, nor shall we review the literature on Ross's paradox.[9] We

[8] There are many variants of this utterance but this will do for our purposes (as a matter of fact, the version we propose is attributed not to Epimenides, but to Eubulides).

[9] On Ross's paradox of self-amendment, see among the others: Conte 1989; Sauber 1990.

shall limit ourselves to providing a formalisation of the paradox and a solution to it, according to our logical model for normative reasoning. Let us consider a specific instance of Ross's paradoxical assumptions:

- provision η_{p1} says that ⌈the constitution can only be modified through a vote of the Parliament⌉;
- the Parliament votes provision η_{p2}: ⌈The constitution can only be modified through a referendum⌉.

We need to ask ourselves whether provision η_{p2} is valid. This question is paradoxical since it seems that the following holds. If η_{p2} is valid, having been approved by the Parliament according to η_{p1}, then constitutional modification are to be adopted through a referendum. But then η_{p2} is not valid since it has not been approved through a referendum (but rather through a parliamentary vote): If η_{p2} is valid, then it is not valid.

Let us try to map Ross's paradox into our model of normative knowledge and reasoning: We represent amendment-regulations as rules (normative conditionals) which establish the bindingness (in our sense of *cognitive bindingness*), or the non-bindingness, of normative propositions enacted in certain ways.

Let us first express provision η_{p1} in our formalism. We do that by extracting two rules from the text of η_{p1}.[10]

The first rule—which we call the *positive part* of the amendment provision p_1 and denote as η_{r1Pos}—says that a constitutional modification is binding (starts to be binding) if it is approved by the Parliament:[11]

η_{r1Pos}: FORANY (t) FORANY (r)
 IF [r is a constitutional provision] AND
 [r is enacted through *parliamentary vote*]
 happens at time t
 THEN^n *Binding* r

The second rule—which we call the *negative part* of the amendment provision p_1 and denote as η_{r1Neg}—says that if a constitutional modification is enacted without a vote by the Parliament, then it is not binding.

[10] We choose a representation that is simple enough to allow us to focus only on Ross's paradox. A more accurate representation would require us to view particular token-statements as being, or not being, textually binding. The bindingness of a certain proposition would then result from the bindingness of the token statement expressing it in the enactment-act. This would allow the same proposition to be expressed, through different token-statements, at different times, the later enactment resulting in a binding statement and a binding proposition, though the first one resulted in a non-binding statement and failed to produce a binding proposition. Moreover we could view the enactment of a statement as initiating bindingness, rather than simply determining it. The latter refinement however, would not entail significant changes in our example, given our distinction between cognitive bindingness and temporal applicability.

[11] In this rule, as in the following, we distinguish the temporal variable by applying a distinct quantifier to it. This is irrelevant to the logical content of the rule, since FORANY (x, y) is just an abbreviation for FORANY (x) FORANY (y).

η_{r1Neg}: FORANY (t) FORANY (r)
IF [r is a constitutional provision] AND
[r is enacted without *parliamentary vote*]
happens at time t
THEN^n NON (*Binding* r)

Similarly, provision η_{p2} needs to be represented through the combination of two rules. The first rule—the *positive part* of the amendment provision η_{p2}, denoted as η_{r2Pos}—says that a constitutional modification is binding (starts to be binding) if it is approved by the Parliament:

η_{r2Pos}: FORANY (t) FORANY (r)
IF [r is a constitutional provision] AND
[r is enacted through *referendum*]
happens at time t
THEN^n *Binding* r

The second rule—the *negative part* of the amendment provision η_{p2}, denoted as η_{r2Neg}—says that if a constitutional modification is enacted without referendum then it is not binding.

η_{r2Neg}: FORANY (t) FORANY (r)
IF [r is a constitutional provision] AND
[r is enacted without *referendum*]
happens at time t
THEN^n NON (*Binding* r)

Besides these rules, we also need a rule stating that the provisions in the original constitution are binding from the time of their enactment.

η_{r0}: FORANY (t) FORANY (r)
IF [r is a constitutional provision] AND
[r is enacted through *original constitution*]
happens at time t
THEN^n *Binding* r

Let us also assume that—according to the new procedure laid down in η_{r2Pos}—a new substantive constitutional provision η_{r3} was issued, for instance a rule saying that everybody has a right to data protection.

η_{r3}: FORANY (t) FORANY (x)
[x has a right to data protection] *holds at time* t

We need to add to our knowledge base the fact that the first couple of our amendment-rules (η_{r1Pos}, η_{r1Neg}) were included in the original constitution, which was enacted on 01.01.1960. The second couple (η_{r2Pos}, η_{r2Neg}) was enacted on 01.01.2000, through parliamentary vote, and without a referendum.

Premise set η

η_{f1}: [η_{r1Pos} is a constitutional provision]
η_{f2}: [η_{r1Pos} is enacted through *original constitution*]
happens at time 01.01.1960
η_{f3}: [η_{r1Neg} is a constitutional provision]
η_{f4}: [η_{r1Neg} is enacted through *original constitution*]
happens at time 01.01.1960
η_{f5}: [η_{r2Pos} is a constitutional provision]
η_{f6}: [η_{r2Pos} is enacted through *parliamentary vote*]
happens at time 01.01.2000
η_{f7}: [η_{r2Pos} is enacted without *referendum*]
happens at time 01.01.2000
η_{f8}: [η_{r2Neg} is a constitutional provision]
η_{f9}: [η_{r2Neg} is enacted through *parliamentary vote*]
happens at time 01.01.2000
η_{f10}: [η_{r2Neg} is enacted without *referendum*]
happens at time 01.01.2000
η_{f11}: [η_{r3} is a constitutional provision]
η_{f12}: [η_{r3} is enacted through *referendum*
happens at time 01.01.2001
η_{f13}: [η_{r3} is enacted without *parliamentary vote*
happens at time 01.01.2001
η_{r0}: FORANY (t) FORANY (r)
IF [r is a constitutional provision] AND
[r is contained in the original constitution]
THEN^n *Binding* r

Table 27.15: *Premise set for Ross's paradox*

The last rule (η_{r3}) was adopted on 01.01.2001, through referendum and without a parliamentary vote.

By putting together our premises we obtain the set η in Table 27.15.

This premise set allows us to build argument A^η for the bindingness of the new amendment-rule η_{r2Pos}, which was enacted by the Parliament (without a referendum), but which states that constitutional provisions enacted through referendum are binding, as shown in Table 27.16 on the following page.[12]

Unfortunately argument $\mathcal{A}_\eta$ is defeated by argument $\mathcal{B}^\eta$ (in Table 27.17 on page 719), which concludes that rule η_{r2Pos} is not binding, by using the negative part of provision p_2, namely, rule η_{r2Neg} (constitutional provisions enacted without a referendum are not binding), as shown by argument B^η Table 27.17 on page 719.

[12] To draw the attention to the bindingness conclusions, which generate Ross's paradox, we frame their numbers.

Argument A^η

1.	η_{f1}: [η_{r1Pos} is a constitutional provision]	⟨premise⟩
2.	η_{f2}: [η_{r1Pos} is enacted through *original constitution*] *happens at time* 01.01.1960	⟨premise⟩
3.	η_{r0}: FORANY (t) FORANY (r) IF [r is a constitutional provision] AND [r is enacted through *original constitution*] *happens at time* t THEN^n *Binding* r	⟨premise⟩
4.	*Binding* η_{r1Pos}	⟨from 1 2, and 3, by *syllogism*⟩
5.	η_{r1Pos}: FORANY (t) FORANY (r) IF [r is a constitutional provision] AND [r is enacted through *parliamentary vote*] *happens at time* t THEN^n *Binding* r	⟨from 4, by *Binding-elimination*⟩
6.	η_{f5}: [η_{r2Pos} is a constitutional provision]	⟨premise⟩
7.	η_{f6}: [η_{r2Pos} is enacted through *parliamentary vote*] *happens at time* 01.01.2000	⟨premise⟩
8.	*Binding* η_{r2Pos}	⟨from 5, 6, and 7, by *syllogism*⟩
9.	η_{r2Pos}: FORANY (t) FORANY (r) IF [r is a constitutional provision] AND [r is enacted through *referendum*] *happens at time* t THEN^n *Binding* r	⟨from 8, by *Binding-elimination*⟩

Table 27.16: *The inference of the new amendment-rule (in its positive part)*

Argument $\mathcal{B}^\eta$ preferentially defeats argument A^η, according to the principle of posteriority (see Table 27.18 on page 720): The conclusion that η_{r2Pos} is not binding (not having been enacted through referendum) is derived using rule η_{r2Neg}, which is posterior to rule η_{r1Pos} (according to which we should conclude that η_{r2Pos} is binding having been enacted through parliamentary vote). More precisely, according to the posteriority-based preference-argument $\mathcal{P}^\eta$, rule η_{r2Neg} is stronger than rule η_{r1Pos}, and thus reason ||9, 10, 11, for 12 in $\mathcal{B}^\eta$|| outweighs reason ||5, 6, 7 for 8 in A^η||. Note that argument $\mathcal{P}^\eta$ also contains the common-sense rule[13] that a rule r_1 is later than a rule r_1 if r_1 was issued (in whatever ways w and z) at a later time than r_2.

Finally, there is a third main argument that is relevant to our analysis, argument $\mathcal{C}_\eta$ in Table 27.19 on page 721, according to which rule η_{r2Neg} is not binding, according to η_{r2Neg} itself.

[13] We freely us in our example, common sense assumptions, indicating them as $cs_1, cs_2, \ldots$

Argument B^η

1. η_{f1}: [η_{r1Pos} is a constitutional provision] ⟨premise⟩
2. η_{f2}: [η_{r1Pos} is enacted through *original constitution*]
   happens at time 01.01.1960 ⟨premise⟩
3. η_{r0}: FORANY (t) FORANY (r)
   IF [r is a constitutional provision] AND
   [r is enacted through *original constitution*]
   happens at time t
   THEN^n *Binding* r ⟨premise⟩
4. *Binding* η_{r1Pos} ⟨from 1, 2, and 3, by *syllogism*⟩
5. η_{r1Pos}: FORANY (t) FORANY (r)
   IF [r is a constitutional provision] AND
   [r is enacted through *parliamentary vote*]
   happens at time t
   THEN^n *Binding* r ⟨from 4, by *Binding-elimination*⟩
6. η_{f8}: [η_{r2Neg} is a constitutional provision] ⟨premise⟩
7. η_{f9}: [η_{r2Neg} is enacted through *parliamentary vote*]
   happens at time 01.01.2000 ⟨premise⟩
8. *Binding* η_{r2Neg} ⟨from 5, 6, and 7, by *syllogism*⟩
9. η_{r2Neg}: FORANY (t) FORANY (r)
   IF [r is a constitutional provision] AND
   [r is enacted without *referendum*]
   happens at time t
   THEN^n NON (*Binding* r) ⟨from 8, by *Binding-elimination*⟩
10. η_{f5}: [η_{r2Pos} is a constitutional provision] ⟨premise⟩
11. η_{f7}: [η_{r2Pos} is enacted without *referendum*]
    happens at time 01.01.2000 ⟨premise⟩
12. NON (*Binding* η_{r2Pos}) ⟨from 9, 10 and 11, by *syllogism*⟩

Table 27.17: *The inference that the new amendment-rule (in its positive part η_{r2Pos}) is not binding*

Argument C^η is paradoxical in the sense that it is self-defeating. More precisely, the argument's final conclusion:

11. NON *Binding* η_{r2Neg}

rebuts a previous step in the argument, that is, the intermediate conclusion

8. *Binding* η_{r2Neg}

However, for getting to proposition (11), we must have previously obtained proposition (8). Thus, we can express the paradox as follows: If η_{r2Neg} is binding according to argument C^η (proposition 8), then according to C^η it is not binding (proposition 11).

Note also that that the reason leading to the final conclusion of C^η preferentially defeats the reason leading to the intermediate conclusions, according to

Argument P^{η}

1.	η_{f2}: [η_{r1Pos} is enacted through *original constitution*] *happens at time* 01.01.1960	⟨premise⟩
2.	η_{f9}: [η_{r2Neg} is enacted through *parliamentary vote*] *happens at time* 01.01.2000	⟨premise⟩
3.	cs_1: FORANY (t_1, t_2) FORANY (r_1, r_2, w, z) IF [r_1 is enacted through w] *happens at time* t_1 AND [r_2 is enacted through z] *happens at time* t_2 AND $t_1 > t_2$ THEN^n [r_1 is later than r_2]	⟨premise⟩
4.	η_{r2Neg} is later than η_{r1Pos}	⟨from 1, 2, and 3, by *syllogism*⟩
5.	pr_{post}: FORANY (φ, ψ) IF [φ is later than ψ] THEN $\varphi \succ \psi$	⟨premise⟩
6.	$\eta_{r2Neg} \succ \eta_{r1Pos}$	⟨from 4 and 5, by *syllogism*⟩
7.	‖9, 10, 11, for 12 in $\mathcal{B}^{\eta}$‖ OUTWEIGHS ‖5, 6, 7 for 8 in A^{η}‖	

Table 27.18: *Priority argument based on posteriority*

the principle of *posteriority* (as defined in the previous section), given that the adoption of rule r_{2b} is subsequent to the adoption of rule r_{1a}, according to the preference argument P^{η}.

We need to establish the following:

- whether, on the basis of the information we have, any argument supports the conclusion that the new amendment rule is binding—especially in its positive part η_{r2Pos} (binding constitutional provisions can be enacted through referendum)—and
- whether this argument is justified.

The first question can be easily answered: We can derive the conclusion that η_{r2Pos} is binding according to A^{η} in Table 27.16 on page 718. To answer the second question, we need to establish whether A^{η} is justified, that is, whether is a proof for it. Our attempt to construct a proof develops in the following way:

- the starting *pro*-node is A^{η};
- A^{η} is defeated by the *con*-node B^{η};
- B^{η} is preferentially defeated by the *pro*-node $\mathcal{C}^{\eta}$, combined with P^{η} (preference by posteriority);
- $\mathcal{C}^{\eta}$ is defeated by the *con*-node formed by $\mathcal{C}^{\eta}$ itself;
- no further *pro*-node can be added to the proof tree.

Argument C^{η}

1.	η_{f1}: [η_{r1Pos} is a constitutional provision]	⟨premise⟩
2.	η_{f2}: [η_{r1Pos} is enacted through *original constitution*] *happens at time* 01.01.1960	⟨premise⟩
3.	η_{r0}: FORANY (t) FORANY (r) IF [r is a constitutional provision] AND [r is enacted through *original constitution*] *happens at time* t THEN^{n} *Binding* r	⟨premise⟩
4.	*Binding* η_{r1Pos}	⟨from 1, 2, and 3, by *syllogism*⟩
5.	η_{r1Pos}: FORANY (t) FORANY (r) IF [r is a constitutional provision] AND [r is enacted through *parliamentary vote*] *happens at time* t THEN^{n} *Binding* r	⟨from 4, by *Binding-elimination*⟩
6.	η_{f2b0}: [η_{r2Neg} is a constitutional provision]	⟨premise⟩
7.	η_{f2b1}: [η_{r2Neg} is enacted through *parliamentary vote*] *happens at time* 01.01.2000	⟨premise⟩
8.	*Binding* η_{r2Neg}	⟨from 5, 6, and 7, by *syllogism*⟩
9.	η_{r2Neg}: FORANY (t) FORANY (r) IF [r is a constitutional provision] AND [r is enacted without *referendum*] *happens at time* t THEN^{n} NON (*Binding* r)	⟨from 8, by *Binding-elimination*⟩
10.	η_{f10}: [η_{r2Neg} is enacted without *referendum*] *happens at time* 01.01.2000	⟨premise⟩
11.	NON (*Binding* η_{r2Neg})	⟨from 6, 9, and 10, by *syllogism*⟩

Table 27.19: *The new amendment rule (negative part): being binding leads to not being binding*

This proof tree (see Table 27.20 on the following page) fails to provide a proof of $\mathcal{A}^{\eta}$: It terminates with a *con*-node and cannot be further extended with a *pro*-node (remember that *pro*-nodes cannot be repeated in the same branch of a proof).

Thus it seems that we are unable to conclude that the new amendment provision is binding (in its positive part), which impedes us from recognising the bindingness of constitutional provisions enacted according to the new procedure (through referendum).

This analysis needs to be completed with some considerations concerning self-defeating arguments. One view is that self-defeating arguments are completely irrelevant: Since they defeat themselves they cannot support any conclusion, and thus, *a fortiori*, they cannot attack any conclusion. According to this view, which we endorsed in Prakken and Sartor 1997, sec. 10.1, argument $\mathcal{C}_{\eta}$

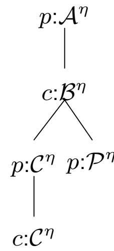

Table 27.20: *There is no proof for the argument that the new amendment rule (positive part) is binding*

fails to be usable in proofs.[14] However, argument $\mathcal{A}^\eta$ still is defeated by $\mathcal{B}^\eta$: There is no proof for $\mathcal{A}^\eta$, regardless of the status of $\mathcal{C}_\eta$. Thus the conclusion we reach concerning the justifiability $\mathcal{A}^\eta$ (and the bindingness of r_{2a}) is independent of what view we adopt on self-defeating arguments.

27.3.5. A Solution to the Self-Amendment Paradox: Non-Retroactivity

Our solution to the self-amendment paradox is based upon the analysis of some temporal aspects in legal rules.

We need to distinguish two time-frames, with regard to a conditional rule r:

- The *creation time*, namely the time when the events happen which initiate r's bindingness. For enacted rules, this is the time of the completion of the enactment procedure.
- The *applicability duration*, namely, the time-intervals during which the rule operates, by determining normative effects for events taking place during those intervals. These are the time-intervals during which the realisation of instances of r's antecedent determines the realisation of instances of r's consequent.

The relevant meta-rule mr—establishing that r's enactment initiates r's bindingness—needs to be applicable at r's creation time: At this time r's enactment must be able of determining the initiation of r's bindingness. After r's bindingness has been initiated it will continue even if meta-rule mr is not applicable to subsequent enactments: The subsequent inapplicability (or defeat) of the mr does not impact on r's bindingness.

The creation time of a rule r does not need to fall within r's application-duration. For instance I may consider as now binding, having been created

[14] We can make self-defeating arguments irrelevant, by requiring that an argument is not self-defeating, for it to rebut or undercut other arguments.

at the beginning of this year all of the following: (*a*) a retroactive rule according to which the tax on bank interests is 15% during last year, (*b*) a currently-applicable rule according to which the tax on bank interests is 14% during this year, and (*c*) a futurely-applicable rule according to which the tax on bank interests will be 14.5% during next year. The first of these rules, for instance, will be represented as follows:

FORANY (t)
  IF [01.01.2003 $\leq$ t $\leq$ 31.12.2003]
  THEN^n
    FORANY (x)
      IF [x is a loan]
      THEN^n [x's interest rate is 5% *holds at time* t]

According to our notion of cognitive bindingness all three rules, which have the same creation time (31.12.2003) are currently binding (they all have to be accepted in legal reasoning), though they will be applicable in different time intervals, as specified by their temporal antecedents.[15]

It is true that many normative propositions are stated in universal terms: They do not include the specification of a limited applicability-duration, so that they seem to be applicable to events or situations holding at any time, in the past and in the future. However, the assumption that normative proposition are temporally universal is limited by the principle of non-retroactivity.[16]

According to this principle, a rule is only applicable after the time when it was enacted (more generally, after the time when the rule has initiated to be binding).[17] The rationale of this principle is obvious: It would usually be unfair (or even irrational) to assume that the qualifications established by a rule are also determined by events which happened at a time antecedent or contemporary to the enactment of a rule, when the concerned people could not adapt their behaviour to the rule being aware of its legal bindingness.

[15] Others may want to use the notion of *validity* or *force* of a rule in a more restricted sense than our notion of bindingness, that is, to speak of a valid law (a law in force) only to denote the rules which are applicable to current and future state of affairs (this is usually the case for temporally-general statutory rules which have been enacted and have not yet been abrogated). We have no objection against this terminology, as long as it coexists with our more basic analysis, which distinguishes the cognitive bindingness of a rule and the scope of its temporal application.

