In its most influential meaning, however, political theology refers to Carl Schmitt thesis in his seminal *Political Theology* (1922): "All significant concepts of the modern theory of the state are secularized theological concepts." According to Schmitt, it could hardly be otherwise considering that "the metaphysical image that a particular age forms of the world has the same structure as that which appears most self-evident to it as a form of political organization." Schmitt's analysis is especially concerned with the theological origins of the concept of *sovereignty* and of the exception that, in Schmitt's view, defines it: "He is sovereign who decides on the exception." Thus, for Schmitt, "the exception, in jurisprudence, has a meaning analogous to that of the miracle in theology." Revisiting the question half a century later in his *Political Theology II* (1970), Schmitt reaffirms his thesis and vehemently rejects as a "myth" the notion that political theology may be considered obsolete.

Leo Strauss, one of the most renowned proponents of the study of political philosophy in the United States after World War II (1939–1945), considered facing the challenges of theology a primary responsibility for the philosopher. Thus Strauss concludes *The City and Man* (1964) with an exhortation to "be open to the full impact of the all-important question . . . *quid sit deus*?" (What would God be?) By his own profession, Strauss had found himself "in the grip of the theologico-political predicament" from his earliest days as a scholar when he was grappling, from 1925 to 1928, with his study on Baruch Spinoza's *Theologico-Political Treatise.* "The theologico-political problem," he declared in his preface to the German edition of his *Political Philosophy of Hobbes* (1965), "has since remained *the* theme of my studies." For Strauss, philosophy as the highest way of life can justify and give meaning to its ultimate demands only by meeting head-on the strongest, most radical challenge that can be put to it, which Strauss took to be the challenge posed by the life of strict obedience to divine revelation.

The theological-political problem arises from the fact that such a confrontation is as dangerous as it is indispensable to the philosophical way of life, as the death of Socrates had demonstrated for the ages. While it cannot be avoided if philosophy is to remain true to itself, it is not clear that the political-theological problem can be brought to a satisfactory resolution, and modern theologico-political treatises since Hobbes and Spinoza appear guilty, to Strauss, of declaring victory prematurely, to the ultimate detriment of philosophy as a serious way of life. Carl Schmitt's affirmation of the political in general, and of political theology in particular, was for Strauss an affirmation of the seriousness of human life, and it is surely in this where he found the greatest affinity with his own thinking.

Among Strauss's adherents, Heinrich Meier has perhaps shown most interest in the question of political theology. Thus

Meier, who in an earlier work stressed the connection between Schmitt and Strauss, offers the most sustained study to date in his *Leo Strauss and the Theological-Political Problem* (2006). The revised and expanded 2009 edition of the work is also the best source for some of Strauss's shorter, less well-known and accessible, but also most topical, writings on the theological-political problem, and it includes an essay by Gerhard Krüger, whom Strauss credited with being the only reviewer to have properly grasped the meaning and importance of his book on Spinoza. Meier's own conception of what constitutes political theology develops in Chapter 3, and was first published in *Interpretation.* Meier sees political theology as the core, the unifying center, of Carl Schmitt's oeuvre, and stresses the polemical purposes that motivated him in deploying as a weapon a term he had taken from Mikhail Bakunin. According to Meier, "The obedience of faith is the raison d'être of political theology in the best sense," and thus Saints Paul and Augustine, Martin Luther, and John Calvin may all be included "among the most important representatives of political theology in the history of Christianity." For Meier, a connection may even be made between political theology and postmodern thought, for example in Jean-Francois Leotard use of the divine commandment bidding Abraham to sacrifice Isaac, and Abraham's faithful obedience.

The reverse of Schmitt's thesis, thus not that all political concepts are at bottom theological, but that all theology must be political, is also sometimes meant by political theology, for example in the work of Catholic theologian Johann Baptist Metz, an important influence on the development of liberation theology. Jürgen Holtmann is prominent among those Protestant theologians of the immediate post–Vatican II period who wrote on political Theology, offering his own understanding of liberation theology. Two of the earliest examples of twentieth-century theologians giving prominence to the term *political theology* in their writings are a book by Protestant Alfred de Quervain published in 1931 and an essay by Catholic Karl Eschweiler published in 1931 to 1932. Among the earliest original treatments of political theology in English are studies by Julian Obermann on *Political Theology in Early Islam* (1935), Ernst Kantorowicz on mediaeval political theology (*The King's Two Bodies,* 1957), and J. Deotis Roberts on *Black Political Theology* (1974).

The Blackwell Companion to Political Theology, published in 2003, straddles different usages when it purports, with its wide-ranging collection of newly commissioned essays, to demonstrate both the "inherently political" nature of Christian theology and its impact on contemporary ideologies and "present-day political issues." Speaking more loosely still, political theology may be applied today to nearly any study of the interplay between political and religious questions. Thus the journal *Political Theology,* which published its first issue in 2002, defines its mission simply as one of investigating and examining religious and political issues from an interdisciplinary perspective. In popular usage and on the Internet, political theology can refer to anything remotely connecting politics and religion.

Political Theory

In the lead article of the first issue of *The Journal of Politics* in 1939, George H. Sabine posed the question, "What is political theory?" This subject has, to this day, remained persistently contentious. The difficulty is, in part, that while political theory is professionally attached to the discipline of political science, it has, intellectually, since at least the early 1970s, evolved as a relatively autonomous interdisciplinary field of study allied more closely to academic practices such as philosophy and history.

When Sabine's article was published, the domain of political theory, as exemplified in Sabine's own work, consisted primarily of the study of the history of political thought, that is, the exegesis of, and commentary on, a classic canon extending from Plato to Marx, which, in turn, was still an integral dimension of American political science. As a generic form of discourse conducted in diverse ways and settings by university scholars as well as by political actors, political theory is apt to be conceived as a relatively universal endeavor. However, as a self-ascribed and institutionally differentiated academic field, political theory refers to a form of discourse that was a nineteenth-century American invention. Although it is possible, and common, to identify, in various countries and eras, what might be considered as functional equivalents and prototypes of this academic practice, it was largely a creation of American political science.

POLITICAL THEORY AND THE ORIGINS OF THE AMERICAN SCIENCE OF POLITICS

The work of authors such as Aristotle, John Locke, and Jean-Jacques Rousseau were already important texts in the late eighteenth- and early nineteenth-century American college curriculum in moral philosophy. A Scottish Enlightenment perspective dominated this course of studies, which included practical ethics and was taught by Protestant clergy. This iconic literature, which became the core of a classic canon, was viewed not only as the progenitor of the ideas embodied in American institutions but also as containing principles that should be inculcated in citizens and political leaders.

Although political science, as a particular discipline, was, as Bernard Crick so notoriously put it in 1959, a distinctly "American science of politics," this United States setting did not entail a lack of European influences. The person most reasonably credited as the discipline's "founder" is the German émigré Francis Lieber (ca. 1798–1872), who grafted German philosophical history onto the political dimension of American moral philosophy and made the concept of the state the subject and domain of political science. From the point of his earliest writing on the study of politics (*Manual of Political Ethics,* 1838), Lieber also situated the already canonical authors, from Plato onward, as central actors in a Kantian and Hegelian vision of history, which was the story of the state and its evolution toward institutions of civil liberty. Lieber believed these institutions were most fully manifest in the American nation-state. Lieber designated the classic authors, beginning with the ancient Greeks, as the predecessors of the field of study that he was attempting to institutionalize, and the history of politics culminated in American self-government where the existence of a sovereign people overrode diversity. The emerging discipline, as a whole, was devoted to justifying American government as the ultimate realization of popular sovereignty, and the study of the history of political thought validated that putative body of knowledge by attaching it to an illustrious lineage. The history of political ideas was conceived as, at once, the history of political science and the history of the theory and practice of the state, and thus as providing a provenance for both the discipline and its subject matter.

Lieber's successor at Columbia, John W. Burgess, and the latter's colleagues and students, most fully institutionalized the discipline of political science as part of the American academy, and this included both the theory of the state and the attending study of the history of political ideas. More than any other work, it was Archibald Dunning's three volumes on *A History of Political Theories,* written over a period of two decades (1903–1920), that established the history of political theory as a consciously recognized academic literature and a defined element of the university curriculum. Although Dunning broadened the perspective beyond the earlier Germanic accounts, he continued to stress the claims that the history of political theory was the past of contemporary political science, that politics were the subject of history, and that political change was a product of a dialectical relationship between political ideas and their social context.

The work of W. W. Willoughby at Johns Hopkins University paralleled that of Dunning. Willoughby emphasized the importance of theory in political life and, even more than Dunning, the immanence of political ideas in the context of

political fact in his *Political Theories of the Ancient World* (1903), but he also stressed the difference between political thought in politics and political theory as an element of political science. He was one of the principal actors in founding the American Political Science Association and in designating political theory as a recognized subfield, and he claimed that the history of political theory should also be viewed as a repository of concepts for scientific political inquiry.

POLITICAL THEORY AS THE HISTORY OF LIBERALISM

For early exponents of a more naturalistic scientific study of politics, such as Charles E. Merriam, who along with his colleagues in the Chicago school fundamentally changed the character of the discipline during the course of the 1920s, the history of political theory remained an important element of political science. Despite the new emphasis on political theory as an element of an empirical science of politics, the history of political thought continued to dominate the subfield of political theory. The history functioned as both the story of democracy and an account of the development of political science. What had also taken place, however, beginning in the mid-1920s, was an Americanization, and Anglicanization, of the literature. This was in part a consequence of the turn away from German philosophy after World War I (1914–1918), and there was also greater intercourse with England and the influence of a number of British scholars. But although the more strictly Hegelian elements that had characterized the American adaptation faded, the essential characteristics of the form, such as the relativity of ideas leavened by an idealist image of progress, persisted.

The crisis of democratic theory in political science during the 1920s ended with the demise of the theory of the state as an account of democracy based on the belief in the existence of a homogeneous American public. However, the history of political theory continued to flourish as a justification for the new theory of democratic pluralism, as well as for the changing image of political science. The political polarization of the globe in the 1930s and an inferiority complex about the articulation of democracy, or liberalism, as an ideology provided incentives for moving that history yet further in the direction of justifying American democracy. The image of a great tradition political thought became, more than ever, the past of both American politics and political science. Works such as C. H. McIlwain's *The Growth of Political Thought in the West* (1932) did much to solidify the assumption that the classic works were pivotal elements of an actual historical tradition, but, among the proliferating number of texts during the 1930s and 1940s, which served to underwrite liberal democracy as well as the discipline devoted to studying it, Sabine's *A History of Political Theory* (1937) became the most paradigmatic. Although Sabine claimed that political ideas were relative to their context, depreciated the assumption that political theory had anything to do with ultimate truth, and stressed the danger of all transcendental perspectives from natural law to Marxism, he sustained the image of progress in both ideas and institutions. He

claimed that the logic of the experimental method, which lay at the heart of both science and liberalism, ultimately ensured their survival and doomed the aberrational absolutist lapses of totalitarianism.

Although it is often assumed that the behavioral revolution in political science, which defined the discipline during the 1950s and 1960s, involved a rejection of the history of political theory in favor of what it characterized as the emulation of the methods of the natural sciences and the development of scientific theory, a radical change in the literature associated with the history of political theory instigated, in part, the behavioral movement. Behavioralism was in many respects a reaffirmation of and a recommitment to both the account of liberal democracy and the methods of studying politics that had dominated the discipline for a generation.

THE TRANSFORMATION OF POLITICAL THEORY

Between the late 1930s and early 1940s, a significant number of German émigré scholars arrived in the United States and, for various reasons, gravitated toward the field of political theory. By the mid-1950s, these scholars had brought about a fundamental sea change in the discipline. This group included, most notably, individuals such as Leo Strauss, Hannah Arendt, Eric Voegelin, and Herbert Marcuse. They were, in several respects, a philosophically and ideologically diverse group, but despite their differences, ranging from Marxism to conservatism, they embraced some common principles and assumptions.

For Americans, who had for a generation been relatively insulated from foreign influences, their arguments appeared both similar and unfamiliar. There were some American partisans who aided in the penetration of the genre, and, by the early 1960s, with the publication of what many saw as the principal successors to Sabine's book—Sheldon Wolin's *Politics and Vision* (1960) and Strauss and Joseph Cropsey's edited *History of Political Philosophy* (1963)—a basic intellectual shift had occurred. The quite sudden behavioralist depreciation of the study of the history of political theory was in large measure a consequence of this literature increasingly becoming a rhetoric now devoted to undermining, rather than defending, mainstream political science and the pluralist vision of democracy that had become emblematic of political science as well as of American public philosophy. The classic articulation of this alienation was Wolin's account of "Political Theory as a Vocation" (1969), which he advocated as an alternative to the "methodism" he ascribed to the behavioral program in mainstream political science. Wolin claimed that this calling, represented in the texts comprising the classic canon, was one to which academic theorists should and could aspire, even if only by interpreting and teaching this literature.

The antimodernist work of individuals such as Martin Heidegger, Oswald Spengler, Stephan George, and Carl Schmitt influenced many of the émigré theorists, as well as others who followed their lead. Political theorists began to propagate images of a crisis of the West and the decline of political thought. Since they all saw relativism in its various manifestations as a precursor

of philosophical and political nihilism, they reacted negatively to American pragmatism and subscribed to some version of transcendental and foundationalist philosophy. In short, they could not, in most respects, have been more at odds with the substantive content and purpose of the field of political theory as it had heretofore been conceived in the United States.

The form of this intellectual vessel was, however, more congenial and familiar. The tale of the tradition, as told by political philosophers such as Strauss, became a much more dramatic and structured trope. Authors such as Niccolò Machiavelli were cast as romantic or demonic protagonists in a plot containing distinct points of beginning, transformation, and, even, end. Although the new literature was addressed, at least obliquely, to contemporary society, issues surrounding the cold war, and the viability of democratic institutions, it represented a kind of philosophical politics in which actual events resonated more as exemplars than objects of investigation. Also, finally, the subfield became increasingly alienated from the very discipline in which it was professionally situated. The new synoptic account of the tradition that took shape after World War II still told the story of political science and liberalism, but it was now a tragic story of their entwined flaws and irrelevance. At the same time, however, the narrative singled out the "vocation" of political theory as surviving the defects of modernity and recovering a lost remnant of truth.

By the late 1960s, the estrangement between the subfield of political theory and mainstream political science resulted in a partition of political theory into what were designated as *empirical, historical,* and *normative* domains, with the latter categories becoming the principal property of the emerging interdisciplinary field of political theory and its professional outpost in political science. The appearance of the journal *Political Theory* in 1971 exemplified the relative autonomy of political theory that increasingly became defined by a series of conversations, such as those surrounding the work of both foreign scholars such as Jürgen Habermas (*Knowledge and Human Interest,* 1971) and Americans such as John Rawls (*A Theory of Justice,* 1971) and Robert Nozick (*State, Anarchy, and Utopia,* 1974). There was also a significant shift in the study of the history of political thought.

Debates in the 1960s about such matters as whether the whole tradition had been based on a logical mistake, and consequently whether political theory was "dead," were largely manifestations of philosophical controversies about the implications of philosophical positivism for normative claims about politics. Even this discussion, however, continued to assume the existence of the tradition as a piece of historical reality. The invocation of the great tradition, now as the past of contemporary academic political theory rather than mainstream political science, was in many ways the last gasp of the history of political theory as an epic story encompassing two millennia.

THE NEW HISTORICISM

By the 1970s, the study of the history of political theory had become simply another element in a highly pluralized world of academic specialization, but the genre was vulnerable at the core of its self-ascribed identity—history. It was, at this point, quite thoroughly criticized on the grounds that it was a discourse about the past that was inadequately "historical" with respect to both method and substance. Several scholars, although hardly agreeing completely either about alternatives or the criteria of historicity and interpretation, advanced quite extended critiques arguing that an analytically and retrospectively constituted canon had, for a century, masqueraded as an actual tradition. As much as this literature had been studied, it had been approached in terms of, and encased in, a framework that often obscured the meaning and significance of both texts and contexts, as well as their actual political character and potential relevance for the present. The attachment to the idea of the sole tradition had also inhibited the capacity to recognize and study a variety of actual historical traditions.

The study of the history of political thought originated as a rhetorical discourse devoted both to vouchsafing the identity of political science and to establishing it as a body of knowledge with practical significance, and, for a century, it functioned as such a discourse. The principal goal of the "revolution" in the theory and practice of the study of the history of political thought initiated, more than a generation ago, was devoted to transforming this literature into a more credible body of historical research. Scholars exemplifying this goal include Quentin Skinner and J. G. A. Pocock, who, among their cohorts, rejected what they characterized as philosophical and ideological renditions of past political thought in favor of what they claimed was an authentic historical recovery of the meaning of past texts. This task was to be accomplished in part by a careful reconstruction of the political context and form of discourse in which the authors were situated.

If the transformation initiated by the émigrés had not alienated political theory from mainstream political science, some speculate whether the study of the history of political theory would have remained a rhetorical adjunct. Isolated from the discipline, however, it became increasingly exposed and susceptible to criticism. Despite the growing popularity of arguments, such as those of H. G. Gadamer, that challenged the idea of objective accounts of history as well as somewhat similar conclusions advanced by various strains of poststructuralism and postmodernism, the *new historicism* associated with the Cambridge school claimed that there was something beyond varieties of rhetorical and "presentist" history. Those who embraced this approach claimed that it was preferable to earlier work because it deployed a method that yielded an objective recovery of the past, and an authentic understanding of the texts and their authors.

THE SEARCH FOR IDENTITY

Seeking some general identity for political theory as well as considering how it relates to political science has, during the past quarter century, remained a significant concern. Simply charting this now highly pluralized discursive realm is a formidable task. Its foundations are often still assumed to be in some manner historical, but the field today tends to reflect a

variety of philosophical perspectives and political concerns. Mainstream political scientists tend to emphasize their scientific and empirical approach, whereas political theorists stress their commitment to normative claims. However, the distinction is, in practice, not so easily parsed. Nevertheless, although political theorists sometimes direct critical attention toward the discipline of political science, and although issues relating to the nature and status of democracy occasionally prompt an intersection of these once closely allied domains, the contemporary intellectual distance between political science and political theory is quite pronounced.

Political Thought, Foundations of

The foundations of the way in which people think about political life can be reconstructed and assessed through three primary models of foundations of political thought. These include the classical antiquity model, the medieval model, and the modern one. Contemporary perspectives continue to question the foundations of political power, and sustain relevancy in modern society.

GREEK CLASSICAL ANTIQUITY

It is often stated that both philosophy and democracy were born in ancient Greece between the seventh and the fifth centuries BCE. In particular, the city-state of Athens in the fifth century BCE presents a model of democracy that continues to exercise its influence today. Although the thesis of the Greek birth of philosophy and democracy has recently been subject to much criticism by pointing toward the existence of multiple civilizations, the political thought then elaborated has nevertheless been highly influential in Western thinking. It, legitimately, laid the foundations for Western political thought.

The classical model is based on a strong conception of the common good. Against the challenge of the Sophists, who argued that politics and language result from mere conventions, the major thinkers of the classical antiquity argued that political life aims to attain the good within the community. The good of each human being was not seen as opposed to that of the community, but as homogeneous with it. This is because the political life was conceived as the natural condition for human beings, as the result of their specific place in the cosmos. Aristotle (384–322 BCE) famously argued that the human being is a political animal by nature. Living in common is so innate that Aristotle stated that those who can live outside political communities are either beasts or gods.

Plato (427–347 BCE), Aristotle's master, had put forward similar views. In his *Republic,* living in common is the result of the very nature of human beings, who are not enough to themselves and need the collaboration of others to provide for their own needs. The society derives from a division of labor, with each person doing only one thing at the time, according to natural disposition, and relying on others for the necessities of life. Politics is thus the supreme and most important art, and its task is that of orienting all the other arts and therefore also the life of the community as a whole.

This is why Plato asserted that rulers must be philosophers or philosophers must become rulers. A just society is a society where every segment of the society performs its specific task in harmony with the others. Like the soul must be ruled by reason, so the polity must be ruled by philosophers, who are the only individuals who know the common good and can therefore orient the whole society toward its attainment. Philosophers do not seek material goods and honors, but only pursue the good of the community.

Aristotle followed his master in this view and also maintained that the political community aims to attain the common good. Aristotle gave this thesis a strong teleological connotation: since the human being is by nature a political being, the state comes before the individual itself. Conceptually speaking, the whole of a body comes before its parts, because without the whole, it does not make sense to speak of a hand or a foot. In his view, equally natural is the relationship of subordination between slaves and masters, women and men. As within the individual the soul dominates the body, so men dominate women and the most intelligent men dominate those who have only physical force and can therefore serve as slaves.

With the decline of the political system of the city-states and the rise of the large empires and monarchies of antiquity, a new model began to emerge. Greek democracy was based on the systematic exclusion of women and slaves from politics. Stoics argued that every human being is endowed with reason, and thus implicitly criticized Aristotle's conception of natural subordination. Furthermore, in contrast to the ideal of the city-state or *polis*, they supported the ideal of a *cosmopolis* where all people can live in peace because they are all equally subject to the law of reason.

THE MEDIEVAL MODEL

The rise of Christianity marked a rupture with the classical model, but an element of continuity also characterized the shift. This continuity occurs because both models are based on the idea that politics derives from the specific place of human beings in the cosmos, and therefore conceives of politics in a teleological way. The major difference is that the ordering principle is no longer a reason immanent to the cosmos itself, but the transcendent will of the God of Christianity. This generates problems specific to the medieval model.

In this respect, the Christian message stands in contrast to the classical model. Whilst the latter emphasized force and intelligence and argued for the superiority of the strong over the weak, the Christian message offers a subversion of these values, by evaluating weakness and the equality of all individual human beings in the face of the omnipotence of God. Although the message has a potentially revolutionary content, Christendom did not fully realize this message in political terms. The prevailing idea is that the full equality is an ideal to be realized in the spiritual world, but not necessarily in the earthly one. Jesus's saying, "Render unto Caesar the things which are Caesar's, and unto God the things that are God's," became the object of a lively debate about the relationship between Christianity and secular authority.

In particular, after the creation of a sacred Roman Empire, the problem became that of the relationship between the authority of the emperor and that of the pope. Questions arose whether the temporal authority of the ruler was autonomous, or whether the spiritual autonomy of the pope superseded it. For highly religious thinkers, the prevailing idea is that of the superiority of spiritual authority. Differences, however, emerge with regard to the degree of autonomy recognized in the temporal authority and politics.

According to Saint Augustine (354–430 CE), for instance, without the Christian message, there cannot be justice, and, without justice, there cannot be a legitimate polity. As he argued in the fourth book of his *De Civitate Dei,* without Christian justice there cannot be a union of citizens under law and for the attainment of the common good. As he provocatively puts it, without justice, a political community is in no way different from a mere association of bandits, which are united just to burgle and then share the loot. Although Augustine's position was more nuanced on this point, his name became associated with the view of the subordination of temporal power to the spiritual one.

After the diffusion of the Latin translation of Artistole's *Politics,* a different position emerges. Authors who had been inspired by Aristotle, such as Thomas Aquinas and Marsilius of Padua, recognized the autonomy of political power. Following Aristotle, Thomas Aquinas (ca. 1225–1274) argued that politics is deeply rooted in human nature. In a more radical way, Marsilius of Padua (1275–1343) argued that peace cannot be guaranteed unless political authority is recognized without any superior power. As he wrote in his *Defensor Pacis,* the law must derive from the will of the citizens or of the prevailing part—both in quantitative and qualitative senses. By rooting the law in the will of individual human beings, Marsilius's theory anticipates the modern model.

THE MODERN AGE

The modern model stands in contrast to both the classical and the medieval one. While the latter grounded politics in the idea of a *cosmos* teleologically ordered for the common good, where every being is assigned its specific place in the hierarchical chain of beings, the modern model places the foundations of politics in the *will* of individual human beings. The ancient world is by nature closed and hierarchically ordered, yet the world depicted by the modern science is open and infinite, so that human beings can stand in a position of free equals within it.

Thomas Hobbes (1588–1679) offers the clearest view on this. His political philosophy accompanied the emergence of the modern system of sovereign states, providing a powerful justification for its existence. Hobbes's phrase *autoritas non veritas facit legem* (it is the authority and not the truth that makes the law) marks the decline of a model of political thought that had prevailed for centuries. The foundation of political power consists no longer of pursuing a common good, but in the will of the citizens themselves. According to Hobbes, and all the other thinkers who endorse the contractarian model, such as Jean-Jacques Rousseau (1712–1778) and John Locke (1632–1704), a contract that human beings stipulate among themselves—in order to exist in the natural condition of absence of government—justifies political power. Through such a contract, human beings cede part, or all, of their sovereignty to a common power in order to receive from it the protection of their fundamental rights. The conception of such rights varies in the different thinkers, ranging from the mere right to survival (Hobbes), to political freedom (Rousseau), or to private property (Locke), as well as diverge in the forms of government they envisage—an absolutist (Hobbes), a democratic (Rousseau), and liberal one (Locke).

Notwithstanding all those differences, which ultimately derive from their different conceptions of the state of nature, understood as a brutal condition of potential perpetual war (Hobbes) or as a condition where the rights are simply not enough guaranteed (Locke), all these thinkers share the premise that political power derives from the will of individuals. The contractarian model of political order accompanied the rise of European modernity, with its institutions of an emergent system of sovereign states and capitalist economy. While the

model did not fail to provoke severe criticism, it also exercised a deep influence on Western political thought.

The criticism raised by German idealists at the beginning of the nineteenth century contributed to the crisis of the contractarian model. In particular, Georg W. F. Hegel (1770–1831) sharply criticized contractarianism for grounding the state in the contract—a category of private law. In his view, grounding the existence of the state in the mere accidental encounter of individual wills amounts to misunderstanding its deeply ethical nature. The state is the reality of an ethical idea, the culminating point of the objective spirit of an epoch. As such, it transcends, in the sense of the German *aufheben*, not just private law and morality, but also other inferior incarnations of the objective spirit such as the family and civil society.

Hegel thus endorsed the idea of a separation between the civil society and the state—a view that still exercises its influence today. Whilst contractarian thinkers work with the simple opposition between a state of nature and a civil society, thinkers influenced by Hegel maintain a sharp separation between the two. In his critique of the bourgeois society, Karl Marx (1818–1883) radicalized such a distinction by arguing that the state is part of a superstructure which is separated from, but also reflects the relationships of, domination taking place in the economic structure: the exploitation of the proletariat by a capitalist bourgeoisie. In this view, political power is a means for the bourgeoisie to sustain its system of exploitation, and contractarian theories are the mere ideological covering of such a system of exploitation.

The rise of the capitalist economy was accompanied by a new awareness of the deep economic inequalities and forms of exploitation that sustained it. Radical thinkers such as socialists and anarchists saw in political power a means for domination to be expropriated and put in the hands of the proletariat (communism) or to be abolished altogether (anarchism). Anarchism represents the most radical answer to the question of what constitutes the foundation of political power. In this view, the state always implies a form of asymmetry of power so that a minority of the people—those who are part of the state apparatus—dominate over a majority. Anarchists, therefore, see no possible reform of the system of the sovereign states: it must be abolished. In their place, Pierre-Joseph Proudhon (1809–1865) and Michail Bakunin (1814–1876) proposed a noncoercive political system based on the free federal associations deriving from the specific needs of the society. In their view, only through a bottom-up organization of society can the freedom of individuals be guaranteed.

CONTEMPORARY TRENDS

A useful way to group contemporary approaches is according to the answer given to the question regarding whether there are foundations for political power. Among those who provide a positive answer, and therefore stand in the tradition of modern political thought, is John Rawls. By reviving the contractarian model after a few centuries of decadence, Rawls argued that a just society is the society that people would chose if put in an hypothetical original position. In this place, known as

the veil of ignorance, they do not know their specific position in the society, their comprehensive doctrines, and natural talents. In Rawls's view, such a society would be based on two principles that provide for (1) the maximum freedom for every individual compatible with a similar system for all, and (2) the arrangement of social and economic inequalities so that they are both to the greatest benefit of the least advantaged and attached to offices and positions open to all.

While Rawls's theory envisages a method for the discovery and the justification of the just form of political power, postmodern thinkers tend to see no possible foundations for it. By criticizing the very attempt to provide rational foundations for the existence of political power, postmodern thinkers argue that the Western canon of political theory is nothing but a myth—the myth of the white man. The very attempt to provide rational foundations for the existence of political power is seen as a result of a logocentric practice, which is the hallmark of Western tradition. Together with questioning the possibility of rational foundations, the merit of postmodernism has been that of casting doubts on the adequacy of the Western models of political thought as a whole. In a world that must accommodate diversity and pluralism of histories and worldviews, there is the possibility that the Western canon is only one among many possible stories.

An intermediate answer is that of authors who work in the tradition of a critical theory of society. Jürgen Habermas's deliberative democracy attempts to propose a form of democracy that can account for the possibility of public deliberation in a postmetaphysical setting and a condition of pluralism. His attempt to ground democracy in the ideal conditions for speech and deliberation has attracted so much attention that some authors have spoken of a deliberative turn in political philosophy.

The activity of boundary questioning thus deeply contributed to repositioning the foundations of political thought. In a global age, it is not only the possibility of foundations of political thought that is called into question, but also that of its traditional boundaries. Poststatist political theory questions the boundaries between the sovereign states by arguing that in a globalizing world, a form of democracy beyond the traditional state boundaries must be found. Feminist political theory questions the traditional boundaries between the public and the private sphere by arguing that this is a means for perpetrating the domination of males in the former and segregation of women in the latter. Finally, there is a variegated set of approaches that point toward a new form of green political theory. Such approaches question traditional ways of conceiving the boundaries between politics and the natural environment, arguing that the latter is not the mere background of the former. In an epoch of artificially induced natural catastrophes, the foundations of political thought must be rethought in order to assure both justice among human beings and their survival.

Politics

There are two main concepts of politics: politics as a sphere and politics as an activity. The history of the concept is present in the contemporary conceptual struggles, and the disputes surrounding the concept form an inherent part of the concept itself. With the principle that the "political life itself sets the problems for the political theorist" (Skinner, xi), the language of political agents gains priority over that of theorists. The conceptual history of politics emphasises breaks and turning points in the process of conceptualization.

THE STUDY OF THE POLIS

The ancient Greek *polis* was formed in opposition to the despotic *oikos* of traditional monarchies. The rise of an egalitarian and participative regime among the male citizens in the classical Athens provoked new conceptualizations of the polis among the historians, playwrights, Sophists, and philosophers.

The *Politics* of Aristotle refers to a discipline of studies on the polis, its regimes, and its citizens. For Aristotle, the polis refers to a distinct type of community, and he analyzed the Greek political practice in terms of *politiké techné*, as an art, opposed to the "science" of the polis. In his *Rhetoric,* Aristotle opens another line of conceptualization calling "political" the deliberative speech in the assemblies dealing with contingent issues of future. The phronesis and deliberation aspects were close to the political analysis of Greek Sophists and playwrights.

The study of the Roman city-republics was called *scientia civilis*, and since the twelfth century, many Italian authors emphasised the similarities between autonomous city-republics with the ancient poleis. Translations, such as William Moerboke's thirteenth-century Latin translation of Aristotle's *Politica,* transferred the Greek vocabulary into Latin. In the universities of early modern monarchies the subject matter of *Politica* extended to all kinds of rule—government and the state.

Politica and its vernacular translations referred to a discipline, a science, or an art. The early modern discipline of politics covered an umbrella of governmental and administrative questions. The "science" of politics was confronted with the arts of phronesis, emphasizing "politic, clever, or cunning" measures. In the sixteenth century, the gradual formation of the state contributed to the practice to call politics a normative doctrine. In the Westphalian regime after 1648, the interstate relationship almost became a paradigm of political questions.

The vernacularization of the political vocabulary also contributed to conceptual shifts. In English, the adjective *politic*, or *political*, refers to three nouns: policy, polity, and politics. Originally, *policy* alludes to the regime, and with the coinage of *polity*, policy was left to a normative doctrine. In *Oceana,* when James Harrington calls Machiavelli "the only politician," he still refers to a thinker of *politics*.

FROM THE DISCIPLINE TO THE PHENOMENON

Once no polis or autonomous cities existed anymore, the umbrella discipline of politics contained nothing outstandingly "political." The academic disciplines differentiated in the eighteenth century according to their subject matter. A residual sphere outside ethics, law, or economics was left to the discipline of politics. In this situation, however, new proposals for interpreting the autonomous political sphere were offered. For example, to John Locke and Jean-Jacques Rousseau, "political" referred to the metaphorical space of contractual relations, opposed to the state of nature.

After the late eighteenth century, a process of contamination between the discipline of politics and its subject matter took place, and speaking of politics as a separate phenomenon gradually replaced the discipline of politics. In the course of the nineteenth century, the discipline became completely obsolete, and the English noun *politics* turned from the plural into the singular.

This horizon shift from the discipline to the phenomenon is visible in both the sphere and the activity concepts of politics. The origins of the latter are detected in that the English nouns *policy* and *politician* received a temporal connotation. The normative discipline of policy was transformed so that policy became a line followed in the diplomatic and governmental activity.

The activity of politics was initially located within the sphere of politics; however, during the nineteenth century, it became possible to speak of the activity of politics independently of spheres. The spatial and temporal concepts offer partly competing interpretations of what is decisive in politics and

refer partly to different levels of abstraction. According to the spatial concept, everything that belongs to the political sphere is politics, but the temporal view requires a further qualification of the distinctively political activities. The two concepts regularly appear in different combinations with each other. For example, Hannah Arendt insists both on the public sphere and the performative activity as essential aspects of politics.

POLITICS AS A SPHERE

The spatial concept of politics concerns the demarcation of the sphere of politics. Many scholars contend that spheres like religion, morals, law, and economics are better known than politics. The reason lies in the tacit assumption that these spheres manifest a higher degree of constancy and regularity than politics. In other words, politics as a sphere has remained both diffuse in its borders and vague at its core.

The residual character of politics has practical consequences and legal issues. Since the first half of the nineteenth century, issues such as the status of political crimes, prisoners, and associations rose to the agenda. At the 1899 Hague peace conference, a vote was even held on the question of which issues are political in international relations.

The distinction between the public and the private sphere forms the traditional core of the spatial concept of politics. The strong tendency to identify the political with the public still holds for thinkers like Arendt, Michael Oakeshott, and Richard Rorty. However, making this distinction renders the borders between the private and the public endlessly interpretable and subject to conflicting demarcations. Thinking of politics in terms of a sphere is also a target of criticism among many feminist scholars.

In the course of the twentieth century, more abstract spatial terms to conceptualize politics have risen, and the key metaphor of academic political science has been the political system. The metaphor relies on the interconnectedness of the parts in a whole and has been challenged. For example, Ulrich Beck's concept of subpolitics insists on the crucial political role of the margins of the sphere. Spatial metaphors of politics may also separate the focus from its background. Regarding politics as an arena, forum, stage, or theatre renders the distinction between the sphere and activity concepts fluid, because these metaphors also allude to performing an activity.

The abstraction the political has become popular in recent sphere concepts. Hans Morgenthau systematized this notion in the juridical debates of Weimar Germany, as did Carl Schmitt with his *Der Begriff des Politischen* (The Concept of the Political). In the postwar era, post-Schmittian thinkers from Julien Freund to Chantal Mouffe continued this line. Mouffe follows Martin Heidegger when distinguishing the *ontological* category of the political over the merely *ontic* category of politics (Mouffe, 8–9). French scholars such as Régis Debray or Pierre Rosanvallon insist, along with Schmitt, on the stability of the political over the fluidity of mere politics.

POLITICS AS AN ACTIVITY

"Politics is an activity," not a thing, writes Bernard Crick (36). The historical links of the temporal contingency of politics to the deliberative rhetoric are evident. Nonetheless, the activity of politics results from drawing new horizons for politics in a complex process of conceptualization since the nineteenth century. Early works such as Carl von Clausewitz's *Vom Kriege* (On War) and Alexis de Tocqueville's *De la démocratie en Amérique* (Democracy in America) use the activity concept of politics fairly consistently. The democratization and parliamentarization of politics served as historical conditions for a more systematic thematization of the contingent, contested, and controversial activity of politics. Different *topoi* (themes, conventions, rhetorical figures) regarding the interpretation of the crucial moment of politics can subsequently be constructed.

Competence, prudence, and judgment all have direct links to the criteria of suffrage in the context of the political in the personal capacity. The type of political leader in democratized regimes is also analyzed in terms of judgment, using, for example, tact, craft, or approximate judgment as the key to politics.

Policy refers to a conception of politics emphasizing the continuity between single measures. This allows some authors to distinguish between politics or to denounce all opportunism. The core of a policy lies in the balancing of teleological expediency and normative demands. For example, in the twentieth century, the reason of state has been singularized into the best possible policy line.

Different stages of the political process—including deliberation, commitment, or contestation—also offer alternative topoi for conceptualizing politics. The parliamentary style of politics accentuates the rhetorical moment of deliberating between alternatives. According to Max Weber, a deliberating parliamentarian can judge the effect of the words, and Albert O. Hirschman sees, in the manifestation of a voice, the core of politics. The deliberation on issues is combined with the persuasion of the adversaries, and for Arendt, the politician appears as analogous to the performing artist for whom "virtuosity of performance is decisive" (153).

For William Kay Wallace, politics is commitment, "a means of realizing the aims and plans of an individual or general will" (15). Hans Morgenthau sees, in a Nietzschean manner, the aims of politics based on "a desire to maintain the range of one's own person with regard to others, to increase it or to demonstrate it" (192). Carl Schmitt's authoritative distinction between the friend and the enemy radicalizes the commitment through a decision.

The topos of contestation is directed toward the opening moment of the situation. Max Weber insists, in his famous 1919 lecture *Politik als Beruf,* on the link between politics and struggle against adversaries. Before World War I (1914–1918), German expressionists presented contesting demands of politicization of various phenomena. The contestation of the existing order lies in the core of politics for many movements since the 1960s.

Another cluster of topoi of politics operates with time and contingency. The *realpolitik* and the Bismarckian "art of the possible" try to minimize the possible and absolutize the reality. Several interpretations of politics soon opposed these as "art of the impossible." For Max Weber, the concepts of

chance and objective possibility illustrate how an acting politician's judgment of the possibilities is more crucial than the factual reality. Oakeshott's famous slogan on politics as sailing on a "boundless and bottomless sea" similarly reevaluates the opportunities.

The topos of the situation now combines the judgment of the possible with the use of rising occasions. Seizing the unique situation is decisive for politics. According to Henry Fairlie, the regular and recurrent occasions in a parliamentary democracy offer a party leader the possibility to wait for the right time and then "to seize real opportunities when they present themselves" (68). For Walter Benjamin, the play with deadlines and meetings is the distinctive mark of a politician, and he sees, more generally, in this unique situation a dramatic priority of the present as the proper time of politics.

The metaphors of play and game also offer together another key topos of politics. Eugène Pierre understands how, for the politician, the game is an end in itself, and Philip Cambray analyzes politics in terms of strategic games. For Oakeshott, the playful component is "nowhere more present than in the various levels of political activity" (111). Jean-Paul Sartre in *Critique de la raison dialectique* (Critique of the dialectical Reason) regards politics in the subversive terms of *déjouer*, the derailing of adverse policies and outplaying of the adversaries.

POLITICS IN THE CONTEMPORARY LANGUAGE

Contemporary politics and politicians do not always have positive reputations. Nonetheless, any phenomenon can be politicized in the sense of rendering it contingent, controversial, or contested. Since the late 1960s, numerous waves of politicization have emerged. Simpler forms of speaking of politics as a separate sphere are now obsolete, when the point is to read and to specify the political aspect in any phenomenon from different perspectives. Also, the activity concept may be challenged by its application to the phenomena of everyday life, where the question is less of an explicit opposition between agents and their projects than of a clever use of situations and occasions.

A construction of a repertoire of topoi for both the sphere and activity concept of politics may help clarify present and past controversies on the concept of politics. It directs attention to the formal aspects of the concept, to the history of its conceptualization, and to the possibilities of the mutual combination of the topoi for different purposes. It also serves as a tool of a pluralistic and historically oriented mode of political literacy.

Politics, Comparative

The field of comparative politics addresses a large number of questions. A small fraction of these include: Why are some countries democracies and others dictatorships? Why do some governments tax and spend more than others? How do electoral institutions shape the outputs of government? Why does ethnic conflict happen in some places but not others, and why is ethnic identity salient in some places but not others? Why do some political parties make programmatic pitches to the electorate, while others rely on clientelistic relations with voters? Why is there so much variation across countries and regions in the extent to which religion plays a role in politics? Why are women better represented in elected office in some

countries than others? Why are governments corrupt in some cities but not others?

While fascinating, neither these particular questions nor the countless others of importance in the discipline today are the essence of comparative politics. The precise questions that motivate comparative political scientists vary tremendously in response to events of the day, the desire to impact public policy, and intellectual fads. Instead, it is the approach to understanding and explaining causal relationships in the social, political, and economic worlds that defines comparative politics. Two aspects of the approach distinguish the practice of comparative politics from other academic disciplines: first, the use of social scientific methods to assess causal relationships, and second, what it is that comparativists compare. On one hand, the emphasis on causal relationships distinguishes comparative politics from conventional history, journalism, and some portions of other social sciences that aim primarily to describe particular countries, communities, people, or events. On the other hand, using the comparison of countries, regions, communities, and such as a means to understand causal relationships in the political world distinguishes comparative politics from the hard sciences and some social sciences.

COMPARATIVE POLITICS, SOCIAL SCIENCE, AND CAUSAL INFERENCE

Comparative politics is thus a branch of political science that attempts to draw descriptive and causal inferences about the political world on the basis of evidence from more than one setting. A descriptive inference uses evidence on one case or set of cases (e.g., countries or ethnic groups) to learn about other cases not directly observed. Therefore, a comparativist might study Iraq and Afghanistan, both religiously and ethnically heterogeneous societies, in order to learn something descriptive about other societies that resemble them—how ethnic groups are likely to get along, the difficulties of developing state capacity in divided societies, and the like. Causal inference, on the other hand, involves using information about a set of cases to make claims about causal relationships in the political world. Thus, analysis on Afghanistan, Iraq, and perhaps a host of other cases may be a means to test a causal proposition about the conditions under which foreign intervention by a great power produces civil war. Causal inference is the holy grail of comparative politics.

Drawing causal inferences requires two things: first, a theory about what causes what in politics, and second, a method for testing the theory. Simply stated, a theory involves a causal argument from which one can draw testable hypotheses. A test of a theory involves examining the evidence relevant to the hypotheses generated by the theory. If the evidence supports the hypotheses, there is evidence in support of the theory; if it does not, there is evidence contrary to the theory. These features of comparative politics are consistent with the method of scientific inquiry applied in the hard sciences, such as physics, and in other social sciences, such as economics. It is the application of these social scientific principles to comparisons in the political world that defines comparative politics.

Research in comparative politics begins with theory just as it does in other social sciences and the hard sciences. Historically, there was a stark divide between comparativists who valued deductive theorizing—or beginning with very abstract theoretical principles, deriving empirical implications, and then seeing how the real world matched theoretical expectations—and comparativists who emphasized the worth of working inductively—or beginning with observations of the world and trying to work backward to develop theoretical explanations for what is observed. Over the last decade, this debate has subsided as many researchers in comparative politics have come to recognize the value of both deductive and inductive approaches to theory development. Most now acknowledge that a sharp distinction between the two is oftentimes difficult to sustain.

ALTERNATIVE THEORETICAL APPROACHES TO COMPARATIVE POLITICS

If most researchers in comparative politics value both deductive and inductive approaches to theory development, the actual content of the theories tends to be the subject of more contention. Though the discipline has seen theoretical schools of thought come and go, four are particularly prominent today. Rational choice theories, which draw strongly from economics, begin with the assumption that individuals, for example, voters or politicians, are utility maximizers. Such theories then define what it is that the relevant actor seeks to maximize and examines how this actor behaves under different constraints. Such theories have been particularly useful for providing insight into the behavior of political actors when they operate under a set of stable institutional rules, be they electoral, economic, or otherwise. One prominent example is Douglas North's 1990 text, *Institutions, Institutional Change, and Economic Performance*.

Cultural theories, on the other hand, seek to explain how community-level norms develop and shape political outcomes, such as the prospects for democracy or development. While in rational choice theories of politics the individual is always the building block of causal accounts, cultural theories place local, regional, or national communities at center stage. A particularly noteworthy example of such work is Robert Putnam's 1993 study of social capital in Italy, which emphasizes the importance of rich social networks for explaining variation in the robustness of democracy across Italy's regions.

Third, class-based theories of politics, long rooted in Marxist thought, suggest that the key actors in societies are classes, where classes are composed of individuals who share a similar place in the process of production. Such theories assume that class relations are inherently conflictual, as in Gösta Esping-Anderson's influential account in 1990 of the rise of the welfare state in the Organisation for Economic Co-operation and Development (OECD). Class-based theories of politics have recently been reborn, illustrated by researchers such as Carles Boix, who in 2003 aimed to link the behavior of classes to the underlying interests of their individual members.

Fourth, there has recently been an explosion of interest in constructivist theories of politics. Such theories, rather than assuming the preferences of actors, are interested in explaining the ways in which the preferences of actors are constructed by their social environment. In some cases, such theories build on work in psychology and behavioral economics, both of which emphasize the diverse ways in which people understand and pursue their interests. Constructivist theories are particularly prevalent in the booming literature on comparative ethnic politics, which, like Hale's work in 2008, is interested in explaining why individuals define themselves as members of groups with some ascriptive characteristics but not others, and how group membership affects political behavior. As Jan Elster notes, these different theoretical traditions can be compatible in some instances, but comparativists typically think of them as competing schools of thought.

METHODOLOGICAL APPROACHES TO COMPARATIVE POLITICS

If considerable theoretical diversity characterizes comparative politics, practitioners also employ a diverse array of methods to test the hypotheses that emerge from theory. Establishing a causal inference requires that identifying the precise causal mechanisms through which one variable affects another. As James Fearon explains, testing such causal mechanisms is, in essence, an exercise in comparing one or several counterfactuals. Suppose, for instance, one is interested in testing the causal claim that authoritarianism contributes to economic growth in China. Testing such a claim requires considering whether China would have grown as quickly in recent decades if it were a democracy. Since China was not a democracy, this is a counterfactual, and comparativists must figure out means of entertaining such a counterfactual. As a practical matter, practitioners of comparative politics live in a world of counterfactuals.

The most venerable approach to counterfactuals and empirical testing in comparative politics involves the use of qualitative, or *small-n*, methods whereby a single or small set of countries (or whatever the unit of comparison might be) are analyzed in detail with an eye toward testing the implications of a theory. Such tests, particularly in the context of a single case study, are based on the notion of a *crucial case*—one that either has all of the characteristics that theory says should produce an outcome or, contrarily, one that has none of the characteristics that theory posits ought to produce an outcome. To return to the Chinese example, this might imply a study of a country (e.g., post–World War II Russia) that has all of the characteristics of authoritarianism that seem to contribute to growth in China to see if those features also contributed to economic growth in that country. Recent work in historical institutionalism, for example, by James Mahoney and Dietrich Rueschemeyer in 2003, contributes to the use of such methods; this work emphasizes the value of close attention to the precise historical processes that connect causes with outcomes.

A more tenuous approach to using small-n cases to test hypotheses in comparative politics relies on the notion that one can "control" for important alternative causes by carefully selecting cases. A control variable is one that might cause the outcome of interest but that is not the subject of theorizing. Small-n research designs can try to control for alternative explanations by carefully selecting cases that are very similar with regard to alternative explanations. With such an approach, the carefully selected case or cases are meant to serve as counterfactuals to each other. Controlling for alternative causes, however, is exceedingly difficult with a small number of cases. It is very hard to know, for instance, if Sweden developed a large welfare state because it had a powerful labor movement opposed to some other feature of Sweden, if the research design only includes Sweden and, for instance, the United Kingdom. With such a research design, the number of potential causes exceeds the number of countries under analysis.

A more promising approach to the challenge of controlling for alternative causal factors is the statistical analysis of data on a large number of observations. In this *large-n* approach, the unit of analysis can vary from individuals (e.g., the use of survey data) to states within countries to countries themselves, and the comparative political scientist gathers data not just on the variable of theoretical interest, but also for other factors that might impact the outcome of interest. When properly conducted, such large-n studies have the advantage of providing more robust tests of the correlations between the causes and outcomes of interest, exactly because it is possible to come closer to controlling for alternative explanatory factors.

Large-n studies have two costs, however. First, data shortcomings often limit the extent to which comparativists can examine the precise causal mechanisms of interest. Second, using large-n studies to make causal inferences requires strong assumptions. Some of the more important assumptions include that the sample available for analysis is representative of the population as a whole, that the observations are independent of each other, and that causal effects are the same across the units (i.e., individuals, countries, etc.) under analysis. There are reasons to believe that these assumptions are sometimes violated, that for instance, the cost of political participation varies according to the resources a person has (e.g., it is harder to vote if one has a boss who will not allow time off or if one does not have a car to drive to the polling place), and that a financial crisis in the United States has implications for financial markets and politics in other countries (i.e., these countries are not independent of each other). As Adam Przeworski notes, there are ways to correct these problems, but the corrections can themselves be problematic, and oftentimes researchers simply do not know if the assumptions underpinning statistical analysis are violated or not.

To address the concerns associated with reliance on either large-n or small-n research designs, many researchers employ both. While statistical analysis is oftentimes used to establish the plausibility of a correlation among variables, qualitative analysis is used to examine whether the causal processes at work are actually those the theory has proposed. Methodological concerns with the traditional approaches to research

in comparative politics have also fueled the growth of experimental work. Researchers conduct such experiments in labs or in the "field," or setting in which they are interested.

One excellent example of such work is James Habyarimana and colleagues' 2007 study of ethnic identity and public goods provision. In an attempt to uncover why ethnically heterogeneous societies seem to provide fewer public goods, the authors conducted a series of experimental games in Kampala, Uganda, that provide evidence that while members of ethnic groups cooperate thanks to dense social networks, the absence of such networks between groups reduces such cooperation. In the absence of cooperation, public goods suffer.

Such experimental studies offer comparativists a new means of analyzing the individual-level dynamics of decision making, but they too suffer shortcomings. Most importantly, it is difficult to know if experimental settings sufficiently approximate the real world to reveal much about how politics actually work.

THE SUBSTANTIVE FOCUS OF COMPARATIVE POLITICS

Many of these scientific methods are also used in other hard and social sciences, but it is *what* researchers aim to draw causal inferences about, and the settings for their comparisons, that distinguish comparative politics from the hard sciences and other social sciences. The settings for comparisons in comparative politics are almost as varied as the field's research questions. Comparisons range from individuals to neighborhoods, to cities to states or provinces within countries, to countries themselves to regions of the world.

Any case can even be compared with itself through time. Something general can be studied and learned, for instance, about each of the iterations of the U.S. Congress. The 110th Congress is different from the 109th Congress, which is different from the 108th, and so on. Because the overarching institutions of Congress are stable but the rules governing committee decisions and citizen preferences change through time, the Congresses can be compared with each other through time, and each Congress becomes the unit of comparison. If the goal of such an investigation is simply to describe how Congress evolved through time, practitioners of comparative politics would not be interested. Such a study only becomes comparative politics when the goal is to make inferences about the functioning of legislatures around the world. Thus, if the U.S. Congress is totally unique, it is not in the least bit useful for comparative politics—it cannot provide a means for generalizing about legislatures elsewhere. If, on the other hand, the U.S. Congress shares key characteristics with other legislative bodies around the world and can, therefore, provide evidence generalizable to those cases, its study has important implications for comparative politics.

Even with these diverse types of comparisons and the wide array of methodologies, comparative political scientists have a great deal of difficulty being confident in the inferences drawn from the countries, regions, cities, and other places that are compared. This results primarily from the fact that researchers are left to analyze the world as it is. Experiments cannot be conducted to see what would happen to the level of democracy in a society, if a researcher were to change its underlying social structure in the same way that a scientist can conduct experiments to measure, for instance, the precise temperature at which water boils. As such, comparative political scientists can never be sure that the causes inferred from their conduct of comparison are the result of the theoretical mechanisms they have proposed, or something idiosyncratic to the particular countries, citizens, or whatever can be observed. Indeed, so many theories in comparative politics underscore both the complexity of the political world they study and the difficulty of falsifying their theories.

Comparative politics has nevertheless produced some important findings in recent decades. A couple of noteworthy examples include findings that: majoritarian electoral systems link with the prevalence of two-partyism, political participation increases with a citizen's resources, democracy is associated with wealthy societies, revolutions are more likely when societies are poorer and governments are weaker, strong ethnic and religious identities are associated with smaller governments and stronger distributive conflicts, and that parties of the left are associated with more fiscal redistribution in the OECD. At the same time, there is not a lot of agreement on the causal factors underpinning some of these findings. It is not certain, for instance, whether societal wealth causes democracy by increasing the size of the middle class, as discussed in Carles Boix's *Democracy and Redistribution* (2003), or alternatively, if democracies emerge for random reasons but simply are more likely to survive at higher levels of income, as Adam Przeworski and Fernando Limongi discuss in their article "Modernization: Theory and Facts" (1997). This disagreement has produced a renaissance in the study of democratization, and it is common that new findings spur new debates and produce new research frontiers in comparative politics.

Currently, there are a number of major research frontiers. There is an ongoing attempt to assess the causal impact of political institutions on outcomes ranging from electoral competition to economic growth at the same time that researchers recognize that institutions themselves are the outcomes of political struggles. A related, emerging body of work focuses on the political underpinnings of authoritarianism and asks why some authoritarian regimes build robust institutions, such as political parties like the Communist Party of China, while others systematically destroy institutions. This research ultimately aims to explain the varying stability and longevity of authoritarian regimes. Quite different is an ongoing attempt to understand the underlying processes that drive group-based identification, be they religious, ethnic, or regional, and the political implications of group-based identities. Societies with heterogeneous group identities seem to be associated with preferences for less redistribution and smaller government, for instance, but it is not yet understood why this is the case. A similar concern drives a reborn interest in examining the link between citizen interests and collective action, and between collective action and government action via the political

process. This angle is particularly robust in recent attempts to understand when and why political parties have programmatic, opposed to clientelistic, links to citizens and the implications of these different kinds of links for how politicians behave and the prospects for democratic accountability.

Finally, there is an emerging interest in political geography. Geography seems to shape processes as diverse as economic development, ethnic conflict, distributive conflicts, the design of constitutions, the mobilizational incentives of political parties, the dynamics of social protest, and the preferences of voters. The territorial distribution of political preferences and key political institutions, such as electoral systems, also seem to strongly condition the impact of geography. Untangling these complex relations will require the best of comparative politics—precise theorizing, many different types of empirical evidence, and a rich array of methodological approaches.

Clearly, comparison is fundamental to any scientific attempt to uncover causal relationships. Without carefully designed comparisons between, for instance, smokers and nonsmokers, one cannot know if smoking tobacco causes cancer. Contemporary comparative politics is the social scientific design of comparisons aiming to uncover causal relationships in the political world. To the extent other areas of political science, such as international relations or American politics, are interested in making causal claims, they too engage in comparisons. In international relations, great powers might be compared with each other or the systemic characteristics of the international system are compared through time. In American politics, the U.S. political system is compared with itself through time in a quest for general insights into the factors that cause policy in democracies. In the absence of such comparisons, these other areas of political science cease to be social scientific, and contemporary political science, therefore, really is comparative politics.

Politics, Literature, and Film

Unlike the law and literature movement, which credits *The Legal Imagination* (1973) by James Boyd White as its epiphanic text, there is no such author or coherent institutionalized approach that speaks to the effect of literature or film on politics. This is likely because until the nineteenth century, there was no serious doubt that authors, and especially poets, spoke authoritatively on political issues.

The common thread that runs unbroken between the political impact of literature and film is the narrative. Narratives become political when the stories they tell have the potential to alter the social and cultural assumptions informing the viewer or reader's political imagination. Not all literature, and even less film, has overt political significance defined in terms of audiences altering their political imagination upon contact with the artwork. However, when works do have such an impact, it is usually as profound as it is immeasurable. Empiricists therefore usually consider literary thinking to be peripheral and dispensable, an activity reserved for recreation and certainly not as the basic functional unit of the mind. In *The Literary Mind* (1996), Mark Turner makes just this bold yet persuasive claim. Without narrative, one cannot imagine one's self in the future, one cannot plan, predict, or explain what one has predicted. In fact, rational capacities rely on an individual's ability to construct a narrative in which the individual, and all the surrounding human beings, can be ordered and acted upon coherently and humanely. Since humans think in narratives—even when engaged in quantitative analysis, scientific endeavors, or mathematical constructions—literary constructions are revealed as the most persuasive way to gain access to the human mind. That said, there is little theory that effectively engages in a sociohistorical critique. The dominant approaches remain the new historicist and the Marxist methods.

NEW HISTORICIST AND MARXIST APPROACHES

New historicism sees the sociopolitical context as a fruitful and potentially life-altering context against which to set a human drama. The contextual background provides a series of "markers" that indicate how the reader is to understand the broader meaning of the character's utterances. German philosopher Hans-Georg Gadamer (1900–2002) identified the problem that the "contemporary audience" sees historical contexts as too far removed to be understood, leading the author to either grossly romanticize the past or use the historical background as merely a colorful backdrop against which to address contemporary issues.

For the politically focused critic, this is much less of a problem, but for this very reason, new historicism has little explanatory work to do outside of the literary critic's circle. If a modern work about black soldiers in the U.S. Civil War (1861–1865) confronting and overcoming their racist officers is historically anachronistic, it is less important than the impact that such a novel has on the contemporary debate over race relations in the United States. This problem surfaced in the 1989 film *Glory* and in 2007 with *The Lives of Others,* which featured an East German Stasi officer working to save a suspect he was spying on after being moved by the music of Beethoven. The director of the memorial at Hohenschönhausen prison, Hubertus Knabe, refused permission for filming at the original location because there was no record of a Stasi officer ever being inspired to aid a dissident, by Beethoven or anyone else. Nevertheless, audiences did not care enough to have their enjoyment of the film compromised, and the film went on to win an Oscar, as had *Glory* two decades before.

The Marxist approach focuses more on the problem of production of a work than its consumption or, as Terry Eagleton states, the task of Marxist literary criticism "is to show the text as it cannot know itself, to manifest those conditions of its making (inscribed in its very letter) about which it is necessarily silent" (43). A Marxist reader explores how the text reveals ideological oppression of a dominant economic class over the exploited worker(s).

While more explicitly political than new historicism, this rather limited concern highlights how neither critical approach offers much in the way of analytical breadth to understand the political impact artists have on their audience. To ask whether Jane Austen's *Emma* (1815) affirms or resists bourgeois values is to miss the potential epiphanic moment of recognition that a sympathetic reaction to the character Emma's own understanding can create in a reader. Neither approach illuminates the truism of *Emma*'s opening lines: that "the real evils of Emma's situation were the power of having rather too much her own way, and a disposition to think a little too well of herself" cannot be simply stated in order to be understood. The reader needs to walk a metaphorical mile in Emma's shoes before any real understanding can take place. Filmmakers have recreated the characters in *Emma* thirteen times since 1932, not counting 1995's *Clueless,* to successive generations of filmgoers. There were no complaints of transgressing new historicist criteria, but the filmmakers did manage to analyze contemporary problems such as social class barriers, materialism, solipsism, and race.

FROM POETRY TO NEW MEDIA

Percy Bysshe Shelley (1792–1822) declared the poet to be the "unacknowledged legislator of society" on the grounds that the poet had historically demarcated the parameters within which the cultural—and thereby the political—imagination was permitted to function. Although unelected, poets maintained their influence for as long as they articulated the public's mood in times of social, political, or economic unrest. By the nineteenth century, poets were enjoying the benefits of a dramatically increased level of literacy among the lower orders, encouraging them to investigate the romantic allure of individual liberty, universal suffrage, alienation within the urban landscape, and democratic rights.

By the twentieth century, growing interest in more visual—and thereby passive—media such as television and film meant that political poetry, such as it was, returned to the hands of highly educated elites with more rarified ambitions but dramatically reduced political influence. In the West, post-nineteenth-century poetry has largely lapsed into the solipsistic indulgence of autobiographical exegesis, which negates the broader political influence once enjoyed by Victor Hugo, Johann Wolfgang von Goethe, or Alexander Pope.

Canadian philosopher and educator Marshall McLuhan (1911–1980) insightfully noted that the content of a new medium is the preceding medium's output. Speech is the content of literature, literature is the content of film, and film is rapidly becoming the content of the Internet. An inevitable consequence of this rule is, as Marshall McLuhan noted in 1964, that those who strive for a deeper content always end up enmeshed in the tropes of an earlier medium (23). This is as true for political film as it is for all other genres.

Political films fall into three broad categories: they either undermine or satirize social stereotypes (e.g., *Bob Roberts,* 1992; *Wag the Dog,* 1997; *Erin Brokovich,* 2000); they allegorize social and political phenomena such as the fascism (e.g., *Lord of the Rings,* 2001–2003; *Star Wars,* 1977–2005); or they confront an audience with a social or political reality that they only feel safe examining from the discrete distance of a movie theatre seat (*Boyz 'n the Hood,* 1991; *Trainspotting,* 1996). Political literature is similarly demarcated: Social stereotypes are challenged in *Les Miserables* (1862) by Hugo and satirized in *The Eagle's Throne* (2002) by Carlos Fuentes. Political allegory is highlighted in George Orwell's *Animal Farm* (1945) or Salman Rushdie's *Midnight's Children* (1980), and confrontational social exposés are the basis for Charles Dickens's *Oliver Twist* (1837) and Gustave Flaubert's *Madame Bovary* (1857). Although journalists have supplanted the latter form with a concomitant lessening of their long-term effects, it is alive and well in the drama departments of the film and television studios.

LITERATURE, SATIRES, AND ALLEGORIES

Pedagogically speaking, it is much easier to teach students who are uncomfortable with how new concepts challenge their preconceived notions of how the world works; it is a technique called *pedagogical disequilibrium*. Skilled authors with a political message inevitably resort to this method when persuading a reader of the value of a previously maligned or misunderstood member of society. This disruption of social stereotypes is a prominent feature of Dickens's *Hard Times* (1854), a novel of class division in a factory town. The happily married, socially solid factory owner and the shiftless, politically radical worker were social stereotypes that Dickens's own factory experience had caused him to doubt. That he had to almost overemphasize the natural nobility of Stephen

Blackpool in the face of extreme systemic indifference to his happiness or personal goals speaks to the distance cultured nineteenth-century readers had to cover to appreciate the humanity of the workers who were responsible for their elevated wealth and international status. The three failed or failing marriages in the novel serve to critique the social conventions that kept even the elevated classes in loveless unions against their will. The savage attack on the charity schools, symbolized by the pedagogical prejudices of Thomas Gradgrind, caused questions to be asked in parliament and reforms to be undertaken across the country.

Hard Times was titled "Black and White" in some early drafts, and as Karen Odden has noted in her 2004 introduction to *Hard Times,* it is this very concern with Dickens's fellow Victorians's binary approach to social and political matters that make it an exemplary novel of the political imagination. Dickens is profoundly disturbed by the absence of human pity, sympathy (in the Smithean sense), and compassion that lie outside the purview of the capitalist enterprise—all that has made everybody materially wealthy yet spiritually bankrupt. The socially concerned novelist makes a quest to humanize the characters that other forms of media have turned into cartoon scapegoats, such as single mothers, criminals, immigrants, and the dispossessed.

Satire has retained its edge even as poetry has lost its relevance, and this longevity is worth investigating. Jonathan Swift's *Tale of a Tub* (1704), *Gulliver's Travels* (1726), and *A Modest Proposal* (1729) satirize religion, technological progress, and human society, along with the state and most of its citizens. However, a sneaking suspicion remains that the satirist is only capable of half of the job of "constructive criticism." Orwell describes Swift as "a Tory anarchist, despising authority while disbelieving in liberty, and preserving the aristocratic outlook while seeing clearly that the existing aristocracy is degenerate and contemptible," all of which might equally apply to Greek playwright Aristophanes and to English actor and comedian John Cleese. However, several noble exceptions have overcome the tendency to toothless criticism, including Maurice Joly's 1864 pamphlet *The Dialogue in Hell between Machiavelli and Montesquieu,* which uses a satirical dialogue between the Frenchman and the Florentine to effectively expose the political ambition of Napoleon III.

In its simplest form, allegory is a literary device that clothes abstract concepts with the exterior form of human beings, objects, or animals in order to allow that concept a temporal and spatial presence in a narrative. In this way, the virtue of chastity might take on the form of a pure and naive maiden, perspicuity might be represented as an eagle, and knowledge as a book. The value of such a literary move is that the author can create an extended metaphor, permitting the reader to extract a broad range of meanings that lie outside of the overtly literal details of the story itself. The political author can make social and political statements by having these anthropomorphicized figures interact with human characters in a narrative. The allegory remains a rich genre for political subversion for the simple reason that unpacking an allegory makes demands on the reader that inevitably lead to a greater degree of engagement with the potential results of such a labor. Political allegory is rarely about finding universally valid answers to politically contingent problems; instead, it illuminates aspects of broader, potentially critical, political probabilities and encourages an investigator to examine them from a multitude of different perspectives on at least three levels.

Political allegory was at its zenith in the Renaissance when readers expected a complex layered narrative structure. The most obvious narrative was at the *literal* level, which presented a variety of characters of differing personality or social status interacting with a given allegorical figure that had assumed some recognizable form. For example, in the opening of Niccolò Machiavelli's *L'Asino* or *The Ass* (1517), the hero wakes up in a dark and frightening wood and meets an allegory of politics in the shape of a servant of Circe.

The second, or *typological*, sometimes confusingly called *allegorical*, level develops new layers of meaning when associations caused by other literary works resonate with the reader and are then read "between the lines," as it were, of the literal narrative. An earlier Florentine poet, Dante, who wrote in exile after being falsely accused by his political party, opens his *Divina Commedia* (ca. 1308–1321) with the terrified author waking up in a dark wood. Later in canto 13, the reader sees Dante enter a second dark wood, this time made up of trees embodying the spirits of souls who had committed suicide. Dante speaks to one, a Pier della Vigne, who was a courtier before his suicide.

Each typological exercise might present different outcomes, through which the *tropological* or moral level of the text can be explored. Tropologically speaking, one interpretation is that both Machiavelli and Dante began their literary self-examination in a state of suicidal despair brought about by a political wrong. However, like Pier della Vigne and unlike Cato, whose presence on the shores of purgatory means that he will be saved despite his suicide, both Dante and Machiavelli have made the mistake of contemplating suicide on the basis of a temporal loss of money, honor, or political reputation. The political lesson derived from the combination of the previous two levels is that one should never allow the temporal and pecuniary side of politics to cause one to lose one's focus with respect to the grander and timeless aspects of life.

The fact that commentary on Dante's master allegory has not failed to produce a major contribution to the critical corpus in every decade since it was first published in 1308 suggests the almost infinite number of literal, typological, or tropological reads that are possible when intelligent readers engage with an allegorical text. Through an ongoing process of contemplation, it allows new and uncertain outcomes to be continuously evaluated and best-case scenarios worked out in advance of an actual crisis. This constant working out of possibilities, testing of defensible hypotheses, bringing to bear of one's past experiences, failing when the stakes are low, and preparing for success through endless speculation is the correct pedagogical approach for both the prospective ruler and the allegorical reader.

FILMS, DOCUMENTARIES, AND POLITICAL THRILLERS

Following from McLuhan's dicta, in one sense cinema simply updates the narrative possibilities of literature, despite the claims of film critics such as Pauline Kael and Jonathan Rosenbaum that movies stand alone as purveyors of identity and desire. Notwithstanding that there are important differences in the reception of film to literature, especially for a generation for whom a book is an increasingly curious artifact, there is little fundamental difference between the range of narratives expressed in films and those employed by literature. However, there needs to be a strong imperative to separate the *figure* from the *ground* if that new media content is to be properly recognized. It is telling, for example, that film allegories have rarely been accepted or even noticed as such by the general public. Readers of Dante's *Commedia* did not need a mediator to tell them that they were entering a world of allegorical significance, yet it took Mike Rogin to point out to America the disturbing allegorical subtext at the heart of *Independence Day* (1996) or *King Kong* (1933). Film is much better than literature at directly featuring politicians, lawyers, or members of the general public engaged in political action (*Bulworth,* 1998; *A Civil Action,* 1998; *The Insider,* 1999). Most of these works were originally written for the screen or adapted from autobiographies rather than from novels, so to amend Kael and Rosenbaum's assertion, film presents some aspects of the content of literature in a much more compelling manner than literature could ever do alone. Two of those more compelling genres are documentaries and the political thriller.

Documentaries really became politically relevant in the 1960s and 1970s with the work of Frederick Wiseman. He was the first filmmaker to document the power relationships between people and institutional authority. Eschewing music, commentary, or sound effects, he offered grainy monochromatic glimpses behind the walls of a *High School* (1968), *Hospital* (1970), and *Juvenile Court* (1973). Despite the real-time social situations, he understood the rhetorical effect of framing nonactors engaged in their everyday lives, naming his works "reality fictions" rather than documentaries. However, his *cinéma vérité* style was impossible to ignore, and his films were cited as motivations for change in several of the institutions he documented. He is the cultural ancestor of contemporary political documentarians, such as Michael Moore or Morgan Spurlock, in that he was the first to demonstrate the political impact of real people confronting the systemic horrors of postindustrial institutional ideologies.

The political thriller came into its own with the jittery sensibility that defined the politics of the 1970s. After Watergate, citizens believed that the technologies of the cold war, including listening devices, the computer, and the telephoto lens, were being turned inward on the population they were supposed to protect. Even nonradical cinema goers noticed the increasingly intrusive bureaucracy that controlled their lives. Costa Gravas probably instigated the 1970s political thriller with the widespread commercial success of *Z* (1969),

which criticized the Greek military's cover-up of the murder of a prominent leftist. Francis Ford Coppola's *The Conversation* (1974) tapped into a public sensibility that anyone could be under surveillance at any time without their knowledge. *Three Days of the Condor* (1975) confirmed the belief that agents of the state could eliminate anyone with impunity if they posed even a tangential threat to state security. Films such as these created the cinematic language seen in *Enemy of the State* (1998), *Syriana* (2005), and the *Bourne* trilogy (2002–2007).

Polling, History of

The genesis of opinion research traces to 1824, when *The Harrisburg Pennsylvanian* conducted its presidential *straw poll*, showing Andrew Jackson leading John Quincy Adams. As a "man-on-the-street" poll, such opinion measurement did not employ the scientific rigors used in modern survey research. However, it laid the cornerstone of modern practice for forecasting election outcomes. Through the next one hundred years, this type of straw polling increased in popularity; yet it remained local, usually a citywide exercise.

Before the straw poll, a more rigorous method of social measurement had been in use for more than a generation. Beginning in 1790, the U.S. Bureau of the Census operated on principles that would become standard practices in social research firms not until the 1940s. As early as the 1820 census, the secretary of state's report indicates that census takers used standardized forms detailing "the interrogatories to be put forth at each dwelling house." This report indicates that census takers followed a method of deciding whom to interview, and how to pose questions. Simple as they seem, these are standard features required of today's large-scale survey research efforts. As is the case today, the census takers in the 1820s made multiple visits to a dwelling in order to speak with a specified respondent, as would field interviewers would do today. Like the three prior censuses, the 1820 census acquired information on all household inhabitants by age, gender, and slave or free status. Unlike the prior census, it collected information on

occupations and thus was the first in the United States to go beyond simply enumerating the population, and began economic and demographic measurement.

The early census data collection efforts were conducted face-to-face. As such, these surveys were succinct. Concerned with literacy levels, it would not have been feasible to conduct the census by mail as much of the census is done today. The labor-intensive face-to-face methods of the census would have been cost prohibitive for most newspapers or magazines. Consequently, newspapers of the day used local *intercept* samples or so-called man-on-the-street interviews for timely feedback on topics of the day.

THE PHILOSOPHERS

The history of monitoring *public opinion* begins in antiquity. Aristotle (384–322 BCE) saw a place for public input and expressed the view that a collective wisdom would cancel individual ignorance: "All when they meet together, are either better than the experts or at any rate no worse." Later Italian political operative Niccolò Machiavelli (1469–1527) shifted the discussion from the place of opinion in a good society to the manipulation of it. In *The Prince,* Machiavelli advised his audience to manage, manipulate and control public through threats and rewards. John Locke (1632–1704) suggested that consensus is essential to forming a government. Out of self-interest, people form a social contract requiring each to surrender some unfettered liberty in exchange for security. Similarly Jean-Jacques Rousseau (1712–1778) echoed Aristotle, saying that the "organic will" of the people was greater than the sum of its individual parts.

THE EARLY 1900s: BEYOND THE STRAW POLLS

Scientific research began in the 1900s, with Harvard president Abbott Lawrence Lowell publishing *Public Opinion and Popular Government* (1913) and *Public Opinion in War and Peace* (1923). Lowell sought to define the concept of public opinion, and chart its formation by beginning with an understanding of how individual preferences form. He observed "violent temporary emotions" in Britain after the World War (1914–1918). At about this time American news journalist Walter Lippman noted the power of symbolism in opinion formation. He instructed to recognize "the triangular relationship" between an event, the individual's interpretation of an event, and the observer's reaction to that event. Similarly Harold Lasswell observed the importance of symbolism and ideas that helped keep a few in control of the many. Leaders intervened in the interpretation to shape behavior.

A major methodological breakthrough for nonfederally funded social research came in 1916, when the *Literary Digest* conducted the first national survey (other than the U.S. Census). With this endeavor, the *Literary Digest* mailed postcards to its wide readership and counted the returns. Using this readership sample, the *Literary Digest* called the following four presidential elections. In 1936, the *Literary Digest* went wrong. Despite its sample of two million subscribers, it was a generally affluent readership and tended to lean Republican. The *Literary Digest* did nothing to account for this and misreported that Alf Landon was leading Franklin D. Roosevelt by a wide margin.

GEORGE GALLUP AND THE GROWTH OF A SCIENCE

At about the same time, George Gallup conducted a far smaller, but more scientifically valid, survey. By polling a demographically representative sample, Gallup accurately predicted Roosevelt's 1936 victory. Later Gallup demonstrated that even rigorous methods must acknowledge a *margin of error*, as his organization predicted Thomas Dewey would win the 1948 presidential election. Only with the rise of sampling methods like Gallup's could privately owned and operated survey research organizations afford to perform valid social research. Moreover, the introduction of methodological and statistical rigors allowed for the systematic examination of public opinion. Gallup's use of a probability sample reduced the costs of conducting nationwide research between censuses.

After the 1936 election, Gallup launched a subsidiary in the United Kingdom. Using statistical methods, Gallup correctly predicted Labour's 1945 victory, to the dismay of nearly every other pundit, who expected incumbent prime minister Winston Churchill's Tories to win. In the late 1940s, Gallup and his colleagues Angus Campbell, Paul Lazarsfeld, Elmo Roper, and others brought widespread professionalism to survey research and organized the American Association for Public Opinion Research. The significance of this move was to create a body that advocated rigorous methods, and shared and published sound research and experimental findings on questionnaire features and sampling methods, and promulgated *best practices* in the conduct and reporting of survey research. They subsequently established a peer-reviewed journal, *Public Opinion Quarterly.*

As data collection methods matured, so did statistical sampling techniques. One of the more enduring probability selection methods was introduced in 1965, when statistician Leslie Kish published *Survey Sampling.* Kish described a method of rostering household members and then selecting one for inclusion. This reduced bias in the sampling process. Another innovator of this era was Gertrude Cox, who, with W. G. Cochran moved the world of experimental design in the 1950s by emphasizing the importance of methodological rigors and the centrality of randomization. Later in life she stressed the importance of ethics in social science.

TECHNOLOGICAL ADVANCES

Advances in communication combined with population concentration in North America meant that survey research became less expensive and more common. With this, sociologists, psychologists, economists, political scientists, and market research firms all saw opportunities to conduct sample survey research.

For many years, opinion polls were conducted face-to-face, in homes. They still are for major public health and economic surveys, and even political surveys such as the National

Election Studies in Britain, Canada, and the United States. Using paper and pencil less frequently, such surveys today are recorded using laptop computers and more recently, handheld devices. Computer assisted interviewing (CAI) programming ensures that appropriate follow-up questions are posed and can catch inconsistent entries. CAI records time to complete surveys and individual question times, thereby helping to detect interviewer fraud. Phone banks, where computer assisted telephone interviewing (CATI) is used, employ this same type of technology.

Today's computerized personal interviewing allows for multiple modes of data collection by posing sensitive questions using audio devices running on a laptop computer. In-person interviewing remains widely used, but in some countries telephone data collection has overtaken it, because telephone data collection can be conducted faster and more affordably. Telephone interviewing has been used since the 1960s, but two features emerged in the 1970s and 1980s that increased its utility. The first was random-digit dialing (RDD) the other is CATI technology. The RDD sampling method selects phone numbers randomly using known area codes and exchanges. This helps minimize bias of using phone directories. With this growth of cellular phone use comes concerns over sampling cell phones in household surveys. Because of the common practice of telemarketers selling products under the guise of a telephone survey and the proliferation of residential call screening devices, do-not-call lists, and use of cell phones, response rates for some phone surveys have plummeted. With these innovations, the adequacy of telephone survey research is being closely scrutinized.

Warren Mitofsky is credited with creating the first RDD methodology while serving the U.S. Bureau of the Census. After leaving this position for a career in political polling for news media, he developed another modern practice: the *exit poll*. In the late 1960s, he initiated the use of brief, in-person interviews with voters as they left voting places. This allowed broadcasters to anticipate outcomes before the votes could be counted. This practice was criticized as polluting the election process and discouraging voting especially in western time zones. By the 1990s, Mitofsky, with cooperation of major news outlets, performed these through his Voter News Service, VNS, avoiding the problem and cost of having competing services deluging voters at polling places. News agencies then, by consensus, agreed not to forecast election day outcomes until polls close.

Another quickly growing computerized data collection method is Web-enabled interviewing. Programs with standardized forms can be purchased that permit anyone with a Web page to create a Web-enabled survey. This new technology raises sampling issues since older and some less affluent people do not own home computers. Use of e-mail lists is also treated with trepidation, as these also attach to an individual rather than household. Concerns center as well on the ease with which addresses become obsolete as people change providers or e-mail is screened. Technological advances have also led to emergence of polling services such as Survey Monkey and Zoomerang. These "off the shelf" systems provide stock questionnaires and an online response system available to paying customers.

More sophisticated online panels have been another innovation in the survey marketplace. Knowledge Networks (KN) and Harris Interactive (HI) are two examples of "sampling" through panels since the late 1990s. A panel, or group of survey respondents representing people with various demographic or other features, participates in surveys at multiple points in time. KN and HI sell access to these panels, maintain contact information on them, and carry out "maintenance" to evaluate the representative qualities of the panels and keep panelists participating and provide analytical support. The reliability of panel research is an area of ongoing study.

Technological advances permit easier, more secure, and faster data collection. At the same time, researchers do take caution in measuring the effects of technology on coverage, response rates, and bias due to modality.

Polsby, Nelson

Nelson Polsby (1934–2007) was an American political scientist who studied the presidency and Congress. Born in Norwich, Connecticut, Polsby earned a bachelor's degree from Johns Hopkins University in 1956, a master's degree in sociology from Brown University in 1957, and a doctoral degree in political science from Yale University in 1961. His dissertation was published as *Community Power and Social Theory* (1963). He argued a single ruling group did not dominate cities, but that there were different dominant groups in different areas and that this pluralism was compatible with democracy.

Polsby taught at the University of Wisconsin-Madison from 1960 to 1961 and Wesleyan University from 1961 to 1967. He joined the faculty at the University of California, Berkeley in 1967 and served as the director of the Institute of Governmental Studies at the University from 1988 to 1999.

Polsby was the managing editor of the American Political Science Association's *American Political Science Review,* the

discipline's most important journal, from 1971 to 1977. In 2002, he received the association's distinguished service award.

Polsby wrote or edited fifteen books on American politics and a number of articles. He first gained attention by asserting that much of Senator Joseph McCarthy's success was due to support he received from the Republican Party. Polsby later analyzed, in *Consequences of Party Reform* (1983), how changes in the electoral rules of the Democratic Party after 1968 changed presidential politics. The changes, while giving increased representation to African Americans and women at the Democratic Convention and giving single-issue groups greater influence in the party, made it difficult for the Democrats to nominate a candidate with broad-based support that would allow them to win elections. He also explained how the House of Representatives had become a more complex institution and how policy entrepreneurs impacted major initiatives in American political life after World War II (1939–1945). His 1968 article, "Institutionalization of the U.S. House of Representatives," was listed in 2006 as one of the twenty most influential articles to be published in the *American Political Science Review* during its first one hundred years.

In 1964, Polsby and fellow political scientist Aaron Wildavsky published *Presidential Elections.* This book became the leading textbook on the topic and was published every four years, with Polsby serving as the sole author after Wildavsky's death in 1993. The twelfth edition was published posthumously in July 2007, a few months after Polsby's death.

Polsby's scholarship was not limited to American politics. In 1981 he and Geoffrey Smith, a writer with the *Times* of London, coauthored *British Government and its Discontents.* Polsby had spent time as a visiting professor at the London School of Economics and as the Olin Professor of American Government at Oxford.

Polyarchy

Polyarchy, or rule by many, is a representative democracy in which all social classes and demographic groups regardless of race, ethnicity, religion, or gender have roughly equal political access and power within the government. The concept was developed within political science by Robert A. Dahl in a series of publications that began with his 1956 work, *A Preface*

to Democracy and was later refined in his 1971 book, *Polyarchy: Participation and Opposition.* Dahl argued the United States was the first nation to develop as a polyarchy. Polyarchies vest policy control and decision-making procedures in elected bodies or through explicit public referenda. People in turn accept the authority and legitimacy of elections and elected bodies.

Conditions necessary for a polyarchy include regular, free and open elections, universal or near-universal suffrage for adults, freedom of expression, and freedom of the press. Polyarchies are also marked by the healthy competition of ideas between groups and interests. Critics of the concept, including Dahl in some of his later works, point out even if a country meets the main criteria of a functioning polyarchy, the system may still disenfranchise segments of its population. For instance, disadvantaged groups, such as those with lower incomes or the impoverished, may not have the same political access as other groups within the society. Also, groups excluded from citizenship or the full rights of citizenship are unlikely to possess the same political rights as the rest of the population.

Polybius

Polybius (ca. 200 BCE–120 BCE) was a Greek historian who was born in Megalopolis. When Rome conquered Greece and Macedon in the Battle of Pydna in 168 BCE, Polybius was one of one thousand Achaean hostages taken to Rome, where he was detained for seventeen years. He managed to become friends with members of noble Roman families, including General Aemilius Paulus, the victor of Pydna, and his son, P. Cornelius Scipio Aemilianus. The latter, whom Polybius tutored, and with whom he became lifelong friends, was later the conqueror and destroyer of Carthage, and the most important political figure of his time. Polybius was by Scipio's side as Carthage burned and Scipio wept for fear that the same fate might one day befall Rome.

Polybius's main work, the *Histories* (1922–1927), examines Rome's rise and conquest of "nearly the whole inhabited world." Most of the work's original forty books are lost. Among the surviving portions, however, is much of Book 6, in which Polybius describes the success of Rome as stemming mainly from the form of its constitution, which he viewed as "mixed."

Polybius begins from the traditional classification of constitutions—good and bad forms of rule by the one, the few, and the many. He asserts that constitutions move in a cycle, each form changing into the next, continuously. He begins with kingship. Although the king rules well, his sons grow up in luxury, which causes them to become selfish and to rule in their own interest rather than that of the city when they succeed to power. Thus kingship gives way to tyranny, the oppressiveness of which leads the best citizens to band together to overthrow the tyrant and establish an aristocracy. A similar process leads to the corruption of the next generation, and thus to a general

revolt by the people. The people install a democracy, which in turn becomes corrupted and so requires overthrow and the establishment once again of a kingship. According to Polybius, each of the three simple forms of constitution has an inherent defect, as iron is susceptible to rust.

It is possible, however, to arrest the cycle by combining the different simple forms in a mixed constitution. Polybius attributes the success of the ancient Greek city-state of Sparta to a constitution along these lines, which combined monarchical, aristocratic, and democratic elements. Its constitution contained a double kingship, a council of elders, and a popular assembly. The same principle was responsible for the success of Rome, in which consuls, the Senate, and the popular assembly represented the three elements. Because of this complicated mixture, a person looking at the Roman constitution would not be able to tell if it were a monarchy, an aristocracy, or democracy.

Central to Polybius's analysis is the way different institutions work to counteract possible abuses by others. Although he does not use the terms, his theory presents an important early version of checks and balances. However, his theory is subject to obvious criticisms. In addition to the clear historical fancifulness of his cycle, his analysis of constitutions is purely formal, focusing exclusively on the number of rulers in each form of state and failing to take into account wider social and political factors that affect political stability and instability. In spite of its problems, his theory held great attractions for subsequent theorists, including Marcus Tullius Cicero and, more surprisingly, Niccolò Machiavelli. In addition, the idea of combining institutions that represent rule by the one, the few, and the many is present in the U. S. Constitution, which thus also exhibits Polybius's influence.

Pool, Ithiel de Sola

Ithiel de Sola Pool (1917–1984) was an American political scientist. He earned his doctorate in political science in 1952 from the University of Chicago, where mentors such as Harold Lasswell helped influence a fertile intellectual environment. His initial collaborations with Lasswell on propaganda, the role of the press, and the influence of communications led to a distinguished and pathbreaking career in research methods, the interaction of technology and politics, and social change.

As a founder and chair of the political science department at the Massachusetts Institute of Technology (MIT), Pool's leadership and talent made the program one of the best in the United States and in the world. He had a formidable research output of twenty-four books and several hundred articles, and maintained a rich consulting advisory role for governments around the world. In terms of general contributions to the study of politics and social processes, Pool pioneered the use of content analysis to study written communications and symbolic messages, the role of elites in social communication and influence, and the use of modern information technologies to enhance social science research. In this latter area, Pool developed simulation models of complex social processes, such as effects of issues and candidate strategies in electoral outcomes.

Through these studies, Pool was able to discern how symbols are used in totalitarian and open systems of government as tools of coercion and persuasion; understand the recruitment and selection of elites to better understand who attempts to gain power, who attains it, and what attributes such persons have; and observe how people and information circulate and interact in a social networking context. There is evidence that Pool was one of the first social researchers to understand the dynamics of social networks, even estimating the smallest number of linkages to connect two random persons in what has become known as the *small world* or *six degrees of separation* phenomenon.

Pool's research into the interaction of human communication and technology is another major contribution he made to political science. Pool was highly sensitive to the political implications of fast-developing digital information and communications technologies, and their implications for democratic governance and the survival of freedom. His last work, *Technologies of Freedom,* published in 1983, advanced the argument that freedom of speech as traditionally understood could only be guaranteed in modern society if the underlying information and communication technologies were also themselves free. In this sense, Pool saw connections between political power and technological controls that had not previously been articulated so vividly. This book remains relevant and thought provoking in the early twenty-first century, touted by advocates of Internet freedom and opponents of censorship.

Pool's insights into human communication have also had important implications for political theory in the areas of the nature of political participation, the role of trends affecting the degree of human liberty, the intersection of civic and scientific questions, and political reform and revolutionary movements. Pool's papers and other research data he collected over his career are available primarily through the MIT archives in Cambridge, Massachusetts.

Popper, Karl Raimund

Karl Raimund Popper (1902–1994) is widely regarded as one of the twentieth century's most influential philosophers of science. Born into an intellectual Viennese family of Jewish descent, he earned a PhD in philosophy at the University of Vienna in 1928. After leaving Europe to evade Nazism, Popper taught at the University of Canterbury in New Zealand and subsequently at the London School of Economics, remaining an active public intellectual even after his retirement in 1969.

Popper advanced his view of science in *Die Logik der Forschung* (1934, *The Logic of Scientific Discovery,* first translated in 1959). He developed the notion of *falsifiability* as his demarcation criterion between science and nonscience, inspired by German physicist Albert Einstein's revolutionary—and risky, because improbable *and* falsifiable—theory of relativity. According to this criterion, a theory incompatible with possible empirical observations (i.e., data derived through observation or experiment) is scientific, while theories compatible with all such observations are unscientific, if not necessarily meaningless nor irredeemable. Because all empirical observations are selective, conditional, and fallible, science cannot be distinguished from nonscience on the basis of methodology; but to use falsifiability for this purpose instead, a distinction must be made between its *logic* and its application. Concretely, while testing a scientific theory means attempting to refute or falsify it, in practice, no single counterexample nor even accumulating counterevidence may be enough to reject it, especially in the absence of alternatives. Thus, although it is logically impossible to conclusively prove or verify a theory, one can amass a convincing amount of corroboration for it. But at the same time, a theory can always be superseded by a better theory that explains more. Unlike traditional empiricists, Popper holds that experience cannot shape theories, but it helps to eliminate false theories and choose, among the remainder, the best available in terms of explanatory and predictive power. All human knowledge, therefore, is hypothetical and provisional.

The normative implications of Popper's critical rationalism—the importance of academic freedom and openness to new ideas as well as the dangers of dogmatism—tie in with his argument for an *open society*. His works *The Poverty of Historicism* (1944) and *The Open Society and Its Enemies* (1945) form a powerful defense of democratic liberalism against the principal

philosophical presuppositions underpinning totalitarianism: holism, which posits that social groups shape their members and are subject to specific laws of development, and historicism, which, on this basis, interprets history as teleologically developing to a predetermined end. Popper counters these ideas, and the resulting attempts at large-scale social engineering (e.g., under such totalitarian regimes as in China, Cambodia, and the Soviet Union), with the indeterminist view that social groups are no more or less than the sum of their members, and that history is the predominantly unplanned and unforeseeable result of individual interactions, based on the fact that an infinite number of therefore unknowable factors predates any event. His is thus not a moral, but a deeper, logical argument for liberalism.

In the ideal open society, the state progressively develops policies for actual social problems, aiming to minimize suffering—negative utilitarianism—while the creation of social and personal happiness is left to individuals who may or may not act collectively toward this end. Popper's theory of science and his political philosophy are linked by the key idea of fallibility: just as scientific progress depends upon constant theoretical scrutiny, social progress is made possible through constant political scrutiny, both requiring an open setting that allows modification or rejection of falsified theories and faulty policies, as well as bold new ideas.

Pork Barrel

Pork barrel is a commonly used metaphor in the United States to refer to the spending of public money for a specific group's benefit in return for political support. More specifically, pork barrel is a derogatory term used to describe spending attached to federal appropriations' bills that are designated for a very specific purpose or program that benefits a small, select group while distributing the costs across all taxpayers. It is thought that the legislators able to attach "pork" to appropriations bills will be aided in securing reelection because they are "bringing home the bacon" to their individual district. The securing of pork by legislators is often accomplished by logrolling—that is, the exchange of favors among policy makers.

The metaphor is believed to have originated in the southern United States, where the remnants of pigs were put into

a barrel. These pork barrels were given to slaves, and the rush of slaves to eat from the pork barrel is likened to the rush of legislators attempting to secure money for their local district. The Bonus Bill of 1817 is one of the earliest examples of pork barrel politics. The Bonus Bill was introduced by John C. Calhoun and was directed at constructing highways to connect the east and south with the western frontier.

Position Taking

Position taking refers to a type of electorally motivated behavior in which legislators publically express a stance on an issue of concern to constituents to increase their chances of reelection. This behavior is often regarded as an inexpensive—in terms of time and effort—means of policy intervention in favor of constituent interests, in that it may simply involve issuing a public statement or participating in a roll call vote rather than producing a solution.

Position taking may be risky on controversial issues, despite the actual ease of the process. Fear of defeat may spur legislators to adopt innovative issue stances to broaden electoral support in the constituency. However, the effectiveness of such entrepreneurial position taking depends on factors such as the heterogeneity of the constituent population and risk of offending existing supporters.

Due to the potential risk of alienating voters, candidates representing districts with diverse and conflicting interests may avoid position taking on polarizing issues to avert potential electoral hazards, such as creating unnecessary opposition. In addition, politicians facing decisive situations may seek to mitigate risk by offering a nuanced explanation of their opinions on the issue, though this option may be less effective in the face of a roll call vote.

Positive Discrimination

Positive discrimination refers to the broad range of deliberate, time-bound (voluntarist) policies intended to facilitate the integration of historically deprived social groups that were hitherto discriminated or disadvantaged either by government policy or social prejudice. The principle of positive discrimination aims to reduce de facto inequality and gives preferential treatment to people belonging to groups whose past and actual discrimination in a given society is tied to ascriptive characteristics such as gender, race, ethnicity, region, language, caste, or religion. It is thus a form of discrimination that actually benefits the actee or recipient of discrimination

and aims to achieve equality of outcome or results, as well to enhance the diversity of a society and redress the material conditions of the deprived group. The end goal is to bring them in line with the average standards already being enjoyed by society as a whole.

Positive discrimination is enacted primarily in areas of employment, education, and business, in order to increase the representation of historically excluded groups in the workforce. This is accomplished through specially designed admission or recruitment policies (i.e., the selection of a candidate for a position on the grounds of race, caste, or gender rather than merit alone). However, positive discrimination strategies can also cover other areas characterized by the underrepresentation of certain social or political groups. For example, in the area of political representation, some countries have introduced positive discrimination policies setting mandatory group quotas for the selection of candidates from, or the reservation of constituencies for, such underrepresented groups (e.g., women, ethnic minorities).

Positive discrimination is an elusive concept with no clear definition. Policies based on the principle of positive discrimination are known by a variety of terms such as *affirmative action* in the United States, *reservation* in India, (black) *economic empowerment* in South Africa, *temporary special measures* in international law, *indirect discrimination* in European law, and *positive action* in the United Kingdom. The latter, however, is based on the distinction between positive action, aimed at ensuring equal opportunity through, for example, targeted recruitment campaigns, and positive discrimination as preferential treatment at the point of selection.

Forms of implementation include targeting funding and financial assistance for underrepresented groups, building awareness and capacity, removing practical barriers that disadvantage certain groups, creating legally established (mandatory) quotas for political representation, intraparty selection, public sector as well as corporate recruitment, and admission to institutions of higher education.

The term as such, contradictory in itself, remains controversial because the notion of discrimination, independent of the objective of redressing inequality, implies that the measures it describes run against equality and, consequently, against the principle of formal justice. Positive discrimination could therefore eventually mean *reverse discrimination*. The principle of positive discrimination is no less controversial. On the one hand, it is argued that all discrimination is negative and that, especially with regard to recruitment, positive discrimination violates the principle of meritocracy leading to less able applicants filling positions, and thus causing resentment among those who were rejected, hardening existing discriminatory attitudes. Instead, the focus should be on improving access to education for all. On the other hand, positive discrimination levels the playing field for disadvantaged groups, empowering them to surpass the obstacles put on them by a long history of exploitation, exclusion, and deprivation. It helps bring to the fore the untapped potential of so far underrepresented groups, thus furthering the extent of diversity, representativeness, and

fairness in a given society. Beneficiaries of positive discrimination could act as role models for future generations and, in the ideal scenario, contribute to alleviating existing racist, sexist, or casteist attitudes to the extent that the temporary measure of positive discrimination would no longer be necessary.

Ultimately, the question of whether positive discrimination is a useful instrument to work toward a more just society must be addressed from a standpoint of morality. It is a question of compassion, and the preservation of a collective morality of humanity based on a historically derived moral obligation to compensate for the effects of past discrimination and exploitation, effects, and wrongs that otherwise risk occurring undiscussed and unaddressed.

Apart from philosophical investigations into the ethical underpinnings of positive discrimination, current empirical research on the matter concentrates mainly on whether measures of positive discrimination undertaken worldwide have had any impact at all and on what the best institutional devices are to make positive discrimination a useful and successful instrument. Results are ambiguous and do not always point in a positive direction. However, changing deeply ingrained discriminatory attitudes and redressing inequality is a difficult and long-term task, which is not only a matter of policy and institutional innovation.

Positive Theory

Positive political theory is the study of politics based on the assumption that goal-oriented individuals behave rationally. A rational individual ranks the alternative actions available, taking into account personal preferences and beliefs about the possible outcomes associated with those actions. The rational individual then chooses the action that ranks highest. Positive theory is a political theory because it is explicit about its fundamental assumptions concerning political behavior and because it formally derives the implications of those assumptions using the theorem-proof method used in mathematics. It is positive because it attempts to explain and predict what happens when individuals find themselves in political settings, rather than assess these outcomes in terms of what is good or right.

ORIGINS OF POSITIVE POLITICAL THEORY

If William H. Riker is the father of positive political theory, then Anthony Downs may be considered its godfather. Downs's *An Economic Theory of Democracy* (1957) made the rational choice assumption the foundation of a theory of democratic elections. Although his book contained virtually no economics, presumably he labeled his approach an economic theory because, by that time, the rationality assumption had become so completely identified with that discipline. Riker was responsible for wresting that assumption away. His use of the qualifier *positive*, in turn, reflected the extent to which political theory had become so closely identified with normative evaluation. In particular, Riker's *Theory of Political Coalitions* (1962) exploited results from game theory, which had been developed by John von Neumann and Oskar Morgenstern, to predict the characteristics of coalitions that would form in legislatures and in international settings. For example, he demonstrated the conditions under which legislative coalitions would contain just enough members to pass the legislation their members desired.

In *The Calculus of Consent* (1962), James M. Buchanan and Gordon Tullock revisited a central question of modern political philosophy by investigating why rational individuals would create coercive political institutions like legislatures in the first place. They reinvigorated a very old analytic device, the thought experiment imagining individuals in a so-called state of nature, and recharged it with a more explicit and careful use of the rationality assumption. In studying the design of institutions, Buchanan and Tullock showed that democratic political goals were not as clear-cut as many had thought. Thus, they argued that the principle of majority rule did not deserve its special status in political theory. Rather, it was only one of many voting rules individuals would fashion to achieve their complex and competing goals.

Individuals may want political institutions, but in *The Logic of Collective Action* (1965), Mancur Olson recognized the difficulty of mobilizing the collective energies of individuals even when they share a common goal. Thus, positive theory brought into question the sociologist's typical assumption that common goals automatically produce united action. This so-called collective action problem continues to be an area of extensive research.

By the 1970s, under Riker's original intellectual and then institutional leadership at the University of Rochester, positive theory became the foundation of a broad and increasingly influential research program. One important strand of this program focused on the spatial theory of voting associated with Downs. Positive political theorists investigated modifications and the limitations of Downs's median voter theorem, the prediction that in two-candidate single-issue elections, candidates will converge to the median voters' ideal position so long as all voters participate, their utility declines monotonically away from their unique ideal position, and candidates are only concerned with winning. Modifications included the reconsideration of candidate motivations, possible abstention by voters, and, perhaps most important, election campaigns involving platforms that cannot be described in terms of a single dimension. In the latter case, initial theoretical results suggested the likelihood that there will be no equilibrium, which threatened to empty spatial theory of some of its empirical content. More recent work has discovered empirically plausible ways to restrict the range of likely outcomes.

Another important strand of research examined the legislative process within governments. In this context, voters directly consider policies rather than the candidates representing them, so the typical problem that votes do not automatically translate into policies does not directly arise. However, the potential instabilities involved in voting remain. Addressing this concern, researchers have found that institutional structure plays a significant mediating role between legislators' preferences and policy outcomes. When legislative committees are given different jurisdictions over policies, for example, more stable or different policy outcomes can emerge than would prevail in an institution-free setting. Similarly, the sequence in which policies are decided can have an important impact on what is decided. Even potential instability in voting outcomes can have specific empirical consequences insofar as it opens the door to agenda setting by legislative leaders.

PRACTICAL USES

Increasingly, the positive theory of elections and legislation has been integrated into comparative politics, turning to multicandidate elections, proportional representation schemes, and coalition building in parliamentary democracies. Positive theory's attention has also expanded beyond democracies. Dictatorships and oligarchies have proved to be a fertile area of research, including the determination of why some societies become democratic and others do not, and why some are stable and others are not. Positive theory has also played a major role in international relations, the study of interactions among governments. Positive theorists have shown how different environments can lead the same rational leaders to war or peace.

In its relatively brief history, positive theory has had an extraordinary impact on political science. It also has generated, and continues to generate, substantial intellectual opposition. Questions have been raised about the use of mathematical methods to study human behavior, the restrictive nature of its deductive techniques, and its empirical adequacy. In truth, positive theory has not definitively resolved even the basic problem of explaining turnout in mass elections. Perhaps most contentious of all is the theory's underlying idea that individuals behave rationally. As these debates unfold, it is important to recognize that the rationality assumption is deeply embedded in the way scholars think about individuals. Absent this fundamental assumption, political science would somehow have to discover a way to ascribe to an individual specific preferences and beliefs that were not rationally connected to the very behavior providing the evidence for those inferences.

Post–9/11 Politics

The 9/11 attacks dramatically altered domestic politics in the United States and other states. The strikes led to alterations in national security policy in a number of countries as issues such as immigration, nacro-trafficking, and cyber crime were included in broad definitions of homeland security. Meanwhile, the codification of a homeland security doctrine increasingly caused new restrictions on civil liberties. As time progressed, however, concerns about personal and societal rights led to the repeal of some post-9/11 security measures and greater attention on government security programs in the United States and other states.

In the aftermath of the 9/11 attacks, the administration of George W. Bush initiated the global war on terror which included Operation Enduring Freedom (the invasion of Afghanistan), direct military operations against various terrorists and training facilities, and increased security and economic support for key allies such as Pakistan, the Philippines, and the Central Asian Republics. These measures enjoyed broad public and congressional support. The administration concurrently launched a series of domestic security reforms.

Central to these new initiatives was the 2001 USA PATRIOT Act, which expanded the surveillance and detention powers of national security bodies, including the Department of Justice and the National Security Agency. Components of the PATRIOT Act were criticized and in some cases, challenged in court, because of concerns over civil liberties. The administration also adopted a policy to detain suspected terrorists who were not U.S. citizens. These persons were designated unlawful enemy combatants, and the majority placed in captivity at the military facility at Guantanamo Bay, Cuba. These detainments were criticized by even some of the closest allies of the United States.

The second major domestic initiative of the Bush administration was the creation of the Office, and later Department, of Homeland Security. The new body was the greatest reorganization of the federal bureaucracy since World War II (1939–1945), and it brought together twenty-two agencies and 180,000 federal employees. The department was created to bridge the gaps in domestic intelligence sharing and counterterrorism efforts that existed before 9/11 and coordinate domestic security programs. The 2002 act authorizing the new department passed with overwhelming public and congressional support (it passed 295 to 132 in the House and 90 to 9 in the Senate).

The 9/11 attacks made security the major concern for U.S. voters. In 2002, the Republicans were able to counter historic trends in which the party in power in the White House generally lost seats in midterm elections and instead regain the majority in the Senate and add seats in the House of Representatives through a security-focused campaign. National security was also the major issue in the 2004 presidential elections in which Bush was reelected and the Republicans again gained seats in both houses of Congress. However, the administration's management of the Iraq War (2003–) became increasingly unpopular so that by the 2006 midterm elections, Iraq, the federal response to Hurricane Katrina in 2005, and a series of congressional scandals resulted in the Democratic takeover of Congress. The election marked the end of the short-term electoral cycle in which domestic security was the main national political issue. However, incidents such as an attempted attack on board a U.S.-bound airliner in December 2009 renewed concerns about homeland security. This and other episodes reinforced the continuing importance of homeland security as a domestic concern.

Throughout the world, the 9/11 attacks prompted new domestic security measures and increased counterterrorism efforts. A range of countries and international organizations offered security assistance to the United States in the aftermath of the attacks. For instance, sixty-eight countries increased intelligence and law enforcement cooperation with the United States and twenty-seven provided direct military assistance for the 2001 invasion of Afghanistan. The attacks also forced a recalculation of global alliances. Pakistan's importance as a regional ally increased, while the United States forged closer ties with the Central Asian Republics and bolstered counterterrorism funding and military assistance for a variety of countries such as the Philippines, Georgia, and Yemen.

Many individual states adopted heightened internal security measures. In France, in November 2001, a new comprehensive national security measure was enacted that expanded the government's ability to monitor e-mail and other forms of electronic communication and made it easier to interdict terrorist financing. The United Kingdom passed the Anti-terrorism, Crime, and Security Act of 2001 and the Prevention of Terrorism Act of 2005, both of which broadened the counterterrorist powers of the government. In addition, Parliament also passed the 2004 Civil Contingencies Act to improve the ability of the government to respond to large disasters, including massive terrorist attacks. These examples demonstrated the global trend toward increased police, surveillance, and detention powers enacted by states in the aftermath of the 9/11 attacks.

Postcolonial Theory

Postcolonial theory denotes a field of political theory that questions the universal character of modernity and takes into account the fact of colonialism to understand the relationship between the global North and the global South. The term denotes a field of theoretical analysis that focuses on the effects of colonialism in the history of Asian and African independent nations, and the problems that colonial practices bring about in the process of nation-building. Postcolonial theory, without the hyphen, analyzes the effects of colonialism during and after colonial rule, and it cannot be reduced to the theoretical analysis vernacular of something occurring after the end of colonialism. There has been some discussion about the effects of colonialism on Latin American nations, but Latin American scholars hold that postcolonial theory should be a term that denotes only the Asian and African experience; in its stead they have introduced the concepts of *coloniality of power* and *de/colonial theory* to address Latin American colonial and post-colonial history.

SOURCES
Postcolonial theory finds its sources in two bodies of research developed in the 1970s and 1980s. First, it draws upon the discursive analyses of Indian history and the emergence of the subaltern classes in Indian historiography in the late 1970s and early 1980s that led to the creation of the Subaltern Studies Group; this included Gayatri Spivak, Ranajit Guha, Dipesh Chakrabarty, and Partha Chaterjee, amongst others. These scholars questioned the kind of traditional history occurring and being taught in India and concluded that there was a need to take into account other experiences—those of the subaltern. By analyzing colonial subaltern experiences, they had to take into account British imperialism in the region and therefore the effects of colonialism on Indian identity. Second, Palestinian scholar Edward Said, using French philosopher Michel Foucault's analysis on the discursive history of human sciences in his book *The Order of Things: An Archeology of Human Sciences* (1969), analyzed the development of a particular field of studies, oriental studies. In 1978 in his book *Orientalism,* Said reached the conclusion that oriental studies told more about the West and its own self-perception than about the East. He held that orientalism is the discursive construction of a field of knowledge that is used to control and dominate the East (the Orient).

POSTSTRUCTURALISM AND MEMORY
Poststructuralism, which is a political analysis of language and knowledge, is central in subaltern and postcolonial studies because it helps foster understanding of the knowledge and

power practices of colonial subjects and how they have been discursively constructed. Indian scholar Ranajit Guha shows that subaltern classes are not present in the writing of the elites, but he holds that they can be found by taking into account what elites hide or what they oppress, a technique he calls *writing in reverse*. As American scholar John Beverley demonstrates, Guha means by this the prose of counterinsurgency "not only the record contained in the nineteenth-century colonial archive, but also the use, including the use in the present, of that archive to construct academic discourses (historical, ethnographic, literary, and so on) that purport to represent these peasant insurgencies and place them in a teleological narrative of state formation" (27).

The nineteenth-century archive, and the historical archive in general, becomes a central tool for remembering the past, not only in the historiographic sense but also as a history of the present, because as postcolonial scholar Homi Bhaba puts it, as quoted in Leela Gandhi's *Postcolonial Theory* (1998), "Memory is the necessary and sometimes hazardous bridge between colonialism and the question of cultural identity" (9).

In the 1990s, African scholar Valentin Mudimbe and Latin American scholars Arturo Escobar and Walter Mignolo built their theories about Africa, Latin America, and the developing countries on the foundations of Said's work. These authors also have used anticolonial discourse, and anticolonial scholars such as Frantz Fanon and Aimé Césaire have analyzed the colonial state to build a real post-colonial state and not one that replicates colonial domination but within the conditions of a politically independent state.

FRANTZ FANON

Frantz Fanon's *The Wretched of the Earth,* published in 1961, is one of the most important texts in anticolonial analyses and shows the importance of the concept of the nation to the idea of colonialism. Fanon writes from the perspective of the colonial subject in a struggle for liberation who is trying to think about the post-colonial period. What makes Fanon's conception of the nation interesting is that he is not proposing a bourgeois or a Eurocentric nation. In his analysis, he shows that those bourgeois intellectuals who want solely to replace the colonizer cannot lead a nation. He also shows that it is precisely through the elimination of the bourgeoisie that the nation can be a reality. The real nation implies the participation of the people and the government made by themselves without intermediaries. For Fanon, the elites do not mediate the process of construction of a nation—it is not the elites' nation, as in the European process, but the people's nation.

Fanon shows how the colonizer likely dissolved the traditional forms of government and society existing in the colonized countries. The nation did not arise during colonization, but precisely in the moment in which the colonized identified themselves as oppressed and fought for their liberation. Fanon analyzes Algerian colonial history, and shows how post-colonial Algeria had a limited nation, for instance with regard to women's rights. The process is completely different from the one in Europe, in which elites built their nations. For Fanon,

it is in the struggle that the intellectual becomes part of the nation; it is the fight and not the discourse that makes the nation in underdeveloped countries. In this fight, nationhood and national culture emerges, and nationalism is put aside as a European product that needs to be eliminated.

AIMÉ CÉSAIRE

Writing from the perspective of a French Caribbean colonized subject, Aimé Césaire denounces the universalism of the European idea of knowledge, that is, the idea that the way European science works is the way scientific knowledge should be done, which Colombian philosopher Santiago Castro-Gómez has called the *hybris of the point zero.* Césaire illustrates how European ideas are hegemonic in the composition of post-colonial nations and proposes in their stead a pluriversalism in which the history, ways of life, and knowledge of the colonized are taken into account in the development of new nations. According to Césaire, European universalism is racist and colonial, and political independence is not the end of colonialism but just a first step. Césaire proposes a nonracist and localized universalism that is the result not of a colonial imposition but rather of an intercultural dialogue among people who see themselves as equals.

CONCLUSION

Postcolonialism could then be defined as a theoretical and political position that embodies an active concept of intervention to end the oppressive conditions left by colonial domination. In that sense, the *post* of postcolonialism denotes a critique and a commitment to transnational social justice. It is an approach to colonial relations that recognizes the fact that colonialism is an important part of modern times that needs to be addressed and eliminated.

Postcommunism

Postcommunism has at least two meanings; according to Richard Sakwa, the narrower one refers to the situation in countries formerly under socialist or communist rule, while the broader one can be a shorthand term for metanarratives of the world beyond the cold war. In its narrower, more common meaning, the term captures the unique period in Eastern Europe and the former Soviet Union between what is known as the *fall of communism* and a still uncertain horizon in the future when all major idiosyncrasies of communism disappear. In this meaning, the reference context for all postcommunist regimes is the structure and mechanisms of communism itself.

Characterizing the period of postcommunism are multiple transformations (e.g., political, economic, social, etc.), including the processes of building the market economy and democratic institutions—the scope and pace of which differ from one country to another. In some countries, there are also practices of *decommunization*, like disqualification of former Communist Party members from some positions in the public life.

Many lingering legacies of communism have affected the whole postcommunist period—such as undeveloped civil society, weak rule of law, persistence of communist elites, and environmental problems. Although the transition from communism was largely peaceful, in some parts of the postcommunist region (e.g., the Balkans and some post-Soviet republics) violent ethnic conflicts occurred in the 1990s, followed by so-called colored revolutions in the 2000s.

Postcommunist Transformation

Postcommunist transformation broadly encompasses the political transition to implementing democratic concepts and civil liberties, as well as an economic transition to developing a free market trade economy. The postcommunism transition is widely observed from 1989 to 1992—most commonly associated with the end of the cold war—as parts of Eastern and East Central Europe and most of the former Soviet Union underwent considerable transformations. However, earlier transitions in Greece, Spain, Portugal, and some Latin American states are also applicable to the study of postcommunism transformation.

In Eastern Europe, the political transitions varied from clearly organized, gradual processes to more sudden revolutions and regime collapses. With Poland and Hungary, the transitions were of the first type. In the late 1980s, the Polish government engaged in negotiations with the once suppressed, popular anticommunist labor union, the Solidarity movement. This resulted in semifree elections in 1989, and the Solidarity movement leading the government. In Hungary, the Hungarian Socialist Workers' Party effectively disbanded itself in 1989, opening the political arena to new and reborn parties of the precommunist era. On the other hand, Czechoslovakia, and the German Democratic Republic (East Germany) established in 1949 witnessed something closer to regime collapse and the takeover of the central political space by a hitherto-repressed opposition. In the Balkans, an intraruling party coup ushered in moderate democratization. While in Romania, what may have begun as a military coup of the Communist president Nicolae Ceausescu's regime turned into mass public rebellion and chaos, eventually resulting in the drumhead trial and execution of Nicolae and his wife, Elena Ceausescu.

With the disbandment of the Soviet Union, fifteen states emerged from the largely peaceful dissolution process, which occurred from August to December of 1991. There were no regime collapses, as leaders of Russia, Ukraine, and Belarus dissolved President Mikhail Gorbachev's Soviet state. Estonia, Latvia, and Lithuania—the Baltic states historically and culturally referred to as the westernmost of the former Soviet Republics—did not participate in newly established former USSR organizations, such as the Commonwealth of Independent State (CIS). These three Baltic states and Russia set themselves resolutely on the path of democratic reform in 1991, opposed to the Central Asian and Caucasus republics, which were more deeply mired in authoritarian pasts and political divisions. Notably, the CIS formed after the dissolution of the Soviet Union, with twelve of the fifteen states, and is organized as a very loose association of states with few supranational powers, perceived as more symbolic than functional; yet regional powers coordinate on issues of trade, finance, security, and cross-border crime prevention. In 2008, Georgia withdrew membership from CIS.

Postcommunist transformations—opposed to those in the West—also involved the replacement of more-or-less similar versions of the Stalinist planned economy, which was implemented in the Soviet Union at the end of the 1920s with market designs and practices. Though questions of political-economic linkage and of appropriate phasing of different components of the market reform package persist even today, it seems clear that most states chose to engage in deep, and swift, economic reform on the basis of a reasonably broad political consensus.

Outcomes thus far are diverse and trajectories of individual postcommunist states differentiate in degree of transformative success, as measured by international yardsticks including think

tanks, Freedom House's political freedoms index, Transparency International's corruption perception index, the Heritage Foundation's economic freedom index, and the United Nations human development index. On the whole, East Central and Eastern European states, which experienced the imposition of communist political and economic structures for approximately forty years, have done better than most components of the former Soviet Union on these transformation scales.

Geographic and cultural patterns have also emerged reflecting which countries tend to fare better at implementing political and economic transitions. For instance, countries with a Western heritage or with large Protestant or Catholic populations, or that had previous influence from the historic Renaissance and Enlightenment movements, tend to outperform states of Eastern Orthodox or Muslim religious heritages. Poland, Hungary, Czechoslovakia, and Slovakia, as well as Slovenia and to a degree Croatia, typically outscore Bulgaria, Romania, Albania and the other ex-Yugoslav states. Further, on most measures, Russia, Ukraine, Belarus, and Moldova enjoy an advantage over the five "-stans" of Central Asia—Kazakhstan, Kyrgyzstan, Uzbekistan, Tajikistan, and Turkmenistan—and Azerbaijan. Finally, Georgia and Armenia, located in the Caucasus, typically place ahead of the three Slavic states—Estonia, Latvia, and Lithuania—but usually fall behind the Baltics.

Postindependent Africa, Politics and Governance in

Sub-Saharan Africa's postindependent political experience has been largely a disappointing one. While there are a few exceptions, most African states have experienced broadly based economic stagnation or decline; generalized state weakness, fragmentation, or failure; military interventionism; poor governance and abuse of power by political leaders including personalistic and neopatrimonial rule; at times serious and violent communal conflict (ethnic, religious, regional); and, in some cases, long and violent civil wars and insurgencies.

The challenge for political scientists is to discern the recurring factors that underlie these manifestations of political failure. For example, many patterns of government that seemed important in the early postindependent era have been found to have little explanatory value. Much was made in the 1960s and 1970s of the differences between single-party *mobilization regimes*, and apparently "democratic," competitive party

systems; between socialist versus capitalist private-enterprise economies; and the differences stemming from Anglophone versus Francophone colonial rule. Yet, after several decades of history, it is clear that these once seemingly important differences have little to no association with African states' dysfunctions. Just about every type of political and economic "system" has experienced many or all of these problems.

Factors explaining Africa's situation still remain. While there is varying emphasis in the literature on several underlying factors, there is general convergence on several of them. These include:

- *Initial state weakness and distortions deriving from the colonial heritage.* This includes geographic artificiality; states made of multiple and fragmented ethnic groups; underdeveloped and distorted governance institutions; the organizational, normative, and spatial incongruence between states and indigenous historical and traditional political institutions; weak structures of accountability; the legacy of colonial legal and institutional systems focused on top-down control; poverty, economic weakness, and vulnerability to the world economy; and African states' acceptance by world institutions as *sovereign states* and governments without actually meeting historic norms of sovereignty.
- *Mobilization of ethnic, regional, and religious identities in order to compete for limited resources, and by elites to take and hold political power.* Generally these identities were latent in the precolonial era. Colonial policies and practices stimulated their emergence as active identities, and postcolonial politics generally stimulated their further development to where they have become problematic for the contemporary state.
- *Early establishment of regimes that survived economically by collecting rents.* These were taken from the agricultural and extractive industries. They paralleled political leaders' early maneuvers to dominate political and economic space and ensure that rent-generating peoples and regions were unable to challenge the governments through democratic or other institutionalized mechanisms. This also coincided with the strength of *inheritance* elites who received power at independence, and their establishment of lucrative lifestyles that could only survive by continued extraction of rents from rural areas and extractive industries. Also occurring were lucrative income streams from natural resources that incentivized violent rebellions, insurgencies, and criminal enterprises that the state could not suppress, as well as spillovers from regional conflicts based on these resources.

These patterns contributed to one another and created what became a near "perfect storm" for many African governments. This resulted in political, economic, and social decline for most of Africa's peoples.

INITIAL STATE WEAKNESS

Most African states achieved independence within ten years of the colonial powers' decision to grant it to them. A few

received it within a mere few months of those decisions. As a result of this and other factors, African states were generally unprepared for effective governance. Colonialism left many other challenges for these new states as well.

The institutional legacy of colonial rule was one particular challenge. Colonial regimes were essentially governments of military occupation. Colonial policy, at least until the late 1940s, was exploitative and minimalist; colonial powers sought to extract the maximum economic advantage from their colonial possessions with the least expenditure of resources. As a result, colonial states were developed only to produce and export goods of value to the colonizing powers. This led to distorted economies and infrastructure, such that the colonial states were highly specialized in a few, low value-added products such as cocoa, coffee, tea, pyrethrums, sisal and cotton, and raw minerals. They played little role in any value-adding processes. These left the independent states with narrowly based and internationally vulnerable economies, which generated relatively little wealth to stimulate domestic economic growth or to fund the state and its programs. It also left the state with a highly underdeveloped and extraction-focused internal transportation infrastructure, which hindered domestic and intra-African trade, and therefore economic growth. These factors, among others, reinforced deep poverty among most of Africa's peoples. They weakened the states' economic base, while the large sunk costs invested in them made it difficult to move to more broadly based, internationally resilient, and remunerative economies. State capacity was thereby reduced.

Other problems deriving from the legacy of the colonial state exacerbated the economic weaknesses. These included underdeveloped structures of accountability and interest articulation as well as weak bureaucracies. Civil society was underdeveloped, hindered by the economic underdevelopment caused by colonial mercantilist policies as well as the conscious policies of colonial governments to keep it weak. Small voluntary organizations were fragmented across many localities, while the independent governments easily co-opted or suppressed the few professional organizations and labor unions that did exist.

Finally, newly independent governments inherited small and weak managerial and service bureaucracies that were usually understaffed with trained and experienced personnel. A pattern often developed where one or two well-qualified personnel were surrounded by many with minimal qualifications and were overwhelmed by the difficulty of getting anything done. In contrast, political leaders strengthened the relatively stronger police and security apparatuses they inherited, as well as their control over major industries. They used the legal and institutional tools of top-down rulership that they inherited from the colonial states to maintain their hold on power. Executive structures had been overdeveloped during colonialism, primarily to work as mechanisms of social, political, or economic control, and had administrative and police powers to manage the economy and to suppress media freedom, assembly, protest, and dissent. Moreover, legislative bodies were relatively new, weakly institutionalized. With inexperienced personnel leading

them, they were vulnerable to the promises—and threats—of the executive. Legislative bodies quickly became rubber stamps for state leaders and structures for their members to pursue rents and other advantages. They never became effective structures of accountability and faded in relevance from the political arena. Lacking any institutionalized checks, the potential for government incompetence as well as abuse of power grew.

Africa's independence movement parties, again, were far weaker organizationally than they seemed at independence, and eroded rapidly as independence was quickly granted to leaders who in reality had narrow power bases. Ambitious rural and regional party personnel flocked to the capitals seeking their fortunes and to help staff the new governments, and whatever institutional capacity parties had declined rapidly. Furthermore, there was generally little that had held the parties together beyond the incentive to comply with colonial requirements for democratic elections to achieve independence, and the desire to capture power. They were frequently led by a charismatic leader and integrated through patron-client relationships that did not extend beyond party cadres and a few key regional, religious, or ethnic influentials.

In general, these movements' promise to the public was that economic opportunities would dramatically improve once independence was granted. They stood for little else, except as structures for some to grab and hold power. Their subsequent economic poor performance certainly eroded the legitimacy of the new governments. The early military coups reflected their unpopularity.

A less obvious, but perhaps no less important legacy of colonialism, is often referred to as Africa's *two publics*. Peter Ekeh argues that there are two spheres of moral discourse in Africa. One surrounds the contemporary state and grew from the behavior of the colonial state. This was essentially amoral in its workings, at least regarding its African subjects. It was absolutist, accountable elsewhere (to the metropole), and acted only in its own interests. Africans learned to deal with it and its amorality by behaving in opportunistic ways. Ekeh argues that this absence of moral expectations was quickly transferred to the independent state, which Africans, generally with good reason, saw in largely the same light.

However, there is a second public sphere where Africans expect moral behavior. This includes historical and traditional political institutions, extended family, and community or ethnic associations. This hypothesis, which appears applicable to most African states, though in varying degrees, helps explain these states' high levels of corruption, the largely opportunistic behavior toward them of their citizens, and their lack of effective and sustained penetration into social affairs. It partly accounts for the general weakness of African states, at least beyond their elites' ability to hold power. In most cases these states lack legitimacy, are rife with opportunistic behavior that erodes resources, and are ineffective in "capturing" the citizenry. Many thus look elsewhere for more accountable and productive governance arrangements, such as in the *economy of affection* and in patron-client relationships, as observed by Goran Hyden.

Carl Rosberg and Robert Jackson developed another argument, in the 1980s, for the persistent ineffectiveness and fragility of Africa's states. Jackson and Rosberg argued that the well-intentioned effort of the developed world to support newly independent states by redefining the term *sovereignty* led to unintended and quite negative consequences for those states. Historic criteria for recognizing governments emphasized a de facto definition of sovereignty, which expected governments to meet certain, minimal levels of performance regarding control of borders and maintenance of domestic law and order. However in the post–World War II (1939–1945) era, the concept of *juridical sovereignty* prevailed; it awarded recognition to a government merely because a colonial power had passed the title, regardless of its effective control of its space. Weak and ineffective states were given financial and other aid from the international community and were protected from secession and external challenge by the refusal of the international community to recognize any alteration in borders except by consent of the so-called sovereign state.

This system denied recognition to alternate but possibly more effective regimes such as developed in Katanga, Biafra, or recently in Somaliland. This introduced moral hazard for these political elites, where they were insulated and protected from the consequences of misrule, no matter how poor it was. Significantly ineffective, corrupt, and even abusive regimes such as Mobutu's Congo, Amin's Uganda, Moi's Kenya, Taylor's Liberia, Abacha's Nigeria, and now Mugabe's Zimbabwe, were recognized and sustained by their status as sovereign states and the support this brought from the international community. This was in spite of the substantial portions of their territory beyond their control, and that these were collapsing into famine and disease, and ruled solely through violence and terror.

COMMUNAL FRAGMENTATION AND MOBILIZATION

African states also entered independence hobbled by high levels of social fragmentation. This followed lines of ethnicity, religion, and region. While most of the world's contemporary states are multiethnic and multireligious, and many face regionalism as well, the majority of these states manage to maintain effective governance, economic progress, and largely peaceful relations among their citizens. However, a number of factors have made these differences a source of conflict in many, though certainly not all, African states, and contributed to state weakness and failure.

African states are almost without exception artificial creations. They are the remnants of agreements cobbled together among competing nineteenth-century imperial powers. As a result, at independence there was little holding together a state's citizens beyond their shared experience under British, French, Belgium, Portuguese, or Spanish rule, and the arbitrary borders those powers had defined. The states were not organized around or based on communities that were particularly well integrated along normative, economic, historic, linguistic, social, or political grounds. This legacy also left in place national political institutions and civil law systems largely

alien to the vast majority of Africa's citizens. These operated in European languages most of the public did not know, and were in the hands of small *inheritance elites* who were more or less fluent in the alien languages and institutions. These groups captured control over the new state as the colonial powers departed but did not provide an effective unifying structure.

Nonetheless, Africa's subnational divisions are best understood as latent ones where there are multiple communities and personal identities. These exist as potential lines of conflict among people who have usually lived in peace for many years, even centuries. They typically become overt, however, and mobilize people into conflict when access by one or more groups—ethnic, religious, regional—to critical resources seems threatened by other groups. The critical resources for survival in Africa are access to land, water, and state-controlled opportunities and resources. Conflicts have broken out when one group appears to monopolize or capture excessive amounts of one or more of these natural resources, or appears likely to capture control over the state and its resources to the exclusion of others. Recent conflict in Kenya can best be understood through this prism.

Land is usually regarded as the critical resource for survival for the large majority of poor Africans who still earn their living in agricultural or pastoral occupations. As Sara Berry has shown, land tenure rights are frequently ambiguous. Over several generations, persons from different groups have developed competing claims to plots of land, depending on more than one system of customary law, differing interpretation of those laws, and the actions of the state. Migrations of peoples into less well-settled areas have intensified this, as growing populations of *home* and *stranger* groups begin to compete intensely for the same land. Migratory pastoralists with historical and customary claims to land have had to compete for land and access to water which was once unclaimed or became subject to multiple and ambiguous traditional claims. Key natural resources that can be converted into income streams, such as diamonds, gold, or oil, play the same role, though for far fewer Africans.

Similarly, the state has controlled substantial resources—though fewer currently than in the past—such as employment in the modern economy; scholarships and access to higher education; location of schools, clinics, and roads; access to subsidized credit and foreign currency; tariff protections; directorships of the once numerous parastatal corporations. Also, the state can use its police powers at times to act in effect as the arbiter of land tenure and water rights issues, as well as to allocate shares of lucrative mineral resources.

This background of competition and conflict over land, water, valuable natural resources, and the potentially explosive consequences of control over the state and its powers sets the stage for communal conflict. Individual and community struggles to survive in harsh economic circumstances often mutate into perceived zero-sum conflicts. While these conflicts have frequently followed stereotypical ethnic lines, such as the conflicts among the Kikuyu and Kalinjin in Kenya over lands in the Great Rift Valley, or the Hausa and Southern Nigerian

peoples' conflicts over land rights in the Jos Plateau, they have also developed among community groups, such as the conflict between strangers and home peoples in Ife and Modakeke in Nigeria (who are all Yoruba); clan-based conflict among the Somali people; or so-called ethnic conflict among the Hutu and Tutsi in Rwanda and Burundi. The latter is really caste conflict among people who share their same language, religion, and appearance.

In each case, the conflict has grown from competing claims for limited resources by individuals, into group conflict as similarly situated individuals mobilize along one identity, and join one another as allies in zero-sum competitions with others over these resources. These frequently turn into violent, negative-sum interactions. The enduring hostility between North and South in Nigeria essentially grows out of the competition over which region will capture the lucrative, oil-based rents controlled by the Nigerian state. These patterns developed over land, and now oil, in Sudan. Similar dynamics, even without oil, have recently sundered Ivory Coast effectively into two states.

Thus, poverty, limited resources, latent social fissures, and the state elites' critical role in the distribution of resources and opportunities, all combine to develop and then sharpen conflict among diverse peoples. These conflicts in turn weaken, discredit, and in some cases destroy African states. Of course, were African states strongly institutionalized, they might have been able to manage, contain, and arbitrate these conflicts, as has happened in a few cases. However, their initial weakness and the strategic choices of their elites to pursue rents and economic and political control above all else pushed this beyond most states' reach.

In many cases, the close alignment of ethnicity, region, religion, and economic opportunities intensified the differences. In West Africa, for example, coastal peoples were the first to make contact with the Christian missionaries and colonizing officials, and thus received the earliest education and career opportunities from European organizations. The hinterland frequently received late, little, or no exposure to these opportunities. Thus, coastal peoples were largely Christian, had experienced more economic investment and commerce, and had far more education. The hinterland peoples were largely Islamic, uneducated in European languages, and experienced little economic investment or opportunities. These fissures endure to this day and are part of the explanation for the civil war, which divided Ivory Coast in the early 2000s, the civil war in Liberia, the enduring conflict between North and South in Nigeria, and the cycles of coups experienced by Benin, Togo, and Congo (Brazzaville).

At times, political elites competing for power, or to hold on to power, have consciously intensified these divisions, and the fears that accompany them, to mobilize popular support. Nigeria's cycles of political violence can be explained by this, as can violence in Liberia, Rwanda, Burundi, Kenya, Sudan, Zimbabwe, Ethiopia, Chad, and other states. While each of these tragedies followed its own script, their core dynamics are remarkably similar: competing political elites consciously intensified and manipulated latent fears of economic or political domination by other groups as a strategy to take or hold power, resulting in intensified violence.

RENT-SEEKING BEHAVIOR

As already noted, African states have been ineffective, weak, and at times fragile for many years. A key way these governments and their ruling coalitions survived in spite of this, and a major incentive for rulers to stay in power, was their ability to generate, consume, and artfully distribute rents they captured from their economies, and from aid from international organizations. Rents became the dominant currency of politics, displacing policy, program, performance, accountability, and, eventually, most legitimacy the governments might have had or developed. Where rents were inadequate, or funds ran short, governments used thuggery, intimidation, violence, and even murder to maintain their hold on power. Zimbabwe today is an example of this.

It is a reasonable to infer that the overall economic weakness of these societies both weakened economic and civil society and made them more vulnerable to the appeal of state-controlled resources. Offering few comparable economic opportunities outside politics, it also increased the incentives for those who held power to be ruthless in their actions to continue to hold that power. While many leaders moved to single-party systems to internalize the competition for shares of state resources, even two- and multi-party systems presented the same dynamics: winning coalitions denied resources to those outside of them, and allocated resources such as rents through patron-clientage to those whose support they needed.

Military regimes behaved much the same way. Not incidentally, patron-clientage substituted political considerations for efficiency or effectiveness in development programs, in location and management of state-owned industries, and in production of public goods. It increased corruption and waste, further delegitimizing the state, and slowed or reversed economic growth. This led to an even poorer and less effective state. This strategy extracted wealth from the public and from international organizations, and turned it into private goods for key members of that coalition. This was a far more lucrative strategy for the elite to hold power than to try to win general public support by expending vast amounts of state resources, trying to produce public goods to serve the population in general, resulting in little is left to the elite for personal consumption. The outcome is apparent at various times in many African states: Economic decline occurs as rent extraction reduces the incentive for production and depletes capital in productive industries. Then the state is more aggressive in capturing what it can from declining sectors and industries. This eventually leads to economic collapse and, at times, armed conflict. As early as 1962, René Dumont noted the growing cost of the burgeoning African state and argued it could not be sustained. However, the inheritance elites were economically and socially dependent on sustaining the extraction of rent.

Robert Bates, in his classic 1981 work, revealed the rent-based dynamic through which small political elites captured

vast sums by manipulating the price paid for cocoa to producers in Ghana. Allocations of undervalued hard currency and of opportunities in the "modern economy" were ways economic rents were distributed to the coalition that governed Ghana. Bates noted this would likely destroy the economic foundations of the Ghanaian state, but it was pursued nonetheless because the rents were so lucrative to the small group who captured them that the threat of economic and political collapse paled in comparison. In recent work, Bruce Bueno de Mesquita and his colleagues explain the dynamic that develops when a small and unaccountable group captures a state, and finds it highly profitable to transfer the wealth it generates to itself. The group needs to stifle broad-based discontent generated by the consequences of this economically destructive strategy, and thus it suppresses dissent through a variety of mechanisms such as single-party systems, co-optation of opponents, show charges and trials for dissidents, establishment of presidencies for life, rigged elections, and suppression of electoral challenges through violence and intimidation.

In many cases, factions of the military, as a subgroup of the elite, seized power directly if they felt threatened with marginalization or to ensure a larger share of rents for themselves. Most of the states functioned primarily to extract and distribute rents from the people and overseas aid organizations to members of a ruling class—clearly underlying both the poor performance and the survival of the African state. State elites were unconcerned with producing public goods, but determined to hold on to power one way or another, as it alone was their source of economic security and social reproduction. This led frequently to shadow or *soft* states, which had little presence beyond the capitals and a few urban areas to extract rents from their peoples.

A final dimension of the crisis in rents faced by many African states grows from the combination of state weakness and the opportunity to capture extremely profitable rents from raw materials such as diamonds, gold, oil, timber, and the like. As Reno shows, several African states have faced stubborn and violent insurgencies incentivized by income streams won by capturing control of these resources. This dynamic can explain lengthy and bloody civil wars in Angola, Congo, Liberia, and Sierra Leone. In the case of Liberia, Charles Taylor used his control over diamond mining areas to seize control of the state and then proceeded to export violence to Sierra Leone and Ivory Coast in an attempt to expand his control and personal wealth.

In Nigeria, while insurgencies in the southeast have not captured the ability to produce oil, their ability to disrupt production has led to an *indirect rent*, via ransom. If the shipping lanes off the coast of Somalia are considered another lucrative "raw material," Somali pirates have engaged in much the same enterprise. In each of these cases, weak states have failed to maintain control over their territories, enabling criminal elements to capture lucrative sources of wealth, which increase the latter's access to arms and ability to further challenge and erode the state. It can become a vicious cycle and spillover into regional disruption, as it did among Liberia, Sierra Leone, and Ivory Coast as well as in the African Great Lakes, and potentially the Horn of Africa.

CONCLUSION

With but a few exceptions, postindependent Africa has fared poorly. The tragedy of the African state begins with an unfortunate institutional and economic inheritance from the colonial era, develops into communal conflict over politicized competition for control of limited resources, and into rent-based regimes that erode economic well-being as they weaken and delegitimize state institutions. Finally, weak states leave the door open for regional, warlord-led insurgencies focused on capturing control of lucrative income streams arising from a few valuable natural resources. The states further erode, and in a few cases, have completely collapsed.

A few African states have done better. Ghana, Mali, Benin, Botswana, and, in some measure, Tanzania have avoided, grown beyond, or at least better managed these challenges. A few, such as Liberia and Mozambique, appear to be on the mend. The prospects for South Africa are hopeful though still unclear. However, many other African states are deeply mired in these problems, or at least stand on the brink. It can only be hoped that they will fare better in the future.

Postindustrial Society

As the importance of industrial manufacturing declines and economic development becomes more centered on the service sector, information technology, and knowledge-based growth, questions arise regarding what social, political, and cultural challenges advanced capitalist economies will encounter in the twenty-first century. These questions, concerned with the nature of postindustrial society, have occupied a central place in social scientific research for over three decades.

According to the pioneering work of American sociologist Daniel Bell, the movement toward a postindustrial society should be conceived as a historical progression gradually supplanting, without eliminating, industrial society. Bell forecasted, in 1973, that the reliance on information, technology, and services instead of material goods as the driving forces of the economy would lead to deep transformations in the underlying social structure—or what he referred to as society's *economic-technological-industrial order*. This in turn would have political and cultural consequences; the most significant of these would be the empowerment of a whole new class of technical elites using their knowledge and expertise to place new demands on the polity for rationalized planning "and the centrality of theoretical knowledge as the source of innovation and of policy formulation for the society" (Bell, 14).

Bell's work on the postindustrial society was not without its detractors. During the course of the 1970s, a range of scholars debated the merits of his approach. The main criticisms leveled against Bell for overstating the feasibility of universities replacing firms as the primary engines of technological innovation and economic growth. Additional criticisms accused Bell of portraying the transition to postindustrialism as a teleological process, and neglecting the social conflicts that underpin capitalist societies.

While the 1980s witnessed a retreat from, and in some cases even a rejection of, the notion of postindustrial society within academic discourse, it underwent a substantial revival in the 1990s. Although scholars from this second-generation debate tend to agree varieties of postindustrial society—also termed *information* or *network society*—now existed across the advanced capitalist world, they differed radically in their interpretations of its exact characteristics. Scholarship from this period tended to place less emphasis on forecasting future scenarios, and instead studied the actual conditions of postindustrial society in various contexts. Although Bell's predictions about the political rise of technical elites have been largely discarded, scholars on the whole have concurred with Bell's assertions that postindustrial development would transform many of the foundational institutions of industrial society (e.g., the welfare state, social class, nationalism, and political parties). In scrutinizing categories, such as the working class, more recent work on postindustrial society is increasingly bound up with discussions of the postmodernist philosophical movement and its rejection of the *metanarrative* of modernity.

Postmodernism

Postmodernism is a philosophic and analytical perspective traversing multiple disciplines in the humanities and social sciences. Its roots—while perhaps found in early twentieth-century German idealism (Georg Lukács and Karl Mannheim), the Frankfurt school and its critical theory (Theodor Adorno and Max Horkheimer), and to a lesser extent phenomenology—is attributed primarily to various French scholars such as poststructural anthropologist Claude Levi-Strauss, deconstructionist Jacques Derrida, and social scientists such as Michel Foucault and Louis Althusser. While the major tenets of postmodernism have been intensely debated and disagreed upon by most proponents, an underlying agreement derives from the basic assumption that modernity—often considered to have begun sometime around the Enlightenment or the onset of Industrial Revolution in the seventeenth century—has passed in most developed societies; as such, a new conceptualization of postindustrial, postmodern societies is necessary.

DEVELOPMENT

Two types of postmodernist works prevail in the social sciences. The earlier work was a critical philosophy in its agenda (led by Jean-Francois Baudrillard and Jean Lyotard) and the more recent work either looks back at the early work self-reflexively or attempts to integrate the disparate scholarship of the earlier period. For instance, Zygmunt Bauman, in Craig Calhoun and colleagues' book *Contemporary Sociological Theory* (2002), asserts that postmodernity is, essentially, "modernity emancipated from false consciousness . . . [and is] marked by the overt institutionalization of the characteristics which modernity . . . set about to eliminate and, failing that, tried to conceal" (429).

More often couched in a critique of either modern society or the social sciences' attempts at positivistic methods, postmodernists prefer to see the social world as: fragmented and, therefore, not a clean system; constructed out of the efforts of individuals and not external and objective; and impossible to apprehend, test, or measure using scientific instruments. At the heart of this thread of postmodernism is an epistemological critique positing cumulative social sciences as an impossible task because culture, reality, and experience are relative.

More recently, Kenneth Allan and Jonathan Turner attempted to put forth a formal theory of postmodernism. They identify four phenomena of interest that crosscut postmodern theory: (1) the increasing importance of culture vis-à-vis the material world, which is considered more modern; (2) the destabilizing effects caused by the prominence and intensified penetration of culture; (3) the increasing importance of the individual; and (4) a decentering process caused by hyper-differentiated societies. Allan and Turner posit that certain capitalist processes contribute to the transformation of modern societies into postmodern universes. First, advanced capitalism leads to a mushrooming in the number, size, and level of penetration of markets, caused, in part, by the means of advertising. Second, as Marx once predicted and as the Frankfurt school cogently pointed out, advanced capitalism transforms everything into commodities further contributing to the growth of markets. Third, capital becomes less fixed in advanced capitalist societies, leading to its rapid movement across physical spaces and, consequently, deconcentration. Fourth, communication and transportation technologies grow so fast and so efficiently that time and space become radically altered in ways that are unnatural to human biology, leading to destabilizing, rapid changes as well as more effective economic penetration in everyday life. The world, in a sense, grows smaller, while human biological adaptivity does not change.

Finally, advanced capitalist, postmodern societies witness the rise of means of reproduction and the decline of means of production. Imaging techniques, the Internet, and television become the primary source of economic growth while manufacturing is "farmed out." The penetration of new mass media leads to new means of domination as well as exploitation. Everyday life speeds up. The number of roles a person can assume, or imagine assuming, exponentially grows. Some of the results include discombobulation, disorientation, and high levels of anomie, as well as newfound individual self-reflexivity and the elevation of the individual over the group and the community.

DEBATE

Whether or not postmodernism is a theory, a philosophy, a critique, or an amalgam of the three has been a key area of debate. On the one hand, there is widespread disagreement among self-proclaimed postmodernists as to what it is and what its major tenets should be. Moreover, as a critique of positive, cumulative science, it is difficult to conceive of how its propositions can be tested empirically—or whether testing would defeat the purposes of its practitioners in the first place. On the other hand, postmodernism offers a lens in the same vein as the Frankfurt school for comparing the so-called modern world and the arguably different structural elements of (post)industrial societies such as the United States, Germany, or Japan.

Finally, some question has been raised as to whether or not postmodern theory is or was a fad, as postmodernists rarely tried to create traditions or schools, focusing more on deconstructing those *metanarratives*—worldviews that encompass all of human or natural history—and rationalist theories already extant. While efforts like Bauman's or Allan and Turner's are directed toward synthesizing the disparate parts, the recent wars in the Middle East, the continued reliance on fossil fuels, and the continued prominence of industrial production in most of the world are stark reminders of the staying power of modernity. Thus, some have suggested that *postmodernity* is better termed *late modernity*.

Poulantzas, Nicos

Nicos Poulantzas (1936–1979) was a leading theorist on the capitalist state. Although widely regarded mainly as an exponent of the structuralist Marxism associated with Algerian philosopher Louis Althusser, Poulantzas's thought evolved through various stages to its culmination in a reexamination of Marxist tenets and an engagement with Eurocommunism. Contrary to his image as a jargon-laden theorist of abstract structuralism, Poulantzas remained focused on questions of political strategy throughout his career. His suicide on October 3, 1979, prematurely robbed Western Marxism of one of its most influential figures and marked the end of the great "state debate" of the 1970s.

Born in Athens, Greece, on September 21, 1936, Poulantzas lived through both the Nazi occupation and subsequent civil war. After studying law, he moved to Paris in 1960. Although originally attracted to the existentialism of French philosopher Jean-Paul Sartre, Poulantzas began reading the work of Italian political theorist and activist Antonio Gramsci, who would prove to be a lasting influence. An early article written by Poulantzas led Althusser to invite him to join his informal group of students. This, combined with the political ferment in Paris at the time—which later climaxed in the street protests of May 1968—led to the publication of Poulantzas's first book.

Political Power and Social Classes (1968) firmly established the state as an object of theorizing and analysis, following decades of neglect by social scientists of all theoretical stripes. Poulantzas portrayed the capitalist state as a relatively autonomous condensation of class struggles that functions to manage class contradictions such that the dominant class or bloc of class fractions can create and maintain the political conditions necessary for the survival of the dominant mode of production. Together with Belgian political theorist Ralph Miliband's *The State in Capitalist Society* (1969), which offered a more empirically based and instrumentalist portrayal of the state in contrast to Poulantzas's conceptual and structuralist treatment, the book stimulated a wealth of new research and theorizing.

Despite the degeneration of the Miliband-Poulantzas debate into a dispute over what constitutes correct "Marxist" methodology, Poulantzas constantly developed his ideas. Miliband's critique of structuralist abstraction met its response in Poulantzas's subsequent works of a more empirical nature. These focused on the experience of interwar fascism and the more contemporaneous European military dictatorships, such as that of Greece.

In *Classes in Contemporary Capitalism* (1974), Poulantzas extended his structuralist analysis of the state, analyzing the "imperialist chain" linking formally separate states via the cross-border expansion of multinational corporations. The consequent reconfiguration of host countries' legal and political systems along American lines led him to portray multinational corporations as vehicles of U.S. hegemony.

State, Power, Socialism (1978) marked Poulantzas's shift away from both Althusserian structuralism and Leninist politics as he sought to respond to challenges posed especially by French historian and philosopher Michel Paul Foucault. Poulantzas saw Foucault's treatment of power as diffuse and pervasive as both suggestive of more fruitful inquiry and theoretically inadequate. Poulantzas depicted an expansive and expanding state, which, in contrast to the belief common in Leninism, was itself a site of political struggle, rather than something to be smashed from outside. However, he continued to acknowledge the state's relative autonomy. Among the various prescient contributions of this book, Poulantzas observed trends toward authoritarianism and the growth of new social movements that became much more pronounced in the following decade. He also anticipated much subsequent critique of Foucault.

Poverty

The United Nations (UN) estimates that approximately 1.2 billion people in the world currently live in poverty, and one-half of those are children. Before 1950, definitions of poverty were generally based on the *bread basket theory*, which identified the poor as those who were unable to meet minimum food requirements for each family member for a month. Today the definition of poverty is based on the UN guideline of living below one dollar a day. More than one-sixth of the world's poor meets this stipulation, with the poorest people generally living in sub-Saharan Africa (46 percent) and South Asia (40 percent). In 2000, 189 members of the United Nations adopted the eight Millennium Development Goals designed to alleviate poverty and improve the quality of life within their borders.
Children play in front of a shack outside of Lima, Peru. One-half of all those in poverty are children, and many struggle to subsist in nations that cannot provide them with assistance.

However, poverty also exists in the richest nation in the world, Bermuda, with a per capita income of $69,000 and a poverty rate of 19 percent, and in the poorest nation in the world, East Timor, with a per capita income of $400 and a poverty rate of 42 percent. The differences in the quality of life among the poor in the richest and poorest nations may be vast. Developed nations offer social services that, at a minimum, provide food, clothing, shelter, and basic health care. In developing nations, people regularly die because governments either cannot or will not provide basic needs. The poorest countries are generally those in which subsistence agriculture dominates the economy. Scholars have argued that globalization is a key factor in increasing poverty levels in developing nations because industrialization has left some nations out of the loop, and increased gaps between the rich and the poor in industrializing countries.

International aid provides a large portion of national budgets in countries such as Niger, which, according to the United Nations Development Programme, has the lowest standard of living in the world. Government corruption in some poor nations results in withdrawal of international, regional, and national aid. Countries must meet strict World Bank and International

Monetary Fund requirements, including poverty alleviation and anticorruption measures, to qualify for acceptance into the Heavily Indebted Poor Countries program, which provides debt relief for twenty-nine of the poorest countries.

REALITIES

Poverty may be a result of many things, but most scholars agree that individual factors affecting poverty are sex, race, age, unemployment, divorce, number of people in a family, poor levels of education, and lack of job opportunities. On a broader scale, factors that increase the likelihood of living in poverty are national residence, poor governance, ethnic conflict, corruption, degradation, crime, violence, and absence of social services.

The poor are more likely than others in any society to be hungry, cold, malnourished, illiterate, sick, and unemployed. They have lower life expectancies and higher infant, childhood, and maternal mortality rates. The poor are also more prone to alcoholism and depression. They are also more likely to be outside political and legal systems, more likely to be convicted of crimes with which they are charged, and less likely to seek recourse when rights are denied.

Many of the poorest countries are located in areas where droughts, floods, earthquakes, and other natural disasters occur regularly with devastating results that disproportionately affect the poor. This phenomenon was made abundantly clear in December 2004 when a tsunami caused by the Sumatra-Andaman earthquake in the Indian Ocean wiped out whole communities, leading to the loss of more than 275,000 lives. Natural disasters can also have devastating results among the poorest people in the richest countries. Such was the case when Hurricane Katrina devastated America's Gulf Coast in August 2005 at a cost of approximately 2,000 lives. Tens of thousands of people from New Orleans were forced to flee to other states when levies broke in the wake of the storm. Many of those who returned remain housed in government-issued trailers, facing life in a city with a heavily damaged infrastructure.

Some of the poorest people in the world are those who live in refugee camps where they have migrated to escape from areas devastated by natural disasters, ethnic conflicts, oppressive governments, and extreme poverty. Large refugee populations also place enormous strains on the economies of host countries and may cut into funding for social programs designed to alleviate poverty among existing populations.

Many countries of the former Soviet Union struggle economically, and poverty is a major problem in these transition countries, which have an aggregate poverty rate of 27.1 percent. Individually, poverty rates range from 8.6 percent in Hungary to 80 percent in Moldova. Conversion to free markets has also increased income gaps between the rich and poor. According to the Gini Index of Inequality, which is the most common measure of inequality, income disparity is greatest in Armenia (41.3) and narrowest in Hungary (29.4). The European Union (EU) mandates poverty alleviation programs in transition countries seeking membership.

CHILD LABOR

In response to extreme poverty, parents in Asia, Latin America, and Africa sometimes sell young children as indentured servants. The UN International Labour Organization estimates that employers make as much as $10 billion each year from illegal child labor. The problem of child labor is most severe in Africa, which provides approximately one-sixth of all child laborers.

Indentured children generally live in appalling overcrowded circumstances where they are denied adequate nourishment and access to health care, education, and the joys of childhood. They receive only small pittances for their labor, and even these small amounts are often withheld for months at a time. Brutal employers frequently punish inattentive, sleepy, or slow children with beatings. Although some governments have passed antitrafficking laws, they are difficult to enforce. Outside entities such as the International Organization for Migration have been more successful in rescuing children from virtual slavery and placing them in shelters or returning them to their families.

SOLUTIONS

Scholars who study poverty agree that individual governments and international organizations must share the responsibility for alleviating poverty. Poverty alleviation programs generally consist of economic safety nets, increased job and credit opportunities, and programs designed to improve quality of life, education, and health care. Some scholars have found that placing women in control of the family economy in the poorest countries may be a factor in bringing children out of poverty. They maintain that increasing the discretionary spending of mothers leads to improved nutrition and health of children and makes children twenty times more likely to survive than when fathers control income.

Individuals and small organizations can also make a difference. In 2006, the Nobel Peace Prize Committee honored economist Muhammad Yunus of Bangladesh and the Grameen Bank for their pioneering work in instituting a program of microcredit in which small loans are granted to those who cannot secure loans from other sources. Recipients of these loans include penniless widows, abandoned wives, laborers, rickshaw drivers, sweepers, and beggars. With loans of only a few dollars, recipients raised themselves out of poverty with the purchase of milk cows, work tools, and merchandise for sale at small stalls. Yunus's work has inspired banks around the world to invest in similar projects.

Power

Power, a central concept in political science, is the capacity to achieve values in collaboration with and in opposition to others. It includes the ability to act autonomously and to exercise influence or control over others. Power can be an end in itself, but it is primarily instrumental to the achievement of other objectives. Within a group or in relationships between a group and others, capacities tend to be distributed unevenly, so that more powerful people and groups have more autonomy than others, as well as more effect over others. When a distribution is extreme and persists over time, it is referred to as *domination*.

