of methods. One characteristic of state repression is the asymmetry of power and resources, between the contenders. The states have vast institutions and resources whereas the opposition groups tend to lack the organizational, economic, and military capacity to resist them. This asymmetry explains the high number of victims of state repression, which in many cases is carried on without any restrictions or organized opposition. The asymmetry of resources is most evident in the examples of state repression provided by Germany in Europe (1938–1945) or by the Iraqi repression of the Kurdish population through the use of chemical weapons (1990).

State repression is a recurrent process in modern politics, often associated with major regime changes and economic crises. All states and regimes lacking legitimacy are faced with the overpowering temptation to choose this strategy instead of engaging in complicated and costly political and economic reforms. State repression can occur also in democracies, especially when the state is supported by a majority and used against a minority. The counterterrorist policy of both authoritarian and democratic regimes show that the latter can use disproportionately violent means against individuals and groups. Thus, the potential for elites to use the state institutions and their resources to create and maintain particular political and economic orders in a coercive and violent manner remain high.

States, Size of

States vary in size, from Russia's seventeen million square kilometers (27.4 million square miles) and China's 1.3 billion people to Nauru's twenty-one square kilometers (thirteen square miles) and ten thousand people. The puzzles of why there is so much variation and whether there is a generalizable explanation for state size are important ones, because the answers could shed light on why the world looks the way it does today and also explain ongoing changes such as the growth of the European Union or the potential dissolution of Canada, Iraq, or Russia.

Alesina and Spolaore (2003) develop a general explanation for state size starting with two premises: States produce local public goods, and citizens have tastes for different kinds of public goods. Local public goods, like defense and market regulations, can be supplied at a lower cost per citizen as the number of citizens increases. Differing tastes, however, are a source of inefficiency for ever-larger states, because citizens with different preferences for how the economy should be regulated or how defense should be provided will end up getting a kind of government very different than the one they would ideally prefer, giving them an incentive to break off and start their own states.

Several conclusions follow from the formal model. When the risk of war is low, states will be smaller because there will be less of a gain from common defense. Likewise, if the world trading system is generally open, states will be smaller because they no longer need to provide a large common market internally. Democracies will be smaller than autocracies, because citizens in a democratic periphery will vote to secede when they would be better off supplying a public good that suits their tastes, while citizens in an autocratic periphery will be coerced into staying. Those states that are larger will tend to be homogenous, indicating similar preferences over a large population. These conclusions generally match the experience of the 1990s, when smaller states emerged after the end of the Soviet Union and the further opening of world markets.

Similar arguments include ones that emphasize trade routes and state administration. David Friedman (1977) observes that multiple states along a single trade route will overtax the route in a tragedy of the commons, while multiple states along parallel trade routes will undertax them in a race to the bottom; evidence from early modern Europe suggests that states will therefore grow to encompass an entire network of routes. David Lake and Angela O'Mahony (2004) also posit that states will be larger when they require valuable fixed investments such as railroads.

An alternate approach emphasizes identity rather than political economy. Alexander Wendt (2003) argues that states, like people, seek to be acknowledged as members of a community. Being admitted into a club not only confers status but also serves as a marker that validates a state as being a member of an in-group. States seeking acknowledgment by peers continue to formalize their relationships until, eventually, they federate. This argument, which does not posit an upper limit on state size and so cannot account for dissolutions, has not been empirically tested, and its final conclusion—an eventual, inevitable world government—has not been realized.

Some empirical evidence suggests that states form in response to considerations of scale economies as well as homogeneity, and by some measures scale economies (such as presence of railroad networks) are related to the average

size of new countries over time. A historical survey of federations suggests that the need for common defense may have been behind decisions by some states to voluntarily unify, but no such surveys have included control groups. Other empirical studies have failed to find clear evidence that size matters, because small countries seem no worse off on average than large countries, by a variety of economic and social measures. Furthermore, there is little cross-national evidence that the theorized efficiencies to a particular size are felt by leaders or decision makers who then take action to bring their states to the optimal size.

A challenge for theories of state size is that these theories often have difficulty accounting for why states adjust their borders when they could, or as an alternative, achieve the benefits of scale in some other way. States needing to pool their resources for common defense or market gains can simply form alliances or customs unions, or coerce partners into cooperating with them. Some scholars speculate that integration and dissolution may be driven as much by commitment problems as by underlying interests in size. At the very least, however, size of states studies such as Alesina and Spolaore set important necessary conditions for theories of why states take the shapes they do.

States' Rights

The American political doctrine of states' rights has its roots in the struggles of the American colonies with the British Crown and its agents. Rallying to the cry "no taxation without representation," the colonies assembled at the Second Continental Congress virtually as an assembly of ambassadors from the colonies and declared themselves to be free and independent states through the Declaration of Independence. Their sovereign statehood was affected on the battlefields of the Revolutionary War (1775–1783).

After the revolution, the original thirteen states joined in a national government that was designed to be weak in order to protect them from a home-grown tyrant. The Articles of Confederation government created a national government that had no executive or judiciary except in the form of several committees of the Articles of Confederation Congress. The Congress, composed of the "states in Congress assembled," was weak, requiring almost all decisions to be unanimous. The states were explicitly described as sovereign.

The weaknesses of the Articles of Confederation government quickly became apparent. Calls for its amendment to strengthen the national government were heeded after the excitement generated by Shays' Rebellion (1786–1787). The Constitution that emerged from the Federal Constitutional Convention in Philadelphia in September of 1787 was sent to the states to be ratified by conventions in the several states (Article VII). The small states quickly ratified the Constitution; however, it would not have been ratified in the New York Convention if the supporters (Federalists) had not agreed to make a bill of rights the first priority of the new government. The Anti-Federalists championed the retention of power by the states as rights.

THE TENTH AMENDMENT

The Bill of Rights was proposed by the new government and ratified as amendments by the states by 1791. The rights listed in the Bill of Rights are mostly personal civil liberties of the people; however, the Tenth Amendment stated that, "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people."

The Constitution granted specific powers to the central (federal) government. These are limited in scope and purpose. Through the Tenth Amendment, the autonomous nature of the states is also recognized. However, the Supreme Court through its assumption of the power of judicial review has stated that it is merely a truism.

States' rights became an issue in George Washington's administration. Alexander Hamilton and other Federalists sought to strengthen the federal government. Secretary of State Thomas Jefferson opposed the creation of a federal bank, which was supported by Hamilton. Opposition was stated in terms of states' rights.

In 1798 the John Adams administration adopted the Alien and Sedition Acts. Opposition was led by Thomas Jefferson and James Madison. They respectively authored the Kentucky and Virginia Resolutions. The resolutions opposed the power of the federal government with state power, arguing that the states were closer to the people, a claim still popular from colonial opposition to British abuse of power. Therefore, the states could "interpose" themselves to shield the people from abuse by the federal government. Moreover, the states had the right to "nullify" abusive laws to protect the people or the rights of the states.

The victory of Jefferson in the election of 1800 ended the developing states' rights conflict. However, the efforts of the

federal government to prevent a conflict with Great Britain in the years prior to the War of 1812 and during the war itself were opposed by states in New England. Secession was being considered when the war ended with Andrew Jackson's victory at the Battle of New Orleans.

LIMITS TO THE TENTH AMENDMENT

In 1819 states' rights doctrines fueled attempts to destroy the United States Bank in the case of *McCulloch v. Maryland*. Two issues presented themselves: Does the federal government have the right to create a bank (an entity not named in the expressly delegated powers of Article I) and does Maryland have the right to tax the bank. Chief Justice John Marshall's decision was a loss for states' rights because it affirmed the doctrine of implied powers while denying states the right to tax federal agencies. Implied powers often have been used by the federal government to accomplish its goals at the expense of the interests of individual states.

During the Jackson administration, South Carolina passed an act of nullification against federal tariffs. Jackson declared the law treasonous; however, a compromise was adopted by Congress. Among the states' rights arguments developed were those of John C. Calhoun in his *Disquisition on Government* (1851). He argued that the federal system was a compact between the states. Opponents favored viewing the Constitution as an act of the American people, an historically inaccurate claim because North Carolina and Rhode Island entered the union as virtually foreign countries.