[16] Further limits to the temporally-general application of a legal rules is provided by the possibility that a rule is abrogated or suspended. For a discussion of the temporal applicability of rules, though in a partially different conceptual framework, see: Sartor 1996; Hernandez Marín and Sartor 1999.

[17] Various legal systems have specific rules establishing until when an enacted rule still is inapplicable (for instance, applicability only starts one month after enactment, according to the Italian civil code).

Argument D^η

1.	η_{f9}: [η_{r2Neg} is enacted through *parliamentary vote*] *happens at time* 01.01.2000	⟨premise⟩
2.	*nonretro*: FORANY (t) FORANY (r, w) IF [r is enacted through w] *happens at time* t_0 AND [$t \leq t_0$] THEN r *is* NOT *applicable at time* t	⟨premise⟩
3.	η_{r2Neg} *is* NOT *applicable at time* 01.01.2000	⟨from 1, 2, and 3, by *syllogism*⟩

Table 27.21: *The new amendment rule (negative part) is not applicable to itself at the time of its enactment*

nonretro:
FORANY (t_0, t) FORANY (r, w)
IF [r is enacted through w]
happens at time t_0 AND
$t \leq t_0$
THEN^n r *is* NOT *applicable at time* t

According to our formalisation of the non-retroactivity principle, this principle works as a defeater against the use of instances of a rule concerning any time no later than (abbreviated as $\leq$) the time when the rule was enacted. Thus it undercuts in particular the instances of the schema *normative syllogism* where the rule's antecedent is satisfied exactly at the time when the rule was adopted.

The non-retroactivity principle undercuts in particular the syllogism constituted by lines 9, 10, 11 and 12 in argument argument B^η in Table 27.19 on page 721, namely, the syllogism concluding that the positive part of the new amendment-rule is not binding on the basis of the negative part of the same rule: This syllogism concerns the application of rule η_{r2Neg} exactly at a time when it was enacted, thus at a time no later than its enactment. You can see the corresponding argument in Table 27.21.

Argument $\mathcal{D}^\eta$ in Table 27.21 is able to strictly defeat argument $\mathcal{B}_\eta$ in Table 27.19 on page 721 by undercutting its last step. Thus, argument $\mathcal{A}^\eta$, having been freed of its only counterargument, is proved to be justified: Its proof indeed terminates with an undefeated p-argument, namely $\mathcal{D}^\eta$, as you can see in Table 27.22 on the next page.

Moreover, the same argument $\mathcal{D}^\eta$ also undercuts the paradoxical argument $\mathcal{C}^\eta$, thus making it overruled. $\mathcal{D}^\eta$ excludes that η_{r2Neg} is applied exactly at the time when it is enacted, and thus it excludes that η_{r2Neg} is applied to its own enactment, as in $\mathcal{C}^\eta$.

Table 27.22: *The effects of argument $\mathcal{D}^\eta$, based on non-retroactivity*

Thus, when coupled with the non-retroactivity clause, Ross's paradox is no paradox at all: We can derive the justified conclusion that both rules η_{r2Pos} and η_{r2Neg} are binding, since the non-retroactivity argument prevents η_{r2Neg} from being applied to η_{r2Pos} and to η_{r2Neg} itself.

27.3.6. A Second Solution to the Self-Amendment Paradox: An Interpretative Assumption

According to our analysis of the temporal applicability of legal norms, Ross's paradox seems to be a real menace only in very unlikely case of a new amendment provision which is retroactive, namely an amendment provision that is declared to apply also to amendments-acts enacted at or before the time of its adoption.

Even in this case, however, we can avoid Ross's paradox, if we directly assume that the negative part (η_{r2Neg}) of the new amendment provision is inapplicable to the positive part (η_{r2Pos}) of the same provision. This assumption can be viewed as an interpretative proposition, which we are required to endorse for capturing the (real or counterfactual) intention[18] of the constitutional legislator and for satisfying that values which underlie an updatable constitutional arrangement. Given that we want to have a modifiable constitution, it would be absurd adopt at the same time the two following attitudes:

- to accept the rule ⌈constitutional provisions cannot be enacted without a referendum⌉.
- to exclude the bindingness of the rule that ⌈constitutional provisions can be enacted through a referendum⌉, and

The joint adoption of these two attitudes entails the conclusion that constitutional provision can be enacted in no way, nor with a referendum neither without

[18] By the *counterfactual intention* of a legislator we mean the solution that the legislator would have intented to adopt, had it considered this problem. Identifying a counterfactual intention is an issue which pertains to vicarious reasoning (see Section 10.2.3 on page 284).

Table 27.23: *Proof-trees after excluding self-application of the new amendment rule*

it. But, in our framework the unrestrained application of the first rule (η_{r2Neg}) leads exactly to exclude the bindingness of the second one (η_{r2Pos}) which was enacted without a referendum.

Under this condition, a reasonable interpreter, while accepting both rules, would exclude that η_{r2Neg} applies to η_{r2Pos}.

Thus, such an interpreter would endorse the following assumption, which represents an exception to η_{r2Neg}:

η_{exc1}: η_{r2Neg} *is* NOT *applicable to* η_{r2Pos}

This assumption represents indeed an undercutter against $\mathcal{B}_\eta$, and in particular against the inference of conclusion (12) from premises (9), (10), and (11).

The argument $\mathcal{E}^\eta$, which only includes η_{exc1} undercuts $\mathcal{B}_\eta$, allows a proof of $\mathcal{A}_\eta$ to be completed, as you can see in Table 27.23.

Similarly, we can assume that the negative part of the amendment rule (η_{r2Neg}) does not apply to itself (clearly, it would be absurd to exclude the bindingness of the rule that ⌈constitutional provisions cannot be enacted without a referendum⌉, through the application of this rule (an application which depends upon the assumption that this rule is binding).

η_{exc2}: η_{r2Neg} *is* NOT *applicable to* η_{r2Neg}

This second exception provides an argument $\mathcal{F}^\eta$ undercutting the paradoxical $\mathcal{C}^\eta$, and thus making it overruled.

Thus our conclusion concerning Ross's paradox of the self-amending clause is that it is no paradox at all, or rather that it is a paradox only under the following highly improbable conditions:

- the new amendment-rule is retroactive;
- its negative part is intended to apply also to its positive part (and to itself).

Under the above conditions, we shall not be able to derive justified conclusions neither concerning the bindingness of the new amendment-rule, nor consequently of rules issued according to the new amendment-rule. However, since

it seems to us that both conditions above are quite odd (we are indeed inclined to reject both of them, at least with regard to reasonable contexts), we can dismiss Ross paradox and maintain our faith in the validity of constitutional provisions, even after their amendment-procedure has changed.

27.4. Extensions of the Basic Model

In this last section we shall quickly go through some issues concerning the formal representation of legal arguments. We cannot provide here an account of the vast debate on formal models of legal reasoning which has taken place in the last years, especially in the domain or Artificial Intelligence and law (for a review, see Prakken and Sartor 2002). Thus, we shall only consider a few aspects that are particularly relevant to the model we have presented in the previous pages. This will require us to analyse some technical aspects. The reader who does not want to deal with logical technicalities can jump to the next chapter.

27.4.1. Representing Non-Provability

Some legal rules establish that a certain proposition holds unless it can be shown otherwise (like: innocent until proved guilty), or under the condition that something is not proved. This traditional form of legal language and reasoning has been recently modelled through formalisms—taken from non-monotonic logic and computer programming—which are based upon the idea of *non-provability*.

In particular, the notion of non-provability plays an important role in representations of the law based on logic programming. In fact standard logic programming is based upon the language of extended Horn clauses,[19] and deals with negations through the operator of negation by failure, which we write as FAILED (see, for instance, Sergot et al. 1986).[20] The proposition ⌈FAILED A⌉ is proved, relatively to a certain premise set (a program), exactly by establishing that A is not entailed by that premise set (by showing that any attempt to prove A is bound to fail). Negation by failure allows for non-monotonic reasoning, since when further information is added, which allows to infer A, then FAILED A (and what depends from it) can no longer be established.

Consider a provision of the Italian civil code, which says that messages are presumed to have been known by their addressee when they arrive at the addressee's domicile unless he or she proves to have been, without fault, in the impossibility of accessing them. In logic programming this may be represented as follows: [21]

[19] Extended Horn clauses are conditional propositions having an atomic consequent, and an antecedent consisting of atomic propositions and negations of such propositions.

[20] Negation by failure is usually denoted by *not*, but we prefer to write FAILED to avoid confusion with usual negation. On logic programming, a classical reference is Kowalski 1979.

[21] For keeping our formulas short, we abbreviate "is without fault, in the impossibility of accessing" with "is unable to access."

μ_1: FORANY (x, y)
IF [message x reaches the domicile of y] AND
FAILED [y is unable to access x]
THEN [y is presumed to have received x]

(for any message x, and any person y, if x reaches the domicile y and it cannot be proved that y was unable to access x, then y is presumed to have received x)

Let us consider how an automatic theorem-prover based on logic programming would process rule μ_1, when trying to determine whether Tom is be presumed to have received Mary's acceptance letter. After establishing (on the basis of the available information) that the letter has reached Tom's domicile, the theorem prover will try to establish whether Tom was unable to access the letter. If the theorem prover fails to achieve this result (the available information does not entail this result), it will draw the following conclusion:

FAILED [Tom is unable to access $Mary's\ letter$]

Consequently, the theorem prover will be able to conclude that Tom is presumed to have received the letter.

Assume however that we add some new information to the knowledge base, information that is accessible to this theorem-prover and allows it to infer (to prove) the proposition:

x is unable to access x

Then it is no longer the case that

FAILED [x cannot x]

and consequently we can no longer establish that

Tom is presumed to have received $Mary's\ letter$

In our model we do not need to explicitly add negation by failure to our system. We can model it through the mechanism of undercutting. A rule:

r: IF (A_1 AND FAILED A_2) THEN B

can be viewed as an abbreviation for the following combination of two rules :

r_a: IF A_1 THEN B
r_b: IF A_2 THEN [r_{1a} *is* NOT *applicable*]

For instance the rule μ_1 above can be viewed as an abbreviation for the following combination:

μ_{1a}: FORANY (x, y)
IF [y reaches x's domicile]
THEN [y is presumed to have received x]
μ_{1b}: FORANY (y, x)
IF [y is unable to access x]
THEN [μ_{1a} *is* NOT *applicable to* y and x]

27.4.2. Non-Provability and Burden of Proof

The view we presented in the previous section—namely, the idea that the legal non-provability of a proposition A consists in the impossibility to infer A from the available knowledge—has been criticised by various legal theorists. In particular, Allen and Saxon (1989) have argued that in a legal text requiring that something is not shown, the word "shown" does not mean "logically proven from the available premises," but rather "shown by a process of argumentation and the presenting of evidence to an authorized decision-maker." Thus, they argue the legal notion of "showing" does not refer to logical non-provability but to legal-procedural non-provability.

This criticism has been further developed by Prakken (1999; 2001a), who has argued that logical models of defeasible reasoning cannot capture the burden of proof, as only a procedural model of legal reasoning can do.[22] Prakken's basic contention is that the outcome of failing to prove something (which one has the burden to prove) is different from outcome of failing to derive something according to a defeasible logic. Let us try to express (a simplified version of) his main argument in our framework.

According to Prakken, when one party j has the burden to prove A—in order to prevent the conclusion C of a rule r IF B THEN^n C—failure to prove A is sufficient to enable the derivation of C (assuming that the preconditions B of rule r is satisfied). And such failure also exists (so that C can be derived) when we are incapable to adjudicate the conflict between arguments for and against A.

On the contrary, in our model of defeasible reasoning, when such a balance between arguments for and against A exists, we are unable to build a justified argument for conclusion C according to rule r. For us, the argument for C only is *merely defensible* (it is defensible but not justified), since it is defeated by a merely defensible argument, namely, by the argument concluding for the inapplicability or rule r, on the basis of the merely defensible derivation of A.

Assume that we are unable to establish, on the basis of the available information, whether Tom was unable to access Mary's letter, since we have arguments

[22] For a discussion of different procedural ways of modelling the burden of proof, see also Leenes 2001.

Argument $\mathcal{A}^\mu$

1.	μ_{1a}:	FORANY (x, y) IF [y reaches x's domicile] THEN [y is presumed to have received x]	⟨premise⟩
2.	μ_2:	$Mary's\ letter$ reaches Tom's domicile	⟨premise⟩
3.		Tom is presumed to have received $Mary's\ letter$	⟨from 1 and 2, by *syllogism*⟩

Table 27.24: *Initial argument*

for and against this conclusion. For instance, assume that we are unable to establish which one of the two following incompatible inferences prevails:

- Tom was out of town, thus he was *unable* to access Mary's letter,
- Tom could easily come back, thus he was *able* to access Mary's letter.

Prakken affirms that under such conditions, there is no proof that Tom was in the impossibility of accessing Mary's letter (Tom has failed to discharge his burden of proof), and thus one is licensed to draw the justified conclusion that Tom is presumed to have received the letter. On the contrary, according to our model, we cannot establish this conclusion since our basic argument $\mathcal{A}^\mu$ (Table 27.24) is defeated by the argument $\mathcal{B}^\mu$ (Table 27.25 on the next page).

It is true that in our model, $\mathcal{C}^\mu$ (Table 27.26 on the facing page) defeats $\mathcal{B}^\mu$, since $\mathcal{C}^\mu$ concludes that Tom was able to reach the letter, contradicting line (3) $\mathcal{B}^\mu$ (which asserted that he was able to do that). However, this is case of mutual defeat (by reciprocal rebutting), and it not sufficient to make the $\mathcal{B}^\mu$ overruled (and $\mathcal{A}^\mu$ justified). So long as the conflict between $\mathcal{B}^\mu$ and $\mathcal{C}^\mu$ is not settled, we cannot view $\mathcal{A}^\mu$ as being justified: We must consider it as being merely defensible (neither overruled, nor justified). In fact, we cannot build a proof for $\mathcal{A}^\mu$, according to our definition of the notion of a proof, since this would require that $\mathcal{B}^\mu$ were strictly defeated.

Prakken, on the contrary, argues that under these conditions one is entitled to endorse argument $\mathcal{A}^\mu$: It was required, for blocking argument argument $\mathcal{A}^\mu$, that rule μ_{1a} was proved to be inapplicable (or, if you prefer, a proof was required of proposition $\lceil Tom$ is unable to access access $Mary's\ letter\rceil$) and such proof has not been provided.

We cannot provide here a thorough analysis of this difficult matter, which would require us to go into very technical aspects. However, we tend to believe that the criticism of Allen and Prakken against the ideas of provability as derivability (according to defeasible argumentation) can be countered, at least to some extent.

In particular, Allen's critique can be overcome by circumscribing, according to procedural constraints, the set of beliefs relatively to which provability has to

Argument $\mathcal{B}^{\mu}$

1.	μ_3:	FORANY (x, y) IF [x is far away when y reaches x's domicile] THEN [x is unable to access y]	⟨premise⟩
2.	μ_4:	[Tom is far away when $Mary's\ letter$ reaches Tom's domicile]	⟨premise⟩
3.		Tom is unable to access $Mary's\ letter$	⟨from 1 and 2, by *syllogism*⟩
4.	μ_{1b}:	FORANY (x, y) IF [x is unable to access y] THEN [μ_{1a} *is* NOT *applicable to* x, y]	⟨premise⟩
5.		μ_{1a} *is* NOT *applicable to* Tom, $Mary's\ letter$	⟨from 3 and 4, by *syllogism*⟩

Table 27.25: *Defeater of the initial argument*

Argument $\mathcal{C}^{\mu}$

1.	μ_3:	FORANY (x, y) IF [x can easily go back shortly after y arrives] THEN [x is able to access y]	⟨premise⟩
2.	μ_4:	Tom can easily go back shortly after $Mary's\ letter$ arrives	⟨premise⟩
3.		Tom is able access $Mary's\ letter$	⟨from 1 and 2, by *syllogism*⟩

Table 27.26: *Defeater of the defeater*

be established. In fact, we view argumentation procedures as governing what inputs are to be adopted by a certain decision-maker, but having a limited impact on the way in which these inputs are going to be processed when they have been correctly provided. Thus, when the set of the propositions which provide the premise set of the reasoner (the beliefs that are binding for the reasoner) have been identified according to the correct procedure, it should be possible to apply logical inference to such beliefs, and thus to view proofs as chains of steps performed through ratiocination.

More generally, as we observed, legal reasoning has a larger relevance that just being a technique for skilful behaviour in a procedural framework. Assume that I am a businessman, and I know that I have received the acceptance of an offer—though I also know that the other party will not be able to prove my reception of the offer "by a process of argumentation and the presenting of evidence to an authorised decision-maker," since they have kept no evidence. Am I acting legally if I refuse to implement the contract, affirming that I have not received the letter? Similarly, am I acting legally if I steal some money with the awareness that I could never be discovered?

It seems that, to answer such questions correctly, we must sharply distinguish the issue of the existence of a normative position from the chance of proving it in a dispute. The first issue concerns individual (or collective) legal cognition, and it needs to be solved by a reasoner, using all the available cognitive resources at his or her disposal. The second issue concerns anticipating how other agents are going to use the resources that are available to them, within the limits in which legal procedures allow them to use such resources. Thus, substantive answers to legal issues (Have I concluded the contract?) need to be distinguished from the ways and the constraints through which issues can be addressed in certain types of procedural settings (Will my adversary be able to lead the judge to endorse this proposition?).

In this spirit, we can accept Prakken's contention that the burden of proof is essentially a procedural notion—though it has an impact outside the courtroom, as long as people anticipate the possible outcomes of litigation. This notion specifically refers to a disputational context, and offers a way of taking a stand where declarative reasoning leaves the decision-maker in a state of perplexity.

In certain cases the rules on the burden of proof have an epistemic foundation: The party having the burden of proof is likely to be in a condition of knowing and proving the truth of a certain proposition, which is in its interest to establish. Thus, if that party does not provide the evidence, that proposition must be false. In other cases, other justifications can be found—for instance, a justification for the so-called presumption of innocence can be found in the values of individual liberty and security.

There seems to be an interesting interaction between defeasible reasoning and the burden of proof. On the one hand, rules on the burden of proof help us in circumscribing what may be viewed as the antecedent of a defeasible normative conditional: If one party has the burden of proving A in order to establish C, and the other party has the burden of proving B for preventing C from being established, we can assume that there is a defeasible rule IF A THEN^n C, plus an undercutting exception to this rule, for the case that B holds. On the other hand, rules on the burden of proof demand decisional outcomes that are not commanded by defeasible reasoning alone, as applied only to the substantive rules and the facts of the case.

27.4.3. Combining Defeasible and Conclusive Inferences

Let us finally consider the problem of combining defeasible and conclusive inferences. Let us go back to our Lebach case to illustrate it with an example. Consider the conclusion of argument $\mathcal{A}^\beta$:

6. *Tom* has the (absolute obligational) right that *Lebach documentary* is not broadcast

and the conclusion of argument $\mathcal{B}^\beta$:

Extension of argument $\mathcal{A}^\beta$

6.	FORANY (y) Tom has the obligational right that ⌈y does NOT broadcast $Lebach\ documentary$⌉ ⟨by the definition of an absolute obligational right⟩
6.1.	Tom has the obligational right that ⌈$Mary$ does NOT broadcast $Lebach\ documentary$⌉ ⟨from 6, by *specification*⟩
6.2.	It is obligatory toward Tom that ⌈$Mary$ does NOT broadcast $Lebach\ documentary$⌉ ⟨from 6.1, by the definition of an obligational right⟩
6.3.	It is forbidden toward Tom that ⌈$Mary$ broadcasts $Lebach\ documentary$⌉ ⟨from 6.2, by the equivalence of ***Obl*** NON A and ***Forb*** A⟩
6.4.	It is not permitted toward Tom that ⌈$Mary$ broadcasts $Lebach\ documentary$⌉ ⟨from 6.2 by the equivalence of ***Forb*** A and NON ***Perm*** A⟩

Table 27.27: *Conclusive extension of the privacy argument*

7. $Mary$ has the (absolute permissive) right to broadcast $Lebach\ documentary$

These conclusions do not directly contradict each other. To obtain a plain contradiction, namely, two propositions such that one is the negation of the other, we need to perform further inference steps, referring to our definitions of normative notions, and to the corresponding schemata.