At the same time, less powerful individuals, groups, and political units may act autonomously to organize resistance to the demands of the more powerful and even seek to increase their capacities—both to act autonomously and to shape their environments. It is such contention and conflict that give politics its distinctive character, while interactions with others give power its essentially relational character. Power relations shape political activities as discrete phenomena, but they are often embedded perceptibly in institutions and invisibly in structures.

POWER IN POLITICAL THEORY

The classical political theorists concerned themselves primarily with concepts such as justice, the good life, equality, and so forth. At the same time, they also understood that power was instrumental to the achievement of these values. In *Politics,* Aristotle (384–322 BCE) used the distribution of power as the central criterion by which to distinguish governments of the one, the few, and the many. In his *History of the Peloponnesian War,* Thucydides (ca. 460–400 BCE) related, in the dialogue between the Athenians and the Melians, the aphorism, "The strong do what they will, and the weak suffer what they must," indicating the inequality of power and its consequences. Roman writers concerned themselves with gaining control of, managing, and regulating power.

As an analytical concept, power dates from the work of Niccolò Machiavelli, who devoted much of his writing (e.g., *The Prince,* 1532) to elucidating the uses and mechanisms of power. In *Leviathan* (1651), Thomas Hobbes held the view that power should be concentrated and institutionalized in a sovereign. John Locke, Charles-Louis Montesquieu, and the authors of *The Federalist Papers,* Alexander Hamilton, John Jay, and James Madison, devised their institutional arrangements of dividing, sharing, and separating power with the aim to avoid a concentration of power in the hands of any single individual, group, or institution.

In the twentieth century, writers sought to give more precise shape to the meaning of power, and they conducted extensive debates about its various aspects, its sources, its forms and manifestations, its uses, and its effects. In the primary modern discourse about power, shaped greatly by the writing of Robert Dahl and reactions to his ideas, democracy provided the central normative guideline. In parallel debates in international politics, a normative concern with stability primarily drove writers.

COMPONENTS OF CAPACITY

Capacity is built upon material resources—such as economic wealth and production facilities as well as military capabilities—and individual characteristics, social resources, and political arrangements. Accumulated wealth and current income can be used to purchase commodities and services that can be wielded to ensure autonomy, to gain the cooperation of others in amassing power, and to exercise power over others. Similarly, production facilities can be mobilized to extract, grow, and manufacture instruments for use in achieving political goals. In international politics but also in internal situations, military capabilities afford means for ensuring autonomy and exercising power, both through threats and through the actual use of military power to prevail in contested situations.

Some writers, such as Hannah Arendt in *On Violence* (1970), draw a sharp distinction between power and violence, whereas others, like Thomas Schelling in *Arms and Influence* (1966), have demonstrated the efficacy as well as the limitations of using violence to exercise influence. In maintaining a social order, the latent violence embodied in a police force proves an important component for ensuring domination, and sometimes the actual use of force conveys to society at large the power of the existing order and the high cost of opposition and resistance, thus gaining compliance.

Certain characteristics adhering to individuals also provide capacity. Max Weber, in *Economy and Society* (1978), analyzed the concept of charisma, an attribute of an individual that inspires others to defer to him, allowing the individual to amass power to achieve goals and to exercise power over others. Individuals also command respect and deference, and thus power capacity, by means of intellect and will, by use of knowledge, through rhetoric, by guile, and by the performance of brave and admired deeds.

The quality of personal magnetism provided for Weber one of three types of authority; the others were the traditional authority of inherited leadership and legitimate authority based in law and orderly procedure. These last two stem from social and political arrangements and are thus institutionalized. Whether derived from personal, social, or political characteristics, authority confers on leaders and officials the capacity to achieve values and to exercise power over others.

Social and political arrangements vary considerably in their allocation of authority and distribution of power. For example, monarchical political systems and aristocratic societies provide for inherited offices, titles, wealth, and privileges that confer power on those holding positions. In contrast, democratic electoral systems offer opportunities to many contenders to seek, win, and lose office, while capitalist economic arrangements are based on competition, with rewards for success and risks of failure. Patriarchal social arrangements place men in positions of power over women, whereas egalitarian societies aim for more nearly equal power for men and women. Slave societies structure power so that masters have nearly complete control over slaves. As slave revolts and political revolutions attest, those who are dominated sometimes resist and occasionally are able to overthrow a social and political order and

replace it with another. In both these cases, violence provides the instrument for maintaining and overthrowing systems of domination, although in both cases the violence is organized and wielded in the service of ideas and principles.

In less fundamental circumstances, individuals and groups contend to shape the behavior of those whose power derives from authority. Within polities, citizens, interest groups, and political parties contend over public policy and sometimes over constitutional arrangements. Within business organizations, workers and labor unions resist oppressive forms of domination and strive to control the structure of their working conditions and wages and benefits. Within markets, firms compete not only to gain greater shares but also to shape the rules and structures within which competition takes place. Within families, individuals contend to influence collective decisions and power structures governing family life.

The values human beings seek are countless. Political values include specific policy objectives but also more enduring concepts such as order and justice, equality and freedom, security and stability, and control and checking to avoid despotism and arbitrary rule. Aspirations to domination usually accompany some conception of a future order, but occur sometimes simply to achieve extrication from another group's domination and the achievement of autonomy. Because the future is contingent and others' intentions are uncertain, accumulation of power alone provides an important value in itself.

COLLABORATION AND CONFLICT

Collaboration is essential to gaining political power. Acting together with others through debate and deliberation to agree on common arrangements and objectives provides the basic dynamic for accumulating power. Although such collaboration can occur at many levels and in many ways, the most common comprehensive unit for composing political power in the contemporary world is the nation-state, with nationalism providing the impetus and identity and the state offering the mechanism for accumulating and exercising power. The state establishes the autonomy necessary for operating in a world in which the state form remains the fundamental political organization. Other institutions for political collaboration operate in a context of politics either within states or among them. Accumulated power provides the capacity to achieve goals, but objectives are more often than not achieved in the face of resistance by other centers of accumulated power, or by the actions of others who submit to a determined power wielder.

Thus, conflict characterizes political life as one group or political unit strives to achieve goals against others who may possess the values at stake or who hold incompatible values. Conflict occurs in greatly varied circumstances, ranging from local political issues like school bond issues and zoning decisions, to great matters of state within a polity that run the gamut from conflicts over the suppression of civil liberties and issues of war and peace to mundane issues such as allocating funds for road building, to struggles among states for regional or world domination. Each set of circumstances, to some extent, shapes the exercise of power. Within ordinary local and national politics in well-ordered societies, for example, space has been created to allow conflict to occur without overt violence. On the other hand, armed struggle commonly occurs in situations in which such space has not been insulated from violence, such as civil war situations and deep conflict over the control of territory and political arrangements in international relations.

EFFECTS OF DISTRIBUTION OF POWER

Although cultural and ideological considerations as well as political arrangements contribute to the circumstances in which political conflict occurs, the distribution of power itself shapes the manner in which conflict takes place and the instruments that are employed. In a hierarchical system, especially one in which government holds a monopoly on legitimate violence, conflict mostly occurs without war. In democratic polities, politics provides an arena for contention among groups that employ rhetoric, deliberation through constitutional means, resolution of conflict through legislative and judicial processes, and contested elections. The state exercises power by means of law and administrative routine and the latent power of police and its military monopoly, and it demonstrates its power through rituals, manipulation of symbols, and organizational practices. Other hierarchically organized societies concentrate power more in leaders or relatively small elites, leading to a more arbitrary exercise by the elites. Resistance cannot be channeled through legitimate means, but must be exercised through noncompliance, clandestine behavior, and violence. In such polities, the state usually employs violence more actively against its citizens than democratic polities do.

In anarchical systems, such as those that exist in international politics and civil war situations, power is distributed unevenly but still more equally than in a well-ordered state. The threat and use of force tend to be routine, although diplomacy, law, economic inducements, and institutional means also are brought into play. Distribution of power among more than two major powers in an international system results in greater uncertainty than occurs in a system with only two major powers. Balancing and checking tend to be routine activities in anarchical systems. In systems with a single state whose power greatly exceeds that of others, the leading state may be tempted by hubris in which it overestimates its potential to dominate the system, and resistance and checking are likely to be diffuse; they may also involve violence, even by nonstate actors, because no state or coalition of states may be in a position directly to confront the leading state. Still, the leading state is unlikely to be able to conquer the territories of other major powers whose autonomy remains intact. Structural distribution of power has other, subtler effects, as evidenced by the exponential growth of international nongovernmental organizations as the cold war ended and liberal states, whose ideology encourages nongovernmental political activity, assumed a position of hegemony in the international system.

Within domestic polities, structure results not only from the distribution of power, but also from constitutional or legal allocation of authority, processes, and capabilities. Structures are evident in such arrangements as the allocation of authority between national and provincial or state governments in a federal system and among different branches of government. They tend to be more obscure when they result from policy decisions, for example, tax policies that privilege certain groups who become more powerful over time and injure others who become weaker over time.

In the last part of the twentieth century and continuing into the twenty-first century, neoliberal ideology in favor of privatizing what had previously been public functions produced a trend toward allocating authority to private groups and firms, thus strengthening the structural power of nongovernmental institutions and weakening public ones. This devolution of power to private agencies encompassed not just functions such as cleaning and food provision services, but also police functions such as running jails and providing personal security to government officials in foreign combat zones. Aside from the implications for power, these arrangements diminished public accountability in democratic political systems.

EFFECTIVENESS AND CONTROL OF POWER

A paradox stems from the fact that power needs to be concentrated in order to be effective, while centralized power can easily be abused unless constrained. The problem of instituting means to control power has occupied thinkers who devise governing systems and practitioners who write constitutions. Limited terms of office and contested elections provide constraints in democratic systems, as do accompanying debates, a free press, and political parties. Other constitutional constraints, such as judicial review of executive decisions, have been employed. Governments employ surveillance in their exercise of power, but citizen groups watch over their public officials to hold them accountable. Elites contend for prestige, authoritative positions, and policy preferences, thus checking the power of incumbent elites. Since the rise of professional armed forces in the twentieth century, military leaders in some polities, such as Turkey, have regarded themselves as guardians of the state constitution and intervene against a government when they believe it to have exceeded or abused its power.

Without such mechanisms of control and constraint, authoritarian political leaders have provided many examples of the abuse of power. Abuses range from kleptocracy, in which a ruling elite appropriates the wealth of a country for its private gain, to despotic systems, in which small elites engage in repression of their citizens through torture, killing, and removal of populations on a large scale. In the late twentieth century, liberal governments and nongovernmental groups have organized internationally in attempts to control and constrain such abuses of power through the development of norms, treaties, and institutions as well as direct military intervention and the employment of economic sanctions.

Among international relations writers, there is some division between those who think that stability emanates from concentration of power and others who believe that it is more likely to be achieved through limited diffusion among great powers that check one another. Concepts of concentration of power include concert of power in which leading powers, on the basis of some principle, agree to cooperate in managing the international system. Another view, called power transition theory, holds that the system tends to be dominated by a single power, which is eventually supplanted through the rise of a challenger that replaces it. Similarly, hegemonic stability theory stresses that a dominant power provides the underpinning for an international political economy but that such a power may decline over time and be challenged by a rising power. In long-cycle theory, a system led by a dominant naval power is forged by consensus and rules until it is succeeded by the next power that commands the seas. Most commonly in international relations theory, however, balance of power is the prevalent conception and holds that great power is checked through the opposition and actions of other states that prevent, through diplomacy and war, the assumption of predominance by any single power, as did European powers that checked Napoleon, and the Soviet Union, Britain, and the United States that checked Nazi Germany.

There are also debates among international relations scholars over the fundamental driving forces of power. As neatly summarized by John Mearsheimer in *The Tragedy of Great Power Politics* (2001), there are three schools of thought: human nature realism, defensive realism, and offensive realism. In the first, an innate and universal quest for power drives human beings. The second holds that states seek limited power in order to maintain their positions in the international system. The third argues that the fear of domination leads states to seek unlimited power, which is checked only by inherent material limitations and others acting out of the same motivation. Other views include liberalism, which claims that power is controlled domestically through democratic political systems and internationally through cooperative institutions. Constructivists offer yet another perspective, arguing that international conflict is constructed through intersubjective understandings, thus a less conflictful system can be built through more cooperative discourse and less belligerent interpretations of the words and actions of others.

LEGITIMACY

Whether international or domestic, democratic or authoritarian, those who govern and impose system rules claim legitimacy for their domination, more often than not by asserting that the values that they embody are universal. In contrast, the weak, especially those who feel oppressed or who envision alternative governing arrangements, set forth claims for justice. Such disputes over values themselves form part of ongoing struggles for power. In general, dominant groups tend to stand for stability, whereas subordinate groups tend to advocate for change, and this pattern engenders a dynamic of politics. However, this tendency is not universal; dominant

groups sometimes advocate change to enhance their positions of domination or to bring additional groups within the scope of their rule. Revolutionary regimes frequently aim to spread their revolutions to other countries; but the United States, the leading country at the turn of the twenty-first century and a formidable stabilizing force in the world, has also endorsed changes of regimes from authoritarian rule to democratic rule and has taken actions that have destabilized certain countries and regions.

Legitimacy can be eroded by entropy engendered by incompetence of rulers and corruption within a political system, when a government no longer functions to achieve its declared values. In such conditions, a crisis can be brought on by economic failure, inept attempts to reform political arrangements, and outside pressures that illuminate government failure. In conditions of crisis, vigorous and sometimes virulent struggle occurs as new groups and new leaders seek to create a new order.

CONTINUING DEBATES

In academic debates about power, some writers have drawn attention to *nondecisions*, the fact that certain issues cannot arise in public debate because dominant groups have settled positions not allowing consideration of problems or values that some members of a polity would otherwise bring up. Another concern that has arisen in these debates involves the question of whether individuals and groups sufficiently understand their positions within a system of power to make claims for the values that would serve their interests. This is an unsettled area, but Stephen Lukes, a leading advocate of this view, in 2004 cast doubt on his own previous position, which held that subordinate groups did not understand their own interests.

With varied approaches and alternative interpretations of power, scholarly and public debates continue. Whatever disagreements about the meaning and place of power in politics may be, the use of material resources, individual skills, and social and political institutions in the pursuit of values remains a ubiquitous and universal characteristic of politics. Because individuals and groups aspire to achieve so many values, contention and conflict may be considered the essence of politics. Importantly, individuals and groups need to collaborate to enhance their power resources to achieve their values, and other individuals and groups with different values and objectives are certain to oppose them. Thus, the ancient concept, power, remains a central idea in political science today.

Power Cycle Theory

Power cycle theory explains the evolution of systems structure and the concerns of statecraft, via the generalized cyclical dynamic of state rise and decline in relative power—the state power cycle. The theory discloses essential nonlinearities, or critical points, in the dynamic that affect government decisions about their foreign policy conduct. It explains how the actor and system go from normal periods of statecraft to rare intervals when structural undercurrents suddenly shift the trend on the state power cycle, shattering long-held expectations about future security and foreign policy and greatly increasing the probability of war or conflict.

Since its inception, power cycle theory has been replicated in numerous statistical studies. It provides a robust framework for causal analysis of international political behavior and a practical guide for policy makers assessing the ebb and flow of world power. Additionally, power cycle theory applies to analysis of the market power and behavior of the firm in international political economy.

Power cycle theory transformed the analytic understanding of the structural changes which fractured statecraft prior to World War I (1914–1918), undermining the thesis that Germany would have been master of Europe if it had not gone to war. During the years before the war, in the period of Germany's greatest achievements in terms of absolute power growth, its meteoric rise in relative power abruptly ended and, by 1914, the structural undercurrents turned Germany onto the path of relative decline. Power cycle theory thus exposes the conflicting messages and disturbing surprises in the evolution of the power cycle that make adjustments to structural change so difficult.

The state power cycles evolve as part of a single dynamic that maps the structural trends of history. The principles of

the power cycle explain how differential absolute growth sets the cycles in motion, creating a particular nonlinear pattern of change on each state's relative power trajectory. For instance, a single state growing faster than the systemic norm will initiate change on power cycles throughout the system, altering the systemic norm and the competitive relationships reflected on each state's power cycle trajectory.

When statespersons contemplate future change on a state power cycle, they form expectations regarding the state's future security and foreign policy role. There are five critical points of sudden, unanticipated change at which the statespersons' projected trend of relative power abruptly shifts, creating a crisis of foreign policy expectations. Each critical point on a state's power cycle corresponds to a time in its experience when the tides of history shifted in the international system, calling into question its foreign policy outlook and future security. The five critical points are:

1. Birth throes of a major power: a lower turning point, beginning the state's rise on its cycle.
2. Trauma of constrained ascendancy: an inflection point marking the shift from ever-increasing rise to ever-decreasing rise.
3. Trauma of expectations foregone: an upper turning point, where the rising state peaks and enters decline.
4. Hopes and illusions of the second wind: an inflection point where accelerating decline begins to decelerate.
5. Throes of demise as a major power: a lower turning point where further decline is halted.

What happens at a critical point is a complete deviation from the trend of projected expectations. Competition for power share creates powerful undercurrents that contour structural change via these critical shifts in the trend on state power cycles. Even at the moment of a state's greatest increase in absolute power, with its dynamism undiminished, the state may bump against the upper bound to relative growth and be pulled into relative decline by a much smaller but faster growing state. This tension holds large implications for the debate regarding absolute and relative gains.

Everything changes for the state and system when expectations regarding future security and role are shattered. Governments push and shove in these intervals of high uncertainty where the rules of the game are in flux and the stakes are so high, making wars of large magnitude, high intensity, and great duration statistically much more likely than in normal periods of statecraft, particularly for authoritarian governments. Empirical evidence confirms that a government tries to mitigate fears about security at a critical point by joining an alliance and forming bigger alliances. Militarized disputes, deterrence challenges, and an increased rate of deterrence failure are likewise much more probable in critical intervals.

This dilemma of peaceful change worsens since the role cycle lags behind the power cycle. As a state's relative power increases, other governments refuse to adjust or the state postpones role gratification. As relative power declines, allies demand security and elites want to retain prestige, causing

overextension for states that refuse to adapt. Power cycle theory proposes a dynamic equilibrium that matches strategies of opposition and balance, or of adaptation, to the trajectories of power change of potentially expansionist states.

Power Indices

Since power is perhaps the most important concept in political science, it is natural that political scientists have been looking for correlates of power and, in that effort, found it important to measure it. However, the dispositional nature of the intuitive concept of power makes the measurement difficult. The difficulties encountered are akin to those faced within the study of causal relationships. Given this difficulty, some scholars have focused on the relatively clear-cut settings provided by voting bodies with unambiguous rules—decision rules—for determining which groups of voters form a winning majority. The first assumption made in these studies is that only winning groups—coalitions—of voters have power in the sense of influencing the voting outcomes. The second assumption is that these coalitions all have an equal amount of power.

One way to look at a voter's power in a voting body is to observe how often the voter is a member of a winning coalition. After all, it is the winning coalitions that determine the policies adopted by the body. The more often a voter is present in a winning coalition, the larger influence—it is assumed—the voter has on the policies. Before any coalitions have been formed, it is impossible to tell which kinds of winning coalitions will emerge and, consequently, in how many of them any

given voter is a member. In the *a priori* voting power indices, the concept of swing plays an important role. A voter has a swing in coalition S, for instance, if S is winning when the voter is its member, but nonwinning when the voter is not a member. The Banzhaf indices equate voting power of a voter with the number of the voter's swings when all coalitions are considered. The absolute Banzhaf index, also known as the Penrose-Banzhaf index, divides the number of the voter's swings by 2^{n-1}, while the normalized Banzhaf index uses the sum of all voters' swings as the divisor.

The Shapley-Shubik index, in turn, focuses on permutations of voters, i.e. ordered sequences of them. The total number of all possible sequences of n voters is given by $n! = n(n-1)(n-2)\dots 1$. Among these, a voter's power index value is obtained as the number of such sequences in which the voter has a swing when the winning coalition is formed by adding voters one at the time from the beginning of the sequence. This is the same as giving each swing of a voter in a coalition S with s members the weight $(s!)(n-s)!/n!$ and summing these numbers over all coalitions in which the voter has a swing

The two Banzhaf indices and the Shapley-Shubik index are the best-known indices of a priori voting power, but not the only ones. Another index, the public goods index shares the basic rationale of the Banzhaf indices, but instead of swings in winning coalitions, the number of swings in minimal winning coalitions is counted. Minimal winning coalitions differ from winning ones in that all members in them have a swing.

More recent indices are based on spatial voting games (i.e., they assume voter ideal points in policy space). A voter's power, according to these indices, is measured by the distance of (game-theoretic) equilibrium outcomes and the voter's ideal point.

Power Sharing

Power sharing refers to a set of institutional arrangements that secures every major political force a position in government. Proportional representation, which encourages the coexistence of multiple political parties in the legislature, is a prominent example. Power sharing arrangements, however, are often a combination of mechanisms that ensure political diversity not only in legislatures, but also in executive offices—national or subnational.

Institutions of power sharing are almost always adopted as a response to actual or potential armed conflict, reflecting an attempt to manage violent rivalries of ethnic, religious, or purely political roots. Two or more parties share control of political power when the exclusion of one party would induce rebellions or escalate into civil war. Different combinations of power sharing institutions result from different types and territorial configurations of conflict.

The parliament was the main locus for power sharing in the earliest cases in the modern world—involving the introduction of minority representation in nineteenth-century Western Europe and Latin America. Such institutional innovation was oligarchic governments' response to divisions within the elite, or to the emergence of mass political parties. Power sharing at the level of the executive power has a subnational and a national formula: federalism, which is especially suited for managing conflict among geographically concentrated political forces, and grand coalition governments, which grant every significant party a position in the national cabinet and veto power over major decisions. Both mechanisms are core elements of various peace proposals in multiethnic settings in contemporary Africa.

Power Transition Theory

In international politics, power transition theory is a theory about the causes of major interstate wars. It emphasizes shifts in relative power among the dominant states as a primary catalyst for conflict. First set out by A. F. K. Organski in a 1958 textbook, power transition theory uses the metaphor of a pyramid to describe the hierarchy of states within the international system. At the top of the pyramid is a hegemon or a dominant power, whose supremacy is defined not only by a preponderance of material resources but also by political stability. Hegemonic ascendance is impermanent, however, and beneath the hegemon are a roiling clutch of *great powers*, or states that represent potential rivals to the hegemon and play their own part in shaping the international system, ever eager to assume the top spot. Beneath those are the middle powers, which may possess some regional significance, followed by the small powers.

According to power transition theory, the likelihood of stability and therefore peace, is greatest when a hegemon has

established a clear and credible dominance over the system. Hegemonic powers maintain global order; more precisely, they use their military and economic strength to set up global or regional regimes that increase their own security while promoting systemic stability. These regimes, which typically include a bundle of international political and economic institutions (but also, less formally, norms of global behavior), are designed to benefit both the dominant power and other states that agree to play by the rules of the hegemonic order. Such rule abiders are defined as *status quo states*, opposed to revisionist states that are dissatisfied with their place in the international order and wish to change the rules by which the international system functions.

Power transition theory emphasizes the dynamic and cyclical nature of international relations. Hegemons cannot stay on top for long—inescapable differences in rates of growth, institutional sclerosis brought on by the growth of vested interests at home, and the lure of imperial overstretch abroad all contribute to the eventual decline of the dominant power. According to power transition theory, the probability of war is greatest when a declining hegemon is being overtaken by a rising great power. Thus, if dominance keeps peace, a decline in dominance or confusion over the hegemon's status leads to war. In the dangerous period of power transition, the impulse toward war may come from either the hegemon or the challenger. The hegemon may see a benefit in waging a preventive war to thwart the challenger's imminent ascent; the challenger, meanwhile, may be eager to correct the perceived imbalance in the international system and give itself a place in the sun commensurate with its rising status. Either way, such hegemonic wars at the point of power transition usually create a new hegemonic power and a new order after the transition, leaving the hegemonic cycle to begin anew. Hegemonic wars alter the international system in accordance with the new distribution of power, eliminating the ambiguity that arises when a rising power challenges a dominant state.

Power transition theory is typically contrasted with balance of power theory, which arrives at fundamentally different conclusions despite starting with some common fundamental assumptions. Both theories emphasize the role of power and material interests in shaping international outcomes; both assume that states are the primary actors in global politics. Where the two theories fundamentally diverge, however, are on the consequences of power distribution. Power transition theory finds stability in the imbalance of power and argues that greater imbalances lead to greater stability. Balance of power theory, on the other hand, argues that stability is best achieved when power distribution is approximately symmetrical, precisely where power transition theory expects conflict to be greatest. While balance of power theory emphasizes the lack of order in the international system and the difficulty of hegemonic bids, power transition theory instead views international relations as episodes of stability within a hierarchical global system interrupted by bouts of hegemonic wars.

The two views may be usefully reconciled by noting that the likelihood of war may be greatest in times of transition between very imbalanced and very balanced systems—in other words, that both extreme inequality and extreme equality of power produce a degree of certainty, and thus decrease the likelihood of war, while systems between those two extremes are more prone to war. As a matter of historiography, balance of power theory traditionally focuses on European land-based military competition, while power transition theory often focuses on the international system as a whole, with a greater emphasis on naval superiority; this disjunction in scope may explain some of the disconnect between the two theories.

Pragmatism

The term pragmatism refers to a theory of meaning, justification, and inquiry that was developed in the United States in the later nineteenth century. It has since enjoyed broad, if sometimes sporadic, influence in philosophy, political science, sociology, legal studies, and, more recently, in literary theory, and also the humanities more generally speaking.

MAIN IDEAS

Pragmatic thought begins with the so-called pragmatic maxim, which says, "There is no distinction of meaning so fine as to consist in anything but a possible difference of practice." The pragmatist holds that any meaningful belief commits one to a particular set of expectations regarding the likely consequences of a given course of action. For example, if one believes that something (e.g., a diamond) is hard, then one is committed to the expectation that it will not be scratched by other substances under normal conditions.

If the meaning of a belief consists in the consequences that are expected to follow from acting on it, its validity depends on whether or not those expectations are met in practice. To the extent that they are not, one is said to be in a state of doubt with respect to that belief. For example, if one believes that a given stone is a diamond, and finds that it fails to scratch glass, then that belief will be thrown into doubt. Doubt for the pragmatist is always practical doubt; that is, to be in doubt is to be uncertain about what to do—just as to have a belief is to be disposed to do things in a certain way. The response to doubt is to posit a new belief—a hypothesis—that would account for the doubts, identifying the consequences that would be expected to follow if that belief were correct, and then acting—experimenting—in such a way to see whether those consequences follow in practice. The pragmatic theory

of inquiry is thus closely related to, and was in fact inspired by, the methods of modern experimental science.

According to the pragmatist, inquiry necessarily begins with the beliefs that one actually has—not from a self-evident, context-independent foundation—and when one or more of belief is thrown into doubt inquiry is conducted in order to arrive at better ones—better, again, in the sense of better answering the practical demands of a given context, not of meeting a universal or timeless standard of truth. The pragmatist is therefore not concerned to show how valid beliefs are possible in principle, but only to determine how one should go about revising beliefs once a particular doubt arises.

For the pragmatist, it is not beliefs themselves, but only changes in belief, that are in need of justification—just as for Galileo and Isaac Newton it is not motion itself, but only changes in motion, that are in need of explanation. In fact, doubt itself is only possible against a background of stable beliefs, just as motion can only be perceived against a background of stable reference points. Thus the pragmatist endorses fallibilism while rejecting skepticism: any one of an individual's beliefs might be called into doubt at any given time, but it is literally unthinkable that all of this person's beliefs might be called into doubt at the same time.

HISTORY
The philosopher and logician Charles Sanders Peirce (1839–1914) first formally stated the pragmatic maxim in an essay titled "How to Make Our Ideas Clear," published in 1878. Peirce's work was largely ignored until his more famous friend, the philosopher and psychologist William James (1842–1910), drew on it in the lecture "Philosophical Conceptions and Practical Results" that he delivered at Berkeley in 1898, and in a series of essays and lectures that he published over the course of the next decade. It was James who first publicly used the word *pragmatism* to describe Peirce's views, and by applying Peirce's maxim to controversial questions such as the existence of God, the reality of free will, the meaning of truth, and the implications of metaphysical pluralism, he brought the term to the forefront of philosophical debate.

The philosopher and educational theorist John Dewey (1859–1952) most systematically developed pragmatic ideas. Dewey extended these ideas into nearly all of the traditional areas of philosophical inquiry. Along with the sociologist George Herbert Mead (1863–1931), Dewey was also responsible for introducing pragmatism into the social sciences. The pragmatic tradition was largely neglected from the time of Dewey's death until the 1970s, when the philosopher Richard Rorty (1931–2007) drew attention to the connection between Dewey's work and some of the central themes in twentieth-century philosophy. Rorty's writings helped spark a rich and far-reaching revival of pragmatic thinking that continues to the present day.

INFLUENCE IN POLITICAL SCIENCE
The four aspects of pragmatic thought that have had the greatest influence on the study of politics are (1) its antiessentialism about concepts, (2) its social theory of meaning, (3) its community-oriented theory of inquiry, and (4) its anti-foundationalism about matters of justification.

Pragmatists were among the first to argue that social scientists should study the actual practice of politics, rather than the formal properties of political institutions or the formal relationships between political concepts. Prominent examples of this line of inquiry include Oliver Wendell Holmes's legal realism, Arthur F. Bentley's process-oriented theory of governance, Harold J. Laski's pluralistic theory of sovereignty, and Dewey's functionalist theory of the state.

The idea that meaning is constituted through social practices has led some pragmatists to conclude that social life ultimately rests on communication oriented toward mutual understanding. This idea, which is most closely associated with the work of Mead, has been especially influential in recent German social theory, playing a prominent role, for example, in Jürgen Habermas's theory of communicative action and in Axel Honneth's theory of mutual recognition.

The idea that knowledge is best acquired through experimental inquiry has given rise to a distinctively pragmatic strain of democratic theory. Dewey, for example, associates democratic citizenship with participation in an open and inclusive community of inquirers, and Habermas's defense of deliberative democracy, along with that of Karl-Otto Apel, relies heavily on Peirce's idea that truth is best thought of as the ideal endpoint of collective inquiry.

Pragmatism's antifoundational implications have been most influentially explored by Rorty, who argues that social criticism necessarily begins and ends with the *ethnocentric* self-understandings of a given community. His pragmatic weaving together of themes from postanalytic and postmodern philosophy has given rise to a novel and influential defense of liberalism and has also helped to inspire, among other things, a pragmatic jurisprudence and a pragmatic literary theory.

Prebendalism

Prebendalism is one form of decentralized patrimonialism. Patrimonialism refers to an organization, usually a state, in which the administration and military force are purely personal instruments of the ruler or leader. Prebendalism is a type of patrimonialism in which officials are supported by benefices, including provisions in kind from the personal resources of the ruler, rights to the use and profits from land, or the appropriation of property income, fees, or taxes. Other forms of patrimonialism include feudalism and rule by local notables. Centralized forms of patrimonialism include sultanism and patriarchalism, with more authoritarian state systems.

There are many historical examples of prebendalism, including income given to church administrators in the form of cathedral estates, land given to elites on the Ottoman Empire in exchange for military service, and various waivers of fees and taxes given to important clients of African states. Nigeria is a classic example of such exchanges for loyalty to the state. Prebendalism is sometimes an accepted practice, and at other times considered a form of corruption, depending on the legal setting. The main danger of prebendalism from the perspective of rulers is that they will lose control of the assets they have given as benefices, and thus their resources and power will devolve from the ruler to the benefice holders.

Prebisch, Raúl

Raúl Prebisch (1901–1986) was an Argentine economist and politician. His seminal contributions to structural economics provided the inspiration for dependency theory and import substitution industrialization (ISI) in Latin America. As president of Argentina's Central Bank, director of the Economic Commission for Latin America and the Caribbean (ECLAC), and secretary-general of the United Nations Conference on Trade and Development (UNCTAD), Prebisch was instrumental in the formulation of Latin America's innovative trade and development policies during the mid-twentieth century.

Prebisch was born on April 17, 1901, in Tucumán, Argentina. He studied economics at the University of Buenos Aires from 1918 to 1922, and in 1923 began teaching political economics at the university, a post he held until 1948. During these early years, he demonstrated a strict adherence to free trade orthodoxy, a position supported by the booming Argentine export sector during the 1920s. However, with the devastation of Argentine economy during the Great Depression, Prebisch changed his position and became an advocate of Keynesian economics.

In 1935 Prebisch was appointed president of the Central Bank in Argentina. In this position, he and his colleagues began wrestling with the economic effects of the Great Depression. By reexamining British economist David Ricardo's theory of comparative advantage, Prebisch noticed that supply conditions for primary products—those produced through farming, fishing, and forestry—were significantly different from those conditions that characterized secondary, or manufactured, products. The income elasticity of demand for secondary, or manufactured, products was greater than that for primary products. Specifically, as incomes rose, the demand for manufactured goods increased more rapidly than the demand for primary products. This notion is best expressed in the famous anecdote that as incomes rise, people will buy more cars, televisions, and stereos, but "they can only drink so much coffee." Consequently, countries exporting primary products and importing secondary, or manufactured, products would experience declining terms of trade. For Prebisch, this situation appeared to define the trade sectors of most Latin American countries.

In 1950, while serving as executive secretary of ECLAC, Prebisch made his significant breakthrough on the problem of declining terms of trade, in *The Economic Development of Latin America and its Principal Problems* (1950). The thesis argued that there was a growing gap between the incomes of less developed countries and advanced industrial societies because of a long-term decline in the prices of primary products, which happened to define the export sectors of developing countries. The reason for this long-term decline was due, in large part, to the difference between the income elasticity of demand for secondary products versus primary products. Consequently, countries exporting manufactured products and importing primary products (the advanced industrial core) were able to retain and reinvest savings from manufactured production in unions, higher wages for value-added production, and commercial institutions. In contrast, countries exporting primary products and importing manufactured products (the less developed periphery) had fewer and fewer savings from primary production to reinvest in wages and commercial development. In fact, peripheral countries were required to export more primary products in order to get the same relative value over time.

The implication of this idea was that peripheral states were being drawn into an increasing state of underdevelopment and dependency upon the core states through participation in international trade, where the peripheral states became the producers of raw materials for the core's lucrative manufacturing sector. Over time, the benefits of this international trading relationship would increasingly accrue to the core. Han Singer, a German economist, also independently arrived at a similar conclusion and, as such, this theory of declining terms of trade became known as the Prebish-Singer thesis. After this finding, ECLAC and Prebisch became the center of Latin American economic activism and the Latin American school of structural economics.

Although he still advocated continued trade with advanced industrial societies, Prebisch sought to encourage Latin American governments to stimulate domestic manufacturing in order to reduce their reliance on manufactured imports and primary exports. This idea was later used to justify a policy that became known as import substitution industrialization (ISI). He also advocated for regional economic integration, land reform, and political reform to reduce the income inequalities and overcome the structural impediments to the development of domestic

markets. By July 1963, however, as ECLAC and the policy of ISI began to show serious flaws, Prebisch left the organization.

Between 1964 and 1969, Prebisch served as the secretary-general of UNCTAD. In this role, he molded the organization into an advocacy body for development. Specifically, he adopted a trade-focused approach to development, with particular emphasis on regional integration and preferential access to markets for developing states. He also publicly criticized ISI for having failed to bring about proper development. Disillusioned with the bureaucracy and failures of UNCTAD, Prebisch resigned in 1969. In 1984 he returned to Argentina to work with the newly elected democratic government of President Raúl Alfonsín. Prebisch died on April 29, 1986, in Las Vertientes, Chile.

Precedent

A precedent is a judicial decision regarded as providing a new rule for deciding similar cases that may later arise. Precedents from higher courts are typically binding upon lower courts within the same judicial system. The doctrine of *stare decisis*, or "stand by things decided," directs a court to follow and uphold its own prior decisions as well; however, in many judicial systems, this is not an absolute duty. As traditionally formulated, precedent does not extend to the entirety of a prior decision but only to the considerations relevant to the result, otherwise called the *holding*.

The practice of following precedent is primarily associated with common law jurisdictions, such as Canada, England, and the United States. Some civil law systems, more commonly found in continental Europe, exhibit related, less stringent, practices of adhering to prior long-settled points of law. Justifications for the practice of following precedent include promoting stability and predictability, reducing decision costs, and constraining judicial discretion. In those exceptional circumstances in which a court overrules one of its precedents, the decision to do so is usually based on determinations that the precedent is no longer relevant due to changed societal or legal conditions, is obviously incorrect, or has proven itself unworkable in practice.

Predatory Government

Predatory government refers to a condition in which corruption, inefficiency, and abuse of power mark political institutions. Predatory governments typically lack transparency or a system of checks and balances to prevent abuses by one or more government branches. Bureaucracies may be weak or ineffective, or they are highly powerful constituting the ruling class and often act unchecked or unaccountable to the population. Predatory governments typically allow only a low level of economic and personal freedom for its citizens, and often come in authoritarian forms, such as dictatorships or oligarchies. The ultimate form of predatory government is a *kleptocracy*, meaning "rule by thieves," in which political leaders use their positions and power to enrich themselves to the detriment of their citizens.

The notion deeply intertwines with traditional Western liberal criticisms of the potential power of the state. The growing size of modern government sectors, especially in the economic sphere, has led to charges of predatory government action in developed democracies. The use of regressive tax systems or fees is often cited as a manifestation of predatory governments failing to provide for the common good despite largely benefiting the elite classes. Another example is the use of large public expenditures to support projects of policies expected to have a limited impact on the citizenry, but beneficial to a leader's personal interests or personal contacts. In 2000, former Indonesian president Suharto was placed under house arrest for the alleged embezzlement of half a billion U.S. dollars from government donations to finance his own personal investments. By 2004, the German nongovernment organization, Transparency International, declared Suharto misused approximately $15 to $35 billion during his thirty-two years as president in Indonesia.

. . . . TOM LANSFORD

Preemption

Many political scientists draw a major distinction between preemption and preventive war. Some define *preemption* as action taken when an enemy attack is imminent, such that the term should not be applied when an adversary poses a longer-term threat. Others point to the nature of the logic driving such actions, with preemption referring to situations where the offense is favored in warfare, such that either side will feel driven to attack if war is imminent, by the mere calculation of how to be a winner rather than a loser on the battlefield. The logic of *preventive war*, by contrast, is not driven by an offensive-favoring cast to military weaponry, but by forecast of the trends in military, economic, or demographic power, as one may be stronger than an adversary now, and weaker in the future.

MORAL VERSUS ANALYTICAL ASSESSMENTS

Leaving aside analytical disputes, an important part of the debate may instead derive from the world's strong moral preference for peace over war. Preemption, in this *moral* balance, is a situation where war is now inevitable, and the choice is then simply between one kind of war and another—the war that captures the advantages of striking first and the war where the other side gains this advantage.

Arms control experts and people in general lament the situation that drives opposing states into such a war and hope to avoid such situations by seeking *crisis stability* or *strategic stability*, by avoiding the weapons that favor the attack, and by stressing the kinds of weapons that reward sitting on the defensive. When wars are straightforward actions of preemption, they become *no-fault* wars, where neither side wanted war, but each wanted to avoid being defeated in a war. The situation of the adversaries is very much that portrayed in the game theory *prisoners' dilemma*, where both sides wind up in a bad situation, because they fear something even worse.

In this moral assessment, a preventive war by contrast amounts to a conscious choice to replace peace with war for the present. The world would remain at peace for months or years or decades into the future, while diplomatic means are explored for the resolution of disputes, while worst-case fears of future trends are proved or disproved. Rather than blaming the situation, the peace-loving audience condemns the national leader who makes the choice to launch such a war—a war that did not have to happen.

THE BURDENS OF LEADERSHIP

In defense of any leader launching such a war, however, is the heavy responsibility for protecting a nation's safety, so that worst-case assumptions are recognized as very real. If an adversary is rolling tanks toward a nation's border, the response of anticipatory self-defense is accepted as preemption. However, if this adversary is simply training new troops, or developing new military technologies, or merely growing in population and industrial strength, these scenarios challenge the parameters for defining first moves of a coming attack. Preemption may be characterized as the case where war was inevitable, so that there was no peace lost in the actions taken. But the national leader charged with looking far into the future may see such war as inevitable, and thus may feel that the decision for action does not reduce the total of world peace in the process.

NONMILITARY EXAMPLES

The phenomenon of preemption is hardly confined to military conflict, for it is found in many examples from ordinary life in law-abiding domestic society. The term most generally refers to an action taken in anticipation of an action by an opposing actor. The ploy of the preemptive bid in the card game of bridge serves as one familiar example.

While the occurrence of negative campaigning in any electoral contest in a democracy is generally deplored, the logic behind such negativity is often a calculation that one's opponent may score a point with some mudslinging the following morning; in this case, the candidate likely moves to beat the opponent to it with some such attacks the prior evening. If the electoral public is inclined to frown on whoever makes personal attacks in a campaign, the temptation to launch such attacks, and the fear that someone else is about to launch them, lessens, and the prisoners' dilemma disappears. When the public, however, tends to be titillated by such attacks and to believe that there must be some truth to the charges, it is very difficult to avoid the traps of preemption.

AMERICAN ATTITUDES IN THE PAST

With regard to international military conflict, those who want preemption confined to very narrow bounds likely cite what may be the most significant American contribution to international law, the Caroline doctrine developed in an 1841 note by Secretary of State Daniel Webster in response to an 1837 British preemptive attack on an American ship in the Niagara River loaded with arms intended for rebels in Canada. Ironically, supporters of the American incursion into Iraq today argue that one should not make too much of the Caroline doctrine, but the international legal community has often cited the parameters proposed by Webster, that a preemptive attack could only be justified if the opposing attack were immediately imminent, and that the preemption must be proportionate in scale to the attack being fended off.

Skeptics about such a standard emphasize that this doctrine emerged when Britain was dominant on the high seas, and America was weak, and when Britain had professed a willingness to engage in preemption or preventive war more generally if its naval preponderance was ever challenged. Such skeptics also cite the example of the Nazi threat of world dominance in the 1930s, and the prospect of terrorist attacks today with weapons of mass destruction, as arguments that a much broader array of preemptive attacks may have to be legitimate.

Preferential Voting

Preferential voting occurs within the framework of a particular type of ballot structure, used in both single-winner and multiple-winner elections around the world. Examples

include the alternative vote and single transferable vote systems. Unlike nonpreferential ballots where voters mark an *X* or checkmark next to their preferred candidate(s), preferential ballots have an ordinal structure, requiring that voters rank candidates in order of preference. Within this framework, voters mark a 1 next to their first choice candidate, 2 next to their second choice, 3 next to their third choice, until the required number of preferences are exhausted.

In determining the election outcome, ballot counting incorporates not only the votes for those ranked with 1, but also includes the rankings that follow. In the alternative vote system, for example, a candidate requires 50 percent or more of voters' support to win the race. If no candidate wins 50 percent of first preference votes, then the candidate with the fewest votes is dropped, and the second preferences on the dropped ballots are reallocated to all of the remaining candidates, and so on, until a candidate obtains more than 50 percent of the votes. Proponents of preferential systems argue that they allow for greater voice and participation for those preferring third party candidates and minority parties, whose votes would be "wasted" under other systems, since although their first choice candidate may not win the race, the preferences remaining on their ballots are transferred, and will play a role in the outcome of the election.

Prerogative

Prerogative, according to the political philosopher John Locke, is "this power to act according to discretion for the public good, without the prescription of law and sometimes even against it." Locke's notion of prerogative has influenced the development and understanding of executive powers and responsibilities in modern constitutional government, and it is to Locke whom most refer when discussing this concept. Prerogative has a long, rather controversial, history and has been defined and used differently over time. As a result, it remains one of the most perplexing concepts to students of constitutional government.

The term stems from Latin *praerogativa,* which literally means "ask before," which was a procedure during the Roman Republic whereby a segment of the assembly (chosen by lot) would cast their votes first and thus influence the outcome of the vote. Prerogative later became associated with the privileges and powers of feudal lords in medieval Europe (those who were asked first before all others) and eventually with those of the European monarchs, with the royal prerogative of the British Crown emerging as the most well-known example. The royal prerogative was defined as the collection of powers and privileges belonging to the British monarch exclusively and not subject to review or repeal. Prerogative was entirely discretionary and included any act that the Crown, or its ministers, exercised without any consultation of Parliament. Prerogative powers separated the monarch from everybody else,

placing the king above the law. As the English jurist William Blackstone suggests, prerogative "can only be applied to those rights and capacities which the King enjoys alone, in contradistinction to others, and not to those which he enjoys in common with any of his subjects."

In his renowned study *The Constitution of England,* Jean Louis de Lolme offers a list of the British Crown's prerogative, which included granting titles of honor, coining money, performing as supreme judge or head of the Church of England, interacting with foreign nations (to include the prerogative to initiate war and sign treaties), and raising armies and navies and directing them in times of war. In exercising its prerogative, the king, accordingly, is "above the reach of all Courts of law whatever, and that his person is sacred and inviolable." Perennial conflict arose from the prerogative existing among the most important powers and privileges of the nation, vesting them solely to the monarch subject to no other body—and on occasion violent revolt—between the Crown and Parliament over the arbitrary exercise and abuse of this power and attempts to limit it.

Over time, as the power of the monarch within the British political system decreased, the residual prerogative has become associated with the unilateral powers exercised by the ministers and other members of the executive branch within British Commonwealth countries. Similarly, scholars of the American presidency have applied this conception of prerogative to refer to unilateral executive action exercised to accomplish particular domestic and foreign policy objectives. These prerogatives, though controversial, are usually contained within the interpretive purview of the president's powers.

In his *Second Treatise,* John Locke shifted the focus of prerogative away from the particular powers of the monarch to a broader framework of emergency powers within limited constitutional government. Prerogative, more specifically, emerges as a means to describe the extraordinary and extraconstitutional powers exercised by a government's executive branch in times of emergency.

Locke frames the exercise of prerogative power as a fundamental tension between a constitutional government's need for a strong and extraordinary executive power in times of danger while also aiming to prevent the abuse of such power and bound the executive by the rule of law. Locke, among others, recognized the disadvantages that legislative bodies would have in trying to prescribe laws to meet the various contingencies the political order might encounter. Therefore, Locke suggested that, in time of danger, the executive ought exercise extraordinary powers and even act outside of the legal order to preserve it, as long as such measures were done for the public good. The uncertainty of the dangers that a government might face from war, natural disaster, or other catastrophic event led Locke to conclude that the executive must be equipped with a potentially unlimited reservoir of power to ensure the safety and survival of the state.

Locke's expanded notion of prerogative, in essence, highlights the tension between natural and positive law in that the latter may, on occasion, be violated to realize the former.

Modern political philosophers, Locke among them, suggested that self-preservation was the fundamental tenet of the natural law. His argument was that, in times of danger, the executive must be able to take discretionary actions outside of the scope of the written positive law, and violate it if necessary, to preserve oneself. Due to its seemingly unlimited and arbitrary nature and the potential for severe abuse, prerogative poses problems for constitutional government and liberal democracies that seek to limit power and protect individuals. It may, in practice, be tantamount to nothing more than a mere veil to tyranny operating on behalf of the public good.

Presidencialismo

The Spanish term presidencialismo is common throughout Latin America and refers to the concentration of political power in the office of the presidency. This fact of political life has several explanations. First, Spanish colonies were ruled for more than three hundred years by absolute monarchs and highly centralized top-down hierarchical arrangements. Following the Wars of Independence in the early nineteenth century, politics was dominated by *caudillo* figures, or "strong men on horseback," who seized power through strength of personality or ruthlessness, and who bent legislators and judges to their will. Competing sources of power were largely absent. As electoral politics began to take hold in the latter part of the nineteenth century, political parties were for the most part personalist vehicles for individual leaders seeking the presidency, not consistent policies or ideologies.

During the first few decades of the twentieth century, more and more Latin American countries experimented with electoral democracy, but this frequently meant semidemocratic rule at best and sometimes harsh and brutal rule by presidents who cemented themselves in office through a variety of techniques, legal and illegal. Extreme personalist examples include Alfredo Stroessner of Paraguay (1954–1989) and Rafael Trujillo of the

Dominican Republic (1930–1961). Such presidents often wrote (or had written for them) constitutions that gave them considerable power, but the question of how long such a president could rule remained unclear. A military *golpe de estado* or coup was one way to terminate a president's administration; another was constitutional proscription on immediate reelection, a legal device that had been used since the nineteenth century. But this period of experimentation came to an end starting in 1964 with a coup in Brazil that was followed by many others, until by the late 1970s only Colombia and Venezuela had civilian governments in South America.

Since the decade of the 1980s, all Latin American countries, except Cuba, have returned to electoral democratic rule, and the great majority did so under newly written constitutions. These documents in general carry on the tradition of a strong chief executive and give significant power to the president and, for the most part, much less to the legislature. As a rule, and there are many variations on this theme, presidents are given a great deal of formal and informal discretion; if they have a majority in the legislature, their power may be virtually unlimited. In addition, most Latin American constitutions give presidents the power to rule by decree; that is, they can issue laws when they wish to do so without consulting or the approval of the legislature.

There is considerable variation on the question of reelection. Some countries have strict no-reelection policies (e.g., Mexico); others allow it with an intervening term or two terms, while still others allow immediate reelection or reelection after an intervening term. A strong party can indeed be reelected time after time (e.g., again in Mexico from 1929–2000), but such dominance may be due more to party strength rather than a single individual. Whatever the case, these variations illustrate the tension between the tradition of a strong chief executive and the historical record of abuse of such strength.

Presidency and Women

Scholarship on the presidency and women was in its infancy until the 1980s. This is perhaps because the areas perceived as most visible in producing action on the part of women and tangible outcomes of research measurable through quantification (e.g., appointments) did not fully embrace the office of the presidency or women in a common or systematic direction until the presidency of Jimmy Carter. Although the field of public administration had already begun to look at women throughout the federal civil service, and historians had long taken note of the contributions of women such as Clara

Barton, it was only the occasional creative political scientist who took a fresh look at the role of the president vis-à-vis women. A focus on substance of legislation and actions of the president, rather than institutional and constitutional processes, would have produced a different outcome in the political history that commonly became reproduced in books and articles.

WOMEN PROTESTORS AND LOBBYISTS

Theda Skocpol's seminal work, *Protecting Soldiers and Mothers: The Political Origins of Social Policy in the United States* (1992), provides a deeper understanding of the vetoes on the part of presidents beginning in the late 1880s. Skocpol notes that the vast number of vetoes had to do with private bills passed by Congress seeking relief not only for civil war veterans, but also for widows of the six hundred thousand veterans killed on both sides of that war. The issue was centrally focused on the relationship between women and the presidency in the broad area of social policy. Political scientists who focus solely on the long-term struggle for power between Congress and the presidency, and the increased and then decreased use of vetoes in understanding shared and separated powers in the Constitution, fall short in their analysis without noting the substance of those vetoes, and the major constituent group—women—affected by policy decisions on pensions.

Clear documentation exists that women have been petitioning the president as lobbyists for over one hundred years. Early photos taken in the decade after the West Wing was added to the White House prominently show women in the lines of lobbyists, documenting their role in following their First Amendment responsibilities to petition government for a redress of grievances.

WOMEN IN GOVERNMENT ROLES

The rise of women's organizations, with a focus on labor interests, child welfare, and workplace safety, as well as the professional interests of women, became a major concern and received the attention of some administrations. Jane Addams lobbied President Theodore Roosevelt on behalf of children. Frances Perkins—later named by President Franklin D. Roosevelt to the post of secretary of labor and the first woman appointed to a position as secretary in a president's cabinet—became acquainted with Roosevelt following the tragic Shirtwaist factory fire in New York City in 1911. Roosevelt, Robert Wagner, and Al Smith were all in the New York legislature at the same time and passed legislation to create the New York State Factory Investigation Commission, later formed with Wagner as chair, and Frances Perkins as the commission's secretary.

Structural barriers kept women from posts in the foreign service, and therefore women did not have many opportunities for involvement in foreign policy decision making until the late 1990s. Positions as ambassadors were also constrained, although presidents who drew from an appointment pool outside of the careerists in the foreign service were more likely to include women in their ambassadorial pool, and women have now been appointed as ambassadors since the 1930s. Therefore,

the management styles of presidents did reflect how women were included in an administration, as well as the president's perspective of the foreign service career. When appointments were drawn from the pool of careerists, few women would serve as ambassadors; when ambassadors came from a pool of political appointees, the percentage of women selected for the rank of ambassador increased.

There has been progress for women advancing to the highest ranks in the foreign policy decision-making apparatus of the White House. Madeleine Albright served both as the foreign policy adviser to Bill Clinton during his presidential campaign and later as the first female secretary of state during his second term of office. Condoleezza Rice served on President George H. W. Bush's national security staff, and then as foreign policy adviser and secretary of state in the second term of President George W. Bush. In addition, President Barack Obama selected Hillary Clinton as secretary of state, and she challenged Obama for the Democratic Party's presidential nomination. Nonetheless, until the 1990s, women did not make the same gains overall in serving in high-level positions in the areas of government foreign and defense policy. Women have long been actively discouraged from joining the foreign service through its examination and appointment policies, resulting in a number of lawsuits against the State Department.

The move to an all-volunteer army during the Nixon administration, coming coincidentally at the same time as the push for an equal rights amendment (ERA), created new opportunities for women and minorities to rise through the ranks. In order for an all-volunteer army to succeed with a sufficient number of recruits, a certain number of minorities and women were required. The linking of the two issues—support for equal rights for women and breaking down barriers for women and minorities in military service—eventually led to the service academies accepting applications from women, and positions long closed to women in the military began to open up. Once women gained combat experience in an official capacity, they moved up the ranks to serve in the highest posts in the Department of Defense.

With the growth of the executive branch and the establishment of the Executive Office of the President, some of the roles and activities of women within the White House became more formalized. The Office of the First Lady was established in 1978, which recognized the long-established working relationship between the president and his spouse. In addition, studies in the past ten years have focused specifically on the topic of the presidency and women, examining the broader role many first ladies played as true advisers to the president, with archival research offering much evidence of this.

WOMEN'S CONNECTIONS WITH THE WHITE HOUSE

Several decades ago, political scientist George Edwards, a prolific author of studies on the presidency, urged scholars to adopt a behavioral approach to their work. This led to some of the first work on presidents and women when the National Academy of Public Administration established

databases on presidential appointments. As scholars continued to add to this work, some aspects became the derided "bean counters" President Clinton harped upon as the numbers of women appointed and confirmed in each administration were counted, noting the cycle of appointments made to women. Also noting women's federal judgeships as well as titles and roles in the White House, the procedure accounted for the experience of these women in prior department or federal sector work; job experience in Washington; work on a congressional staff, interest group, or party organization; as well as lower-level posts. Another topic of studies focused on presidential speeches, along with choice of advisers and strategies for managing information.

In terms of policy, judicial scholars have begun to place attention on the solicitor general in texts on the presidency. The solicitor general, rarely the focus of presidency studies, has been highly important in setting the agenda of the Supreme Court in cases of particular importance to women in the past thirty years—such as reproductive rights, affirmative action, and equal opportunity. However, references to the bully pulpit and communications studies continue to omit an area rich in potential research. The suffrage movement and the ERA are areas in which presidential rhetoric could have some potential influence. Most studies that have focused on these topics, however, have not turned to the presidential archives for a detailed examination of the president's role in amendment processes, which is far more limited than the congressional or state legislative role. For example, the case of President Jimmy Carter is a good one for reexamining specifically what a president could do in passage and ratification of an amendment versus the major role a president can play in the policy process in general. Questions thus arise regarding what policy options were forgone with the focus in the late 1970s on the ratification of the ERA, and whether President Carter could have done more.

Also uncertain is whether the role of the president was fully understood by the time of the 1980 campaign. This issue is one that is particularly important for political scientists to turn to as various amendment drives take hold. Even the case of suffrage should be refocused with a critical examination of the role Woodrow Wilson could have taken. This would help clarify the separation of powers and a federal system, the rhetoric of a president, and the constitutional powers and limits on a president. It would also be useful in understanding larger issues such as war powers in terms of leadership and what presidents can and cannot do, as well as how they explain their role and choose their actions, and what constitutes the essence of their decision-making process. For amendments, what policy work a president chooses to not spend time on can also be examined. With the reintroduction of the ERA in the 110th Congress, these questions are relevant for the incoming administration, and for women in particular.

Press/Fourth Estate

The term *the press* refers to the idea that the major news media outlets in a country, taken together, perform important functions necessary for governance, acting collectively as an important institution alongside the official governmental institutions. The phrase *fourth estate* first appeared in print from Thomas Carlyle in 1837 in reference to the revolutionary war in France, where Carlyle suggested that the "able editors" of the newspapers played an equal role to the recognized three estates of prerevolutionary French government: the church, the nobility, and the bourgeoisie or commoners. Carlyle attributes this phrase to Edmund Burke, who he quotes as saying there were three estates in the British parliament, but that the reporters' gallery was an estate more powerful than them all.

PRESS/FOURTH ESTATE IN THE AMERICAN POLITICAL SYSTEM

The phrase *fourth estate* has translated well into American politics, with the suggestion that in addition to the three official branches of government—the executive, legislative, and judicial branches—the press acts as a fourth branch of government. In this conception, the press is expected to provide a conduit of communication between the government and the people, relaying all-important information about government to the citizens, and also to be a watchdog, or provide checks and balances on the three official branches of government. There is some indication that the Founders of the United States shared this view, in that freedom of the press is provided for in the First Amendment to the United States Constitution, and subsequent court decisions have expanded the freedom of the press.

U.S. free press protections expanded on those traditional under British law in preventing the press' prior restraint on publication of information and allowing only for prosecution after the information was disseminated. Since this time, all major democracies have adopted protections of freedom of the press, in recognition that the media play important roles in

democratic governance. Despite these protections and perhaps the intentions of democratic governments to delegate these duties to the media, scholars have suggested that the media, and especially commercial media driven by profit motives, are ill-suited for performing these functions in a democracy.

MODELS OF GOVERNMENT AND PRESS RELATIONS IN DEMOCRATIC SOCIETIES

Scholars have identified three models of media as political institutions in Western democracies. The liberal model is the most prominent model, typified by the United States, Canada, and, to a lesser extent, the United Kingdom. In the liberal model, the government exerts very little influence over the media in terms of content, and, in the case of the United States, in terms of funding. In all liberal model countries, there are laws preventing the government from interfering in the production and dissemination of news, with the U.S. First Amendment protections the strongest in this realm. Political parallelism, or the connections between the press and the major political parties, is low in liberal countries, allowing the press to be independent and critical of all parties. In most cases, the press follows norms of internal pluralism—also known as the objective model—whereby the major viewpoints on an issue present in society are included within a story. Commercial media dominate in liberal model countries, though the government may make significant investments in public broadcasting, as occurs in the United Kingdom and Canada. Though fewer governmental restrictions and plentiful funding through commercial sources allow the mass media to be critical of government and to investigate government wrongdoing and corruption, research has demonstrated that government officials have a strong influence on the content of the mass media in liberal model countries.

A second model, the polarized pluralist model, is characterized by strong state intervention, both in terms of content and funding. The primary audience of the press in polarized pluralist countries is elites, and there is a high degree of political parallelism, with newspapers or television programs often representing the views of a particular political party. Reporters

The media mob British politician Margaret Thatcher during a 1979 election. In the British, liberal model of the media, the government exercises no control over press content, though it does invest in public broadcasting.

generally present only one viewpoint in their stories; external pluralism of views is provided at the level of the media system, with different outlets presenting differing views. Spain and Italy are examples of countries where the media institutions developed along this model. In this conception, the role of the media is to foster communication within political parties, and from the government to the people. The watchdog role is less prominent.

The third model scholars have identified is the democratic corporatist model. This model is characterized by a coexistence of government-sponsored media and commercial media. Sweden and the Netherlands provide examples of this model. In these media systems, the level of political parallelism is between that found in the liberal model and the polarized pluralist model, with newspapers and broadcasts representing the positions of particular social groups, rather than specific political parties. This system rejects the objective model and operates according to the norms of external pluralism, where each social group expresses its views through particular outlets. In democratic corporatist countries, discussions about the role of the media involve balancing the watchdog role with the role of promoting communication within and between particular social groups. To this end, the government provides heavy subsidies for public broadcasting and regulates media content in regards to issues such as hate speech in order to maintain civil dialogue.

All of these models represent different ways in which media can develop as a set of political institutions within a democratic system. In each system, the media perform critical functions of communicating information from the government to the citizens, from citizens back to the government, and fostering discussion among citizens about politics. These models vary in their focus on these roles.

CRITICISMS OF THE PRESS/FOURTH ESTATE CONCEPT

The idea of looking at the media as a fourth estate or at the press as an institution in government has been criticized for failing to take into account the wide variety of norms across media organizations in the same country, and for attributing motives to collective news organizations rather than to individual journalists.

Pressure Groups

A pressure group is widely defined as a group of people who come together to influence policy on a matter of mutual interest. Other terms commonly used to refer to pressure groups are *special interest groups* and *lobbies*. Interest groups are found in every society, autocracies and democracies, in the world. They are distinct from political parties in that they do not field their own members for political office, but rather attempt to influence policy through the existing set of policy makers, including executives, legislators, political parties, dictators, ministers, bureaucrats, judges, and international organizations. Groups may be formally or informally organized; be interested in a single or a wide range of issues; and be temporary entities or permanent organizations with dedicated budgets, staff, and space. They organize across a range of issues and geographic locations. Some examples are the Beijing Software Industry Association, a local single-sector economic interest group; the American Civil Liberties Union, a national multi-issue social group; and Greenpeace, an international environmental group.

Pressure groups employ a wide range of resources and tools to influence policy, including legal and illegal financial donations to policy makers, technical and political information, media campaigns aimed at influencing public opinion, member demonstrations, and the votes of their members. Strategic decisions regarding whom to lobby, how to lobby and when to get involved in the policy process vary as a function of the nature of issues, characteristics of groups, and the institutional and regulatory environment of countries.

An active community of interest groups allows members of society to represent their interests and concerns to policy makers at all stages of policy making and allows policy makers, in turn, to benefit from the information and expertise of such groups. The belief that such interactions bring better representation, more equitable distribution of benefits and costs, and better policy in both democratic and authoritarian systems has led international organizations and aid agencies—such as the World Bank, the United Nations (UN), and U.S. Agency for International Development (USAID)—to promote civil society groups and business organizations as essential components of democratic and economic reforms. However, the evidence of success has so far been mixed.

In many countries, groups with money or political connections have frequently dominated access to policy makers. Critics argue that success in influencing policy and its consequences, therefore, has accrued primarily to these groups. Furthermore, by flushing the political system with money, rich pressure groups have also increased political corruption and constrained political competition. These critics thus argue that pressure groups have come to dominate the political process to an extent that they are undermining the integrity of the democratic process and need to be constrained.

Proponents point to the experience of many developing countries where pressure groups in favor of reform were critical to overcome the resistance of traditional elites and entrenched

bureaucracies who were opposed to beneficial economic and political reforms. Similarly, social interest groups in repressive regimes have successfully lobbied governments to increase social and media freedoms, release political prisoners, and redress public officials' infractions. These scholars argue that designing appropriate regulatory systems that require pressure groups to disclose their membership, the sources of their funds, and their lobbying actions, as well as instituting high penalties for illegal behavior, will minimize their costs without sacrificing their benefits.

However, without more evidence, the debate about the appropriate role of interest groups in society cannot be resolved. Most of the current knowledge about pressure groups is based on information from a few developed democracies like the United States, United Kingdom, and the European Union. For most of the world, there is little systematic evidence on basic questions about how pressure groups organize and lobby in these countries, whether they are able to exercise any influence on policy, and what their net impact on society has been.

Price and Wage Controls

Wage and price controls are government policies designed to restrict the movement of wages and prices to their natural equilibrium market values. In a free market, prices tend toward an equilibrium value that equates the supply of a good or service with its demand. In conditions of excess demand, shortages cause prices to rise, and in conditions of excess supply, surpluses cause prices to fall. If rising prices are an issue of economic and political concern, consumers may lobby the government for the imposition of price controls known as price ceilings. If falling prices are of concern, it is the producers who may lobby for relief in the form of price floors.

PRICE CEILINGS

Price ceilings are legally established maximum prices that prevent market prices from rising. The irony of such policies is that shortages will result if they are effective because shortages are the source of rising prices. Reductions in supply or rising demand in markets for goods or services in controlled markets will only worsen the shortage problem. History reveals many significant trials of price ceilings. The trials have nearly all yielded the same results: shortages, rationing, black markets, costly implementation and enforcement, and quality deterioration of products. Also commonly known as a price freeze, price ceilings have been used at times as an attempt to control inflation. It was believed that combining price controls with restrictive demand policies would reduce or halt inflation, when, in fact, it is the latter doing the work. Changing a price with a stroke of a pen does not solve the underlying problem of rising prices at its source, whereas reducing demand or increasing supply would.

A price ceiling imposed on gasoline at the beginning of the summer season provides an example of how price controls work. Rising demand from summer travel increases the number of consumers at the pump. An increase in the demand for gasoline increases the demand for the resources used to produce it. With a fixed price, rising costs, and falling profits, gas station owners may simply let the gas pumps run out. The Nixon and Carter gas price controls of the 1970s are well remembered by drivers of that era. Long gas lines, empty pumps, per diem gas purchase limitations, and other such forms of rationing were common. Lower U.S. domestic oil production and exploration were also direct results. In 1981, Ronald Reagan removed gas price controls as one of his first official acts. Gas prices rose immediately, as expected, to their equilibrium levels but then later declined as production increased and consumers found ways to reduce their gasoline use via smaller, lighter, more fuel efficient cars and such strategies as moving closer to work. Despite the lessons learned throughout history, price ceilings are still being implemented. Examples include the energy price controls behind the California energy crisis, rent controls in major cities such as New York and Los Angeles, threats to control health care prices, and the repealed gas tax in Hawaii.

PRICE FLOORS

In the case where falling prices are an issue of economic and political concern, producers are the ones who lobby the government for the imposition of price controls known as price floors. Price floors are legally established minimum prices that prevent prices from falling. Examples of such policies include minimum wage legislation and agricultural price supports. Price floors carry the same appeal as price ceilings, an active government intervention into a free market for the sake of

fairness. However, for a price floor to be binding, it must be set above the market equilibrium. Prices above equilibrium generate surpluses as producers that otherwise would have dropped out of the market expand production. In order to maintain a price floor, the government must buy the surplus at taxpayer expense. In the case of minimum wage, if it is raised high enough to be binding, individuals who otherwise may not have worked seek employment, and firms, facing rising costs and reduced profits, consider reducing their workforce. This surplus of workers now represents an increase in unemployment.

Priestley, Joseph

Joseph Priestley (1733–1804) was an English intellectual who wrote more than 150 books as well as numerous letters and sermons in the various disciplines of history, literature, theology, moral philosophy, politics, rhetoric, and physics. His discovery of oxygen and writings on electricity and chemistry gave him entrance to the Royal Society in 1766. He wrote comprehensive treatises about science, such as *The History and Present State of Electricity* (1767).

In addition to being a renowned scientist, Priestley was a rational dissenter. While a member of the "Club of Honest Whigs," an eighteenth-century discussion group of supporters of the American colonists, Priestley wrote his central political work, *Essay on the First Principles of Government* (1768). In *Essay,* which has been said to come directly from English philosopher John Locke's *Second Treatise of Government* (1689), Priestly argued for religious liberty, universal toleration, and separation of church and state. He also wrote *A Free Address to Protestant Dissenters* (1768), in which he argued for broader religious tolerance than Locke had advocated. Unlike Locke, Priestley believed atheists should be tolerated, and he rejected Locke's view of the integral relationship between civil and ecclesiastical authority. Priestley adopted the Socinian belief that Jesus Christ was only human, and, like most rational dissenters, he espoused the centrality of scripture and human reason

Motivated by his opposition to Scottish theologian John Brown's argument in *Essays on Shaftesbury's Characteristics* (1751) that government should play an important role in the moral formation and education of children, Priestley wrote *An Essay on a Course of Liberal Education* (1765), advocating civil liberty and government nonintervention, based on his belief in individual intellectual freedom. Making a distinction between civil liberty and political liberty, Priestley viewed society as an aggregate of individuals rather than a community. The role of civil power was to ensure individual freedom, which would result in the common good. However, his strong belief in civil liberty did not translate into political liberty. Priestley thought voting should be based on wealth, and he did not believe that equality and political participation were essential principles for reform.

Priestley's early and lifelong influence from English philosopher David Hartley's *Observations on Man* (1748) came to fruition in Priestley's conflation of matter and spirit. The multiple volumes of Priestley's *The Institutes of Natural and Revealed Religion* were published between 1772 and 1774. In these volumes, he stated that God's will and plan for the universe governed how human liberty would be used. Priestley's writings became quite millenarian under his monistic perspective on divine causality. In *A Free Discussion of Materialism and Philosophical Necessity* (1778), he asserted his deterministic philosophy against his reformer colleague, Scottish minister and philosopher Richard Price.

Because of his support for the French Revolution (1789–1799), which he saw as a precursor to the millennium and the second coming of Christ, Priestley's house, laboratory, and church were destroyed. In 1794 Priestley and his wife left for the United States, where they were welcomed in Philadelphia by President George Washington. Priestley remained active in his intellectual and scientific endeavors, becoming a member of American statesperson Benjamin Franklin's American Philosophical Society. He kept himself out of politics in America as he had in England, and continued his work as a minister, scientist, and writer. Priestly established the first Unitarian church in America.

Primaries

Primaries are preliminary elections to select a political party's candidate or candidates for public office. Primaries are a form of candidate selection with an inclusive *selectorate,* the body that selects candidates for an election. This contrasts with more exclusive *selectorates,* common in many longstanding

European democracies, where the party organizations, such as party leadership bodies or activists, typically select the candidates. Primaries are common in the United States where they are used to select legislative and executive candidates; while not the norm in the rest of the world, they are increasingly apparent.

TYPES OF PRIMARIES

There are several types of primaries, and can be distinguished by who is allowed to participate. Participation in *closed primaries* is restricted to members of a particular political party. In this case, for example, only registered Democrats would be able to participate in the Democratic Party primary. *Open primaries* allow voters to participate in any political party's primary regardless of formal party affiliation or lack thereof, and voters need not publicly declare in which primary they will participate. Using the U.S. example again, an independent or registered Republican could opt in the polling booth to participate in the Democratic Party primary, but would not be allowed to participate in another party's primary.

There are further variations in these procedures. Semiclosed primaries allow party members and voters who are unaffiliated with a party to participate, or allow voters to change their party affiliation on primary election day. Semiopen primaries require that primary voters publicly declare their choice of party ballot on primary election day.

The second important distinction is between direct and indirect primaries. In indirect primaries, like those for the U.S. presidency, eligible primary voters select delegates who have typically declared their commitment to a candidate and in some cases are legally bound to support that candidate. These delegates subsequently select the candidate at a party meeting or convention. Eligible primary voters directly determine the candidate or candidates for the general election in direct primaries. This is more common in Latin American presidential primaries.

USE OF PRIMARIES

Primaries are generally associated with candidate selection in the United States, where they have been employed the longest. However, while still not the rule, primaries are now used in a variety of countries, and there is evidence of their use increasing worldwide, particularly for selecting presidential candidates.

The trend toward presidential primaries is evident in Latin America. Presidential primaries have been held by at least one party in countries as diverse as Argentina, Chile, Colombia, Costa Rica, Mexico, and Uruguay. South Korea and Taiwan have also employed primaries to select presidential candidates, and in the Spanish parliamentary system, the Spanish Socialist Workers' Party (PSOE) allows party members in some instances to select candidates for executive offices.

Primaries have also been employed to select legislative candidates in countries such as Argentina and Israel, and many European democracies, including the Labour Party and Conservative Party in the United Kingdom, have employed some form of membership vote to select legislative candidates. However, party membership in Europe, which requires paying membership dues and implies a stronger partisan commitment and perhaps activity, contrasts significantly with the limited requirements and obligations of party registration in the United States. Therefore, membership ballots and primaries in Europe to date tend to be less inclusive and more controlled by the party organizations than are primaries in the United States.

EFFECTS OF PRIMARIES

Because primaries permit more people to participate in candidate selection, they are often characterized as enhancing political transparency and openness and strengthening internal party democracy. Primaries open an additional arena to broader participation of citizens opposed to having candidate selection controlled by party activists or a more limited group of party leaders. In this way, primaries may also increase the legitimacy of those selected. Proponents of primaries argue that this broader selectorate makes public officials (successful candidates) more responsive to citizens. Some also argue that presenting a greater array of precandidates to the primary electorate produces better candidates in the general election; in effect the primary process rewards, or punishes, candidates based on their campaigning skills, political positions, and their ability to appeal to a large pool of voters.

On the other hand, primaries lengthen the electoral process and can prove expensive and exhausting for both the electorate and the candidates. Also because candidates from the same party compete with one another, primaries can divide the party and make it difficult for it to unite prior to the general election or to present a unified party platform. The primary process can also make representatives more beholden to campaign donors who candidates may need to win the primary election, and can make representatives less loyal to their political parties; the less the political party organization controls candidate selection, the less it may be able to count on elected officials' support for party positions, and party discipline in the legislature accordingly weakens. Primaries may thus create a style of politics that focuses on the individual characteristics of candidates opposed to party platforms and policies.

There is also much debate in the United States about whether primaries polarize politics. Despite allowing a greater degree of participation in candidate selection, voter participation in primaries tends to be low, and those who participate may be more extreme than the average party voter in the electorate as a whole. For example, more conservative-than-average Republicans may participate in the Republican Party primaries and more liberal-than-average Democrats may participate in the Democratic Party primaries, which can lead to candidates in the general election who are more extreme than the average citizen. Open primaries may better reflect the general electorate, but they can also give rise to strategic voting whereby voters support the perceived weakest candidate of another party to enhance the electability of their preferred party and candidate in the general election.

Prime Minister (Head of Government)

In a parliamentary system of government, a prime minister is the head of the cabinet that constitutes the executive branch of government. Instead of being popularly elected to the post, a prime minister holds office as long as the cabinet maintains the confidence of a majority of popularly elected members of parliament. As the name implies, a prime minister ranks first among ministers, but shares collective responsibility to parliament with other ministers in the cabinet.

BRITISH SYSTEM

In the United Kingdom, where a single party normally holds a majority of the seats in Parliament, the leader of that party automatically becomes the prime minister. In such circumstances, the government expects a parliamentary majority to endorse its legislative proposals. If members of parliament (MPs) in the governing party refused to give a vote of confidence in their own party leadership, this would split the party.

A prime minister is also responsible for leading the respective party to victory at the next general election. The concentration of media attention on the prime minister's campaign role is often described as leading to the *presidentialization* of politics. However, unlike a president, a prime minister's term of office is usually not fixed. The prime minister can be forced out of office in the middle of Parliament's term if opinion polls indicate the prime minister's government is unpopular and headed toward electoral defeat. In the past half century, the British prime minister has more often left office under midterm pressure from within the governing party than because of electoral defeat.

UNDER PROPORTIONAL REPRESENTATION

In many parliamentary systems, a proportional representation electoral system results in no party having a majority in parliament. To gain office, a prime minister depends on support from members of parliament of parties that have fought each other at the preceding election. A coalition cabinet can distribute major offices between two or more parties that collectively have a parliamentary majority. If a large party is short only a few seats of a majority, then a larger party can be joined by a smaller party. For example, a "red-green" coalition could exist between a large social democratic party and an ecological party. If seats in parliament are widely distributed among half a dozen or more parties, a coalition cabinet may consist of three or more parties, as is usually the case in Belgium or the Netherlands. A large party can sometimes govern even though it has a minority of seats in parliament if opposition parties are so divided they cannot join together to defeat the government in parliament. A prime minister must be a political manager to maintain the unity of a coalition government and avoid some members quitting to force an election or a coalition under a different prime minister.

In a single-party government, the task is to manage frictions among competing interests and competing personalities, because the cabinet will contain several ambitious colleagues who aim to succeed to the top office. A prime minister can use the power of patronage to silence potential critics by giving them an important ministerial post, and those hopeful for a cabinet job can compete in showing loyalty to the prime minister.

POLICY RESPONSIBILITY AND THE CABINET

The chief policy responsibility of a prime minister is to represent the country internationally. For example, when the British prime minister is in contact with the U.S. president, the prime minister deals with the White House, while cabinet ministers of finance and defense deal with their opposite numbers in the U.S. Treasury or Pentagon. In the European Union's Council of Ministers, each prime minister meets with twenty-six other heads of government to deliberate on European Union issues.

Collectively, the dozen or more cabinet ministers responsible for departments concerned with the economy, social affairs, defense, law, the environment, and local government have far more time to deal with issues than the prime minister. They, and their civil servants, together form the core of the executive branch. The constraints of the clock limit the amount of time a prime minister can devote to any one issue. Therefore, the first decision a prime minister must make is whether to get involved in an issue—and on matters of little electoral importance, the prime minister may allow a cabinet minister wide leeway. The formation of a coalition government often involves a formal agreement acknowledging that different parties can take the lead in different ministries, thus creating "no go" fields where the prime minister cannot intervene.

A prime minister is responsible for balancing competing demands from cabinet colleagues, such as the desire of health and education ministers to spend more money on popular policies and of the treasury minister wanting to deliver popular tax cuts. In striking a balance, the prime minister takes into account how the government's taxing and spending measures will influence the electorate as well as the economy.

MIXED SYSTEMS

In a strictly parliamentary system, the formal head of government may be a monarch or president chosen in ways that deny that office electoral legitimacy. Countries such as France and Russia have a mixed system in which there is a president elected separately from parliament, as well as a prime minister leading the dominant party in parliament. General Charles de Gaulle devised a constitution for the Fifth French Republic in which the president was institutionally dominant. However, there have been periods when party control of the presidency and of the French Assembly and prime ministership have differed, creating an uneasy coexistence.

The Russian Federation Constitution, prepared by President Boris Yeltsin in 1993, not only gave many powers to the president, but also created the office of prime minister, appointed by the president but requiring the support of the Duma, or parliament. The presidency became even stronger under Vladimir Putin. However, because he was constitutionally prevented from standing for a third term, in 2008 Putin used his role as leader of the United Russia Party to become prime minister and nominated a young protégé, Dmitry Medvedev, to succeed him as president. This brought about a major shift in the balance of power between the offices of prime minister and president.

Priming

Priming refers to the effects a stimulus has on a person's processing of future information. According to Lars Wilnat, "In essence, priming is built on the assumption that the frequency prominence or feature of stimulus activates previously learned cognitive structures and influences interpretations of an ambiguous stimulus." That is, priming makes the stimulus more accessible, which influences information processing.

Priming is used to explain media effects. For example, television news coverage has been shown to significantly affect the standards by which viewers judge politicians. For example, if the media focuses on the economy, the president will be evaluated on the state of the economy. Some scholars argue that media priming is a result not of attitude accessibility, but rather trust in the media.

Priming also figures prominently in the survey response literature. Survey respondents often base their answers to questions on what is most accessible in memory, which is the result of a prime caused by recent news reports, conversations, or even previous survey questions. Psychologists have explored the underlying mechanisms of priming, revealing that factors such as the intensity, frequency, and recency of the stimulus all affect how and whether a concept or issue can be accessed and applied to a new evaluation. It has further been shown that the priming of one concept will also bring to mind related concepts. Priming is frequently associated with agenda setting—and often dismissed as a variant of agenda setting, or vice versa—since both rely on similar causal mechanisms.

Primitive Communism

The idea that humanity experienced a long period of primitive social equality prior to the formation of political communities and states has been a recurring theme in political philosophy since at least antiquity. Expressed most prominently in the idea of a *state of nature*, the notion of primitive social equality played a key role in theoretical systems of the various social contract theorists of Europe, beginning in the sixteenth century. Thomas Hobbes, John Locke, and Jean-Jacques Rousseau all argued that prior to the development of the state, humanity lived in a type of anarchy in which all people were responsible for their own personal security and well-being.

ROUSSEAU

The concept of the state of nature came closest to an idea of primitive communism for eighteenth-century Enlightenment philosopher Rousseau. In Rousseau's theory, the state of nature was a generally positive condition for humanity, in which equality abounded and people were free from the oppressive control of others. According to Rousseau, the founding of the political community was not a progressive

act, but a step backward for the human race in which some morally bankrupt individuals, interested in their own private wealth and advancement, ensnared the rest of humanity into what Rousseau considered to be the decadence of modern society. Rousseau, writing in prerevolutionary France, looked at the inequality around him—embodied by the decadent aristocracy—and harkened for a previous age of simplicity and equality.

MARX AND ENGELS

Rousseau's conception of the state of nature was a prime influence on the social, political, and historical ideas of the eighteenth century German revolutionaries Karl Marx and Friedrich Engels. Like Rousseau, Marx and Engels looked at the world around them and were disgusted by the social and economic inequality of a new burgeoning capitalist society. However, they argued that capitalism was but one transitory epoch in the historical evolution of human societies. Marx and Engels believed that capitalism was the last stage of class society in human evolution, followed by the emergence of a communist society in which class distinctions were eliminated and humanity lived according to its needs. Marx and Engels believed that capitalist society generated its own gravediggers in the proletariat—the industrial working class—who, because they had no property of their own to defend, could lead humanity towards the classless society.

However, Marx and Engels argued that the future stage of communism would not be an entirely new phenomenon. They believed that prior to the evolution of class societies in antiquity, humanity lived in a stage of what they called *primitive communism*. For Marx and Engels, under primitive communism humanity lived a stark existence in which small tribes were forced to battle nature, and often rival tribal groups, in order to survive. However, this daily fight for survival made it necessary for early humans to organize themselves in very tight-knit egalitarian communities, where social distinctions were absent or temporary. The theoretical idea of primitive communism allowed Marx and Engels to argue that the material and social inequality of their time was not natural or inevitable. Humans did not always divide themselves into classes or exploit one another for material gain.

For Marx and Engels, primitive communism foreshadowed the future postcapitalist society of *modern communism* in its social equality and its lack of class antagonisms. However, as materialists, Marx and Engels did not idealize primitive communism as Rousseau did in his version of the state of nature. Instead, they argued that primitive communism was a *communism of scarcity* and as such was unable to provide for the full development of human potential. They argued that the long historical period of class societies was necessary in order to develop humanities' productive forces so that a *communism of abundance* could emerge in the postcapitalist epoch. For Marx and Engels, primitive communism was thus the original stage of history that eventually leads to a new phase of communism in which many of the positive features of the primitive era are recreated in the context of material abundance.

The most famous reference to primitive communism in Marx and Engels's work occurs in a footnote Engels added to the *Communist Manifesto* (1848), in which he corrects a passage on the opening page that reads "…the history of all hitherto existing societies is the history of class struggle." Engels's footnote corrects this passage to acknowledge the existence of the primitive commune.

In later works, in particular Marx's *Ethnological Notebooks* (1880–1882) and Engels's famous *The Origin of the Family, Private Property and the State* (1884), the pair expand upon the idea of primitive communism. Marx's notebooks continue to be an important source for Marxist scholarship on non-European societies, while Engels's book continues to inspire Marxist and feminist debates on the family and the origin of the oppression of women. Their work on the primitive commune—Engels's work in particular—was inspired by the writings of the nineteenth-century American anthropologist Lewis H. Morgan, and his theories on kinship and relations between materialism and social structures based on studies of Native American Indians.

LEGACY OF THE MARXIST NOTION

While other approaches, such as anarchism and psychoanalysis, have taken up the issue, the Marxist idea of primitive communism—or the primitive commune—has dominated most discussion of this idea in modern political science. Political theorists have attempted to evaluate the veracity of this idea in the wake of anthropological evidence and historical experience. The idea remains the source of much controversy today. Some argue that the Marxist idea of the primitive commune does not escape the colonialist assumptions embedded in the theoretical dichotomy between *primitive* and *modern*, while others argue that it does not withstand the scrutiny of modern anthropological research.

Principal-agent Theory

Principal-agent theory is based on a hierarchical notion of political relationships that traces back to the politics-administration dichotomy first enunciated by Woodrow Wilson in 1887. Politics involves deciding who gets what, while administration deals with how—and arguably, when—it is delivered. For Wilson, at least

rhetorically, the solution was simple: separate politics from administration, and develop a science to guide administrative matters. The reality, which Wilson recognized, is that administration requires grants of discretion, is often hard to monitor, and translates into political power. Principal–agent theory is thus interested in identifying the conditions under which agents, those who administer programs, can be expected to act as faithful instruments of political principals. Because those who decide the answer to political questions are often not those who administer the programs, *agency*—defined as "acting for"—is at the heart of principal-agent relations.

Originally developed in microeconomics, like theories of the firm and transaction cost economics, agency theory focused on shirking (or not working) by agents. Shirking was attributed to either of two possibilities: *adverse selection,* which involves choosing an agent that lacks the skills or resources required to complete the assigned task; or *moral hazard,* which involved choosing an agent whose goals were in opposition to the principals. In economics the central concern involves minimizing the cost of information acquisition so that one can avoid either adverse selection or moral hazard, or both. In adapting to fit the interinstitutional dynamic in a political setting, the primary focus has been on explaining and minimizing problems associated with moral hazard, while studies of elections and judicial selection tend to focus on adverse selection. As Terry Moe explains, adverse selection focuses on picking the right agent for the job, while moral hazard involves controlling agents after the selection process. This later task is particularly difficult, since it is often hard to determine what agents are doing and if their actions result in goal achievement.

CONTROL EFFORTS: THE PRINCIPAL SIDE OF THE MODEL

Some of the earliest efforts to use a principal-agent approach in political science involved those interested in investigating the conditions conducive to congressional control of bureaucracy. Early studies married agency theory with formal models to demonstrate that control is possible through a combination of *police patrols* in which congressional committees acted as overseers when engaged in oversight, or through *fire alarms* in which interest groups called congressional attention to bureaucratic drift. Critics of these studies used a combination of empirical work and formal models to demonstrate congressional control was far from certain, suggesting a number of factors unique to the political realm complicated the effort to apply agency theory in a political setting.

The efforts to develop a more accurate depiction, and parsimonious theory, focus on both the principal and agent parts of the model. On the principal side, the first modification includes multiple principals, notably the president, but also the courts and interest groups. With the addition of multiple principals, there is recognition that agent actions not in accordance with a particular principal's goals might not involve either moral hazard or adverse selection, but instead result from agent responsiveness to a rival principal. Rather than emphasizing control, recognition of the existence of multiple, often times

competing, principals moves the discussion to an investigation of the conditions under which the *influence* of agent's action are possible. These studies conclude that influence is a product of both issue salience (i.e., how visible an issue is and who pays attention to it), and issue complexity (i.e., how technically complex the issue is and how complicated the tasks required to realize goals are).

Quite simply, high salience issues have the potential to involve more principals, who in turn send mixed signals to agents. On the other hand, highly complex issues tend to limit participation and often result in greater levels of discretion granted to agents. The recognition that salience and complexity vary over time, and present different types of agency problems, also attracted the attention of those who are more interested in modeling the agent part of the model.

UNDERSTANDING MOTIVATION: THE AGENT SIDE OF THE MODEL

On the agent side, those who study bureaucracy insist that understanding agent motivation is the key to explaining why bureaucracy does what it does. The argument, in brief, is that bureaucratic actions are a product of a combination of factors—self-interest, previous experience, professional training, organizational culture, and clientele influence. An agent's choice of activity is more complex than simply choosing between the option of working or shirking borrowed from microeconomics. The choice to work, leisure shirk, dissent shirk, or engage in sabotage is a product of individual motivation, conditioned by the organizational and political setting. While most agents work, the possibility of leisure shirking fits well into the economic-based model. The latter two options—dissent shirking and sabotage—recognize that when agent goals clash with what they are being asked to do, they can choose to slow down their work effort (dissent shirk), or actually pursue a course of action designed to realize goals diametrically opposed to those of a particular principal (sabotage). Focusing on bureaucratic motivation suggests adverse selection is a potentially significant problem in agency.

A PROBLEM BY DESIGN

In the end, agency is especially bothersome because so much of what agents do, and the effects of what they do, is hard to determine. James Q. Wilson suggests that there are really four agency problems, distinguishable by whether a principal can monitor the outputs (work) or outcomes (results) of agent actions. William Gormley and Steven Balla propose that principals need to employ a mix of screening mechanism, institutional design, and oversight to mitigate these problems—but conclude all involve shortcomings if the goal is to achieve perfect control. This arrives back at the starting point, a principal's delegation of authority to an agent is at heart problematic, but also an unavoidable feature of any political system.

Prisoner's Dilemma

In political science, one of the most popular game theory tools, the prisoner's dilemma, is a nonzero-sum game in which two suspects of a crime are arrested and each given the option of either accusing the other prisoner—*defect*, in game theory jargon—or stay silent—cooperate. Jail terms attach to the four resulting combinations such that each player's order of preferences is: unilateral defection (DC) > mutual cooperation (CC) > mutual defection (DD) > unilateral cooperation (CD). This configuration makes defection the dominant strategy for both players.

The prisoner's dilemma describes and analyzes strategic political interactions characterized by the relative payoff structure, and its peculiarity is that the Nash equilibrium solution, DD, is a Pareto-inefficient point, as all players would be better-off if they could move to the unstable solution, CC. Put differently, this game illustrates domestic or international situations in which reciprocal cooperation is advantageous for all actors involved, but it is nonetheless difficult to achieve because of the incentives at work. Examples include disarmament, trade wars, and the provision of public goods.

Given the problematic nature of the prisoner's dilemma, political scientists have devoted much effort to studying the conditions under which stable cooperation is possible. Two of these are the intervention of a superimposed enforcing agency, such as the state, or the infinite, or indefinite, iteration of the game.

Prisoners of War (POWs)

Since ancient times, the status of prisoners of war has been an indispensable aspect of warfare and their treatment has oscillated between extermination, enslavement, ransom, and practices of exchange and parole.

The ethics of war have been a hotly debated feature of international relations since the seventeenth century. Hugo Grotius raised issues regarding the ethics of war in his seminal work, *The Law of War and Peace* (1625). Grotius examined the laws of war from two different perspectives: *jus ad bellum*, the law concerning the rights of states to engage in armed conflict, and *jus in bello*, the law governing how wars are to be fought once they have started. Generally the status of prisoners of war is covered by the principles of *jus in bello*. In the same period, the development of the idea of the nation-state after the 1648 Westphalia agreement shifted the control of prisoners of war from the individual captor to the sovereign. Consequently, the economic exploitation of war captives for labor or ransom was regularized.

In the nineteenth century, the *just war* tradition that Grotius discussed in *The Law of War and Peace* began to be formally declared as positive law. In 1862, a code of rules was developed for the conduct of the U.S. Civil War (1861–1865) in accordance with President Abraham Lincoln's directions. This code was known as General Order 100, or Lieber's Code, and was the first formal code of law to regulate an army's conduct toward enemy soldiers since ancient Rome. In this sense, the United States played a key role in developing humanitarian and legal doctrines concerning prisoners of war. About the same time, in 1863, the International Committee of the Red Cross was established in Geneva and an international conference adopted the Convention for the Amelioration of the Condition of the Wounded Armies in the Field in 1906. Furthermore, a series of international conventions were held to contribute to the development of an internationally recognized law of war. These were formulated during conferences in Brussels in 1874, The Hague in 1899 and 1907, Copenhagen in 1917, and Geneva in 1929 and 1949.

The 1929 Geneva Convention concerned the treatment of prisoners of war. It completed the rules of the previous regulations by prohibiting reprisals and collective punishment

A captured Israeli soldier holds up a newspaper in a video made by militants in Gaza. Under Geneva Conventions, a prisoner of war is anyone who has fallen into enemy hands, though questions arose in the aftermath of the September 11, 2001 attacks as to whether non-state actors fall under the prisoner of war designation.

SOURCE: Getty Images

against prisoners of war. In 1949, after World War II (1939–1945), the Geneva Convention was revised and replaced with four conventions, each of which deals with different aspects of the conduct of war. The third Geneva Convention is primarily concerned with the treatment of prisoners of war. Nearly every state in the world has agreed to be bound by these conventions. Today, many provisions of the Geneva Conventions are considered as customary law.

Article 4 of the third Geneva Convention defines prisoners of war as persons who have fallen into the power of the enemy. Article 4 defines eight categories to classify prisoners of war: (1) members of the armed forces of a party to the conflict; (2) members of other militias and members of other volunteer corps; (3) members of regular armed forces who profess allegiance to a government or an authority not recognized by the detaining power; (4) persons who accompany the armed forces without actually being members; (5) members of crews, including masters, pilots, and apprentices; (6) inhabitants of a nonoccupied territory, who on the approach of the enemy spontaneously take up arms to resist the invading forces; (7) persons belonging, or having belonged, to the armed forces of the occupied country; and (8) persons belonging to one of the categories enumerated in the present Article, who have been received by neutral or nonbelligerent powers on their territory and whom these powers are required to intern under international law.

Prisoners of war were defined as being in the power of the government that held them prisoner and the captor government was responsible for the safety and humane treatment of prisoners. The Geneva Conventions provide that prisoners of war must be quartered in conditions that meet the same general standards as the quarters available to the captors' forces. Even though interrogation of prisoners is not prohibited, all forms of mental and physical pressures to elicit intelligence information are forbidden.

Recently, as experienced in the war on terror following 9/11, states have found themselves fighting with nonstate actors like international terrorist organizations. Consequently, the limits of the Geneva Conventions regarding the treatment of prisoners of war have become debatable. The treatment of Taliban and al-Qaida detainees in Guantanamo Bay has triggered debates over the status of al-Qaida prisoners, and human rights organizations have questioned the U.S. government's classification of captured fighters as unlawful combatants and therefore not entitled to protection under the Geneva Conventions.

Privacy

Privacy can be an elusive concept. Privacy sometimes refers to solitude or physical isolation, though residents of densely populated cities can lead private or anonymous lives. Privacy also refers to not having information about oneself revealed to others. In *Olmstead v. U.S.* (1928) Justice Brandeis captured these senses by referring to privacy as the "right to be let alone." The term is also used to refer to a right to be free to make decisions about one's life, such as whether to have an abortion, or what lifestyle to adopt. In *Roe v. Wade* (1973), the Supreme Court struck down a law criminalizing abortions by claiming it violated a right to privacy. Here privacy refers to autonomy, which is distinct from informational privacy or anonymity.

William Prosser identifies four distinct torts of privacy invasion: intrusion upon seclusion, such as eavesdropping;

public disclosure of embarrassing facts; publicity that puts one in a false light in the public's eye; and appropriation of one's name or likeness. Several of these torts can be seen as a violation not of privacy but of some other right: property rights, in the case of appropriation of one's name; or rights over one's person, including a right not to be defamed. The philosopher Judith Jarvis Thompson articulates the controversial view that the wrongness of every violation of the *right to privacy* can be explained by appealing to these other rights and that there is no need to refer to a right to privacy.

Invasions of privacy can be mere inconveniences, as when telemarketers or e-mail spammers intrude upon seclusion. They can also be more invasive, such as when employers monitor keystrokes or phone conversations, when the police search garbage or attach GPS devices to cars to track movements, or federal agents obtain electronic communication transactional records of those suspected of terrorism. If such invasions are permitted, individuals may be forced to shred their papers before discarding them, or restrict what they type or say, where they drive, or which Web sites they visit. Some intrusions upon privacy can be extremely invasive, such as when police conduct body cavity searches or require urine samples for drug testing.

Not everyone values privacy when it's understood as a state of limited access to a person. Privacy has been criticized as perpetuating inhibitions, deterring relations with others and preventing ties to one's community, and most importantly, providing a subversive shield for wrongdoers. Many economists argue that inhibiting accurate information flow encourages fraud and is inefficient. People, governments, businesses, and other organizations all have a need for information that must be weighed against the value of privacy.

THE VALUE OF PRIVACY

Some argue that privacy should be valued because privacy protects only deceivers and criminals and that innocent people should not care if information about them is exposed. However, there are reasons why even people with nothing to hide may value privacy. Charles Fried argues that the ability to selectively reveal information about oneself and keep secrets is essential for forming intimate relations with friends and loved ones. Fried also argues that respecting privacy is an important way to convey trust: "A man cannot know that he is trusted unless he has a right to act without constant surveillance so that he knows he can betray the trust" (212–213). Others argue that respecting a person's privacy is an important means to respect a person's individuality and autonomy. Alan Westin writes that a loss of privacy threatens one's core self. He points to instances of suicide and emotional breakdown that result from exposure by government or the media. Edward Bloustein and Jeffrey Reiman each argue that respecting someone's privacy is a way to respect an individual as a person. Invasions of privacy are an "affront to personal dignity" (Bloustein, 180) and privacy a "precondition for personhood" (Reiman, 310).

Members of different societies value privacy to different degrees. American attitudes toward privacy have been contrasted with those from Britain and Germany, and anthropologists note that in some societies, doors are left open all day and anonymity is virtually impossible. The privacy a person can expect is a function of architecture and social practices that vary across time and place. But even in societies with strong antiprivacy norms, such as colonial New England, privacy is valued to some degree.

LEGAL RIGHTS TO PRIVACY

Laws attempt to balance interest in privacy and the need for information. The Fourth Amendment protects the right of people "to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures" and requires probable cause for a warrant to be issued. It was adopted largely as a response to *writs of assistance* that empowered officers and their assistants to search at will any place they suspected uncustomed goods to be; they were general warrants with no particular description of the objects of the search, and no probable cause was required for their issuance. In *Katz v. U.S.* (1967) the Supreme Court interpreted the amendment to mean that the government may conduct searches without a warrant if the search does not violate a reasonable expectation of privacy.

People cannot generally expect privacy if they are in a public place, for example, although they may reasonably expect privacy in a conversation if they are whispering in an uncrowded marketplace, out of earshot of anyone else. The Supreme Court and other federal courts have upheld the aerial surveillance of a person's backyard (*California v. Ciraolo,* 1986), and use of beepers to track a vehicle's location (*U.S. v. Knotts,* 1983). Also upheld are searches of garbage (*California v. Greenwood,* 1988), prison cells (*Bell v. Wolfish,* 1979), the property of trespassers onto government-owned land (*U.S. v. Ruckman,* 1986), and persons in plain view. These searches and surveillance were said to violate no reasonable expectation of privacy and are therefore permissible even without a warrant. However, the court has invalidated searches using thermal-imaging devices to detect heat usage in homes (*Kyllo v. U.S.,* 2001) or electronic eavesdropping of conversations in public phone booths (*Katz v. U.S.,* 1967) because they violate reasonable expectations of privacy and therefore require a warrant.

Privacy Rights

In mainstream America, there is a cherished belief that everyone has a right to privacy. Most Americans believe that their home is their castle, and that it cannot be invaded. Unfortunately, many commonly held beliefs concerning a right to privacy are usually not based in reality. Indeed, the legal and political aspects of the scope of the right to privacy are still not settled.

CONSTITUTIONAL, CIVIL, AND CRIMINAL LAW

Neither the Declaration of Independence, nor the U.S. Constitution, nor the Bill of Rights expressly recognize or mention "a right to privacy." However, such a right to privacy is implied in the Fourth Amendment, which provides protection against unreasonable seizures or searches of the people, their homes, their property, and their papers. In the famous U.S. Supreme Court case of *Griswold v. Connecticut* (1965), which concerned the privacy rights of married couples—specifically, to purchase contraceptives—the right of privacy was formally recognized as based in the penumbra of the Bill of Rights and the Ninth Amendment, which explains that other widely recognized fundamental rights not explicitly written in the Bill of Rights are nevertheless to be protected.

In tort law, which is the law of civil wrongs opposed to criminal wrongs, there are four aspects of privacy. These aspects are: (1) publication of private facts, such as personal sexual practices; (2) placing a person in a false light, by publishing information that would damage their reputation; (3) invading a private space, such as trespassing in a person's house; and (4) appropriation of another person's identity. In any of these instances, a person may sue another person for invading personal privacy.

Also, there are a number of statutes that provide for the privacy of certain information about a person. These statutes include but are not limited to: the Privacy Act of 1974, limiting the government's authority to maintain and disseminate records concerning individuals; the Family Educational Rights and Privacy Act of 1974 (FERPA), which limits access to a student's educational records; and the Health Insurance Portability and Accountability Act of 1996 (HIPAA), which limits the release of a person's medical information. However, there are numerous exceptions to many of these statutory privacy protections for such purposes as law enforcement, which can have a significant impact on political expectations of privacy.

TECHNOLOGY AND POLITICS

Technology also reduces the right of privacy of individuals. Government monitoring of computers and their use raises serious privacy issues. In the United States, the government's use of data mining programs such as CARNIVORE and TIA (Total Information Awareness) to mine the Internet for intelligence caused a serious public outcry. It is generally accepted that the U.S. National Security Agency monitors e-mails for certain keywords that might indicate terrorist activity. With the use of highly specialized technological equipment, the government can learn what is happening behind closed doors. For example, the use of certain night vision scopes can reveal otherwise private activity. In the case of *Kyllo v. U.S.* (2001), the Supreme Court required that a search warrant be obtained before using such equipment on a home.

In the context of politics, privacy is of enormous importance as an essential safeguard to prevent improper interference in political activities. Two of the more infamous examples of political interference in American politics by the violation of another person's privacy are the illegal surveillance activities by the FBI of the civil rights movement in the 1950s through the 1970s, called COINTELPRO, and the Watergate burglary to gain politically damaging information relative to the Democratic Party in the 1970s during the Nixon administration. Further, many historians recognize repeated invasions of privacy during the anticommunist political hysteria during the 1950s known as the "red scare," when Senator Joseph McCarthy of Wisconsin conducted congressional hearings against suspected Communists, a "witch hunt" that destroyed the lives of many American citizens.

Within the context of politics, there is the problem of drawing a line between legitimate political activities, which should be protected by a right of privacy and illegal terroristic activities, which are usually prohibited by law. Depending upon the nature of the political and legal system within which the issue of privacy is examined, widely divergent perspectives result. For example, in many autocratic, fascist, or tyrannical systems, any dissent or opposition is considered a crime and is granted no right of privacy. In contrast, in most free political systems, dissent and political opposition is usually tolerated, even if there are aberrations such as COINTELPRO and Watergate. In these systems, political privacy interests are given some protection.

However, depending upon political events, any political privacy is frequently sacrificed for the sake of expediency. For example, after the attacks on September 11, 2001, the USA PATRIOT Act was swiftly enacted through the U.S. Congress. This law significantly reduced the rights of privacy previously enjoyed by U.S. citizens. The law became more permissive in

allowing the government to intrude into the private lives of its citizens, including the ability to examine what books were being read, by whom, at libraries and bookstores. Telephone monitoring by the government was also more easily approved, and it was much easier to detain people only suspected of being connected with terroristic activity.

CONCLUSION

Privacy is also a serious concern internationally. Article 12 of the Universal Declaration of Human Rights, in contrast to the U.S. Constitution and the Bill of Rights, specifically recognizes a right to privacy. Article 12 of the European Convention on Human Rights also guarantees the right of privacy. In the context of politics, individual and political privacy is an essential requirement for a free society. However, it is problematic to draw the line between vigorous political privacy and prohibited criminal activity deserving of no privacy.

Privatization

The debate initiated around the neoliberal themes of privatization, deregulation, denationalization, and destatization is based upon new political economy—economic politics applied to political markets. It signifies political action in economic markets with the definite aim of maximizing profit and utility—the underlying themes of neoclassical economics. Whether considered Thatcherism, Reaganomics, or the contributions of Milton Friedman, the confluence of two important political legacies of 1980s and 1990s—the renewed enthusiasm for the market economy, and the rolling back of the frontiers of the welfare state—led to the spread of privatization movement in the so-called first, second, and the third worlds alike, cutting the ideological barriers in recent history. Privatization can mean anything from sale of public enterprise to public-private partnership.

Etymologically speaking, privatization implies "withdrawal of the state from the production of goods and services or transfer of ownership from the public sector to the private sector." In the narrow sense, it may refer to the sale or leasing of assets, substitution of user charges for tax finance, and liberalization measures aimed at providing competition, efficiency, and wider choice. In the "de-ideologized" recasting of the concept, a variety of measures have sailed under the flag of privatization, such as contracting, leasing, imposing user charges, changing ownership through divestiture, liquidation, postponing proposals, and so on. It has been used as an economic device, political strategy, or administrative tool by different countries in different contexts.

RATIONALE FOR PRIVATIZATION

Privatization can be seen as an economic device to rehabilitate the market forces following an intellectual disillusionment with the Keynesian approach to economic management and failure of socialism as a serious intellectual force. It can be seen as a political strategy to eliminate loss-making public sector enterprises, curtail budgetary support, or retrench government employees through divestiture. At the heart of the privatization movement lies the assumption that the public sector is always wasteful, inefficient, and unproductive, and privatization can make it more efficient, competitive, and consumer friendly. It can be seen as an administrative tool useful for taking some of the load off the government.

Depending upon the motivation, privatization may take different forms in different countries. In advanced economies, it may attempt to reinvigorate a poorly run state enterprise through divestiture, or spreading ownership more widely by selling shares to the general public. In some countries, privatization may involve various measures toward liberalization, deregulation, and structural adjustments ranging from liquidation to leasing. Ancillarization could be another technique of privatization. In some countries, the government may encourage small-scale ancillary units to undertake production, provide certain services, or technical know-how.

Managing change through privatization requires a great deal of political sagacity and administrative expertise. No government can implement privatization programs and policies effectively without cooperation from the top bureaucrats, legal experts, and financial analysts. All privatization efforts require a lot of restructuring prior to privatization, such as selecting the enterprises or parts of it to be privatized, obtaining loans from official banks or financial institutions, establishing long-term guarantee programs in cooperation with private commercial banks, floating shares, converting bonds, creating debt-equity swaps, writing off liabilities, allowing flexibility in the valuation of public assets and "shares to be floated," and providing the regulatory framework. Contrary to the popular perception, the privatization drive initially may actually enhance the role of the government and the bureaucracy. It may also require additional resources.

The bureaucracy must play a proactive role in providing the necessary information, assistance, and support to the government in making privatization policies and implementing them effectively. The bureaucrats help identify the public enterprises, utilities, and services to be privatized. They suggest the modalities and time schedule. They also provide the necessary financial expertise in evaluating the value of public assets or fixing the price of a share to be floated. If these are overvalued, the privatization drive may be halted, and if these are undervalued, the government may be criticized for selling family silver at throwaway prices. Once the government decides to privatize a particular enterprise, a high level of administrative efficiency is required to assess the bids made by the potential buyers, arrange finance and insurance cover, provide a safety net for the staff retrenched, and deal with legal matters. An incompetent bureaucracy can never lead to economic efficiency—the hallmark of privatization.

Many believe that even after privatization, the role of public bureaucracy is not really reduced. The nature of its job merely changes. The bureaucracy now must regulate the privatized bodies in public interest. For example, privatization in the United Kingdom actually led to the proliferation of regulatory watchdogs, such as the Monopolies Commission and the Merger Commission to look after the interests of industrial customers of British Gas. Once a public enterprise, utility, or service is privatized, the cardinal values of traditional public administration are likely to conflict with the modern requirements of knowledge-based and technology-driven market economies.

SHIFT IN PARADIGM

With privatization, the very administrative culture, in terms of red tape, is replaced with a managerial and entrepreneurial culture. Instead of inputs, the focus is now on outputs and performance monitoring. Instead of autonomy, the focus is more on accountability. Instead of standardized procedures, the emphasis is more on innovation and flexibility. Under the traditional public administration, personnel are recruited either on the grounds of merit or seniority, under privatized administration; whereas with privatization, the stress is more on contractual arrangements.

Privatization can be regarded as an administrative tool, yet certainly not an end in itself. There may be conflict in values as far as the new role of entrepreneurial managers. While entrepreneurship requires autonomy, personal vision, secrecy, and risk taking behavior on the part of administrators-cum-managers, the democratic norms of the society may call for accountability, citizen's participation, openness, and transparency in policy making and stewardship. Therefore, privatization cannot be seen as a panacea to political, economic, sociocultural, or administrative problems. The more one is privatized, the less part one likely takes in collective actions or civic engagements.

Process Tracing

In political science methodology, process tracing indicates the detailed and systematic empirical analysis of the causal mechanisms—or processes—linking political outcomes to their putative or possible explanatory factors. Based on a variety of sources such as interviews, memoirs, surveys, and historical documents, this procedure complements and reinforces more traditional correlational methods, which focus exclusively on the causal effect of independent variables (X) on dependent variables (Y). More precisely, process tracing allows the researcher to open the "black box" of causality and examine the path through which X leads to Y, thus gaining a better knowledge of its observable components (such as the intervening variables) and achieving a more reliable account of its unobservable parts. This makes process tracing an especially useful tool not only for testing hypotheses, but also for generating and refining them.

Process tracing is an in-depth methodological procedure. The requirements in terms of data, time, energies, and resources usually limit its use to small-n or single case studies. On the theoretical side, process tracing is compatible with all positivist research programs, and it is particularly useful in theoretically eclectic works where, in addition to the functions previously described, it can help delimit the domains of application of different logics of sociopolitical behavior.

Program Evaluation and Auditing

The structure of policy making is a continuous multistage process during which programs or policies are designed, implemented, evaluated, and modified. Program evaluations are the part of the process focused on determining whether

intended objectives have been met. In this way, program evaluation is an institutional tool for implementing accountability and control. To a greater degree, program evaluation enables the policy process to be continuous by providing information on the necessity of program changes or modifications.

There are three general types of program evaluations—auditing, formative, and summative. The specific type of evaluation needed largely depends on the phase of the program and the requirements of the organization engaging the evaluation.

Auditing is a type of program evaluation focused on the accounting of procedures or funds used in the implementation of a program. In terms of procedures, auditing examines the activities of a program and verifies whether correct procedures were followed. Fiscal auditing accounts for the funds used in the implementation of a program and similarly determines whether they were used appropriately. Both types of auditing are tightly linked to the accountability and control aspects of program evaluation. Auditing may occur at any stage of a program's implementation.

Formative evaluations occur during a program's implementation. These evaluations periodically monitor the program's progress in achieving preset goals or objectives. Formative evaluations allow users to identify trends and cumulative effects. Moreover, they determine if changes in program delivery are necessary. In this way, formative evaluations aid in the development of programs by identifying whether changes in policies or procedures are needed.

Summative evaluations are different from formative evaluations based on the phase in which they are conducted. This type of evaluation is typically conducted at the end of a program or after a period of time during which the program should have achieved some level of result. Summative evaluations, the most common type of evaluation, provide information to decision makers on whether the program achieved its goals. Summative evaluations are an important tool in ensuring accountability, as they identify whether the funds used were an efficient or effective allocation of resources.

The literature reflects a lack of agreement on the purpose of program evaluations. Generally, program evaluations are seen as the process of measuring and assigning a level of merit or worth to a program. However, others disagree and see program evaluation as a branch of scientific inquiry interested only in results, leaving judgments of value and worth judgments to others. These distinctions are important as they guide the roles of the evaluator, which are classifiable into three categories—methods, valuing, and use.

The methods approach subscribes to the tenets of social inquiry. Evaluators using this approach identify program evaluation as an outgrowth of scientific inquiry. Therefore, these evaluators are concerned with generalizability and internal and external validity. They are also interested in the reduction of bias and errors. Those using this approach leave judgments of merit, value, and worth to the users of the information.

Evaluators following the valuing approach see themselves as having an additional role in the process. Unlike the methods approach, this category makes the distinction between evaluators and researchers. This approach views the role of the evaluator as not only researcher, but also as an evaluator of those findings. This is based on the belief that evaluators have the knowledge, skills, and abilities important to making valid judgments. This is contrary to the methods approach holding the evaluator as an objective participant. Evaluators using this approach are active participants in assigning a level of value or worth to the evaluated program.

Finally, evaluators employing the use approach are concerned with the entity receiving the information produced by the evaluation. These evaluators view themselves as both evaluator and teacher. Their focus goes beyond the actual conduct of the evaluation to include teaching the users how to evaluate and use the information in an effective way. This approach engages the users at every step of the process. While the methods category views the evaluator as an objective participant, and the values category views the evaluator as the source of decisions, this category aims to empower the users as decision makers.

Programmatic Party

Typological exercises to grasp the essential features of political parties are manifold in political science, and for nearly a century, new classification schemes evolved within the scholarly literature. Various criteria have been used to differentiate between worldwide party types. Among these, organizational, functionalist, and sociological types are the most prominent.

While the programmatic party has also been distinguished by its organizational structure, its social base of representation and the linkages it builds in its exchange relations with the citizenry to influence voters' electoral conduct are the most decisive characteristic for its classification. Consequently, the programmatic party is a political party whose rationale and reputation is bound to a distinct, consistent, and coherent programmatic or ideological agenda; it works, campaigns, and competes on the basis of clearly articulated programs and positions on issues of broad public concern.

The programmatic party thus stands in contrast to political parties rooted in clientelist strategies. It also differentiates from parties dependent on the charisma of individual leaders whose electoral appeal and exchange relations with the citizenry depend on durable patterns of loyalty linked with targeted transfers of services and obligations, or relations dependent on the personal charisma of the leader or principal candidate, who is portrayed as indispensable to the solution of the country's problems.

Often, the programmatic party commands a less elaborate and extensive party organization than the classical mass-based or the clientelist party, which have to invest heavily in their organizational structure to manage and monitor their exchange relations with the electorate. However, the programmatic party must work constantly and intensively to establish and maintain a common collective party program. This includes bundling the individual preferences of the party members with a view to changing preferences of their constituencies, seeking agreement on and compliance with its goals, and promoting its programmatic appeals and credibility in its electoral campaigning and government agenda. The programmatic party is primarily an electoralist party, meaning that its objective is to win office through its programmatic platform or vision, mobilizing its strengths at election time and using modern campaign techniques. Its social base varies, not the least depending on the institutional framework and electoral system within which it operates. In majoritarian systems, programmatic parties tend to amalgamate their programmatic agenda with catchall electoral appeals, whereas in proportional systems they often focus on a core constituency receptive to its specific program and issue positions.

THE ORIGINS OF THE PROGRAMMATIC PARTY

The concept of the programmatic party closely ties to the idealized model of responsible party government. This model dominated the scholarly contributions to the study of political parties and party systems since the 1950s and was decisive for the formulation of both rational choice and, to a lesser extent, historical-sociological explanatory approaches to the emergence and development of party systems and party competition. The responsible party model is based on the premise that political parties are basically engaged in integrating issue positions into programs or electoral platforms to be enacted if elected to office. Voters, as well as parties, rationally weigh a given party's issue position or voters' preferences with their policy or programmatic preferences. Vote choice, parties' programmatic orientation and, hence, the structuring of the party system, consequently depend on individual assessments of party performance, perception of variance in party position, and perception of voters' preferences.

While useful in determining the basic rationale of a distinct party type, modes of citizen-party linkages and patterns of party competition, the responsible party model and the concomitant conceptualization of the programmatic party type ignores several political realities: the unpredictability of political and economic constraints on party resources; the crucial role of candidates' personality attractiveness in electoral choice, reinforced by the advent of new campaign techniques and modern communication technologies, which have become the most important medium of political communication in all modern democracies; and the availability and persuasive power of alternative modes of citizen-party linkages, such as clientelist linkages.

The programmatic party is an ideal-type description of a political party derived from the study of West European parties. It's closely tied to the normative thinking within liberal theory, built on the idealization of programmatic linkages as the essence of democratic responsiveness and accountability. It is rarely found in a pure manifestation without traces of personalistic, clientelist, or other characteristics. It basically reflects political parties' functioning in established, affluent capitalist democracies. The concept is less able to grasp the logic of political parties' functioning in other parts of the world as well as more recent trends in party competition and party system development.

Apart from the typological literature, research on the programmatic party type focuses on the conditions conducive to the emergence of programmatic parties and programmatic party competition, and on whether programmatic parties have a significant influence on party system institutionalization, democratic consolidation, and public policy. The former line of research identifies various factors, such as a historical legacy of programmatic parties, the wealth level prevailing in a given context, or the existence of a high-quality bureaucracy as main determinants for the emergence of programmatic parties. The latter is more inconsistent in its assessment of the putative benefits of programmatic party competition. While the correlation is relatively straightforward that the pluralist and tolerant nature of most programmatic parties favors party system institutionalization and centripetal party competition, the nexus between the prevalence of programmatic parties and a government's public good orientation is less so. However, it seems that in the presence of programmatic parties, governments are less inclined to engage in rent-seeking and corruption.

Progress

The ancient philosophers were aware that the earliest periods of human history were primitive in nature, and that the more advanced social condition of the present arrived after a number of intervening stages of development. Aristotle, for example, traces social development through the clan, the village, and finally to the polis, while Thucydides is emphatic about how far the Greek cities of his time were in advance of the communities of earlier times. However, no matter how fully these thinkers believed society would come to understand the separation between the present and prehistoric times, the ancients nevertheless were not inclined to see the future as differing fundamentally from the present. They had a cyclical approach to time, tending to see history as an endless repetition of cycles running from utter devastation to rebirth and back again.

CLASSICAL AND MODERN PROGRESS

Although the idea of progress or development was known to the ancient philosophers, it is much more a distinguishing aspect of modern thought. Any study of such thinkers as Giovanni Vico, Marquis de Condorcet, Immanuel Kant, Pierre-Joseph Proudhon, Auguste Comte, John Stuart Mill, Georg W. F. Hegel, and Karl Marx illustrates time meditating on the meaning of history to an extent not found in the writings of Plato, Aristotle, Xenophon, Cicero, and Lucretius. Furthermore, the modern doctrine of progress suggests a prejudice in favor of the current time as being either the highest stage of civilization or closer to its full culmination. In line with the advancement of learning associated with names such as Copernicus, Galileo, and Newton, the modern thinkers tended to view past thought as more of an obstacle to, rather than a basis for, further knowledge, and as something that must be transcended, and perhaps even forgotten, if humankind's full development is to be reached. The moderns sometimes described antiquity as a period of humankind's childhood, while the closer people come to the present time the more grown up they are in understanding and insight. This attitude contrasts with a kind of backward-looking respect on the part of the ancients for the contributions of their intellectual predecessors.

Prior to the modern period, Christian writer Joachim of Fiore made a tripartite division of human history into the age of the Father (from Adam to Christ), the age of the Son (between the advent of Christ and 1260), and finally the age of the Holy Spirit (impending in 1260), when humankind was to come in direct contact with God. The modern philosophers picked up Joachim's thread and thus Vico presented his divine, heroic, and human periods; Hegel described his phases of oriental despotism, Greco-Roman aristocracy and Protestant freedom; Comte volunteered his theological, metaphysical and positive epochs; and Marx came forward with his feudal, capitalist, and communist stages of class struggle.

As in the earlier theological thought of Joachim, the modern view suggests the possibility of an *end of history* once humankind's capacity for progressive development has been unleashed and pent up energies have been allowed to play themselves out. With the hindsight that an end-of-history vantage point affords, all the limitations and distortions of the earlier stages come to sight as so many steps on the road to final resolution. Kant, for example, suggests that world history could end with a republic of humankind living in harmony and good order through some version of what is now known as the United Nations. Hegel's end of history takes the form of the modern Prussian state with its constitutional monarchy and professional civil service. Later, the end of history takes the form of the worldwide church of humanity for Comte and the dictatorship of the proletariat leading to communism for Marx.

QUESTIONS ABOUT PROGRESS

The philosophical question at the heart of the concept of progress is thus whether a final stage of history is possible, at which the most deforming contingencies that restrict human flourishing are removed from the lives of most human beings. Will a new human nature more pristine than the old make its presence felt when the constricting limitations of the past have been overcome? Are humans capable of leaving their beastliness in the mists of the past as they shape their own futures according to a new and higher standard? Or are humans condemned by a fatal flaw or original sin never to be able to rise above their innate depravity? Furthermore, there is the question that if progress is inevitable by a kind of law of human nature, it should make no difference whether it is sought deliberately and willfully, or simply by sitting passively and waiting for its unfolding. If the law of progress is the law of human nature, then attempts to resist it are futile. On the other hand, if progress is not inevitable but is more a product of human willing and striving, then human beings will have to put their shoulders to the wheel.

This ambiguity in the doctrine of progress is evident in many thinkers. Various liberal thinkers express skepticism about the possibilities for progress given that humankind is "crooked wood," as Kant phrased it, while conservative thinkers have not infrequently expressed their hope that human beings can improve themselves and their world. Jean-Jacques Rousseau and Edmund Burke come to mind here as emblematic of these paradoxical philosophical tendencies present on both the left and the right. Therefore, while it is fair to say that the idea of progress is akin to modern religion, it is important to note that it has its critics that hail from all points on the political compass.

Since the Enlightenment and the great age of Victorian progress, modern history has seen two world wars, totalitarianism, a cold war, regional conflicts, and now the rise of such nations as China and India whose fate was once determined in the capitals of Europe. Such developments have engendered grave doubts about the validity of the inevitable law of human progress, which had been adhered to in the West so firmly for so long. If the current era is sometimes characterized as the age of postmodernism or nihilism, it is in large measure attributable to the weakening of the idea of progress as an underlying philosophical principle of modern society. Yet, however spirited the rejection of the idea of progress becomes, it is impossible to deny its role in forming the sensibilities of the modern mind. The biblical tradition flowed into this mind with its story of historical redemption, relaying that there will certainly come a day when goodness and righteousness will prevail, all the while insisting that humans are fallen creatures forever crippled by original sin. At the same time, humans have been shaped by their Greco-Roman legacy with its humanistic teaching that through the use of reason, a human being comes close to the divine, with a constant reminder that hubris, or pride, "goeth before a fall," as was the case with Icarus. There is reason to believe then that the debate over the possibility of progress is coeval with the Western experience itself, and thus it will continue into the future.

Progressivism

Progressivism is an ideological perspective broadly opposed to conservatism in regards to any number of political, economic, social, or moral issues. As such, it is often, though not always, premised upon a philosophy of history that affirms the continual possibility of progress toward improved conditions of justice in human consciousness and society. This conception of progress is usually not a perfectionist or utopian one, whether religious or secular, but instead emphasizes ameliorative reform and innovation in private behavior, as well as public matters and organizations. Since these reforms and innovations frequently clash with the traditional patterns of exchange and governance, religious and moral beliefs, or cultural norms and customs defended in a wide variety of ways by different forms of conservatism, progressivism has often come to be identified with the various liberal, egalitarian, and democratic movements that oppose conservative parties and tendencies in numerous societies around the world.

However, progressivism in the United States is also closely associated with a specific historical era of political, economic, business, and bureaucratic reforms and the policies established during that period. The extensive changes that took place during the twenty years covering the presidential administrations of Theodore Roosevelt (1901–1909), William Taft (1909–1913), and Woodrow Wilson (1913–1921) resulted in the first decades of the twentieth century often referred to as the *Progressive Era*. Some participants in various modern liberal, egalitarian,

and democratic movements in the United States today—most usually within or at least aligned with the Democratic Party, but occasionally as members of other, more narrowly focused or radical ideological organizations and political parties—have taken to looking back to that particular era as a source of benchmark measurements. They use these measurements to assess their own aspirations, goals, and approaches. (However, explicitly socialist or social democratic thinkers sometimes see the "progressive" moniker as signally too much willingness to accept and work within the modern liberal capitalist order.) Thus, those associated with the modern liberal, egalitarian, and democratic movements sometimes adopt the label "progressive" with the explicit intention to associate themselves with those historical reformers, in contrast to the more generally moderate "liberal" perspectives that are more common among opponents to conservatives in America today.

The basics of the progressive perspective in this more particular sense is a belief that the social and economic transformations that accompanied the Industrial Revolution—and which have only continued as the centrality of technology to modern life has grown—demand a rethinking of the traditional responsibilities of democratic government. The increasing pluralism of societies with significant migrant and immigrant populations also calls for reconsideration, in the sense of both large numbers of people moving from the countryside into the cities, as well as large numbers of racially, ethnically, and religiously diverse immigrants coming to the nation from foreign shores—both of which were the case in late nineteenth- and early twentieth-century America, and which remains the case today. More specifically, the progressive perspective requires an expansion of the powers of state bureaucracies and regulatory agencies in order to control the exploitive practices of key economic actors, and to make democracy more accessible, effective, and accountable. The overarching goal is to empower American citizens by making mechanisms of participation available in an increasingly complex economy and in the government of an industrialized, urbanized state, as well as to streamline and make those same mechanisms more efficient.

The various liberal, egalitarian, or democratic accomplishments of the Progressive Era ranged from the constitutional accomplishments (e.g., the extension of votes to women, the direct election of senators, the foundation of a progressively scaled income tax) to the political achievements (e.g., the widespread establishment of the secret ballot, primary elections, state referendums and ballot initiatives, and the recall vote) to the economic feats (e.g., trust-busting, child labor laws, support for unionization, the minimum wage, and workers compensation). The legacy of this era of accomplishment inspires those who adopt the progressive label today to seek and use government agencies to achieve, within the context of liberal democratic capitalism, ever greater political and economic equality. This occurs through the expansion of the welfare state, the extension of public education and health care coverage, and so forth.

In some basic ways, these goals, both historically and today, parallel those pursued by various advocates of populism. In

fact, many of the reforms associated with the Progressive Era actually began through earlier populist agitation, from the 1870s through the early 1900s, and some influential populist leaders (e.g., William Jennings Bryan) came to affiliate themselves with the progressive movement. However, progressivism was from its beginning a more mainstream, urban, and middle-class (and upper-class) phenomenon, and much more willing to trust in the authority, language, and expertise of higher education—and the practitioners of such emergent fields as public administration or political science—than were the primarily agrarian and rural defenders of local populist sovereignty. This class divide, which also has a racial subtext, can be seen in the enthusiasm many progressives of that era had for Prohibition, for the urbane (and easily secularized) teachings of the social gospel, and for political reforms (e.g., civil service requirements) that disempowered ethnic and religions enclaves and parties. It is also evidenced in their favor for approaches to civil planning that privileged centralized management and mass production, thus breaking up small neighborhood and local economies, and—in a few cases—for policies premised upon the practice of eugenics. While few self-described progressives today associate their commitment to egalitarian reforms and democratic improvements with these kinds of practices, the legacy of the elite educational, bureaucratic, and class perspective of American progressive liberal thought sometimes still brings populists or radicals in alignment with conservative movements in order to oppose them.

Proletariat

The term proletariat refers to a political, social, and historical idea used to describe the class of people who do not own any means of production, and who sell their labor power to capitalists—or the *bourgeoisie*—in order to earn enough money to provide for their families' immediate material needs. Although the term itself predates the work of the German communist Karl Marx, communists and socialists have used it predominantly since Marx's time to describe the industrial working class in modern capitalism.

Proletarians' lack of productive property requires them to sell their labor power in the marketplace to the capitalists who control the means of production. While Marxists recognize that proletarians have existed throughout much of human history under different modes of production, it is only under modern capitalism that the proletariat emerges as the main *productive class* in society; their labor creates the foundation for all social wealth.

According to Marxist theory, the bourgeoisie's exploitation of the proletariat's labor power is the source of the profit, or *surplus value*, capitalists earn. In this sense, the bourgeoisie is a parasitic class that adds nothing to social production itself and lives off the labor of the proletariat. The proletariat's position as both a productive and an exploited class gives it a special historical role to play in leading humanity beyond the divisions of class society and toward a new socialist or communist future. Because the bourgeoisie has no choice but to exploit the proletariat in order to maintain its profits, the proletariat is necessarily in an antagonistic opposition to capitalist society itself. The proletariat is thus a revolutionary class with a material interest in transcending capitalism. The proletariat's role as a productive class means that it has no incentive in developing new exploitive class relationships to its own benefit and therefore is in a unique position of being able to lead humanity toward the classless society of the future.

The historical accuracy of the Marxist conception of the proletariat and its historical mission remains the subject of intense controversy and dispute among social scientists. Most historians recognize that during the late nineteenth and early twentieth centuries, an organized workers movement led by unions, socialists, and communists did constitute the most important challenge to capitalist society. Moreover, in the early twentieth century, spontaneous revolutions led by the working class broke out in several European countries in the aftermath of World War I (1914–1918), leading to the establishment of ostensibly socialist or communist governments in several countries.

However, in most instances, socialist and communist parties led these movements and their precise relationship to the working class remains unclear. Many historians argue that the most important of these revolutions—the Russian Revolution of 1917—was in fact a coup led not by the spontaneous action of workers, but by Vladimir Lenin's Bolshevik Party, an elite group of revolutionaries—many of whom were not proletarians.

More recently, the importance of the proletariat within Marxist theory itself has also been challenged. In the 1960s, German political theorist Herbert Marcuse argued that the proletariat had been recuperated by capitalism's consumer society and was no longer a revolutionary class. More recently, others have argued that capitalist restructuring has led to a decline

A 1920 Soviet poster says "We destroyed our enemy with weapons, we will earn our bread with labor—Comrades, roll up your sleeves for work!" In Marxist theory, the working class, or proletariat, is a revolutionary class with an interest in overcoming capitalism.

SOURCE: The Granger Collection, New York

in importance of the industrial working class and the rise of a new *white-collar proletariat,* who—while still propertyless laborers—have a managerial mentality and are thus unable to distinguish themselves from the capitalists who exploit them.

Still others have claimed that in the new era of global capitalism, the proletariat has been replaced as the proper agent of historical change by a new global class of impoverished and marginalized people who may or may not be proletarians in the sociological sense of the term.

Pronunciamiento

Pronunciamiento is translated as *pronouncement* or *declaration,* and refers to the military overthrow of a government in Latin America or, historically, Spain. Although it has precedents in seventeenth-century Spain, the model is based largely on rebellions after the restoration of Ferdinand VII in 1813. The concept involves the military's self-proclaimed duty—and in some cases a constitutionally granted right—to intervene in times of crisis in the name of defending the integrity of the nation. It entails a declaration of principles about the deficiencies of the government and the need for military-led salvation.

For Latin American militaries, the term has an important technical meaning because it reflects what they believe to be the "legitimate" nature of what can be very violent actions. By contrast, *coup d'état* and *golpe de estado* suggest an illegal or unjustified change of government. In the minds of officers, the distinction is critical, as it differentiates between honor and venality, rejecting the use of power for selfish and narrow ends. Therefore, public discourse emphasizes the necessary and proper role of the armed forces to reestablish order.

Propaganda

In previous centuries, the verb *to propagate* meant to transmit faith to people who otherwise were seen as "lost" forever; thus, for Catholics—as established in the Catholic *Congregatio de Propaganda fides* in 1622—propaganda was seen as a service given to pagans and tribes who believed in magic and other superstitions. In the twentieth century, in a modern, political sense, propaganda was understood as transmitting convincing messages (i.e., not always true, but not necessarily false) or communicating one single ideology in order to persuade audiences—individuals or groups, political leaders, or the media—and, finally, to influence public opinion. Therefore, propaganda does not necessarily alter reality into a message, but rather organizes facts, images, formulas, testimonies, and reasonings according to a certain ideology or worldview.

In 1948, in the aftermath of World War II (1939–1945), the United Nations Conference on Freedom of Information defined *bad propaganda* as information "either designed or likely to provoke or encourage any threat to the peace, breach of peace, or act of aggression" (Alleyne, 96). Propaganda did not only exist in religious or political speeches, or in the media; for example, in France in the 1930s there was an *association de propagande pour le vin,* a kind of trade union that

promoted the consumption of French wines in restaurants. And at the time of the 1917 Russian Revolution, the *agit-prop,* which mixed the words *agitation* and *propaganda,* helped the proletariat to express in spontaneous and provocative ways the new political slogans of the day.

Even though propaganda was already used in many countries during World War I (1914–1918), Nazism was seen as the era of propaganda at its worst, though also its most efficient. Even during the prewar years (1933–1939), the Third Reich had a ministry dedicated solely to propaganda, led by Reich minister Joseph Goebbels and, among many collaborators, Reich press chief Otto Dietrich. From 1933, the Third Reich's school system and media, including the whole German film industry, were controlled by the Nazi regime, which produced (among many others) the famous documentary *Triumph of the Will* (1935), directed by popular German actress Leni Riefenstahl (1902–2003). From a technical point of view, her use of camera angles, editing, and collective symbols was innovative in many ways; it contributed to turn Adolf Hitler into a popular hero and suggested that Nazi ideology was deeply rooted in the Germanic traditions, folklore, and people, and therefore was part of a logical, historical continuity. However, dozens of feature films (e.g., Veit Harlan's *Jüd Suss,* in 1942) and many German popular magazines also promoted anti-Semitism and hate propaganda.

While in Paris in 1939, Sergeï Chakotin released an enormous book titled *Le Viol des Foules par la Propagande Politique* (translated the following year into an abridged version, *The Rape of the Masses: The Psychology of Totalitarian Political Propaganda*). Perhaps the most famous book on propaganda, Chakotin's anti-Nazi study analyzed the Hitlerian messages from the mid-1930s, using a behaviorist approach owing much to Ivan Pavlov. Just after its release, the book was banned in France even before the German occupation in 1939, because the French authorities did not want to offend the German government. However, Chakotin did not oppose the use of propaganda per se; he even concluded his classic book by advocating for a "good propaganda" that was against all totalitarian regimes but "at the service of the ideal of socialism."

Between 1939 and 1945, wartime propaganda was just about everywhere, including the United States, which produced a variety of movies, documentaries, newsreels, and posters to counter enemy propaganda. Filmmaker John Ford directed *The Battle of Midway* (1942), about the Japanese attacks on the U.S. military, and Frank Capra produced *The Negro Soldier* (1942) in order to give a positive image of African Americans who served in the U.S. Army. European émigrés like Fritz Lang (*Ministry of Fear,* 1944) and Alfred Hitchcock (*Saboteur,* 1942) directed anti-Nazi films in Hollywood. Countless posters were created in countries that did not directly suffer from war, with messages asking people to remain discreet about their relatives who were serving in the army abroad, reminding the average citizen that "foreign ears could be listening to them."

While living in the United States during World War II, German theoreticians Max Horkheimer and Theodor Adorno studied the Nazi propaganda and media bias in their classic text *Dialectic of Enlightenment,* which remains the most influential study emerging from the group of scholars known as the Frankfurt school. In an addendum to their book, the sociologists criticized not only propaganda but advertising as well; they were even suspicious of propaganda for freedom. Since the end of World War II, many historians and media experts have studied Nazi propaganda; exhibitions in museums and memorials have analyzed and deconstructed its strategies and acknowledged its influence.

The cold war was another era for academic research on propaganda techniques. Harold D. Lasswell was among the first theoreticians to study propaganda and mass communication. His 1948 formula for considering the origins of any given message, the audience that is targeted, and the ways in which the message is sent—"Who says what, to whom, through which channel, and with which effects?"—is well known. Other sociologists doing research on propaganda were Paul F. Lazarsfeld and Robert King Merton.

In his classic 1962 book *Propagandes,* French theoretician and historian of propaganda Jacques Ellul explained that propaganda could only be studied and understood in a specific cultural and historical context. This is why most examples of propaganda coming from other countries, different cultures, or previous decades often seem naive or pointless for today's observers.

QUESTIONING THE FEASIBILITY OF "GOOD" PROPAGANDA

After the end of World War II, the term *propaganda* became pejorative and was used as an accusation. For example, in 2007 Canadian scholar Tim Patterson, at Carleton University in Ottawa, accused Davis Guggenheim and Al Gore's 2006 documentary *An Inconvenient Truth* of being propaganda rather than an informative or educational film. The filmmakers championed only one side of the global warming debate, he claimed, and disqualified their opponents by calling them "so-called skeptics." In recent decades, as John Michale documents in his book *Communication and Change* (2004), communication strategies made in Western countries took other names, like *publicity, advertising, public information, public relations campaigns,* or *advocacy*. In itself, hate propaganda is actually forbidden by law in countries such as Canada.

In democratic countries, election campaigns use communication strategies that sometimes seem similar to the old propaganda techniques in order to persuade populations, especially undecided voters. As editors Frank Esser and Barbara Pfetsch illustrate in *Comparing Political Communication* (2004), the use of symbols and positive images for candidates, but also negative images given to opponents—plus assessments of candidates made by credible celebrities—are critical and often efficient.

PROPAGANDA TODAY

Today, and especially since 1948, institutions and governments no longer use the term *propaganda* when communicating with citizens or targeting specific groups. The label *political propaganda* is used instead to target or condemn an opponent's strategy. For example, in the 1980s the Reagan administration accused Canada of implementing political propaganda when

three Canadian documentaries were presented in Washington, D.C. These short films on environmental issues included *If You Love This Planet* (1980), an antinuclear conference directed by Terri Nash; *Acid Rain Requiem or Recovery* (1982), by Seaton Findlay; and *Acid from Heaven* (1982), by George Mully. However, in September 1983 the U.S. Supreme Court ruled that this "propaganda" label was unconstitutional.

One question remains regarding instances when a minister or an agency wants to send a "positive" message to help the population or to change bad habits. For example, what if policymakers need to express a vital message that says "don't drink and drive" to teenagers? In those cases, strategists aiming for social change on sensitive issues declare they plan *awareness campaigns* or *awareness-building campaigns*—interestingly, in French-speaking countries officials and politicians call these *campagnes de sensibilisation*.

Another question concerns whether institutions should use propaganda for a "good cause." In his book *Global Lies? Propaganda, the UN, and the World Order* (2003), Mark Alleyne argues that the Department of Public Information of the United Nations constantly used propaganda even after the United Nations Conference on Freedom of Information in 1948. This tied to various subsequent campaigns related to so-called good causes like human rights, AIDS awareness, and the international campaign to free Nelson Mandela.

In recent decades, research has gone beyond propaganda and counterpropaganda. For example, in *Manufacturing Consent* (1988), Edward S. Herman and Noam Chomsky argue that the United States is a country where propaganda has been replaced by *prop-agenda,* which implies that many political topics are always avoided in the public sphere and in the mainstream media.

Another subtle form of propaganda is *disinformation*; even if this term seems newer or lesser known, this strategy has existed since the works of Chinese author Sun Tzu, who lived sixth century BCE. Disinformation implies the fabrication of a deliberately false message, sometimes with manipulated photographs, in order to propagate false news or misleading information.

In questioning what can save citizens in democracies from being bombarded virtually every day by propaganda-like messages or similar one-sided perspectives, the fact is that living in pluralistic systems allows various opinions to coexist, be challenged, and debated. In theory, propaganda operates in the name of one sole ideology; hence, propaganda is an essential means by which totalitarian regimes legitimize their actions and maintain their existence. Such regimes can use the specter of a common enemy or an eternal opponent to the nation as a constant means to demonize other civilizations or nations and therefore validate their own system. For example, in the twenty-first century, anti-Americanism remains the ideological foundation for propaganda in nondemocratic countries. And, sadly, as French political philosopher Pierre-André Taguieff points out in his book *La Nouvelle Propagande Anti-Juive* (2010), new forms of anti-Semitism and anti-Jewish propaganda have appeared in recent years.

Property Rights

Property rights are at the foundation of liberal democratic societies and social orders. However, how property rights are justified, and accounts of their limits, are matters of considerable debate. Nevertheless, the protection of property rights is a primary function of the liberal state and forms the basis of liberal freedom. While in liberal theory, property rights are private—that is, rights of individuals to their own property, and to use and exploit it as they will—the centrality of property rights to liberalism stems from historical opposition to the arbitrary power of absolutist forms of government. Property rights can therefore usefully be understood as functioning to impose constraints on political authority and create spheres of private liberty.

The most well-known liberal defense of private property is John Locke's argument in Chapter 5 of his *Second Treatise of Government.* In contrast to theorists before him, most notably Thomas Hobbes, Locke attempts to make the case for the natural right to property. For Hobbes, property rights could not come into being prior to a political authority assigning them. In this sense, property rights are artificial creations or are conventional. Locke's argument focuses on the implication of this view, emphasizing that if the state in fact creates property rights, then there are no good reasons, or constraints, against the state imposing limits on them—thus, according to Locke, limiting the freedom of individuals.

Locke presents an elaborate argument for the development and possibility of natural property rights. His argument hinges on the principle of self-ownership, such that when one mixes one's self-owned labor with an external object, the

ownership extends to that object—through laboring, individuals take resources (most notably land) out of the pool of common ownership and acquire exclusive rights over it. There are initial limits on appropriation, which the introduction of money and improvements in general welfare overcome. In time, when the great bulk of the land is removed from common ownership and the distribution of the earth's resources becomes increasingly unequal, natural property rights grow insecure. From the insecurity and "inconvenience" of all individuals protecting their own property, persons together can consent to create a common authority restricted to protect "life, liberty, and property." While there is debate as to Locke's understanding of the role of the state with respect to the common good, modern libertarians, notably Robert Nozick, defend Locke's view of property rights preceding the state imposing "side-constraints" on the extent of its legitimate authority.

Locke's theory specifically, and liberal property rights in general, have been the subject of diverse and intense criticism. An early and still influential argument against Locke is Jean-Jacques Rousseau's *Discourse on the Origins of Inequality.* Entrenching initial property distributions as natural rights, according to Rousseau, is a form of institutionalized theft. Appealing to the principle of individual consent cannot legitimatize them, since no rational individual would consent to a system designed to institutionalize one's own deprivation. Notably, Locke leaves the propertyless outside of the consenting process.

Perhaps the most well-known indictment of property rights is that of Karl Marx. Property rights, for Marx, are the foundation of the bourgeoisie's exploitation of the proletariat. With no property of their own, the working class is compelled to sell their labor to property owners. Since labor, according to Marx, is the source of value, to make profit, capitalists necessarily exploit laborers in extracting surplus value. The post-capitalist communist society is thus based on the abolition of private property.

The appeal to liberty and natural rights is not the only type of liberal defense for property rights. Many theorists, including Locke, appeal to the beneficial consequences of a system of property ownership and make broadly utilitarian arguments for it. One of the most well-known examples of this type of argument is found in Adam Smith's *Wealth of Nations.* For Smith, a system in which each individual pursues personal interests will produce more socially beneficial results than a system based on common ownership or nonownership. Other arguments for the social efficiency of property rights include Douglass North and Robert Thomas's account in *The Rise of the Western World*, where they attribute this "rise" to the efficiency gains resulting from the development of property rights.

Proportionality

In political psychology, proportionality is usually considered as the principle, rule, or value, describing distributive justice within a state or local or regional populace. In this sense, according to proportionality, individual outcomes need to match individual inputs to achieve justice within a system. In making the allocation decision, authorities use distributive rule of proportionality or equity.

The principle of proportionality is a fundamental concept for the European Union (EU), to ensure member states act or provide of themselves to the extent required to fulfill a certain EU objective, but do not exceed this quota as to not upset the balance of proportional inputs and outputs. Also, citizens partly base fairness judgments on the value of proportionality. Individuals perceive a situation as fair when their own ratio of outputs to inputs is the same. Hence, equal ratios lead to a public sense of fairness and satisfaction, whereas unequal ratios lead to sense of unfairness and emotional distress.

More specifically, people with low levels of benefits experience frustration, anger, rage, indignation, or disappointment; people who are overindulged often experience anxiety and guilt. Equity theorists, who assume that the individual sense of proportionality stems from a more general psychological need for cognitive balance, identify the negative emotional reactions as motivators to take corrective actions to restore proportionality. Also, the will to maximize one's personal or own group's material or immaterial benefits stimulates a desire to see the proportionality between contributions and retributions of various individuals or groups.

Applying the rule of proportionality does not easily allocate goods and allow evaluation of the outcomes of the allocation decision. The allocator and the recipients not only have to combine the delivered inputs—such as personal contributions, skills, status, or age—but they also have to compare the inputs and outputs of themselves and their significant others. As a result, several theoretical models have been proposed to describe the combination of information about inputs and outputs. The cognitive algebra model of monotonic relationship between inputs and outputs claims outcomes based on multiple information are best predicted by additively combined inputs, but the magnitudes of the increments are not the same. On the other hand, the linear relationship model predicts that increment in input always leads to the same or higher increment in the outcome. Another method, Jasso's model, ascertains that an evaluation of the fairness of a reward is best described as the difference between the natural logarithm of the actual reward and the just reward. Conversely, according to the affective model of justice reasoning, affect is

not only a by-product of cognitive processes. Negative events such as underreward and overreward—in a smaller degree—prompt emotional reactions that elicit cognitive judgment of fairness.

In Western culture, the principle of proportionality traces to Aristotle's *Nicomachean Ethics.* In Aristotle's argument on political justice, citizens are defined as those "who are free and either proportionally or numerically equal." Today, the idea of proportionality permeates the law in various respects. It applies: in criminal law, with the need of proportion between guilt and punishment; in election law, with equal proportion between the numbers of votes and seats; in tax law, with the need of proportion between the amount of tax and the public services the state offers to society; and in constitutional and administrative law, with proportion between the burden an act of the government creates and the purpose it pursues.

Proportional Representation

Proportional representation was developed in the late eighteenth century at a time when representative democracies were gaining popularity in the midst of the American Revolution (1776–1783) and the French Revolution (1789–1799). Fearing tyranny of the majority, which was a persistent accusation made against representative democracies or republican forms of government, different electoral schemes were considered to ameliorate the dangers posed by this new form of government and to reduce the possibility of tyranny from occurring. Proportional representation, an electoral formula, provides a close correlation between the percentage of votes received for a particular group of candidates, represented by their party, and the percentage of seats they then receive in government for representation.

Proportional representation was first used in Swiss cantons in the 1860s. However, it wasn't until 1899 that it was used in a nationwide election, which occurred in Belgium. Today, the formula used most often in legislative bodies bases the division of seats between different parties on the percentage of

the vote. Most democracies throughout the world use a version of proportional representation in allocating seats in their respective legislative bodies. In fact, plurality voting systems, as evidenced in the United States, are the least frequently used electoral system. However, allocating votes for an executive, as practiced in the United States, is based on a winner-take-all system.

Not all legislative bodies recognize proportional representation as the electoral formula to determine which candidates hold which seats. For instance, the United States does not operate its elections for Congress based on proportional representation. Instead, the United States is bound by the winner-take-all system or first-past-the-post process. Best understood in the U.S. presidential system, the candidate who wins the plurality of the vote in the election for a specific seat, regardless of party, wins that seat. According to election rules, each candidate for president must win electoral votes for each state from their respective parties. The candidate who wins a plurality of the vote in a given state wins all electoral votes regardless of the percentage of the popular vote carried. If the United States practiced proportional representation, a different scenario would occur. For instance, if candidate A wins 53 percent of the popular vote in a given state and candidate B wins 47 percent of the popular vote in the same state, the electoral votes are divided between the two candidates. Candidate A then wins 53 percent of the electoral votes and Candidate B wins 47 percent of the electoral votes. This therefore does not align with a winner-take-all system.

Proportional representation attempts to link the popular vote with the actual distribution of votes or governing seats. As a result of this close link, supporters of proportional representation systems claim that out of all electoral formulas this is one of the most democratic because it considers those voters that are in the minority. Many advocate its use in order to ensure that racial, ethnic, and gender minorities are represented and their voice is heard in elections. Advocates for its adoption in the United States make the case that proportional representation would not only provide fair representation for minorities, but also end the practice of gerrymandering, encourage campaigns that are based on the issues, promote the emergence of third parties, foster greater turnout at the polls, and facilitate the election of more women and racial and ethnic minorities.

The term *proportional representation* is used to more broadly refer to electoral formulas that deviate from winner-take-all systems and ensure the provision of a proportion of seats for the corresponding proportion of votes. Proportional representation can be subdivided into party list (PR/PL) and single transferable vote (PR/STV). Party list refers to lists of candidates for each respective party in which a vote is cast for the party, not the individual candidates. Depending on the proportion of votes received by that party, the party is allocated a corresponding percentage of seats. The party then determines which candidates will occupy the seats they won. The possibility exists that not all candidates on the party list will be allocated a seat. Single transferable vote is similar to party list; however, the use of this system does not depend on the

presence of political parties and voters assume the role of creating the "lists." Voters develop groupings, and their votes correspond to the grouping, not the individual candidates.

Prospect Theory

Prospect theory is the most influential behavioral theory of choice in the social sciences. Psychologists Daniel Kahneman and Amos Tversky created it in 1979 when they discovered that how someone thinks about a choice influences one's attitude toward risk. To illustrate, when given a choice between a sure gain of $900 and a 90 percent chance of $1,000, and a choice between a sure loss of $900 or a 90 percent chance of a loss of $1,000, most people take the sure gain of $900 and the 10 percent chance of losing nothing. Since the expected values of the choices are identical, people "should" bet the same way in each gamble. This observation strikes many people as counterintuitive and thus captures the genius of prospect theory: people choose more risk to avoid an outcome they view as a loss, and choose less risk to obtain an outcome they view as a gain. Kahneman won the 2002 Nobel Prize in Economics for his work with Tversky, who died in 1996.

No one likes to lose, and in this sense people are all loss averse. But for prospect theorists, loss aversion means that people will assume more risk to avoid an outcome framed as a loss than they will to obtain the identical outcome framed as a gain. For example, people feel differently about a policy that guarantees 90 percent employment than one that guarantees 10 percent unemployment. Framing a policy as a gain (90 percent employment) puts people in a domain of gain and makes them risk averse; framing a policy as a loss (10 percent unemployment) puts people in a domain of loss and makes them willing to accept more risk to avoid that outcome. Identical problems should be viewed identically, but they are not when the framing of a choice puts one in a domain of gain or of loss, which then systematically influences one's choices. People are loss averse because preferences are reference dependent. Rather than use the objective features of a choice as the basis for a decision (e.g., an absolute gain or a final state of employment), people pay attention to changes from some reference point (e.g., a gain or a loss). Because people dislike losing

more than they like to win, they will assume more risk than they would in a different frame to escape that loss. Being in a domain of loss makes people risk acceptant, and this can be a source for either conflict or cooperation.

APPLICATIONS

The political implications of prospect theory are profound. Unlike normative theories such as rational choice that explain how people *should* make decisions, prospect theory describes how people make decisions, which is especially valuable in strategic settings (i.e., where one's best move depends on the other's move). According to prospect theory, policy makers in a domain of loss will accept more risk than they would if they were in a domain of gain. They might escalate a military intervention that is going poorly, gamble on a risky rescue mission, or embrace radical economic reform because they are in a domain of loss. An actor who frames discontinuing action as a loss may assume more risk to continue that action than would an actor who has the capability of action but has not yet started it. For example, compelling a state to surrender its chemical weapons stockpile is harder than deterring a state from developing such weapons.

More generally, risk aversion might account for the relative stability of the international system. If people value what they have more than what they covet, then decision makers would be most likely to accept the risk of war to avoid losing what they have, rather than risk war when they see an opportunity to acquire more. Appropriate strategies of influence depend on whether actors are in a domain of gain or loss. For example, one should use threats against actors seeking gains—because threats increase risk to actors who are averse to risk—and use promises for actors seeking to avoid losses. Identifying predictable biases makes prospect theory a powerful tool for anticipating an individual's behavior as well as the behavior of financial markets.

CONTROVERSIES

Critics focus on three problems with using prospect theory to explain political decisions. First, prospect theory has no theory of frames. Because preferences are reference dependent, empirical applications of prospect theory must identify whether an actor is in a domain of gain or loss. Outside the lab, people create their own frames and this complicates using prospect theory. For example, will a dictator view the development of a nuclear weapon as a newfound gain and thus be risk averse, or will other concerns (e.g., a collapsing economy) keep the dictator in a domain of loss making him risk acceptant? No solution exists to the problem, though political scientists have explored techniques for assessing domain. Some scholars use the status quo as the basis for an actor's reference point: foreign policy setbacks create a domain of loss and a desire for a return to a precrisis status quo.