The greatest test of the doctrine of states' rights came in 1861 with the secession of the eleven states of the Confederacy. In 1869 the Supreme Court was called on to decide the issue of the lawfulness of their secession and stated that the federal system was "an indissolvable union composed of indestructible states."

STATES' RIGHTS SINCE WORLD WAR II

States' rights arguments were popular in the southern United States during the years of slavery and racial segregation. In the election of 1948, many Southern Democrats broke away from the Democrat Party to form the States' Rights Democratic Party (Dixiecrats). In the name of states' rights, the faction tried to maintain Jim Crow laws and practices. It won thirty-nine electoral votes but did not survive politically after Harry Truman won the election.

States' rights arguments were expressed often during the decades of the Great Depression, World War II (1939–1945), and the cold war when federal power expanded enormously. Legally and politically, these arguments were of little avail as the federal government used its power, including eminent domain, to construct the Tennessee Valley Authority's dams, create military installations, and other actions opposed by the states and local citizens. However, the end of the cold war and the growing practice of unfunded federal mandates fueled opposition to its power.

The Supreme Court has generally decided cases so that federal power has increased, often at what is perceived to be the states' expense. However, on many occasions, it has decided in favor of the states. The Rehnquist Court decided against the federal government and in favor of the right of South Carolina to prohibit gambling ships in its ports as an interpretation of the Eleventh Amendment. Other states' rights cases of the Rehnquist Court included *Kimel v. Florida* (2000), which rejected the clear intent of Congress to abrogate state authority in matters of age discrimination. In *United States v. Morrison* (2000), the court again limited federal civil remedies in favor of the states.

States' rights arguments were again being espoused during the first year of the Barack Obama administration. The doctrine is used by those opposed to the central government. Opposition historically was regional; however, by 2010, opposition was increasingly ideological. The passage of the Patient Protection and Affordable Health Care Act of 2010 produced law suits by the attorney generals of over a dozen states to stop provisions mandating state financed Medicaid health care as a violation of the Tenth Amendment. At the same time, some states were moving to legalize the sale of marijuana, homosexual marriage, euthanasia, and other issues in opposition to federal law.

Statistical Analysis

Statistical analysis is concerned with ways of analyzing quantitative data using statistical methods. Data used in statistical analysis may come from a variety of sources, such as standardized surveys, content analysis of the media, standardized observation, experiments and quasi-experiments, censuses, official statistics, or election results. The two major elements of statistical analysis are description and inference. Statistical inference is either classical or Bayesian.

DESCRIPTIVE STATISTICS

Descriptive statistics are used to summarize and explore data using measures that are more easily understood even by an inexperienced observer. For instance, a complete listing of all data points (e.g., a long list of political candidates favored by respondents in a poll) is substituted by a few numbers (e.g., a frequency distribution of the most popular candidates, or a modal candidate, or something similar). These summary descriptions, called descriptive statistics, are more meaningful for most purposes than a complete listing of the data, which

may be enormous. (A survey may interview a few thousand respondents and record several dozen or even hundreds of responses.) The major challenge of descriptive statistics is to choose such data reduction techniques that will represent the data succinctly and adequately without distorting or losing too much of the existing information.

The most frequently used descriptive statistics are the mean, the median (and other percentiles), the mode, the range of values, the standard deviation, the variance, and the interquartile range. Graphical representation is a very useful and efficient way to describe data. Histograms, stem-and-leaf plots, pie charts, scatter plots, and box plots are perhaps the most commonly used graphs.

STATISTICAL INFERENCE

Statistical inference makes predictions and generalizations based on the data. Data may, for instance, represent a sample drawn from a larger population (e.g., a sample of voters chosen from all participants in a poll, or a sample of administrative units taken from a larger universe of such units). Samples are routinely taken to reduce cost and increase flexibility of data collection, yet the ultimate goal is always to learn about the population. Classical statistical inference consists of methods that use information based on a sample from a population (sample statistics) to make predictions about the parameters of that population. Bayesian inference differs from classical inference in that it blends sample characteristics and some prior knowledge to make predictions.

Inferential statistics are of two basic types: parametric and nonparametric. *Parametric statistics* is a branch of statistical inference that makes assumptions about the underlying mathematical distributional form of variables. *Nonparametric* statistics does not make such assumptions. Some statisticians claim that the use of parametric statistics is hardly ever defensible in the social sciences, yet they continue to be employed frequently. Nevertheless, nonparametric approaches represent a major growth area in political science, perhaps as a reaction to the nature of the data that political scientists may gather.

Statistical inference offers two types of predictions about population parameters. It produces point estimates and interval estimates. A *point estimate* is the single best guess of what the (unknown) population parameter might be. An *interval estimate* consists of a range of numbers around the point estimate in which the parameter is believed to be. An interval estimate helps express the accuracy of the point estimate.

Statistical inference is used also for the purpose of statistical hypotheses testing (i.e., to carry out significance tests). Significance tests tell us if (and with what level of certainty) something observed in the sample (such as an association between two variables) may be generalized to the population. There are a large number of concrete significance tests. The choice of the most appropriate test is guided by the nature of the data. There are tests for means, proportions, variances, correlations, and so on. There are tests for one-, two-, and multiple-sample studies. There are also tests for nominal, ordinal, and interval variables. The chi-square test is a well-known example of a significance test.

Statistical inference requires a clear definition of the population to which the inference is applied. It also requires detailed knowledge of the sampling procedure. Statistical inference may be rather difficult (or even impossible) for some sampling techniques. While many sampling procedures are in use in the social sciences, statistical inference is possible only if data come from a probability sample (a simple random sample, a stratified random sample, a clustered random sample, or a systematic random sample). Nonprobability samples (such as volunteer samples, convenience samples, purposive samples, quota samples, or snowball samples) require adjustments.

Deviations from the probability sample requirement are quite common in political science. Researchers may, for instance, employ a coincidence sample consisting of all countries included in some publicly available database. Scholars also may have data on all relevant cases (e.g., on all states in the United States or on all EU countries). Then no sampling procedure has been involved in producing the data. Classical statistical inference is often criticized or abandoned in these situations. Bayesian inference is nevertheless possible and provides an alternative that is becoming increasingly popular. Yet another advantage of Bayesian inference involves the use of prior beliefs about parameters—for example, knowledge of historical election results may help us make predictions about future elections.

STATISTICAL ANALYSIS AND THE SOCIAL SCIENCES

All social science disciplines have been placing more and more emphasis on quantitative methods in recent decades. There are several reasons for this. First, research itself has taken on a more quantitative orientation. This is evident in published works as well as in the training of social scientists. Second, the computer revolution has made more quantitative data easily available. Survey data, for instance, are now routinely deposited in online data archives that often also offer rudimentary tools for online data analysis.

Finally, developments of computers and software applications make statistical methods faster, cheaper, more flexible, and more easily available than ever before. Whereas statistical analysis of quantitative data is the mainstream of empirical social science, it exists along with other respected methodological approaches such as interviews, participant observation, comparative historical methodology, the study of documents, ethnomethodology, and conversation analysis. There also exist established techniques to investigate qualitative information (text, picture, video) produced by these methodologies.

Stokes, Donald

Donald E. Stokes (1927–1997) was an American political scientist who was a specialist in public opinion research. He was known for his studies of voting behavior in the United States and Great Britain.

Stokes was born in Philadelphia, Pennsylvania. He received a bachelor's degree from Princeton University in 1951 and earned his doctorate from Yale University in 1958.

He was on the faculty at the University of Michigan from 1958 to 1974. During that time, he served as chair of the political science department (1970–1971) and dean of the university's graduate school (1971–1974). He then moved to Princeton as dean of the Woodrow Wilson School of Public and International Affairs in 1974. He left the deanship in 1992 but remained the Class of 1943 University Professor of Politics and Public Affairs at Princeton until his death. He also taught as an associate member at Nuffield College, Oxford, and as a visiting professor at the University of the West Indies and the Australian National University.