Let us rewrite proposition 6 of argument $\mathcal{A}^\beta$ according to such definitions, and extend argument argument $\mathcal{A}^\beta$ with the lines in Table 27.27.

Similarly argument $\mathcal{B}^\beta$ can be extended through conclusive inference steps, as shown in Table 27.28 on the following page. In this way we get two contradictory conclusions: On the one hand we conclude, according to argument $\mathcal{A}^\beta$, that it is permitted toward Tom that Mary broadcasts the documentary; on the other hand we conclude, according to argument $\mathcal{B}^\beta$, that this is not permitted.

As we have observed, when we face a collision of conclusive reasons R_1 and R_2 (by a conclusive reason, we mean the precondition of a conclusive reasoning step), we cannot endorse both of them. Thus we need to question the elements of such reasons, that is, their subreasons. If a subreason is, in its turn, the conclusion of a conclusive reasons R_R, we must examine R_R, and examine similarly the reason supporting its elements. The backward search stops when we reach defeasible reasons (i.e., preconditions of defeasible inference-steps), since, as we know, a defeasible conclusion may be withdrawn without rejecting its reason. Thus, in order to adjudicate the conflict between conclusive reasons R_1 and R_2, we need to:

Extension of argument $\mathcal{B}^{\beta}$

7.	FORANY (y) *Mary* has the permissive right toward y that *Lebach documentary* is NOT broadcast ⟨by the definition of an absolute permissive right⟩
7.1.	*Mary* has the permissive right toward *Tom* that *Lebach documentary* is broadcast ⟨from 7, by *specification*⟩
7.2.	It is permitted toward *Tom* that *Mary* broadcasts *Lebach documentary* ⟨from 7.1 by the definition of a permissive right⟩

Table 27.28: *Conclusive extension of the information argument*

1. start our search from R_1 and R_2;
2. keep moving backward (from each subreason to its preconditions) while we reach conclusive reasons, stopping when we get to defeasible reasons;
3. collect all defeasible subreasons we can reach this way; and
4. compare the set of defeasible subreasons that lead us to endorse R_1 with the set that has lead us to endorse R_2.

This comparison, as was argued in Prakken and Sartor (1996; 1997), must take into account the weakest defeasible reasons in each of these sets, and preference must be given to the argument such that its weakest defeasible subreasons are better than the weakest defeasible subreasons in the other.

In our example, for instance, we need to go backward from the directly conflicting conclusions 6.4 in the extension of argument $\mathcal{A}^{\beta}$ and 7.3 in the extension of argument $\mathcal{B}^{\beta}$ to the reasons supporting the first defeasible elements of those inferences, that is, reasons 6.1 and 7.1 respectively. By adjudicating this conflict we obtain the comparative evaluation of the competing arguments (for a discussion of this issue, including formal definitions, see Prakken and Sartor 1997).

Chapter 28

CASES AND THEORY CONSTRUCTION

This chapter addresses *case-based reasoning* in the legal domain by merging various ideas we have discussed in the previous pages: heuresis, rationalisation, preferential reasoning, teleology, factor-based reasoning, and argumentation.

In particular, our analysis of case-based reasoning will allow us to develop the idea of *theory-construction*: We view cases as inputs for building a *practical theory* (see Section 4.1.4 on page 125) of a legal domain, namely, a body of knowledge that, while explaining previous experiences, provides guidance for future legal decision-making.[1]

28.1. Case-Based Reasoning as Theory Construction

In this section we shall present the idea of theory-construction, as applicable to legal cases, that is, we shall discuss how cases can be explained and justified through theories.

28.1.1. Cases and Theories

Legal doctrine often approaches case-based reasoning by focusing on the distinction between civil-law and common-law jurisdictions—a distinction which seems to lie mainly in the different value that is attributed to *rationes decidendi*.

According to the civil law tradition, or rather to its stereotyped representation, *rationes* of precedents do not provide reasons for drawing legal conclusions.[2] At most precedents provide examples: They only have a heuristic function. This means that their decision and their justification indicate some possible ways of solving new cases, and some possible normative rules supporting such decisions. However, the normative force of *rationes decidendi* does not depend on the fact that they were used in the precedents: The fact that a rule is a *ratio decidendi* is no normative ground why one should endorse that rule. The

[1] This chapter is based upon joint work with Trevor Bench-Capon (see: Bench-Capon and Sartor 2001a; 2001b; 2003). In particular, various paragraphs had been taken literally (or almost literally) from Bench-Capon and Sartor 2003. I am very grateful to Trevor for his generosity in allowing me to make use of the outcomes of our effort. However, I must take responsibility for the modifications I have made in order to embed this analysis of case-based reasoning into the overall framework of this book.

[2] Though the opinion that *rationes decidendi* have a certain degree of bindingness is gaining increasing acceptance in civil-law jurisdiction; see Rotolo, Volume 3 of this Treatise, sec. 7.3.1.2.

precedent only helps in retrieving legal contents that may be useful in certain contexts. Whether such legal contents are normatively binding (whether they should be endorsed, and thus support a certain conclusion) depends on their legislative (or customary) source and possibly on their content. For instance, a rule should be endorsed if it was stated by the legislator, or if its adoption would advance certain legal goals and values, regardless of the fact that it provides the *ratio* of a precedent.

In the common-law tradition, on the contrary, it is usually assumed that the fact that a rule is the *ratio* of a precedent supports its endorsement. This very fact provides a (sub-)reason for the endorsement of that rule in new cases, regardless of what other merits that rule may have had: Besides having a heuristic function, precedents also have a justificatory function. We have described this attitude as consisting in the endorsement of a meta-rule saying that *rationes decidendi* are binding (see Section 25.2.2 on page 655). By combining this attitude with the belief that a rule is a *ratio decidendi*, we obtain indeed a reason for the adoption of that rule.

Here we are not going into the comparative debate on the bindingness of precedents, an aspect which has been discussed by Shiner, Volume 3 of this Treatise, chap. 3.[3] We would rather like to stress that, when focusing on comparison, we tend inevitably to emphasise differences between different legal systems, and forget their commonalities, which are usually deeper and more significant from a theoretical perspective. The different degree of bindingness of *rationes decidendi*, and the different ways in which they constrain judicial decision-making should not lead us to forget that there is much in reasoning with precedents that remains outside the application of certain *rationes* according to the degree of their bindingness.

First of all, in all legal systems, the facts of a case are not givens: Cases need to be interpreted, and different lawyers will interpret them in different ways. The *rationes decidendi* that justify the outcome of the cases are also not in plain view: A case may interpreted in a variety of ways, at different levels of abstraction,[4] and the interpretation of a precedent may change in the light of subsequent cases.[5] Moreover, cases give rise to inherently defeasible rules: When we come to apply them, we shall typically find conflicting rules pointing to differing decisions, so we need a means of resolving such conflicts. Thus none

[3] For an exhaustive discussion of the role of precedent in different legal systems, see MacCormick and Summers 1997.

[4] See Twining and Miers 1991 and, for a computational analysis, Branting 1994 and 2000.

[5] As Levi (1949) stresses (see also Twining and Miers 1991, 311ff.). As a famous example of a case which was interpreted in a way which seems to be much broader than its expressed *ratio*, we can mention *Brown vs Board of Education* (1954), a case which—though having been justified with regard to the specific requirement not to segregate African-American children in schools (since this would have a detrimental effect on the education of these children)—was then applied to prohibit the most diverse cases of official segregation (in golf courses, beaches, public transportation, and so forth).

of describing the facts of the case, extracting rules from precedents and applying these rules is straightforward. Besides and before consisting in the application of pre-existing *rationes decidendi*, reasoning with cases consists in a process of analogical reasoning. This process can be viewed in different ways.

One may be content with the comparison of individual cases. Correspondingly one may approach a new situation by comparing the particular combination of factors in that situation, with the combinations that characterised specific past cases, and by evaluating the importance of similarities and differences.[6] However, the comparison of individual cases fails to capture appropriately the need to justify analogical conclusions, and to organise the outcomes of analogical reasoning in a coherent view. We think that the process of analogical reasoning needs (also) to be understood as a way of constructing and using theories.

These theories may contain not only rules but, as we shall see, also other pieces of normative information. They are corroborated by their ability to explain past cases, and they provide justifications for deciding future cases. The construction of such theories is an important component of a lawyer's job, as McCarty (1997, 285) observes:

> The task for a lawyer or a judge in a "hard case" is to construct a theory of the disputed rules that produces the desired legal result, and then to persuade the relevant audience that this theory is preferable to any theories offered by an opponent.

These theories are no substitutes for the intuitive ability to understand and evaluate commonalities and relevant differences: This ability is required both to provide inputs to the theory-construction effort, and to assess the merits of its output.

The view of case-based reasoning as theory-construction applies both to common law and to civil law, though the two models diverge in what significance they assign to the constructed theories, and in particular, to their ability to explain past cases and justify new decisions. It is, we believe, at the level of theory-construction that we may hope to advance our project of capturing some general patterns of legal rationality, as we shall try to do in the next pages.

[6] This is the idea we have explored in Section 6.2 on page 181, though admitting that formal models can capture only to a small extend the capacity of human intuition, as fine fined-tuned by experience. This may mean that the ability of dealing with cases is to be seen as a skill that is learned through adaptation, as an implicit kind of knowledge that cannot be fully translated into conceptual and symbolic structures. This approach has been adopted in some computer models of legal reasoning based upon neural networks (see, for instance: Zeleznikow and Stranieri 1995; Bochereau et al. 1999).

28.1.2. Levels of Explanation and Justification

Suppose we have a case and know no statute that provides a ready-made solution. We may still feel that the case requires a certain outcome, that one of the parties deserves to win. However, we may want (or need) to give reasons for our intuitive reaction. This happens when our view is contested, but also because we are victims of our "passion for reason" (Peczenik 1997), and feel the need to provide rational support for our positions.

The first way of rationalising our intuition is to resort to *factor-based reasoning* (see Section 6.2 on page 181). We identify the factors of our cases, that is, those features of them that lead to one outcome or the other, and describe our cases through the relevant factors. Such descriptions do not come "written on" the cases: They involve a degree of interpretation. At this point it is possible to argue over the factors that should be used to describe the case, but let us suppose that we have resolved this. We now have a case with a number of factors to decide it one-way and a possibly also a number of factors to decide it in the other way. We feel indeed that the factors supporting our favourite outcome are strong enough to support that outcome, in the given circumstance. But this may be insufficient to satisfy our drive towards rationality. Why were these factors sufficient to support our favourite outcome? And how could they outweigh the factors to the contrary?

At this point we must ascend a level and introduce *precedent cases*. Precedents represent past situations where these competing factors were weighed against one another, and a view of their relative importance was taken. On the assumption that new cases should be decided in the same way as precedent cases, we can take the following view: If we can find a precedent with the same factors as we have in the current case, then we have a ground for deciding the new case in the same way as the precedent. If no precedents exactly match or subsume the current case, we need to reason about the importance of the differences.

The fact that a precedent had a certain outcome in the presence of factors leading to that outcome makes us assume that these factors were indeed sufficient to decide that way, that is, to construct and endorse a *rule* (a *ratio decidendi*) to the effect that such combination of factors produces that outcome. We may, however, want to be more daring and assume that only a subset of the factors in the case were sufficient to produce its outcome. In this way, we attribute to the precedent a rationale (a *ratio*) which can also apply to cases that do not share all factors in the precedent (though this will expose our precedent to the risk of being distinguished, as we shall see). Various further ways of building rules are available, to bridge the differences between different cases. For instance, we can bridge certain differences between cases, by arguing that the same abstract (intermediate) qualifications are expressed by different lower level properties (as we shall see in Section 29.4 on page 773).

When a precedent case also contains factors that go against the decision of that case, we have a further clue to use in theory-construction. We may assume that the set of factors which supports the outcome of the case is stronger than the combination of the factors to the contrary: The decision of the cases reveals an *ordering over sets of factors*, and thus certain *preferences over the rules* we can build on the basis of those factors.

The rationalisation process does not stop at the level of rules, or *rationes decidendi*. We wonder why a factor is a reason for a certain outcome. We argue that this is because drawing that outcome (when the factor is present) contributes to promote or defend some value that we wish to be promoted or defended. And a rule including certain factors may be assumed to favour all values linked to such factors. Thus, our rules reveal certain *values* that the legal community appears to pursue through the adoption of such rules.

Moreover, the assumption that certain rule-preferences exist (as revealed by the decision of the cases) discloses an *ordering over (sets of) competing values*: If rule r_1 prevails over rule r_2, we can assume that the values advanced by r_1 outweigh the values that are advanced by r_2. Thus, the solution to the conflict is finally stated in terms of competing values rather than competing cases or factors, or rules.

The picture we see is roughly as follows:

- Factors provide a way of describing cases.
- Combinations of factors appearing in past cases ground defeasible rules (*rationes decidendi*).
- Past decisions express preferences between such combinations of factors, and thus indicate priorities between the corresponding rules.
- From these priorities we can abduct preferences between values.

Thus the body of case law as a whole can be seen as revealing an ordering on values, a *value hierarchy*. This upward movement is indeed what we have represented in the left side of Figure 28.1 on the following page.

Once we have moved up to identifying values and their hierarchies, we have completed the process of rationalisation. We may then move down, following the justification or derivation path, which is shown in the right side of Table 28.1 on the next page: Values ground rules and factors (according to teleological reasoning), and rules justify the decision of the cases (according to syllogistic reasoning).

Note that the process we have described is not to be viewed as being deterministic, especially in its upward going phase. Different possibilities can be available for identifying factors, for building rules, for assessing their conflicts, for identifying the corresponding values. Thus, different theories may be developed, given the same cases. To emphasise how the theory-construction process may lead to different incompatible results, we shall assume an adversarial

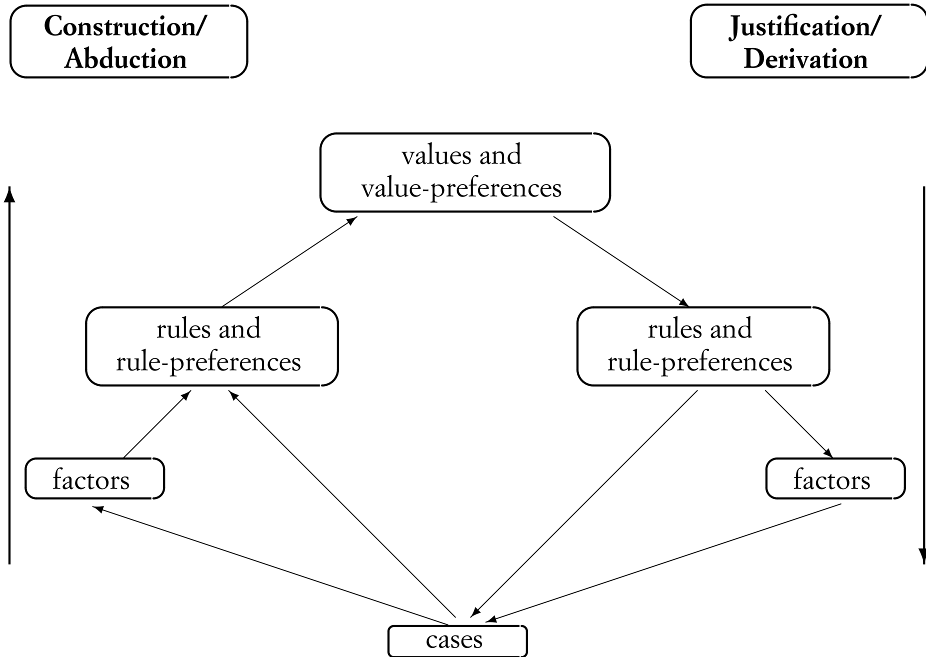

Figure 28.1: *The cycle of theory-construction-application*

framework, where each party tries to develop the theory that mostly advances its position.

However, the possibility of building different theories does not mean that all these theories are equivalent: Some are more coherent than others. Thus, the idea of coherence constrains and directs the theory-construction process: It is the criterion for choosing between alternative theories. Moreover, the coherence judgement, being anticipated by the reasoner who is producing the theory (though unconsciously, in the form of a positive or negative feeling one has towards one's achievements), directs the reasoner toward the most promising constructions.

28.2. The Construction of a Theory

In this section we shall describe the elements of a theory, provide a set of operators for constructing theories, and describe how theories can be used to explain past outcomes and predict new ones.

28.2.1. The Example

We shall illustrate our discussion with an example consisting of three cases involving the pursuit of wild animals.[7] In all of these cases, the plaintiff (π) was chasing wild animals, and the defendant (δ) interrupted the chase, preventing π from capturing the animals.

The issue to be decided is whether π has a legal remedy (a right to be compensated for the loss of the game) against δ or not.

1. In the first case, *Pierson vs Post* (a case decided in England in 1707), π was hunting a fox on open land in the traditional manner using horse and hound. Before π could gain possession of the fox, δ killed it and carried it off. In this case π lost (δ won): π was held to have no right to the fox.
2. In the second case, *Keeble vs Hickeringill* (tried in New York, in 1805), π owned a pond and made his living by luring wild ducks there with decoys, shooting them, and selling them for food. Out of malice δ used guns to scare the ducks away from the pond. Here π won: He was granted a remedy for the loss of the ducks.
3. In the third case, *Young vs Hitchens* (an English case of 1884), both parties were commercial fishermen. While π was closing his nets, δ sped into the gap, spread his own net and caught the fish. In this case π lost (δ won).

28.2.2. The Background of Theory Construction

We assume that our theory-construction process starts from a store of available information, the *background*. This background will include two basic elements, cases and factors, which we denote respectively as *case background* and *factor background*.

The starting blocks of our theories are decided cases, the *case background*.

A case can be initially seen as a set of facts, together with a decision (an outcome) made on the basis of these facts.

However, facts are in themselves neutral, they may be too specific and not necessarily relevant to the outcome. For the purpose of case-based reasoning a more abstract representation is required, where factors, rather than facts are used.

As we said in Section 8.1 on page 221, factors are an abstraction from the facts: A given factor may be held to be present in the case on the basis of several different fact situations. Moreover, factors are taken to favour one or the

[7] The example is taken from Berman and Hafner 1993, who use it to illustrate the idea of a teleological approach to case-based reasoning (see also Hafner and Berman 2002). For an extended discussion of this example, where further aspects and cases are considered, see Bench-Capon and Rissland 2001.

other of the possible decisions of the new case, and generally one or another qualification of the case. For instance, in the above cases one such factor is that ⌈plaintiff π has no possession of his quarry⌉. This single factor is an abstraction covering all the following facts: the hounds not yet having caught up with the fox, the ducks not yet having been shot, and the fish still swimming in the sea rather than landed on the boat. The factor points to what all these situations have in common: Plaintiff π has no possession of the game, and this favours the conclusion that π has no right over it.

We make use of factors, and assume that a prior analysis of the cases has identified a set of applicable factors, and has established for each case whether the factor is present or absent. Such an analysis of the example cases is given in Berman and Hafner 1993.

For a lawyer, the case background may be assumed to include all cases that are accessible in his or her jurisdiction. However, since one's memory, energies and time are limited, one will only have access to the limited set of cases which one has been able to find and to recognise as potentially relevant. Identification of the factors included in the cases will be a complex and largely unconscious process, through which one brings to bear on the retrieved material one's legal knowledge, experience and ingenuity. This is a tremendous task, which we are happy not to tackle here, assuming that cases have already been selected and represented through factors.[8]

In our example, for the sake of simplicity we assume that our background only contains the three cases above: *Pierson*, *Keeble*, and *Young*. We also assume that each one of these cases only concerns a single issue, that is, whether the plaintiff (the hunter who lost the game he was pursuing) has a right to the game, denoted as R^π (*R*ight for π), or whether he has no such right, denoted as $\neg R^\pi$ (which is the combination of the symbol $\neg$, which we us as an abbreviation for the negation NON and R^π).

As far as factors are concerned, we adopt the analysis given by Berman and Hafner (1993) and identify four factors; πLiv (π was pursuing his livelihood); $\pi Land$ (π was on his own land), $\pi NPoss$ (π was not in possession of the animal), and δLiv (δ was pursuing his livelihood). In Table 28.1 on the next page, for each of these factors we indicate the cases in which it appears and the legal result it favours.