Second, measuring loss aversion in the field is difficult because it is often unclear whether one is being risk averse or risk acceptant. For example, is invading a country that might have nuclear weapons riskier than not invading that country? Reaching a consensus on these issues can be difficult even

with access to archives. Using an economic definition of risk can address the problem: the more extreme the possible outcomes, the riskier the choice; the more moderate the outcomes, the less risky the choice. Nonetheless, observers will sometimes differ in their assessments of risk and this complicates measuring loss aversion.

Third, psychological experiments cannot capture how people behave in real environments. Markets and international bargaining are too complex, and decision makers are too sophisticated, for such a simple psychological theory. Prospect theorists respond that experts reveal the same biases as do novices, and giving people greater incentives to reason carefully may make them more confident in their responses. However, it does not make them more accurate. Testing hypotheses in the field that have been contradicted in the lab is probably a mistake, but testing hypotheses derived from prospect theory that have been repeatedly confirmed in the lab is normal science. Whether prospect theory reveals how people behave in real settings is an empirical question, which is why political scientists who use prospect theory are committed to detailed empirical case studies.

Protectionism and Tariffs

Protectionism is a term used to describe action that a national government takes to affect the importation of goods or services in the interest of sheltering domestic producers or service providers from international competition. Traditionally, the most common form of protection has been the tariff, which constitutes a tax levied against imported goods.

PROTECTIONISM AND POLITICS

Protectionism represents an economic conundrum; while economically problematic, once in place, protectionism proves remarkably robust. It has been a staple of economic theory since David Ricardo first articulated the theory of comparative advantage: under most conditions, states will maximize their aggregate wealth if they concentrate exclusively on the production of goods that, according to their allocation of assets (traditionally labor, land, and capital), they are most efficient at producing. This specialization is encouraged through the market principles associated with free trade. Under such conditions of maximum competition, producers have the greatest incentive to produce efficiently, and consumers are afforded the widest array of choice at the most reasonable cost.

However, while free trade tends to maximize a state's aggregate wealth, the elimination of import protection distributes costs and benefits unevenly. The benefits of removing protection are, generally speaking, broad but latent. That is, a large number of consumers—and already-efficient producers—benefit, but these benefits are often marginal to any given individual. By contrast, the costs associated with the removal of import protection tend to be concentrated and manifest. For producers in inefficient sectors of the economy, the reduction or elimination of import protection can be sufficient to shut down industries and cost jobs. Given this asymmetry of costs and benefits, despite the aggregate benefits associated with free trade, democratically elected officials are predicted to gratify the policy demands of an intensely preferential minority over a less preferential majority. Protectionism is also made more robust insofar as advocates of import protection enjoy manifest rhetorical advantages. The economic benefits of free trade are fairly technical and hence engage the imagination of a modest segment of the population. By contrast, the tangible, real-life costs of people losing jobs and factories closing are more readily understood, both intellectually and emotionally.

REASONS FOR PROTECTIONISM

Protectionism is not an inherent bad. In addition to the significant costs borne by individuals who stand to lose profits and jobs, there are other considerations that factor into states' decisions to protect domestic producers. One is the so-called infant industry argument. One of the problems faced by late-industrializing states is that it is difficult for new firms to break into industrial markets. These new firms face larger advertising costs, for example, than do established firms that enjoy more brand recognition. They also face disadvantageous economies of scale, or cost per unit of output. Firms that already enjoy established market shares can generally produce each unit at a lower cost than can firms seeking to enter such markets. As a result, late-industrializing states (e.g., Germany during the third quarter of the nineteenth century) often choose to shelter new "infant" industries from foreign competition until they are mature enough to reasonably compete with more established foreign competitors.

While free trade tends to maximize a state's aggregate wealth, there are often considerations other than wealth maximization that might serve a country's interests. National security is an example. Historically, nations have been loath to create disincentives for agricultural production, even when

they do not have comparative advantage in such production. The economic advantages of shifting production to more efficient sectors and instead importing foodstuffs can render a nation vulnerable to blockade during times of war. The same logic applies to the production of munitions. Nations that rely on foreign countries to produce their armaments run the risk that the supply of munitions, not to mention their capacity to develop state-of-the-art weaponry, could be shut off during times when they are most needed.

TYPES OF PROTECTIONISM: TARIFFS AND NONTARIFF BARRIERS

Tariffs are the most visible form of import protection. Historically, they were used not only to protect domestic producers, but also, particularly before the widespread use of the income tax, as sources of national revenue. During the Progressive Era in the United States, the so-called scientific tariff was the basis of what was known as *fair trade*. Under fair trade, tariff levels are set at a level that equalizes production costs between domestic producers of a given commodity and more efficient foreign producers. While the effect is superficially more just, fair trade undercuts the logic of the theory of comparative advantage.

Countries historically have set differential tariff rates, with the best rates on a particular commodity offered to *most favored nations* (MFN). The MFN principle can operate in one of two ways. Under the *conditional* MFN principle, state A enters into a trade agreement with state B whereby state B is granted state A's lowest tariff on a particular commodity. State A then offers this same MFN rate to noncontracting parties in exchange for the same concessions that state B has granted. Under the *unconditional* MFN principle, however, all states with which state A has entered into a trade agreement are considered most favored nations and are thus granted the MFN rate on all of state A's commodities. As such, each time state A enters into an agreement with one MFN, the MFN rate extends to all of state A's trade partners. A concession to one is a concession to all.

The unconditional MFN principle has been the foundation of the World Trade Organization (WTO) since its founding in 1947 as the General Agreement on Tariffs and Trade (GATT). The WTO operates according to *rounds*—episodic periods of negotiations designed to extend the scope of MFN concessions. The early rounds of the (then) GATT negotiated industrial tariff reductions on a commodity-by-commodity basis. With the Kennedy Round (1964–1967), however, and the introduction of the *Swiss formula*, tariffs reductions were negotiated across the board. During the Tokyo Round (1973–1979), member nations negotiated the reduction of less-visible nontariff barriers; these include import licenses, quotas, voluntary export restrictions, and subsidies.

Until the Uruguay Round (1986–1993), the GATT had been concerned only with industrial commodities. The Uruguay Round and Doha Round (2001–) have been dedicated to reducing protectionism in the contentious agricultural and tertiary (i.e., services) sectors, as well as in commodities, particularly textiles, deemed most advantageous to developing nations,

most of which failed to enjoy the enormous benefits achieved by industrialized nations through the GATT and WTO.

Protestant Political Thought

The Protestant Reformation set in motion a series of largely unintended revolutions, from the sudden transformation of European geopolitics, to the formation of the modern nation-state, as well as the reshaping of families and the ideals of individuality. Martin Luther (1483–1546), a German, and John Calvin (1509–1564), a Frenchman, were the leading figures introducing and spreading Protestant political thought leading to the creation of Protestant churches and Protestant states and societies.

BEGINNINGS OF PROTESTANTISM

The first phase of the Protestant Reformation, beginning with Luther's Ninety-five Theses in 1517, was a widespread Gospel-oriented critique of the Catholic Church doctrine and polity, especially regarding salvation. As civil authorities enlisted in this movement, there developed a magisterial Protestantism, which spearheaded the reform of church doctrines and practices but included religion under the guidance of godly rulers. The initial phase of the Reformation created protonational churches, converting normally recurring political struggles into prolonged internecine religious wars. By the end of the Thirty Years War (1618–1648), the principle *cuius regio, eius religio*—"whose realm, his religion"—was established in which state-building and church-building went hand in hand. Essentially, the religion of the ruler dictated the religion of the ruled. The Thirty Years War, primarily fought in modern day Germany, involved the major European powers of the

sixteenth century and is considered a war between Protestants and Catholics. The result for political thought was paradoxical: as Protestant political leaders became heads of their respective confessional churches, politics increasingly subsumed sacred duties and purposes as the state undertook the spiritual and ethical elevation of its members. The loss of the sacerdotal, or priestly, authority of the church was mirrored in the increase in the moral and tutelary tasks undertaken by governments.

While this early development of a macropolitics of *Protestantism from above* might seem to confirm an increasing secularization of society and the increasing consolidation and authoritarianism of politics, the power of *Protestantism from below* in the churches and local communities tells a different story. Replacing priests and masses were intense religious communities bound together by prayer, sermons, and hymns. The micropolitics flowing from a religion of personal conviction—exemplified by Calvinist Geneva—destabilized many regimes, leading to the independence of the Low Countries from Spain and the rapid rise to power of the Netherlands.

The most prominent example of the power of a new religious and social discipline from below, however, occurred in the mid-seventeenth century with the rise of Puritanism and the English Civil War (1642–1651). In both England and the Netherlands, a "revolution of the saints" forged strong links in religious community between personal and familial discipline and republican citizenship. These revolutionary movements, whether intended or not, set the framework for the development of early modern political thought: the writings of Thomas Hobbes, Samuel Pufendorf, Hugo Grotius, John Locke, and Jean-Jacques Rousseau are incomprehensible absent the "disciplinary revolution" of Independency, Calvinism, and pietistic Lutheranism. In addition, colonial New England and the American Revolution (1776–1783) would be even less understood without the context of these movements.

ADAPTING TO MODERN CULTURE
A strong but quite different relationship between Protestantism and political thought was forged in the nineteenth century. Protestantism from below had always had a strong social reform impulse fueled by hopes of millennialism, meaning a paradise on Earth when Christ rules for nearly one thousand years before the anticipated final judgment. Lay-dominated disciplinary consistories in local churches, the formation of orphanages and work houses, the reform of prisons, the establishment of common schools, and reforms in marriage and the family all attested to a Protestant evangelical imperative to fulfill one's calling and to manifest one's inward regeneration. Protestantism from above lodged important ethical tasks in the state.

It was the task of German academic theologians, philosophers, and historians in the nineteenth century to incorporate these dual imperatives into a systematic Protestant theology and biblical interpretation studies. F. C. Baur, Albert Ritschl, Adolf Harnack, and, later, Ernst Troeltsch, sought to integrate religious and secular history in a larger narrative of the progressive revelation of God's spirit. This philosophical history, in which the birth of Protestantism was the signal modern event, tended to make cultural, political, social, and economic life the chief site of God's contemporary revelation. As God's kingdom becomes more clearly revealed, the distinctive role of the church and Christian dogma is progressively displaced. Through moral philosophy and social reform, an increasingly noncreedal Protestantism became the vehicle through which Christian ethics would achieve a world-universal status. On this reading of history, this kind of secularization represents the progressive fulfillment of Christian prophecy and not its denial. Georg W. F. Hegel's philosophy of history stands as the most notable product of this project.

Elsewhere, political philosophers and public moralists quickly adopted these readings of history as a sacred story. In England, Samuel Taylor Coleridge, John Stuart Mill, Mark Pattison, Benjamin Jowett, and Thomas Hill Green incorporated and reworked these ideas into their own historical–philosophical writings, while theologian F. D. Maurice and clergyperson Charles Kingsley, along with novelists like Humphrey Ward and George Eliot, conveyed these same ethical–historical teachings into the homes and churches of the middle classes.

It was in America, however, where political values and Protestant ethical ideals were most closely bonded. Before the Civil War (1861–1865), an evangelical united front spearheaded a series of national moral and social reform programs, most notably the abolition of slavery. After the Civil War, German-trained political economists and historical sociologists infused the new research universities with reform ideas that quickly became allied with Progressive reformers and intellectuals and with the reform projects of a noncreedal social Christianity. The early John Dewey, Jane Addams, Richard Ely, Walter Rauschenbusch, and Lyman Abbott are representative of this fusion.

The legacy of Protestantism for political thought was less a set of new Christian doctrines and more a series of new and often unintended conditions within which modern political thought—and modern society itself—developed. Since Protestantism was hostile to hierarchic priesthoods and claims of sacerdotal authority by church governments, the authority of individuals, families, and governments was enhanced. The individualism inherent in a religion of personal conviction was increasingly augmented with a belief that gathered congregations, voluntarily constituted by the body of believers and protected in their corporate freedom by the state, represented the true ideal of human association. Finally, a covenantal political theology projected an ideal that all true polities achieve their unity and purpose, in this world and at the end of time, through a common dedication to transcendent ends.

Protest Music

Protest music encompasses many artistic forms, such as poetry, music, or satire with a dose of politics. As a genre, protest music exists in various cultures. Unlike military marches and national anthems, contemporary protest music and songs criticize a state's establishment and propose another social vision.

There are numerous classic examples of protest music in the twentieth century. For instance, in Germany during the 1920s, Kurt Weil and Bertholt Brecht composed many subversive songs, which were appreciated by the socialists. In France, singer and songwriter Léo Ferré always defined himself as an anarchist, and even attacked Spanish dictator Francisco Franco in two songs, "Franco la Muerte" (1964) and "L'Espoir" (1974). In the United States, African American artists expressed their subversive feelings about poverty, life in prisons, and class tensions in the musical blues genre. For example, during the 1950s and 1960s, African American blues artist J. B. Lenoir wrote and recorded topical songs portraying America's engagement in war during the cold war era, such as "Alabama Blues," "Eisenhower Blues," "I'm in Korea," "Korea Blues," and "Everybody Crying About Vietnam."

Earlier, novelist and songwriter Boris Vian helped jazz become popular in France during the 1950s with his subversive songs. His most famous composition was "Le Déserteur" (1954), a strong antiwar song in which a humble man writes to the president, explaining in polite terms that he refuses to go to war. This song was released at a time when France was in conflict in Indochina, later to be called Vietnam. The words of the song refer to how soldiers are victims who lose their wives and souls while on the front. In the conclusion, the lyrics relay that if soldiers want to force the narrator to go to war, they will have to shoot him. The song was banned on the French radio because it was considered demoralizing for soldiers and an insult to the French army. However, Vian created many more antiwar songs, including "Le Petit Commerce" (The Little Commerce), in which a merchant explains he finally made a fortune by selling arms and tanks, but then loses all his friends who were sent

to war. In another ironic song, "La Java des bombes atomiques" (The Java of the A-Bombs), Vian tells the story of an inventor who wants to show his new A-bomb to all presidents of the world, reunites them for a secret meeting, and then throws a little A-bomb on them. After his death in 1959, dozens of Vian's subversive songs were sung by other artists.

Famous U.S. songsters such as Woody Guthrie and Pete Seeger composed protest songs influenced by left-wing, socialist slogans during the 1940s and 1950s. Soul music from the 1960s was also a form of protest, such as James Brown's "Say It Loud—I'm Black and I'm Proud," a funk song recorded in 1968. In Canada in 1973, Félix Leclerc wrote "L'Alouette en colère" (The Angry Lark) to protest the Canadian army, which—under a special War Measures Act during the October crisis in 1970—occupied Montreal and Quebec City, plus a part of the Ile d'Orléans.

Singer and songwriter Bob Dylan is often seen as the epitome of the protest singer, mainly because he succeeded in bringing protest songs to a large audience and indoctrinating his music into mainstream culture. Dylan's songs, "Blowin' in the Wind" (1962), "The Times They Are A-Changin'" (1963), "A Hard Rain's A-Gonna Fall" (1964) are all examples. Beginning in 1965, Dylan transcended from the folk scene and brought his vision to mainstream radio.

Popular music, which was predominantly mainstream Anglo-American music, was a convenient means to bring easy listening protest music to the masses. The Beatles included pacific messages in their songs, such as the antiwar "We Can Work It Out" (1965) released during the Vietnam War (1959–1975), or "All You Need Is Love" (1967), which was the first song performed live and simultaneously broadcasted on television via satellite worldwide. In the United States, music festivals such as Monterey International Pop Festival in 1967 and Woodstock Music and Art Fair in 1969 contributed to broadening pop music's audience beyond the sphere of hippies. Feature films from these two megaconcerts were seen by millions, and still allow the twenty-first century observer to witness the high energy between protest singers and their audience.

Philosophers from the Frankfurt school, a neo-Marxist center, had a strong interest for popular music, jazz, and radio. While they were living in the United States during the mid-1940s, Theodor Adorno and Max Horkheimer, two of the school's famous philosophers and sociologists, explained that mass culture does not emerge from the masses; it is rather conceived for massive audiences, produced and distributed as any industrial process. More recently, scholars in cultural studies question the former distinctions between high art and low art in terms of music, and focus on how audiences and individuals can appropriate elements of a specific popular culture into building their own identity. In many contexts, music has become an important part of social identity and systems of fashion.

Ethical dimensions of popular music appeared when cases of copyright infringements emerged. The limit between influence, inspiration, and plagiarism has always been difficult to indicate. For instance, composer George Gershwin could say

he was "inspired" by traditional African American spirituals when he wrote "Summertime," on his classic *Porgy and Bess,* when he in fact copied the melody of "Sometimes I Feel Like A Motherless Child," and merely added new lyrics.

Protests and Demonstrations

Worldwide, protests against a state or a political entity, or in advocacy of a public cause, happen frequently, in a variety of ways, and are usually short-lived. The effectiveness of a protest can be measured and interpreted by a variety of factors, not all dependent on achieving the actual reform or cause the protestors seek, as the amount of support and attention a protest receives could be considered a type of achievement. The initial step for understanding protest is to examine the terms of a protest's mobilization. Three major theories circulate about the concept of a protest's mobilization.

First, cultural theories argue that local culture is vital and that protesters think. One problem with these theories is that numerous relevant cultures exist. Many may affect any given protest action and it is difficult to understand fully more than a few cultures at a time. Second, structural theories posit external causes for mobilization. For Theda Skocpol, the international capitalist pricing system is a prime mobilizer, while for Charles Tilly, maintained industrialization and urbanization lead to protest mobilization. Tilly considered leadership critical, but was otherwise a completely structural theorist because he felt individuals and their thinking was unimportant. Third, and in contrast, Mancur Olson created a rational theory that considers each person as an individual thinker with preferences. Olson's theory focuses on clubs and interest groups, but not on conflict.

Mark Lichbach extended the rational theory to risk and conflict. He agreed with Tilly in believing leadership important, but created dozens of solutions to the mobilization problem and found four distinct categories: (1) market, by lowing costs and increasing benefits; (2) community, by using common knowledge; (3) contract, by making deals with other groups; and (4) hierarchy, by leaders ordering followers to act. In order to mobilize anyone for a successful protest campaign, it is necessary to combine at least two of these groups. Lichbach also incorporated many cultural norms in his theory.

Of these theories of mobilization, the rational one is ascendant. Structural theories ran into two difficulties. First, they could not tell how to bring one person out to protest without bringing all dissidents out at the same time. Second, their concept of political opportunity structure claimed dissidents act only when structural opportunities open. However, researchers found dissidents themselves could create such opportunities, and this lowered the value of the political opportunity structure. The apparent insanity of accepting personal risks challenges the rational theory of protest. Yet, the theory can be tested under risk because most people do not want to be arrested, injured, or killed, and thus find ways to elude or at least to minimize repression. For instance, with the Iranian presidential elections in June 2009, hundreds of thousands of Iranian citizens took to the streets to challenge the election results, claiming electoral fraud in defiance of Iran's militant theocracy. Despite Iran's security crackdown and censorship of the protests, Iranian citizens remained dissuaded from publicly demanding new elections, even after hundreds to thousands of protestors were arrested or killed by Iranian security forces.

Although demonstrations seem to be most frequent, there are many forms of protest. Of the 30,000 recorded protest events in the United Kingdom over a sixteen-year period, demonstrations accounted for 533. Demonstrations are simply the most public forms of protests and therefore receive the most media attention. Demonstrations that remain stationary are called *rallies*; those that move become marches. Typically, demonstrations last less than two hours and occur on workdays, avoiding weekends when free time would be consumed. According to recent studies, Muslim Albanians protest most frequently on Wednesdays, Belgians on Sundays, French on Thursdays, and Germans and British on Saturdays. A well-known coding project in Germany relied on Monday newspapers to collect protest data over the weekends, missing about 72 percent of all protests taking place during the full week.

In the United States, almost all demonstrations are nonviolent; when violence does occur, it stems from riots, especially when police leave the scene. European demonstrations begin calmly, but when they start to unravel, some persons typically organize rock throwing or car burning tactics, as this is an easy means to mobilize a violent protest. Recent, contemporary examples of international demonstrations, which gained considerable amount of media attention, were the 2009 G20 summit protests in London, then Pittsburgh in the United States. International protesters amassed in the thousands seeking increased economic oversight of the participating capitalist powers or proenvironmental reforms. While these demonstrations were to remain peaceful, some protestors did attempt to react violently against security officials.

Proudhon, Pierre-Joseph

French philosopher and author Pierre-Joseph Proudhon (1809–1865) was the first to call his social philosophy *anarchist*. He considered state order to be artificial, contradictory, and ineffective, thereby engendering oppression, poverty, and crime. Furthermore, he believed public and international law, along with the varieties of representative government based upon the principle of individual ownership of productive property, are also false. In his important work *What is Property?* (1840), Proudhon famously proclaimed that "property is theft." With this, he asserted that authority is incapable of serving as a proper basis for constituting social relations, and the citizen must be governed by reason alone.

An opponent of communism, which Proudhon viewed as requiring the subservience of the individual to the collective, he argued for a system of mutualism that allowed for a synthesis of private property—or possession—and collective ownership that would avoid the extremes of each on their own. In the system, workers controlled their specific means of production and exchanged the products of their labor, with exchange values determined by the amount of necessary labor time involved in the production of the products in question. It was not a system of full equality, since the industrious were rewarded more than those who were less ambitious.

In Proudhon's system, social affairs would develop in economic organizations and over time the state would render obsolete. In place of political institutions, Proudhon advocated economic organizations such as cooperatives and "people's banks" as means toward the reorganization of social life. With this, limiting of constraint, the reduction of repressive methods, and the convergence of individual and collective interests creates what Proudhon calls the condition of total liberty, or anarchy; he suggests that it is the only context in which "laws" operate spontaneously without invoking command and control.

In the absence of a governmental state, self-regulating communes would associate in federated networks. Proudhon envisioned Europe as a confederation of federations overcoming national borders. Proudhon's mutualism achieved great popularity among the working classes during the French revolution of 1848, when workers demanded liberal social, political, and economic reforms. In his *General Idea of the Revolution in the Nineteenth Century* (1851), Proudhon reflects on the lessons of 1848 and presents a defense of revolution as a permanent and ongoing social process—a necessity of social life.

Pierre-Joseph Proudhon advocated economic organizations to reorder social life and create a state of total liberty or anarchy, without political institutions.

SOURCE: The Granger Collection, New York

Proudhon's ideas came to dominate among those members of the French working class who contributed to the foundation of the International Working Men's Association (IWMA). During the workers' revolutionary movement known as the Paris Commune of 1871, the largest political ideological group that participated consisted of Proudhonians. Proudhon's calls for working-class self-liberation through economic organization contributed to the founding of anarcho-syndicalism, or revolutionary unionism, and influenced the autogestion (i.e., workers' self-management) movements of the 1960s and 1970s. His followers founded the main organization of the union movement in France, the *Confédération générale du travail* (General Confederation of Labour—CGT).

Despite his influence on progressive movements, Proudhon espoused a number of reactionary perspectives. He viewed the family as society's primary and most significant socializing agent, the source of moral values and social affections, and a bulwark against modern market values. This view of the family has been criticized for upholding a patriarchal vision of women as suited primarily to home, rather than public life. Proudhon was also deeply anti-Semitic and racist, and he claimed the inferiority of certain races and proposed that Jews be expelled from France, arguing that land belongs to the race that was originally born on it.

Psephology

Psephology is the quantitative analysis of elections and balloting. Psephology is Greek for "pebble" and refers to the stones used in ancient Athens to indicate voter preferences. British political scientists and election commentators, R. B. McCallum and Robert McKenzie popularized the term in the 1950s. Psephology uses voting records, polling data, finance records, and other primary data and records to analyze voting patterns and voter preferences. It attempts to explain swings in voter preferences, variations in electoral turnout, and demographic voting trends. Psephology research can be used to explain past or contemporary voting results or to develop predictive theories for future balloting.

Research areas within the field typically concentrate on voter behavior and motivation, and models for future elections. Studies and findings are often used to affirm or challenge existing theories on voting. Political parties, polling firms, and political consultants often employ psephologists. Some psephology studies have been criticized for developing false predictive theories or for creating inaccurate correlations between political, economic, or social conditions and election results. Critics also argue that biases in polling data or study criteria can skew the predictive value of psephology.

. . . . TOM LANSFORD

Ptolemy of Lucca

Italian historian Ptolemy of Lucca (ca. 1227–1327), also known as Bartholomew of Lucca or Tolomeo of Lucca, was a member of the Dominican order and held several influential positions within the hierarchy of the Roman Catholic Church. He is the author of *On the Government of Rulers*. Originally, authorship of this treatise was attributed to theologian St. Thomas Aquinas, Ptolemy's teacher and friend, and the work became very influential due, in part, to that misunderstanding.

Consistent with Ptolemy's studies with Aquinas, ancient Greek thinker Aristotle had the most important philosophical influence on Ptolemy, particularly Aristotle's *The Politics*. Aristotle had offered a threefold classification of different kinds of regimes, depending on the number of rulers and whether those rulers governed for the common good or only in their own self-interest. The favorable forms of government were monarchy, aristocracy, and constitutional rule of the many. The corrupted versions of these regimes were tyranny or despotism, oligarchy, and mob dictatorship. But whereas most thinkers of the period accepted Aristotle's classification without much revision, Ptolemy complements it with the addition of different modes of lordship, also borrowed from Aristotle. There are four kinds of lordship: sacerdotal and regal, regal alone, political, and household. In *On the Government of Rulers*, Ptolemy focuses primarily on regal and political forms of rule.

In his discussion of regal rule, Ptolemy tends to equate it with despotism, although his discussion of these matters is at times contradictory. Regal rule is rule of a single ruler or sometimes the rule of the master over the servant. Political rule, on the other hand, is rule by the laws adopted by citizens or their representatives. It may include either direct democratic rule or republican systems of government. Ptolemy's discussion of republicanism, particularly his claim that it is the best form of government for virtuous people, has led some commentators to conclude that he was committed to some form of republican government. However, he also believed in the sinfulness and moral corruption of human beings. In *On the Government of Rulers* he states: "As is clear from what I have said, we should prefer the government of one, which is best, although it may be converted into tyranny, which is worst" (79). He goes so far as to suggest that a certain degree of tyranny is acceptable, since the alternative would allow too much latitude for a person's sinfulness.

Despite exhibiting some sympathy for republican forms of government in certain circumstances, Ptolemy endorsed the claims of papal authority with regard to temporal rule. Included in his arguments is the claim that Jesus Christ bestowed upon his disciple Peter, and subsequent popes, authority in all matters regarding the church. Since the affairs of the church take precedence over temporal issues, church authority on all matters, temporal or divine, is final. However, the assumption here is that the pope must work for the common good. If this is not the case, Ptolemy offers no alternative.

As suggested earlier, Ptolemy's influence on political thought was largely a result of the mistaken belief that Aquinas was the author of *De Regimine.* Ironically, despite his own preference for regal rule, it was his arguments regarding republicanism that would have the greatest influence on other Italian thinkers such as poet Dante Alighieri, political reformer Girolamo Savonarola, and statesman Niccolò Machiavelli. Hence, Ptolemy helped provide a basis for what would eventually become known as civic humanism.

Public Diplomacy

Public diplomacy (PD) is a communication process employed by states and nonstate actors to influence a foreign government by influencing its citizens. It is a relatively new field of practice and scholarship. It attracted attention in the previous century with the opening of diplomacy to the media and public opinion, and became a more substantial area during the cold war, which was dominated by the delicate balance of nuclear weapons and the ideological battle for the hearts and minds of peoples around the world. PD became a critical element of national security and foreign policy following the emergence of the information age, the end of the cold war, and the September 11 attacks on New York City and Washington, D.C.

PUBLIC DIPLOMACY DURING THE COLD WAR

Originally, states used PD in antagonistic relationships in order to achieve long-term results in foreign societies. The assumption was that if public opinion in the target society is persuaded to accept a favorable image of the other side, this will exert pressure on the government to alter existing hostile attitudes and policy. Thus, during the cold war, both the United States and the Soviet Union extensively utilized PD to shape favorable public attitudes around the world toward their respective rival ideologies. They primarily used international broadcasting, international exchanges, and cultural diplomacy.

The United States established radio stations such as Radio Free Europe and Radio Liberty, and Britain used the BBC World Service to provide citizens in communist countries with accurate information about events occurring in their own countries and in the West. The Soviet Union and China used broadcasts in numerous languages to spread their messages around the world.

Cultural diplomacy includes participation in festivals and exhibitions, building and maintaining cultural centers, and teaching a language and organizing musical tours. The purpose is to cultivate admiration, reputation, and good will. Many countries maintain permanent cultural centers in major cities around the world so that citizens can be directly exposed to the cultural world of the state employing cultural diplomacy. Examples include the cultural centers of the British Council, the German Goethe-Institute, and the Chinese Confucius Institutes.

International exchanges refer to programs designed to bring overseas students, faculty, intellectuals, and artists to study or to work in universities and scientific centers. The assumption is that spending time, studying or teaching, will make foreign students and scholars ambassadors of good will for the host state. Examples include the U.S. Fulbright program and the German Academic Exchange Service (DAAD).

THE NEW PUBLIC DIPLOMACY

At the beginning of this century, scholars and practitioners adopted the term *new public diplomacy* (NPD). First, they wanted to distinguish between the PD of the cold war and the PD of the postwar era. Second, they wished to adjust the classic PD to the opportunities and challenges of the information age. NPD includes the following components: (1) it is pursued by states and nonstate actors; (2) it is based on *soft power*, two-way communication, strategic PD, information management, nation branding, and e-image; (3) it involves domestication of foreign policy; and (4) it deals with both short- and long-term issues. Contrary to popular misunderstanding, the NPD is not propaganda and is not just public relations. It is a communication system designed to create a dialogue with both foes and allies. It requires a capability to effectively use credible information to persuade actors to understand, accept, or support policies and actions.

Contemporary public diplomacy is related to soft power. Power is the ability to influence the behavior of others to yield the outcomes one wants. To achieve these outcomes, an actor may employ *hard power*—that is, military and economic means—or soft power, which entails attraction, seduction and persuasion. Soft power arises from the attractiveness of a nation's values, culture, and policies. It causes people to act through cooperation rather than coercion. The Vatican, many international organizations, and nongovernmental organizations (NGOs) possess only soft power. Critics suggest that only *smart power*—a balanced combination of hard and soft power can yield the best results. PD could be viewed as the wielding of soft power.

While only nations pursued classic public diplomacy, both states and non-state actors conduct the NPD; this includes international organizations, NGOs, multinational corporations, global media networks, terrorist organizations, military alliances, and prominent individuals. Also, classic public diplomacy was one-sided. Messages and information were delivered to the masses, but there was no effort to create a dialogue and listen to the interests and wishes of the messages' recipients. The NPD utilizes two-way communication, a central element in several models of international public relations and public diplomacy, which requires serious listening and suitable responses to messages from other nations.

STRATEGIC PUBLIC DIPLOMACY

The NPD is based on strategic communication, which includes scientific measurement of public opinion and persuasion techniques. It also involves the creation and persistent dissemination of clear and consistent themes. *Information management* refers to the means officials use to influence media coverage and framing of major events, leaders, and processes.

A *brand* is best described as a consumer's idea about a product, and public relations and marketing experts believe nations can be branded like products. Branding thus entails giving products and services an emotional dimension with which people can identify. The *brand state* refers to what people around the world think and feel about a nation. This formulation also applies to nonstate actors.

With the Internet now a major arena for information dissemination, almost all states and nonstate actors maintain Web sites to present their history, policies, values, culture, science, and other achievements. The Internet provides actors with ample opportunities to present themselves in a way that can cultivate positive support or attack opponents. By using the Internet for self-promotion, actors pursue cyberpublic diplomacy, and the cumulative effect creates competing e-images. National e-images appear primarily on the official Web sites of presidents; prime ministers; foreign affairs and defense ministries; domestic security agencies; and trade, tourism, and science organizations. NGOs and terrorist organizations have been particularly effective in using the Internet to promote their causes and actions.

In 2001, following the September 11 attacks, President George W. Bush employed force but also extensive PD to combat global terrorism. He established new PD agencies, pursued new programs, and allocated substantial budgets. His successor, President Barack Obama, has increased the emphasis on PD and his Cairo speech of June 2009 is an example. In this century, PD is likely to become the major instrument of foreign policy due to the continuing decline of military force as a legitimate instrument to settle international disputes and the continuing increase in the importance of world public opinion.

Public Domain

Public domain can refer to land that is under the direct control of a government, or to art, literature, music, or other intellectual property that is no longer under copyright restrictions. Public domain includes those territories that belong to the central government and not state or private entities. It typically includes parks, nature reserves, and other common spaces. Although public domain areas are generally considered to exist for the benefit of all citizens, governments may sell, lease, or otherwise dispose of the land to pursue national interests. In the United States, much of the nation's early history involved efforts by the federal government to encourage settlement of public domain areas, especially as America acquired new areas of the West.

Public domain books, paintings, or songs are considered to form the cultural fabric of a society, and are therefore open for use by individuals, groups, or corporations. Copyright laws generally grant people exclusive rights over their creations during their lifetimes, plus fifty-seventy years. Items may be in the public domain through one of several ways, including if they were created prior to the establishment of copyright law, the copyright timeframe has expired, or through the voluntary release by the artist or creator.

Public Enterprises

Public enterprise is used to describe specific corporate entities partially or wholly sponsored by the government. These enterprises may include governmental entities, such as public authorities or special purpose districts, which are distinguished from traditional government agencies by their corporate structure, fee-for-service funding model, or insulation from the traditional government bureaucracy and elected bodies. Entities that bear greater resemblance to traditional for-profit corporations are frequently labeled public enterprises, including state-owned enterprises (SOEs), which the state typically owns entirely or the government is a stakeholder.

There are, then, essentially two classes of public enterprises. Some public enterprises are government agencies adapted to look and function as for-profit companies. Others represent private firms blended with elements of government. The implications of the mixture—and the salient issues for political scientists—are different for the two classes of public enterprise.

ADOPTING BUSINESS PRINCIPLES

The prospect of running a government as a business has been attractive for bureaucrats and government agencies for years. Promises of enhanced efficiency, reduced corruption, and lessened burden on the public purse have led to the creation of public enterprises to provide a vast array of services. Some of these include housing projects, transportation, infrastructure, medicine, and social services. As such, the most venerable and familiar form of public enterprise of this type is the public authority. As its name suggests, a public authority is endowed with many powers of a state agency and typically charged with building, maintaining, and operating a public facility or infrastructure project, such as a bridge, power plant, or airport. A key feature of a public authority—one that is not common to all public enterprises—is the ability to borrow independently. Typically, public authority issues bonds backed by the expected revenues to be earned, as the public authority

charges users or local municipalities for the amenities they provide. For example, a transit authority sells bonds and repays debt holders with the fares paid by riders.

This arrangement transfers the cost of providing the public good to users of the public good. In some cases, however, government agencies pay the user fees out of general revenue. The perpetual concern with public authorities is their seeming alienation from government or public control or oversight. Often, the concern is elected executives who use public authorities to evade the control of legislatures. Most famously, twentieth-century New York urban planner, Robert Moses, used his dominion over a passel of public authorities to transform the infrastructure of New York. At the U.S. federal level, the Tennessee Valley Authority—established in 1933 to create public works programs in the Midwest and the South to supply jobs—is often criticized for its alleged immunity to political control or government oversight.

PLACING BUSINESS FIRST AND GOVERNMENT SECOND

There are two forms of government agencies performing as business entities, referred to as *government corporations* or *government-sponsored enterprises.* The label government corporation should be nearly synonymous with public enterprise, but this is hardly the case. Rather, many government corporations resemble public authorities with the notable difference they do not borrow through the government. They are run on a fee-for-service basis and generally are self-sustaining, as they carry out activities as varied as generating electricity, financing mortgages, and operating railroads.

With government-sponsored enterprises (GSEs), although their origins are the same as government agencies, GSEs are public enterprises that move to the business-with-government features spectrum of public enterprises. These are traded companies, which historically returned significant profit to shareholders, compensated their executives in line with finance industry norms, and functioned largely beyond governmental control. Government agencies regulate GSEs to monitor financial safety and soundness as well as to achieve public mission. In return, GSEs enjoy several advantages; most notably, the implicit guarantee on their debt reduces their borrowing costs.

In 2009, GSEs entered the public consciousness when Fannie Mae and Freddie Mac, two massive housing finance companies, crumbled. Their collapse prompted a remarkable federal intervention. The failure of Fannie Mae and Freddie Mac underscored a central public concern with many public enterprises: the public takes a great deal of risk with such organizations and yet does not reap the rewards, albeit financially or enhanced delivery of public goods.

The significant 2009 American investment in private firms—including General Motors; the international insurance giant, American International Group (AIG); and the international financial conglomerate, Citigroup—reintroduced the types of public enterprises in the United States generally associated with socialist regimes. State-owned enterprises (SOEs),

or firms in which governmental agencies hold a significant stake, are well-known throughout the world. Nowhere is concern for the future of state-owned enterprises greater than in China, the largest socialist regime in modern history.

The fear surrounding SOEs is that government participation interferes with the businesses' ability to prosper, with policy imperatives given precedence over profit-driven considerations. In some cases, the public purpose of a SOE is quite explicit, but often corporate executives are under pressure to pursue nonfinancial objectives at the state's behest. There is a related concern that state-owned enterprises quash competition because they are favored over their private competitors. Generally, the concerns associated with SOEs are contrary to the commonly held misgivings regarding government corporations, public authorities, and other government-as-business enterprises, such as lack of state oversight and involvement.

For public enterprises emerging from the business end of the spectrum, then, the public mission of the entity is less certain. In some situations, government participation is seen to connote a corresponding public role, but in other contexts, state-owned enterprises are regarded as businesses that happen to have governmental ownership. More often than not—and this is the case with the government intervention prompted by the financial crisis—there is tremendous ambiguity on this critical point.

Public Good

The idea of the public good, also called the *common good,* refers to those generalizable interests and values that all members of a polity share by the mere fact of being members of that polity, whether particular individuals recognize those interests and values or not. Policies, practices, and actions that support or embody such interests are said to be in the public or the common good. The public good often contrasts with one's private or particular interests—those interests that one chooses for oneself and are not necessarily shared with other citizens or groups.

One common example of the conflict between the public good and individual self-interest is national defense of, or military service to, one's country. Thinkers who subscribe to the theory and practice of the public or common good often argue that although it is in no single person's interest to die in war, it is part of the common good that the polity determines some way to defend itself, including enlisting citizens in military service. Hence, universal military service is often described as a policy that is in the public good, even if many of those subject to it find it inconvenient, endangering, or oppose it. Similarly, one can argue that it is in everyone's interest to breathe unpolluted air that does not endanger one's health, even if few people voluntarily adopt behavior that decreases their contribution to pollution.

CIVIC VIRTUE AND PRIVATE INTEREST

This potential conflict between the public good and individual private or particular interests points to another concept associated with the idea of the public good. *Civic virtue* refers to the willingness of citizens to mold, alter, tailor, revise, or even sacrifice their private interests for the public good. The exercise of civic virtue presupposes that one has an obligation to endorse those policies or laws that benefit the society as a whole, even if they are inconvenient to or in conflict with one's self-interest or even one's well-being.

A classic example from antiquity can be found in Leonidas, one of the kings of Sparta, and the three hundred Spartans who composed his bodyguard. They marched to the pass at Thermopylae to face a Persian army they knew numbered in the tens of thousands. Hence, they knew they marched to certain death. Yet it was a sacrifice they were willing to make in defense of Sparta and Greece as a whole. Similarly, Pat Tillman, an American football player, was willing to forgo a salary of seven million dollars to join the U. S. Army after the attacks of September 11, 2001. He died fighting in Afghanistan, the victim of friendly fire. Less dramatic examples of civic virtue include when people go out of their way to assist those who are victims of national disasters or human actions, even when lending such assistance may be inconvenient or costly. People who contributed to relief efforts of the victims of Hurricane Katrina or the earthquakes in Haiti, expecting no personal reward in return, can be said to exercise civic virtue.

In addition to the fact that the public good and civic virtue are often in tension or conflict with private interests, the notion of the public good can be contrasted with the idea of the public interest. The term *public interest* most commonly refers to those shared interests that citizens have that are determined by the summation of private interests. It is determined simply by calculating which of several private interests is in the majority or plurality. The public interest and the public good may overlap, but this is not a necessary element of either and there may be times when the common good and public interest are at odds with one another.

ORIGINS OF THE PUBLIC GOOD

The notion of the public good traces to the pre-Socratics. However, its first systematic discussion takes place in Plato's *The Republic.* Plato argues that for a just society to be created and sustained, it must be ruled by those citizens who have the natural capacity and the appropriate education for moderating their passions with their reason and discovering the transcendental truth of the idea of justice. Plato refers to such citizens as *philosopher-kings*. Being able to control their passions, they are able to distinguish between those things that appear to be good and those that are genuinely good. Most importantly, they are able to distinguish between those policies and practices that appeal to the passions and appetites of the majority of common citizens from those that are genuinely in the public good of the polis as a whole. Plato goes to great lengths to ensure that the education of the philosopher-kings cultivates their control of their passions for just this reason. Moreover, although all their living needs are met, they are to own no possessions, for such ownership may tempt them to consider their own material advantages rather than the good of the polity.

Aristotle similarly argues for the notion of the common or public good, although he rejects Plato's ideal of a univocal, completely undifferentiated conception of the good. Aristotle argues that each form of activity—such as music, warfare, or athletics—issues in its own conception of the good. However, at the pinnacle of all human activities is that conception of the good that has genuine human happiness as its goal. Genuine happiness does not consist of such things as wealth, status, or physical pleasure, each of which makes one dependent on something outside of oneself. Genuine happiness is that which is self-sufficient. This is to be found in fulfilling that function which is distinctively human—reason. To exercise reason well is to exercise it in relation to virtue. Hence, for Aristotle, the human good is realized in the practice of virtue. It follows that politics, concerned with the happiness of all the citizens, is concerned with the cultivation of virtue among citizens. The responsibility of the statesman is to implement those laws that enable people to act with ethical virtue consistent with the requirements of political virtue and justice.

The idea of the public good has also been the focus of much religious political thought, including all variants of Abrahamic religions, Judaism, Christianity, and Islam. The version most common in the West, Christianity, received its fullest

expression in the work of Thomas Aquinas. Aquinas distinguishes among three kinds of law, human law, natural law, and divine law. Human laws are those promulgated by monarchs. As much as possible, such laws should be consistent with natural law. Natural law consists of those moral imperatives that are discoverable by all human beings, Christian or non-Christian, because of the capacity for reason that God has placed in all people. Divine law is that law which is discoverable only by way of the acceptance of Christianity. As long as the ruler's laws are not a violation of the natural law of God, they are likely to fortify the common good, whether the ruler is Christian or not. Hence, all subjects owe the ruler their allegiance and obedience. If the ruler's laws violate natural law or divine law, citizens may consider deposing the ruler, but only after every other alternative to getting the unjust laws changed has been pursued.

MODERN INTERPRETATIONS OF PUBLIC GOOD

In the modern period, the name most commonly associated with the notion of the common good and civic virtue is that of Jean-Jacques Rousseau. In rejecting the liberal theory of John Locke and Thomas Hobbes, Rousseau argues that no just, secure, or free society can be grounded merely in the pursuit of self-interest. Although Rousseau agreed that it is to be expected that people will pursue their self-interest, they must do so only as citizens of a community with a strong notion of the public or common good. That is, the commitment of citizens to the common good must underwrite their own ways of thinking about their particular private interests. Consequently, the two must be able to dovetail.

Rousseau refers to this strong notion of public good as the *general will*. The general will consists of those political decisions that every citizen would will if they had the well-being of the community in mind when they deliberate about politics. Rousseau recognizes that this may not take place in all circumstances. There may be times when the general will contradicts the will of all. In such instances, citizens can be encouraged or coerced into following those laws that are consistent with the general will. It is such a formulation that has been the basis of many liberal criticisms of Rousseau.

A more recent example of the idea of the common good is found in the work of Alexis de Tocqueville. In *Democracy in America* (2007), Tocqueville argued that one of the things that distinguishes American political culture is the prevalence of individualism, the independence of citizens and their pursuit of self-interest. But although Americans pursued their self-interest and were concerned with their material well-being, Tocqueville argued that their practice of individualism was exercised with self-interest *bien entendu,* or self-interest well-understood. By this, Tocqueville meant that Americans tended to see their self-interest tied to the common good of the community. Consequently, the exercise of self-interest was tempered by a sense of civic virtue that took into account the needs, well-being, and sustainability of the community as a whole. So common was this among Americans, Tocqueville argued, that their sense of their civic virtue was virtually natural, constituting what he called *habits of the heart*. These were, in Aristotle's terms, habituated to the practice of virtue.

Drawing in part on Tocqueville's perspective, a number of contemporary scholars have argued that in contrast to previous historical periods, there has been a serious decline in civic engagement, participation and virtue, at least in the United States. Robert Putnam argues that, in the last several decades, American political culture has seen a rise of privatization of work and leisure and a decline in civic engagement in voluntary, community organizations. The result has been a decline in social capital, or the engagement and commitment to social and political networks and organizations that help provide the nongovernmental foundations of democracy. A serious decline in social capital is also a decline in civic engagement that a healthy democracy requires, according to Putnam.

Similarly, in their book *Habits of the Heart,* a title making its debt to Tocqueville clear, Robert Bellah and colleagues argue that the ideas and practices of individualism in the United States have undergone significant change. In the early years of the American colonies, individualism took the form of what the authors call the *biblical* and *republican traditions*. Both embodied the idea that one's economic self-interest had to be tempered by the concern for the well-being of one's fellow citizens, and in the case of the biblical tradition, their spiritual salvation as well. Slowly these early practices of individualism have been replaced by utilitarian and expressivist individualism. Utilitarian individualism calculates self-interest solely in terms of the material benefits to oneself. Expressivist individualism sees self-interest in terms of self-realization or the fulfillment of some deep sense of personal satisfaction. Both utilitarianism and expressivism tend to minimize or even reject the idea that one has obligations to something called the common good that go beyond one's personal preferences.

CRITICISMS

There are several criticisms of the idea of the public good and its reliance on civic virtue and the sacrifice it requires. One of the earliest, most notable criticisms originated with Benjamin Constant. Echoing thinkers such as Montesquieu, Constant argued that a significant change had taken place with the emergence of modernity. He distinguished the *liberty of the ancients* from the *liberty of the moderns*. The former emphasized republican civic virtue and the commitment to participate in the civic and political life of one's political system in support of the public good. The latter emphasized instead the liberty from excessive government obligations and a respect for the individual liberties of citizens. Constant insisted that the liberty of the ancients had become obsolete. The political and social conditions for it no longer existed. Modern society, with its emphasis on commerce and its growth in size, meant republican politics of common good and civic virtue were no longer the basis for civic and political life. Instead, most people would be involved in commercial activities and leave the business of politics to elected representatives.

A second line of criticism argues that there is no way to identify the public good. It is not something that can be defined, as everyone has dramatically different ideas as to what the public good may be. While there may have been some agreement on the idea in simpler times, in modern, pluralistic societies, any attempt to identify a single notion of the public good, or set of policies in the service of the public good, distinguishable from the personal self-interest of individual citizens is impossible.

Yet a third criticism contends that the idea of the public good and the sacrifices required of civic virtue are not only imaginary, but have also been used for purposes of political manipulation, and to the advantage of some at the expense of others. Too often, political and economic elites can escape the sacrifices required of policies alleged to be in the common good while benefiting from the sacrifices imposed on lower classes. For example, much of medieval political thought argued that the hierarchical features of feudal society were required for the common good. But clearly, political and religious elites enjoyed a disproportionate share of the benefits, wealth, power, and status of that society in comparison with other classes, particularly serfs. A more recent example is found in what has become known as the *chickenhawk syndrome*. It is not uncommon that political elites and the economically advantaged advocate wars while evading any military obligation themselves. The burden for fighting war is then foisted upon others— either through the compulsory military service, appeals to the economic advantages of military service for the poor, or through manipulated appeals to patriotism in the name of the public good.

Fourth, the notion of the public good can result in forms of moral coercion and even political persecution. Critics argue that phenomena, such as the Reign of Terror in the French Revolution (1789–1799), Western imperialism, McCarthyism in the United States, and the killing fields of Cambodia, trace to extreme notions of the common good. Political elites, convinced of their infallibility in knowing the common good, feel justified in enforcing the most violent forms of sacrifice, including systematic extermination of recalcitrant populations, in the name of the common good.

Debate around the idea of the public or common good continues today. Liberal individualists continue to argue that the notion of the public good separate from the private interests that people have is elusive at best and dangerous at worst. Communitarians like Amitai Etzioni and Michael Sandel would agree that repressive policies implemented under the auspices of the public good are obviously objectionable and reprehensible. Nonetheless, justice and democratic politics requires an element of properly constituted civic engagement and virtue that invokes a politics of the public good even if no single version of it can ever be completely realized. Moreover, they argue that even those liberal thinkers skeptical of the public good tacitly draw upon such notions in their own arguments. Hence, the debate about the nature of the public good is likely to continue as a necessary part of democratic theory and practice.

Public Interest

See *Public Good; Public Interest Groups.*

Public Interest Groups

The concept of a public interest group has varied operational definitions within the discipline of political science. Broadly defined, public interest groups represent diffuse, generally noneconomic, interests in society. Their primary focus is on representing causes that have no natural constituency, or advocating for people or groups that traditionally have not had a voice in the political process. Public interest groups are formed to counter the traditional lobbying community that focuses on procuring discrete material benefits for its membership.

Public interest groups have assumed a prominent role in the pressure group community since the 1960s. Prior to this time, groups seeking material gain from the political process were the primary forces lobbying government in the United States. Consequently, political scientists traditionally focused their attention on the interplay of interest groups attempting to further their own economic ambitions or agenda. This traditional ecology of lobbying included large organizations that represented business, labor, farmers, and various professions. Each of the groups had a material interest in the outcome of government decision making, and therefore focused their lobbying on gains for their members regardless of the larger social or economic costs to the nation as a whole.

Public interest groups existed prior to the 1960s. However, social movements related to civil rights, anti-Vietnam War (1959–1975) activities, the environment, and women's rights all led to an increased belief that advocacy groups should be formed to provide a counterveiling power to the existing interest group system. Public interest groups emerged to represent what social scientists refer to as *postmaterial* issues. These issues are based on the belief that there is a diminishing return for further economic growth in Western democracies. Consequently, their advocacy focuses on quality of life issues without tangible monetary value such as a clean environment, transparent government, and human rights. Public interest groups have thus added a noneconomic dimension to the materialism of debate among the traditional interest group community.

A great diversity exists in the agendas and ideologies of public interest groups. Some organizations, such as Mothers Against Drunk Driving (MADD), target a single issue that they believe benefits all of society. Other groups focus on a number of issues within one area of policy, such as the Natural Resources Defense Council (NRDC) with environmental issues. A final class of public interest groups lobbies on behalf of a broad range of issues facing a particular group that has been underrepresented in the political system, such as the National Association for the Advancement of Colored People's (NAACP) advocacy for civil rights and racial equality.

There is a tendency to mistakenly associate public interest groups with a liberal ideology because they often oppose the material interests of conservative forces within society such as business. However, the ecology of public interest groups is very diverse. Many groups advocate for issues that are nonpartisan or nonideological in nature. One example is MADD's support for strict drunk-driving laws. Other groups, such as the National Right to Life Committee and the Christian Coalition advocate for conservative causes such the rights of the unborn and the support of traditional moral values in society.

The concept of public interest groups has been subject to criticism on a number of counts. First, the notion of "the" public interest is nebulous. Given the broad diversity of society and complexity of most public policy issues, it is often difficult to determine what is in the best interests of the public. The trade-off between economic and postmaterial benefits often presents a murky picture of the public good. This leads traditional lobbying groups to claim that policy outcomes advancing their own material benefits are in the public interest. Thus a business organization representing oil interests can argue that the public is best served by drilling for oil in a pristine wilderness because it will keep energy costs down. They present this argument as an alternative "public interest" to the claims of groups representing the environment. Further, even within the public interest community there can be diverging conceptions of the public interest.

The second criticism of public interest groups is that some organizations accept funding from corporations that represent traditional "material" interests. This creates the potential perception that corporations can use the public interest groups as proxies to lobby on behalf of their own material interests against opposing industries.

Finally, skeptics argue that every group, regardless of its claims, represents some type of self-interest rather than a diffuse public good. Consequently, a public interest group focused on providing access to the arts on the basis that cultural enrichment is essential to education can be seen as a front for art lovers who want their hobby to be subsidized by the government. Critics would argue that while the benefit the arts lovers get is not strictly material, it still is in the self-interest of the group's members opposed to a broad public interest.

Public Opinion

Public opinion concerns the views of people taken together, and these views can be about anything. Political scientists are especially interested in what the public thinks about the political system; government policies and performance; and prominent political actors, such as elected officials, candidates, and political parties. Public opinion is of importance in any political system, especially in representative democracies. Not surprisingly, public opinion gained in importance with the rise of the public in political life in the eighteenth century.

Jean-Jacques Rousseau was perhaps the most ardent proponent of the public's role, arguing in *The Social Contract* that the *general will* of the people is a necessary guiding force for the state. The famous utilitarian Jeremy Bentham provided a more specific statement on public opinion as a sanction in the modern day. In *Democracy in America,* Alexis de Tocqueville famously documented public opinion's empirical significance during the early years of the United States of America.

However, some have challenged the very existence of public opinion. Walter Lippmann saw a public that was largely uninformed, and argued that because of the sheer flow and increasing complexity of information, the public could neither absorb nor truly understand much of what was happening in the world. Edward Herman and Noam Chomsky offer another critique, maintaining that public opinion is manufactured through political communication. To Pierre Bourdieu, public opinion is a social construct—one that largely rationalizes elite opinion. Scholars who study public opinion routinely grapple with claims such as these about the character and causes of public opinion.

MEASURING PUBLIC OPINION

Measuring public opinion requires technology. In the modern era, polls produce a summary of what people think, yet nonrandom straw polls have been in regular use at least since the early nineteenth century. Thus, even back then, there was information about what the public thought and wanted; however, it was not highly reliable.

The development of random sampling—and its application by Gallup, Crossley, and Roper—changed things in important ways, as it allowed more reliable information about public preferences. The changes were especially pronounced for scholarship, as political scientists were afforded good data, particularly with the establishment of the American National Election Studies (ANES) in 1948. This data provided the basis for statistical inference about populations and relationships at the individual level, and it made the explosion of research on

Public opinion polls comprise the average support of individuals on any number of topics, including political party and candidate approval.

voting behavior, attitudes and opinion possible in the latter half of the twentieth century.

Additional developments in polling technology played a huge role in this new realm. For many years, most major surveys, including the ANES, relied on cluster sampling and face-to-face interviews. With this, the population is divided into groups or geographic areas, and the survey researcher draws a sample of these clusters and then samples randomly from within them. This is particularly useful when surveyors do not have a full list for the entire population. The invention of random digit dialing (RDD) changed things even more so, as interviewing could be done over the telephone. The more recent introduction of Internet polling is having a similar impact.

The developments in technology have provided clear and increasing advantages in cost and speed, making it much easier to conduct polls, as evidenced in the growth of the number of preelection trial-heat polls in presidential election years. Other examples include the National Annenberg Election Survey (NAES), which conducted more than one hundred thousand telephone interviews in 2000, and Knowledge Networks's study of the same election campaign, which involved repeated interviews with twenty-nine thousand individuals via the Internet. These numbers would have been almost inconceivable using face-to-face interviews.

The developments also come with disadvantages, particularly in the representativeness of samples. Not everyone has a telephone, and the number relying solely on a cell phone—which poses special challenges for telephone surveys—is growing. Fewer have access to the Internet and surveyors cannot randomly e-mail. Even among those who do have a landline telephone or Internet access, nonresponse is a problem. Survey organizations and scholars have long relied on weighting devices to help make surveys more representative of the target population. In recent years, more complicated approaches have been used, including propensity scores; however, the extent to which these fixes actually work is the subject of ongoing research.

UNDERSTANDING PUBLIC OPINION

A lot has been learned about public opinion from the many surveys conducted over the years. To being with, and perhaps most importantly, surveys give only limited information about people's true opinions. According to John Zaller and Stanley Feldman, survey responses reflect the relevant considerations that are uppermost in people's minds at the time they are asked. Responses will differ over time, and across individuals at particular points, simply because the samples of considerations themselves vary. In the aggregate, these seemingly random differences should cancel out.

At the same time, public opinion about policy exists on many issues. In their now-classic portrait, *The Rational Public,* Benjamin Page and Robert Shapiro depict public preferences as fairly stable over time, particularly in the short run. They also show that public opinion often changes very deliberately, in understandable ways, and that the change is largely parallel

across various subcategories of the American public. There are important differences across people, across levels of education, and across partisan attachment. Page and Shapiro's main point is that people with different preferences tend to move together on particular issues in the same liberal or conservative direction over time, implying that they generally react to new information in the same way. Aspects of economic and national security seem to play an important role and policy does, too—indeed, the public behaves much like a thermostat in many policy domains.

James Stimson's study of a wide range of public opinion data further reveals that public opinions about policy in various domains not only vary predictably, but also are closely connected. Simply, opinions across a range of policy domains tend to move in the same liberal or conservative direction, implying an underlying structure to those preferences, what Stimson termed *policy mood*. However, the movements are not altogether parallel. Opinion in some spending domains shares little in common with opinion in others; instead, it varies independently over time. Perhaps more important, even where it moves together, opinion in the different domains also varies independently to some extent. Public opinion in different policy areas thus contains unique components that are specific to different areas. These differences may matter to politicians, especially in politically salient domains.

Public Policy

Public policy is what officials within government choose to do or not to do about public problems—conditions that are perceived to be unacceptable. Government policy makers typically set certain policy goals and objectives, and then identify the tools or means to reach those ends. Debate over public policy choices reflects differing views about the goals or the means or both. Questions center upon whether the government should be involved in a certain policy area or not, and if it is involved, whether it should try to regulate individual and corporate behavior, provide economic subsidies to certain individuals or businesses, redistribute societal resources from one group to another, make information available to the public, provide services directly to citizens, or aim for some combination of such policy tools.

Sometimes, governments decide not to adopt policies because little political consensus exists over what needs to be done. In this case, policy makers may conclude that the problem is best left to citizens and the private marketplace. For years, for example, most governments did little about energy consumption because citizens and policy makers saw no reason to reduce the use of energy, which was plentiful and inexpensive. By the 1990s, however, policy makers around the world began to link high levels of energy use, particularly fossil fuels, to climate change as well as to economic and national security risks. They increasingly came to believe that governments should intervene by setting energy efficiency standards, imposing new energy taxes and fees, and creating carbon dioxide emissions limits and trading schemes, among other actions.

Disagreements over policy goals themselves may involve conflicts over political ideology or social values, evident, for example, in battles over abortion, stem cell research, affirmative action, and immigration reform. David Easton's famous dictum that politics is "the authoritative allocation of values for a society" captures well the connection of public policy to societal values and underscores the importance of asking what governments choose to do about public problems, why they do so, and what effects these actions have on society.

EVOLUTION OF THE STUDY OF PUBLIC POLICY

Political scientists have long studied public policy, but the field changed considerably during the 1970s and continued to evolve in later decades. Particularly within the United

States, it emerged as a subfield of the study of American government and public administration. Today it is far broader in scope, cuts across all fields of the discipline, attracts scholars and students with highly disparate interests, and involves the use of the full range of contemporary methods of investigation and analysis.

Many students of public policy trace the field's origins to work by Harold Dwight Lasswell (1902–1978) and others in the 1920s and 1930s, out of which ideas arose about the promise of policy sciences. This was also a time of considerable change in the study of social sciences in general, where empirical and analytical work began to dominate over the more traditional emphases on history, normative or philosophical ideas, description of government programs, and practical issues of program management.

The policy sciences approach reflected a problem-focused and interdisciplinary view of what governments might do about society's problems—from the diffusion of nuclear weapons to energy use and urban development. Not surprisingly, the new field contributed significantly to the rise of think tanks, such as the RAND Corporation and Brookings Institution, to advise governments on complex issues of public policy. By the early 1970s, the field of policy studies began to grow at a rapid pace. New organizations such as the Policy Studies Organization were founded because, at that time, the field had no natural home within the discipline of political science or the American Political Science Association. New journals, such as *Policy Sciences* and the *Policy Studies Journal,* were launched at this time as well, and new schools of public policy were established at Duke University, the University of Michigan, and Harvard University, among others.

The next three decades were characterized by continued growth in academic public policy programs, the proliferation of policy research organizations, and an increasing volume and diversity of policy studies research. Compilations such as the *Encyclopedia of Policy Studies,* edited by Stuart Nagel and first published in 1983 with a second edition in 1994, and more recently, the *Oxford Handbook of Public Policy,* edited by Michael Moran, Martin Rein, and Robert E. Goodin in 2006, captured the wide range of models, theories, concepts, ideas, and methods found in the burgeoning field, including its comparative and international aspects and its interdisciplinary character. While not unusual for the discipline of political science, this multiplicity of research approaches created major fractures among students of public policy, particularly within academia. They parallel the kinds of conflicts over appropriate approaches, theories, and methods found in most other fields within the discipline.

APPROACHES TO THE STUDY OF PUBLIC POLICY

It is common to identify three related but distinct emphases within the study of public policy. One stresses analysis of policy processes such as agenda setting, formulation, adoption, and implementation, as well how political, social, and economic forces are linked to them and affect the way policies are developed, proposed, and acted on in government. This policy process approach—essentially study of the politics of policy making—is most often associated with political science and often draws from theories and models common within the discipline to explain policy developments. These include political systems theory, group theory, elite theory, institutional theories, and rational choice or formal theory. Articles reflective of the policy process perspective can be found in most mainstream political science journals but also in law and public policy journals, such as the *Policy Studies Journal.* Most major textbooks in the field continue to use some variation of the policy process approach.

Early work of this kind can be found in studies and texts by Charles Lindblom, Aaron Wildavsky, Theodore Lowi, James Q. Wilson, Charles Jones, Hugh Heclo, Michael Lipsky, John Kingdon, Deborah Stone, Bryan Jones, Frank Baumgartner, Daniel Mazmanian, Paul Sabatier, Hank Jenkins-Smith, and Kenneth Meier, among many others. Often this work drew from theories of the policy-making process and helped to advance understanding of how policy making actually works. Studies by Kingdon, Stone, and Baumgartner and Jones substantially improved knowledge of how public problems and policy alternatives are defined and are affected by political processes, as well as how they emerge or do not emerge onto societal and governmental agendas for action. Work by Jones, Heclo, Lowi, and Wilson clarified how policies are formulated and acted on by policy makers, with particular attention to the role of policy legitimation, the importance of issue networks and interest groups, and variation in policy-making processes attributable to issue characteristics, such as saliency, complexity, and the distribution of perceived costs and benefits in society. Studies of policy implementation by Mazmanian and Sabatier, Lipsky, and Wildavsky; of policy change by Sabatier and Jenkins-Smith, among others; and of policy and program evaluation by Meier and others identified the key variables that affect these policy processes, led to the development of sophisticated causal models, and stimulated empirical studies that tested hypotheses about these relationships.

Compilations such as Sabatier's *Theories of the Policy Process: Theoretical Lenses on Public Policy*, first published in 1999, testified to the advancement of the field by the late 1990s, and especially to new expectations for development and testing of theories that could explain policy processes. As Sabatier argued, the classic policy process model was clearly not a causal theory or even a very good description of how policy making takes place in the real world. Nevertheless, the model clearly directs attention to certain important political phenomena and policy actors and can highlight the variables that are worthy of study. For example, studies by Kingdon in the 1980s boosted interest in the agenda-setting phase of the policy process, and subsequent work by Baumgartner and Jones, among others, substantially raised the bar of expectations for data collection and analysis to test theories about agenda setting and the dynamics of policy making over time. Similarly, Sabatier's development of the advocacy coalition framework helped to foster empirical studies of policy change.

Another approach to public policy study relies heavily on concepts borrowed from economics and related disciplines and builds on the heritage of policy sciences by focusing on the practice of policy analysis. From this perspective, the key tasks are systematic or scientific assessment of possible policy alternatives in terms of their likely effectiveness, efficiency, and equity, among other criteria. Economists emphasize efficiency, such as achieving the greatest benefits at a given cost or minimizing a certain risk at a reasonable cost. But normative political theorists are equally concerned with criteria such as the extent of government authority in regard to individual rights or questions of justice or equity, such as how the benefits or costs of public policies are distributed across a population. Scholars who employ decision theory are likely to draw from economics, psychology, statistics, and operations research to emphasize decision choices and associated risks and consequences, such as choosing between more and less risky alternatives with varying costs and consequences.

This general approach to the study of public policy is evident in research within political science over the past three decades and can be seen in public policy textbooks in the 1980s, 1990s, and 2000s, such as Gary D. Brewer and Peter deLeon's *The Foundations of Policy Analysis* (1983), Grover Starling's *Strategies for Policy Making* (1988), Carl V. Patton and David S. Sawicki's *Basic Methods of Policy Analysis and Planning* (1993), David L. Weimer and Aidan R. Vining's *Policy Analysis: Concepts and Practices* (2005), and William Dunn's *Public Policy Analysis: An Introduction* (2009). It can be seen as well in pathbreaking work by James March and Johan Olsen in the 1980s that sparked a renewed interest in what might be called institutional policy analysis, which involves asking what difference certain formal and legal aspects of institutions make. Its influence can be found in similar innovations by Elinor and Vincent Ostrom to develop an institutional approach to public policy that could clarify how the choice of certain institutions and rules affect decision making and policy impacts. In 2009, Elinor Ostrom shared the Nobel Prize in Economic Sciences for this work, particularly both conceptual and empirical research that demonstrated how common property resources can be successfully managed by user associations and not just by centralized government. This heritage is also clear in Anne Schneider and Helen Ingram's intriguing work on policy design, where they suggest that sound policy choices depend on an understanding of the attitudes and motivations of key policy actors, including the "targets" of public policies. These are examples of what some call institutional rational choice frameworks that share a focus on institutional rules, an assumption of rational actors, and the resources and incentives that motivate them.

In all of these instances, the authors illustrate a strong interest in advancing the interdisciplinary study of public policy in addition to making contributions to the development of political science. These scholars often borrow from economics, sociology, psychology, and public administration in an effort to understand policy phenomena, build new theories, and inform empirical studies. Their work is as likely to appear in interdisciplinary public policy journals as in leading journals in political science.

The *Journal of Policy Analysis and Management,* for example, publishes articles that reflect the policy analysis approach, as do some journals in public administration and applied economics and sociology, and those devoted to a specific area of public policy such as health care, the environment, energy, welfare, or urban affairs. This kind of work can also be found in the publications of many policy research organizations such as the Brookings Institution, the Urban Institute, Resources for the Future, and the Pew Research Center, as well as in research supported by university policy institutes and government agencies, including hundreds of studies released each year by the Government Accountability Office.

A third common approach to the study of public policy concentrates on the substance of public policy itself, that is, work on health care, education, environmental protection, energy, defense, foreign affairs, and a multitude of other policy fields. Studies of substantive public policy may include a focus on the history of policy development, the specifics of policy goals and means, competing ideas and proposals for policy change, or assessments and evaluation of existing policies and programs. Rather than study policy-making processes or conducting policy analyses, this kind of work tends to examine what policies actually try to do and how successful they are at it, as well as to explore the disagreements nearly always found over the design of current policy and available alternatives. Often, authors of such studies display little interest in using them to build theory or test hypotheses, but the studies nonetheless may be used to illustrate or advance a particular theory, argument, or interpretation.

This third approach is often found among those with training in law, public administration, and public policy or with experience in government. Articles, research monographs, and books reflective of this approach are published by policy research organizations or think tanks; nonprofit organizations and interest groups; and law, public administration, and public policy journals. Some of these are devoted exclusively to the history of public policy such as the *Journal of Policy History.* Most textbooks in the field of public policy include a number of substantive policy chapters, typically ones on economic policy, health care policy, environmental and energy policy, education policy, criminal justice policy, Social Security and welfare policy, and foreign and defense policy.

Among the three approaches, there are often notable differences in the extent to which students of public policy stress scientific goals (e.g., development of testable hypotheses and theories, collection of reliable data, and use of rigorous analytic methods), professional purposes (e.g., using policy analysis or program evaluation to identify strengths and weaknesses of policies), or the advancement of political values (e.g., those often associated with some think tanks, interest groups, and partisan organizations). The first emphasis tends to be found in academic political science departments, the second in public policy schools and think tanks with a strong applied or professional orientation, and the last in organizations with a strong

commitment to particular social and political values. However, the dividing lines are rarely hard and fast. As critics such as Deborah Stone argue, even work that is ostensibly objective or value-free often reflects hidden political values. Also, research produced by policy organizations that are committed to certain values, such as environmental protection, women's rights, or equitable access to health care, can still be rigorous and valuable.

CONTINUING CONTROVERSIES AND DEVELOPMENTS IN POLICY STUDIES

The major debates today in the study of public policy are similar to those that have taken place within many other fields of political science over the last several decades. They include the extent to which work should be theoretically grounded, and if so, in what theories or analytic frameworks. They extend to disagreements over the relative strengths and weaknesses of relying on qualitative or quantitative research methods. They also include conflicting ideas about whether the chief purpose of policy studies should be the advancement of knowledge—especially within the discipline—or provision of knowledge to society and policy makers that can foster solutions to public problems. As noted, these are primarily controversies within academia because those who work in public policy research institutes and other kinds of policy organizations are usually not preoccupied with questions of theory and methods. They are more likely to value studies that offer new data or analyses, fresh insights and interpretations, and practical suggestions for policy improvements.

It is likely that the near-term future of policy studies will reflect the current diversity of work. Most scholars will engage in the kind of studies they think are interesting and appeal to the audiences they value. Their professional training, present positions, and expectations about the results shape these choices. Yet, there is a growing consensus that the best scholarly work involves a combination of approaches and methods, such as the use of both qualitative and quantitative methods, and the integration of historical, descriptive, legal, and analytic research. In some subfields such as environmental policy studies, scholars also may try to pull together ideas from a number of pertinent disciplines, such as ecology, economics, sociology, and political science, to offer new insights into the range of variables that contribute to public problems, shape the adoption of policies, or affect policy implementation and success. Similarly, in many policy areas, scholars try to integrate the study of politics and policy analysis to foster a greater sensitivity to the way political contexts can affect the use of policy analysis.

Above all, much work in the field of public policy studies today reflects a keen appreciation of the importance of smart policy design, the institutional and political constraints and opportunities that are likely to be faced during policy making and implementation, and the need for assessment of policy results and adoption of appropriate policy changes. Put otherwise, regarding whether scholars seek to explain the formation, operation, and impact of public policy or to affect these processes, many are likely to draw creatively from the multiplicity

of approaches, methods, and insights that have become available since the 1970s.

One of the most valuable lessons of the past several decades is that much of what is thought known about the performance of political institutions and public policies could be proven wrong over a longer time frame. This is especially likely when social, economic, and political conditions change substantially or abruptly, and thus alter the premises on which current policies are based. One example is climate change and the implications for energy policies. Another is the new threat of international terrorism and the impact on foreign and defense policies. Studies that draw from any of the three perspectives could be valuable. Research on the policy-making process could identify the factors most likely to affect a political system's capacity for successful policy change under such circumstances. Studies in the policy analysis tradition could examine the most promising policy alternatives, perhaps with special attention to qualities of resiliency, or the potential for adaptation as conditions change over time. Substantive policy studies could delve into the details of public policy and help to identify those aspects of enduring social value regardless of altered circumstances.

In more general terms, societies around the world are entering a new and turbulent period. Globalization may dramatically alter economic practices and security. Population growth and economic expansion in developing nations may undercut the capacity of natural resources to meet people's needs. Advances in technology and communications may contribute to the erosion of cultural and religious traditions and threaten social and political stability. All of these trends suggest that there will be no shortage of challenging public problems and policies to study in the years ahead. The evolution of policy studies as a field, and the rich diversity of work within it, means that students of public policy can find abundant frameworks, theories, models, and methods to put to work to improve understanding of the changing world and to devise suitable responses to the problems that now exist or will emerge in the coming decades.

Public Policy Development

There is the story that when asked about the making of American foreign policy, former secretary of state Henry Kissinger reportedly responded, "We don't really make policy, instead we make a series of decisions that eventually become the policy." This anecdote illustrates the difficulties in understanding what policies are, when they emerge, or why. The most important things governments do is make policy. Yet, despite the centrality of those actions to the lives of most Americans, scholars and practitioners are frequently at a loss to explain why governments do what they do, and when they do it—or do not do it. This loss, however, is not for a lack of trying. Over the last several decades, there has been no paucity of theories put forward to account for the birth, life, and death of public policies.

Some theories look at the course of government over long periods of time. Still others seek to explain policy from an intermediate or more immediate time frame. Theories also differ in terms of their specificity. Some, like historian Arthur Schlesinger's cyclical thesis, address the overall thrust of policy—in his case whether governments pursue a public or a private agenda over the course of a century. Other explanations concentrate on a single policy, such as education, welfare, or health care. Then there are those theories that focus on a single aspect of the policy process, such as agenda setting, decision making, implementation, or policy termination. Not surprisingly, there are numerous perspectives on how decisions are made; these include models of rational decision making, bounded rationality, incrementalism, group think, and even a model of decision making described as the garbage can model.

A sampling of theories that have been used to account for policy development can provide a sense of the variety of considerations that drive the development of public policy. While significant examples come from the United States, many of the explanations for these can and have been used to account for the actions of governments elsewhere in the world. Three sets of examples provide these models. The first takes a long-term, historical perspective on policy development; the second looks at the policy process over an intermediate time perspective;

and the third describes and explains policy decisions that occur over relatively short periods of time. In each case, the models of policy development provide important clues to account for a signature feature of U.S. public policy—the tendency toward long-term policy stability interrupted only occasionally by large scale policy change.

A HISTORICAL PERSPECTIVE

One useful way to look at how policies develop is to view them from a long-term or historical perspective. The obvious advantage of a historical perspective is that it allows a view of how policies emerge, endure (or not), and evolve over long period of times.

Development of U.S. public policy in the twentieth century is a good example of how a long-term perspective can highlight how "policies of the day" fit more enduring patterns of governance and politics. Historians generally agree that U.S. politics over the period from the late nineteenth through the late twentieth centuries saw three periods of an unusually active federal government—the Progressive Era (1890–1930), the New Deal (1930–1950) and the Great Society (1960–1980). During each era, popular presidents, Theodore Roosevelt, Franklin Roosevelt, John Kennedy, and Lyndon Baines Johnson, led the nation on a path of substantial public intervention in the social, economic, and political lives of its citizens.

During the Progressive Era, Theodore Roosevelt and other progressives sought to reform government by replacing patronage with merit and appointing professionals rather than elected officials to do the day-to-day administration of government. Other reforms included child safety laws, workplace safety rules, and the adoption of the federal income tax.

During the New Deal period, the nation saw a dramatic increase in the role of the federal government as Franklin Roosevelt sought to end the Great Depression through programs aimed at reforming the financial sector and providing relief to America's farmers and workers. During his first term, America saw the creation of an "alphabet soup" of legislation, new programs, and new agencies including the National Recovery Administration (NRA), the Agricultural Adjustment Administration (AAA), the Works Progress Administration (WPA), the Federal Deposit Insurance Corporation (FDIC), the Rural Electrification Administration (REA), and the Tennessee Valley Authority (TVA). The most important piece of the New Deal was the passage of the Social Security Act of 1935, which provided compensation for the unemployed, pensions for the elderly, and welfare relief for the poor.

The New Frontier and Great Society initiatives of Presidents Kennedy and Johnson expanded the reach of the national government even more by enacting major civil rights legislation, creating Medicare and Medicaid, and waging the War on Poverty.

What is equally striking about each era of government expansion is the push back that almost immediately followed each "burst" of federal energy. In the 1920s, the election of Warren Harding ushered in a "new era" of conservatism that shifted the focus from public to the private sector as the free market

was given free reign in America. During the 1920s America prospered, consumers consumed, and American manufacturing grew dramatically. For its part, the federal government promoted the private sector by lowering taxes, raising tariffs, and scaling back its efforts to regulate the business sector.

A similar resurgence of conservatism and retreat from public activism occurred following the presidencies of Franklin Roosevelt and Harry Truman as the American public turned to a military hero, Dwight Eisenhower, to lead an increasingly conservative nation. As Arthur Schlesinger notes, "In the 1950s as in the 1920s, public purpose receded, private motives predominated. The Eisenhower years provided a needed respite amidst the storms of the twentieth century." More recently, the election of Ronald Reagan in 1980 signaled the latest round of conservative backlash as Reagan and others sought to get government "off the backs of the American people" while finding new ways to infuse market principals and mechanisms into the public sector.

To explain this pattern of lurching from the public to the private sector and back again, Schlesinger offers a cyclical thesis to account for these developments. Approximately every thirty years throughout the twentieth century, national policy cycled from periods of intense public action to a retreat to the private sector, only to eventually cycle into a new era of public action. In describing the nation's mood following the presidencies of Theodore Roosevelt and Woodrow Wilson, Schlesinger notes: "After two decades of unrelenting public purpose, the American people were worn out. Their capacity for further response to crisis was spent. They were disenchanted with discipline, sacrifice, and intangible goals. They had had their fill of crusades."

Similar developments occurred toward the end of the New Deal and Johnson's Great Society. The turbulence of the sixties surrounding the Vietnam War (1959–1975), the civil rights movement, and the War on Poverty led to a similar withdrawal from the public sector.

By the later 1970s Americans were once more, as they had been in the 1950s and 1920s, fed up with public action and disenchanted by its consequences. The compass needle now swung toward private interest and the fulfillment of self. However, it did not take much time for subsequent generations to tire of the narrow pursuit of private interests and embrace a new burst of public energy and national goals. Typically, a "detonating" issue prompted the shift, including economic trusts in the 1920s, the depression of the 1930s, and racial injustice in the 1960s. To account for such policy dynamics, Schlesinger maintains that policy cycles are simply the natural order of things.

The roots of this cyclical self-sufficiency doubtless are deep in the natural life of humanity. There is a cyclical pattern in organic nature—in the tides in the season, in night and day, in the systole and diastole of the human heart, and so on. There is also a cyclical basis in the very psychology of modernity. With the acceleration in the rate of social change, humans become creatures characterized by inextinguishable discontent. For Schlesinger, however, the real impetus for change lies with intergenerational conflict. He states, "Each new generation, when it attains power, tends to repudiate the work of the generation it has displaced and to reenact the ideals of its own formative days thirty years before."

INTERMEDIATE PERSPECTIVES

Models of political change that look at development from an intermediate time perspective offer alternative explanations of U.S. public policy development. Paul Sabatier and Hank Jenkins-Smith's *advocacy coalition framework* and Frank Baumgartner and Bryan Jones's *punctuated equilibrium theory* each acknowledge the propensity for long-term policy stability, but point to different dynamics to account for that tendency in American policy.

Sabatier and Jenkins-Smith's advocacy coalition framework provides an excellent example of theories that seek to explain policy change and development from a somewhat shorter time frame. The advocacy coalition framework begins with the premise that policies are made and change within relatively stable policy subsystems. Policy subsystems are made up of "those actors from a variety of public and private organizations who are actively concerned with a policy problem or issue, such as air pollution control, and who regularly seek to influence public policy in that domain." Policy actors include those within and outside of governments and include administrative agencies, legislative committees, interest groups, journalists, and scholars from all levels of government—national, subnational, and, increasingly, international. Actors within the policy subsystem are typically organized into two to four competing advocacy coalitions; advocacy coalitions are groups of policy actors who share common policy beliefs and seek public policies that will achieve the group's policy goals. Those policy beliefs are crucial to both holding policy coalitions together and setting their action agendas.

According to Sabatier and Jenkins-Smith, those policy beliefs operate like belief systems and include "value priorities, perceptions of important causal relationships, perceptions of world states (including the magnitude of the problem), and perceptions/assumptions concerning the efficacy of various policy instruments." At the most general level are the *deep core beliefs* that include "basic ontological and normative beliefs, such as the relative valuation of individual freedom versus social equality, which operate across virtually all policy domains." Not surprising, these values and beliefs are the most enduring and resistant to change. At the next level are those *policy core beliefs*, which speak to the coalition's normative and empirical beliefs concerning value priorities (e.g., natural security versus the right to privacy), the causes and magnitude of policy problems, and assumptions about the best policies for addressing those policy problems. At the remaining level are those *secondary aspects* of the coalition's system of beliefs, shared by some but not necessarily all coalition members, concerning things like support for specific policy actions, perceptions of the causes and seriousness of particular problems in various locales, or beliefs concerning the performance of various policy actors.

Armed with fairly unique and conflicting policy beliefs and the group's resources and strategies, advocacy coalitions

compete with one another to enact public policies that achieve their respective policy goals. Given the rigidity of each coalition's fundamental beliefs, it is not surprising that little policy change occurs, particular where the differences between each coalition's fundamental beliefs are substantial. In those instances, the policy brokers—those elected and unelected government officials seeking to mediate the conflict between competing advocacy coalitions—can, at best, reach agreement on relatively incremental changes in policy. As a result, barring major change in the setting in which subsystems operate, policies will remain stable for periods of a decade or more.

According to Sabatier and Jenkins-Smith, major policy change is most likely to occur as a result of large-scale changes in the social, economic, or political environment. Examples in recent decades include the Great Depression in the 1930s or the election of Ronald Reagan in the 1980s. Less frequently, significant policy change can result from *policy-oriented learning*. While fundamental beliefs are rarely changed, there are occasions when experiences and new information lead coalition members to reexamine critical policy beliefs. For example, many environmental groups are more willing today to consider market mechanisms, like cap and trade policies, as a means to regulate pollution. Yet, the fundamental value of protecting the environment and reducing emissions has not changed. Instead, at least some environmentalists have concluded that alternatives to a command-and-control approach to regulation can achieve pollution reductions.

To determine when change induced by policy learning is likely to occur, Sabatier and Jenkins-Smith argue that learning-induced change will take place when the following conditions are met: (1) disagreements between advocacy coalitions are moderate and occur at the policy and secondary levels, not at the level of fundamental normative beliefs; (2) the problem being addressed involves "natural" systems, not political or social systems; and (3) professional norms and "accepted" quantitative data and theory are brought to the discussion.

Baumgartner and Jones offer a second perspective that considers policy change from an intermediate time frame. Like Sabatier and Jenkins-Smith and Schlesinger, Baumgartner and Jones are struck by how "political processes are often driven by a logic of stability and incrementalism, but occasionally they also produce large-scale departures from the past." Their explanation of large-scale changes, punctuated equilibrium theory, focuses on the fragmented nature of America's political system and the process of issue definition and agenda setting. A constitutional framework—one that relies on a separation of powers and federalism to allocate power and responsibility among numerous branches and levels of government—fragments politics and policy in America. Given the size and complexity of a fragmented political system, the normal course of events is for key policy actors to defer to the policy decisions of policy subsystems. These subsystems include relatively small groups of interest groups, legislators, and executive branch officials who share common interests and beliefs within substantive policy areas. The result is that policy subsystems, and the public policies they promote, enjoy a monopoly over policy within their

domain for relatively long periods of time. Consequently, policies change very little.

However, the same institutional fragmentation that promotes policies' monopolies can also help break up those monopolies by moving the discussion of public issues from the microlevel to the macrolevel of U.S. politics. According to Baumgartner and Jones, this likely occurs when issue definitions are changing and receiving greater media and public attention. During periods of policy stasis, policy actors within the subsystem subscribe to a single policy image—the prevailing mix of empirical and normative beliefs that undergird existing policies. The decentralization of U.S. politics can provide competing groups the opportunity to "venue shop" for other forums to gain support for new policy images, and this allows events to challenge the image and proponents of an alternative policy perspective, and often move the issue to the national agenda.

In the 1970s, both civil rights advocates and environmental groups moved the discussion of each of their cases from the state to the national level and were able to mobilize support among members of Congress, the White House, and the Supreme Court. More recently, policy activists have returned to the states for relief. Unable to motivate federal action on global warming, for example, environmentalists successfully lobbied a number of state governments to require reductions in carbon dioxide emissions.

SHORT-TERM PERSPECTIVES

Three models of decision making provide additional insight into how policies develop in general, and why policy in the United States seems to remain stable over long periods of time. These models include *incrementalism, bounded rationality,* and *groupthink*.

The incremental model of decision making is essentially a political model of how policies are made in the United States. Like Baumgartner and Jones and others, proponents of an incremental perspective view U.S. politics as highly fragmented and decentralized. This results from the constitutional provisions of federalism and a separation of powers, and a two-party system that motivates both parties to move to the ideological center to win elections and the plurality of interests that exist in American society. In that setting, policies develop out of the competition and bargaining between competing interests at multiple levels and branches of government. Given the high decision costs of reaching compromises, politics tend to change slowly and only at the margin (i.e., incrementally).

The model of bounded rationality, offered by James March and Herbert Simon, also predicts that policies will typically change slightly—if at all—but for different reasons. According to these scholars, individuals and organizations are limited in their capacity to obtain and analyze the information they need to make truly rational decisions. In a state of bounded rationality, individuals and organizations employ decision-making processes that limit the number of policy alternatives and the amount of consideration given to those alternatives. In normal or routine policy situations, policy makers tend to look at

"old" solutions and decision processes (i.e., standard operating procedures); they limit the search for additional policy options, and analyze options sequentially. They also "satisfice" by selecting the first policy option that meets minimal expectations. While critics argue that limited search ignores the full range of policy options and their potential consequences, advocates of the model maintain that a satisficing approach to policy making is a realistic response to limits on rationality and dramatically reduces the time and costs it takes to make decisions.

Social psychologist Irving Janis developed a model of decision making in which key decision makers are primarily concerned with maintaining group unanimity. The tendency to fall victim to groupthink most likely occurs during crisis periods, and also when policy makers come from similar backgrounds and share basic beliefs, and when they are insulated from outside information and lack a tradition of impartial leadership.

Based on his analysis of several foreign policy failures, including the Bay of Pigs invasion and the Vietnam War, Janis identified eight symptoms of groupthink: (1) an illusion of invulnerability, excessive optimism, and a willingness to take extreme risks; (2) a belief in the group's morality; (3) a tendency to discount information inconsistent with the group's decision; (4) a propensity to stereotype the enemy as either evil or inept, or both; (5) self-censorship; (6) an overestimation of the group's consensus; (7) pressure on members to conform to the group's pervading beliefs; and (8) the emergence of self-appointed "mind guards" to guard against information that challenges the group's position. According to Janis, when a majority of these symptoms are present, decision making is likely to be characterized by the incomplete consideration of goals and alternative courses of action, a failure to consider risks, a tendency to filter information that is inconsistent with the preferred policy, and the lack of a contingency plan. The result is, once again, little policy change and little opportunity for policy learning.

Critics of the George W. Bush administration's decision to go to war in Iraq contend that the president and his advisers were "victims of groupthink" during the course of the war. Critics point to a number of administrative actions as evidence: the selective use of intelligence to make the case that Iraq had stockpiles of weapons of mass destruction and long-standing ties to the group responsible for the attack on the Pentagon and World Trade Center in 2001; the tendency to underestimate the difficulty and expense of the war; and a tendency to divide the nations of the world into "those who are with us and those who are against us."

CONCLUSION

There is no shortage of perspectives on how public polices develop. Taken together, those and other perspectives support a number of conclusions concerning the development of public policy in the United States. First, there is general consensus that policies develop in small steps and endure for relatively long periods of time. Second, that tendency toward stability reflects the fragmented character of the U.S. political system, a pluralism of interests, and an inherent resistance among many Americans to abandon deeply held beliefs that form the basis for public policy. Third, major policy shifts typically require major changes in the larger political, economic, or social system, such as the Great Depression, the racial strife of the 1960s, or the election of Ronald Reagan in the 1980s.

Public-private Dichotomy

The question of public and private is essentially a philosophical one, centered upon the proper scope of the activity of the state. Determining this scope entails studying whether some kinds of human endeavor, whether individual or collective, are private—that is, private in the sense that they are or ought to be protected from, or otherwise unaffected by, the regulations of the legitimate agents of public authority. Stated otherwise, this question examines whether there limits to the appropriate reach of the law and other instruments of state regulation and, if so, what those limits are and how they are justified.

HISTORICAL BACKGROUND

Notions of public and private may have their theoretical roots in the ancient distinction between *oikos*, or household, and *polis*, or city. For example, Aristotle suggested that a certain degree of freedom from the concerns of the oikos was required to be a citizen effectively participating the affairs of the polis, and that this would rule out political participation by certain types or classes. The problem of public and private may also reflect

theological issues in Christianity concerning the relationship between ecclesiastical and temporal powers, as first suggested in the gospel of Matthew and as pursued with special urgency during the Middle Ages. In a rather different vein, it may also reflect the implicit doctrine of the Magna Carta, a fundamentally medieval document that proposed a nascent conception of aristocratic rights; this immunized certain activities of the nobility from the scrutiny of the throne, and provided legal remedies designed to protect those immunities.

The problem of public and private is, nonetheless, a fundamentally modern problem closely connected to the development of liberalism. In his *Letter Concerning Toleration,* John Locke is thought to have described a large and important realm of human and social life—the realm of religious belief and practice that government either cannot or should not regulate. In formulating such an argument, Locke appears to have outlined the basis for conceptualizing a truly private realm that is, or should be, free from state interference. In his *Two Treatises of Government,* Locke proposed a rather different formulation, according to which the government of a family, based on the highly particularized affections of the paternal authority for his offspring, is sharply distinguished from the government of civil society, which involves the application of general legal requirements to people from any kind of particularized identity. Taken together, these arguments seem to propose a strong dichotomy between a private world of belief and personal preference and a public world of order and generalized rules.

MODERN INTERPRETATIONS

Many or most modern political theorists accept some dichotomy of the public and private, hence argue or assume there is or ought to be a category of truly private endeavor that limits the activity of the state. However, the problem of how to characterize this category, and the related problem of where to draw the line between public and private, has proved to be immensely difficult. In part, the issue is terminological. Thus, for example, *private* is often thought denote anything that is not governmental, as in the private enterprise system, and yet much private property is in the form of financial securities that are publicly held and publicly traded. Yet, the larger problem is conceptual, rather than terminological. Specifically, many of the activities widely thought to be typical instances of the private category turn out to be activities toward which no responsible public authority could possibly remain indifferent. Examples of this are physical abuse within the family or fraudulent behavior within business. Scholars must then determine what kind of principle can justify state regulation of certain kinds of behavior within the family, such as preventing violence against children or ensuring children receive medical care, while leaving other kinds alone.

In addressing such questions, some theorists argue for a conception of natural or civil rights. Thus, for example, the Fourth Amendment to the United States Constitution, which prohibits warrantless searches of the "persons, houses, papers and effects" of citizens, seems to suggest a right to privacy, and some jurists and legal scholars use to defend, among other things, abortion rights. On the other hand, the Constitution does not explicitly enumerate a right to privacy, and the nature and range of the protections afforded by the Fourth Amendment have long been a matter of intense discussion and dispute. Others theorists defend some version of John Stuart Mill's harm principle that asserts the scope of public authority should be limited to circumstances in which one or more individuals are or may be harmed by someone else. Again, though, the questions of how to conceptualize harm and how to distinguish indirect harms from direct harms, prove difficult.

Contemporary discussions of public and private have been profoundly influenced by the writings of Hannah Arendt, who postulated a conception of the public realm as a sphere of truly free action, distinguished from the biologically driven activity of labor and the goal-oriented activity of craft or work. For Arendt, the triumph of the private, or the social, over the public—resulting in fewer opportunities for authentic political engagement—increasingly has characterized modernity. Jürgen Habermas's discussion of a transformation of the public sphere—from an arena of rational discussion and debate to a system of managed, administered thought control—has been equally influential. In addition, the liberalism of John Rawls invokes a conception of a public reason that pursues practical terms of political accommodation and cooperation within complex, highly pluralistic societies. On the other hand, feminist theorists such as Susan Moller Okin insist that "the personal is political" and that the alleged distinction between the public and the domestic is misleading in itself, and harmful in its consequences. However, other theorists argue that if there is a category of private endeavor, this can be only at the sufferance of the authoritative judgment of the state itself.

Public Utilities

Whether publicly or privately owned, it is the job of a public utility to handle and maintain the operation of a public service. Usually, a public utility has a natural service monopoly. While its own consumers own a publicly owned utility, investors own a privately owned utility. A few examples of public utilities include an electric utility, roads and tollways, public transportation, telecommunication, heat generation and distribution, natural gas distribution, waste disposal, water purification and distribution, and sewage treatment and disposal.

A public water department is regulated to purify and distribute water to the consumers of its given area. To be a public water system, there must be at least fifteen service connections, or an average of at least twenty-five individuals served daily at least sixty days out of the year. In 1805, the first large American city to consider water distribution a municipal responsibility was Philadelphia, born out of a yellow fever epidemic that had to do with an unhealthy water supply. In his will, Benjamin Franklin gave the city one hundred thousand pounds to develop a suitable water supply for the residents and industries of the city. The city waterworks was subsequently created to pump water in from the Schuylkill River into two pumping stations through wooden pipes. One of these pumping stations was on Chestnut Street, while the other was at Centre Square. A watering committee was created and helped in providing stability that made Philadelphia one of the most prosperous cities during the Industrial Revolution. The waterworks served as a model for thirty other cities.

Before electricity was a public utility, it was a very expensive and very difficult business to run. There were a number of different companies offering different services. While some companies offered electricity for homes, others offered it for street lamps or commercial use. To be able to offer service for any of these different areas, an electric company also needed to acquire franchise rights from the local municipality. A few companies, one such ran by Samuel Insull, noticed that the cost of maintaining power plants to create electricity and then to only distribute to a specific sector of the public was unprofitable. It wasn't worth the high investments in the plants to only serve a few. Insull discovered that if he could go above serving specific sectors and actually serve each of them at different times, the price of electricity would be affordable to citizens, and it would be a profitable business. In a move to a public utility, observations at the time determined that one large operating plant would be cheaper than many smaller ones.

Still, the problem of franchise rights lowered investor confidence and thus hindered profit. Many in the industry decided it would be more profitable if, instead of consulting the city council every time, to instead operate through a nonpartisan state agency. Insull subsequently proposed that a state agency regulate prices and standards. The companies favored the idea of attracting more customers, and the customers were pleased to know that the companies were doing what was best for the consumer. In 1916, thirty-three states created these nonpartisan state agencies to regulate the industry. Today, most of these companies are privately owned utilities with a large shareholder investment base.

While often seen as a problem, the monopolization of these industries actually profits the consumer and the company. State agencies must be created in order to accomplish all the goals for any public utility. This is because heavy governmental support is needed when the distributed products become a necessity of living; a middle ground between profit and affordability must therefore be established.

Pufendorf, Samuel

Samuel Pufendorf (1632–1694) was a German jurist and historian, often considered an important forerunner of the German Enlightenment and a significant influence upon British philosopher John Locke. In 1658, while he was the tutor for the family of a Swedish ambassador in Denmark, Pufendorf spent eight months in a Danish prison as a result of hostilities between the two countries. Later, he held professorships at the universities of Heidelberg and Lund and served as the royal Swedish historiographer and the Prussian court historian.

The violence of the Thirty Years War (1618–1648) and the establishment of the Treaty of Westphalia marked Pufendorf's early years. As a result, his political and legal thinking was primarily concerned with the preservation and perpetuation of peaceful and stable states, and the duties of the good citizen in the new nation-state. Toward the end of his career, he moved away from politics, jurisprudence, and international law and devoted himself to studying history.

Despite his extraordinary influence in the seventeenth century, Pufendorf has been largely overlooked by later generations of political theorists and dismissed as a Grotian or a Hobbesian. In fact, his major work of natural law, *De Jure Naturae et Gentium* (1672), and the abridgement which followed it a year later, *On the Duty of Man and Citizen According to Natural Law* (1673), seek to revise Dutch legal theorist Hugo Grotius's natural law theory in light of English philosopher Thomas Hobbes's methodological and anthropological innovations to arrive at a new jurisprudence appropriate for the political and legal issues confronting the Westphalian world. Pufendorf argued that the law of nations is a part of natural law, not positive law, and that it applies universally to all of humanity, not only to Christian nations. His conception of natural law is essentially voluntarist and positivist; that is, he argued that there is no morality beyond the commands of God and all law proceeds from the will of a superior. In Pufendorf's view, human reason is sufficient only to generate principles of prudence and utility, not binding moral laws.

In contrast to Hobbes, Pufendorf believed that the state of nature was not a state of war, but he saw its peace as insecure. Accordingly, the first and supreme law of nature is the command that humanity be sociable; humans must adopt an attitude consistent with the preservation of social and political life. Pufendorf's voluntaristic understanding of natural law and natural rights results in an authoritarian conception of political power, in which the state is a moral person with the rights,

powers, and will formerly belonging to individuals; in this, Pufendorf anticipates the social contract tradition.

Pufendorf's demarcation argument strengthened his justification of authoritarian political power. He argued that while all law comes ultimately from God, divine, natural, and civil laws are methodologically distinct and apply to different spheres of life. In essence, he sought to separate religion from the state in an effort to overcome the religious conflicts that characterized the Thirty Years War. The desacralization of politics meant that political rulers could no longer be held accountable to moral norms beyond their authority and that religion was relegated to the private sphere. The deconfessionalization of politics was, for Pufendorf, the first step toward an enduring peace in the wake of the Treaty of Westphalia.

Punctuated Equilibrium

In *Agendas and Instability in American Politics* (1993), Frank Baumgartner and Bryan Jones argue that debate on most policy issues remains confined to a small circle of interested players that constitute a policy domain. These players may be in conflict, but the terms of the debate and the outcome of policy decisions remains relatively stable over time, with only small, incremental changes. However, this policy stasis can change dramatically as issues are redefined and highly publicized events cause issues to be placed on the policy agenda. Policy questions then move from the relatively hidden confines of the policy domain to the highly visible locus of presidential or congressional politics. In these venues, the old relationships of the policy domain break down, and a policy is subject to dramatic change, thus leading to a punctuated equilibrium.

Baumgartner and Jones adapted their theory from evolutionary biology. Stephen Jay Gould and Niles Eldredge developed the punctuated equilibrium theory as a counter to the Darwinian belief that species evolved slowly over long periods of time. Gould and Eldredge argued that the evolution of most species remained stagnant over long periods of time—equilibrium—and that changes came in drastic bursts—punctuations. Baumgartner and Jones used this model as the basis to explain the evolution of public policy issues in the United States. Like

evolution, policies often were characterized by long periods of stagnancy or incremental change, followed by sudden dramatic shifts.

Punctuated equilibria result when changing policy images push issues that were previously uncontested onto the broad public agenda. Policy images define the ways in which the public conceptualizes an issue. Because of widespread acceptance of the status quo, when people have a positive image of an issue, there is little likelihood that much change will occur. Policy change instead occurs when elites or specialists begin to challenge an accepted policy image based on research, external events, or problems with the implementation of existing policies. They create a negative image that is reinforced and popularized by media attention. Congress is then willing to undertake broad debate on the policy, which may result in substantial change to the status quo, thus creating a punctuated equilibrium.

The punctuated equilibrium model of policy development is an ambitious attempt to synthesize conceptions of policy making to establish an all-encompassing theory of policy change in the United States. Traditionally, variations of elite theory or pluralism have dominated the study of public policy. According to elite theorists, special interests that structure the political system for their own benefit primarily direct public policy. Special interests create policy monopolies that enable them to preserve the status quo by keeping policy making out of the public eye. Consequently, elite theorists argue that radical policy change is an anomaly. Pluralists take the opposite tact, arguing that the system is open to anyone who can mobilize an interest group. Thus substantial policy change can occur at any time.

Baumgartner and Jones's theory has been termed *neopluralism* because it synthesizes elements from both of these broad theories. Their methodology of studying single areas of policy over decades allows them to show that policy is often dominated by special interests within policy monopolies. However, change is also possible when elites or public opinion pressure Congress for a change in the status quo.

Puritanism

Puritanism—a term rarely used by Puritans themselves, but rather by their critics and opponents—originated as a reformist movement within the sixteenth- and seventeenth-century

Church of England. Puritans were English Protestants dissatisfied with the extent of reform in the English church after its break with Rome under Henry VIII. They sought the purging of remaining *Romish* or *popish* residues in the Church (e.g., an Episcopal system overseen by bishops and archbishops, ornate church buildings, and liturgies); emphasized personal piety, devotion, and the experience of personal conversion; and supported an educated ministry.

Drawing on the example of the primitive Christian church as a model for their own times—and understanding the church to be a gathered congregation of *visible saints* not confined to the geographical or parish boundaries of Anglicans or Catholics—Puritans supported a significant degree of congregational autonomy within the structure of a national church. Yet many views held by so-called Puritans (e.g., salvation by faith alone, or providentialism) were not fundamentally different from those held by their Reformed contemporaries, and *Puritan* and *Anglican* did not always denote hard and fast categories in early modern England.

As the seventeenth century progressed, Puritans opposed increasingly assertive Anglican royalism, as in Charles II's *personal rule*—or rule without calling Parliament— between 1629 and 1640, and distrusted Archbishop of Canterbury William Laud's ceremonialism as unacceptably popish. During the civil wars of the 1640s, Puritans generally supported Parliament against the king. With the parliamentary victory, however, the unifying effects of opposition began to wear off, and sects proliferated under the rule of Oliver Cromwell, whose theological leanings were deeply Puritan. After the restoration of the Stuart monarchy in 1660, and the reestablishment of the Anglican Church, Puritans tended to refer to themselves as *Nonconformists* or *Dissenters* and moved into a more explicitly oppositional role outside the national church structure.

Puritanism played an important role in America as well, and scholars have long noted the significance of the "great migration" from Puritan strongholds in England to New England during the 1630s and 1640s. Reflecting their Anglican roots, Puritans in New England set up a system in which church and commonwealth worked closely to ensure godly behavior and social order; reflecting more specifically Puritan commitments, they sought to maintain congregational autonomy in matters of church discipline and stressed the importance of covenants as the basis of such congregations, and indeed of the political order itself. Though never espousing theocracy—clergy did not hold elective office—American Puritans believed that civil magistrates and covenanted churches should work together to build a godly community in the American wilderness and to suppress vocal religious dissent. Thus they were deeply dismayed to see their English counterparts embracing religious toleration during the English Civil War (1642–1651) and under Cromwell's regime.

Puritanism in America was never short of critics: Anabaptists, Quakers, and other sectarians denounced New England Puritans as merely replicating the coercive church establishments of Europe. Emerging commercial elites also took issue with Puritanism's attempts to control social life and mores, although the relationship between Puritanism and commerce is certainly more nuanced than the strident rhetoric on either side might suggest. In addition, worries about "Indianization" and its effect on the religious foundations of New England life were never far from Puritans's minds.

The importance of Puritanism to American culture and politics has constituted one of the more enduring themes in scholarship about the development of the United States as a national community and an international power. Yet, as many other scholars have pointed out, Puritanism is not the entirety of America, but one among many influences—including those of Southern thinkers, American Catholics, and the importance of the frontier—that have informed and shaped Americans's approach to politics and society.

Pye, Lucian

Lucian Pye (1921–2008) was a political scientist known for his work on Chinese politics. Pye was born Bai Luxun in Fenzhou, Shanxi Province, China. After receiving a bachelor of arts in 1943 from Carleton College in Minnesota, he entered the U.S. Marine Corps and became an intelligence officer posted in China. After being discharged, Pye entered graduate school at Yale University, earning a master of arts in 1949 and a doctorate in philosophy in 1951. His dissertation, "The Politics of Tuchinism in North China, 1920–1927: An Aspect of Political and Social Change in Modern China," focused on the warlord system of politics in 1920s China.

In 1949, Pye joined the faculty of Washington University in St. Louis, Missouri, where he remained until 1952. He became

a faculty member at the Center for International Studies of the Massachusetts Institute of Technology (MIT) in 1956, and he spent the next thirty-five years there, becoming one of the leading scholars of Chinese and Asian politics.

Pye also was active outside academic institutions. He was a consultant to the Department of State and the National Security Council (NSC) on China and advised presidential candidates John F. Kennedy and Henry M. Jackson. In addition, Pye held leadership positions in a number of organizations. He was a trustee of the Asia Foundation (1963–2004) and a member of the board of directors of the Council on Foreign Relations (1966–1982). He cofounded and served as an acting chair of the National Committee on United States–China Relations and helped set the stage for the 1971 "ping pong diplomacy" visit of the U.S. table tennis team to the People's Republic of China.

Pye was president of the American Political Science Association from 1988 to 1989 and was elected a member of both the American Academy of Arts and Sciences and the American Philosophical Society. He was a founding member of the Committee on Comparative Politics of the Social Science Research Council (SSRC) and chaired it from 1963 to 1972. In 1978, he also helped found the International Society of Political Psychology and in 1994, he was awarded the society's Harold D. Lasswell Award.

Pye wrote or edited twenty-five books during his career. During the 1950s and 1960s, he wrote about the political development of less developed countries, focusing on specific political cultures. He believed that political culture had an impact on politics in different nation-states and this helped explain why political systems differed from one another. His approach was significant because, rather than relying on rational models of political behavior, he focused on political culture, personal behavior, and other variables that were not easily quantifiable.

Pye's biography of Mao, *Mao Tse-Tung: The Man in the Leader* (1976), was significant because he used a psychohistorical approach in an effort to understand the Chinese leader. He analyzed the psychological impact of Mao's childhood experiences, including his relationship to his mother. Pye suggested that Mao's feelings that his mother did not give him the attention he deserved made him narcissistic, which could be useful information in considering the rebellious and charismatic leader Mao later became.

In *Asian Power and Politics: The Cultural Dimensions of Authority* (1985), Pye sought to find common characteristics among a number of Asian political cultures, explaining that Asian nation-states, despite significant differences, were all pursuing modernization as a means to move away from their past. In Asia, according to Pye, pursuing change was a common political theme.

Al-Qaida

Al-Qaida (Arabic for "The Base") is defined by the U.S. Department of State as a "Foreign Terrorist Organization." This means that the organization is foreign, engages in terrorist activity or terrorism or retains the capability and intent to engage in terrorist activity or terrorism, and its terrorist activity or terrorism threatens the security of U.S. nationals or U.S. national security (national defense, foreign relations, or the economic interests).

The State Department labels the al-Qaida network, which includes a core al-Qaida organization and numerous confederated extremist groups, the greatest terrorist threat and a threat that will remain for decades. According to the State Department, al-Qaida uses subversion, sabotage, open warfare, and terrorism, and it seeks weapons of mass destruction. It aims to unite Muslims to fight the United States as a means of defeating Israel, overthrowing regimes it deems "non-Islamic," and expelling Westerners and non-Muslims from Muslim countries. The eventual goal is the establishment of a pan-Islamic caliphate throughout the world. The State Department believes the group probably has several thousand extremists and associates worldwide. It maintains moneymaking front businesses, seeks donations from supporters, and illicitly siphons funds from donations made to Muslim charitable organizations.

Al-Qaida was founded by Osama bin Laden in Afghanistan in 1988. Bin Laden was born into a wealthy family in Saudi Arabia in 1957 and appears to have adopted militant Islamist views during his university studies. One of bin Laden's instructors, Abdullah Azzam, viewed the 1979 Soviet invasion of Afghanistan as an attempt by a non-Muslim power to conquer sacred Muslim territory and people. Bin Laden and Azzam went to Afghanistan to fight the Soviets and in 1984 established a network of international recruiting and fundraising offices. In 1988, toward the end of the Soviet occupation, there was a power struggle between bin Laden and Azzam, and Azzam was assassinated in November 1989.

The August 1990 Iraqi invasion of Kuwait apparently changed bin Laden from a de facto U.S. ally against the Soviets into an enemy of the United States. Bin Laden had returned to Saudi Arabia in 1989 and opposed the stationing of U.S. troops in Saudi Arabia following Kuwait's fall. In 1991 he relocated to Sudan, where he hosted and trained al-Qaida militants to fight against the United States and its interests. These militants also received training for al-Qaida operations in the Balkans, Chechnya, Kashmir, and the Philippines. Bin Laden and his close confidant, Ayman al-Zawahiri, apparently believed that the only way to bring Islamic regimes to power was to end the U.S. regional presence.

In 1992 the group claimed responsibility for bombing a hotel in Yemen, and it has been linked to the February 1993 bombing of the World Trade Center in New York. In May 1996, bin Laden was expelled from Sudan and returned to Afghanistan, where he helped the Taliban gain control of the country. Kabul, the capital, was captured in September 1996, and the Taliban imposed their extreme interpretation of Islam on the Afghan people. Al-Qaida was allegedly responsible for the August 1998 bombings of U.S. embassies in Kenya and Tanzania. The United States in turn launched a missile attack against bin Laden's Afghanistan terrorist training camp. In October 2000, al-Qaida members attacked the USS *Cole* while it was docked in Yemen.

The United States was attacked on its own soil on September 11, 2001, (9/11) in the worst attack to date. On that day, al-Qaida members hijacked and crashed four U.S. commercial jets—two into the World Trade Center towers, one into the Pentagon near Washington, DC, and a fourth into a field in Shanksville, Pennsylvania. The attack left nearly three thousand people dead or missing.

Following the Taliban's repeated refusal to expel bin Laden and his group and end its support for international terrorism, the United States and its allies began a military campaign in Afghanistan. This led to the fall of Taliban-occupied Kabul in November 2001. Khalid Sheikh Mohammed, the alleged mastermind of the 9/11 attack, was captured in Pakistan in 2003 and said at a December 2008 pretrial hearing in Guantanamo Bay that he would plead guilty.

Al-Qaida has remained active since 9/11. Apart from the continued fight against the United States and its allies in Afghanistan and post–Saddam Hussein Iraq, it has been linked to numerous incidents. These include the bombing of a hotel in Mombasa, Kenya, in November 2002; bombings in Istanbul, Turkey, in November 2003; bombings in London, England, in July 2005; and the September 2008 attack on the Marriott hotel in Islamabad, Pakistan. The Central Intelligence Agency (CIA) said in November 2008 that bin Laden was isolated

from the daily operations of al–Qaida and probably was hiding in the tribal area of northwestern Pakistan. As of November 2009 he remained at large.

Q-methodology

Invented by British psychologist William Stephenson in 1935, Q-methodology represents a kind of observer rating that can be used to assess subjective opinions or beliefs about any topic or situation. It is often used in political science in observations of policy issues and decision makers.

In a Q-sort, subjects are asked to rank their impressions of a particular topic, person, or event by indicating how well they think predetermined words or traits describe those things. For example, they might be asked to rank order one hundred descriptive adjectives by how accurately they think the particular word applies to a subject, or they may be asked how much they may agree or disagree with a given set of statements. Oftentimes, a stimulus, such as a video or speech on the subject, might be delivered to observers before they are asked to rank the target. These rankings are then factor analyzed to reveal areas of overlapping subjective points of similarity and difference between subjects. In contrast to conventional factor analysis, which operates on the intervariable correlation matrix, Q-methodology operates on the intersubject correlation matrix.

The goal of this kind of research is to provide a systematic way to combine the idiosyncratic individual responses of observers into an aggregate assessment of individual subjective judgments; this helps researchers understand the nature of preferences, motives, and other phenomenon that can be otherwise difficult to determine. Once this is done, investigators often examine whether these imputed characteristics can predict particular behaviors. Q-methodology can be used in concert with other methods to provide a multimethod investigation of political traits or character.

Several criticisms of this kind of work exist, including claims that many individuals converging in their judgments do not necessarily make these perceptions accurate. This criticism is particularly relevant under modern conditions of impression management and media attention.

Qualified Majority Voting

A qualified majority voting system, also known as a supermajority, is a parliamentary rule which requires that legislation or motions obtain a predetermined number of votes beyond a simple majority. Common qualified majority voting numbers range from three-fifths to three-quarters of the legislature; however, the percentage required for a qualified majority varies from issue to issue and from country to country. For instance, in the United States, the Senate may invoke cloture to end a filibuster with a qualified majority of three-fifths of the members present and voting, but to ratify a treaty, the Senate needs a two-thirds majority vote. Both houses of Congress require a two-third majority vote to override a presidential veto. Under the Treaty of Nice, the Council of Europe requires a supermajority of 255 votes or 62 percent in order to pass measures.

The qualified majority voting system was developed as a means to ensure the broadest possible support for the most significant measures considered by legislatures, and to ensure that legislation was not enacted without significant debate and consideration. Critics of qualified majority assert that the system often places unfair obligations on minority groups in the legislature and reinforces majoritarian systems.

Qualitative Analysis

Qualitative analysis refers to the way researchers analyze data collected through methods such as participant observation, case studies, interviews, narratives, and other nonquantitative formats. Qualitative analysis includes three major components: (1) reducing data by narrowing the focus, organizing, and transforming raw data (e.g., field notes) in a meaningful way; (2) displaying data through a detailed narrative about the phenomenon under examination or visuals (or both), such as charts and figures; and (3) drawing and verifying conclusions. In qualitative analysis, conclusions are often drawn early in the data collection process. Such conclusions are not final, but rather are refined continuously during the analysis process.

Two concerns emerge about qualitative analysis and the researcher. The first is researcher bias since the researcher collects the initial data. Second, the conclusions drawn by the researcher need to be verified and then validated. In recent years, researchers using qualitative analysis have received assistance from computer-assisted qualitative data analysis (CAQDA) software which helps them with functions such as coding data. In conclusion, qualitative analysis offers researchers an alternate approach to quantitative analysis.

Qualitative Methodologies

Case study methods underwent a renaissance over the last decade that encompasses three key developments. First, methodologists have clarified philosophy of science foundations in case study methods, and their comparative advantages vis-à-vis statistical methods. Second, scholars have improved their practical advice on how best to conduct case studies. Third, researchers have institutionalized the teaching and advancement of qualitative methods through a new American Political Science Association section on qualitative methods and an interuniversity Consortium on Qualitative Research Methods.

While qualitative methods encompass many approaches—including ethnography, participant observation, focus groups, and other techniques—new ways of using case studies to develop and test concepts and theories about complex political phenomena include typological theorizing, fuzzy set analysis, and two-level theories. Recent practical advice has also emerged on how to carry out case studies, including how to select cases for study, identify negative cases, execute within-case analysis using process tracing, conduct counterfactual thought experiments, and carry out multimethod research. While recent developments all hold significance, ongoing development of qualitative research methods will continue the welcome trend toward methodological pluralism in the social sciences.

PHILOSOPHICAL AND THEORETICAL ISSUES

In 2006, James Mahoney and Gary Goertz identified ten key differences between qualitative and statistical methods. The most fundamental of these have to do with the often implicit assumptions that the two approaches have about *explanation* and *causation*. Mahoney and Goertz argue that a central goal in qualitative research is the historical explanation of individual cases, such as the causes of major wars, financial crises, or transitions to or from democracy. This preoccupation with the *causes of effects* leads to questions such as, "Through what processes and mechanisms did this outcome arise in this case?" In contrast, statistical researchers are more interested in the general *effects of causes* on specified populations. These researchers raise questions such as, "How much, on average,

would a one-unit change in this variable affect the outcomes for this population of cases?"

This difference relates to a deeper philosophy-of-science debate on causal explanation. Gary King, Robert Keohane, and Sidney Verba draw upon probabilistic notions of causality and the metaphor of controlled experiments to define causation in terms of causal effects. In contrast, case study researchers, such as Alexander George and Andrew Bennett, draw upon a scientific realist view of science to argue that causal explanation involves reference to hypothesized causal mechanisms. In this view, causal mechanisms are entities in the world independent of one's mind, which, if they operate as one theorizes, would generate and account for the processes and outcomes one observes.

Either approach faces thorny philosophical and practical questions. Probabilistic ideas of causation and the notion of causal effects have difficulty providing satisfying explanations for individual cases. They also raise perplexing questions about whether the kinds of inherently probabilistic relations found in quantum mechanics are relevant to political life or can be considered causes or explanations. Moreover, earlier attempts to explicate causation in terms of probabilistic relations have had difficulty distinguishing between correlations and causation. Readings of a barometer, for example, correlate with the weather but they do not cause the weather. Yet explanations relying on correlations cannot distinguish whether a barometer qualifies as a cause of weather.

The explanation of cases via reference to causal mechanisms raises difficult issues as well. Are causal mechanisms in some ultimate sense unobservable, and if so, how do they relate to the observations one makes in the world? How can one address the problem of a potentially infinite regress of explaining mechanisms within mechanisms at ever-finer levels of detail, lower levels of analysis, and smaller increments of time? Does explanation via reference to hypothesized causal mechanisms entail a commitment to methodological individualism or the study of politics at the level of the individual, or does it allow for development and testing of macrolevel theories? How do mechanism-based explanations generalize from one context to another?

George and Bennett, in their 2005 book *Case Studies and Theory Development in the Social Sciences,* address each of these issues regarding causal mechanisms. They argue that hypothesized mechanisms be tested against their observable implications. Although what is observable changes with new instruments of observation, there is always some ultimately unobservable horizon that one would like to study, beyond the current processes. In addition, researchers must make pragmatic and potentially flawed decisions on when to stop pursuing ever-finer levels of explanation. It is possible to err on the side of stopping too soon, when a better explanation is just around the corner, or too late, when the researcher has begun to tell curve-fitting stories. As for macrolevel testing of theories, George and Bennett argue this is possible but that a macrolevel theory is subject to challenge if it can be shown that individuals did not behave as the theory predicts, even

if the theory accurately attains aggregate outcomes. Process tracing is subsequently a key case study method for examining whether hypothesized mechanisms operated within a case as predicted.

Finally, George and Bennett maintain that contingent generalizations—or theoretical statements with specified and often narrow-scope conditions—are typically the most that students of politics can achieve. There are very few nontrivial political science theories that use just a few variables to make broad, detailed, and accurate predictions. These arguments, although still subject to debate, strengthen the philosophical underpinnings of case study methods.

A second set of developments concerns innovations in social science concepts and a turn toward more complex theorizing about politics. Gary Goertz, in *Social Science Concepts: A User's Guide* (2005) distinguishes between necessary and sufficient concepts versus family resemblance concepts. In the former, a single variable may be conceptualized as either necessary or sufficient for a theory to hold or an entity to qualify as an instance of a concept. For example, the democratic peace theory posits that the absence of democracy in one of two contending states is a necessary condition for these states to go to war against one another. A family resemblance concept suggests that some combination of a number of substitutable characteristics qualifies an entity to be classified as an instance of a concept. A family resemblance concept of democracy, for example, might define a state as democratic if it has competitive elections plus any three of the four following attributes: viable political parties, an independent judiciary, universal suffrage, or freedom of the press.

In the 2005 article, "Two-level Theories and Fuzzy Set Analysis," Goertz and Mahoney note that many types of two-level theories are possible by combining necessary and sufficient concepts at one level of a theory with family resemblance and substitutable concepts at another. Their analysis of Theda Skocpol's theory of social revolutions, for example, shows that in her two-level theory, both state crisis and agrarian revolt are necessary conditions at one level for a social revolution. At the same time, at a prior level, there are several substitutable conditions that can lead to agrarian revolt and other substitutable conditions that result in a state crisis.

These distinctions among kinds of concepts overlap with several other approaches to complexity. James Mahoney, Erin Kimball, and Kendra Koivu, in "The Logic of Historical Explanation in the Social Sciences" (2009), discuss five kinds of causal relationships invoked in historical explanations: (1) necessary but not sufficient, (2) sufficient but not necessary, (3) necessary and sufficient, (4) insufficient but necessary part of an unnecessary but sufficient (INUS), and (5) sufficient but unnecessary parts of insufficient but necessary (SUIN). The first three are widely familiar, but INUS and SUIN relationships require explanation. In an INUS variable, for example, A is an INUS variable with respect to Y if: A in conjunction with B is sufficient to cause Y, neither A nor B can cause Y by themselves, and other conjunctions like DE can also cause Y. Conversely, the authors illustrate SUIN variables with

democratic peace theory. This theory, again, argues that lack of democracy in one of two contending countries is a necessary condition for war. If any one of several conditions can by itself constitute a lack of democracy—major electoral fraud, authoritarianism, and so on—but none of these conditions is by itself sufficient for war, then each is a SUIN variable with respect to war. Mahoney and colleagues discuss how the careful evaluation of sequences in historical cases can help assess the relative importance of these five kinds of causes in explaining historical cases.

George and Bennett discuss the use of typological theorizing as another approach to complexity. Typological theories provide contingent generalizations on how different combinations of variables interact to produce outcomes. Because typological theories are seldom fully specified for all possible combinations of variables, and because history does not provide natural experiments of all possible combinations, George and Bennett's approach involves careful iteration between deductive theorizing about combinations of variables, or types, and empirical knowledge about extant cases. Using the example of a study on burden sharing in the Gulf War (1990–1991), George and Bennett show how combinations of variables from theories such as balance of threat, collective action, and alliance dependence can explain why countries contributed as they did, or did not, to the U.S. coalition in the Gulf War. This example also illustrates how typological theorizing assists in choosing the most informative cases for study, and how subsequent burden-sharing episodes could be used to further develop contingent generalizations on burden sharing. One challenge of typological theories is that they become combinatorially more complex with each additional variable. George and Bennett, along with Colin Elman in "Explanatory Typologies in Qualitative Studies of International Politics" (2005), discuss ways to both simplify typological theories and focus on selected subtypes.

Charles Ragin's fuzzy set analysis, presented in his 2000 book *Fuzzy Set Social Science,* constitutes a third approach to complexity. In this method, the analyst assigns fuzzy set scores between 0 and 1.0 for how clearly a case fits as an instance of a concept. A full democracy, for example, might be coded a 1.0, a full autocracy would be 0, and a country that allows elections and eschews electoral fraud but limits the opposition parties' access to media might be a .75. Such fuzzy set scores can be superior to traditional crisp measures when variation does not matter above a certain threshold. For example, democratic peace theory holds that all fully democratic countries refrain from war with one another, and with this theory, for those cases above the threshold of established democracy, it does not matter whether one country is more democratic than another. Ragin elucidates methods for fuzzy set analysis of populations that typically range from about ten to sixty cases. This number of cases is generally too small for traditional statistical analysis and too large for detailed case studies of the full population, so within this range of cases, fuzzy set analysis can have advantages over alternative research designs.

Path dependency is a final form of complexity that case study methodologists have addressed. In a path dependent process, patterns set in a period of contingency become locked in through increasing returns to scale, learning effects, positive or negative externalities, or other mechanisms that make the new outcome strongly self-reinforcing. As Bennett and Elman argue in "Complex Causal Relations and Case Study Methods: The Example of Path Dependence" (2006), case study methods are well-suited to unraveling the choices made in the contingent period, examining the mechanisms that sustain the new path thereafter, and exploring the instances in which the established equilibrium might have broken down or might yet break down. Many comparative historical analyses, which focus on explaining big and important outcomes over long periods of time, use path dependency models and case study methods of assessing them.

PRACTICAL METHODS IN CASE STUDY RESEARCH

Qualitative methodologists have elaborated on practical means of carrying out case studies as well. John Gerring and Jason Seawright, in *Case Study Research: Principles and Practices* (2007), analyze nine different case selection criteria and their uses, advantages, and disadvantages. In their view, a researcher might select a typical case for study, or a case that is deemed to be representative by some criteria (e.g., having average values on the variables, or a small error term in a statistical study), and study this case in detail to see whether the mechanisms hypothesized to explain population outcomes in a statistical study are actually evident in a typical case. Selection of diverse cases might show how cases at either end of a distribution operate, while study of extreme value cases might show causal mechanisms in sharp relief, though such cases may not be representative of the population. Study of deviant outlier cases, or cases with a large error term in a prior statistical study, might help identify omitted variables, though further analysis is necessary to determine if such variables are relevant only to the outlier case or the population. Study of influential cases—or cases in which removal from the population in a statistical analysis would have the largest effect on the results—can help determine if these cases are truly part of the hypothesized processes relevant to the full population, or are in some sense deviant and need to be either recoded or dropped from statistical analysis of the full population. Study of most likely cases that fail to have the expected outcome, and least likely cases whose outcomes fit a hypothesis even in unpropitious circumstances, can help identify the scope conditions of theories. Comparison of most similar cases—or cases that are similar in all but one independent variable and differ on the dependent variable—and least similar cases—which differ on all but one independent variable and have the same value on the dependent variable—can be strong research designs to assess the roles of the independent variables isolated by each comparison. Finally, pathway cases can each illustrate different paths to similar outcomes when there are alternative paths to the same outcome; this is a condition known as *equifinality*.

Mahoney and Goertz, in "The Possibility Principle: Choosing Negative Cases in Qualitative Research" (2004), note that negative cases, or cases that could have had the outcome of interest but did not, are often neglected in both statistical and case study analysis. Negative cases are often harder to identify, and potentially far more numerous, than cases that are positive on the outcome of interest. It is more difficult to identify situations that could have led to war and countries that might have gone to war, for example, than to identify actual wars. Researchers can err in either of two directions: excluding relevant cases that could have had the outcome of interest but did not, or including irrelevant cases in which the outcome of interest was not possible. Mahoney and Goertz devise a *possibility principle* for identifying cases that could have had the outcome of interest. This principle consists of a rule of inclusion, which would include cases in which at least one independent variable predicts the outcome of interest, and a rule of exclusion, which excludes cases in which at least one variable makes the outcome of interest impossible or nearly so. Researchers can adjust the tightness of their criteria for inclusion or exclusion depending on the theory building or policy consequences of mistakenly including an inappropriate case versus those of mistakenly excluding a relevant case.

Methodologists have also focused on how to do within-case analysis, particularly through the technique of process tracing. Process tracing involves looking within a single case for the observable implications of hypothesized causal mechanisms, or the processes they predict should have been evident in the events leading up to the outcome of the case. Analogous to detective work, process tracing examines the detailed sequences through which outcomes arose. It addresses questions of who knew what, did what, and when, in order to affirm or disconfirm the predictions made by alternative explanations. It proceeds both deductively, from hypothesized observable implications, and inductively, from details in the case that may surprise the researcher and that need to be theorized and tested against additional observable implications within the case or in other cases.

In many respects, the logic of process tracing parallels that of Bayesian inference. Both approaches stress the importance of diverse evidence, of casting the net widely for alternative explanations, of never placing 100 percent confidence in an explanation, and of putting the greatest value on evidence that helps differentiate between competing explanations (i.e., evidence that affirms one explanation while at the same time disconfirming others). Both perspectives indicate that the degrees of freedom problem, which arises in frequentist statistical analysis when the researcher has more parameters to be estimated than cases to study, is not applicable to within-case analysis in which a single piece of evidence might disprove many possible explanations. Whether there is (in)determinacy in distinguishing between alternative explanations of a case depends on the nature of the evidence with respect to the rival explanations, not of the number of cases or pieces of evidence relative to the number of variables. Process tracing can thus enable causal inference even from a single case with many variables, and it

can thereby compensate for the limitations of cross-case comparisons. Process tracing can help test, for example, whether the one independent variable that differs between most similar cases relates to the difference in these cases' outcomes. Process tracing is not a panacea, however, because it is time-consuming, requires lots of information, and may be indeterminate if the right kind of evidence is not available.

Counterfactual analysis can supplement both within-case analysis and cross-case comparisons. Every causal explanatory statement—"Y happened in this way at this time because of X"—implies a counterfactual: "If not X, then not Y in the same way or at the same time." Because researchers cannot run perfect experiments or rerun history, counterfactuals are ultimately untestable. Yet thinking through the counterfactual implications of causal arguments can help check for logical inconsistency in one's own thinking. If researchers do not find a counterfactual claim equally convincing as the logically equivalent causal claim that they are asserting, then they need to fix the inconsistency in their thinking. In their 1996 work *Counterfactual Thought Experiments in World Politics,* Philipp Tetlock and Aaron Belkin suggest criteria for good counterfactuals, including clarity, logical consistency, minimizing the rewriting of history necessary to sustain the counterfactual, and projectibility. Projectibility, or ability to get back toward testable implications, is particularly important. Although counterfactuals are ultimately untestable, they may have some degree of testability. For example, one could assess whether actors made contingency plans in case events took a different path, or if powerful actors considered or advocated options other than those that they ultimately chose. Gary Goertz and Jack Levy, in *Explaining War and Peace: Case Studies and Necessary Conditions Counterfactuals* (2007), provide extended analysis of some of the counterfactual arguments that have been made concerning the outbreak of World War I (1914–1918) and the end of the cold war.

Finally, methodologists provide techniques for combining case study methods with statistical and formal analysis within a single research project. Much of the advice on case selection from Gerring and Seawright, for example, requires prior statistical work to identify outlier cases or influential cases before such cases can be selected for within-case analysis or paired case comparisons. Similarly, in the 2005 article "Nested Analysis as a Mixed-method Research Strategy for Comparative Research," Evan Lieberman discusses how statistical analysis and case study analysis can be *nested* into a multimethod research design. The basic premise of multimethod analysis, and one increasingly recognized by methodologists of all kinds, is that every methodological approach has strengths and weaknesses, so combining methods can allow the strengths of one to address the limits of another.

CONCLUSION

Innovations in case study methods have provided them with a more equal basis relative to the decades of refinements in statistical and other methods. This has contributed to a welcome methodological pluralism and to growing interest in multimethod research. However, it has also raised the level of effort required to master best practices in case study methods, or even to become adept enough at these methods to critically read case study research. Still, these emerging trends provide a valuable basis even where methodology is a secondary focus, or for those whose primary methods are not case studies.

Quality of Life

Quality of life (QOL) is a term used by politicians, journalists, and social scientists to distinguish differences in objective and subjective social well-being among individuals and between different units of government. Most often, it is used to measure and compare differences in the satisfaction of fundamental social and psychological needs.

However, most QOL researchers do not try to justify the indicators used to measure differences in life quality. Rather, they often explain their selection on the basis of commonly held standards of economic, social, environmental, health, and political well-being. This is why other researchers and interested parties often contest and dispute their results. Thus, QOL studies usually reflect both a conscious and unconscious mobilization of political and social bias.

Interest in life-quality differences is especially high among Americans and residents of developed countries. Perhaps one reason is the high level of social mobility found in advanced industrial democracies. Each year, approximately 20 percent of all Americans change their place of residence, frequently to different metropolitan areas and states than those in which they formerly lived. Most move for jobs and better salaries. Others move for reasons of climate and health. Still others may seek a new start in life, a more satisfying lifestyle, or residential proximity to family and friends. Whatever the reason, Americans, especially newly arrived immigrants, continue to be a highly mobile people, as evidenced by the growing numbers who have migrated from colder to warmer climates, from metropolitan to nonmetropolitan areas, and more recently, from second and third world countries, to the first world. Public concern over life-quality differences is therefore natural and perhaps inevitable.

For many Americans, the quality of life can be largely defined in terms of their economic welfare (i.e., the bundle of goods and services they command in the free market). Indeed, until the economic recession that began in December 2007, the rising levels of material well-being attained in the United States during the past century greatly reinforced the prevailing faith in democratic capitalism and "the power of economic affluence to elevate the good life in America." (Novak; Campbell, 2) For others who deplore the blatant materialism and rampant individualism of the age, the quality of life is better measured by postmaterialist values including the livability of a community, the humanity of government, the purity of the environment, personal and community health, and the amenities that promote personal growth and development.

Thus, there is a strong subjective component to the way in which many Americans assess the quality of their lives. Ironically, most studies attempting to relate objective life-quality conditions with subjective measures of life satisfaction have found either weak or nonexistent relationships. As John Milton observed in *Paradise Lost,* "The mind is its own place and in itself can make a heaven of hell, a hell of heaven." Clearly, objective well-being does not necessarily lead to

personal happiness. Nonetheless, studies suggest that richer people tend to be happier, healthier, and live longer.

Quality of life studies also suggest that the overall quality of life in states and communities can be linked to differences in racial composition, economic development, and culture. Using an overall index of life quality developed by Ben-Chieh Liu for 243 small, medium, and large U.S. metropolitan areas, Joel Lieske finds that three indicators explain 65 to 79 percent of the variation. These include percent black, percent high school educated, and an index of political moralism based on Daniel Elazar's cultural typology. These results and others suggest that the overall quality of life is higher in metropolitan areas where residents are less racially and ethically diverse. Second, the results suggest the priority of human development over purely economic development. Third, all things equal, the results indicate that moralistic (participant) cultures do the most to enhance the overall quality of life, individualistic (commercial) cultures do the next most, and traditionalistic (hierarchical) cultures do the least. Overall, the quality of life in U.S. metropolitan areas and the American states depends fundamentally on the quality of the people who inhabit them.

Quangos

Quangos are quasi-autonomous nongovernmental organizations. The term quango was created in the 1970s to describe public bodies that conduct public functions but are not directly controlled by central government. The purpose of quangos is to allow experts to directly control policy-implementation processes. However, there is no clear and single definition of a quango and it is not unusual that definitions are disputed for political reasons. Quangos range across a vast number of types of bodies and policy areas, from the delivery of health care to managing parks or ensuring the roadworthiness of cars.

Quangos exist in some form in most political systems but with different nomenclatures. For example, in the United Kingdom, they are referred to as nondepartmental public bodies; in the Netherlands, they are independent administrative bodies, in Germany, they are known as federal agencies; and in the United States, they are independent agencies and regulatory commissions.

To some degree, before the development of the modern state, quangolike bodies were often used for delivering public goods. All governments have had quasi-independent systems in some form or another from the East India Company—responsible for governing trade and the economy in India—to the Tennessee Valley Authority in the United States—set up as part of Roosevelt's New Deal program to encourage economic development in the region. However, it seems that quasi-autonomous bodies are growing in number and are seen by politicians as an effective way to either provide services or regulate the provision of services.

Quangos are attractive to government because they provide for flexibility in administration. Policy implementation can be devolved to experts or officials in regions who are able to make decisions on the basis of particular circumstances. Moreover, quangos allow experts to decide priorities and processes. The largest quangos in Britain, for example, tend to be health bodies that enable medical professionals and health service managers to make decisions about spending priorities according to their perceptions of the needs in their area. They also allow processes of delivery to operate outside of politically controlled local government. For example, in the 1980s, control over public housing in Britain shifted from local government to a quango, the Housing Corporation. Quangos also allow for governments to shift or avoid the blame for decisions. Politicians can use quangos either to distance themselves from difficult political decisions (i.e., ethical decisions around stem cell research) or to depoliticize certain issues (i.e., the regulation of utility prices such as gas and water).

The growth of quangos has also been linked to the notion of new public management. New public management, concerned with improving the efficiency and effectiveness of the public sector, leads to governments' perception of quangos as a mechanism for delegating decision making to managers and removing it from the hands of politicians and bureaucrats. quangos have also been seen as a way to reduce the size of central government by contracting out services to bodies that are not directly controlled by the central state. New public management also emphasized privatization where possible. However, governments throughout the world have been keen to regulate privatized sectors; as a consequence, privatization has concurrently risen in regulatory bodies. For instance, in the United Kingdom, privatized security has grown significantly. As private security developed, the government established the Security Industry Authority to regulate private companies.

Despite the universal growth of quangos throughout the world, they are frequently subject to criticism. There are two main criticisms of quangos. First, they are seen as being unaccountable. It is often the case that quangos are not open to normal mechanisms of legislative scrutiny. Indeed, in the United States, quangos have sometimes been used to avoid congressional oversight and budget limitations. Therefore, while central government departments have clear and direct lines of accountability to legislatures, in the case of quangos, these can often be obscure and vary from body to body. In addition, quangos spend vast amounts of public funds and often there is a lack of clarity on how, where, and why this money is spent.

The second main criticism of quangos is their frequent association with patronage. Quango chief executives and boards are appointed, and not elected; consequently, there is considerable criticism that politicians use quango positions as rewards for political supporters. However, in most systems, there are rules governing appointments and often posts are unpaid.

Regardless of the problems associated with quangos, they are important mechanisms for delivering public goods and are thus likely to continue long term in most political systems.

Quantitative Analysis

Quantitative analysis in political science entails assigning numbers to observed events in the political world, and then using the rules of mathematics, probability, and statistics to make statements about the world we live in. Quantitative analysis enables not just precise identification of the relationships between events, but also statements about the uncertainty surrounding these relationships. As apparent from the term *event*, this type of analysis relies on some level of abstraction, and is based on the notion that unique events are considered instances of more generic variables. For example, individual transactions can be lumped into *imports*, voters' opinions can be compared based on their responses to survey questions, and violent conflict between two groups in two different places and times can be treated as two instances of "war." With the rapid growth of computing power and development of large-scale data sets over the last sixty years, quantitative analysis has migrated from being the domain of a few scholars working in specific areas (e.g., voter behavior or public opinion) to its current position at the heart of empirical political science in all major subfields.

Quantitative analysis is distinct from formal modeling. Formal models are self-contained exercises designed to identify the consequences of a set of assumptions using the rules of mathematics and formal logic. Formal models and quantitative analysis frequently complement one another and coexist in specific scholarly works. Both use the language of mathematics but only quantitative analysis involves the creation and analysis of numerical data from the observable world.

Quantitative analysis is frequently contrasted with qualitative analysis. While the differences between them often appear obvious, on closer consideration, it becomes harder to distinguish the two. Analysts using both sets of tools often have similar goals. Works considered qualitative commonly report numerical data, while quantitative analysis is useless without substantive interpretation. Items such as words in speeches, while appearing qualitative, are amenable to analysis using advanced graphical and statistical tools. The logic of quantitative research can profitably apply in qualitative settings, while qualitative or historical knowledge can incorporate directly into quantitative analysis, especially in a Bayesian setting: The Bayesian paradigm combines prior beliefs with our newly analyzed data to provide a formal method for knowledge accumulation. Our priors are a function of historical and qualitative information.

MEASUREMENT AND DATA

LEVELS OF MEASUREMENT

Assigning numerical values to observed events can take different levels of precision. Conventionally, these levels are grouped into four categories representing the extent of numerical content implied in numerical measurements. The level of measurement affects the numerical manipulations applicable to statistical modeling choices.

Nominal data contain numeral representing pure names; the actual value assigned has no meaning. For example, a democratic country can be coded with the numeral 1 and a nondemocratic country with a 0, or vice versa. Or, democracies could be coded as 5498 and nondemocracies as -3.14. It makes no difference; what matters is that the numerical values denote difference of kind. For nominal measurement to be useful, the extent of the categorization must be exhaustive—all observations are assigned a value—and mutually exclusive—no observation gets more than one value. In describing a distribution of a nominal variable, only frequencies can be used. It makes no sense, for example, to discuss the "mean of democracy."

Ordinal data measurements convey a sense of magnitude using the ordered nature of numbers, that is, the binary relations of greater than (>) and less than (<). The actual distance between the numbers, however, has no meaning. For example, a survey question may ask respondents whether they agree with a particular statement "a lot," "somewhat," or "not at all." An analyst might code these responses as 2, 1, and 0 respectively. Equally valid, however, is -5, -5.2, and -223. For data measured on this scale, conclusions can be made only that one respondent agrees more than another, and not how much more. The difference between the numbers 2 and 1 is not meaningful. In describing ordinal data, modes, medians, and percentiles can be used but the mean and standard deviation are undefined. Similar to ordinal data, interval data holds meaningful differences between values are meaningful. Equal distances between measurements represent equal intervals. Time is a commonly used interval-level variable.

Ratio data are interval data that also have a meaningful 0 point. In this way, statements such as, "There were twice as many battle deaths in Iraq last year compared to this year," can be made. In other words, researchers can interpret ratios. In describing both ratio and interval data, the full suite of tools is available, including the arithmetic and geometric means, standard deviation, coefficient of variation, and so on.

RELIABILITY, VALIDITY, AND ERROR

All measurement occurs in the presence of error. The tools used for measurement vary in their reliability—the extent to which an instrument gives the same answer under the same conditions—and their validity—the degree to which an instrument returns the true value on average. A related problem is one of bias, since some measurements may be reliable but biased away from the true value. *Selection bias* affects the ability to observe a representative sample of possible outcomes. A canonical example is women's wages: only wages of the women who chose to work are observed, so the estimate of women's wages is therefore likely to be biased.

DATA STRUCTURES

Quantitative data are frequently described by their structure. The simplest is cross-sectional data. These data are simply a collection of observations at a single point in time. For example, survey data from a random sample records the answers of *N* people to *K* questions at the time of the survey. These data are simple in that they are independent samples from a population. More complicated data structures have increasingly complicated dependencies among observations. Longitudinal data measure one unit over time. For example, the U.S. unemployment rate is measured monthly. Clearly, one month's unemployment rate depends on the prior month's rate. Spatial data are data in which the units of study are distributed in space, either as regions or as point processes, for example, whether the level of democracy in one country is affected by the regime type of its neighbors. Dyadic data measure the links between two other units. For example, trade between pairs of countries is dyadic. It seems likely that the trade between the United States and Canada, the United States and Japan, and Canada and Japan might be correlated. Dyadic data, taken together, describes a *network*.

Quite common in some subfields of political science, panel data and time series cross-section (TSCS) both involve the repeated observation of a set of units over time. Panel studies typically observe a large number of units over a small number of intervals (e.g., a survey administered to the same set of respondents each year for three years). TSCS data describe data on a smaller set of units over a longer period, such as the rich Western democracies since World War II (1939–1945). These data structures require the analyst to address both

the longitudinal dependence within subjects and the spatial or network dependence within time periods. TSCS are one type of hierarchical data. Other examples include cities within counties within states or children within schools. Hierarchical models attempt to account for the dependence among observations (e.g., children within the same school).

GOALS OF QUANTITATIVE ANALYSIS

Quantitative data analysis has at least one of four major objectives: description, prediction, theory testing, and causal inference. While not mutually exclusive, the bread-and-butter of quantitative analysis, the regression model, can be deployed in the service of any of these goals.

DESCRIPTION

Description is probably the most common goal of any quantitative analysis. A variable observed repeatedly generates a sample. Description then begins by characterizing the distribution of the observations with easily understood summary statistics such as the range, mode, median, mean, and standard deviation (average deviation from the mean) as well as higher moments. Rarely, however, is an analyst only concerned with a single variable, but more typically cares about the relationship between variables. Correlation is the most basic description of a bivariate relationship. It describes the extent to which bigger values of one variable associate with bigger values of another.

Correlation is only a description of association, not a sufficient condition for a causal relationship. Strong correlations often form the basis of interesting puzzles, such as the strong negative correlation between pairs of democratic countries and the likelihood of war. Comparativists have long attempted to explain the strong positive correlation between the proportionality of the electoral system and the number of political parties in a country.

The most powerful tool in descriptive quantitative analysis lies in the ability to present large quantities of data in compact, intuitive, visual form. Simple scatterplots can present enormous amounts of information efficiently. By creative use of perspective, contour plots, and even color, visual displays can offer insight into the relationships between three and four variables far beyond what summary statistics can provide. Visualization can also describe the outputs from statistical and simulation analysis in understandable ways for audiences who may not have background in the complexities of the models themselves. While visual displays are increasingly common in political science, more rigorous and advanced visualization techniques are a major research frontier.

Because the political world is complex, understanding any relationship usually requires accounting for other factors, and regression is the tool of choice. A simple regression is a procedure for drawing a line through a cloud of points such that the average distance from the line is as small as possible. For example, to describe the relationship between a variable y and x_1 while accounting for the relationship between y and x_2, y could be a voter's level of approval for the American president, x_1 is the voter's age and x_2 is the voter's income. This is an example of what some call *multiple regression*. Such a model might take the form

$$y = a + b_1 x_1 + b_2 x_2 + e$$

In this example, y is referred to as the *dependent variable* or *response,* while x_1 and x_2 are called *independent variables* or *covariates.* The parameters a, b_1, and b_2 are estimates, and e represents random error. Here b_1 describes the relationship between age and approval for the president holding income constant. The values of a, b_1, and b_2 are chosen to make e as small as possible, on average. In general, in order to estimate this model, there must be at least as many observations as parameters to estimate. In this example, we need at least three observations. The difference between the number of observations and the number of parameters is called the *degrees of freedom.* A major strength of regression analysis—and statistical analysis more generally—is the ability to quantify the amount of uncertainty about an estimate of a particular relationship. Discussions of uncertainty ultimately derive from statistical assumptions often couched in terms of standard errors and statistical significance.

Originally developed with ratio-level data in mind, the regression framework extends in numerous ways to accommodate different types of data and for different scientific questions. The generalized linear model (GLM) is among the most widely used amplifications of linear regression. Different assumptions about the data–generating process distinguish one form of the GLM from another. Logit and probit models assume binary nominal responses. Ordered logit and probit assume ordinal response variables. More generally, polytonomous nominal data are often modeled as emerging from a multinomial process. The Poisson and negative binomial models treat the response as integer counts. Political scientists have applied these and other members of the GLM family in a wide range of empirical contexts.

Descriptive statistics and visual displays of data, so widespread in political science, make citation of any particular study unnecessary. Regression analysis is equally as common but analysts usually interpret regression analysis as representing something more than just description (e.g., as a test of a theory). Even if regression is deployed for more aggressive goals, it provides a geometric simplification of a set of relationships between variables.

PREDICTION

A common goal of quantitative analysis is predicting outcomes. Election prediction probably receives the most attention. Political scientists have also spent considerable effort developing predictive models in other areas, such as the onset of war or the collapse of states. Analysts usually derive their predictions from some form of regression model, though other types of quantitative models are used, including dynamical systems and local simulation.

Typically, prediction connotes forecasting (i.e., predicting unrealized future events). Other types of predictive exercises exist, however. In-sample prediction is a way to evaluate a model, helping determine the effectiveness of different models

at predicting the data the analyst used to fit the model. The frequently used R^2 statistic is a summary of in-sample prediction. Out of sample prediction evaluates how well a model for one set of data predicts another set of data not used to estimate the model. In the earlier example, out of sample prediction would involve using estimates of the b derived from one survey to predict someone else's level of presidential approval, given that new person's age and income.

Accurate prediction does not presuppose a true model of the world or even that there is any causal relationship between the predictor variables and the outcome. A correct casual model will give great predictions, but an analyst whose goal is only predictive is purely concerned with identifying the variables that improve the ability to predict accurately. In this way, exercises such as data mining are justified. With prediction, true or parsimonious models are neither necessary nor of paramount importance, while strong and exhaustive correlations do hold significance.

CAUSAL INFERENCE AND THEORY TESTING

Ultimately, science is concerned with identifying and quantifying causal relationships. Causal relationships rely on the notion of *counterfactuals*. For example, what would have been the economic growth rate in Ecuador had it not participated in an International Monetary Fund (IMF) structural adjustment program? It is impossible to simultaneously observe Ecuador's economic performance both with and without its experience with the IMF. This problem is known as the fundamental problem of causal inference. To estimate a causal relationship, analysts typically rely on repeated measures. By divorcing the level of the independent variable of interest, or *treatment*, from all other possible confounding variables, one can estimate a causal effect. Randomized treatment is the most effective way this is achieved in practice.

The identification of a causal effect is difficult in political science since researcher-controlled randomized experiments are often impossible. Analysts must therefore be cautious in asserting the existence of a causal relationship. Matching models are one set of quantitative tools recently developed to assist in this exercise. These models pair observations that are as similar as possible along all dimensions, save the variable of interest and then use the differences in outcomes to estimate causal effects. Sandy Gordon and Greg Huber, in their article "The Effect of Electoral Competitiveness on Incumbent Behavior," use matching to examine the effect of electoral competition on judges' sentencing behavior. In another article, titled "Do UN Interventions Cause Peace? Using Matching to Improve Causal Inference" Michael Gilligan and Ernest Sergenti use matching to examine the effectiveness of UN peacekeeping missions.

Theory testing, related to causal inference, frequently allows political scientists to describe a set of plausible causal relationships based on some assumptions and understanding of the political world. The analyst then asserts a series of hypotheses, typically relationships between variables, that the theory would lead analysts to observe. Quantitative analysis permits analysts to describe whether the relationships estimable from available data are consistent with their theoretical expectations.

Analysts do not directly observe or estimate a causal relationship. Rather they assert one and then confront it with data. Analysis consistent with the assertions leads to increased confidence that the theoretical story may describe an actual causal relationship. Thus, political science is largely populated with statements of causal relationships that, while not demonstrated through randomized experimentation, have yet to be convincingly disproven.

QUANTITATIVE ANALYSIS AND THE FUTURE OF POLITICAL SCIENCE

Quantitative analysis has transformed political science over the last eighty years, expanding the understanding of numerous facets of the world—from public opinion to the relationship between democracy and economic development. But this expansion of knowledge has generated at least as many questions as it answered. As data sets proliferate, researchers will need to pay closer attention to where their data are originating and the incentives for governments, survey respondents, and interest groups in acquiring and reporting truthful values. Vast new sources of political information are soon to be available for quantitative analysis—including Internet traffic patterns, satellite images, and high-precision spatial locations—opening up whole new research frontiers.

Quasi-experiment

Quasi-experimental design refers to situations in which an experimenter can assign treatment conditions but, for certain reasons, is not able to randomize subjects across conditions. Variants on this design include interrupted time series designs, which can either be simple or equivalent types, and non-equivalent control group designs.

Quasi-experiments represent one of a broader range of nonexperimental alternatives to experimental work. They strive to incorporate as much of standard experimental design as possible but, or practical or ethical reasons, fail to achieve full experimental control in one area or another. These kinds of alternatives include correlational work, pseudo-experiments, and quasi-experiments.

In correlational work, researchers observe how variables correlate to each other, as with smoking and lung cancer. However, because it is not ethical to force people to smoke to see if the behavior gives more of them cancer, there is no treatment manipulation; thus experimenters are not able to prove causality. This is because problems exist in determining causal direction, and because spurious associations remain possible. For years, tobacco companies asserted that some third, unknown case made certain people both more likely to smoke and more likely to contract lung cancer, but there was no direct relationship between smoking and cancer. Often, statisticians can correct problems in determining causal direction with a cross-lagged panel design. But it took systematic experimental research in a laboratory to show that exposure to substances in cigarettes caused cancer in lung tissue in a petri dish to prove causality.

Regression-discontinuity designs compare treatment groups between pretests and posttests but use a distinct method of subject assignment. Subjects are placed into groups based on their preintervention score; those above a particular threshold are placed in one group, whereas those below are placed in another. While selection threats to internal validity exist, this method offers the advantage of targeting those most affected by a particular outcome.

According to Elliot Aronson and colleagues in their book *Methods of Research in Social Psychology* (1989), pseudo-experimental design exerts some control over administering manipulations to subjects. However, in this design, there is no control group, so comparisons between conditions remain impossible. Such studies often occur with natural experiments, where a real-life occurrence only makes one measurement

possible. There are three kinds of pseudo-experiments. The first, a one-shot case study design, occurs when investigators can only administer a single posttest, after a given disaster like a fire, hurricane, or earthquake has taken place. The second pseudo-experiment design is known as the one-group pretest–posttest. In this variant, the same group is studied before and after a manipulation, but no comparison control group exists so many threats to internal validity remain. A final kind of pseudo-experiment is the static group comparison design. In this design, two different groups are tested at the same time on the same variable, but because the subjects were not randomized to condition prior to the observations, there is no way to know whether preexisting systematic differences between subjects caused any observable differences between the groups.