Stokes' book, *Political Change in Britain* (1969), written with David Butler, received the Woodrow Wilson Prize from the American Political Science Association, awarded to the year's best book on political science. Using the behavioral approach to election studies, they found that political generation (the era in which one was born) and "duration of partisanship" predict party identification; that is, the longer that one has identified with a political party, the more likely that person is to vote for that party. They also found that party identification, initially transmitted by one's parents, may change under the impact of historic events. Stokes was also the coauthor of two other books on American and British voting behavior: *The American Voter* (1960) and *Elections and the Political Order* (1966). A second edition of *Political Change in Britain* was published in 1974. He and David Butler originated the British General Election Studies in 1964 and Stokes continued to direct them until 1970. Stokes, with Donald Aitkin and Michael Kahan, conducted the Australian National Political Attitudes Studies (1967, 1969). In later years, Stokes' interests turned to the science policies of the federal government and the relationship between basic and applied science. He was principal author of *The Federal Investment in Knowledge of Social Problems* (1978), and *Pasteur's Quadrant: Basic Science and Technological Innovation* (1997) was published posthumously.

Stokes was a Senior Fulbright Scholar to Great Britain, a Fellow for the Social Science Research Council, a Fellow of the Guggenheim Foundation, a visiting research fellow at the Royal Institute for International Affairs, and a fellow for the American Association for the Advancement of Science.

Stokes died from acute leukemia on January 26, 1997, in Philadelphia.

Stolper–Samuelson Theorem

As presented in the original 1941 article by Walter Stolper and Paul Samuelson, the theorem postulates that the imposition of an import tariff by a small nation leads to an increase in the real income of the scarce production factor of that nation and to a reduction in the real income of the abundant factor. Factor abundance depends thereby on the relative endowments of the production factors (e.g., capital to labor ratio) in one country compared to the other. However, in the literature the theorem is usually understood as referring more generally to the linkages between international trade, goods prices, and factor prices. It is one of the cornerstones of the Heckscher–Ohlin model as presented by Bertil Ohlin in 1933, which is the central model in neoclassical theory of international trade.

The theorem essentially explains the linkages between changes in the relative prices of goods caused by trade policy interventions, on the one hand, and changes in the absolute income levels of the different production factors, on the other. These linkages between prices and remunerations depend on the factor intensities of the goods. The theorem is based on the assumptions of the Heckscher-Ohlin model, including homogeneous goods and production factors, general equilibrium, interindustry factor mobility, international factor immobility, and full employment (before and after a trade policy intervention). In the case of an imposition of an import tariff, it has been demonstrated that the increase of the income of the scarce factor exceeds the price changes of *both* goods and that, therefore, the postulated income effect is independent from the consumption pattern of the owners of the factor. In other words, changes in the relative prices of goods cause even greater effects on the income distribution of the trading nation.

The Rybczynski theorem, as published by Tadeusz Rybczynski in 1955, is the counterpart of the Stolper-Samuelson theorem, linking factor quantities to goods quantities. The Rybczynski theorem postulates that an increase in the

endowment of one production factor in a nation leads to an absolute increase in the production of the good intensive in that factor and to an absolute reduction in the production of the other good.

From a political economy point of view, the relevance of the Stolper-Samuelson theorem lies in the fact that it helps to identify winners and losers of trade liberalization or protectionist policies. For example, if we consider a developing country with a relative abundance of land and unskilled labor (and a relative scarcity of capital and skilled labor) with an initial set of protectionist policies in place, the theorem predicts that trade liberalizing policies will be supported by the land owners and trade unions because of the expected effects on their respective real incomes. The opposite would apply in the case of a "developed" country characterized by a relative abundance of skilled labor and capital. The theorem contributes thus also to an understanding of the relationships between trade openness, or economic globalization, and the international and within-country distribution of incomes.

Although the prescriptions of the theorem may seem plausible, altering underlying assumptions might lead to different conclusions. If, for example, there is imperfect within-country factor mobility like in the specific factors model, as posited in the work of Ronald Jones in 1971, Wolfgang Mayer in 1974, and J. Peter Neary in 1978, interests may be organized—in support or against certain trade policy measures—by industries or regions, rather than in the traditional way as implied by the theorem.

Strategic Interest

Strategic interest is, by definition, a highly contextual notion reflecting the preferences of the actors involved in politics or in policy. Simply put, a strategic interest implies the preference or a set of preferences that are considered crucial by a specific actor. An actor's interests will define its actions.

Strategic interests will prescribe its behavior. Yet, as this definition makes it clear, each actor has different interests and values differently each option to fulfill its goals therefore emphasizing different key enablers for its policy.

Scholars of international relations have developed analytic tools to model strategic interactions. *Game theory* is a branch of mathematics concerned with predicting bargaining outcomes. It assumes that actors are rational and that they perform cost-benefit analyses. The different games capture the fundamental dynamics of various bargaining situations. The results of the analyses depend on the preferences that actors are assumed to have about outcomes. Preferences ultimately depend on the identification of the actor's strategic interests.

The identification of strategic interests is at the core of theories of negotiations, conflict resolution, foreign policy, and coercion. A successful bargaining process implies knowledge of what the other party treasures and what scares it. This provides a range of interests that, when combined with ours, describes a zone where a possible agreement can be met by both parties. Strategic interests are those interests beyond which no agreement can be found. Alternatively, the identification of the enemy's strategic interest and its denial also allows coercing it into an agreement or capitulation.

In theories of international relations, interests are considered by the materialists as coming from the power structure of the international system. For the realists the distribution of material capabilities defines a state's interests. For the neorealists, the ultimate strategic interest is survival; for the classical realists, it is power. For the latter, strategic interests are those that allow power projection or deny others the ability to do so. These can be territories, allies, or technology. For sociological approaches, interests come from ideas and cultural contexts. Also, interests are not limited to states but can stem from domestic groups or be influenced by international actors. Strategic interests are here conceived as those that are essential for the maintenance of the actor's values. The major limitation of these two approaches is that they are one-sided. Not only do they assume that interests are determined unilaterally by power or norms but they are also mutually exclusive.

The relationship among interests, identity, and power is best conceived as reflexive, each feeding back one upon the other. Adopting this understanding implies that strategic interests can evolve with time and that a dynamic approach to the analysis of strategic interest must be adopted. This can be done by adopting a two-level game of analysis. This concept was coined by Robert Putnam (1988), and it implies that state's strategic interests are the result of both the domestic and the international environment. A state must make a cost-benefit analysis that ultimately depends on the maximization of its utility at the domestic and international level.

Strategic Voting

Strategic voting (also referred to as *tactical voting*) describes the decision-making process of individuals who fail to express their true preferences at the ballot box in order to prevent their least preferred candidate from winning an election. It assumes that individuals maintain a level of knowledge about others' voting preferences and a candidate's probability of winning. This type of voter behavior is often studied in primary elections and first-past-the-post electoral systems where only one candidate can secure the party's nomination or has the opportunity to take office. It is thought that such situations force voters to examine the viability of their preferred candidate's electoral success and vote in a way that maximizes their individual preferences while minimizing the potential for their least preferred candidate to achieve electoral success. Most models of strategic voting incorporate rational choice theory to explain if such tactical voting behavior exists, how it works, and when it is employed in the electoral process. Tactical voting is difficult to observe and measure because it requires both the knowledge of genuine voter preferences as well as the actual voting behavior. While survey research provides empirical evidence for the latter, the former is often unknown. For these reasons, scholars of voting behavior disagree about the presence, impact, and extent of strategic voting.

Strategy, Military

Strategy is the art of utilizing military power or its threat to achieve political objectives. War can be analyzed at four different levels. At the political level, sometimes called *grand strategy,* a state's political goals—which ultimately aims at guaranteeing its survival—are defined as well as the means—which extend beyond the military dimension—for pursuing them. The strategic level then translates the political ends into military objectives. The operational level attains the military goals by the conduct of military campaigns and operations. Finally, the tactical level describes how battles and engagements are to be conducted.