Our description of a factor needs to be integrated with a further element, that is, the indication of the value which is promoted by recognising that factor as favouring or disfavouring a certain outcome. With regard to our example, we may say that by recognising factor $\pi NPoss$ we reduce the number of the controversial cases and thus discourage litigation; by recognising factor $\pi Land$

[8] There have been studies where ways for identifying factors have been proposed and a factor-based analysis has been carried out with regard to significant domains of the law. For a discussion of some experiences in case-based reasoning, see Ashley 1992.

πLiv	=	π was pursuing his livelihood (Keeble, Young), favouring R^{π}
$\pi Land$		π was on his own land (Keeble), favouring R^{π}
$\pi NPoss$	=	π was not in possession of the animal (Pierson, Keeble and Young), favouring $\neg R^{\pi}$
δLiv	=	δ was pursuing his livelihood (Young), favouring $\neg R^{\pi}$

Table 28.1: *The factors*

$LLit$	=	Less Litigation
$Prop$	=	Enjoyment of property rights
$MProd$	=	More productivity

Table 28.2: *The values*

$(\pi Liv \uparrow R^{\pi}) \Uparrow MProd$
$(\pi Land \uparrow R^{\pi}) \Uparrow Prop$
$(\pi NPoss \uparrow \neg R^{\pi}) \Uparrow LLit$
$(\delta Liv \uparrow \neg R^{\pi}) \Uparrow MProd$

Table 28.3: *The factor background*

we promote the enjoyment of property; and by recognising factors πLiv and δLiv we safeguard socially desirable economic activities. We thus identify the three values in Table 28.2: $LLit$ (less litigation), $Prop$ (enjoyment of property rights), and $MProd$ (more productivity).

To completely describe our factors, we need to associate each of them to the outcome it favours and to the value promoted by its recognition. For simplicity, we assume that each factor is related only to one value, although our framework could, if desired, be straightforwardly extended to allow sets of values. We write:

$$F \uparrow O$$

to express that factor F favours outcome O. We also write:

$$(F \uparrow O) \Uparrow V$$

to express that the recognition that F favours outcome O promotes value V. In this way we obtain the set of factor descriptions indicated in Table 28.3.

$Pierson$: $\{\pi NPoss\} \mapsto \neg R^{\pi}$
$Keeble$: $\{\pi Liv,\ \pi Land,\ \pi NPoss\} \mapsto R^{\pi}$
$Young$: $\{\pi Liv,\ \pi NPoss,\ \delta Liv\} \mapsto \boxed{?}$

Table 28.4: *The case background*

By applying all those factors to our cases, we obtain the corresponding case-background, which is described in Table 28.4, where we use the symbol $\mapsto$ to connect the factors applicable to a case and its outcome.

Note that we have not indicated an outcome for $Young$, since we want here to model adversarial theory-construction. We assume, for the sake of the argument that $Young$ has not yet been decided, and consider now what theories the parties of $Young$, denoted as π and δ according to their position in the dispute, could develop to argue for the outcome they wish (π arguing for R^{π} and δ for $\neg R^{\pi}$).

28.2.3. *The Components of a Theory*

A theory consists of the following components:

- descriptions of the cases considered relevant by the proponent of the theory,
- descriptions of the factors chosen as relevant in those cases,
- rules, to be used in explaining the cases, and
- preferences between rules and values, to be used in resolving conflicts between rules.

A theory is thus an explicit selection of the material available from the background, plus further components that are constructed from the selected background-material.

We assume that legal reasoners construct theories by using a number of heuristic procedures, which we call *theory constructors*. In the following we list a few of these constructors. Our list is not intended to be exhaustive: On the contrary, we admit that it captures only a small portion of possible heuristic moves an ingenious reasoner may accomplish. We hope that nevertheless it may suffice to exemplify what we mean by theory-construction.

28.2.4. *Including Cases and Factors*

First of all, one can cite the cases one views as being relevant to the issue at stake, in order to support the point one is making. By *citing a case* we mean inserting

it in one's theory, using the factors (among those that are applicable to the case) that one views as relevant.

One is not bound to describe a case using all applicable factors: In an adversarial framework one will provide a description that is appropriate to one's strategy. When one chooses to describe a case by using certain factors, one also needs to include the descriptions of these factors. For instance, if one party includes the case *Keeble*, described by using only factors πLiv, and $\pi NPoss$:

$$Keeble\text{: } \{\pi Liv,\ \pi NPoss\} \mapsto R^{\pi}$$

that party will have to insert in the theory also the following factor descriptions:

$$(\pi Liv \uparrow R^{\pi}) \Uparrow MProd$$
$$(\pi NPoss \uparrow \neg R^{\pi}) \Uparrow LLit$$

28.2.5. Constructing Rules

Cases typically contain several factors favouring a given party. By deciding to view the conjunction of certain factors (having the same conclusion) as defeasibly sufficient to produce a certain result, one constructs a rule. Since factors only are contributory reasons, there is no logical warranty that, by joining more factors, one will obtain a sufficient condition (Section 6.2.6 on page 190).

Thus, building a rule involves a non-deductive step, a *jump*, to use the terminology of Peczenik (1996). For instance, by merging factors πLiv and $\pi Land$, we obtain the rule:

$$\pi Liv \text{ AND } \pi Land \Rightarrow R^{\pi}$$

(if π was pursuing his livelihood and he was on his own land, then π has a right to the game)

A rule combining a set of factors tends (usually) to promote all values that are separately promoted by such factors. Thus, when building the rule above we can assume that its application advances the values that are linked to πLiv and to $\pi Land$, that is, productivity (*MProd*) and property (*Prop*):

$$(\pi Liv \text{ AND } \pi Land \Rightarrow R^{\pi}) \Uparrow \{MProd,\ Prop\}$$

(the rule ⌈if π was pursuing his livelihood and he was on his own land, then π has a right to the game⌉ promotes the values of productivity and property)

We may thus describe our rule constructor as follows:

Theory constructor: *Rule from factors*

RELEVANT INPUT:

(1) $(F_1 \uparrow O) \Uparrow V_1;\ \ldots;\ (F_n \uparrow O) \Uparrow V_n$

CONSTRUCTIBLE OUTPUT:

(2) $(F_1 \text{ AND } \ldots \text{ AND } F_n \Rightarrow O) \Uparrow \{V_1,\ \ldots,\ V_n\}$

Sometimes, rather than building a new rule from factors, it may be convenient to construct a new rule by modifying an existing rule—though the same result, for rules obtained from factors, could also be achieved by using the constructor *rules from factors*. We distinguish two such modifications, which we call *specialisation* and *generalisation*. Specialisation consists in obtaining a stronger rule by adding additional factors (having the same conclusion as the rule), while generalisation consists in building a weaker rule by dropping some factors.

Theory constructor: *Specialisation*
RELEVANT INPUT:
(1) F_1 AND ... AND $F_n \Rightarrow O$;
(2) $F \uparrow O$
CONSTRUCTIBLE OUTPUT:
(3) F_1 AND ... AND F_n AND $F \Rightarrow O$

Theory constructor: *Generalisation*
RELEVANT INPUT:
(1) IF F_1 AND ... AND F_n AND F THEN^n O
CONSTRUCTIBLE OUTPUT:
(2) IF F_1 AND ... AND F_n THEN^n O

Various more complex kinds of specialisation or generalisation operations could be defined, such as substituting one factor with a more specific one or with a more general one (relative to the available conceptual organisation of the considered domain). For our purposes, however, it is convenient not to go into these details, which would distract us from the presentation of the core of the idea of theory-construction.

28.2.6. Constructing Preferences

A major role played by cases is to indicate preferences between factors and related rules. According to our model of defeasible argumentation, when we have a rebutting collision between two arguments and none of them prevails, we cannot derive any justified conclusion.

This is what happens when a theory contains conflicting rules applicable to the same case and we are incapable of establishing which rule is stronger: In such circumstances, the theory fails to explain the decision of the case. This happens, for instance, when theory T containing case *Keeble*:

$Keeble$: $\{\pi Liv, \pi NPoss\} \mapsto R^{\pi}$

also includes the following two rules, both of which are applicable to *Keeble*:

$\pi Liv \Rightarrow R^{\pi}$
$\pi NPoss \Rightarrow \neg R^{\pi}$

Under such conditions, however, case *Keeble* provides an indication on how to exit the predicament. When interpreted in the light of theory T, *Keeble* tells us precisely that the first rule was preferred to the second one. This is what one must presuppose, if one wants that T provides the basis of a decision in *Keeble*, i.e., if one assumes that T may have prompted the decision-maker of *Keeble* to decide for R^{π}. In other words, in the framework provided by T (including *Keeble*), we are authorised to assume (abduct) that the first rule is stronger than the second:

$$(\pi Liv \Rightarrow R^{\pi}) \succ (\pi Liv \Rightarrow R^{\pi})$$

This assumption is not arbitrary, but it is rather grounded on the evidence provided by precedent *Keeble* (similar to the way in which scientific theories are grounded in the evidence provided by empirical observations). Precedent *Keeble* supports (justifies) this extension of theory T with the above preference, for the following reason: T was incapable of explaining *Keeble* and T becomes able to do it once we add that preference. If, on the contrary, T already provided an explanation for *Keeble*, the preference above would not be supported on explanatory grounds (since it would not contribute to explain an unexplained case). This is the rationale of theory constructor *abduct rule-pref.*, which introduces in our theories such abductions based on the evidence of previous decisions.[9]

Theory constructor: *Abduct rule-pref.*
RELEVANT INPUT:
(1) theory T does not explain precedents C;
(2) T plus rule-preference $R_1 \succ R_2$ explains C
CONSTRUCTIBLE OUTPUT:
(3) $R_1 \succ R_2$

We can also use rule preferences to derive value preferences, and value preference to derive rule preferences. If a rule is stronger than another rule, then we may assume that the values promoted by the former rule are more important than the values promoted by the latter one, according to theory constructor *value preferences from rule preferences* (abbreviated as *value-pref. from rule-pref.*).

[9] We use here the notion of abduction in a generic sense, to mean the endorsement of a proposition on the grounds that it explains the available evidence. On abduction, the classical reference is provided by the work of Charles S. Peirce, for whom abduction covers "all the operations by which theories and conceptions are engendered" (Peirce 1966, vol. 5, par. 590). For a formal model of legal abduction, see Gordon 1991. For a recent reference on abduction in the law, see Tuzet 2003.

Theory constructor: *Value-pref. from rule-pref.*
RELEVANT INPUT:
(1) $R_1 \succ R_2$;
(2) $R_1 \Uparrow V_1$; $R_2 \Uparrow V_2$
CONSTRUCTIBLE OUTPUT:
(3) $V_1 \succ V_2$

Similarly, if a set of values is more important than another set of values, we may assume that a rule promoting the former set of values is stronger that the rule promoting the latter one.

Theory constructor: *Rule-pref. from value-pref.*
RELEVANT INPUT:
(1) $V_1 \succ V_2$;
(2) $R_1 \Uparrow V_1$; $R_2 \Uparrow V_2$
CONSTRUCTIBLE OUTPUT:
(3) $R_1 \succ R_2$

Sometimes one asserts a preference between rules or values on the basis of one's intuition (or because this serves one's aims), even though this cannot be justified on the basis of previous cases, or existing preferences between values. Given the limits of our model, we shall not consider how one may come to have such preferences (they are arbitrary, when seen from our limited perspective). We simply assume that one may express intuitive preferences and may want to include them in one's theory, using theory constructor *arbitrary rule-pref.*

Theory constructor: *Arbitrary rule-pref.*
RELEVANT INPUT:
(1) $\varnothing$
CONSTRUCTIBLE OUTPUT:
(2) $R_1 \succ R_2$

Similarly we may wish to assert an unreasoned preference between values, using theory constructor *arbitrary value-pref.*

Theory constructor: *Arbitrary value-pref.*
RELEVANT INPUT:
(1) $\varnothing$
CONSTRUCTIBLE OUTPUT:
(2) $V_1 \succ V_2$

These arbitrary preferences are required to enable a theory to justify a conclusion when no support can be derived from previous cases (or other legal material). They make the preferences explicit that are being used to justify that

conclusion. In this way they locate those aspects of one's viewpoint which one should critically investigate, to see whether they any support—namely, any rationalisation—can be found for them. Moreover, disagreement about arbitrary preferences indicates to reasonable disputants where they should develop their argumentative efforts, if they want to convince the other party.

Chapter 29

THEORY-BASED DIALECTICS

This chapter is dedicated to the application of the idea of theory construction (as defined in Chapter 28) to the dynamical modelling of case-based reasoning. First we illustrate our basic model of case-based reasoning, and then we provide various extensions and refinements of it.

29.1. The Basic Model

We assume that two parties, having access to a set of precedents, are discussing a new case; let us call it $CSit$ (Current Situation). Like the precedents, also $CSit$ is characterised by a set of factors, but its outcome is not determined. As a matter of fact, it is possible that $CSit$ too is a precedent case, but we consider it as being undetermined, since we want to use it as a test for our theory: We want to establish what outcome our model determines for $CSit$, and whether this outcome coincides with the decision of the judges, and with our intuitive judgement.

For instance, with regard to the example we introduced in Section 28.2.1 on page 741, we assume (see Section 28.2.2 on page 741) that $Pierson$ and $Keeble$ have already been decided, the first for plaintiff π and the second for the defendant δ). Our aim is to establish how $Young$ should be decided. Thus our $CSit$ is the following :

$$CSit = Young\colon \{\pi Liv,\ \pi NPoss,\ \delta Liv\} \mapsto \boxed{?}$$

The plaintiff π will try to provide a theory (an *explanans*, in the terminology of Hempel 1966, 51) that both explains the precedents (the *explanandum*) and gives $Young$ the outcome that he (π) desires, namely, the decision that the plaintiff has a right over the game, abbreviated as R^{π}. Let us use the expression π-theories to refer to such theoretical hypotheses advanced by the plaintiff.

The replies of defendant δ will consist in alternative theoretical hypotheses, the δ-theories, which still explain the precedents, but imply for $Young$ the outcome she (δ) desires (the $\neg R^{\pi}$ decision).

In the following paragraphs, after considering how a theory may explain or justify a case, we shall provide an extensive example.

Cases:	*Pierson*: $\{\pi NPoss\} \mapsto \neg R^{\pi}$	
	Keeble: $\{\pi Liv, \pi NPoss\} \mapsto R^{\pi}$	
Rules:	$\pi Liv \Rightarrow R^{\pi}$	⟨by *rule from factors*⟩
	$\pi NPoss \Rightarrow \neg R^{\pi}$	⟨by *rule from factors*⟩

Table 29.1: *Theory T*

29.1.1. Constructing Theories and Explaining Cases

The evaluation of a theory basically depends on its ability to explain cases (this is the key aspect of the notion of legal coherence, as we shall characterise it). We must therefore introduce the notion of *explaining a case* (or, better, a case-description). Our analysis of this notion will be based upon our theory of defeasible argumentation (see Chapters 26 and 27), which allows us to provide the following definition.

Definition 29.1.1 *Explanation of a case. A theory T* explains *a case description C: $F \mapsto O$, if O is a* justified conclusion *with regard to premise set $R^T \cup F$ (where F is the set of all factors used to describe C, R^T is the set of all rules in T).*[1]

Remember that an argument is (inferentially) justified, with regard to a premises set, if it is justified with regard to all arguments that can be constructed from that premise set, i.e., if it can withstand all counterarguments arising from the premises set.

For instance, we may say that theory T in Table 29.1 succeeds in explaining *Pierson*, but fails to explain *Keeble*. It succeeds in explaining *Pierson* since—with regard to $R^T \cup \{\pi NPoss\}$ (the premises set we obtain by merging the rules of the theory with the facts of the case)—there is the following justified argument for $\neg R^{\pi}$ (*Pierson*'s conclusion): Since π had no possession, then he should not be compensated. Using our logical language this inference is expressed as follows:

1.	$\pi NPoss$	
2.	$\pi NPoss \Rightarrow \neg R^{\pi}$	
3.	$\neg R^{\pi}$	⟨from 1 and 2, by *detachment*⟩

Theory T fails to explain *Keeble* since, with regard to premises set $R^T \cup \{\pi Liv, \pi Land, \pi NPoss\}$ besides the above argument for $\neg R^{\pi}$ there is also an argument for R^{π}, according to which, since π was pursuing his livelihood, he has a right to the game he is chasing:

[1] $R^T \cup F$ denotes the union of rules R^T and factors F.

1. πLiv
2. $\pi Liv \Rightarrow R^{\pi}$
3. R^{π} ⟨from 1 and 2, by *detachment*⟩

Since we have no criterion for solving the conflict of these two arguments, they defeat one another and consequently none of them is justified. Thus, we are not able to explain *Keeble*'s conclusion R^{π}, on the basis of theory T.

The logic of the theories put forward by the parties to the dispute (the logic we use for determining the conclusions that are derivable from such theories) needs to be a dialectical logic. This is because one must include in one's theory, besides the reasons (the factors) supporting the conclusion one is aiming at, also the reasons favouring one's adversary. If one just considered one's own reasons, one would appear to be biased and one-sided.

On the contrary, one's task is that of showing that a decision for one's side is implied by the (allegedly) most balanced account of the controversial domain, that is, by the account that gives the most thorough and impartial consideration to the circumstances favouring one's adversary. Therefore, one's theory will licence inferences for the adversary (inferences which, on the basis of factors favouring the adversary, conclude that the latter should win), though one will claim that these inferences are defeated by prevailing reasons favouring one's side.

Thus, the theory of one party and its logic will be dialectical in the sense of including reasons, counter-reasons and meta-reasons (reasons for preferring certain reasons to certain others) and of licensing an architecture of corresponding inferences, rather than in the sense of modelling or constraining a real dialogue. In particular, though we shall call the inferences available within one theory *arguments* (as usual in argumentation logics), we do not view these inferences as explicit statements of the parties to the dispute and, in particular, we do not assume that each party states all and only the inferences favouring his or her side. Similarly, the method for adjudicating the conflicts between such argument—also called *argumentation framework*—is no protocol for a dispute, but only a way of specifying what conclusions are justified (or implied) by a single theory.

Consequently, we need to distinguish on the one hand the dialectical exchange between the two parties, and on the other hand the dialectical semantics of their theories. The dialectical exchange concerns the articulation and the refinement of alternative competing theories, while the dialectical semantics, based upon an argumentation logic, concerns establishing the defeasible implications of each theory.

29.1.2. A Simple Theory

Let us now show through an example the dialectical construction of theories concerning the three wild animal cases. As we said in Chapter 28, we shall

CSit:	*Young*: $\{\pi NPoss\} \mapsto \neg R^{\pi}$	
Cases:	*Pierson*: $\{\pi NPoss\} \mapsto \neg R^{\pi}$	
Factors:	$(\pi NPoss \uparrow \neg R^{\pi}) \Uparrow LLit$	
Rules:	$\pi NPoss \Rightarrow \neg R^{\pi}$	⟨by *rule from factors*⟩

Table 29.2: *Theory* T_1

suppose that *Young* has not yet been decided: *Young* is our current case. With regard to *Young* the parties take different stands: The plaintiff π will construct theories according to which R^{π} (plaintiff has a right to the game) is the justified outcome of *Young*, while the defendant δ will construct theories according to which $\neg R^{\pi}$ (no right for the plaintiff) is the justified outcome of *Young*.

Let us start with the simple pro-δ theory T_1, presented in Table 29.2, which we construct by including appropriate descriptions for *Pierson* and *Young*. Theory T_1 contains just one rule:

$$\pi NPoss \Rightarrow \neg R^{\pi}$$

which has been constructed from the factor:

$$(\pi NPoss \uparrow \neg R^{\pi})$$

using constructor *rule from factors*. This theory expresses the view that the plaintiff π had no right in *Pierson* ($\neg R^{\pi}$), since π did not have possession of the animal ($\pi NPoss$), which is indeed a reason, together with the corresponding rule ($\pi NPoss \Rightarrow \neg R^{\pi}$) for concluding that also in Young π has no right. No preferences are necessary: In T_1 no argument for R^{π} is available, and thus $\neg R^{\pi}$ is a justified conclusion, according to T_1, in both *Young* and *Pierson*.