Quasi-experimental designs give experimenters more control than either correlational or pseudo-experimental designs, but not as much as a fully controlled experiment. In quasi-experiments, experimenters can assign treatment and control conditions to subjects and collect the dependent measures they desire, but they cannot randomize subjects to condition. The main difference between real and quasi-experiments thus lies in the lack of randomization to condition in the latter design. This often makes quasi-experiments more feasible for real-life studies in field environments where such randomization remains impractical, illegal, or unethical, but this does limit the strength of the causal claim that can be made concerning any findings.

There are two types of quasi-experimental studies. The first is the interrupted time series, which involves a within-subject comparison using the same independent variables on the same group of subjects over time. Dependent measures are taken both before and after the manipulated treatment. Sometimes, measures are simply made after different levels of manipulation have been applied to different groups, as when more of a particular drug may be given to one group than another.

A second type of quasi-experiment is called the non-equivalent control group design. This design takes the form of a between-subjects model to measure the impact of a given independent variable on different groups of subjects. Comparisons of these groups are made at the completion of the study, but these subjects have not been assigned at random to condition, so threats to internal validity remain.

Queer Theory

THEORETICAL FOUNDATIONS

Queer theory is a form of postmodern analysis that embraces four basic political claims: sexuality is central to politics; identity is performative; politics are ironic; and popular culture may be politically transformative. Queer theory emerged in the mid-1980s and early 1990s, when scholars from the humanities such as Judith Butler, D. A. Miller, Eve Sedgwick, and Michael Warner laid out the basic claims of queer theory. Subsequently, queer theory was further developed by political scientists such as Lisa Bower, Marla Brettschneider, Susan Burgess, Joe Rollins, and Shane Phalen. It is sometimes also associated with radical political responses to the HIV/AIDS crisis that emerged in the form of organizations such as ACT-UP and Queer Nation.

Queer theorists argue that political meaning and power are typically constituted through a series of oppositional categories, or binaries; these may include heterosexual-homosexual, reason-desire, white-black, man-woman. Since each term is constituted and defined by distinguishing itself from its oppositional pair, the terms are mutually dependent for their meaning. However, these binary terms are asymmetrical. That is, while the legitimacy of the second term in each binary is questioned or suspect, the first term gains default legitimacy, remaining largely unquestioned. In this manner, the binary produces various forms of material inequities such as unequal rights and liberties, privileging those associated with the first term and disadvantaging those associated with the second. Thus, heterosexuals are typically granted rights and liberties, such as the right to marry, that are not accorded to homosexuals.

THEORETICAL COMPONENTS

Queer theory distinguishes itself from other forms of postmodernism by contending that every binary—even those that seemingly have nothing to do with sexuality—will necessarily be inflected with sexuality, enacting what Eve Sedgwick has called "an epistemology of the closet." The lesser, even demonized status of the minor term in each binary leads many associated with it to closet themselves, and those who fear such association may out others in order to imply that themselves are identified with the major term. Thus, status insecure heterosexuals may seek to solidify their own heterosexual identity by gay bashing, by outing "real" homosexuals, or by calling attention to the illicit nature of same-sex marriage. Such moves serve to reveal that heterosexuality needs homosexuality to gain meaning and to maintain a position of superiority; the moves also reveal the material advantages that result.

Queer theorists also claim that identity is fluid and thus performative. Arguing that the meaning of each term in a binary is a product—rather than a precursor—of political contestation,

Gay pride demonstrators hold signs during a 1974 rally in New York City. Queer theorists argue that homosexuals coming out may fail to challenge the existing politics of sex and gender order, a viewpoint in opposition to that held by the LGBT movement in the 1970s and 1980s.

queer theorists claim that meaning is produced in specific communities at particular historical junctures. These communities tend to reproduce themselves and their conceptual systems. Over time, the meaning of their central binaries appear to be given or natural, rather than politically contingent, performances.

Queer theorists are typically quite skeptical about both the possibility and desirability of resolving the problem of sexual identity. In this sense, queer theory challenges the model of identity politics that had grounded lesbian, gay, bisexual, and transgender (LGBT) studies in the 1970s and 80s, which promoted coming-out as a significant mode of political transformation. In the identity politics model, coming-out is thought to dissolve shame and foster pride not only in individual gays and lesbians, but also in the gay and lesbian community. Coming-out promises to reveal an authentic self, hidden underneath the facade of contemporary heterosexuality.

POLITICAL IMPLICATIONS

In contrast to the identity politics model, which assumes a reconciliation of the problem of identity when the authentic homosexual identity is personally embraced and then publicly integrated into the reformed political order, a queer analysis of sexuality contends that there is no tidy resolution of the problem of sexual identity in this or any other political order. The instability of identity and the persistence of power make stable resolutions of this sort impossible. To come out as a homosexual, one relies on the dependence or entwined nature of these terms and identities, as the action assumes a compulsory heterosexuality from which the newly public homosexual seeks to emerge. Thus, queer theorists argue that coming-out may actually serve to stabilize the politics of the current sex and gender order, as newly out gays may trade one rigid identity for another (e.g., closeted homosexual for out homosexual), unwittingly propping up heterosexuality, which needs homosexuality to continue as a foil in order to maintain a dominant position in the political order. Rather than trying to stabilize identity and political contestation by identifying an authentic self upon which an earnest political struggle may be staked, queer theorists opt to create performances that reveal the irony of the search for the authentic self and the ideal political order. Accordingly, parody and drag are central political strategies of queer theory, as they reveal the irony of the search for the authentic self and tidy political resolutions.

Earnest political struggle to construct a better future, abstracted from a larger more ironic framework, is seen as hopelessly naive at best, and dangerously misguided at worst. While the desire to create a better political order may be irresistible at some level, queer theorists are typically quite sober about the possibility of successfully disrupting the sex and gender order in any sort of permanent way. Rather than either embracing or abandoning earnest political activism, they seek to recast such activity into an ironic parody that more accurately encompasses the contradictions that are inherent to political struggle. The queer parodist commits to working within rather than resolving such contradictions.

As a consequence, queer theory has been concerned with popular culture as a site that might readily accommodate queer performances that reveal the instability of identity, offering alternative narratives that ironically serve to both support and challenge the political status quo. These works offer fresh interpretations of pop culture performances, foregrounding previously overlooked queer narratives that both reflect and evade dominant power, highlighting the centrality, performativity, and irony of the politics of sexuality.

Questionnaire

A questionnaire, or survey instrument, is a structured set of questions administered to individuals to obtain information. Frequently used in survey, political behavior, and public opinion research, a questionnaire involves either the direct or indirect solicitation of information from individuals. Questionnaires are used to gauge a respondent's attitudes on a topic, obtain factual information on the individual, or ask respondents to self-report about behaviors or habits. Questionnaires are particularly useful in obtaining data on a population too large for measurement on practical grounds by drawing from a sample of individuals from within that population. While questionnaires differ based on the subject being researched, the purpose of a questionnaire is to ensure that each individual respondent completes a more or less standardized instrument, thereby ensuring both the reliability and the validity of the data obtained.

While a questionnaire can assume several forms, the method of data collection involves a carefully structured or scripted series of questions that may then be presented to individuals in a variety of ways. Some questionnaires are administered by an interviewer. These can be done face-to-face or by telephone via a traditional landline phone or a cellular phone. Questionnaires may also be self-administered. Self-administered questionnaires can be administered electronically (e.g., over the

Internet or by email) or in hard copy (e.g., by mail or placed in drop-off locations for potential respondents to find). Furthermore, a researcher may employ a mixed-mode design, which may incorporate multiple administration methods. The chosen methodology generally relies upon a variety of practical considerations, namely cost, time frame, the nature of the study, and the size and composition of the populations involved.

A questionnaire can either be scientific or nonscientific in nature, a designation frequently contingent upon how it is administered. Scientific questionnaires are generally considered nonexperimental in design, but may be incorporated into some experimental designs. Scientific questionnaires can be classified into one of three general categories: a cross-sectional design, wherein the survey is administered once to a sample; a panel study, which is a type of cross-sectional design in which the same respondents are administered a questionnaire at multiple points in time; or a time-series analysis, which involves a questionnaire administered at multiple points in time, but not necessarily to the same set of respondents. Nonscientific questionnaires do not generally follow any prescribed scientific guidelines—either in terms of composition or administration—and thus the measures cannot be considered accurate or valid and should not be used for scientific research purposes.

Building a questionnaire is a complex task. For a questionnaire to be reliable and to provide valid measures for quantitative analysis, a researcher must fulfill a multitude of methodological obligations simultaneously. Questions can be asked on any topic and in any number of ways, so it is not sufficient simply to write a series of questions and disseminate a questionnaire without first considering several factors. These factors include careful selection of the types of questions that will provide an adequate measure of the phenomenon being researched, the wording of questions, the order of the questions, the careful selection of the sample that will ultimately receive the questionnaire, and the interviewing techniques and survey methods best suited for the administration of the survey instrument.

Ignoring any one of these potential methodological pitfalls can result in invalid or unreliable data. For instance, invalid measures of the phenomenon or phenomena being analyzed may result from failing to control for question wording effects, which may influence a respondent's answer to a question. Invalid measures can also result from question-order effects, as earlier items may affect responses to questions later in the questionnaire. The result in either case is potentially false or misleading information. Furthermore, if the sampling frame chosen is not representative of the population being studied, the results will also be rendered invalid and, therefore, unusable.

Question Time

Question time is a section of parliamentary proceedings in which government ministers respond in the parliamentary chamber to questions posed by members of their own party and opposition parties. Members of parliament (MPs) are permitted to submit questions in advance of question time and may ask supplementary questions once they have received a ministerial reply, but all questions must relate to matters for which the answering minister is responsible. The proceedings allow MPs to request information from the government, ask for further inquiries to be made on specific subjects, and call government ministers to account for actions taken by specific departments or for government policy as a whole.

The practice of question time began in the Westminster system as established in the United Kingdom, and it is most commonly found in political systems based on the Westminster model. In the British parliament, for example, each government department has a place in a fortnightly question time rotation. The prime minister has a separate question time, which takes place every Wednesday at noon for thirty minutes. Often, MPs belonging to or supporting the government will use question time to pose questions that allow the answering minister to highlight the positive aspects of government policy or attack criticism from the opposition, while opposition MPs may ask questions designed to critique ministerial actions or government policy within the minister's portfolio.

Quotas

The term quota implies allocation, allotment, apportionment, share, or distribution in cases of school admission, jobs, or seats in legislative bodies. Quotas are attained through legal or constitutional devices on the basis of criteria other than merit and qualifications. Highly controversial, yet necessary in representative democracies, quotas give an appropriate weight to the historically exploited, marginalized, unrepresented, or underrepresented sections of society. In particular, quotas aim to empower women or subaltern groups and are based on the premise of promoting group rights versus individual rights or entitlements.

Approximately forty countries have introduced quotas for women in their legislatures. In India, 33 percent of seats are reserved for women in the *Lok Sabha* house of parliament. There is also a quota of 15 percent for the scheduled castes and 7.5 percent for the scheduled tribes. Two seats are reserved for Anglo-Indians in the Lok Sabha, in case they are not adequately represented. Quotas are therefore fixed on the basis of two cardinal principles of representation: (1) *equality of outcome* opposed to the traditional notion of *equality of opportunity,* and (2) the focus on *real equal opportunities* or de facto equality rather than the rhetoric of equality of opportunity in the presence of vast sociocultural, economic, or political barriers.

A significant challenge of the twenty-first century is rapidly expanding diversity, along with stubbornly persistent inequities in terms of status and power based upon caste, race, ethnicity, class, language, citizenship, or region. Affirmative action is promoted as serving the interest of the underprivileged or underrepresented sections of society, on the one hand, and providing legitimacy and justification to them in a democratic polity, on the other. Examples of affirmative action, positive discrimination, reverse discrimination, reservation, or quotas in any nondemocratic system are rare—whether in the past or present.

Reservations or quotas are methods for promoting affirmative action. Different from a reservation or quota, affirmative action remains open-ended and without any fixed number. However, all such devices aim to serve as a corrective to the past sociocultural, governmental, or individual bias against certain individuals, groups, women, or minorities based upon caste, class, creed, or ethnicity. Such disadvantaged groups have often been subjected to unfair, derogatory, or discriminatory treatment for no faults of their own.

PROS AND CONS OF QUOTAS

Some equate the concept of quotas to a social contract between the so-called winners and losers. Quotas may also be considered an outcome of the psychological mechanism toward reciprocal altruism among nonkin. Under this mechanism, people are encouraged to extend certain benefits and services to nonkin with the understanding that the benefactors reciprocate those benefits at some time in future—targeting those groups disadvantaged on the basis of sociocultural status, ethnicity, economics, education, geography, or gender.

The quota has always generated polarizing debate in democracies. Those who defend it argue that it is natural to find some ways and means to provide social justice and economic opportunities to all those who were deprived of the same. The nonbeneficiaries vehemently oppose it in the name of quality and meritocracy. Often referred to as *reverse discrimination,* opponents of the quota find it unfair and undemocratic.

The underlying goals of quotas include the following: compensation to the victims of past discrimination and maltreatment, redistribution of resources and opportunities from the privileged sections of society to those worse off, motivation of people from lower socioeconomic and disadvantaged classes to aspire for better positions in society, better appraisal of students in terms of potentiality and productivity, better access to social capital in terms of useful contacts and networks, and fostering a more legitimate and vital democratic order.

Quotas are a complex issue and need careful treatment, in part because they are a zero-sum game—improvement in the well-being of one group comes only at the cost of another group. Fortunately or unfortunately, the losers never take a backseat but instead actively protest at the earliest opportunity. Paradoxically, quotas can harm the interests of those very people they intend to protect by branding them as inferior or incompetent or both. Quotas may even lead to further polarization or stigmatization, despite the best intentions to the contrary.

The proponents of quotas for women contend that they are the most effective way to provide a better gender balance, circumventing conservative party leadership, offering role models for other women, engaging political parties in finding suitable women candidates, and removing some of the structural barriers that prevent women from being elected. Quotas, proponents argue, put women on the fast track and aim to empower them from above without having a massive following, capacity, or support at the base. However, incremental change in the increase of the number of women from one election to another is seen as a better mechanism of adaptation and assimilation. Since the causes behind adopting quotas as a political policy vary from country to country, their consequences are also likely to vary.

Much depends on how the very concept of representation is interpreted. It may mean representing the total society or it may mean serving the interests of one's electorate. There should be resemblance between the representative body and the citizens at large. According to Melancton Smith, as cited by Herbert Storing in *What the Anti-Federalists Were for: The Political Thought of the Opponents of the Constitution,* "A full and equal representation is that which possesses the same interests, feelings, opinions, and views the people themselves would have were they all assembled." This view legitimates the debate about quotas and reverse discrimination in education, employment, and legislatures. The day when quotas will be no longer necessary may be far away, for as long as inequities prevail, quotas will also remain in some form or other.

Race and Gender

Princeton scholar Cornel West and an American public that in 2008 elected its first African American president know that *race matters.* Although the debate remains regarding the use of the terms *race* and *ethnicity* as constructs to describe differences between and among individuals, it cannot be denied that the outward manifestation of such differences has had an impact on the political and economic treatment of individuals in American society and in other societies in general.

The same holds for gender. Indeed, with the growing consciousness regarding the more than 50 percent of the population participating in the economic and political life of various societies, women need to be treated equitably. Thus, *gender also matters.*

Most Americans believe that in the United States race is no longer a factor because people generally receive what they deserve based on their talents and efforts. However, some consider this a "sincere fiction" because minorities still lag behind in every relevant social indicator, are poorer, earn less, and possess significantly less wealth than whites.

DISCRIMINATION

The focus on race and gender stems from the historical fact that women and minorities have tended to be treated differently and inequitably by the majority white male population in the United States. When the difference in treatment results in unfairness purely from the belief that the minority is inferior due to skin color, then discrimination takes place. When the difference in treatment results in unfairness purely from the belief that the minority is inferior due to gender, then discrimination takes place. Discrimination may be overt (explicit, outwardly expressed) or covert (hidden, implicit). Regardless, society has labeled these actions and feelings as *racism* and *sexism,* respectively.

Racist and sexist actions have impacts on individuals' lives. Skin color stratification or colorism (discrimination based on skin color or tone that implies that discrimination can take place within as well as among racial groups) as well as gender discrimination have tended to determine a person's educational attainment, occupational status, and income.

HISTORICAL DEVELOPMENT

Movements to overcome racism and sexism have run parallel to each other nationally and internationally. When it comes to the treatment of minorities in the United States, we are reminded often of the legacy of colonialism, the racial oppression during the time of slavery, the legalized discrimination under the Jim Crow era, and the de facto segregation of the civil rights era. The focus of attention on minorities impacted by such discrimination has had a tendency to change—from Native Americans to African Americans to Asian Americans, and now to Arab Americans. But the discrimination against any minority remains nonetheless, regardless of who was the focus of attention.

Women's movements ran along the same lines as the anti-slavery and civil rights movements. They began in Seneca Falls with the Declaration of Sentiments in 1848, when women wanted to gain equal rights in education and work. Women wanted to obtain political equality with the right to vote as well. However, they subsumed that goal in order to help with the abolitionist movement. It would not be until the 1920 ratification of the Nineteenth Amendment to the U.S. Constitution that American women would earn the right to vote. Even then the exercise of that right would not guarantee equal treatment for women. The feminist movement or the women's liberation movement of the 1960s and 1970s would come at the tail end of the civil rights movement and would try to awaken women to the various areas in their lives where inequity still prevailed—in education, in wages, and in politics. Policies such as affirmative action would not only keep minorities but also women in mind in their implementation goals for equality.

Not until the 1980 elections would the voter turnout gap go in favor of women exercising that right to vote in larger numbers than men. Not until the 1992 elections would women gain numbers in the U.S. House and Senate as well as in offices in the state and local levels. And it would not be until that time that women would obtain greater acceptance and admission into law schools and medical schools. And now, this second decade of the twenty-first century, women still earn only seventy-seven cents to every dollar earned by men.

Despite advancements in better treatment for women and minorities, a backlash would occur starting in the 1980s and continue into the twenty-first century. There are fears that minorities would become the majority in states such as California, Florida, and Texas. And there are fears that women are taking over academic institutions with their increasing numbers in colleges, law schools, and medical schools. Some states and universities have even changed their policies to bar or discourage Asian Americans and women from their programs because there are "too many of them."

IMPLICATIONS

Race and gender are two outward characteristics of an individual that have been the focus of attention of many studies. Knowledge about the racial and gender composition of a society has many implications for determining trends in ideological leaning, political party affiliation, and voting behavior. In the United States the majority white population has a greater tendency to be conservative and to be affiliated with the Republican Party—and, until recently, a greater tendency to vote. Minorities have a greater tendency to be liberal and to be affiliated with the Democratic Party (except for Asian Americans), and have a lower tendency to vote. These trends reinforce the notion that there are intraracial and interracial differences when it comes to making such generalizations. Women, like minorities, have a greater tendency to be liberal and associated with the Democratic Party—and, quite recently, have turned out to vote in larger numbers than men.

When it comes to gender, the general tendency is to lump all women together and treat them as a single entity. It has been shown in the later part of the twentieth century that women of color need to be treated separately and differently if they are to progress. Minority women get the brunt of the burden of race and gender, a "double whammy."

Throughout the world, women and minorities face obstacles for their participation in politics. These barriers exist in prevailing social and economic systems, as well as in existing political structures. In 2007 the rate of female representation at the national level stood at merely 18 percent globally. Although this figure has increased over the years, at the end of the old century and early in the new one, minimal progress has been made, meaning that parity between men and women in national legislatures still remains a distant ideal. Because general women's participation is currently studied most often, it is easier to find data on this aspect than on minority participation and minority women participation.

Race and Racism

Race and *racism* are terms with considerable political importance, yet they are more difficult to define than may appear at first blush. Over the past few centuries, the meaning—and manifestation—of both terms has undergone a gradual transformation. Race, initially seen as group-based differences rooted in biology, is now seen by most scholars as a social construction. Some even suggest that it will be impossible to sustain the concept of race much longer. Racism has undergone a similar change, transitioning from overt acts of race-based discrimination to more subtle forms of racial exclusion. For example, political scientists have expanded the definition of racism to include institutionally-based forms of discrimination in which the policies and practices of institutions, rather than the actions of specific individuals, function to maintain—or even exacerbate—racial inequalities. This has led to an era of what some refer to as color-blind racism or racism without racists. In essence, scholars from this tradition argue that racism can now operate on autopilot (i.e., without the active or willful intervention of individuals).

RACE

The meaning of *race* has a storied and politically charged history. At the most basic level, race has traditionally been defined as group-based differences that are rooted in biology, often manifested by skin color (e.g., blacks, whites). This definition of race is to be contrasted with ethnicity, a term used to distinguish between people who come from different cultural backgrounds. That is, race is used to group people together who share a set of physical characteristics, while ethnicity is used to group people together who share a set of cultural practices such as language, religion, and history, to name a few. Oftentimes, however, race and ethnicity co-occur, thereby contributing to the confusion over the distinction made between the two. Nevertheless, because the traditional definition of race focuses on physical characteristics, most historical treatments of the term argue that race is an essential category whose meaning is inherent and unchangeable.

Though some political scientists and philosophers argue that race has manifested itself in one shape or another since the beginning of Western thought, most scholars now agree that the traditional conception of race became a dominant political force among western Europeans during the Enlightenment (i.e., in the eighteenth century). Prior to this, religion was seen as the most salient and politically meaningful social cleavage.

By the Enlightenment, however, an essentialist view of race had gained prominence. Specifically, theorists began proposing that there were distinct biological differences between people of different races. In practice, this ideology was used to separate people of western European ancestry from people of nonwestern European—especially African—ancestry.

The biological view of race was championed by many of the prominent social contract theorists of the Enlightenment. This list included, perhaps most notably, Immanuel Kant. In an essay written in 1775 titled *Of the Different Human Races,* Kant argued that race was an immutable characteristic that played an important role in determining intelligence. The view of race as a biologically determined entity quickly became the dominant mode of thought during this period and was used to justify the emerging slave trade. It also eventually provided the underlying ideology behind the notorious *one-drop rule* in the United States (i.e., that anyone with even a trace of African ancestry was considered to be a *Negro*). Similar essentialist views of race were used to justify discrimination against Irish immigrants during the mid-nineteenth century, as well as Italian and eastern European immigrants at the turn of the twentieth century. Moreover, the biological view of race became an important component of social Darwinism, as many late nineteenth and early twentieth century scholars argued for a laissez-faire approach to social welfare based on the assumed unchangeable causes of inequality (e.g., the supposedly inherent racial differences in ability). In essence, social Darwinists argued that because differences in inequality were based on race (i.e., biology), government or other interventions would be futile.

The view of race as an essential (i.e., biologically-based) distinction has maintained its prominence in popular parlance. In fact, the *Oxford English Dictionary* defines race as "each of the major divisions of humankind, having *distinct physical* characteristics" (emphasis added). Other modern-day examples of the essentialist view of race include Richard Herrnstein and Charles Murray's controversial book, *The Bell Curve* (1994). In this book, the authors claim that racial differences in intelligence may be partly due to biology. Though the authors' claims were met with harsh criticism, the concept of race itself continues to be seen by many as an essential—and therefore immutable—social category.

Political science and other academic fields have steadily moved away from an essentialist view of race. Specifically, scholars within the social constructionist tradition argue that race is best conceptualized as the product of social forces rather than inherent biological differences. That is, racial distinctions are believed to be based on an arbitrary set of physical characteristics that, under different social and historical conditions, would manifest themselves in a different set of physical characteristics. In the United States during the 1800s, Irish and Italian immigrants were thought of as being racially distinct from western Europeans. Over time, however, Irish and Italian immigrants began to be incorporated into popular conceptions of whiteness. This suggests that racial boundaries are more fluid than implied by the essentialist view of race.

More direct attacks against the essentialist view of race have come from an unlikely source: namely, the biological sciences. Specifically, recent advances in genetic testing have allowed geneticists to study the human genome in detail. Contrary to what the essentialist view of race would predict, there do not appear to be specific genetic markers that are *unique* to one race. That is, scientists have yet to find a "racial gene" that exists in one race, but not another. As such, it is difficult to sustain the argument that race is determined by biology. This adds considerable weight to the social constructionists' view that the concept of race has no objective biological foundation. Rather, social and historical forces appear to shape the meaning and interpretation of race.

Social constructionists argue that race is created through various racial projects in which the signifiers of race (e.g., skin color) are shaped by the given historical context. Specifically, various sets of physical characteristics are identified and used to differentiate between the "racial" groups in different societies. Over time, these signifiers become entrenched in the ideology of the ruling class and emerge as common sense. That is, race eventually becomes a concept that is taken for granted and seen as intuitive by each society. In essence, social constructionists argue that the physical characteristics used to signify race are not intrinsically linked to the social meaning that becomes attached to them.

There are also alternative views regarding the importance of race within the social constructionist tradition. In particular, some Marxist scholars suggest that, while race is a social construction, it is merely an ideological tool used to further the interests of the ruling class. Specifically, they argue that race has been used to prevent the working class from forming a unified opposition to capitalism. That is, by invoking racial distinctions, members of the ruling class have been able to "divide and conquer" the working class. Theorists within this tradition point to, among other things, the failed efforts of the Communist Party (USA) during the 1920s to unify the working class across race lines. These theorists argue that the privileges conferred upon whiteness provided working-class whites with an incentive to maintain divisions between themselves and working-class African Americans. Despite past failures to unify the working class, many Marxist scholars maintain that racial inequalities will disappear once society reaches a resolution to the question of class differences.

Another alternative to the essentialist view of race posits that *race,* as a term, has lost meaning. That is, given the confluence of factors that often co-occur with race (e.g., ethnicity, social class, religion), some suggest that it would be best to abandon the term and focus on more meaningful social distinctions. Proponents of this view often point to social class and ethnicity as possible alternatives. Others argue that, to move beyond the political baggage associated with race, society must abandon all references to it. Adherents to this perspective claim that society will be able to transition to a postracial society in which racial boundaries disappear only after it abandons the idea of race. This view, however, has been critiqued by some as utopian. That is, critics of this view suggest that society must

first recognize race in order to overcome the historical legacy that has befallen those who are placed in the category of the *racial other*. The intensity of the debate over the importance of race as a social category suggests that race will continue to be a salient and politically meaningful concept well into the twenty-first century.

RACISM

As was the case for race, the definition of *racism* is contested by scholars. While most agree that it has three common elements that can be thought of as necessary conditions, there is disagreement over what beyond these elements is sufficient to qualify as racism. One necessary element is categorically negative feelings toward members of a particular race—feelings of antagonism or prejudice on the basis of race, or the fear of racially different peoples (i.e., xenophobia). A second necessary element is, as a popular online dictionary puts it, the belief "that members of one race are intrinsically superior to members of other races." A third necessary element focuses on the unequal treatment of individuals because of their race, including the practice of racial discrimination, segregation, abusive behavior, or persecution.

Others suggest, however, that to demonstrate racism, one must go beyond prejudice and discrimination. Stokely Carmichael and Charles Hamilton's oft-cited distinction between *individual racism* (individual whites acting against individual blacks) and *institutional racism* (acts by the total white community against the black community) leads them to a purpose-driven definition of *racism*: "the predication of decisions and policies on considerations of race for the purpose of *subordinating* a racial group and maintaining control over that group" (1967). In Phyllis Katz and Dalmas Taylor's (1988) more modest terms, racism represents the cumulative effects of individuals, institutions, and cultures that result in the oppression of ethnic minorities. Andrew Hacker (1992) similarly focuses on effects rather than intent when describing institutional racism in terms of the consequences of biased white institutions that discriminate—sometimes subtly and sometimes blatantly—based on the belief that the *racialized other* is inherently inferior.

This dispersion of definitions of *racism* has led some to believe that the term is overused and perhaps therefore no longer useful. Others argue for limiting its use to the most extreme cases and allowing broader terms like prejudice, discrimination, and xenophobia to cover the more standard occurrences of intergroup conflict. Accordingly, the historian George Frederickson (2002) limits his definition of racism to a particularly extreme set of cases. According to him, racism is much less common than simple prejudice or xenophobia, which are nearly ubiquitous in human societies. To qualify as racism, three additional elements are required. First, racism is based on the belief that the stigmatized group possesses innate and unchangeable characteristics. Second, the goal of racism is to establish a permanent group-based hierarchy. Finally, racism entails an ideology that justifies practices that are used to maintain the racial order.

In Frederickson's view, the earliest anticipation of modern racism was the treatment of Jewish converts to Christianity in late medieval Spain. Enmity toward the newly converted targeted their unchangeable Jewish bloodlines rather than their changeable religious beliefs. Similarly, nineteenth African American slaves were thought to have been victims of "the curse of Ham," which forever poisoned their blood and doomed them to inferiority, even if they converted to Christianity. To German Nazis, Jews also had poisoned blood, which they believed threatened the Aryan race with sexual pollution and impurity.

Important disciplinary differences exist in the definition of racism. Historians and sociologists tend to prefer that racism be defined as having characteristics that extend beyond simple xenophobia. Social psychologists, however, tend to use the term interchangeably with *prejudice*. For example, John Dovidio and Samuel Gaertner's oft-cited collection of the major different versions of racism identified by social psychologists cites nine versions of racism in its index, eight of which refer to individual prejudice in the sense used above (1986).

SOCIAL PSYCHOLOGY OF RACISM

The usual sociopsychological approach to racism begins with the cognitive act of categorizing individuals into groups. At the most basic level, the sociologist William Graham Sumner (1906) suggested that people naturally perceive groups as *ingroups* to which the perceiver belongs and *outgroups* composed of individuals categorized differently than the perceiver.

This distinction is alluring but perhaps too simplistic. Any individual belongs to multiple ingroups, whether based on family, nation, race, religion, neighborhood, or a host of other dimensions. Likewise, there are many groups to which any individual does not belong. As social identity theory suggests, research demonstrates that perceptions of ingroups and outgroups are heavily influenced by momentary social contexts. In the context of a war, one's own national identity is salient, as is the national identity of the enemy; this is generally not the case in the context of a trip to the supermarket. Second, there is no simple relationship between evaluations of ingroups and outgroups. Sometimes ingroups are evaluated positively, and the corresponding outgroup, negatively. But sometimes people of all groups, members and nonmembers alike, evaluate a low status group negatively and a high status group positively. And third, all definitions of racism assume that it centers on *race,* which historically has focused on skin color. But race often is confounded with other dimensions of difference between people, such as social class, occupation, ethnicity, religion, and nationality. In Shakespeare's *The Merchant of Venice,* Shylock was not only a Jew but a loan shark. Race is rarely a clean concept.

Racism requires more than categorization and negative affect toward groups that are perceived as different. It requires a belief system or ideology. The *scientific racialism* that emerged during the nineteenth century is a premier example of such a belief system. This belief postulated a finite number of biologically distinctive races in human societies, of which the

European races, especially northern Europeans, were blessed with the most superior attributes. In the United States, scientific racialism had at least three significant practical consequences. First, it provided an ideological foundation for the postslavery Jim Crow system that emerged after the Civil War (1861–1865). Second, it led to the eugenics movement that urged limiting the reproduction of "inferior" races. Third, it was used in the United States during the 1920s to justify preferential quotas that favored immigration from nations with supposedly superior racial stocks.

CHANGING FORMS OF RACISM

The latter half of the twentieth century led to major changes in human societies' treatment of race, triggered by the extreme anti-Semitism of Nazi Germany. In the United States, old-fashioned or Jim Crow racism was common among whites before World War II (1939–1945). Its core beliefs concerned blacks' alleged inherent intellectual inferiority and was used to support formal racial discrimination and segregation. After World War II, support for such views diminished sharply and, by the end of the century, was almost gone. Support declined earliest among the college-educated and younger whites, findings usually interpreted as reflecting their greater enlightenment. Support eroded more slowly among whites living in the South, presumably because of its long cultural history of formally subordinating African Americans.

Numerous scholars have argued that other forms of racism have since taken the place of Jim Crow racism. Several of these new forms of racism are specific to the political domain: symbolic racism, modern racism, and racial resentment. In Europe, a parallel distinction has been made between blatant prejudice and subtle prejudice. Other forms of racism have been applied to interpersonal relationships, such as aversive racism or ambivalent racism. All these newer forms of racism share the view that whites accept the general principles of racial equality, but continue to harbor negative feelings toward blacks. Both the old and new forms of racism have generally been measured with surveys or other questionnaires, using items such as how much discrimination against blacks the individual believes continues to exist, how strong blacks' work ethics are, and so on. Some controversy exists about how distinctive the *new racism* is from the old racism, however, with some scholars claiming they share common elements (e.g., the stereotype that blacks have a weak work ethic).

The new racism has been described as having a wide variety of effects. In politics, it contributes to opposition to black candidates and to support for white candidates who are thought to be racially biased. It also contributes to opposition to racially targeted liberal policies, such as government-enforced school integration or affirmative action. It also contributes to a wide variety of other conservative attitudes on dimensions that have no manifest link to race, such as party identification or political ideology, or policy preferences concerning welfare, crime, or tax policies. In the interpersonal realm, it contributes to avoidance of minorities when avoidance can be attributed to nonracial factors.

Four contemporary alternatives to the idea of the new racisms should be noted. One is an implicit form of prejudice that is largely automatic, unconscious, and uncontrollable. This has been measured with a variety of indirect techniques that do not involve questionnaires, and so is arguably less prone to social desirability biases. Implicit prejudice may emerge in more unguarded forms of behavior, such as eye contact or nonverbal behavior, whereas the new racisms may be most influential in deliberate behaviors, such as choice of a presidential candidate.

A second alternative challenges the specificity of the new racisms to a single stigmatized racial group such as African Americans. Instead, they may emerge from generalized ethnocentrism involving both antagonism toward a variety of lower-status minority groups and excessive valuation of one's own high-status racial ingroup.

A third alternative challenges the notion of the new racisms on the grounds that they really reflect political conservatism rather than racial antagonism. This point of view has been generally discredited by evidence that the new racisms and their effects, though correlated with ideological conservatism, are only explained by it to a modest degree. There also is evidence that ideological divisions in the United States have themselves increasingly reflected racial attitudes, rather than vice versa.

A final challenge comes from those who believe that the new racisms are a product of dominant racial groups' sense of threat from subordinate groups and their efforts to protect the existing racial hierarchy. Social dominance theory, sense of group position theory, and color-blind racism theory all posit fixed racial hierarchies of power, status, and resources; dominant groups' efforts to protect their privileged positions; and the construction of ideologies that legitimate the hierarchy and deflect attention from its essentially racial nature. For example, the Protestant work ethic asserts that beneficial outcomes should, and do, come primarily to those who work hard and persevere. Because stigmatized racial groups often are alleged to have weak work ethics, their lesser accomplishments are blamed often on their own lack of effort rather than on their race. These theories are also often skeptical of the lower levels of racism expressed by the better educated, as their more tolerant views may merely reflect their superior knowledge of conventional social norms against blatantly racist expressions. Regardless of one's position in this debate, most scholars confer that racism will continue to have a substantial influence on politics in the years to come.

Racial Discrimination

Racism is a set of beliefs or behavior regarding the inferiority a particular group of people based on their race, color, ethnicity, or ancestry. Prejudice refers to unfavorable feelings and attitudes toward a particular group based on race, color, or ethnicity. Racial discrimination may or may not stem from prejudiced attitudes because unprejudiced individuals may engage in discriminatory behavior for other motives, such as social pressure, conformity, or economic profit.

From a legal standpoint, there are two types of discrimination: *de jure* (as a matter of law) and *de facto* (as a matter of conduct or practice, not founded on law). De jure discrimination is directly intended and approved by law. Examples of de jure discrimination include the so-called Jim Crow laws that mandated the strict separation of the races in the South, and the *Plessey v. Ferguson* judicial decision that authorized "separate but equal" treatment for blacks and whites. In contrast, de facto discrimination lacks governmental sanction; instead, it originates from the habits, customs, or traditions of a society. De facto racism is caused by social, psychological, or economic conditions. Segregated residential patterns, segregated school districts, and education and wage gaps are illustrations of de facto discrimination. Although these forms of racial discrimination come from vastly different sources, the systematic economic, political, and social disadvantages they generate are similar in nature and severity.

Racial discrimination can be categorized into distinct subtypes: individual discrimination, institutional discrimination, side-effect discrimination, and environmental racism. Individual discrimination occurs when purposeful action on the part of one or a few individuals harms or restricts a member of a subordinate group in some way within a relatively isolated context. Institutional discrimination, on the other hand, occurs when an apparently neutral requirement or standard excludes a great portion of a particular racial group because they cannot comply with the rule or meet the standard. Institutional discrimination is so deeply ingrained in the customs, laws, and cultures of an institution or a sector of society that it generally goes unnoticed. Institutional discrimination is often unintentional. Organizations staffed by unprejudiced individuals can produce racially disparate outcomes if staff members comply with biased operating procedures. Therefore, once racist policies are institutionalized, simple conformity to the organizational standards places certain racial groups at a perpetual disadvantage, regardless of the prejudiced attitudes of individual actors. For example, university admission standards that favor students with high college placement scores disproportionately exclude black applicants who are more likely to attend poorer quality secondary schools.

Side effect discrimination, another form of institutional discrimination, occurs when intentional discrimination in one social system results in unintentional discrimination in another, related system. For example, the common practice of real estate agents *steering* black and Hispanic clients to racially segregated neighborhoods eventually leads to segregation in schools and the workplace. Finally, environmental racism refers to the fact that people of color disproportionately bear the effects of human-induced environmental degradation primarily due to governmental and corporate decisions to dump urban and environmental waste in areas where they reside. Environmental racism is exacerbated by the fact that people of color are least likely and least equipped to resist these efforts. In addition, housing discrimination and economic inequality leave people of color with fewer housing options, which forces them to settle in areas located near toxic waste sites.

Also, race-based differential enforcement of environmental protection rules and regulations are another important component of environmental racism.

Racist processes are very difficult to uncover and document. Therefore, observers are left to infer the presence of racial discrimination when racial disparities are evident. For example, blacks and Hispanics are far more likely to live in poverty than whites. According to the U. S. Census Bureau, the 2007 U.S. poverty rates for blacks (24.9 percent) and Hispanics (21.8 percent) are nearly three times the poverty rate of whites (8.3 percent). Unemployment rates average 4.0 percent for whites, 5.2 percent for Hispanic Americans, and 9.0 percent for blacks (U.S. Department of Labor, Bureau of Statistics, 2007). In addition, there are significant earnings differentials among the races. In 2003, whites earned an average of $46,911 annually, compared to $31,671 for blacks and $35,495 for Hispanics (U.S. Census Bureau, 2005). Although the large gap in life expectancy between blacks and whites has narrowed in recent years, there is still a five-and-a-half-year difference in expected life span between the two groups. In 2001, the overall mortality rate for blacks was 31 percent higher than for whites. Further, blacks are more likely to die of strokes, heart disease, cancer, and HIV than their white peers (National Center for Health Statistics, 2004). Because it is unlikely that these economic and health differences are caused by individual factors, they are generally attributed to direct or indirect racial discrimination.

Radical Feminism

See *Feminism, Radical.*

Radicalism

Radicalism refers to extreme political, social, and cultural ideologies that emphasize fundamental changes in the existing order. Historically, political radical movements have attempted to dramatically remake their contemporary societies seeking widespread reforms impacting the powers and functions of the state. Early American radicalism culminated in the American Revolutionary War (1775–1783), which led to the creation of a new government. Shortly thereafter revolutionary movements began manifesting in Europe, most popularized by the French Revolution (1789–1799). With the French Revolution, the radical ideologies and leaders ushered in liberalism by emphasizing individual rights and liberties and the end of absolute monarchies.

This form of radicalism eventually spurred democratic, abolitionist, and, later, suffragette movements in Europe and the United States. New radical movements in the mid- to late nineteenth century critiqued the economic and social inequities of the period and laid the basis for modern socialism and communism. With the end of the cold war in 1991, new ideologies emerged challenging the growing instances of globalism, in which multilateral state alliances and international cooperation expanded as countries sought to work globally rather than in isolation. Additionally, radicalism can manifest as an inward or outward social focus. For instance, from the Middle Ages to the creation of 1970s communes, some radical groups have sought to achieve their societal reform by withdrawing from the mainstream in order to implement the changes they desire within smaller communities.

Raison d'État

Raison d'état is a French phrase, loosely translated as "reason for being," often used to describe a state's national interests or goals. Historically, the main raison d'état of any state was protecting one's survival, which theorists and political leaders asserted was best ensured by expanding the power of the state through military territorial conquests or acquisition of greater economic resources. According to some theorists, from the fifteenth to seventeenth centuries, state survival and security took precedence over political or foreign policy considerations. Writing in the early 1500s, Italian political scientist Niccolò Machiavelli argued that a nation's national interests superseded any moral or ethical constraints on use of aggressive action. Consequently, if state survival was at stake, a government might disregard any international norms or customs to safeguard its nation.

These ideas were exemplified in the seventeenth century when put into practice by the French politician and diplomat Cardinal de Richelieu, whose foreign policy emphasized political realism and power politics. Although a Catholic cardinal, Richelieu developed policies centralizing state powers over the church or dynastic considerations, as well as entered France into practical alliances with Protestant states in effort to preserve France during Europe's continental Thirty Years War (1618–1648). Since the rise of Palestinian terrorism in the 1970s, Israel often has come under international scrutiny by the United Nations, Arab states, and international human rights organizations for its domestic and transnational antiterrorism methods and segregation of the Palestinian population. Given Israel's military superiority to Palestinian terrorists, Israel's military raids into Gaza and the West Bank or international

targeted killings often draw international criticism if Palestinian civilians become collateral damage or international laws are breached. However, Israeli leaders continue to justify their behavior under raison d'etat, as their military use protects their national interests from a demonstrated record of Palestinian-sponsored terrorist activities in Israel.

Rand, Ayn

Ayn Rand (1905–1982) was a Russian-born American novelist and philosopher who founded the philosophic system of objectivism. She defended metaphysical realism (that reality is what it is independent of what human beings think or feel) as the only valid means of human knowledge, ethical egoism (or rational self-interest) as the only proper morality, and

Ayn Rand promoted the philosphy of objectivism and strongly opposed communism and fascism.

SOURCE: AP Images

laissez-faire capitalism as the only moral social system. Her works of fiction, including *The Fountainhead* (1943) and *Atlas Shrugged* (1957), and her works of nonfiction, including *The Virtue of Selfishness* (1964) and *Capitalism: The Unknown Ideal* (1966), inspired a generation of readers who embraced her romantic, heroic conception of human achievement and her political individualism.

Though her political thought was broadly libertarian insofar as it entailed a defense of voluntary social relations and the individual rights to life, liberty, private property, and the pursuit of happiness, Rand was notably critical of libertarian intellectuals who, she argued, disconnected their political commitment to freedom from the wider philosophical and cultural context that it required. As an advocate of limited government—albeit one that, under ideal conditions, would finance its operations through voluntary contributions—Rand also was opposed to social theorists such as the libertarian Murray Rothbard, who had embraced a version of anarchist ideology.

Rand challenged the conventional left-right political spectrum. She had emigrated from the Soviet Union to the United States in 1926 and became a fierce critic of communism. Her first novel, *We the Living* (1936), was semiautobiographical; it detailed the horrors of communist rule. But Rand was equally opposed to fascism and to all variations of statism, including the redistributive welfare state advocated by modern-day liberals. She was firmly committed to laissez-faire capitalism and free markets and opposed all government intervention in the economy. Influenced by the Austrian economics of Ludwig von Mises, Rand argued that government intervention was the root cause of business cycles, monopolies, and social crises. The emergence of a mixed economy, in Rand's view, guaranteed the rule of pressure groups, with each group vying for some special privilege at the expense of others. However, she felt government had no right to dispense privileges to any individual or groups of individuals. For Rand, government's only proper role was in the retaliatory use of force to protect individual rights through such agencies as the police, the armed forces, and the legal courts.

Though Rand's support for capitalism seemed to place her on the right wing of the political spectrum, she was adamantly opposed to modern-day conservatism. An advocate of reason, she was an atheist who criticized attempts to link the defense of capitalism to religion. Moreover, a limited government, Rand maintained, should have no power to regulate peoples' personal life choices. In stipulating that no individual or institution had a right to initiate force against others, Rand defended the right of the individual to engage in all adult consensual activities.

Championing free minds and free markets, Rand saw an inextricable connection between intellectual, political, and economic freedom.

Rational Choice Theory

Politics is a particularly difficult science. The classic definitions of politics—the study of who gets what, when and where (Harold Lasswell), the authoritative allocation of values (David Easton), and the legitimate monopoly of violence (Max Weber)—raise more questions than they answer. What is being allocated? Possible answers include money and resources; policies and payoffs; rewards and punishments; material interests, social identities; global ideals; and class, status, and power. How are these things allocated? They may be distributed through institutions and regimes; mechanisms and rules; norms and values; markets, communities, contracts, and hierarchies; force and fraud; and fights, games, and debates. And what is at stake? Equity and efficiency; poverty and development; war and peace; and, more generally, the relation between individual choices and reasons of state are among the outcomes of politics.

Rational choice theory (RCT) first entered political science in the 1950s and early 1960s to address such questions. Anthony Downs's theory of elections (1957), William Riker's theory of political coalitions (1982), and Thomas Schelling's work on deterrence (1960) began modeling the institutions and processes of collective action and collective choice. RCT soon became one of the core research programs in the four fields of political science—American politics, international relations, comparative politics, and political theory. For many hard-working political scientists, it is a philosophy of social science, social theory, and research methodology—a way of thinking and working in the midst of inquiry.

RCT is so successful because it positions itself between the denigration and the glorification of reason. Partly an attempt to contain the empirical and normative relativism of the irrational, RCT seeks the reasons and causes of social phenomena. Yet RCT finds rationality highly imperfect. RCT thus works out the empirical limits of applied reason and problem solving in the concrete institutional life of politics. Moreover, like the poetry of mathematics and the art of abstract reason, RCT exerts a certain aesthetic allure. And, like the attractions of liberalism, many find RCT ethically appealing. In short, RCT's truth, beauty, and justice charm political scientists.

THEMES OF RATIONAL CHOICE THEORY

In the dark days of the twentieth century, when science, modernity, and reason resulted in a European civil war that turned into a world war that produced the Holocaust and Hiroshima, three economists and a mathematician returned to the problems of pure reason that drove Enlightenment thinkers. They developed ideas about multiperson decision-making that became the basis of RCT.

Given the first and second fundamental theorems of welfare economics, everyone recognized that there were first best problems of choosing among (Pareto) optimal points and second best problems of having the chance to choose (i.e., reaching the Pareto frontier). How do collectivities choose? *Politics* seems somehow required to supplement *economics.* Economist Kenneth Arrow addressed these basic questions of welfare economics (1963). He unearthed the problems confronting any possible social welfare function applied to resource allocation.

Others recognized the indeterminacies of strategic reasoning in collective choice situations. For example, suppose two or three people agreed on how to divide a fixed resource, and their agreement was executed. Which coalitions would form and how would the resource be divided? Mathematician John von Neumann and economist Oskar Morgenstern (1953) raised general questions in decision theory and game theory. Like Arrow, they unearthed the problems and offered possible solutions.

Still others saw that economics was developing along two separate tracks: econometrics was becoming a statistical science at the same time that theoretical economics was becoming mathematical modeling. What was the connection between the normative and the empirical? Economist Paul Samuelson (1947) showed how comparative statics provided the linkage: if a utility function is maximized and an equilibrium found, exogenous changes could shift the equilibrium. For example, if consumers optimized a utility function, equating marginal benefits and marginal costs, exogenous shifts in price influenced the quantities consumed. Comparative statics thus linked normative optima to observable quantities, allowing mathematical models in economics to fit the positivist cannons of testability and falsifiability. Now that it had an operational mode of proceeding, RCT could become a science.

These disparate concerns became a unified field of inquiry. Pulling together the strands, RCT has grown into the most developed paradigm in political science, influencing all traditional areas of political inquiry. Journals contain numerous articles applying insights from RCT to empirical questions about policy outcomes, political participation, governing institutions, and constitutional choice, as well as to normative questions of equity and efficiency, democracy and justice.

What are RCT's unifying themes? RCT assumes that citizens are rational (i.e., choose their most preferred course of action) and that they interact within an institutional environment (e.g., competitive elections). RCT then uses mathematically formalized models of reasoning to derive implications about collective choices (e.g., public policy). RCT's most basic question is, therefore, how individual preferences are aggregated into equilibrium social outcomes by a decision-making process. Given a choice mechanism, whether consumers and firms allocating resources by market exchange, players choosing

strategies in a game, or citizens voting over a policy issue, what will be the characteristics of the collective outcome? Will an equilibrium exist? If an equilibrium exists, will it be stable? Will it be desirable? Answering these questions is complicated by the fact that voters do not necessarily vote sincerely and people who want public goods do not necessarily demand them openly. People, in other words, often find it in their own best interest to dissemble and strategically reveal their preferences. When studying how decision-making procedures—whether democratic or nondemocratic, political or economic—aggregate individual preferences into social outcomes, RCT cannot assume honest preference revelation.

RCT offers two methodological approaches to studying such problems: game theory and axiomatic theory.

1. **Game Theory.** How are differences in preferences among actors reconciled into equilibrium outcomes? One wants to determine the social outcome that actually results from a set of individual preferences when the preferences are advanced strategically. RCT seeks to discover, for example, how the coordination and distribution of resources emerge given private goods (the neoclassical market) or public goods (economist Mancur Olson's topic). The basic approach in game theory is to determine how one particular collective choice process (e.g., voting or voluntarily participating in some political act), when modeled as a game in some environment (e.g., private goods, public goods), produces an outcome. Game theory thus studies cooperative and conflictual interactions among players, including threats and promises, offers and counteroffers, as well as the use of trickery: ploys and bluffs, commitments and surprises. Because institutions help locate equilibria, changes in institutions produce changes in outcomes.

2. **Axiomatic Theory.** This approach raises normative questions about how differences in preferences among actors should be reconciled by the rules of collective choice. The puzzle is to discover the best choice for society, or equivalently, to locate a collective choice mechanism that maximizes the group's social welfare function. For example, RCT seeks to determine whether one can order social choices for society transitively or to operate on any set of individual preferences and meet certain additional democratic standards. Axiomatic social choice theory thus examines the compatibility of certain ethically appealing standards for choice (i.e., equity and efficiency, liberalism, and Pareto optimality) for all possible collective choice processes. RCT then locates possibilities and impossibilities, which are, of course, affected by institutions and altered when institutions change.

Political scientists typically use game theory and axiomatic theory to understand three types of social choice problems: Collective action, collective choice, and collective institutions.

3. **Collective Action.** Using arguments from microeconomic theory about public goods and game theory about the Prisoner's Dilemma, Mancur Olson (1971) and others showed that, under certain conditions, the equilibrium outcome of voluntary contributions to the general welfare will be Pareto deficient: although everyone would be better off if all contributed, rational people almost never will voluntarily contribute, and hence groups to promote the general welfare almost never will form. People, of course, do display voluntarism and groups do form. The elaboration of the collective action problem therefore involves locating institutional (e.g., political entrepreneurs) and motivational (e.g., altruism) factors that overcome Olson's problem.

4. **Collective Choice.** A second application of social choice theory in political science is the study of how voting procedures produce policy outcomes. Majority voting procedures over three or more alternatives can lack an equilibrium outcome. Majorities may prefer A to B, B to C, and yet C to A, producing a cycle among the three outcomes. The voters' paradox leads to two political consequences. The first is that whoever controls the agenda can determine the outcome and lead the majority decision to any alternative. The second is that voters can affect the outcome by reporting false preferences. The political battle is thus between monopoly agenda setters and strategic voters.

5. **Collective Institutions.** People also choose the formal and informal laws by which they live. Constitutions are written that then dictate voting and taxation regulations. Rules of procedure in legislatures are written that then determine committee systems and the power, for example, of the U.S. Speaker of the House. Moreover, norms guiding contributions to public goods are ultimately established. How can we explain why one set of rules is adopted and another rejected?

The theorems (results) of these inquiries have been puzzles and paradoxes. Three theorems are especially important. Arrow's theorem demonstrates an incompatibility among several ethically appealing desiderata for preference aggregation. Gibbard-Satterwaite's theorem demonstrates that a large class of methods of preference aggregation are subject to strategic preference revelation. And McKelvey's theorem demonstrates that the results of majority rule voting can be wholly cyclic over all possible outcomes. It has been proven formally, in other words, that the same set of individual preferences can be aggregated differently by different collective choice rules, and differently even by the same rule.

Social choice theory, therefore, has revealed a fundamental indeterminacy in how social interactions produce social outcomes. As a result of these discoveries, political scientists have concluded that social outcomes are generally anything but stable and intended equilibrium outcomes of individual choices. The social consequences of individual choices are often unwanted by all. At one point, a general nihilism about taking individual preferences into account in making social decisions took hold; preference revelation and aggregation involve so many potential manipulations and incompatibilities that incoherence and disequilibrium in social outcomes are to be expected. Since then, political scientists have come to recognize that humans acting in society rely on institutions to structure preferences and produce equilibrium outcomes. RCT thus investigates how differences or changes in institutions yield differences or changes in outcomes. However, as indicated above, institutions

themselves are products of social choice, which raises key questions about the origins of institutions.

RATIONAL CHOICE THEORY METHODOLOGY

Although RCT subsumes many interrelated ideas and techniques, it always combines assumptions about individually rational actors with mathematically formalized modes of reasoning to reach conclusions about collective outcomes. RCT thus has a certain way of proceeding, a typical set of practices.

A classic example is the public goods problem. The conditions of individual choice involve self-interest coupled with nonexcludable and nonrival goods. A voluntary exchange institution exists. Mechanisms investigated involve free riding or not wanting to be a sucker. The outcome is noncontribution or reduced contribution. Hence, inefficiency, a suboptimal supply of the public good, and inequity, or exploitation of contributors by noncontributors, results. Unintended and unwanted outputs lead entrepreneurs to propose new institutional arrangements to fix the problem. For example, taxation schemes can facilitate the provision of public goods.

In general, the ideal or quintessential RCT is developed, beginning with a characteristic *problem situation,* as follows:

1. RCT is concerned with complex macrolevel phenomena. Outcomes, collective preferences (such as government policies), or collective actions (such as group actions) animate inquiry.

2. Collective preferences and collective actions are especially worth studying when they are inefficient. Outcome performance varies in space and time, but what catches the eye is wasted resources: poverty and underdevelopment, violence and war, force and fraud, anarchy and lawlessness, theft and plunder, and rent seeking and corruption. Suboptimal outcomes are the distortions and dysfunctions, flaws and failures, of collective choice. RCT addresses such breakdowns of reason.

3. RCT also addresses issues of justice, fairness, and democracy; for example, the sometimes-inequitable distributions of income and government services.

A RCT *explanation* is then constructed as follows.

4. Assume individuals' desires plus beliefs lead to actions. This is Karl Popper's logic of the situation.

5. Assume methodological individualism: macro structure = f(micro interactions). The world is populated by actors, agents, or players with interdependent strategies, beliefs, and resources whose interactions produce outcomes. The question is one of n-person preference summation and choice aggregation. Visible actions produce invisible equilibria embodying complex regularities, both stable and unstable.

6. Assume that interactions among individuals involve decentralized mechanisms and processes yielding spontaneous order and self-organizing complexity. Inefficient or inequitable outcomes thus result from the generic social dilemmas and universal political traps of coordination, cooperation, competition, and conflict. Bare-bones baseline models of the mechanisms

are developed. Rousseau's model of the state of nature, Coase's model of voluntary exchange, Waltz's model of anarchy, Rawls's veil of ignorance, Walras's model of pure exchange, and Arrow's axioms of social choice begin with highly abstract reasoning.

7. Assume that institutions aggregate choices: preferences plus institutions lead to outcomes. Additional models, therefore, must be developed that thicken rationality and thereby explain real-world institutions and outcomes. RCT thus studies markets, communities, contracts, and hierarchies; groups, organizations, teams, coalitions, and networks; norms, rules, regulations, standards of behavior, and (property) rights; and contracts, agreements, bargains, transactions, settlements, and pacts. It studies market institutions such as credit cooperatives, credit bureaus, firms, merchant guilds, and law merchants. RCT also studies nonmarket institutions, such as governments, regimes, and states; democracy, liberalism, and constitutionalism; courts, legislatures, and executives; representation, elections, and voting rules; autocracies, dictatorships, and bureaucracies; and organizations in the international system. In other words, RCT operates at the center of political science.

8. Assume that the institutions themselves are macroequilibrium outcomes of an underlying game of strategy. Because different institutions correspond with different endogenous equilibria, actors try to shape the institutions. Stable or self-enforcing institutions therefore must be endogenous to desires, beliefs, and actions.

9. Given these assumptions—equilibrium rules and institutions that set in motion decentralized mechanisms of choice—the result is outcomes that exhibit fatal problems of aggregation. Intentional action often produces results that are unintended and unwanted, unpredicted and unexpected, and unstable and incoherent. The many paradoxes and antinomies, tragedies and ironies, of choice are the main results of RCT: market failures, bargaining failures, and intertemporal resource allocation failures; and principal-agent problems, commitment problems, and asymmetric information problems. RCT also uncovers the problems of chaos: butterfly effects, the power of initial conditions, and the significance of complexity; the problems of equilibria: multiple equilibria and disequilibria; the problems of path dependence: rigidity, deadlock, and stalemate; and the problems of feedback: complementarities, adaptability, and integration.

Evidence and testing is conducted as follows:

10. RCT compares institutions. The grand problem of the social sciences, from the RCT point of view, is how humanly constructed institutions matter. RCT thus compares the costs and benefits of organizing cooperation (e.g., minimizing post-contract opportunism, restraining self-interest) under different structural arrangements.

11. RCT employs comparative statics exercises to examine causality. It explains observed behavior, the emergence of cooperative, and noncooperative equilibria by finding the conditions of nature and of the underlying rules of the game that make institutions produce particular outcomes.

Finally, new *problem situations* are generated.

12.   The rules of the game are neither constant nor unalterable. Institutions, after all, are the results of choice. Some are created to solve coordination and cooperation problems: efficiency-enhancing institutions are designed to implement collective optimization and mechanisms designed to achieve incentive compatibility. Optimal voting rules, social welfare functions, compensation criteria, and constitutional contracts are in this tradition. For example, RCT might discover that purely instrumental reason, strategic rationality, and unconstrained rational egoism cannot successfully coordinate social and political relations. Taking the perspective of the benevolent planner or political engineer aiming to repair the world, RCT asks the evaluative question: What is to be done? How can actors achieve mutual advantage, joint gains, the public good, successful coordination, and productive exchange? Yet institutions are created also to enhance inequities. The power to construct institutions is the power to forge opportunities and constraints for the players. The possibility of using RCT to enhance the power of some rather than others always exists.

13.   As problems are modeled in a sustained way, RCT learns about political life. It discovers, in particular, the limits of institutional revolution and reform. Uncovering the transition costs of moving along equilibrium paths and the problems of jumping between punctuated equilibria, RCT espouses pragmatism. One recalls Weber: the balance of the ethics of conviction and the ethics of responsibility. One also recalls Hillel: ours is not to complete the task, but we are not to desist from it either.

RCT thus realizes that it is the human-made institutions that embody the most interesting and important paradoxes and puzzles. Institutions fashioned by men and women create problems of myopia, risk aversion, self-interest, materialism, dishonesty, preference falsification, fraud, cheating, promise breaking, credible commitments, uncertainty, lack of information, and transaction/decision costs. For the most part, RCT in political science thus studies how particular institutions produce market failures and political failures: public goods problems, prisoner's dilemma problems, bargaining problems, incentive incompatibilities, and organizational failures. RCT now realizes that institutions often are created to reduce the transaction costs of cooperation, contracts, exchange, and bargains. As the field turns from the operation of institutions to their origins, stabilization, and transformation, the dynamics of real-world institutions move center stage.

Rawls, John

John Rawls (1921–2002) was a major American political philosopher of the twentieth century. His widely read book, *A Theory of Justice,* released in 1971, revived an age-old question: what makes a democratic society just? At a time when empirical research and language analysis dominated Anglo-American political philosophy, Rawls' approach to political inquiry was unabashedly normative or value centered.

Rawls was born on February 21, 1921, in Baltimore, Maryland. He attended Princeton University, where he studied under Norman Malcolm, a former student of influential Austrian philosopher Ludwig Wittgenstein. In 1943 Rawls completed his undergraduate degree in philosophy and enlisted in the U.S. army.

Rawls returned to Princeton in early 1946 on the GI Bill and completed his PhD in philosophy four years later. After serving as a philosophy instructor at Princeton for a year, he received a Fulbright fellowship in 1952 to study at Oxford University. This gave him an opportunity to attend H. L. A. Hart's lectures on legal philosophy and also to participate in a seminar led by Russian-British philosopher Isaiah Berlin and British philosopher Stuart Hampshire. It was then that Rawls' interests turned to the question of how normative principles, such as justice and equality, might be better realized through a carefully designed democratic process of deliberation. In the following years, he published several essays addressing this question, including "Justice as Fairness" in 1958, "Constitutional Liberty" in 1963, and "Distributive Justice: Some Addenda" in 1968. Rawls joined the philosophy department at Harvard in 1962 and remained there until his retirement in 1991.

While at Harvard, Rawls publically denounced the Vietnam War (1959–1975) but complained that if Americans must fight, exempting college students from the draft gave an unfair advantage to wealthy families. It was during this time that he completed the manuscript for *A Theory of Justice.* In the book, Rawls presented in detail his idea of *justice as fairness.* Drawing on the social contract tradition of English philosopher John Locke and Swiss-French philosopher Jean-Jacques Rousseau, Rawls proposed a hypothetical *original position,* a Rawlsian state of nature, wherein citizens might freely enter into an agreement among themselves. However, to prevent them from favoring their own interests, they were to know nothing about how the choices they made would affect *their* particular case. This *veil of ignorance* would enable all citizens to share one another's fate.

Rawls continued to revise and expound on what his critics called a liberal utopia of pure procedural justice. Rawls was not deterred. In *Political Liberalism* (1996) he explored the relationship between religion and democratic pluralism, showing how citizens who held irreconcilable moral outlooks might still achieve an "overlapping consensus" on political principles. In *The Law of Peoples* (1999), he extended his argument to international relations, insisting that popular government is *educative* in that, by learning more about what others think and want, people also learn more about themselves.

For his scholarly contributions, Rawls was honored with an endowed position of Conant University Professor at Harvard and received a National Humanities Mental of Excellence. After suffering a series of strokes, Rawls died on November 24, 2002, at his home in Lexington, Massachusetts.

Realignment, Partisan

A partisan realignment is a shift in the ideological, or partisan, preferences of voters that leads to a transfer of power in government from the majority party to the minority party for a sustained period. These realignments can occur within a single election or take several elections to manifest and often revolve around new issues or political events. The U.S. elections of 1800, 1828, 1860, 1896, and 1932 are often characterized as realigning elections, with recent debates centering on whether the elections of 1964, 1980, and 1994 fit a similar pattern. The 1896 and 1932 realignments in the Northeast were the first to be studied and reported in a seminal article written by political scientist V. O. Key in 1955 in which he identified their characteristics.

A widening of ideological cleavages, which the majority party fails to address while in power, precedes realignment. For example, the rise of the conservative coalition in U.S. politics helped bring the Republican Party into power with Reagan in 1980, and again into the House and Senate in 1994. The same shift in voter preferences wrested power away from the Republicans and placed the New Deal Democrats in the majority at the end of the Great Depression. These transfers of power occur because of building tension in the political system and the inadequacy of the majority party to deliver policies that voters desire.

Following the stock market crash in 1929, the Republicans in Congress and particularly President Herbert Hoover believed that the national economy would soon recover on its own and attributed its demise to the worldwide depression. With no relief by 1932, presidential candidate Franklin D. Roosevelt championed change with his campaign for New Deal policies that would help rescue the public from economic disaster. His policies realigned voters who wanted economic growth and led to a landslide election for Roosevelt and the Democrats in what became known as the Fifth Party or New Deal Party System.

Realignments often have occurred according to a thirty-six-year cycle, leading some to believe that a realignment happened in 1964. Others disagree that such a cycle exists in U.S. electoral politics and contend that the 1964 election shifted party positions only along the issue of race and civil rights and did not lead to a critical realignment. Those who believe that partisan realignments occur in a cyclical pattern argue that there is a weakening of partisan identification before the realigning election. After the realignment, new partisan identifications solidify and are based on new differences on issues. The weakening of partisan identification often is attributed to younger voters who are not as affiliated with the party in power.

Often, before a partisan realignment, a third party emerges that raises concerns about significant issues that the two previous parties did not address. The Populist Party emerged in

1892 to represent the interests of farmers, and in 1924 the Progressive Party introduced issues such as economic progressivism, welfare, and worker's rights. The dominant parties during both eras subsequently consumed the newly created parties' positions. Newly emerging parties can often become large enough to constitute major parties while other parties dissolve.

Partisan identification strengthens before partisan realignment. This leads to polarization of the two parties. These realigning elections are often known to have emotional and symbolic overtones that bring a larger than average number of voters to the polls. The increased turnout brings the minority party to power due to its distance from the other party and its position on issues. To stay in power, the new majority must institute policies or reforms that the previous government failed to achieve.

Realism and Neorealism

Broadly defined, realism is one of the major and most longstanding theoretical traditions in the study of international and foreign affairs. Realists view the world as a naturally conflictual arena in which rational and selfish states compete for the pursuit of their mutually incompatible interests. Power, especially in its military form, is for realists the main ingredient of international politics. On the one hand each state needs power to advance its interests and protect itself in an anarchical and hostile environment—an environment in which war is the rule rather than the exception. On the other hand, power is the key to international order and cooperation: the former can only be structured along the lines of a balance of power or a hegemonic system (or a mixture of the two), while the latter materializes out of fear or imposition rather than trust or altruism.

With their focus on power, conflict, and violence, realists assign a very limited role to those who do not control the means of physical force, like sub-, trans-, or supranational actors. For one thing, the sovereign state is seen as a unitary actor, whose vital interests are unaltered by the groups in power, its leadership, or its domestic institutions. As for international nongovernmental and governmental organizations, they lack the means to impose their preferences and decisions when they are inconsistent with the interests of the states involved. Similarly, the realist worldview relegates factors such as ethics, law, culture, and ideology to a secondary position, from which they can influence politics only to the extent that they do not contrast with the states' attainment of power and security.

The above common tenets of realism coexist with a number of theoretical and methodological differences originating several branches and subdivisions within this broad tradition. The most important of these divisions is between classical realism and neorealism.

CLASSICAL REALISM

Classical realism emerged in the 1930s and developed primarily in the following two decades. It is one of the oldest paradigms in the study of world affairs. In its initial phases, realism represented a reaction to the utopian liberalism that had dominated the discipline of international relations since its birth, right after World War I (1914–1918). Early realists such as Reinhold Niebuhr, Edward Carr, and Hans Morgenthau attacked utopianism on two fronts. First, they criticized the utopianist prescriptive approach to international politics, proposing description and explanation instead. The world, realists argued, should be portrayed as it is rather than as it ought to be.

Second, supported by the crisis of some of the main political products of liberalism, like the open international economic system and the League of Nations, classical realists rejected the interpretation of the world as a harmonious environment in which law, commerce, and social learning would guarantee peace and prosperity. In its place, they propounded a pessimistic analysis of sociopolitical behavior that built on the work of past thinkers, such as Hobbes and Thucydides, to describe the international system as a state of nature writ large—the so-called domestic analogy—in which states, like Hobbesian natural men, are engaged in an endless struggle for power and domination. Far from being an aberration, war is, in this view, just the most obvious expression of the inherent friction in the system. Similarly, peace and security are not the products of integration and institutions but the result of a careful balancing of power (through rearmament or alliances) and policies of national independence.

On neither the methodological nor the theoretical front, however, did classical realism reach radical positions. For one thing, while condemning the naïve normativism of the utopianists, realists never advocated the opposite extreme of a detached scientism. Rather, theirs was a pragmatic approach, which acknowledged the existence of some eternal laws of politics but admitted that human behavior can sometimes deviate from these laws and that policy needs to be corrected when this happens. Their writings, therefore, can be seen as both explanations of the political reality and guides for good statecraft. This dualism is particularly clear in the work of policy-oriented realists such as George Kennan, Walter Lippmann, and Henry Kissinger. In the second place, the interpretation of international politics in terms of power did not imply a total rejection of alternative principles like law, ethics, and ideology. In the classical realist scheme, these factors can and often do operate at the margins of power politics, sometimes mitigating it, sometimes exacerbating it—although never replacing it.

NEOREALISM

Unlike classical realism, neorealism (or structural realism) owes most of its development and success to the work of a single scholar: Kenneth Waltz. In *Man, the State, and War* (1959) and *Theory of International Politics* (1979), Waltz laid the philosophical and theoretical foundations of what would become one of the dominant international relations paradigms in the last decade of the cold war, and remains a popular research program in the early twenty-first century.

Waltz's neorealism departs from classical realism both ontologically and epistemologically. In the first place, while Waltz shares the classical realist understanding of international politics as a sphere of egotism and conflict, he rejects the anthropological pessimism on which this understanding rests. Borrowing from Rousseau and his "stag hunt" episode, Waltz offers an alternative reading of the state of nature in which man is neither good nor bad (or, put differently, can be both) but just rational and in which conflict results from the mutual mistrust that the lack of a central coercive authority generates among rational beings. While sovereignty solves the problem domestically, it reproduces it at the international level. In an anarchic system, Waltz argues, states are concerned primarily with their survival and physical security. However, each step toward the maximization of one state's security (most notably rearmament) produces more insecurity for other states. This permanent clash of interests makes, first, interstate cooperation in the military or in other fields highly unlikely unless this constitutes the lesser evil in security terms (defensive alliances are a case in point). Second, it easily entraps states in a "security dilemma"—whereby the improvement of one state's security ends up creating more tension in the system—that can sometimes spiral out of control to the point of attacking, not to be attacked first.

Although re-elaborated as a means rather than an end in itself, power remains central in the neorealist framework: in its systemic configuration, polarity, power is one of the two crucial structural variables (the other being anarchy) for the explanation of international politics. On the other side of the equation, the balance of power is for Waltz one of the main recurrent outcomes of the international system.

Epistemologically, neorealists usually reject the ambiguities of classical realism in favor of a stricter form of positivism characterized by a complete detachment between the analyst and the object of study (which can neither influence nor be influenced by the analyst), by a quasi-mechanical view of sociopolitical behavior in which the maximization of security is taken as an exogenously given objective and ideational factors have hardly any space and, finally, by a predilection for deductive and universally applicable theories. Nowhere are all these features more manifest than in the more recent rational choice applications of the neorealist paradigm.

Recall

To remove an elected official from office, an electorate gathers signatures to petition for a referendum. The recall is traceable to Rome in 133 BCE, when Tribune Octabius was removed from office by a vote of the people because he vetoed a Senate bill, and to the Pennsylvania state Constitution of 1776, which in article VI declared the people possessed "a right, at such periods they may think proper, to reduce their public officers to a private station, and supply vacancies by certain and regular elections," but its current form dates to nineteenth-century Switzerland and to Los Angeles in 1903. Eighteen state constitutions and numerous local government charters in the United States authorize voters to employ a recall. Members of the U.S. Congress cannot be recalled.

Elected judges in seven U.S. states cannot be recalled, and the Montana statutory provision stipulates that a government official is not subject to the recall for performing a mandatory duty. A Minnesota statute authorizes county voters to employ the recall only if the charges against an officer are malfeasance or misfeasance. An officer, upon assuming office in the states of California and Washington, becomes subject to recall, but the recall cannot be employed against an officer during the first two months to one year of service. A 1995 British Columbia law authorizes Canadian voters to place on the ballot by petition the question of removing a member of the Legislative Assembly from office between elections. The Korean Assembly in 2005 authorized the recall to remove local government officials. President Hugo Chávez of Venezuela survived a recall election in 2004.

The first step in the process is the filing and publishing or posting of a notice of intent to circulate a petition. Every petition must contain a declaration by the circulator that each signature is a genuine, and petitions must be filed within a stated

number of days after the certifying officer notifies proponents that the wording of the petition is correct. Often the petitioners must gather certified signatures totaling 25 percent of the votes cast for all candidates in the previous general election for a governor or a local official. Kansas requires 40 percent, but California requires only 12 percent for officers other than members of boards of equalization, that address assessments of specialized types of real properties, reviews county assessment levels, and assesses taxes on insurers judges, and state legislators.

Eight states allow an official five days to resign after signatures are certified. A short list of reasons for the recall is included on the ballot, and an official typically can include a short rebuttal. Voters may choose simply to remove the government official or hold an election to replace the official. The most famous recall election resulted in the removal of Governor Gray Davis of California and the election of Arnold Schwarzenegger as his replacement in 2003.

Arguments in favor of the recall include strengthening popular control, overcoming failures of the electoral system, reducing voter alienation, improving voter education, and encouraging removal of constitutional restrictions to, for example, lengthen terms of office. Opponents maintain that the recall restrains innovative officers, discourages potential candidates, increases costs, encourages abuse by special interest groups or the opposition party, and destroys judicial independence. They also note there are alternative removal methods and that voters' accusations often do not warrant removal of an official from office.

Reciprocity

Reciprocity is a principle in international relations whereby one actor, or group of actors, grants equal benefits or concessions to another in exchange for the same considerations. Reciprocity is often associated with trade treaties and agreements and the earliest reciprocity accords dealt with the exchange of goods. Most reciprocity treaties deal with the elimination of tariffs or other restrictions on imports. For instance, two states may agree to reduce or eliminate quotas on a specific trade good. These arrangements also may provide for the elimination of trade restrictions on one product or group of goods in exchange for some type of concession in another area. Reciprocity agreements are narrow in that they only extend concessions to the signatory countries and do not involve general or open reductions in trade barriers that benefit all states.

Through the nineteenth century, the United Kingdom and the United States used reciprocity treaties as part of a broad strategy to increase free trade and open new markets in a controlled fashion. The expansion of reciprocity treaties led to the creation of the first customs unions, and later trade blocs, in which trade barriers are eliminated between all member states. Reciprocity also may include the reciprocal exchange of benefits for officials or citizens, including granting alien citizens travel or work rights within a host country. In international relations theory, specifically regime theory, reciprocity is an important component to explain cooperation. Through the work of Robert Axelrod or Stephen Krasner, cooperation can be explored through structural factors such as the "shadow of the future"—the recognition that reciprocal behavior in the present, in one area, can led to future cooperation.

Redistricting

Redistricting is the process by which election district boundaries are redrawn periodically in conformity with constitutional or statutory mandates. Primarily, redistricting is undertaken to equalize district populations and thereby equalize individual voting power. However, in many cases, the redistricting process is constrained as well by constitutional or statutory requirements to ensure the preservation of representational opportunities for particular political, ethnic, or geographic groups. Insofar as the process entails the reallocation of political power, it is highly contentious.

Redistricting should not be confused with either reapportionment or gerrymandering. Reapportionment refers to the process by which political representation (in terms of the number of legislative seats to which a particular state, province, or region is entitled) is reallocated in accordance with a particular formula. Thus, in the United States, the number of seats in the House of Representatives to which a state is

entitled is recalculated after the decennial census. Gerrymandering refers to the manipulation of the redistricting process for partisan or other discrete political gain. To the extent that the group controlling the redistricting process can draw election district lines in a manner that either helps or harms the representational opportunities of particular political groups, critics may claim that the district lines have been gerrymandered.

Gerrymandering is a special problem in countries where the redistricting process is subject to partisan control. Thus, in the United States, the Constitution grants control of the line-drawing process to states. In most cases, the party or parties controlling the state legislature at the time of the census also control the redistricting process. In contrast, other countries, such as Canada, turn the process over to independent commissions. This practice removes the veneer of partisanship that characterizes the U.S. process.

Because even the most neutral process and statutory principles may have a severely deleterious impact on the representational opportunities of particular political groups, many nations have enacted constitutional or statutory requirements to ensure that minority groups or other political communities of interest are protected. In the United States, the Voting Rights Act of 1965 (as amended in 1982) mandates that those who redistrict ensure that particular minority groups have a fair opportunity to elect their candidates of choice. In other countries, such provisions may include requirements that party lists include a certain minimum percentage of women or ethnic candidates, or the creation of special minority electoral districts.

In a few countries, such as Canada and the United States, the redistricting process may be challenged in the courts. However, in most countries, the redistricting process is strictly the province of the elected branches or commissions.

In sum, redistricting remains a contentious issue because it allows a select group of people (e.g., legislators, commissioners) to decide how political power will be allocated. Invariably, the redistricting process breeds controversy because there always will be one or more political actors who believe that the district boundaries have been drawn unfairly.

Reformation Political Thought

The political thinking of the Protestant Reformation originated with the circulation of German priest and theologian Martin Luther's *Ninety-Five Theses* in 1517 and concluded in 1648 with the Peace of Westphalia treaty. The Reformation touched on every aspect of political and social life in Europe. The central issues, however, both theoretical and practical, centered on the nature of civil authority and whether one owed that authority obedience regardless of its actions.

THE LAW AND THE GOSPEL AND THE USES OF THE LAW

The theory of civil authority in the Reformation had its origins in a theological debate over the meaning of law in Christianity. The debate began in the 1520s, when theologians were influenced and emboldened by Luther's views that eternal salvation was attained by faith alone, challenging the rituals, sacraments, and indulgences implemented by the Catholic Church and the pope. A group of theologians in Wittenberg, Germany, argued that the Christian freedom of the New Testament meant a complete release from the very concept of law.

Luther and his fellow reformer, Philip Melanchthon, were convinced that these theologians were mistaken. Luther wrote that while a purely Christian society would have no need of civil authority, this was only in the abstract, because men are Christian more in name than in reality. Thus the gospel alone, with its methods of preaching and exhortation, was insufficient for politics. Law was necessary for organizing and keeping order in human community but also ensuring individual salvation. Luther spoke of the *double use of the law,* meaning an outer use compelling one to be good externally within society; and an inner use, later called the *theological* or *accusatory*, which causes one to seek Christ and his grace for one's failings and weaknesses.

THE TWO KINGDOMS

While there was general agreement among many Reformers that law was necessary, debate over the relationship between Christianity and the state was fierce. In this period, the separation of the authorities of law and gospel, of church and state, was not so much a concern about the liberty of conscience in a pluralistic society, but whether political and ecclesiastical authority could both be exercised in the same way. The distinction between the law and the gospel suggested to Luther that there should be separate sorts of authorities for the preaching of the Word of God and the administration of the state law.

Inspired by the St. Augustine's *City of God,* which discusses the ancient transition and debate surrounding of polytheism versus monotheism, Luther spoke of two kingdoms, especially in his treatise *Temporal Authority: To What Extent It Should Be Obeyed* (1523). The heavenly kingdom is composed of the faithful, who are motivated to act correctly without

the threat of coercion, while the earthly kingdom is composed of unsaved men, who need civil authority as a remedy for their fallen sinful natures. In so far as all Christians are at once saved and sinners, they are all obligated to the civil authority and encouraged to participate as soldiers and magistrates. Luther stressed the kingdoms should be kept separate. The civil authorities should not try to compel faith and the ecclesiastical authorities should not govern as temporal lords. The earthly kingdom, because it was concerned with man as man, did not need the gospel, but could rely on reason alone in devising and enforcing positive laws. Thus, Luther and Melanchthon deferred frequently to lawyers—especially of the Roman law—on substantive questions of politics.

The Swiss Reformers, who agreed in principle with the Lutherans' view of the two kingdoms, argued for a more active involvement of the ecclesiastical authorities in the prosecution of the moral law. In Zurich, Ulrich Zwingli, a Swiss Reformist leader in the sixteenth century, argued there should be a prophet, a title which he was the first to hold, who was to serve as the biblical prophets and apostles, preaching about positive and moral civil affairs. The great reformer in Geneva, John Calvin, believed divine law could be executed by ecclesiastical authorities as church discipline as long as it did not resort to coercive force, but relied instead on the methods of the gospel—exhortation, admonition, and excommunication.

The theologians of the Radical Reformation, a smaller group of leaders of peasants and some radical Anabaptists, believed moral law was not simply a natural law that could be entrusted to the civil authorities to enact as positive law. Rather they believed divine law as revealed in the Bible was the ultimate source of all law. Essentially, the Radical Reformation rejected all Catholic Church authority and opposed Protestant Reformation civil interpretation of divine law. Today, descendants of these smaller separatists group, include Amish, Mennonites, and Hutterites. However, these ideas led to conflict over whether church taxes were biblical and eventually to the hostilities of the Peasants' War in 1524–1525, in which approximately three hundred thousand peasants in modern-day Austria, Germany, and Switzerland revolted against Holy Roman Emperor Charles V of Spain. The German and Swiss Anabaptists who subscribed to the *Schleitheim Confession of Faith* (1527) believed that it was possible for Christians to live together as a community of the faithful without the law (i.e., magistracies, taxation, or military service). Such views led Melanchthon and other Lutherans to revise their position, arguing civil authority should in fact supervise ecclesiastical affairs and prosecute heresy as well.

THE RIGHT TO RESISTANCE

The majority of German and Swiss Reformers in the sixteenth century believed Christians owed strict obedience to the civil authorities as both the source of positive law and the custodians of the civil use of the law. However, when the Lutheran princes were forced into conflict with the Holy Roman Emperor Charles V to defend their new faith in the 1530s, the strict theory of political obligation began to give way. This led to the articulation of the grounds of resistance to legitimate authority, which over the next hundred years would become the basis of European theories and dissent of popular sovereignty and limited government.

Several arguments were proposed by the lawyers of the Protestant princes in the late 1520s and early 1530s to justify their resistance. They argued, first, on constitutional grounds, that the emperor was accountable by the terms of his election to the inferior magistrates of the empire (i.e., the princes and city officials); second, from a principle of Roman law, that resistance to the emperor could be considered a case of resistance to an unjust judge; finally, on the basis of natural law, that force can be repelled by force. Luther originally only approved of the Roman law argument, but as conditions worsened, he followed Melanchthon in accepting the natural law basis of resistance as well.

CONCLUSIONS

Reformation political thought contributed to the growth of the absolutist state, more commonly known as absolute monarchies, which characterized most of Europe between the seventeenth and nineteenth centuries. By characterizing civil authority as a monopoly on the use of coercive force and the source of positive law, reformation political thought replaced the alleged injustices and powers of the church with centralized powers of the state, namely the ruling monarch of the time. However, the Reformation did lay the foundation for limited government concepts, through its articulation of what would later become the basis for the separation of church and state. Further, through the development of constitutionalist and natural law arguments, the groundwork was laid for the seventeenth century theories of social contract and popular sovereignty, which shape the modern world.

Refugees

A refugee, as delineated by the text of the 1951 United Nations Refugee Convention and 1967 Protocol, is an individual or group of individuals, who, due to reasonable fear of being persecuted on the basis of race, religion, nationality, membership of a particular social group, or political opinion are outside the country of their nationality and are unable, on the account of such fear, or are unwilling to avail themselves of the protection of that country; or who, not having a nationality and being outside the country of their former habitual residence as a result of such events, are unable, or on the account of such fear are unwilling, to return to it.

The term *refugee,* has existed ever since the start of wars, armed conflicts, political upheavals, ethnic intolerance, religious discriminations, and all the human rights abuses that can coerce an individual or group of individuals to leave their homeland and seek asylum in another country where they are protected from the abuses, intolerance, persecutions, or natural disaster that they were evading. Once recognized or granted refugee status by the host nation, a refugee is entitled to basic rights such as emergency medical care and food supplies, and afforded the option of eventual voluntary repatriation, third country resettlement, or local integration in the host nation. The latter option although fairly common is often problematic as many nations have increased their restrictive immigration and citizenship laws or lack the space and resources to accommodate extensive populations of refugees.

The word *refugee* was first recorded in France as *refugie,* in 1573, in the context of granting asylum and assistance to the nonnative Calvinists fleeing persecution from the Spanish rulers of the Low Countries, which encompasses modern Belgium, the Netherlands, Luxembourg and parts of northern France and western Germany. Ironically, a century later the word *refugee* was adopted in the English language when French King Louis XIV persecuted the same Calvinists Huguenots in France in 1724 for forty years and they fled to England. The Huguenots were refugees as a consequence of their association to a religious group being targeted by the sovereign authorities of their country, and in peacetime without any provocation on their part. This distinguished them from an aggregate of individuals in flight. Historically, religious refugees proliferated throughout Europe in the sixteenth and seventeenth centuries, primarily due to emerging popular reformations challenging previous church powers. Major streams include the Muslim Spaniards expelled after the fall of Grenada in 1492, culminating in the deportation of 275,000 people across the Mediterranean to North Africa. In the same year, 150,000 Iberian Jews were forced to leave Spain for refusal to convert to Christianity.

These movements halted toward the mid-seventeenth century, when absolutism surrendered to benevolent despotism.

The eighteenth century gave birth to a new type of refugee flow: political refugees. The revolutionary conflicts of the late eighteenth century were fought in the developing language of political ideology with the intent of advocating and implementing a particular regime. The French Revolution (1789–1799) produced about 129,000 refugees, who refused to take an oath of allegiance to the revolutionary constitution. The American Revolution (1775–1783) created a similar movement, with a conservative number estimating sixty thousand British loyalists who left for Canada or England. The refugee figures from the American Revolution were five times higher than the French Revolution, based on the refugee ratio to total population. The eighteenth century refugees differed from the previous type, since they were displaced because of their political opinion and the threat they carried to the current regime or the ruling government.

The nineteenth and the twentieth centuries gave rise to nationalism and a consolidation of state boundaries, which led to the introduction of immigration laws, passports, and other legal barriers to enter or leave a country. Thus, in the aftermath of World War I (1914–1918), Europe was faced with a great humanitarian crisis due to the restrictive measures systematized on personal movement. The war had considerable consequences for the Austro-Hungarian, Ottoman, and Russian empires. Thousands of people were displaced and stateless, they could not go home and yet were unable to find sanctuary elsewhere. It was against this background that the League of Nations established the High Commissioner for Refugees (HCR), to assist refugees and successfully negotiate refugee rights, including travel documents, education, and employment. HCR was the first international agency to help define the refugees as a population with rights.

World War II left Europe with an even bigger refugee crisis, as the six years of war between 1939 and 1945 left thirty million people displaced. At the end of the war, eleven million survivors were refugees and in dire need of assistance. United Nations High Commissioner for Refugees (UNHCR) was created in 1951 to assist those refugees and help states carry out their obligations toward providing asylum for these refugees.

The twenty-first century *refugee* definition constitutes the classic definition with an added category of the refugee as a victim. This adds people who are displaced by societal or international violence that is not particularly directed toward them, but makes life difficult for them to remain in their own country. Because so many twenty-first century armed conflicts and ethnic persecutions occur within third world countries, many of today's refugees often seek asylum in neighboring countries of equal or lesser financial straits, creating further economic burdens on themselves and the host nation.

Regime

When characterizing a country, we inescapably ask whether it is a democracy or a dictatorship. That is the question of the *political regime*. As gross domestic product (GDP) is for macroeconomics, the political regime has become the master variable for macropolitical analysis. Most big events in the political history of the modern world, including the French Revolution (1789–1799), the rise of Nazism, and the fall of the Soviet Union (1991), involve struggles over democracy and dictatorship. The regime question is a key research topic in political analysis because the selection of the political regime is a central conflict in human affairs: it shapes who has what political rights.

CONCEPTUALIZATIONS OF POLITICAL REGIME

The definition of regime types has been a perennial concern in political analysis. Some scholars, following Aristotle, focus on the question *How many rule?* The answers—one, few, or many—originate the classical classification: autocracy, oligarchy, and democracy. Others emphasize the related but distinct question *Who rules?* They may follow Karl Marx in identifying the regime type in terms of the dominant social coalition (e.g., bourgeois democracy or proletarian dictatorship), or the tradition of Italian realism that points to the hegemony of a "political class." Others, following Charles-Louis Montesquieu, emphasize the question of *How do rulers rule?* The key alternative is whether rulers abide by constitutional principles, which differentiates republican from despotic rule. Finally, some scholars focus on the question *Why do the ruled obey the rulers?* For Max Weber, options include fear, tradition, admiration, normative commitment, and rational calculation.

Building on the conceptual insights of the classics of political and social thought, the contemporary literature on regimes has evolved in two directions. One strand refined the classical analytical dimensions, seeking to add nuance to the overarching distinction between dictatorship and democracy. In order to differentiate forms of dictatorship, Juan Linz (2000) introduced the key distinction between totalitarian and authoritarian regimes and called attention to sultanism as a third type of nondemocratic regime. In turn, Arend Lijphart (1999) distinguished among democracies through his contrast between majoritarian and consociational (or consensus) democracy. The richness and fertility of this conceptual work notwithstanding, its limitations from the perspective of scholars who sought to move from conceptualization to explanation were readily apparent.

One problem was that many regime conceptualizations were tailored to the characterization of sets of cases that were of interest to different scholars, which led to the proliferation of regime subtypes, and even variations on subtypes, based on an ad hoc addition of particular conceptual attributes as opposed to general conceptual attributes. Indeed, even the best of this conceptual work focused primarily either on dictatorships or democracies, rather than give the same degree of attention to the two key options simultaneously, and thus did not lend themselves to generalizations. A second problem was that even the more general conceptualizations combined attributes that were intrinsic to the characterization of regimes with other attributes that were probably better understood as possible causes of regimes (e.g., various actor characteristics) or consequences of regimes, making them analytically problematic for the purposes of causal theorizing.

Responding to these shortcomings, researchers interested in explanation largely gravitated to a second strand in the conceptual literature on regimes. This alternative revolved around Robert Dahl's (1971, 1989) definition of democracy as a regime type characterized by competition and participation in the access to power; that is, the election of rulers in contests between two or more parties with universal suffrage. This conceptualization was narrower than the ones offered in other classifications and typologies; Dahl's concept of political regime referred only to the procedures regulating access to top legislative and executive positions in a country or, for short, access to control of the state. But the payoff of this parsimonious conceptualization was important. It offered something the alternative approach did not: a minimum set of shared concepts around which a large community of scholars could converge. Indeed, taking Dahl's elegant conceptualization as a point of reference, regime analysts turned their attention to an explanatory question: why do democratic regimes emerge and endure? And this research generated many rich debates that, as the following section shows, were organized along the lines of various rival explanatory factors.

EXPLANATIONS OF REGIME CHANGE AND STABILITY

Explanations of regime change can be distinguished depending on whether they focus on distant versus proximate causes, structure versus agency, and economic versus political factors. The classic debate in the study of regimes concerns the relationship between economic development and regimes. A founding observation in the study of regime change, and the core claim of modernization theory, is that richer countries are more democratic. The microfoundations of this correlation are still unclear. Critics of modernization theory share an emphasis on the conflicting nature of capitalist development, and see democracy and dictatorship as the reflection of alternative balances of power among social classes, either between the landed upper class and the urban bourgeoisie, or between the bourgeoisie and the working class. A recurrent point of reference in this debate has been Barrington Moore's (1966) thesis that the social origins of democracy can be found in

the transition to commercial agriculture, and that the rise of an urban bourgeoisie is the driving force behind democratization. But the argument that the bourgeoisie is the chief sponsor of democracy has been challenged on various grounds, including Göran Therborn's (1977) argument that none of the great bourgeois revolutions actually established democracy. An alternative thesis, which claims that it is the strength of the working class that actually explains the rise of democracy, has been proposed and, in turn, questioned. Beyond the developed world, the rise of strong military dictatorships in countries undergoing rapid modernization in the 1960s and 1970s (e.g., Argentina, Brazil, and South Korea) motivated the insight that the relation between development and democracy may be nonmonotonic. The key insight in Guillermo O'Donnell's work (1973) is that the process of industrialization in middle-income, dependent countries gives rise to political tensions that jeopardize the "deepening" of economic development and spur the formation of a coup coalition including business elites, civilian technocrats, and the military.

A second classic debate in the study of regimes concerns the relationship between regimes and the state. This literature focuses on the impact of state formation on democracy and explains different political regimes in terms of alternative resolutions to the struggles involved in the construction of modern state structures; that is, struggles between the state-making elite and regional groups resisting incorporation into a national territory and taxation from a distant political center. A widely shared thesis is that the stronger the resistance state-making elite must overcome in order to build modern state structures, the larger the scope of political rights conceded by state-builders. Yet the specific determinants of the resistance against state-making initiatives are a major focus of contention. Thus, whereas for Charles Tilly (1990) the resistance is a function of the prior social organization of the population that was eventually incorporated into the state's territory (in particular, the level of urbanization), for Thomas Ertman (1997) it depends on the institutional organization of the Medieval representative bodies that preceded the onset of the state-formation process.

Consistent with an emphasis on theories of action, a more recent body of work focuses on proximate factors of regime transformation; namely, the very processes through which political change occurs and the choices made by actors that have a direct impact on these processes. Although originally applied to the analysis of democratic breakdown, this action-centered approach has flourished in concomitance with the Third Wave of democratization. In this approach, democratization is viewed as an open negotiation between moderates within the pro-democratic and authoritarian camps, who in turn are placed in strategic interaction with radical groups within the state and society.

Another body of literature focuses on political institutions, which are seen as intermediate causes: more proximate than capitalist development and state formation, but more distant than the choices of political actors. In fact, political institutions are conventionally regarded as the link between structural forces and political decisions, refracting the former and constraining the latter. The current literature on institutions is largely centered on variations in the institutional setup within the family of democratic regimes (the literature on nondemocratic institutions is considerably less developed), and hence seeks to illuminate the institutional conditions of the stability of democracy, as opposed to the causes of transitions to democracy. Debates in the institutional literature have largely centered on the durability of presidential, parliamentary, and semipresidential democracies, and the suitability of power-sharing arrangements, including federalism, for culturally diverse societies.

Recent research in formal political economy can be viewed as a systematic attempt to integrate structural and strategic explanations of democratization. Like class analysis, this literature views the emergence of democracy as the response of the elite in authoritarian regimes to revolutionary threats from below. The key contribution of this research is the understanding of democratization as an institutional change involving power sharing. In contrast to simple policy concessions, for instance, economic transfers that can be terminated as soon as revolutionaries are demobilized, power-sharing reforms are by their very nature harder to reverse. Democratization thus provides a credible mechanism to avoid costly revolutionary conflict.

In sum, the study of regimes has largely focused on the distinction between democracy and its various authoritarian alternatives, one of the oldest and most enduring distinctions in political theory. It has addressed issues of regime change and durability or, more concretely, regime democratization and dedemocratization. And it has been closely associated with some of the central themes in classical social theory, such as capitalist development and state formation, and some of the most pressing concerns within current political science, such as the attempt to build theories of political institutions and of strategic interaction. Indeed, regime analysts have engaged in wide ranging theorizing with a distinct political edge.

RESEARCH FRONTIERS

Recent assessments of the knowledge on regimes that has been accumulated through the work of regime analysts differ considerably. Some authors offer largely positive assessments of this literature, while others are decidedly more critical. Whatever assessment is correct, a lot of work remains to be done to capitalize on the important research on regimes done over the past five decades.

DELIMITING THE DEPENDENT VARIABLE

One weakness of the literature is its failure to clearly delimit the dependent variable of concern. One manifestation of this weakness is the tendency to conflate and confuse two different questions: whether a regime is democratic and whether a democracy is stable. Although identified in the 1970s, this problem has crept back into the literature on democratic consolidation and, as a result, theorizing has been hampered by the lack of a clearly specified outcome that requires explaining.

Another manifestation of this weakness is the persistent tendency not to distinguish adequately actors from the rules or procedures that are defining features of political regimes. This problem is readily apparent in explicit definitions of regime that include a reference to features of the actors that gain access to the state, such as the social base and support coalition of rulers, either in addition to or instead of the rules that regulate access to the state. Likewise, this is a problem with typologies of regimes that are based on social characteristics of the ruling personnel, such a being a member of the clergy, the nobility, or the populace, or other characteristics of the rulers, such as a commitment to an ideology. The negative consequences of such conceptualizations are severe. By failing to distinguish clearly between actors, a part of explanations of regimes and rules, the constitutive element of regimes, causal theorizing about regimes is necessarily confused in that a distinction between explanatory and outcome variables is not appropriately introduced.

DISAGGREGATING THE DEPENDENT VARIABLE

A second weakness of the literature is its failure to disaggregate the dependent variable of concern and to consider the way in which a disaggregated view of the outcome of interest might offer a way beyond the impasse in certain debates. For example, the Dahlian distinction between two regimes dimensions, competition and participation, can help clarify the debate regarding the impact of the bourgeoisie on democracy. Thus, the discrepancy between Moore and Therborn can be disentangled by showing that the bourgeois revolution explains one necessary but not sufficient component of democracy, the competition component, in that bourgeois revolutions led to the development of a peculiar institutional configuration that allows for the peaceful expression of political disagreements. It does not explain, however, the extension of the franchise to allow for the political participation of labor.

Likewise, the introduction of a distinction between competition and consultation can help clarify the debate regarding the impact of state making on democracy. Thus, the discrepancy between Tilly and Ertman can be resolved by showing that Tilly's research goal is the same as Moore's; that is, to account for the competition dimension of democracy; whereas Ertman is concerned with consultation, a third dimension of democracy—implicit in Robert Dahl's definition of democracy—which basically refers to constitutional arrangements of power sharing between the executive branch and collegial bodies of decision making. In short, the literature on regimes would benefit from greater attention to the multiple dimensions of democracy and from an analysis that recognizes that different components of democracy might be explained by different factors.

INTEGRATING CAUSAL THEORIES

Another challenge facing students of regimes concerns the integration of causal theories. As discussed above, explanations focus on distant versus proximate causes, structure versus agency, and economic versus political factors. Moreover, within these families of explanations, a plethora of potential factors are routinely discussed. Some efforts have been made to integrate the considerable variety of explanatory factors. But the literature on regimes has prized more the introduction of new variables than the development of theoretical syntheses, and this emphasis has entailed some serious costs. Indeed, causal models in the statistical literature routinely include a large number of explanatory variables, usually presented as though they constituted wholly unrelated variables, a strategy that rarely leads to strong empirical tests. Thus, efforts to integrate causal theories are likely to lead to the formulation of more testable hypotheses, and even hold the promise of theoretical breakthroughs, and are well worth encouraging.

TESTING CAUSAL HYPOTHESES

Finally, a fourth problem with the literature on regimes concerns the way in which hypotheses have been tested. The study of regimes, for a long time the province of qualitative scholars, has benefited greatly from the recent reliance on quantitative methods. But qualitative and quantitative tests of the hypotheses in this literature have rarely been complimentary. The qualitative literature has largely used dichotomous measures and typologies, while the quantitative literature has used interval measures and indices. And the differences have been large, to the point that qualitative and quantitative scholars have actually used different measures of key dependent variables such as democracy, democratic transition, and democratic consolidation. Moreover, qualitative and quantitative scholars have focused on different explanatory variables. Specifically, while the qualitative literature has placed great emphasis on actors and choices, the quantitative literature has overwhelmingly focused on economic and institutional factors. Thus, the development of empirical tests that adequately draw on qualitative and quantitative methods remains a challenge that regime analysts must address.

THE NORMATIVE STAKES

To conclude, the question *Why do political regimes matter?* merits a few words. This is not a simple issue to resolve. The normative import of variations in regime has usually been discussed in terms of the consequences of different regimes. In particular, a rich literature has developed on the impact of democracy, as opposed to authoritarianism, on economic growth and the respect for human rights. This research has yielded unstable results and thus has not provided a strong basis for arguing about the benefits of democracy. But such a perspective overlooks the most obvious value of a democratic regime: its intrinsic, as opposed to its instrumental, worth.

The intrinsic value of democracy is frequently overlooked because democracy, as a type of regime, consists of a set of procedures. And the tendency to consider procedures as no more than a method or a mean to arrive at an end and hence as "incapable of being an end in itself," as Joseph Schumpeter (1942) argued, has been associated with evaluations of democracy and other regimes in terms of their results. Yet such a perspective errs in counterposing process to substance and hence failing to see, as Dahl has pointed out, that "the democratic process is packed to the full with substantive values" (1989,

164) Indeed, the value of democracy as a regime resides in its provision, in contrast to its various alternatives, of a peaceful way for all adult members of a political community to participate in the making of the decisions they are legally bound to obey. Although democracy might not be considered an absolute value, it can certainly be treated as an end in itself.

Regime Change

A political regime consists of the chief institutions by which the state exercises its authority. Regime change is a fundamental alteration in these institutions. It occurs when there is the wholesale replacement of one set of institutions by another, such as the replacement of communist regimes by democratic regimes in eastern Europe following the fall of the Berlin Wall in 1989. Regime change normally involves an existing constitution being repudiated and a new and different constitution adopted.

An alternative use of the term *regime* focuses on processes of interaction between political actors that cut across institutions. This usage is especially common in discussions of international political economy and security. However, this second use of the term creates confusion between clearly identifiable institutional structures and patterns of interaction between groups and categories of people, such as bankers. The term is thus best used to discuss governments and their institutions.

Regimes can come and go while the state remains. The French state is many centuries old but since the French Revolution (1789–1799) it has had more than ten different regimes. Its current regime dates from 1958. A regime does not change when a general election alters the party in control of government. In the United States, this is referred to as a change in administration, for example, from the Bush to the Obama administrations. In a stable undemocratic regime, control of government changes hands through decisions of an elite clique, such as the military *junta* or the central committee of a one-party state.

The reform of a major institution to adapt it to new political circumstances is not a complete regime change. In the People's Republic of China, the communist regime is promoting economic reforms but resisting political reforms that it fears could destroy its one-party regime. Regime change occurred in the Soviet Union when reform initiatives by Mikhail Gorbachev in the late 1980s got out of hand. The introduction of direct election of United States senators by the seventeenth amendment to the constitution in 1913 altered the composition of Congress but did not alter the institutions of the regime set out in the 1789 American Constitution. To describe as a regime change, a shift from one party controlling both the White House and Congress to control of the two institutions being divided between Republicans and Democrats ignores the difference between changes that take place within a constitution and those that involve substituting one constitutional structure for another.

Regimes can take many forms, democratic or undemocratic. These include military rule, personal dictatorships, one-party regimes that use totalitarian ideologies and force to maintain their authority and regimes in which rulers are restrained by the rule of law but are not democratic, such as Singapore today, or Britain and Sweden in the nineteenth century.

The process of regime change can involve an evolutionary change from an undemocratic to a democratic regime, as occurred in northern Europe and Anglo-American countries, or an abrupt change; for example, democratization in Spain following the death of General Franco in 1975. Some European countries have experienced dramatic transitions between democratic and undemocratic regimes. In the twentieth century, Germans have been successively governed by an undemocratic imperial regime; the democratic Weimar Republic; a Nazi regime under Adolf Hitler; by a division between the democratic Federal Republic and a communist regime in East Germany; and since 1990 by a united and democratic Federal Republic. Regime change also can take the form of an alternation between dictatorships, as tends to happen in the Middle East.

Regime change can occur as a consequence of peaceful evolutionary change, a military coup, a quarrel between elites who fall out in a struggle for the succession after the death of a dictator, or as a result of a war of independence, as in the American Revolution (1775–1783), or a civil war. The contemporary map of central and eastern Europe reflects the coexistence of changes in the boundaries of states as well as

of regimes. When the communist regime of the Soviet Union collapsed in 1991, its constituent parts broke up into fifteen independent states with different types of regimes, ranging from democracies in Estonia, Latvia, and Lithuania to very undemocratic regimes in Tajikistan and Turkmenistan.

Changes in the regime of a powerful country has major implications for international security and foreign aid. If the new regime is democratic, this can be prematurely hailed as a gain for greater international stability, while if a new regime is undemocratic, this can cause democratic states to become anxious about its potential for supporting actions disrupting international affairs.

Regional Integration, Comparative

Comparative regionalism refers to studies that examine similarities and differences among regional groupings in the global system to understand the underlying causes, processes, and effects of regional integration. Most comparative integration studies apply the frameworks of politics, economics, and law to analyze the context of regionalism and its effects on states and regions as a whole, but sociological studies of regionalism also abound.

Simplified, there are two main waves of comparative regionalist scholarship. The first wave took place in the 1960s and was dominated by neofunctionalist research. While basic neofunctionalist assumptions regarding processes of spillover and supranational entrepreneurship were primarily derived from detailed empirical studies of the major institutions of the European communities (EC), the search for a generalizable explanation of integration led scholars to apply the theory to other regions. Ernst Haas examined integration in the Soviet Bloc, and among Arab states and the Nordic countries, Haas and Philippe Schmitter juxtaposed integration processes in Europe and Latin America, and Joseph Nye (1968, 1971) compared integration in East Africa, Latin America, and the Middle East. However, applications of European-derived integration theories outside Europe were rarely productive. Integration in other regions appeared to advance at a far slower pace than

in western Europe. This led scholars to focus on factors that disposed Europe, especially favorably, for integration. Particular features of European integration, such as the fact that all members of the EC were liberal democracies with high levels of industrial and economic development, broadly compatible elite values, and close ties of military alliance, were elevated to necessary background conditions for integration. The formulation of necessary background factors highlighted the theory's limited scope. Neofunctionalism was geared toward explaining integration among a group of advanced liberal industrial economies in a geopolitical context of bipolarity and as such had limited applicability outside western Europe. As a result, by the 1970s, scholars had largely abandoned comparative integration studies in favor of the isolated study of the EC and its institutions.

Comparative regional integration studies have undergone a significant revival in the past fifteen years. The late 1980s and early 1990s saw an upsurge in regionalism on a global scale. New economic groupings, such as APEC, Mercosur, and NAFTA, were born while existing regional groupings, such as the European Union (EU), deepened their institutional infrastructure and expanded their geographic reach. This reinvigoration of regionalism gave rise to a second wave of scholarship dedicated to comparative analysis. While scholarship in the 1960s focused on understanding the contexts that facilitated the creation and subsequent consolidation of regional institutions, the new regionalism agenda concentrates more sharply on both the causes and effects of regionalism and on accounting for variation in institutional structures across regions. Many new regionalism studies have an economic focus, using new trade theories to understand the sources of regionalism. The main emphasis is on the relationship of regionalization to processes of globalization, with some studies depicting regionalization as a defensive or semiprotectionist response to the challenge of growing competitive pressures from global markets, whereas others view regionalism as a stepping-stone to full integration into the global economy. Alternatively, some international relations scholars, such as Barry Buzan and Ole Wæver (2003), concentrate instead on the regionalization of security, reviving the concept of regional security communities to analyze patterns of regionalism.

DEFINING REGIONS AND INTEGRATION

It is a common complaint that the comparative study of regional integration is hampered by a lack of consensus on how to define the fundamentals of comparison. Some regard the term *region* as connoting a geographically circumscribed area, while others focus on the presence of a common culture, language, or shared religion. Yet others hold that shared political institutions and practices define a region. Agreement is equally elusive when it comes to defining *integration*. What does it mean to say that a region is integrating or has been integrated? Does integration refer to the creation of institutions for joint decision-making at the transnational level, to the creation of a transnational economy, or a combination of the two? Must integration involve a change in social attitudes, such as a shift in loyalties away from the nation-state toward the regional level? It is argued that the fact that analysts work with different conceptions of both *region* and *integration* makes it difficult to compare their findings. Yet, as is often the case, such difficulties are easily exaggerated. By and large, researchers can work with different definitions of integration and still draw valuable insights from each other's work in relation to particular dimensions of integration understood as specific kinds of economic, political or social interactions.

COMPARATIVE REGIONALIZATION AND THE EU

Many scholars also worry that despite a revival of comparative studies, the field of regional integration studies remains sharply divided between studies of the EU and regionalism in the rest of the world. This perceived fragmentation is seemingly a product of the longer trajectory and greater depth of integration in Europe compared with elsewhere. Yet, the difficulty of comparing the EU to other regional schemes can be relatively easily overcome by selecting specific dimensions on which to compare cooperation within Europe to cooperation in other regions. By abandoning the goal of universal grand theories of integration, we can focus on developing valid midrange theories based on observations of particular processes and outcomes. As for understanding the overall trajectory of Europe integration, comparative studies also may be facilitated by conceptualizing the EU as an emergent polity rather than as a regional organization. This was the approach favored by Karl Deutsch and his colleagues. They suggested that international political unification could be studied alongside the growth of nation-states. Deutsch and his associates drew specifically on the experiences of multinational empires like the Austro-Hungarian Empire and federal nation-states like Switzerland to analyze integration processes. Other candidates for comparison with the EU include regional trade and currency unions like the German Zollverein or the United Dutch Provinces, which both evolved into single polities, or the United States, which began as a loose confederation but eventually developed into a federation.

Regional Security

Regional security pertains to the theoretical and empirical conceptualization of security from a macroregional perspective. It stems from the idea that regional security has a degree of autonomy from global collective security and from national security strategies. In a globalized world, which accentuates the circulation of people, goods, and ideas and is, moreover, conducive to the permeation of national borders, it is virtually impossible to conceive security uniquely from a national perspective. Thus, by transcending bilateral relations, polities cluster regionally to protect themselves against their common regional threats. Similarly, regional security also is autonomous vis-à-vis global security in the sense that macroregions follow certain patterns that cannot be replicated universally.

Regional security can be illustrated by the geographical diffusion of conflicts and by the formation of zones of peace. In the post–cold war era, the majority of conflicts have a regional component. Several regions of the world are struggling with cross-border ethnic tension, illegal immigration, transnational crime, failed states, civil wars, or deficient management of common water resources. These social (ethnic), political, economic, and military linkages at the regional level that derive from intra- and interstate disputes, therefore, have created specific clusters that are recognized as *regional conflict complexes, regional conflict formations,* or *regional peace and security clusters.*

The opposite also holds. Some regions seem to maintain a long-standing capacity to remove military interstate disputes from the regional political game. The term *zone of peace* has been commonly associated with the long periods of peaceful interchange between democratic countries, which may be portrayed by the attainment of a security community in South America (since 1883), North America (since 1917), or Australasia and western Europe (since 1945).

In the conceptualization of regional security, another key aspect is agency. In this equation one needs to consider the role played by regional and subregional organizations in the maintenance of regional peace and security. According to Chapter VIII of the United Nations Charter, regional arrangements and agencies have been empowered to handle intraregional conflicts as they offer comparative advantages. First, as the members of an organization share the same cultural background, they are likely to be more in tune with a conflict at hand. Second, personal relationships with the leaders have developed in the past, which results in greater understanding of the situation and may result in fruitful dialogue based

on personal trust. Third, as time is of the essence in a crisis situation, regional organizations could offer a more timely response, compared to bureaucratic global organizations as the United Nations or foreign states. Fourth, as the members of a regional organization are the ones who would suffer more directly the impacts of the conflict, they have a legitimate vital interest at stake in preserving regional stability.

REGIONAL SECURITY THEORY

The phenomenon of regional security has been described and explained by a gamut of different approaches, of which the most prominent are the regional security complex theory (RSCT), the regional orders approach, and the zones of peace approach.

First developed by Barry Buzan, the regional security complex theory is marked by the idea that security is a relational matter based on the (positive or negative) interdependence of units at the regional level. This is the principle that leads to the formation of macroregions of security and paves the way for regions to be objects of analysis in themselves—particular locations where one can find outcomes and sources of explanations. Regional security complexes are defined as "a set of units whose major processes of securitization, desecuritization, or both are so interlinked that their security problems cannot reasonably be analyzed or resolved apart from one another" (Buzan and Wæver, 2003). The structure of regional complexes is composed of (1) the arrangement of units and the differentiation among them, (2) the patterns of amity and enmity, and (3) the distribution of power among the principal units. RSCT also introduced a social constructivist approach to understand the process by which issues become securitized. The process of securitization is interpreted as a speech act, by which security issues range from *nonpoliticized* through *politicized* to *securitized.* Security is thereby approached as a *self-referential practice,* in the sense that an issue becomes a security issue as the result of a practice (i.e., the securitization of a threat is the consequence of a perception by a securitization actor and not necessarily the consequence of a real and objective threat).

The second prominent theory of regional security is the regional orders approach. David Lake and Patrick Morgan (1997) introduce the idea of *regional order* as an important paradigm to understand regional security. The authors define a regional security complex as "a set of states continually affected by one or more security externalities that emanate from a distinct geographic area." By introducing the idea of *externality,* they imply that a regional security complex is not contingent to territorial contiguity given that in some cases an externality of a complex has an impact on another country (or vice versa) with which the complex shares no borders. The authors contend, hence, that "geography defines the physical area from which security externalities radiate, not the set of states that may be members of a regional security complex." Lake and Morgan suggest that regional security processes have a life on their own and can refract the impact of the global system. Regional complexes are used by Lake and Morgan as a launching pad to introduce the concept of regional order. Whereas a

regional complex is defined by its patterns of security conceived in terms of externalities, a regional order is characterized by the way in which the states that comprise a regional complex manage their security relations. And the typology put forward by Lake and Morgan includes (1) balance of power, (2) concert of power, (3) multilateral collective security, (4) pluralistic security community, and (5) integration.

Finally, another prevalent way to approach regional security is by conceptualizing the evolution of a region as a *zone of peace*. Arie Kacowitz's work (1998) is devoted to explaining how peace can be maintained at the regional level, sometimes even if this process is not sustained by plural democracies. He sets out his study by defining a zone of peace as

> a discrete geographical region of the world in which a group of states have maintained peaceful relations among themselves for a period of at least thirty years—a generation span—though civil wars, domestic unrest, and violence might still occur within their borders, as well as international conflicts and crisis between them.

An African Union soldier holds the African Union flag in a military camp damaged in an attack in Darfur, Sudan. As a regional organization, the African Union is in a position to respond quickly to crises on the continent and to have better understanding of the conflict.
SOURCE: AP Images

Furthermore, within this definition he differentiates among three different categories of zones of peace in an ascending order of quality and endurance: zones of negative or precarious peace, zones of stable peace, and, finally, pluralistic security communities. To explain the maintenance of regional peace, he assesses the necessary, favorable, and sufficient conditions drawing from a pool of realist/geopolitical and liberal theories: (1) regional hegemony; (2) regional balance of power; (3) common threat by a third party; (4) isolation, irrelevance, and impotence; (4) regional democracy; (5) economic development and prosperity; (6) economic interdependence, integration, and transnational links; (7) normative consensus/common cultural background; and, finally, (8) satisfaction with the territorial status quo.

Regions and Regional Governments

Region usually denotes a territorial unit, with or without political identity, and the corresponding form of government. This is typically an area smaller than the state but larger than the lowest local administrative layer, which in most countries are the municipalities. Within this perspective, there are different types of regions: the homogeneous or uniform region, the polarized region, and the functional region, each defined according to different criteria. In unitary states, these types of region correspond in most cases to an intermediate administrative tier between the state and the lower level of the political and administrative organization, while in federal states it can coincide with the state level or with one of its subdivisions. In all these cases, regions are contained within the same country. However, in the case of the European Union, the concept of transnational or cross-border regions that emerged in recent years has introduced a new type of region into the already complex institutional landscape.

THE ADMINISTRATIVE MEANINGS OF REGION AND REGIONALIZATION

The term *region* is taken here as synonymous with a subnational form of self-government between the central state and the lower tier of local self-government. This tier of public administration between the state and municipalities,

sometimes called *province,* can be traced back at least to the Middle Ages in some parts of Europe. However, it was during the nineteenth and twentieth centuries that it acquired its contemporary characteristics and its administrative relevance.

The term *regionalism* also has several meanings. Often it is applied to describe movements associated with the promotion and preservation of a regional identity, as well as nationalist movements whose objective is the separation of a particular region from its host state. It also often refers the process of political and administrative decentralization from the state to the region, a process implemented usually due to a mixture of political, economic, and social reasons specific to each case. The term *regionalism* is used here as synonymous of *regionalization,* and by this is meant the process of political and administrative decentralization from the state to the intermediate tier of subnational self-government.

DECONCENTRATION AND DECENTRALIZATION

Region in the sense of subnational administrative or political tier has a long tradition in both unitary and federal states. There are two forms that can define the relationship with the central state: it can be a form of deconcentration or a form of decentralization, with the later characterized by more extensive administrative autonomy. In both cases, the adoption of a regional tier is one alternative for addressing sociogeographical and political diversity inside the country.

In the deconcentration case, when the region is just one level within the vertical organization of the state, a form of peripheral state administration, central government retains the most important keys in the decision-making process and in public resource allocation but the regional boards may make decisions on less important issues, making government services locally accessible. This process is called administrative deconcentration. In some countries, the creation of this form of region is followed by the institutionalization of a regional tier of self-government. When a regional self-government tier is created and elections are held for its boards, the tier often will retain the geographical area and most of the previous professional and administrative structures. In other cases, the regional tier of self-government was introduced with no relation to previous forms of administrative deconcentration. In both cases, there are substantial differences between countries and over time, either in the competences assigned to the region, in the level of public expenditure made by the regional government, or even in the size of the regions.

There is another form of regional self-government that goes beyond administrative decentralization, including also political decentralization, which has been implemented due to specific historical and political conditions, such as in the case of Spain's autonomous regions. This also can occur in response to geographic, economic, social, and cultural characteristics, including historic aspirations for autonomy within the local population, such as in the case of Madeira and Azores in Portugal.

FEATURES AND TRENDS OF ADMINISTRATIVE REGIONS

Administrative regions have normally an executive (a council, a president, or both) and a deliberative assembly with control powers over the executive as well as the power to issue regulations. In the case of political decentralization, or autonomous regions, the assembly also may possess the power to legislate on issues not pertaining to the sovereign functions of the state, such as justice, foreign affairs, and national defense. The regional assembly normally is elected directly by proportional representation by the citizens of the region, and elects, among its members, the executive council or the president of the region. In practice, however, there are various forms of regional political leadership and each model is influenced by the local political culture, the support that the president or the executive has in the regional assembly, and the demographics of the region, among other factors. Once elected, political and administrative accountability is provided internally by the regional assembly and externally by the press, citizen participation, and ultimately central government inspectorates and the courts. Central authorities would be more likely to judge the legality, rather than the merit, of local political decisions.

The competences of administrative regions are typically defined by the principle of general competence, which means that the administrative region usually is not confined to its specific list of competences, and therefore can execute all other functions deemed to be in the interest of the region by its elected boards. The financial regime of administrative regions is based on its own resources and resources transferred by the state, either in the form of block grants, conditional grants, or a combination thereof. The relative weight of each specific component is another variable that differentiates regional self-government between countries.

Administrative regions have been affected in recent decades by shifts from traditional hierarchical forms of administration to administration through networks of public and private organizations within the same country. This process can weaken political accountability and policy coordination. In other cases this trend was followed also by the development of transborder relations with regions in neighboring countries, such as in the case of European Union in which regions of different countries cooperate under the umbrella of European structural programs. A third major trend affecting regions is the widespread use of information and communication technologies in regional government or regional governance, which allows a transition to administration through electronic communication.

Regression with Categorical Data

In its most basic form, ordinary least squares (OLS) regression describes the linear relationship between a dependent variable and one or more independent variables by fitting a line or plane to a collection of data points. Most introductory treatments of regression analysis use examples with dependent and independent variables measured at the interval level (e.g., income in dollars and years of formal education). But many researchers work with variables measured at the categorical (nominal) level.

OLS regression should not be used if the dependent variable is categorical. In this situation, one cannot assume a linear relationship between the independent and dependent variables. The relationship is likely to be best illustrated by an S-curve rather than a straight line. Even though OLS is remarkably flexible and can be used to estimate some curvilinear relationships, it is not suited to describing relationships involving categorical dependent variables. Researchers should use logistic regression, probit, or another model designed for limited dependent variables.

OLS can accommodate categorical independent variables, such as gender, region, or marital status. This is done through the use of dichotomous dummy variables representing the categories of the independent variable. Standard practice is to code a dummy variable 1 if a case falls into a specific category or 0 if it does not. Gender, for instance, would yield two dummy variables: Female (1 = female, 0 = otherwise) and Male (1 = male, 0 = otherwise). Region might be transformed into four dummy variables: Northeast (1 = Northeast, 0 = otherwise), Midwest (1 = Midwest, 0 = otherwise), South (1 = South, 0 = otherwise), and West (1 = West, 0 = otherwise).

One of the dummy variables must be excluded from the regression analysis to avoid perfect collinearity between the dummy variables. An important rule of thumb is, if the original independent variable has C categories, include C-1 dummy variables in the regression analysis. The excluded dummy variable will serve as a baseline for interpreting the effect of the included dummy variable. The choice of which variable to exclude is primarily substantive rather than statistical; which baseline will provide the most sensible or interesting interpretation of results?

Take as an example a multiple regression analysis examining the influence of education and gender on annual income:

$$\text{Annual Income} = a + b_1 \text{ Education} + b_2 \text{ Male}$$

In this example, the dependent variable, *Annual Income,* can be measured at the interval level in dollars. Similarly, *Education* can be measured at the interval level as years of formal education. Because gender is a categorical variable, it can be represented by a dummy variable for males, where 1 = male, 0 = otherwise (female). Because the dummy variable for females was left out of the equation, female is the excluded, or baseline, category for gender. The coefficient for *Male*—b_2 in the equation above—will show the average difference in income for men (holding education constant) as compared to women. Suppose this regression analysis yielded the following results:

$$\text{Annual Income} = 31,000 + 1,650 \\ \text{Education} + 4,500 \text{ Male}$$

The coefficient of 4,500 for the dummy variable *Male* indicates that, on average, annual income for men exceeds that for women by \$4,500, holding education constant. Had the researcher included *Female* in the equation instead of *Male,* the b_2 coefficient would have been -4,500, showing that, on average, women had an annual income \$4,500 less than men. The specific statement of results is different, but the substantive conclusion about gender differences in income is the same.

Regulation and Rulemaking

Like many other political concepts, regulation is hard to define, not least because it means different things to different people. The term is employed for a myriad of discursive, theoretical, and analytical purposes that cry out for clarifications. It is also a highly contested term. For the far right, *regulation* is a dirty word representing the heavy hand of authoritarian governments and the creeping body of rules that constrain human or national liberties. For the old left, it is part of the superstructure that serves the interests of the dominant class and frames power relations in seemingly civilized forms. For progressive democrats, it is a public good, a tool to control profit-hungry capitalists and to govern social and ecological risks. For some, regulation is something that is done exclusively by government, a matter of the state and legal enforcement; while for others, regulation is mostly the work of social actors who monitor other actors, including governments. State-centered conceptions of regulation define it with reference to state-made laws, while society-centered analysts and scholars of globalization tend to point to the proliferation of various forms of civil and business-to-business regulation.

COMPETING PERSPECTIVES

For legal scholars, regulation is often a legal instrument, while for sociologists and criminologists it is yet another form of social control. For some it is the amalgamation of all types of laws—primary, secondary, and tertiary legislation—while for others it is confined to secondary legislation. For Chicago school of regulation economists, it is usually a strategic tool used by private and special interests to exploit the majority. Not all economists are alike: for institutional economists, regulation is a constitutive element of the market and is often understood as the mechanism that constitutes property rights or even as a source of competitiveness. The French Regulation school seems to have developed a similar institutional perspective but with a more critical tone and without the functionalist orientation of some Anglo-Saxon economists. While scholars of public administration seem to perceive it with direct and intimate reference to the scope of state authority and formal regulatory organizations, scholars of global governance tend to focus on standards and soft norms. While some seem to think of the rise of regulation as yet another indication of the advance of neoliberalism and the retreat of the welfare state, others tend to see it at as a neomercantilist instrument for market expansion, high modernism, and social engineering. In European parlance, for most of the twentieth century regulation was synonymous with government intervention and, indeed, with all the efforts of the state, by whatever means, to control and guide economy and society. This rather broad meaning of the term seems to have faded, and scholars now make efforts to distinguish rulemaking from other tools of governance, and indeed from other types of policy instrument, such as taxation, subsidies, redistribution, and public ownership.

Regulation not only is a distinct type of policy but also entails identifiable forms and patterns of political conflict that differ from the patterns that are regularly associated with redistribution and distribution. In addition, while other types of policy such as distribution and redistribution are about relatively visible transfers and direct allocation of resources, regulation only indirectly shapes the distribution of costs in society. Government budgets include (relatively) visible and clear estimations of the overall costs of distribution and redistribution but hardly any of the cost of regulation (with the exception of the administrative costs of regulation—costs of fact finding, monitoring, and implementation). The most significant costs of regulation are compliance costs, which are borne not by the government budget but mostly by the regulated parties. The wide distribution of these costs and their embeddedness in the regulatees' budgets make their impact, effects, and net benefits less visible and therefore less transparent to the attentive public.

For some, regulation is a risky business that is prone to failure, but for others the business of regulation is the business of risk minimization. Some contend that regulation comprises mostly rulemaking while others extend it to include rule monitoring and rule enforcement. For some, regulations are about the rules and functions of the administrative agency after the act of delegation; for others, as already observed, regulation includes every kind of rule, including primary legislation and even social and professional norms. The extensive literature on regulation in the United States and the extensive attention paid to regulation could have resulted in a consensual definition of regulation. Yet this is not the case. The American Administrative Procedure Act defines the term *rule* but not the term *regulation,* and what it defines as rule is confined to the scope of the act itself.

ROLE OF ADMINISTRATIVE AGENCIES

One important aspect of any discussion of the different connotations and characteristics of regulation is the intimate relations between regulation and the existence of an administrative agency. Rulemaking and rulemaking agencies are closely connected. An emphasis on the workings, characteristics, failures, and merits of regulation by administrative agencies is prevalent in the literature on regulation. Thus, one of the most widely cited definitions of *regulation* suggests that regulation is a "sustained and focused control exercised by a public agency over activities that are valued by the community." Not only does this definition include an explicit reference to public agency, but it also stresses the sustained and focused nature of regulation. Regulation involves a continuous action of monitoring, assessment, and refinement of rules rather than ad hoc operation. Implicit in this definition is also the expectation that *ex ante* rules will be the dominant form of regulatory control. The definition is less apt in the sense that it fails to recognize that many, perhaps very important, regulations are not exercised by public agencies but by a wide variety of executive organs. It excludes business-to-business regulation as well as civil regulation and unnecessarily limits regulation to those actions that are valued by the community.

The regulatory agency is a nondepartmental organization that is involved mainly with rulemaking but that also may be responsible for fact finding, monitoring, adjudication, and enforcement. It is autonomous in the sense that it can shape its own preferences, and the extent of its autonomy varies with both its administrative capacities and its ability to enforce its rules. The autonomy of the agency is constituted by the act of its establishment as a separate organization and by the allocation of a policy space where the agency is expected to operate in order to meet its functions and responsibilities. Note that rulemaking, fact-findings, monitoring, adjudication, and enforcement capacities are usually the characteristics of regulatory agencies. While regulatory agencies are not new, their growth and proliferation is the outstanding feature of the emergence and consolidation of the regulatory state. Regulatory agencies originated in various boards, ad hoc committees, and other premodern organizational entities that during the twentieth century became the pillars of the modern administrative state. Regulatory agencies became a distinctive feature of the American administrative state in the early twentieth century. What other countries often nationalized, the United States regulated. Indeed, the history of the American administrative state is also the history of the establishment of regulatory agencies. Yet, while the number of regulatory agencies

in the United States has not grown since the mid-1970s, such agencies have become popular elsewhere in the world. A recent survey of the establishment of regulatory agencies across sixteen different sectors in sixty-three countries from the 1920s through 2007 reveals that it is possible to find an autonomous regulatory agency in about 73 percent of the possible sector–country units that were surveyed. The number of regulatory agencies rose sharply in the 1990s, partly in connection with privatization policies but also in fields and places where privatization had little effect. The rate of establishment increased dramatically, from fewer than five new autonomous agencies per year from the 1960s to the 1980s, to more than twenty agencies per year from the 1990s to 2002 (rising to almost forty agencies per year between 1994 and 1996).

The expansion in the number of regulatory agencies, and arguably also in the scope of regulation and of the policy capacities of these agencies, has been manifest since the 1990s in the popularity of the notion of the regulatory state. In its most straightforward form, as defined by Christopher Hood and colleagues' in *Regulation inside Government,* (1999), the term *regulatory state* "suggests [that] modern states are placing more emphasis on the use of authority, rules and standard-setting, partially displacing an earlier emphasis on public ownership, public subsidies, and directly provided services." Three elements are especially useful in characterizing the regulatory state. First, bureaucratic functions of regulation are being separated from service delivery. Second, the regulatory functions of government are being separated from policy-making functions and, thus, the regulators are being placed at arm's length from their political masters. In this way, regulatory agencies became the citadels that fortify the autonomous and influential role of the regulocrats in the policy process. We are witnessing the strengthening of the regulators at the expense of politicians on the one hand and of the managerial elite on the other. Third, and as a result of the first two elements, regulation and rulemaking emerge as a distinct stage in the policy-making process. Accordingly, regulation is emerging as a distinct profession and administrative identity. Professional affiliation to global networks of experts becomes a major source of innovations, world views, accountability, and legitimacy.

FROM THE REGULATORY STATE TO REGULATORY CAPITALISM

The focus on the administrative elements in the study of regulation might be less useful for scholars who emphasize the limits of "hard law" and who are aware of the importance of social norms and other forms of "soft law" in the governance of societies and economies. A wider definition of regulation that captures regulation as soft law would suggest that regulation encompasses "all mechanisms of social control" including unintentional and nonstate processes. Indeed, as pointed out by Robert Baldwin and colleagues (1998), it extends "to mechanisms which are not the products of state activity, nor part of any institutional arrangement, such as the development of social norms and the effects of markets in modifying behavior." Thus, a notion of intentionality about

the development of norms has been dropped from this definition of regulation, and anything producing effects on behavior may be considered regulatory. In addition, a wide range of activities that may involve legal or quasi-legal norms, but without mechanisms for monitoring and enforcement, might also come within the definition. This definition connects widely with the research agenda on governance, *the new governance,* and the *new regulatory state,* where elements of steering and plural forms of regulation are emphasized in the effort to capture the plurality of interests and sources of control around issues, problems, and institutions. This rather wide definition of regulation also allows us to *decenter* regulation from the state and even from well-recognized forms of self-regulation. Decentered approaches to regulation emphasize complexity, fragmentation, interdependencies, and government failures, and suggest the limits of the distinctions between the public and the private and between the global and the national.

Scholars of regulatory systems often point to the growth in the number of civil and business actors that invest in regulation and accordingly also in the growth of civil and business-to-business regulatory institutions and instruments. At the same time there are indications of the transformation of the politics of interest groups and nongovernmental organizations. Civil actors are often associated with advocacy (e.g., lobbying) and service provision (e.g., replacing the state in the provision of welfare), but in our areas of study they also produce, monitor, and enforce regulation. The concept of *civil regulation* aims to capture this evolving feature of civil politics. The term refers to the institutionalization of voluntary global and national forms of regulation through the creation of private (nonstate) forms of regulation intended to govern markets and firms. Civil regulations attempt to embed international markets and firms in a normative order that prescribes responsible business conduct. It includes old and traditional forms of self-regulation but goes beyond it to include regulatory techniques such as third-party accreditation and certification, gatekeeping strategies, metaregulation, enforced self-regulation, self-regulation, and leagues tables. *Business-to-business regulation* is another form of a nonstate source of regulation. Here the growth of regulation is driven by the ability of some businesses (most often big business) to set standards for other businesses (most often smaller). One relevant example is the ability of big supermarket chains to set standards of food manufacturing, processing, and marketing all over the world.

The narrow definition of regulation and the broader one are coming together in the literature of regulatory capitalism in order to denote a global order that is characterized by the simultaneous growth of plural forms of regulation. It also denotes the growth in scope, importance, and impact of regulation at the national and global levels and the growing investments of political actors in regulation in general and regulatory strategies in particular. It suggests that regulation and rulemaking are the major instruments in the expansion of global governance. The notion of regulatory capitalism takes regulation theory analysis beyond national boundaries (hence, beyond the notion of the regulatory state) and beyond formal

state-centered rulemaking (therefore toward civil regulation and decentered analysis of regulatory systems). It also denotes a world where regulation is increasingly a hybrid of different systems of control; étatist regulation coevolves with civil regulation; national regulation expands with international and global regulation; private regulation coevolves and expands with public regulation; voluntary regulations expand with coercive ones; and the market itself is used or mobilized as a regulatory mechanism.

Reich, Wilhelm

Wilhelm Reich (1897–1957), an Austrian American psychoanalyst, stands as one of the most controversial and groundbreaking figures in psychology. A collaborator with Sigmund Freud during the 1920s, Reich would later combine Freudian psychoanalysis and study of the individual personality with a Marxist sociopolitical analysis of social relations. His greatest contributions to political studies are his works *The Mass Psychology of Fascism* (1933) and *The Sexual Revolution* (1936).

For Reich, the character of child rearing was closely related to social organization and the political development of social institutions. His works, in particular *The Mass Psychology of Fascism,* linked authoritarian character structures to authoritarian institutions in society. Sexual repression was a key feature of authoritarian child rearing and instilled within the child not only an obedience to authority, but also an incapacity to freely express oneself against authority. The key task of education, as for psychotherapy, is sexual liberation and the abolition of the patriarchal family structure that represses sexuality. Reich argued for the economic self-determination of women and called for availability of contraceptives, abortion, and divorce.

For Reich, the solution to social and personal problems is something akin to anarchism. In his view, it is possible for people to overcome what he identifies as the irrationalism of government and institutional politics and establish what he calls "work-democracy." This would usher in a society free of authoritarian institutions, including the state and the patriarchal family, as people establish self-regulating character structures. In his view, social relationships would develop from economic organizing in which workers create and control their workplaces and working relations. Thus, social relations would be built on a radical vision of workers' democracy.

Reich was controversial within leftist circles for his assertion that authoritarian relations could even overtake socialist or communist projects where moral codes and child-rearing practices and education did not free people's character structures. Thus, as Reich explains in *The Sexual Revolution,* the promise of the 1917 Russian Revolution's early years was never realized, in part because of its failure to follow through on the revolutionary experiments in education and the radical revision

of morality expressed initially. The result was an authoritarian system that maintained repressive practices in the context of Stalinism. Reich's identification of soviet authoritarianism as "Red Fascism," highlighting its shared repressive character with rightist fascism, led to his expulsion from Germany's Communist Party.

In *The Mass Psychology of Fascism,* Reich tries to answer why workers supported parties whose leadership opposed their interests as workers. The working-class support for fascism was found in working-class identification with the character structure of the middle classes (the farmers, bureaucrats, and small business people who initially supported and stood to gain from fascism) as changing work relations, such as shorter working hours and increased incomes, led to worker identification with the middle class and its typical family structures that were becoming the norm or ideal.

The emphasis on revolutionary social transformation in his work represents a significant break from, and repudiation of, the conservative acceptance of social relations in much of psychology. Strikes and protests were not expressions of irrationalism as some psychology suggested. The question of social psychology concerning why the majority of workers do not strike could contribute to Marxist analyses of social change.

Relative Power

Power is normally thought of in terms of the absolute capacity of an individual, institution, or state. But power is also the capacity of A to get B to do what B would otherwise not do of its own choosing. In power relations, the capacity of one entity must be considered relative to the capacity of another entity or entities vis-à-vis that outcome. Such a concept of *relative power* has relevance regarding the capability of a state to ensure its security and carry out its foreign policy objectives.

The term *relative* denotes a comparison that can be either a *signed difference* or a *ratio* of the things compared. The measures are far from congruent in meaning, and both are essential for understanding power. A signed difference indicates the gap between two levels, as in balance of power calculations. A dyadic ratio of the two levels is sometimes used as a measure of relative power. But these dyadic measures do not capture the complexity of power relationships involving three or more actors, a complexity that international relations theorists have encapsulated in the notion of *systems structure.* At any given time, a state's relative power is its percent share of systemic power—that is, the ratio of its absolute power over the absolute power of all the states in the system under consideration.

How is power to be measured? Relative power is sometimes used to describe a situation in which not all but some capacities of actors can be brought to bear on a specific situation to elicit a desired outcome. Do we focus on capabilities or on outcomes? Do we use perceptions of power or empirical indexes of power? We would like the capabilities to correspond to expected outcomes, and perceptions of power to correspond to the empirical measures.

The power of the state is in large part drawn from the underlying material indicators of national capability such as armed forces size, population size, GDP, military spending, and per-capita wealth, with issues of national unity, national will, and ideology added as qualifications. Also, the long-term foundation of power, its latent resource base that changes only incrementally, must be kept analytically distinct from short-term actualized power that may accelerate during war time.

Factor analysis reveals that state power has two dimensions—size and wealth—measured across the entire spectrum of military and economic indicators. Natural experiments reveal that experts can rank states according to perceptions of power with a very high level of agreement. These subjective perceptions of power are stable across cultures and are highly correlated with national capability.

Over long time periods, state relative power follows a cycle of rise and decline, of varying amplitude and periodicity, which traces the state's evolution as a major power. Germany passed through an entire cycle, from rise to peak to decline, in less than a century. The United States rose gradually, during an interval of more than 150 years, to its peak in relative power. China is on the rising side of its relative power cycle.

Because governments respond to utilities of foreign policy objective using only a fraction of the power at their disposal in any circumstance (such as a foreign intervention), the analyst should not expect a close correlation between underlying indicators of relative power and foreign policy outcomes. No easy and direct relationship exists between relative power and the foreign policy purposes to which that power may be put.

Relativism

Relativism refers to any doctrine holding that concepts and beliefs are relative to conditions and thus not universally valid. Relativists usually argue that because one's cultural or historical context determines one's core beliefs, universal knowledge is impossible to discover. This argument moves from *descriptive* relativism, or the factual account of different ethical, metaphysical, and epistemological claims held in the world, to *normative* relativism, the doctrine that such claims are correct *only* in relation to a given nonobjective conceptual framework. Absolute normative relativism is, however, difficult to defend, as it suffers from self-referential incoherence, for its claims are inherently relative. Accordingly, relativism's proponents tend to allow for universal knowledge in some domains, such as in medicine, while denying it in others, such as in ethics. Although critics rightly charge that relativism renders any critical standpoint problematic, the fact of human difference allows for some degree of relativism. Most would accept, for example, that taste in cuisine is culturally relative, but the question is more fraught when it concerns morality. Alternative views of relativism are offered by historicists, pragmatists anthropologists, and sociological theorists. These perspectives, among others, form the foundation of contemporary methodological discussion, as does the stronger relativism of the postmodern scholars.

Reliability

Reliability is the degree to which a measure of a theoretical concept has variable errors. The measure is reliable if measuring the same concept several times produces the same results in each instance. A measure is assumed to contain a fixed part and a variable part. The spread of each part, the variance of a fixed component and the variance of a variable component, and their ratio are used to assess how reliable a measure is. If the ratio of the variance of a fixed part to the variance of a variable part of the same measure is close to zero, then the measure is considered unreliable. This is the case when the variable error is very large. If the ratio of the variance of a fixed part to the variance of a variable part of the same measure is close to one, then the measure is a reliable one. This is the case when the variable error is small. Reliability cannot be computed precisely due to impossibility of the calculation of variances and needs to be estimated. There are four approaches to estimate reliability: interobserver, test–retest, parallel-forms, and internal consistency (split-half, average interitem correlation, and average item-total correlation).

See also *Reliability and Validity Assessment; Statistical Analysis; Validity.*

. . . . TATIANA VASHCHILKO

Reliability and Validity Assessment

In social science research, the terms *reliability* and *validity* refer to the accuracy of measurement. Inaccurate measurements may lead to erroneous or artificial conclusions or inferences.

RELIABILITY

Reliability refers to consistency and uniformity of measurements across multiple administrations of the same instrument. More simply, there should exist some measure of equivalence and consistency in repeated observations of the same phenomenon. Thus, the more consistent the results across repeated measures, the higher the level of reliability. Conversely, the less consistent the results across repeated measures, the lower the level of reliability. Reliability cannot be computed precisely because of the impossibility of the calculation of variances and needs to be estimated.

RELIABILITY ASSESSMENT

In political science, there are four primary methods for assessing the reliability of empirical measurements: the test–retest, alternative-form, split-halves, and internal consistency methods.

The *test-retest method*, or retest method, involves administering the same test of the same phenomenon to the same sample at two different times. If the measurements of both tests are consistent, the measure has high reliability. This method is not without its limitations. Some phenomena, for instance, are measurable only at one particular time, rendering the test-retest method impossible to conduct. Additionally, the test-retest method may suggest unreliable measurements

not because the measure itself is unreliable, but because the phenomenon being studied may have changed in the interval between the two tests, often times as a result of reactivity, or the actual act of testing, which may itself inspire a change in the phenomenon.

The *alternative-form method* is similar in principle to the test-retest method; however, a different mode of test is administered to measure the phenomenon at the second instance. Thus, two parallel but different measures are used instead of measuring the phenomenon using the same measure at each instance. Using two different measures reduces the risk of reactivity. As with the test-retest method, there is risk that the phenomenon itself may change between tests, artificially deflating the perceived reliability of measurements. Furthermore, the alternative-form method poses a unique challenge in that the tests need to be different yet parallel to yield comparable results.

The *split-halves method* affords the researcher the ability to conduct two measures of the same phenomenon at the same time, eliminating the risk of reactivity or the phenomenon itself changing over time. The researcher groups the items being measured into equivalent halves and administers the same test to each and then compares the results. If the results are consistent, the measurements demonstrate a high level of reliability. The split-halves method has its limitations, particularly as there are multiple possibilities as to how the items in each test can be grouped into halves. If the two halves are not identical, there is a high likelihood that the two tests may result in a different measurement on the basis of the halves being nonequivalent.

Finally, reliability can be assessed using the *internal consistency method*. This method, like the split-halves method, allows the researcher to measure a phenomenon at a single point in time. Moreover, like the alternative-form method, internal consistency is based on different measures of the same phenomenon; however, this method measures consistency and correlations among multiple similar items on the same test, thereby eliminating the need to administer two different tests or to split the items being measured into two groups. Therefore, it is implicit that similar items measuring the same phenomenon be included in a single test. If similar measures produce similar scores or illustrate a strong correlation, the measures demonstrate high internal consistency and are highly reliable.

VALIDITY

Validity refers to how well an instrument actually measures what it is designed to measure, or the degree to which a measurement procedure captures a theoretical concept being measured. A measuring instrument that measures what it purports to measure is said to be *valid*. Conversely, an instrument that does not measure what it is designed to measure is said to be *invalid*. However, it is important to note that an instrument may be valid for measuring one particular type of phenomenon but be completely invalid for measuring another. Therefore, when assessing the validity of a given measure, a researcher does not evaluate the measuring instrument itself, but the measuring instrument in relation to its ultimate purpose

TYPES OF VALIDITY AND VALIDITY ASSESSMENT

Disciplines define validity in different terms. In political science, there are four fundamental types of validity. The first is known as *face validity,* which refers to how well an instrument appears on its face to measure the phenomenon it purports to measure. When there is reason to question the correlation between a measuring instrument and the phenomenon it is designed to measure, an instrument lacks face validity. As such, when an instrument seems not to be relevant to the phenomenon it is measuring, or if there is a weak link between the measure and the concept that is being researched, the measure lacks face validity. Therefore, the assessment of face validity is a product of a researcher's deductive reasoning and judgment based on the appearance that a given measure is valid.

Content validity is similar to face validity in that it predicates individual judgment, but it is often more difficult to assess, as it evaluates the extent to which an instrument adequately measures all aspects of a given concept or domain. As a result, the assessment of content validity necessitates the identification of all facets of a phenomenon and then determines the extent to which a measurement reflects and measures each facet. This is particularly difficult when the phenomenon in question is complex or multidimensional, as an instrument is only content valid when it measures all aspects of a given domain. However, if all aspects of a phenomenon are not sufficiently or adequately defined and enumerated, a measure cannot be content valid.

The third type of validity is *construct validity,* the degree to which a measure of a variable corresponds to the theoretical framework of a concept. An instrument is considered to be construct valid when it corresponds to the measure of a related concept. To determine construct validity, a researcher must first identify a potential relationship between two concepts, establish a measure for each, then examine the strength of the relationship between the pair. If the relationship is significant, a measure is construct valid. If no relationship is determined, the measure lacks construct validity, as at least one or the measures must not accurately reflect or measure the phenomenon.

The fourth way to assess validity is known as *interitem association*. It relies on using multiple measures of the same concept to determine validity. Similar to the internal consistency method, it evaluates the reliability of a measure by using more than one measure of a concept within a single measurement instrument. A consistency within outcomes demonstrates the validity of the overall measurement instrument.

See *Freedom of Religion.*

Religion and Politics

Religion and politics are concepts that designate two different and interdependent subsystems of society. Although the concepts are separated analytically, the relationship between religion and politics is characterized by interdependence. A definition of religion widely accepted among social scientists is provided by Peter Berger (1967, 1999), who defines religion as a "set of beliefs that connects the individual to a community, and in turn to a sense of being or purpose that transcends the individual and the mundane." The concept of politics denominates the regulative power to make collectively binding decisions, allocate resources, and solve social problems.

SECULARIZATION AND SECULARISM
The relationship between religion and politics experienced a systematic restructuring in the context of the early modern secularization processes, which led to the emergence of the modern secular state. While the past century has seen a myriad of often contradictory usages of the concept of secularization, most social scientists today agree, at a minimum, on the historical-descriptive conception of secularization as denominating the process of *differentiation* of the secular spheres (e.g., state, law, economy, science, administration) from religious institutions and norms (e.g., the transfer of persons, things, meanings) from ecclesiastical or religious to civil or lay use, possession, or control. This conception is also closest to the etymological origin of the term. Other conceptions of secularization are of teleological nature, as used, for instance, in Berger who prognosticated a worldwide decline in the relevance of religious beliefs in social and political life with increasing societal modernization and rationalization. This conception of secularization has been refuted most prominently in the discipline of the sociology of religion, which has shown that declining levels of religiosity in the twentieth century were a phenomenon confined to Europe and thus a global exception rather than the rule. Contrary to prognoses about the "end of religion" in the twentieth century, a worldwide resurgence of private and public religion has taken place.

A third conception of secularization denominates the privatization of religion—the relegation of religious norms,

Archbishop Desmond Tutu, left, visits with African National Congress leader Nelson Mandela shortly after Mandela's 1990 release from prison in South Africa. Political and religious figures often interact with one another to serve their causes.

SOURCE: Corbis

practices, and beliefs to the private realm. John Rawls postulated that religion be taken "off the agenda" in liberal democratic politics and, in his 1993 work *Political Liberalism,* asserted that secularization as privatization is a requirement to the liberal democratic state. The Rawlsian postulate has been rejected by recent democratic theory, and Rawls himself moderated his position in a later journal article. A decisive revision of the Rawlsian postulate was undertaken by Alfred Stepan's (2001) concept of the *twin tolerations* between religion and the state. Stepan posits that democratic politics requires the separation of religious and political authority, but beyond this allows for a variety of arrangements of cooperation and accommodation between the two spheres. Democracy needs the twin tolerations, defined as mutually respected spheres of autonomy between religion and the state, "freedom for democratically elected governments, and freedom for religious organizations in civil and political society," but does not require secularity in the sense of a strict institutional separation of state and religion.

Secularism commonly refers to the division of the religious and political spheres in modern society, and therefore, contrary to secularization, to a condition rather than a process. At times, secularism denotes "an ideology or set of beliefs that advocates the marginalization of religion from other spheres of life."

RELATIONS BETWEEN POLITICS AND RELIGION IN THE CONTEMPORARY STATE

STATE REGULATION OF RELIGION

Contemporary states exhibit great variation in the formal relationships between religion and politics. Some level of interweavement of religion and politics in the modern state is the rule, while a strict institutional separation between the two is the exception. Most states entertain complex relationships between religion and politics, in that they, for instance, allow for religious instruction in public schools, provide public subsidies for private religious schools, recognize religious holidays as state holidays, provide welfare through (or in partnership with) religious institutions, grant tax breaks to religious organizations, allocate to religious institutions and authorities time in public broadcasting, and maintain or subsidize buildings and venues used or owned by religious institutions. These arrangements are prevalent in most societies, irrespective of the majority religion—they can be found around the world, whether the majority religion is Hindu, Jewish, Muslim, Christian, or otherwise. Some states even recognize an official state religion; this is the case among long-standing democracies such as Denmark, Finland, Greece, Norway, and the United Kingdom, as well as nondemocratic regimes, such as Iran and Saudi Arabia.

Within the great variance of religion-state relationships, it is useful to identify some archetypes. At one extreme of the continuum of institutional religion-state relations stands strict separation of religion and state, such as is *de jure* in the United States. Since 1947, the U.S. Supreme Court interprets the Establishment Clause as constituting a "wall of separation" between religion and state. At the other extreme of the continuum stand regimes that highly regulate religion, such as theocratic and atheist regimes. The Islamic Republic of Iran presents an example wherein religious and political authority is merged, the legal system purports to be Islamic, conversion away from Islam is punishable by death, and religious institutions (e.g., mosques, seminaries, religious schools) are highly regulated by the state. Albania between 1967 and 1989 is an example of an atheist regime, where all religions, religious organizations, and religious practice were prohibited; religious schools were closed, religious authorities persecuted. Between these extremes of strict separation on the one hand and high regulation of religion by the state on the other are several archetypes that present mixed systems.

The state is the principal authority structuring relations between religion and politics. Because state policies aim at the allocation of goods and resources as well as the solution of social conflicts, they also tend to involve some regulation of religious affairs. This is done through constitutional provisions and legislation. Because nondemocratic regimes tend to regulate society and societal affairs more intensively than democratic regimes do, this also applies to religion: nondemocratic regimes often exhibit higher levels of regulation of religion than democracies do. Due to requirements of certain rights standards in democratic politics in the realm of civil rights, human rights, and religious freedom, there are limits with regard to how much democratic regimes can regulate religion before violating or undermining their democratic foundations. Too much regulation of religion necessarily involves the violation of human or civil rights (for instance, tying citizenship to a particular religious affiliation; recognizing only certain religions and not others; limiting the rights of certain religions to organize, practice, and assemble).

Jonathan Fox (2007) has classified countries around the world with regard to the level of separation between religion and state. In its first round, Fox's Religion and State Dataset comprised five main indicators that measure the relations between state and religion (RAS) in 175 countries for the years 1990 until 2002: (1) formal establishment or nonestablishment of religion in the state, (2) regulation of the majority religion, (3) regulation of minority religions, (4) religious elements in general legislation, and (5) enforcement levels. The five indicators in turn consist of numerous subindicators. A composite score that comprises all five dimensions ranges from 0 (the lowest score, given to the United States) to 77 (the highest score, given to Saudi Arabia). RAS ranges in most democracies between 0 and 35. Long-standing democracies show great variation in the extent to which the state regulates religion: from the near absence of regulation (i.e., strict formal separation) in Australia, South Korea, and the United States to high levels in Finland or Greece. Generally, it can be observed that Christian-Orthodox states tend to exhibit higher levels of state regulation of religion than is the case in Catholic or Protestant countries. Muslim-majority countries showcase great variance in the level of regulation, between Senegal (3), Albania (8), Mali (17), Lebanon (22), and Iran (66).

Apart from the relationship between politics and religion elucidated above, religion plays a political role in contemporary states through two formal institutions: religious law and religious political parties.