FIRST GENERATION: CLASSICS

Strategy does not evolve in a vacuum. It is influenced by political, social, economic, and technological context. Throughout history different generations of strategic thinking can be delineated. The first generation is the classics. Sun Tzu's *The*

Art of War is one of the most influential texts on strategy and was written around 500 BCE. Its main argument is that the purpose of the art of war is not to win victories but to achieve military objectives by the least costly means. This must be done by targeting the adversary's will and morale. For Niccolò Machiavelli, war is inevitable because the major goal of policy makers (as stated in 1532's *The Prince*) is to conquer and to maintain power. Strategy must therefore aim at defeating the adversary as quickly as possible through decisive battles. Carl von Clausewitz is probably the most often quoted strategic thinker, not the least because he famously acknowledged that war is the continuation of politics by other means. He also made the distinction between absolute and limited wars and often was misinterpreted—not the least by the German general staff prior and during World War I (1914–1918)—for arguing for the former. He thus became known as the apostle of total war. For Clausewitz, the use of force should be aimed at destroying the enemy's center of gravity. The Swiss general Antoine-Henri de Jomini defined much of the vocabulary of contemporary strategic through principles such as *decisive points* or *interior lines.* Jomini's focus on the importance of the logistics has had a strong influence on American strategic culture.

SECOND GENERATION: BY SEA AND BY AIR

The second generation covers the nonterrestrial dimension of strategy: maritime and air power strategies. Alfred Thayer Mahan argued that state's power depended on its ability to coercively control sea lanes and maritime commerce (command of the sea). Sir Julian Corbett saw the merits of naval power in its ability to project forces ashore via amphibious operations and to keep war limited. Giulio Douhet and William Billy Mitchel extrapolated from the experience of the First World War and argued that strategic bombing in the future was likely to be so effective that the need for armies and navies would strongly be reduced. For Douhet, air power would have the most important impact by targeting civilian populations in cities, while Hugh Trenchard, Alexander de Seversky, and the Air Corps Tactical School argued for destroying the industrial centers of the enemy.

THIRD GENERATION: DISLOCATION

The third generation, called the *indirect school of thought*, revived the ideas of Sun Tzu that aimed at the dislocation of the adversary rather than its physical destruction. Basil Liddell Hart and John Fuller focused on the technology developed in the First World War for restoring mobility and achieving decisive effects on the battlefield. Liddell Hart's *indirect approach* argued for using deception and maneuvers supported by tanks with close air support to induce a state of strategic paralysis. The German *blitzkrieg* and the Russian concept of *deep battle* built on these assumptions. A second group of strategists theorized *peoples' wars* and irregular warfare. Mao Zedong's *On Guerrilla Warfare* (1937) argued for avoiding costly pitched battles by securing the support of the people through a sustained campaign to win hearts and minds. Che Guevara

developed ideas for guerrilla actions by an insurgent vanguard to foster revolutions while Carlos Marighella suggested urban guerrilla could achieve the same goal. As a reaction to these revolutionary thinkers, counterinsurgency theorists such as Robert Thompson or David Galula argued for securing the support of the population and undermining the legitimacy of the insurgents. These approaches have recently impacted American strategic thinking.

FOURTH GENERATION: NUCLEAR

The fourth generation, developed during the cold war, addressed the problem of nuclear strategy. Unlike previous generations, these strategists did not come from the military but from academia, and include Thomas Schelling, an economist, Albert Wohlstetter, a mathematician, and Herman Kahn, a physicist. They used game theory and developed models to prevent and deter the use of nuclear weapons. Their key contribution was to emphasize the use of threats rather than actual violence to achieve political objectives. It follows that deterrence relied on the idea of securing a second strike capability so as to guarantee the threat of retaliations.

FIFTH GENERATION: GLOBALIZATION

The fifth generation, developed after the cold war, addresses the challenges of globalization. The 1991 Gulf War ushered for some a "revolution in military affairs." Developments in technology, notably the fusion of standoff firepower and networked information technologies, made it possible to overcome Clausewitzian fog and friction thereby increasing operational effectiveness by striking at an adversary's center of gravity. John Warden III's depiction of the enemy as a system of concentric rings, together with John Boyd's recommendations of getting inside the enemy's decision cycle (OODA loop), provided a renewed interest in the strategic use of air power through the conduct of effects-based operations. In reaction to this technological and U.S.-centered approach, asymmetric strategies were developed. They sought to avoid direct military confrontations through economic or network warfare, the exploitation of international law or morale, and even terrorism. Terrorism since 9/11 has been at the center of strategic thought.

Though some strategists have tried to impose enduring rules and principles, the character of strategy remains fluid and reflects the dimension of the time, while the nature of strategy is fixed. Strategy is about the use of military power or its threat to deny the adversary's strategic goals. Thus strategy can affect the opponent's capability and will—and hence convince it to accept a political outcome that is acceptable to both parties.

Strauss, Leo

Leo Strauss (1899–1973) was a German twentieth-century political philosopher whose writings continue to echo through present-day debates on modernity and its prospects. Lamenting the onslaught by liberal relativism on tradition, customs, and moral principle, Strauss emphasized the message of ancient political philosophy as a remedy for the wastefulness and nihilism characteristic of the modern era. His work pitting modern reason against spiritual revelation has compelled many contemporary political philosophers and scholars to examine the role of classical political society in the nature of the state and to reevaluate the path to the "good life" prized by thinkers such as ancient Greek philosophers Plato and Aristotle.

Strauss was born in Hesse, Germany, in September 1899. Growing up Jewish in Weimer Germany, he struggled with the fraught status of his religion in a society that vilified it. He immersed himself at a young age in the philosophy of another Jewish thinker, Baruch Spinoza, while also grappling with the atheism espoused in the philosophy of fellow German theorists Friedrich Nietzsche and Martin Heidegger. Not satisfied with modernity's supposed refutation of orthodoxy, Strauss, in his formative years at the Gymnasium Philippinum and the University of Hamburg, abandoned his political Zionism for the Islamic Aristotelianism of Muslim philosopher Abu Nasr al-Farabi.

This point marked the transition for Strauss toward the philosophic way of life understood in the Platonic sense. Defending the tradition of ancient philosophy against radical historicism and modern claims to natural rights, Strauss began to wrestle with what he would later articulate to be the conflict between "Jerusalem and Athens": the tension between the

revelation of biblical truths and the primacy of reason for the Greeks. Motivating his research was the belief that he had been unlucky enough to be born in a period of civic decline where man's path to the truth—indeed, his understanding of his permanent place outside of his temporal existence—was inhibited by modern superficiality. Strauss saw the need to return to classical philosophy's message of knowledge that transcended its place in Greek society and conveyed a message of truth for all generations.

Strauss led a mostly itinerant life while in Europe until the late 1930s when he moved to the United States with his wife, Miriam Bernsohn. After teaching a number of years in New York City, he spent the bulk of his academic career at the University of Chicago, where he lectured for twenty years on political philosophy prior to two brief stints at Claremont McKenna College and St. John's College. During this period he produced a number of critical commentaries, including *What Is Political Philosophy? And Other Studies* (1959) and *Liberalism, Ancient and Modern* (1968). His pupils included a number of prominent future intellectuals, such as philosopher Allen Bloom and political author Harry Jaffa, as well as former deputy secretary of defense Paul Wolfowitz. Many of his followers and former students credit him today for his novel impact on how political philosophy should be read and studied in the modern era. He died in October 1973 of pneumonia.

Straussianism

Leo Strauss was born and educated in Germany. Fleeing from the Nazis in the early 1930s, he emigrated first to England and then to the United States. He was a professor of political philosophy at the New School for Social Research until Robert Maynard Hutchins brought him to the University of Chicago in 1948.

More than most thinkers of the twentieth century, Leo Strauss polarized his audience. One was either for him or against him, influenced by him or repelled by him. Thus has arisen the phenomenon, nearly unique among the twentieth century's academic thinkers, of a recognized group of followers, called *Straussians.* Where and when the label arose, and what exactly it means, are uncertain. It seems originally to have been a label invented by the opponents of Strauss and applied to individuals who had studied with or were manifestly influenced by him.

Over time, and somewhat reluctantly, the label has been accepted by many if not all of those to whom it has been applied.