29.1.3. The Introduction of a New Case

The plaintiff can, however, reply by producing theory T_2, in Table 29.3 on the facing page. T_2 absorbs T_1, in the sense that it includes all information in T_1, though supporting a different outcome. Observe that theory T_2 expands theory T_1 with some information which has been inputted from the background, that is, case *Keeble* and factor πLiv. Moreover, it includes information that has been produced by using the appropriate constructors:

- the new rule $\pi Liv \Rightarrow R^{\pi}$,
- the preference according to which this rule is stronger that the contrary rule $\pi NPoss \Rightarrow \neg R^{\pi}$, and
- the corresponding value-preference according to which having more productivity is more important than having less litigation ($MProd \succ LLit$).

CSit:	*Young*: $\{\pi NPoss\} \mapsto R^\pi$	
Cases:	*Pierson*: $\{\pi NPoss\} \mapsto \neg R^\pi$	
	Keeble: $\{\pi Liv, \pi NPoss\} \mapsto R^\pi$	
Factors:	$(\pi NPoss \uparrow \neg R^\pi) \Uparrow LLit$	
	$(\pi Liv \uparrow R^\pi) \Uparrow MProd$	
Rules:	$\pi NPoss \Rightarrow \neg R^\pi$	⟨by *rule from factors*⟩
	$\pi Liv \Rightarrow R^\pi$	⟨by *rule from factors*⟩
RulePref:	$(\pi Liv \Rightarrow R^\pi) \succ (\pi NPoss \Rightarrow \neg R^\pi)$	⟨by *abduct rule-pref.*⟩
ValPref:	$MProd \succ LLit$	⟨by *value-pref. from rule-pref.*⟩

Table 29.3: *Theory* T_2

Like T_1, also T_2 explains why the plaintiff π had no right in Pierson. This happened since π did not have possession of the animal, and this entails having no right over it, according to the rule $\pi NPoss \Rightarrow \neg R^\pi$. However, T_2 also explains why π's right was recognised in *Keeble*: π was chasing the game while pursuing his livelihood, which entails have a right to the game, according to rule $\pi Liv \Rightarrow R^\pi$.

It is true that the rule $\pi NPoss \Rightarrow \neg R^\pi$ also applies to *Keeble*, but the contrary rule $\pi Liv \Rightarrow R^\pi$ is stronger, according to the rule preference in T_2 (a preference which enables T_2 to explain *Keeble*). Thus, with regard to T_2, conclusion R^π is justified, being established by the justified argument $\mathcal{A}_1$. In Table 29.4 on the next page you can see a proof of the justifiability of argument $\mathcal{A}_1$: $\mathcal{A}_1$ is attacked by $\mathcal{A}_2$ but succeeds in strictly defeating (by preferentially rebutting) the attack thanks to preference argument $\mathcal{P}_1$, against which no counterargument is available in T_2. Theory T_2, thanks to this proof, succeeds both in explaining why *Keeble* was decided the way it was, and in justifying why *Young* should be decided in the same way.

29.1.4. Theory-Based Distinguishing

Note that one factor in *Keeble* ($\pi Land$) and one factor in *Young* (δLiv) have not been used in describing such cases. According to the interpretation of plaintiff π, the proponent of T_2, neither of these factors is relevant.

Defendant δ can, however, consider them to be relevant. Let us assume that she focuses at first on $\pi Land$ and responds to T_2 with theory T_3, in Table 29.5 on page 757. This move is interesting, since it shows how δ may advance her position also by pointing to a factor favouring her adversary.

Consider the differences between T_2 and T_3. Also T_3 explains why *Keeble* had decision R^π, but in a different way, that is, by appealing to rule πLiv AND $\pi Land \Rightarrow R^\pi$ and preferring this rule over $\pi NPoss \Rightarrow \neg R^\pi$. In this

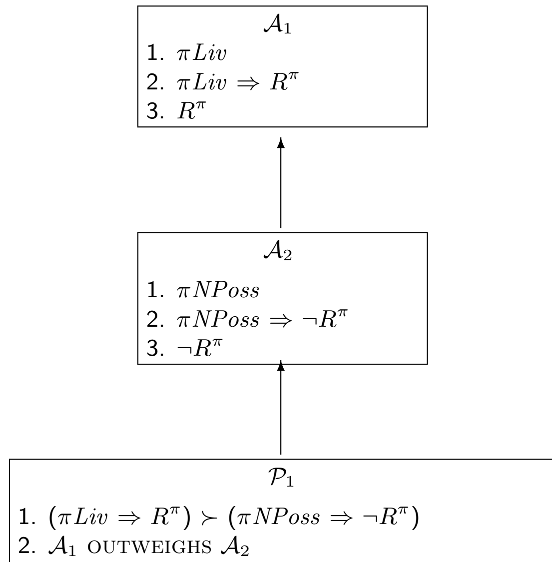

Table 29.4: *Explanation of a case*

way δ succeeds in distinguishing *Keeble* from *Young*: It explains why *Keeble* was decided for R^{π} without implying the same decision for *Young*.

In fact, according to this reconstruction, the reasoning of Keeble cannot be applied to Young, where there only πLiv (and not $\pi Land$) is present, and thus rule πLiv AND $\pi Land \Rightarrow R^{\pi}$ is not applicable.

29.1.5. Arbitrary and Value-Based Preferences

The plaintiff π can reply in two ways. Either he insists that $\pi NPoss$ is irrelevant (representing theory T_2), or he tries to absorb the theory of his adversary.

He may implement the latter strategy by distinguishing *Young* from *Pierson*. This can be done since *Young* contains a pro-π factor, namely, πLiv, which is contained in *Pierson*. In T_3 πLiv is not a sufficient reason for R^{π}: it determines R^{π} only together with $\pi Land$. The plaintiff—though admitting that $\pi Land$ is relevant, and contributes, when present, to determine R^{π}—may insist that πLiv is sufficient to achieve that result, also when factor $\pi NPoss$ has to be countered. Thus, π may correspondingly propose to expand T_3 with rule $\pi Liv \Rightarrow R^{\pi}$, and assume that this rule is stronger than *Pierson*'s rule ($\pi NPoss \Rightarrow \neg R^{\pi}$), so obtaining theory T_4, presented in Table 29.6 on the next page.

Note that in the framework of theory T_4, the latter preference cannot be justified (abducted) as being necessary to explain *Keeble*. It would be an arbi-

CSit:	$Young$: $\{\pi Liv, \pi NPoss\} \mapsto \neg R^\pi$	
Cases:	$Pierson$: $\{\pi NPoss\} \mapsto \neg R^\pi$	
	$Keeble$: $\{\pi Liv, \pi Land, \pi NPoss\} \mapsto R^\pi$	
Factors:	$(\pi NPoss \uparrow \neg R^\pi) \Uparrow LLit$	
	$(\pi Liv \uparrow R^\pi) \Uparrow MProd$	
	$(\pi Land \uparrow R^\pi) \Uparrow Prop$	
Rules:	$\pi NPoss \Rightarrow \neg R^\pi$	⟨by *rule from factors*⟩
	πLiv AND $\pi Land \Rightarrow R^\pi$	⟨by *rule from factors*⟩
RulePref:	$(\pi Liv$ AND $\pi Land \Rightarrow R^\pi) \succ (\pi NPoss \Rightarrow \neg R^\pi)$	⟨by *abduct rule-pref.*⟩
ValPref:	$\{MProd, Prop\} \succ LLit$	⟨by *value-pref. from rule-pref.*⟩

Table 29.5: *Theory* T_3

CSit:	$Young$: $\{\pi Liv, \pi NPoss\} \mapsto R^\pi$	
Cases:	$Pierson$: $\{\pi NPoss\} \mapsto \neg R^\pi$	
	$Keeble$: $\{\pi Liv, \pi Land, \pi NPoss\} \mapsto R^\pi$	
Factors:	$(\pi NPoss \uparrow \neg R^\pi) \Uparrow LLit$	
	$(\pi Liv \uparrow R^\pi) \Uparrow MProd$	
	$(\pi Land \uparrow R^\pi) \Uparrow Prop$	
Rules:	$\pi NPoss \Rightarrow \neg R^\pi$	⟨by *rule from factors*⟩
	πLiv AND $\pi Land \Rightarrow R^\pi$	⟨by *rule from factors*⟩
	$\pi Liv \Rightarrow R^\pi$	⟨by *rule from factors*⟩
RulePref:	$(\pi Liv$ AND $\pi Land \Rightarrow R^\pi) \succ (\pi NPoss \Rightarrow \neg R^\pi)$	⟨by *abduct rule-pref.*⟩
	$(\pi Liv \Rightarrow R^\pi) \succ (\pi NPoss \Rightarrow \neg R^\pi)$	⟨by *arbitrary rule-pref.*⟩
ValPref:	$\{MProd, Prop\} \succ LLit$	⟨by *value-pref. from rule-pref.*⟩
	$\{MProd\} \succ LLit$	⟨by *value-pref. from rule-pref.*⟩

Table 29.6: *Theory* T_4

trary preference, which π assumes just in order to justify the outcome he wishes. Moreover theory T_4 is defective since, with this addition, it provides two explanations for $Keeble$: one based upon rule $\pi Liv \Rightarrow R^\pi$, the second based upon rule πLiv AND $\pi Land \Rightarrow R^\pi$.

The defendant δ can do better: She can resort to value-based preferences. Assume that she accepts all of theory T_4, except for the arbitrary preference, and brings in one further factor, that is, δLiv. This allows her to propose a new rule, which only applies to $Young$:

> δLiv AND $\pi NPoss \Rightarrow \neg R^\pi$
> (if the defendant was pursuing her livelihood, and the plaintiff had no possession, then the plaintiff has no right)

For justifying $\neg R^\pi$, δ needs to assume that this rule prevails over the $Pierson$ rule. This preference cannot be abducted from cases, since it is not required

to explain either *Pierson* or *Keeble*, which already are explained in T_4. However, δ may still argue that this preference is not completely arbitrary. This is because $\{MProd, LLit\}$, is more inclusive than $\{MProd\}$ ($\{MProd\} \subset \{MProd, LLit\}$).[2] The idea is that if all values are good, then a more inclusive set of values must be better than a smaller one (Prakken 2000; Sartor 2002).

This idea could be adopted into our framework by adding a theory constructor that allows one to introduce preferences for any set of values over its own proper subsets. This follows indeed from schema *a fortiori* (see Section 8.1.2 on page 222 and Section 8.1.4 on page 225), if we extend its application also to values.

Theory constructor: *Value-pref. from value inclusion*
RELEVANT INPUT:
(1) Vs_1 is more inclusive than Vs_2
CONSTRUCTIBLE OUTPUT:
(2) Vs_1 OUTWEIGHS Vs_2

This is a very rough approximation of a full analysis of value comparisons. In particular, we discount interferences between values: If two values are incompatible, then promoting only one of them can be better than promoting both of them at the same time. However, it seems to be an acceptable schema for defeasible inference (or, at least an acceptable theory constructor). Thus, we may assume that δ wins the dispute, with theory T_5 (in Table 29.7 on the facing page).

29.1.6. Evaluating Theories

In the above discussion we produced five different theories. How do we choose between them? We believe that theories are to be assessed according to their coherence, following to the general ideas we introduced in Section 4.1.4 on page 125.

We shall not, however, attempt to develop a precise notion of coherence here, both because of the difficulty of this task, and because we are using a very broad notion of coherence, which does not commit us to a coherentist epistemology strictly understood.

On the contrary, we reject the conceptions of coherentism that view the connectedness of a set of beliefs as the only criterion for assessing the merit of such beliefs, regardless of their link to experience: Our idea of coherence includes all

[2] As usual, by a set Vs_1 being more inclusive than Vs_2 we mean Vs_2 is a strict subset of Vs_1 ($Vs_2 \subset Vs_1$).

CSit:	*Young*: $\{\pi Liv, \pi NPoss, \delta Liv\} \mapsto \neg R^{\pi}$	
Cases:	*Pierson*: $\{\pi NPoss\} \mapsto \neg R^{\pi}$	
	Keeble: $\{\pi Liv, \pi Land, \pi NPoss\} \mapsto R^{\pi}$	
Factors:	$(\pi NPoss \uparrow \neg R^{\pi}) \Uparrow LLit$	
	$(\pi Liv \uparrow R^{\pi}) \Uparrow MProd$	
	$(\pi Land \uparrow R^{\pi}) \Uparrow Prop$	
	$(\delta Liv \uparrow \neg R^{\pi}) \Uparrow MProd$	
Rules:	$\pi NPoss \Rightarrow \neg R^{\pi}$	⟨by *rule from factors*⟩
	πLiv AND $\pi Land \Rightarrow R^{\pi}$	⟨by *rule from factors*⟩
	δLiv AND $\pi NPoss \Rightarrow \neg R^{\pi}$	⟨by *rule from factors*⟩
RulePref:	$(\pi Liv$ AND $\pi Land \Rightarrow R^{\pi}) \succ (\pi NPoss \Rightarrow \neg R^{\pi})$	⟨by *abduct rule-pref.*⟩
	$(\delta Liv$ AND $\pi NPoss \Rightarrow \neg R^{\pi}) \succ (\pi Liv \Rightarrow R^{\pi})$	⟨by *rule-pref. from value-pref.*⟩
ValPref:	$\{MProd, Prop\} \succ LLit$	⟨by *value-pref. from rule-pref.*⟩
	$\{MProd, LLit\} \succ MProd$	⟨by *value-pref. from value inclusion*⟩

Table 29.7: *Theory* T_5

features that enhance the cognitive value of a theory, there included validation through experience.[3]

Firstly, we demand as much *explanatory power* as possible from our theories. In this context, explanatory power can be approximately measured by the number of cases explained. More exactly, since different cases may have different weights (one case being more recent, or having been decided by a higher court, etc.) we should consider also the relative importance of the sets of cases that the competing theories can explain.

We cannot consider here the details of the metrics for such a comparison, which is also dependant on the features of the legal system under consideration. At the very least, however, we can certainly say that theory T_a has more explanatory power than theory T_b, when T_a explains all precedents explained by T_b and some additional ones: The precedents explained by T_b are a proper subset of those explained by T_a ($T_b \subset T_a$).

Secondly we can require theories to be *consistent*, in the sense that they should be free from unsolved internal collisions. Note that we allow theories to include conflicting rules applicable to the same case, and we assume that these conflicts can be adjudicated through preferences (also contained in the theory). The contradictions we wish to avoid in a theory are those that remain undecided. Only these contradictions impair *consistency*, as we understand it.

A third classically desirable feature of legal theories is *simplicity* (a usual standard for evaluating scientific theories). This could be roughly measured

[3] As we observed in Section 4.1.4 on page 125. On the need to link coherence and experience, though from different perspectives, see Thagard 1992, and Haack 1993.

in terms of the number of factor-descriptions in the theory, or by the number of rules. Thus, a theory containing more general rules—that is, rules which consider fewer factors to be relevant—would provide simpler and more general explanations.

An argument could, however, be mounted for preferring theories which provide for a more accurate analysis of the cases, that is, an analysis which takes into account more factors. Whenever a theory does not consider a factor that was present in one of its cases, that factor can be introduced, so possibly jeopardising the previously-abducted rule preferences, and so threatening the theory's ability to explain the cases. The use of factor $\pi Land$ in T_3 above, to challenge T_2, is an example of this move.

Thus a theory is *safer* in accordance with the completeness of the factors it considers. Whether we should look for simplicity or safety depends on the status of the factors. If a factor contributes to the most plausible explanations of past decisions, it is certainly better to insert it, but if it appears to have played no part in previous decisions, it is preferable to omit it (at least when appealing to it is unnecessary to support the outcome one wishes).

Finally a theory is better in so far as it makes less recourse to *arbitrary* assumptions, namely, assumptions that are not required to explain, include, or rationalise valid input-information. The notion of valid input-information must be understood in a very wide sense. Such information includes first of all case-decisions (this is the aspect on which we have focused), but also the values, goals and rules which may be attributed to the legal community (being the content of legislation, or recognised values, shared customs, and so forth).

The fact that an item of information constitutes a valid input does not make this item necessarily decisive or even acceptable within the theory, but rather gives to it an independent importance, which is reflected in the merit of the theory: The more a theory succeeds in integrating such input information the better it is. For instance, the most coherent theory may fail to explain a case or to include a communal value, since this leads to conflicts with other components in the theory. However, given the same level of internal coherence, a theory including more cases and shared values is a better one.

It is not easy to find a way of combining these different criteria into a unique evaluation, given that they may lead to different results: T_1 may explain more cases than T_2, but may include fewer or less important values, T_1 may be simpler than T_2 but may provide a less accurate representation of the cases, and so on. We shall make some comments on that in Section 29.5.1 on page 783.

29.2. Argument Moves and Theory Construction

In this section we shall show how some classical moves of case-based argumentation can be viewed as theory-construction steps. We shall refer in particular to the model of case-based reasoning developed by Kevin Ashley and Edwina Rissland, with the help of their associates (in particular Vincent Aleven, David

Skalak, and Stephanie Bruninghaus). This model was implemented in two computer programs, *Hypo* (Rissland and Ashley 1987; Ashley and Rissland 1988; Ashley 1992), and *Cato* (Ashley and Aleven 1991; 1997). We shall occasionally refer to Hypo and Cato, but our interest here lies on their conceptual model rather than on their computational implementation.[4]

29.2.1. Citing a Case

The most basic reasoning move in case-based reasoning consists in citing a case, in order to strengthen one's position. From our viewpoint, this involves extending a theory with an additional precedent case. However, achieving the purpose of the citation also involves expanding the theory further, so that it is able to take into account the new case: This consists in adding factors, rules and preferences, so that the theory can explain the cited case and possibly others cases included in the theory, but also give indications on new cases

An example above is theory T_1, which cites *Pierson* in support of the defendant in *Young* by introducing case:

$$Pierson\colon \{\pi NPoss\} \mapsto \neg R^{\pi}$$

When introducing the case, the defendant also needs to introduce factor:

$$(\pi NPoss \uparrow \neg R^{\pi}) \Uparrow LLit$$

and the rule:

$$\pi NPoss \Rightarrow \neg R^{\pi}$$

(if π has no possession of the game, then he has no right over it)

which explains the case. This citation is particularly simple, since the theory does not contain any rule that would require the case to have a different outcome.

If the theory already includes such a rule, then the citation of a case also requires the introduction of a preference, explaining why the case deserved the decision it had as a matter of fact, through the constructor *preferences from case*. As an example of this more complex type of citation, consider how the plaintiff π constructs theory T_2 by citing *Keeble*. At this stage π introduces a case:

$$Keeble\colon \{\pi Liv,\, \pi NPoss\} \mapsto R^{\pi}$$

a factor:

$$(\pi Liv \uparrow R^{\pi}) \Uparrow MProd$$

[4] A computer application intended to assist in building legal theories, according to the model we shall present in the following pages, is presented in Chorley and Bench-Capon 2003.

a rule:

$$\pi Liv \Rightarrow R^{\pi}$$

(if π was pursuing his livelihood, then he has a right over the game)

and a preference:

$$(\pi Liv \Rightarrow R^{\pi}) \succ (\pi NPoss \Rightarrow R^{\pi})$$

The preference is necessary to enable the theory to explain Keeble.

Pragmatically, the best case to cite is the one that—besides having the outcome that the citing party wishes for the current situation—includes as many factors in common with the current situation as possible. This allows the most specific, and thus safest, rule to be constructed, and thus pre-empts several possible challenges. Thus citing a case is essentially a move of theory-construction, although considerations as to which is the best case to cite anticipate the evaluation of the theory.

29.2.2. Counterexamples and Distinctions

Following Hypo's model, we identify two different responses to a cited case: *providing a trumping counterexample* and *distinguishing* the case.

Let us first analyse providing a *trumping counterexample*. This is the stronger move to attack a theory. It consists in providing a new case which licenses a non-arbitrary way of absorbing the opponent's cases into one's own theory: This requires that the newly cited case has a larger set of factors in common with the current situation that any of the opponent's cases. The resulting theory will explain both the counterexample case and the previously cited ones, besides giving the current situation the result desired by the citing party. It thus wins on explanatory power. The use of $Keeble$ in T_2 is an example of this move. We need to distinguish a trumping counterexample from an *as-on-point counterexample* . An as-on-point counterexample provides an outcome opposed to a precedent's but does not contain all factors which the precedent shares with the current situation. Thus it does no more than display a failure to explain certain cases on the part of the theory, whereas the trumping counterexample gives rise to a new theory superior in explanatory power.