RELIGIOUS LAW

Most states outside the Christian-majority world, but even several Catholic and Christian-Orthodox countries, uphold sizable bodies of religious laws and statutes. This is the case most prominently in the realm of personal status law, where issues of marriage, divorce, and custody are regulated according to positivized religious norms (for instance, in India; Israel; most Muslim-majority states except for Turkey, Albania, and the former CIS states; as well as Catholic-majority states like Ireland and Italy; and Christian-Orthodox countries like Armenia, Georgia, and Greece). Beyond personal status law, matters such as inheritance and common-law trusts are often regulated by religious law. Religious law is usually promulgated by the state or a state-instituted body of religious

authorities who are granted a mandate over the delineation of religious law.

The existence of religious law brings to light the continuing tensions that exist between liberal notions of citizenship that do not differentiate between citizens based on religion, language, or ethnicity, and the demands that religious norms continue to exert on adherents. Some of the questions related to religious law provoke the most heated normative debates. Controversies usually revolve around the extent of religious jurisdiction; which body is authorized to positivize and reform religious law; the composition of this body; the methodology of deriving religious law and the sources of law; the training and appointment of those adjudicating on the basis of religion; and ways in which national law, including religious law, can be brought in line with international human rights conventions that states have signed and ratified.

RELIGIOUS POLITICAL PARTIES

The second institution through which religion may exert a major impact on politics of the contemporary state are religious political parties, which range from Christian parties in Catholic countries, to the Hindu-nationalist Bharatiya Janata Party (BJP) in India, Jewish Orthodox parties in Israel, and Islamic parties in countries of the Muslim world. The prohibition of religious parties in democracies as, for instance, in Mali, Portugal, Senegal, and elsewhere is problematic from the perspective of democratic theory. Political parties are a constitutive element of democratic systems because of their intermediary functions of representation and aggregation of interests in processes of political decision-making. Liberal notions of democracy posit that any societal group must have the right to found and run a political party and represent their interests in politics. Not the ethos of a political party is decisive for democratization but its conformity with constitutional provisions and democratic norms, behavior, and attitudes. Constraints on political parties ought only be imposed after a party, by its actions, is proven to have violated democracy.

RELIGION AND DEMOCRACY

While most democratic theorists will agree that the values of democracy and human rights derive from extrareligious sources, democracies rely on the existence of a certain ethos for citizens to obey laws and rulers to prioritize the public good over individual pursuits. It is here that religion can play an important role. In the words of Abdolkarim Soroush, "Democracy cannot prosper without commitment to moral precepts. It is here that the great debt of democracy to religion is revealed: Religions, as bulwarks of morality, can serve as the best guarantors of democracy" (2000). While democracies need to be neutral toward worldviews, including religious views, they do rely on certain sources of morality, for which religion may be a source as well as constitutional and republican values.

Whereas the first two waves of democracy were predominantly Protestant waves, the third wave (post-1974) is often referred to as the "Catholic wave and the fourth wave

(post-1989) has involved numerous Orthodox-Christian and non-Christian majority countries with Buddhist, Confucian, and Muslim backgrounds. While the question of the compatibility of democracy with certain religions occupied a great deal of scholarship until recently, the fourth wave has given empirical credence to the argument that all religions are multivocal and can be reconciled with democratic values and human rights, if and where local religious intellectuals succeed in generating arguments within their own religious traditions supportive of such values. In turn, given the interdependent relationship between religion and politics, religious beliefs and practices evolve within the context of sociopolitical institutions. That is, the political regime type can significantly shape religious beliefs and practices in the medium to long term.

RECENT TRENDS IN POLITICAL SCIENCE RESEARCH ON RELIGION AND POLITICS

The interest for the role of religion in politics and society dramatically increased in the aftermath of the 9/11 attacks in the United States. Methodologically, empirical-analytical and institutionalist approaches have since been dominant in the study of religion in comparative politics. In more sociological accounts, the religious economy approach has been popular, which treats religious organizations as firms competing in a religious market to increase or maintain their adherents. Research agendas focus on the function, collective actions, and political significance of religious actors, religious movements, religious authorities, and religious political parties in domestic and international politics.

Three research programs are particularly salient in the literature on religion and politics:

1. *The relationship between religion, religious actors, movements, and institutions on the one hand, and the state on the other, and the impact of this relationship on a number of issues: regime stability, development, and rights standards.* Of particular interest is the extent to which state regulation limits religious freedom, how state regulation of religion impacts regime stability and erosion, and how the provision of welfare by religious authorities affects the quality of citizenship and, in turn, regime stability.

2. *The transnational character of religion.* Religion increasingly crosses national boundaries and exerts an impact as a transnational phenomenon on domestic politics. For a long time, the Catholic Church functioned as the largest transnational religious organization, which until today with very few exceptions controls clerical appointments and finances across the world from its center in the Holy See and enjoys the status of a sovereign entity in international law. Besides the Catholic Church, numerous Protestant, Islamic, Jewish, and Hindu movements have begun to catch the attention of political scientists as transnational actors. Research in this area focuses on the effects of the charitable nature of transnational religious movements, as well as violent and terrorist religious activism.

3. *Religion as an independent variable in peace and conflict studies.* Studies concentrate on the question of whether religion and religious actors contribute to the emergence, continuity, or management and solution of conflict. The results of these studies show that (a) religion lends itself to the political instrumentalization for the mobilization and polarization of conflicting parties (examples reach from post-Hussein Iraq to conflict on the Molukkas in late 1990s to Darfur), but also (b) religious authorities can function as powerful managers and mediators in violent conflicts (as happened in apartheid South Africa, post–genocide Rwanda, and post-independence East Timor).

Religious Minorities

In 1843, Karl Marx announced, "Religion is the sigh of the oppressed creature, the heart of a heartless world, just as it is the spirit of spiritless conditions. It is the opium of the people." And it seemed that a little more than one hundred years later, many Westerners had kicked their religious habits. Shortly after Marx, God's obituary writer Friedrich Nietzsche famously stated that God was dead and that we had killed Him, and by the 1960s, religion was indeed supposed to be dead. In 1967, Martin E. Marty (2004) suggested that spirituality as a topic of public discourse had been abandoned in that decade; however, religion turned out to be the great vanishing act of the twentieth century, reappearing in a flood of intolerance. The past two decades have seen a dramatic resurgence in religious interest, and religious minorities have been at the center.

RELIGIOUS FRAGMENTATION

For most of the twentieth century, the principal interest in religious minorities was as a sociological group deserving of particular rights, but of little interest to politics other than that, and an array of international, regional, and national declarations and laws were introduced to protect their rights. Gradually accepting its marginalization in relation to the state, Western Christianity relinquished most of its political functions to the state and loosened hold on the status of national religion, while religious minorities increasingly demanded recognition.

This move to a religious level playing field had the dual benefits of recognizing emerging minority rights while neutralizing religious influence on the national political scene, or so it seemed. Jonathan Fox (2008) argues that religious discrimination has, in fact, increased since 1990, and he offers six major reasons: policies of domestic protection from external influence, religion seen as challenging the state, perception of religious movements as dangerous, religion already linked to national identity, existence of a symbiotic relationship between religion and state, and state religion itself creating discrimination against competitors.

Religious resurgence has fragmented majority religions into minority groups from within and led to the emergence of new religions. Some religious minorities are dismissed universally as a cult, and new religions are frequently ridiculed or discriminated against. They can be perceived as dangerous cults like the Branch Davidians and Aum Shinrikyo, as harmful like

the Unification Church or Scientology, and as disruptive like Islam fundamentalism. Other religions, such as the Jehovah's Witnesses and Mormons, are treated as borderline sects. Religious discrimination also may overlap with ethnic discrimination, such as in the case of Jews and Sikhs, and create further problems of classification.

VARIETIES OF RELIGIOUS EXPERIENCE

This has played out differently around the globe, and William James' phrase "the varieties of religious experience" is more apt than ever. Samuel Huntingdon (1993) argues that religious resurgence is a response to urbanization and massive social changes in the twentieth century. As people feel more alienated, religion provides meaning and identity. In the Western consumer culture, it has come back as consumer choice, and as the major political blocs of communism fell, religion filled the void. The religious wars of old gave way in the late twentieth century to new forms of religious terrorism and ethnic cleansing. States also have agonized over more subtle issues like the role of religious dress in schools and in public.

Islam is at the forefront of this debate. The watershed Iranian Revolution (1979) marked the rise of a more globally visible Islam, becoming politically important because of its impact on Arab politics where it is dominant and a concern where it is a minority, particularly in the West. The 9/11 attacks, other acts of extremism, "hate speeches," the Danish cartoon controversy, and the killing of a Dutch filmmaker have highlighted the tensions in liberal policies of multiculturalism and tolerance. Yet, Islam today is not just about fundamentalism, for there has been a general revitalization of the faith. In the areas of immigration, education, and use of Islamic law there has been a desire of Islamic minorities to hold onto their faith in non-Islamic cultures. Many Muslims reject secularism and want to promote Islamic non-Western values and identity, eschewing hierarchy while balancing transnational and local ideas.

Christianity remains the world's largest religion, but continually splinters into minorities largely because of liberal and conservative differences on theological and cultural matters. The most significant today is evangelical Pentecostalism, which is growing exponentially in Africa, Asia, and South America to the point of shifting the center of Christian gravity. Hence, in Central and Latin America, evangelicals have challenged hitherto Roman Catholic dominance and become an important political influence promoting conservative and laissez-faire ideals, while conservative Anglicans in America have sought communion with dissenting African bishops over issues like homosexuality.

A SEARCH FOR TOLERANCE

The secularization thesis that wealthy societies would repudiate religion as people found their comfort, or opiate, elsewhere, no longer prevails. Perceiving a failure of secularism and liberal democracy, religious minorities have challenged both political and religious orthodoxy. Religious minorities challenge the Western universalist model of religion as a private sphere where all religions are merely different spiritual paths. The problem is that religions make truth claims that often conflict with liberal ideals, cultural trends, and other faiths, and that stray from the parameters acceptable to liberal tolerance. For instance, debates with feminism, sexual ethics, animal rights and ecology bring religious minorities and liberal values into conflict over other rights, such as the role of women in religious life, abortion, ritual slaughter, and stewardship of the earth's resources.

It is increasingly recognized that identifying an individual or group purely according to religious identity begs gross oversimplification. People belong to gender, class, nation, and various other identifiers, wherein they may hold as much in common as they have in religious difference. It is also an oversimplification to assume there is a singular faith, for each faith is multifaceted. In this spirit, some religionists react by generating interfaith dialog and understanding, arguably the converse of twentieth century relativism. By working together, even agreeing to disagree, they believe tension and conflict can ultimately be transformed into harmony. Religions represent different truth claims, but they are also a human search for ultimate meaning. Thinkers and policy makers who thought we would grow out of it ignored this very core of religion, but the general resurgence of religion and the burgeoning of religious minorities demand a new search for tolerance in the early twenty-first century.

Religious Parties

Religious or confessional parties are political formations that promote religious ideas, symbols, policies, and goals. Whereas religious parties make religion central to their activity, other parties use religion and religious symbols to gain additional electoral support, without making religion their main concern. Their social base is represented by the religious group whose interests they represent, but often their sympathizers include religiously neutral or inactive individuals.

In the past century, religious parties have emerged in democracies and nondemocracies alike. The historical context of anticlericalism, the political role of the clergy, the minority or majority status of the religion, and the structure of the political and party systems have contributed to their appearance. Religious parties are differentiated not so much by the form of government in which they operate as by the religion they advocate for and the role they envision for religion in society.

CHRISTIAN RELIGIOUS PARTIES

Christian religious parties originated in the nineteenth century. In his 1891 encyclical *Rerum novarum,* Pope Leo XIII advocated the creation of Catholic popular organizations, a call heeded by Catholics in Europe and Latin America. In time, Catholic organizations turned into parties seeking to determine their countries' political agendas. Christian Democrat parties have played important political roles after World War II (1939–1945). While European Christian Democrats advocate center-right policies, Latin American Christian Democrats are center-left in orientation.

In western Europe, Christian Democratic parties emerged in countries where Catholics constituted a large part of the population, but secular forces (Belgium and Italy) and Protestant ones (the Netherlands) challenged the Catholic influence on social and educational policy. In Italy and Germany, Christian Democrats represented the mainstream social–conservative political forces tied to the dominant Catholic Church; in Sweden, they surged as a center-right force linked to the minority evangelical Free Churches. While the proportion of Catholics in western Europe remains high, few of them are practicing, thus leaving room for the mobilization of liberal or socialist secular political forces. In eastern Europe, Christian Democratic parties appeared as a result of renewed religiosity. While in the 1990s Christian Democrats briefly formed the government in Romania and Bulgaria, they could not retain the support of societies that believed that religion should be separate from politics. Though present in other postcommunist countries, Christian Democrats have played no significant political role.

In Latin America, Christian Democrats embrace a liberation theology agenda, rising against formations that challenge the place of religion in society and advocating a capitalist economy. Among the strongest is the Chilean Christian Democrat Party, which supports a strong national government and legislative proposals that bridge communism and capitalism. In other countries, Christian Democrats have embraced statism and have abandoned their roots in Catholic social thought.

JEWISH AND ISLAMIC RELIGIOUS PARTIES

In Israel, religious parties have aimed to establish a Jewish state governed by the Jewish religious code, the *halacha.* These parties consider the Jewish colonization of Greater Israel (Eretz Israel) legitimate and oppose the creation of a Palestinian state. Religious parties registered their greatest success in the 1999 elections, when together they won 21 percent of Knesset seats. The oldest party, Agoudat Israel, was created as an ultraorthodox Ashkenazi party to advocate strict observance of religious law. Its successor, the Sephardic Torah Guardians (Shas), advocates Jewish colonization of the occupied territories. Until its dissolution in 2008, the National Religious Party (Mafdal) supported all government coalitions, occupying the Ministry of Interior and Religion and initiating most religious legislation in Israel.

Islamic religious parties have gained prominence in reaction to U.S. policies in the Middle East. U.S. intervention has radicalized some Muslims in Algeria, Egypt, Iran, Iraq, Lebanon, Pakistan, Palestine, and Turkey. The rise of political Islam has been most marked in the countries most closely linked to the United States. In Iraq, the Da'wa and the Islamic Mission Party represent the southern Shiite community. In 2002, a right-wing coalition of Pakistani religious parties (the Muttahida Majlis Amal) won parliamentary representation and formed ultraconservative and pro-Islamist provincial governments in two provinces bordering Afghanistan. In Egypt, the nominally banned Muslim Brotherhood became the official opposition in 2005. The poor often feel that religious parties represent justice, integrity, and equitable resource distribution, hence the strong showing of Hamas in Palestine, the dramatic rise of Hezbollah in Lebanon, and the electoral triumph of the Justice and Development Party in Turkey.

The persistence of religious parties baffles researchers. The increased secularization of European societies should drastically reduce the social basis of Christian Democratic parties, while the rise of Islamic parties following the invasions of Iraq and Afghanistan should diminish these parties' support once the foreign intervention is over. Despite expectations, Christian Democrats have registered tremendous success and have showed resilience in secular and democratic Europe, discarding their initial principles and objectives to become secular forces governing secular societies. Similarly, voters continue to support parties that advocate a greater role for Islam in the political and social life of Middle Eastern countries.

Despite worries that they oppose tolerance and pluralism, moderate religious parties can coexist with democracy. The institutional context, electoral politics, party unity, party rules and leadership, and political learning explain why religious parties become moderate or radical (extremist), regardless of the religion to which they adhere. This observation is important because moderate religious parties may contribute to democratic stability, but the extremist ones can undermine liberal

democracy. As studies on religious parties in secular Israel and Turkey demonstrate, religious parties do not emerge as a religious liberal alternative to authoritarian secular nationalist ideologies, despite their capacity to expand the boundaries of political discourse. In emerging democracies, by contrast, the rise of religious parties is more worrisome. When radical religious parties win critical elections in emerging democracies, they can stall and even reverse democratization by imposing theocratic authoritarian institutions.

Religious Persecution

Religious persecution can be broadly defined as an action that either obstructs or inhibits religious practice or that seeks to impose particular religious or antireligious norms. Students of religious persecution disagree about what constitutes persecution; some scholars consider any adversity caused due to religious belief to be persecution, while others have suggested more stringent criteria of bodily harm, displacement, or death. Either the state or a particular religious or social community may serve as the primary agent of persecution. In cases where subnational groups engage in persecution, the national government may either be complicit in the activity or unable to stop it.

The most extreme form of persecution consists of a direct campaign against either a particular religious group or against all persons who do not belong to a dominate faith position in a territorial area. Either through genocide, forced migration, or forced conversion, such campaigns attempt to eliminate the targeted religion(s) from a particular area. The Spanish Inquisition by Catholic monarchs, Ferdinand and Isabella, against Muslims, Jews, and nonconformists, is one of history's best known examples.

More commonly, persecution undermines religious freedom rather than directly assaulting it. In many cases the state's regulatory power imposes burdensome restrictions that inhibit the ability of adherents to practice their religion; for example, by consistently refusing to allow the construction of places of worship. In other instances, the state may deny benefits, services or opportunities to the targeted group. The state also may restrict freedom by compelling its citizens to follow a specific set of norms, such as the explicit prohibition of the religious attire of a part of the population or the requirement that all residents of a state conform to religious standards of the majority.

Powerful substate actors also engage in religious persecution. In some cases, the state tacitly allows or encourages social or religious communities to carry out persecution. A state might formally provide for religious freedom, but allow a dominant social community to informally exclude other religious communities from opportunities such as employment, or allow a campaign of intimidation by failing to sanction acts such as the destruction of places of worship. Substate persecution is also a common feature in weak or failing states. In these instances, persecution frequently takes on a violent character and often is linked with ethnic or regional conflict. One example is Lashkar Jihad's assault on Christians in Indonesia's Maluku Islands.

The principle of religious freedom as a human right is enshrined in Article 18 of the 1948 UN Universal Declaration of Human Rights and again in the binding International Covenant on Civil and Political Rights, ratified in 1977. These conventions guarantee all persons equality of treatment regardless of religious beliefs or the lack of such beliefs, and freedom of exercise in matters of conscience except when this causes a specific conflict with social order. A variety of theories have been advanced to account for the development of the acknowledged right to religious freedom, and the classification of denial of such rights as persecution. One widely held theory credits a rise of Enlightenment liberalism and mass identification with a national state, along with a corresponding decrease of the importance of religion to identity. Other scholars have challenged this explanation, contending that a form of rational-choice theory in which individual states allow religious freedom when the benefit to the state outweighs the cost provides a better explanation.

Despite the assertion of freedom of religion as a human right, governments still claim to legitimately enforce laws that restrict some aspects of religious practice. The most common justification comes from balancing a right to religious freedom against other functions of the state. In such instances the state contends that some other fundamental interest of the state trumps its population's right to religious freedom. Controversy persists regarding which restrictions are legitimate exercises of state authority, particularly when a state possesses an explicitly secular or religious identity.

Much attention has been focused on religious persecution in countries that incorporate *sharia* law into their legal systems. Enforcement of provisions prohibiting Muslims from leaving Islam has been particularly scrutinized. Consistent with an understanding that allows fundamental state interests preference over religious liberty, many states in the Islamic world made reservations to Article 18 of the Covenant on Civil and Political Rights, agreeing to follow the article only insomuch as it is consistent with their interpretation of sharia. Religious constituencies in the United States have called for these restrictions on religious freedom to be officially opposed as religious persecution in U.S. foreign policy.

Religious persecution is officially condemned both by the United Nations and by many of the world's most influential nations. However, despite the fact that religious persecution is criticized as a violation of fundamental human rights, active opposition to persecution is routinely evaluated against both other foreign policy goals and against what can be realistically achieved by such opposition. Citizens of strong states who experience religious persecution frequently have little remedy in practice.

Religious Right

The *religious right* refers to the political movement of Christian conservatives, most of whom are evangelical Protestants, which began in the United States in the 1970s, gathered momentum in the 1980s, and became institutionalized in the 1990s. Some supporters actually see the term *religious right* as derogatory, preferring instead the appellation *profamily movement.* The religious right is best classified as a social movement, although many of its social movement organizations are well-established interest groups. The movement is perhaps most noteworthy for the significant extent to which it has mobilized grassroots activism at the state and local levels, especially in recent years. Although the religious right has not brought about large numbers of substantial, transforming policy victories, the movement has had great success in affecting electoral outcomes from the top of the ballot to the bottom. The roots of this success lie in the religious right's thoroughgoing partisan realignment of millions of evangelical Protestant voters. At least three-quarters of all evangelicals are Republicans.

RELIGIOUS AND POLITICAL ORIENTATIONS

From a religious perspective, evangelical Protestants are distinctive in three major ways. First, they take the conservative view that scripture is the revealed word of God. Second, they emphasize the "born-again" experience, in which Jesus Christ

is intentionally accepted as one's personal savior. Third, they engage in evangelism, which means that they actively seek to convert others to Christianity. They constitute 25 to 30 percent of the U.S. population, and their numbers have grown steadily since the 1970s.

The religious right's political and social agendas traditionally have been rooted in an overriding desire to preserve a traditional, nuclear, heterosexual model of family. The movement's opposition to abortion and gay rights is well known and rooted in a worldview that rejects nontraditional interpretations of gender roles, family structure, and sexual morality. Certain factions of the movement also emphasize education policy (including advocacy of home schooling and the battle over biology and sex education curricula in public schools), religion's place in the public square (by supporting school prayer and other public expressions of Christian faith), and obscenity in the media.

THE EARLY YEARS

Evangelicals first attracted attention as a political force in 1980 when they voted in large numbers for Ronald Reagan. Their intense and sudden mobilization in that election year marked a sharp departure from a long-standing evangelical tradition of political avoidance. For generations, evangelical Protestant leaders had argued that politics was a dirty and sinful forum; Christians, they felt, were better served by avoiding politics. Events of the 1960s and 1970s, however, caused a sea change in evangelical opinions about the propriety of political participation. Many evangelicals felt threatened by the sweeping social changes of the 1960s. They lamented the U.S. Supreme Court's decisions decreeing school prayer unconstitutional and abortion constitutional. There was also great disappointment in evangelical circles with the presidency of Jimmy Carter, a professed born-again Christian and Sunday school teacher. During the 1970s, evangelical leaders began to conclude that their political views were not being represented by what they viewed as an increasingly secular American government.

Evangelical Baptist minister and religious broadcaster Jerry Falwell noticed this sense of unease and responded to it by founding the Moral Majority, an interest group designed to represent religiously and politically conservative Americans. Along with several smaller interest groups, the Moral Majority mobilized millions of evangelicals to vote for Reagan in 1980 and attracted substantial attention (first from the media, later from scholars) to itself and its high-profile leader. For example, Falwell was listed among the ten "Most Admired Men in America" in *Good Housekeeping* magazine several times in the 1980s. As the decade wore on, however, the religious right began to lose some of its energy. Several evangelical religious broadcasters became embroiled in various sexual and financial scandals in the late 1980s, and despite its great visibility, the Moral Majority had won few victories on Capitol Hill. Falwell disbanded the Moral Majority in 1989.

THE CHRISTIAN COALITION

A new leader emerged in 1988 to lead the religious right into the next decade, however: Rev. Marion "Pat" Robertson. A

Yale-educated lawyer and religious broadcaster, Robertson made a surprisingly strong run for the 1988 Republican presidential nomination (he came in second in the Iowa Caucuses, ahead of George H. W. Bush). His presidential bid ultimately failed, but Robertson used the momentum his campaign had generated to launch a new interest group to represent the religious right—the Christian Coalition. Robertson's organization went on to become one of the most powerful lobbies in Washington in the 1990s. Its lobbying tactics were much more refined than those of the Moral Majority. It also solidified evangelical voters' commitment to the Republican Party and its candidates, in large part because of the voting guides it published and distributed in evangelical churches across the United States. The Christian Coalition is a shadow of its former self. It has endured many changes in leadership, a dramatic falloff in membership and fund-raising, and a messy (and ultimately unsuccessful) battle with the Internal Revenue Service, which accused the organization of illegal electioneering because its voter guides almost always scored Republican candidates favorably and Democratic candidates unfavorably.

Despite the decline of the Christian Coalition, the religious right remains alive and well as a force in American politics. Its strength lies not in one visible national-level organization but in its sophisticated networks of evangelical (and, increasingly, traditional Catholic) activists at the state and local levels. Many conservative Christians have been elected to school boards, city and county government posts, and state legislatures. Conservative Christian activists also hold enormous sway over many state- and local-level Republican Party organizations. The primary strategy of the Bush-Cheney reelection campaign in 2004 focused on mobilizing so-called values voters, a code word for conservative Christians, in battleground states. The religious right displays little of the Moral Majority's political inexperience. Instead, conservative Christians are savvy participants in the American political process.

Renner, Karl

Karl Renner (1870–1950) was an Austrian socialist who was the chancellor of the Austrian Republic from 1918 to 1920 and president of the Second Republic from 1945 to 1950. During his first term he signed successive peace treaties yielding Austrian territory to Czechoslovakia and Italy. In 1919 he was summoned by the Entente to sign the Treaty of Saint-Germain, which concluded World War I (1914–1918). The treaty contained a clause prohibiting Austria's union with Germany. As Renner supported the annexation of Austria by Germany, he thereupon resigned. Even after losing his office, Renner advocated Austria's entry into the League of Nations. He became leader of the Social Democratic Party's right wing in the 1920s and was president of the lower house of parliament from 1930 to 1933, a period that also witnessed the rise of the Nazis in Germany. In 1938 he supported Adolph Hitler's Anschluss, the political union of Germany and Austria.

Upon Germany's defeat in World War II (1939–1945) and the occupation of Vienna by the Soviets in 1945, Renner formed a provisional government under Soviet auspices and became the first chancellor of the Second Republic.

Renner wrote the *Osterreichs Erneuerung* in three volumes in 1916 and his memoirs, *An der Wende Zweier Zeiten,* in 1946. With his classic work on jurisprudence, *Rechts-Institute des Privatrechts und ihre soziale funktion* (1929), he became one of the founders of the discipline of sociology of law. As an authority on private and public rights, he applied Marxist theory to command economy and the role of the new middle class. Renner was a preeminent statesman-scholar who played a major role in preserving Austrian national identity after two world wars.

Rent-seeking

Rent-seeking, broadly conceived, is the allocation of resources by people or organizations in the pursuit of rents created by the government. The conceptual framework of rent-seeking emphasizes the net welfare loss to society because of intervention failure. An increased economic and financial regulatory role of the government is blamed for encouraging and rewarding unproductive activities, such as lobbying for protection, competing for import licensing, and persuading legislators to enact barriers to domestic entry, to allocate income to the target interest groups.

The term *rent-seeking* was coined in the 1970s, a time of academic and intellectual reassessment of prevailing Keynesian

economics, which allows for an economic regulatory role for the government. With the end of the Bretton Woods system in 1973, free market or laissez-faire economic literature, emanating primarily from the Chicago school of economics and its prominent scholar Milton Friedman, advocated for a limited role for government in economic affairs. Monopoly and monopoly-inducing legislations were perceived as the antithesis of competition and free market activities. The prevailing literature at the time cited primarily the net welfare loss to society because of diverting resources from production through lobbying, or what was later termed as *rent-seeking*.

Gordon Tullock (1967) first explored the implication of rent-seeking behavior on conventional welfare as a result of tariffs, monopoly, and theft within the tradition of positive economic analysis and public choice theory. Ann Krueger (1974) officially coined the term *rent-seeking* and focused on government interventions in developing countries with respect to quantitative restrictions on international trade. Richard Posner (1975) went a step further and contended that there is a higher social cost from public regulation than there is from private monopoly. Jagdish Bhagwati (1982) tried to expand the term to include a synthesis of market-distorting activities, including rent-seeking as a subcategory. Rent-seeking also has been cited as a possible explanation for the reported increase in government expenditure as a percentage of GNP between 1960 and the 1990s.

Two of the most cited examples of rent-seeking relate to lobbying activities of dairy farmers and the automobile industry in the United States. Lobbying activities by dairy farmers include milk price support and other agricultural policies that are ultimately taken up by the consumer through higher costs. U.S. import restrictions on automobiles support the stakeholders and workers of the automobile industry while disadvantaging the consumer. Gordon Tullock (1993, 2005) cited the lack of information, ignorance, romanticizing of farm life in the American psyche, and the patriotic ideologies that weaken voter resistance to such legislations as possible explanations for the continuation of lobbying and other rent-seeking activities of both industries.

Reparations

Reparations are a long-standing legal, moral, and cultural concept that has, in recent years, attracted considerable attention from human rights advocates, political leaders, survivors of atrocities, and researchers.

DEFINING REPARATIONS

Scholarship on reparations, or redress, has struggled to address widespread confusion and disagreement over the meaning of key terms of debate. Given the notoriety of the punitive extraction of monetary reparations from Germany under the Treaty of Versailles, the term *reparations* often is equated with forced financial compensation. However, under international law, as reflected in the United Nations Basic Principles and Guidelines on the Right to a Remedy and Reparation for Victims of Gross Violations of International Human Rights Law and Serious Violations of International Humanitarian Law, *reparations* is an umbrella term covering five different types of redress: restitution, compensation, satisfaction, rehabilitation, and guarantees of nonrepetition of the offense. Restitution has traditionally been viewed as the preferred form of redress where attempts are made to restore the conditions that existed prior to a violation, such as by returning lost land or artifacts. Compensation entails monetary payment for material or moral injuries, and satisfaction attempts to redress moral injuries through a range of potential mechanisms, including truth commissions, public commemorations, and apologies. While rehabilitation involves delivering assistance, such as medical and social services, as a form of redress, guarantees of nonrepetition may entail institutional and legal reforms designed to prevent future violations.

In contrast to this legalistic approach, some scholars underscore the deep roots the idea of reparations has in different cultural traditions and ethical and religious frameworks. Some contend that the legal tools of remedy are "all different levels of acknowledgement . . . by perpetrators for the need to amend past injustices," and define reparations as the "entire spectrum of attempts to rectify historical injustices.'" (Barkan 2001, xviii, xix).

LEGAL FOUNDATIONS

It is a basic maxim of law that harms should be redressed, and every legal system requires that this obligation be met in some form. The right to a remedy may be considered a secondary right that follows from a breach of primary rights, such as the right not to be tortured. The 1928 Permanent Court of International Justice *Chorzów Factory* decision established the basic remedial norms for violations of international law. The ruling stated that "reparation must, so far as possible, wipe out all the consequences of the illegal act and re-establish the situation that would, in all probability, have existed if that act had not been committed" (PCIJ 1928; Shelton 2002, 835).

International law has historically focused on reparations as a tool to remedy wrongs between states, a perspective reflected in the International Law Commission Articles on State Responsibility. Yet, depending on the actors involved and

the relevant legal and political frameworks, reparations claims may be made by and against a range of actors, including individuals, ethnic or community groups, states, corporations, and international organizations.

Most contemporary reparations campaigns attempt to secure reparations for individuals, often in large groups, from states that have violated human rights. The individual's right to redress under international law evolved out of the post–World War II (1939–1945) human rights regime and is reflected in agreements like the Universal Declaration of Human Rights and the International Covenant on Civil and Political Rights. However, respect for the individual's right to redress has been limited by a lack of effective and accessible enforcement mechanisms at the international level and often at the domestic level.

THE MODERN REPARATIONS MOVEMENT

Despite the absence in many cases of effective and accessible judicial mechanisms, various survivor groups have, in recent decades, met with notable success in generating public support for their reparations campaigns and creating pressure for politically mediated solutions to their claims. The negotiation of a compensation agreement in 1952 through which West Germany provided redress to both the state of Israel and individual Holocaust survivors often is identified as the first major example of a modern reparations process. However, the emergent reparations movement mostly stagnated until the 1990s when Holocaust survivors filed class action suits in U.S. courts against three leading Swiss banks for their complicity in the Holocaust. Although ultimately resolved out of court, this campaign prompted renewed interest in the rectification of historical injustices and propelled various complex reparation claims onto national and international political agendas, including the cases of Korean women sexually enslaved by the Japanese Imperial Army in World War II, Japanese Americans interned during World War II, and the abuse of indigenous peoples in Australia, Canada, New Zealand, and the United States. Long-standing debates on reparations for slavery were reignited in the United States, while South Africa struggled to come to terms with and redress the legacies of apartheid.

The past two decades also witnessed the development of new types of institutions intended to redress historical injustices, including truth and reconciliation commissions, internationally supported compensation commissions, and property restitution commissions designed to facilitate the return of real property to displaced persons. This period also saw the development of more community-oriented, collective approaches to redress. While reparations advocates and scholars initially focused predominantly on cases involving affluent Western democracies, the reparations movement has broadened to include a stronger focus on cases in the global South, solidifying the connection between reparations politics and transitional justice.

THEORETICAL DEBATES

Among other issues, theoretical debates on reparations have focused on the contention that "struggles over recognition are displacing struggles over redistribution" (James 2004, 884). Related scholarship probes the possibility that the reparations movement represents what Torpey (2006) calls a "juridification of politics" and an inevitably backward-looking perspective that detracts liberal attention from the pursuit of a more just society for the future.

Representation, Descriptive

See *Descriptive Representation*.

Representation and Representative

Representation is one of the more vexing, even mysterious, concepts in politics. How can a political system make present that which is not present? To many political thinkers it is an impossibility. Jean-Jacques Rousseau, for one, simply believed that "the instant a people chooses representatives, it is no longer free; it no longer exists." And, yet, the idea of providing a coherent understanding of representation is one of the central endeavors of modern thought and appears to be absolutely essential in our judgment of the legitimacy of modern,

representative democracy. Indeed, without a proper appreciation of representation it is hard to see how any government can be considered a democracy. Of course, the idea of representation and the importance of someone or something standing for something else exists in the political practices of many types of regimes.

REPRESENTATION: TWO DIMENSIONS

The concept of representation is a complex one; however, there are two fundamental ways in which we employ the idea. First, what is being represented—an individual, a district, or the nation itself? Thus, a president or monarch can stand for the nation, or a flag symbolize a country, and a U.S. senator represent a state. Second, representation is judged on whether it is authorized or it is typical. Thus, certain people are authorized to act on behalf of others—a lawyer is authorized to represent a client and a congressman legally represents constituents. In this way, someone or group of people consent to the representation. However, we can ask also if something or someone can be representative because it is typical of or has the same traits of some other group. For instance, we can ask if a legislature reflects the entire population with regard to race, ethnicity, or gender. Of course, it is an open question as to what characteristics should be regarded as needing representing when evaluating how representative something is. In the case of typical representation, the judgment is about institutions because we must ask what is typical of bodies and not individuals. Furthermore, this form of representation as typical may not require the consent or involvement of those who are represented.

THE REPRESENTATIVE: DELEGATE OR TRUSTEE

It is often said that the ancients had no clear notion of representation, and the first major political theorist to wrestle directly with the idea was Thomas Hobbes. His thoughts on representation highlight many of the key ideas and problems associated with the concept ever since. If one person can represent another person, or group, what is the exact relationship between the representative and those he represents? What does the appointment of the representative entail—what is he or she authorized to do. The classic formulation is that representatives are either delegates or trustees. By delegate we mean someone who is delegated to present the political beliefs or ideas of the represented group. Whatever the representative's personal belief is matters not; what is of prime importance is that the person should reflect the views of those being represented. The trustee model departs sharply from delegate mode. The most famous and eloquent proponent of the trustee model is that of Edmund Burke, who argued that representatives are chosen for their judgment and wisdom. Furthermore, Burke argued that in whatever body representatives gather (e.g., parliament, congress), deliberation must take place. Because that is the case, the collective reflections and considerations of that body must not be compromised by the parochial interests that may be well represented by the delegate model.

Yet, this simple dichotomy is only partially helpful. The task of a representative in the delegate model is severely constrained by the practical question of knowing what the constituents actual want. Is there any good way to know what it is that they believe? Do the constituents have all the facts, have they reflected on those facts, and can they even appreciate the collective deliberations undertaken in the hearings, committee meetings, and constant debate that occur in legislatures? Furthermore, even if one could know what the majority of one's constituents believe, what of the minority? In what sense are they represented? Have they lost representation if the representative votes against their desires? Such questions seem to push us to some notion of representatives as trustees. After all, we know that the average citizen has only limited interest in and knowledge of the day-to-day world of politicians. If that is the case, whatever we may say is the correct understanding of representatives, they function as trustees at least some of the time.

Finally, as an empirical question, research has shown that representatives balance these two ideals in their actions. What then becomes of paramount importance is how representatives are held accountable for their actions—which would lead us to consider the issue of elections or the reappointment process however defined. Hence, from this perspective, representation is vital to our understanding of the health of political regimes and their overall legitimacy.

REPRESENTATION AND MISREPRESENTATION

In considering this broader question of the health and legitimacy of the political system, representation directs us to think about what would be a good representation of the people and what would be misrepresentation of the constituents. In some sense, if the selection process is fair, then misrepresentation is impossible—the representative has the legal office and what that person does is binding, and constituents' only recourse would be at the reappointment moment. Yet, to many, this seems wrong. There is the notion, at least in democracies, that the people are sovereign at all times. If that is the case then regardless of the time, whatever the actions of the representative may be, they are continually subject to the judgment of the people. For only the people have the authority to act. If this is so, the issue of accountability is paramount for representative democracy. Indeed, the failure of a representative to act correctly can be subject to continual evaluation, and, despite the recourse to elections, clear violations of the duty of the representative can lead to a recall or even, if need be, rebellious acts. In an increasingly complex and diverse world, the quality and opportunity for input from the citizens is vital. The effort to find new and effective ways to enlist voting and participation is essential in making democracy work. Thus, in recent years, various political entities (e.g., states, localities) have experimented with voting through the mail or via the Internet. If these ways are not successful, Rousseau's original challenge to the very idea of representation will stand as an indictment of modern democracy.

Representative Democracy

The term *representative democracy* was coined in France and America in the age of constitutional revolutions; its implementation as a form of government began at the local level—township government in New England and, after 1789, municipal government in Paris.

EIGHTEENTH CENTURY BEGINNING

Since the beginning, representative democracy was perceived as peculiarly modern and either prized as an alternative to democracy or criticized as mockery of the government by the people. Although we do not know for sure who first spoke of representative democracy, the Marquis d'Argenson, a foreign minister under Louis XV, was among the first who described the characteristics of this form of government and judged them favorably. As he wrote in his *Considérations sur le gouvernement ancien et present de la France* (1765):

> False democracy soon collapses into anarchy. It is government of the multitude; such is a people in revolt, insolently scorning law and reason. Its tyrannical despotism is obvious from the violence of its movements and the uncertainty of its deliberations. In *true democracy,* one acts through deputies, who are authorized by election; the mission of those elected by the people and the authority that such officials carry constitute the public power.

Like d'Argenson, Gabriel Bonnot de Mably and Alexander Hamilton used the term *representative democracy* (in 1766 and 1777 respectively) as a corrective of "pure" or "absolute" or "monstrous" democracy. A very different perspective can be found in Jean-Jacques Rousseau's *The Social Contract* (1762). Indeed, although Rousseau did not deem democracy a good form of government, he excluded categorically that representative government was legitimate: this made him the inspirer of a theory of participatory democracy as opposite to representative democracy.

Rousseau derived this view from a juristic conception of sovereignty that had in Jean Bodin its most authoritative interpreter in modern Europe. According to Bodin, whose goal was to conceptualize the absolute power of the monarch, because the will is the source of sovereignty and cannot be represented, for the sovereign to preserve supreme power, delegates or procurators must not have an autonomous will or become "representatives." Drawing on this conception, Rousseau concluded that either the elected are delegates with imperative mandate or they are representatives with no mandate at all: but the former only entailed a legitimate form of indirect political autonomy because it did not deprive the people of their sovereign will. Rousseau reached surprisingly similar conclusions as le Baron de Montesquieu, the mentor of liberal representative government, who merged self-government (sovereignty) and direct government (democracy) and created a firm opposition between representation and democracy. Montesquieu's formulation has became paradigmatic of those theorists who deemed representative democracy an oxymoron: a government is democratic if "the people as a body have sovereign power" and if "the people alone . . . make laws" (10, 1989). England was a model of good (i.e., moderate) government because it was constitutional and electoral; that is to say, neither absolute nor direct or pure (wherein it was clear that democracy was both).

REPRESENTATIVE GOVERNMENT AND REPRESENTATIVE DEMOCRACY

Yet another important distinction emerged in the eighteenth century between representative *government* and representative *democracy*. Although both terms were sometimes used synonymously, the more perceptive political leaders were aware of the semantic difference between the two. Emmanuel-Joseph Sieyès and the authors of *The Federalist Papers* used the term *representative government* instead of *representative democracy* because they perceived representation as a welcome strategy to disentangle the principle of legitimacy by popular consent from people's direct participation. Sieyès brought Rousseau's perspective into the representative context and perfected the metamorphosis of the citizen into the elector and the sovereign-people into the sovereign-nation, which was given unity and voice by the elected assembly. *Federalist No.* 63 argued that representation made possible "the total exclusion of the people, in their collective capacity" from any share in the power of making laws and concluded that this contributed in making modern republic more secure than the ancient ones.

Both the axioms held by the Federalists and Sieyès and those held by Montesquieu became canonical, and the adoption of universal suffrage in the twentieth century did not alter the perception of the undemocratic nature of a system whose basic arrangements have remained the same since its inception, when it was a government of notables elected by few privileged voters. Along this line, contemporary political theorists have defined modern democracy a *government by discussion* in which voting for representatives (rarely on issues) is the only direct power to which adult citizens are always entitled. But, as Benjamin Constant observed in 1814, it is paradoxical to call it democratic, for the only moment the citizens decide directly is when they delegate their lawmaking power. Consequently, the function of elections, Giovanni Sartori wrote in 1965, is "not to make a democracy more democratic, but to make democracy possible. Once we admit the need for elections, we minimize democracy for we realize that the system cannot be operated by the *demos* itself" (108). Thus whether the government of the moderns is democratic depends on how elites are selected and how their selectable characteristics are formed. The extent to which representation is democratic relies on

the extent to which these characteristics are not associated with inborn qualities but can be *de jure* acquired by all. Joseph Schumpeter's classical formulation was the best rendering of representative government: what makes it democratic is only the equal right and possibility citizens have to elect and be elected, to dismiss and be dismissed.

Unlike these scholars, the main theorists of representative democracy, Thomas Paine, François Brissot, and le Marquis de Condorcet (to be followed by John Stuart Mill in mid-nineteenth century), agreed that state institutions should be organized to facilitate the coexistence of representation and participation. They interpreted representation not as the opposite of direct rule but as an enrichment of democracy. According to Paine, only two forms of government met the criterion of legitimacy by consent: democracy in its *simple* form and democracy in its *representative* form. Following in the footsteps of the authors of *The Federalist Papers,* Paine used the word *republic* to denote the latter. But unlike them, he did not interpret it as a strategy of popular exclusion. As he stated in 1792, it is wholly inaccurate to see representation as a mere remedy for the implementation of popular sovereignty in a large territory. In fact, representation *allows* popular sovereignty to exist and to operate in a legal and social space composed of individuals who have the same rights and who are not defined by their social status or communitarian membership regardless the size of the state. For Paine, Athens proved by default that if Athenian democracy had a turbulent and unstable life, it was because it did not have institutional means to cope with the effects of individual freedom. Indeed, without the unifying work of representation, Athenian democracy *lacked* the capacity of transforming the plurality of interests and views held by its free and equal citizens into a unitary process of decision that was able to protect the general interest from direct interference by factions and classes. Hence, Paine concluded that "Athens, by representation, would have surpassed her own democracy" (2000, 180).

Contemporary democratic theory endorses Paine's reading. Indeed, representation now engages democracy scholars more directly, a change from the traditional defense of representative institutions by the Schumpeterian theorists of the circulation of elites and electoral democracy against the proponents of "participatory" or "strong" democracy. George Kateb (1981) has recently argued that the institution of representation is the source of the "moral distinctiveness" of modern democracy, and even the sign of its superiority over direct democracy. Even more radical is David Plotke's argument that in a representative democracy "the opposite of representation is not participation" (1997, 19), but exclusion from representation. Rather than being inimical to participation, Iris Marion Young has suggested, "political representation is both necessary and desirable," while the "elevation of direct democracy to the apex," as the only "real" democracy, "is mistaken" (1997, 352). Thus whereas theorists of electoral government from Sieyès, Schumpeter, Robert Dahl, Sartori, and Bernard Manin have identified democracy with the right to vote for representatives and the right to free speech and association by which means

citizens contribute in the making of the government by discussion, theories in the tradition of Condorcet, Paine, and Mill have proposed instead we stretch the meaning of representation and see it as a political process and an essential component of democracy. Hence, Hanna Fenichel Pitkin has argued that it is paramount that we understand government is representative "not by demonstrating its control over its subjects but just the reverse, by demonstrating that its subjects have control over what it does" (Pitkin 1984, 232).

PARTICIPATION AND REPRESENTATION

This brief historical excursus shows that the term *representative democracy* conveys the complexity, richness, and uniqueness of the political order of the moderns, an original synthesis of two distinct and, in certain respects, alternative political traditions. *Democracy,* a Greek word with no Latin equivalent, stands for direct rule ("making things done") by the people. *Representation*, a Latin word with no Greek equivalent, entails a delegated action on the part of some on behalf of someone else. As a mixture of these two components, in its standard meaning representative democracy has four main features: (1) the sovereignty of the people expressed in the electoral appointment of the representatives; (2) representation as a free mandate relation; (3) electoral mechanisms to ensure some measure of responsiveness to the people by representatives who speak and act in their name; and (4) universal franchise, which grounds representation on an important element of political equality. The central element of this standard account is that constituencies are formally defined by territory, not economic or corporate interests or cultural identities, an aspect that belongs to democracy since Cleasthenes' reform of Athens's demes in sixth century BCE. This basic formal equality in the distribution of the voting power among adult citizens gives the mark of authorization and legitimacy to a government that relies on consent.

Because representative democracy is first and foremost the name of a form of government, reference to people's sovereignty and authorization is essential, not accessory. Electoral representation is thus crucial in expressing the will of the people, even if the claims of elected officials to act in the name of the people unavoidably become an object of contestation by citizens. This tension is at the core of representation and also accounts for the complexity of representative democracy. Representation is the locus of the dynamics that keep the political process in motion and activates the communication between state institutions and society. Thus, although political representation starts with elections, because it starts with the equal distribution of the power of voting, a merely electoral rendering of representative democracy does not exhaust the meaning of representation and democracy. Nor does it exclude the possibility of a different approach and also different institutional solutions. Far from a homogenous category, representative government can be best described as a complex and pluralistic family whose democratic wing is not the exclusive property of those who argue for participation against representation and its representative wing is not the exclusive property of those

who identify it with the electoral selection of an elite against participation. To better capture this complexity, the meaning of *representation* has to be revisited.

POLITICAL UNITY, PLURALISM, AND LIBERTY

Representation emerged in the Middle Ages within the juristic tradition. Scipione Maffei, writing in 1736, maintained that representation was practiced in the Roman Empire as a means that unified its large territory by a federative system in which communities ruled themselves on issues pertaining to the government of their localities, while submitting to the central power on issues of military defense and taxation. Yet notwithstanding Maffei's perspicacious link between federalism and representation, it was in the Middle Ages that the rule of the contract (of representation) was fully inscribed in public law. Representation was born in a confrontational environment within Christianity and between secular and religious powers. Its origins are to be found in the context of the medieval church and the relationship of power between localities and the emperor, and between the nobles and the king. Representation was thus born as an institution of power's containment and control, and moreover as a means of unifying a large and diverse population. In synthesis, unification (of the multitude) and subjection (to the decisions made by chosen delegates) merged in the institution of representation. These two aspects presumed an active involvement of both partners because the representative, who was sometime called *procurator* and *commissary,* was supposed to speak or act for a specific group of people, who endowed that person with the power of representing their interests in front of an authority that was recognized as superior. When a given community delegated some members to be represented before the court of the king or the pope, with powers to bind those who appointed them, there lay the origins of representation. Then the technique was transferred to other contexts and used for other purposes.

The origins of representation account for its mix of private (*Vertretung* or legal representation in court) and political (*Repräsentation* or representation in government) elements. On the one hand, representation conveys the idea of somebody being authorized to act or speak for somebody (the Latin word *re-presentare* means to make something manifest or present). On the other hand, it conveys the idea of the representative forming a unitary will that did not exist before. From this dual nature another duality arises—namely the fact that representation has both a passive character and an active one. In the juristic tradition to which the modern conception of sovereignty as authorized will belongs, the representative is unavoidably related to the represented not only because of the dependence on the latter's designation or choice but also because the representative is under the inspection or monitoring surveillance of the represented.

Representation designates a relation of *interdependence* that brings to the fore a novel kind of liberty, one that does not need to be associated with the agent's direct action or presence in the place where decisions are made, as was the case in ancient democracy. The sources of representation's richness and fault rest precisely in its complex relation to political autonomy. No one else could render this tension better than Immanuel Kant, who was not only the philosopher who categorically defined the concept of freedom as exit from tutelage or autonomy, but also the political theorist who declared representation an essential condition for constitutional government. Kant was aware that representation made autonomous persons (citizens) trust someone else to act on their behalf, more or less like individuals, such as children, women, servants, and aliens, who were declared in need of tutelage by the civil authority. Not surprisingly, critics of representative democracy have turned precisely to direct presence as the unavoidable condition of political autonomy when they wanted to stress the ambiguous nature of this form of government.

A DIARCHY OF WILL AND JUDGMENT

Thus the term *representative democracy* does not entail an oxymoron, on condition that political autonomy is apprehended beyond the intermittent and discrete series of electoral instants that the conception of sovereignty as the authorizing *will* entails and located in the *continuum* of informal power (influence) and formal power (voting) that the open public sphere creates and recreates. To paraphrase Augustine Cochin, the public sphere is not inhabited by isolated electors, and representative democracy is not a consenting "crowd of inorganic voters"; political parties and movements are the means citizens create to give their political interests and beliefs a presence in politics and make their influence effective and persistent through time. The strength and social rootedness of these political associations signal the strength of democratic representation.

Representative democracy is the name of a government that starts with elections but develops beyond them. It opens up a domain of participation that, although informal and not authoritative, can deeply influence the political direction of the country. In democratic politics, representation is not "acting in the place of somebody," but more precisely, is a *political relation* of sympathetic similarity or communication with those in the place of whom the representatives pass laws (from here citizens' quest that representatives' choices should enjoy representativity or be in a reflective adhesion with citizens' opinions comes). The development of this kind of reflective sympathy (which is the foundation of the advocacy aspect of representation) is revealed by the statute that regulates how the representatives vote in the assembly: except in clearly specified cases (which pertain to decrees, not laws), the voting record must be made public. Electors need to know what the representatives do and say and how they vote in the assembly because they need to compare representatives' judgment to their own judgment. It is thus appropriate to describe representative democracy as form of popular government that rests on a *diarchy* of will and judgment and an endogenous tension between institutionalized power and extrainstitutionalized power, or between representative institutions and citizens' participation.

Representative Systems

Extant democracies are based on representation: decisions are taken by politicians, elected and regularly controlled by citizens. In this process, political parties play a crucial role. They build up the alternative political projects among which citizens choose in elections. By doing this, parties both aggregate and reflect some of the different interests in conflict that can be found in any given society; for instance, among territories, social classes, ethnic groups, or religious denominations. In spite of the growing literature on the crisis of parties, democracy and representation cannot be understood without them.

HOW SOCIAL CONFLICTS CONDITION REPRESENTATIVE SYSTEMS

Political parties reflect social conflicts between groups with different interests or values. However, not all interests in conflict are equally represented in all contexts. Certain issues, such as class or language, may be the fundamental axes along which party systems are structured in some cases, but not in others. Which conflicts have become predominant cleavages that have shaped the structure of the party system?

A social conflict becomes a cleavage when it fulfills three conditions. Firstly, it involves a social division that separates groups with different characteristics, such as ethnic origin, language, religion, or occupation. Second, the people separated by this division are conscious of their collective identity and share certain common values, culture, or ideologies as members of their respective groups. Finally, a cleavage has also an organizational dimension: the groups separated by the cleavage, with a common identity or culture, tend to form their own organizations such as trade unions, parties, or other associations to defend their interests.

Social cleavages are thus based on social differences that result from historical processes, but also are politically constructed, reinforced, or smoothed down by political entrepreneurs, parties, and other organizations.

In their seminal work on party systems, Seymour Lipset and Stein Rokkan (1967) distinguished four main cleavage lines that are at the origin of contemporary political alignments in the early years of western European democracies. Two of them—center versus periphery, state versus church—are the result of the process of creation of nation-states in the modern age, triggered in France, while the other two—rural versus urban, workers versus employers—appear as a consequence of the Industrial Revolution that started a few centuries later in Britain.

The center-periphery cleavage appeared as the result of the conflict between the national elites wanting to standardize laws, markets, and cultures within the state borders, and the communities, normally situated in the periphery, wanting to preserve their autonomy. This resistance to centralization ended up in cases of independence (such as Ireland from the United Kingdom) or absorption of the minorities by the center in more successful processes of nation-building (such as the French). In many other cases the tension between the dominant center and the ethnic and linguistic minorities was

translated into the party system, such as for instance in Spain or Belgium, with party systems that include regionalist or nationalist parties.

The state-church cleavage opposed the centralizing and mobilizing nation-state to the traditional privileges of the church, particularly concerning education, a fundamental tool for standardization. In some countries, such as for instance the Netherlands, the churches (Catholic and Protestant) managed to create vertical networks of associations, including religious parties, to ensure maximum loyalty from their faithful citizens.

The Industrial Revolution shifted conflict toward economic issues, once there was already a certain degree of national consolidation. The growth of trade and industrial production introduced tensions between primary producers in the countryside and merchants and entrepreneurs in the cities. In the Nordic countries, this conflict overlapped with the center-periphery opposing conservative-agrarian and liberal-radical parties.

Finally, conflicts in the labor market between workers and employer were reflected in all western European party systems with the appearance of socialist parties defending working-class interests. In the Scandinavian countries and the United Kingdom, these parties were soon integrated into the system, while in Germany and southern Europe, socialist movements were repressed and did not become fully integrated until the end of World War II (1939–1945).

This scheme can broadly be applied to the United States and to other democracies. In the United States, for instance, the tension between the North and the South can be considered a form of center-periphery cleavage, the religious cleavage opposes Protestants to other denominations, and there is also a noteworthy rural-urban distinction. But there is also a significant difference: no party in the United States can be considered a working-class party, as we find in most western European countries. This responds to several characteristics of the American political system: workers were enfranchised much earlier in the United States than in Europe, the system was more open to better education and social mobility, there were very large amounts of religious and ethnic heterogeneity within urban workers as well as among the very large rural population, and the prevailing political culture opposed high government intervention.

Thus, although we can find some common patterns, countries differ in the way social differences become cleavages and structure the party system. Depending on different patterns of historical alliances among actors, some conflicts became dividing lines across parties and others did not. In some cases social cleavages encapsulate segments of society (producing pillarization or *verzuilling*). In some others social differences within parties are as important as those between parties. But whether reflecting closed cleavages or not, once they become established in a fully enfranchised electorate, parties are political organizations that tend to stay and are difficult to change. This means that to a large extent and in spite of the social changes that have occurred in the past years, extant parties are those that were in existence a few decades ago, reflecting a freezing of party alternatives.

Postindustrialized societies of the early twenty-first century are, however, very different to those in the mid-twentieth century. The expansion of the welfare state has smoothed class differences, education has expanded throughout society, and mass media have assumed many of the functions that parties used to perform. It should come to no surprise, therefore, that traditional social divisions (particularly class) and long-term attitudes such as party identification are becoming less important in explaining vote choice. Although the empirical evidence is mixed, other aspects related to the political context, such as issue positions, candidate evaluations, or evaluations of government economic performance, could be becoming more relevant. According to some authors, the political agenda now includes postmaterialist concerns such as environmental protection, alternative lifestyles, participation, self realization, or minority rights. These issues have in some occasions been accommodated into the old parties (like in the United States) or produced new parties (like the environmental parties in France or Germany). New extreme right parties have appeared also in some places as a reaction to the new left. Parties have experienced change particularly in their organization, in their relationship with both civil society and the state, evolving from the mass party, to the catch all and the cartel party. However, new parties based on new social conflicts have not replaced most of the traditional parties born from the old classic conflicts of class, religion, and territory.

HOW INSTITUTIONS CONDITION REPRESENTATIVE SYSTEMS

Democracies are organized in a variety of ways. They differ widely in a number of institutional features that condition the way representation works and the role of parties. In some contexts parties are the crucial actors, while in others individual representatives have a more important part. In some countries the institutional setting leaves room for the representation of many different parties, while in others there are high thresholds of access that only the largest ones can overcome. Some institutional features also condition the extent to which members of parliaments are a biased or a representative sample of the electorate in terms of attitudes and social characteristics.

Presidential and parliamentary systems, for instance, have very different expectations considering the role parties should play. To start with, the very personalistic nature of presidential elections reduces the weight of parties. Particularly in the United States, candidates are not party leaders, but self-promoted individuals with large fund-raising abilities. It is presidential candidates, and not so much parties, that articulate broad government policies. Moreover, in presidential systems, parties are not necessary for government stability. Presidents do not need the support of congress to stay in office, and thus representatives belonging to the president's party may eventually vote against the president without bringing about a government crisis. This means representatives may feel freer to defend the interests of their local constituency. This may be good, but also can bring about a number of less heartening

consequences: a fragmented legislature defending particularistic constituency interests in detriment of broader policy considerations and lack of cohesion and ideological commitment.

In parliamentary systems, on the contrary, government stability depends on stable parliamentary majorities, which can only be secured by party discipline. In these systems, parties are the key actors both in parliamentary elections and in parliaments. Party discipline is a standard feature of European parliamentarism. While sometimes considered as a limitation to a representative mandate and to the ability of members of parliament to represent the interests of their constituency when they contradict the party line, it is also a means to guarantee party cohesion and government stability.

The electoral system is another fundamental institutional feature that can reinforce these differences in representation across systems. The electoral system may play an important role in structuring the behavior of representatives in cases where there is a difference between party policy positions and the interests of local districts.

Single-member districts were the first used, at the early stages of democratization, before suffrage was extended to the whole population, mass parties appeared, and party discipline became a common feature of parliamentary democracy. In this electoral system (currently still used in countries like France, the United Kingdom, or the United States), territorial representation is central. Representatives are very visible to their local constituents and thus may find it useful to pay close attention to the interests of their electoral districts if they seek reelection. This also may happen in other electoral systems where candidates must compete among themselves, such as the Irish or the Finnish.

On the contrary, in some proportional electoral systems (for instance, those of Spain or Portugal), citizens can only choose among closed party lists, usually made by the parties' apparatus themselves. In this case, the chances of a representative being (re)elected depends largely on being located in a top position in those lists, and thus on the party decision. The representative has then many incentives to follow the party guidelines and less to cultivate a close link to the territorial constituency. The degree of personalization in the electoral system, which depends on the type of district and on the ballot design, thus influences the style of representation. The stronger linkage between the representative and her territorial constituency is actually one of the arguments in favor of single-member districts (although not entirely undisputed).

However, single-member districts have other consequences for representation. Only the winner can take the (single) seat in each district. This means that smaller parties—unless they have their electoral support concentrated in a few districts were they can win a plurality or a majority—are strongly underrepresented in parliament, if they manage to get any representation at all. Electoral systems thus not only affect the behavior of representatives, but also who actually gets representation. Small parties are better represented in systems with proportional representation and large districts. There is thus a close relationship between the proportionality of the electoral system (mainly a consequence of district magnitude) and the number of political parties that obtain seats in parliament. This is important because a larger number of parties is usually considered to provide a wider choice for citizens, and a better representation of voters' heterogeneity. It also partially explains why the American parties are large, broad, and loose coalitions of very heterogeneous voters. They reflect the decentralized structure of the state as well as the closure of the electoral system: no third party has managed to overcome the high electoral threshold of the American electoral system at the federal level.

Beyond effects on party representation, scholars have argued also that women and minorities of any kind are better represented in systems with high levels of proportionality. This refers to the descriptive notion of the concept of representation, as stated by Hanna Pitkin (1972), according to which the representatives are expected to be similar to the population they represent in terms of attitudes and social attributes. Although many authors tend to disregard descriptive representation as problematic (arguing, for instance, that what is important is the accountability of the representative), others acknowledge its importance in certain circumstances, like when interests are not clearly articulated before the election takes place, or in contexts of deep distrust.

Encompassing several institutional features Arend Lijphart (1999) has distinguished between majoritarian or Westminster democracies and consociational democracies. In the Westminster model of democracy, representation is articulated as to produce a majority in parliament, which would support a single-party government during (hopefully) a whole legislature. Thus there is a single relevant house in a centralized state, with a majority produced by a plurality or majoritarian electoral system. The party system is then likely to be structured around two main alternatives that change from government to opposition depending on how well they perform (like in the United Kingdom).

This system would not be applicable to plural or segmented societies, deeply divided by a number of social cleavages, usually class, religion, or language (such as Belgium, the Netherlands, or Switzerland) where there is no clearly identifiable majority. This is why consociational democracies are organized over the proportional representation of all relevant minorities in parliament, in government, and in all relevant institutions. Other relevant features of this pattern of democracy are a decentralized state, a veto right for minorities, and political elites that tend to cooperate rather than compete. Lijphart has explored the consequences of these two models, coming to the conclusion that consociational democracies outperform majoritarian systems on measures of political equality, women representation, and proximity between voter preferences and government policies, but other authors contend that minority interests are actually better served under majority rule.

THE LINKAGE BETWEEN CITIZENS, REPRESENTATIVES, AND PARTIES

When talking about representative systems, it seems reasonable to inquire how well citizen interests are represented, or in

other words, to what extent the views of the representatives reflect those of the citizens they represent. This is, however, a tricky question for several reasons. In the first place, it would be difficult to argue that citizens have independent, exogenous attitudes; on the contrary, these often are shaped by the parties and representatives themselves. For instance, issue positions and candidate evaluations are to a large extent the result of party identification. Secondly, even a perfect match between citizens and representatives' characteristics and issue positions would not mean we have the best possible substantive representation, nor that citizens are actually controlling their representatives. It is not clear which should be considered the relevant issues, and in any case *being* or *thinking* is not the same as *doing*. One should consider what the representative actually does for the represented, and whether the representative is responsive and accountable to voters.

Still, citizen-elite agreement or correspondence, though difficult to analyze because of scarce data, have become a standard for judging the quality of representative systems. There are several ways of analyzing this relationship. Some authors have analyzed the *dyadic* correspondence between the constituency opinion and their representative behavior. This makes sense in single-member district electoral systems, in which each constituency elects a single representative. However, citizens also can be represented in parliament by representatives elected in other constituencies, so the distribution of elite attitudes can also be compared to the distribution of citizens' views in what is called *collective* correspondence. Where representatives are elected by parties rather than by voters, and parties behave in blocs within parliament, as in most European democracies, what is more interesting is the comparison between voters and party positions. The empirical analyses of these questions, certainly impossible to summarize here, have found that the degree of congruence between citizens and their representatives, whether individual legislators or parties, depends on many different factors: the policy domain, the attitudes of representatives, and the institutional and political characteristics of the context and of the parties themselves.

Interest representation in a political system depends on a combination of historical, socioeconomic, and institutional factors. Early social conflicts are reflected in party systems, that although have evolved reflecting social change, still mirror pervasive old-politics cleavages. Institutional variables such as the relationship between the executive and the legislature (presidentialism versus parliamentarism), the electoral system (plurality versus proportional), or the pattern of democracy (majoritarian versus consociational) have also a fundamental influence both on who gets elected (and thus who gets represented) and how representation works. The correspondence between citizens' and representatives' attitudes varies accordingly.

Reproductive Rights

Reproductive rights are a diverse set of political instruments invoked by individuals, governments, nongovernmental organizations, international organizations, and other parties to address the social, political, and legal constraints on people's ability to exercise control over their sexual and reproductive lives. Reproductive rights are controversial and rigorously contested worldwide for their tight connection with gender and sexual freedoms and rights. They are highly stratified by geography, race, class, and other social categories productive of inequalities and disparities. At the heart of reproductive rights are questions of power concerning individual choice and decision making; individual versus social and cultural equity, norms, needs, and wants; social health and well-being versus disease models; access to knowledge and information; and broader understandings of gender equality, sexual health, and social determinants of health and well-being. In some cases violations of reproductive rights coincide with violations of ethical codes of medical practice or research involving human subjects.

Substantively, reproductive rights include a broad set of policy and legal issues including: the right to legal, safe, and affordable birth control and abortion services; the right to access quality reproductive and maternal health care, including (in)fertility services; the right to education, information, and other conditions that enable maximum self-determination and protection from sexual coercion and violence, sexually transmitted infections, and coerced sterilization, abortion, and contraception; as well as protection from gender-based practices such as female, as well as male, genital cutting practices.

In the context of U.S. women's movements prior to the legalization of abortion in 1973, reproductive rights were largely focused on the rights of women to have ultimate decision-making power over their reproductive capacity through birth control and abortion services and in some cases through the prevention of coercive sterilization policies. After the Supreme Court decision *Roe v. Wade* (1973) struck down state laws prohibiting abortion, reproductive rights became narrowly associated with the abortion issue that divided many facets of U.S. political life into opposed camps—either in support of or against legalized abortion (*prochoice* or *prolife*). Yet, even abortion opponents generally support some rights that fall within the broader umbrella of reproductive rights.

At the International Conference on Population and Development (ICPD) held in Cairo, Egypt, in 1994, a transnational network of feminists questioned the dichotomy between rights and needs, and between the individual and social. Concretely, feminists active in the ICPD proposed policy to foster the "enabling conditions" intrinsic to rights, but refused to rank needs as somehow more fundamental than rights. Owing to an unprecedented level of feminist engagement, the ICPD Programme of Action codified reproductive rights not only as "the basic right of all couples and individuals to decide freely and responsibly the number, spacing, and timing of their children and to have the information and means to do so," but also as "the right to attain the highest standard of sexual and reproductive health,"

and, the "right to make decisions concerning reproduction free of discrimination, coercion and violence, as expressed in human rights documents" (United Nations ICPD 1994, Article 7). Other international feminist alliances questioned this political strategy to reform international population policy instruments by adding a more comprehensive definition of reproductive rights. These groups asserted that any policy ultimately aimed at reducing human numbers might well compromise an agenda to protect and ensure human rights and needs.

Echoing a human rights perspective, recent women of color theorizations have put forth the concept reproductive justice as an alternative to reproductive rights. The concept addresses the limits of an *individual choice* paradigm that effaces the social context that often constrains the choices of women depending on their race, class, gender, sexuality, ability, age, and immigration status. It further suggests that integrating the idea of social justice in the politics of reproduction is a necessary prerequisite to addressing reproductive oppression defined as "the control and exploitation of women's bodies, sexuality and reproduction as an effective strategy of controlling women and communities, particularly those of color" (ACRJ 2005; SisterSong 2006). One main impetus behind this approach is to counter a perceived narrowing of reproductive rights from the sole issue of abortion in the agenda of mainstream U.S. reproductive rights organizations.

Republic

Cicero defines *res publica* as *res populi*—the thing of the people. *Republic* signifies the public thing or public good or interest, referring to a political community. A republic is

a commonwealth in which the commonweal of the whole people is paramount to that of a section, faction, or elite group. The rule of law is an important element in republican government and replaces dependence on the political authority of an emperor or king. Sovereignty resides in the people, not in a monarch. Distinguished from a democracy in which the people rule directly, a republic is democratic indirectly through representative government. Order, moderation, reason, and restraint are the benefits to be achieved by a republic through the rule of law. The key distinction between a democracy and a republic is that a democracy is ruled by an unlimited majority; whereas, in a republic the majority is limited by a constitution. Thus, in a democracy the minority has no protection against what Alexis de Tocqueville called the *tyranny of the majority.* In a republic, the constitution limits the powers of majoritarian democracy by separation of legislative, executive, and judicial powers, and protection of individual rights of minorities. While all people are equal under the law, the emphasis is on social pluralism, not uniform equality as may be the object of a direct democracy.

After rejecting kingship, the Romans established the Roman Republic, which had a mixed constitution balancing monarchy (consuls), aristocracy (Senate), and democracy (people). Even though the Roman Republic was not an Athenian democracy, no act of the consuls or Senate could be legitimate without popular support. Further, the people (adult males with property) had the constitutional rights to vote on legislation, elect political and military officials, and serve as a collective judge in popular courts. Political virtues, such as honor, glory, military power, and public sacrifice, were fundamental to the concept of the Roman Republic.

To secure the common good, a republic requires an institutional legal framework that mitigates destructive self-interested factions. Thus, James Madison's focus in *Federalist Paper* no. 10 (1787) is to control the "effects" of factions because the "cause" of factions—human nature—cannot be changed. Madison, an American politician, philosopher, and president, believed that a republic offered the cure for the "mischiefs of faction," something a democracy could not accomplish. An extended republic of representation can control the effects of factions by an offsetting interaction between parties and interests so that ambition can counter ambition, preventing the rise of an omnipotent majority.

Also, in *Federalist Paper* no. 39 (1788), Madison asserts that the ratification of the U.S. Constitution must be a *national* act ("We the People") because its primary objective is the commonweal of the people. Madison describes the U.S. Constitution as a compound republic, both national and federal. The nation as a whole and the individual states share power. Because political power is derived from both federal and national sources, federalism is a key political principle. Originally, the U. S. Senate was elected by state legislatures, who prior to the Civil War (1861–1865) were predominant. This federal aspect was eliminated by the Seventeenth Amendment (1913) shifting the elective power from the states to the people. Still, the limit of political power remains federal: the Tenth Amendment provides that all constitutional power not delegated to the national

government is reserved by the states or the people. Also, Article IV, Section 4 of the U.S. Constitution guarantees every state a republican form of government, not a democracy. It establishes a mixed government, with separation of powers and checks and balances; popular sovereignty; the rule of law; and civil rights. The U.S. republic is democratic, but not a democracy. As such, the first ten amendments to the Constitution, known as the Bill of Rights, ensure that minority interests are protected from majoritarian supremacy.

Throughout history, republics have differed widely in democratic substance and form. Plato's *Republic* (360 BCE), an ideal conception of justice as hierarchical class orders in society, could not be described as democratic, nor could Aristotle's democracy, which he considered a defective form of constitution, serving the self-interest of the impoverished masses. Other notable republics in history, such as the Israelite Commonwealth, San Marino (the oldest extant republic), Icelandic Republic, Swiss Republic, Dutch Republic, South African Republic, English Commonwealth, French Republic, Italian Republic, and USSR (Union of Soviet Socialist Republics) are not the same. For example, the USSR and the South African Republic were not democratic states.

Public participation and moral virtue provide the foundation for a republic. St. Augustine believed that without justice there could be no commonwealth, and there could be no justice without divine law. Cicero relied on natural law to provide unalterable norms as the basis for legislation, whereas Machiavelli thought republican virtue had a more secular nature. In any case, loyalty and adherence to the state or public realm and the willingness to participate, contribute, and sacrifice for the common good is the spirit of a republic. The "friend of the people," Publius, a founder of the Roman Republic, inspired Hamilton, Madison, and Jay to use his name as author for *The Federalist Papers,* the eighty-five essays that provide the theoretical basis for the founding of the U.S. republic.

Republicanism

Republicanism is an ancient tradition of political thought that has enjoyed a robust revival in recent years. At its heart is the conviction that government is a public matter to be directed

by self-governing citizens, not the domain of one ruler or small set of rulers. Dictionaries try to convey this point by defining a republic as a political system governed by elected representatives, including an elected executive officer, rather than by a monarch. Indeed, republicanism is often defined simply as opposition to monarchy.

The standard definition is misleading, however, in that it mistakes common associations for identifying characteristics. To be sure, republicans usually favor representative government and oppose monarchy, but they need not do either. The classical republican thinkers, such as Polybius and Cicero, had no clear conception of representative government, and there is nothing to prevent a republican from advocating a form of government that includes a substantial measure of direct democracy. Nor are republicans necessarily hostile to monarchy. Their objection is to unrestrained or absolute rule, whether by one person or many. This makes them hostile to absolute monarchies but not necessarily to constitutional ones. Above all, republicans want self-government under the rule of law, as the origin of the word *republic* itself indicates.

CLASSICAL REPUBLICANISM

Republic derives from the Latin *res publica,* the public thing or business. In some ways, though, *republic* stands between the older Greek term *politeia* (polity) and the newer English term *commonweal* (or *commonwealth*). In every case the emphasis is on government in the public interest, as when Aristotle defined *polity* as rule by the many in the interests of the whole city-state. To ensure that those who governed would promote the common good, the many, or the people, had to have a significant share of political power. But people also had to be restrained lest they turn the government into a democracy—that is, government in the class interest of the poor and propertyless. To secure this restraint, republican thinkers recommended the cultivation of civic virtue and a mixed constitution.

Cultivating civic virtue was a matter of fostering the proper disposition in the citizenry, a category that did not include women, slaves, or resident aliens. Civic virtue had to be cultivated because the tendency toward corruption, or putting one's private interest first, was so strong. The passions that corrupt citizens—especially avarice, ambition, and the love of luxury—had to be blunted or turned to the public benefit. The virtuous citizen thus would be one who lived simply, respected the rule of law, and identified his own good with that of the body politic. Citizens of this kind will have some sense of the public good or commonweal; in other words, and their business will be to govern themselves with an eye to that good rather than their private interests. In Cicero's words, "the commonwealth [*res publica*] is the concern of a people, but a people is not any group of men assembled in any way, but an assemblage of some size associated with one another through agreement on law and community of interest" (1998, 18).

Some scholars distinguish between the Athenian and the Roman schools of republicanism, with the former stressing the importance of public-spirited political participation and the latter the value of independence or freedom under law, as captured in the enduring claim that a republic is the empire of laws, not of men. Allowing for such differences of emphasis should not, however, obscure the classical republicans' agreement on the importance of the mixed or balanced government. According to this idea, developed by the Greek Polybius while a hostage in Rome, the best government is one that mixes rule by one person, the few, and the many because this mixture staves off corruption through a checks-and-balances process that makes it difficult for any element to acquire enough power to dominate the body politic.

REPUBLICANISM REVIVED

Many political thinkers of the Middle Ages and modern era drew on and extended the republican tradition, among them Niccolò Machiavelli, James Harrington, the Baron de Montesquieu, Jean-Jacques Rousseau, and the men who drafted a constitution that guaranteed every one of the United States "a republican form of government" (Article 4, Section 4). With the rise of liberalism, socialism, and the other modern ideologies, however, republicanism faded into the background. The increasing popularity of democracy also tended to eclipse republicanism, as the transition of the United States' first political party from *Republican* to *Democratic-Republican* to simply *Democratic* indicates. In the second half of the twentieth century, though, a significant revival of interest in republicanism began.

Historians took the lead in this revival, but political philosophers such as Hannah Arendt also played an important part. The biggest boost probably came from J. G. A. Pocock's *The Machiavellian Moment* (1975), which combines Arendt's praise of political activity with the historian's interest in what Pocock called "the Atlantic republican tradition."

By the end of the twentieth century, the republican revival was in full swing, with four themes predominating in neorepublican thought. First is an emphasis on equality that adds a belief in the equal moral worth of persons to the classical emphasis on the political equality of citizens. Second is the continuing commitment to self-government. Philip Pettit (1997) and Quentin Skinner (1998) have been particularly important in this regard because both call for a return to the republican (or "neoroman" in Skinner's terms) conception of freedom as the absence of domination. Moreover, citizens free from domination may govern themselves in a deliberative fashion, which is the third neorepublican theme. As Cass Sunstein says, "republicans will attempt to design political institutions that promote discussion and debate among the citizenry; they will be hostile to systems that promote lawmaking as 'deals' or bargains among self-interested private groups" (1988, 1549). Finally, many neorepublicans share an abiding interest in civic virtue, without which debate and deliberation will be little more than a diversion from the "real" politics of bargaining for personal advantage.

The new republicans also face challenges, most notably the complaints that their theory is too nostalgic to meet the demands of an age of globalization or to shake off the biases implicit in the classical ideal of the citizen as a property-owning, arms-bearing man. Neorepublicans are responding to these challenges, however, and the value of their revival no

doubt will be judged in large part by the persuasiveness of their responses.

Republicanism, Classical

Classical republicanism is a political and philosophical orientation that emphasizes a notion of freedom opposed to that under which slaves operate—namely, that of having a master, of being owned or dominated by another. It is an orientation that draws heavily on the Roman idea of the *res publica,* the "public interest" that many Roman thinkers argued had to be collectively and actively attended to if human beings were to safeguard their lives and communities from tyrannical actions.

BETWEEN INDIVIDUALISM AND COMMUNITARIANISM

While identifying and attending to the public or common interest involves a level of moral education and civic virtue, the effort to prevent domination typically requires the advancement of certain key political priorities and policies. These include the rule of law, the balanced involvement of different social and economic classes in government, the strong resistance to favoritism and corruption, and the prevention of the "professionalization" of political life through elections or rotations among political authorities. This classical republican way of viewing freedom is, in some ways, highly communitarian in that it accepts that human flourishing requires some sort of membership or communal order and that the freedom sought is one that is premised on the existence of or need for such collective arrangements. However, classical republicanism also may be seen as involving a different orientation from that usually associated with either liberal or communitarian arguments. Nondomination is not the same thing as noninterference, which suggests that individual freedom is always in tension with any kind of law, nor the same as self-mastery, which suggests that individual freedom is a matter of aligning one's capabilities with larger or more general goals. It may be that classical republicanism suggests an alternative to the individualist/modern/negative versus communitarian/ancient/positive scheme that, in different ways, both Benjamin Constant and Isaiah Berlin made central to their political theories and that has been prevalent in much Western political philosophy since the nineteenth century.

ORIGINS

Many scholars claim that classical republicanism has had a clear—or at least easily discernable—intellectual lineage, moving from the patriotic and agrarian writings of Roman thinkers, leaders, and landowners, through the humanist revival in Florence and other cities during the Italian Renaissance. It then continued into the seventeenth and eighteenth centuries via the writings of James Harrington, Algernon Sidney, and so-called commonwealthmen such as John Trenchard and Thomas Gordon. However, others have suggested that modern usages of the label *classical republicanism,* like *civic humanism,* are at least partly products of historiographic reconstruction rather than actual history, with several distinct historical bodies of thought being assembled to suggest a single coherent perspective on freedom, community, virtue, economics, and citizenship. Aside from this debate, the classical republican label is commonly used to express a distinct approach toward various political goals.

In the United States, classical republicanism has had a much more specific and identifiable history, in that several early leaders of both the American Revolution (1775–1783) and America's national government strongly identified with various classical republican ideas, such as civic virtue, land ownership, social and economic independence, the cyclically recurring threat of faction and corruption, and the necessity of making certain that all citizens stand equal before the law. It must be noted that the egalitarian aims of classical republican thought did not necessarily include liberal or individualistic notions of social or economic equality; the key point was that no person ought to be subject to arbitrary treatment or be dominated by forces in response to which they have no appeal or recourse. The ideal of freedom as nondominion does not mandate that all be able to equally resist any action by the state or society in their personal lives or choices, but rather than any such action be aligned with the common interest, or the *res publica*. As we are all, ideally, to be understood as equal members of the community, laws that serve the interests of all would presumably not stigmatize certain sections of the whole, discriminate in unprincipled ways, or take the form of an arbitrary, dominating

force. This particular orientation underlines the U.S. Constitution's various countermajoritarian elements, such the separation of powers, the Electoral College, and the guarantee of certain rights. While these and other elements of the American founding can be explained in classical liberal, social contract terms, there is an undercurrent of republicanism to them that has emerged in the historical scholarship of recent decades as an important explanatory insight into the motivations of early American leaders. The aim of these devotees to classical republicanism was to make certain that the power exercised by the national government could always be contested by those who would challenge it as not supporting the good of the nation.

CONCLUSION

However, the distinction between populist and republican appreciations of government is a contested one. Some classical republicanism scholars suggest that the pursuit of the common good must be connected to citizens' active involvement in public life. If not, then citizens will not have the breadth of experiences necessary for them to learn what truly common goods entail, and private interests and arbitrary discriminations likely will creep back into the operations of government. On the other hand, other scholars argue that this participatory, even democratic, interpretation of republicanism partakes of a neo-Athenian reading of the republican legacy. The argument over to what extent popular democratic action, including organized majorities, should play in the development of civic virtue and the protection of republican freedom is central to the question of how classical republicanism may be ultimately related to classical liberal and communitarian ideas.

Resampling Methods

Resampling methods encompass a wide variety of techniques that use empirical data, as opposed to distributional assumptions, to estimate uncertainty about parameter estimates in a statistical model. Bootstrapping and jackknifing are used when parametric measures are difficult to compute or unreliable, but

should be used with caution in small samples. Cross-validation is used to prevent overfitting of the data.

Most bootstrapping routines take random, repeated samples with replacement from the original data and can be performed with no assumption of an underlying distribution. Similar to bootstrapping, jackknifing routines systematically omit the ith observation of the sample where $i = 1, \ldots, n,$ creating n resampled datasets. In both cases, the statistic of interest is calculated for each resampled dataset, then aggregated to obtain the quantity of interest and its estimated variance. Simple nonparametric bootstrapping should be used with caution for incomplete data, small samples, and samples with substantial numbers of outliers and shouldn't be used with nonindependent cases. Variants of the bootstrap ameliorate these issues and are commonly used in these cases.

Lastly, cross-validation splits the data sample into k parts. The model is estimated systematically on all subsets with one part excluded in each estimation to be used in the validation of the model. This method can help prevent overfitting a model based on chance occurrences contained within a given dataset.

Research Design

Research design is the process of creating a scientific plan for answering research questions through sampling, measurement, and analysis. It is the formal and creative process of comparing competing theories and making inferences to yield discoveries about the world. The hallmark of social-scientific research design is a rigorous attention to inference, sampling, and measurement.

Political science research aims to make inferences regarding subjects of political interest and does so based on empirical observation. These inferences may be a mixture of the descriptive (for example, what is the rate of voting among all U.S. adults living in poverty?), predictive (for example, will the turnout rate increase if the government institutes an election day holiday?), and explanatory (for example, what are the fundamental determinants of turnout in the United States?). In each case, a correct and effective research design requires careful attention to issues of controls, sampling, and measurement.

In classic experimental research design, a sample is drawn from a population; an attribute is measured for each individual in that sample; a treatment is then applied to a randomly selected subgroup of that sample; and the attribute is remeasured and compared to the attribute level of those not

treated (the "control" group). Experimental design provides insurance against numerous threats to inference, such as confounding variables, endogeneity, and self-selection.

QUASI-EXPERIMENTS AND CAUSAL INFERENCE

Political science research designs are rarely true experiments, because political events and political behavior are often impossible to fit into this mold. Although some political science theories can be tested through laboratory or field experiments, most political science research is quasi-experimental or observational. In quasi-experiments (also known as "natural" experiments), the researcher measures the attributes of a sample, some of which have received a "treatment" and some of which have not. The control group is not randomly assigned, and in many cases, there is no pre-measurement of those "treated." Observational studies examine attributes of a single sample before and after a test without a control group. For example, a natural experiment might analyze the changes in voter turnout in cities after changes in registration requirements have been instituted. Unfortunately, a relationship between treatment and attribute change in such designs is not a strong basis for inferring causality: the relationship could be created by a confounding variable; not included in the model (perhaps a separate attribute, like scandal, determined both turnout and whether a political subdivision adopted the law); by selection biases (those cities that chose to adopt reform could be systematically different with respect to peoples' voting behavior from those that did not adopt reform); or could even have the opposite direction (perhaps those cities in which voters were already mobilizing and were ready to turn out were also driven to change their registration requirements).

SAMPLING

Sampling is an important aspect of all research designs. Good research design draws from a sampling frame that is a good match with the population of interest, aims to obtain a sample that is sufficiently variable in the levels of treatments that effects could be detected, and avoids selecting cases based on values of the explanatory variable bias (unless the intent is the tracing or disconfirmation of a covering theory).

In social science, it is rarely possible to directly measure the properties in which there is the most interest. Instead, scholars are forced to measure concepts of interest, such as "poverty," through such indirect measures as per-capita income. An indirect measure is judged by its reliability and validity. Reliability is stability over repeated measures, and validity is how well the measure equates with the underlying concept.

Choosing the size of the sample is a critical part of the research design, and there is often a trade-off between small and large samples. Small sample designs (sometimes known as "case studies"), in which a single case or a small number of cases is examined in great detail, make it difficult to apply formal statistical inference. It is usually impossible to draw broad inferences from individual cases; however, it may be possible to disconfirm explanatory or predictive theories that were hypothesized to have applied through examination of case history and the

tracing of the causal processes that run through a case. The thick descriptions that can emerge from case studies also can be useful in generating other hypotheses. Large samples allow the use of strong methods of statistical inference, but such samples can make it more difficult for researchers to construct valid measurements (since these need to be applied across a wider domain of cases) and to maintain causal homogeneity.

THE QUESTION OF "SCIENCE" IN POLITICAL SCIENCE

A good research design attempts to answer a research question that is both important in the world and offers some purchase for current social scientific methods and theory to yield insight. These are fundamentally gray areas, and "'interesting" is value-laden term, especially in the social sciences. An interesting question may shed light on an important policy issue, test a widely contested (or widely accepted) theory, or posit an explanation of an anomaly—something that is not explained by current theory or even seems inexplicable. Tractability is determined by a variety of factors, including the availability of data, available research resources, physical law, and the state of statistical methods. Still, there remains a core of questions and methods generally considered interesting and tractable.

In practice, the process of research design in political science is both iterative and creative, as Henry E. Brady and David Collier (2004) note. It is rare that researchers start with a crisply defined theoretical question, develop measures of the variables of interest from first principles, go into the world and collects data in one fell swoop, and emerge with compelling results. Instead, they may start with a vague question, immerse themselves in the details of the cases relevant to this question, and use these details to generate new theories and new questions. They might start with one set of measures and find, when they attempt to apply these measures to the world, that they are unreliable or flawed. They may attempt one method of sampling but, on examination of the sample, find that it is unbalanced or non-random.

Nevertheless, problem selection, and research design in general, occur within a scientific framework. This framework emphasizes testing competing theories based on evidence gathered from the world, is always open to the possibility that new data will require the updating of theories and conclusion, and insists on transparency on how data is collected and analyzed.

Reserved Seat

Reserved seats are positions within legislative systems that are allocated to specific groups. Reserved seating arrangements are typically the result of constitutional or other political concessions whereby seats are granted to disadvantaged groups to ensure representation in elected bodies. For instance, in the Croatian House of Representatives, five of the 140 seats are reserved for ethnic minorities, including one each for Serbian, Hungarian, and Italian minorities; one seat shared by the Czech and Slovak minorities; and one shared by the Austrian, German, Ruthenian, Ukrainian, and Jewish minorities. Other countries reserve seats for women. In Uganda, one seat from each of the countries electoral districts is reserved for women candidates, while Bangladesh reserves thirty seats for women legislators and Tanzania, fifteen. Many countries, including Italy and Portugal, have reserved seats for their citizens living abroad. Critics of reserved seats argue that the system undermines democracy by granting certain groups additional influence in the voting process. They also assert that reserved seat arrangements are simply quota systems that actually prevent the election of more minority candidates by concentrating office-seekers from those groups in the reserved seat contests.

Responsibility

Stemming from the Latin *spondeo-respondeo,* meaning to promise to answer, the concept of responsibility is strongly related to the condition of moral *imputability* of an actor in relation to the actor's deeds or omissions, as described by Mariana Oshana in 2001, with regard to the foundations of moral agency. Aristotle argues that moral responsibility regards praise or blame on the basis of individual actions and dispositional traits, when the capacity for decision is ascertained. On the other side, social sciences have tried to anchor the question of responsibility to a given institutional context and to the processes of an agent's role. In this view responsibility has been reserved primarily for actions occurring in the scope of interpersonal relationships, considering that behavioral expectations and obligations accompany any particular status. Yet, although often the focus remains concentrated on the individual agent, other modern interpretations of responsibility are not only connected to the debate on individual duties and free will. Indeed the concept of responsibility also has been analyzed with reference to the processes of delegating authority to an individual representative or to a collective body.

The use of responsibility as a political concept is relatively recent. Strongly related with the development of representative democracy, it was compared for the first time in *The Federalist Papers* (1788), where it was associated by Alexander Hamilton with the idea of government, in expressions such as *responsible government* or *responsibility of government.* The American Founders used the term *responsibility* as a synonymous with *accountability,* implying "mechanisms for the active monitoring of public officials and the means for enforcing public expectations," as noted by theorist Joseph Bessette (2001, 39). Maintaining such meaning, responsibility has become a key concept of liberal theory. In a constitutional regime, government is controlled by citizens and acts with a constant reference to such oversight.

Yet a different interpretation of responsibility has accompanied the spread of democratic institutions: governors could be responsible also taking care "that the results are correct and good for many. Such responsibility is the most interesting kind because it goes beyond questions of accountability and obligation in any simple meaning," as argued by Mark Blitz (1998). Edmund Burke provided the base of the modern prohibition of the imperative mandate for elected members of parliament in his speech to electors of Bristol. This view protects the autonomy of representatives, who have to act with reference to a general will. He stated that "parliament is not a congress of ambassadors from different and hostile interests, which interest each must maintain, as an agent and advocate, against other agents and advocates. But Parliament is a deliberative assembly of one nation, with one interest, that of the whole" (Burke 1968, 115). Along the same line, when considering the practical application of responsibility, a protagonist of French Revolution (1789–1799), abbé Joseph Sieyès, provided the most explicit formulation of the opposition between the will of nation and special interests, expressing skepticism that representative actors could be accountable to citizens.

The main dilemma of modern representation can be identified in divergent concepts of responsibility. As noted by Hanna Pitkin (1967), the difficult definition of the concept of responsibility resides essentially in its twofold nature: it may express the product of a concrete fiduciary relationship as well as a propensity to act in accordance with the evolving general will. Responsibility represents one of the most important challenges for democracy, concerning the difficult balance between the necessity to make political agents responsive to citizens and the need to give actors autonomy to make decisions in the interests of collective.

Reverse Discrimination

Whole classes of people within their own states have historically been marginalized, treated as second-class citizens, or even enslaved—as in the United States. Rectifying past wrongs inevitably brings accusations of *reverse discrimination,* a charge in the United States leveled against public and private remedies to undo the remnants and relics of past officially sanctioned racial segregation and discrimination. The landmark case of *Brown v. Board of Education* (1954) declared unconstitutional public schools racially segregated by law (*de jure,* as opposed to *de facto*). After years of resistance to judicial desegregation orders following *Brown,* the Supreme Court defined *desegregation* as *integration* of previously segregated school systems, which began the contentious process of busing schoolchildren into and out of the mostly black and mostly white residential areas to achieve racially integrated public school systems. Underlying the judicial decree was an assumption supported by considerable evidence that but for long-standing official segregation policies, public school systems and residential neighborhoods would have been naturally more racially integrated. Education was only one facet of entrenched racial inequity in the United States. *Plessy v. Ferguson* (1896) had launched the *separate but equal* doctrine that permitted segregation and embedded in the American social order legalized racism and its appalling consequences that might have been eliminated much sooner had the court ruled differently. Instead, in law, medicine, education, and industry few African Americans were included, and much of the black community had been forced to lag far behind as the rest of the nation developed. America, of course, is not unique.

Remedies in the United States came at first by judicial decree, and Congress followed by successfully passing historic and comprehensive legislation (the Civil Rights Act of 1964) that prohibited discrimination in education and the workplace based on classifications such as race, religion, national origin, and gender. Stopping discrimination was one thing, but correcting past inequities through *affirmative action* spawned controversy and sharp political divisions. Critics complained that this was *reverse discrimination* against innocent whites. However, doing nothing except terminating discrimination kept generations of once excluded sectors of American society stages behind white men on nearly every measure of social achievement. On the other hand, given limited resources and opportunities, affirmative action to correct past wrongs could disadvantage a current generation of whites—especially men—who bore no responsibility for the official unfairness that had preceded them. Hence the social, political, and legal dilemma still in search of an equitable resolution, with decision makers treading a thin line between affirmative action and reverse discrimination.

For more than thirty years, the Supreme Court has interpreted both the Equal Protection Clause and the Civil Rights Act many times to guide decision makers on how lawfully to confront this dilemma, but the justices have been as divided as everyone else. In two major admissions cases in 2003 from the University of Michigan regarding law school and undergraduate admissions, the court, deeply split, indicated that raw quotas, or using race as a decisive or automatic factor, violates the principle of equality. Michigan's undergraduate admissions program had assigned fixed points to minority applicants, and this was unconstitutional. The law school process survived because race was just one general factor in what the university claimed was a complex, individualized review process designed to obtain a critical mass of diversity among the student body.

In 2009, an equally divided court invalidated New Haven, Connecticut's, refusal to certify test results it had given to the city's firefighters. The test and the city's promotion rules yielded results such that none of the eight blacks who had taken the test (three of whom had passed) would have been promoted. The city's decision was based on fear of a lawsuit under the *disparate-treatment* provision of the Civil Rights Act that established grounds for legal challenge of hiring and promotion standards in the workplace. The court ruled that because the city's own hearings produced no strong evidence of a disparate-impact violation, New Haven could not ignore the test "solely on the racial disparity in the results."

Unintentional discriminatory effects or impact are not the legal responsibility of government. In fact, if decision makers tried to adjust the scales or to reset standards to benefit minorities at the expense of whites, government risks violating the principles of equality enshrined in both the Fourteenth Amendment to the Constitution and the Civil Rights Act. Although a great deal of progress has been made in the second half of the twentieth century, the legal, social, and political problems of inequities regarding gender and race (as well as other classifications) still linger. As the personnel of the judiciary changes, so will its attempts to resolve these problems.

Revisionism

Revisionism can refer to broad movements within the study of history that seek to reinterpret the past or to one of a series of ideological movements within Marxism. Revisionist historians have challenged accepted narratives of past events in order to overcome subjectivity and to account for newly discovered, or long hidden, sources. For instance, in the post–World War I (1914–1918) era, historians produced a range of new works that questioned the traditional interpretations of the causes of the war. Revisionism also can be a form of propaganda, used by states to rewrite the past. In Marxism, revisionism initially referred to the work of theorists such as Eduard Bernstein who argued that Marx's predictions concerning the imminent collapse of capitalism were incorrect. According to Bernstein, this made revolution impossible, but capitalism could be overcome through a gradual process of political and economic reform. Orthodox Marxists, including Vladimir Lenin, rejected Bernstein's contentions, and revisionism acquired a negative connotation. It became a pejorative term to describe any movement within Marxism that challenged traditional orthodoxy. In addition, Maoists charged the Soviets with revisionism following the death of Joseph Stalin. However, revisionist movements in the late 1950s evolved into the new left in the United States and western Europe.

Revolutions, Comparative

Revolutions are rapid changes in the institutions of government, carried out by noninstitutional means and usually with the support of popular groups mobilized for demonstrations, local revolts, guerilla warfare, civil war, mass strikes, or other revolutionary actions. Until the 1960s, revolutions were viewed as major turning points in history, ending traditional systems of government and ushering in modern political organization. However, the proliferation of revolutionary movements and rapid shifts in governments throughout the twentieth century led to a more open and ambiguous view. Revolutions—even "great social revolutions" such as the French Revolution (1789–1799) and the Russian Revolution (1917)—are now seen as bringing a mixture of change and continuity.

COMPARATIVE REVOLUTIONS: CLASSIFICATION BY GOALS AND PROCESSES

Although all revolutions bring a relatively sudden change in authority structures, the causes, processes, and outcomes of revolutions have differed greatly throughout history. Scholars, therefore, have developed a variety of classifications of different kinds of revolutions to aid comparison and highlight differences.

Constitutional revolutions sought to replace traditional monarchies or empires with republics bound by newly written rules that would limit state power, end the privileges of hereditary elites, and confer rights and responsibilities on citizens. Major examples include the American Revolution (1775–1783); the French Revolution; the revolutions of 1848 in France, Germany, and Austria; the Iranian Revolution of 1905; the Chinese Republican Revolution (1911); and the Turkish Revolution of 1919.

Anticolonial revolutions aimed to end rule by foreign countries, drawing on nationalist identities to inspire resistance and the foundation of new institutions of local self-rule.

In many cases, nationalist traditions were in fact newly developed by elites, and in some cases, self-rule became rule by local elites rather than citizen-based democracy. Major examples include the Latin American revolutions (1808–1828), the Vietnamese (1954) and Algerian (1962) revolutions, the Indian Independence movement (1949), and the Mozambique and Angolan revolutions (1974).

Fascist revolutions also drew on nationalist traditions but used them to mobilize mass support for the replacement of weak monarchies or republics with authoritarian regimes. Major examples include Italy (1921) and Germany (1933).

Communist revolutions, inspired by the historical theories of Karl Marx, intended to overturn existing regimes and replace them with one-party states that abolished private property. Although the communist regimes were one-party dictatorships, they labeled themselves "democracies" or "republics," as they destroyed the prior economic and political elites while claiming to represent workers and peasants. Major examples include those in Russia, China (1949), and Cuba (1959).

Antidictatorial revolutions, provoked by the excessive corruption or depredations of modernizing dictators, endeavored to create new regimes based on constitutions or populist one-party states. Major examples include Mexico (1911), the Philippines (1976), Nicaragua (1979), and Iran (1979).

Some revolutions combined these features; thus, the Vietnamese revolution was anticolonial and communist. Other revolutions were distinctive and fit none of these categories; for example the South African antiapartheid revolution (1994), in which a native ethnic majority wrested power from a ruling minority of foreign descent.

The past several decades have seen the emergence of yet another kind of revolution, the *people power* or *color* revolutions—so termed because popular demonstrations toppled dictators or communist regimes not by mass violence, but by rallying huge crowds around symbols of national unity and popular opposition, which were mainly colored symbols such as yellow or orange ribbons (the Philippines in 1976 and Ukraine in 2004) or flowers (Georgia's "rose revolution" in 2003 and Kyrgyzstan's "tulip revolution" in 2005). Other examples include the Velvet Revolution in Czechoslovakia (1989) and the Cedar Revolution in Lebanon (2005).

COMPARING REVOLUTIONS BY OUTCOMES

The outcomes of revolutions vary greatly. In some cases, revolutionaries start with, and maintain, relatively moderate and focused goals of political change. Examples include the American Revolution, the Latin American revolutions, and the Philippines Revolution (1996). These revolutions mainly opened up political competition and did little to change the economies of these countries. Such cases often are called *liberal* or *moderate* revolutions.

By contrast, in other cases revolutionaries came to embrace a more radical program of economic and social transformation—whether through internal or external struggles to defend their revolutionary program or through ideological inspiration. In the French, Russian, Chinese, Cambodian, and a number of other revolutions, revolutionary leaders sought to fully transform society's elite structure, to radically accelerate social mobility, and to replace the foundations of economic organization through extensive state seizures of property. Such cases often are called *radical* or *great social* revolutions.

The political character of the regimes that result from revolutions also varies. In some cases, revolutionary leaders have been genuinely committed to achieving democracy and have guided their new regimes to that goal. Examples include the United States, South Africa, Poland, Hungary, the Czech Republic, and the Philippines. In other cases, revolutionary leaders placed a higher value on staying in power or maintaining the revolutionary regime in the face of powerful threats; in these cases, revolutionary regimes swiftly moved toward one-party or personal dictatorships. Examples include France, the Soviet Union, China, Cuba, Mexico, and Algeria. In some cases, the revolutionary outcomes remained mixed and unclear for some time, as with Russia's anticommunist revolution of 1981 (first moving toward, then away from democracy) or Nicaragua's Sandinista Revolution of 1979 (first moving away, then toward, democracy).

Sometimes revolutionary efforts to take power are suppressed but only after they shock society substantially. In such cases, scholars speak of *unsuccessful* revolutions, such as the Russian Revolution of 1905 and the revolutions of 1848 in Prussia and Austria-Hungary.

In sum, revolutions vary widely by their goals, their processes, and their outcomes. One of the key challenges in the comparative study of revolutions is to account for patterns of similarity and difference and to identify complexes of causal factors or trajectories that lead revolutions to assume certain forms or bring particular outcomes.

So far, however, the comparative politics of revolutions has not progressed much beyond classification and typologies. Scholars have been more concerned to explain why revolutions occur at all, rather than why they have taken specific forms or generated certain results in various places. Even the classifications and typologies above are frequently challenged as new forms of revolutions develop.

Rhetoric

Rhetoric is the study and art of public speaking and communication. The Greeks developed the main techniques of rhetoric that would be used well into the twentieth-first century. Beginning with the Sophists, rhetoric emphasized the ability to persuade audiences and stressed the importance of style over substance. Rhetoric was initially one of the cornerstones of education, along with grammar and logic, and it was a critical component of political life. Rhetoricians such as the Roman politician Cicero built careers on their ability to sway the public through speech. The three main branches of classical rhetoric were: *deliberative,* designed to persuade or dissuade; *judicial,* meant to either indict or defend; and *epideictic,* which was ceremonial in nature and used to celebrate or denigrate.

Rhetoric fell out of favor as an academic discipline in the nineteenth century, but was revived at the beginning of the twentieth century with the rise of a new group of theorists to include scholars such as Kenneth Burke and the expansion of media, especially, initially radio and recorded sound, as a means to spread political ideas and persuade the public to support or oppose politicians, parties, or policies. In this period, the neo-Aristotelian critique of classical criticism emerged. This model was the first developed method to critique various forms of communication and had its roots in Aristotle's teachings and emphasized an analysis of the communicator, not the actual communications. By the middle of the twentieth century, a new period of rhetoric had developed that expanded past the political arena to include art, literature, television, and a variety of other media. For instance, Burke discussed rhetoric as a form of communication that uses particular symbolic expressions to persuade a targeted audience, political or otherwise. Meanwhile, new stylistic elements related to more practical fields of inquiry such as economics and traditional scientific thought, became increasingly accepted, especially with the rise of the new media (such as television or digital exchanges) and information outlets, leading to greater influence on political decision-making models.

Ricardo, David

David Ricardo (1772–1823) was an influential British political economist. Born in London to wealthy Jewish immigrants from Holland, his formal schooling ended early in his teenage years. Ricardo began working in his father's stockbroking firm at age fourteen, which enabled him to start his own business career. In his late twenties, he read Scottish political economist

Adam Smith's *The Wealth of Nations* (1776), which precipitated his interest in studying economic principles. He married a Quaker girl, Priscilla Ann Willkinson, at age twenty-one and became a Unitarian. As Sephardic Jews, his family had sincere religious commitments and disowned their son as a result of the marriage outside the faith. Ricardo pursued an independent career as a stockbroker, making a fortune for himself in the stock market, and prospered in nearly every endeavor in which he engaged himself. He retired at age forty-two with a fortune of approximately £1 million and established himself as a land proprietor.

In 1819 Ricardo was elected to a seat in the English House of Commons, where he served until illness forced his retirement. In Parliament, he advocated free trade among nations and the repeal of the Corn Laws, which limited the import of corn in an effort to protect English landholders. His prediction of the damaging effects of protectionism was ignored by Parliament during his lifetime, but it was regarded eventually by England and numerous other modern nations as a valid one.

Ricardo was one of the first economists to understand the benefit of free trade among nations even if one was more efficient in all production than the other. He famously illustrated that even if Portugal could manufacture cloth and wine more efficiently than England could, it was still beneficial for England to manufacture cloth and Portugal to manufacture wine provided there was unrestricted trade with each other.

Ricardo's first work, *The High Price of Bullion* (1810), which was originally published in the *Morning Chronicle,* was the development of arguments explaining the increase of the price of gold as paper money depreciated. Through participation in this controversy, Ricardo became friends with economist Thomas Robert Malthus. Although Ricardo affirmed Malthus' principles of population growth, the two disagreed concerning the causes and nature of gluts (oversupply) and recessions. Ricardo affirmed Say's Law that supply will call forth its own demand, but Malthus argued that gluts resulted from unequal production and consumption by the wealthy, resulting in higher levels of saving. Ricardo also opposed Malthus' support of the Corn Laws. In his *Essay on Profits* (1815), Ricardo argued that the Corn Laws increased the income of landowners at the expense of the consumers and workers. Ricardo advocated the principle of comparative advantage, which still governs as a fundamental law of economics. His labor theory of value was articulated in his *The Principles of Political Economy and Taxation* (1817), which greatly influenced German philosopher Karl Marx. Ricardo's economic thought advanced the heritage of classical economists.

Right

The left–right dichotomy is a conceptual tool to describe and classify political parties, actors, ideologies, attitudes, and specific policies along a spectrum. Historically, the terms *left* and *right* refer to the seating positions in the National Assembly, during the French Revolution (1789–1799), of pro- and anti-Ancien Régime members. They became part of the mainstream political language in the nineteenth century and are still used to describe opposed political affiliations—notwithstanding debates on the contemporary relevance of the dyad.

Positions on a left–right axis are relative and not absolute. The right is not monolithic and one can distinguish between extreme, moderate, or center rights. The substantive content of the term *right* varies according to the political, social, cultural, or historical contexts, which explains that several disputed criteria have been put forward to differentiate the right from the left.

Very often the right has been defined as more in favor of status quo, of individual (as opposed to collective) rights and responsibilities, of limited government or social interventions in the economy, and of the acceptance of inequalities construed as (largely) natural as well as socially necessary. In contemporary political discourse, right often refers to variants of conservatism, fascism, libertarianism, and (neo)liberalism.

Right to Die

The right to die tends to be a controversial issue around the world. Proponents of the right to die generally support the right of the terminally ill to end their own lives through assisted suicides and believe that life should not be prolonged when there is no chance of recovery. Many patients and families now routinely choose hospice care as an alternative to indefinite periods on life support. The focus of such care is on making patients and families comfortable without sustaining life by artificial means. Critics reject the notion that the right to die exists, contending that assisting or hastening death in any fashion is outright murder.

In 1968 a group of American physicians defined death as the end of human life when the heart and lungs cease to operate.

The term *brain dead* has since been used to describe patients who suffered irreversible brain damage, including the cessation of involuntary functions like heartbeat, such that they could only be kept alive through artificial means. A reexamination of when death occurs had been necessitated by advancing medical technology that allowed physicians to prolong life through the aggressive use of antibiotics, respirators, feeding tubes, and organ transplants.

According to the American Hospital Association, death occurs in three out of every four cases when terminally ill patients have been removed from life support. With prior consent of the patient or by permission of families, doctors can harvest vital organs to be transplanted into various patients or used in training facilities. Each country deals with the right to die in its own way, and positions range from that taken by the Netherlands, which accepts the right to die with equanimity, to Japan where a refusal to accept the scientific concept of brain dead prevents doctors from harvesting organs for major transplants.

SWITZERLAND AND THE NETHERLANDS

Some countries lack specific bans on assisted suicide, but Switzerland was the first country to legalize the practice in the 1940s. This permissiveness came under scrutiny in 2009, as an increasing number of foreigners (especially British, French, and German citizens) came to Switzerland to end their lives, a practice known as *suicide tourism*. The practice of suicide tourism was also controversial in the United Kingdom, as lawmakers debated whether to prosecute family members or friends who aid those travelling abroad to end their lives, or whether to recognize the right to die in the United Kingdom. Divergence in laws concerning the right to die among countries of the European Union promises to perpetuate controversy. In 2002, the European Court of Human Rights rejected the argument of a British woman, Diane Pretty, that the British law against assisted suicide violated her fundamental rights. As of 2010, the European Court of Human Rights had yet to reconsider this ruling.

Also, in 2002, the Netherlands became the second country to legalize assisted suicide and now has more than two thousand people choose to end their lives each year. The practice is legal only when a patient with an incurable illness or who is in unbearable pain that cannot be alleviated by other methods freely and persistently asks for assistance in dying. The decision must be agreed to by at least two physicians (one of whom is independent), and a committee has to be set up to monitor the case. If these guidelines are not followed, physicians may be prosecuted for murder. Belgium followed the Netherlands in 2002, but other countries have been slow to follow their lead.

UNITED STATES

The issue of assisted suicides has proved controversial in the United States, where the right to die is decided on a state-by-state basis and faces vigorous opposition in the *prolife* movement rooted in antiabortion activism among Christian conservatives. The right to die debate has been heated in the United States since 1976 when the parents of Karen Ann Quinlan, 22, who was declared brain dead after a drug overdose, asked and received permission to remove her from a respirator. The decision was challenged, and Quinlan lived several years in a vegetative state after the respirator was removed. The debate heated up again in 1990 when the Supreme Court entered the arena. In *Cruzan v. Director, Missouri Department of Health* (497 U.S. 261), the court held that competent individuals have a "liberty interest" based on the Due Process Clause of the Fourteenth Amendment to refuse medical treatment. Nevertheless, the justices decided that if no "clear and convincing evidence" of the right to die exists, the compelling interest of the state in sustaining life takes precedence.

This practice received international attention in the late 1980s and 1990s when Dr. Jack Kevorkian, dubbed "Dr. Death" by the media, helped more than one hundred terminally ill patients end their own lives (one case led to an eight-year prison sentence for second-degree murder). Meanwhile, in 1997, Oregon became the first U.S. state to legalize assisted suicide, followed by neighboring Washington in 2006. In 2010, the Montana Supreme Court issued a ruling protecting doctors from prosecution for assisted suicide, but falling short of recognizing a constitutional right to die.

The most recent controversial right to die case in the United States involved Terri Schiavo of Florida, who went into a coma in 1990 at the age of twenty-six after experiencing cardiac arrest. Doctors determined that she existed only in a vegetative state, but she was kept alive through a feeding tube. In 2003, Schiavo's husband Michael asked that her tube be removed, in keeping with what he believed would have been his wife's wishes. Her parents challenged the decision, disputing her diagnosis backed by their own doctors, and set off a round of battles that involved the Florida governor and legislature and eventually President George W. Bush (the brother of Florida's governor) and the U.S. Congress. On four separate occasions, the Supreme Court refused to hear the case. Despite the controversy, Schiavo's tube was ultimately removed in 2005, and she died two weeks later. Autopsy reports revealed that it would have been medically impossible for Schiavo to recover. The Schiavo case is a good example of the connection between U.S. Christian conservative opposition to abortion and rejection of a right to die—her parents, Roman Catholics, received spiritual counsel from Fr. Frank Pavone, the leader of Priests for Life, an organization of Catholic clergy opposed to abortion, euthanasia, and assisted suicide.

Right to Life

The right to life is a concept from international human rights law, suggesting that all people are entitled to live and that, under most circumstances, human beings should not end a life. It is included in a number of international human rights treaties and documents, most notably in Article 3 of the 1948 Universal Declaration of Human Rights (UDHR), which is the foundation for international human rights law. The right to life is given primacy in the document and, therefore, resulting law; in fact, it is the first enumerated right (part of "life, liberty, and security of person"), with the two articles that precede it only necessary for establishing the basis of common rights for all. The right to life subsequently has been included in Article 2 of the 1950 European Convention on Human Rights, Article 6 of the 1966 International Covenant on Civil and Political Rights, Article 4 of the 1969 American Convention on Human Rights, Article 4 of the 1981 African Charter on Human and People's Rights, and a number of other international agreements and conventions.

Although the concept entered human rights law after World War II (1939–1945), the idea of a fundamental right to life can be traced back to earlier documents, such as the American Declaration of Independence, which claimed the right of all men to "life, liberty, and the pursuit of happiness." Even the Magna Carta demanded that "No Freeman shall be taken or imprisoned . . . or any other wise destroyed . . . but by lawful judgment of his Peers, or by the Law of the Land," prohibiting at least the arbitrary taking of a life. Still, the earlier document suggested that the laws in place grant the right to life, while the Declaration matches the understanding of the UDHR and subsequent documents in that the right to life is somehow more fundamental, originating in the inherent worthiness of a human being or backed by the teachings of a deity.

As with many other human rights, the crux of many debates about the right to life is the extent to which it applies. Is the right to life a negative liberty, not to be killed arbitrarily, especially by the state, or does it require positive action to protect life? Those who view the right as a protection from arbitrary treatment often invoke it at the international level to decry or defend against abuses of human rights by autocratic governments, including the use of torture, disappearance, and war. Those who see a positive mandate may refer to the right to life in demanding international humanitarian efforts to alleviate suffering from natural disasters and human malfeasance, from earthquakes to famine to flooding.

Demonstrators at a pro-life rally speak out against abortion. The concept of the right to life has been adopted in discussions of social issues such as abortion, euthanasia, and capital punishment.

In Western democracies, particularly the United States, the concept of the right to life has been adopted by those concerned about social issues, especially in reference to abortion. Opponents of abortion often claim that an unborn fetus is a human life that requires state-sanctioned protection; indeed, one of the major American opponents of abortion is the National Right to Life Committee, an advocacy group with more than three thousand chapters. The right to life also has been invoked to oppose euthanasia, most famously in the case of Terri Schiavo, a brain-damaged Florida woman whose husband wished to cut off artificial life support systems in 2005. Conservatives unsuccessfully demanded that her right to life be protected by continuing to employ artificial means.

However, right to life discourse is not confined to the American right-wing. Catholics the world over use the term to oppose not only abortion, but also capital punishment; their claims have theological basis in a number of papal documents from Vatican II to more recent encyclical letters. (While again suggesting that the right to life is more fundamental than any earthly law, the church makes it clear that even the state is never sanctioned to take life.) By contrast, others invoke the right to life to defend women from unsafe medical procedures or oppressive cultural practices.

In general, the right to life is considered an important signpost of the overall shift of international law toward personal security and protection of the individual, rather than national security and protection of the state. It remains an important rallying point and justification for advocates of a number of international and national rights causes stemming from a host of political perspectives.

Riker, William

William H. Riker (1920–1993) was an influential twentieth-century American political theorist who developed methods for applying mathematical reasoning to the study of politics. After receiving his PhD from Harvard, Riker began his teaching career at Lawrence College in Wisconsin, right in the middle of the mid-century behavioral revolution in political science. He took a less-traveled path and sought something different from the statistical truths and behavioral reality that were popular in the day—something more fundamental and foundational.

Riker did not, as did his behavioralist contemporaries, think of individuals in political life as bundles of demographic characteristics, sociological connections, or psychological predispositions, but rather as goal-oriented, purposeful actors. Individuals, for him, were rational; they had an innate capacity to assess alternatives in terms of preferences, to organize their beliefs about the likelihood of various events occurring, and to combine preference and belief in a logical manner. If preferences are represented by a utility function, and beliefs by subjective probabilities, then rationality entails maximizing behavior—choosing the alternative with the highest expected utility. For Riker, the rationality hypothesis provided the firm foundation on which to understand human behavior in general. To understand political behavior in particular, his instinct was to imbed rational individuals in institutional settings—in committees, legislatures, courts, bureaucracies, parties, electoral situations, even revolutionary groups. He called the study of politics from this perspective positive political theory (to distinguish it from normative political theory). Through his teaching and writing, he created a new school of thought that, half a century later, remained part of the mainstream of political science and one of the essential building blocks of modern political economy.

Of the nearly one hundred papers he wrote, the two most often cited are "A Theory of the Calculus of Voting" (Riker and Ordeshook 1968) and "Implications from the Disequilibrium of Majority Rule for the Study of Institutions" (1980). He is perhaps best known, however, for four books: *The Theory of Political Coalitions* (1962), *Federalism: Origin, Operation, Maintenance* (1964), *Introduction to Positive Political Theory* (1972), and *Liberalism against Populism: A Confrontation between the Theory of Democracy and the Theory of Social Choice* (1982). The first characterizes all that we think of as political as consisting of the forming of coalitions, where rational individuals engage in this activity in order to win. The volume on federalism, significant when it first appeared, had a renaissance at the end of the twentieth century when, with the fall of communism, federal experiments in nation-building accelerated. *Introduction to Positive Political Theory* was essentially the very first textbook of political theory, transforming important parts of political science from civics and wisdom to science. *Liberalism against Populism* demonstrated how an axiomatized logic of political choice could shed light on many of the philosophical issues at the foundation of democratic theory. Together, this corpus became the exemplar for how to do political science.

Riker's crowning achievement was to institutionalize rational choice approaches to politics into a political science curriculum at the University of Rochester in New York. He came to Rochester in 1962 as its chair and created a PhD program in political science shortly thereafter. By the time of his death three decades later, Rochester had produced more than one hundred PhDs and had become a brand name.

Rogue States

The concept of rogue states first emerged as a key analytical category for Western policy makers and academics in the early 1980s. Although the term itself predates this period, the climax and conclusion of the cold war era witnessed a surge of interest in rogues, particularly within the United States. As former president Bill Clinton said in 1996, this interest was borne out of a widespread belief that the certainty and stability of a bipolar international system had been replaced with a far messier world of unpredictable and disparate threats: "Our struggle at the end of the cold war is to deal with these new perils—the rogue states like Iran and Iraq" (cited in Hoyt 2000, 300). With the terrorist attacks of September 11, 2001, further accentuating this sense of uncertainty, Clinton's successor President George W. Bush located rogue states at the very center of his administration's security strategy: "We must be prepared to stop rogue states and their terrorist clients before they are able to threaten or use weapons of mass destruction against the United States and our allies and friends" (National Security Strategy 2002, 14).

DEFINING AND IDENTIFYING ROGUE STATES

Prior to being at the heart of U.S. security policy, the term *rogue state* referred to patterns of domestic repression by states of their own citizens. Typically, it is reserved to describe states posing—or perceived to be posing—a direct threat to regional or international security. For scholars and policy makers alike, three criteria in particular warrant the use of this label: A state can be considered a rogue for facilitating, sponsoring, or actively engaging in international terrorism. In the United States, the State Department's annual *Patterns of Global Terrorism* reports have been central to identifying states that meet this criterion. A state also can be deemed a rogue for developing or actively pursuing weapons of mass destruction (WMD)—specifically chemical, biological, and nuclear weapons—and their delivery systems. Finally, and more controversially, the term also is applied frequently to states perceived to be acting in defiance of the international community's established laws, rules, norms, and conventions.

Although there has been some variation in the states designated rogues within contemporary political discourse, a small number have retained their positions of prominence. North Korea, Iran, and Iraq, three members of the "axis of evil," have consistently been identified as the most dangerous rogue states. Cuba, Libya, Syria, and Sudan also have been assigned this label by Western political elites, albeit less frequently.

Due to the unconventional nature of the threat posed by rogue states, efforts to counter them have overwhelmingly concentrated on coercive and militaristic security policies. The Clinton and Bush administrations pursued aggressive containment strategies for confronting rogue states, exemplified in the latter's prolonged pursuit of a national missile defense program, despite continued opposition from critics. More controversially, the existence of rogues has been used to justify preemptive or preventative military action against nonimminent threats—a policy that became the cornerstone of the so-called Bush Doctrine after the 2003 invasion of Iraq.

The continued centrality afforded rogue states by the security and foreign policy-making elites of Western states has provoked considerable opposition. Critics have argued that the concept is employed with such inconsistency that it is rendered worthless. Although frequently designated a rogue, Cuba, for example, fails to meet any of the above criteria. At the same time, Israel is almost never discussed under this label, particularly within the United States. These critics argue that the United States itself is the dominant rogue state. A related line of criticism suggests that this concept is applied in a politically selective manner as a powerful rhetorical strategy for condemning or demonizing enemies of the United States and its allies. Other critics maintain that the threat posed by these actors is considerably exaggerated; rogues are no more antagonistic or likely to resort to force than other states because they lack the infrastructure, as in the case of Libya, or because militarily strong neighbors constrain them, as in the case of North Korea.

Finally, and most important, critics have argued also that designating a state as rogue leads to unfortunate, even pernicious, political consequences. With coercive measures such as economic sanctions and military invasions the preferred strategy for confronting these actors, the use of this label frequently results in missed opportunities for improved relations, dialogue, and an end to direct or indirect violence.

Rokkan, Stein

Stein Rokkan (1921–1979), professor of comparative politics at the University of Bergen, Norway, was one of the world's leading social scientists. His life work produced a gigantic "historical fresco" of political development in Europe universally acknowledged as being fundamental to the study of the formation of nation-states and the birth of democracy. Rokkan's theoretical contribution, combined with his indefatigable organization of data archives and scholarly networks and his pioneering promotion of computerized research techniques, make him a "classic" of comparative politics.

Rokkan's working method consisted of constantly rewriting his pieces and completing them through new data and theories. The continuous evolution that characterizes his thought led to the fragmentation of his writings into a myriad of publications, in which previous conclusions are taken up critically. Rokkan never wrote a systematic and integrated volume. In fact, his intellectual endeavors were never intended as final products. Yet his work is extremely coherent. This unity stems from his concern with two basic phenomena.

The first of these phenomena is the formation of nation-states. Rokkan's models explain the emergence of the territorial and centralized states controlling peripheries and borders. He was interested in differences of timing between states that formed late in the nineteenth century in the *city-belt* in the middle of Europe, and old states in the territories surrounding it. His models also describe the building of nations, with the standardization of religion and language. Again, he was interested in variation, the goal being to explain why peripheral identities survived in some countries but not in others.

The second phenomenon Rokkan was concerned with was the development of mass democracy. His models reconstruct the paths from absolutism toward democracy (through *thresholds*) and how oppositions organize. His most famous model is that of four *cleavages* (class, state-church, center-periphery, rural–urban), caused by the national and industrial revolutions of the nineteenth century, which were expressed in political parties that stabilized in the twentieth century (the *freezing hypothesis*). Rokkan's work is characterized by parsimonious modeling of historical processes, political structures, and causal links. Text is accompanied by numerous figures that Rokkan considered useful for model-building.

Rokkan's intellectual achievements are matched by his entrepreneurial role in organizing international social science. He was secretary of the International Political Science Association (IPSA)/International Sociological Association (ISA) Committee on Political Sociology (1960–1979) and president of UNESCO's International Social Science Council (ISSC) Committee on Comparative Research (1973–1977). He was also IPSA's president (1970–1973) and ISA's vice president and chair (1966–1976). He cofounded the European Consortium for Political Research, of which he was the first chair (1970–1976). In Scandinavia, he was chair of the Nordic Political Science Association and helped to create the journal *Scandinavian Political Studies.* Rokkan also founded the Department of Comparative Politics at the University of Bergen.

Convinced of the potential of both the behavioral and computer revolutions in the social sciences, Rokkan became the leader of the archival movement for the organization of permanent infrastructures for the collection, dissemination, and classroom use of "ecological" (micro and macro) data produced by collaborative and cumulative research. He organized the Conferences on Data Archives in 1963 and 1964, helped to build the Committee of European Social Science Data Services, and edited *European Political Data.*

Rokkan was fluent in several languages and traveled ceaselessly for conferences and research purposes. His stature is witnessed worldwide by recognitions in his honor, including lectures, prizes, and chairs named after him. Most importantly, his models have remained a constant source of inspiration for later generations and are employed to interpret democratization throughout the world as well as the process of European integration.

Roll-call Analysis

Roll-call analysis could be defined as the use of quantitative or qualitative research methods to understand the decision-making process behind a legislator's vote; the reasons and rationale behind that vote; and the implications and consequences of

the vote. Roll-call studies can use single roll calls or aggregated data, depending on the researcher objectives. Roll calls may be analyzed for a variety of reasons, including forecasting roll calls and identifying trends inside the legislature, monitoring interests, and keeping track of legislators' records and party cohesion. The idea is that when a representative votes on the floor, that vote represents the end of a decision process. Therefore, voting on the floor is the expression of a choice that can be measured and used by political scientists. Roll-call analysis might be the most-used method to analyze legislative behavior because votes are available in most of legislatures at national, state, or city levels. Besides, it is possible to compare the same legislator—or party—across different periods or subjects, and many others levels of analysis. It is also possible to contextualize the vote to try to understand it better. Roll-call analysis can use simple methodologies such as coding individual votes and comparing them within a political party, or extremely complex methodologies that use factorial analysis, simulations, and mathematical models.

Roll Off

Roll off is a form of incomplete voting participation. In modern elections, voters rarely are offered only one electoral position on a ballot. If a voter participates in the top-of-the-ballot election and does not vote in other elections on the ballot, participation is not complete. This failure to complete a ballot is referred as voter roll off.

The existence of voter roll off has important consequences. The most significant consequence of voter roll off is its impact on voter turnout rates. While the turnouts in the US. off-year congressional elections can be as low as 35 percent, and turnout in local elections around 25 percent, voter roll off may further reduce the level of political participation in elections farther down the ballot. The phenomenon of roll off can be attributed to lack of certain election skills, information, or resources. For example, certain ballot formats more than others confuse or "fatigue" voters, and therefore cause some voters to cease casting a ballot. Some voters refrain from casting a ballot when they lack information about a particular election or public office. Roll off also may be caused by a lack of interest in politics, minimal concern with public issues, a sense that activity makes no difference, and no consciousness of membership in a group with shared political interests.

Roman Catholic Social Thought

Catholic social thought is a systematic Christian reflection on the social order. Neither Jesus nor the early church sought the cooperative agency of the state, sharply delineating the two realms. Seeking to strip politics and the state of divine pretensions, the church, under Pope Gelasius I, in 494, formalized the doctrine that there were two authorities, ecclesiastical and civil, each legitimate in its own realm.

CLASSICAL FORMULATIONS: AUGUSTINE AND AQUINAS

In *De civitate Dei,* Saint Augustine articulated what would be the defining Christian attitude toward politics. Until the end of time, there are two cities, the heavenly and earthly, the former comprised of those who love God, the latter by those who love themselves and the world without reference to God. Political life is always the mingling of the two. Coupled with Augustine's conviction that the majority is unconverted, Augustine's views of politics are rooted in the grim realism that human beings, weakened by original and actual sin, can only attain a very limited justice in this world. Willed by God as a necessary, partial remedy for human sinfulness, the state's role is largely coercive and punitive, limiting sin but unable to treat the roots of the disorder in the human soul. Although incorporating essential Christian insights into the human condition, Augustine's theology ran the risk of promoting an unduly negative view of the state's role.

Saint Thomas Aquinas is generally regarded as providing the needed corrective that renewed the Augustinian tradition through reappropriating the best of the Aristotelian corpus. Government's functions are not limited to the remedy of human deficiency, but include the essentially positive functions of choosing the means to and material requirements of the common good, and securing justice. He underlined the case for Christian support of constitutional government by affirming Aristotle's preference for a mixed regime, claiming that Scripture supported the ideal as well. Aquinas' theory of law would become Catholic patrimony, particularly in his classic statement on natural law, a law imbedded in human nature, discernible by reason, by which we can attain a sure knowledge of fundamental and universal moral principles; these properly condition and limit all human, political law.

MODERN FORMULATIONS: NATURAL RIGHTS AND PAPAL ENCYCLICALS

In the sixteenth century, Spanish Thomists in particular would develop two of the most influential doctrines for the subsequent development of Western political thought: popular sovereignty and natural rights. Jesuit scholastics, Francisco Suárez and Robert Bellarmine in particular, developed the former in the process of rejecting the divine right of kings, denying the proposition that God directly chose either political rulers or regimes. Historian Brian Tierney (1997) has shown how Francisco Vittoria and Bartolomé de Las Casas played equally fundamental roles in arguing the case for universal natural rights in the process of defending the rights of native peoples at the time of the colonization of the Americas.

Pope Leo XIII's *Rerum Novarum* (1891) begins the systematic exposition of Catholic social teaching as an authoritative and comprehensive body of doctrine. This landmark papal encyclical was a response to both the perceived injustices

against the working class as a result of the Industrial Revolution and the challenge of Marxism. It has been followed by a number of others, as well as documents released by groups of Catholic bishops that interpret and apply its principles in local settings. Perhaps the most significant of these was The Second General Conference of Latin American Bishops, held in Medellín, Colombia, in 1968. In rather stark and prophetic language, the bishops condemned poverty in Latin America as an inhuman scourge resulting from institutionalized injustice, calling for profound economic and political reform. Catholic political engagement increased significantly in the subsequent two decades. In addition, the Catholic bishops in the United States emerged as serious participants in debates over war and peace (*The Challenge of Peace,* 1983), the economy (*Economic Justice for All,* 1986), and in the promotion of national health care (provided it avoids government funding of abortion).

The teaching is comprehensive of the social order. The most fundamental principle is the sanctity of human life from conception to natural death, exemplified by John Paul II's 1995 encyclical *Evangelium Vitae,* which translates into an abolitionist approach to abortion, embryonic stem cell research, euthanasia, as well as a severely circumscribed support of the death penalty, limiting it to cases when a given society would have no reliable alternative way of protecting itself from violent criminals. This document provided a comprehensive explanation of the Vatican's efforts at the UN Conference at Cairo (1994) and elsewhere to reject the inclusion of abortion and the other named practices from the generally recognized list of universal human rights. Related to this is the insistence on the family as the most essential social institution and a rejection of same-sex marriage and divorce.

Philosophically, the church has insisted on the essential complimentarity of the principles of autonomy and solidarity, resisting both individualism and collectivism. The church came to insist on the valid rights of conscience, particularly in religious matters, a development highlighted by the landmark document *Dignitatis Humanae* (1965), despite the objections of a small percentage of the world's bishops who continued their preference for a "confessional state." In addition to the clear embrace of religious freedom, the church came to recognize a broad list of human rights as a legitimate outgrowth of its long-standing commitments to natural law, as in the Universal Declaration of Human Rights. Catholic social teaching rejects moral relativism, in which it sees the negation of the objective moral order, which alone can properly support a universal philosophy of human rights.

TEACHING ON THE STATE: OPTION FOR THE POOR AND SUBSIDIARITY

Concerning the state, Catholic social teaching has defined a position that avoids ideological characterization. On the one hand, it strongly condemned Marxism, defending in principle the rights of private ownership and economic initiative. On the other hand, from *Rerum Novarum* (1891) through *Caritas in Veritate* (2009), the church has consistently condemned laissez-faire capitalism for its violations of human dignity, particularly with respect to the exploitation of workers. Moreover, it defends the rights of the state to intervene to protect the rights of workers to living wages and to organize collectively. The insistence that social policy reflect a "fundamental option for the poor" has become increasingly a central theme. In Latin America, from the late 1960s into the 1980s, a movement called *liberation theology* emerged, which placed considerable focus on this "fundamental option for the poor" in promoting social and political change as a constitutive dimension of the Gospel. Some theorists and practitioners adopted Marxist analysis and praxis to some degree, which led to two clarifications by the Vatican insisting on the religious, moral, and epistemological division between Marxism and Christianity, while affirming the pursuit of social justice (*Libertatis Nuntius* in 1984, *Libertatis conscientia* in 1986).

Nevertheless, one of the most distinctive features of the teaching is the principle of subsidiarity, which forbids higher associations (such as federal or state government) from taking away the legitimate functions of lower associations (such as a local level of government or the family). For example, if a family or local community can resolve issues pertinent to them, higher levels of government should not intervene. The principle does not, however, forbid government intervention when the order of justice demands the realization of conditions that lower forms of association are unable to bring about.

Rooted in subsidiarity, Catholic social teaching has, on the one hand, been sympathetic to the arguments that the social assistance state runs the risk of creating a demeaning clientelism among the disenfranchised. On the other hand, the most recent contribution to the social magisterium, *Caritas in Veritate,* clearly contends that in the context of the globalized economy, the proper role of the state in the promotion of social justice in the future most likely will be an expanded one. On economic matters, the person-centered approach insists on the priority of labor (the personal factor) over capital. The entire social order, the church insists, must serve the person, and never the other way around. The depth and breadth of the teaching permit scholars with leanings both left and right to work within the developing tradition. Some interpret subsidiarity as a generalized skepticism to an expanding state; others are more generally accommodating of a more European, social democratic approach. The church strongly resists nativist immigration, insisting that human dignity accompanies the person wherever he or she may go. Finally, the church recognizes the importance of being stewards of creation.

Roman Political Thought

Roman political thought is characterized by the influence of moral philosophy and individual ethics on theorizing political questions. This is due, in large part, to the centrality of Epicurean and Stoic philosophy, both of which primarily focus on individual well-being and on the moral status of the individual in the universe, more so than in the polis. The result is a separation of moral philosophy and political philosophy that were strongly linked in the ancient Greek tradition, which makes deeper connections between questions of the good person and the good citizen.

EPICUREANISM AND STOICISM

Nevertheless, Epicureanism and Stoicism differ on the value of politics and whether the wise person should engage in politics and public life. Epicureanism advocates a rejection of the inherent dangers of public life and political participation for individual happiness, suggesting instead withdrawal, going unnoticed, and quietism. Rather than a condition of a moral life, politics in the Epicurean view is theorized instrumentally, as a means to achieve physical security, but will work against the happiness of those who chose to participate. As a result of advocating the private life, Epicureans are criticized for enjoying the advantages of political life, such as security, without contributing to it.

Roman Stoic philosophers, such as Cicero, Seneca, Epictetus, and Aurelius, while advancing a doctrine of individual well-being, argue against the private life of mind and withdrawal from political life, and hold instead that we have duties to serve others and that the wise person should participate politically. Humans are theorized as naturally social and thus drawn toward the performance of public duties. As social beings, we cannot be purely self-interested but have the capacity for altruism. Politics itself depends on such capacity because the moral standing of individuals is thought to be required for a stable and just social order, especially wise and virtuous leadership. Damaging self-interested motivation is due to the corrupting influence of improperly ordered institutions, suggesting interdependence between institutions and individual motivation.

VIEWS OF THE ROMAN ELITE

Cicero argues that the primary threat to political stability is the moral corruption of political elites, especially personal ambition. Cicero was critical of the ruling classes getting involved in commerce, which he thought sets their self-interest against the common interest. The requirements of empire necessitated full commitment, patriotism, and public virtue as the source of personal status and reputation. The functional goal was to integrate personal ambition with patriotic virtue and to conflate the pursuit of common and personal goods. As such, Cicero's diagnosis of the decay of the republic was blamed not on the limits of its institutions in adapting to changing political reality and scope, but on the decline of the virtue of its leadership.

Seneca, writing one hundred years after Cicero in the post-Republic era, suggests that political stability and social cohesion do not result from conventional matters of political theory, such as well-ordered constitutions and balanced, inclusive legislation, but on the individual ethics and virtues of rulers. According to Seneca, the gods select kings, and though not themselves divine, have similar powers over their nations. However, this status imposes significant obligations on leaders to act toward their subjects with justice and clemency. Good rulers must cultivate virtue in their subjects to strengthen society, by choosing clemency over cruelty, overlooking injuries to self, and ensuring that harms incurred by subjects are punished. Seneca is largely unconcerned with modes of selection, constitutional balance or legitimacy questions—the powers of king are not bound by the law, nor are they shared. The distinction between kings and tyrants is not found in constitutional types or their relationships to the constitution but in their behavior and their virtue. The power of kings is not externally constrained, but the role of the ruler itself demarcates duties, much like all social roles.

ATTRIBUTES OF ROMAN POLITICAL THOUGHT

A further prominent virtue required of political leadership in Roman political thought is rhetorical ability. According to Cicero, the best orator is a statesman, functioning in the assembly and the courts, and using the power of rhetoric to uphold the republic. The function of rhetoric is to win goodwill and move the emotions. Theorizing rhetoric as a political virtue raises potential conflict between philosophical discourse and political discourse. Whereas philosophical persuasion is directed at the intellect, oratory aims for the passions. This is thought to be justified and necessary because

political leaders must persuade those who have underdeveloped intellects. Political stability is furthered by deliberation, debate, and persuasion, as Cicero theorized the function of the Roman Senate, compared with reliance on force, bribery, and patronage.

In addition to able and virtuous practitioners of politics, Roman political thinkers, particularly during the republic, emphasized the importance of a well-ordered constitution and institutions to political stability, and attributed Rome's success to its republican constitution. Cicero thought the Roman constitution was perfect and the realization of Greek political ideals, particularly Aristotle's polity. According to Cicero, all pure types of constitutions, including monarchies, aristocracies, and democracies, are inherently unstable because they exclude portions of society from political participation. Mixed or republican constitutions, however, are stable because they are based on equality and inclusion, giving social classes no reason to strive for constitutional change. Institutionalizing social conflict makes the constitutional regime the site of contestation rather that its object.

The Greek historian Polybius also attributes Rome's stability and imperial success to its superior constitution and institutions. Mixed and inclusive government is more stable than pure forms because it acquires the consent and approval of the governed, rather than ruling out of fear. Republican constitutions also limit the security of rulers and their absolute control, which diminishes the likelihood of corruption. The interdependence that is created by constitutionally established cooperation promotes unity and equilibrium among social classes and protects the constitution from corrupted and ambitious individuals.

Roman Stoics also developed a cosmopolitan view of the universe as a polis, replete with obligations to humanity, equality grounded in rationality, and a natural law. While goodness requires serving other human beings, particular or local obligations to Rome are defended within the cosmic city as the best way to realize universal obligations. Despite the defense of local obligations, Cicero argues for a universal and natural conception of justice, against a conventional, relative, and thus open-ended view. Justice, like all virtues, is good in itself and should be pursued for its own sake.

Rorty, Richard

A leading philosopher of his time, American Richard Rorty (1931–2007) challenged the foundations of modern Western philosophy. His work is most often linked with American pragmatism—that is, to the work of such individuals as Charles Sanders Pierce, William James, John Dewey, Wilfred Sellars, W. O. Quine, Donald Davidson, Ludwig Wittgenstein, Martin Heidegger, and Jacques Derrida. His challenges to widely accepted aspects of philosophy both garnered a large audience outside the discipline and were met with widespread criticism within it.

Beginning in *Philosophy and the Mirror of Nature* (1979) and continuing throughout his career (perhaps most clearly in *Objectivity, Relativism, and Truth* [1991]), Rorty criticized the epistemological tradition of modern philosophy. This tradition stated that under the right conditions subjects were said to accurately "mirror" reality. However, Rorty argued that having any such accurate representations of reality would entail some specifically epistemological process between subjects and objects for which a coherent philosophical account would be needed, and such an account, he asserted, continued to prove elusive.

Influenced by Darwinian naturalism, late nineteenth– and early twentieth–century pragmatism provided the seeds for an alternative approach. Instead of characterizing the relations between people and the things in their environment in representational terms, they could be characterized as practical "habits for action," the latter being understood as causal and behavioral capacities, or virtual instruments. If what were taken to be representations of reality were re-described as habits for action, and if the processes of "acculturation" involved in habit acquisition were taken seriously, then a shift beyond the traditional epistemologically based paradigm would begin. What is called truth would no longer have anything to do with a subject's representations of reality (because such representations would no longer be entertained). Rather, truth would be a term of endorsement or caution with respect to the effectiveness of the habits for action by which subjects are acculturated. Of course, representationalism has been privileged by the great tradition of Western philosophy, a tradition outside of which it remains difficult to think for most. Nevertheless, as rich as the tradition has been, Rorty recommended shifting the paradigm, because it seems to have failed to provide the required coherent account of a mediating epistemological process.

Rorty's view entails the centrality of acculturation, but individuals' acculturation precedes them, he argues, there is no independent—that is, cultureless—access to some "essential" reality "out there" by means of which acculturation may be assessed or grounded. The beliefs held by individuals are thoroughly "contingent." Nevertheless, their activities and conversation are both enabled by and address the beliefs in the midst of which individuals find themselves. If conversation becomes more inclusive—if the beliefs of new interlocutors are woven into it—it will become more open and democratic, increasing the scope of ethical and political "solidarity." Here lies Rorty's

reformist and inclusive liberalism, detailed in *Contingency, Irony, and Solidarity* (1989). Although no beliefs whatsoever may be assessed objectively (that is, standing outside one's acculturation), what has resulted are sets of beliefs by means of which, and about which, individuals converse, and which they may revise. Rorty recommends that the open conversation about and revision of habits for action be taken seriously, while the countless unsuccessful attempts to ground them in putative foundations or essences be abandoned. Thus the liberal "ironist" engages in an "anti-foundationalist" or "anti-essentialist" "cultural politics."

Rothbard, Murray N.

Murray N. Rothbard (1926–1995) was a twentieth-century political economist and social theorist in the modern libertarian tradition. The author of more than twenty-five books and thousands of articles, he constructed a libertarian politics that drew from neo-Aristotelian realism, Lockean natural rights theory, individualist anarchism, the Austrian school of economics, and new left revisionist history. He advocated a version of anarchism known as anarchocapitalism, in which all goods and services, including defense and judiciary, are provided by free markets.

In *The Ethics of Liberty* (1982), Rothbard begins with Aristotelian principles of natural law, placing central priority on the individual as a rational, acting being. For Rothbard, the axiom at the base of all politics is the principle of self-ownership: individuals own their own bodies and the products of their labors. By appropriating the material objects of nature and mixing their labor with the land, people justly acquire property based on first use, as well as title transfer, whether through free exchange, gift, or inheritance. In Rothbard's view, individual rights are founded on a nonaggression principle: no one has the right to initiate the use or threat of physical violence against others or their justly acquired property. Every individual retains the right of self-defense.

Throughout history, Rothbard argues, the state has systematically violated individual rights by imposing a monopoly on the use of force within a given geographical area. In such works as *For a New Liberty* (1973), Rothbard views the free market and the state as polar opposites. The free market is synonymous with individual freedom, mutual benefit, harmony, and peace, while the state is synonymous with coercion, exploitation, class conflict, and war. Whereas markets promote efficiency, rational economic calculation, and production, states are necessarily parasitic, inefficient, and destructive. Rothbard envisions a future libertarian society in which the nonaggression principle is enshrined in a Libertarian Law Code, regulating the activities of voluntarily financed competitive defense and judicial agencies.

This anarchocapitalist perspective drew from the works of individualist anarchists such as Lysander Spooner, Benjamin Tucker, and Albert Jay Nock. However, the most important influence on Rothbard's thought was the work of his mentor, the Austrian economist Ludwig von Mises. Rothbard's works in political economy, such as *Man, Economy, and State* (1962) and *Power and Market* (1970), extend the principles of Misesian theory, examining state intervention as the root cause of business cycles, inflation, unemployment, monopolies, war, and imperialism. Rothbard maintained that no government action was neutral and that state intervention created class (or caste) conflict by enriching certain groups at the expense of others.

Drawing from the work of new left revisionist historians such as Gabriel Kolko, William Appleman Williams, and James Weinstein, Rothbard focused on the monopoly of the state over the money supply, which structurally privileged banks and their capital-intensive beneficiaries. He advocated the end of central banking and the imposition of a strict 100 percent gold reserve requirement on all banks to prevent what he characterized as legalized counterfeiting and its deleterious consequences. His ideal society is one that celebrates the free and voluntary exchange of goods, services, and ideas.

Rotten Boroughs

Rotten boroughs is primarily an English term used to describe electoral districts with very small populations. Initially the phrase applied to English districts in the late seventeenth century, but today, the term typically refers to the dominant political party within a district, which likely remains uncontested due to their popular constituency support. Prior to nineteenth century electoral reforms, the aristocracy in England used these constituencies to maintain influence in the House of Commons where the less-populated rural districts

balanced the growing urban areas. With small populations, the local aristocracy manipulated electoral processes by generally choosing the given candidate(s). Consequently, these boroughs were said to be in the pocket of the local gentry, and were also referred to as *pocket boroughs.*

By the 1830s, there were at least 140 rotten boroughs among the 658 electoral members in the British House of Commons, including some fifty boroughs with less than fifty eligible voters. One borough, Gatton, had two voters, while Old Sarum had no eligible voters, but regularly sent two members to the House. In 1832, The Great Reform Acts eliminated the most egregious of the rotten boroughs, and the 1867 Reform Act consolidated many of the remaining boroughs with small populations, but it was not until 1884 that district lines were adjusted so that British populations were roughly equal and given proportionate representation. The rotten boroughs in England inspired other democratic systems to enact legislation to ensure roughly equal voting populations in electoral wards.

Rousseau, Jean-Jacques

Jean-Jacques Rousseau (1712–1778) was a French political and social thinker recognized as making major contributions to social contract and democratic theory through his writings, such as the *Social Contract* (1762). Rousseau's works are credited also with being a major influence on the French Revolution (1789–1799), as well as education, gender, and literary theories, and they served as inspiration for many subsequent political theorists.

Rousseau was born in Geneva, Switzerland. His mother died soon after giving birth to him, and his father fled the city when Jean-Jacques was ten. All three of these events would dominate Rousseau's biography and writings. His citizenship in Geneva and his admiration for the city affected his views on the political community, and his 1755 *Discourse on the Origin and Foundations of Inequality among Men*—known as the *Second Discourse*—was dedicated to its citizens. Scholars theorize that the early death of his mother and the abandonment by his father pushed Rousseau into relationships with older women who served often as patrons for his work and affected his views on gender.

Rousseau's importance in political theory derives from a collection of writings that situate him within the social contract theory tradition of Thomas Hobbes, John Locke, and subsequently Immanuel Kant and John Rawls. Rousseau's first major work, *Discourse on the Arts and Sciences*—the *First Discourse*—was a 1750 essay that initially thrust him into the French literary limelight. The essay questioned whether progress in knowledge had led to human perfection and the improvement of civilization. Rousseau was skeptical of this progress, suggesting human nature had been corrupted by society.

The idea of a more primitive yet noble and uncorrupted human nature that predated society dominated Rousseau's *Second Discourse.* It sought to explain the sources of human inequality. Rejecting beliefs that political and social distinctions were natural, Rousseau instead saw them as conventional. Appealing to a distant time that predated the construction of social institutions, he saw a natural savage who lived an unreflective but uncorrupted solitary life in a state of nature. The lure into society, and eventually into inequality, in the *Second Discourse* is the result of the invention both of private property and the trick of a few seeking to convince all that joining a political community would be to their advantage.

This theme of society, at least as then constituted, corrupting humanity continues in Rousseau's *The Social Contract,* which inquires whether any political society can be just, fair, and legitimate by opening with the claim that "Man is born free, and he is everywhere in chains." The purpose of this book was to forge a theory of government that preserves individual freedom. Rousseau appears to find an answer in constructing a small homogeneous political community where individuals align their political will with that of the general will. Individuals thus give up nature for moral freedom, creating a political community they will for themselves.

Besides exploring the limits of legitimate political authority, much of Rousseau's work also can be seen as an examination of human alienation and societal roles. In his posthumous *Reveries of a Solitary Walker* (1782) he ponders the question of self-identity and consciousness by asking "What am I?" In *Emile* (1762) he examines the appropriate means of educating men to be citizens and women to be wives.

Rousseau's discussions of human nature, alienation, property, gender, and political authority influenced writers as diverse as Mary Wollstonecraft, Edmund Burke, Karl Marx, Immanuel Kant, George Hegel, and Sigmund Freud. Finally, his writings questioned the legitimacy of the French monarchy, helping to forge the ideological weapons that would drive the French Revolution.

Roy, Manabendra Nath

Manabendra Nath Roy (1887–1954), popularly known as M. N. Roy, was a Bengali Indian revolutionary, philosopher, political theorist, activist, and exponent of the philosophy of radical humanism. Born as Narendra Nath Bhattacharya, he became a militant nationalist at the age of twenty and was jailed thrice before the age of twenty-three for actions against the British colonial government in India. He adopted the name of Manabendra Nath Roy as an alias to escape arrest by the authorities.

In 1915 Roy left for Japan and China in search of arms and support, traveling under various names and disguises, until he reached Mexico, where he founded the Communist Party in that country. At the invitation of Russian political leader and revolutionary Vladimir Lenin, Roy left for Moscow. In the newly formed Soviet Union, he became a major figure in the communist organization Comintern as an expert on colonial nations and as a major theorist in Marxism. After Lenin's death, Roy fell out of favor with new Soviet leader Joseph Stalin and fled to India.

In India Roy was arrested by the British authorities and jailed for six years. While incarcerated he wrote manuscripts in which he examined the causes for the degeneration of Marxism into Stalinism. He blamed German philosopher Karl Marx's collectivism and materialism for the betrayal of social-ist ideals in the Soviet Union. He tried to explore a way to synthesize liberalism and Marxism on the one hand and mate-rialism and idealism on the other to create what he called *radical humanism*. Parts of these prison manuscripts have been published in such works as *Fascism* (1938), *The Historical Role of Islam* (1939), *Materialism* (1940), and *Science and Philosophy* (1947).

Roy continued to refine his ideas in *Beyond Communism to Humanism* (1946) and *Reason, Romanticism, and Revolution* (1952). He attacked both individualism and collectivism and advocated instead a cooperative democracy or a loosely struc-tured polity of self-governing units in the model of Switzer-land, with the rights of recall and referenda serving to temper state aggrandizement. It would be sustained by a cooperative economy that was neither capitalistic nor communist but communal. To achieve such a just society, Roy called for a cultural revolution that would instill love of freedom, equality, and mutual respect among the masses. He dismissed political parties as front organizations for special interests and favored small bands of radical democrats who would serve as leaven for transforming society. In line with this thinking, Roy dis-banded the Radical Democratic Party he had set up in 1941 and invested all his energies thereafter on the Indian Renais-sance Institute, which functioned more as a think tank. It did not survive Roy's death in 1954.

Rulemaking

Rulemaking is the process by which executive branch agencies write regulations that have the force of law. Rules include everything from requiring public corporations to notify shareholders that proxy voting materials are available on the Internet in a manner prescribed by the Securities and Exchange Commission, to specification by the Environmental Protection Agency of concentrations of pollutants in drinking water that require corrective action by local agencies. Agency authority to make rules comes from acts of Congress, and the process of rulemaking is governed by an extensive body of statutes (the watershed is the Administrative Procedure Act of 1946) and court cases. Though they are sometimes described as merely "filling up the gaps" in acts of Congress, agency rules can mark important substantive changes in policy and

implicitly pick among competing social interests or values. Rulemaking significantly expands the reach of the federal government; no area of federal policy making is untouched by rulemaking.

LEGITIMACY QUESTIONS

Because agency personnel are not elected, rulemaking as substantive policy choice by agencies raises important issues of democratic legitimacy. Because rulemaking is a quasi-legislative function vested in executive agencies, it raises potential challenges to separation of powers. Thus, while rulemaking can be partly justified on the basis of agency expertise on substantive policy matters, the democratic and constitutional issues it presents raise agency accountability in rulemaking to paramount importance. All three constitutional branches of government possess formidable tools to hold agencies accountable, if they choose to use them.

Courts have been committed to close review of agency rules from the earliest days of federal regulation. Agency rules can be challenged in court on numerous grounds—e.g., that the agency's decisions are arbitrary and capricious; that its interpretation of the statute granting rulemaking authority is either inconsistent with the clear meaning of the statute, if such is apparent, or, if the clear meaning is not apparent, not reasonable; that the statute delegating the authority is an open-ended delegation of Congress's power to make law; that the agency did not follow appropriate procedures in making rules; or that the rule is not justified by substantial evidence. On top of statutes governing rulemaking procedures, federal courts have established a large body of precedents and tests to resolve these issues in extensive review of specific agency rules every year. Courts also implicitly influence rules through control of *standing,* the determination of who has the right to sue federal agencies due to adverse effects of rules.

PRESIDENTIAL INFLUENCE

The president also has several formal channels to influence agency rulemaking. First, though statutes empowering agencies to make rules usually delegate that power to department or agency personnel, not the president, it has been apparent since 1835 (when President Andrew Jackson fired his Treasury secretary for declining to use his statutory authority as the president desired) that presidents can fire executive branch appointees based on disagreements with their use of discretionary authority granted by Congress. Second, a less disruptive channel of presidential control is regulatory review. This authority was asserted by President Ronald Reagan in Executive Order 12291 (after assertions on a more limited scale by President Richard Nixon), and requires agencies to clear "major rules" with the Office of Management and Budget (OMB) before they become effective—effectively a screening device for the president. Subsequent presidents have reaffirmed or expanded OMB review. These potent formal tools of presidential management apply to rulemaking in cabinet departments and their agencies, not to independent regulatory commissions. Presidents cannot fire appointees in independent commissions due to mere policy disagreements, and presidents have not attempted to assert regulatory review authority over their regulations.