The label was originally proposed in a spirit of enmity because it was intended to suggest, at the extreme, something like a cult, or, more moderately, a group with a unified set of views, views that were decidedly not those of mainstream academics in the fields of political science or philosophy. It was meant, in other words, to designate an "unorthodox orthodoxy."

That original attribution of unity of outlook has since given way to recognition that little such unity exists. The so-called Straussians have broken into different, sometimes warring, camps and to a discerning eye embody much less unity of viewpoint than, say, rational choice theorists or international relations realists in political science.

Indeed, it is now a question, as it always was, whether there is any real content to the label *Straussian.* Contrary to what is often said, those who have followed Strauss are far from single-minded in what they take from him, except perhaps for some threshold or methodological commitments: that philosophy is important; that political philosophy is a viable enterprise; that philosophic texts must be read in a particularly attentive manner; that the distinction between ancients and moderns means something, although what it means is not clear or universally agreed upon. To this list of common characteristics must be added a self-conscious orientation toward, but by no means comprehensive agreement with, Strauss himself. A Straussian then is one who works to a degree that cannot be entirely specified within a framework of Strauss's questions and chief concepts, and, if the scholar in question is concerned with textual studies, deploys Strauss's methods of close reading.

According to these very loose criteria, the number of Straussians is quite large and the studies they pursue extremely diverse and varied in character. The large number and the diversity of subject matter make it quite impossible to canvass or catalogue the universe of Straussians, but there are several major lines of cleavage discernable among them. These lines of cleavage often are characterized in terms of East Coast and West Coast, and even Midwest, Straussians. This classification serves some rough and ready purposes, but it is probably more revealing to identify the actual substantive disagreements. Straussians disagree, for example, on how to read Plato's *Phaedrus* or how to understand Locke. They disagree over whether the U.S. Supreme Court is a good or bad political institution. More significant, however, are a series of disagreements that are closer to the core of Strauss's own thinking. These disagreements arise as a result of certain puzzles in Strauss's thinking concerning the status of religion, the status of morality, and the status of modern liberal democracy.

What is perhaps most striking at the end of the day is how diverse the Straussians are. Strauss himself worried that schools were dangerous things for philosophy for they were breeding grounds for dogmatism. Among the Straussians it would be fair to say that intellectual vigor and disagreement are more apparent than hardening of the intellectual arteries. This result is largely the outcome of Strauss's way of presenting

his thought. To the chagrin of the professionals, he left much unsaid and thus left ambiguities and puzzles. His aim was not to transform the world, but to understand it, and to encourage the young, the ones he called "the puppies of the race," toward philosophy. The vibrant disagreements among the Straussians are testimony to the degree to which he succeeded in not inspiring a set of dogmas and orthodoxies that would strait-jacket those who follow him.

Structural Adjustment Program (IMF)

Structural adjustment programs are conditional loan programs that have been provided by the International Monetary Fund (IMF) and other donors to developing countries with the goal of addressing underlying problems in national economies that cause persistent balance-of-payments problems. Structural adjustment loans are programmatic in nature and do not finance specific projects but rather support policy reform. Conditions attached to the loans specify the reforms that the IMF expects governments to implement. The IMF and the World Bank widely used these programs in the 1980s and 1990s but then replaced structural adjustment lending with poverty reduction lending in the late 1990s.

THE ORIGINS OF STRUCTURAL ADJUSTMENT LENDING

The oil shock of 1979 and 1980 and the subsequent recession in the industrial world led to increasing costs of imports and decreasing earnings from exports for many developing countries, resulting ultimately in significant balance-of-payments difficulties. In 1980, the World Bank introduced the *structural adjustment loan* to help developing countries reduce their current account deficits and undertake policy reforms that presumably would lead to better underlying macroeconomic fundamentals.

The IMF traditionally used *stand-by arrangements* to help countries address short-term balance-of-payment problems, but these agreements were not designed to address recur-ring problems. In 1974, the IMF began using the *extended fund facility (EFF)* to respond to medium-term balance-of-payments problems requiring economic policy adjustment. Use of the EFF increased markedly during the first half of the 1980s and represented the majority of fund activity between 1981 and 1983. In 1986, the IMF introduced the *structural adjustment facility (SAF).* SAF loans were available to low-income member countries and featured reduced interest rates. In 1987, one-third of new programs were structural adjustment programs; the proportion increased to one-half in 1988. In 1987, the IMF introduced the *extended structural adjustment facility (ESAF),* which aimed to support "especially vigorous" medium-term adjustment programs and relied on extensive conditionality. In 1989, combined structural adjustment lending represented 38 percent of the value and 65 percent of the number of total active IMF programs. From 1987 to 1999, structural adjustment programs accounted for more than 50 percent of all ongoing IMF programs, although because of their smaller size, they amounted to only 18 percent of ongoing IMF commitments.

GOALS OF STRUCTURAL ADJUSTMENT

As observed by the academic Tony Killick in 1998, the IMF's structural adjustment programs typically aimed to accomplish three types of policy change: to increase the role of markets and private enterprise relative to the public sector; to improve the efficiency of the public sector; and to mobilize new domestic resources. Common conditions in structural adjustment loans included the reduction or elimination of agricultural or petroleum subsidies and price controls; the privatization of public enterprises; the reduction of government expenditures; trade liberalization; and reform of the financial sector. These market liberalizing policies came to be known as the *Washington Consensus*.

PROBLEMS WITH STRUCTURAL ADJUSTMENT

The specific content of reform programs was supposed to be negotiated between the IMF and the aid-receiving country. However, critics of structural adjustment viewed the reform conditions as too uniform across countries and critiqued the IMF for failing to consider the distributional consequences of the policies. In particular, structural adjustment reforms often left the urban sector worse off, making the policies politically difficult to implement.

Countries that entered structural adjustment programs tended not to graduate from them. Following a first structural adjustment loan, there was an 80 percent chance that a country would enter an additional program; following six structural adjustment loans, the probability of an additional loan remained 80 percent. Over a dozen developing countries spent more than two-thirds of the 1980s and 1990s in an IMF structural adjustment program.

Yet countries in structural adjustment programs did not show improvement in their budget deficits, current account deficits, inflation rates or other macroeconomic indicators. In

general, countries in IMF programs appear not to have experienced as much economic growth as they would have in the absence of the IMF program. Recognizing the problems with structural adjustment programs, in 1999, the IMF transformed the ESAF into the *poverty reduction and growth facility*. This instrument puts increased importance on government participation in the design of the program and on both poverty reduction and growth-oriented outcomes, although some critics see it simply as continued structural adjustment lending.

Structural Equations Model (SEM)

A *structural equations model* is a representation of a set of relationships among constructs and between those constructs (or latent variables) and their indicators (or observed variables). The first component is the *measurement model,* which is constituted by the relationships between latent variables (or constructs) and their respective indicators. In contrast to linear regression, which assumes no-measurement error, *structural equations modeling (SEM)* can model this type of error, and it can be analyzed. The second component is the *structural model,* which constitutes the set of relationships among latent variables (similar to relationships in linear regression). SEM, which is a second-generation statistical technique, allows for the opportunity to simultaneously test the measurement and structural models (see Figure 1).

Two of the main SEM techniques are covariance-based SEM and partial least squares. Covariance-based SEM, as implemented in LISREL, AMOS, or EQS software, minimizes the differences between the observed and calculated values in the covariance matrix. A formal specification of a structural equations model is given by the following three equations (Bollen, 1989):

$$\eta = B\eta + \Gamma\xi + \zeta \text{ (structural equation for latent variable model)}$$

FIGURE 1: A GENERIC EXAMPLE OF A STRUCTURAL EQUATIONS MODEL
$$x = \Lambda_x\xi + \delta \text{ (measurement model—exogenous variables)}$$

$$y = \Lambda_y\eta + \varepsilon \text{ (measurement model—endogenous variables)}$$

Where:

η = latent endogenous variables

ξ = latent exogenous variables

ζ = latent errors in equation

B = coefficient matrix for latent endogenous variables

Γ = coefficient matrix for latent exogenous variables

y = observed indicators of η

x = observed indicators of ξ

ε = measurement errors for y

δ = measurement errors for x

Λ_y = coefficients relating y to η

Λ_x = coefficients relating x to ξ

A *latent variable* is a construct not observable or measured directly, but is indirectly measured through observable variables (indicators). The relationships among constructs are sometimes referred to as *paths,* and the use of path diagrams to graphically depict SEM models is a common practice. In addition, one of the advantages of SEM is the possibility of assessing both direct and indirect effects among constructs.