Let us now consider *distinguishing*. There are two main ways of distinguishing a case. The first way points to a factor favourable to one's opponent, which is present in the precedent case and absent in the current situation; the second points to a factor favourable to oneself, which is present in the current case and absent in the precedent.

The first way of distinguishing a case involves introducing a new factor F_{dis}, which favours the opponent, and which is not already considered in the opponent's theory. F_{dis} is not contained in the current case, but applies to a precedent

Prec which was decided for the opponent's side, and from which the opponent has abducted the rule and the preference which allow her to provide a certain solution the current case. Once the new pro-opponent factor F_{dis} is introduced, and *Prec* is described also through F_{dis}, a different explanation of *Prec* can be provided, an explanation that does not apply to the current situation.

Assume that the current situation *CSit* shares with precedent *Prec* factors F_1 and F_2. *Prec*'s was explained by the opponent assuming that rule $F_1 \Rightarrow O$ is stronger than rule $F_2 \Rightarrow \neg O$:

$$(F_1 \Rightarrow O) \succ (F_2 \Rightarrow \neg O)$$

Thus $F_1 \Rightarrow O$ was assumed to be the *ratio* of the present, a *ratio* determining (together with the corresponding preference) the outcome of the current situation. Distinguishing consists in substituting the *ratio* identified by the opponent with a more specific *ratio*:

$$F_1 \text{ AND } F_{dis} \Rightarrow O$$

and a corresponding preference:

$$(F_1 \text{ AND } F_{dis} \Rightarrow O) \succ (F_2 \Rightarrow \neg O).$$

The latter rule and preference do not apply to the current situation, which does not contain factor F_{dis}. Thus, once the new, more specific rule and preference are available, the old combination becomes unnecessary to explain the precedent, and so fails to provide a convincing ground for a decision in the current situation.

The introduction of factor $\pi Land$ in T_3 above exemplifies the distinguishing move. By introducing this additional factor, the defendant was able to transform the rule:

$$\pi Liv \Rightarrow R^{\pi}$$

(if π was pursuing his livelihood, then he has a right over the game)

into the rule:

$$\pi Liv \text{ AND } \pi Land \Rightarrow R^{\pi}$$

(if π was pursuing his livelihood and he is on his own land, then he has a right over the game)

saying that if the plaintiff was pursuing his livelihood *on his own land*, then he has the right.

The defendant can then use this rule to explain the case *Keeble* (as described through factors πLiv, $\pi NPoss$, and $\pi Land$) according to the following preference:

$$(\pi Liv \text{ AND } \pi Land \Rightarrow R^{\pi}) \succ (\pi NPoss \Rightarrow \neg R^{\pi})$$

The new rule (and the corresponding preference) is not applicable to the current case, *Young*. In fact, *Young* has factors πLiv, $\pi NPoss$, but misses $\pi Land$, which is required if the new rule is to be applied.

On the other hand, in the new theory (resulting from adding to T_3 the new rule and preference) one can dismiss both the old rule:

$$\pi Liv \Rightarrow R^{\pi}$$

and the corresponding preference:

$$(\pi Liv \Rightarrow R^{\pi}) \succ (\pi NPoss \Rightarrow \neg R^{\pi})$$

Therefore, through distinguishing δ constructs a new theory in which a R^{π} decision in *Keeble* does not entail a R^{π} decision in *Young* (which is what the plaintiff wanted to establish).

This way of distinguishing is less powerful than a trumping counterexample because it does not form the basis for a different decision in the current situation, but merely blocks the rule the opponent needs. In conclusion, this theory-construction move involves a factor rather than a case. The effect of the move is to make the opponent's theory arbitrary, by showing that an alternative explanation of the precedents is possible: This explanation provides a more accurate account of the factors in the precedents and fails to deliver the outcome wished by the opponent in the new situation.

An as-on-point counterexample can also be seen as the combination of a distinguishing move together with a case which grounds a new alternative theory, based on different factors. This new theory itself can, of course, be subject to a distinguishing move. We would then end up with two theories which both require arbitrary assumptions in order to justify a decision in the current situation.

The second and simpler way of distinguishing consists in pointing to a factor in the current situation which supports one's favourite outcome, and which was absent in the precedent. By using this factor one gets a new rule, only applicable to the current situation, which collides with the *ratio* the opponent wants to apply to both the precedent case and the current situation. One then argues that the opponent's *ratio*, though prevailing in the precedent, does not ensure the same outcome for the current situation, where there is a stronger rule (a larger set of factors) to the contrary.

For instance, the defendant—when replying to theory T_2 (Table 29.3 on page 755)—rather than introducing factor $\pi Land$ (and distinguishing *Keeble* on this basis), could have immediately introduced factor δLiv, which is only present in the current situation (*Young*). This would have allowed her to build rule $\delta Liv \text{ AND } \pi NPoss \Rightarrow \neg R^{\pi}$ (if the defendant is pursing his livelihood and the plaintiff has no possession, then the latter has no right to the game).

She could consequently admit that, according to *Keeble*, the rule concerning the plaintiff's economic activity ($\pi Liv \Rightarrow R^{\pi}$) prevails over the rule only

concerning the plaintiff's lack of possession ($\pi NPoss \Rightarrow \neg R^{\pi}$). However, she would say that *Keeble*'s rule does not prevail over the stronger rule concerning the combined effect of the defendant's economic activity and the plaintiff's lack of possession (δLiv AND $\pi NPoss \Rightarrow \neg R^{\pi}$), which is only applicable to Young.

29.2.3. Emphasising Strengths and Showing Weaknesses not Fatal

In the Cato system (Ashley and Aleven 1997) four additional argument moves are introduced: (1) emphasise strengths, (2) show weaknesses not fatal, (3) emphasise a distinction, and (4) downplay a distinction. Let us consider here the first two moves, since the last two require an extension to the basic model and will be considered in Section 29.4 on page 773.

The move *emphasise-strengths* consists in adding precedents that support one's point of view. In our framework, this simply corresponds to introducing more cases that are explained by the theory, with factors shared with the current situations, thus increasing the theory's explanatory basis. Again these moves can be seen as constructing a theory that will be evaluated as better.

Showing weaknesses not fatal consists in showing that the weaknesses of the current situation with regard to the desired outcome—in particular, the presence of factors against that outcome, or the absence of factors favouring it—are not decisive, since the desired outcome was obtained in precedent cases that shared the same weaknesses. In our framework, this move involves including cases with the desired outcome, but this time missing factors for that outcome or containing factors against it. In our terms, this move can be seen as an attempt to increase the safety of the explanations in the theory, by anticipating and pre-empting the introduction of additional factors. It is also possible that such cases may licence the introduction of preferences that contradict preferences arbitrarily introduced by the opponent.

29.3. Dimensions in Theory Constructions

A significant extension to the model we described in the above sections consists in embedding *dimensions* in the theory-construction process. We have already considered how dimensions differ from binary factors (see Section 8.1.4 on page 225). Let us now see how the difference between dimension-based thinking and binary thinking may affect theory-construction.

29.3.1. Dimensions and the Representation of Cases

Let us refer to our hunting example to shows the limitations of binary thinking. Consider, for instance, the *Pierson* case. Using the factors we identified, it

would appear that plaintiff π had no case to present: He did not get possession of the fox ($\pi NPoss$), and this is assumed to signal that he had no right over it.

However, let us further consider the factor $\pi NPoss$ (the plaintiff has no possession of the animal), and assume that it can be applied whenever the plaintiff has not caught the animal. As set up, this is an all or nothing affair, in which either plaintiff has not caught the animal (so that the factor does hold), or has caught it (so that the factor does not holds). Under the first condition (the animal has not been caught) it does not matter whether the plaintiff has seen the animal, whether he was in hot pursuit of it, or even whether he has wounded it (perhaps mortally). All of these situations are treated by $\pi NPoss$ as being equivalent ways of realising the pro-πfactor $\pi NPoss$, all of them favouring outcome $\neg R^{\pi}$.

We do not, however, have to see the situation this way. We could see instead a range (discrete or continuous) of positions between seeing the animal and actually possessing it, and the points on this range as being progressively more favourable the conclusion R^{π} (that π has a right over the game) and less favourable to the conclusion $\neg R^{\pi}$ (that he has no such right).

The binary perspective transforms this range into a yes/no alternative: According to $\pi NPoss$ having failed to catch the animal is a reason for finding for the defendant (for $\neg R^{\pi}$), whereas if the animal has been caught there is no such reason.

However, there is not only one way to transform the range of possible positions into a binary factor. Instead of the pro-$\neg R^{\pi}$ factor $\pi NPoss$ we might have introduced a pro-R^{π} factor, $\pi Chase$, which was intended to cover all cases in which the plaintiff has given chase: According to this choice, having pursued the animal is sufficient to establish a reason for the plaintiff, and only failing to start a chase would not instantiate this reason. Note that the situation existing in $Pierson$ (plaintiff was chasing the animal though he had not caught it yet), would favour the defendant when seen from the perspective of factor $\pi NPoss$, while it would favour the plaintiff when seen from the perspective of factor $\pi Chase$.

Consider also factor πLiv (the plaintiff was pursuing his livelihood). Also the choice of this factor is not the only possible one: Besides earning one's living one may be acting out of a number of progressively less favourable motives (with regard to acquiring a right over the animal), such as altruism (foxes are vermin and a threat to farmers), pleasure, or even malice (if it was the defendant's pet fox). Assume that in $Pierson$ the plaintiff's hunt was motivated by the desire to reduce the number of foxes, to safeguard the community's poultry. Perhaps the correct factor was one which would apply if the plaintiff was earning his living or acting out of concern for his neighbours. Had this factor been available, another pro-plaintiff factor would have been available in $Pierson$.

Considerations such as these are present in the text of the judgement in $Pierson$. The judgement speaks of "caught or mortally wounded" and a dis-

senting opinion expressed the view that the social utility of the fox hunting was so great that the activity should be encouraged and protected by law.

Thus for possession we could see a possible dimension $\pi Control$, representing the level of control which the plaintiff had over the animal, with a possible *dimensional spectrum* of degrees such as

$$\langle NoContact, Seen, Started, Wounded, MortallyWounded, Captured\rangle$$

which favours R^{π} according to the extent to which capture was approached (moving to the right), and favours $\neg R^{\pi}$ to the extent to which no-contact was approached (moving to the left).

Seen in this way, choosing a binary factor is not a matter of simply picking one feature favouring one outcome of a dispute from a pre-existing background-store of such features, but rather involves selecting a significant point within a dimension from which a binary-factor can be formed and linking that point to an outcome. This selection implies that the realisation of the dimension to that point starts to favour the chosen outcome.

Therefore all positions in the span from the chosen point toward the dimension's extreme (in the direction indicated by the chosen outcome), will also realise the factor.

29.3.2. Dimensions and Values

Also dimensions need to be related to *values* (like factors in general). We have seen that a factor is a reason for endorsing a particular outcome because to do so would promote some value. Correspondingly, a dimension is an increasingly strong reason for endorsing an outcome as its position approaches the corresponding extreme, since as the dimension goes toward the corresponding extreme that outcome more probably or more strongly promotes some value. Thus we should see the positions in a dimension as offering a stronger opportunity to promote some values (by endorsing the corresponding outcomes) as we move toward an extreme.

Two types of value need to be distinguished:

- those which are more surely promoted by deciding for the plaintiff as we approach the pro-plaintiff extreme, and
- those which are more surely promoted by deciding for the defendant as we approach the pro-defendant extreme.

This can be illustrated by analysing dimension $\pi Control$. When we move toward the left of the dimensional spectrum (there is less control over the chased animal), the dimension $\pi Control$ favours outcome $\neg R^{\pi}$, in order to promote the value of reduction of litigation $LLit$; while as we move to the right of the spectrum (there is more control over the chased animal), the dimension favours

outcome R^{π} in order to promote the (quite questionable nowadays) value of appropriation $Prop$ (encouraging private appropriation as the best way to exploit natural resources).

In fact, as we move toward the $\neg R^{\pi}$ extreme—that is, when the plaintiff's control over the animal is more tenuous—we approach less clear-cut situations. Deciding for the plaintiff in those situations would be likely to encourage litigation in other similar cases, and would increasingly do so, the less the plaintiff's control. If judges were to decide this way, hunters who missed the animal they were pursuing, which was captured by other hunters, would begin suing the latter, alleging to have been the first to wound, chase, start, or even see the animal.

Note that, from this perspective, if having wounded the animal is a form of control so tenuous that we have a reason to find for the defendant ($\neg R^{\pi}$), mere pursuit will be a stronger reason to find for the defendant.

Appropriation, on the other hand, is more surely promoted by deciding for the plaintiff when he has a stronger control over the animal: In this condition, deciding for the plaintiff means to give legal backing to the physical possession he has gained over the animal, and so to recognise and encourage private appropriation. If merely chasing a fox is a reason to find for the plaintiff, then mortal wounding will be a stronger reason.

29.3.3. *The Extraction of Factors*

Our discussion of the dimension $\pi Control$ has shown how one dimension can provide factors leading to opposite outcomes, outcomes that are more strongly promoted when one approaches the corresponding extreme of the dimensional spectrum.

We always need to choose a starting point for the factor, but the behaviour of the factor will be different. Factors favouring an outcome to the right of the dimensional spectrum (the outcome which is increasingly favoured by an increase in the dimension) will cover all positions in the range spanning from the chosen point to the right extreme. Factors promoting an outcome located to the left side of the dimensional spectrum (the outcome that is increasingly favoured by a decrease in the dimension) will include all positions in the range spanning from the chosen point to the left extreme.

Dimensions provide the input material for constructing factors. Before considering this aspect of theory-construction, let us see how we can describe a dimension. The *description of a dimension* d includes all of the following elements:[5]

- The *dimensional spectrum*, which is a continuum or discrete spectrum of positions $\langle p_1 \dots p_n \rangle$ realising increasing degrees of d (p_{i+1} realises d more than p_i).

[5] For a discussion of the structure of a dimensions see Section 8.1.5 on page 231.

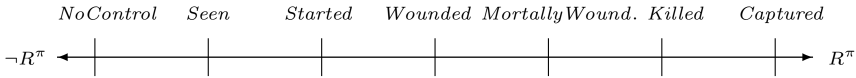

Figure 29.1: *The spectrum of dimension* $\pi Control$

- The *dimensional outcomes* $\langle \overleftarrow{O}, \overrightarrow{O} \rangle$, which are a pair of legal qualifications such that:
  - $\overleftarrow{O}$, the *leftward outcome*, is increasingly favoured by decreasing degrees of d ($\overleftarrow{O}$ is favoured by p_{i-1} more than it is favoured by p_i);
  - $\overrightarrow{O}$, the *rightward outcome*, is increasingly favoured by increasing degrees of d ($\overrightarrow{O}$ is favoured by p_{i+1} more than it is favoured by p_i).
- The *dimensional values*$\langle \overleftarrow{V}, \overrightarrow{V} \rangle$ is a pair of (sets of) values, such that:
  - $\overleftarrow{V}$, the *leftward value*, is more strongly promoted by $\overleftarrow{O}$ as d decreases ($\overleftarrow{O}$ under condition p_{i-1} promotes each $\overleftarrow{V}$ more strongly than $\overleftarrow{O}$ under p_i does);
  - $\overrightarrow{V}$, the *rightward value*, is more strongly promoted by $\overrightarrow{O}$ as d increases ($\overrightarrow{O}$ under condition p_{i+1} promotes each $\overrightarrow{V}$ more strongly than $\overrightarrow{O}$ under p_i does).

By applying our model of a dimension to $\pi Control$, we obtain the following dimension-based description:

Property:	$\pi Control$
Spectrum:	$\langle NoControl, Seen, Started, Wounded,$ $MortallyWounded, Captured \rangle$
Outcomes:	$\langle R^{\pi}, \neg R^{\pi} \rangle$
Values:	$\langle \{LLit\}, \{Prop\} \rangle$

In Figure 29.1 you can see the dimensional spectrum of $\pi Control$.

Assume that the background description of cases is now provided in terms of dimensions rather than factors. Each case will be characterised by a set of *dimensional positions* $\{p^{d_1}, \ldots, p^{d_n}\}$, where each p^{d_i} indicates the position (degree) at which dimension d_i was realised in the case.

Factor descriptions can be constructed out of dimensions by choosing one of the positions on the spectrum, one outcome, and one of the values promoted by

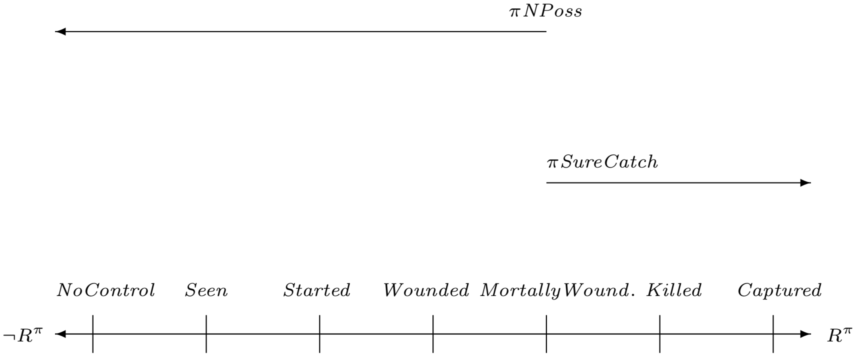

Figure 29.2: *Factors from dimension $\pi Control$: $\pi SureCatch$, $\pi NPoss$, $\pi Started$*

that outcome. The construction of a factor starting at position p_i with regard to dimension d, and having outcome Q entails the assumption that the realisation of the chosen position p_i of dimension d, supports the chosen outcome Q, but also that:

1. if $Q = \overleftarrow{O}$, then any p_j such that $j < i$ also supports Q,
2. if $Q = \overrightarrow{O}$, then any p_j such that $j > i$ also supports Q.

For example, given the dimension $\pi Control$, described above, one could construct the pro-R^π factor $\pi SureCatch$ (π is sure of the catch), which begins being realised when the game has been $MortallyWounded$, or the pro-$\neg R^\pi$ factor $\pi NoPoss$, also beginning when the game has been $MortallyWounded$, but going in the opposite direction, along the dimensional spectrum (see Figure 29.2).

It is important to stress that a factor—starting at a certain dimensional position p_i, and favouring outcome O—applies not only to the cases that exhibit the dimensional position p_i, but also to the cases exhibiting a position that more strongly favours O along the dimensional spectrum. In other words, p_i indicates an outcome O that which is also realised by more O-favourable positions. These are are the positions p_j such that $j < i$ when O is the leftward outcome, and the positions p_j such that $j > i$ when O is the rightward outcome.

For example, according to the dimension $\pi Control$, the pro-$\neg R^\pi$ factor $\pi NPoss$ is realised not only when the animal was mortally wounded, but *a fortiori* in all positions preceding $MortallyWounded$ in the dimension's list, whereas the pro-R^π factor $\pi SureCatch$ is realised not only when the animal

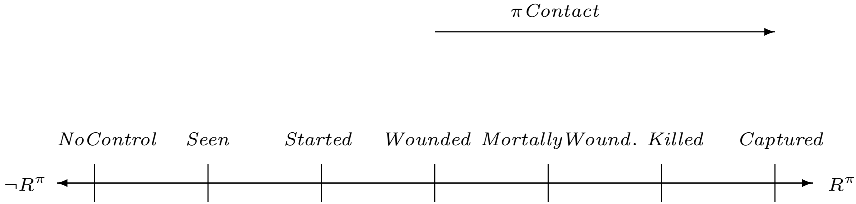

Figure 29.3: *Another factor from dimension* $\pi Control$: $\pi Contact$

was mortally wounded, but *a fortiori* when the animal was captured (on dimensional *a fortiori*, see Section 8.1.6 on page 233).

Thus, we may say that a factor *subsumes* all dimensional positions that precede (for leftward-going factors) or follows (for rightward-going factors) the initial positions for that factor. For example, factor $SureCatch$ above subsumes both $\pi Control^{Killed}$ and $\pi Control^{Captured}$, while it does not subsume $Control^{Wounded}$ nor $Control^{Started}$ (see Figure 29.3).