CONGRESSIONAL RULEMAKING

Congress also has several tools, formal and informal, to influence agency rulemaking. First, the Congressional Review Act (CRA) imposes a sixty-day waiting period before rules become effective; during this period either house of Congress can pass a Joint Resolution of Disapproval (JRD) of the rule, which if passed by the other house and signed by the president nullifies the rule and prevents the agency from issuing any substantially similar rule in the future. The important points in the CRA are the waiting period and the fact that the JRD cannot be filibustered in the Senate. The CRA was most prominently invoked to nullify a major rule on ergonomic safety in the workplace by the Department of Labor. The ergonomics rule, the result of more than ten years of work by the department, was passed in the waning days of the Clinton administration; the waiting period overlapped with President George W. Bush's term, thus giving the Republican Congress a more sympathetic president when it passed the JRD. (In earlier decades Congress could choose to require prior approval by Congress before rules took effect—a practice called *legislative veto*—but the Supreme Court ruled this unconstitutional in 1983. The CRA was passed to reclaim some of this authority for Congress while meeting the Supreme Court's objection.)

Additionally, through repeated interaction with agencies, control over budgets and statutory authority, and giving favored interest groups privileged access to agency proceedings, Congress has several channels to control or at least influence the content of agency rules, when and if it is unified enough to send clear messages to agencies. However, because Congress requires majorities or supermajorities in two chambers to take formal action, internal disagreements within Congress can de facto increase the discretion agencies have to forge their own course of action, which McCubbins, Noll, and Weingast (1987) have dubbed *agency drift*.

Because rulemaking can profoundly affect public policy, at times each constitutional branch does take enough interest to wield its tools of influence. Scholars have found measurable influence over the content of agency decisions by Congress, the president, and courts. The question of who "controls" rulemaking in the bureaucracy is too simplistic to be meaningful, but it is clear that several actors have the means and, given rulemaking's importance, the incentive to influence the content of rules.

Rule of Law

The rule of law initially seems a simple and straightforward idea, concisely articulated by Aristotle in his view that the laws, not men, should rule in a well-ordered polity. This aspirational prescription for good government unites thinking about the rule of law from the ancient Greeks down to contemporary theorists. Though men and women do, of course, wield public power, the rule of law represents a normative standard by which all legal subjects can evaluate and challenge official public action. Because the concept stands for the supremacy of law over unconstrained political power, a commitment to the rule of law guarantees that public officials are both authorized and bound by law in the exercise of their functions and powers. In a legal system governed by the rule of law, all persons in the polity will possess formal equality, ensuring that elected officials and high-ranking members of the executive branch of government will be held legally accountable like any other person.

A BRIEF OVERVIEW OF THE HISTORICAL DEVELOPMENT OF THE RULE OF LAW

In ancient and medieval thought, the concept of the rule of law imperfectly regulated the power of the sovereign through obligations embedded in positive law—such as the Magna Carta—as well as obligations believed to be part of natural or religious law. In the seventeenth and eighteenth centuries, the rule of law shifted its meaning to signify political resistance against any form of unconstrained political power in the state, no matter its source or institutional location. In English constitutional law, the political struggle focused on the capacious prerogative power of the monarch. During this period, the idea of the rule of law as a restraint on sovereign power solidified, contributing to the demise of absolute monarchy as a legitimate form of government in the West.

The rule of law typically implies a form of constitutionalism, but does not dictate type or content. It is related to the concept of the *Rechtsstaat*—the state of law—in the German tradition of constitutionalism. Both concepts, despite different histories, contain similar principles. The *Rechtsstaat* arguably offers less of a distinction from the notion of rule *by* law, where law is viewed as a malleable instrument of state power such that government simply acts through laws it creates, but without being affected by constraining principles. In Anglo-North American legal systems, rule of law principles and values formed part of the common law, and later achieved formal constitutional status in written documents such as the U.S. Constitution.

The introduction touched on three predominant themes that run through the political history of the rule of law, each possessing a proximate cluster of meanings: the rule of law, not men; formal legality; and, government limited by law. These three themes attest to its central function of imposing effective legal restraints on political power. Nevertheless, many legal and political theories consider the rule of law an important, but, following Jeremy Waldron's characterization (2002), "essentially contested concept" because of fundamental disagreements about its content and its scope. Before discussing these theoretical debates, this entry analyzes several of the less controversial features of the rule of law: the legal core, the necessary institutional arrangements, and broad sociocultural orientations.

THE LEGAL DIMENSION AS A FORMAL CONCEPTION OF THE RULE OF LAW

In legal theory, the rule of law commonly entails a set of legal procedures and forms that regulate and legitimize statutes, judgments from courts of law, and administrative decisions. Rules, principles, and enacting processes must be in place for law to be considered valid. In this way, the rule of law acts as a metalegal principle organizing a subsidiary set of standards that generate legal validity and contribute to political legitimacy because legal subjects judge the lawmaking capacity and resulting laws as worthy of respect. Without such respect, compliance with the law can only ever be partial.

In many theories of the rule of law, a legal system must aim for a set of formal characteristics that are public and that can guide the conduct of all legal subjects. A common set of principles has evolved over time and includes those enunciated by Lon Fuller (1969) and Joseph Raz (1979): publicity, nonretroactivity, clarity, generality, consistency, stability, capability of being obeyed, and declared rules constraining the administration of law as well as the discretion of public officials. Despite overlapping agreement on many of the principles, substantial disagreement exists concerning their respective content, importance, and scope.

The presumed virtue of these formal requirements rests on the belief that they permit individuals to predict legal responses to their behavior by state officials, thereby avoiding sanctions and enabling them to take into account relevant legal duties, as well as to benefit from a circumscribed range of rights, liberties, and freedoms. Such a presumption is especially important for criminal law. People also can interact with each other secure in the knowledge that they are aware which rules likely will apply to their behavior should a dispute arise between them. Because prior knowledge is not universally true for all legal subjects, this claim is not empirical. Instead, its validity rests on the ability of the law as a normative order to align with background political moralities as well as with other coexisting normative systems (e.g., custom, etiquette, workplace, religious or business norms and interactions) in order to be maximally effective. Individuals can also rely on a certain determinacy in the application of law such that like cases will be treated alike. In this minimalist form, the rule of law can be equated with legal formalism because adherence to the rule of

law does not mean that the resulting laws are substantively just, only that their form and manner of promulgation are valid and meet the minimum legal conditions considered essential for the realization of procedural justice. Because formal characteristics are in the service of predictability, clarity, and stability, they also contribute the idea of the rule of law as a distinctive mode of social ordering that potentially generates a moderate form of politics.

The legal dimension provides the fundamental basis for a narrower conception of the rule of law—one that possesses minimal content. The political theory buttressing this minimal conception promotes the rule of law as a system of public norms addressed to legal subjects who are considered rational beings and who will comply with the impartial administration of these rules. The legal values informing the resulting procedural standards will meet what John Rawls (1999) terms "justice as regularity" as a component of justice as fairness.

THE INSTITUTIONAL DIMENSION OF THE RULE OF LAW AND ITS RELATIVE AUTONOMY FROM POLITICS

The relative autonomy of law from politics is a central requirement of the rule of law. Though it is impossible to isolate law from politics completely, a complex institutional structure helps guarantee impartiality and fairness in legal processes. One way of thinking about this relative autonomy is through the idea of the separation of powers as a fundamental constitutional principle. Here, sovereign public power is divided and housed within three different branches of government, each with its own function and staff: the executive, the judiciary, and the legislature. In reality, these three branches of government experience overlap, particularly the potential dominance of the executive in Westminster systems of government. In parliamentary systems, the executive branch exerts considerable influence in appointing judges as well as in controlling the legislative agenda during a majority government. In the U.S. system of government, Congress, the judiciary, and the president are in principle co-equal branches of the federal government. Nevertheless, even in the American presidential system, the executive branch possesses significant powers, and the president plays a strong executive role.

One important institutional outcome of the rule of law is the commitment to impartial, public, and independent tribunals charged with resolving disputes between individuals, as well as among the state and affected groups and individuals. The rule of law therefore supports the principle of judicial independence and the right to a fair hearing before a tribunal—a tribunal that includes both a court of law as well as an administrative body. General principles of due process, and specific principles such as *habeas corpus,* are fundamental to the endorsement of institutional processes as independent and impartial. Judges in Western judiciaries usually benefit from certain constitutional guarantees of protection, such as security of tenure, financial security, and administrative independence.

Contrary to the views of prominent Victorian constitutional theorist, Albert Venn Dicey (1996), the expansion of

administrative agencies, concurrent with the growth of the modern welfare state, has not resulted in the end of the rule of law. The scope of discretionary decision-making delegated to agencies, and the functioning of their internal procedures, have both come to be constrained by a combination of statutory and judicial requirements. Judicial oversight through the common law remains a key rule of law guarantor of accountability in the regulatory state.

With the recent global trend towards constitution-making, the rule of law has informed the creation of written constitutions, specialized constitutional courts, and an overarching rights discourse usually realized in a bill of rights. One significant consequence of a written constitution that guarantees individual and/or group rights, however, is the concomitant institutional reallocation of public power. In such a constitutional state, the judiciary receives the power to review and strike down or invalidate legislation that offends the constitution in terms of individual rights, division of powers, or other types of content requirement. In older conceptions of the rule of law in public law, the courts were conceived primarily as overseers of the arbitrary actions of executive and administrative actors. Judicial review places legislatures under scrutiny. Depending on the theorist, such a change either represents the triumph of rights and the rule of law or the demise of democracy and a balanced constitutional state. Some commentators characterize the new institutional arrangement as the rule of judges, instead of the rule of law, since there appears to be little in the way of obvious and effective constraints on judicial discretion and arbitrariness in judicial approaches to the interpretation of law. In countries with written constitutions, debates about constitutional balance and judicial activism remain contentious.

THE SOCIOLOGICAL DIMENSION OF THE RULE OF LAW AS A SHARED ORIENTATION WITHIN A POLITICAL COMMUNITY

Sociological and historical approaches to the rule of law emphasize its contingent social and cultural dimensions. The sociological dimension is far too broad and heterogeneous for this entry to cover; therefore two key aspects will be highlighted: the role of the legal profession and a rule of law culture.

Historically, lawyers have played important roles in legal, economic, and political liberalization in the West. Lawyers argued for parliamentary liberties in the English revolutions (1640–1660, 1688), worked on constitution-making in the American Revolution (1775–1783), and fought for political freedoms in the French Revolution (1789–1799). And, though often conservative and devoted to the maintenance of its professional status, an independent bar may provide a center of resistance to authoritarian rule as well as indirectly promote political pluralism. The recent lawyers' movement in Pakistan challenging interference in the judiciary by General Pervez Musharraf's regime remains a potent example. Nevertheless, it is problematic to suggest that lawyers and legal associations can

automatically be assumed to be liberal democrats or republican defenders of the common good, images made famous by figures like the fictional lawyer Atticus Finch. Lawyers can be antistatist or prostate, independent or deeply bound to commercial interests, democratic or elitist, self-interested or devoted to the public good.

Despite the fact that the nature of the legal profession has varied greatly over time and between common law and civil law countries, the development of a specialized class of persons charged with the authority to interpret the law on behalf of clients or on behalf of the public represents a significant achievement. Though these legal officials do perform varying functions, the rule of law is premised on institutional arrangements and agents making the law real, contestable, effective, and accessible to those affected by it. Lawyers will ideally act on behalf of their private clients or governments. Judges ideally will act according to their particular institutional role morality that demands that they enforce rules impartially, without corruption, and showing no bias or favoritism to any individual, whether or not the individual is a private litigant or a state official.

Different countries also adhere to the sociological dimension in varying degrees. Universal access to justice as a right, for example, is unevenly distributed and legal services in many countries remain out of the reach of the average citizen (though it is sometimes available through programs such as legal aid). States are also not uniform in their commitment to effective remedies nor are legal officials such as the police consistent in enforcing laws. Lawyers may advise minimal compliance with existing rules or they may encourage litigation to improve the legal position of their more affluent clients. Judges may adhere to the text of written law to the exclusion of the intent of law, justice, mercy, or reasonableness.

It is clear that the rule of law cannot exist unless it is embraced by the populace as an important political-legal ideal. When it is widely shared, the rule of law possesses a resiliency in the face of government intransigence or perceptions that the law is unfair because it reflects particular societal interests. Societies emerging from authoritarian regimes may not possess or fully develop this orientation because citizens fear and distrust state law and legal officials. For similar reasons, countries where the legal rules and the legal system have been transplanted may also see the rule of law as a threat or a sham, ensuring that only a weak form will develop. These functional and legitimacy problems attest to the importance of creating a rule of law culture or culture of legalism in government and throughout civil society, but one that does not take the legalism as the primary value to be realized at the expense of other important considerations.

THE POLITICAL DIMENSIONS OF THE RULE OF LAW

The rule of law has withstood many criticisms as an unrealistic pipe dream and a hegemonic sham. Early twentieth-century legal realists emphasized the subjective nature of judging that undermined the autonomy of law from politics.

Legal realists argued that behind every determination in law lay ideological commitments, only some of which were made explicit. Such commitments appeared natural and self-evident in judicial decision-making, but were actually the result of judges' personal attitudes or values. Deconstructionist critiques of the rule of law denied the possibility of determinacy of meaning, jurisprudential coherence, justice as fairness, and noncontradiction. Marxists critiques suggested that the rule of law conceals and legitimizes political domination by a ruling economic class. Finally, Foucauldean-derived critiques argued that the rule of law is simply one mode of power among many in society.

Internal disagreements among rule of law theorists are also robust. As alluded to previously, conceptions of the rule of law can be placed on a continuum ranging from "thin" to "thick" depending on the preferred set of values (Tamanaha 2004, 91–92). In contrast to the minimal version of the rule of law that has been presented thus far and which generally imposes only procedural requirements, thicker accounts of the rule of law remain contentious because they each demand differing substantive requirements in essential content. Libertarians, such as Friedrich von Hayek (1978), argue for the necessity of certain individual rights—property, contract, security, privacy—as a core. Liberal theories emphasize individual rights, but also normative concerns regarding human dignity and maximum inclusion. Ronald Dworkin's (1985) "rights conception" of the rule of law relies on the view that citizens have pre-existing moral and political rights that are positively recognized in society's "rule book" and that individuals can demand to have enforced by judges. Other theorists, such as Trevor Allen (2001) and Jürgen Habermas (1999), argue that the rule of law is inextricably linked with certain institutional arrangements that go beyond formal legality to include individual rights and democracy. Republican theories consider the concept of the rule of law as a means to renounce domination and unconstrained power as a basis of rule. In contrast to the idea of freedom as noninterference that constitutes the basis of liberal and libertarian conceptions of liberty, republicanism relies on a conception of legal freedom as nondomination. The thickest versions of the rule of law require the recognition of social and economic rights in order to advance substantive equality as part of a theory of distributive justice or to redress historic injustice. They may also require the enforcement of human rights as integral to a rule of law order.

Finally, the tragedy of the terrorist attacks on September 11, 2001, has revived a much older conceptual debate regarding the possibility and desirability of limiting sovereign power, the modern sovereign being a president or a parliament. From Aquinas to Hobbes to Schmitt, political theorists have conceptually questioned the ability of the rule of law to bind the sovereign when it is the sovereign who declares the laws. When a sovereign declares states of emergency, imposes martial law, is guided by secret laws, or creates ad hoc military courts, the rule of law is both put to the test and put at risk because discretionary power within the executive branch of government can become unconstrained and unaccountable. With respect

to current states of emergency, disagreements center on the question of whether legal or political modes of constraint and accountability are preferable and effective.

THE INTERNATIONAL DIMENSION OF THE RULE OF LAW

The rule of law has participated in globalization historically through colonialism and currently in a variety of international development and human rights initiatives. Historically, the rule of law cannot be disentangled from the colonial project engaged in by Western powers, though these powers did not adhere to even the thinnest conception of the rule of law, as lawyers and judges often served colonial rule by giving lip service to the ideal and validated law as an instrument of subjugation. Though the rule of law did bring some benefits to colonized countries, it was nevertheless part of imposed rule by rich nations on poor nations and on indigenous peoples. On the other hand, lawyers like Mohandas Gandhi played key roles in resistance movements against colonialism, often in the very name of the rule of law.

In current forms of globalization, two versions of the rule of law circulate. The first is a market view advanced by multilateral lenders like International Monetary Fund (IMF) and development banks like the World Bank that embraced neoliberalism in the 1990s. This conception of the rule of law rests on the belief that a reciprocal relationship exists between a framework of effective and predictable legal rules and rights and well-functioning markets. Market-based approaches prioritize the protection of property rights, freedom and enforcement of contracts, and low levels of regulation as key components of the rule of law. Practical measures have focused on legal reform (e.g., bankruptcy laws), anticorruption measures, and judicial training. Critics of the market-based view suggest that this understanding of the rule of law mistakenly privileges a minimal state in developed and developing countries and does not place effective constraints on the power of government and market actors. In response to internal and external critiques, the literature has recently turned to new institutionalism to supplement the earlier focus on the rule of law as a specific set of legal practices that can be unproblematically uprooted from their Western context and transplanted into new environments.

A second approach also imbues the rule of law with substantive content. The human rights view, often advanced by nongovernmental organizations (NGOs) and a variety of social movements, not only requires legal restraints on state action—including prohibitions against torture and extrajudicial killings—but often also demands a set of positive rights such as rights to democratic government and participation, the regulation of harmful conduct in both the public and private spheres, and the alleviation of substantive inequality. The institutional program envisioned here requires a more interventionist state guaranteeing comprehensive social and economic rights and restructuring social relations in order to further political equality. In contrast to the market-based approach that concentrates on private law relations, the human rights conception focuses on public law relations and the role of the state. Critics suggest that these approaches underestimate the costs and trade-offs necessary for the implementation of social and economic rights and pay insufficient attention to the beneficial role of the market. Lastly, a too substantive version of the rule of law may downplay its role in the mediation of social relations in a complex, pluralistic society.

THE RULE OF LAW AS A COMPLEX, QUALIFIED GOOD

English Marxist historian E. P. Thompson famously defended the rule of law as "a cultural achievement of universal significance" because it could place effective curbs on power and also regulate and reconcile societal conflicts, sometimes in favor of the less advantaged (1975: 265). He more controversially celebrated the rule of law as an "unqualified human good." (267). Nevertheless, and as Joseph Raz (1979) cautions, it is perhaps better to conceive of the rule of law as a qualified human good, but a good nonetheless since government by the rule of law is preferable to one based on rule by law. The rule of law is distinguishable from a variety of other highly valued goods including democracy, human rights, dignity, liberalism, and substantive equality. Yet democracy, human rights, and constitutionalism cannot exist without the rule of law and are intricately related to the concept. A political community committed to the rule of law will therefore go some distance towards realizing equality, liberty, and fundamental respect for all persons. The rule of law has great worth as an ideal, but it is also a pivotal means to realizing other important ends.

Rules of Order

Rules of order are standardized procedural rules adopted by any deliberative body or assembly. Constitutions, bylaws, and rules of order are the general documents used to govern and define deliberative bodies. The purpose of rules of order is the regulation of the day-to-day conduct of debate. Bylaws and constitutions generally deal with who can be a member of a body, how the members are chosen, and the subjects that the deliberative body can address. Rules of order address who can make a motion before the body, how the motion should be made and handled, and how many votes are needed for specific motions to pass.

Rules of order, bylaws, and constitutions are distinguished also by the ease with which they can be changed. Constitutions typically take months or years to change. Bylaws usually take at least two regular meetings to change. Both almost always require notifying the entire membership of the deliberative body about the proposed change well before meeting to decide the change and formally publishing the changes. However, rules of order can be changed either permanently or temporarily during a meeting; the change simply requires the approval of the people present. Just as there are different types

of constitutions and bylaws, there are different types of rules of order as well.

The purpose of rules of order is to enable the deliberative body to handle business as efficiently as possible. This holds true no matter the rules of order employed. All deliberative bodies—from the U. S. Senate and House of Representatives to corporate boards of directors and executive committees to elementary school parent-teacher organizations and Boy Scout troops—have a limited amount of time to handle necessary business. When people argue about whether a decision of the chair is appropriate, decision making is prolonged.

In the United States, the most common form is *Robert's Rules of Order.* This form gets its name from Henry Robert, who authored the first version in 1876. A number of companies publish his rules, which remain basically the same. The standardization makes it easy for a group to adopt *Robert's Rules of Order* when it does not have the resources or need to develop its own.

At the U.S. state legislature level, individualized rules of order are the norm. Unlike most organizations using rules of order, government legislatures operate continuously to handle what are regular situations for them but are uncommon for other bodies. State legislatures tend to rely on *Mason's Manual of Legislative Procedure* (1935) as their guide. The U.S. Senate and House of Representatives have their own rules of order that date back to Thomas Jefferson.

French-speaking areas of the world rely on the *Code Morin* (1938). In Canada, *Bourinot's Rules of Order* (1884) and *Robert's Rules of Order* are both used. Most countries of the English parliamentary tradition use rules of order based on those of Westminster and the British Parliament. The person responsible for ensuring proper use of the rules is the *parliamentarian*. The National Association of Parliamentarians or the American Institute of Parliamentarians concern themselves with parliamentary procedure.

Run-off

Run-off electoral systems use two rounds of voting to select a single winner. The first round eliminates some of the candidates, while the second round chooses between the remaining candidates. Run-off elections are commonly used to elect presidents. Indeed, with the adoption of run-off systems by many South American and eastern European countries since 1980, most countries with directly elected presidents now use some kind of run-off electoral system. Run-off elections are used also in legislative and local elections in places such as France and Louisiana.

The most common form of run-off elections has the first round eliminate all but the top two vote-getters, who then compete in the second round (unless one candidate gets more than 50 percent of the votes in the first round). There are variations, however. For example, in Argentina if any candidate gets 45 percent of the vote in the first round, or 40 percent with a 10 percent margin of victory over their nearest competitor, that candidate is elected without a second round.

It is possible to replace the two rounds of elections by having voters indicate their first and second choices on their ballot paper, and then automatically transferring the votes of voters whose preferred candidate is eliminated in the first round. This is known as alternative vote, preferential vote or, in the United States, instant run-off elections. This method is used in legislative elections in Australia and in municipal elections in a number of countries.

A related electoral system is sequential elimination, in which multiple rounds of voting eliminate the lowest vote-getter in each round. This is commonly used to elect party leaders in legislatures.

The advantages claimed for run-off elections over simple plurality elections are that the results have more legitimacy because a majority has voted for the winning candidate, and that it is less likely that an extremist candidate will be elected with only narrow support because of a split opposition. Both of these claims are only partially true. While the run-off winner must win a majority of votes in the run-off, a majority may prefer some (or even all) of the candidates eliminated in the first round to the eventual winner. Even when there is a candidate clearly preferred by a majority, also known as a Condorcet winner, run-off elections will not necessarily elect the candidate. Indeed simulations suggest that run-off elections often will not select the preferred representative, although run-off elections seem to do better in this regard than simple plurality, as noted by political scientist Samuel Merrill in 1984.

It is also not the case that run-off elections necessarily will choose moderate candidates. It is possible for all the moderate candidates to be eliminated in the first round, and for the voters to be forced to choose between two relatively polarized candidates in the second round. Simulations suggest this outcome is likely, although once again plurality elections seem to produce more extreme outcomes, as observed by Anthony McGann and colleagues in 2002.

It has been observed since Maurice Duverger's analysis of political parties in 1954 that plurality elections tend to reduce the number of serious candidates to two. There is no reason to expect run-off systems to have this effect, although systems that allow first round victory with less than 50 percent may promote some consolidation. Empirically it appears that run-off presidential elections are associated with a higher effective number of candidates than plurality elections, as argued by Matthew Shugart and Rein Taagepera in 1994. This is consistent with the hypothesis that plurality elections create incentives for candidate consolidation, although some, including the analysts Karen Remmer (2008) and Stephen Callender (2009), have suggested that the causation runs the other way. Others such as Matthew Shugart and John Carey (1992) prefer plurality elections for electing presidents in order to reduce the number of candidates and eliminate extremists, while others would consider increasing the choice available to voters a reason for preferring run-off elections.

Run-off electoral systems are not monotonic—it is possible that winning extra votes can harm a candidate. For example, if French President Jacques Chirac had won 195,000 extra first round votes in 2002 at the expense of Jean-Marie Le Pen (the Front National candidate), Le Pen would not have made the run-off, and Chirac would have faced a far harder challenge in the second round. In 1996, Dominique Lepelley and colleagues estimated that the probability of such situations is small but potentially influential.

Russell, Bertrand

British philosopher Bertrand Russell (1872–1970) made significant contributions to mathematical logic and analytic philosophy. He also wrote many widely read books and essays on education, history, political theory, and religion. Russell defined philosophy as a "no-man's-land" between, on the one side, the moral certainty of theology and, on the other, the skepticism of a scientific outlook. Much of his life was devoted to antiwar activism.

Russell was born on May 18, 1872, in Wales. His grandfather, Lord John Russell (former prime minister), and grandmother, Lady Russell, became Bertrand's legal guardians after the death of his parents. He attended Trinity College in Cambridge where he studied mathematics and coauthored *Principia Mathematica* (1910–1913) with mathematician and philosopher Alfred North Whitehead. While establishing his academic reputation, Russell unsuccessfully stood for Parliament in 1907 as the first candidate of the National Union of Women's Suffrage Society.

With the onset of World War I (1914–1918), Russell left Cambridge to join the No Conscription Fellowship and participated in their propaganda campaign against the war effort. He was fined one hundred pounds, dismissed from his lectureship at Trinity, and served five months in Brixton Prison for his antiwar activities. After the war, Russell's lecture tours and freelance writing established his credentials as a liberal critic and iconoclast. His treatise *The Practice and Theory of Bolshevism* (1920) offended radicals, while his book *Why I Am Not a Christian* (1927) received condemnation from conservatives. In *Marriage and Morals* (1929), he aroused controversy by proposing trial marriages and suggesting that infidelity should not necessarily be grounds for divorce. Religious leaders interpreted the book as sanctioning adultery and, in 1940, after a public outcry against Russell, his appointment to the City College of New York was retracted.

Russell, however, was never a steadfast pacifist. After witnessing the ruthlessness of fascist and communist dictators, he recognized the limitations of nonresistance. He believed that World War II (1939–1945) was justified but considered the allied Soviet government worse than German dictator Adolf Hitler's. Notwithstanding his contentious political views, Russell writings continued to be popular. His *A History of Western Philosophy* (1945) became a best seller on both sides of the Atlantic.

By the late 1940s, however, Russell's antinuclear war activism overshadowed his philosophical writings. In 1950, on the occasion of receiving the Nobel Prize for Literature, he spoke out against the development of atomic and bacterial weapons. His famous "Man's Peril" broadcast on the BBC, condemning the Bikini H-Bomb tests, became the basis for the Russell-Einstein Manifesto. Scientists from both communist and noncommunist countries signed the manifesto, urging the curtailment of nuclear weapons proliferation. Russell also organized the Pugwash conference of international scientists to discuss weapons development and helped organized the Campaign for Nuclear Disarmament. During the 1960s, he participated in antinuclear demonstrations and spent a week in prison for inciting public civil disobedience. Although he feared an impending nuclear disaster, Russell never lost hope. "I am convinced," he wrote in his 1969 *Autobiography of Bertrand Russell,* "that intelligence, patience, and eloquence can, sooner or later, lead the human race out of self-imposed tortures provided it does not exterminate itself meanwhile." He died on February 2, 1970, at his home in Northern Wales.

Russian Political Thought

Russian political thought, like Russian society, has been undergoing a wrenching transition since the collapse of the Soviet Union in 1991. The old verities that had been inculcated in three generations of Soviet citizens had collapsed. This was a crisis for the rulers, ordinary people, and intellectuals. They found themselves entering a new world, one laced with threats and uncertainty.

Moreover, the Soviet collapse was not the first cataclysm to hit Russian society in the twentieth century. The tsarist regime also had experienced a revolutionary breakdown, triggering years of civil war, famine, and pestilence. The collectivization of the 1930s and the near-defeat at the hands of the Nazis in 1941 were equally traumatic. Few societies had experienced so many severe tests in the course of living memory, raising doubts about the philosophical and practical bases for the very existence of Russia. Intellectuals had to come up with some explanations for why their society kept experiencing such shocks. Why did the Soviet system collapse? Why were such radical economic reforms launched in 1992? Will Russia ever enjoy a normal, peaceful, and stable existence?

In the 1990s, Russian political thinkers faced two choices, neither particularly attractive. One approach was to declare the "end of history" and embrace the values and principles of the developed West. Then, their task would be to try to customize liberal ideas to the post-Soviet context—to somehow make them work in Russia or to explain why they would not work. In this case, there would not be such a thing as Russian political thought per se; it would just be a branch of universal (i.e., Western) rationality.

A second approach was to look back into history to search for something that was distinctively Russian. The whole Soviet experience was a protracted attempt to catch up with the West using imported versions of Western ideas, from Marxism to Fordism. One has to go back to the tsarist period

Russian author Alexander Solzhenitsyn spent eight years in a Russian forced labor camp as punishment for anti-Soviet writings before his release in 1953.

SOURCE: Getty Images

to find something authentically Russian. But could that rich nineteenth-century tradition of Russian political thought be revived and reapplied to post-Soviet Russia?

In the 1990s Western observers focused on the first school, hoping that the moment had come when liberalism would triumph in Russia. They have tended to downplay the search for an authentically Russian political world view. Few Western academics have published on Russian political thought since 1991. (One exception is Axel Kaehne: *Political and Social Thought in Post-communist Russia,* 2007). In most Western studies of Russian in transition, it seems as if Russia has political culture and political values, but not political thought.

THE SOVIET LEGACY

For seven decades, the Soviet state was committed to a massive program of indoctrination in the official ideology of Marxism–Leninism and scientific communism. These principles were drummed into all citizens—in the schools, army, workplace, and mass media. Over time, this became a complex conceptual framework, and in the hands of sophisticated practitioners, some interesting ideas could be discussed,

typically in small-circulation publications using arcane language. Western political concepts were forbidden from circulation. Pre-Soviet Russian thought was either suppressed or skewed to fit into the official Soviet version of Russian historical evolution. Some Soviet intellectuals and reform-minded officials were strongly influenced by developments in eastern Europe, such as the consumer-friendly "goulash communism" of Janos Kadar in Hungary, the 1968 Prague Spring, and the Solidarity workers' movement in Poland.

A small number of intellectuals openly condemned Soviet ideology, and paid the price in imprisonment and exile. These *dissidents* attracted a lot of attention in the West, but censorship limited their public visibility inside the Soviet Union. Some of them embraced Western liberal values, such as the essayist Andrei Amalrik and the famed scientist Andrei Sakharov. Others, notably author Alexander Solzhenitsyn, turned back to traditional Russian spiritual values. This division echoes a long-standing debate among Russian intellectuals, who divided in the nineteenth century into Westernizers, who advocated the rapid assimilation of Western values of individual freedom and limited government, and Slavophiles, who argued for the uniqueness of Russian civilization and the need to chart an independent path to the evolution of Russian institutions. Beneath the radar screen of the official ideology, ordinary Russians developed their own private set of values based on friends and family and retreated from the realm of public politics.

Soviet ideology did slowly evolve over time, embracing new slogans in the 1960s such as *developed socialism*—the idea that the Soviet Union had entered a new intermediate stage and was not yet ready for full communism, the endpoint of human history according to Karl Marx. But it was not until Mikhail Gorbachev came to power in 1985 that the Communist Party made a serious effort at structural reform. Gorbachev's program of restructuring (in Russian, *perestroika*) included economic reforms, a new approach to political thinking, and a new foreign policy. Gorbachev promoted reconciliation with the West, proclaiming a universality of human values. Domestically, he encouraged citizens to criticize state officials through a new policy of openness (or *glasnost*) in the media. However, Gorbachev's reforms undermined the monolithic unity of Soviet ideology and triggered a process of political and economic unraveling that led to the state's collapse in 1991.

THE BIRTH OF A NEW RUSSIA

During the brief years of *perestroika* and *glasnost,* political debate flourished. The dull conformity of the official communist ideology gave way to a bewildering array of political views. The opposition ideologies were rather amorphous and poorly defined; each was more a moral stance than a political program. Three major groups emerged during the *perestroika* years and persisted through the 1990s. Liberal democrats favored the extension of press freedom, democratic elections, and protection of individual rights. Communists wanted the preservation or restoration of the Soviet Union's political and economic institutions as they had existed prior to Gorbachev, including social guarantees for workers, pensioners, and other

vulnerable groups. Nationalists rejected both the liberals' efforts to import Western ideas and the Communists' desire (as they saw it) to subordinate the Russian nation to a radical, secular, internationalist agenda.

These three groups had sharply differing attitudes toward the collapse of the Soviet Union. The liberals more or less accepted it as inevitable, in that the old regime was no longer sustainable. The Communists blamed Gorbachev's reforms for destabilizing an otherwise viable system. Most of the nationalists thought a common state could have been preserved, but not under Communist leadership.

In the 1990s, Westerners typically sorted the political actors in Russia into two categories—reformers and reactionaries, with reform understood uncritically to mean movement toward a Western-style liberal democracy and market economy, such as Swedish social democracy or Anglo-American neoliberalism. Gorbachev failed in his effort to build a coalition for change, largely because he was trying to hold together the multiethnic Soviet Union. His successor in the Kremlin, Russian Federation president Boris Yeltsin, was more successful. Yeltsin faced down the August 1991 coup by Soviet hard-liners at the head of a coalition of liberal democrats and moderate nationalists.

However, Yeltsin's subsequent embrace of so-called shock therapy caused a split in the ranks of the prodemocracy coalition. Most of the nationalists and even many liberals blamed the reforms for the economic chaos the country experienced in 1992. The anti-Yeltsin opposition controlled the parliament until October 1993, when Yeltsin dissolved the legislature by force. Yeltsin's decision to attack Chechnya in December 1994 alienated many of the remaining liberals, and the ham-fisted way in which the war was fought further angered the Communists and nationalists.

Most of the political elites who rallied behind Yeltsin were simple pragmatists who recognized that he had won the struggle for state power; they did not have any political philosophy to speak of. Those officials were typified by the former gas industry executive Viktor Chernomyrdin, who served as Yeltsin's prime minister from 1992 to 1998. His cynical observation, "We hoped for something better and ended up with the usual," captured the disillusion of the Yeltsin years. Political philosopher Aleksei Kara-Murza even argued that the shift from ideology to pragmatism was a major achievement for Russia and a necessary component of social modernization.

The main opposition force was Gennadii Zyuganov's Communist Party. They did not really have a clear alternative program, defining themselves by what they were against rather than what they were for. They opposed the present and in favor of the past. In the 1990s, they became the main defenders of parliamentarism because it gave them the opportunity to criticize Yeltsin without being responsible for coming up with policies of their own. Zyuganov did not radically redefine communist philosophy, for example, by moving toward social democracy. His main innovation was to introduce nationalist symbols and rhetoric.

The nationalists (or, as they style themselves, the "patriots") were the group that seemed to have the greatest potential to fill the ideological vacuum of postcommunism—as evidenced by Vladimir Zhirinovsky's surprise victory in the December 1993 parliamentary election. A country that had lost its empire and seen its economy shrink by one-third seemed to be fertile soil for politicians raising the specter of national betrayal. After Zhirinovsky's electoral success, both Democrats and Communists swung in the nationalist direction. Note that the rationale for Yeltsin's invasion of Chechnya was the defense of Russia's "territorial integrity."

In the 1990s, the political discourse was sharply polarized: Communists versus Democrats, patriots versus traitors who have sold out to the West. The issues were presented as Manichaean alternatives: the choice was between right and wrong, good and evil. Politics was seen as a Darwinian struggle for power in which the winner took all, including the head of the opponent. Yeltsin himself deployed such tactics in his narrowly won presidential race in 1996, claiming that his Communist opponents wanted to turn the clock back to the Stalin years.

The Yeltsin team never really came up with a new political formula to replace the anticommunist theme of the early 1990s. One of the challenges was that liberal state formation seemed to presuppose the existence of a nation-state. Russia had been an empire, then an internationalist project, but never a nation-state. Yeltsin toyed with the resurrection of the "Russian Idea": a quest to pin down the essence of Russian civilization. (There was even a national competition launched for the best essay on the topic in 1998.) But Yeltsin's rule was indelibly associated with a cynical fire sale of Russia's assets to insider cronies, so his half-hearted efforts to orchestrate a new sense of Russian national identity failed to materialize. And the fact that one in five citizens of the Russian Federation were not ethnic Russians (and many of them were Muslims) constrained the Kremlin's ability to formulate a new ethnically exclusive identity for Russia.

One issue that did unite all the disparate political currents in the 1990s was a belief in the importance of Russia as a factor in European and world history. Liberals, Communists, and nationalists alike regretted Russia's descent into a new "time of troubles" (referring to a period of chaos in the early 1600s) and were confident that Russia could and should regain the great power status that it had enjoyed for the previous two hundred years. They just disagreed about how this could be done. However, the consensus on the idea of Russia as a great power provided the unifying theme for the political order constructed by Yeltsin's successor, Vladimir Putin.

THE PUTIN REGIME

After Vladimir Putin became president in 2000, there was something like a return to the ideological orthodoxy of Soviet times. Political debate was pushed out of the mass media, especially television, while opposing views were banished to the fringes of political life.

Putin's political philosophy was an eclectic mixture of elements from the three prevailing political philosophies. For liberals, he offered a commitment to the market economy and rule of law and a surprising ability to forge close personal ties

with Western leaders. For the Communists, he offered nostalgia for the Soviet past while recognizing that it was *past* and could not be recovered. He brought back the Soviet national anthem (with new words), created new youth organizations that resembled the Young Pioneers and Komsomol, and reintroduced military training in schools. For the nationalists, he offered a vigorous assertion of Russian national interests, at first against the rebel Chechens and then against perceived Russian enemies in Estonia, Georgia, and Ukraine. He was more willing than Yeltsin to address his fellow Russians using the ethnic term *Russkii,* as opposed to the ethnically neutral term, *Rossiiskii.*

What was holding together this bricolage of rival traditions was the person of Putin himself. The Russian people seemed happy to delegate to him whatever power he needed to implement policies that somehow balanced these various political elements. Putin portrayed himself as a man of action not of words, and he expressed skepticism about the need for political ideology in general. He did not write, or pretend to write, any ideological tracts. Just before his election in 2000 he issued a book, *From the First Person,* in the form of an extended interview with two journalists. Biographical in focus, it did not lay out a political philosophy; it was more a personal narrative about surviving the collapse of just such a political ideology. As president, Putin excelled at thinking on his feet, firing off pithy one-liners to inquisitive journalists or giving thorough, fact-based answers to callers during marathon live television phone-ins. More often than not, in his longer formal speeches, he tended to invoke or mimic mainstream Western ideas—modernization, the rule of law, democracy, and civil society. These words were not always matched by his actions in office.

Some members of the presidential apparatus under Putin did try to generate new ideological concepts to legitimate his rule and to give the Kremlin a vocabulary with which to engage outside powers. However, no coherent body of ideas had emerged by the time Putin left the presidency in 2008. One concept that surfaced during Putin's first term was that of *managed democracy.* This meant that democratic institutions were the norm, but they could not be trusted to behave responsibly without some direction from the state. This was not a new idea; in the 1960s, Indonesian president Suharto had devised a *guided democracy.* But Putin himself did not use the phrase, and no one seemed quite clear what it meant.

A more serious effort was made to promote *sovereign democracy,* the brainchild of the Kremlin's chief ideologue, Vladislav Surkov. Surkov launched the idea in a February 2006 speech to United Russia party functionaries. A state has to be independent of foreign influence before it can truly function as a democracy; hence, the West should stop trying to tell Russia how to run its internal affairs. Democracy is the most reasonable form of government, and this rationality must be encapsulated in a cohesive ruling elite. The role of elections is not to pick leaders but to demonstrate the unity of the governors and the governed. This approach certainly has an intellectual pedigree, drawing on a conservative, antiliberal tradition of Continental thinkers such as François Guizot and Carl Schmitt. Putin's

selective approach to the rule of law aptly fits Schmitt's notion of the "state of emergency"; that is, in moments of crisis the sovereign must be prepared to act outside the law. But in practice, *sovereign democracy* is a wooly term, and as a practical matter, Russia's sovereignty was no longer under threat. Putin's chosen successor as president, Dmitrii Medvedev, explicitly stated that he did not see the need for any hyphenated versions of democracy. But the idea of sovereign democracy lives on; it even has its own website. It is the official ideology of Nashi, a Putin youth movement created in 2005 in the aftermath of the pro-Western, youth-led Orange Revolution (2004–2005) in Ukraine.

The most serious intellectual currents are variations on the theme of Russia's historical uniqueness as a state bridging Europe and Asia with a tradition of strong centralized power. Russian thought is strongly dichotomous, structured around bipolar opposites: East versus West, Europe versus Asia, weak society versus strong state. The mainstream of such analysis is well represented by the liberal academics Yuri Pivovarov and Alexander Akhiezer. Pivovarov traces the evolution of what he calls the *Russian System* of a single power center from the Mongols through the tsars. The actual exercise of power takes place through personal networks, hidden from view and not captured by formal constitutional rules. This pattern reproduces itself in all three twentieth-century regimes—Soviet communism, Yeltsin democracy, and Putin authoritarianism. Russia never will assimilate to the European model. Akhiezer sees the core of the problem more in the specific features of Russian society, which is still rooted in quasi-mystical concepts of tradition and community (*sobornost*). The role of the state is to express society's essential unity—an impossible task. As a result, society oscillates between angry rejection and hopeful worship of the state. Russian thinkers do not take social diversity as a starting assumption: the differentiation that comes with modernization is a challenge and a threat. The writings of the nationalist émigré Ivan Ilyin enjoyed a revival during the Putin years. He stressed the need for moral unity between the ruler and ruled.

The most eccentric wing of political writing is that represented by the Eurasianists, who have revived a philosophical school that grew up among Russian émigrés in the 1920s. Their most influential thinker was Lev Gumilev. Post-soviet Eurasianists seem to have a mass readership; whether their views have any impact on actual government policy is another story. The Eurasianists believe that Russia is a distinctive civilization that arose out of the nomadic tribes of the Eurasian steppe, with a life force superior to the sedentary civilizations of Europe and Asia. Russia's history is indissolubly connected to both continents, but Russia never will be accepted as a full member of either continental club. Nor should it want to be. Rather ironically, contemporary Eurasianists, such as Alexander Dugin, draw heavily on the geopolitical theories of the nineteenth-century British strategist Halford Mackinder, who focused on the Eurasian "heartland" as the key to world domination. Also, the Eurasianists' defense of Russian statehood is driven by their hostility toward the military preeminence enjoyed by the United States in the post–cold war world.

So Eurasianism is not a hermetically Russian invention; it is rooted in emulation and envy of the Western powers.

The few remaining liberals have moved to the fringes of the Russian political scene. Former prime minister Yegor Gaidar wrote an ambitious book, *The State and Evolution,* in which he tried to justify his actions as prime minister in 1992 as an attempt to create a property-owning class who could provide a check on the bureaucratic state. Others, such as philosopher Boris Kapustin, have given up on the modernist project altogether. With the crash of the Soviet model, Russia has leapt straight into a postmodern condition. Kapustin defines the central elements of postmodern politics as "ironic detachment, fluid coalitions and temporary issue-oriented alliances, ideological pastiche, [and] the affirmation of local customs and practices at the expense of vast projects" (2000). Similarly, Mikhail Epstein argues that in postatheist Russia the return of spirituality will not lead to a revival of organized religion, but to a personalized, "minimalist religion." Russia's search for an ideational basis for its political system, whether it remains authoritarian or evolves in a more democratic direction, is still very much a work in progress.

Sabine, George Holland

A professor of philosophy at Cornell University from 1931 until his retirement in 1948, George Holland Sabine (1880–1961) was a highly regarded American historian of political ideas. His *A History of Political Theory* was required reading in political theory courses during the 1940s and 1950s, influencing generations of scholars and their students.

Sabine was born in Dayton, Ohio, on December 7, 1880. He entered Cornell University as an undergraduate in 1899, earning his AB degree in 1903 and a PhD in 1906. His academic career began at Stanford University, where he lectured in philosophy. From 1914 to 1931, he taught philosophy at the universities of Missouri and Ohio State. He then returned to Cornell, where he was the Susan Linn Sage Professor of Philosophy, a title he held until retiring. While at Cornell, he also served as dean of the graduate school from 1940 to 1944 and was vice president of the university from 1943 to 1946.

The first edition of Sabine's *A History of Political Theory* appeared in 1937, and it was published worldwide in several languages. He organized the work around theories of the state, covering thinkers and movements from the ancient Greek city-state to the modern nation-state. He continued to revise editions of his book in light of new secondary material and the unfolding of historical events, including the emergence of fascism in Italy, national socialism in Germany, and communism in Russia. Toward the end of his life, Sabine expanded the chapters on German philosopher Karl Marx to distinguish between democratic socialism and Leninist Marxism. His last published article, appearing in the July 1961 issue of *Philosophical Review,* examined the ethics of Bolshevism.

Sabine's writings on Marxism, moreover, revealed his capacity as a scholar to be open, even receptive, to political ideas and convictions contrary to his own. However, this did not mean for Sabine, as it did for Marxists scholars, that all political theorists are ideologues, speaking on behalf of their party, class, or social group. While it is true that political theories provide standards against which behaviors and institutions can be judged, it is also true that they too can be judged. For example, any "clear-headed theory of politics," Sabine wrote in his preface to *A History of Political Theory,* must not confuse statements of reason, fact, and value.

In the end, it was not Marx, but Scottish philosopher and historian David Hume who inspired Sabine's historical and analytical approach to his subject. Consequently, Sabine refused to read into the historical record of political theory any single, metaphysical truth or end point. He was convinced, on the one hand, that, as he stated in *A History of Political Theory,* "no man can stand apart for the values and the convictions of the culture in which he was reared." But, on the other, he was "also convinced that there is in intelligence and good will a power of discrimination and of intellectual honesty that is not wholly limited either by nationality or by social class." Sabine identified this conviction with the tradition of liberalism and concluded that this tradition provides the most likely prospect for social and political improvement through nonviolent means.

After having received many honorary degrees, Sabine died on January 19, 1961.

Sacrificial Lamb Candidacy

In democratic systems, a *sacrificial lamb candidacy* is an office-seeker chosen by a party to contest an election even if there is little or no likelihood of success. Sacrificial lambs are chosen for a variety of reasons. In some cases, a party may put forward a sacrificial lamb to blunt the appeal of an opposition candidate who has an aspiration for higher office. Sacrifice candidates also can force rival political parties to expend resources and therefore dilute their ability to support candidates in more closely contested elections. Sacrificial lambs may be put forward in an effort to give candidates experience and prepare them for future political campaigns. The sacrificial strategy further gives parties an ability to nominate candidates for office in an effort to attract voters from groups

not normally aligned with that party or to launch attacks that might be considered too risky for a mainstream candidate. For instance, in 2004, the U.S. Republican Party nominated former diplomat and African American party member Alan Keys to oppose Barack Obama in the Illinois senatorial election, with the expectation that Keys could criticize Obama more sharply than other Republicans without provoking a backlash or prompting charges of racism. The Republican Party also hoped Keys would diminish Obama's popularity ahead of an expected presidential run in 2008.

Said, Edward

The radical literary views and persuasive style of the Palestinian American Edward W. Said (1935–2003) rapidly promoted him to one of the most prominent and influential cultural critics of the twentieth century. Said was born in Jerusalem and studied in Cairo, Egypt; Northfield Mount Hermon in Massachusetts (1953); Princeton (BA, 1957); and Harvard (MA, 1960; PhD 1964). His doctoral dissertation in English Literature was titled "The Letters and the Shorter Fiction of Joseph Conrad" and was published as *Joseph Conrad and the Fiction of Autobiography* in 1966. Conrad would continue to figure prominently in Said's later writings and had a resoundingly deep-seated effect on the development of his cultural philosophy.

Arguably, Said's most provocative work was *Orientalism* (1979). In that seminal text, Said eloquently proved along literary lines how the West had structurally defined itself in terms of an *occidental other* (refers to the mirror image of the occident—i.e., the orient—that helps the occident know itself) through the domination, subordination, seduction, and subduction of the Middle East. *Orientalism* resulted in a spate of intense criticism and high praise for illuminating literary approaches to colonialism and postcolonial politics in the tradition of Tunisian novelist and sociologist Albert Memmi and French psychiatrist and revolutionary writer Frantz Fanon. Said widened and deepened their intellectual scope with his vast comprehension of social history, literary criticism, political theory, and cultural theory. Said addressed the many limitations of *Orientalism* later in his *Culture and Imperialism* (1993). One of these limitations involved the nature of indigenous resistance and the importance of the colonized natives' interpretation of the colonizer.

Said was prophetic when he warned in 1986 that the excessive ultranationalist tendencies sweeping America would lead to a false sense of American invulnerability, a sense that indeed was shattered by the terrorist attacks against the United States in September 2001. He was caught between nominalism and realism. He was also a Palestinian, an Arab, and a Christian who was raised in a Muslim-dominant region but schooled in two conservative American universities. In *Covering Islam: How the Media and Experts Determine How We See the Rest of the World* (1981) he criticized the media-produced misconceptions about Islam. His *The World, the Text, and the Critic* (1986) illustrated the importance of critical distance and heteronormative formations of dominant cultures brought forth by Conrad and Hungarian Marxist philosopher Gyorgy Lukács through the poststructuralism of Jacques Derrida, the founder of deconstruction, and French philosopher Michel Foucault's postmodernism.

Throughout his life, Said's scholarly publications, newspaper articles, and public interviews directly challenged predominant intellectual norms embedded in the political economy of the modern Western psyche. He influenced generations of young scholars from a wide range of academic disciplines across the world. As America's strongest proponent for Palestine, he simultaneously criticized and exonerated the problematic leadership of the Palestinian cause. He spoke at more than one hundred universities and institutions and published ten single-authored books that included method in criticism and political activism. Among his many academic accolades and international prizes, he was given the Lionel Trilling Award in 1976 for *Beginnings* (1975) and an endowed chair at Columbia University.

Said's deep sense of moral and political dislocation arose out of his upbringing, his preponderant brilliance, and his unfortunate and prolonged battle with sickness until death. His powerful influence over future generations of Old World critics and New World scholars represents an appropriate epitaph to the legacy of a great thinker and profound intellectual. He died on September 25, 2003, in New York City.

Saint-Simon, Claude-Henri

Claude-Henri de Saint-Simon (1760–1825) was a French social reformer. Though still influenced by the aspect of Enlightenment thought that placed emphasis on philosophical inquiries, Saint-Simon also envisioned the usefulness of empirical studies and social science. While Saint-Simon's disciple, Auguste Comte, became known as the founder of sociology, it was, strictly speaking, not Comte but Saint-Simon who laid some of the foundations that enabled "positive science" and sociology to emerge.

Saint-Simon was born in Paris, France, into an aristocratic family. At seventeen he joined the French army and fought in the American Revolutionary War (1775–1783). He lost his personal fortune in the French Revolution (1789–1799) and

became a financial speculator and engineer. Only later in life did he turn to scholarly pursuits.

In addition to his influence on Comte, Saint-Simon's ideas are present in the writing of other diverse thinkers such as German philosopher Karl Marx, French social scientist Émile Durkheim, and German sociologist Max Weber. With Comte, Saint-Simon shared a belief in progress and the conviction that the study of society and human development deserved to be a discipline separate from philosophy and natural science. Moreover, he believed the direction of history, as well as of social change, can be understood and scientifically examined. Saint-Simon's *law of three stages,* fully developed later by Comte, outlined the idea of identifiable intellectual progress, moving from theologically oriented understanding to metaphysical thought and ultimately to scientific explanations. Obviously, the deterministic nature of such development was overstated, as was Saint-Simon's positivistic faith in the ability to discover laws underlying human behavior. Nevertheless, the idea of progress and the validity of empirical study are still shared by many contemporary scholars and social scientists. Saint-Simon also anticipated Durkheim's concept of *collective conscious,* and, in correctly interpreting the declining role of religion in state affairs, he anticipated some of Weber's and Durkheim's ideas on the secularization of the West. Saint-Simon's philosophy of history is one that sees history as a continuing progress toward greater socialization.

Saint-Simon's political writings are best considered with an understanding of his philosophy. He argued for the appropriation of hereditary wealth by a strong government that had an active role in the political, economic, and social life of society, but did not go as far with this concept as Marx and later Marxists. Although both argued for the appropriation of the means of production, Saint-Simon did not seek to put industrialists and capitalists under tutelage—on the contrary, they, together with scientists, could in his view become the new elites. His idea of the individual also differed from that of Marx. Whereas the latter saw in the individual the personification of alienation, denied freedom unless liberated by true consciousness, Saint-Simon's idea of the individual was more modern (liberal). Saint-Simon believed a person was endowed with both reason and the ability to become an autonomously acting individual. Both Saint-Simon and Marx believed in the desirability of a classless society and both, albeit to different degree, saw in the working classes a vehicle for social change. Saint-Simon's notion of *terrestrial morality* advocated the elimination of (unfair) privilege, a redistribution of class arrangements, a greater role for the state, and the institutionalization of equal opportunity.

Saint-Simon's dream of a secular and rationally guided morality is evident in his 1825 work, *The New Christianity,* written just prior to his death. In it he sought to remind believers of the "true spirit of Christianity" and criticized Catholics, Protestants, Jews, kings, ordinary people, philosophers, revolutionaries, and especially theologians. Saint-Simon believed that, simply put, faith and science have led to the deterioration of human morals—though it is not Christian values per se that failed, but those humans who interpreted, preached, and practiced them. What he called for, then, was not a reform of humanity's religion(s), but a new religion of, by, and for humanity.

Sanctions and Embargoes

The terms *sanctions* and *embargo* describe two particular kinds of economic penalties applied from one country (or a group of countries) on another one with a double purpose: to punish the latter by depriving it of essential goods and to force it to conform to the will of the former. Although they represent two different forms of economic coercion, these concepts are currently considered almost synonymous.

Sanctions can be applied for a variety of reasons, including altering the target's behavior, removing leadership or bringing about regime change, and sending "messages" to other international actors. Sanctions can be imposed to avoid war or to signal the sender's intention to escalate to more forceful forms of influence. Domestically, sanctions can be aimed to appease a constituency that demands some course of action but does not fully support war. In this case, sanctions constitute an *expressive* activity, a release of internal tension directed primarily at a domestic or international audience without other ends. Finally, the use of specific sanctions does not imply that the sender wants to achieve only one objective. Various purposes are usually being met. During the oil embargo in 1973, for example, the main sender, Saudi Arabia, had three goals: the Israeli retreat from the Palestinian territories, to relaunch Saudi leadership in the Arab world, and to solidify the domestic consensus for the monarchy in the country.

The use of sanctions as a tool of influence has a longstanding tradition. The continental blockade of the Napoleonic wars and the cotton embargo during the American Civil War (1861–1865) are just two of the most notable examples in which economic sanctions were used to achieve political gains. However, it was only after the First World War (1914–1918) that economic sanctions became a major tool of influence in a policy maker's hands. Both in the founding treaties of the League of Nations and the United Nations (UN), economic sanctions have been identified as key instruments in maintaining peace and order. Article 16 of the League of Nations established the automatic and total imposition of economic sanctions against any country committing an act of war against another state.

Similarly, the UN Security Council can impose mandatory sanctions under Articles 39 and 41 of Chapter VII of the

Activists oppose United Nations sanctions against Iraq in 2002. Critics of sanctions and embargoes argue that the measures harm regular citizens more than they do regime leaders.

SOURCE: AP Images

while the civilian population suffered terrible hardship due to the sanctions. According to UN agencies, the destruction of Iraq's civilian infrastructure during the Gulf War (1990–1991), and the inability of Iraq and the UN Security Council to agree on a humanitarian exception to the sanctions, caused the death of more than five hundred thousand children under the age of five.

To contain the devastating humanitarian impact on the target population, scholars and policy makers have tried in recent years to develop new forms of sanctions customized to maximize the target regime's costs of noncompliance while minimizing the target population's suffering. Known as *smart sanctions,* they do not target the country as a whole. Rather, they identify and target only those groups of individuals that really detain decisional power in the target country. Examples include freezing the assets of selected people, imposing limited embargos on certain goods (such as oil, weapons, or diamonds), and restricting the travel opportunities for individuals and refusing visas. However, because smart sanctions by themselves may not always succeed in inducing early compliance of the target, usually they are integrated with other tools of influence.

In summary, it is difficult to give a definitive evaluation on the effectiveness of sanctions. If sanctions have proved to be unsuccessful in many cases in which they were employed in the past, this does not diminish the fact that they may be more useful in the future. First, sanctions' efficiency should be measured based on the possible solutions available to the policy maker in a given situation. It would be misleading to talk about costs and benefits in using economic coercion, if no other solution is available. Second, sanctions have proved to be successful when multilateral and proportional to the goal to be achieved. If these conditions are not met, the employment of sanctions could weaken their effectiveness and undermine the sender's credibility.

UN Charter. Article 39 states that the Security Council "shall determine the existence of any threat to the peace, breach of the peace, or act of aggression and shall make recommendations, or decide what measures shall be taken . . . to maintain or restore international peace and security." Article 41 authorizes the Security Council to call on members to apply nonviolent sanctions against offenders. The United States is also a major employer of economic sanctions. During the twentieth century, the United States imposed economic sanctions more than 110 times. In 1998 alone, the United States imposed sanctions on twenty-six target countries.

Although the application of economic sanctions is growing (from 1991 to 1994 the UN Security Council imposed mandatory sanctions eight times, compared to only twice between 1945 and 1990), sanctions have never fully satisfied statesmen and policy analysts in their effectiveness. The reasons for this are manifold. First, sanctions seem unable to achieve their declared targets. In a study made by Gary Hufbauer and colleagues (1990), sanctions appeared to be successful in only 34 percent of the cases where employed. Second, sanctions are slow in achieving their goals. Time affords the target the opportunity to adjust, to find new suppliers, and to mobilize public opinion, with the effect of jeopardizing sanctions' effectiveness. Third, sanctions are sometimes more costly for the sender than for the target, especially when the sender must compensate domestic companies and neighboring countries for their lost revenues caused by the disruption of their trading routes with the target. Finally, in many cases sanctions do not work on authoritarian regimes.

Sanctions may actually produce consequences directly opposite to those intended by the sender. In the case of Saddam Hussein in Iraq, sanctions strengthened his regime,

Sandinismo

Sandinismo was the ideology of the revolutionary Sandinista movement in Nicaragua. The movement was named after Augusto César Sandino, a nationalist figure who opposed the U.S. military occupation of Nicaragua in the late 1920s and 1930s. Its main ideological tenets were developed by Carlos Fonseca Amador, Silvio Mayorga, and Tomás Borge Martínez, who cofounded the Sandinista National Liberation Front in 1962. Sandinismo incorporated many of the ideals of other leftist revolutionary movements in Latin America and was influenced by Fidel Castro, Che Guevara, and Mao Zedong. Sandinismo emphasized the need to create a socialist state, but broke with traditional Marxist ideology by asserting that the armed struggle to overthrow capitalism should begin among rural populations (as had been the case in Cuba). In addition, the movement's leaders accepted the utility of forming alliances with middle-class and upper-class groups in their struggle against the pro-U.S. regime of Anatastasio Somoza Debayle. After the Sandinistas took power in 1979, they implemented land redistribution and other social reforms, but efforts to develop a socialist economy led to hyperinflation and a lengthy economic downturn, magnified by corruption. They were defeated in 1990 in the country's first contemporary, open elections, although the Sandinistas recast themselves as social democrats and won the balloting in 2006.

. . . . TOM LANSFORD

Sartre, Jean-Paul

The central and most prolific figure of French phenomenology and existentialism, Jean-Paul Sartre (1905–1980) made significant contributions to philosophy, literature, political analysis, drama, and biography. A critic of bourgeois conformism, oppression, and capitalism, he was the lifelong companion of French author and feminist Simone de Beauvoir and an internationally recognized public intellectual. During the cold war, he was very critical of France and the North Atlantic Treaty Organization allies, and, without quite joining the fold, became a "fellow traveler" of the Communist Party, a position that drew him into public debates and alliances with other prominent French intellectuals, such as author Albert Camus, philosopher Maurice Merleau-Ponty, and psychiatrist and revolutionary writer Frantz Fanon.

As a young man, though many of his colleagues were engaged in left-wing politics, Sartre worked on a modest "opposition aesthetics" that championed the individual who was aware of, and broke free from, the essentially ungrounded order of bourgeois society. Starting from his readings of German philosophers

French philosopher Jean-Paul Sartre and writer Simone de Beauvoir (on sofa) meet with Argentine revolutionary Ernesto "Che" Guevara (right) in 1960. Sartre merged elements of Marxism and existentialism.

SOURCE: The Granger Collection, New York

Friedrich Nietzsche and Edmund Husserl, Sartre developed accounts of the world as fundamentally ungrounded (following Nietzsche) and of consciousness as free awareness (following Hursserl), which he wove together in the novel *Nausea* (1938), a classic of existentialist literature.

In *Being and Nothingness* (1943), Sartre argued that the human is essentially a freedom-to-be-something. Uncomfortably stretched between freedom and thinghood, people deceive themselves by pretending to either pole in "bad faith." For example, to avoid feeling that his identity is pegged, a man might keep his options open, never commit to a specific role in life, and so pretend to an unlimited freedom. However, by not attempting to be anything, he squanders his freedom by failing to make a significant choice of his life. Alternatively, he might throw myself into a role and believe he is a kind of thing, such as an academic, but then because academics are not activists for example, he would not believe the possibilities of activism were his own, which would be false. Again, his freedom would be lost to him. Bourgeois life is a swamp of bad faith in which people neither face these truths of existence nor take responsibility for the choices they make. If an individual does face his freedom-to-be-something, if he takes responsibility for his life, he will realize that he is "nothing but what he makes of himself." This radical account of human agency amounts to a philosophical humanism in which individuals are and ought to be fully responsible for their lives.

Increasingly from the 1940s onward, Sartre mobilized his words as weapons to fight oppression, making of himself a politically engaged champion of freedom. For some four decades, in polemical essays, in the press, and on the streets, Sartre wrote and spoke out in support of such groups as the Jews, the colonized Algerians, the victims of French and American imperialism in Vietnam, the proletariat, and the students of the 1968 uprisings in France.

In *Critique of Dialectical Reason* (1960), Sartre wove together existentialism and Marxism. According to German social and political philosophers Karl Marx and Friedrich Engels, humans make their history through their practices, but their practices, rather than being unlimited, are significantly conditioned by dominant social relations, a view with which Sartre came to agree. However, Sartre argued further that the social relations themselves may be traced back to past practices that have become unintentional or inert patterns that continue to have inertial effects—the "practico-inert." By reducing the conditioning limits of human practices to the practices of past humans, Sartre generated a Marxism in which the making of human history was entirely in the hands of humans in the final analysis—that is, a Marxism compatible with the philosophical humanism of his own existentialism.

Challenges to Sartre's philosophical humanism inaugurated in part the postmodern tradition of the late twentieth century.

Satire, Political

Political satire uses sarcasm and or humor to point out the foibles, incompetence, or corruption of political leaders and government actions. One of the earliest political satirists known to history is Aristophanes, who wrote many theatrical comedies that satirized ancient Athenian politics.

Political satire has become much more common in modern civilization, because of literacy growth; technological advances in forms of entertainment like television, film, and the Internet; and expansion of free speech and free press rights in many countries. Such forms of satire can flourish under governments that tolerate freedom of expression, while under authoritarian regimes, poking fun at political leaders and their policies can result in imprisonment or even death.

In the United States, the federal Supreme Court upheld constitutional protections for political satire in the somewhat unusual case of *Flynt v. Falwell,* 485 U.S. 46 (1988). Pornography publisher Larry Flynt printed a parody in his magazine that created a fictional and crude account of the first sexual experience of Jerry Falwell, a well-known conservative political activist and evangelist preacher on American television. Falwell sued Flynt for libel and was awarded $150,000 by a jury for emotional distress, but the Supreme Court unanimously overturned the jury decision by stating that no one would believe the parody was true and that public figures must get used to the possibility of ridicule.

CARTOONS, ESSAYS, LITERATURE

Jonathan Swift became a well-known English-language political satirist in the eighteenth century for his works like *Gulliver's Travels,* while Voltaire's *Candide* gained great popularity and controversy in mid-eighteenth century France. Political satire also became a form of commentary on British rule in colonial America, one of the most prominent authors being Benjamin Franklin for works like "Rules by Which a Great Empire May Be Reduced to a Small One."

Political satire became more popular among the majority of people, many who were illiterate in the nineteenth century, through political cartoons. The term *gerrymander* became famous when a political cartoonist in Boston added a salamander's feet and head to a map of an oddly shaped legislative district in Massachusetts drawn to benefit the party of Governor Elbridge Gerry in 1812. Thomas Nast became famous in the second half of the ninth century for his political cartoons in *Harper's Weekly,* in which he created the symbols of the elephant for Republicans and the donkey for Democrats. Nast also published a series of cartoons critical of New York City's Boss Tweed, head of the Tammany Hall political machine, who eventually went to prison.

In nineteenth-century France, Honoré Daumier's caricatures of King Louis-Philippe at one point led to the artist's imprisonment, and Victor Hugo published *Les Châtiments,* a collection of poetry that contained strident satire of the reign of Napoleon III. In the twentieth century, novels like George Orwell's *Animal Farm* and Joseph Heller's *Catch-22,* as well as H. L. Mencken's newspaper columns, continued a rich English-language tradition of political satire. Political cartoons remain common in newspapers, while Garry Trudeau's *Doonesbury* became a well-known satire of contemporary American politics in comic strip form. The magazines *Private Eye* and *Le Canard enchaîné,* from the United Kingdom and France, respectively, remain known for their satirical articles and cartoons.

TELEVISION, FILM, INTERNET

One of the twentieth century's most famous and politically significant political satires was presented on film in 1940, with Charlie Chaplin's *The Great Dictator,* a critique on the rise of Hitler in Germany. Later, 1964's *Dr. Strangelove* satirized the cold war, while Woody Allen's 1971 film *Bananas* satirized Latin American dictatorships. In 1997, *Wag the Dog* was released, a dark comedy about the creation of a fake war to distract the public from an American president's sex scandal. Michael Moore has made a series of documentaries in which he satirizes American political policies on gun control, health care, and the 2003 war in Iraq.

Television also has become a very popular medium for political satire in American shows such as *The Simpsons,* which includes a buffoonish Mayor Quimby character and frequently pokes fun at mass public ignorance on political issues, and *South*

Park, which has satirized American views on immigration, abortion, censorship, and environmentalism. The weekly program *Saturday Night Live* frequently contains satirical skits and impressions of political leaders that can have an impact on public attitudes, such as skits poking fun at 2008's Republican vice presidential candidate Sarah Palin. During the first decade of the twenty-first century, *The Daily Show* and *The Colbert Report,* both political satire programs, became especially popular among American young adults.

British television programs also poke fun at politicians, perhaps most memorably in the *Spitting Image* puppet show of the 1980s and 1990s, whose portrayals of Ronald and Nancy Reagan were used in a music video of the song "Land of Confusion" by the band Genesis in 1986. In Canada, the CBC network has, for many years, presented political satire shows like *Royal Canadian Air Farce*, *This Hour Has 22 Minutes,* and *The Rick Mercer Report,* with each of the shows featuring frequent appearances by leading national politicians of the day. *Le Bébête Show* and *Les Guignols de l'info,* similar to *Spitting Image,* have used puppets to satirize French political leaders. Japanese comedian Hikari Ota began a weekly program in 2005 in which he pretends to be a Japanese prime minister who proposes preposterous policies.

Widespread Internet access, starting in the late twentieth century, also led to an exponential increase in political satire, as websites such as YouTube make themselves available to anyone in many countries, though most of the satire produced in this way has not attracted much attention. Organized political satire websites, though, have had more of a following and occasionally gained attention from other media. The Onion website contains a large number of humorous fictional news articles and videos about politics. JibJab.com gained a lot of attention for the satirical video it posted during the 2004 American presidential election, in which George W. Bush and John Kerry sing along together to the folk song "This Land Is Your Land."

If Internet access continues to spread, if electricity reaches more communities around the world, and if more countries adopt policies that tolerate the freedom to criticize political leaders, then the amount of satirical content produced about politics is likely to grow in the twenty-first century.

Satyagraha

Satyagraha translates from Hindi as "zeal for truth." The term is an Indian political philosophy developed by prominent Indian politician and spiritual leader Mohandas Gandhi during the 1920s, which emphasized nonviolence to overcome political repression. Gandhi rejected political violence and instead drew on traditional indigenous forms of protest as part of the Indian nationalist movement to end British occupation of India. Satyagraha emphasizes the search for truth and the concurrent effort to convert political opponents to the righteousness of one's cause rather than coerce or force one's goals on an opponent. Unlike conventional armed struggles, the ultimate goal is a cooperative solution in which the opposing party does not perceive itself to be the loser of the struggle, nor is the opposition harmed.

Gandhi argued that nonviolence was part of human nature and violence was an aberration. Satyagraha was both a political and personal philosophy that aimed to improve an individual's life. Gandhi initially promulgated Satyagraha in an address in Johannesburg, South Africa, in 1906 as a part of an opposition movement to the racial policies of the British colony toward Indian immigrants. Satyagraha later formed the core of the Indian independence movement and employed tactics such as boycotts. Gandhi's philosophy would influence later nonviolent movements, including the 1960s civil rights movement in the United States and in South Africa under Nelson Mandela protesting apartheid in the 1950s and 1960s.

Scandals and Blame Management, Political

Political scandals are pervasive events that span across nations, capture media and public attention, have no party division, and exclude no level of office. Scandals are mediated events that can involve presentations of corrupt acts. Although some scholars treat corruption and scandal as identical, they are not the same phenomenon. Joseph Nye provides the most quoted definition of corruption as the "behavior which deviates from the formal duties of a public role because of private-regarding (personal, close family, private clique), pecuniary, or status

gains; or violates rules against the exercise of certain types of private-regarding influence" (1967, 419). While all corrupt acts can become scandals, not all scandals involve corrupt acts. As Suzanne Garment notes (1991), a scandal is not an event that is intrinsically evil or corrupt. Rather, it is an event that shocks and upsets the public. For example, sexual infidelity is considered a scandal although it does not involve corruption. Publicity is the second element of scandals that distinguishes them from corruption. Of all those behaviors that conflict with society's moral standards, it is only the publicized ones that constitute scandals. John Thompson (2000) notes that *scandals* are interpretations of immoral acts defined through the media, elites, and public discourse. A scandal is as much related to the nature of the act as it is to the publicity that it receives. Corruption does not need an audience while scandals cannot exist without one. And while corruption is measured by the seriousness of the act itself, a scandal's impact is assessed by the seriousness of the damages inflicted on political actors.

With the above in mind, a scandal can be defined as the information about an act that is considered immoral or shocking, made available to a large audience, which results in a loss or injury of reputation to the actor(s) involved. Scandals are further classified on the basis of the nature of the act, and the most frequent categories appearing in the literature are campaign violations, bribery, moral violations, and abuses of congressional prerogatives. Other classifications refer to the level of scandal activity; that is, whether the act is individual or institutional. According to Dennis Thompson, a scandal is institutional when "the gain a member receives is political rather than personal, the service the member provides is procedurally improper, and the connection between the gain and the service has a tendency to damage the legislature or the democratic process" (1995, 7). In the event of an institutional scandal, illegal conduct performed by an individual implicates the institution that person is associated with and undermines its reputation. Scandals are also classified on the basis of whether the scandal act is of high or low severity, ranging from "grand" to "petty," and whether it is traditional or modern. Traditional scandals would include patronage and improper influence, while money laundering through electronic means would be a modern scandal.

CASE STUDIES, SURVEYS, AND EXPERIMENTAL EXPLORATIONS OF POLITICAL SCANDALS

Systematic research on political scandals employs a variety of methodologies to understand their impact on voting behavior. Case studies show that the degree of scandal damage depends on its details. Ethical misconduct and moral charges are the most damaging and can harm severely or even irreversibly damage political careers, while campaign violations, bribery, abuse of congressional prerogatives, and relation with others involved in misdeeds leave only minor scars on the actors' public profiles. Research on institutional scandals indicates that when blame can be shifted to endemic characteristics of the institution, it is diffused. The institution absorbs the negative impact of the scandal and the culpability of the individual member is discounted. In the case of individual scandals, as for instance bribery in return for a political favor, the blame does not involve the institution and its implications on the individual are more severe. In a public opinion survey, John Peters and Susan Welch (1978) found that the type of office the accused official occupies generates responsibilities and perceptions of these responsibilities shape scandal impact. The public allows executive office holders greater latitude to act and exercise a more independent style of political leadership compared with legislators. For that reason, public officials and the public react differently to explanations of corrupt behavior provided by legislators than to explanations provided by executives (e.g., mayors, governors, and presidents). The public is more forgiving of an executive's misbehaviors compared to legislators' misbehaviors. For the same reasons, judges are held to higher standards than are legislators.

Several scholars place emphasis on elements of the scandal publicity, such as the scandal frame and whether it is situated in the public or private sphere. As Paul Heywood notes (1997), when the act has an effect on the performance of public duty, it is considered "public," and its implications are serious. However, activities driven by personal, "private" ends are considered to be outside the public sphere, lying outside the boundaries of public concern. The timing of the publicity also determines scandal impact. The further away a scandal breaks from an election, the more negligible its effect, because scandal impact deteriorates over time as novelty wears off. Scandal duration is also important. The longer a scandal stays on the public agenda, the more serious its implications, because its salience can shift voters' opinions.

Experimental and survey evidence shows that character perceptions of those scandalized also determine scandal impact. According to Richard Fenno (1978), what a political actor gives off as a person has implications for accountability, because the public has the tendency to forgive people they know. Carol Funk (1996) and Tereza Capelos (2001) show that favorable political reputations centered around competence and qualification skills often operate as a protective shield, moderating the effect of a scandal. On the other hand, perceptions of integrity do not offer much cushion of support as they consistently plummet after a scandal. Also interesting is the finding that in the absence of reputation, scandal impact is more pronounced. The public evaluates unfamiliar political actors more harshly than politicians about whom they know something. Party identification is also shown to have a significant effect. As the literature on motivated reasoning suggests, party affiliation generates a feeling of identification. In the context of a scandal, partisan affiliation provides resistance to negative information that suppresses negative reactions and blame attribution. Issue agreement operates in a similar fashion. Public support for corrupt office holders is likely to continue among voters with strong policy preferences for the positions of the office holder, according to the findings of an experiment by Barry Rundquist, Gerald Strom, and John Peters (1977). Experimental studies also show that men and

women are not evaluated in a uniform fashion in the context of a scandal. Leonie Huddy and Tereza Capelos (2002) find that female candidates enjoy a higher chance of survival due to gender stereotypes related to inferences of honesty.

BLAME MANAGEMENT AND ACCOUNTS

Scandal effects are manageable because political actors strive to maintain the approval of those to whom they are accountable. Kathleen McGraw (1991) explains that in their effort to shape citizens' perceptions, politicians provide accounts, public explanations of their behavior. McGraw offers a fourfold typology of accounts: (1) Excuses deny some or any measure of responsibility of the offensive act in an attempt to weaken the causal link between the actor and the outcome. (2) Denials deny that the event in question occurred. (3) Justifications attempt to reframe the outcome, denying some or any measure of offensiveness in the act while admitting responsibility. (4) Concessions acknowledge the occurrence of the negative event with explicit or implicit assumption of responsibility, expression of regret, or offer of restitution.

Providing public accounts is a critical tactic that requires skill. McGraw provides evidence that the political loss can even be turned into political gain, if the reframing of the consequences of the act is successful. Serious offenses are associated with concessions, denials, and justifications, while seniority and high public support lower the likelihood of offering an explanation. Social-psychological literature also predicts a preference of concessions among female politicians and politicians of the ruling party, while politicians of the opposition use more excuses, assigning blame to the ones in power.

Despite the blame management efforts of those who find themselves caught in the web of public accountability, political transgressions stigmatize many political careers. Interestingly, in some cases the account can fall short of remedying the wrongdoing, creating unanticipated new problems. The cost for political actors translates to decreasing electoral margins, electoral defeat, resignation, or early retirement. In presidential systems, scandals are negatively related to electoral support for the party in control of the presidency. In parliamentary systems, they have implications for prime ministerial evaluations, following the decision to fire or protect scandal-implicated ministers. Scandals can erode trust and confidence in political institutions and the democratic system in general. The revelation that political actors abuse their power injects waves of public anger and encourages the rise of political cynicism and public disengagement. Political scandals are not only bad, however. They can be good when they expose abuses, promote public scrutiny toward openness in government, and stimulate debate about moral standards and political humility. Active citizens and accountable political leaders can mean gains for democratic politics.

Schattschneider, Elmer E.

Elmer Eric (E. E.) Schattschneider (1892–1971) was an American political scientist who wrote about political parties.

Schattschneider was born in Bethany, Minnesota. He earned his bachelor's degree from the University of Wisconsin in 1915. He then worked for the Young Men's Christian Association from 1916 to 1918 and joined the U.S. Navy in 1918. After leaving the military at the end of World War I (1914–1918), Schattschneider taught at the senior high school in Butler, Pennsylvania, from 1919 to 1926. He then entered the University of Pittsburgh and was awarded his master's degree in 1927. In 1935 he received his doctorate from Columbia University.

Schattschneider taught at Columbia (1927–1930), the New Jersey College for Women (1928–1930), and Wesleyan University (1930–1960). After his retirement, he continued to teach as a professor emeritus of government at Wesleyan until 1970. He also was a visiting professor at Syracuse University (1949–1950), where he supervised visiting German students.

Schattschneider was active in public service. He served on the Connecticut City Council of Middletown (1938–1940), as a member of the Connecticut State Board of Mediation and Arbitration (1940–1946), as a "visiting expert" in Germany for the U.S. Army of Occupation (1949), as chair of the Governor's Commission on Community Adjustment Problems (1951), and as a member of the Old Saybrook (Connecticut) Charter Study Commission (1967–1968).

Schattschneider was vice president (1953–1954) and president (1956–1957) of the American Political Science Association. In 1949 he chaired the association's Committee on Political Parties, which published "Toward a More Responsible Two-Party System" in 1950.

Schattschneider's books include *Party Government* (1942), *Equilibrium and Change in American Politics* (1958), *The Semisovereign People: A Realist's View of Democracy in America* (1960), *Political Parties and Democracy* (1964), and *Two Hundred Million Americans in Search of a Government* (1969). *The Semisovereign People* is significant because Schattschneider wrote about the transformation of American politics from a set of regional political systems to a truly national political one.

Schattschneider's work on parties and interest groups made him influential in political science. His observation in *Party Government* that, because people are torn between their interests, there can never be 100 percent mobilization of an interest helped frame the understanding of the workings of interest groups in American politics. In the same work he writes that "A political party is first of all an organized attempt to get power. *Power* is here defined as control of the government. That is the objective of party organization. The fact that the party aims at control of the government as a whole distinguishes it from pressure groups" (2004, 35) A few lines later he adds that "Since control of a government is one of the most important things imaginable, it follows that a real party is one of the most significant organizations in society."

Schmitt, Carl

Carl Schmitt (1888–1985) was a German political theorist and law professor. His theories favored strong executive authority to maintain order during time of crisis.

Schmitt, a Roman Catholic, was born in Plettenberg, Westphalia. He studied law and passed his state examinations in 1915. A year later he volunteered for the German Army. After World War I (1914–1918), Schmitt taught law at a number of German universities, including the University of Griefswald (1921–1922), the University of Bonn (1922–1926), the Handelschochschule (1926–1932), and the University of Cologne (1932–1933). He finally joined the University of Berlin faculty in 1933.

Schmitt was a legal advisor to German chancellor Kurt von Schleicher in the chancellor's efforts to block a seizure of power by the Nazis or Communists. However, Schmitt joined the Nazi Party in 1933, where he captured the attention of Hermann Göring, one of the party's leaders and was appointed president of the Union of National-Socialist Jurists. Schmitt assumed a number of other leadership roles in the legal profession in Germany and used them to provide legal justification of the National Socialist regime and the persecution of Jews. He defended the Nazi regime's murder of political opponents on the so-called Night of the Long Knives in 1934. In October 1936, Schmitt demanded that all publications by Jewish scientists be designated with a symbol. At the 1936 conference that he organized on Judaism and jurisprudence, he demanded that German law be cleansed of what he called the "Jewish spirit."

Schmitt's influence would be short-lived. In December 1936, *Das schwarze Korps,* a Shutzstaffel (SS) publication, accused him of being an opportunist and cited his earlier criticism of Nazi racial theories. Schmitt then was stripped of his leadership roles but was allowed to keep his position at Berlin through Göring's intercession on his behalf.

Schmitt was captured by the American army in August 1945 and was interrogated on at least four occasions by the American Military Government and the Nuremberg prosecutors. However, he was never prosecuted, and he eventually returned to his birthplace of Plettenberg, where he would continue to write.

Schmitt's writings tended to support executive power. According to him, unanticipated and sudden changes in political situations cause instability in any system based on the rule of law. In his essay "Die Diktatur" ("On Dictatorship"), which was published in 1921, he examined the constitution of the new Weimar Republic. Schmitt viewed the emergency powers granted to the president as a strength of the document, contending that the weakness of parliamentary democracy was its deliberative nature. He believed that for government

to be effective, it must be decisive. In subsequent works, Schmitt continued his criticism of liberal democracy. In *The Crisis of Parliamentary Democracy* (1923), he contends that liberal democracy, which is justified by the notion that policies are the product of rational discussion, is actually a process where decisions are made by political party leaders who are more concerned about good politics than good policy.

In *The Concept of the Political* (1927) Schmitt contends that politics is different than other aspects of life because, "The political is the most intense and extreme antagonism." He suggested that, in politics, the annihilation of one's adversary is acceptable if necessary.

Schmitt's work has influenced both European conservatives and those on the far left who find his rejection of liberalism and support of strong executive power attractive.

Schumacher, Ernst Friedrich

Ernst Friedrich (Fritz) Schumacher (1911–1977) was an environmental, or Buddhist, economist best known for his influential book *Small Is Beautiful: Economics As If People Mattered* (1973). Influenced by the Austrian philosopher Leopold Kohr, he argued for small-scale economies, social and ecological justice, and nonviolence.

Schumacher was born in Bonn, Germany, to an academic family and studied first at Oxford University in Britain as a Rhodes Scholar and then at Columbia University in New York. In 1934 he returned to Germany but fled in 1936 with his new wife to escape Nazism, settling in Britain.

After becoming a British citizen in 1946, Schumacher was sent to Germany as part of the British Control Commission to work on the economic reconstruction of Germany following World War II (1939–1945), and he began around this time to think about the idea of *appropriateness* in terms of economic scale and patterns of ownership. The idea of appropriateness has since become a key theme in environmental economics.

In 1949 Schumacher became chief economic advisor to the British Coal Board, a post he held for twenty years. He argued that coal rather than oil should supply the greater part of the world's energy needs and voiced concerns about the depletion of fossil fuels. He was active in the British Soil Association from this time as well, an interest that developed as a consequence of a family move to a house with a large garden in Surrey; Schumacher became an enthusiastic advocate of organic gardening.

In 1955 Schumacher travelled to Burma as an economic consultant but later said that he felt Burma could teach the West a great deal about economics. Impressed by the lack of materialism he observed in the Burmese people, he was committed to the idea that economics conceptualized purely in terms of providing for material needs was insufficient; economic activity also must be fulfilling for people in sustainable ways. His celebrated 1966 essay "Buddhist Economics" expanded on this theme and outlined his thesis that the most rational economic policy was production from local resources for local needs.

Schumacher's ideas found practical expression in the Intermediate Technology Development Group (later known as Practical Action), which he founded in 1966 to work on economic development within people's cultural context development, thereby respecting cultural differences and promoting the principle of appropriateness in technological and economic development.

Schumacher died in Switzerland in 1977. In addition to *Small Is Beautiful,* he wrote only one other book, *A Guide for the Perplexed,* published posthumously in 1977. Both titles have been widely read around the world. He also made regular contributions to the magazine *Resurgence;* a selection of these essays was collected in the 1997 publication *This I Believe.* In 1980 the E F Schumacher Society was founded in Britain to continue Schumacher's work, and it grew to include branches in several countries.

Schumpeter, Joseph Alois

Economist Joseph Schumpeter (1883–1950) was born in Austria-Hungary. After the death of his manufacturer father, his mother married a retired army officer with an aristocratic title. Schumpeter was thus able to attend an exclusive Viennese school and then the University of Vienna, where he studied with both neoclassical and historically minded economists. After World War I (1914–1918), despite sympathies with the defunct monarchy, he served briefly as finance minister in an Austrian government led by social democrats. Following the emergence of almost-inevitable conflicts, Schumpeter went into banking and then eventually returned to scholarly life. In

1932 he accepted a position at Harvard, where he sealed his reputation among English and American social scientists.

Schumpeter made his mark on political science with his conception of democracy as method. Contrary to what he termed the *classical doctrine,* he insisted that democracy was no more than an institutional arrangement or a political method that allowed elite politicians to engage in electoral competition for decision-making power. For many political scientists, this conception had several attractive features. It seemed to banish normative elements and made it easy to distinguish democratic governments. It was congenial to the predominant mood of researchers who downplayed the political sophistication of ordinary citizens. And it posited as the driving force of politics the hard-headed competition of elite politicians, which produced substantive law and policy as mere "byproducts." The conception, however, soon attracted critics, who argued that it devalued participation, deprived the term *democracy* of its critical power, and inappropriately treated contingent observations about voters as evidence of inalterable human psychology.

Schumpeter elaborated his conception of democracy in *Capitalism, Socialism, and Democracy* (1942), a work focused on what he perceived as the historical tendencies leading toward the demise of capitalism. The significance of this fact has not always been appreciated. Democratic theory could be, for Schumpeter, only a part of a broad science of social development. As an economist, he greatly admired neoclassical models, which focused on systematic relationships between economic quantities and on the tendency toward equilibrium. But as early as 1911, he expressed dissatisfaction with the implicit neoclassical assumption that the equilibrating capitalist system contained within it no drive toward change. Early on, Schumpeter posited entrepreneurial innovation as an internal source of disruption, constantly remaking the economy—a process he later summed up as *creative destruction*. As his thought developed, he also began to stress that the capitalist system was surrounded by an institutional framework he termed the *capitalist order.* A fully articulated theory of capitalist development required an economic sociology that could elucidate this framework and the tendencies toward change embodied in it. As an economic sociologist, Schumpeter argued that the entrepreneurial function would likely disappear, crucially weakening the capitalist order. He also argued that democratic ideologies were part of a broad cultural challenge to the capitalist order—even while elsewhere arguing that the democratic method was a form of elite rule under which the economy was protected from popular interference.

Science, Technology, and Politics

The advent of a methodical, experimental, organized, publically funded and honored, and technologically oriented science has introduced deep transformations in politics. Where this science has been institutionalized and its fruits available—in Europe, North America, Australia, and much of Asia—it has enabled wealth and leisure, as well as generally improved living conditions. Indeed, the tremendous inequality in living conditions and military might between nations where this science and its fruits are known, and those where they are unknown, is arguably the basis for classifying the world into developed, developing, and underdeveloped countries. In large part because of its practical efficacy, the scientific account of nature that underlies this power has tended to spread along with its technological fruits, replacing or forcing the modification of traditional beliefs about the nonhuman whole, and thus about humanity, law, and duty.

Moreover, in progressively expanding human power over nature and thus the limits of possible action, technological science has the capacity to change expectations of the state and the conduct of politics. Thus, while commonly seen simply as an instrument of those who develop and use it, technological science also can effect change in people's beliefs and alter their relationship to each other and to their political community. Political science has been slow to take account of this dynamic and dialectical relationship between politics and technological science, but the prominence of pressing policy questions involving science and technology have forced it onto the agenda of all branches of the discipline.

CLASSICAL CRITICISMS OF ART AND SCIENCE

In Europe, where modern technological science emerged, however, the inquiry to uncover the unchanging character of the nonhuman whole (or nature), which was originally called *physiology* or *philosophy,* and the practical and productive arts, the totality of which we now call *technology,* were originally distinct enterprises, both of which were viewed with suspicion, if not hostility, from the vantage point of politics or the health of the political community. In the Hebrew Bible, the questionable nature of the arts is indicated by their origin—the founders of metallurgy, tools, and instruments come from the cursed descendants of Cain—and shows itself in the tension between the arts and law or man's duty to God. Thus, in the Babel story, the invention of the art of masonry tempts man to undertake the prideful project of making a name for himself through the building of a united and universal city.

A mushroom cloud from an atomic bomb looms over Nagasaki, Japan, in 1945. Government investment in science in during the world wars contributed to the development of the atomic bomb and, by extension, Allied victory in World War II.

SOURCE: Corbis

As for science, Plato has preserved for us the anecdote of Thales, who, while stargazing, fell into a well, at which sight a witty Thracian maid quipped that Thales was so eager to know the heavens that he forgot the things at his feet. Sharper still is Aristophanes' critique of the scientific enterprise in his comedy *Clouds,* where a buffoonish Socrates is shown engaged in a variety of inane inquiries into nature, apparently oblivious or indifferent to Athens' plight in the Peloponnesian war, and complicit in the corruption of the youth of Athens, encouraging doubt about the being of the gods of the city and thus undermining the authority of its laws. The single-minded quest for the truth about nature leads to an irresponsible and dangerous forgetfulness about politics and the demands of practical life.

The founders of political philosophy and political science recognize the questionable nature of the philosopher's place in the community and share the skepticism about the arts, if albeit for different reasons. Both in Plato's *Republic* and his *Laws,* philosophy is restricted to a very select class of individuals. Regarding the arts, in his *Politics,* Aristotle directly considers a proposal, attributed to Hippodamus, to encourage useful innovation and argues against it on the grounds that it will encourage innovation in law, which is dangerous. Though he later acknowledges the city's need to attend to developments in the military arts in particular, lest its rivals become too powerful, even this recognition does not persuade the philosopher to adopt a general policy of encouraging innovation.

Nor was the marriage of science and the arts simply unknown to the ancients, as the wondrous machines of Hero of Alexandria and Plutarch's portrait of Archimedes indicate, but these examples make clear the separation and rank order of importance assigned to the arts on the one hand and science or philosophy on the other. Simplifying and generalizing, we can say that while the usefulness, even the necessity, of pursuing certain avenues of technological innovation, particularly in the military arts, was recognized and accepted, the systematic encouragement of scientific and technical innovation was never pursued, both out of fear of the revolutionary potential of all innovation and an aristocratic scorn for concern with means and the merely necessary. Science or philosophy, insisting on its essentially theoretical character, is accepted or rejected by the political community as a leisure activity, perhaps beautiful, but effectively useless.

THE BACONIAN REVOLUTION TO THE BOMB

A twofold transformation in this relationship is thus the precondition of the politically institutionalized technological science with which we are familiar. Science must rescind or at least qualify its essentially theoretical character, show itself to be practically useful, and the political skepticism toward innovation must be overcome. With respect to the former of these, many scholars argue that late medieval Christianity played a crucial part, forcing a qualification of the classical defense of science or philosophy and breaking down the aristocratic ethos and its high-minded contempt for the productive arts. Thus in the medieval period one sees a flowering of technical innovation and figures like Roger Bacon, monk, philosopher, and mechanic.

The first systematic effort to think through and work for the unification of natural philosophy, or science, and the arts, with a view to fundamentally resetting the relationship of natural philosophy, or science, and politics occurs in the thought of Englishman Francis Bacon around the turn of the seventeenth century. Bacon's project was twofold: to provide the foundational argument for a methodical, experimental, and practically oriented science, which as such, would yield works and not mere words or understanding; and second, to advocate the institutionalization of this science. Unlike classical science, the new natural science was a large and collaborative venture, therefore requiring not only tolerance or freedom, but funding, honor, and support. In exchange for these, Bacon and his successors promise to the state useful knowledge and extraordinary new powers. In essentials, the terms of this "social contract between science and society" remain the same in the early twenty-first century. The guiding vision for this project can be glimpsed in Bacon's *New Atlantis,* which tells of the discovery by a ship of Europeans of the utopian

island of Bensalem, where institutionalized science contributes to securing maximum political happiness.

Bacon's writings and the *New Atlantis* in particular were of crucial importance to the founding of the Royal Society and so to the great age of English science that culminated in Sir Isaac Newton's *Principia*. The Royal Society is among the first scientific establishments supported not only out of aristocratic largess, but for the goods that it promises to generate. Anglo-Irish satirist Jonathan Swift produced a hilarious lampooning of the society and its science in the third voyage of *Gulliver's Travels,* which suggests the society's early failure to make good on this promise but may be taken also as an implicit acknowledgment of its growing prominence.

By the late eighteenth century, Bacon and French philosopher and mathematician René Descartes were revered or condemned as the architects of the "scientific" aspect of the Enlightenment project to rationalize and meliorate human life. Taken together, science, liberal government, and commerce would bring comfort and prosperity, as well as chase religion into the private realm, freeing politics from its authority. This Enlightenment project of science, technology, and a new kind of politics in the service of human liberty is clearly visible in the patent clause of the U.S. Constitution, empowering Congress, "To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries."

Over the course of the nineteenth century, scientific and technological progress proceeded at a remarkable pace in Europe and the United States. While the extent to which scientific inquiry is prerequisite to technological development remains somewhat controversial, both in this period and in general, in some clear and famous cases (the lightning rod and the telegraph, for instance), developments in science clearly precede and make possible important technological innovations. Moreover, this *linear model,* as it is sometimes called, was surely the prevailing understanding of the relationship between science and technology through the nineteenth and twentieth centuries. *Basic* or *pure* science precedes and makes possible *applied* science and technology.

During the nineteenth century, the university became the primary home of the *scientist* (a label coined in the 1830s and controversial through the end of the nineteenth century), while applied science and engineering found a home in the corporation. Outside of agriculture, the geological and oceanic surveys, and some limited ventures in the realm of public health, however, the state kept or was kept at a distance from both basic science and engineering.

This distance of the state from science and engineering was decisively changed by the two world wars. The advent and use of chemical weapons in the First World War (1914–1918) is among the first clear indications of a new relationship of interdependence between technological science and the state; science was enlisted and mobilized to serve the ends of the state, a movement that culminated with the development of the atomic bomb. No event in the history of modern natural science makes so clear its potentially decisive practical power; no event so immediately alters its relationship

to politics. Many saw (and see) the advent of the bomb and the possibility of nuclear annihilation as disclosing the dangerous hubris of the Baconian project to master nature, as well as confirming the concerns of critics of technology from Rousseau on. But for those in power, faced with deciding what is to be done, the main question henceforth was how this science can best be harnessed and directed to the benefit of the state and humanity generally. And so, following the Second World War (1939–1945), every industrialized nation undertook a programmatic reevaluation of their capacities for scientific and technological innovation. Perhaps the most famous and influential of these reports was Vannevar Bush's "Science—The Endless Frontier." With the development of "the bomb" a number of essential features of the relationship between modern science and politics are brought to the fore and with them, questions and controversies that remain unresolved to this day. They are customarily, if imperfectly, categorized as matters of policy for science and technology and of science and technology for policy.

AFTER THE BOMB: POLICY FOR SCIENCE AND TECHNOLOGY

To begin with the crudest and most obvious considerations, the development of the bomb reveals the importance, if not the necessity, of funding science, even or perhaps especially the most abstract branches of science. Estimates vary, but according to Don K. Price (1962), at the turn of the twentieth century, total federal support for research and development (R&D) in the United States was on the order of ten million dollars; by 1930 it was still less than one hundred million dollars, and by the end of the Second World War, one billion dollars. According to the National Science Foundation report for fiscal year 2008, federal R&D support totaled 116 billion dollars. Such huge investment, however, gives rise to controversy. What is the role of the state as opposed to industry in funding research, and how much of a say does the funding public get in how its money is distributed? The prevailing understanding of the workings of science suggests that state funding is necessary, particularly for capital-intensive projects and early-stage research and that no-strings-attached funding distributed by scientists with a view to the scientific merits of proposed inquiries is the surest path to progress.

Still, the public justification of funding for science is primarily in terms of practical use or consequence. Even apparent exceptions—space exploration and supercolliders—are undertaken for the global prestige or recognition, as symbols of preeminence calculated to have political effect. When governments are forced to choose between constructing a new supercollider and the biomedically relevant human genome project, the project with the clearer practical benefit is likely to prevail. Because public benefit remains the only legitimate ground for public funding, scientists have an interest in encouraging belief in the fruitfulness of basic research. As Daniel Greenberg (1999) has pointed out, from a scientist's point of view, there is scarcely any problem facing the nation to which the answer is not more funding for science.

A related question is the relative efficacy of directed versus undirected scientific research. Given that the public funds

science largely, though perhaps not exclusively, with a view to the technological benefits it receives from the science, it has an interest in maximizing its investment. Again, the case of the bomb is a helpful entry to the problem. Many, including Vannevar Bush (1960), interpret the development of the bomb as a confirmation of the importance of undirected funding of basic science. Both because science itself resists being managed from without and because the ultimate implications or consequences of a particular line of research cannot be predicted in advance, but those consequences are undeniably of great consequence, the state must fund generously and broadly, turning over authority for distributing the funding to the scientists themselves, the only ones in a position to know what to do with it.

On the other hand, the bomb was the outcome of the most aggressive project of government-directed research in human history, the Manhattan Project. It can be plausibly argued that, far from demonstrating the utility of basic research, the bomb is proof of the fruitfulness, even the necessity, of direct government supervision and guidance of research. Indeed, the Manhattan Project and the moon landing have become proverbial examples of what focused effort and big spending can accomplish. Daniel Sarewitz (1996) has provocatively and persuasively argued in favor of abandoning the "myths" of the infinite benefit of unfettered research, which he sees as obstacles to clear thinking about policy for science and technology.

The bomb makes clear that scientific and technical talent and ability are vital resources to be jealously guarded and cultivated. The massive exodus of theoretical physicists from Nazi Germany was a crucial factor in the success of the Manhattan Project and the health of physics in the United States after the war. Similarly, in the aftermath of the launch of Sputnik, there was a sudden concern about whether the United States was training enough scientists and engineers. At the same time, because there is no necessary connection between being a good scientist and being a good citizen, states become concerned about scientists sharing secrets, spying, and defecting. The newly discovered dependence of the state on the integrity and devotion of its scientists exposes those scientists to heightened scrutiny, which is in tension with the freedom from oversight and political interference taken to be crucial to scientific progress.

The internationalism of the scientific community is thus a factor in policy for science. On the one hand, the existence of a meaningful international community of scientists makes possible action on a global level, as suggested by the cases of nuclear testing and arms control during the cold war and the current efforts of the Intergovernmental Panel on Climate Change. On the other hand, the transnational character of science opens the possibility of scientists simply moving from one state to another to avoid justifiable regulation or supervision and thus stands in the way both of state-level as well as global policy for science and technology.

Another uncontroversial implication of the development of the atomic bomb is the need for supervision and regulation of certain potentially dangerous or morally questionable avenues of scientific and technological development. But by whom, and according to what criteria? Again, on the one hand, only the technically and scientifically expert are competent to distinguish real dangers or concerns from the merely fanciful, but on the other hand, how can interested parties be trusted with judgment in their own case? Moreover, certain of the most uncontroversial limits to scientific and technological research—the prohibition of experimentation on unwitting human subjects, for instance—have nothing to do with scientific expertise and indeed rest on bases external to the science itself. Here, as with the case of funding, the scientific impulse seems clearly in tension with the demand for regulation. No consensus has emerged on how such disputes should be resolved and policy made, as the ongoing debate about the funding and regulation of research on human embryonic stem cells indicates. This picture is further complicated when looked at comparatively, for particular states with distinct histories handle the same policy questions very differently, raising the question of which approach is best. To generalize, while the need has been clear for more than half a century, developing institutions, national or international, capable of regulating science and technology remains very much a work in progress, and a dispositional openness to technological innovation leads to the acceptance of an increasingly problematic "wait and see" approach to regulation.

AFTER THE BOMB: SCIENCE AND TECHNOLOGY FOR POLICY

The second half of the twentieth century also sees the proliferation of science and technology in policy. With the advent of an evolutionary view of nature and the corollary notion of species interdependence, humanity is forced to look at choices and actions in terms of potential consequences for nature as a whole and even the future of nature as a whole. As Hans Jonas observed (1984), practice has become more far-reaching and total than ever before. The discovery of the environment as an object of concern, together with the explosion of new products and processes with potential impacts on human health to consider, has the consequence that science-and-technology expertise and advice is suddenly indispensible to policy making. Yet, as this expertise involves the prediction of future consequences in extraordinarily complex systems, the uncertainty of such advice seems unavoidable. Moreover, even in the absence of deep uncertainty, scientific expertise seldom, if ever, compels a particular political choice. Policy makers and citizens turn to experts, but they tend to ask more of experts than they can deliver.

This problem has two grave consequences: the politicization of science and technocracy. The politicization of science names the use of science to rhetorically defend or rationalize a policy choice and the involvement of scientists in the political process such that they come to been seen as partisans rather than the disinterested seekers they need to be to justify appealing to their authority. Technocracy names the capture of decision-making authority by the technically and scientifically expert and therewith a loss of democratic self-government. It has become customary to speak of the task of maintaining the separation between science and politics requisite to avoiding

these twin dangers as "boundary-work," though more recent studies of science and technology in policy have tended to show that successfully enacting policy often entails blurring and crossing these boundaries; for instance, when scientific advisors sympathetic to the position of regulators tailor their recommendations accordingly. Thus, what works and what accords with our opinions of the proper relationship between science and policy appear to be at odds, and, as Peter Weingart has observed (1999), despite widespread awareness of this situation, the pattern tends to repeat itself.

Simultaneously, states turn to innovators and technicians to help with the management of problems and dangers. There are limits, however, to the capacity of technology to solve the problems generated by science and technology. Proliferation and testing of nuclear weapons continues despite improvements in detection. Recycling does not undo damage done by the original production and use. Worse yet, the belief or hope in the possibility of innovating problems away discourages undertaking the more difficult effort of making burdensome regulatory policy.

Finally, the introduction of science and technology to existing political institutions often can give rise to further problems and complications. This challenge is perhaps clearest in considering science-and-technology issues in the legal system, where decisions about what constitutes sound science must be made by nonscientists and where the capacities of technological innovations (e.g., DNA testing or MRI scans) must be assessed and judged by nontechnicians. Again here the tension between democratic norms and science-and-technology expertise strain our institutions, often forcing their modification.

CONCLUSION

The incorporation of the findings of historians, philosophers, and sociologists of science and technology into political science remains a work in progress, and science-and-technology policy remains a relatively underdeveloped subfield despite the growing importance and centrality of policy questions involving science and technology at both the national and international levels. What is clear is that the relationship between science, technology, and politics is a dynamic one, with each element exerting influence on the other two, and that this relationship cannot be taken for granted or presumed to function automatically for the good. Its management is thus a task, a particularly important task, of politics and a fruitful area of study for political science.

Science Policy

Science policy refers to that aspect of public policy that addresses funding, regulation, and organization of science and technology. Nations support scientific endeavors for a number of reasons, such as economic growth and military or security interests. While facets of scientific inquiry have been supported by governments throughout history, it was not until the interwar period that science policy materialized as a distinct policy area.

The Soviet Union led activist government science believing that science and technology were key to industrialization and modernization. The Soviets supported science with public funds, promoted the profession as a branch of civil service, required that research be targeted toward the social and economic goals of the state, and made science education available broadly. By the mid-1930s, the Soviet Union was spending about 0.8 percent of its national income on scientific research, compared to 0.1 percent by the United Kingdom.

Scientific institutions and societies in the United Kingdom historically eschewed involvement in government and politics as the ideal of pure, disinterested science reigned. Rethinking of the role that science may have in mitigating the deep social crises of the interwar period and the impending Second World War (1939–1945) led to changes in the relationship between government and science with increased funding and coordination of research into military-relevant technologies.

The United States lagged behind the United Kingdom in developing a wartime alliance between science and the military, but by 1939 advances in understanding the potential destructive power of atomic power triggered the establishment

of the governmental Advisory Committee on Uranium, which ultimately led to the Manhattan Project to develop the first atomic bomb. The project ushered in the era of "Big Science" and involved the mobilization of an unprecedented number of scientists; coordinated activities around multidisciplinary projects for military purposes; and brought together industry, academia, and the government.

Governments in most, if not all, industrialized countries became actively involved in funding and coordinating scientific research following World War II, establishing or substantially increasing funding for science councils, national laboratories, and research institutes. Most of the investment at the time was in mission-specific areas that included military research, agricultural productivity, and atomic energy, with the goals and criteria set by the relevant government funding agencies. On the other hand, the scientific community set goals of basic research and assured quality through the peer-review process.

ASCENDANCE AND INSTITUTIONALIZATION OF U.S. SCIENCE POLICY

The 1957 launch of the Soviet spy satellite, Sputnik, accelerated investment in science and engineering, particularly in the United States, with increases in research and development spending averaging 15 percent, achieving technological supremacy by the mid-1960s. The ascendance of science led to new bureaucracies, expanded legislative committee jurisdictions, and the growth of existing science-oriented organizations. The National Science Foundation was established in 1950 as the federal agency to support fundamental research in all scientific and engineering disciplines. President Kennedy established the Office of Science and Technology in 1961 in response to the space race. In 1976 it was renamed Office of Science and Technology Policy, and its mandate was broadened beyond space to advise the president on the effects of science and technology in domestic and international arenas.

In the legislature, the Senate Standing Committee of Aeronautical and Space Sciences was formed in 1958, then folded into the Commerce Committee in 1977. Similarly, the House of Representatives established the Committee on Science and Aeronautics in 1958, which has undergone a number of name changes and is presently the Committee on Science and Technology. Broadly speaking, these committees have full or partial oversight of agencies such as the National Aeronautics and Space Administration, the National Oceanic and Atmospheric Administration, the U.S. Environmental Protection Agency, the U.S. Department of Energy, and other science-dependent bureaucracies.

Interacting within these political arenas are powerful science organizations such as the National Academies of Science, the American Association for the Advancement of Science, as well as a number of university and industry lobbyists. The effects these groups have on science policy range from congressional earmarking of projects (funding or prioritizing science outside of the peer-review process) to advocating for more robust peer-review processing in government funding decisions.

INTERNATIONAL DRIVERS AND TRENDS IN SCIENCE POLICY

International organizations such as the Organization for Economic Cooperation and Development (OECD) and United Nations Educational, Scientific, and Cultural Organization played important roles in reporting on and shaping science policy in both developed and developing countries. Today there are science-based bureaucracies in all developed and most developing countries. In the early 1960s, both organizations set explicit guidelines and goals for member governments to establish scientific advisory bodies, as well as recommendations to support scientific and technological research. In its 1963 report, *Science, Economic Growth, and Government Policy,* the OECD made an explicit link between science and the economy, arguing that higher education and research were long-term investments to stimulate economic growth.

Sociopolitical changes in the late 1960s had profound effects on science policy. Environmental, feminist, antiwar, and student movements questioned decision making and called for more public participation. The result was a broadening of the scope of science policy to reflect emerging societal concerns including environmental issues, reproductive technology and birth control, and the conversion of military research and development to civilian applications. A second OECD report, *Science, Growth, and Society: A New Perspective* (1971), shed uncritical optimism of scientific development, emphasized social and environmental contexts of technological change, and argued for more active citizen engagement in science policy development and consequences.

The 1980s saw a shift toward investing in more commercially oriented innovation policies as a response to the economic ascendance of Japan and the East Asian newly industrializing countries—Hong Kong, Korea, Singapore, and Taiwan. In these countries, science policy was integrated into industrial policy. A 1981 OECD report emphasized stronger relationships between universities and industry and focused on industrial innovation. In the following decade, OECD countries increased funding for materials sciences, information technology, and biotechnology and shifted their science policy orientation to commercial innovation.

In the 1990s the OECD continued to focus on innovation policies, but its framework of analysis included "innovation as interaction" and highlighted that states needed to develop capacity not only to develop their own innovations, but also to develop the capacity to adopt technology developed in other countries.

INTERNATIONAL COOPERATION IN BIG SCIENCE

While science and technology policies for economic growth and military applications maintain a nationalist perspective the 1990s and 2000s saw an unprecedented degree of international cooperation in Big Science projects that pertain to mapping the human genome and climate science. The estimated

US$3 billion Human Genome Project actively engaged industry, research scientists, and the medical community around the globe. Major contributors to the project included the China, France, Germany, India, Japan, and the United States. Completed in 2003, the project catalyzed the biotechnology industry with transfers of technology to the private sector. It also spurred a host of ethical, legal, and social concerns such as who owns and controls genetic information, are genetically modified foods safe for humans and the environment, and how and should fetal genetic testing be used? These complex social and ethical issues have led to politically charged debate that has integrated into science policy in many countries.

Climate change science is arguably the largest and most international project in the history of science. While countries fund climate science through specialized agencies, universities, and institutes, as well as private sector investment in understanding causes, risks, and developing mitigation and adaptation strategies, the Intergovernmental Program on Climate Change (IPCC) has emerged as the most authoritative source of information and policy decisions for climate science. The IPCC Panel is composed of government appointed representatives and neither conducts its own research nor monitors climate itself. Rather, the lead authors of IPCC reports assess available information from peer reviewed, published scientific literature. In 2007 the IPCC shared the Nobel Peace Prize with Al Gore.

Scottish Enlightenment

The Scottish Enlightenment was one of the most fruitful intellectual movements in eighteenth-century Europe. David Hume, Adam Smith, and about a dozen other significant thinkers revolutionized modern ideas of human cognition and sentiment, as well as political and economic philosophy. "At a time when we have lost our Princes, our Parliaments, our independent Government, even the Presence of our chief nobility . . . , speak a very corrupt Dialect of the Tongue which we make use of," wrote David Hume in 1757, "is it not strange . . . that, in these circumstances, we shou'd really be the People most distinguish'd for Literature in Europe?"

SCOTLAND'S UNIQUE EDGE

Centered chiefly in Edinburgh and in Glasgow, socializing in circles such as the Select Society and the Poker Club, Scottish thinkers created not merely a school of thought but a complex hub of debate and inquiry into history, science, moral, and political philosophy. This hub of accomplishment, dubbed "a hotbed of genius" by Tobias Smollett's Humphrey Clinker, can be partially understood against the background of Scotland's unique historical circumstances.

Scotland joined England in a Union of Parliaments in 1707, giving up a long tradition of independence. At first, post-Union discontent peaked into several Jacobite uprisings in support of exile Stuart contenders to the British throne, most significantly the failed attempt at power seizure led by Charles Edward Stuart. His defeat in Culloden in 1745 terminated the era of struggle, but even earlier, many Scots, especially Lowlanders, preferred to remain partners to England and share its economic prosperity and imperial ambitions. The traditional Highlands clan society was a waning world of ancient valor and communal values that became the object of cultural nostalgia and a theoretical challenge for philosophers of modernization.

Scottish thinkers thus faced the problem of an identity for Scotland within the assimilated structure. They witnessed the consequences of modern commerce and industry, which were transforming landscape and society. By mid-century, parts of Scotland experienced unprecedented growth in manufacture and trade. The Church of Scotland lost its grip on the imagination of a new generation. Educated Scots looked to London for cultural inspiration, but others, notably Hume and Smith, reached toward the new Enlightenment discourse being created in Paris and elsewhere. At home, they favored the philosophy of political liberty loosely associated with Whiggism, the political outgrowth of the Glorious Revolution (1688), rather than the continental-style absolute monarchy linked with the Stuarts. Fascinated by progress, the Scottish Enlightenment displayed a powerful future orientation.

MAJOR THINKERS AND IDEAS

Roughly between 1739, the publication date of Hume's *Treatise of Human Nature,* and the 1790s, a generation of thinkers set out to create a new understanding of modernity based on good laws, peaceful commerce, and social refinement. Inspired by its unique crossroads between English civility and Gaelic tradition, and drawing on its long-standing contacts with the European continent, Scotland created a distinct voice within the European Enlightenment.

Influenced by earlier theorists of natural law, such as Hugo Grotius and Samuel Pufendorf, by travel and ethnographic literature, and by the French philosophers Charles-Louis Montesquieu and Jean-Jacques Rousseau, Scottish thinkers saw human history as divided into socioeconomic stages of

development leading from primitive man to refined modernity. Scotland's entry into a union with England could be seen in the context of civil and economic advance. The Highlands presented these sophisticated Lowlands thinkers with a handy model of traditional society, a mirror image to urban and urbane modernity.

Sharing the French spirit of rational investigation, the Scottish Enlightenment thinkers focused more closely on aspects of economic modernity and on a new and sophisticated grasp of interplay between individual interests, market forces, and forms of government. Put concisely, the unique Scottish contribution to European Enlightenment discourse is most visible in investigations into sentiment and "common sense" and in the innovative philosophy of political economy associated mainly with Hume and Smith.

Francis Hutcheson, professor of moral philosophy at Glasgow, is considered a founding father of the Scottish Enlightenment. His analysis of human virtue and benevolence led him to oppose the Thomas Hobbes theory of human nature by stipulating a realm of "moral sense" that underlies men's ethical judgments. Pleasure, he wrote, is effected by virtue, and "that Action is best, which procures the greatest Happiness for the greatest numbers."

Hume set out to challenge Hutcheson by applying Isaac Newton's scientific method to epistemology, moral philosophy, aesthetics, politics, and history. His "science of man" was purportedly based on experience and observation alone. The *Treatise* broached a new philosophical skepticism and a pioneering discussion of causation, induction, and human knowledge, which creatively provoked Immanuel Kant and inspired many other philosophers of the mind. The *Essays, Moral and Political* (1741–1742 with later additions), *An Enquiry Concerning Human Understanding* (1748), and *An Enquiry Concerning the Principles of Morals* (1751) based morality on human psychology, particularly on sentiments, drawing on man's love of pleasure and aversion to pain. Hume's *History of Great Britain* (1754–1762) set an agenda for the Scottish inquiry into the rise of modernity in general. His political theory advocated trust in modern monarchies, when able to safeguard rule of law, civil liberty, and freedom of trade. Hume's essays "Of Superstition and Religion" and "Of Miracles," and the posthumously published *Dialogues Concerning Natural Religion* (1779), offered a powerful philosophical basis for both skepticism and atheism.

Thomas Reid was the most important voice of the "common sense" school that also included James Beattie, George Campbell, and Dugald Stewart. Opposing Hume's empiricism, these thinkers identified principles of cognition common to all mankind and exempt of rational proof. Reid's inquiries into sensation, language, and free will are of interest to philosophers today.

An important group of thinkers turned to the history of mankind or of social groupings. Among them were Henry Home, Lord Kames, William Robertson, Adam Ferguson, and John Millar. They attempted to create categories for understanding the material, social, and economic progress and "division of ranks." Ferguson's *An Essay on the History of Civil Society* (1767) has recently aroused renewed interest as a republican-minded

exploration of man's primeval communal nature as a standing challenge to civilized, commercial modern society.

Adam Smith's engagement with the Scottish subject matter resulted in two important works: *The Theory of Moral Sentiments* (1759), which analyzed the independence of men's moral judgments, and *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), which established the modern science of political economy. Following Hume and differing from Ferguson, Smith stipulated a market-based society based on modern manufacture and trade, vouchsafed by strong laws and civil refinement.

The Scottish Enlightenment thinkers enjoyed a particularly close-knit version of the famed eighteenth-century sociability. Intricately interconnected through correspondence and intellectual interplay, many of them gathered in such Edinburgh groupings as the Select Society and the Poker Club (intended to poke interest in a cherished but failed cause, the establishment of a Scottish militia). These circles included prominent scientists, including William Cullen and Joseph Black, and literati such as James Boswell and James MacPherson.

The Scottish Enlightenment's impact on future generations of philosophers was profound and lasting. Francois-Marie Voltaire lauded his Scottish contemporaries. Ferguson was influential among German Enlightenment philosophers and romanticists, culminating in Georg W. F. Hegel. Smith made his impact on continental political economy throughout the nineteenth century. Since his initial stamp on Kant, Hume's impact on Western philosophy has been constant. Significantly, since the 1970s, interest in the Scottish Enlightenment has grown among political thinkers and social commentators, fascinated by parallels between its early-modern tension fields and our late-modern concerns.

Secession

Secession can be defined as the establishment of sovereignty over a territory that once belonged to a larger political entity. *Secessionism* is the pursuit of sovereign status for that territory. *Separatism,* in turn, denotes the broader pursuit of increased independence for the territory—up to and including secession. The majority of secessionist movements are based on presumed ethnic differences between the seceding region and the larger state entity.

THE MORALITY OF SECESSION

Because secession usually involves unilateral breakup of the state, legal scholars and political theorists have outlined conditions under which secessionism might be a justified course of action under prevailing international norms and existing legal practice. Here, the most important debate is between remedial rights and primary rights advocates. *Remedial rights arguments* hold that ethnic groups that have suffered massive repression by the center may be entitled to independent statehood if the violations were so severe that reconciliation within the existing state framework is no longer deemed viable. *Primary rights arguments,* on the other hand, hold that groups might have a right to secede whether or not they suffered repression from the government. Within the primary rights camp, *ascriptive theorists* hold that when there are significant ethnic differences between the group and the majority population, or when the group has a long-standing claim to sovereignty, it has a natural right to secede. In contrast, *plebiscitary rights theorists* hold that when a majority of residents in a given territory desire to separate from the state, they have the right to do so, regardless of whether they have a history of ill treatment or even shared ascriptive traits.

THEORIES OF SECESSIONISM

By now, the literature on the causes of secession is considerable and may be divided into several broad theoretical frameworks. Essentialist arguments hold that ethnic identities trump other identities such as class and gender in modern political organization. In this formulation, secessionist movements are a function of significant ethnic differences between the minority and majority (measured in terms of race, custom, appearance, language, beliefs, or religion). The argument follows that any strongly differentiated group quite naturally will desire control over its political destiny in the modern era.

Secessionist claims are therefore a straightforward reflection of group desires for political independence. Consequently, secessionist conflicts cannot be resolved without granting the group some degree of sovereignty.

Institutionalist theories of secession hold that quasi-state structures such as regional autonomy, veto power, or local tax authority predispose ethnic groups to separatism. Much of this scholarship employs constructivist logic in arguing that national institutions (regardless of their original function) effectively create national groups, which ultimately mobilize for secession once the opportunity arises. The former Soviet republics provide a striking illustration of this phenomenon. The Soviet Union gave its union republics national constitutions, communist parties, academies of sciences, and national flags; the republics even had the rights to secede and conclude bilateral treaties with foreign countries. Though these structures had no functional value under centralized Kremlin rule, Ronald Suny (1994) demonstrates that these institutions served to construct salient republican identities around which groups mobilized for national independence when the Soviet state began to implode.

Political economy theories hold that secessionism is the outcome of economic differences between the seceding region and the state center. There are two separate and seemingly opposing predictions concerning secessionism in this literature. Proponents of advanced region secessionism predict that wealthy regions will attempt to secede in order to avoid taxation by the poorer center (e.g., Slovenia, Croatia, and the Katanga region of Congo). In contrast, backward region secessionism predicts that poor regions will seek independence in response to exploitation by the wealthier center in conjunction with limited access to state economic, cultural, or social institutions (e.g., Slovakia and Ireland).

Although not explicitly a theory of secession, the ethnic security dilemma holds that ethnic groups mobilize in response to the security vacuum brought about by state collapse. Barry Posen (1993) argues that regime change in multiethnic states creates an internal security dilemma by reproducing the condition of international anarchy on the substate level. In the absence of central authority, individuals will mobilize along the default cleavage of ethnicity. Where ethnic populations are intermingled, groups have a significant first-strike advantage; this creates an incentive for both groups to strike preemptively, increasing the likelihood of ethnic war. Under these conditions, an ethnic group may pursue secession (or territorial separation) as a means of increasing its physical security.

Credible commitment theories of secessionism build on this logic, predicting that a group will fight for secession when the center or majority cannot commit to protecting its well-being in the future. For example, Barry Weingast (1998) argues that the Southern states attempted to secede from antebellum America when the sectional balance in the Senate tipped in favor of the "free" states. Once the South lost its legislative veto, the Northern states could no longer credibly commit to protecting the Southern slave economy. This led the Southern states to attempt secession. Both security dilemma and commitment arguments rest on the assumption that secessionism is primarily driven by minority fears of victimization.

Ethnic bargaining theories challenge this view by focusing instead on opportunities for mobilization in the context of minority-state bargaining. Rupen Cetinyan (2002) argues that secessionist threats serve mainly as a bargaining tool for minorities to extract concessions from the center. When minorities have internal sources of strength (such as territorial concentration) and external sources of power (such as patronage from an external lobby actor), then the minority is more likely to escalate its demands of secession to obtain greater side-payments from the government.

The ongoing debate over the causes of secessionism has real-world implications, as our prevailing understandings of such conflicts inform the interventions that are designed to solve them. Essentialist theories prescribe a degree of autonomy for seceding groups on the assumption that they will continue to fight until their desires for self-determination are met. In contrast, institutionalist theories recommend against autonomy, which is believed to serve as a stepping stone to eventual secession. Security dilemma and commitment theories argue for external security guarantees so that seceding minorities will feel safe enough to reintegrate into the state. Ethnic bargaining theories suggest instead that third-party intervention may paradoxically encourage groups to secede, prolonging the conflict and provoking a majority backlash. Thus, the prescribed solutions to such conflicts depend very much on one's understanding of their causes.

Secularism

The term *secularism* is most commonly associated with the Age of Enlightenment in the late seventeenth and eighteenth century. Secularism maintains that knowledge should be derived from the human capacity for reason rather than in revealed religion (i.e., scripture). Scientifically, secularism proposes the world is governed by natural processes and mechanical laws rather than the embodiment of divine meaning. Further, secular thought legitimizes the workings of the political system based on human decisions and reason rather than influenced by or dictated from divine right or clerical members. Hence, secularism often is related to or equated with similar philosophies, including humanism, naturalism, and the separation of state and religion. Ironically, the term *secular* has early Christian roots, deriving from the Latin *saeculum,* meaning century or age. Originally, *saeculum* referred to the period of profane time between the biblical fall out of Eden and the second coming of Christ, focusing on those affairs specific to mundane, this-worldly existence, but understood in relation to a supramundane divine meaning.

In the late nineteenth and early twentieth centuries, various theories of the secularization of society emerged in the work of European thinkers such as August Comte, Émile Durkheim, Karl Marx, and most importantly Max Weber. Weber argued that the development of the modern world was defined by the spread of capitalism and the new forms of rationalization and technology accompanying it. These new forms of technology gradually replaced religious and magical forms of thinking in economic, social, and political practices. Although some specifics of Weber's secularization thesis were subject to criticism, the connection between modernity and secularism mirrored the declining influence of religion in economics and politics in the twentieth century.

FORMS OF SECULARISM

Despite the common use of the term to describe some Western societies, secularism has taken several different forms. Communist states, such as China or North Korea, commonly adopt secular policies, in which the government does not recognize an official religion, nor do they allow religion to interfere with state politics or differentiate their citizens based on religious identification. Aside from communism, many secular states, including Brazil, India, Japan, Mexico, or Turkey, do not formally acknowledge a state religion, but do not obstruct the practice of religion or advocate atheism. Populations within secular states can boast a majority religion or exhibit significant religious diversity.

In respect to Western societies, for example, although the United Kingdom has an official state religion, it is largely seen as a secular political system. On the other hand, the U.S. Constitution prohibits any religious test to hold office, but it is a country in which a substantial majority of citizens profess their religious beliefs and in which religious slogans often adorn public buildings. The form secularism takes in France is called *laicite*, meaning the exclusion of religious symbolism, including the display of religious articles by citizens, from the public sphere.

In his seminal work on secularism, Charles Taylor (2007) argues that we need to distinguish among three different meanings of secularity. The first refers to the idea that religion is largely absent, either withdrawn or expelled, from public spaces and spheres of common activity (e.g., politics, economics, professional, cultural, among others). This is a contrast to earlier centuries when religion permeated every aspect of common life. The second meaning refers to the declining numbers of people practicing religion or subscribing to religious belief in Western nations. The third, and most important, form of secularity refers to the belief that God is only one of a number of possibilities for understanding our moral, political, and spiritual situation. In this latter sense of the term, the very understanding of the world and the conditions of our common human experience are devoid of sacred or religious foundations. Taylor argues that it is this latter sense of secularity that best describes the modern world and provides the context for the postsecular age, one in which dialogue between theistic and nontheistic thinkers can take place.

CONTEMPORARY SECULARISM AND CHALLENGES

By the turn of the century, a number of developments emerged to challenge the various versions of secularism and the secularization thesis. First, some Western nations, notably the United States, have seen a rise in fundamentalist religious movements become politically influential. In other Western nations, such as France and United Kingdom, the presence of immigrant religious communities from former colonies has challenged the practices of secularism. Moreover, the number of people throughout the world practicing traditional religions, particularly in poor, developing countries, has continued to grow. This resilience and growth of religion poses new challenges to ideas about the relationship between modernization and religion.

Second, a number of people have argued that modern secular politics is itself rooted in or draws on the religious ideas and traditions in ways secularists do not fully recognize. This argument goes beyond the claim that the ideas of classical religious thinkers continue to be important. Rather, according to Jürgen Habermas and Joseph Ratzinger, the question that is raised is, "To what extent does modern secular thought and political practice depend upon religious tradition for its legitimization?" (2006).

A third line of argument, one sometimes related to the second, raises the question of the extent to which the seeds of disenchantment of the world and the rise of secularization are to be found in religion itself. Specifically, thinkers such as Marcel Gauchet (1997) argue that secularization is the fruit of a long, slow process begun in the Axial Age (800–200 BCE) with the movement of the sacred to other-worldly locations. Fourth, there has been an increased focus on the relationship between secularism as a defining quality of modernity and non-Western religions, specifically Hinduism and Islam.

Perhaps most importantly, several thinkers representing diverse perspectives have argued that the West is entering a postsecular age. In undermining the prospects of any single grand narrative concerning human society, including any single secular version, secularism has ironically opened up the possibility of what Gianni Vattimo and David Caputo (2007) refer to as the death of the death of God, or a return of religious searching or a dialogue between theists and nontheists.

Secular Realignment

The concept of realignment has been very prominent in the study of American electoral politics over the past fifty years. There are multiple definitions of *realignment,* exhibiting a good deal of variation. However, most agree that realignment involves fundamental and large-scale changes in the party system, usually including changes to both the primary line (or lines) of cleavage and to party coalitions.

By far the most important figure in thinking about realignment is V. O. Key Jr., and it would not be inappropriate to claim that the near obsession with the idea of realignment within the subfield of American electoral politics over the past half-century can be traced to Key's writings on the subject. Indeed, scholarly interest in the concept of realignment has spread far beyond the American context to the study of systems other than the United States. In his writings, Key offered two very different types of realignment. The first type, outlined in his seminal 1955 article, is *critical realignment*. Critical realignment is large-scale change that happens abruptly in one or two election cycles. The results produced by this massive change then persist for a number of years in a state of relative stability. In Key's words, critical realignments produce change that is "sharp and durable."

Key's idea of critical realignment has shaped the study of American politics like few other ideas. Indeed, as Everett Carll Ladd and Charles Hadley state, "It truly is a case of Key sneezing and political science catching a cold." However, Key significantly modified his thinking on the concept of realignment shortly after his original piece. In 1959, he offered another type of realignment, one that was much different than its critical cousin. This other type, of course, is *secular realignment*.

Like critical realignment, secular realignment results in change in the party system. But how change comes about is very different. Two elements are central to understanding the concept of secular realignment—time and group partisanship. At its most basic level, secular realignment is the gradual shifting in the patterns of partisan support by certain groups of voters over the course of a number of election cycles. It is useful to quote Key at length:

> A secular shift in party attachment may be regarded as a movement of the members of a population category from party to party that extends over several presidential elections and appears to be independent of the peculiar factors influencing the vote at individual elections. The category of persons . . . becomes either more or less homogenous in its partisan attachment. A variety of factors operates over time either to solidify the group or erode the ties that unite it politically. (199)

For many years, scholars focused heavily on critical realignment, while secular realignment was largely ignored. Indeed, many works that are now regarded as classics in the study of American politics—Burnham (1970), Campbell et al. (1960), Schattschneider (1960), and Sundquist (1983), to name but a few—elevated the idea of critical realignment to default status as *the* way to understand and explain political change in the American context. But, before long, critics were punching holes in the explanation of change offered by critical realignment, and exposing numerous weakness in the theory overall—Carmines and Stimson (1989), Fiorina (1981), Ladd (1991), and Ladd with Hadley (1975). Indeed, David Mayhew's trenchant critique (2002) calls into question the very utility of the critical realignment concept.

The idea of secular realignment, on the other hand, has fared much better in recent years. As scholars are increasingly pointing out, American politics since the 1950s seems to fit the framework of secular realignment pretty well. As John Petrocik (1981) notes, understanding election outcomes in the United States means understanding the voting patterns of various social groups, and in most cases those patterns develop and evolve over time. Despite their assertions to the contrary, the issue evolution model that Edward Carmines and James Stimson use to explain how the issues of race fundamentally altered American politics beginning in the 1960s closely resembles Key's secular realignment. The same can be said of how cultural issues have affected the American political landscape over the same period.

Most would agree that the United States has not witnessed a critical realignment for quite some time. Yet it is inescapable that group partisan loyalties have changed, new issues have moved to the forefront of American political debate, and the American party system has changed. Key's concept of secular realignment—where "processes operate inexorably, and almost imperceptibly, election after election, to form new party alignments and to build new party groupings"— offers one reasonable mechanism for understanding America's recent political past.

Sedition

Sedition defined in most judicial contexts (as specific countries' laws do vary) is any action, speech, or writing that seeks to undermine a government by a person or group from inside the territory of that government's authority. Often these laws are passed during times of war when threats to a government's authority are a paramount concern to the rulers, but they also have been passed and enforced to eliminate political opponents and quell dissent. It is important to note that the associated offense of treason is similar to sedition in that both are seen as threats to the existent governmental authority; however, treason involves working directly with a government's foreign enemies, and sedition is working for an overthrow from the inside. Of course, these legal boundaries are often not as clear when governments are threatened, and police, prosecutors, and judges blur lines that are clearer during more reasonable times.

So why have governments instituted sedition laws? The simple answer is that they want to protect their power. Inherent to most forms of government is the desire to protect against political forces that are interested in challenging the legitimacy of the present ruling structure. For most of recorded history, governments chose to use direct physical force to prevent dissatisfied persons from speaking out against their governments and rallying others to their causes. So, for example, Roman citizens who thought the emperor was not giving enough grain to the plebs certainly could have walked into the forum and said as much to anyone that would listen. However, it is likely that that person would end up with not much life left to live. Yet, as brutal as rulers have been in the past to those individuals interested in challenging their governments, today's ruling governments often use different means of silencing dissent.

As mentioned, governments have passed many sedition laws during times of crisis as a legal structure for squashing domestic dissent when the country is involved in a conflict with a foreign enemy. Two examples from the United States are relevant to this point. The first comes from the period of World War I (1914–1918) when the United States passed the Sedition Act of 1918 to stamp out dissent among critics of U.S. policy. Many social and political critics of the Wilson administration were prosecuted for their public statements.

Another example is that of a nurse who worked at a veterans hospital in New Mexico. In 2005, Laura Berg criticized the Bush administration's foreign policy in a public letter, and she was investigated by her superiors for possible seditious actions. The investigation was ended after press reports emerged, and it was clear that she was protected by her first amendment right to free speech.

Each of these instances indicate a common thread among most attempts to administer sedition laws in democracies—the difficulty of balancing the right to free speech and the protection of the state from domestic insurrection. This issue is not problematic in overtly totalitarian and authoritarian states, but in countries that claim to allow citizens to express themselves without fear of suppression, retribution, and violence, it is much more difficult to manage. What often happens in such democratic societies is that they revert to authoritarian means of maintaining their power at the time that such action is deemed necessary, and then they may apologize later for such actions after the crisis has long since passed. Governments tend to err on the side of protecting the state from overthrow rather than on the side of protecting free speech that may lead to political revolution and the overturning of the previous political order.

Many countries have similar histories with the problem of sedition. With recent attention turning to antiterrorism in countries around the world, many governments have struggled to achieve the balance of protecting their present political order with a commitment to hearing from all political parties. As history has demonstrated, antiterrorism is but the latest context for this continuing effort to find a political equilibrium between a democratic, responsive government and constant political turmoil.

Segregation and Desegregation

Though people are naturally inclined to live near others with similar characteristics, for a power or authority to mandate that condition as a tool of discrimination amounts to *segregation*. Segregation results from ignorance, intolerance, and inaction from those who could change the situation. Though many countries separate segments of their population by specific traits, this entry is concerned with how segregation of races occurred in the United States and why that condition changed over time.

AFTER THE CIVIL WAR: RECONSTRUCTION'S PROMISE UNFULFILLED

Following the Civil War (1861–1865), Congress led by a Republican majority passed a plethora of legislation intended to help the transition to freedom for blacks. The Thirteenth Amendment, which outlawed slavery, was successfully proposed by Congress and ratified in 1865 by the states in a single year. That same year, the Freedmen's Bureau was created to furnish food, fuel, and clothing to those who suffered previous servitude. In 1866, Congress passed the Civil Rights Act, which conferred citizenship on blacks. The Fourteenth Amendment was proposed by Congress in 1866 to ensure citizenship to those of color; it took two years for the states to ratify that amendment. Congress passed the Reconstruction Act of 1867, which set the terms for the readmittance of Southern states to the Union. One of the latter terms was the requirement of "Negro suffrage" in revised state constitutions, a right successfully gained through ratification of the

Fifteenth Amendment in 1870. In the last major national legislation addressing minority rights during Reconstruction, the Civil Rights Act of 1875 mandated equal access to public accommodations among people of all races.

However, the aforementioned progress in civil rights was mitigated by racist policies within states. For example, a series of "black codes" were enacted that forbade blacks to own property or to give testimony in court in certain instances. Among the most severe of the discriminatory policies against blacks were laws permitting imprisonment for lack of employment. Various methods of preventing black voting rights were employed, including grandfather clauses, poll taxes, literacy tests, white-only primaries, and at-large elections. As if these were not enough, hate groups like the Ku Klux Klan formed to intimidate and frighten minorities. Ultimately, racism turned into murder in stark numbers, with an average of more than 180 blacks lynched annually during the 1890s alone.

PLESSY RULING AND INSTITUTIONALIZED SEGREGATION

Supreme Court rulings dealing with civil rights that were handed down in the last quarter of the nineteenth century were not supportive of progressive civil rights for minorities. In fact, they had the impact of legalizing separation between whites and blacks in the United States. In its 1878 ruling in *Hall v. DeCuir,* a unanimous court struck down Louisiana's law banning racial discrimination by common carriers. Four years later, the court struck down federal laws seeking to punish crimes like murder and assault. The 1883 decision, referred to as Civil Rights Cases, actually declared the 1875 Civil Rights Act unconstitutional. In that ruling, the court held that Congress may legislate on civil rights only if a state passes a discriminatory law and that the Fourteenth Amendment's equal protection clause is silent on racial discrimination by private citizens.

By 1890, most southern states had developed segregated facilities. In that year, Louisiana passed the Separate Car Act, which required separate cars on railroads for blacks and whites. Through a coordinated series of actions, a group of New Orleans citizens challenged the law. After failing at the state court level, they appealed to the Supreme Court. In a seven to one decision, the court upheld the constitutionality of the Louisiana law, basing its ruling on the concept of "separate but equal." The result was institutionalized segregation in most areas of American life for the next half-century. Perhaps one area where this pattern was most apparent is with minority representation in Congress. From 1865 to 1900, twenty-two blacks were elected to Congress. However, that number dwindled to zero in 1900 to 1929 and totaled only seven from 1900 through 1966.

DESTROYING THE "SEPARATE BUT EQUAL" MYTH

Segregation occurred in all areas of American life during the first half of the twentieth century. One area where separate facilities were not equal between the races was in education. Founded in 1909, the National Association for the Advancement of Colored People (NAACP) began a coordinated campaign in the 1930s to discredit the "separate but equal" doctrine. In two cases three years apart, the NAACP succeeded in getting the University of Maryland (1935) and the University of Missouri (1938) to admit blacks to their law schools. In a 1947 decision, the U.S. Supreme Court held that Virginia's separate accommodations for blacks and whites on interstate buses were unconstitutional.

As the legal attack against "separate but equal" continued, American society began to recognize the insidiousness of segregation. In 1947, Jackie Robinson became the first African American to play major league baseball. In 1948, President Harry Truman signed an executive order that ended segregation in the U.S. military.

As the 1950s began, a series of court rulings finally broke the back of segregation. Two U.S. Supreme Court rulings in 1950 forced the University of Texas Law School and the University of Oklahoma's doctoral program in education to admit African American students for the first time. After exhausting state appeals, supporters of equal education in Kansas, Delaware, Virginia, and South Carolina filed an appeal to the U.S. Supreme Court. The court combined the appeals and titled the case *Brown v. Board of Education*.

On May 17, 1954, the Supreme Court unanimously held that the "separate but equal" doctrine as applied to education was unconstitutional, thus explicitly overturning the *Plessy v. Ferguson* precedent. A year later, in a case titled *Brown v. Board of Education II*, the court unanimously directed school desegregation to proceed with "all deliberate speed." Court-ordered busing, use of National Guard troops, and federal lawsuits were among the tools used to ensure integration orders.

The unanimous rulings in *Brown v. Board of Education* had many positive results. First, they hastened desegregation of education and subsequently of many other areas. In a series of per curium decisions between 1955 and 1958, the Supreme Court invalidated segregation at state parks, beaches, bathhouses, golf courses, and public transportation. Second, the *Brown* rulings gave impetus to the civil rights movement and to mass action by advocates of equality, as the Montgomery bus boycott was initiated the same year that *Brown II* was decided. Third, the *Brown* rulings stimulated landmark federal legislation, which culminated with the 1964 Civil Rights Act and the 1965 Voting Rights Act.

Select Committee

Select or *special committees* are temporary committees in the U.S. House of Representatives and Senate that primarily hold hearings and bring attention to emerging issues. Typically, these panels do not have the power to send legislation to the chamber for a vote. Instead they study, investigate, and make recommendations. A few select committees continue from Congress to Congress, but most are established by House or Senate resolution to work temporarily and disband when they complete their appointed task.

Originally, Congress convened temporary committees to consider individual bills. By the 1820s, however, standing committees replaced this function, and select committees began serving the functions they have today.

Usually smaller than their permanent counterparts, select committees supplement the existing committee system. Membership on select committees does not affect other assignments, so legislators can serve without losing coveted positions on permanent panels. Select committees usually focus on a particular hot-button issue or an investigation, a characteristic that often draws media attention and attracts publicity for the panel's members. Titles of high-profile select committees are sometimes abbreviated in news coverage, usually taking on the name of the panel's chair.

Examples include the Senate Select Committee on Presidential Campaign Activities that investigated Watergate (often called the Ervin Committee) and the Select Committee on Energy Independence and Global Warming created in 2007.

Selectorate

The *selectorate* is the body that selects a political party's candidate or candidates for a general election. The selectorate decides which individuals will become official candidates, while the *electorate* chooses among those designated to determine who wins the general election. The number of people who constitute the selectorate and the inclusiveness of the selectorate vary widely. For example, in *candidate selection* processes for public office, the selectorate can range from a single party leader, who personally designates candidates, to the electorate as a whole in the case of open *primaries*. In between these extremes lies a range of selectorates, including a few party leaders, a larger group of selected or elected party representatives, or all active party members. Inclusive selectorates include the open primaries in some U.S. states, in which all registered voters, regardless of political party affiliation, can participate in the selection of candidates. This contrasts with more exclusive selectorates, common in many long-standing European democracies, where the party organizations, such as party leadership bodies or conventions of selected party activists, choose the candidates. Legal statutes in some countries, such as in the United States, regulate the composition of the selectorate, but more often political party rules, procedures, and norms determine the selectorate.

Self-determination

Self-determination is a legal or philosophical principle that embodies the right of peoples or nations to choose how they live their collective lives and structure their communities based on their own norms, laws, and cultures. It is the fundamental human right to control or affect one's choices, life, and destiny. According to S. James Anaya (1993), five fundamental characteristics are embodied in self-determination: freedom from discrimination; respect for cultural integrity; social welfare and development; lands and natural resources; and self-government.

External self-determination involves independent statehood, including recognition as a nation under international law, provided that the nation in question has a permanent population, a defined territory, a government, and the capability of entering into relations with other states. *Internal self-determination* includes those rights that support and preserve cultural difference, economic self-sufficiency, and political autonomy, including self-government and various forms of democratic, political, and representative rights. The latter is limited to self-determination *within* states and thus does not require attempts at secession or absolute political independence. However, there is still the potential for conflict in areas of overlapping jurisdictional authority, especially in the context of substate national groups who seek to achieve self-determination.

Self-government

Concerning public life, *self-government* is the capacity for a group of people or administrative unit to govern themselves on matters of their jurisdiction without direct interference from other authorities or sources of power. In contemporary societies, *self rule* or *home rule* mainly refers to the wishes of subnational communities to take responsibility on powers that directly affect them, and arguably to improve democratic accountability. The quest for a greater political say in the running of public affairs may impel the communities concerned to claim self-determination and eventual independence, as the decolonization process after World War II (1939–1945) illustrates.

The politics of territorial accommodation seeks to recognize the aspirations of regions and ethnoterritorial entities within larger national states to self-government. Political decentralization is regarded as a response to an expressed desire for self-government on the part of subnational communities. In such cases, political autonomy is thus a means of generating renewed legitimacy and quelling challenges to the state's territorial integrity. Administrative and political decentralization also may have a functional goal from the subnational perspective. Arguments for greater involvement in political decision making by local and regional layers of government concern the maximization of available information for policy makers and a better "tailoring" of public policies according to local needs and citizens' expectations.

Semi-presidential System

Semi-presidential government systems were first defined in contemporary academia by the contributions of Maurice Duverger (1974, 1978, 1980), which were dedicated to the French Fifth Republic. Duverger identified a "dual authority structure, [. . .] a diarchy between a president who is head of state, and a prime minister who heads the government," as described by Giovanni Sartori in 1994. Indeed, as the most relevant variation on the theme of presidential regimes, semi-presidentialism may be defined by three basic features: a president who is popularly elected; the office of the president has *de jure* and *de facto* considerable constitutional authority; and there exists also a prime minister and cabinet, subject to the confidence of the assembly majority.

Consequently, actual working patterns in semi-presidential systems are directly dependent upon the presence or absence of political congruence between the president and parliamentary majority. It can be conceived also as an "alternation of phases" that depends on the contingent political composition of the assembly. In fact, in such systems of government, an elected president who is supported by a cohesive and disciplined majority in parliament will acquire predominance in governmental decision-making. On the contrary, when the opposite case occurs, and the two heads of government are an expression of rival parties, the way is paved for periods of so-called cohabitation. As a result, divergent majorities grant the prime minister a primary role in most legislative arenas, with the general exception of foreign policy.

Despite its complex constitutional architecture, a diffusion of semi-presidential models has proliferated recently, especially in new democracies. According to Matthew Shugart's observations in 2007, twelve of fourteen countries among the postcommunist states that are now democracies are semi-presidential in some form. An additional twelve African cases also can be classified as semi-presidential. Only countries in the Americas seem to privilege pure presidentialism.

In Western countries the prestige of the semi-presidential constitutional model is increasing. The mixed regime format is not universally accepted, however, with scholars such as Juan Linz arguing that "in view of some of the experiences with this type of system it seems dubious to argue that in and by itself it can generate democratic stability" (1994, 55).

The debate on the best form of government is still unsettled. Academic controversy over ideal institutional formats for government has been shaped by the lack of agreement on classificatory criteria and by the varied forms of semi-presidentialism. Matthew Shugart and John Carey in 1992 proposed a further division of the concept into *premier-presidential* and *president-parliamentary* subtypes: Under *premier-presidentialism,* the prime minister and cabinet are exclusively accountable to the parliamentary majority, while under *president-parliamentarism,* the prime minister and cabinet are accountable to both the president and parliamentary majority. Other approaches are more dynamic in that the three most diffused forms of representative government—parliamentary, presidential, and semi-presidential—are not viewed as mutually exclusive categories. Among adherents of this perspective, Thomas Poguntke and Paul Webb (2005) have provided a flexible analytical framework for the study of varieties among and within semi-presidentialisms.

Sentencing Policy

Government response to crime is usually reactive and cyclical. When crime rates increase, responses become more punitive in nature. When crime rates stabilize or decrease, responses become more lenient. Public opinion also influences how

government responds. When victimization rates climb, pressure on lawmakers to "do something" prompts swift action. In liberal democracies, the failure of lawmakers to act quickly to assuage public fear often results in electoral defeat. In some jurisdictions in the United States, citizens have taken matters into their own hands by passing more punitive sentencing laws through the ballot initiative process.

SENTENCES PROMOTING REHABILITATION

In the early twentieth century, advances in psychology, sociology, and the medical sciences prompted social scientists to theorize that perhaps with the right course of treatment, criminal tendencies could be effectively "cured." Accordingly, sentencing policy was revised to emphasize prevention and treatment rather than punishment. Corporal punishment was banned, capital punishment became increasingly rare, and prisons were refashioned as treatment centers rather than places of punishment. Moreover, sentencing laws were altered to expand judicial discretion over the sentencing process. To facilitate effective treatment, judges would base offenders' sentences on their rehabilitation potential rather than the severity of their crimes. Lawmakers also created a system of probation and parole that facilitated individualized treatment plans.

Although many penal systems still emphasize rehabilitation as a sentencing goal, evaluative research in the United States revealed flaws with rehabilitation-only sentencing. First, in many jurisdictions, treatment plans were found to be ineffective at reducing recidivism rates of participants. U.S. government reports revealed that half of the nation's offenders committed new crimes shortly after completing their sentences. Second, academic studies found that judicial discretion led to inequities in sentencing. Often, judges would base their sentences on offenders' demographic characteristics, such as race, ethnicity, and socioeconomic status instead of the seriousness of the behavior of offenders. This led many lawmakers to conclude that rehabilitation-oriented policies produced disparate and unjust sentences.

SENTENCES PROMOTING DESERVEDNESS, DETERRENCE, AND INCAPACITATION

As a result of these findings, nearly all of the states in the United States have reformed their penal systems to reflect more traditional penal philosophies of deservedness, deterrence, and incapacitation. Lawmakers replaced indeterminate sentencing laws that gave judges the ability to craft individual sentences with determinate provisions grounded in the principle of deservedness or *just deserts.* Accordingly, criminal sentences are now gradated according to the seriousness of the offense. Yet, not all offenders receive prison sentences. Probation allows first-time nonviolent offenders to remain in the community while under the supervision of the court, and alternative sentences, such as mandatory community service and victim restitution, give judges additional options with nonviolent offenders who pose no discernable public safety

threat. For more serious transgressions, however, offenders are typically sentenced to fixed periods of imprisonment that increase in proportion to the severity of their crimes.

Although just-deserts reforms eliminated some of the sentencing inequalities found in rehabilitation-oriented systems, continuing increases in crime and victimization rates have led lawmakers to adopt utilitarian-based sentences that promote deterrence and incapacitation. Deterrence is based on the premise that people are rational actors and, thus, will behave in a way that maximizes their benefits and minimizes their costs. When the rewards of wrongdoing are high and the cost of crime is low, people are more likely to offend. By increasing the severity of sentences, the cost of crime is thought to exceed the overall value of wrongdoing; consequently, would-be offenders are deterred from breaking the law. Furthermore, lawmakers use deterrence theory to justify specific sentence increases for those who commit crimes with a firearm, those who target children, and those who habitually recidivate.

Additionally, lawmakers have used lengthy prison sentences to incapacitate high-risk offenders. Academic research showing that a small percentage of high-rate offenders commit more than half of all crimes allowed lawmakers to justify policies targeting "career criminals." "Three-strike" laws became popular in the United States in the mid-1990s, and although these policies often are critiqued as being too severe, the U.S. Supreme Court has consistently upheld their legality. Recently, other nations have explored similar policies to deal with persistent, high-rate offenders.

In this new penal scheme, judicial discretion has been reduced dramatically; in some cases, it has been eliminated altogether. Mandatory sentences, which are popular with policy makers and citizens alike, restrict the ability of judges to moderate criminal sentences for certain types of crimes. Many mandatory sentencing laws target sex offenders, subjecting them to lengthy periods of imprisonment. Even with longer sentences, recidivism rates remain high, and recent policy innovations, such as satellite monitoring, registration requirements, and residential restrictions, have sought to extend governmental oversight after parole periods have been successfully completed.

Sexism

Sexism is discrimination, domination, and oppression based on sex. Both men and women can experience sexism, but sexism against women is more pervasive. The word *sexism* is commonly associated with assumptions about female physical and psychological inferiority and weakness, and male superiority and strength. Sexism can refer to individual attitudes and actions or to sex-based prejudices institutionalized in social structures. Institutionalized sexism often is referred to as *patriarchy.* In varying degrees around the world, sexism against women is evidenced by gender wage gaps, devaluation of women's labor, occupational segregation, violence against women, women's under-representation in positions of political power, women's limited access to education, limitations on reproductive freedom, and unequal legal protections. Referring to sexism as a form of domination and oppression implies a serious problem that needs to be addressed with widespread social change. Referring to sexism as a form of discrimination implies that sexism is a less serious problem that can be dealt with on a case-by-case basis. Sexism is a manifestation of social hierarchy based on sex. Sexism is therefore related to other social hierarchies based on categories such as race, ethnicity, and class.

Sex Workers and Trafficking

Human trafficking involves the recruitment, transportation, and harboring of human beings by means of coercion and abduction, primarily for the purposes of sexual exploitation or prostitution. Human trafficking appears to have the strongest detrimental effect on those who are already marginalized: Women and children from impoverished countries. Like the trafficking of other illicit goods, the trafficking of humans is primarily controlled and operated by organized crime groups working at the transnational level.

While many women and children are trafficked for purposes of prostitution, some also are trafficked to be workers in industries such as construction, farming, textiles, or mining. Because these trafficked individuals usually have illegally entered a given country, they are not provided with the same rights that legal immigrants are. This allows those who purchase their services
A student walks past a poster warning women against prostitution and human trafficking. Many women and children are trafficked to provide sexual services, victims of a growing problem around the world.

to avoid paying appropriate wages and to ignore health and safety requirements.

SEX TRAFFICKING

Sex trafficking is one of the most common forms of human trafficking. Beyond prostitution, victims of sex trafficking also may be forced into pornography, sex tourism, the strip trade, the mail-order bride trade, escort services, and other forms of sex work. *Sex work* is, by definition, more than just prostitution; it is any form of work that involves sexual services.