The adequacy of a covariance-based SEM model can be assessed in two important ways. There are several overall model fit measures, which evaluate the plausibility of the model as a good representation of the actual covariance values that exist among the variables. Some examples are chi-square, adjusted goodness of fit index, goodness of fit index, and normed fit index. Also some specific measures can assess the structural and measurement models. For the measurement model, the size and statistical significance of loadings are the most important ones. For the structural model, the size and statistical significance of path coefficients and the size of the coefficients of determination (R-squares) should be examined.

Structuralism

Structuralism is a theoretical and methodological perspective, often combined with functionalism, and employed in the social sciences. At the foundation of the perspective is the assumption that society is a system with distinct parts interlinked and positions determined by the overall structure itself. Generally, linguist Ferdinand de Saussure (1959) is credited as the first structuralist, but the method and the perspective soon spread to sociology, anthropology, psychology, and then literature and even architecture.

ORIGINS AND SPREAD

In the social sciences, the theory began with the argument that meaning itself was structurally embedded in activities as diverse as preparing food to highly ritualized dances. That is, symbols themselves are organized into systems that permeate the actions, attitudes, and physical organization of a group. The goal would be to uncover the deep structural meanings of each symbol through ethnographic analysis, including such practices as objective observation, interview, and perhaps even participant observation. Thus, modes of behavior often taken for granted by those participating in them are actually indicative of latent structures that provide meanings unobtainable by the outsider.

Taking from the linguists, social scientists often have asserted the importance of binaries for organizing social life. Believing that the mind itself is dichotomized, innate distinctions between night-day or male-female manifest themselves in the actual ways humans divide their own world, the classifications they derive, the taboos the create, and the rituals they employ. Others, such as anthropologist Mary Douglas (1970) have gone so far as to argue that certain ubiquitous features of human societies must be derived from sharing the same neuroanatomy. For instance, the color red signifying danger becomes embedded in the structure of society through stop signs and warning lights or signs.

Take for instance anthropologist Claude Levi-Strauss's work on kinship (1969). The question asked by many anthropologists is what function did kinship have for early hunter-gatherer groups; moreover, what was the structural meaning behind exogamous kinship systems. The answers to this question had been relatively diverse ranging from a method of preventing incest to the classic women-as-property claim. Levi-Strauss argued it was actually a deeply embedded practice signifying the groups who considered themselves kin, even if fictively. Labeling his theory *alliance theory,* he saw the bride exchange that was often not a direct, reciprocal exchange as a deeply embedded practice signifying relationships, obligations, and expectations between two or more groups of people that were otherwise tacit to both the participants and the surface observer.

In sociology, structuralism was pervasive among the functionalists coming from the Parsonsian school and, to a lesser extent Robert Merton. Talcott Parsons constructed a grand social theory that was meant to incorporate all social phenomena within its proper place in the larger social structure. Dividing the social world into four dominant structures—analogized in his famous fourfold box within a box—Parsons assumed that every society, once large enough, would divide up the four most important tasks by creating four discrete structural entities. One structure would serve to set and mobilize others to meet societal goals; one interacted with the environment and worked to adapt the society to changes in the environment; one sought to integrate the disparate social units into a socially stable whole; and the other created, perpetuated, and disseminated a cultural pattern that generated a degree of conformity across society. While a static fourfold construction ensued, Parsons did not imply that there were truly just four structures, but that social phenomena fell into one category or the other—the economy was typically the system uniting the society with the environment while the polity is typically the structure concerned with goal attainment. Niklas Luhmann, a student of Parsons, was perhaps the last great structuralist in the social sciences positing a theory that organized society into three systems: the social system, the organizational system, and the interaction system. Each system was linked through symbolic systems that coordinated the flow of input and output across boundaries.

POSTSTRUCTURALISM

Over the course of the past forty years, structuralism has been relegated to an increasingly minor role in most disciplines. On the one hand, it was never able to satisfyingly defend itself against the critique that it ignored social change and was ahistorical. Structuralism, by definition, examines the unchanging elements coordinating meaning for a group of people, not the dynamics that drive these elements to change or reconfigure them. On the other, structuralism became a victim of the sociocultural context of the 1960s and 1970s, when tumult, feelings of change, and strong agent-based movements dominated the political, academic, and social scenes. Many aspiring social scientists and scholars in the humanities called into question the conservativism and determinism of structuralists, preferring new perspectives like poststructuralism, deconstructionism, and postmodernism. Pierre Bourdieu, in particular, argued that some structures were *structured,* while others were *structuring*—put another way, some structures were constraining while others were

better understood as processes that meant outcomes were not already determined. Structuralists tend to be deterministic in their theories of action, which they see as tightly constrained by structures embedded within the actor through the process of socialization. Conversely, the 1960s brought a wave of agent-based sentiment that argued that humans were being oversocialized by structuralism and that, in fact, humans, human nature, and society were much more malleable than structuralists conceded.

Student Politics

Student politics is a term encompassing a broad range of student behavior. It generally refers to collective student activity that aims at effecting political or social change. Most student movements and organizations falling under this heading, therefore, look "outward" at the political and social environment beyond the campus. But campus-directed activity aiming at university reform, like the influential 1918 student movement in Argentina, also may be included insofar as it is seen as having broader implications within the social and political context. While it's most significant historical manifestations have been leftist, student politics can be informed by any variety of political ideologies. It also can take place at any level of schooling, though postsecondary student politics has generally been most effectual and has received by far the most scholarly attention.

Scholars have pointed to numerous factors accounting for the propensity of students to engage in political activity, including the higher prevalence of idealism among youth; the critical atmosphere of the university and frequently liberal views of faculty; the generally permissive campus culture; the geographical concentration of individuals with similar interests and motivations; the tendency for universities around the world to be located in politically significant cities; and the free time afforded students, especially by schools based on the European model. Politically engaged students are more likely to come from affluent, educated backgrounds and are disproportionately concentrated in the humanities and social sciences. Scholars like Lewis Feuer (1969) have offered psychological explanations for student activism as well, though Feuer's theory of an oedipal "generational conflict" has found limited reception within the scholarly community.

However prominent it may appear at times, student politics is almost always a minority phenomenon, generally involving only a small segment of the student body, and tends to be concentrated in large, quality schools. The relatively limited prevalence of political engagement within the student body may be explained in part by other aspects of student life that are less conducive to sustained political activity. High student turnover and fluctuating student interests make it difficult to build durable student organizations, and universities with demanding examination schedules—like those in the United States—leave students little time for extracurricular endeavors. Additionally, a wide variety of apolitical extracurricular offerings—again more typical of the United States than the rest of the world—also may absorb a substantial amount of students' time and energy.

Scholarly interest in student politics was largely stimulated by the emergence of radical student activism in the 1960s in the United States and other Western democracies, notably the heavy involvement of students in the civil rights movement through the Student Nonviolent Coordinating Committee, the 1964 Berkeley Free Speech Movement, and the French student protests of May 1968. The roots of modern student politics go back much further, however. The first politically significant student organizations arose in Europe during the first half of the nineteenth century, particularly in the German *Burschenschaften,* and students played a significant role in the 1848 political upheavals in Germany and elsewhere.

With few exceptions and thanks in large part to state repression, however, student activity in the West had limited impact until the 1960s. The same was not true in other parts of the world, where the European university model had been introduced through imperialism. In European countries, student politics has historically played a much more prominent and influential role on the national stage. Thanks to the often extensive contributions of students during independence struggles, as in countries like Burma, India, Kenya, and Vietnam, student politics was entrenched as an important part of the political scene; after independence there, students played a key role in modernization. Consequently, students tend to garner more respect in these countries, which increases the likely effectiveness of their activities and compels the government to take them seriously. The impact of student actions has occasionally been huge—for instance, toppling the government of Adnan Menderes in Turkey and forcing the resignation of Prime Minister Nobusuke Kishi in Japan in the 1960s,

and causing major political disruption in Burma and South Korea in the late 1980s, to name only a few examples.