Note that building factors out of dimensions gives a degree of discretion: it requires setting the bound at which one outcome is supported along one dimension. Different choices in this regard would lead to different interpretations of the cases. So while the factor $\pi SureCatch$ favours outcome R^π only from the point where the animal is mortally wounded, the pro-R^π factor $\pi Contact$ (π had contact with the animal), with starting position $Control^{Wounded}$ would imply that just wounding the animal (and *a fortiori* mortally wounding it) supports the outcome R^π (see Figure 29.3).

29.3.4. Additional Reasoning Moves

A dimensional representation allows us to explore the creation of factors rather than taking them as given, and allows for additional reasoning moves. This is useful since limiting oneself to applying the already available factors can significantly bias one's view of a case.

In particular, a dimensional view allows for new ways of distinguishing. Assume that a new case $CSit$ is similar to $Pierson$, except that while in $Pierson$ π has started the fox, in the new case π has wounded it. Assume that the defendant δ has cited $Pierson$, and has provided a theory explaining $Pierson$ according to factor $\pi NPoss$ (π had no possession of the game), which δ describes as follows:

$$\pi NPoss\colon\ (Control^{MortallyWounded} \uparrow \neg R^\pi) \Uparrow LLit$$

This factor description means that $NPoss$ (the plaintiff has no possession of the game) starts to hold when one has mortally wounded the animal (rather than catching it) and favours the conclusion that the plaintiff has no right. This factor, favouring the leftward outcome $\neg R^{\pi}$, subsumes all position to the left of its starting point in the dimensional spectrum ($Wounded$, $Started$, $Seen \ldots$), as Figure 29.2 on page 770 shows. Factor $NPoss$ provides a ground why $Pearson$ was decided for the defendant, and thus a ground for deciding the new case in the same way, according to the rule:

$$\pi NPoss \Rightarrow \neg R^{\pi}$$

In his response, however, the plaintiff could take into account a different position in the dimension, and so would be able to point out that along the dimension $Control$, he is in a more favourable situation as compared to the $Pierson$'s plaintiff, and this requires a different solution than in $Pierson$. For instance, he could introduce the factor $\pi Contact$, meaning that π had contact with the animal, with description:

$$\pi Contact: \quad (Control^{Wounded} \uparrow R^{\pi}) \Uparrow Prop$$

According to this description, factor $\pi Contact$ favours the rightward outcome R^{π}, starting from the point where the animal was $Wounded$, and thus also covers positions $MortallyWounded$, $Killed$ and $Captured$ (see Figure 29.3 on the preceding page).

At the same time the plaintiff could also introduce a factor $\pi NoContact$, with description

$$\pi NoContact: \ (Control^{Started} \uparrow \neg R^{\pi}) \Uparrow LLit$$

According to this description, factor $\pi NoContact$ favours the leftward outcome $\neg R^{\pi}$, starting from the point where the animal was $Started$, and thus also covers positions $Seen$ and $NoControl$ (see Figure 29.4 on the next page).

Assume that the first factor is applicable in the new case and produces a rule

$$\pi Contact \Rightarrow R^{\pi}$$

while the second factor was satisfied in $Pierson$, and produces the rule

$$\pi NoContact \Rightarrow \neg R^{\pi}$$

which contributes to explaining $Pierson$'s outcome.

By substituting factor $\pi NPoss$, according to which $Pierson$ and $CSit$ are indistinguishable, with these two factors, the plaintiff has succeeded in distinguishing $Pierson$ and $CSit$: He has explained the outcome of $Pierson$ ($\neg R^{\pi}$) in such a way that he can continue to argue for the opposite outcome (R^{π}) in $CSit$. Similar moves are possible with respect to counterexamples and their rebuttals. This is a very important type of move, but one which obviously requires dimensions.

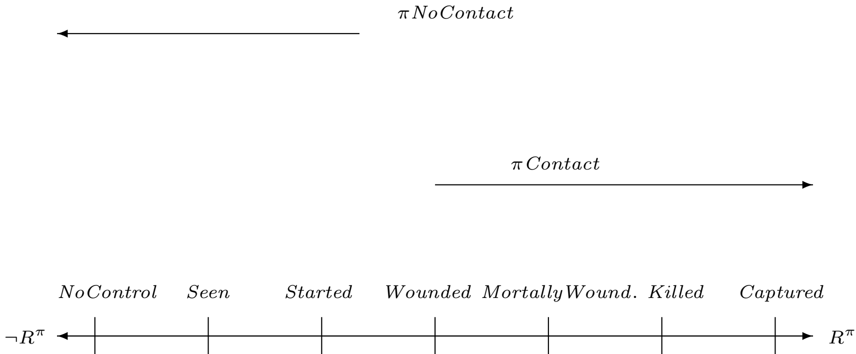

Figure 29.4: *Factors from dimension $\pi Control$: $\pi Contact$ and $\pi NoContact$*

Finally, let us observe, that if we wished, we could take a further step back, and bring the choice of dimensions into theory-construction: We could replace the dimensional descriptions with a set of pairs of attributes and unordered positions for these attributes, which would need to be turned into dimensions by choosing a subset of the possible positions, and ordering them according to some social value or values. We shall not, however, pursue this further here.

29.4. Stratified Legal Theories

So far we have considered "flat" legal theories, only including rules that directly link certain combinations of factors to the final outcome of a case. We now want to investigate how and why one may build a *stratified legal theory*, where legal qualifications bridge over the factors of a case and its final outcome.

This is a subject we have already addressed, when analysing the function of *cognitive instructions* (instruction prescribing to form mental states, rather than directly to behave in certain ways) and of *non-deontic normative propositions* (according to which the fact that an event or a situation has certain qualifications determines its having certain other qualifications).

The perspective of theory-construction enables us to understand some aspects of the function of intermediate normative concepts, and in particular to analyse their dialectical role.

Our main inspiration will be provided by the above-mentioned Cato system, but we shall reformulate Cato's ideas in our model and expand these ideas using the constructs at our disposal.

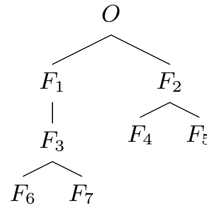

Table 29.8: *Factor hierarchy*

29.4.1. *Hierarchies of Factors*

The construction of intermediate rules will be based upon the information contained in the factor background. We shall allow our background knowledge to include factors favouring intermediate outcomes, besides the possible final outcomes of our cases. By an intermediate outcome, we mean a normative qualification which determines a further normative qualification, that is, a further step of the reasoning process that concludes with a final outcome. Such an intermediate result is what we call an *abstract factor*.

To model this, we need to allow for more than one factor description for a given factor: If factor F promotes a certain final outcome O (in order to advance value V), via an abstract factor (an intermediate outcome) F^a, it will have descriptions:

$$(F \uparrow O) \Uparrow V$$
$$(F \uparrow F^a) \Uparrow V$$

Note that we assume that the values promoted by the original factor remain the same. The abstract factors will, in their turn, favour further outcomes, which may still be intermediate, or may represent the final outcome for the dispute. By linking each factor to the outcome it produces, we obtain a tree where each intermediate node (each node, except the root and the leaves of the tree) represent an abstract factor: It is both an outcome (of a preceding factor) and factor (for a subsequent outcome), as you can see Table 29.8.

Abstract factors do not appear in our basic representation of cases, but they can be used in multi-step arguments, where the final outcome of a case is explained through a sequence of chained inference steps.

For example, suppose we have the hierarchy shown in Table 29.8. If a case containing factor F_6 had decision O, its explanation may be based on the argument in Table 29.9 on the facing page.

In our representation a factor does not support only its parent node: Via its parent node, the factors gives support to all of its ancestors (to avoid clutter, we have not represented these further links in the Table 29.8). Thus, the factor-background besides factor-descriptions connecting each factor to its parent:

1.	F_6	
2.	$F_6 \Rightarrow F_3$	
3.	F_3	⟨from 1 and 2, by *detachment*⟩
4.	$F_3 \Rightarrow F_1$	
5.	F_1	⟨from 3 and 4, by *detachment*⟩

Table 29.9: *Hierarchical argument*

$$(F_6 \uparrow F_3) \Uparrow V$$

will also contain factor-descriptions connecting each factor to all of its ancestors, shortcutting the intermediate links:

$$(F_6 \uparrow F_1) \Uparrow V$$
$$(F_6 \uparrow O) \Uparrow V$$

We may alternatively assume that these shortcuts do not need to be in the background knowledge, but can be introduced at the theory-construction stage. However, we shall avoid considering this additional theory-construction step for simplicity's sake (though it will be a very easy addition).

29.4.2. Downplaying a Distinction

A factor with multiple ancestors has multiple factor descriptions, and so provides the opportunity for the reasoning move that Ashley and Aleven (1997) call *downplaying a distinction*.

As we have seen above (Section 29.1.4 on page 755), distinguishing involves two steps:

1. adding the new, distinguishing factor F_{dis}, which applies to precedent *Prec* but does not apply to the current situation *CSit*,
2. explaining *Prec* by a rule including the distinguishing factor F_{dis}.

Downplaying the distinction of *Prec* consists in providing an explanation for both *Prec* and *CSit* through a rule including an abstract factor F^a, which is an immediate consequence both of the distinguishing factor F_{dis}, and of a different factor, the downplaying factor F_{dow}, which can be established in the current case.

Let us now go through the process of distinguishing and downplaying the distinction. We assume the factor-hierarchy of Table 29.10 on the next page, which corresponds to the factor-background of Table 29.11 on the following page.

Finally, we assume that the current situation is the new case $NewC$ while the relevant case is $PrecC$, which are characterised as in Table 29.12 on the next page.

Table 29.10: *Factor hierarchy: downplaying distinction*

$(F_1 \uparrow O) \Uparrow V_1$
$(F_{dis} \uparrow F_a) \Uparrow V_1$
$(F_{dis} \uparrow O) \Uparrow V_1$
$(F_{dow} \uparrow F_a) \Uparrow V_1$
$(F_{dow} \uparrow O) \Uparrow V_1$
$(F_a \uparrow O) \Uparrow V_1$
$(F_2 \uparrow \neg O) \Uparrow V_2$

Table 29.11: *Factor-background: hierarchical factors*

$NewC$:	$\{F_1, F_{dow}, F_2\} \mapsto \boxed{?}$
$PrecC$:	$\{F_1, F_{dis}, F_2\} \mapsto O$

Table 29.12: *Case-background: hierarchical factors*

Suppose the plaintiff argues that $NewC$ should have outcome O, because of the rule establishing O for antecedent F_1, which prevails, as shown by $PrecC$, over the rule establishing $\neg O$ for antecedent F_2. More exactly, his story is expressed by theory T_1 in Table 29.13 on the facing page .

With regard to this theory, the justified conclusion for the current situations $NewC$ is indeed O, as it was in $PrecC$, according to the same justified argument $\mathcal{A}$, which strictly defeats its counterargument $\mathcal{B}$ (see Table 29.14 on the next page), according to preference:

$$(F_1 \Rightarrow O) \succ (F_2 \Rightarrow \neg O)$$

The defendant would obviously reply by distinguishing precedent $PrecC$ from the current situation $NewC$. She affirms: “It is true, $PrecC$ had decision O, but this was not only because $PrecC$ had feature F_1. To reach conclusion (and to outweigh the argument to the contrary) also the distinguishing feature F_{dis} was required which is not present in $NewC$. Thus the precedent does not justify an O decision also in $NewC$.”

For substantiating such claim, she needs to transform theory T_1 into the theory T_2, in Table 29.15 on the facing page.

CSit:	$NewC$: $\{F_1, F_2\} \mapsto O$	
Cases:	$PrecC$: $\{F_1, F_2\} \mapsto O$	
Factors:	$(F_1 \uparrow O) \Uparrow V_1$	
	$(F_2 \uparrow \neg O) \Uparrow V_2$	
Rules:	$F_1 \Rightarrow O$	⟨by *rule from factors*⟩
	$F_2 \Rightarrow \neg O$	⟨by *rule from factors*⟩
RulePref:	$(F_1 \Rightarrow O) \succ (F_2 \Rightarrow \neg O)$	⟨by *abduct rule-pref.*⟩

Table 29.13: *Theory T_1: the starting point*

$\mathcal{A}$			$\mathcal{B}$		
1.	F_1		1.	F_2	
2.	$F_1 \Rightarrow O$		2.	$F_2 \Rightarrow \neg O$	
3.	O	⟨from 1 and 2, by *detachment*⟩	3.	$\neg O$	⟨from 1 and 2, by *detachment*⟩

Table 29.14: *Arguments from theory T_1*

CSit:	$NewC$: $\{F_1, F_2\} \mapsto \neg O$	
Cases:	$PrecC$: $\{F_1, F_{dis}, F_2\} \mapsto O$	
Factors:	$(F_1 \uparrow O) \Uparrow V_1$	
	$(F_{dis} \uparrow O) \Uparrow V_1$	
	$(F_2 \uparrow \neg O) \Uparrow V_2$	
Rules:	F_1 AND $F_{dis} \Rightarrow O$	⟨by *rule from factors*⟩
	$F_2 \Rightarrow \neg O$	⟨by *rule from factors*⟩

Table 29.15: *Theory T_2: distinguishing*

As we have seen in discussing the hunter's case, the latter theory allows the defendant to explain why $PrecC$ had decision O, while maintaining that $CSit$ should have decision $\neg O$. In fact, $PrecC$ is explained in T_2 by appealing to a rule, which is not applicable to $NewC$ (since $NewC$ does not satisfy factor F_{dis}).

Let us now consider the move *downplay distinction*. This move exploits the factors hierarchy, and in particular the fact that both factors F_{dis} in $Prec$ and factor F_{dow} in $CSit$ favour the abstract factor F_a, which favours O. The party using this strategy accepts that at the lower level the precedent case and the current situation appear to be different, as including different factors. However, he claims that when one better considers the precedent, one sees that the factor in the precedent has a certain relevance since it expresses an abstract property which the precedent shares with the current situation (though in the current situation the abstract property is expressed in a different way): Therefore the same

CSit:	$NewC$: $\{F_1, F_{dow}, F_2\} \mapsto O$	
Cases:	$PrecC$: $\{F_1, F_{dis}, F_2\} \mapsto O$	
Factors:	$(F_1 \uparrow O) \Uparrow V_1$	
	$(F_{dis} \uparrow F_a) \Uparrow V_1$	
	$(F_{dow} \uparrow F_a) \Uparrow V_1$	
	$(F_a \uparrow O) \Uparrow V_1$	
	$(F_2 \uparrow \neg O) \Uparrow V_2$	
Rules:	F_1 AND $F_a \Rightarrow O$	⟨by *rule from factors*⟩
	$F_{dis} \Rightarrow F_a$	⟨by *rule from factors*⟩
	$F_{dow} \Rightarrow F_a$	⟨by *rule from factors*⟩
	$F_2 \Rightarrow \neg O$	⟨by *rule from factors*⟩
RulePref:	$(F_1$ AND $F_a \Rightarrow O) \succ (F_2 \Rightarrow \neg O)$	⟨by *abduct rule-pref.*⟩

Table 29.16: *Theory T_3 downplaying a distinction*

ratio applies to both. More exactly, to downplay the distinction the plaintiff can build theory T_3 in Table 29.16.

To obtain this theory, the plaintiff has added to her theory two new factors, the intermediate factor F_a and the downplaying factor F_{dow} (which only applies to $CSit$) and has interpreted both factors F_{dis} and F_{dow} as expressing F_a. This allows him to solve the new case by applying the same rule he uses to explain the precedent:

$$F_1 \text{ AND } F_a \Rightarrow O$$

In theory T_3, the plaintiff can non-arbitrarily assume that this rule prevails over the contrary rule to which the defendant refers, according to the following inference:

$$(F_1 \text{ AND } F_a \Rightarrow O) \succ (F_2 \Rightarrow \neg O)$$

This preference is not arbitrary since it contributes to explaining $Prec$. Thus the plaintiff is justified in appealing to this preference to justify outcome O also in the current case $NewC$.

In this way, the plaintiff has achieved the result of disarming the defendant's attempt at distinguishing $PrecC$ from $NewC$: From the plaintiff's perspective the two cases are indistinguishable since their outcomes results from the same rule and the same rule preference.

29.4.3. Distinguishing, Downplaying, and Distinguishing Again

Let us now consider an example that allows us to see the dialectical process, typical of case-based reasoning, in which distinctions are introduced, countered by downplaying, and reintroduced in a different way.

CSit:	$NewC$: $\{HealthDamage, Omission\} \mapsto L^{doc}$	
Cases:	$PrecC$: $\{HealthDamage, Contract, Omission\} \mapsto L^{doc}$	
Factors:	$(HealthDamage \uparrow L^{doc}) \Uparrow Health$	
	$(Omission \uparrow \neg L^{doc}) \Uparrow Autonomy$	
Rules:	$HealthDamage \Rightarrow L^{doc}$	⟨by *rule from factors*⟩
	$Omission \Rightarrow \neg L^{doc}$	⟨by *rule from factors*⟩
RulePref:	$(HealthDamage \Rightarrow L^{doc}) \succ (Omission \Rightarrow \neg L^{doc})$	
		⟨by *abduct rule-pref.*⟩
ValPref:	$Health \succ Autonomy$	⟨by *value-pref. from rule-pref.*⟩

Table 29.17: *Medical-omission theory* T_1

Consider a case (the current situation) $NewC$ where a patient was treated by a doctor in a hospital, without there being a contract between the patient and the hospital (for instance, within a national-security program or in an emergency case), and the doctor omitted to give the patient a useful therapy, so damaging his health: The factors of $NewC$ are $Hospital$, $Omission$, and $HealthDamage$.

The issue to be decided is whether the doctor is liable for her omission. We use the following abbreviations:

$L^{doc} = \lceil \text{the doctor is liable} \rceil$
$\neg L^{doc} = \lceil \text{the doctor is not liable} \rceil$

Assume that there is a precedent case $PrecC$, where a doctor was considered to be liable for the damage suffered by a patient, a contract being in place, even though the damage was due to an omission: The factors in $PrecC$ were $HealthDamage$, $Omission$, and $Contract$.

With regard to the factors, we may assume the following:

- $HealthDamage$ favours outcome L^{doc}, in accordance with the value of $Health$;
- $Omission$ favours outcome $\neg L^{doc}$, in accordance to the value of $Autonomy$, which requires that nobody is punished unless for taking an initiative; and
- $Contract$ favours outcome L^{doc}, in accordance with the value of $Trust$, on the teleological ground that putting liability upon the defaulting party in a contract advances reciprocal reliance.

Assume also that the patient explains the doctor's liability both in $PrecC$ and in $NewC$ according to the theory that causing health damage produces the liability of the doctor, even when the damage is caused by omitting a therapy (rather than by providing a wrong therapy). In other words, he builds theory T_1 in Table 29.17.

CSit:	$NewC$: $\{HealthDamage,\ Omission\} \mapsto \neg L^{doc}$	
Cases:	$PrecC$: $\{HealthDamage,\ Contract,\ Omission\} \mapsto L^{doc}$	
Factors:	$(HealthDamage \uparrow L^{doc}) \Uparrow Health$	
	$(Contract \uparrow L^{doc}) \Uparrow Trust$	
	$(Omission \uparrow \neg L^{doc}) \Uparrow Autonomy$	
Rules:	$HealthDamage$ AND $Contract \Rightarrow L^{doc}$	⟨by *rule from factors*⟩
	$Omission \Rightarrow \neg L^{doc}$	⟨by *rule from factors*⟩
RulePref:	$(HealthDamage$ AND $Contract \Rightarrow L^{doc}) \succ (Omission \Rightarrow \neg L^{doc})$	⟨by *abduct rule-pref.*⟩
ValPref:	$\{Health, Trust\} \succ \{Autonomy\}$	⟨by *value-pref. from rule-pref.*⟩

Table 29.18: *Medical-omission theory* T_2

This theory allows the patient to provide the same explanation for the precedent case and the current situation: The rule that a doctor is liable for causing health damages applies to both cases, and this rule prevails over the rule that there is no liability for omissions (which also means that the value of health prevails over the value of autonomy).