Individuals become victims of sex trafficking through either voluntary or involuntary means. Individuals might voluntarily agree to illegally immigrate to another country in search of a better life for themselves and their families when faced with harsh conditions of war or poverty in their homeland. Once they have been illegally smuggled into a country, the traffickers may exploit the precarious position the illegal immigrants are faced with because they cannot find other sources of income. Or, through forms of coercion such as threats of physical harm or family humiliation, the traffickers might force the illegal immigrants into sex work. In either case, the traffickers draw on the precarious position the illegal immigrants are left in, with little opportunity to make a consistent income and no access to legal services for fear of their own incrimination.

Many women and children also become victims of sex trafficking through involuntary means. In this sense, individuals have not chosen to illegally immigrate, but rather, have been forced to do so. This commonly occurs through debt bondage, whereby an individual or family secures a black market loan through an organized crime group and cannot pay it back at the high rate of interest that is required. To clear the loan, such individuals must offer themselves, spouses, or children in

exchange for the repayment of the debt. Through this, individuals become enslaved as property of the traffickers and can then be smuggled into other countries and forced to work as strippers, escorts, or prostitutes.

GEOGRAPHIC LOCALE

Sex trafficking is known to affect virtually every country in the world. However, the victims of sex trafficking appear to come primarily from impoverished regions of Asia, the former Soviet Union, eastern Europe, Latin America, and Africa. The flow of human trafficking appears to be from these impoverished places toward more industrialized regions of the world such as North America, western Europe, and Australia. Once smuggled into these regions, victims of sex trafficking tend to be concentrated in large cities, tourist areas, or near military bases where the demand for sex services appears to be the highest.

It is also common for victims of sex trafficking to be smuggled into regions of the world where the laws surrounding prostitution, or the enforcement of these laws, are not perceived as very harsh, such as Brazil, Thailand, and Amsterdam in the Netherlands. These locations, not restricted to the few listed above, become known as sex tourism destinations. Sex tourism involves the deliberate travel to a destination for the purpose procuring sexual services that are likely not available within one's own country.

CHILD SEX TOURISM

An increasingly common form of sex tourism is child sex tourism. As with sex tourism in general, child sex tourism thrives in regions of the world where legal restrictions surrounding prostitution are underdeveloped and underenforced. Children often are taken from their families in reparation of debts, as a misguided favor to families in extreme financial struggle, or due to the loss of parents through war or the AIDS epidemic. Once separated from their families, the children are then forced into prostitution and pornography as their only means of survival.

In response to human and sex trafficking, many countries have adopted policies and laws to make it increasingly difficult for women and children to be illegally smuggled into countries, as well as restrictions for people traveling to other countries for the purposes of sex tourism. For instance, it is now illegal in the United States for individuals to travel to other countries to engage in child sex tourism; such individuals can be prosecuted in the United States for their actions outside of the country. It is, however, exceedingly difficult to prove that individuals are traveling for these purposes, and thus, few prosecutions have ever been successful.

Shadow Cabinet

The *shadow cabinet* is an alternative slate of would-be government ministers from the main opposition parties in certain Westminster parliamentary systems, which are democratic parliamentary systems modeled after the UK Houses of Parliament. Aside from the United Kingdom, other popular examples of shadow cabinets exist in Australia, Canada, France, Ireland, Israel, Italy, Japan, South Africa, and Thailand. The shadow ministers of the shadow cabinet serve as the designated spokespersons for their opposition party on specific issues, such as defense, foreign policy, or home affairs, endeavoring to undermine the credibility of the official cabinet ministers by presenting rival policies or viewpoints. Individuals in the shadow cabinet use the unofficial posts to gain experience on national issues and areas of interest while making themselves familiar to the public. The members of the shadow cabinet are typically chosen to serve in the official cabinet should their party win the next election and form the government.

The formation of shadow cabinets is unique to each country and to each party. For instance, in the United Kingdom, the Conservative Party leader chooses the members of the shadow cabinet, while in the Labour Party, the members are elected by their fellow party parliamentarians. The shadow cabinet concept originated in the mid-nineteenth century when former UK cabinet ministers adopted the practice of continuing to meet after their party lost their majority in Parliament. The former cabinet ministers held consultations on party strategy and policy and served as the nucleus of the opposition.

Sharia

Sharia, which literally means "path to a watering place," is the Islamic law based on the principles in the Quran and sunnah that were systematized in 100 to 200 A.H. (700–800 CE) into a legal framework regulating the public and private life of people living under Islamic rule. *Fiqh* (understanding) is the science of Islamic law developed from such sources. Based on the Quran's eighty or so lawmaking verses, sharia's compendia (collected juridical commentaries) embody the legal needs of early Islamic rule and gave rise to five sharia schools (four

Sunni, one Shia), each possessing textual authority in matters of law.

Unlike other legal systems, the scope of sharia is very wide. As the expression of God's will, not only does it organize interpersonal relations among Muslims (e.g., family, inheritance, sexuality) and their relationship to the state (e.g., penal law, foreign policy, jihad), but it also defines their relationship to God and informs their conscience by creating five levels of approved activities: forbidden (*haram*), blameworthy (*makruh*), permissible (*mubah*), praiseworthy (*mustahab*) and mandatory (*wajib*).

As sharia developed, legal scholars discussed the relative merit of reason as an exegetical tool for interpreting Islam's sources with Sunni schools restricting its role more than the Shia school did. Once consolidated, the early process of interpretation gave way to rigidly scholastic legal doctrines based on seemingly infallible source materials and precedents set by classical jurists.

Islamic civilization began to wane in the sixteenth century in response to Western economic and technological superiority. In some Muslim regions in central Asia, North Africa, and the Near East, Western law was imposed following European conquests. Elsewhere in the Ottoman and Persian Empires, attempts were made to modernize the local legal systems by incorporating secular Western elements.

Although Islamic legal theory allows no law but God's, early Islamic rulers had to make concessions to practical needs and the legal customs of the lands they conquered. As such they adopted secular administrative rules (*Qanun*). Although theoretically still subject to examination by religious scholars (*ulema*), they were rarely challenged because the latter often depended on secular rulers for positions. Hence, when secular modernization began in places like Turkey in the 1830s and Persia in the 1850s, it swept the Islamic world.

Nevertheless, a confluence of developments, including decolonization, the conflict in Palestine, and political repression and oil wealth in Arab states, nurtured their grievances, enabling Islamist supporters of sharia to assert themselves in the 1970s. Some took power, as in the case of Iran, while others were co-opted, as in Sudan and Pakistan. In all cases, proponents of sharia tried to re-Islamize the laws of Muslim nations. Although sharia is an international issue and is now sometimes referred to by diaspora communities in the West, the battle for its implementation primarily involves Muslims in Muslim-majority states challenging their more moderate coreligionists, with whom they often share the same urban middle-class background.

Shklar, Judith N.

Judith Nisse Shklar (1928–1992), the first female president of the American Political Science Association (1989) and president of the American Society for Political and Legal Philosophy (1982), was a leading twentieth-century political theorist and faculty member in the Harvard University Department of Government. Author or editor of eleven books and numerous essays and reviews, Shklar played an important role in the reinvigoration of political theory during the second half of the twentieth century, and more particularly in the articulation of a skeptical version of liberal theory that she called the "liberalism of fear."

Shklar was born in Riga, Latvia, on September 24, 1928, and her family relocated to Canada during World War II (1939–1945), traversing a circuitous route from Riga to Montreal by way of Sweden and Japan that Shklar recounted with grim humor in her autobiographical essay "A Life of Learning" (1996). She received her BA (1949) and MA (1950) degrees from McGill University and her PhD from Harvard (1955), where she taught from 1956 until her death in September 1992.

Shklar wrote that she became interested in political theory to help her make sense of the experiences of the twentieth century. Her work consistently sought a psychologically realistic and robust liberalism that could combat the human propensity for cruelty and vice that she had witnessed in Europe during the war years. Shklar's liberalism of fear was shorn of abstract and ahistorical justifications such as natural rights or rational choice theory. Drawing especially on the thought of French intellectual Michel de Montaigne and French political philosopher Charles-Louis Montesquieu, her approach emphasized the prevention of cruelty rather than the securing of extensive schemes of individual rights. As she claimed in "A Life of Learning," "skepticism, autonomy and legal security for the individual, freedom and the discipline of scientific inquiry . . . are our best hope for a less brutal and irrational world." Such a quest, for Shklar, required not only a clear understanding of the attractions (psychological, moral, political) that cruelty had always held for humans, but also a commitment to historical memory and to listening to the experiences of those who had experienced victimization and injustice.

Shklar's corpus addressed an impressive range of historical, philosophical, and political questions. In addition to articulating and defending her own brand of liberal theory and practice, she authored extensive treatments of Montesquieu, French political and social thinker Jean-Jacques Rousseau, and German philosopher Georg Hegel; a penetrating exploration of political and legal thinking that used the Nuremberg and

Tokyo trials to reflect on the relationship between law, politics, and morals; a compelling revisitation of the conceptual and political foundations of injustice; and two volumes that take up questions of American citizenship, politics, and political thought.

Sidgwick, Henry

Henry Sidgwick (1838–1900) was a British utilitarian philosopher. His version of utilitarianism, presented in the 1874 *The Methods of Ethics,* built on and amended the work of fellow Victorian philosopher and political theorist John Stuart Mill. The next generation of British thinkers found the sheer moral sincerity of their predecessors an easy target. In his 2004 *Henry Sidgwick, Eye of the Universe: An Intellectual Biography,* Bart Schultz quotes economist John Maynard Keynes as saying that Sidgwick "never did anything but wonder whether Christianity was true and prove it wasn't and hope that it was" (4). It is perhaps fairer to say that Sidgwick was born into a turbulent era of increasing doubt and, like Mill before him, responded to these challenges with both passion and hard thought.

Sidgwick's inner existence was marked by struggle and change, but outwardly he led a quiet life that was spent for the most part within the academy. The greatest drama of this scholarly life was his resignation of his post as a fellow at Trinity College in 1869. He had come to believe that biblical scripture could not stand up to modern scientific scrutiny, and he decided he could no longer endorse the Thirty-nine Articles of the Church of England, acceptance of which was required of the fellows of Cambridge. He nevertheless remained at Cambridge in a specially created position. Two years later, partly due to Sidgwick's resignation, British parliament voted to abolish the religious requirement, and Sidgwick was reinstalled in his position as fellow.

Sidgwick attempted to strengthen utilitarianism as the most promising secular alternative to the eroding religious morality. His most distinctive contributions were methological and metaethical. These innovations are contained in Sidgwick's greatest work, *The Methods of Ethics.* According to Sidgwick, ethics studies what an individual ought to do. A *method of ethics* is a comprehensive, internally consistent standard of moral behavior that answers this question. By definition, one cannot rationally employ more than one method. However, Sidgwick states that the average person does not consciously employ a single method to guide his moral decision-making. Instead, he uses multiple commonsense maxims as guides. Ordinary practical reasoning, thus characterized, is limited and conflicted. Despite its limitations, Sidgwick asserts that this is the place to begin moral philosophy. By critically examining commonsense reasoning, one eventually can uncover what methods do exist.

At first, Sidgwick argues that all genuine methods of ethics belong to one of three categories: egoism, utilitarianism, or intuitionism. The category of egoism consists of the method that directs the agent to pursue his own happiness. This utilitarian method is to act so as to maximize the happiness of humanity as a whole. The third category of intuitionism contains more than one method. Each settles on right actions based on clear moral intuitions. Later in the *Methods of Ethics,* however, Sidgwick complicates this initial classification by stating that utilitarianism and hedonism also each rest on a basic moral intuition. Here he evades a criticism made of John Stuart Mill. Mill's proof of the principle of utility in *Utilitarianism* (1861) was widely viewed as unsuccessful because it argued from a positive fact to a normative principle. By deriving utilitarianism from the moral intuition of "rational benevolence," Sidgwick avoids this particular criticism.

Sidgwick divides ethical questions about political life into two groups. The first set of questions concerns the proper relationship between the individual agent and his political environment. This set includes traditional questions about individual political obligation and belong to ethics proper, according to Sidgwick's definition of it. The second set of questions inquires into the ideal society. Sidgwick calls the discipline that addresses these questions *politics.* He asserts that ethics and politics are related but distinct disciplines. He examines politics, as understood by him, in both his 1883 work *The Principles of Political Economy,* and in his 1891 work *The Elements of Politics.* In these texts, he employs a utilitarian standard, discussing the details of a government whose arrangements maximize the happiness of the community. His contributions to the study of political economy, focusing on socialist interventions into a market system, are especially distinguished.

The immediately following generation of British philosophers tended to denigrate Sidgwick even as they borrowed from him; G. E. Moore is a prominent example. In the second half of the twentieth century, the political philosophy of John Rawls reintroduced Sidgwick to political theorists. An opponent of utilitarianism, Rawls nonetheless championed

Sidgwick as a rigorous thinker and adopted some aspects of his methodology. Since then, the literature on Sidgwick has continued to grow.

Sidney, Algernon

Algernon Sidney (1623–1683) was a prominent English statesman and political author during his country's civil war period.

Sidney was born into a prominent family and benefited from a comprehensive liberal education, which was augmented by his father's contacts with philosophers like Hugo Grotius. However, Sidney did not immediately turn to scholarship. He fought for Parliament in the English Civil War (1642–1651) and was then elected to the Long Parliament in 1646. However, he was a foe of influential English soldier and statesman Oliver Cromwell and spent most of the 1650s in political retirement. After the Restoration, Sidney went into voluntary exile.

Sidney's many legal and extralegal attempts to restore the republic culminated in what is known as the Rye House Plot of 1683, a conspiracy that sought to assassinate or overthrow England's King Charles II. The plot failed and Sidney was arrested on charges of treason. He was convicted in a trial infamous for its many violations of legal procedure. Most notably, the prosecution could only produce one of the two required witnesses and used some seized pages of Sidney's *Discourses Concerning Government* (posthumously published in 1698) as the second "witness." Sidney was executed in 1683.

The *Discourses* are not primarily a call to sedition; in fact, the work was composed around the same time as British philosopher John Locke's *Treatises* and is also an attack against English political theorist Sir Robert Filmer. Sidney found Filmer's patriarchalism repugnant and felt it flew in the face of "that universal liberty which God hath given to mankind." Instead he emphasized the human capacity for self-rule and judgment and followed republicans like Florence's Niccolò Machiavelli in asserting a connection between liberty secured through laws and the prosperity of a nation. Sidney placed ultimate authority in the universal law of the common good and rejected Filmer's contention that man is naturally suited to monarchy, suggesting instead,

following the Aristotelian tradition, that mixed and popular governments were generally superior. Sidney also embraced the Machiavellian idea that the best government had to be prepared for war. These sections of the treatise, as well as Sidney's more explicit commendation of revolution, give the *Discourses* a more aggressive tone than Locke's work and, by most accounts, reflect the pugnacious nature of their author.

A manuscript of Sidney's other major work, the *Court Maxims* (1996), was discovered in the 1970s. The *Maxims* are a series of dialogues that amplify the basic principles of the English republican movement. Some critics argue that the piece was propagandistic, while others see it as an "uncompromising text" and an attempt to rally renewed support for the English Parliament against the royalists.

In terms of contemporary scholarship, Sidney is placed in the republican tradition by some authors, whereas others tend to ally him more with natural rights theorists. According to history scholar Caroline Robbins, Sidney's writings and the perceived injustice of his trial made him a hero among the "commonwealthsmen" of the eighteenth century, and he was also an important influence on the American founders.

Sieyès, Emmanuel–Joseph

Emmanuel–Joseph Sieyès (1748–1836), better known as the Abbé Sieyès, is the writer of the key text of the French Revolution (1789–1799), *What Is the Third Estate?* (1789). An ungifted orator, Sieyès nonetheless led the fight for radical reform in the name of the French people's national sovereignty, calling for the dissolution of the entire French social and political system, including the Estates General that would meet in 1789 after Parisians stormed the Bastille, a medieval fortress serving as a state prison. Later Sieyès laid the ground for French military leader Napoleon Bonaparte's coup d'état of 1799.

Born into a large family in Fréjus, France, Sieyès acceded to his parents' wishes and spent his youth preparing for the priesthood. In his ten years at a Parisian seminary, he was far more likely to be found studying British political philosopher John Locke, French political scholar Jean-Jacques Rousseau, and writings on political economy than the scholastic writers pushed upon him by his tutors. Sieyès nevertheless entered

the priesthood in 1773. While moving up the church hierarchy, he was named a representative in the Provincial Assembly of Orléans, where he took up the plight of the poor with increased urgency as France's economy faltered in the 1880s. Sieyès made few friends and was ill at ease, in fact, with his social inferiors in the Third Estate (those not members of the nobility or clergy). Tired of the intransigency of the French social order and his inability to effect any change, he made plans to emigrate to America, but these plans were interrupted by the explosion of open political debate in 1788. Sieyès soon made his mark with the publication of two revolutionary pamphlets, but it was his third that pushed him to the front of events in 1789. In *What Is the Third Estate?* he upended the notion of the "nation" as it was thought hitherto in France. Sieyès argued that the Third Estate, rather than the upper classes or the monarchy, was the true French nation upon whose backs the other orders of society rested. The nation should be empowered through the only legitimate form of government, which was for Sieyès a representative legislature. He called for the disbanding of the Estates General, arguing that because the Third Estate represented the whole of the French nation, it could, on its own, form a national assembly, which is exactly what occurred on June 17, 1789. The National Assembly, by Sieyès's account, would represent the interests of "passive citizens," such as the nobility and the poor, who would play no "active" role in political power.

Outflanked by those who called for the destruction of the aristocracy, Sieyès would soon lose political power, returning to prominence only at the end of the Reign of Terror (1793–1794), a period marked by conflicts between rival political groups and mass executions of those opposed to the revolution. After the republican coup of 1797, Sieyès was for a time the president of the Council of Five Hundred, the lower house of the French legislature. In 1799 he became convinced of a need for a strong executive to balance the ineffective councils. Turning to Napoleon to strike the blow necessary to change the constitution, Sieyès inadvertently helped end all hope of a republican government. His power under Napoleon was marginal, and later Sieyès was exiled to Belgium as a regicide upon the return of the monarchy in 1815. He returned to France in 1830, dying six years later, his legacy forever tied to the revolution and the widespread aspiration for national sovereignty his writings helped unleash.

Simon, Herbert Alexander

Herbert Alexander Simon (1916–2001) was an American psychologist and economist. His research focused on decision making and its implications for social institutions.

Simon, the son of German-Jewish immigrants, was born in Milwaukee, Wisconsin. He attended public school and entered the University of Chicago in 1933 on a full scholarship, earning a BA in 1936 in political science (he majored in political science because he did not wish to take accounting, which was required of economics majors at the university). After graduating from Chicago, he went to work as a researcher for the International City Managers Association (1936–1939) and then moved to the Bureau of the Public Administration at the University of California-Berkeley (1939–1942). In 1942 he joined the political science department at the Illinois Institute of Technology, teaching there until 1949 and serving as department chair from 1946 to 1949. In 1943 he won his doctorate in political science from the University of Chicago. At Chicago, he studied under Harold Lasswell and Charles Edward Merriam.

In 1949 Simon joined the faculty of the Carnegie Institute of Technology (since 1967 the Carnegie Mellon University) and would remain there for the rest of his academic career. At Carnegie, he was Professor of Administration (1949–1967) and the Richard King Mellon University Professor of Computer Science and Psychology (1967–2001).

Simon made contributions to a number of fields. He was an early proponent of computer artificial intelligence, creating with computer scientist Allen Newell what they called a "thinking machine" in 1955. In economics, Simon argued that the theory of *economic man,* which contends that individuals make rational economic decisions that maximize personal benefits, failed to account for the uncertainty of human action. His research on decision making by business executives, published in *Administrative Behavior* (1947), led him to conclude that business leaders failed to maximize profits because they made decisions without assessing all information and long-term effects. He argued that the complexities of the modern world meant that individuals could not process or even obtain all the information they needed to make decisions. Instead, they try to make decisions that are merely good enough. He called this approach *bounded rationality.* Instead of economic man, Simon suggested that *administrative man* attempts to find courses of action that are satisfactory. His work also had an influence on the study of decision making in the public sector. In psychology, he was a leader of the cognitive revolution in the 1960s as scientists began using computer models to study human thought processes.

In 1978 Simon won the Nobel Memorial Prize in Economic Sciences. In the citation, the Swedish Academy of Sciences proclaimed that "modern business economics and administrative research are largely based on Simon's ideas." He also won the A.M. Turing Award for his work in computer

science (1975), the National Medal of Science (1986), and the American Psychological Association's award for outstanding lifetime contributions to the field (1993).

Simulation

Simulations comprise a methodology that can assist researchers investigating the interplay between multiple *agents* and a simulated *environment*. Both individual agents and their synthesized environment are artificial.

Simulated agents imitate the natural appearances or behaviors that are important to a researcher. The programmed characteristics of agents include rules, goals, and allowed adaptations within the environment. Similarly, the programmed environment includes any variations and constraints important to a researcher.

In political science, simulations add value in two ways. First, *confirmatory simulations* can test theories by contrasting predictions with observations of actual phenomena.

Second, *exploratory simulations* can extend existing knowledge by observing simulated results obtained from past data or known relationships between agents and their environment. When simulating phenomena, a researcher must balance between parsimony and fidelity. Increased simulation fidelity often is associated with increased complexity. Simulations should focus on high fidelity specific to the important elements of a research investigation.

Simulations serve as explanatory and predictive tools for political scientists, benefiting both theoretical and policy-related inquiries. Confirmatory simulations can (1) define individual agent goals and compare emergent, group-level behaviors against empirical observations or (2) define group-level goals and compare emergent, individual behaviors against empirical observations. Exploratory simulations can employ knowledge of past data, agent behaviors, group goals, or environmental constraints to make predictions regarding future interventions or policies.

. . . . DAVID A. BRAY

Simultaneous Equation Modeling

Simultaneous equation models (SEMs) are useful for testing hypotheses involving complex causal ordering, which are common to research questions in political science and public policy. SEM examples include instrumental variables, two-stage least squares, and seemingly unrelated regression models.

A classic example of complex causal ordering is the impact of policing on crime rates. A larger police force may indeed lead to a reduction in crime. However, a reverse causal order is equally plausible; for example, an increase in the crime rate may lead to the hiring of more police. Another example is the estimation of campaign contributions (*X*; predictor) on votes received (*Y*; outcome). In this case, both campaign contributions and votes may be influenced by how voters feel about the challenger, essentially both *X* and *Y* are effected by yet another variable. When a predictor is a function of other variables in the system, it is not truly independent or *exogenous*. We refer to these dependent variables as *endogenous* and they are problematic because they are likely to be correlated with the error term. *Ordinary least squares (OLS)* regression will produce a biased estimator unless we untangle the system of equations. However, simultaneous equation models remove the bias that would result from an OLS approach.

A common SEM technique employs an instrumental variable with *two-stage least squares (2SLS)*. This involves isolating the variation in the endogenous variable that is problematic (correlated with the error) from the part of the variation that is not problematic (uncorrelated with the error). In the first stage of the process, *X* is decomposed to obtain the component that can be predicted by an instrument and the problematic component. Then the predicted value of *X* from the stage 1 regression is used to estimate the effect on *Y*.

Consider the example of the impact of policing on crime rates given above. Some researchers have pointed out police forces tend to increase in election years; since election years are predetermined (exogenous) they may be the source of a good instrument. Applying a 2SLS, in stage 1 we would isolate the police force new hires that can be predicted by the election cycle, which we assume are uncorrelated with the error. In stage 2 we would use the predicted values of *Y* (police) from the first stage regression to estimate the effect on crime. To specify:

$$\textit{Stage 1: } \text{police}_i = \alpha_0 + \alpha_1 \text{ election}_i + \infty_i$$
$$\textit{Stage 2: } \text{crime}_i = \gamma_0 + \gamma_1 \text{ police-hat}_i + \nu_i$$

As is probably evident by now, the challenge with 2SLS is finding a good instrument, a variable that is correlated with the endogenous regressor but not correlated with the error term. The good news is that most basic econometric textbooks discuss statistical tests for instrument validity and the

logic behind them. Popular statistical software packages are also indispensable tools for analyses.

Singer, J. David

J. (Joel) David Singer (1925–2009) was one of the foremost scholars of world politics of the twentieth century. His creation of the Correlates of War Project was instrumental in shifting the study of international relations from the reliance on historical analyses toward the use of quantitative or scientific research methodologies.

Born in Brooklyn on December 7, 1925, Singer grew up with what he later admitted was a rather romanticized view of war. German anti-Semitism and anti-Japanese propaganda contributed to his decision to enlist in the U.S. Navy on December 7, 1942 (a year after Pearl Harbor). Though he left the service in 1946, he returned for a second tour of duty during the Korean War (1950–1953). Thereafter, he resumed graduate studies at New York University, earning his doctorate in 1956. Singer then began his teaching career with a two-year stint at Vassar College.

At this stage in his career, Singer considered himself to be a "policy wonk, but a public dove." He focused on deterrence policy, but challenged the prevailing positions concerning nuclear disarmament, as in his testimony before Senator

Hubert Humphrey's subcommittee of the Committee on Foreign Relations in 1956. He subsequently spent a yearlong Ford Fellowship at Harvard University, where he met conflict resolution expert Kenneth Boulding, who successfully persuaded Singer to come to the University of Michigan.

In 1959, Singer spent a year at the Naval War College, where he completed *Deterrence, Arms Control, and Disarmament,* which several publishers rejected due to its dovish stance. Singer then returned to the University of Michigan with positions at the Mental Health Research Institute and later the political science department. Singer's policy work had convinced him of the need for a more rigorous and scientific study of world politics, and, with the support of Karl Deutsch, he created the Correlates of War Project (COW) in 1963 with the hope of understanding war so that it could be ended and prevented. Singer also continued his activities as a public dove, speaking out against the cold war and the Vietnam War (1959–1975) and becoming involved in the Caucus for a New Political Science, which promoted a more activist and critical role for those in academia.

The Correlates of War Project has become one of the longest-running and most influential research projects in world politics. The project launched a quantitative study of war, and Singer, along with project historian Melvin Small, published two groundbreaking analyses of war: *The Wages of War, 1816–1965* in 1972 and *Resort to Arms: International and Civil War, 1816–1980* in 1982. The project has continued to expand, gathering data on a number of elements that are related to war, including system membership, capabilities, alliances, diplomatic ties, intergovernmental organizations, and conflict short of war (militarized interstate disputes). Its impact is seen not only in the numerous books and articles that Singer published individually and with COW colleagues, but also in the plethora of other data-gathering projects that COW has spawned. In recognition of his contributions, Singer was elected president of the Peace Research Society (International) and president of the International Studies Association.

Skinner, Burrhus Frederic

Burrhus Frederic (B. F.) Skinner (1904–1990) received notoriety for his work in behavioral psychology. In *Beyond Freedom and Dignity* (1971), he claimed that human beings are shaped by their environmental conditions. The soul, free will, or "autonomous man," he insisted, does not exist except in outdated theories of philosophy, politics, and religion, and if freedom or democratic principles require the support of such theories, so much the worse for them. To reject a scientifically "designed culture" meant surrendering society's future to political leaders who use crude, unscientific methods of behavioral control for their own selfish purposes. Although critics charged that his "science of social engineering" robbed human beings of both their dignity and rationality, Skinner never abandoned his belief in the saving powers of a behavioral science.

Skinner was born in the small Pennsylvania railroad town of Susquehanna on March 20, 1904. He attended Hamilton College, a small liberal arts school in New York. The poet Robert Frost read Skinner's unpublished work and encouraged him to become a writer. However, Skinner decided to abandon a literary career, having been drawn to modern philosophy and psychology through the writings of Bertrand Russell, John B. Watson, and H. G. Wells. Skinner enrolled in the psychology department at Harvard University, completing his master's degree in 1930 and his doctorate a year later.

Skinner spent most of his academic career at Harvard. There he conducted laboratory experiments using rats and pigeons to test his theories on behavioral control. He developed the *Skinner Box* that taught pigeons to play ping-pong by rewarding them with food. He thought that the same principles of environmental conditioning could be applied to human beings. His Skinner Box later became confused with his invention in the 1940s of the "baby box"—or, as he called it, the "baby tender"—designed to provide a safe, air-regulated sleeping box for infants. Some viewed his baby box as cold and inhuman, while others thought it was ingenious. It provided the kind of environmental control that Skinner envisioned for improving society in general, although the techniques when applied to adult behavior would be more subtle and complex.

To create a world free of overpopulation, pollution, the threat of nuclear war, and social strife, Skinner continued defending the development and use of behavioral technology. In his utopian novel, *Walden Two* (1948), he described a tightly organized, peaceful community where envy, jealousy, laziness, and other human vices had ceased to exist because the social environment no longer rewarded such behavior. As Frazier, the fictional designer explains, "a constant experimental attitude towards everything," whether it's child rearing, work, or the creative use of leisure, ensures that everyone is industrious, content, and cooperative. Many psychologists and nonpsychologists considered Skinner's utopian vision naïve, if not dangerous. Although he recognized the dangers of science being misused, Skinner never doubted the social benefits of behavioral control undertaken by scientifically trained men of good will.

Skinner retired from Harvard University in 1974 and was honored for his work by the American Psychological Association just prior to his death on August 18, 1990.

Slavery

The practice of slavery has occurred in many civilizations throughout human history and was caused by social stratification, economic factors, and high population density. Perhaps most noteworthy of places it occurred were ancient Egypt, China, India, Greece, and the Roman Empire. During the Roman Empire alone, it is estimated that one hundred million people were captured or sold as slaves.

Slavery developed in many ways, including as a means of repaying debts, as punishment for crime, as treatment of prisoners of war, and due to child abandonment. But the trading of slaves for what would be intended as cheap labor is what led to its popularity in North America.

SLAVERY'S RISE AND DECLINE IN AMERICA

Slavery began in the American colonies with the first black indentured servants sent to Jamestown, Virginia, in 1619. Transatlantic slave trade began in 1637, and by 1641, colonies under British rule began to sanction slavery by law.

During the 1700s, slavery expanded significantly in the American colonies and states. Major slave revolts occurred in New York in 1712 and in South Carolina in 1739. Though some blacks who fought for the Americans in the revolution against England were freed, the number of those who were enslaved far outnumbered them. Just as Massachusetts became the first state to ban slavery in 1780, the Articles of Confederation, which established the first national government, contained no legal recognition of slavery.

Despite the efforts of abolitionist groups and laws such as the 1787 Northwest Ordinance, which banned slavery in the territories of Ohio, Michigan, Indiana, Illinois, and Wisconsin, the U.S. Constitution legalized slavery in at least three ways without specifically mentioning the practice. For one, each slave counted as three-fifths of a person for the purpose of determining a state's taxation and representation. Second, the importation of slaves was permitted to occur until 1808. Third,

slaves were included in criminal extradition provisions so as to protect the property rights of slaveholders.

According to the 1790 census, there were approximately 757,000 blacks in the United States, of whom 92 percent, or 697,000, were still enslaved. The number of those enslaved increased to 1.2 million in 1810, 2.0 million in 1830, 3.2 million in 1850, and just under four million in 1860.

The plantation system and its reliance on manual labor received a boom in 1793 with the invention of the cotton gin by Eli Whitney. Previously, tobacco and rice had been the most profitable items to grow among states in the South, but with the cotton gin, cotton production reached forty million pounds (eighteen million kilograms) in 1800, and the output would double in each of the following decades. Cotton became among the chief exports of the United States in first half of the nineteenth century.

In 1793, Congress passed the Fugitive Slave Act, which required the federal government to assist in the return of runaway slaves. In 1808, Congress officially banned the importation of slaves from abroad. However, that action resulted in a concomitant increase of domestic slave trade.

Because Congress was balanced between slave and free states, the acquisition of new states precipitated debate over the their status. The War of 1812 verified the viability of the United States and led to expansion of the west and south, and seven states joined the Union between 1812 and 1821. In the Missouri Compromise of 1820, it was agreed that Maine would enter the Union as free state and Missouri as a slave state, with slavery prohibited in the balance of the Louisiana Territory.

After the war between Mexico and the United States, the Treaty of Guadalupe-Hidalgo was signed in 1848. This treaty recognized the Rio Grande as the southern boundary of the United States; ceded parts of present-day Colorado, Utah, Arizona, Nevada, New Mexico, and California; and exchanged monetary payments for claims. The takeover of the aforementioned territory, combined with the discovery of gold in California, hastened the need to determine the status of newly admitted states, of which there were five between 1845 and 1850. In the Compromise of 1850, California was admitted as a free state and Texas's status was changed to a slave state. This law also abolished the slave trade in the District of Columbia, guaranteed popular sovereignty in New Mexico and Utah, and strengthened fugitive slave law features. Four years later, the Kansas-Nebraska Act repealed the Missouri Compromise of 1820 by permitting popular sovereignty on slavery in areas comprising the unorganized Louisiana Territory.

Judicial rulings during the antebellum period supported the continuation of slavery, and an 1842 decision by the U.S. Supreme Court upheld the 1793 Fugitive Slave Act. In the 1857 *Dred Scott v. Sanford* ruling, the Supreme Court held that Congress did not have the authority to ban slavery in the states and that slaves were property rather than citizens.

Opposition to slavery during the 1800s took many forms. Major slave revolts occurred in 1822, 1831, and 1859. Legislation like the 1846 Wilmot Proviso opposed the expansion of slavery. Antislavery literature such as 1852's *Uncle Tom's Cabin* proved enormously beneficial to the abolitionist cause.

THE CIVIL WAR AND THE GLOBAL LEGACY OF SLAVERY

After the election of Republican candidate Abraham Lincoln in 1860, seven southern states seceded from the United States; four others followed shortly thereafter. These states established the Confederate States of America, which supported slavery and which declared war on the United States. After several versions were proposed, the Lincoln administration issued the Emancipation Proclamation on January 1, 1863, freeing those enslaved in rebel states. The Union prevailed in a war that killed six hundred thousand Americans in both the North and South. In rapid succession, three constitutional amendments were ratified: the Thirteenth Amendment, which outlawed slavery; the Fourteenth Amendment, which provided citizenship to those in previous servitude; and the Fifteenth Amendment, which furnished the right to vote to males who were previously enslaved. It would take another century before full citizenship and voting rights were enjoyed by African Americans in the United States.

Just as the eradication of slavery in most of the British Empire pursuant to an 1833 law may have impacted the direction of American slavery, so the result of the Civil War (1861–1865) influenced the practice of slavery for the rest of the nineteenth century. For instance, Portugal stopped slavery in its African colonies in 1869; slavery was abolished in Puerto Rico in 1873 and in Cuba in 1886; and Brazil and Korea ceased slavery in 1888 and 1894, respectively. The last nation to eliminate slavery during the twentieth century was Mauritania in 1981. Though illegal as a practice, slavery continues in many countries.

Small–*n* and Case Study

Small–*n* and case studies are two methods of qualitative research used in political science and other social sciences. Small–*n* studies (with *n* referring to the number of subjects or cases in a study) are the opposite of large–*N* quantitative projects that involve significant amounts of data or observations.

Central to small-*n* studies is the idea that by only using a limited number of subjects or cases, a researcher can develop a much more detailed and nuanced set of information. Consequently, researchers may be better able to identify casual relationships, such as *if A, then B.* One major problem of small-*n* studies is their limited ability to account for all variables that led to a particular outcome.

A case study is a comprehensive analysis of an individual, group, model, or historical period (small-n studies can be case studies). Case studies do not necessarily seek to develop broad general theories, but instead present casual relationships that exist under a specific set of circumstances that may or may not be replicable elsewhere. Some case studies, generally known as *deviant* or *extreme,* seek to explain why some cases do not conform to expected norms, while others, known as *paradigmatic* do allow researchers to develop generalizations about cause and effect.

. . . . TOM LANSFORD

Smith, Adam

Known as the father of classical economics, Scottish economist and rhetorician Adam Smith (1723–1790) was one of the two leading lights of the Scottish Enlightenment. The other was his close friend, David Hume. Smith is best remembered today for his groundbreaking work, *An Inquiry into the Nature and Causes of the Wealth of Nations,* published in 1776, the same year the American colonies declared their independence from Britain.

Wealth of Nations was written as a criticism of mercantilism, the predominant economic thought of the day. Government policy under mercantilism was based on the theory that governments benefited from advancing the interests of capitalists through protective laws and tariffs. Smith, however, declared that the interests of nations were best served by allowing the market to seek its own equilibrium. Although Smith used the term *invisible hand* only three times, he is best remembered for this description of the foundation of classical economic theory. Specialization was also a major element of Smith's theory, and he argued that both the market and government benefited from more productive workers who earned higher wages.

As a professor of logic, metaphysics, rhetoric, literature, and moral philosophy (including economics, ethics, theology, and law) at the University of Glasgow, Smith honed the ideas that were articulated in his works. In 1759 he published *The Theory of Moral Sentiments,* receiving accolades from noted writers and thinkers. Smith used *Moral Sentiments* as a vehicle for examining human nature, concluding that morals allow human beings to live together peacefully. He identified self-control, prudence, justice, and beneficence (sympathy) as the four guiding virtues for humankind. A number of scholars have criticized Smith for perceived inconsistencies in *Wealth of Nations* and *Moral Sentiments.* This so-called Adam Smith Problem is based on the notion that Smith's views on self-interest in the former are incompatible with his views of sympathy in the latter.

In 1766 Smith compiled his university lectures into *Lectures on Jurisprudence,* presenting his views on justice, the history of law and government, legal authority, and taxes. That same year, he spent time at the British Coffee House in London, interacting with noted British writers. Smith also met Benjamin Franklin, who read an early draft of *Wealth of Nations.* Smith was ultimately responsible for the decline of mercantilism and for the rise of classical economics in Europe. He was read widely in the United States, and, in addition to Franklin, his supporters included statesmen John Adams, Alexander Hamilton, Thomas Jefferson, James Madison, and James Monroe.

Before Smith's death in 1790, he asked his literary executors to burn all unfinished works, which included a revised edition of *The Theory of Moral Sentiments* and a history of literature and philosophy. *Essays on Philosophical Subjects,* covering a range of topics, was published in 1796. During the worldwide depression of the 1930s and World War II (1939–1945), the influence of Smith's economic theories declined. However, they were restored to favor in the 1980s by conservative economists such as Milton Friedman of the Chicago School of Economics and were instrumental in the development of government policies under President Ronald Reagan in the United States and Prime Minister Margaret Thatcher in Great Britain.

Social and Political Cognition

Social cognition is the study of how people make sense of other people and themselves. As an area of study, social cognition relates directly to the study of attitudes, persuasion, stereotyping, and small group behavior. *Political cognition,* a subset of social cognition, is the study of how people make sense of the political world.

Political cognition research arose out of discontent with attitudinal studies of political behavior in the 1970s. Early studies in political cognition made wide use of schema theory (a schema can be thought of as a mental structure that

represents some aspect of the world). One widely adopted schematic model of political cognition argued that people made sense of the political world by using pyramidal classification systems in which "big picture" ideas, such as liberalism or conservatism, were most influential in the evaluation of a political object, while "smaller" ideas, such as general feelings toward a group, candidate, or policy, refined attitudes. Further, this research argued that one could operate with several schemas that were not tightly connected. The nature of the stimulus object could direct an individual to use one schema or another in order to make sense of the object.

As the body of research grew, scholars were forced to move beyond schema theory in order to make meaningful advances in our understanding of social and political cognition. Memory-based models and online models of political cognition grew to popularity because of their ability to account for irregularities in individuals' expressed attitudes. Memory-based models posit that, when asked to express an opinion, individuals scan their memory banks for relevant information, then integrate the given information to form an opinion. Because people cannot possibly remember all relevant pieces of information, a theory developed that argued people sampled only relevant information. Opinions seem inconsistent to the extent that different pieces of information are salient, and sampled, at different times.

Online models, unlike memory-based models, argue that people do not remember each piece of information. Rather, people evaluate a given piece of information as it pertains to a political object, decide whether it supports or opposes their current opinions, and update their opinions accordingly. Upon updating their tally, people may then forget specifics regarding processed information. Online models allow for both opinion change and for meaningful opinions to exist even though it may be the case that people cannot explicate why they feel the way they do about a given topic.

It is not clear which type of model, online or memory-based, provides the most accurate description of how people think about politics. On one hand, research suggests that political sophisticates tend to engage in online processing while those with less political sophistication tend to use memory-based processing. Further, it may be the case that people use different methods of processing information to analyze different political objects. For example, studies indicate people use online processing for candidate evaluation and memory-based processing for survey response.

Recent research considers the impact of values, elite behavior, institutions, social identities, and social networks on political cognition. While it is clear that research has made considerable strides in understanding peoples' thought processes, there is still much to be discovered.

Social Capital

Why do some communities function well, while others do not? The concept of social capital recently flourished in political and social sciences, because it provides an explanation for prosperous and democratic social development.

The definition of social capital is somewhat ambiguous, but an accepted definition is that it is the connections among individuals, the social networks and norms of reciprocity and trust that arise from them. It is sometimes referred to as the glue that holds society together and related to social cohesion in general. We might ask: Why use the term *capital*? It is used frequently in social science to refer to properties that can be reproduced or augmented and represent an investment of some kind. Hence, social capital, like financial capital or human capital, represents a resource, in this case one held by social groups or within social networks. Social capital offers access to resources and valued collective outcomes that would be unattainable or too costly for individuals to access. An example would be that of blood donation, whereby individuals freely donate their blood, which then becomes a collective asset for the community.

The three main proponents of the term bring us slightly different definitions and functions of social capital. Pierre Bourdieu (1986) argued that social capital was a resource that people could draw on in their social networks. He identified a range of capitals (cultural, symbolic, economic) that formed part of an individual's resources. However, he was concerned with how these resources were used to maintain systems of inequality and exclusion rather than to promote the public good.

James Coleman (1988), on the other hand, used social capital to explain why some children were less likely to drop out of school—the relationship between human and social capital. In his analysis, public participation and social networks reinforced social norms of achievement in families and communities.

Robert Putnam and colleagues (1993) carried out the most comprehensive survey of social capital, using the term to explain the differences in development between northern and southern Italy. He argued that it was the tradition of civic associations in northern Italy that had helped it become more democratic and prosperous than the south. Putnam (2000) went on to apply these ideas to the United States, arguing that social capital had declined in that country due to generational

changes, increased labor force participation, passive entertainment such as watching TV, and urban sprawl.

COMPONENTS

The components of social capital that emerge from these different perspectives include social resources provided through civic participation, social networks, and the social trust that is built up from these activities. Civic participation is measured often in terms of membership and participation in voluntary associations, although this does not entirely capture social capital. For example, public engagement can take place without joining associations. It is easy enough to simply subscribe to an association, but Putnam, for example, argues that social capital can only be built by face-to-face activity, so subscriptions are not enough.

Social networks are more difficult to measure, but Nan Lin (2001) assesses the role of social networks in building social capital. He argues that they are based on ongoing reciprocal relationships that can be used by individuals to promote their own goals and that they help to secure reputations. Like economic capital, they can form a basis of exchange and reciprocity. They also can form a source of economic capital in situations where people cannot turn to banks (for example, in migrant communities). However, this individualistic and instrumental view of social networks is contested by those who argue that the reason that social capital leads to good social relationships is because they are based on altruistic ties of friendship or contribution to the community, which is in itself a social resource.

Social networks operate in different ways, and some have argued that loose social networks are more useful than tight social networks for getting a job, for example. This has lead Putnam to identify two types of social capital: *bridging* social capital that links disparate social groups and *bonding* social capital based on dense and close ties among smaller groups. Woolcock (1998) has introduced the idea of *linking* social capital, which brings together social groups not normally in touch with each other, such as across religious divides. While bridging social capital can be good for creating social cohesion, bonding social capital helps to build up the dense networks of trust and reciprocity. However, it has the danger of becoming exclusionary and monopolizing resources, as in the example of mafia-type organizations based on strong internal loyalty. Too much bonding social capital also can be destructive for social development.

Trust is both an outcome and a component of social capital because without trust, social networks cannot operate. While trust may be seen in a purely personal dimension, social capital is measured often in terms of *social trust* with people responding to the question as to whether other people can generally be trusted. High trust societies tend to be high in social capital because economic and political institutions are based on shared norms.

THE FUTURE OF SOCIAL CAPITAL

Has social capital recently declined? Putnam (2000) marshals impressive evidence that it has declined in the United States and that this poses a threat to the development of American society. In Europe it is possible that social capital may have declined due to the ongoing shrinkage in trade union and church membership as well as for similar reasons as in the United States. However, recent empirical analysis suggests that membership of civic associations has remained stable in Europe (even if it remains low in southern and eastern Europe) and that social trust has actually increased in recent decades. Social networks are thriving in some countries, especially those with strong welfare states, but take different forms in different regions. For example, in southern Europe family networks may be more important as a source of social cohesion than in the north.

Many have argued that in the era of electronic communications and the *network society,* people are less inclined to join organizations in the traditional way or to meet their friends face-to-face. Instead there has been an explosion of electronic networking activities as well as electronic mobilization, for example, through support of various causes, calls for participation, or petitions. Electronic communications have collapsed the space between the public and their leaders, as well as created new arenas for public debate. Therefore, the nature of social capital has changed also, but there is no agreement as to whether electronic communications have actually replaced the kinds of social capital described earlier.

Social capital is seen has having many benefits for the society, and various researchers have claimed that it is associated with economic growth, more democracy, less crime, better health, better educational performance, getting a job, and a better welfare state. For this reason it has been of great interest to policy makers, and the World Bank has been a champion of the promotion of social capital in international development. Other international organizations and national and local governments have applied these ideas in a variety of ways. Social capital is seen as a tool for building a well-functioning community.

Social Choice Theory

Social choice theory is as old as ancient Greek times. Social decisions, involving "diverse interests" and "concerns," were explored by Aristotle and Kautilya around the fourth century BCE. It grew into a systematic theory around the time of the French Revolution (1789–1799). The intellectual climate during the European Enlightenment provided the necessary boost to the "reasoned construction of social order." The subject of social choice was pioneered by the French mathematicians in the late eighteenth century, such as J. C. Borda (1781) and Marquis de Condorcet (1785). Some of the early social choice theorists were also the "intellectual leaders" of the French Revolution, as observed by Amartya Sen in 1998.

Social choice refers to judgments about the society, such as social welfare, public interest, or aggregate poverty, in view of available diversity of preferences, concerns, and predicaments of different individualizers within a society. It became popular in the context of welfare economics. It focused more on distributional justice than on utilitarianism. Social choice theory has broad relevance, including judgment about the well-being of the society as a whole; measurement of aggregate poverty; rights and liberties of persons; and social valuation of public goods, such as the natural environment.

The discipline of social choice was revived in the twentieth century by Kenneth J. Arrow. His book *Social Choice and Individual Values* (1951) became very popular for his "impossible theorem." Arrow argued that even the mild conditions of reasonableness could be satisfied on the basis of social choice theory. To him, only dictatorship could deal with the inconsistencies involved, sacrificing "participatory decisions in politics" and "by being insensitive to heterogeneous interests of a diverse population" in welfare economics. In the eighteenth century, it was believed that social appraisals, welfare economic calculations, or evaluative statistics could only be "arbitrary" or "irremediably despotic" (Sen 1998, 181). Arrow's impossibility theorem drew a major response and had a devastating effect on welfare economics as a discipline.

AS A NEGATION OF UTILITARIANISM

Traditional welfare economics was developed by utilitarian economists, such as Francis T. Edgeworth, Alfred Marshall, and Arthur C. Pigou. Their approach was different from vote-oriented social choice theory and garnered inspiration from the philosopher Jeremy Bentham. Jeremy Bentham and John Stuart Mill pioneered the utilitarian theory based on judgments about the social interests by "aggregating the personal interests of different individuals in the form of their respective utilities" (Sen 1998, 182).

Bentham's concern was more with the "total utility" of the community. Utilitarianism served as the backbone of welfare economics, pursuing maximum benefit for the collective whole, irrespective of individual gains or losses. He neglected distributional issues and came under criticism by authors such as John Rawls (1971) and Lionel Robbins (1938). They found the logic of utilitarian welfare defective and without any scientific basis. While Rawls rejected it on the basis of lack of concern for social justice, Robbins rejected it on the grounds that there could be "no common denominator of feelings" (636). From the 1940s onward, the focus shifted to Pareto efficiency (optimum gains). Arrow had demonstrated that Pareto efficiency, "nondictatorship," and "social choice with a complete ordering" could not be achieved simultaneously. Nor could a purely mathematical or formal approach be relied upon.

Contemporary social choice must deal with real-world problems and cannot ignore any conceivable cluster of individual preferences. Some preferences are bound to result in inconsistencies and incoherence in social decisions. When one prefers increasing one's own share without bothering about others, then the majority rule is bound to be "inconsistent." Voting may be considered as a viable choice for general elections, referendums, or committee decisions, but it may not reflect actual choice due to manipulation by the leaders, political parties, or media. It cannot help in arriving at some aggregative index of social welfare (Sen 1998).

There can be two obvious reasons. Voting requires active participation, and the opinion of someone who decides not to participate may not get any representation in social decisions. Additionally, even if one decides to participate in the voting process, there is no direct method of getting interpersonal comparisons on the basis of voting data. Because we cannot arrive at any meaningful interpersonal comparisons on the basis of choices made through voting, it is necessary to reject the consensus arrived at through voting systems in laying the foundation of a constructive social choice theory.

IN ECONOMIC THEORY

Economic theory draws on law and philosophy in evaluating rational decision-making. In economics, the focus is usually on maximization of utility, whereas under law an opinion may be based on shared understanding without any comprehensible reasons for which a shared understanding would lead to a shared preference. The same applies to majority voting behavior. The individual members of the decisive majority need not share the same reasons for voting or making social choices in a particular way. It is like saying that one wants to buy a white car because it is a sports car or just because it is a white car and vice versa.

According to Richard McKelvey (1976), an individual may make choices on the basis of one decisive dimension, making it difficult to organize rationally the different or plural dimensions of social choice. Two parties might form a coalition and say, "given a sports car, we would like to have it black." An

alternative pairing can form another coalition and say, "given that it is white, we would like to have a sports car." Hence coalitions can stick to generic preferences without any stable or rational basis. Much remains unresolved, yet we find adherence to common understanding of doing a thing in a particular way. It makes it rational for players to achieve certain shared goals. Such shared understanding comes through effective communication, accessibility, and intersubjectivity. Public reason can lead to collective action and social choices, though not necessarily on utilitarian basis.

As such, interpersonal comparisons of utility cannot really help in making interpersonal comparisons of social choices. We may find variations in terms of personal heterogeneities, environmental diversities, and variations in social climate or differences in terms of relative deprivation. It is not enough to know how many people are below the poverty line for the purposes of making social choice. It is also important to understand how deprivation is shared and distributed among the poor (Sen 1998). The same logic applies to gender-based inequality and deprivation of women in traditionally unequal societies. It is not enough to have liberty; it is important to make it effective.

Social Conservatism

Social conservatism is an ideological perspective on how individuals in free societies ought to respond to matters having to do with moral beliefs or behavior, cultural traditions, religious institutions, or patterns of social interaction generally. It involves the desire to see older norms and assumptions regarding all of these matters to be preserved. Hence, social conservative thinkers either oppose or are cautious about individual innovations in personal habits and preferences, marriage and family arrangements, civic rituals and customs, religious observances, and so forth.

In general, social conservatism reflects the concerns advanced by Edmund Burke, as well as other late-eighteenth and early-nineteenth-century writers who confronted modern revolutionary or democratic movements and transformations, and warned against or tried to moderate the changes being wrought by them. Their arguments were that society is not a social contract between individuals, but rather an organism, a living culture with a specific history and specific classes and customs that must be acknowledged; that social accomplishments depend on maintaining a foundation of traditions from which the members of society draw their inspiration and connection to the past and the future; and that a healthy society is one with both stability and continuity, which only widely accepted, shared, and promoted public values and practices can provide. These ideological beliefs form the traditional core of most socially conservative movements and parties around the world. However, many social conservatives today, while agreeing with these basic insights, have come to premise their ideological perspective on much more explicitly religious (generally Western Christian) doctrines than was the case with Burke and other "traditional conservatives." So thorough has been the merging of the cultural concerns felt by many Protestants and Catholics with the language of traditional conservatism in the United States that the label *Christian right* often has come to be used interchangeably with social conservatism itself.

Social conservatism in this sense is therefore a much stronger force in the United States than in other North American or western European countries, as the United States is by most measures a heavily Christian country, with high rates of religious affiliation and a frequent reliance on and a broad acceptance of religious rhetoric and arguments in political discourse. (The prevalence of this particular Americanized image of social conservatism around the world often leads various parties and movements that otherwise agree with certain principles of traditional conservatism, especially those associated with the ideas conveyed through the mostly secular Counter-Enlightenment tradition of Justus Möser or Joseph de Maistre, to eschew the label *social conservative* entirely.) This kind of social conservatism has been a growing presence in American politics and policy debates since the early 1970s, with the controversy over abortion rights, which exploded following the U.S. Supreme Court's decision in *Roe v. Wade* in 1973 to legalize abortion across the nation, often identified as the real beginning of the contemporary Christian conservative movement. But the ideology of social conservatism has been influential elsewhere as well. Contests over norms and laws regulating or permitting pornography, Sunday commerce restrictions, no-fault divorce, sex education in public schools, access to birth control, state-sponsored gambling, public funding of controversial or arguably offensive works of speech or art, homosexual behavior, and most recently homosexual marriages, have all been arenas in which social conservative thinkers, activists, and voters have been a major influence.

While initially many of these concerns had been seen as the sole and narrow concerns of various evangelical or fundamentalist Protestant sects, through the 1980s and 1990s they became important concerns for many conservative Catholic thinkers and voters as well. The merging of many evangelical and Catholic Christians into one socially conservative cultural and political movement (predominantly but not solely in the United States) had a large impact on not only party allegiances, but also on how the language and ideas of traditional conservatism have been adapted and used to advance various causes. For example, for many years in the United States. both Catholic and "social gospel" Protestant thinkers had seen—in different ways—their moral priorities as requiring an emphasis on progressive or communitarian responses to the problems facing their adherents. In this, American Christians often tended to follow European Christian socialist or democratic patterns (the Catholic church in Europe has long combined socially conservative perspectives on moral and civic matters with a support for social justice in economics). But in recent decades the secularization of American society has, for many believers, pushed those concerns aside in favor of a focus on conserving specific moral or religious norms and practices that often are grounded on common Christian beliefs shared across denominational lines. This synthesis, sometimes called *theoconservatism,* has had some influence on conservative parties and movements elsewhere around the globe, but for the most part this particular mix of concerns under the label of social conservatism remains an American phenomenon.

Social conservatism has had an ambiguous intellectual relationship with the development of *neoconservatism* in the United States. While some of the "new conservative" thinking that emerged alongside critiques of the social changes and egalitarian policies of the 1960s and 1970s did turn to social conservative ideas to buttress their arguments about the need for cultural standards and stability, not all did, with the result that the neoconservative intellectual camp remains divided between those who are doubtful of the religious tone of much social conservatism and those who embrace populist religious conservatism as a part of the neoconservative project.

Social Contract

The *social contract* is an agreement between the people and government, according to which rulers agree to rule justly and the people to obey. The idea is most familiar from works of the great contract theorists of the seventeenth and eighteenth centuries: Thomas Hobbes, John Locke, and Jean-Jacques Rousseau. But it has received considerable recent attention because of the work of John Rawls. In conjunction with the closely related idea of the consent of the governed, the social contract indicates popular control over government. As the people have agreed to it, they may view the contract as broken if government behaves unacceptably.

HISTORY OF THE CONCEPT

The social contract has a long history. Perhaps the earliest extant version is found in Book II of Plato's *Republic.* Plato's spokesman, Glaucon, argues that rules of justice arose from an agreement. People agreed not to take advantage of others, in exchange for not being taken advantage of themselves. However, this particular agreement established rules of justice, rather than political authorities to enforce them.

The contract developed into something approaching its classic form in the course of medieval struggles to place limits on royal authorities. A recognizable contract was expressed by Manegold of Lautenbach, a Saxon monk, in the late eleventh century, during the Investiture Controversy. Manengold argued that, if we would fire a swineherd who did not take proper care of our pigs, the same should hold with a ruler who did not take care of his charges. Arguments for limited authority were developed in the church by "conciliar" theorists, who claimed that authority in the church was held by the members generally (in different forms) and delegated to church officials on a conditional basis. Implications of this view were realized during the Great Schism of the Church, in the late fourteenth century, as two and later three competing popes contended for power. The Council of Constance (1414–1418), summoned to address the crisis, declared the authority of the council over that of the pope and resolved the problem of competing popes. Even though the conciliar position was beaten back in subsequent years, conciliar ideas were developed by later thinkers, who readily transferred them to secular bodies. An especially clear expression is the *Vindiciae Contra Tyrannos,* written in 1579 to justify resistance against the French monarchy. Arguments based on contracts between the king and the people were central to this and numerous other similar treatises

During the political turmoil of seventeenth-century England, Hobbes performed the impressive feat of using a contract argument to establish absolute government. Hobbes argued that the state of nature is a horrific condition, "a war of all against all" that is only remedied by the establishment of absolute government. To do so, people enter into an agreement that is literally unconditional, not a contract, but rather a grant of power by each individual to the ruler. In exchange for peace, they accept the inviolable authority of government.

The traditional contract doctrine, limiting governmental power, received classic expression in Locke's *Second Treatise of*

Government. Living under natural law that they enforce themselves in a generally peaceful state of nature, people come into conflict because of their self-interested natures, and so recognize the need for an impartial umpire. They leave the state of nature in two stages, through two agreements, forming first a community and then government. Although Locke does not refer to the crucial second agreement as a contract—he uses the language of "trust"—when its terms are violated, people have the right to resist.

The contract takes a radically democratic turn in Rousseau's *Social Contract.* In his *Discourse on the Origin of Inequality,* Rousseau depicts natural man as little different from an ape, but happy and morally innocent. The movement into society corrupts man, a condition that can be largely reversed in a properly organized society. The remedy is the new contract Rousseau presents in *The Social Contract.* People give up all their rights to the community, receiving in return rights to vote on all laws. For Rousseau, only the terms of this particular contract can render government legitimate. The only legitimate form is direct democracy, in which the people rule themselves, with their votes determining the "general will."

The historicity of a Lockean contract was sharply criticized by David Hume, in his essay, "Of the Original Contract." Although he agrees with what he views as Locke's fundamental claim concerning the limited nature of political power, Hume rejects an actual historical contract. There is no record of one, and people have no recollection of entering into one. Hume argues for limited government on grounds of social utility, without the fictions of an original state of nature or social contract. Government is necessary for the good of society. But if it ceases to be useful, it loses its rationale and so also its authority. Because of the enormous costs of changing governments, revolution can be justified only if governments become egregiously tyrannical. But in essence, this is what Locke too had held.

Hume's arguments did considerable damage to the idea of an actual social contract, which had always been vulnerable on historical grounds. Although theorists had used it as an analytical device, they tended to be ambiguous in regard to its historical existence. Accordingly, Immanuel Kant made an important contribution, in viewing the contract as purely hypothetical, rather than an historical occurrence. Kant argues that government is limited by the terms of a hypothetical agreement, which the united people could accept.

RECENT DEVELOPMENTS

Contract arguments were revived by John Rawls. In his monumental *A Theory of Justice* (1971), Rawls self-consciously places himself in the contract tradition. He argues that appropriate principles of justice are the product of an agreement between representative individuals in an artificial choice situation, the "original position." The representative individuals are placed behind a "veil of ignorance," which deprives them of knowledge of their personal attributes—age, race, level of talents, and so on—and so prevents them from choosing principles that would advantage themselves at the expense of other people. With Rawls and other recent

thinkers who argue along similar lines, the contract is not only a purely analytical device, but is used to identify appropriate moral principles, rather than to constitute a limit on legitimate political authority.

Social Darwinism

Social Darwinism is the theory that human societies obey the same process of natural selection that Charles Darwin identified in the natural world. Applying the idea of "the survival of the fittest" to society, politics, and economics, social Darwinists argue that the wealthy or strong succeed under conditions of fair competition because they are better adapted to their environments, and that the poor or weak therefore have no legitimate claim to government protection. Social Darwinism was especially popular in the late nineteenth and early twentieth centuries, although the term itself was typically used by its opponents rather than its advocates. While it had strong proponents on both sides of the Atlantic—most notably, Herbert Spencer and Walter Bagehot in England and Edward L. Youmans and William Graham Sumner in America—it was particularly influential in America where it was used to justify laissez-faire economics during the Gilded Age.

Despite the name, social Darwinism is most closely associated with the work of Herbert Spencer, who coined the phrase "survival of the fittest" nine years before the publication of Darwin's *The Origin of Species* (1859). Charles Darwin's own remarks on the application of his theory to human society are infrequent and tentative, although he was influenced by Thomas Malthus's argument that population growth was ultimately limited by food supply and that a struggle for existence naturally resulted whenever the former outstripped the latter. Herbert Spencer developed the social implications that many assumed were implicit in evolutionary biology and attempted to build the principles of evolution into coherent theory encompassing biology, psychology, sociology, and ethics. The popular association of this theory with Charles Darwin, however, gave it a veneer of scientific validity that masked its significant diversions from Darwin's theory. While Darwin's theory of natural selection was based on empirical

observation, the social Darwinism of Spencer and others was largely deductive and unquestioningly grounded its ethical and normative conclusions in claims about nature. Thus, although Darwinian evolution suggests that a particular characteristic or species flourishes simply because it is better adapted to a particular environment, social Darwinists understood *fittest* to mean *best* in a sense that reflected their preexisting normative commitments.

Social Darwinism was most commonly linked to conservative arguments justifying laissez-faire capitalism and minimal conceptions of the state. Social Darwinists argued that the accumulation of wealth demonstrated successful adaptation to the laws of economic competition and that assistance to the poor only preserved those who lacked the industriousness, intelligence, and self-control to succeed on their own. Therefore, efforts at social reform and state intervention in the economy (through poor laws, social reform programs, business regulation, and the like) violated natural economic laws and interfered with the progress of society by protecting its least successful members. Drawing on Darwin's observations, thinkers like Francis Galton argued that intelligence and mental qualities were heritable in the same way as physical characteristics; laws and institutions that preserved "inferior" individuals, he cautioned, ran the risk of degrading human populations. Applied to the genetic makeup of human populations, social Darwinist arguments could thus be used to justify eugenics and "social hygiene" programs. Similar arguments explaining competition between, rather than within, societies and wedded to assumptions of western cultural and biological supremacy were used to justify imperialism and colonialism.

Despite its initial appeal, critiques of social Darwinism developed early. One line of criticism questioned its scientific basis and emphasized its non-Darwinian features. Social Darwinists, for example, tended to conflate individuals and species as the primary unit of analysis, overlooked Darwin's insistence that adaptation could occur through cooperation as well as competition, and wrongly equated evolution with progress. Another line of criticism questioned the conclusions that social Darwinists drew from the "struggle for existence" in human society. Reform Darwinists like Henry George and Lester Ward insisted that the laws discovered through the social sciences, like the laws discovered through the physical sciences, allowed humans to shape rather than be mastered by their conditions. Because natural selection made no normative assumptions about the particular environment within which the process of adaptation occurred, Reform Darwinists argued that social and political institutions could restructure environments in ways that would facilitate human happiness.

The popularity of social Darwinism declined throughout the twentieth century as new conceptions of the scope and responsibilities of the state developed, and as knowledge of biology and culture increased. However, many see a revival of social Darwinist thought in the development of sociobiology since the mid-1970s.

Social Democracy

Social democracy as a political movement is intimately connected to the rise of modern industrial capitalism and the emergence of the industrial proletariat. This new social class of wage earners stood free from earlier forms of feudal allegiances and responsibilities, and social democracy can be seen as a response to the social needs and the political ambitions of this new industrial working class. In comparison to the earlier feudal and guild-based economic system, industrial capitalism implied that most workers faced a number of risks for which there were no organized remedies.

One of the first major organizational forms of social democracy was the First International, which was formed by British and French workers in London in 1864. One prominent reason behind the establishment of the First International was to hinder British employers in importing French labor to break strikes and thereby lower wages. Already here we see one of the major themes of social democratic ideology and politics, namely to protect the rights of trade unions by promoting solidarity among workers. The First International, in which Karl Marx and Friedrich Engels played important roles, organized several conferences, but it was formally dissolved in 1876 due to internal divisions between factions such as anarchists and revolutionary Marxists. It was followed by the Second International, which was created by European socialist parties in 1899 and dissolved in 1916 due to its failure to prevent national member parties, especially the Austrian and German social democratic parties, from taking a stand in the First World War (1914–1918). The outbreak of World War I was generally seen as a major defeat for the social democratic movement. By arguing that class solidarity was more important than nationalism, leading social democrats in Europe had tried to cool down nationalist fevers, and they made promises at various conferences to do whatever they could to stop the war. This came to an end in 1914 when the Austrian Social Democratic Party, then the strongest party in the Austrian Parliament, and a majority of the Social Democratic members of parliament (MPs) in the German parliament decided to support their governments' war efforts.

THE REVISIONIST DEBATE

The date and place of the birth of modern social democracy as a political ideology can be set to the years between 1896 and 1898 and took place within the German Social Democratic Party. The initiator was Eduard Bernstein, a leading member of the party and one of its foremost theorists. Bernstein had been collaborating with both Karl Marx and especially Friedrich Engels in London and was the editor of one of the German Social Democratic Party's main publications. In a series of articles published in 1896 (later published as a book titled *The Preconditions for Socialism*), Bernstein came to question a number of the central canonical ideas of Marx and Engels and this created an intense debate (i.e., the revisionist debate) within the German Social Democratic Party. Bernstein denied the absolute (zero-sum) character of the conflict between the industrial proletariat and the capitalist class. He criticized Marx's theory about the increasing concentration of capital and the prediction of a rapid collapse of capitalism. He also argued against the scientific nature of the Marxist theory and instead introduced a more idealistic notion of politics based on Immanuel Kant's theories. As a result, Bernstein argued that the party should abandon its revolutionary "all-or-nothing" strategy and pursue a more pragmatic, piecemeal reformist type of politics to improve the situation for the working class. Most importantly, Bernstein was opposed to all forms of violent insurgency, and he argued that the party should work through parliamentary democracy, the rule of law, and union-led bargaining with the various employers' federations.

Bernstein's new ideas sparked an intense debate. He had spent a number of years in exile in London and had come to appreciate the liberal character of the British society. Consequently, he reconceptualized socialist theory as the logical extension of the principles of liberal democracy. His opponents were mostly orthodox Marxists such as Karl Kautsky, Rosa Luxemburg, and Clara Zetkin. It must be emphasized that the German Social Democratic Party at this time was seen as the strongest and theoretically most advanced socialist party. In an election held in 1890, it won a stunning victory and become the largest political party in Germany.

What is of special importance in this debate is the character of the arguments. Bernstein's line of reasoning was not only grounded in ideological terms but also rested on a number of empirical observations that he backed up with a wealth of statistics and other data. The main thrust of his argument was that because there had been no sign of a breakdown of the capitalist economy, no tendency of the proletariat to become the majority of the population, no pauperization of the working class, and not many indications of an increasing revolutionary class consciousness within the labor movement, the Social Democrats should abandon their revolutionary strategy and instead opt for negotiations and compromises with the power holders in the capitalist society. Moreover, Bernstein argued that in its political practice, the German Social Democratic Party had already commenced on this strategy, not least in local politics and in the strategy used by the labour unions. According to Bernstein, what he asked for was merely that the official Marxist revolutionary party ideology should be adjusted to the party's political practice. The way forward, according to Bernstein, was not to strive for the establishment of a socialist state through a political revolution, but to strengthen the working-class movements' organizational resources in order to gradually improve workers' living and working conditions.

The counter arguments produced primarily by Rosa Luxemburg and Karl Kautsky were very different from Bernstein's empiricist reasoning. Instead of challenging Bernstein's description of the political and social situation in Germany by presenting a different set of facts, they chose to rely almost entirely on Marx's general theory. Luxemburg did recognize that especially the trade unions had to use a piecemeal strategy to get workers to join and economically support the unions and the party. However, the main motive for supporting the gradualist strategy that the unions advocated was, according to Luxemburg, not to improve workers' living conditions. Instead, Luxemburg argued that the very nature of the capitalist society would prove that such a reformist strategy was doomed to fail and that the result would be that "the proletariat becomes convinced of the impossibility of accomplishing a fundamental social change through such activity and arrives at the understanding that the conquest of power is unavoidable" (Luxemburg 1972). The question Luxemburg could not deal with was, of course, what would happen if the piecemeal strategy pursued by the unions succeeded. The problem she and the other orthodox Marxists could not answer was why workers should continue to support the unions if these could not produce results that would improve workers' conditions. This is the point at which we find the logic of modern social democracy. The piecemeal strategy implies that it has to produce results and that the leaders who produce such results have to defend them in front of their members. Otherwise workers have no incentive to support the labor unions, which traditionally have been the organizational backbone of social democratic parties. This has created a self-referential political logic in which the constant production of piecemeal results confirms the ongoing success of the reformist strategy.

SOCIAL DEMOCRACY VERSUS ORTHODOX MARXISM

The departure from orthodox Marxism was based on four ideas that later became the defining principles for modern social democracy. The first is the support for parliamentary democracy, civil liberties, and the rule of law not only as (in Marxism) a means to reach the socialist goal, but also as political ideals in their own right. The second is the gradualist approach to political change that implies a focus on negotiations, coalitions, and social compromises. The third is the willingness to adjust the political means to new realities instead of relying on a "grand theory." The fourth is the abandonment of seeing the socialist society as a fixed goal in favor of strengthening the labor movements' organizational capacity. "The final goal is nothing, the movement is everything" is a statement

often attributed to Bernstein. In some European countries (e.g., Austria, Denmark, Germany, Norway, and Sweden), the focus on such organizational measures in the years following World War II (1939–1945) eventually resulted in a huge set of social democratic organizations that covered most needs in life, including activities for young children, sport, leisure, culture, and funeral societies.

While formally staying within the Marxist orthodoxy, the German Social Democratic Party accepted Bernstein's "revisionism" as a legitimate minority view and in practice came to act much according to Bernstein's ideas. The outbreak of the 1917 revolution in Russia and the Bolsheviks' seizure of power by nondemocratic means created an unbridgeable gulf in the socialist movement between social democracy and communism. From the late 1920s, the communist parties in Europe (on Stalin's order) chose the class-against-class strategy and accused the social democratic parties in western Europe of collaborating with the class enemy and labelled them *social fascists.* This split in the socialist movement was one of the reasons for the successes of fascism in Italy and Nazism in Germany, because it made it impossible to form a broad democratic alliance by center-left forces. In addition, as Sheri Berman has argued (1998, 2006), the relative strength of Marxist orthodoxy in the German Social Democratic Party hindered it from developing a politically viable strategy against the economic depression in the 1930s. The situation was the opposite for the Scandinavian Social Democratic parties, and they were able to develop Keynesian types of strategies that became the source for electoral success during the 1930s and led them to become dominant political parties in their respective countries.

CONTEMPORARY SOCIAL DEMOCRACY

On a global scale, social democracy of today is a major international political force. The Socialist International has about 150 member (or associated) parties in 110 countries, of which many are electorally successful and quite a few control the government. Currently social democrats rule in, for example, Australia, Brazil, Greece, Norway, Spain, and the United Kingdom. Longer periods of social democratic government power have taken place in Sweden between 1932 and 1976, in West Germany from 1969 to 1982, in Norway between 1945 and 1965, in Australia from 1983 to 1996, and in the United Kingdom from 1997 to the present. In addition, several social democratic parties have produced a number of political leaders with an international standing; for instance, Tony Blair, Willy Brandt, Gro Harlem Brundtland, Francois Mitterand, and Olof Palme. The ideology of such a broad movement is by nature diffuse. At a very general level, contemporary social democratic ideology can be understood as a combination of "negative" and "positive" rights. On the one hand, social democracy is liberal in the sense that the respect for individual freedom, parliamentary democracy, and the rule of law is central. On the other hand, social democracy strongly favors governments' obligation

to provide citizens with a number of "positive rights" in the form of social services and social insurance systems that either have a very broad coverage or are mandatory. In this focus on social rights, social democracy differs not only from free-market liberal ideology, but also from various forms of conservatism in this emphasis on equality. Individuals should be entitled to resources that make it possible for them to, if they so wish, break away from traditionally established forms of life, regardless if they are based on social class, gender roles, religion, ethnicity, or culture.

The main thrust of social democracy today is that market-based economic prosperity and international economic competitiveness are fully compatible with an encompassing, publicly provided system of social insurances and social services, the latter often including huge investments in education and health care. Social democracy has therefore during the last decades been in conflict with the neoliberal economic agenda that argues that public spending hampers economic growth and individual responsibility. In addition, many social democratic parties, especially those in the Nordic countries, have been pushing for increased gender equality through policies such as subsidized day care, equal pay, and generous publicly funded support for parental leave. Lately, issues concerning environmental protection and minority or immigrant rights have been added to the social democratic agenda.

Concerning the market economy (or capitalism), European social democracy came to abandon its anticapitalist rhetoric during the 1940s and 1950s. Keynesianism had provided social democracy with policy measures to intervene in the capitalist economic system so as to avoid the type of dramatic crisis that hit the world economy in the early 1930s. However, following the idea of positive rights, social democratic ideology does not embrace an unregulated market economy. On the contrary, the view of markets is pragmatic, which often has resulted in an extensive set of policies for regulating markets and for ameliorating class-based economic and social inequalities. In political economy research, such systems have been labelled *social market economies,* and they have been contrasted to *liberal market economies.* The impact of social democratic parties during the post–World War II period has been particularly strong in Austria, the Nordic countries, and the United Kingdom and to some extent also in Australia, Germany (i.e., the former West Germany), the Netherlands, and New Zealand.

The Socialist International and many national social democratic parties have been important in promoting democratization; for example, in southern Europe (Greece, Portugal, and Spain) in the 1970s, as well as in many third world countries. The Party of European Socialists is today the second strongest party group in the European Parliament, with 217 MPs (out of a total of 785). From a global perspective, it seems as if the center of social democracy during the past fifteen years has shifted from northern Europe to Latin America, where a number of countries (Bolivia, Brazil, Chile, and Costa Rica) are led by social democratic governments.

MAJOR ACHIEVEMENTS

Social democracy is closely connected to the establishment of encompassing systems of social insurance and social services also known as the *welfare state.* The general idea is that such systems should not be limited to the poor, but that they should be either universal or cover broad segments of the population, including the middle class. The idea is an outcome of the principle of *social solidarity* and based on an ideology that governments should provide citizens with a number of "basic resources." Such policies have become widely popular and often are supported by other political parties as well. In many ways, modern social democracy can be understood as an ideology that is tuned to the notion of finding a middle way between neoliberal capitalism and heavy-handed statism. While its neoliberal opponents often have warned that such a system may require taxes at such high levels that the economy would suffer, this has generally not been born out by the facts. Empirical research about the relation between high levels of taxation and public spending on social services and social insurance systems, on the one hand, and international economic competitiveness, on the other hand, tend to speak in favor of the social democratic project. There are various reasons for this counterintuitive outcome. One is probably the investment in human capital. Another reason is that, because of problems with asymmetric information, markets are usually less efficient than governments in terms of handling the demand for social insurances. Recent research tends to indicate that this holds not only for developed Organization for Economic Cooperation and Development countries but also for developing countries.

UNSOLVED PROBLEMS AND THE FUTURE OF SOCIAL DEMOCRACY

The main unresolved problem for the social democratic project is that Bernstein's idea that socialism could be reached by a gradualist parliamentary approach is nowhere to be seen. The Socialist International recognizes this in its current program and states that it has no blueprint or clear vision of what socialism (or *economic democracy*) may look like. Nationalization of major industries, which was high on the agenda in many European countries during the 1950s and 1960s, did not produce the results many had hoped for. Even though social democratic parties have been supporting increased union rights such as systems of codetermination within companies, few would say that this can be seen as economic democracy. Moreover, labor unions have not been supportive of systems wherein workers would be the owners of companies because this would minimize the need for unions. One of the most ambitious plans for economic democracy was launched by the Swedish Social Democrats during the 1980s. The system, known as *wage-earner funds,* forced companies to pay a certain amount of their profits into union-controlled funds that would then be invested in companies and thus, through such a system of ownership, wield economic power. After an unusually intense political debate that lasted for more than a decade, the system was, in a scaled-down version, introduced by the Swedish Social Democrats

in 1983, but it was abolished by a center-right government in 1992. This ideological defeat led the Swedish Social Democrats to abandon this version of economic democracy during their twelve years of rule from 1994 to 2006. Interestingly enough, one reason behind this ideological defeat was that the unions could not muster political support among its own members for this variant of economic democracy.

Another problem for the future is the development of main political cleavages. Social democracy has been closely connected to the traditional left-right class-based political division that follows the logic of industrial capitalism. It is not clear how the social democratic ideology will handle new types of cleavage structures based on, for example, problems related to immigration, globalization, environmental protection, and various forms of identity politics.

Social Engineering

In a broad sense, any social change brought through deliberate efforts by government (i.e., all laws and policies) that have the effect of changing behavior and characteristics of a society can be labeled *social engineering.* In its standard usages, the term has rather a negative connotation. The development of modern communications technology, administration, technical and managerial resources, and the media provided the tools through which social engineering could be carried out. Relevant for the modern history of the concept is Karl Popper's distinction between *piecemeal* and *utopian* or *holistic* social engineering, or what we would call the difference between reformist and revolutionary solutions. For Popper (1971), the former is the only form of social engineering that can be rationally justified—one that is small-scale, incremental, and continuously amended in the light of experience and aimed at reducing human suffering. In political discourse, the term is generally used in three different contexts.

1. *Ideologically based policies and techniques aimed at a radical change in the makeup of a society.* Typical examples are totalitarian political systems, which usually engage in visions and pursuit of grandiose social engineering schemes that more often than not involve the thorough remaking of the population, with the goal of creating the desired or "perfect" society. In the 1930s, in Nazi Germany, the idea of the pure Aryan *bermench* was to be achieved by using selective methods of human reproduction and eugenics. In the 1920s, the revolutionary government of the Soviet Union embarked on a project aimed at remaking class structure to obtain the so-called classless society by eliminating the "exploiting classes" and to create the New Soviet man. Other similar examples are the Chinese Great Leap Forward and Cultural Revolution programs (in the 1950s and 1960s) and the Khmer Rouge's genocidal plan of deurbanization of Cambodia (1970s).

2. *Accusation against any policy or theory that advocates changes from above in the characteristics of a society.* It is employed often by the political right as a charge against those who propose to use legislation and policy to change existing social relationships (e.g., between genders or ethnic groups), even if no violence and brainwashing are involved. (Also, political conservatives in the United States have accused their opponents of social engineering because of their promotion of political correctness, insofar as it may change social attitudes by defining "acceptable" and "unacceptable" behavior or language.)

3. *A practical approach or science to solve various problems in the society.* Interestingly, social engineering has been an

official field of study at the Tokyo Institute of Technology since 1966. According to the institute's official website, the discipline has the goal "to solve various problems in the society through practical approaches."

At the end of the nineteenth and in the early twentieth centuries, the idea of social engineering influenced the political thinking and policies in many countries. In the United Kingdom, the Fabian Society tried to establish an association for social engineering, especially to reform social conditions of the working class. In the United States, the idea for a time attracted many intellectuals, including Charles Beard, John Dewey, and Walter Lippmann, and inspired the establishment of such institutions as the Institute for Governmental Research (1916) later the Brookings Institution; the New School for Social Research (1919); and others.

Many critics of social engineering argue that in a democratic polity, it is assumed that society, and especially its founding elements, the citizens, are already evolving independently. They direct and determine government and politics through elective representatives and would resist attempts for radical programs for societal change.

Socialism

Socialism was the most influential secular movement of the twentieth century, worldwide. It was a political ideology (or world view), a wide and divided political movement, and a socioeconomic model tried and developed on a large scale. Weakened in the current twenty-first century, it is still a significant political current, particularly in Europe and Latin America.

A CONFLUENCE OF CURRENTS

Socialism became a public social movement in western Europe of the 1840s, but it grew out of the radical Enlightenment and the leftist currents of the French Revolution (1789–1799). Jean-Jacques Rousseau was a key precursor as an egalitarian and as an icon of the Jacobins and the left wing of the French Revolution. Several currents of thought converged in nineteenth-century socialism.

There were the radical traditions of the Enlightenment, egalitarianism, rationalism, and discrete materialistic atheism. There were the far left activists of the French Revolution, whose legacy was carried forward by postrevolutionary

Delegates of the French Socialist Party stand below a banner reading "Socialist Party, member of the French section of the International Working Men's Association—Workers of the World Unite." Karl Marx was a leading figure in the first International Working Men's Association, or the First International, in 1864.

activists like François-Noël Babeuf, Filippo Buonarroti, and Auguste Blanqui into the embryonic French labor movement of the 1830s and 1840s. There was the sociological analysis of Henri de Saint-Simon and his followers, heralding the arrival of a postrevolutionary industrial society with a new constellation of classes and social forces. There was the enlightened employer Robert Owen, with ideas of producers' cooperatives, inspiring one of the major French "utopian socialists," Eugène Cabet, who was exiled to Britain in the 1830s. There were the new, postfeudal conceptions of labor, incorporated into French Revolution ideas of citizenship by one of its most influential thinkers, Emmanuel-Joseph Sieyès, and there were the Ricardian socialists of Britain, developing David Ricardo's early-nineteenth-century political economy into a critique of capitalism.

Socialist ideas of equality, association, cooperation, and mutualism began coming together in radical labor movements, largely by skilled workers and artisans of France and England in the early 1840s. By 1842, it had become the topic of a major academic analysis by a German scholar, Lorenz von Stein, in his *Socialism and Social Movement*. They came to the forefront, if not to victory, in the Europeanwide national democratic revolution of 1848. The German League of the Just, a diasporic association of left-wing artisans, commissioned Karl Marx and Friedrich Engels to write a program for them. It became the most famous political pamphlet ever—the *Communist Manifesto.*

As a modern political ideology, socialism was a rival of liberalism, as well as of traditional popular deference to royals

or religion. Its most distinctive values were solidarity—which in its collective identification differs radically from charity or compassion—and equality. Both may be seen as manifestations of collectivism. This was a collectivism mainly deriving from workers' experiences, with little means to defend their interests as individuals in the face of merchants, factory owners, master craftsmen, landowners, the propertied, and the generally well-heeled. In the socialist value system, individual freedom is located within parameters of collective responsibility.

Socialism stands for the rights of labor against those of property. Socialism also drew on the modern idea of democracy, which came to the fore, if more in rhetoric than in reality, during the radical phase of the French Revolution. The socialist labor movement became the major international force of universal suffrage and democracy in the nineteenth and early twentieth centuries, in the period when there were severe restrictions and fraudulent manipulations of civic political rights everywhere.

Most socialist currents affirmed the modern world of industry, mobility, exchange, science, and rationalism. This modernism was particularly pronounced in Marxism and in Latin European socialism of republican and anticlerical roots, while at the same time condemning capitalism as an exploitation of modern possibilities as well as of human labor.

But there were also currents inspired by dissident Christianity, often in Britain and then usually coming out of left liberal politics and a romantic anti-industrialism. Socialist communitarianism has always had several entrances. It could even be hijacked by nationalist tendencies. This was a particular risk in Germany, with its strong statist and romantic traditions. What became Nazism started out as an extreme nationalist alternative to the internationalist socialist labor movement, the German National Socialist Workers' Party.

AN INTERNATIONAL MOVEMENT

Socialism developed into a large, well-organized political movement from the last quarter of the nineteenth century, beginning on the European continent. The Social Democratic Party of Germany (SPD), founded in 1875, soon became the largest socialist party and a leading international source of inspiration. In Britain, labor politics and trade unionism developed without separation from the liberal party until the end of World War I (1914–1918), while around the turn of the century, labor became governing parties in the White Dominions of Australia and New Zealand.

Socialism was an international ideology and an international movement. In 1864 the First International, the International Working-Men's Association, was formed, with Karl Marx as the leading figure on its general council. Polarized between anarchist followers of Bakunin and Marxian socialists, it remained small and ineffective. In the conservative repression after the popular uprising in France, the Paris Commune of 1871, the headquarters of the First International were moved to New York, where it soon petered out. A new beginning was the forming of the Second International in Paris in 1889, as an unofficial part of the Centenary of the Revolution. Up to 1914, the regular congresses of the Second International were

the major events of international socialism. It was overwhelmingly Eurocentric, though American, Australian, and Japanese delegates occasionally attended. Important extra-European socialist parties—the very European Labor transplants in Australia and New Zealand excepted—were first created by the communists of China, India (though a small minority), Indonesia, and Vietnam.

World War I split the International, with most parties siding with its own warring nation. An even more bitter split was caused by the Bolshevik Revolution (1917) in Russia. The Bolsheviks were the core of the antinationalist minority of the International, and now their reckless one-party revolution (the Mensheviks was another Russian socialist party of the International) led to a deep, lasting divide of international socialism, between revolutionary communism, which set up its own Third Communist International, and democratic socialism or social democracy.

The Comintern was dissolved in 1943, for reasons of Soviet geopolitics, although there remained de facto an international communist movement, aligned with the Soviet Union. The noncommunists were divided between the world wars, but in 1951 the Socialist International was reconstituted. It was reinvigorated during the presidency of Willy Brandt, in 1976 to 1992, who as a major statesman (former chancellor of West Germany), gave it a high profile and pushed it throughout the third world. The Socialist International is still active and organizes conferences and seminars all over the world but has become too heterogeneous to be a very important global player. It currently has 115 parties as full members, a few countries having two or three. Its membership is strong in Europe—east, including postcommunist parties outside Russia, and west—and in Africa, Latin America, and Oceania, but weak in Asia and Brazil.

Socialism has always had particular difficulty in setting roots in North America, in the United States in particular. The German social scientist Werner Sombart devoted a short book in 1906 to the question, *Why Is There No Socialism in the United States?* The term *socialism* then meant as a mass movement, like in continental Europe. Sombart's analysis is fairly complex, referring both to the established two-party system and to socioeconomic factors, such as high average wages, less visible everyday class differences, and opportunities for social mobility—while unexpectedly concluding that the factors that until now have prevented socialist development in United States are about to disappear.

While many factors certainly contributed, latter-day historians have tended to put strong emphasis on the establishment of a mass two-party system well before the rise of the socialist movement. In Britain, which at the time when Sombart wrote did not have much of a socialist movement either, the party system was shaken by the horrendous casualties of the world wars, aided by the war-related split of the liberals. The late and much less costly American entry into the war could sustain an enthusiastic nationalism, while shattering the pacifist Socialist Party.

What the classical socialist movement was striving for was a new socioeconomic order, socialist as opposed to capitalist.

There was no blueprint for it, since the utopian communities outlined in the first decades of the nineteenth century had been left behind. Marxism was explicitly dismissive of a concrete program for what was seen as something going to evolve, on an international scale, out of the contradictions and class struggles of capitalism. But there was wide agreement that a socialist society would include public ownership of the industrial means of production and of banks and major trading enterprises. About land there was a lively internal debate and no agreement on household ownership or collective organization. Ample room was usually given to cooperatives of various kinds, which the European labor developed extensively and in varied forms: consumer cooperatives, mutual insurance funds, and, less often, producers' cooperatives.

BUILDING SOCIALISM

Before the end of World War II (1939–1945), democratic socialists never got a political chance to transform the socioeconomic order, albeit Scandinavian social democracy got into office on a platform of alleviating the Depression, providing employment and support for the most vulnerable, but with no majority of their own before the war.

What they could do in a number of places was to develop *municipal socialism,* not only in many European cities but also, occasionally, in the United States, such as in Milwaukee. The most ambitious and successful example was Vienna, under social democratic control from the end of World War I until a reactionary coup in Austria in 1934. An extensive housing program, with lots of collective services (kindergartens, schools, libraries, and other collective leisure space), was at the centre of *Red Vienna* and inspired socialists all over western and central Europe.

In the Soviet Union, the communists embarked upon a huge experimental undertaking, without precedent even in theory, to "build socialism in one country." The enterprise was seen as a struggle for survival of a poor country ravaged by the world war and by subsequent civil wars and foreign military interventions. It entailed a brutal collectivization of agriculture to pay for a frantic industrialization under state ownership, and a centrally planned economy, driven more by political targeting and mobilization than by economic calculation. The human costs were enormous, largely because of tenacious peasant resistance, with which the Bolsheviks brooked no compromise. However, the contrast of the spectacular industrial growth of a planned economy in the midst of the global depression made a huge impact far outside communist circles. Most important was probably its impact of the generation of anticolonialist nationalists who were to lead their independent countries after World War II. Soviet socialism emerged as a major model of national development. It also seemed to have passed a crucial test in the war when, unlike Russia in World War I, the Soviet Union was not crushed by the formidable German war machine and in the end was victorious.

A planned economy with full control over finance and investment and state-led industrialization was a widely popular

development model, guiding not only new communist-ruled countries in Asia and Europe, but also in Burma, India, Indonesia, and somewhat later revolutionized Arab countries such as Algeria, Egypt, and Syria. A "socialist pattern of society" was the official goal of independent India. It was adopted by African liberation movements, which tried to implement them after independence. The latter even set out to collectivize agriculture, something the Asian noncommunists avoided. In Latin America there had been some interest in the Soviet economic development, but before the Cuban Revolution (1959) it never went far in economic practice.

The first results could very well be taken as promising. Communist eastern Europe was catching up economically with long richer western Europe, and also in terms of education and life expectancy, while refraining from repeating the Soviet brutality of the 1930s. After a century of economic stagnation, both Communist China and democratic socialist India started to develop, economically as well as with respect to health and education.

Most postwar European social democracies still had no full political mandate. But the British and the Norwegian Labor Parties did began what they intended as a socialist transformation, the Norwegians by starting a system of sophisticated macroeconomic planning, the British by nationalizing a good part of what was called the "commanding heights" of the industrial economy: the coal and steel industry and transport. The 1970s to early 1980s saw bold social democratic attempts at socialist change. In Sweden the strong unions developed a plan for so-called wage-earners' funds, financed out of corporate profits and controlled by trade union representatives, which would gradually become the main owners of the big business corporations. The plan was reluctantly accepted by the social democratic leadership, but when they returned to office, the political momentum, in the face of stiff right-wing opposition, had been lost. The French Union of the Left, led by the socialists but also including the Communist Party, came to power in 1981 on a program of rupture with capitalism. It took the form of a series of important industrial and bank nationalizations. But the attempt soon became bogged down in the international economic crisis of the early 1980s, and the government beat a retreat to liberal policies.

In December 1949, one of the world's most renowned economists of the first half of the century, the heterodoxly conservative Austro-American Joseph Schumpeter delivered an address before the American Economic Association, titled *The March into Socialism*. His argument was that capitalism was destroying itself and was most likely to be superseded by *centralist socialism*. The very success of business and capitalism was about to make the "civilization of inequality and family fortune" sustaining them pass away.

Schumpeter's prospect drew on a special argument about family enterprise, but was part of a very broad public opinion at the time. Forty years later, in 1989, not only maverick conservatives but also many socialists and communists, as well as others in between, would regard the *centralist socialist order* as bankrupt. What links the two different assessments was the

unexpected, historically unprecedented economic growth in the decades after World War II.

It seems that what the socialist economy could achieve, provided there were enough skilled and dedicated organizers to run it (which was often lacking in Africa), was what has been called *extensive development*, mobilizing idle resources and providing basic social needs. But in a world of rapid economic advance, socialism faced problems in developing innovations—outside of strategic political goals, such as the Soviets beating the United States in the first rounds of the space race—and in providing large volumes of discretionary consumption to wide varieties of taste. From the late 1960s, communist eastern Europe began to fall behind western Europe again.

There is also the vulnerability of an alternative economy in a competing, hostile world, something the French Mitterand government soon had to take notice of, and which has guided European social democracy to caution and gradualism. The South African ANC in power has found it easier to promote a black capitalist class than to construct a socialist economy as a base of urgently needed social development.

PROSPECTS

Socialism is little likely to regain its extraordinary influence from the second third of the twentieth century, although it is not unimaginable, and it remains an important part of twentieth-first century politics. The Soviet chapter is closed, but the Chinese government retains at least a rhetorical commitment to socialism, which might conceivably be turned into something more tangible. There remains unsettled the question of how capitalism and socialism should be defined and their boundaries delimited, entailing new possibilities of identity and opposition. Issues of how much public or private ownership, how much public regulation, how many social entitlements, and how many private markets are still central controversial issues. State ownership, public planning, and public regulation have played a very different role in the recent economic success of East Asia than they have done in the United Kingdom and the United States. Generous social entitlements are part of the open, competitive economies of northern Europe, while deemed to be incompatible with international competitiveness in other parts of the world. The financial crisis of that began in 2008 and the increasing urgency to get climate change under control have pushed those issues of socio-economic order into the political spotlight.

Socialism as an ideology has lost its development model and its visible horizon of a rupture with capitalism, which has diminished its appeal. But its core values of solidarity, equality, and collective responsibility are still widely used as critiques of the current world.

As a political movement, democratic socialism is a significant force of the new century, in a wide if neither universal nor coherent Socialist International, and as the second (in size) political grouping of the European Parliament. Communist parties are still ruling China, Cuba, and Vietnam, claiming socialist aspirations, and new powerful socialist movements have recently emerged in parts of Latin America.

Socialist Transition

In classical Marxist theory, the transition to socialism is the period between the overthrow of capitalism and the achievement of communism. Although there is a sketch in Marx's writings of what communism will look like, the institutional and social features of the socialist transition were not comprehensively outlined by Marx or his successors. According to Marx, communism, which also is called the second or higher stage of socialism, will be achieved when there is an end to social alienation. An end to alienation would be achieved when there are no social differences—which are created by economic inequality—and human beings enjoy mastery over themselves and nature. When this condition is achieved, there no longer will be any need for the political management of social division, and consequently, the state will wither away and political conflict will cease.

The socialist transition is, in the revolutionary tradition, the stage before this higher stage of socialism is reached. Coming as it does between the end of capitalism and the achievement of communism, it contains some elements of both. However, Marx did not specify how elements of communism and the capitalist past were to be reconciled and the latter transformed, and he did not work though how his ideas on the political organization of socialist transition might fit with his ideas about economic management. Indeed, Marx's analysis of socialist transition was coincidental. His main description of the economic nature of the transition came in a polemic, the *Critique of the Gotha Programme,* against opponents in the German Social Democratic Party, and his main description of the political form of transition came in an extended piece of political journalism on the 1870 Paris Commune uprising, *The Civil War in France.*

ECONOMIC AND POLITICAL ASPECTS OF TRANSITION

Economically, Marx simply noted that the first stage of socialism would see a continuation of unequal rewards for work. This, Marx argued, was necessary because socialism would still bear the "birthmarks of the old society from whose womb it has emerged." Only later, when distinctions between different forms of labor had been eradicated and work had become an activity through which people expressed themselves, rather than a means of survival, would differentials in reward be ended and distribution take the form of "from each according to his abilities, to each according to his needs."

Politically, Marx saw the socialist transition as being governed by a *dictatorship of the proletariat,* and the Paris Commune of 1870 was an example of this dictatorship. The commune was a democratic reflection of a unified and indivisible proletarian political consciousness for Marx. There were no differences between politicians and workers, and workers were politically active and could recall deputies to the commune who did not reflect the popular will. The commune represented a unified proletariat, and there was no meaningful difference between the commune as an institution and the proletariat as a class. Lenin copied this vision of socialist democracy under the dictatorship of the proletariat in his *The State and Revolution,* in which he described the soviets of the Russian revolution as a version of the Paris Commune. It was not a vision that recognized pluralism or dissent; such things would not exist because of the proletariat's unity. This unity would ensure that the state, as an autonomous force of class repression, would begin to wither away as soon as the socialist transition began.

Marx's failure to devote much time to a theory of socialist transition was not accidental. Underlying what he wrote on the subject was the assumption that the time between the collapse of capitalism and the achievement of the higher stage of socialism would be fairly brief. The demise of capitalism would occur only when it had fulfilled its historical mission and developed a high level of material wealth and a unified proletariat with a pronounced socialist consciousness. Socialism would thus emerge when the time was ripe for it so that the organization of the transition from the lower to higher stages would be minimal. As a dominant and unified socialist class, the proletariat would not require a large political organization, and economic productivity would be high so there would be no need for an extensive state role to ensure the economic abundance on which communism would rest.

No communist party took power in Marx's ideal circumstances; indeed, most of them took power where the proletariat were a minority and the economy was underdeveloped. Therefore, communists came to power where there were no supports for socialist development. Engels had warned of the disasters that this would bring: The "worst thing that can befall a leader of an extreme party is to be compelled to take over a government in an epoch when the movement is not yet ripe for the domination of the class which he represents . . . .

Whoever puts himself in this awkward position is irrevocably lost" (1966). The result was that an already antipluralist conception of popular democracy became even more hostile of and repressive toward political and social difference as communist parties consolidated their control as representatives of the missing proletariat and forced economic modernization to try to create the material circumstances necessary for socialism. As they did this, they created more stages of socialist transition to mark their "progress." These new stages of socialist transition sought to excuse the state's continued existence and vaunt the moral superiority of socialism over liberal democracy. They also were used by communist states to distinguish themselves from rivals within the socialist camp. Hence the USSR proclaimed it had built *developed socialism* before the rest of the socialist camp, while China proclaimed it could leap ahead of the USSR when it split from its sphere of influence in the early 1960s. In the end, the theory of socialist transition became an instrument of foreign policy and a device used by dictatorial rulers to legitimate themselves.

Socialization, Political

Political socialization is the process by which individuals develop a relationship to the political world and acquire the knowledge, beliefs, values, and behaviors conducive to citizenship. Through socialization, people gain a sense of belonging to a society and community and are inducted into the political culture of their nation. Socialization helps people assimilate to their political system by conveying the principles and actions that make them good citizens. In the United States, the sense of being an American, which encompasses belonging to a unique nation where people share a belief in democratic ideals, is passed on through the political socialization process.

Political socialization is responsible for the transmission of political culture across generations. Political culture is "a system of attitudes, values, and knowledge that is widely shared within a society" (Inglehart 1990, 18). Common understandings about the customs, traditions, folklore, and heroes associated with a given societal community, as well as the nature and operation of government, are passed on through the political socialization process.

EVOLUTION OF THE FIELD

The intellectual origins of political socialization research are rooted in studies of civic education. In the early 1900s, Graham Wallas made the connection between childhood education and citizenship, highlighting the psychological dimensions of political behavior. The work of Charles Merriam and his colleagues in the 1930s advanced the field and established a focus on childhood citizenship training as a means of maintaining stable democratic political systems. Formal civics instruction was considered a vital mechanism for the development of democratic citizens who would be loyal to the state and obedient to legitimate authorities and who would recognize their political obligations, such as serving in the military, especially in times of political stress.

Political socialization scholarship flourished during the behavioral period in political science where the emphasis was placed on objective investigations into political behavior as opposed to normative instructions for the making of good citizens. From the 1950s through the 1980s, large-scale studies were conducted, scores of publications were produced, and college courses on socialization were offered routinely. The term *political socialization* came into vogue in the 1950s with the publication of Herbert Hyman's synthesis of the extant scholarship related to preadult political learning. Research in the behavioral tradition sought to explain how people acquired political norms, identities, and orientations, including attitudes toward the political system, trust in government institutions, and sense of political efficacy. Scholars were invested heavily in exploring voting as the primary commitment of citizenship. Much attention was devoted to studying the development of partisan preferences that often were passed on generationally from parent to child.

By the 1990s, the field of political socialization had entered a period of stagnation, as some of the core assumptions underpinning the enterprise were called into question. Critics argued that socialization research tacitly promoted indoctrination to a particular type of citizenship that was largely passive and acquiesced to state authority. The focus on childhood as the primary locus of political learning was challenged, especially as young people who had not reached voting age could not fully participate in politics and government. Further, studies concentrated on how political orientations were passed from adults to children through a limited number of agencies, especially the family, school, and peer group. Decades of empirical research indicated that political socialization via these agencies was more limited than expected. The methodological approaches employed, which largely consisted of survey research, also were questioned for being incapable of adequately exploring as complex a phenomenon as political socialization.

More recently, the field of political socialization has been revitalized by both returning to its roots in civic education and expanding the scope of inquiry. Scholars seeking explanations for the lack of political interest and engagement among young people, especially low levels of voter turnout, are reexamining the political learning process. Studies of civic education and political engagement have proliferated along with prescriptions

for improving classroom education, service learning, and extra-curricular interventions. In addition, socialization research has begun more expansive investigations into the role of a larger set of agencies, including the media, digital technologies, the military, and religious institutions. Also, scholars have been looking more carefully into the process of political socialization that undergirds the creation of specific political generations.

THE POLITICAL SOCIALIZATION PROCESS

Fred Greenstein describes the socialization process as, "Political learning, formal and informal, deliberate and unplanned, at every stage of the life cycle, including not only explicit political learning, but also nominally nonpolitical learning of politically relevant social attitudes" (1965, 10). While some aspects of political socialization are structured, such as classroom civics classes, socialization is largely a haphazard process. There is no standard set of goals and practices for socializing agents, such as parents, teachers, friends, and mass media, to follow, except perhaps for a vague textbook notion of the ideal citizen who keeps informed about politics and votes regularly. Although people can play an active role in their own political development, political socialization scholarship largely assumes a one-way process from agent to subject. Further, the context within which individual experiences take place is consequential for political socialization and differs based on family and social situation, school environment, religious orientations, military service, and other situational factors. Thus, the process of political socialization can be represented by the following model: who (subjects) learns what (political orientations) from whom (agents) under what circumstances with what effects (12).

Identifying the point in the life course that is most consequential for political socialization has been a source of ongoing debate. The political socialization of children and adolescents has been the subject of the majority of research. The early theoretical justification for the focus on youth was based on persistence theories, in particular the primacy and structuring principles, which assume that childhood learning is robust and carries over to significantly shape adult political orientations. Scholars maintained that early learning provides a foundation for future political thinking and action. Studies indicate that the development of a political identity begins in the preschool years as children realize that they belong to a particular town and eventually that they are part of a larger nation. Young children tend to personalize their relationship with government and to idealize political figures, such as police officers and the president, who is seen as a "benevolent leader." The level of idealization differs from one era to the next; children today have a somewhat less positive view of political actors than in the past due in part to parents and the mass media conveying more negative messages about politicians. As children and adolescents gain greater exposure to and experience with public officials, they grow more skeptical about them. Young people gradually develop attitudes toward the political system as a whole. Patriotic values are reinforced through rituals, such as singing the "Star Spangled Banner" as tribute to the nation's military at sporting events. As children mature, they become increasingly sophisticated about their place in the political world and their potential for involvement. They learn to relate abstract concepts, such as the requirements of democracy and majority rule, to the right to vote when they come of age.

The primacy and structuring principles are difficult to validate empirically, and their basic premises have been challenged. Alternative models posit that recent political learning is most relevant because it is fresh in the subjects' mind and more readily applicable to current situations. Researchers contend that politics become meaningful when people approach adulthood and can participate fully, especially by voting in elections. They contend that people are most politically impressionable during the period from high school through the mid-twenties because their political orientations are not yet completely formed. Older adolescents and young adults have greater opportunities to become actively involved by joining organizations advocating for a cause and volunteering in the community, and they may perceive that they have a greater personal stake in the political system.

Lifelong learning models examine stages of political development throughout the life course and present a more comprehensive approach to understanding socialization. A landmark study initiated by Theodore Newcomb tracked women who attended Bennington College in the 1930s over the course of fifty years. Newcomb discovered that the political attitudes of the Bennington women shifted based on their associations with particular reference groups. Many of the young women had grown up in well-off, conservative families, and became more liberal at the progressive college. A good number of them maintained these liberal beliefs throughout their lives, while others returned to their conservative roots after school.

Scholars studying adults note that milestone events in people's lives, such as attending college, taking a job, getting married, starting a family, and retiring from the workforce, can influence political socialization, especially when personal priorities shift and reference groups change. This type of transition is illustrated by 1960s student protestors who developed a strong distrust of government officials. The political orientations of some of the most strident activists changed after they entered the job market and started families. Some became public officials, lawyers, and business executives—the very types of people they had opposed. People who have been politically inactive their entire lives can become motivated to participate as senior citizens when they find themselves in need of health care and other benefits and have more time for involvement.

AGENTS OF POLITICAL SOCIALIZATION

Political orientations are learned through interactions with agents of socialization, such as the family, school, peer group, and mass media. Agents convey cognitive, affective, and behavioral political orientations to subjects. The cognitive dimension of political learning represents people's knowledge and understanding of the political world and how it works. Once people have foundational knowledge of government and

politics, they are more likely to become active. The affective dimension reflects people's feelings about political symbols, objects, myths, and personalities and is related to attitudes like patriotism and trust in government. Finally, the behavioral dimension concerns people learning to take part actively in politics or by abstaining from involvement.

During the heyday of political socialization scholarship in the 1950s through the 1980s, studies focused heavily on the socializing effects of the family, school, and peer group that were considered primary agencies. Scholars assumed that political orientations were conveyed directly through personal, face-to-face interactions with these agencies that held privileged positions in the lives of children. Parents, teachers, and friends could serve as role models for children based on respect, admiration, and even fear. The strong emotional relationships that exist between family members, for example, may compel children to adopt behaviors and attitudes that will please their parents, or conversely, to rebel against them. Nonpolitical norms and values that agents have transmitted to subjects can become politically relevant. Power relationships within the family and school that promote respect for authority, hierarchy, and compliance with rules can translate into support for political leaders and obedience to laws. It is important to note that no single agent is responsible for an individual's entire political learning experience. However, few studies have given more than cursory treatment to exploring the interaction between and joint influence of various agents in the political socialization process.

Early research indentified the family as "[f]oremost among the agencies of socialization into politics" (Hyman 1959, 69) due to its unique position in fulfilling children's basic needs and the strong psychological and physical bonds that exist within the familial hierarchy. The family is perhaps most successful in passing on basic political identities, especially affiliation with the Republican or Democratic parties and ideological leanings. However, this trend is less robust today than it was a quarter-century ago, as more people are politically ambiguous, identifying themselves as partisan independents and politically moderate. There are significant limitations on the family as a socializing agent, especially as politics takes a backseat to issues related to daily life.

Some scholars argue that the school is the most powerful agent of socialization because its designated purpose is to promote learning. Political learning takes place through formal classroom instruction in civics and history classes, ceremonies and rituals such as the flag salute, and extracurricular activities like student government and sports, which can promote cooperation and tolerance for those who are different from oneself. The most basic socializing task of schools is in the area of cognition, especially conveying knowledge about constitutional principles and their implications for citizens' engagement in politics. Students who master these fundamentals feel competent to participate politically. They are more likely to develop the habit of following politics in the media and to become active in community affairs. Studies consistently reveal that the effectiveness of schools in developing civic orientations is heavily dependent on teacher skills and curriculum innovations.

Students exposed to novel approaches to civic learning, such as classroom lesson plans that are linked directly to service learning programs, are more inclined to engage in political affairs during adulthood. While schools have great potential as agents of political socialization, they are not always successful in teaching even basic facts about government to students. Further, the average amount of classroom time spent on civics-related topics is less than forty-five minutes per week.

The influence of the peer group on the preadult political socialization process has received far less attention by scholars than the family or school. Still, evidence suggests that peers, a group of people who are linked by similar age, common interests, and equal social position, can be important to political development. Young people desire approval and are likely to adopt the attitudes, viewpoints, and behavior patterns of groups to which they belong. Unlike the family and school, which are structured hierarchically with adults exercising authority, the peer group provides a forum for youth to interact with people who are at similar levels of maturity. Peers provide role models for people who are trying to fit in or become popular in a social setting. Peer group influence begins when children reach school age and spend less time at home. Peers are least effective in the cognitive realm of socialization, as discussion of politics and current affairs is often limited and sporadic. Pressures to conform to peer group norms can have a more powerful impact on young people's affective and behavioral political development than parents or teachers, especially if group members are engaged in activities directly related to politics, such as student government or working on a candidate's campaign. Young people may change their political viewpoints to conform to those held by the most vocal members of their peer group rather than face being ostracized. Still, individuals often gravitate toward groups holding beliefs and values similar to their own to minimize conflict and reinforce their personal views.

Other agents, especially mass media, were considered to be of secondary importance to the political socialization process in that they were thought to merely reinforce political learning that had been initiated through primary agents. As the media has become more pervasive and interactive, however, its potential to promote political learning directly has increased. Most people's regular experiences with the political world occur vicariously through the mass media. The media is the primary source of information about government, politics, and current affairs. It establishes linkages among leaders, institutions, and citizens; displays models of civic behavior; and organizes political community. Studies highlight the ubiquity of media use, finding that children and adolescents watch more than six hours of television per day and spend more than thirty-eight hours per week consuming a wide range of media outside of school. They rely more on the media for political guidance than on family members, teachers, or peers. Young people, in particular, increasingly use the Internet to learn about and participate in politics, such as engaging with social media during the 2008 presidential election. Popular media, such as entertainment programs, music, and literature, also can have a significant influence on political socialization.

GROUP DIFFERENCES IN POLITICAL SOCIALIZATION

People form group identifications based on their position within networks of people sharing similar backgrounds, such as social and economic status, educational level, and racial and ethnic characteristics. Political learning and socialization experiences can differ vastly based on subgroups differences. Group members frequently share political viewpoints, as their political demands are similar.

Certain groups are socialized to a more active role in politics, while others are marginalized. Political learning is more likely to be a priority for people from privileged backgrounds than for those who struggle economically. Historically, men have occupied a more central position in the American political culture than women, who were not granted the right to vote in the Constitution by the founding fathers. While strides have been made to achieve political equality between the sexes, differences in sex-role socialization still exist. Girls more often are socialized to play supporting political roles, such as volunteering in political campaigns, rather than leading roles, such as holding higher level elected office. The result is that fewer women than men seek careers in public office beyond the local level.

GENERATIONS AND SOCIALIZATION

The political socialization of distinct generations of citizens can be shaped by particular political experiences. A political generation is a group of individuals similar in age who share a general set of political learning experiences. Typically, a generation emerges when people in their impressionable years—from late adolescence to early adulthood—are exposed to a significant political or societal upheaval, such as severe economic crisis or a major war, that results in their developing common cultural bonds. While everyone in a political system is influenced by cataclysmic events in some way, younger people, whose political orientations are not well defined, are affected the most as they begin to think seriously about politics.

In the United States, the generation born between 1900 and 1924 was heavily influenced by World War I (1914–1918) and the Great Depression. This generation tended to trust government to solve programs as they perceived that the New Deal programs helped the country recover from the depression. The generation born between 1922 and 1945 experienced World War II (1939–1945) and the 1950s during their impressionable years. They believed that government could get things done, but were less trusting of leaders. The Vietnam War (1959–1975) and the civil rights and women's movement left lasting impressions on the baby boomer generation born between 1946 and 1960. The largest of the generations, this cohort protested against the government establishment in its youth and still distrusts government. Generation Xers, born between 1965 and 1980, came of age during a period without a major war or economic hardship. This generation developed a reputation for being unknowledgeable about and disinterested in politics. The political development of the Millennial Generation, born between 1981 and 2000, has been influenced

by changes in security and surveillance following the terrorist attacks of September 11, 2001, as well as the revolutionary developments in technology and communication.

Social Movements

One of the developments in both global and national political systems since the end of the Second World War (1939–1945) has been the emergence of groups, organizations, and individuals who seek to influence society, the state, and public policies that are directly or indirectly concerned with public interest. Indeed, increasingly, these organizations and individuals have come to occupy significant positions when issues of societal advancement are considered. For example, the emergence of the green movement, whose dynamics have portrayed its transformation from one state to the other, clearly points to the various groups, organizations, and individuals who argue that there is need to ensure sustainable use of resources in the environment.

CONCEPTUALIZATION OF SOCIAL MOVEMENTS

Social movements are a wide range of social forces and their organizations that seek to influence society and public policies. They provide some sort of counterweight to the state on serious matters of public interest.

Social movements are organizations, groups of people, and individuals who take collective actions to bring about transformation in society. These groups of people and organizations contrast sharply with those of other groups and organizations, such as political parties and governmental organizations. For example, modern social movements in many countries do not seek to capture state power.

Social movements deal with issues that are deemed important for the advancement of society. These movements could take global and national shapes, but it remains that they are issue-driven. The issue creates the need for formation of organizations, but it also could be the other way around, in which already existing organizations enlist to deal with an issue that has been deemed to be of national or global concern for the interest of affected groups.

Activities of social movement organizations signify existence of civic culture and consciousness associated with broad conceptualization of civil society. Civil society is both a descriptive and normative category in relation to the political process and policy politics of nations.

Social movements are issue-based and tend to be contentious. Although not always in ways that lead directly to violence, their contentious character is because they often lack regular access to formal political process.

They are modern phenomena that evolved from premodern forms of contentious politics over the years to deal with issues around humanity and the political system. In fact, it has evolved from traditionalist models of protest that endorsed use of violence to the use of nonviolent and civilized methods of resisting authorities, seeking social change, or influencing public policy. They are divided into the old and new social movements. The former use strategies such as protests, strikes, and the like to address the state. The labor union, the anti-colonial, or various nationalist organizations that emerged in the nineteenth century represent the old social movement. In contrast, the new social movement, such as the human rights, gender, environmental, peace, and nonviolence, give voice to the frustrations of the educated middle class and professionals. They are concerned with rights, demanding what Mary Kaldor (2003) has described as *radical democracy.* In any case, an important area of difference to note between the old and the new social movement is that whereas the old social movement adopted traditional methods of protests that were often violent, the new social movements are basically nonviolent in their approach to issues.

The point of social movements is that they seek to influence government, public policy, and society in general and specific ways. In many respects, social movements such as the environmental movement seek to achieve goals that are directly related to individual rights to a safe environment. The environment is a public good whose protection does not benefit only a section of the world but does add to life for all peoples, especially within the context of human activities, change in climate, and depletion of the ozone layer.

SOCIAL MOVEMENTS AND SOCIETY

In recent times, collective actions of social movement organizations have had tremendous influence on politics, public policy, and society in general. They are sometimes discussed within the context of civil society.

Emphasis on democracy in recent times requires vibrant and dynamic civil society. Indeed, social movements for most of democracy in the developing and developed countries today are centers of power that relate with the political system in ways that shape both the structure and content of politics. Activities of these movements are remarkable because of the effects they create in public policy, partisan politics, and the general political system. Political leaders often respond by repressing groups such as labor, environment, and others who protest certain policies or business organizations or government policies. For instance, the events of mass protests of labor and other civil society groups in Nigeria in June 2007 over a hike in the price of petroleum products and the sale of government business organizations without following due process led to the repeal of the policies. This has had profound implications for current democracy in that country.

Social movements provide the social capital that is needed for civic engagement with policy makers and governmental institutions in democracies. *Social capital* is simply the characteristics of organizations that help to coordinate and facilitate mutual benefits. One way of measuring social capital is the participation of individuals in the activities of social movement organizations. By participating in such activities, especially when it is about serious issues of public concern, social movements serve as a platform for oversight influence on the state and its power.

They sometimes initiate debates on social problems and may mobilize citizens toward it, a feat that more often than not the regular political machineries such as political parties are unable achieve due to bureaucratic procedures and a generally slow approach to certain issues. Response of the state to social problems is sometimes quicker when public interest and demand have been ignited by the civil society.

More often than not, issues of public importance that have remained out of public view are stirred by social movements, bringing focus to the issues' merit for the purpose of winning governmental attention. The merit of such issues may not be so judged by authorities until some sort of organizing is started by these social movements.

They resist certain policies and programs of government seen to be against the public interest. Success in achieving this depends substantially on the availability of resources for the concerned group. The success of such groups in getting government to change a particular policy or even to adopt a definite measure in the interest of the public depends on the regime type—democratic or dictatorship. For instance, various groups involved in the human rights and environmental movements in the Niger Delta of Nigeria today might count

their successes based on regime type. The military regimes were intolerant of opposition over issues of violation of economic, environmental, and other human rights.

The institutional and associational life of any democracy is important for the success of democracy. Given the nature of democracy, whether in normative or descriptive terms, the emergence and activities of social movement organizations in pursuit of a social goal do have a positive impact in the performance of democracy. Indeed, this is why Western democracies such as the United States are regarded as such. The blossoming of associations in response to issues of governance and development of society is a fundamental signpost that the leaders in the near future will be more conscious of the existence of these groups.

Social movements are issue-based, and this is the more reason to make sure that their emergence and possible contributions to debates on societal issues are not hindered. The experience in many countries of the developing world is that most regimes are antagonistic to social movements. This is worse with military regimes.

SOCIAL MOVEMENTS AND POLITICS

Social movements seek change in society. Achievement of such change depends on strategies. The choice of strategies sometimes also depends on the goals of the movement.

In certain instances, leaders of such movements may directly engage political strategies, such as support for political parties that address the problems that define particular social movements. They may sponsor bills of particular societal concern in the legislative institutions. They may field candidates to seek elective positions. All these and more are direct political strategies that leaders of social movements might use.

The success of social movements in the use of political strategies depends on the social forces at work. For instance, interpretations of the intentions of certain movements might depend on the leaders of such movements. In the case of the Niger Delta of Nigeria, the local environmental movement often is interpreted to mean an ethnic project by members of other ethnic groups in the country. Some actually use partisan political methods to effect change in society. The examples of the global environmental movement in European countries have not been very successful, but it does seem that such movements have supported in specific ways green political parties.

Social movements can serve as the vehicle for engendering the mass attitude needed for the sustenance of democracy where it has been challenged by antidemocracy forces. They also can be instrumental in creating the pro-democracy mass attitude needed for establishment of democracy where denied. These processes involve gradual engagement with the citizens to mobilize them toward antidemocracy forces and create democratic institutions where denied. In the political culture literature social movements and other social groups have been identified as important agents of shaping political attitudes of citizens. Indeed, they are very often highly motivational factors for an otherwise apolitical and apathetic population of people and creation of a mass attitude that is supportive of pro-democracy activist groups.

When discussed within the context of civil society, strong social movements facilitate democracy, although this has been contested in literature for transitional societies. Indeed some have argued that civil society in the contemporary sense is a necessary condition for democracy. This argument makes a lot of sense given the fact no democracy in history has ever emerged or consolidated without a strong civil society. Civil society reflects the emergence of a variety of groups with interests that demand recognition and reflection in the political system.

Civil society faces an empirical challenge of definition, but in terms of relationship to social movement organizations, it may be seen as any group that represents collective interests or the entirety of civic engagements of citizens in a polity that tend to promote associational life. Several arguments have been made for the positive effects of the civil society in society. This has been so essentially because of the functional role that social movement organizations have played in development and democratic accountability. Indeed, studies have shown that social movements and their organizations can challenge state authorities to respect the rights of groups or individuals. For example, in Africa, Asia, and eastern Europe, various organizations came together to sign petitions and organized protests against despotic regimes. In other parts of the world, such as Poland and the Philippines, social movement solidarity played significant roles in dismantling authoritarian structures.

It should be noted, however, that existence of the civil society is not a sufficient guarantee for democracy. To be sure, civil society can exist without democracy. Indeed, some civil societies contain undemocratic elements and need to be democratized. Some are also disruptive of social order.

It seems that civil society plays different roles in societies, although this may vary between the developed and developing countries. Civil society is required for maintenance of the plurality of interests, democratization, and provision of the basis for associational democracy. Appreciation of these roles depends on the perception or conceptualization of civil society. Whether seen as a set of societal conditions, conflict resolution mechanism, or organizations as actors, definite roles are expected from the civil society. For example, understood as organizations as actors, the idea is that ordinary citizens might join together in associations or groups to form a public sphere in order to influence public policy on the basis of what Ezra Vogel (1969) has described as *rational critical discourse.* If seen as a set of social conditions, it will imply how integrated these organizations or groups are in society. When lacking access to the public decision-making process or political system, there might exist a tendency for these groups to be conflictive or violent in their approaches of seeking to affect public policy. When integrated, with a tangible sense of that integration among members of such groups, dialogue, and nonviolent strategies are more likely to be employed in the quest to influence public policy and the social structure in general.

Some governments today are beginning to use social movement organizations for the execution of certain programs. For instance, various nongovernmental organizations are in partnership with the government in Bangladesh, Liberia, Nigeria,

and South Africa, to mention but a few, in the designing and administration of certain government programs. Development nongovernmental organizations have long partnered with these governments in areas such as containment of HIV/AIDS. Some of these organizations also campaign for more human-centered and comprehensive government policies to address the problem.

Many of these organizations have long begun to act internationally. One study suggests that international nongovernmental organizations involved in addressing various issues numbered more than one thousand in the 1950s. By the 1970s, it had grown to five thousand. Recently, by the end of the 1990s, it had risen to well over twenty-six thousand.

Social Movements, Comparative

Often times, the political sphere's understated preference for the mundane seems to be best understood as a ringing endorsement of routine and formality and a stinging rebuke of conflict and struggle. However, because most political arrangements—outside of anarchic examples—are structured on some sort of hierarchical system of authority, it is almost inevitable that politics will at some point become contentious. If and when political discord occurs, average citizens usually choose to advance their concerns through conventional forms of political participation such as voting or perhaps canvassing for an established political party. Alternately, depending on the issue, political actors may elect to work for political or social change from outside the system by challenging and confronting elites and authorities through forms of collective action to accomplish a common goal or purpose. Still, the concept of collective action in the political realm is much more than a simple cooperative enterprise of political convenience. It is in many respects a political statement that allows organized groups or social movements to change the nature of mainstream political debate by framing it to reflect their own specific interests.

NORMATIVE ORIGINS

Historically speaking, social movements have come to serve as key access points for political activity in societies where minorities, marginalized groups, and otherwise disenfranchised individuals have either been overtly or subtly snubbed by the political sphere. Not surprisingly, because social movements arise from grassroots activities and networking, they are often particularly adept at identifying underused or constricted avenues for political participation in democratic societies whose existence by their own definition depends on guaranteeing their citizenry unencumbered access to the political process. In fact, sociologist Ian Angus goes so far as to suggest that "contemporary democracy relies upon social movements to continue the process of expanding democracy towards rule by all the people" (2001).

Still, social movement theorists would argue that any influence that social movements have wielded over contemporary democracies should be understood as the product of two distinct lineages of social movements: old and new. For some scholars, the French Revolution of 1789 still serves as the high-water mark in the history of collective action, producing tangible conclusions about the nature of group dynamics and political behavior. However by the late nineteenth century, the works of intellectuals Karl Marx and Friedrich Engels and eventually Antonio Gramsci began to resonate with workers in industrialized countries in Europe and North America who felt exploited, abandoned, and disenfranchised by the "capitalist state." Eventually, socialism's message of revolution and solidarity led workers to conclude that governments that were unwilling or unable to insulate their economic well-being from the broad reach of unfettered capitalism would face acts of civil disobedience or general work stoppages, which in turn led to more formalized social movement activity with the creation of trade unions and communist parties. Theorists categorize these early forms of collective action as examples of old social movements.

As the end of World War II (1939–1945) ushered in the "grand bargain" of the welfare state for most industrialized countries, both working conditions and economic prospects improved to the point where a large portion of the labor force began to emerge consisting of professionals, civil servants, and

the like who would constitute the middle class. But even though middle-class workers still could not identify with society's elites, they also began to view themselves as politically, culturally, and intellectually distinct from the old social movements of the working class. Although middle-class workers did not entirely abandon their support of trade unions and left-wing political parties, they were much more drawn to forms of collective action that reflected a variety of postmaterialist values that went beyond a class-based economic agenda by encompassing a wide range of moral, cultural, and social crusades. Many of the social movements that formed during this era included civil rights groups, women's movements, antiwar groups, and environmentalists and would become characterized by theorists as new social movements.

Some scholars of late have begun to view the loosely connected collection of social movements involved in various kinds of transnational antiglobalization activism as yet another milestone in the history of collection action, given that it features significant elements of both old and new social movements. For contemporary social movement theorists, this modern coalescence of diverse views and interests may indeed point to the emergence of a new global social movement that has defied traditional forms of categorization thus far.

THEORETICAL TRADITIONS

By the 1960s, with scores of new social movements infiltrating the political spheres of Europe and North America to various degrees of success, the scholarly community began to formally conceptualize this trend through a number of theoretical approaches. Yet, all of the efforts on the part of theorists to produce a reasonably concise account of the motivating factors that shape social movement activity were divided between one school of thought that centered its explanations around ruminations on mobilization and another that emphasized the significance of organizational structures.

While several theorists see collective action as the end result of the mobilization of political actors, early on, both interactionism and functionalism suggested alternate explanations for "value-driven" collective behavior. Advocates of *resource mobilization theory* claim that social movement behavior is entirely contingent on a movement's ability to mobilize its resources, which can either be material—work, money, concrete benefits, services—or nonmaterial—authority, moral engagement, fixed friendship. Finally, some *mobilization* theorists cite the institutional constraints of the political process as a movement's primary motivation for taking advantage of potential political opportunities to affect change.

Unlike mobilization theorists who suggest that social movement activity is best understood as the organized expressions and rational aspirations of political actors, *organizational* theorists have produced an alternate narrative that contends that social movements are primarily concerned with their own organizational survival and thus pursue their agendas by adapting their organizational structures to best respond to the pressures of the political sphere. Some of the organizational theories that emerged from this school include contingency theory, the organizational ecology perspective, and neoinstitutional theory.

Social Order

Social order is the result of a common search for cohesion within a given group or society. Some theoreticians believe that social order comes from coercion, while others argue that it is a rational decision made by individuals.

As opposed to the brutal rule of the strongest, French philosopher Jean-Jacques Rousseau explained in his classic book *Le Contrat Social* that in advanced European societies humans agreed to exchange their natural freedom and the possibility to get anything they could see around them with the guarantee of security and the incontestable ownership of what legally belonged to them. In his 1893 thesis on *The Division of Labor in Society,* French sociologist Émile Durkheim stated that social order exists because people need one another and try to agree on some shared moral values; therefore, social solidarity is the result of the need for people to live and work together to reach consensus.

Max Weber analyzed the moment when people begin to agree with a legitimized authority, which is central in citizenship studies, and whenever some people refuse the rules, which is of interest for criminology. In a classic passage in his posthumous book *Economy and Society: An Outline of Interpretive Sociology,* Max Weber identifies three ideal types of legitimate domination: rational-legal authority, traditional authority (religious institutions), and charismatic authority (whenever citizens recognize a leader).

If Karl Marx explained the acceptance of the domination of the upper classes as a result of their power and dominant ideologies, it is the neo-Marxist Louis Althusser who

coined the most efficient formula to explain the process. In his famous essay, "Ideology and Ideological State Apparatus," French philosopher Althusser argued that social order could be maintained only through two levels of control made by the state—either through the dominant ideology or coercion made by the police or the army. Throughout history, various institutions were given a role of protecting social order, such as through a censorship commission.

According to its founder Pierre-Joseph Proudhon, anarchism as a system rejects the actual forms of domination from the state, and cries for another form of order emerging from individuals. In his *Revolt of the Masses,* published in 1930 (only six years before the Spanish Civil War began), Spanish philosopher José Ortega y Gasset wrote that the state represents the biggest danger for people. In the 1960s, French sociologist Pierre Bourdieu wrote extensively about how society reproduces itself, and in his book cowritten with Alain Darbel, *La Reproduction,* both authors argue that the habitus was like a second nature that made people accept social order as it is and as impossible to change.

Legitimacy is key to understanding how social order can or cannot be accepted. Studying the phenomena of riots in prisons, British sociologist Eamonn Carrabine (2005) demonstrated that there is more than one level of social order in jails, from the legal authorities but also through inner circles of social stratification among some privileged prisoners who can achieve some kind of control. Institutionized corruption in a given organization or country indicates a point of no–return for a society when authorities, such as political leaders, civil servants, the police, or the army, reach a certain level of organized corruption.

Some classic movies illustrate the limits of social order in situations of rebellion, such as Sergei Eisenstein's *Strike* and *Potemkin,* Fritz Lang's masterpiece *Metropolis,* and Masaki Kobayashi's *Samurai Rebellion.* Perhaps French poet and singer Léo Ferré gave the most efficient definition in 1972: "Disorder is like order, but without power."

Social Policy

Social policies can be defined as public interventions affecting the distribution of vital opportunities for citizens and their general well-being. Such a generic definition should acknowledge other public policies, not "social" in *sensu strictu,* which also aim at the improvement of people's living conditions and the advancement of social citizenship rights. Thus, social policies interact with education policies to provide a higher level of formal instruction to citizens, as well as with those policies concerning health promotion, access to housing, or subsidies for income maintenance purposes. In general, public polices concern either the individual (distributive and regulatory) or the society as a whole (constituent and redistributive). Social policies are mainly redistributive as they imply transfers and a balancing of resources and capacities among citizens.

Economic policies dealing with labor market participation are of particular relevance for the covering of citizens' social risks (e.g., disability, old age, personal care, sickness, or unemployment). In a broad sense, the term *social policy* is associated with the development of the welfare state. The latter can be defined as an aggregate of public institutions that provide social policies with the aim of achieving a better quality of life for citizens and to facilitate equal opportunities among them. Social scientists and policy makers would generally agree that a main tenet of social policy development concerns redistribution. However, redistribution, in some cases, produces unintended effects as well-off individuals often profit from their advantageous position according to what is known as the Matthew Principle: "For whosoever hath, to him shall be given, and he shall have more abundance: but whosoever hath not, from him shall be taken away even that he hath" (Mat. 13:12).

LEVELS OF PROVISION AND WELFARE MIX

Social policies operate on two main levels: (1) those services and benefits for employees (and their family dependents) who make contributions to the social insurance system during their working life or who are entitled to as taxpayers and (2) those noncontributory services and benefits provided by the public administration as social welfare or assistance to those citizens lacking sufficient material resources. However, there is overlap between both levels; in some countries, the social insurance system takes up social welfare responsibilities (e.g., income support for the frail elderly who are not entitled to contributory services or provision of social services to the poor).

Public social policies and social work, in both contributory and social assistance realms, count on the crucial role played by the families and the paramount role played by women's unpaid domestic work. Corporate welfare and voluntary associations also deliver, in some instances, full services and benefits that the public sector does not take on board by their own initiative or by means of contracting-out arrangements. This panoply of services, along with those available in the market, has led in some countries to the emergence of a "welfare mix," in which such interrelationship between the public and the private (both for-profit and nonprofit) is meant to be optimized.

Third-sector organizations, in particular, have been recognized as key partners of public authorities and professional groups in policy making.

The sociopolitical contexts in which social policies develop highly condition the structures of incentives, opportunities, and constraints for their implementation. Indeed, social policies are public interventions affecting spheres of private well-being. Their impacts may be distorted by decisions subject not only to structural considerations but, above all, to cultural traditions and value systems. Social interventions have an historical dimension that correlates with the processes of state formation and nation-building and with the peculiarities of the public administration or the party system in each country. Likewise, the civic cultures, the intellectual traditions, the forms of collective action, or the different degrees of influence and power exerted by groups or interests' coalitions are important factors shaping the type of social policies put in place nationally.

For purposes of comparisons among the various "welfare logics," countries may be grouped as they structure themselves around one particular organizing principle, ideological underpinning, or cultural commonality. Individual empowerment (liberal Anglo-Saxon), public egalitarianism (social-democratic Nordic), institutional partnership (corporatist continental), or familialistic interpenetration (Mediterranean and Latin regions) could be singled out as core tenets of the various worlds of welfare capitalism. Further to this, new supranational social models induced by globalization follow distinct paths in trying to combine both economic growth and social cohesion by means of workfare and welfare.

TARGETING AND UNIVERSALISM

Of high relevance for the provision of governmental social policies is the discussion between targeting and universalism. It has been generally argued that the implementation of public polices should follow strict criteria of selectivity. This was meant to ensure that disadvantaged groups would dispose of a comparative advantage or positive discrimination, and safety nets of social protection would be built in an effective manner. Likewise, it also has been pointed out that selectivity would avoid unwanted appropriation by well-off citizens of public monies and services targeted for the less-favored (Matthew Principle).

Alternatively, universal provision has been preferred as the institutional means to consolidate welfare arrangements for all citizens. From this perspective it has been argued that outcomes of market-based distribution are often more unequal than those of earnings-related social insurance programs. Paradoxically, and once time has elapsed in the long-term, non-targeted universal programs become more redistributive and effective than targeted ones.

The universal model can be highly redistributive, although it is counterintuitive because policy provision should follow the opposing strategy of "benefiting" the rich in order to benefit (in the long-run) the poor. Public opinion and voters' attitudes tend to be uneasy with the counterargument that you should avoid taking away money from the rich to combat poverty by providing policies to the poor. This is particularly evident in situations of cost-containment and financial constraints for the funding of social policies. In such situations, targeted means-testing appears as a better entrenched claim to neutralize attempts of welfare retrenchment. This contention, however, should be qualified in the case of universalistic welfare states where political strength is based on the solidaristic moral logic whereby the rich accept high taxes in order to distribute resources to those who cannot take care of themselves.

Social Rights

See *Economic, Social, and Cultural Rights.*

Social Security

Social security refers to a category of programs that insure individuals and families against the risk of income loss due to contingencies such as old age, disability, or death of the family breadwinner. As a government program, social security entails a set of legal entitlements to payments that allow individuals to smooth consumption over the life cycle with the goal of reducing insecurity and poverty. In most countries, pensions for old age, disability, and survivorship are the largest social security programs, followed by benefits for work injuries and occupational disease, sickness and maternity, family allowances, and unemployment. Although the 1948 Universal Declaration of Human Rights recognized social security as a basic human right, the International Social Security Association estimates that less than 50 percent of the world's population is covered by some form of social protection.

Social security programs differ greatly around the world in the types of risks they insure and in their generosity and breadth of coverage. All forms of social security, however, share two basic features: universal provision and risk pooling. *Universal provision* means that all members of society are eligible for coverage, while *risk pooling* entails redistribution from the more fortunate (i.e., those members of society facing a lower risk of income loss) toward the more risk-prone (i.e., those who confront a higher chance of poverty due to the loss of earnings). These features distinguish social security from other social protections such as means-tested safety nets, which target a narrow segment of population with conditional benefits, from programs that redistribute income through the tax code, and from social policies that promote self-insurance through individual savings.

Even though some degree of mandatory social insurance is justified by economic theory as a means to increase the allocative efficiency of markets and by social philosophies to promote social justice, there is little common ground on the question of where to draw the line between individual and collective responsibility for income protection. As a result, a recurrent dilemma in social security politics exists over how to divide responsibility for income protection between the state and individual reliance on market institutions. The outcome of these political and economic conflicts is evidenced in the diverse forms that social security programs take around the world, ranging from generous universal and redistributive insurance schemes to mandatory private savings systems. In most nations, moreover, the dividing line between individual and collective responsibilities for income protection has been periodically redrawn in response to shifting demographic and economic landscapes and with changes in the balance of political and economic interests. Although the mid-twentieth century brought a vast expansion of state-sponsored social security programs around the world, by the end of the century more than twenty-five nations had shifted back toward market-based systems of income protection through at least some degree of privatization of social security.

ORIGINS

National compulsory social security programs trace their origins to the private sector, where medieval guilds and mutual-aid societies offered a means for individuals and families to share the risk of income loss and thus to achieve a level of economic security that they could not attain alone. It was rather late in the history of social insurance that governments began to use state authority to extend basic insurance principles to broad segments of society. In France, for instance, there were 1,420 private mutual aid societies providing old age pensions by 1904 when the state first entered this terrain. The relatively late entry of the state into the social insurance business owes in part to the fact that prior to the twentieth century the risk of income loss was not considered a *social* problem. With the process of industrialization, however, wide-scale migration to cities meant that workers could no longer rely on the land, their families, or the local parish for income protection. As workers acquired greater political rights, they began to demand broad protections against the array of new risks associated with wage dependence in an industrial economy.

State sponsorship of social security grew in close connection with processes of economic development around the world. But economic concerns were not the only motive behind state sponsorship of social security; many governments also had political reasons for doing so. Chancellor Otto von Bismarck of Germany, for instance, is said to have established the first national social security program in 1891 to tame labor unrest and limit the growth of socialism among industrial workers. "Whoever has a pension assured to him for his old age," Bismarck famously said, "is more contented and easier to manage than a man who has none." Despite such instrumental and sometimes undemocratic origins, by the mid-twentieth century social security institutions had expanded far beyond the minimally functional level needed either to promote economic development or forestall worker revolt. Social security grew on the force of middle-class demands in democratic societies and with the encouragement of diverse social and political philosophies. Ascendant social democratic parties defended social insurance on universalistic principles of equal citizenship and social worth, while Catholic social doctrine upheld more conservative designs based on a male-breadwinner model; corporatist principles, in turn, supported more stratified social insurance programs, wherein benefits were tied closely to income levels. In the United States, the long-standing resistance to broad government interventions in the economy was diminished by the depth and intensity of the Great Depression, which resulted in broad innovations in financial regulation and social welfare provision. The U.S. Social Security Act of 1935 drew on the principles of universal earned rights, offering wage-related, but redistributive, pension benefits for old age and disability.

Government sponsorship of social security took root in the developing world at the end of the nineteenth century as an instrument of early state-building projects. In Latin America, pensions were offered to veterans of independence wars and to civil servants manning outposts in fledgling states laying claim to territorial sovereignty. Social security programs later were expanded as part of state-led industrialization efforts under populist governments such as Juan Perón in Argentina, Getúlio Vargas in Brazil, and Lázaro Cárdenas in Mexico. Social security benefits were typically offered to the urban, formal-sector workers that formed the political bases of these regimes and thus bore the heavy imprint of intersectoral differences in organizational strength and political clout of these workers. In most developing countries, informal sector workers have largely remained excluded from coverage by traditional social security programs.

The decades after the Second World War (1939–1945) brought a rapid diffusion of social security institutions around the world. In the advanced industrial nations, the postwar years were called the "golden age" of the welfare state, as strong macroeconomic growth in the 1950s and 1960s fueled broad political acceptance of government-sponsored social insurance. Social security also laid the foundation for a new social bargain in advanced industrial nations that underpinned the

reestablishment of the liberal international trading order that had collapsed in the interwar years. In this bargain, social benefits were provided as compensation for acceptance of the risk and cost of openness to the international economy.

Declining economic performance in the 1970s, along with rising demographic and fiscal pressures, opened the door to renewed political conflicts over the balance between state and market responsibilities for social security. The first signs of this dispute emerged as early as the mid-1960s, although critics of the welfare state only gained momentum in the 1980s. Neoliberals, as they were called, drew on classical liberal ideas to criticize big government and bureaucracy as inefficient and detrimental to individual freedom and responsibility. They argued that the public sector had become a burden on economic activity and had crowded out private investment; as a remedy, they called for a broadening of market forces in the economic and social realms. The liberalization movement drew strength from the economic downturn that gripped the advanced industrial nations in the 1970s, spurring widespread liberalization of trade and financial transactions, privatization of state-owned enterprises, and the deregulation of a host of economic activities over which the state had taken control in the postwar era.

In the developing world, the debt crisis of the 1980s signaled what many believed to be the failure of state-led industrialization projects and thus the necessity of reducing the state presence in the economic and social realms. Proponents of free markets argued that state-led development projects had not only failed to secure the benefits of growth for most of society, but also that market reforms would reverse the inequalities and sectoral privileges that were created by state intervention. The final decades of the twentieth century thus brought extensive efforts to broaden the role of market forces in society and curtail the state's allocative functions, including in the provision of social security.

Social security institutions thus became the objects of extensive reform efforts around the world in the final decades of the twentieth century. In most cases, such reforms involved adjustments to the contribution or benefit rates of existing social security systems to reduce costs or increase revenue. In other cases, reforms entailed a fundamental restructuring of the means and ends of income protection, such as through privatization. Some degree of social security reform is required periodically to keep pace with changing demographic and economic landscapes. This is because the effect of increasing life expectancy and declining fertility raise the number of retired persons relative to the working populations, obliging governments to finance their greater social security obligations with the income from a smaller working-age population. The looming retirement of large "baby boom" populations thus raised the specter of wide financial imbalances if adjustments were not made to the social security programs in many countries.

Demographic pressures have been particularly acute in the advanced industrial nations, where the United Nations estimates that the share of the population over age sixty-five will rise by 83 percent between 2000 and 2050—from to 14.3

to 26.1 percent of the population. Although elderly populations are relatively smaller in middle-income countries, sharp declines in fertility have brought an even more rapid increase in the age profile of those nations. Indeed, the UN estimates that population over age sixty-five will grow by 188 percent between 2000 and 2050—from an average of 5.1 to 14.7 percent of the population in less-developed nations. Urbanization and informalization of the labor force in poorer nations, moreover, have increased demands for social protection just as the contribution base for such programs has narrowed. The result has been the emergence of wide financial deficits in social security programs around the developing and developed world, and broad calls for shifts in the terms on which social insurance benefits have been provided.

SOCIAL SECURITY PRIVATIZATION

Privatization involves a fundamental revision to the basic elements of risk pooling and universalism in social security. In the latter instance, privatization entails a shift from universal eligibility for state-funded social insurance benefits toward the conditioning of such benefits on criteria such as means testing. In addition, the risk of income loss that is shared broadly within and across generations through social security is transferred to the individual, whose fortune in the marketplace becomes the central, although by no means exclusive, factor determining her level of income protection. In practical terms, social security privatization involves three basic changes to conventional social insurance programs. Even though none of these changes implies or requires the other, they have typically been bundled in political discourse and practice. The first is a shift in the way that old age benefits are determined, from the traditional defined benefit system, wherein the pension benefit formula is prescribed by law (often in relation to earnings and years of work), toward a defined contribution scheme, in which only contribution rates are defined ex ante, while benefits vary according to the individual's contribution history and the return to invested funds. This change tightens the link between contributions and benefits to eliminate most elements of income redistribution in the benefit formula. Privatization also involves a shift away from the method of financing pensions on a pay-as-you-go basis, wherein the payroll contributions of the current labor force are used to finance ongoing pension benefits, toward one in which benefits are funded fully by each worker's own payroll contributions. And finally, pension privatization entails a transfer of responsibility for managing pension funds from the state to private sector firms or occupational schemes. The state, however, retains important regulatory and oversight functions in privatized systems and is also the ultimate guarantor of the private insurance market.

Heralded as a "revolution" in social security, privatization was first adopted at the national level by the military regime of General Augusto Pinochet in Chile, which replaced the country's social insurance pension institution with a system of individual retirement accounts managed by private sector firms. Beginning in 1981, workers entering the labor force in Chile would no longer pay into the national social security

system, but instead contribute to private retirement accounts through which they receive a pension based on their own contributions and the returns to invested funds. Social security privatization diffused rapidly around the world in the quarter-century after the Chilean reform, revealing strong correlations in space and time as privatization in one nation was followed closely by similar reforms in nearby nations. Indeed, since 1990 more than a dozen Latin American countries have passed legislation to replace state-run social insurance programs in various degrees with private savings schemes. Those reformed institutions typically involve a mix of traditional public risk-pooling systems and private individual savings accounts; however, the relative balance between the two components has varied significantly across nations. By the end of 2008, more than seventy-seven million people were affiliated with a private pension fund in Latin America and more than US$2,263 billion in retirement savings was invested in those systems. Outside of Latin America, eastern Europe and central Asia have been the location of the most transformative social security reforms. More than ten countries in that region have implemented some form of privatization, although the political and financial legacies of earlier social insurance programs encouraged the maintenance of a larger state presence in reformed pension systems. By 2008, five of the countries with significant private pension markets (Bulgaria, Kazakhstan, Poland, Romania, and Russia) recorded more than thirty-four million workers affiliated with a private pension fund, and more than US$89 billion invested by those funds.

Advocates of social security privatization argue that this reform makes a positive contribution to capital formation and to individual choice and freedom. With equal conviction, opponents of privatization warn of the financial risks that are placed on the shoulders of individuals who must bear the cost of unwise or inappropriate investment choices and of an array of macroeconomic and labor market risks that lay beyond individual control. Experts on both sides of the reform debate agree, however, that restoring the financial and actuarial balance to social security programs may be achieved either by revising the parameters of the existing state-sponsored social insurance program, or through privatization.

As the twenty-first century began, the privatization movement in social security began to show signs of slowing; in countries like Argentina and Chile, governments even began to reverse earlier privatization decisions. In East Asia, where responsibility for social security functions has long resided principally in the private realm, governments such as that of the Republic of Korea have instead begun to expand the public sector role in social insurance. Yet other countries have forged a new path in social insurance by introducing a reform model that establishes individual retirement accounts, but without privatization. Whether this marks the beginning of a new trend is as yet unclear.

Because social security institutions play a significant role in the allocation of income and risk in a society, they are likely to remain subject to political and distributional conflicts. And even though the pressures of ever-shifting demographic and economic landscapes are likely to maintain a place for social security on the reform agenda, the outcome of such reforms efforts will remain far from determined.

Social Structure

See *Party and Social Structure.*

Social Welfare

A *social welfare policy* is any policy that improves the welfare of citizens. As a result, a range of programs affecting the health, education, housing, employment, civil rights, and economic conditions of citizens can qualify as a social welfare policy. However, the primary types of social welfare policies are ones

that protect the benefits of those who have contributed to society and ones that provide benefits or services to those who fall below certain income levels. This entry discusses the distinguishing features of these two types of social welfare programs, as well as the main issues surrounding them.

SOCIAL INSURANCE

Social insurance is, perhaps, the most recognizable social welfare policy. These policies aim to maintain the income of citizens who had contributed to society when they are experiencing economic or social distress. For example, Germany enacted a compulsory sickness insurance program for industrial workers in 1883. By the end of World War I (1914–1918), most of western Europe, the United States, and Canada had adopted similar programs. Today, almost every nation has some form of worker's compensation program that provides cash or medical benefits to workers who suffer job-related injuries. Most of these programs are financed by employer contributions and are usually administered through a central financing scheme. In the United States, worker's compensation is implemented at the state level, and it is much more limited in coverage than in many other nations.

Other types of social insurance programs focus on providing cash benefits or medical care to citizens because of other types of economic or social situations, such as retirement, unemployment, sickness, or maternity. The structure, coverage, financing, and administration of these programs vary widely across nations. Some countries (like Japan) implement programs in a very centralized manner using national-level organizations; others (Canada and the United States) rely more heavily on subnational governmental jurisdictions. Some countries (e.g., Sweden) provide fairly generous benefits, while others (like Britain) use more restrictive criteria to determine who is covered and what benefits they receive. There are also a variety of different funding mechanisms and implementation designs in use. For example, Germany relies extensively on taxes from the current workforce to pay for program benefits and services (referred to as *pay-as-you-go* systems), while Japan depends on private pension schemes in which individuals invest independently for their future retirement.

The largest, most expensive, and best known social insurance policy is the old-age pension plan program. In most countries, this program began by providing benefits to those who had made direct contributions into the system. Over the years this program has extended to cover additional groups in society (e.g., widows and children of workers) and the idea of receiving benefits is now widely viewed as a "right" of citizenship in most nations—regardless of previous contributions, earnings, or conditions. This, in turn, has placed greater demands on old-age pension systems to maintain higher benefit levels and services for much larger portions of the population.

SOCIAL ASSISTANCE

Social assistance is the second major type of social welfare policy. Here, benefits are distributed to those who fall below a certain income level or meet specific eligibility criteria (e.g., parents of low-income children or individuals with severe medical problems). Social assistance programs are not designed to maintain the income levels of those who have previously contributed. Instead, they aim to provide a basic level of support (social safety net) to those who could not provide for themselves and their families. Social assistance programs (such as the Temporary Assistance for Needy Families Program in the United States) are often more controversial than their social insurance counterparts. Those who receive social assistance benefits do not make payments or contributions into the system. Instead, the funding is redistributed from those who can pay to those who are in need of assistance.

THE ROLE OF THE PUBLIC VERSUS THE PRIVATE SECTOR

Public institutions play a key role in the development and implementation of contemporary social welfare programs. However, private and nonprofit organizations (e.g., individual families, charity associations, religious groups, community organizations) also have long been involved in the provision of social welfare around the world. The mix of governmental and private sector activity in social welfare policy making has varied across nations and across time. As such, the role of the public sector versus the private sector often is used to identify different reasons for and patterns of national social program development, as well as different types or models of social welfare systems. Government involvement is still an important aspect of contemporary social policy. But many nations have reduced their public sector social welfare commitments (because of demographic shifts, increased citizen demands for services, declining revenues, and general economic problems), encouraging greater participation by the private sector.

OTHER LINGERING QUESTIONS

In addition to the public versus private discussion, there are a number of other lingering questions about contemporary social welfare policies. Is it the responsibility of everyone in society to pay for social welfare services, or should benefits be tied more directly to individual contributions and obligations? Should social welfare services be provided universally, or should they be restricted to those who have the greatest financial need? In sum, what have been the impacts of social welfare policies? Do they actually improve the lives and welfare of citizens?

Sociobiology and Politics

Sociobiology, the synthesis of ethology and population biology, was both hailed and damned when it was first presented systematically in Edward O. Wilson's 1975 pathbreaking volume of the same name. Spurred by Wilson's promise that this emerging new field would lead to the absorption of the social sciences and humanities, a group of political scientists—already intrigued by the promise of rapidly advancing findings in the life sciences—responded to Wilson's challenge by examining connections between the two fields of inquiry. By 1982, one study by Joseph Losco and Donna Baird found that eighty-eight articles and papers had been authored by political scientists exploring the potential contributions of the new synthesis to their own discipline. The majority of these papers were authored by a small core of political scientists, with nine authors accounting for 64 percent of the output. Most of these scholarly works were generated by political theorists exploring epistemological connections between the two fields.

A second census published fourteen years later found that scholarly output connecting sociobiology or its ethological and evolutionary subcomponents to political phenomena climbed by 326 articles and papers between 1981 and 1994. The number of scholars contributing to this pool had increased to eighty-six. However, most of the entries continued to come from a core of about twenty-five researchers. While most of these continued to focus on theoretic and epistemological issues, a growing number of about 20 percent involved some type of empirical application using historical data, measurable ethological observation, game theoretic modeling, or experimentation.

At its core, sociobiology posits the evolution of adaptive behaviors and strategies via inclusive fitness. Accordingly, individuals can achieve reproductive success not only through their own reproductive activities but also by advancing the reproductive fitness of related individuals with whom they share genetic material. This discovery allowed biologists to explain a number of social behaviors, such as reciprocity and altruism, that had previously eluded explication through strict Darwinian individual selection. Inclusive fitness was given a strong boost by the works of W. H. Hamilton in 1964 and Robert Trivers in 1971, among others, who demonstrated robust empirical support through experimentation and observation in the natural world. The evolution of acts like altruism could now be explained by reference to the fitness benefits conferred upon related others. Thus, a warning cry issued by a prairie dog could save a sufficient number of kin to compensate for the loss of its own genes at the hands of a predator alerted by its call. Sociobiologists have shown also that species can alter the sex ratio of their offspring depending on social rank and that levels of parental investment necessary to raise offspring to reproductive age can account for differing mating strategies by males and females, as shown by Robert Trivers and Dan Willard in 1973.

The potential applicability of this paradigm for understanding human behavior led a number of political scientists to utilize sociobiological theory to analyze phenomena like aggression and warfare, as described by J. Van der Dennen and V. Falger in 1990; leadership, covered by James Schubert in 1988; sexual politics, studies by Glendon Schubert in 1991; reciprocity and coalition building, studied by Robert Axelrod in 1986; and authoritarianism, as shown by Albert Somit and Steven Peterson in 1997. Still, most contributors continued to produce works focusing on sociobiology's theoretical insights about human nature, such as Roger Masters' work in 1989, and on theory building, studied by Peter Corning in 1983.