Many scholars have commented on the decline of student activism since the 1960s, particularly in the West, though the perception of this trend may be influenced by fluctuating coverage in the mainstream media. A notable resurgence, however, was stimulated by the growth and significant achievements of international antiapartheid campaigns focusing on campus divestment in 1984 and 1985. Several factors may, however, have made it difficult for students to undertake the campaigns of old. In the United States, the large-scale struggles for civil rights and against the Vietnam War (1959–1975) during the height of student activism have given way to a "new localism," favoring small-scale and pragmatic campaigns that are less combative tactically and often tied to the interests of particular groups. Multiculturalism and postmodernism have become major forces on campuses, and under their influence student organizations have split into smaller and smaller pieces, with more targeted (and thus smaller) membership. Certain issues like antisweatshop activism, however, may provide new opportunities for broad-based campaigns. Internationally, student movements have become harder to situate ideologically, finding a middle ground between capitalism and communism in China and eastern Europe and allying themselves with religious fundamentalism in parts of the Islamic world.

Subaltern Politics

Subaltern politics refers to the political activity of subaltern social groups (i.e., the political activity of subordinated and marginalized social groups). The concept originated in the work of the Italian socialist and political theorist, Antonio Gramsci, who developed the concept to describe, categorize, and analyze the activity and conditions of social groups that lack relative political power with respect to ruling social groups. Since the publication of some of Gramsci's writings on subaltern groups in English in the 1971, there has been growing interest in subaltern themes across the humanities and social sciences. The most notable achievement in this regard is the publication series *Subaltern Studies,* which has developed subaltern studies into a recognizable mode of analysis and scholarship.

ANTONIO GRAMSCI AND THE CONCEPT OF SUBALTERN SOCIAL GROUPS

While incarcerated by Mussolini's fascist regime, Gramsci undertook a massive study of Italian political history, culture, and society, which he recorded in what are known as his *prison notebooks.* Out of his twenty-nine prison notebooks, Gramsci devoted a single notebook, Notebook 25, to the analysis of subaltern groups, which he titled "On the Margins of History: The History of Subaltern Social Groups." Gramsci perceived that the history of subaltern groups was largely unwritten or was "on the margins of history." Gramsci's notes on subaltern groups mainly address issues specific to Italian history, such as the slaves of ancient Rome, various religious groups, women, different races, the *popolani* (common people) and *popolo* (people) of the medieval communes, the bourgeoisie prior to the Italian Risorgimento, and workers and peasants in the early twentieth century.

In Gramsci's view, spontaneity characterized modern Italian subaltern politics, largely because the subordinate masses engaged in rebellions, revolts, uprisings, and brigandage in response to their unacceptable conditions but were incapable of permanently transforming their circumstances. To overcome their subordination, Gramsci argued that it was necessary for subaltern groups to achieve political autonomy from dominant social groups in a struggle for hegemony (i.e., to struggle for intellectual, moral, and political leadership). In Gramsci's conception of hegemony, dominant or ruling social groups maintain political power through coercion and accommodation, in which dominant social groups suppress the political ascent of subaltern groups or attempt to incorporate their demands into dominant political formations. A contributing factor, in this regard, is the formation and articulation of dominant ideology and culture. If dominant intellectuals portray subaltern groups as backward, inferior, abnormal, or psychologically mad, and subaltern groups accept those views, the root causes of subalternity become obscured, ignored, or hidden from history. This in turn negatively affects the capacities of subaltern groups to address the core aspects of their subordination. Thus, Gramsci argued that spontaneity was inadequate for subaltern politics and that the struggle for hegemony required organization, planning, and the cultivation of critical consciousness.

THE DEVELOPMENT OF SUBALTERN STUDIES

Prior to the 1980s, subaltern politics received relatively little intellectual focus. The notable exception to this generalization is the work of the British historians Eric Hobsbawm (1965) and Edward P. Thompson (1966). Although they did not directly rely on the concept of subaltern politics, their works examine "history from below" by focusing on the political agency of subordinated social groups. Ranajit Guha and the small group of English and Indian historians who founded the publication series *Subaltern Studies* are largely responsible for introducing the themes of subaltern politics into current intellectual discussions. In 1982, the *Subaltern Studies* editorial collective published its first volume of the series, which was devoted to writings on South Asian history and society. Guha acted as the principal editor of the series from 1982 to 1988 and edited the first six volumes, and to date, the editorial collective has published twelve volumes. In addition, Oxford University Press published *Selected Subaltern Studies* (1988), which includes a selection of the seminal essays from the series and a preface by Edward Said, and Minnesota University Press published *A Subaltern Studies Reader, 1986–1995* (1997), which includes some of the most influential essays from the series.

The initial focus of *Subaltern Studies* drew from Gramsci's work in attempt to reclaim the politics of the people in South Asian history, which elitist historiography tended to ignore. In the preface to *Subaltern Studies I,* Guha states that the aim of the series "is to promote a systematic and informed discussion of subaltern themes in the field of South Asian studies, and thus help to rectify the elitist bias characteristic of much research and academic work in this particular area." According to Guha, "The word 'subaltern' in the title stands for the meaning as given in the *Concise Oxford Dictionary,* that is, 'of inferior rank,'" and the term is used "as a name for the general attribute of subordination in South Asian society whether this is expressed in terms of class, caste, age, gender, and office or in any other way." However, in contrast to the Gramscian notion, Guha works from the basic assumption that subaltern politics operate in an "autonomous domain" that exists independently from elite politics. This contradiction was pointed out by Suneet Chopra (1982), which prompted a discussion that highlighted the differences between Gramsci's conception of subaltern politics and the understanding developed by *Subaltern Studies.* David Arnold, a member of the *Subaltern Studies* editorial collective, provided further context to the discussion by examining the application of Gramsci's ideas to the study of the Indian peasantry (1984).

"CAN THE SUBALTERN SPEAK?"

In her article "Can the Subaltern Speak?" Gayatri Chakravorty Spivak provides one of the most influential essays on subaltern studies published to date. Spivak considers Guha's approach to rewriting Indian colonial history from a subaltern perspective "essentialist and taxonomic," because it defines the subaltern "as a difference from the elite" and requires one to not only know the consciousness of subaltern groups but also requires one to represent that consciousness. This is illustrated in the fact that the subalternists rely on British, nationalist, and colonialist records to research and validate their work. Spivak reinforces Gramsci's position by maintaining that subaltern groups leave little or no traces of their existence within elite, colonial documents, and if the subaltern are represented at all, they are represented as the "other" within dominant, elite ideology. It is in this sense that the subaltern cannot speak, according to Spivak, because representations of the subaltern are embedded within dominant discourse, which does not present the subaltern's perspective.

Despite its criticisms, *Subaltern Studies* has largely achieved its goal of reclaiming the "politics of the people" from the confines of elitist and nationalist historiography. The hundreds of books and articles that drew on *Subaltern Studies* made a significant impact in the 1990s, and its influence reached beyond India and South Asia. Its focus on nonelite, subaltern history encouraged the founding of the Latin America Subaltern Studies Group in 1993 and the analysis of subaltern history in Africa, Ireland, the Middle East, and the United States. Today the term *subaltern studies* no longer refers exclusively to the publication series launched by Guha but encompasses a recognizable mode of investigation in cultural studies, literature, sociology, anthropology, and history that focuses on marginalized members of society and often is linked closely with postcolonial studies.

Subsidiarity

Subsidiarity is the principle that policy making should be taken at the lowest capable level of government. The term gained political prominence in the 1990s when it became a central operating principle of the European Union (EU). It was cited in the Treaty on European Union (1992) to clarify the policy-making balance between the EU and its member states.