The doctor now distinguishes precedent case $PrecC$ from the current case $NewC$. She points to the fact that in the precedent there was a contract between the doctor and the patient. Accordingly, she assumes that medical liability is explained by two factors: (*a*) causing health damage, and (*b*) being bound by a contract to provide adequate care. She argues that only the combination of these two factors prevails over the principle that there should be no liability for omissions. These ideas are expressed by producing theory T_2, in Table 29.18.

In theory T_2 there is an explanation why $PrecC$ had decision L^{doc}, an explanation which is not applicable to $CSit$. Thus $NewC$ can have outcome $\neg L^{doc}$ without contradicting the precedent. This is obtained according to the rule:

$$HealthDamage \text{ AND } Contract \Rightarrow L^{doc}$$

which is not applicable to $NewC$ (since in $NewC$ there is no contract).

The patient may downplay this distinction, by claiming that the existence of the contract implied that the doctor was warranting a careful performance, and that this was the real reason why a doctor should be held liable under a contract, according to the value of trust. He may also claim that the same warranty is also implicitly given by the practice of the medical profession in a hospital, regardless of the existence of a contract: The doctor in the current situation would still be liable for the same reasons—causing health damage after warranting an adequate performance—as in the precedent. This is the content of theory T_3, in Table 29.19 on the facing page:

This theory allows the patient to explain both $PrecC$ and $CurrC$ by using the same rule:

CSit:	$NewC$: $\{HealthDamage, Hospital, Omission\} \mapsto L^{doc}$	
Cases:	$PrecC$: $\{HealthDamage, Contract, Omission\} \mapsto L^{doc}$	
Factors:	$(HealthDamage \uparrow L^{doc}) \Uparrow Health$	
	$(Contract \uparrow Warranty) \Uparrow Trust$	
	$(Hospital \uparrow Warranty) \Uparrow Trust$	
	$(Warranty \uparrow L^{doc}) \Uparrow Trust$	
	$(Omission \uparrow \neg L^{doc}) \Uparrow Autonomy$	
Rules:	$HealthDamage$ AND $Warranty \Rightarrow L^{doc}$	⟨by *rule from factors*⟩
	$Contract \Rightarrow Warranty$	⟨by *rule from factors*⟩
	$Hospital \Rightarrow Warranty$	⟨by *rule from factors*⟩
	$Omission \Rightarrow \neg L^{doc}$	⟨by *rule from factors*⟩
RulePref:	$(HealthDamage$ AND $Warranty \Rightarrow L^{doc}) \succ (Omission \Rightarrow \neg L^{doc})$	⟨by *abduct rule-pref.*⟩
ValPref:	$\{Health, Trust\} \succ \{Autonomy\}$	⟨by *rule-pref. from value-pref.*⟩

$$HealthDamage \text{ AND } Warranty \Rightarrow L^{doc}$$

in the two arguments of Table 29.20 and Table 29.21 on the following page.

These two arguments preferentially rebut (and thus strictly defeat) the counterargument of Table 29.22 on the next page according to the same preference:

$$(HealthDamage \text{ AND } Warranty \Rightarrow L^{doc}) \succ (Omission \Rightarrow \neg L^{doc})$$

which expresses the fact that the combination of values $Health$ and $Trust$ outweighs the value of $Autonomy$.

As we have just seen, downplaying takes place after one party distinguished a precedent from the current situation. After the distinction has been downplayed, it may still possible to reintroduce it, by claiming that the distinguishing factor also causes another abstract consequence, favourable to oneself, which does not hold in the current situation: The new distinction consists in showing that the distinguishing factor expresses another intermediate factor F_{a2} that is not expressed by current situation.

$\mathcal{B}$

2.:	$Omission \Rightarrow \neg L^{doc}$	
3.:	$\neg L^{doc}$	⟨from 1 and 2, by *syllogism*⟩

Table 29.22: *No liability for omission*

For instance, the doctor may reintroduce the distinction by stating that the contract in the precedent also implied that there was a consideration (which requires liability according to the value of reciprocity), and that both consideration and warranty are required to ground liability for health damages in cases of omissions. This is done by the theory T_4, in Table 29.23 on the facing page. This theory again allows the doctor to explain $PrecC$ via a rule:

$$HealthDamage \text{ AND } Warranty \text{ AND } Consideration \Rightarrow L^{doc}$$

which does not apply to the present case. The dispute may then go on, with the patient still trying to downplay this further distinction (for example, by claiming that the doctor was going to be paid for her work at the hospital by the national health program, so that in a sense there was a consideration), and the doctor trying to introduce further distinctions, still based on the absence of a contract in the current situation.

In contrast with downplaying a distinction, emphasising a distinction does not give rise to new theories: It only draws attention to the non-availability of the downplaying move, and the consequent need for the opponent to resort to arbitrary preferences to repair his theory.

Prakken (2000) expresses this idea in terms of a difference between the values associated with the two sets of factors. The very difference in values alerts us to the significance of the distinction, which requires a consideration of the value preferences to resolve. The move is of course most effective, if the distinction relates to a more highly prized value. Some further moves that can be made to

CSit:	$NewC$: $\{HealthDamage, Hospital, Omission\} \mapsto \neg L^{doc}$

augment the notions of downplaying and up-playing distinctions are suggested by Roth (2000).

29.5. Further Extensions of Our Model

Let us conclude this chapter by listing a few important directions in which it might be possible to expand the account of case-based reasoning that we have provided.

29.5.1. Metrics for Theory Coherence

In Section 29.1.6 on page 758, we discussed the notion of theory coherence in qualitative terms, identifying a number of considerations that might lead us to think that a theory is better than another. Such comparison is unsatisfactorily vague, however, and it would be interesting to see whether there are ways of making it more precise.

Some steps toward this objective are reported in Bench-Capon and Sartor 2001a. This paper draws on the work of Thagard (1992), who has developed a model for assessing competing scientific theories (for a more recent statement of Thagard's view of coherence, and for references to the coherence literature, see Thagard 2001). The essential idea is to represent the evidence to be accounted for by a theory and the tenets of a theory as nodes connected by links representing support and conflict. A set of initial values (between 1 and -1) is assigned to

these nodes, and these values are then propagated, support links increasing the values of nodes, and conflict links decreasing them. Moreover, links are subject to a rate of decay so that isolated nodes decrease in value. This propagation is continued through a number of cycles, until the values of the nodes stabilise. In Thagard's interpretation of this process, nodes which end with a high activation can be considered part of a coherent, and hence acceptable theory, while those with a low activation do not form part of that coherent theory, and so should be rejected.

Bench-Capon and Sartor (2001a) apply this approach to theories of bodies of case law, taking cases as providing evidence, and taking cases, rules, and preferences as nodes. These nodes can support one another in several ways. In particular, rules are applicable to cases, give rise to intermediate conclusions, can explain cases, support and are supported by the values they express. On the other hand, a rule may conflict with a case if it appears to be applicable to the case, and yet would suggest the opposite outcome for that case.

To deal with preferences, however, we needed to extend Thagard's approach. The effect of a rule-preference is to prevent (according to the mechanism of preferential rebutting) that the conclusion of the weaker rule is derived (in those cases where the conflict arises). Thus a preference does not conflict with the rule it disfavours, but rather with the ability of that rule to conflict with the case to which it should be applied (a disfavoured rule is not to be applied to the case, according to the theory including the preference, and therefore it does not conflict with it). A preference thus should not decrease the value of the disfavoured rule, but rather as decreasing the value of the link between the disfavoured rule and the cases to which applies. In this model therefore the weights of links are not fixed, but can be affected by the propagation process. In particular preferences are in conflict with the links from the disfavoured rules to cases where the preference applies.

Following this approach, theories, such as those given in the previous section, have been modelled as a set of connected nodes. These nodes were assigned initial values, which were then propagated until they stabilised. At this point we could see the average level of activation as an indicator of the coherence of the theory.

These preliminary experiments yielded some encouraging results, and showed that the numbers that emerged from the process accorded largely with our intuitions. A number of technical issues were raised by the experiments, for which the interested reader is referred to the original paper. Additionally, the important question arises as to whether the approach has any cognitive validity with respect to the ways in which lawyers evaluate theories. Once the technical questions above have been answered, some kind of empirical study will be required to see how far the judgements on theories given by this approach can be seen as reflecting a shared intuition.

29.5.2. Comparison of Values

A central tenet of our account of theories for case-based reasoning is that preferences between defeasible rules are justified in terms of preferences between sets of values. This means that we need a principled way of comparing sets of values, and of assessing what impact the corresponding rules have upon the satisfaction of these values.

We cannot here address this enormously difficult task, on which we have commented when considering the problems of teleological reasoning (see Section 5.2 on page 150). Let us just recall that one needs to consider not only the comparative importance of different values, but also the extent to which different values are promoted by making certain choices, and the interactions between ways of satisfying different values.

Some simplifications may provide some tractable ways of approaching the tremendous task of assessing the value of different choices, as we observed in Section 5.2.5 on page 158. With specific references to case-based reasoning, we may mention the proposal of Prakken (2000), who views the most important value in a set of values as the primary determinant of the status of the whole set. He suggests a lexicographic order over sets of values: The set containing a more important value (which is missing in the other set) prevails, and lesser values are only used as tiebreakers with sets which contain exactly the same (or exactly equivalent) more highly rated values. This idea (a lexicographic order over values), though not being acceptable as a universal solution, as we observed in Section 5.2.5 on page 158, may provide in some cases an appropriate heuristic clue.

29.5.3. Changes in the Social Context

In the model above, an important aspect is missing, namely, an account of the development of case law, as it depends on the evolution of the socio-political context. This development seems to undermine the very possibility of constructing a coherent theory of a case-law domain: How is it possible to fit in a single coherent theory cases which were decided differently—though being characterised exactly by the same constellations of factors and dimensions—since different decisions were required by different social contexts?

One way of approaching this issue (developed in Sartor 2002) is to focus on the link between factors and values, which is represented in our factor descriptions. Let us recall that a factor description has the form:

$$(F \uparrow O) \Uparrow V$$

and means that by responding to factor F with outcome O, we would promote value V. A factor description expresses two contents:

a. an evaluative judgement, to the effect that V is a value, a socially beneficial goal, and
b. a factual or empirical judgement, to the effect that by endorsing the factor-outcome link (by reasoning and acting on the basis of it) we promote the value.

We shall not consider the evaluative judgement (*a*), in explaining the development of case law, since we do not want to enter here the dispute on whether ultimate values are eternal and universal or relative to particular times and places. We shall rather focus on the factual judgement, namely, on the question of whether and how much certain values are going to be advanced through certain practices. This is an empirical connection, which undoubtedly is dependent upon changing social conditions.

Thus, even if ultimate legal values remain unchanged, the ways in which the practice of a specific rule impacts on them may change over time (a similar change would also concern instrumental values). Therefore, focusing on changed empirical connections we can provide a model of the evolution of theories of case law that does not put into question the status of values, and faith in their objectivity.

For example, it may be argued that under the circumstances prevailing in modern industrialised countries, hunting has lost its ancient economic function: Rather than contributing to productivity, it detracts from it. This may be true especially when hunting hinders some forms of recreation (watching wild animals, hiking, and so on) and so jeopardises the livelihood of those involved in the corresponding economical activities (hotel personnel, tour operators, tourist guides, etc.). In such a context, a factor description such as the following:

$(\pi Liv \uparrow \neg R^{\pi}) \Uparrow MProd$

(the fact that plaintiff is chasing a wild animal for pursuing his livelihood favours an outcome for his side, since this decisional practice, by facilitating professional hunting, promotes more productivity)

is inappropriate and even false: Hunting does not promote social productivity, but rather impairs it.

To model the impact of social change on factors, we need to temporalise factor descriptions (and dimension descriptions), so as to be capable of building theories that can explain conflicting decisions, adopted on the basis of the same set of factors, but taken at different times. This explanation will be based on the fact that factor links (how and how much a factor favours a certain outcome) have changed over time. Taking this into account requires some changes and refinements in the analysis we have provided, but seems fully compatible with the core of our approach.[6]

The basic addition we should do to our framework is to specify the temporal interval within which a factor link holds (for simplicity we consider only one

[6] For a different attempt in this direction, see Sartor 2002.

such intervals). Thus a factor link would need to be expressed as:

FORANY (t)
IF $t_0 \leq \mathsf{t} < t_1$
THEN $((F \uparrow O) \Uparrow V)$ *holds at time* t

(in the interval between t_0 and t_1, it holds that the recognition that F favours outcome O promotes value V)

For instance, we express that hunting promoted value *MProd* from year 0 to year 1900 (excluded), through the following temporalised factor link:

FORANY (t)
IF 00/00/0000 $\leq \mathsf{t} <$ 01/01/1900
THEN $((\pi Liv \uparrow \neg R^{\pi}) \Uparrow MProd)$ *holds at time* t

Similarly, we need to add temporal specifications to cases. Thus the factors characterising each case need to be referred to the time of the decision of the case. More exactly, a case would be an event having the structure:

$(Prec\colon \{F_1, \ldots, F_n\} \mapsto O)$ *happens at time* t

(Case *Prec*, where factors $\{F_1, \ldots, F_n\}$ had outcome O, happened at time t)

For instance, we would describe Pierson as

$(Pierson\colon \{\pi NPoss\} \mapsto \neg R^{\pi})$ *happens at time* year 1707

We need also to change also the constructor *rule from factors*, so that the constructed rule only holds during the intersection of the intervals in which the input factors hold. Similarly, we need to change constructor *abduct rule-pref.*, so that preferences holding during different time intervals can be abducted (with the constraint that the case to be explained falls within the selected time interval).

These modifications, integrated with the appropriate refinements (we leave to the reader the task of completing the picture we have just sketched) will allow us to explain, through a unique coherent theory, cases which have the same facts and different decisions, but which happened at different times.

A similar extension of our framework can enable us to deal also with spatial specifications: Hunting at a certain time may contribute to productivity within a certain territory, but not within a certain other territory, so that different conclusions may be justified according to where hunting took place. For coping with such a spatial relativisation of legal conclusions, we need to add spatial specification to temporal specification—indicating that a factor link just holds for locations within a certain territory—and modify our constructors accordingly.

29.5.4. Links to Case-History

In the debate on precedents, a formalistic (strict) approach and an anti-formalistic (sceptic) approach are frequently opposed (cf. MacCormick 1987, 157, and Twining and Miers 1991, 311).

The first approach construes the binding meaning of the precedent on the basis of the text of the opinion and the plausible intention of the judge. The record of the case includes therefore the detailed argumentation that was developed at the time when it was decided. The meaning of the case is expressed by the relevant rules (the *rationes decidendi*) which can be extracted from that argumentation.

The latter approach looks beyond the text and its author, by considering interpretations given by subsequent judges, and more generally, by providing a holistic interpretation of the development of case law. The record of the case is therefore basically limited to the facts of the decision plus its outcome (according to the jurisprudential model proposed by Goodhart 1959). It is up to the interpreter, using all useful materials, to provide an explanation of the case in the framework of the body of the case law.

Our model of case-based reasoning is consonant with the anti-formalistic side: The explanation of a case is given by a theory that more coherently explains the body of the case law (there included subsequent cases).

This does not mean, however, that expressed opinions are necessarily irrelevant in a coherence-based approach. In fact, our model allows us to address also the concerns that underlie the formalistic approach.

For this purpose, we need to expand the background knowledge available to the parties, with information concerning the statements of the judges and the context of their utterance. This would lead us to a further theory-construction profile: The need to make sense of the history of the case, and in particular of judicial opinions, in the historical circumstances where they were stated.

Thus, the record of a case, besides the dimensional positions (or the factors) and the outcome of that case, may also include the rules and arguments asserted by the judges. An additional profile of the coherence of a theory consists in the way in which the theory can successfully incorporate the expressed rules and arguments into the explanations it provides.

How to implement this profile, and how to relate it to the aspects of coherence we have indicated above, and to balance it with them, is an object of further research.

29.5.5. Other Ways of Analogising

Finally, we need to state again that the theory-construction moves we have here described do not exhaust the multiple forms in which lawyers exercise their analogical competence.[7]

In particular, our analysis has failed to address various forms of analogical reasoning which have been discussed in the literature on artificial intelligence

[7] For a general discussion of analogy, see, for instance Holyoak and Thagard 1996. Among the many publications on analogy in artificial intelligence, see Hofstadter 1998. On analogy in the legal domain, see for instance: Atienza 1986; Nerhot 1991; Sunstein 1993; Brewer 1996; Rotolo 2001.

and law, like for instance the model of McCarty (1995), who examines the creation of new concepts by the deformation of prototypes, or the approach of Rissland and Skalak (1993), who introduce various ways of reasoning with open-textured predicates.

Additionally, we have not considered sub-symbolic information-processing, where analogies are performed without the mediation of a conceptual representation, as in connectionist models of cognition.

More generally, there are many new results now coming from the domain of artificial intelligence and machine learning, which could shed light on legal analogising. Unfortunately, given the limitations of both our knowledge and the available space, we must leave this as a matter for future research.

CONCLUSION

The Greek poet and librarian Callimachus famously criticised a lengthy work (the poem *Argonautica*, by Apollonius of Rhodes), saying that "a big book is a big evil."

After writing almost 800 pages we cannot hope to escape Callimachus's criticism. What we can now do, as partial reparation, is to provide a very short conclusion, where we shall just recall the direction of our inquiry.

Our main aim was bringing legal reasoning back to common-sense reasoning, to general practical cognition, and in this way to provide a comprehensive account of the cognitive processes of legal problem solving.

Thus we have started by considering rationality, and by analysing its two main components, ratiocination and heuresis. After distinguishing epistemic and practical rationality, we have focused on practical rationality, examining how it allows reasoners to acquire new practical mental states (preferences, desires, intentions and wants), given their current practical and epistemic mental states. While emphasising the role of rationality in practical reasoning, we have rejected the illusions of rationalism, affirming the need to recur to non-rational forms of cognition and to make the best use of our limited cognitive resources, as indicated by theories of bounded rationality. This has led us, in particular, to integrate conclusive reasoning with defeasible reasoning, and to complement teleological reasoning with factor-based inferences and analogies.

An important step for bridging the gap between general practical reasoning and legal reasoning has consisted in our analysis of doxification: Practical attitudes originate corresponding beliefs, which can legitimately be processed according to epistemic reasoning.

This has allowed us to map the basic practical attitudes (like preferences, desires, intentions, wants, and propensities) into the noemata which provide the contents of normative beliefs (like values, deontic propositions, non-deontic rules and factors). Moreover, our analysis of doxification has allowed us to introduce the idea of cognitive bindingness, namely, the cognitive duty to endorse a certain belief, an idea which has provided the basis for our analysis of meta-level legal reasoning.

Then we have explored social reasoning, examining the strategic dilemmas resulting from the interaction of autonomous agents. We have argued that collective intentionality is required for overcoming interaction problems and engaging in cooperation. In particular, we have discussed the attitude we have called the plural perspective, namely, the attempt to rationally participate into

collective intentionality. This attempt at rational participation into collective intentionality (concerning the adoption of enforceable practical determinations) is the distinctive feature of legal cognition.

In the second part of the volume we have developed a detailed analysis of the logical structures of legal thinking, and more generally of doxified practical thinking. After examining the limits of classical logic, we have investigated deontic notions, and have used them as building blocks for constructing more complex normative ideas, such as rights and powers. A key role has been given to normative conditionality, the determinative connection between legal conditions and legal effects). Normative determination has provided the basis for our analysis of the intentional production of normative results through contracts and legislation, and more generally, for a logical model of the sources of the law.

Finally, in the last, and more technical chapters we have investigated legal argumentation and the construction of legal theories. Our analysis of legal argumentation has determined how arguments can be constructed, by using normative premises (rules, values, preferences), besides factual information. Moreover, we have provided an account of how justified conclusions emerge out of the competition of colliding arguments.

Our discussion of theory-construction has focused on the realisation of theories of case-law domains, that is, on efforts to rationalise past decisions and current attitudes into coherent theories. These theories are to be built by extracting rules and preferences out of precedents' factors and decisions, according to theory constructors. They aim at explaining past decisions, and at providing suggestions for future choices. They do that through the justified conclusions they provide, according to the arguments they enable.

We hope that the reader, while excusing us for the many failures and omissions of our account of legal reasoning, will be able to appreciate it as an attempt to provide a comprehensive picture which brings together diverse aspects of legal thinking and recognises their diverse contributions to legal cognition.