While mainstream biology has accepted many of the Wilson's ideas despite much early criticism, political science has had less success than sister disciplines like anthropology in generating substantive empirical findings of its own with this new paradigm, partly because of differences in the levels of analysis engaged by each discipline. While sociobiology focuses on units of evolutionary time and ultimate causation, most political scientists seek to explain proximate causes of behavior. As a result, political scientists who employ biological approaches today are more likely to focus on factors issuing from such fields as neuroscience.

Socrates

Socrates (469–399 BCE) was a classical Greek philosopher whose thought had a profound influence on his field. Little is known about his early and middle years, although according to ancient tradition, he worked as a stonecutter. The fact that he served as a *helot* (heavily armed foot-soldier) in the Peloponnesian War (431–404 BCE) indicates that during the early years of the war he was roughly middle class, because helots were required to provide their own armor. At some time during this period, Socrates began the mission of moral reform for which he became famous. He passed his time examining and arguing with his fellow Athenians, subjecting them to his *elenchus* ("test" or "refutation") in order to inquire into the moral subjects that interested him and to inspire them to care for virtue and knowledge. Socrates' followers included not only Plato, but Alcibiades and Critias, both of whom later betrayed the Athenian democracy. Possibly because of such notorious connections, in 399 BCE Socrates was accused of impiety and corrupting the young. Different versions of his defense speech are extant. In Plato's *Apology of Socrates* (c. 395), Socrates defiantly defends his entire life, describing himself as a great benefactor to the city—a gadfly, who stings it to keep it awake—and claims that the Athenians would harm themselves in killing him. In spite of—or perhaps to some extent because of—his defense, Socrates was convicted, sentenced to death, and executed.

Exclusively an oral teacher, Socrates himself left no record of his teaching. At some point, however, his followers began to write down his conversations. From this practice arose the *Socratic dialogue* as a literary genre, examples of which survive in works of Plato and Xenophon. Irresolvable conflicts between the main sources of information regarding Socrates have given rise to the *Socratic problem,* an effort to distinguish the actual historical figure from the many depictions of him put forth by varied authors and interpreters. Recent scholars generally place the greatest weight on the depiction of Socrates in Plato's Socratic dialogues, which are consistent with Aristotle's account. The brilliant, ironic personality depicted by Plato embodies the practice of philosophy at its best and most morally serious. In *Phaedo* (1871), Plato describes Socrates as "the best and wisest and most righteous man" then living.

As expressed in Plato's *Apology,* Socrates claimed to be ignorant, but to be superior to other Athenians in recognizing his own ignorance, and so being motivated to seek the moral knowledge he felt he lacked. In spite of this self-description, Socrates held definite moral views, as expressed in the so-called Socratic paradoxes, that virtue is knowledge and all wrongdoing is due to ignorance. Because Socrates also believed that virtue is both necessary and sufficient for happiness, he willingly allowed himself to be executed rather than commit injustice—including escaping from prison to avoid execution.

Although on one occasion Socrates secured a place on the Athenian Council and fought unsuccessfully against a popular measure he viewed as illegal, he generally avoided Athenian politics. Although apparently without a developed political philosophy, he was highly critical of Athenian democracy. He decried the emotional instability of the populace and is depicted by Plato as a vigorous opponent of the Sophists—teachers of the rhetorical arts that political figures used to manipulate the mob. Socrates also objected to the Athenian practice of assigning political office by lot, as this placed government in unqualified hands. Still, he was devoted to Athens, rarely venturing outside its limits, and dedicated his life to improving his fellow citizens. Although his mission was carried on in a private capacity, in Plato's *Gorgias* (c. 385 BCE), Socrates describes himself as the only Athenian who attempted "the true art of statesmanship," because his actions were always aimed at what was best instead of what was most pleasant.

Sophists

The *Sophists* were itinerant teachers for hire who taught how to argue effectively and to advance interests in judicial, civic, and business forums in Greece, especially in Athens, largely during the second half of the fifth century BCE. It is clear from the texts of contemporaries that the Sophists played leading roles in articulating important trends that both arose from major Athenian and Greek advances during the period and challenged traditional views and customs. A robust classical democracy was put together in Athens by 458, and after the Greeks repulsed the Persians in 478, for about half a century Athens accumulated what amounted to an empire, making itself the centre of commerce, power, and culture in Greece and the region. The Peloponnesian War between Athens and Sparta began in 431 and ended with the defeat of Athens in 404, bringing to a close what some have called the Age of the Sophists. The most famous Sophists include Protagoras, Gorgias, and Thrasymachus.

The term *sophist* originally meant possessor of skill or wisdom, but in the fifth century the term also meant strategic cleverness. The ability to advance one's interests in various forums was essential, and the Sophists taught the requisite rhetorical skills. Occasionally they displayed their skills for fees in large public demonstrations in which they might make

weaker arguments defeat stronger ones, for example. In general, students who could afford individual instruction were taught how to use discourse as a means to their ends—how to defeat any suit brought against them in court, for example—as well as complementary intellectual views, often with relativistic implications, which challenged traditional religion and morality. According to the most extreme of their views, the reason why most people are law abiding is that they are weak, whereas a few powerful individuals pursue their own interests according to their natures regardless of social conventions such as law—this is and ought to be the way of the world.

Very little of what individual Sophists taught has come down to us except as reported in the works of others, most notably in the dialogues of Plato, who criticized their views through his favorite character Socrates, modeled on his admired teacher by the same name who lived during the age of the sophists. Socrates often debated leading figures in Athens and showed by argument that the strong and powerful could not defend their views against the criticisms of inconsequential figures such as himself. He attracted an audience and seemed to some to be a Sophist, but the pursuit of knowledge was for him an end in itself, not a means to personal gain.

Reacting against the pre-Socratics—the first philosophers in the Western tradition—whose various attempts to account for "all things" rationally according to underlying natural principles led to so many counterintuitive and mutually inconsistent conclusions, the Sophists turned to apparent political reality and what individuals could accomplish in it. Plato and Aristotle defined themselves against the Sophists to a great degree and developed the deeply universal and antirelativist moral and political philosophies that were to dominate much of the Western intellectual tradition.

Sorel, Georges

Georges Sorel (1847–1922) was a French social philosopher and political theorist. He was the author of controversial and incendiary works on a range of topics, including the essence of socialism, the decadence of modern society, and the role of violence in politics.

The seeming contradictions in Sorel's life and work are numerous. He was a socialist who repudiated the most influential forms of socialist and Marxist doctrine. He was a radical proponent of the workers' movement who embraced, for a time, certain of the royalist doctrines of ultraconservatives such as French author and critic Charles Maurras. He was admired by Italian dictator Benito Mussolini and other Fascists but also by many on the far left, and he himself admired, again for a time, both Russian revolutionaries and American captains of industry. If his political ideas reflect, above all, the influence of

French philosopher Pierre-Joseph Proudhon's anarchism and mutualism, his later thought owes much to the pragmatism of William James, the American philosopher and psychologist.

Sorel's writings are nonetheless underwritten by a set of fundamental philosophical and moral commitments that give his work a distinctive and highly unified character. Primary among these is an emphasis on the idea of the *heroic.* For Sorel, heroism is a deeply moral quality involving a kind of mysterious and creative pursuit of lofty deeds. It is not an exclusively elitist category. If the protagonists of Homeric epic and the swashbuckling entrepreneurs of American capitalism are, for Sorel, exemplars of the heroic, so too are the warrior/farmers of ancient Athens and the worker revolutionaries of the modern age.

Closely connected to Sorel's emphasis on heroism is a sharp criticism of bourgeois culture. Such a culture represses the heroic impulse in favor of a decadent preoccupation with abstract, intellectualized notions such as the maximization of utility, the inevitability of social progress, distributive justice, and historical materialism. Sorel's critique resonates—and explicitly invokes—German philosopher Friedrich Nietzsche's repudiation of middle-class values and French philosopher Henri Bergson's embrace of the élan vital or life force. But Sorel also attacks the laxity of bourgeois morals and insists on a mode of social action that is grounded in a conservative, even puritanical conception of moral virtue that emphasizes traditional family values.

Sorel's political thought endorses socialism, understood, however, not as a theory or program but as a movement of workers. He believed that the social, historical, and economic doctrines of Marxist intellectuals are often irrelevant, even counterproductive. What matters is the spirit of rebellion. That spirit can be activated by the so-called myth of the general strike, that is, the idea of a full-scale workers' rejection of capitalist domination. The importance of the myth depends less on the possibility that a general strike might actually occur than on its function as a source of inspiration and revolutionary zeal. In this context, Sorel offers a qualified defense of violence, conceived as something sharply different from and opposed to the brutal and calculated force of the state and also as something to be invoked less for strategic reasons than for its connection to the heroic virtues. Sorel's emphasis on socialism as a movement involves, as well, a rejection not only of the bourgeois state but also of the state per se. The result is a political doctrine that perhaps most closely resembles the standpoint of anarchosyndicalism.

Sources of Law

The sources of law have changed over time. It is not possible to find one single source or form of law in any society. Various streams of authorities flow into the whole of a particular legal tradition. Which sources of law are predominant depends on the nature of the political system and historical legal development.

COMMON–LAW TRADITION

America's tripartite (three-part) government provides three major sources of law: legislative, judicial, and executive. The legislature, or elected representatives of the people, enacts statutes that are enforced by the executive branch. Administrative law and regulations are promulgated by executive agencies to carry out the legislative intent of statutes. The courts—state or federal—interpret statutes, administrative rules and regulations, and other cases to determine the outcome of litigation. As part of America's inherited English common-law tradition, judicial precedent is important. The doctrine of *stare decisis* plays a major role in American jurisprudence. By placing great weight on prior court decisions (*precedent*) at either the state or federal level, the judiciary seeks to provide stability, certainty, and continuity for America's polity. On questions of constitutionality and other particular kinds of cases, federal courts have original jurisdiction. As with those of other modern nation-states, the U.S. Constitution is written and granted supremacy over state law. Issues fundamental to American political society may be adjudicated by the U.S. Supreme Court. However, the importance of the judiciary in America is not universal. In England, parliamentary sovereignty overshadows the role of the courts. Yet, even though legislation has been on the increase since the rise of Parliament after the Glorious Revolution (1688), the common law as originally developed from a combination of German customary law, feudal law, and Roman-canonical law has considerable force and power in shaping the English Commonwealth. Perhaps the fact that the English constitution remains unwritten underscores this historical belief in the common law as an organic source of political authority.

CIVIL–LAW TRADITION

The civil law dates as far back as the Twelve Tables in Rome (450 BCE) and is the predominant legal system in the world. The origin of the common law is dated at 1066 when William the Conqueror won the Battle of Hastings; however, the customs, practices, and traditions of the Anglo-Saxons had been rooted in societal legal norms before this time. In contrast to the Anglo-Saxon common-law tradition, where judge-made law and customary practices of the populace are paramount, and where the law of equity developed giving discretionary power to judges, the civil-law tradition relies on legislative codification. Roman emperor Justinian authorized the Corpus Juris Civilis (Justinian Code), which when completed in 533 served as a source of codified law for later comprehensive statutes, such as the Code Napoléon of 1804.

The canon law of the Roman Catholic Church integrated the Roman legal tradition into its form and substance. The Roman-canonic *jus commune,* which developed in the medieval period, transcended localities, communities, and nations and provided a legal structure for feudalism. Modern nation-states eventually replaced the *jus commune* with legal positivism. A rejection of the *jus commune* on the continent and adoption of nationalistic positive legal systems gave sovereignty to the state that had belonged to the royal rulers under the divine right of king's theory.

In addition to Roman law and church canon law, commercial law developed within the civil-law tradition, forming the basis for international law. The International Court of Justice located at The Hague, Netherlands, has jurisdiction over cases arising under private international law and public international law, such as the United Nations Charter.

The predominant source of law in the civil tradition is statutes—legislative acts pursuant to the sovereign power of the state. Implementation of statutes requires administrative regulations as a second source of law. There is customary law, but it does not hold the same influence as the common law does in Anglo-Saxon jurisprudence. In civil-law legal systems, the statute has the higher authority over regulations and customs.

DIVISION OF JURISDICTION OF COURTS

The types of courts in a common-law system differ from that of civil law. Typically, in a common-law country, such as the United States and Britain, there is a unified system wherein civil and criminal cases are adjudicated within a hierarchy of laws—the Supreme Court being the highest in the United States. Both civil and criminal procedures apply, depending on the case with constitutional guarantees of right to trial by jury, due process, the right to remain silent, and so on. In common-law systems, there can be administrative courts, as in the United States, which give executive agencies judicial power to decide cases within their statutory authority. Notwithstanding, an appeal to a judicial court is available to the losing party of an administrative hearing. Cases at law and equity are divided along lines of remedies for particular kinds of legal actions. For example, the remedy of specific performance under a contract is available under the law of equity, most likely to be decided by the same court and judges as a cause of action under ordinary law. Whether it is a legal action involving constitutional law, commercial law, civil law, or criminal law and whether it is based on a common-law right, statute, or constitution, the adjudication of a claim follows the course of a unified system. A basic trust in the judiciary and the overlapping, yet separate, powers of the legislative, executive, and judicial branches account for confidence placed in ordinary courts in the United States.

In civil-law countries, separate courts, each with its own hierarchy, is more typical. This corresponds to the stricter separation of powers between the legislative, executive, and judicial branches. The ordinary courts in France have various sources: elements of jurisdiction formerly distributed among the civil courts of the *jus commune,* ecclesiastical courts, commercial courts, and the special tribunal created after the French Revolution (1789–1799) to interpret statutes. In addition, there is

a separate, independent system of administrative courts—the Council of State—which has developed what is known as the *droit administratif,* a large body of administrative law determining the rights and duties between the state and its citizens. This law derives its authority from executive power, not the judiciary, consistent with the less influential role judges play in the civil law. Because of the comprehensive codification of law in statutes, legal science and scholarly interpretations have more influence. And, although a Constitutional Council was established in France during the mid-twentieth century, it does not have the power of judicial review that an American court possesses. It serves more of a political than judicial role, as the executive courts of administrative law make the ultimate determination.

Even though common-law and civil-law traditions have fundamental differences in history, development, and attitude toward law, there are unifying sources of law, such as customary, statutory, administrative, judicial, and constitutional, which in various degrees of substance and form function within a polity to achieve order and justice, and ensure the individual rights of its citizenry. The particular characteristics of a judicial system arise from the political philosophy of a society about where to place sovereignty and whether or not it is centralized or divided into a balance of power between the legislative, executive, and judicial branches.

South (Third World)

The *South*—sometimes referred to as the *global South*—refers to the poorer countries in the international system, which are viewed also as lacking influence over the working of the international system and its institutions and are located in Africa, Asia, and Latin America.

While this is not an homogenous group of countries, there is a relatively clear pattern of stratification in the international economic system that separates them from the rich countries of the North, as the following table indicates, using World Bank classifications.

The first, low income, group is firmly within the South; the second and third are largely so (but include Russia and some of the poorer economies of eastern Europe). If we equate the "solid" South with the low and lower-middle groups, then

TABLE 1

	NATIONAL INCOME PER CAPITA	SHARE OF WORLD INCOME	SHARE OF WORLD POPULATION
Low Income	$2,698	9.7%	36.9%
Lower-Middle Income	$7,020	23.9%	34.9%
Upper-Middle Income	$10,817	13.1%	12.4%
High Income	$34,701	53.3%	15.7%

SOURCE: From data in World Bank, *World Development Report 2008* (Washington, D.C.: World Bank, 2007). Income in Purchasing Power Parity (PPP) Terms, 2006.

it contains almost 72 percent of the world's population but accounts for only 33.6 percent of world income.

THE THIRD WORLD IN THE INTERNATIONAL SYSTEM

In the past, various terms have been used for this group of states. One which gained widespread currency was that of *third world*. This had the advantage of being a systemic concept, differentiating these countries from both the industrial societies of the capitalist *first world* and *second world* states that had adopted the state-socialist model. The logic of this term has been eroded with the disappearance of any coherent socialist bloc; however, its long history and analytic strengths lead many social scientists and political activists to continue to use the expression.

The third world effectively emerged as an international force in the post–World War II (1939–1945) era when a large number of colonial states achieved independence from European rule, joining the group of poorer states that had maintained their formal independence, such as those of Central and South America and China.

The process of decolonization took varied forms in different parts of the world, but in most cases was associated with a new, assertive nationalism that sought both to establish a unifying national political identity for the new states and to claim a significant place for them in the international order. The pioneering role in this process was played by India, which gained independence in 1947 under the leadership of a mass nationalist organization, the Indian National Congress, and a leader, Nehru, from its radical and internationalist wing. In some cases, the emerging national leaderships remained more closely tied to their former colonial masters. This introduced from an early stage a division in the third world between those states committed to assertive political and developmental policies and those prepared to accept a *neocolonial* status of continued subordination. The latter group often was shored up through external support from the former colonial powers in Africa and from the United States in Latin America.

By the mid-1950s radical nationalist currents had taken power in several third world states—in particular in India, Indonesia, and Egypt. An attempt was made to coordinate

their role in the international political system under the banner of *nonalignment*. This doctrine sought to create a space, both domestic and international, between the cold war rivals capitalism and state-socialism. Nonaligned states refused to cast in their lots with either of these camps, claiming the right to adopt distinct positions in international affairs and to pursue national developmental policies that were socialist in some respects (for example, by undertaking land reform, expanding state ownership, and nationalizing some Western business operations) without embracing the full state-socialist model or excluding trade and investment ties with the capitalist states.

In April 1955, representatives of twenty-nine nonaligned governments met at the Asian-African Conference in Bandung, Indonesia, and in 1961, at the Belgrade Conference, the Non-Aligned Movement (NAM) was born as a formal organization. The NAM has lacked sufficient coherence to be a major international force, but it continues in existence, with 118 members as of 2009. It provides a framework for coordination of views between third world states and was responsible for the launch of the proposal for a New International Economic Order in 1973. It also played an initiating role in the creation of the Group of 77 (formed in 1964–1967), which seeks to coordinate third world positions in international economic negotiations. This structure—which as of 2008 has some 130 member states—overlaps closely with the NAM, but its focus on common economic interests has allowed it to become a more coherent force. The Group of 77 provides probably the best political definition of which states belong to the South or the third world in the international system.

THE THIRD WORLD IN SOCIAL SCIENCE THEORY

In the course of the 1950s and 1960s, two predominant paradigms emerged in the social sciences claiming to provide a social scientific understanding and policy prescriptions for the new third world states. One was modernization theory, the most influential approach in the academic mainstream of the North. The thrust of modernization theory was to assign the primary explanation for the backwardness of third world societies to internal forces. It saw the situation of the South as a result of their backwardness with respect to modern social structures that had developed in the North under the impetus of capitalism and industrialization. The challenge facing third world countries was to modernize their social institutions on the model of the developed countries and in its wake would follow economic development, rising income levels, and political democracy. Most modernization theorists felt that the postindependence elites had positive modernization agendas, although they were concerned that these were in danger of being derailed by hostile internal (and sometimes external) forces. A variant of this theory is the concept of *political development,* which accorded the political sphere some autonomy but applied the same modernization framework to it.

A contrary view was taken by the *dependency* school, which became increasingly influential from the 1960s onward. Linked with both Marxist academics and, especially in Latin America, with left-wing nationalist political forces, the dependency approach argued that the structural economic and social factors behind the poverty of third world countries had been created by the way they had been integrated into the international economy since the colonial period. The main source of third world poverty was not a failure to develop, but a particular form of development imposed by Western imperialism. In the memorable phrase of one of the pioneers of dependency theory, Andre Gunder Frank, what the third world suffered from was "the development of underdevelopment." The main cause of third world backwardness was thus external and the solution lay in breaking away from the externally oriented patterns imposed by imperialism and developing more autonomous, indigenous forms of economic activity.

The political conclusions of the dependency school were varied. On the one hand many of its advocates embraced a socialist model of third world development on Cuban or Chinese lines. Others, like the economists associated with the UN Economic Commission for Latin America, took a more reformist approach and promoted an *import substitution industrialization* (ISI) model of economic development that advocated shifting economic activities from primary producing export sectors to home-market based industrialization, with the support of tariff barriers.

Both modernization and dependency theories have been subject to extensive criticism. The modernization approach was seen as ignoring the historical specificity of third world societies and the international context of their development. Dependency theory suffered from the failure of the many attempts by third world countries to pursue ISI-based policies, and their almost universal conversion, under the pressure of international organizations such as the International Monetary Fund and the World Bank, to a model of export-oriented growth and market liberalization. The ability of some third world economies, in the context of a shift in the international division of labor, to sustain significant industrial development, appeared to refute the original expectations of dependency theory.

However, dependency theory could claim to have captured more accurately the reality of third world societies: a distinct "underdeveloped" economic and social structure, characterized by a small, technologically modern industrial sector alongside a large agrarian and urban informal sector plagued by low levels of productivity and high levels of underemployment. These features look more like a distinct structural pattern, rather than a holdover from some "premodern" past, and this can explain why they have proved so intractable, despite decades of efforts to address underdevelopment.

THE DOMESTIC POLITICS OF THIRD WORLD STATES

Much of the contemporary policy debates over the third world and its problems appear to be between descendants of either the modernization or dependency schools. For example, the views of the neoconservative architects of U.S. foreign policy seem firmly within the modernization tradition, while

the perspectives of the new Latin American left owe much to the arguments of the dependency school.

The distinct social structure of underdevelopment has given the South correspondingly distinct patterns of domestic politics. The upper classes of the South have been relatively inchoate, growing out of deeply penetrated societies in which key economic sectors are under foreign ownership, and state and military institutions are heavily dependent on relations with external powers of the North. The key political elites often are based in the state apparatus—the military or the upper echelons of the state bureaucracy. The sort of national class-based political forms that coincided with the emergence of democratic institutions in the North have developed only episodically in the South. In their place two forms of political structures have tended to arise.

On the one hand, there is a form of politics in which power is tightly held by the state elites through military dictatorships or single-party states. Regimes of this type were common in the early postcolonial period, and often they were favored by the major Northern powers (both West and East), who saw them as reliable allies and a disciplined developmental force.

Such authoritarian regimes suffer from serious internal problems but often can hold power for long periods due to effective repression of opposition and the capacity to encapsulate elite aspirations within the regime, as the case of Indonesia illustrates. Inevitably, however, they encounter crises that they do not have the social resources to cope with and collapse under a combination of internal atrophy and social protest.

An alternative pattern is the development of broad, multi-class movements of a populist character built around charismatic leaders. Such movements often developed in the course of anti-colonial and anti-imperialist struggles, but they also emerge in connection with the collapse of military regimes (especially in Latin America). While frequently espousing a vaguely socialist ideology, such regimes often are based on a set of alliances with traditional dominant groups and on a *machine politics* centered around patron-client relationships with their supporters.

This type of machine politics is inherently volatile and requires a lot of resources to keep the wheels oiled. Both military and populist regimes foster corruption, which generates political resources and rewards elite support for the regime. Populist regimes rarely overcome the limitations of the economies they govern and usually fail to meet the aspirations of their mass base. While they can become quite repressive in the face of serious opposition, they lack the repressive capacity of strictly military regimes and collapse more readily in the face of crises. It is therefore not unusual to see a pattern of military regimes alternating in power with populist forces.

A third tendency that has emerged as a powerful destabilizing force in third world politics is ethnically based nationalism, in which popular mobilizations take place around identities (often quite deliberately constructed by political forces) based on language and religion. Such mobilizations often center on access to state-allocated resources, but they also invoke powerful cultural and historical symbols that make intergroup relations difficult to negotiate and pave the way for brutal encounters. Any external shock to such precariously balanced

political systems can enhance the competition for resources and spark intergroup conflict and the collapse of any form of effective governance. Both military and populist regimes have manipulated ethnically based tensions to reinforce their social base, and this often has been an important factor in starting the process of the ethnicization of politics.

GLOBALIZATION AND STRUCTURAL CHANGE IN THE SOUTH

Many of the economies of the South began to change significantly in the late 1970s as the economic structures of the North shifted. A combination of technological change and moves by large transnational firms to restructure their operations on a global level meant that the economies of the North shifted toward a *postindustrial* pattern centered in the service and technology sectors. This created a space for some economies in the South to expand their industrial sectors while remaining oriented toward international markets and produced a group of *newly industrializing countries* such as Brazil, Malaysia, Mexico, South Korea, and Taiwan. The differentiation of the South was further reinforced by the success of the Organization of Petroleum Exporting Countries, in forcing a major rise in international oil prices in the 1970s. This both enhanced the incomes of Southern oil exporters and produced new sources of capital that became available through the international financial system to finance development projects in the South.

This period, however, also saw a major rise in the international indebtedness of the South, as lending promoted by Northern financial institutions was directed often to poorly conceived "prestige" projects and distorted by political corruption. The international economic downturn of the 1980s further accentuated the lack of viability of many debt-funded schemes. This culminated in a new set of problems for the South, as high levels of debt service began to consume foreign exchange earnings and negate any benefits derived from international aid.

The most recent phase in the development of the South can be seen as an extension of this new international division of labor in the era of globalization. Two of the most populous states of the South—India and China—previously among the poorest countries in the world, have initiated a major new phase of industrial growth, achieving high and sustained growth rates over a period of several years. While they remain third world societies—plagued by unevenness of development and acute inequalities between urban and rural societies, between high and low technology sectors, and between upper and lower social classes—they are emerging as important players on the international economic scene, both at the state and the corporate level. This increase of economic power is gradually producing an increase in their political weight, but how rapidly this proceeds will depend on their ability to act in cooperation.

THE GLOBAL SOUTH IN INTERNATIONAL POLITICS

The states of the South have at various points in recent history attempted to act as a coherent bloc and influence both

international affairs and economic relations. They hold a substantial majority in the General Assembly of the United Nations, and as a result that body has become a relatively autonomous force, although its influence is limited by the structure of the UN. India is making a bid to become a permanent member of the Security Council, a position already held by China, and if that were to happen the political weight of the South within the UN could be significantly strengthened.

The South has played an important role elsewhere in the UN system, using its leverage in the General Assembly to influence key appointments and to propel some UN agencies, such as the United Nations Committee on Trade and Development, to adopt critical stances with respect to the structure of the international system.

The unequal pattern—in terms of both political power and economic wealth—of North-South relations continues to be a key issue in international affairs. It also has moved from the realm of interstate relations to become an important concern in domestic politics around the world, expressed in forms such as the Make Poverty History campaign, the World Social Forum, and the formation of an influential aid lobby in many Northern states.

These concerns are given force by the data about the position of the South in the international economy. Despite more than four decades of official concern for international poverty and development, inequality in the international system appears to have worsened. Of particular concern is the situation of the very poorest countries in the international system—referred to by the World Bank as the *least developed countries* and sometimes as the *fourth world*. Corresponding to these difficulties are often acute domestic political problems that further undermine the capacity of their governments to address these issues or to make effective use of external assistance. In extreme cases, some of these countries collapse into failed states torn apart by civil strife. Afghanistan, the Congo, Liberia, and Rwanda are among the most prominent examples of this process.

One political force of global significance that has erupted from within the third world is that of radical Islamism. Its roots and dynamics are complex, but they can be seen as having a close connection with the poverty and political instabilities of the third world. Armed Islamism emerged in the 1980s out of the Afghan conflict, where the al-Qaeda network of Osama bin Laden was forged. Subsequently Bin Laden turned to sponsoring terrorist activities directed against the United States, culminating in the attack on the New York World Trade Center on September 11, 2001. As a consequence, Islamist terrorism became a key concern of American foreign policy and a major issue within the international system. Islam as a source of political identity and Islamism as a political program are firmly established within the Muslim world, in several countries as a popular political current within a democratic framework. Whether Islamist terrorism develops further will depend on many factors, in particular the ability of the international system to deal with issues of key symbolic significance to Muslims, such as Palestine (the one international problem on which there is a near consensus among third world states).

Another recent development in the South has been the emergence of radical left governments in several countries of Latin America. Drawing upon left-nationalist critiques of dependence, these new forces arise from political movements that appear to have deeper social roots than the radical populism of the past, although they continue to be marked by some of its traits. This development began in 1998 with the election of Hugo Chávez, a former military officer, as president of Venezuela. It was reinforced in 2003 with the election of Luiz Inácio Lula da Silva of the Workers Party as president of Brazil (although, in power, he has followed a cautious, reformist course). The subsequent election of radical presidents in Uruguay (2004), Bolivia (2005), and Ecuador (2006), along with the emergence of socialist and left-populist administrations in Chile, Uruguay, and Argentina, has produced a new left-wing axis in Latin American politics with a resonance throughout the South. It remains to be seen whether these regimes can sustain their initial objectives and contribute toward the political empowerment of the South.

The future of the South within the international order remains highly uncertain (compounded by yet new issues such as the impact of global climate change) but one thing seems sure—the issue of North-South relations and of global social justice will remain a central one both within international institutions and within the domestic politics of states both North and South.

Sovereignty

Sovereignty is the supreme political authority. The concept forms the basis for the modern international system, and it provides legitimacy to contemporary nation-states and

national governments. At its most basic level, sovereignty is control over people and geographic space. Such control is typically invested in the structures of government, and history was marked by the steady growth in sovereignty by national governments and a concurrent accumulation of centralized power. However, many modern democratic systems are based on the principle of individual sovereignty that in turn entrusts authority to representative governments. Consequently, a distinction has developed between the exercise of sovereignty within either domestic affairs or international relations, and the theoretical or philosophical source of sovereignty. Meanwhile, the growth of nonstate, international actors has eroded the traditional power of the nation-state and redefined some aspects of sovereignty.

SOVEREIGNTY, THE CITIZEN, AND THE STATE

Sovereignty has been manifested in one form or another for most of human history. Rulers and governments have gained both legal and practical control over territory and populations by various means. Within political philosophy, the modern concept of sovereignty was initially developed in the writings of St. Thomas Aquinas in the thirteenth century. Aquinas argued that sovereignty resisted with God. The sovereignty exercised by human rulers came from the divine, and it was incumbent upon these leaders to exercise their power in accordance with Christianity. Otherwise, citizens or other states were justified in removing the ruler. This notion of sovereignty formed the basis for the concept of the concept of absolutism. The French philosopher Jean Bodin argued that sovereignty was absolute, and it conferred upon a government unconditional power. His most influential work was *Six Books on the Republic* (1576). He also differentiated between domestic sovereignty and that expressed in the international system. From Bodin's writings, others such as James I argued that monarchs enjoyed complete sovereignty through the principle of the divine right of kings. Other prominent supporters of monarchial sovereignty included Joseph de Maistre.

Englishman Thomas Hobbes agreed that sovereignty was absolute. However, Hobbes contended in his famous work *Leviathan* (1651) that power came not from the divine but from a social contract between the people and the rulers, in which people surrender some portion of their natural rights in exchange for the government maintaining social order and providing for the common defense of its citizenry. Later philosophers such as John Locke expanded on both the importance of natural rights and the role of the social contract in legitimizing domestic sovereignty. Locke contended that governments were granted only enough sovereignty by their people to protect the natural rights of the citizenry. The notion that sovereignty came from the people (popular sovereignty) became one of the main foundations of modern democracy and formed the core of the governmental system of countries such as the United States.

Locke's notion of popular sovereignty contrasted with a later model developed from the philosophy of the French intellectual Jean-Jacques Rousseau in the eighteenth century.

Rousseau asserted that sovereignty was based in the general will of a population (or the common good) and that there was no distinction between the source of sovereignty and its exercise. The general will was consequently the basis for national sovereignty and the means through which state authority was manifested. It was expressed through the structure of government (which Rousseau argued should be a form of direct democracy but was implemented as a representative system). The general will could and would supersede the individual rights of citizens. Under popular sovereignty, power rests with the people, while under the concept of the general will, power rests with the government. An extreme version of the concept of the supremacy of the collective over the individual would later form the core of totalitarian systems, including fascism and communism. Under such systems, the state has total sovereignty over individuals, although the regime bases its authority on the need to promote the public good. For instance, Carl Schmitt advocated that all sovereign governments had the authority to decide when to abrogate the social contract and undertake dictatorial means in order to protect the public interest. Indeed, for Schmitt and some other theorists, the core of sovereignty was a government's ability to establish a *state of exception* to protect the general will from either internal or external threats. Schmitt later defended the sovereignty of totalitarian regimes.

In reaction to the totalitarian regimes of the twentieth century, an antisovereignty movement emerged that rejected the domestic authority of states and argued instead for an internationalization of rights. The French philosopher Georges Bataille's concept of antisovereignty influenced successive scholars and philosophers, including Michel Foucault and Jacques Derrida. In his 1957 book, *Sovereignty: An Inquiry into the Political Good,* Bertrand de Jouvenel acknowledged the importance of state sovereignty but criticized the growing power of the nation-state over individual citizens, a theme echoed by Jacques Maritain who argued that sovereignty was an antiquated concept used to oppress citizens.

While many philosophers and scholars concentrated on the internal dimensions of sovereignty, others concentrated on the study of international law and international relations theory as they applied to state sovereignty in the global system. Hugo Grotius is often considered the father of international law. He asserted that natural law, conventions, treaties, and traditions formed constraints on state sovereignty in external matters. His work formed the core of the rationalist (or Grotian) division of international relations that contrasted with the realist (or Hobbesian) emphasis that stressed power and control of resources rather than cooperation in global interactions. Meanwhile, Immanuel Kant developed a political philosophy that emphasized the importance of constitutional republics as a means to constrain expansionist state behaviors and prevent war. The philosopher's writings would be identified as the basis for the Kantian (or revolutionist) view of international relations.

The English school of international relations of the twentieth century was based on these three trains of scholarship but emphasized the Grotian model. Hedley Bull, one of the

leaders of the English school, emphasized the importance of a community of states within the otherwise anarchical system of international affairs. Bull's most influential work was the 1977 book, *The Anarchical Society,* which stressed the importance of mutual recognition as the key to state sovereignty. Within the international society of states, norms and values develop that both guide and constrain state action and provide the boundaries of sovereignty.

The English school, as well as the realist and neorealist schools that emerged from the Hobbesian tradition, emphasizes the centrality of the nation-state as the principle unit in international relations and therefore the main sovereign entity. However, a number of challenges have emerged to the concept of state-centric sovereignty. Neoliberal institutionalism (modified structural realism) emphasized the growing importance of economics and the interplay between trade and traditional notions of military power to assert that nonstate actors increasingly play a role in global affairs and have led to a diffusion of sovereignty. Neoliberal institutionalism is identified with the work of contemporary scholars such as Robert Keohane, including *After Hegemony* (1984), Stephen D. Krasner, and John G. Ruggie. In addition, cosmopolitanism argues for the development of a form of world citizenship in which national sovereignty exists only within the confines of a broad series of universal individual rights.

THE EVOLUTION OF SOVEREIGNTY

For most of human history, sovereignty was vested in a single individual or in small groups within political units. Sovereignty was usually based on power and rested on the martial capabilities of the ruler and ruling class. A wide variety of political organizations consequently emerged, ranging from multiethnic empires to kingdoms to city-states to assorted religious states. Authority was not the domain of the state, but rather the individual. Rulers and dynasties gained varying degrees of authority over disparate lands as a result of wars, treaties, and marriage. As a result, a series of overlapping and complicated political relationships emerged in which rulers often had multiple loyalties. The feudal system of Europe exemplified this pattern. Rulers who exercised absolute power in one land often found themselves the vassal of another leader because of extended holdings. In addition, vassals could be more authoritative and influential than their liege lords. The Duchy of Burgundy was considerably more powerful then the kingdom of France during the late Middle Ages, and the dukes used their resources to emerge as rivals to the French kings. This occurred despite the fact that the dukes of Burgundy were vassals of the French king. Consequently, national borders had little significant meaning and political authority was uneven and divided. The broken geography of Europe, with its series of mountain ranges and rivers, not to mention the water barriers around the British Isles, divided the continent and precluded the rise of a single empire as was the case in China or India. Instead, geography fostered smaller political units that often competed fiercely with one another for primacy.

Sovereignty was even more diffused because of the role and influence of the Catholic Church, which acted as a supranational body with political manifestations in the form of autonomous bishoprics or other church-states. Nonetheless, the church performed an important role in legitimizing the sovereignty of rulers through participation in coronations and other forms of formal recognition of feudal rulers. In return, secular leaders were expected to support the church financially, politically, and militarily.

Of the political organizations of the period, empires could harness significant military and economic resources. However, these entities often could not maintain the loyalty of their citizenry. The central government faced daunting challenges in attempting to maintain order in remote parts of the empire while the core population typically grew to resist the diversion of resources away from the capital region. Empires also could fall into the trap of imperial overstretch and devote too many resources to conquest and therefore erode their competitiveness against challengers. Thus, most multiethnic empires collapsed as a result of external threats or internal dissension. Alternatively, smaller political units such as city-states could command deep loyalty and sacrifice by their citizenry, but they lacked the resources to defend themselves from larger entities. If the city-states expanded, they risked weakening the bonds of loyalty. From the constant strife of the Middle Ages, a new political entity, the nation-state, emerged to redefine notions of sovereignty and the nature of the international political system.

THE NATION-STATE

The modern nation-state combined the resources of the empire with the loyalty and self-identification of the city-state. It had a population that was large enough to project significant military power, yet its people were typically relatively homogenous. It also had the economic resources necessary to keep pace with the rapid advances that accompanied the series of revolutions in military affairs. The end of the Thirty Years War, through the Treaty of Westphalia (1648), marked the rise of the modern nation-state and the decline of both the church and the feudal system.

Post-Westphalian nation-states were different from their predecessors in four main areas. First, sovereignty was vested in a central government that was generally separate and distinct from other social institutions such as the church. The central government developed a monopoly on the exercise of political authority the use of force, both internally and externally. Second, the new nation-states developed a degree of cohesion and unity of identification among the population that was the forerunner of nationalism. This marked an important distinction from the past when loyalty was generally personal and vested in the person of the king or prince. Instead, in nation-states, loyalty came to be directed to the state and its structures of government. Third, nation-states accelerated the rise of the multiclass system and the rise of the middle class. The traditional lord and vassal arrangement was replaced by a complicated and multitiered system in which the growing middle or bourgeoisie class demanded increased political access and power. Fourth, and finally, the nation-state was a coherent geographic entity. Its borders were usually defined by natural

boundaries and homogenous populations with shared cultural, linguistic, and religious values and norms. Sovereignty within the nation-state was exercised over a compact area and governments were granted a degree of legitimacy and authority unmatched in previous political systems since that authenticity came to be generally voluntary (with notable exceptions). This led to the relative stabilization of borders and populations as external actors and governments conferred recognition of the sovereignty of individual governments over their territory and populations.

The sovereignty accorded to the modern state makes it relatively unique in historical terms. Whereas the international system has been typically marked by inequality with hegemons and client states, in the post-Westphalian era, all states have equal sovereignty under international law in spite of differences in size, resources, and military capabilities. This equality may not always exist in practical terms, but it does form the basis for the contemporary international system. Sovereignty is confirmed by the general acceptance that national governments have near exclusive power or jurisdiction over their territory and population. Significantly, that power is reaffirmed by the global community through formal recognition of a specific government's claim to sovereignty. Sovereignty came from the international community, not from divine power or military might.

Modern nation-states combined high degrees of internal and external sovereignty. Internal sovereignty is the relationship between the structures of government and civil society. Its basis is the recognition of the legitimacy and authority of the central government against any domestic rivals. Internal sovereignty is marked by almost total monopoly on the use of force within a territory and population. Governments also typically exercise sovereignty over a range of social interactions and structures, including education, a country's legal system, and its economy. Public policy is the domain of government and an expression of state sovereignty and is manifested through the control and redistribution of resources. For instance, taxes are collected and then used to fund public services or build or maintain infrastructure.

External sovereignty is based on recognition by other international actors of a state's territory and authority. Such recognition affirms a state's internal sovereignty as the sole legitimate government over a given area. It also grants governments a number of inherent rights under international law and custom, including the right to declare war, to enter into treaties and conventions, and representation in international organizations. States also set trade policy and control currencies. The Treaty of Westphalia confirmed the primacy of the nation-state as the embodiment of external sovereignty in the global arena, but in the post–World War II (1939–1945) era, a number of challenges to state sovereignty emerged.

CHALLENGES TO STATE SOVEREIGNTY

In the aftermath of World War II, a number of international institutions were created to constrain state behavior and prevent another global conflict. Initially, the authority of these organizations remained dependent on the major powers of the day. For instance, the United Nations (UN) as an institution found itself able to act on global matters only when there was consensus among the great powers. Nonetheless, the UN and a number of smaller and regional organizations were able to take action or put in place policies through which states surrendered some degree of sovereignty in exchange for access to greater public goods, including peace, security, and economic prosperity. The European Coal and Steel Community set the stage for the European Community, which later became the European Union (EU). The EU sought deeper political, economic, social, and security cooperation. It achieved its greatest success in the economic sphere where the member states developed an economic union that led in 1999 to the adoption of a single currency, the euro. Meanwhile, the North Atlantic Treaty Organization (NATO) was formed in 1949 as a collective security organization to prevent another hegemonal bid by Germany and defend against Soviet expansion. Membership in NATO forced states to surrender some degree of external sovereignty and harmonize defense and security policy with other member states. Other regional economic and security organizations were less successful, or at least less far-reaching, but many were able to limit national sovereignty, both on the internal and external levels. One consequence was the emergence of what Richard Rosecrance (1986) described as the *trading state.* Trading states such as Germany or Japan concentrated on economic gains instead of traditional geopolitical power. They were willing to surrender control of security to institutions such as NATO or alliances with the United States and divert resources into economic growth. In their efforts to take advantage of markets, states were willing to harmonize trade regulations in order to make goods, capital, and labor mobile.

The modern, post-Westphalian system has been marked by tension between national sovereignty and that of individual citizens. The tension reached its peak following World War II and the horrors committed during that conflict by regimes against their own citizens. In response, in 1948, the Universal Declaration of Human Rights was created as a means to ensure that all people were granted basic natural rights. The declaration was followed by the Genocide Convention. The European Convention on Human Rights (1950) imposed a strict series of protocols to protect the rights of citizens. These instruments were used to justify international humanitarian missions, including the use of military force, in order to prevent genocide or protect populations during the Balkan Wars of the 1990s. Traditional notions of state sovereignty were judged less important than the international community's responsibility to protect human rights. The creation in 2002 of the International Criminal Court with supranational jurisdiction was another manifestation of this trend.

The growing wealth and power of multinational corporations has further eroded national sovereignty. Corporations such as Microsoft or Exxon-Mobil, which individually have annual earnings that far exceed the gross national products of most countries, have become important actors in international relations and may exert enormous power in dealings

with individual states. By the early 2000s, configurations of sovereignty that emerged in the post–Westphalian era faced a variety of challenges; however, the state remained the main embodiment of domestic and international authority.

Soviet Union, Former

The Union of Soviet Socialist Republics (USSR) was founded after the October 1917 Russian Revolution as the world's first socialist state. Led by Vladimir Lenin and the Bolshevik party, the USSR was supposed to be a dictatorship of the proletariat that would facilitate the construction of communism in the Russian empire and globally. The USSR was officially created from the Russian, Ukrainian, Belarusian, and Transcaucasian Soviet republics in 1922. After expansion between 1922 and 1945, it contained fifteen republics: Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Russia, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan.

THE SOVIET UNION UNDER STALIN

Formally the USSR was a federation, and all republics had equal rights and their own governments. In practice, the republics were subject to the central Soviet government, itself under the direction of the Communist Party of the Soviet Union (CPSU, as the Bolshevik party was renamed in 1952).

Politically, this system was a dictatorship by the time that the USSR was created. The soviets that were supposed to ensure mass political participation and emancipation and be the titular core of the political system were subjugated to the will of the Bolshevik party during the civil war (1918–1921) that followed the revolution. The concentration of power in the party enabled its General Secretary, Joseph Stalin, to succeed Lenin as the USSR's leader. Stalin aimed to rapidly modernize the USSR, which was supposed to address both the USSR's security fears—as the first communist state, it was surrounded by hostile capitalist powers—and to lay the basis for communist construction in the USSR by transforming its peasant economy. Control of the economy was centralized and economic activity directed by a five-year plan drawn up under the supervision of the central CPSU leadership. Plan implementation became the main work of party and state, which became intertwined and dominated society.

Rapid modernization through central planning was costly to both the Soviet people and the Soviet system. The human cost ran into millions of lives as agriculture was collectivized amid famine and mass deportations. Later, the Stalinist purges saw the repression of further millions as Stalin struggled to control the growing state bureaucracy and direct economic activity. The cost to the system was its bureaucratization and economic inefficiency. Bureaucratization meant that the party elite began to develop some of the characteristics of a class, and the elite became privileged and isolated from the Soviet people whose liberation it was supposed to nurture. Inefficiency grew because bureaucratization and ideological control dulled flexibility and initiative, and this made the economic problems of central planning—waste, poor labor productivity and investment returns—intractable. Stalin's solution was coercion and more demands for high growth. While this worked in the short term, enabling the USSR to build a superpower military machine and expand its power in eastern Europe after World War II (1939–1945), it was not sustainable in the long term.

AFTER STALIN

Stalin's combination of dictatorship, repression, and ideologically inspired economic control created what Western political scientists called a totalitarian system, but this totalitarianism could not outlast Stalin because of its economic inefficiencies and human costs. The cold war, which was partly prompted by the expansion of Soviet power, placed immense strain on the economic system because the USSR spent much more of its far smaller national wealth to compete with the United States and its allies. The USSR began the process of de-Stalinization under Nikita Khrushchev, who condemned Stalin in his Secret Speech at the 1956 20th Party Congress. De-Stalinization consolidated Khrushchev's leadership position but constrained his ability to reform Stalinism because he could not coerce change from the bureaucracy. The bureaucracy grew unwilling to countenance change or lose any of its privileges. Khrushchev's efforts at reform lost him support and alongside policy failures in agriculture and foreign affairs—most notably the 1962 Cuban missile affair—led to his ousting in 1964.

--- Union Republic boundary (S.S.R.)

The former Soviet Union encompassed land and peoples stretching from Eastern Europe to Asia and the Caucasus.

The new leadership, under Leonid Brezhnev, declared the USSR had entered the stage of developed socialism and would change only incrementally toward communism. This recognized that the USSR was now a modern urban and industrialized society that would no longer grow rapidly, but did not resolve the problems of central planning and bureaucratization. If anything it did the opposite: Brezhnev promised stability to Soviet elites, and they expanded their power and privilege under his rule. Growth in the USSR was secured by oil sales, the price of which was inflated in the 1970s. Oil sales enabled more popular consumption and military spending, but it did not resolve the underlying structural problems of planning. Worse, large parts of the economy were deprived of investment, and the USSR began to fall behind its competitors technologically.

REFORM AND THE COLLAPSE OF THE USSR

Many Soviet leaders recognized the need for reform by the early 1980s. The economy was entering crisis, and the costs of military competition with the West, which grew after the Soviet invasion of Afghanistan in 1979, and its rule over eastern Europe could not be sustained. Brezhnev's immediate successors, Yuri Andropov and Konstantin Chernenko, were not in power long enough to effect change.

Mikhail Gorbachev's accession to CPSU General Secretary in 1985 broke the logjam. Gorbachev's aim was to revitalize the Soviet economy by cutting military expenditure, incentivizing the workforce, and cutting back on bureaucratic obstacles to reform. Foreign policy reform, including withdrawal from Afghanistan, relaxation of Soviet control over eastern Europe, and rapprochement with the West, was to facilitate arms cuts. Reform of the CPSU and democratization were supposed to cut bureaucracy and engage the Soviet people in securing change. Gorbachev's foreign policy was successful in reducing international tension, but domestic reform had unintended effects. The CPSU reformed slowly and popular protest, most notably the nationalist movements that developed in the republics as Gorbachev relaxed political controls, weakened central authority. Elections in 1989 to an all-Union parliament and in 1990 to republican parliaments undermined Gorbachev's power, and he was forced to negotiate a new Union treaty in the spring of 1991. This would have changed the nature of the USSR fundamentally. Conservative forces tried to stop the treaty's August 1991 ratification by overthrowing Gorbachev. Their failure demonstrated that authority lay with republican governments, most of which now seceded from the Soviet Union. An agreement among Belarus, Ukraine, and Russia in early December 1991 sealed the USSR's fate, and it was formally abolished on December 26, 1991.

Spatial Analysis

Spatial autocorrelation is the clustering of similar or dissimilar behaviors, processes, and events among neighboring observations and is predicted by many theories in the social sciences. Spatial dependence can produce biased and inconsistent parameter estimates or biased standard errors. In contrast to the serial dependence of time series, where the past influences the future but not vice versa, spatial dependence is multidimensional—neighbors influence each other. As a consequence, spatial autocorrelation is modeled via maximum likelihood estimation or instrumental variables models. Geostatistical data and lattice data are two of the principal forms of spatial data. In the case of geostatistical data, the observed data are sample data from a continuous underlying surface and the researcher's principal interest is inferring information for unsampled locations based on the sample data. In the case of lattice data, the continuous underlying surface is partitioned into a finite number of areal units, or polygons, such as countries, states, or localities.

Two principal spatial models are generally used for lattice data. The spatial lag model incorporates spatial autocorrelation via a spatially lagged dependent variable. This model corresponds to a diffusion process in which neighbors influence each other. A spatial error model, in contrast, incorporates spatial dependence via the error term. This model is appropriate if the spatial dependence is produced by variables omitted from the model. Emerging frontiers in spatial analysis include spatial panel data models, spatial probit models, and spatial survival models.

Spengler, Oswald

Oswald Arnold Gottfried Spengler (1880–1936) was a German philosopher and historian. His most renowned work is the two-volume *The Decline of the West* (1918–1922) in which he breaks with the Hegelian view of history as a rational process of linear progression. Spengler presented a deterministic theoretical model in which civilizations rise and decline in the same way as biological organisms, following an irreversible series of cycles. He believed that Western civilization was heading toward its final eclipse and that it would be followed by the emergence of new African and Asian powers. Although he was in favour of German hegemony in Europe and supported an organic blend of socialism and traditionalist authoritarianism, his relationship with the National Socialist regime was uneasy.

Born at Blankenburg am Hars, Spengler received a classical education and earned his PhD in 1904. The following years of his life were troubled, due to his personal poverty and loneliness and to the complex political situation of the time. The Agadir Crisis (1911), in which Germany deployed a gunboat to the Moroccan port of Agadir, and later Germany's defeat in World War I (1914–1918) increased Spengler's pessimism and convinced him of the inevitability of the decline of European civilization. His works *The Decline* (1918) and *Perspectives of World History* (1922) had wide readerships and placed his theses in the intellectual arena. Spengler was even offered a post at the University of Göttingen, which he declined.

A bitter critic of the Weimar Republic, Spengler made a brief and unsuccessful attempt to participate in active politics. He was approached by the National Socialists, but he objected to their racialist policies and militarist stand, engaging in a public dispute with Nazi ideologist Alfred Rosenberg. Significantly, *The Hour of Decision* (1933), one of the few books critical to the regime published in Germany, was eventually condemned. Spengler died in 1936, having predicted that the fall of the Third Reich would occur in less than a decade. He also anticipated the cold war.

In *The Decline of the West,* which was influenced by German philosophers Johann Gottfried von Herder, Friedrich Nietzsche, and Johann Wolfgang von Goethe, Spengler develops a biological approach to history, explicitly manifested through the four seasons of civilizational cycles: spring (birth), summer (youth), autumn (maturity), and winter (decline). From aristocratic and warrior beginnings, cultures move through a process of urbanization and intellectualization, entering their phase of decay as they embrace political ideologies as democracy, egalitarianism, socialism, or humanitarianism. Money, industrialism, and technology would be the prime factors in cultural decay, as Spengler further explained in *Der Mensch und die Technik* (1931). Even though he defended the idea of incommensurability between cultures, he did suggest that a "comparative morphology of history" was possible, as diverse cultures in different times but parallel "biological stages" displayed similar characteristics. But Spengler denied the scientificity of history, disregarding unilinear or causal explanations.

As a whole, Spengler's views were, and remain, highly controversial. Even though he was vehemently criticized by the emerging neopositivist tradition, his works became very influential during the 1920s and 1930s. However, his conservative views and firm opposition to the Weimar Republic ostracized his philosophical legacy.

Spin

Spin can be interpreted historically as a form of information management that seeks to manipulate public opinion through the selective presentation of the news or facts or data. The term itself, however, is understood largely as a modern concept related to contemporary forms of media. Spin can be either positive or negative and may be used to either persuade or dissuade the public. Spin also can be understood as a form of rhetoric or propaganda, especially when government-controlled media present only positive news about the regime and suppress any negative stories. Among the most widely practiced forms of spin is *cherry-picking*—the presentation of only those facts or figures that support one's position. With increases in number and availability of news and information outlets in the late twentieth century to early twenty-first century, spin took a subtle form and involved the use of techniques such as *double-speak*—language that seemed to indicate the opposite of its actual meaning. In addition, political or media entities may package information in a manner that disguises its true meaning or impact. For instance, several positive news items might be released at the same time as negative news in an effort to have the public or the media emphasize the positive features. Another tactic is the release of negative information during periods when there is likely to be less media scrutiny, such as on weekends or holidays.

. . . . TOM LANSFORD

Spinoza, Baruch

Dutch-Jewish philosopher Baruch Spinoza (1632–1677) was one of the most influential proponents of rationalism in the seventeenth century. Spinoza was born in Amsterdam to a Jewish family, but he was accused of heresy and expelled from the Jewish community in 1656. Of his three major works, the *Theologico-political Treatise* (1670), *Ethics* (1677), and the *Political Treatise* (1677), only the first was published during his lifetime. His thought is at the crossroads of often conflicting cultural matrices (Hebraism, Classic and Humanistic philosophy, the Scientific Revolution, and Republicanism), and his originality lies not only in his challenge to early modern philosophy but also in the alternative he proposed to the emerging possessive individualism and Cartesian anthropology. Spinoza seldom discloses his sources, thus it is important to note the tribute he pays to the atomist tradition over the philosophical "trifles" of ancient Greek philosophers Plato and Aristotle and the great debt he recognizes to Italian political theorist Niccolò Machiavelli.

Spinoza takes a position within the natural law tradition but also against contractualism. From his original concept of god as substance—impersonal, nonanthropomorphic, and nontranscendental—Spinoza draws the concept of *jus sive potentia* (right as power): Every single existing thing participates in the very same power of substance, and therefore, as he states in *Theologico-political Treatise,* "the right of the individual is coextensive with its determinate power" (*potentia*). According to him, power lies not in potential but only in act. Power is the grounding principle of each thing's *conatus*—the tendency of everything (inanimate objects, as well as animals or men) to preserve its own being.

Because the *conatus* represents the very essence of beings, Spinoza concludes that it is impossible for men to abandon their own natural power and form a state by means of a social contract. He states, "the difference between Hobbes and myself [. . .] consists in this, that I always preserve the natural right in its entirety, and I hold that the sovereign power in a State has right over a subject only in proportion to the excess of its power over that of a subject" (Spinoza 2002, 891).

Spinoza points out that the state has its origin not only in human reason but also in affect, especially indignation. The fundamental right to resist lies at the very heart of the relationship between sovereign and subject. The sovereign doesn't derive his right from a divine authority but is continually exposed to the right and power of the multitude over whom he rules.

While in *Theologico-political Treatise* Spinoza still makes use of the language of social contract, in *Political Treatise* he does not employ this concept and explains the formation of the state only through the constitutive dynamics of the multitude, which he sees as the real sovereign. In fact, the positive role that he gives the multitude is an attack on established political tradition. If for English political philosopher Thomas Hobbes the multitude was the natural, rebellious, and monstrous subject of politics, something to be disciplined and transformed into a people under the legitimate power of a sovereign, for Spinoza it is nothing less than the true sovereign subject, no matter the form of government. As a consequence of this, because the right of the state lies solely in the power of the multitude, for Spinoza, the most "absolute" form of government is democracy.

Split Ticket Voting

Popularized with the implementation of the Australian ballot after the reforms adopted during the Progressive Era, split ticket voting is now a permanent feature of the American political system. *Split ticket voting* refers to the process of casting votes for more than one party for the different offices on the ballot. Since the 1950s, the prevalence of Americans deliberately splitting their votes in presidential and congressional elections has increased. Split ticket voting differs from *straight party voting* or *straight line voting* in which the electorate votes for candidates of the same party for all the offices on the ballot. Other than American's splitting their vote for strategic reasons, several explanations provide possible justification for split ticket voting. The separate election of legislators and executives as well as the staggered terms that exist for different offices improve the chances that split ticket voting will occur. Also, the American executive and legislative branches are not incorporated into one body, as one finds in a parliamentary system. This allows voters the opportunity to vote for different parties for the various levels of government. The anonymity provided by the Australian ballot provides another possible explanation for the popularity of split ticket voting.

Spoils System

The *spoils system,* also known as *patronage,* is the practice of rewarding political supporters or voters by appointing them to public office or providing them with government contracts or services. Although the phrase typically refers to such

practices in the United States, various forms of the spoils system are common throughout the world. After an election, because all or most appointees of the previous government have their tenures end and typically are removed from office, these vacant positions under the spoils system are typically replaced by loyalists from the new party that has assumed power. In addition, government-sponsored construction projects or other infrastructure measures or services often were awarded to companies who had supported the incoming party. Electoral wards or districts, and even states, benefited from government largesse.

With a spoils system, appointees and contracts are rewarded based on loyalty rather than competence or ability qualifications. Consequently, it fosters inefficiency and waste, and it prevents the development of a professional bureaucracy. However, defenders of the spoils system contend it ensures government posts are filled by those loyal and devoted to the success of the new government. In the United States, the spoils system was not only prevalent but unchecked until reforms such as the Pendleton Civil Service Act of 1883 attempted to legitimize the federal bureaucracy with professionals based on merit versus party loyalists. While the spoils system continues to exist today, due to reforms and federal oversight, this method often is used for senior-level positions, such as political appointees.

Stages Model of the Policy Process

The stages model of the policy process is a widely used, if sometimes controversial, representation of the various steps that lead to a policy outcome, from definition of a policy problem to development of a solution through implementation and evaluation. Peter DeLeon (1999) traces the model back to Harold Lasswell, the architect of today's policy sciences, but there have been a number of variants since then. The stages model typically depicts policy making as a cyclical process, in which policies move through a regular series of procedural steps. Though a number of scholars have criticized the model, it has influenced a generation of policy studies and remains the preeminent model of policy making for students of political science and public administration.

Most contemporary descriptions of the model include many or all of the following six stages:

1. *Issue Emergence or Problem Definition:* A previously unspecified issue, or an issue normally of private concern, becomes seen as a public problem that is rightly addressed by the action of governmental authorities.
2. *Agenda-setting:* This newly defined policy problem becomes part of the government action agenda. (The first and second stages are combined in many formulations of the model; other variants differentiate among

levels of government agendas, for example, contrasting a broader institutional agenda with a more urgent decisional one.)
3. *Alternative Selection:* One solution to the policy problem is elevated above all others, for reasons both practical and political.
4. *Enactment, Adoption, or Legitimation:* The chosen policy solution takes on the force of law, either through legislation, executive order, court order, or some other mechanism of governmental authority.
5. *Implementation:* The policy solution is actually put into practice; in other words, this stage concerns what happens "on the ground" or "in the field."
6. *Evaluation* or *Analysis:* The policy is evaluated against initial goals, in order to help policy makers continue on their present course or choose a different policy solution.

While most proponents of the model admit that the divisions between stages are loosely delineated, they either imply or explicitly require that policies proceed from first stage to last.

The stages model has been criticized, first on methodological grounds. Paul Sabatier and Hank Jenkins-Smith (1993) have argued that the stages model is not actually a model, because it lacks any idea of the causal mechanisms necessary for theorizing and the testing of hypotheses. Instead, they claim, it is merely a heuristic, no more than a (severely limited) tool for education. Moreover, others have claimed that the model fails on empirical grounds. Because of the representation of policy as moving through discrete steps within a larger process, the stages model implies a sequential description of how policies are formed and implemented. Robert Nakamura (1987) noted that many policies actually are decided in a much more disorderly fashion, so that the stages model excludes some policies and leads us to misunderstand others. Deborah Stone (2001) agreed, decrying the "unrealistic 'production' model, according to which policy is assembled in stages, as if on a conveyer belt."

Still, even if merely a heuristic, the stages model has been defended by DeLeon and others as a useful, if somewhat artificial, representation of the functional aspects of policy making. Indeed, seminal policy studies have been focused on functionally discrete parts of the policy lifespan, including John Kingdon's 1995 award-winning study of agenda-setting and alternative selection, *Agendas, Alternatives, and Public Policies,* and Jeffrey Pressman and Aaron Wildavsky's 1973 groundbreaking research on implementation, *Implementation.* By separating out the functional components of the policy process, its defenders claim, the stages model enables scholars to sharply delineate the actors and activities involved in each part, while hopefully not obscuring the connection of each to the policy-making process as a whole.

Stalinism

Stalinism refers primarily to the set of policies adopted in the Soviet Union during the leadership of Joseph Stalin (1929–1953). While helping to modernize the country, Stalinism also included political terror and repression, which resulted in millions of deaths and the creation of a totalitarian state. Other communist states such as China and Cuba copied some of his policies and methods. Overcoming the negative legacy of Stalinism would be a major concern of Soviet leaders after Stalin.

In 1917, the Bolshevik (Communist) Party seized power in Russia. Whereas Karl Marx had predicted that the communist revolution would occur in an advanced industrialized state, Russia was overwhelmingly agricultural and had a low standard of economic development. Thus, in addition to solidifying their hold on power, a major preoccupation of early Soviet leaders was to develop the country in order to "build socialism."

Initially, Vladimir Lenin, leader of the Bolshevik Party, adopted a policy of War Communism (1918–1921), which was designed to move Russia rapidly to communism by eliminating private property, establishing state planning, and repressing anti-Bolshevik actors. Realizing this was not a viable strategy, in 1921 Lenin adopted the New Economic Policy (NEP), which was a more gradual move to communism, in which the state would control most of the economy but small-scale private property and market forces would be allowed to exist. The state, while still led by a single party, also would allow more social and cultural freedoms.

Lenin died in 1924, and a struggle for power ensued among his erstwhile allies. Stalin, who in 1922 was named General Secretary of the Communist Party, maneuvered first against Leon Trotsky, who favored a more radical and global approach. Stalin declared that the Soviet Union would build "socialism in one country" and favored the NEP. By the late 1920s, he turned against the NEP, arguing it was too gradual and too procapitalist. By 1929, he had consolidated his power within the party and steered the country onto a new course.

Stalinism had several components. Economically, it harkened back to War Communism, calling for the elimination of private property, state planning of the economy, and rapid industrialization. In order to develop large industrial enterprises such as steel and chemical factories, mines, and power plants, large numbers of peasants were forced off the land and pushed into cities that sprang up all over the country. To pay for the necessary capital equipment and ensure political control over the countryside, all farms were collectivized, meaning that individual farmers lost their property and had to work on large farms owned, in essence, by the state. Prices for grain were set by the state, and surplus grain was exported to earn money for the industrialization program.

These economic aspects were accompanied by repression and political terror. The secret police rooted out real and imaginary enemies. Various groups were targeted: priests, business owners, non-Russian minorities, more wealthy peasants (*kulaks*) and, eventually, even officers in the military and high-ranking party officials. Some of the latter were forced to confess to fictitious conspiracies in well-publicized "show trials." People were encouraged to report any suspicious behavior. Children who reported on their parents were considered model citizens. Ultimately, several million were arrested and sent to harsh labor camps, where they often perished. Many were simply executed. Grain requisition by Soviet authorities led to famine in large parts of the country. The total death toll is unknown, but estimates are as high as twenty million.

To preserve his own support, Stalin also cultivated a cult of personality. He was worshipped as a godlike figure, an infallible ruler. The media were tightly controlled to ensure that only a positive image of Stalin was portrayed. Art and architecture also were used to support Stalin and the construction of communism.

Stalinism did help modernize the country. Economic growth in the energy and industrial sectors was high. Stalinist policies arguably helped create a military–industrial complex that allowed the Soviets to win World War II (1939–1945). By the time of his death, the Soviet Union was a superpower.

The costs, however, were high. Millions had perished. Civil society was completely destroyed. Basic freedoms had been squashed. Economically, the agricultural and consumer sectors fared poorly.

The new leadership realized that Stalinism had to be reformed to be more economically successful and win the support of the people. Nikita Khrushchev (1955–1964) launched de-Stalinization, attacking Stalin's purges of the party leadership and cult of personality for being un-Marxist and un-Leninist. Under Mao Zedong, the Chinese Communist Party continued to adhere to Stalinist principles. Information about Stalin's crimes began to circulate after Mikhail Gorbachev became the Soviet leader in 1985. But even then some segments of the Russian population remained nostalgic for Stalin's "iron hand." Stalinism's relationship to Marxism-Leninism and its role in Russia's historical development remain hotly debated topics.

Standing Committee

Standing committees are permanent panels with fixed subject-matter jurisdictions created by the rules of the U.S. House of Representatives and Senate. Almost all legislative proposals introduced in Congress go to standing committees for consideration and possible processing into bills; most proposals never progress further and thus "die" in committee. Committee consideration of a bill usually follows three steps: *public hearings* to gather information, *markups* to review the proposed text and determine the final language, and *reports* to send approved bills to the floor for a vote.

The committee system helps legislators divide labor, address constituent concerns, and develop policy expertise. The party with control of each chamber holds a majority on its committees and selects the committee chairs. Party leaders also control the size, ratio of Republicans to Democrats, and membership of committees. Legislators seek committee assignments based on issues of greatest interest in their state or district, their personal policy goals, and their desire to gain influence.

The first standing committee, the House Committee on Ways and Means, began in the 4th Congress (1795) to review financial legislation. By the 1820s, both the House and Senate relied on standing committees to process legislative proposals. As of the 111th Congress (2009–2010) the House had twenty standing committees with eighty-four subcommittees, and the Senate divided its work between sixteen standing committees and sixty-eight subcommittees.

State, Fiscal Crisis of the

The theory of the fiscal crisis of the state developed in response to a widespread consensus of the 1960s that the capitalist state's enhanced, downwardly redistributive economic role was likely to continue. Thus writers like Andrew Shonfield (1965) and Harold Wilensky (1975) could envisage

the continued growth of the welfare state as both integral to the contemporary phase of advanced capitalist development and desirable as a means of reducing inequality and of raising living standards more broadly. Confidence in this scenario fractured as a result of the economic crisis of the early 1970s, when traditional Keynesian remedies appeared no longer to work, and the result was stagflation.

While there had always been a libertarian critique of the Keynesian welfare state, Marxists also were unconvinced of its sustainability. Although they, too, foresaw the likelihood of continued expansion, they saw this not as a further advance on the path toward socialism but instead as a prolongation of crisis. Thus Paul Mattick (1969) could write that Keynesianism "mistakes the postponement of a problem for its disappearance." He, like many other Marxists, including Norman Ginsburg (1979), foresaw the limit of the *mixed economy* as that point where state expenditure finally crowds out private capital accumulation, presaging the famous critique of economic liberals Robert Bacon and Walter Eltis (1976). This was based on the view that taxation drained the surplus and that an ever-decreasing share of the surplus was left available for private investment, thereby further reducing the expected future surplus.

The perceived inadequacy of this treatment of state expenditure led James O'Connor (1973) to formulate an alternative Marxist theory of public finance. Accordingly, the capitalist state has a dual role: that of both facilitating and legitimating capitalist accumulation. Creating the conditions for accumulation might appear easiest if achieved via outright coercion, but this threatens regime legitimacy and ultimately social order. Instead the state must legitimate the system, often via concessions to social groups or classes out with the dominant bloc. This can take the form of ideology, as when policies that benefit the dominant class are titled and rationalized in a suitably positive manner (as contributing to "stability and growth," for example).

Consequent to the facilitation and legitimization of accumulation, state expenditure can be classified as social capital and social expenses. *Social capital* indirectly contributes to accumulation, in that it constitutes an investment that mitigates if not reverses (however temporarily) the tendency of the rate of profit to fall. Education, health care, transport infrastructure, and business parks are social investments. Social capital also takes the form of social consumption, which is expenditure that lowers the reproduction costs of labor. Education, health care, and social insurance belong in this category. *Social expenses* relate to the state's legitimization function and encompass welfare expenditure and the costs of the state's repressive and ideological apparatus.

In reality almost all state expenditures relate to the accumulation and legitimization functions, given the state's dual role and contradictory character. Spending on education, for example, comprises social capital in the form of training programs, social consumption in general schooling, and social expenses (for example, security guards).

Given the contemporaneous growth of the monopoly sector and consequent socialization of capitalist production and exchange, the state's role grew accordingly. The fiscal crisis, in

O'Connor's treatment, concerned the financing of the state's activities, because the appropriation of the surplus remained in private hands. The structural gap or fiscal crisis results from the taxpayers' resistance to financing further social capital expenditure. The crisis intensifies owing to the use of state power in favor of particularistic ends. The resulting struggle is resolved (if that) politically, whether through formal elections, lobbying, "corruption," or public campaigning.

O'Connor's work proved more influential in Europe than in the United States, where O'Connor based his study. Subsequent studies by Ian Gough (1979) and Claus Offe (1984) incorporated O'Connor's analytical framework, and, in their respective ways, indirectly anticipated the radical restructuring of the Keynesian welfare state that has taken place since 1980. While O'Connor acknowledges his failure to predict the rise of neoliberalism, the seeds of that rise could be detected in his location of fiscal crisis. Theoretically, his work anticipated much of the later writing on social capital. And while the capitalist state's economic role today is no longer as characterized by downward redistribution, the growth of the state's repressive apparatus, whether in increased military expenditures or in expanding penal incarceration, and the growth of public-private partnerships for the provision of social capital, in addition to other forms of corporate welfare, demonstrates the continued validity and vitality of fiscal crisis theory.

State, Functions of the

The way in which the U.S. government is organized (federalism, or federalist system) divides authority between a central government and the fifty state governments. This division provides for great diversity in politics, programs, and policies across the fifty individual states. *Federalism,* as defined by David Rosenbloom and Robert Kravchuck, is "a form of governmental organization that divides political authority between a central government and state or provincial governments" (2005). Although the U.S. Constitution certainly makes the federal government supreme, states are given a great deal of authority and discretion over programs and their citizens. Generally it is true that functions that serve as a benefit to the entire country, such as national security, foreign relations, and currency, are generally handled by the federal government. However, functions that serve a smaller group of individuals and may be impacted by differences in the cultures and needs seen at a smaller scale are generally handled at the lower levels of the American government, particularly the state level.

The Tenth Amendment states, "The powers not delegated to the United States by the Constitution, nor prohibited by it to the states, are reserved to the states respectively, or to the people." Essentially this says that if the Constitution does not specifically give the federal government the power or authority over a policy area, then the states retain that power and authority. This division of powers and authorities coupled with the wide latitude states are given under the U.S. Constitution has created a great amount of diversity in state level approaches to policy areas and problems. In fact, a metaphor coined by Supreme Court Justice Louis Brandeis in 1932 likened states to "laboratories of democracy." Although variations in specific approaches to social problems and needs exist across the fifty states, several major policy areas are generally viewed as the primary functions of the state: education, social services, justice and protection of people, housing, economic development, and transportation. Of these typical functions, education is the primary function of the states. In fact, states generally fund over half of the public education system. In general, however, within all of these policy realms exists a variety of specific approaches across the states.

In addition to the variation across the states in terms of specific approaches to policies, many states share or delegate responsibility and authority to municipal and county governments. Within the context of the American federalist system, local governments are viewed as entities of their respective states. Dillon's Rule has affirmed that local governments hold only the power that their respective states give to them. Additionally, in some cases, authority, such as is the case with transportation, is shared between the federal, state, and local levels. In addition to specific authorities, states are also often in charge of implementing federal mandates. Generally, mandates are rules or requirements that the federal government forces states to implement and impose on inhabitants of their specific states. These mandates often include environmental controls, educational minimums, and social service provisions.

The division of power in the U.S. federalist system has evolved over the course of history. Alongside the historical evolution of federalism, states' functions and responsibilities have shifted and changed. Federalism often is divided into four distinct eras: dual (layer-cake), cooperative (marble-cake), creative (picket fence), and new (federal retrenchment). During each of these eras the role of the state has changed. With *dual federalism,* separation between the states and the federal government was the primary feature. States were equal and had their own distinct policy realm. States were generally viewed as a separate but equal government entity. The Great Depression ushered in *cooperative federalism,* wherein the

federal government became more powerful and states entered into cooperative agreements with the federal government over policies and programs. The New Deal programs are key examples of the cooperation between states and the federal government during this era. In the creative federalism era, states were forced to implement many more federal government mandates than in previous times. This era was marked by overloaded cooperation and greater federal involvement in the state and local governments' affairs. States were sometimes even being bypassed in policies as the federal government reached down to the local level for implementation of certain programs. Finally, during the new federalism era, a gradual return of states' rights and responsibilities has been seen. During this era a great deal of power and authority has been restored or delegated to the states' domain, with the federal government retreating to its more traditional authorities. With the current globalization trends, the states' role in economic development and public policy likely will become of greater importance in citizens' daily lives, and the variations across the fifty states will hold greater implications for the future.

State, Rights of the

Following the Treaty of Westphalia in 1648, the nation-states of Europe emerged as the primary actors in international politics. However, both the formal and informal rights and powers of states have been in decline since the middle of the twentieth century, concurrent with the rise of nonstate actors, including international organizations such as the United Nations and the European Union. The traditional rights of the state include sovereignty, independence, self-defense, and equality in the international system.

THE INTERNAL ROOTS OF STATE POWER

State power is based on sovereignty. *Sovereignty,* simply defined, is control over people and geographic space. For an actor to be recognized as having sovereignty, it typically has to have a degree of legitimacy (i.e., it is recognized by other actors as the legal authority) and autonomy (i.e., it is independent, not controlled by another actor). For most of human history, sovereignty often resided with individuals such as a monarch or with supranational organizations such as the Catholic Church.

Westphalia marked a period of transition whereby state sovereignty, as manifested by the power of central governments, superseded that of the monarch or the church.

The emerging nation-states had high levels of both internal and external sovereignty that provided the basis for the domestic and international dimensions of state power. Central to both internal and external sovereignty is the right of existence, also known as *independence.* Freedom from control or undue influence by other actors is the cornerstone of the rights of states. Independence permits the state to choose its own governmental system, interact with other states on a nominally equal basis in the international system and create its own internal laws and policies.

The success of the nation-states resulted initially from their specific internal powers, namely control over the use of force, taxation, and the regulation of civil society. As noted by Max Weber, the state had a recognized monopoly on the legitimate use of force within its borders. This allowed central governments to concentrate power and outlaw or eliminate potential rivals, such as private armies. Control over the use of force allowed states to expand their military capabilities through standing armies and conscription. Meanwhile taxation gave central governments the resources to expand control and reinforce their legitimacy through the development and implementation of social and economic programs. Taxation also reinforced the military capabilities of nation-states and helped fuel the revolution in military affairs through the nineteenth and twentieth centuries. Independence allowed states to create domestic legal frameworks that regularized trade relationships and customs. Legal systems also helped bolster the legitimacy of the government. These trends, in turn, accelerated the rise of a middle class in areas such as Europe and North America.

EXTERNAL RIGHTS

Independence is also a core tenet of external sovereignty and is manifested in several areas. A central state right, and component of external sovereignty, is self-defense from external attack. The principle is one of the oldest in international law and is enshrined in Article 51 of the 1945 United Nations (UN) Charter. The article recognizes the right of states to engage in individual or collective self-defense, even prior to UN action in response to aggression.

The state right of equality is the basis for international law. As equal actors, states have the right to control their foreign policies, including entering into treaties with other states and international actors. Article 2 of the UN Charter specifically notes the "equality" of states. This right is often questioned by lesser developed states who argue that the more economically and militarily developed nations dominate contemporary international relations.

Efforts to codify the rights of states under international law, such as the failed 1933 Montevideo Convention on the Rights and Duties of States, have been generally unsuccessful with the notable exception of the aforementioned UN Charter, which outlines rights in specific issue-areas (subsequent efforts to expand the definition of rights within the UN have been only

partially successful). Instead, the rise of international organizations and globalization has constrained the rights of states. For instance, after World War II (1939–1945), states such as Germany or Japan were willing to give up a significant degree of control over their external sovereignty, including accepting constraints on their right of self-defense, in exchange for participation in collective defense arrangements with the United States. The political scientist and economist Richard Rosecrance (2000) argues that this permitted these nations to concentrate on economic development and become first trading states and then virtual states that had accepted significant limits on their internal and external sovereignty. Concurrently, the member states of the European Union have surrendered a significant portion of control over their monetary policy to the regional body.

State, the

A *state* is a set of institutions and specialized personnel that regulates important aspects of the life of a territorially bounded population and extracts resources from that population through taxation. Its regulations are backed by force if necessary. It is recognized internationally as a state by other similarly constituted states.

There are four elements in this definition: the regulatory character of the state, the coercive aspect of the state apparatus, the extraction of resources from the population, and the role of the state as a unit (in fact, the basic and irreducible unit) in the field of international relations. These four elements can be considered as constants in any explanation of what the state is.

THE STATE AS REGULATOR

The regulation of some aspects of the life of the population living within the territory of the state through laws and norms is a permanent feature of a state's activity. However, the scope of the activities regulated by the state has varied across history. According to Samuel E. Finer (1997), the first apparition of developed states goes back to around 3500 BCE, in Sumer. During the following five millennia, at least until the apparition of the modern form of the state in the nineteenth century, the main activities of the state apparatus were the organization of armies for conquering new territories and

Philosopher Thomas Hobbes authored *Leviathan* in 1651, in which he lauded states for offering the order and protection that make civilization possible.

SOURCE: The Granger Collection, New York

defending from the attacks of other states or groups of warriors, as well as the protection of public order and private property within the territory of the state. These activities of the state roughly correspond to Thomas Hobbes's ideas about its role. As he famously claims in *Leviathan* (1651), in the absence of a state, life is "solitary, poor, nasty, brutish, and short." States provide order and protect private property, making civilization possible. This is not to say that these were the only activities regulated by the premodern state. Some public goods, like roads, canals, or locks, were provided by a range of states that comprise, among others, Imperial China, the Roman Empire, ancient Egypt, or the absolutist states of the modern era. The provision of these goods was sometimes connected to the military necessities of the state: Roman roads are a case in point. The state's interests in the expansion of its tax base (in itself, also a consequence of the search for revenue to finance military establishments) led, among other things, to the involvement of the state in economic activities, as irrigation works in ancient Egypt and China or the creation of state

manufactures in Colbert's France. Actually, through its role as enforcer of private agreements and its protection of property rights, the state has been historically essential to economic growth.

After the Industrial Revolution, and especially after the Second World War (1939–1945), it is much more difficult to say that public order, protection of property rights, and organization for war are the main activities of the state. For one thing, the state, with a much-enhanced capacity to penetrate society, is now in most countries the main provider of welfare. This is an enormous change, given that in premodern states welfare provisions (such as health care, education, or poor-relief) were mainly a question of social capital: It was directly provided by local communities and private associations such as, for example, guilds.

Although the capacity of state's penetration in society has varied through time, it is a constant that the state provides norms and regulations that make social cooperation and economic exchanges possible, at least in societies with large populations. Even though in small communities cooperation seems possible even in the absence of state institutions, in large societies the presence of a state that enforces private agreements is essential to social cooperation. Not all authors agree with that. Most of the literature on social capital, for example, claims that trust is the key for social cooperation and consider the state, at best, as unnecessary for cooperation or, at worst, as a destroyer of trust relations, and, therefore, inimical to social cooperation. There are, however, good reasons to claim that in large societies, the absence of state norms and regulations make cooperation, and even trust, unfeasible. Without institutions that enforce private agreements, untrustworthy people will be better off systematically than trusters, and, as a consequence, trust and cooperation will disappear. The resulting situation would be similar to Hobbes's state of nature, where war of everyone against everyone prevails. Indeed, modern social science has consistently demonstrated that relatively weak states without the capacity to enforce public order are the best predictors of civil war onset and revolutions. Therefore, the absence of state's norms and regulations make social cooperation and social peace unfeasible in large societies. However, this does not necessarily amount to say that state's norms and regulations are neutral in the sense of favoring the interests of all groups in society.

Historically, regulations of the state apparatus backed by coercion have favored some social groups above others and have allowed the free organization of certain social interests, while at the same time forcefully repressing the organization of other social groups. Indeed, which interests are being served by the state's norms and regulations has been one of the most controversial issues in the analyses of the state. The three traditions that can claim to have developed a theory of the state—pluralism, Marxism, and what has been called the *statist approach*—have different views about it. According to pluralists, the state is an arena in which different social groups negotiate. None of these social groups has power enough to control the state. The ruler is usually seen as a neutral arbiter between competing interests. This view has been much amended by subsequent neopluralist writers, recognizing that in the real world some interests have more leverage than others in the state's policy agenda. The opposite position to the pluralists is that of the Marxists. There are various versions of Karl Marx's theory of the state. In the *Communist Manifesto* (1848), the state is portrayed as an agency in the hands of the economically dominant class. This is also roughly Vladimir Lenin's idea in *The State and Revolution* (1917). In posterior writings, however, Marx discussed the possibility of state's autonomy with respect to class interests. One way for the state to develop an autonomous position, according to Marx, is to play a "divide and conquer" strategy between two opposed classes, for example, the bourgeoisie and the feudal class in the European absolutist states. Another way for the state to gain autonomy is to rest on a class numerically majoritarian but devoid of class consciousness, as the French small land-owners described in *The Eighteenth Brumaire of Louis Napoleon* (1852). Recent Marxists' theories about the state have fluctuated between instrumentalist views and further exploration of the idea of the state's autonomy.

This idea is also central in another stream of studies of the state that tried to "bring the state back in" during the 1980s. These authors generally claimed that the state should be treated as an agent with its own interests and preferences, independent from those of elites and social classes, and that, under certain circumstances, the state can achieve autonomy from society to carry out those interests and preferences. Certainly, the state can have preferences and interests of its own, although it would be more accurate to consider them the interests and preferences of the rulers and the people who occupy positions in the state apparatus, instead of the interests of "the state" as such. This is the approach followed by studies of the state from a rational choice perspective, as those of Douglass North (1981), Margaret Levi (1988), and Barbara Geddes (1994). From a rational choice approach, it can be claimed that rulers certainly have their own interests and preferences: They can be portrayed as revenue maximizers or as maximizers of their probability of remaining in office. However, they do so subjected to constraints. In Levi's view, these constraints are constituted by their relative bargaining power vis-à-vis social agents and by how much they value future payoffs. Insights from the Marxist theory of the state also could be inserted into this rational choice framework, in the sense that to remain in office or to maximize revenue, the ruler is subjected to the constraints imposed by the necessity to ensure future investment by private capitalists. This imposes a limit on what state agents can regulate. This theory of the structural dependence of the state on capital has been sophisticatedly analyzed by Adam Przeworski and Michael Wallerstein (1988).

THE STATE AND COERCION

States' norms and regulations are backed, if necessary, by force. This leads us to the second characteristic of the state: its coercive nature. It is one of the main elements of Max

Weber's famous definition of the state: "a compulsory political organization with continuous operations will be called a 'state' insofar as its administrative staff upholds the claim to the monopoly of the legitimate use of physical force in the enforcement of its order" (1978). In this definition there are two characteristics of coercion that vary in time and are, therefore, problematic in any general definition of the state: the state's monopoly of force and its legitimacy. It can be argued that both are aspirations of the state, given that the monopoly of force as well as its legitimacy both make the rulers' policies easier to attain by increasing cooperation with rulers' decisions. However, this aspiration, in many cases, falls short of the state's realities.

In premodern states, private violence was pervasive, in the form of banditry or private resolution of feuds. It is notorious, for example, that in the Roman Empire, away from the imperial roads guarded by soldiers, lawlessness and violence prevailed. This must have been the case in most polities until the extension in the modern state of what Michael Mann (1988) calls the state's "infrastructural power," its capacity to penetrate civil society to a point close to the monopoly of the use of force. Legitimacy must have been also variable through history. One possible explanation of this variation can be the type of political regime. Some contemporary analyses of revolutions and rebellions claim that the openness of the political system increases the state's legitimacy and therefore decreases the likelihood of revolutions. Therefore, we should expect more legitimacy in democratic regimes than in what Finer calls "palace" and "nobility" polities, where the decision-making process is exclusively in the hands of a relatively small elite. The prevalence of certain ideological frameworks in a society also can have an impact on the state's legitimacy. Nationalism is a good example. The idea that the population of the state forms a community of feeling that shares common interests as a nation should have a positive effect on the legitimacy of the state that claims to represent that nation. Indeed, nationalism has been actively promoted by the state from the nineteenth century onward, through the creation of national symbols as well as public education in a national language and a national culture. However, modern democratic regimes and nation-states are quite recent nineteenth-century phenomena, and during the previous five millennia (and indeed also during the past two centuries) states have existed that were neither democracies nor nations. What is clear is that although coercion is a characteristic of all states, its monopoly and its sources of legitimacy have varied through time.

The coercive nature of the state is directed inside and outside the state's boundaries. Within the state's boundaries, violence is applied to enforce norms and regulations and, historically, to protect private property and eliminate internal threats to the ruler in terms of dissent, rebellions, or terrorism. The intensity of the violence applied by the state to eliminate internal threats to the ruler has varied across time and space, depending on a range of variables, including the infrastructural power of the state, the type of political regime, and the size of the threat to the rulers' position. The lack of infrastructural power severely limits the options available to rulers to cope with threats to their rule. Given that a ruler lacks information about where these possible threats are, violence in these cases will be either minimal but brutal (compensating the lack of accuracy in identifying potential culprits with the severity of the punishment), as in many premodern states whose penal codes included extremely cruel forms of punishment, or indiscriminate. In the Chinese empires, for example, the difficulties in the monitoring of corruption of public officers were partly compensated by extremely severe punishments. The type of political regime frequently is related also to the degree of violence applied by the state. A well-proven fact in modern political science is that democracies apply lower levels of violence than authoritarian regimes. This has to do with the formal checks that democratic regimes impose on the ruler, including electoral accountability and the presence of institutional veto points. Finally, another determinant of the variation in the levels of violence applied by the state is the importance of the threat toward the rulers' position: Higher threats usually will be followed by higher levels of violence by the state.

All the previous discussion about coercion applied by the state to people within its boundaries does not mean that ruling is based just on violence. It is true that in *The Prince* (1532), Niccolò Machiavelli claimed that, for a ruler, it is better to be feared than to be loved. Nevertheless, it must be remembered that Machiavelli was discussing how a new prince can consolidate power. Old dynasties, Machiavelli also claims, have other forms of legitimacy that make the use of extreme violence less necessary. In modern democratic states, that is precisely the case: Ruling is usually based more on consent than on coercion. This does not mean that coercion is absent in democratic regimes. Democracies also apply violence toward dissent, especially during national emergencies such as wars and terrorist threats, but, more importantly, the enforcement of the state's norms and regulations rests always in coercion as the last resort.

Violence also is applied by the state outside its boundaries. Indeed, during most of its existence, the main activity of the state has been the organization for war. Actually, there is a scholarly consensus in claiming that war was decisive for the creation of the modern state in Europe between the sixteenth and the nineteenth centuries. The territorial state triumphed because of its superior organization for war. Wars were the necessary incentive for rulers in sixteenth-century Europe to improve the state apparatus, its centralization, its capacity to extract resources both from peasants and from the new urban wealth created by commerce and trade. The political landscape at the end of the Middle Ages in Europe was highly fragmented, containing about one hundred or so polities. Four hundred years later the number of political units has been reduced to about thirty states. War has been the driving force that made some states survive and others, like Burgundy, to perish. The particular type of regime adopted by the state (absolutism, like Bourbon France and Habsburg Spain, or constitutionalism, like Britain and Poland, for example) depended also on other variables like, according to Thomas Ertman (1997), the

presence in Britain, Hungary, Poland, and Scandinavia of participatory patterns of local government and their absence in Germany and Latin Europe. These participatory institutions blocked the way to absolutist forms of government.

However, it has to be stressed that this model of state-building based on war is circumscribed to the European state system, and it is difficult to export to other continents. Although the model of the modern state is European, state-building has followed different avenues in other places. In Africa, for example, contemporary states are a product of the process of decolonization from the European empires, not of interstate wars. Indeed, although African states have been plagued with civil wars, interstate wars have been much less frequent and the boundaries of states have remained remarkably stable since decolonization. However, it is also the case that the African pattern of state-building has frequently led to failed states or, in any case, to very weak states dependent for their income to a large extent on foreign aid. The great difference of the environment in which European states developed is that, while from sixteenth to nineteenth-century Europe the international system of states punished weak states even to the point of allowing them to disappear, in the modern international system weak states are legitimized and protected. This is one of the reasons for the subsistence of weak states such as those of sub-Saharan Africa.

THE STATE AS A COLLECTOR OF TAXES

States have to extract resources from society to finance their activities. This is another characteristic of the state: It extracts resources from the population through taxes. It is in exchange of these resources that the state provides laws and regulations, social peace, and public goods such as roads and education. All these things make civilization possible. However, as North noted, there is frequently a contradiction between the action of the state as an extractor of resources and as a provider of laws, regulations, and public goods. Historically, most rulers have tended to maximize their revenues at the cost of providing inefficient laws and regulations. This means that they extract more resources than it is needed to guarantee law, order, and provision of public goods, but also that they design property rights and regulations that promote their interests but not the general interest of sustained growth. This tension between maximization of the rulers' revenue and creation of the necessary framework for the economy to flourish is the reason why most states, although indispensable for economic growth, have been unable to guarantee vibrant economies. In any case, the extraction of resources from society is at the very core of what a state is. It implies at least the development of a minimal amount of infrastructural power and the employment by the ruler of specialized personnel, a bureaucracy. This bureaucracy reached its full development in the modern state, where, according to Weber, administrative personnel are hierarchically organized and selected on the basis of technical qualifications, and each office has a clearly defined sphere of competence in the legal sense. Nevertheless, although not as rationally organized as in the modern state, bureaucracies have been a permanent characteristic of the state from the scribes in ancient Egypt onward, and in certain premodern states, as imperial China, it reached a remarkable degree of sophistication. The intimate connection between the organization of a bureaucratic structure and the collection of taxes is seen in the case of certain African states. In many cases, the failure of the state in Africa to develop a proper administrative apparatus is due to the fact that rulers have alternative sources of revenue—as for example, income from exports of raw materials and mineral concessions—and, therefore, they do not need to build elaborate bureaucracies to enforce taxes on the population.

THE STATE AND INTERNATIONAL RELATIONS

Another characteristic of the state is that it is the most important unit in the system of international relations. This means that states are recognized as such in the international arena by other states. This is a notorious feature of the state since the apparition of the modern state in Europe. Absolutist states in the sixteenth to eighteenth centuries developed an increasingly sophisticated diplomacy that included permanent embassies in other countries. Indeed, recognition of states by other states through treaties and temporal embassies seems to have been a feature of the state since its very apparition, with remarkable early examples such as the peace treaty between Egypt and the Hittite king at the end of the second millennium BCE. It can be argued that the insertion of a state in the international system of states has had an increasingly important effect on the probability of a state's survival. While in previous centuries the weakness of the state and its inability to wage war, as we noted before, led in most of the cases to its destruction at the hands of more powerful states (as the fate of Poland at the end of the eighteenth century illustrates), in the contemporary world weak states have a good chance of survival through the fact of being recognized as legitimate states by the international community, as is the case in many African states.

State, Theories of the

Theories of the state have focused primarily on the determinants of the formation of state policy secondarily on the consequences of policies and have barely addressed the issue of the implementation of state policy. Although particular theoretical arguments about the state are numerous, most can be grouped into five general schools of thought or traditions: pluralism, elite theory, Marxism, state-centered theory, and public choice theory. This entry defines these theories of the state and discusses their arguments about the causes and consequences of state policies.

PLURALISM AND ELITE THEORY

Pluralist theory argues that power is widely diffused in democratic states, and, as a result of that, state policies reflect the interests of the majority of the population. In its most simple form, the main actors competing to shape state policies are interest groups attempting to influence politicians. These interest groups, formed to aggregate and give voice to the interests of various subgroups of the population on particular issues, all have different amounts and types of power. The state is viewed not as an actor in its own right but simply as a neutral "referee" in the contest between competing interest groups, so policy outcomes are a function of which interest group or coalition of interest groups has the most power. The power of interest groups is mainly a function of the extent to which the public supports them, leading pluralists to the sanguine conclusion that democratic systems usually produce policies that reflect the interests of the majority of the population. Neopluralist arguments expand the theory by looking at the importance of institutional structures, class power, and the independent interests of state actors.

Power elite theory argues that the pluralist view ignores the main underlying determinants of state policy by focusing only on competing interest groups. A great deal of power is exercised prior to interest group competition, by the structure of institutions and by the formation of preferences. Elite theory suggests that institutional structure prevents some interest groups from forming and limits the power of others. For example, things like poll taxes, literacy tests, and all-white democratic primaries in the South limited the political power and organizational capacity of poor and minority groups in the United States. Furthermore, elites control important media outlets that limit the information and distort the values of groups with interests opposed by the elite. As a result of their ability to construct institutions and shape preferences in ways that favor them, a unified power elite composed of top officials in economic, political, and military organizations is able to limit the extent of explicit conflict and shape state policy in their interests.

MARXISM

Marxist theory argues that class power and the structure of modes of production determine the nature of state policy. The instrumentalist variant claims that dominant classes directly control the state by monopolizing the most important positions within the state apparatus. Democratic states are thus not the neutral referees of pluralist theory, but the state is an instrument in the hands of capitalist classes. Structural Marxists argue that such direct control and agency is not necessary to ensure that democratic states act in the interests of capitalist classes—the functional requisites of capitalist modes of production compel policies in the interests of capitalists regardless of the class origins or preferences of state officials. For example, the tax base of the state depends on the private investment decisions of capitalists, so if one state pursues anticapitalist policies, capitalists will move to another state.

STATE-CENTERED THEORY

State-centered theories do not see state actors either as neutral referees or as completely controlled by elites or dominant classes, but as potentially autonomous actors with their own interests and often with the power to act on those interests. State policies therefore often reflect the institutional structure of the state and the interests of actors running the state. As a result, one of the main consequences of state policies when the state has high autonomy is to increase the size, power, and independence of the state itself. One of their most important contributions has been in explaining the origins of revolutions. In contrast to earlier accounts that looked for causal factors outside the state, such as changes in class power or in ideologies, state-centered theorists argue that the most important cause was the weakening of the state itself, usually a result of military defeats.

PUBLIC CHOICE THEORY

Public choice theory applies economic models to democratic politics. Its main contribution is optimal location theory. Beginning with the assumption that politicians choose their

policy platforms to maximize the probability of winning elections, Anthony Downs (1957) developed elegant models predicting the optimal location of political parties (the policy platform that maximizes votes) in issue spaces (continua of voters' opinions on an issue). For presidential, winner-take-all systems like the United States, it yields several interesting predictions: (1) there will be only two viable political parties, and third-party bids generally will fail; (2) both parties will locate as close as possible to the middle of the ideological spectrum, trying to attract the "median voter," so the differences between them will be minimal; and (3) redistributive government policies will be especially influenced by and relatively beneficial for the median voter—in economic policies, the voter with roughly the median income. Political systems based on proportional representation will have the opposite characteristics: They produce multiple political parties spanning the ideological spectrum, increasing the choices available to voters but decreasing the stability of system (the latter is due to both the shorter tenure of governing coalitions and the wider swings in state policies when the ruling coalition changes).

Theories of the state are not static, but are constantly evolving in response to new data and changing intellectual trends. The main current trend is toward increasing complexity. Contemporary theories of the state are developing much more nuanced and synthetic models of the formation and consequences of state policy. Whether these more complicated theories will gain more in terms of explanatory power than they lose in precision and parsimony remains to be seen.

State, Varieties of the

Max Weber defined the *state* as the human community that, within a defined territory (successfully) claims the *monopoly of the legitimate use of force* for itself. This definition focuses on the function of the state ascribing territory as its only inherent characteristic. On the topics of the use of force, Weber argues that, though force is not the normal or sole means available to a state, without the ability to use force, a state would cease to exist. He suggests there are three pure types of legitimacy: custom (based on time immemorial), gift of grace (i.e., charisma), and legal statute. Weber explains that these pure types are rarely found but more often there exist complex variations, transitional forms, and combinations of these types. This widely accepted definition has continually met criticism as Weber's definition focuses on the functions of the state rather than its identifiable characteristics.

In the 1950s to 1960s, the concept of state was subsumed in sociological analyses that focused on society at large. The state, sociologist Edwards Shils argued, was one (though arguably very important) organization within a broader array of organizations existing at the center of society. Shils understood the center to be the elites, values, beliefs, and institutions that act as the modernizing force within a given society. This modernizing center must struggle for change against a traditional periphery.

By the 1970s and 1980s, however, the center-periphery model had lost influence, as critics of Shils pointed to the birth of "new nations" in the third world that were not following the Western path toward modernization. Theda Skocpol reintroduces the state as an autonomous (and not simply central) actor in "Bringing the State Back In" (1985). She argues that states are not simply organizations controlling territories but rather they are braced at the "intersection between domestic sociopolitical orders and transnational relations within which they must maneuver for survival and advantage in relation to other states." Thus, states must be viewed as organizations maneuvering to consolidate power domestically and maneuvering to survive internationally.

Joel Migdal argues that the state as an independent actor may provide a simple theoretical concept, but it lacks applicability. Instead, Migdal returns to the concept of the state as a central organization that battles among social organizations to gain social control both domestically and internationally. He argues that in the fifteenth and sixteenth centuries in western Europe the state began to directly challenge other forms of social organization and proved the most effective domestically in improving existing tax-collecting mechanisms and expanding its courts, as well as defending itself internationally with a large standing army.

In his 2001 work, *State in Society,* Migdal has posited a more dynamic definition of the state than Weber's. The state, Migdal suggests, "is a field of power marked by the use and threat of violence and shaped by (1) the image of a coherent, controlling organization in a territory, which is a representation of a people bounded in that territory, and (2) the actual practices of its multiple parts." He argues that the two parts of a state, its image and its practices, could either be reinforcing or mutually destructive.

Migdal's definition is not only a two-level analysis of the state but the two levels are paradoxical in nature. The image of a state, Migdal argues, presents a view of the state as a "clearly bounded, unified organization that can be spoken of in a singular term." In contrast, a given states' practices are executed

by "a heap of loosely connected parts or fragments, frequently with ill-defined boundaries between" them and responsible for promoting conflicting sets of rules from one another and from the accepted rule of law. Though this definition lacks simplicity, Migdal warns that theories that do not capture the paradoxical nature of the state "end up either overidealizing its ability to turn rhetoric into effective policy or dismissing it as a grab-bag of every-man-out-for-himself, corrupt officials." From this conception, Migdal moves to an analysis of state society relations, or the relations of the state with its component societal interests.

Countries vary in their state-society relations, specifically in the ability of the state to achieve social control within society. States that have effectively gained social control are considered authoritarian or strong. Russia is an example of an authoritarian state that exercises almost complete control within its own society. Many European and Asian countries have strong states that have not gained complete control over society but are nonetheless effective in regulating and limiting it. Other countries have weak states. The United States, for example, has a weak, "checked-and-balanced" government. Many developing counties are considered too weak in that they have such little social control that they cannot govern or carry out effective public policies.

State Capacity

State capacity concerns the ability of the state to make and implement its decisions. State capacity became more central in social science debates due to recent increases in the incidence of societal conflicts and phenomena relating to state failure and weakness. The concept is also central in the debates on globalization and its impact on the nation-state's internal capacities to design and effectively implement policies. State capacity appears to be a useful tool in describing the state as worldwide institution, exhibiting significant variations in form and performance.

HISTORICAL EVOLUTION OF THE STATE CAPACITY

State capacity is expanding and transforming as the state diversifies its functions and significantly increases its turnover of personnel, money, and regulation. State transformation has two distinct parallel histories of modernization and diffusion. The modernization of the state had two main directions: cultural homogenization and the containment of resources (capital, labor, and technology) inside well-defined state boundaries. The state gained its core functions and instruments as known today in the eighteenth and nineteenth centuries. The process included the separation of the ruler and traditional elites from the state institutions, bureaucracy, and infrastructure growth; army strengthening; and the establishment of comprehensive internal security and juridical structures (police, courts, and prisons). If under the pressure of major conflicts, the early-modern state privileged the security institutions and services, it later extended its role in organizing the majority of societal spheres. The majority of states participated in the twentieth century in two world wars that required a massive mobilization and projection of available resources. During this century the state concluded its control over individuals, groups, and organizations, especially in the totalitarian and authoritarian states. The history of diffusion parallels the modernization process. The ideological and institutional template of the European state provided inspiration for the majority of aspirants to statehood and independence. The historical development of the European state has proven to be very specific and difficult to reproduce in other contexts.

TYPES OF STATE CAPACITY

The dimensions of state capacity largely fall in two distinct categories: constitutive and infrastructural. *Constitutive capacity* describes the ability of the modern state to mobilize individuals, groups, and social institutions and co-opt them into the governmental process. The variables describing the constitutive capacity are segmental, organizational, identity, and state form and regime.

The *segmental variable* refers to the extent to which the society is divided along specific lines and the extent to which the segments participate to the organization of the state and the implementation of its policies. The divisions could be ethnic, religious, linguistic, or socioeconomic. Deep segmentation and restriction from participation together can produce open state contestation. The *organizational variable* refers to the extent to which social institutions cooperate with the state. The societies can have different levels of organizational development. Institutions such as markets, churches, unions, and political parties are indispensable to the functioning of the state. Where the institutions are strong and distinct, state action can be significantly enhanced or inhibited.

The *identity variable* refers to the extent to which individuals primarily identify themselves through citizenship and nationality. States where the cross-cutting identities were too weak have sometimes experienced political instability. The *state form and regime variable* refers to the variation in vertical

organization of authority and the way the political institutions (constitutions, legislative-executive relations, and party and electoral systems) manage public participation and decision making. Federal and confederal designs and the special representation of minority groups in representative and executive institutions have been used as instruments for mitigating conflicts and preservation of statehood.

The *infrastructural capacity* describes the ability of the state to expand its institutional network, to penetrate and control territories and organize societal relations. The variables describing infrastructural capacity are territorial, economic, bureaucratic, and functional.

The *territorial variable* refers to the extent a state effectively controls its entire territory. The lack of control is defined as the permanent absence of state agents and institutions (police, army, courts) in a given area. The effective control is related to the level of contestation and violence and is the precondition for the operation of the other infrastructural variables. The economic variable refers to state's ability to extract and make use of the resources within a territory. In time this capacity has increased even though significant spheres are escaping state control and monitoring. Most governments struggle to control criminal financial activities such as smuggling, drug trafficking, and other types of transnational crime. The ability to use public resources in a transparent, equitable, and efficient way is also important.

The *bureaucratic variable* refers to the extent to which the state administratively penetrates its own territory. If for the purpose of controlling the territory and extracting its resources the institutions were of a security and fiscal type, the penetration is carried out by a variety of institutions that support governing and administration at all levels. It includes complex bureaucracies organized vertically (central, regional, local) and horizontally (agencies). The *functional variable* of state capacity refers to the ability to provide public services such as health, education, social assistance, transport, and environmental protection. This activity places the state in societal context and highly influences the level of support for the state and its political regime.

The two types of capacities are intertwined. High levels of constitutive capacity could reduce the need for infrastructural expansion and help the state better fund and offer public services. High levels of infrastructural capacity could facilitate the development of constitutive capacity through the provision of services such as education or social assistance. By contrast, low levels of constitutive capacity permit infrastructural excess, especially in authoritarian states.

STATE WEAKNESS AND FAILURE

All types of states have difficulties in performing, given demanding societal and international pressures. While formally protected by international norms and institutions, weak and failed states have experienced serious internal conflict, chronic poverty, and institutional decay. Their profile became especially salient in the early 1990s when countries like Somalia, Bosnia-Herzegovina, Liberia, and Afghanistan experienced structural crises. In a capacity-centered definition of state weakness, it is useful to make a distinction between the countries that are lacking a polity and central political authority (*failed states*) and those experiencing a serious lack of institutional and economic performance (*weak states*). The key feature of a failed state is the absence of a functional and recognized political center capable of making and implementing decisions. The political institutions, to the extent that they exist or function, are captured by particular groups and used against competing groups or society in general. Weak states are not contested to the extent of having their existence threatened, yet they have serious difficulties in securing the support of individuals and groups. Their limitations are mainly infrastructural as they usually have to govern large territories and a significant number of individuals.

GLOBALIZATION AND STATE CAPACITY

Recent debates question the ability of states to preserve their authority and functions given the increase of global flows of information, resources, and people. It is increasingly difficult for modern states to manage and steer the economic activity or to protect individuals from new threats such as ecological degradation and new forms of terrorism. By managing significant resources and mobilizing significant numbers of individuals, businesses, civil society, and other groups are asserting their increased role in social organization. Even though states are not the only influential social actors, their explicitly assigned tasks—territorial control, monopoly on the use of violence, and enforcement of decisions—remain largely undisputed. However, these tasks are differentially managed depending on their own internal management and available resources and, thus, yield variable levels of effectiveness and legitimacy.

State Capitalism

State capitalism is a term applied to national political economies in the postwar period that were characterized by a strongly interventionist state. France until the early 1980s was the ideal-typical model of state capitalism. The *developmental state* as found in Korea and Taiwan is another variant of state capitalism. Even Italy, in particular the "first Italy" of large firms and nationalized enterprises with highly unionized workforces, approximated the model, albeit the weakest case of state capitalism.

STATE CAPITALISM IN THE POSTWAR PERIOD

In the postwar period, state capitalism, or *statism,* was ordinarily contrasted with two other patterns of economic management, liberalism and corporatism, or market capitalism and managed capitalism. Typically, in state capitalism, the interventionist state organizes cooperation among autonomous economic actors and directs their economic activities. In *market capitalism,* the liberal state allows economic actors to operate autonomously and to decide for themselves on the direction of their economic activity, whereas in *managed capitalism,* the enabling state encourages economic actors to operate cooperatively and to coordinate the direction of their activities with one another and the state.

Moreover, in state capitalism, the state tends to organize the business relationship. Interfirm relations are mediated by the state, as opposed to the distant, competitive interfirm relations of market capitalism or the close network-based interfirm relations of managed capitalism. Industry-finance relations are similarly state-mediated. Industry is more dependent for financing upon the state than the banks (as in managed capitalism) or the markets (in market capitalism). The state in state capitalism therefore takes a more medium-term view than long-term emphasis on firm value of managed capitalism or the short-term focus on profits per se of market capitalism. The state also tends to direct business investment, with the state influencing business development through planning, industrial policy, or state-owned enterprises. It often picks winners and losers rather than only arbitrating among economic actors or facilitating their activities. Government relations with labor also tend to be state-controlled. Wage bargaining is largely determined by the state, which seeks to impose its decisions on fragmented unions and business, while labor-management relations are mostly adversarial.

Among European countries, France, until the 1980s, was the ideal-typical state capitalist country, with the *dirigiste,* or directive, state predominating through its leadership of business activity and its control over labor. Italy, by comparison, fell far short of the ideal, as a kind of failed state capitalism in which the state could not control the unions or provide leadership to business. In both, however, the state, whether playing an enhancing role, as in France, or a hindering role, as in Italy, contrasted greatly with the role the state played in British market capitalism, with its liberal, hands-off approach to business, or in German managed capitalism, with its enabling, facilitating approach to business and labor coordination.

THE TRANSFORMATION OF STATE CAPITALISM

Since the early 1980s, however, under the pressures of globalization and regional integration, state capitalist countries have transformed their economic management systems. Whereas both market or managed capitalist countries could adapt their models to the new environment, state capitalist countries found their model particularly ill-adapted and in need of change. In an increasingly complex and competitive environment, the state could no longer ensure economic growth or firm stability because it could no longer substitute for the market effectively, direct industry efficiently, or coordinate industrial relations successfully. In an increasingly tight budgetary context, moreover, the state could no longer afford to disregard firm profitability or underwrite industry investment as it had in the past.

As a result, the state in state capitalist countries engineered its own retreat, dismantling state power and control through the turn to monetarism in macroeconomic policy, the liberalization of the financial markets, the deregulation of business activity, and the privatization of nationalized firms. The state gave up its organizing role along with its financing of business, leaving firms to chart their own strategies and to arrange their

own financing from the capital markets. And yet, the state continues to exercise leadership, albeit in a more indirect and often supply-side way. It may do this through the informal relationships among state-trained business elites; through state supply-side support of industry, through social policies; where the state has redirected its most interventionist efforts; and through labor market policies.

With regard to labor, the state has reformed either through decentralization or better coordination of the labor markets. Whereas the French state abandoned its control of wage bargaining, leaving labor relations almost as highly decentralized as in Britain today, the Italian state recentralized bargaining through a state-led kind of corporatism, as has Spain. The resulting industrial relations systems, however, are less fully market-reliant than in market capitalist countries and less stably coordinated than in managed capitalist countries. The state still plays a larger role in France, whether to liberalize or "moralize" the labor markets, while in Italy, politics gets in the way: Left-leaning governments negotiate social pacts that right-leaning ones can't or won't.

As a result of such transformations, there is now some question as to whether formerly state capitalist countries are a separate category of capitalism. Theorists who see convergence to a single neoliberal model as a result of globalization as well as those who posit continued divergence into two varieties of capitalism, liberal market economies and coordinated market economies, deny poststate capitalist countries any distinctive categorization. But the countries that the latter theorists leave out of their binary division of capitalism, which represent a nonvariety of capitalism they call *mixed-market economies,* are for the most part formerly state capitalist or developmental states. And these countries remain distinctive not only for the greater role left to the state but also for their logic of adjustment. In this third variety of *state-influenced market economies,* the state continues to intervene more, and differently, for better or worse, than in liberal or coordinated market economies. Although adjustment is firm-led in those domains where business now exercises autonomy—in business strategy, investment, production, and wage-bargaining—it is state-driven in those domains where neither business nor labor can exercise leadership—in labor rules, pension systems, and the like—or where the state sees a need to reshape the general economic environment to promote competitiveness. A number of scholars also have identified this greater state role as at the core of a third variety of capitalism or a distinguishing factor in one of an even greater number of varieties of capitalism.

THE FUTURE OF STATE CAPITALISM

But what can we say about the 2008 responses to the financial crisis, when states across advanced industrialized countries intervening massively, even to the point of nationalizing financial institutions? The new interventionism of states everywhere raises a question about whether all countries are state capitalist now, as well as about whether the differences among varieties of capitalism are still relevant, because all states intervened in similarly aggressive ways to stabilize the financial markets.

A closer look at the kinds of actions taken, together with the accompanying ideas and legitimating discourse, makes it clear that differentiation remains not only among countries that fit different varieties of capitalism but even among countries within the same variety. The starkest contrast is between the liberal market economies of the United Kingdom and the United States. The latter hesitated to take action, allowed a major investment bank to fail before intervening, experienced a political revolt against "financial socialism," and backed into taking equity stakes only once the United Kingdom had shown the way. The United Kingdom was better able to take the initiative than the United States not only because of political ideologies related to the party in power (Britain's New Labour versus the Bush White House) but also because of deeper historical differences in attitudes toward the state (with much greater legitimacy in the United Kingdom for a strong state in a limited domain). The French state-influenced market economy went further than either the United States or the United Kingdom, leading on eurozone coordination, proposing multilateral global intervention, and engaging in much greater internal intervention (reined in by the EU Commission). In the case of the German coordinated market economy, it is interesting to note that although the state also intervened, it was slower and more cautious initially than other major European member-states, a result not only of its kind of capitalism but also of collective memories about the inflationary dangers of deficit spending.

Countries that were formerly state capitalist, in short, were often faster in intervening. But the reasons may not only be related to historical patterns and memories but also to institutional arrangements and state capacity. Federal states, in which reaching agreement to intervene is often more complicated, were slower to respond to the crisis—the cases of the United States and Germany—than unitary states, whether in Britain, France, the Netherlands, or Sweden. State capacity to intervene, however, is another factor, which may help explain why formerly state capitalist Italy did not respond much, despite its own great economic difficulties.

Finally, it is important to note that whatever the intervention, this was far from the state capitalism of the past. All states resisted nationalization where possible, moved to nationalization only as a last resort, and committed themselves to reprivatizing as quickly as possible. The same could be said for state aid, which was seen as a short-term measure, to be paid back as quickly as possible—in the European Union under the watchful eye of the Competition Directorate-General. State capitalism, in short, has no future. But the state will continue to play an important role in capitalism, and some states more than others, in particular if they were historically state capitalist.

State Church

A *state church* is a religious organization that receives official endorsement or significant financial subsidization from a government within a society. Official endorsement implies a legal statement to the effect that a specific denomination is the preferred faith of a government to the exclusion or significant limitation of all others. This may mean that other churches are not allowed to exist or proselytize within a nation or that the official state church receives significant legal, economic, or social advantages not available to alternative faiths. The heads of state churches are often appointed by state officials, and the salary of clergy are paid from public funds. In some cases, secular leaders claim to have say over official church policy and doctrine.

There are numerous reasons why governments prefer to maintain state churches and why religious leaders often yield to control of the state. From the vantage point of secular political authorities, state churches may lend religious legitimacy to secular rulers, making religious citizens more likely to comply with government policies. Political leaders often find it attractive to regulate tightly an institution that controls the creation and propagation of social values, norms, and beliefs. On the other side, leaders of a state church usually welcome the financial support of governments. In the absence of state tax support, religious organizations typically rely on voluntary contributions from parishioners. Additionally, state churches frequently enjoy protection from religious competitors as governments often will limit proselytizing activity of nonofficial churches via restrictions on property ownership, access to media, or outright bans on minority faiths.

Throughout history, state churches have been the norm. In early civilizations, shamans or priests would either be among tribal leaders or part of the ruling councils. This was common across many cultures of the world. Early Judaic history is replete with examples of state leadership being coterminous with religious leadership (e.g., King David). Christianity began its history as a minority religion under the Roman Empire, which heavily subsidized numerous pagan temples. In 313, Emperor Constantine issued the Edict of Milan that provided the Christian Church with funding equal to paganism. Though this edict did not technically make Christianity the official state church, the increasingly hierarchical nature of Christianity combined with a rapid drop in financial support for paganism quickly gave Christianity that status. The gradual split of Eastern Orthodox Christianity from the Roman Catholic Church did not affect the state church status of Christianity in the Byzantine Empire. Orthodox churches in Greece, Russia, and other parts of Eastern Europe became officially established in the Middle Ages. Through agreements with the Vatican, the Spanish and Portuguese monarchies made the Catholic Church the official state church in Iberia and Latin America. While the Protestant Reformation in the early 1500s represented a reaction to corruption within the Catholic Church and was in part motivated by the church's close affiliation with secular authorities, Protestant churches often were converted into state churches by various kings. State churches remained popular in the colonial British Americas even though religious dissenters had sought freedom from religious persecution by the Church of England. The Massachusetts Bay Puritans established their own religious organization as the state church in their colony. The Church of England retained official status and funding in the southern American colonies.

In Europe, a number of Protestant nations still maintain official state churches. Some nations such as Belgium and Germany provide special status and funding for multiple denominations, thus showing it is possible to maintain two or more state churches within a society. In recent years, Norway and Sweden have made movements toward disestablishing their state churches, although each church still receives significant public funding. Following the collapse of the Soviet Union, the Russian government under Boris Yeltsin created an open religious marketplace where all churches received similar treatment. By 1997, however, the Russian Duma declared the Russian Orthodox Church to be the official state church and gave three other groups—Judaism, Islam, and Buddhism—privileged status.

The term *state church* typically refers to Christian societies, although the general concept of state control over religious organizations can be applied to societies with other faith traditions. In most nations with a Muslim majority, Islam is considered the state religion, wherein official sanction is given to the general faith tradition without an endorsement of any specific hierarchical leadership or institution. Many

governments (e.g., Egypt, Iran, Saudi Arabia) provide substantial funding for state-favored mosques, clergy, and religious schools, but there are still Islamic clergy and mosques that exist outside of the strict control of the state. Turkey has been officially considered a secular state since 1923, although its government maintains ownership of and strict control over numerous mosques, giving these mosques a quasi-official status as state "religious institutions."

State Compliance with International Law

One of the major questions in the research on international institutions, as stated by Robert Keohane (1984), has been "why governments, seeking to promote their own interests, ever comply with the rules of international regimes when they view these rules as in conflict with . . . their myopic self-interest." While realists argue that states simply do not comply if the costs of a rule are too high, rational institutionalists point to the role of international regimes and organizations, whose monitoring, sanctioning, and adjudication mechanisms increase the costs of noncompliance. In contrast to these enforcement approaches, management theories assume that noncompliance is involuntary and results from a lack of resources and, therefore, focus on capacity-building and rule specification. Finally, social constructivists stress legitimacy, socialization, and norm internalization through processes of social learning and persuasion as mechanisms explaining compliance behavior. These three approaches provide different explanations for why states comply. They have paid less attention to the question of why some states are worse compliers than others. Their explanatory power is even more limited when it comes to understanding why the same state complies less with certain international laws than with others.

THEORIES OF STATE COMPLIANCE: POWER, CAPACITY, AND LEGITIMACY

To explain why there is substantial variation between states compliance with international law, country-based explanations are necessary. Compliance theories, such as enforcement, management, and legitimacy approaches, primarily focus on institutional design (monitoring and sanctioning, capacity-building and adjudication, and socialization). Consequently, they have largely been used to account for variation in compliance across international institutions. However, all three approaches can be reformulated in a way to account for country-based explanatory factors, such as power (enforcement), capacity (management), and the acceptance of international rules and institutions (legitimacy).

Enforcement approaches assume that states choose to violate international norms and rules because they are not willing to bear the costs of compliance that result even from technical and narrow legal acts. From this rationalist perspective, noncompliance can only be prevented by increasing the costs of noncompliance. Establishing institutionalized monitoring and sanctioning mechanisms can alter the strategic cost-benefit calculations of states. The likelihood of being detected and punished increases the anticipated costs of noncompliance. However, state power can significantly mitigate the extent to which states are affected by and sensitive to compliance costs.

States are more sensitive to reputation and material costs imposed by others if they have less political or economic power and are more dependent on future goodwill and cooperation than are other states. Powerful states, in contrast, can afford to be more resistant to external pressures because they have more alternatives to cooperation with a particular partner and can more easily pay for reputation or material damages. At the same time, powerful states can use their economic and political resources to shape international laws according to their preferences, thereby reducing the costs of compliance. Their assertiveness should render powerful states, such as the United States or China, better compliers, while their power of recalcitrance would expect exactly the opposite. Power-based approaches are less indeterminate when it comes to predicting the compliance behavior of small and weak states, which have neither the power to shape international laws nor to resist compliance.

Unlike the enforcement approach, the management school assumes that noncompliance is involuntary. Even if states are willing to fully act in accordance with international law, they are prevented from doing so if the preconditions that enable states to comply are absent. The literature has identified three sources of such involuntary noncompliance: lacking or insufficient state capacities, ambiguous definitions of norms, and inadequate timetables within which compliance has to be achieved. Only state capacities can account for interstate variation, because the other variables are rule-specific.

The concept of state capacity is not used uniformly in the literature, and its operationalization differs significantly. Resource-centered approaches define capacity as a state's ability

to act (i.e., the sum of its legal authority and financial, military, and human resources). Neoinstitutionalist approaches, in contrast, argue that the domestic institutional structure influences the degree of a state's capacity to act and its autonomy to make decisions. Thereby, domestic veto players come to the fore, blocking the implementation of international rules because of the costs they have to (co-)bear. A large number of veto players reduces the capacity of a state to make the necessary changes to the status quo for the implementation of costly rules. Irrespective of the operationalization, states with low capacities are expected to be bad compliers.

Social constructivist approaches, finally, draw on the logic of appropriateness to explain state compliance with international law. They assume that states are socialized into the norms and rules of international institutions. They comply out of a normative belief that an international rule or institution ought to be obeyed rather than because it suits their instrumental self-interests. This sense of moral obligation is a function of the legitimacy of the rules themselves or their sources. Legitimacy can be generated in several ways. In order to explain interstate variation, country variables, such as the national rule of law culture and domestic support for the rule-setting institution, are of particular relevance.

Legal sociological studies refer to the relation between national legal cultures and states' inclinations to comply with national norms. Legal cultures comprise three elements: the characteristics of legal awareness, general attitudes toward the supremacy of law, and general attitudes toward the judicial system and its values. In this perspective, the degree of compliance correlates with the extent to which rule addressees accept the legitimacy of the rule of law and consider compliance with legal norms as demanded by a domestic logic of appropriateness. The acceptance of a rule and the subsequent inclination to comply with it result from the diffuse support for lawmaking as a legitimate means to ensuring political order in a community. Consequently, even costly rules will be complied with principally. While this argument was developed for compliance with domestic laws, it should apply also to international rules because they also constitute law. Yet, rules are not only complied with because laws ought to be obeyed, but because the rules are set by institutions, which enjoy a high degree of support. Thus, social constructivist approaches would expect states to comply with international laws if their rule of law culture is strong or their domestic support for the international institution issuing the law is high.

TOWARD AN INTEGRATIVE APPROACH

The three compliance approaches, which dominate the international relations literature, treat power, capacity, and legitimacy as alternative or competing explanations of variation in state compliance with international law. Yet, there are good empirical and theoretical reasons to combine them. Empirical studies have shown that combination of management and enforcement instruments is an effective

way to restore compliance. On the theoretical level, some of the explanatory variables are causally connected, so that they condition their respective effects on compliance. For instance, enforcement and management approaches can interact, because differences in capacity affect the cost sensitivity of states concerning compliance decisions. While powerful states can afford to resist enforcement pressures by international institutions or other states, those with high capacities will less frequently choose to infringe on international law than their less resourceful and inefficient counterparts because they have the capacity to comply. And indeed, research on compliance with European law shows that states with high capacities but little power, such as Denmark, comply much better than powerful countries with limited capacities (e.g., Italy).

FROM INTERSTATE TO INTRASTATE COMPLIANCE

While the international relations literature provides a fairly good account for why some states comply less than others, explanations are less adequate as to why the same state violates some international laws more frequently than others. First, compliance theories are rather state-centric and focus on country-based variables, such as power, capacity, and legitimacy. They neglect that those variables can vary within states (e.g., across different policy areas). Second, most studies explore state compliance with one particular international regime, such as human rights, environmental protection, or trade. Comparisons of different international regimes are rare. As a result, policy-related explanations as developed in the early implementation literature, such as issue salience, redistributive consequences, or policy style, have not received much attention. Variation in state compliance with different bodies of international law is at best explained with reference to institutional design (e.g., varying degrees of obligation, delegation, and precision).

Statecraft

Simply put, *statecraft* is the art of conducting state affairs, which may be either domestic or foreign. Statecraft is generally defined in two ways. The first definition views statecraft as the science of government that focuses on the institutions and instruments of power. The second is that it is the application of political understanding as the art of governing or ruling. This definition points to the skills used to apply power to political goals.

Statecraft is associated with statesmanship, skillful management, and effective leadership of public affairs to achieve political goals. It requires the definition of policy goals, the use of sound political judgment to select the means for achieving these goals, and valid arguments for the state's actions that will persuade people to follow. When statecraft is skillfully conducted, the affairs of state are achieved at acceptable costs; however, poorly conducted statecraft fails to achieve its goals. Failure in statecraft can be very expensive, causing numerous deaths, the destruction of property, or the death of the regime and its leaders.

The political skills used in statecraft are numerous and include everything from the ruler's voice and demeanor to the ability to effectively enlist and lead others. The development, acquisition and exercise of power toward specifically defined goals are an essential part of statecraft.

Statecraft has been the subject of literary works produced in ancient China, ancient Greece and elsewhere. Aristotle discusses the arts of power in *Politics,* Plutarch describes statecraft in "Precepts of Statecraft," and Niccolò Machiavelli's *The Prince* offers advice on how to rule effectively even if moral principles are violated. Desiderius Erasmus's *The Education of a Christian Prince* seeks to teach the young prince how to rule effectively without losing his soul.

MODERN EXERCISE OF STATECRAFT

Since the advent of modern diplomacy, statecraft often has been associated with diplomacy. However, it is more than diplomacy, which practices the arts of peace, especially negotiations, because statecraft also involves the use of military power to achieve its goals. It is conducted not only through diplomacy, but also through psychological, economic, and military channels. Regardless of the channels it uses, effective statecraft must be formulated and conducted through intelligence. The work of intelligence agents and agencies that produce quality intelligence products or the safeguarding of state secrets by counterintelligence agencies is vital to good statecraft.

Defensive statecraft is more than applying force—military organizations create communities that are complex instruments for use in statecraft. To be effective, military statecraft must use psychology and any other means possible to defeat an enemy before a shot is fired. Simply displaying the military might of a nation on holidays or naval voyages creates images that make others respectful of the power of the state.

Economic statecraft is similar to foreign economic policy but is distinguished from it by the fact that economic statecraft seeks to achieve goals that may or may not be economic, and in the modern world, these goals are focused on trade. Closely related to economic statecraft is *financial statecraft.* Since the development of a global economy, the flows of trade, securities, and money have made it an important state interest to exercise some supervision of banks and other markets. Control of gold and silver mines or trade sources was an ancient concern that now has its modern counterpart in financial statecraft.

The psychological element in statecraft is extremely important. Power is exercised by an ego to gain compliance from an alter ego whether singular or collective. If the ego uses persuasion, effective willing compliance can be gained from the alter ego. However, if not, the threat of force or of unwholesome consequences also can be effective in gaining compliance. To gain psychological perceptions evoking awe in their alter egos, kings and other rulers have manipulated symbols to create an image of power that is spiritual as well as material. In the age of mass media, statecraft uses *stagecraft* to create the image of the ruler held by the masses or by alter egos.

Part of the psychological aspects of statecraft is viewed as *soulcraft,* the power of a state to shape the moral beliefs, political attitudes, and practices of its people. Laws against racial or other forms of discrimination can be used along with other means of power to shape the character of nations or their people.

State Failure

Since the end of the cold war, scholars and policy makers have become increasingly concerned about state failure. The focus began in the U.S. policy community in the 1990s when the primary concern was forecasting changes of government and humanitarian crises. After al-Qaeda's 2001 attacks in the United States, the focus shifted to preventing terrorism. Since then, both measures of state failure and arguments about its importance have flourished.

Analysts do not agree on a single definition of state failure. Instead, there are different concepts of state failure, numerous indicators of failure, and various lists of states that have failed and are likely to fail. Thus, there is also a lively debate about whether states have been properly classified and what causes states to fail.

CONCEPTS OF STATE FAILURE

Analysts have advanced two concepts of state failure: absence of state authority and lack of legitimacy. To understand and evaluate these differences, one must begin by defining the state. The most widely accepted definition of the state was proposed by German sociologist Max Weber. According to Weber, a state is a human community that successfully claims the monopoly of the legitimate use of physical force within a given territory. But scholars disagree about what this definition means and how to determine whether an entity is a successful state.

According to realists, the essence of a state is its monopoly of the use of force. For them, a state is an entity that has the last word on foreign and domestic policy in a territory. A state may not always be authoritative, but it is more authoritative than any other actor in a territory. Should this cease to be the case, the state has died, whether through conquest, union, revolution, disintegration, or collapse. Any of these means of death could be considered state failure.

Historically, realists have primarily been interested in state failure because of its effects on great-power relations. For them, conquest could signal the expansion of a great power, revolution could precipitate new alliances, and collapse could create power vacuums into which other states are drawn. Since the end of the cold war, realists have become more interested in intrinsic aspects of state failure because of the disintegration of the Soviet Union, which demonstrated that even great powers can fail to survive, and the terrorist attacks of 2001, which demonstrated that the collapse of a weak state like Afghanistan can create security problems for a powerful state even in the absence of rivals. Seminal works in the realist vein include William Zartman's edited volume on collapsed states in Africa and Anthony Vinci's 2008 article exploring the nature of anarchy in collapsed states.

For liberals and constructivists, a state must have more than a monopoly of force over territory. A state must have legitimacy. For some scholars, this means a state must be chosen or at least accepted by its subjects either because it benefits them or because its principles accord with theirs. For other scholars, legitimacy means that a state must be recognized by its peers. In recent years, these ideas have come together in the concept of states' *responsibility to protect,* which asserts that states must respect the human rights of people within their borders and that when they fail to do so, it is the responsibility of other states to intervene.

INDICATORS AND LISTS OF STATE FAILURE

Each of these concepts of state failure can be operationalized to yield a list of states that have failed or could fail. Because concepts of state failure differ, the measures and lists vary greatly.

For realists, weak states are most likely to fail. Weak states lack the military, economic, and political capabilities needed to cultivate domestic sovereignty and deter other states from attacking and conquering them in particular technological eras. To evaluate state vulnerability to failure, realists rank states according to their material capabilities. The most comprehensive list of this type is the Correlates of War National Material Capabilities data set. Realists also explore the effects of relative power in differentiating states that die from those that survive.

By contrast, liberals and constructivists measure and rank states in terms of domestic and international legitimacy. Analysts who emphasize domestic legitimacy focus on public opinion polls and standards of living, and those interested in international legitimacy rank states according to compliance with purported international norms. In practice, the two concepts of legitimacy often are combined. For example, the Failed State Index (FSI) published annually by *Foreign Policy* and Fund for Peace measures states on twelve dimensions, including the availability of food and compliance with norms of transparency and accountability.

DEBATES ABOUT STATE FAILURE

Debates about state failure relate to whether states have been properly classified and why some states succeed while others fail. These questions have both methodological and political strands.

The methodological debate centers on the technique of developing an index by amalgamating individual variables. This makes it difficult to know which variables are associated with which outcomes. In addition, there is the problem of

determining whether statistical correlations reveal causes or effects. These problems are especially acute for analysts who combine indicators of authority and legitimacy. For example, although states that score poorly on the FSI indicators are considered unstable, nine of the ten most "critical" countries in 2009 were in the top ten the previous year. Moreover, the top twenty included North Korea and Zimbabwe, neither of which has experienced political crises usually associated with state failure, such as conquest, union, revolution, disintegration, or collapse.

The politics of the state failure discourse are highly charged. At stake is the question of who should determine which states are failing. In 1992, the United Nations Development Program dropped a measure of human freedom in its Human Development Index because developing countries argued it was culturally biased and would deter donors from providing development aid. The notion of state failure has been criticized and advanced as an effort to legitimize neocolonial intervention by powerful states. Why states fail is also contested. Explanations range from predatory rulers to international power politics.

State Formation

Inheritor of the ancient Greek concept of *politeia* (polity), the state in Europe emerged gradually, to varying degrees and in response to various dynamics, from around the twelfth century until the end of the eighteenth century. More concretely, the period of 1485 to 1789 saw the building of most modern European nation-states. According to social scientist Stein Rokkan, the second phase of nation-building, the subsequent processes of mass politics, and the construction of the welfare state completed with early state formation the main four-phase process of political development in contemporary Europe.

The development of the modern state as a national state, or *nation-state,* gave rise to the idea that the territorial boundaries of the polity also represent the boundaries of a nation or a people. The concept of nation is implicit in many of the characteristics of the state, including its territorial boundedness and the status of citizenship conferred on its members. The emotional force of nationhood, and the solidarity and mutual belonging it engenders, also serve political purposes. The idea that the state represents a people sharing a common identity and a set of civic values enhances its legitimacy, fosters citizens' participation in the democratic process, and underpins much of the discourse used to justify public policy-making and governmental action.

According to Max Weber, the modern state embodies the legal order of a given territory and exercises the monopoly of the legitimate use of force. As a political system (*politischer Verband*), the state has traditionally been regarded as an organization structured in a hierarchical manner aiming at maintaining civic order in a defined territorial context. Its rational-legal legitimacy is greatly dependent on the effective enforcement of the rule of the law to all inhabitants within a territorially delimited area. This was meant to be achieved by depersonalizing state authority from that of the rulers and by implementing abstract rights and duties not based on historical prerogatives and privileges.

As a result of diverse historical developments of state formation, two broad models can be identified: (1) *unitary,* in which (a) sovereign political power is undivided and rests on an organic core of governmental responsibilities and (b) executive, legislative, and judiciary operate on a state basis with some delegation of administrative functions to subnational agencies or bodies and (2) *plural* (or compound), in which (a) territorial power is distributed by consent among the different layers of government and (b) central, meso, and local government can implement policies according to their own jurisdictions. In general terms, the unitary-plural typology finds expression in two corresponding systems of government: *centralized,* where the *loci* of decision making are concentrated in one core, and

decentralized, with a dispersion of power throughout distinct layers of government.

Among the various influential schools of social thought, functional diffusionism has persistently conveyed the idea that internal territorial differences within states would disappear with the extension of liberal democracy and industrial capitalism. Accordingly, the processes of periphery migrations into the urbanized core areas would eliminate the old local ascribing identities in favor of new associative links of a functional nature. The refutation of these theoretical assumptions by historical events has given way to new approaches, among which neoinstitutionalism underlines the role of state institutions in shaping the preferences and objectives of social actors in their decision-making processes. It is argued also that, as a consequence of state formation, institutions highly condition the outcomes of such political decisions with the establishment of the game rules of power and influence.

At the turn of the millennium, the modern state is challenged from above by the forces of globalization of the world economy, the mobility of people and capital, and the rise of many international institutions. Globalization has meant a transfer of authority and power from the nation-states to the markets. The very patterns of economic competition are to comply with the new rules of global markets and the strategies of transnational corporations. From below, the reassertion of territorial minorities demanding increased autonomy has put further stress on sovereign states, and in some cases they defy the state with the option of "exit" rather than that of "voice." The state also is challenged internally by the advance of individualized social relations and by a declining confidence in and engagement with the formal political process. All things considered, the state continues to be a central concept in the study of politics and a major actor in the power relations at the international level.

State Formation, European

Institutions possessing features now identified with statehood began to emerge in many European societies during the investiture controversies of the eleventh and twelfth centuries. These controversies led to an increasingly strict separation between secular and religious authority, and in so doing they consolidated centralized political institutions as societal actors charged with a body of increasingly differentiated public functions. European states were essentially constituted by their antithesis to the local and devolved powers of feudal society, and once they had begun to emerge as distinctively public orders they were constantly exposed to the threat of privatistic disaggregation; that is, the threat of a refeudalization of public offices resulting from the anticentralist ambitions of the nobility. In consequence, the form that states assumed in different national, cultural and geographical settings was largely determined by the strategies that actors within the state employed to counteract the threat of refeudalization and the conjuncture between the integrity of statehood and the relative strength of the late-feudal elites that distinguished particular societies. The process of state-led defeudalization was extremely tortuous, and the modern state did not approach completion until the eighteenth century. Only the most centralized European societies possessed fully evolved states by the nineteenth century.

THE EMERGENCE OF EUROPEAN STATES

In their first emergence, European states usually assumed a legal-constitutional order, and their effective expansion of centralized territorial power normally depended on their ability to construct concessionary arrangements to co-opt the support of the baronial class or nobility. Among the earliest European states, the Kingdom of León assumed a rudimentary representative constitution in 1188, Capetian France had a basic parliamentary apparatus before 1300, the Magna Carta was introduced in England in 1215, the Holy Roman Empire obtained a formal electoral system and enshrined electoral privileges in 1356, and the major northern Italian cities also acquired extensive quasi-constitutional statutes through the later thirteenth century. Of fundamental significance in this process is the fact that modern states are defined by their need for regular taxes; that is, they cannot consistently raise revenue from feudal tenures, and in consequence they cannot rely on personal levies to sustain their military operations. To raise taxes and conduct warfare, then, modern states require mechanisms that enable them to penetrate society and to obtain approval for their fiscal imperatives. The states that managed to stabilize themselves in the Middle Ages normally deployed a system of quasi-delegatory representation to solve this problem. This allowed states to address and placate powerful interests outside the state, to harden their foundations in society, and—crucially—consensually to regularize their sources of revenue.

In the second stage of their formation, European states widely adopted a more repressive attitude to the corporate elites that they assimilated, and they began to devise means for evading the need for noble consent in questions of fiscal legislation. In early modernity, many more centralized states began to promote rigidly ordered patterns of rule. They were less

inclined to recognize time-honored local freedoms and more intent on absorbing privileged classes into their own inner structure, usually in the civil service or military organizations. The key example of this tendency is the Spanish state, which under the Catholic monarchs after 1474 began to limit the competences of assemblies and to levy taxes in more peremptory style. Other examples are the Italian city states; by 1400 only Florence and Venice retained elements of their original communal constitutions. This process was subsequently emulated in France, and after 1600 the French monarchy gradually developed a centralized civil service, attacked the powers of the nobility, and began to pass fiscal laws with limited negotiation. This tendency was not universal, however, and throughout this period most central European societies, which were marked by very low levels of state integration, witnessed a reinforcement of their representative structures. In the sixteenth century, Bavaria, Brandenburg, the hereditary Habsburg territories (later Austria), and Württemberg were marked by an effective condominium between regents and regional assemblies (*Landstände*). The same is true of Poland. It was only toward the end of the seventeenth century that many German-speaking states began to copy more concentrated methods of state-building. The move toward more prerogative governance was normally unsuccessful in states that had already reached a condition of consensual integration. England's collapse into civil war in the 1630s and 1640s can be seen as an example of a relatively solidified state order that resisted transformation into an apparatus of personalistic rule. Experiments with absolutistic patterns of state-building thus tended to occur in societies characterized by moderate levels of centralized statehood; societies marked either by a high or a low degree of state integrity rarely converted to absolutism.

CONSTITUTIONS

The resistance to the reprivatization of state power through the nobility was also the dominant force in the most intense period of European state-building: the constitutional revolutions between 1789 and 1848. At this time, states adopted constitutions specifically to eradicate the remaining seigneurial powers of the nobility; to place state authority on generalized legal foundations; and to ensure that state power could be disseminated easily and regularly across unified territories, now constructed as *nations.* Most modern constitutions did not immediately succeed in liberating the state from noble influence. In Spain, the 1812 constitution marked only the beginning of this process, and in many German states it was not complete until the early twentieth century. Generally, however, throughout the nineteenth century national constitution writing was used as a technique for the elaboration of cohesively integrated states. The strongest European states also usually began to develop proto-democratic foundations in the middle decades of the nineteenth-century, and this further intensified their integrity.

The legacy of these variations in the process of European state-building remained pervasive through the twentieth century. The fact that some European states succumbed to fascist governance in the earlier twentieth century is directly linked to earlier conjunctures between state executives and private societal actors. Those states that had obtained a high level of state integration at an early historical stage tended to be most resistant to fascism.

Stateless Nation

A definition of a *stateless nation* included several elements, such as a sharing by the inhabitants of a self-perceived common culture and history, an attachment to a particular territory within a larger state, and a desire for home rule and eventual independence, as noted by Montserrat Guibernau (1999). In broad terms, a stateless nation can be referred to as a minority nation that has secured or aims to achieve a degree of institutional autonomy or independence within a plural or multinational state, and that concurs or coexists with a majority nation or other regions or ethnoterritorial groups.

As a relational construct, the stateless nation is a category put forward mainly by the ideology of minority or stateless nationalism, which usually develops within plural states and is associated with demands for self-government (it also can affect two or more neighboring states, as the Basque or Kurdish cases illustrate). Demands for political power can range from a

degree of home rule to the formation of a new independent state. This type of stateless nationalism often has been made synonymous with that of regionalism. Indeed, both share three important elements in most of their manifestations: (1) a collective identity and consciousness of community belonging, (2) a center-periphery conflict, and (3) an existence of social mobilization and political organization for the achievement of their objectives. However, the upsurge of stateless nationalism during the second half of the twentieth century in countries such as the Basque Country, Catalonia, Corsica, Flanders, Quebec, Scotland, or Wales has come to reassert their preunion identities by means of political mobilization for the achievement of political power. This trend was observed by Michael Keating (1996), John Loughlin (2001), and David McCrone (1992).

In advanced industrial countries, some region states have become natural economic zones and the source of economic prosperity, as observed by Kenichi Ohmae (1993). Regions may share many features with stateless nations although the former do not necessarily aim at the creation of a new state on its own. Some stateless nations can be regarded as successful "region states" that may qualify also as stateless nations. In fact, with their efficient economies, such "region states" can pursue their own strategic interests without major disruption from central government interference and taking advantage of supranational intergovernmental relations (e.g., European Union). For such stateless nations, the processes of bottom-up supranationalization and top-down devolution of powers have allowed a considerable extension of a type of *cosmopolitan localism,* as pointed out by Luis Moreno (1999). This is reflected in both societal interests, which are aimed at developing a sense of local community and at participating simultaneously in the international context, allowing in such a process a growing adjustment between the particular and the general. *Cosmopolitan localism* concerns medium-sized polities without the framework of a state, such as Catalonia, Flanders, or Quebec.

In general terms, the revival of ethnoterritorial political movements in the Western world has coincided with an increasing challenge to the centralist model of the unitary state. Devolution and federalization have sought to articulate a response to the *stimuli* of the diversity of society. This plurality comprises cultural and ethnic groups with differences of language, history, and traditions, which also can be reflected in the party system. Minority or stateless nations aim at achieving greater degrees of home rule and political power based, among other factors, on the variable manifestation of a duality in citizens' self-identification. As noted by Luis Moreno (2006), the more the ethnoterritorial identity prevails on modern state-national identity, the higher the demands for political autonomy. Conversely, the more characterized the state-national identity is, the less likely it would be for ethnoterritorial conflicts to appear. At the extreme, complete absence of one of the two elements of dual identity would lead to a sociopolitical fracture, and demands for self-government are to take the form of independence and eventual secession. In other words, when citizens in a substate community identify themselves in an exclusive manner, the institutional outcome of such antagonism will tend to be exclusive as well.

Asymmetrical constitutional arrangements can provide a means of accommodating plural claims within multinational states. The emerging European polity can be regarded as a model for a postsovereign order in which legal pluralism and constitutional diversity can accommodate multiple nationality claims, including those region states or stateless nations with aspirations for greater self-government or self-determination.

State of Nature

The *state of nature* is a condition without government, generally used in social contract theory to justify political authority. The device assumed greatest importance in the works of the great contract theorists of the seventeenth and eighteenth centuries. But it has a long history, both before and after that period. Descriptions of man's purported natural condition differ in important ways (e.g., on whether circumstances were peaceful or ridden with conflict). Such variations are used to justify different moral and political conclusions.

Mythical accounts of a prepolitical (and presocial) Golden Age are common in ancient Greek and Latin literature; e.g., in Plato's *Protagoras* (c. 390–380 BCE) and Cicero's *On Invention* (84 BCE). Classical arguments blended well with Judaeo-Christian accounts of the Garden of Eden and subsequent Fall to support the medieval notion that the state arose as a remedy for sin.

During the late medieval and early modern periods, claims that political power originated from a prepolitical, natural condition generally supported limitations on political power. Thomas Hobbes was highly original in using a contract argument to establish absolute government. At the heart of Hobbes's theory is a horrific picture of the state of nature as a

"war of all against all." To escape such horrors, people would consent to absolute political authority. Although Hobbes employed the state of nature for largely analytical purposes, he also believed in its historical accuracy. Evidence is provided by "savage people" in America, whom Hobbes viewed as living in a "brutish manner," and conflict between states in the international arena. Hobbes's view of international relations taking place in a state of nature has been enormously influential in international relations theory.

In the state of nature described by John Locke in his *Second Treatise of Government* (1689), people live under the law of nature, which, in the absence of government, they enforce themselves. People also possess property rights, use money, and have something of a developed economy. Locke's view that rights, including property rights, exist in the state of nature was central to the development of subsequent theories of rights. When conflict breaks out in the state of nature, people recognize the need for impartial authority and move from the state of nature in two stages, forming first a community and then government. When government violates the agreement according to which it was established, people are justified in rising in revolution.

Influenced by anthropological and zoological discoveries, Jean-Jacques Rousseau's *Discourse on the Origin of Inequality* (1754) depicts natural man as little different than an ape: solitary, with limited reasoning capacity, but also content and morally innocent. Man becomes corrupt only through a gradual process of moving into society, and the contract through which government originates is a clever fraud perpetrated by the rich upon the poor. Rousseau's political theory aspires to recapture as much primordial natural purity as possible through the new social contract described in *The Social Contract* (1762).

By the end of the eighteenth century, the social contract and, along with it, the state of nature were widely criticized on historical grounds. But contract theory was revived by John Rawls in *A Theory of Justice* (1971). Rawls argues that appropriate principles of justice are those that would be agreed upon under fair conditions. The state of nature reappears in his theory as the *original position*. To prevent people from choosing principles that would advantage themselves, they are placed behind a *veil of ignorance* and so deprived of knowledge of their personal attributes, such as age, religion, race, or wealth. With Rawls and other recent thinkers who argue along similar lines, the state of nature (original position) loses all historical pretense. It is solely an analytical device to help identify appropriate moral principles.

State of the Union

Article II, Section 3, of the U.S. Constitution specifies that the president "shall from time to time give to the Congress information of the state of the union and recommend to their consideration such measures as he shall judge necessary and expedient." President George Washington delivered, in person to Congress, the first State of the Union address on January 8, 1790. However, the nation's third president, Thomas Jefferson, discontinued the practice and instead submitted his State of the Union in writing to Congress. This tradition remained for more than 100 years until President Woodrow Wilson reestablished the practice of delivering the address in person to Congress. The Constitution does not specify how often or when the address should be given. However, precedent has established it as an annual address to Congress. The State of the Union informs Congress as to the condition of the nation and provides the president with the opportunity to lay forth legislative goals and priorities to the Congress. With the advent of radio and television, the State of the Union allows the president to speak directly to the American people and seek their support as well.

State Repression

State repression represents the use of coercive power upon social groups and individuals by state institutions in a given territory. More specifically, it denotes policies of modern states and regimes to forcefully integrate, assimilate, or eliminate ethnically, religiously, or ideologically distinct groups engaged in resisting or contesting existing political orders. State repression involves a relationship of authority between state institutions and those subject to their rule, either within a nation-state or an imperial/colonial order. It entails organized violence on the part of the state through its own institutions or nonstate agents targeting specific groups and individuals.

HISTORICAL EVOLUTION OF STATE REPRESSION
State repression has been associated with the historical process of state-building, nation-building, and regime formation associated with modernity. These processes helped the institutionalization of state power and its targeting of organizations and institutions posing real or imaginary threats to the political order. As the capacity of states to act and deploy resources advanced during modernity, state repression engendered a severely asymmetric relationship between states and their contenders. The historical targets of state repression were initially nobility and local authorities resisting centralized rule within

the state and those social groups (peasantry, workers, ethnic or religious groups) who were resisting specific economic and political orders. State repression, at different scales and using different instruments, is associated historically both with democracies and dictatorships. It became more visible and extensive in the latter, but it was not absent from democracies either. Democratic regimes have institutionalized rules that limit the use of government violence against individuals and groups. Despite the existence of these rules, in fragmented or unequal societies, authorities commonly use violence to preserve order. In most national states, social relations are pacified even though in many cases organized opposition still exists.

COMPARING STATE REPRESSION

State repression is a less emphasized historical process, much of the attention in social sciences being directed toward the building and maintenance of legitimacy and consensus around political order and toward the existence and success of protest and various revolutionary movements. Two main approaches emerge as dominant in its study: The first tends to associate state repression with particular dysfunctional regimes and socioeconomic structures and relations, heralding repression as a modern but illegitimate state behavior, while the second associates repression with the governing process across all types of states and regimes, including democratic ones, depicting repression as a neutral instrument to be used by state elites.

Ted Gurr (1986) shows that the reasons for state elites to engage in state repression depend largely on existing political cultures and traditions but also on structural characteristics of the societies and international context. If the societies are fragmented and experience shortages of resources, there is a significant potential for contestation and, subsequently, for state repression. State repression is especially violent against marginal groups that are economically and politically deprived. In countries where states are centralized and powerful in relation to society, repression is a particularly common policy phenomenon. If the societies are deeply segmented and the political institutions are weak, then the state tends to be more violent and aimed at physical destruction rather than submission or cooption. If one state is either protected or ignored by powerful actors in international politics, it is more likely to use repressive policies.

As a common modern phenomenon, state repression refers to a wide spectrum of state actions in very diverse temporal and geographical contexts. State repression can be compared by analysing its intentions, agents, and instruments.

The intentions behind state repression significantly differ across time and space. The state can attempt to coerce the leaders of distinct groups into accepting the political order, thus eliminating its radical or armed sections, as in the Basque, Irish, and black movement in United States cases. It also can try blocking access to power by repressing distinct majorities, as is the case of South African black movements (1948–1994), or by eliminating ideologically opposed insurgencies in Africa, Asia, and Latin America. In other cases, the state can aim at physical elimination of a particular group, more commonly known as genocide, as it was with the case of the extermination of the Jewish population during Nazi rule in Germany and occupation of Europe (1938–1945) or the elimination of Tutsi ethnics by the politically dominant Hutu group (1994) in central Africa. In combating separatist movements, the aim of the repression is a combination of physical elimination and group submission, as in the former Yugoslavia (Bosnian war and the repression of ethnic Albanians). Ideologically based state repression also can be aimed at elimination of specific social groups, as in Cambodian repression of urban and bourgeois elite (1975–1979). Imperial or colonial repression is also violent and tends to share both of the above aims. This is exemplified by the case Turkish repression of ethnic Armenian (1914–1918) or the French repression of independence movements in Algeria (1954–1962) and Cameroon (1955–1960). In the British dominions that eventually became independent, the indigenous populations were constantly repressed to the extent that they were threatened to the point of near extinction, most notably in North America and South Africa.

State repression can be carried on by a multitude of actors. In the majority of cases, state institutions (army, police, and intelligence services) are directly involved in organizing the violence. However, in numerous instances violence is produced by organizations and groups (militias, paramilitaries, vigilantes) sponsored, protected, or tolerated by the states' institutions. These groups and organizations usually share similar ethnic, religious, and ideological background with the ruling class and have convergent economic and political interests. The type of institutions and agents involved in repression also depend on the type of contention a state has to face. Historically, states tended to replace armies with police and intelligence organizations and state institutions with nonstate actors. Yet examples of army involvement and army-led repression are still present, as in Myanmar (2007). Communist regimes developed extensive intelligence organizations directly under the control of top political leadership whose role was to ensure the lack of opposition in society and ideological conformity in the state and party apparatus. The several Soviet purges during the rule of Joseph Stalin would not have been possible without perfectly organized and loyal secret police. The rising engagement of nonstate actors in carrying out state repression is explained by the state and its regime's attempt to avoid responsibility and blame for their policies. In Rwanda much of the violence against Tutsis was carried on by Hutu militias informally supported by the regime. In Argentina and other Latin American states, right-wing organizations carried out most of the violent actions against opposition with the protection of the state institutions.

State repression is carried through a multitude of strategies ranging from surveillance and intimidation to exile, imprisonment, and assassination. In the case of collective protest and armed resistance, states use military technology and tactics against contending groups. Other methods include forced displacement, detention, and labor and collective punishment missions (death squads). In genocide situations, the states use starvation and collective elimination (death camps) against targeted groups. In the majority of cases, the state uses a mixture