The term originated in Catholic social thought. It was cited in the 1931 Papal Encyclical *Quadragesimo Anno,* which suggested that higher organizations should restrict their activities to those that individuals, families, and smaller social units do not have the capacity to undertake. Politically, proponents have traced the meaning of and justification for subsidiarity to Aristotle and Alexis de Tocqueville. It is defended on the grounds that people have a right to self-determination and that they can better hold officials accountable at lower levels of government.

Subsidiarity became an important concept within the EU as a result of the rapid shift of power from member states to the EU. While integration efforts were initially an elite-driven process focused on removing barriers to trade, over time the EU has moved into social and political policy areas, raising public awareness. Moreover, under the 1986 Single European Act, the member states moved from unanimous voting to qualified majority voting in the Council of Ministers on a number of issues, which meant that individual states could no longer veto legislation. This led to talk of a democratic deficit and to fears that citizens would lose their ability to influence decision making and preserve their cultural diversity.

Under the Treaty on European Union, the member states agreed to widen further the competence of the community and the scope for qualified majority voting. To reassure the public and some member countries, the EU explicitly incorporated the principle of subsidiarity into the treaty. The preamble of the treaty states that decisions will be taken "as closely as possible to the citizen, in accordance with the principle of subsidiarity." Article 3b of the treaty explains that under this principle, in any areas that do not fall within its exclusive competence, the European community should take action, "only if and in so far as the objectives of the proposed action cannot be sufficiently achieved by the Member States and can therefore, by reason of the scale or effects of the proposed action, be better achieved by the Community." Subsidiarity affects areas in which the EU and member states have concurrent competence, including health, consumer protection, culture, and education.

The Treaty on European Union was initially rejected by Danish voters in a 1992 referendum and was nearly defeated by French voters. This led the European Council to underscore the importance of subsidiarity in its annual summit in Edinburgh in December 1992. In a protocol on subsidiarity that was later incorporated into the Amsterdam Treaty of 1997, the council agreed that subsidiarity was binding on all of the community's institutions and could be adjudicated in the European Court of Justice. After passage of the Treaty on European Union, the European Commission reviewed, amended, and repealed some legislation in light of the subsidiarity principle.

While closely linked to ideas of federalism, subsidiarity is less an institutional arrangement than a set of procedures. It requires discussion of whether the powers that do not fall exclusively into the competence of the EU should be exercised by the commission or by member states. As such, it is a political decision. The term has generated considerable debate. Some view it as a means of protecting the sovereignty of national states and regions. Others argue that it interferes with the ability of the EU to integrate further and achieve its policy goals. Still others argue that it could lead to important powers being logically transferred to the EU as these could be more effectively dealt with at the supranational level. Analysts are divided on its usefulness. Some suggest that its definition is too vague, while others see it as crucial to the legitimacy of the EU. Much of its usefulness will depend on the future willingness of the European Court of Justice to limit the policy-making scope of EU institutions, something it has generally not done.

Summit Diplomacy

Serial summitry has become a regular part of the contemporary diplomatic global landscape. It is a measure of the significance that summit diplomacy has acquired in the early twenty-first century that, according to Gideon Rachman, "the formation of the G20 group of world leaders is likely to be the most lasting institutional consequence of the global financial meltdown of 2008" (2009). As a biannual forum for cooperation and consultation among the heads of state and finance ministers of nineteen nations plus the European Union on matters pertaining to economic global governance, the G20 best highlights the relevance of summit diplomacy in the twenty-first century.

Although the term *summit diplomacy* was originally coined by British Prime Minister Winston Churchill in 1950, as he called for another cold war talk with the Soviet Union at the highest level, summits date back to the Middle Ages. Summits have historically been reserved for meetings between heads of state or governments. Although summitry declined from the Renaissance until the nineteenth century during the Age of Classical Diplomacy, conference diplomacy underwent a revival in the early twentieth century, most notably with the conclusion of World War I in 1919, when leaders of Germany agreed to a peace negotiation with leaders of France, United Kingdom, and the United States in Versailles, France.

There has been debate as to whether the Munich meetings between British Prime Minister Joseph Chamberlain and Adolf Hitler in 1938 or the 1945 Yalta meeting between the Big Three—Churchill, U.S. President Franklin Delano Roosevelt, and Soviet Union Premier Joseph Stalin—contributed or detracted from the standing of summits as a form of effective diplomacy. Because neither summit attained the intended goals, for a time these summits were criticized as poor examples of twentieth-century summit diplomacy. Yet, during the cold war, summits between the leaders of the United States and the Soviet Union became important, especially to deflect international tensions during the nuclear age. As U.S. President John F. Kennedy put it in 1959, "it is far better to meet at the summit than at the brink."

Throughout the twentieth century and into the twenty-first century, ease of international travel coupled with growth of multilateralism and an increasing role of public opinion in international affairs have all contributed to the popularity of summits as a regular foreign policy tool. U.S. President Richard Nixon from 1969 to 1974 participated in more summits than President Roosevelt did in his twelve years in the White House (1932–1945).

However, summits have been known to elicit controversy. Many professional diplomats are critical of them. Former U.S. Under Secretary of State George W. Ball summarized the case against summits, arguing heads of state or government are vain; do not know policy details; and are far too willing to accommodate the desires of their foreign counterparts, sometimes to the detriment of the national interest.

Despite the frustration of professional diplomats, there is a reason why summits have proliferated. This is not just due to the desire of political leaders to bask in the reflected glory of their counterparts; too much international travel can easily become a handicap with national electorates. Globalization and complex economic interdependence have led to increased levels of diplomatic activity. Few areas now escape international scrutiny, and global challenges like climate change, international financial stability, transnational terrorism, or the illegal drug trade demand collective action. As the December 2009 Climate Change Summit in Copenhagen showed, it is difficult enough to get countries to agree to commit to significant domestic policy changes for the sake of global public goods *with* the participation of heads of state government, let alone without them. The notion that routine diplomatic processes are good and swift enough to address many global public policy issues misses both the significance and urgency of these modern global challenges; traditional diplomacy may downplay or procrastinate on taking action on global challenges requiring the attention of heads of state. Most states understand the political message a government can deliver by opting not to participate in global or regional summits or by sending junior representatives.

One reason the 2008–2009 Great Recession did not become another Great Depression was due to the quick and concerted action formulated by the heads of state participating in the G20 summit in London in April 2009. Summits are flexible, versatile instruments that concentrate the minds of top policy makers and can get a lot of business done if well-prepared and well-managed. While summits alone do not necessarily produce immediate changes, they can defuse crises, establish global reforms, implement regulatory measures to eventually alleviate future problems, and fortify new or existing global alliances. Summits can lead states to adhere and respond to international standards. Thus, summits likely will remain a popular diplomatic tool.

Sumner, William Graham

William Graham Sumner (1840–1910) was a prominent American sociologist and a vocal advocate of laissez-faire capitalism, anti-imperialism, and the futility of social reform. His academic works and popular essays contributed significantly to the influence of social Darwinism on American political and economic thought in the late nineteenth century.

Born in Paterson, New Jersey, Sumner grew up in Hartford, Connecticut, in a working-class English immigrant family. After graduating from Yale in 1863, where he studied political economy, Sumner continued his education in history and language at the universities of Geneva and Göttingen and in theology at Oxford University. Sumner was ordained in the Episcopalian Church in 1867 but left the ministry in 1872 to become a professor of political and social sciences at Yale University, a position he held until shortly before his death in 1910.

Sumner sought to join the social Darwinism of English philosopher Herbert Spencer with the assumptions underlying political liberalism, classical economics, and the Protestant work ethic in order to justify and naturalize the economic inequalities that developed in America after the Civil War (1861–1865). Sumner's political thought rests on a view of society comprised of individuals competing against nature for economic survival. The accumulation of capital provides individuals with a competitive advantage and is instrumental in the advance of civilization. Because accumulation requires intelligence and self-denial, wealth is the result of successful adaptation to economic competition, and poverty a natural result of individual failure. Hostile to philosophical speculation, Sumner denied the existence of natural rights, arguing instead that the individual had only the right to use his powers for his own welfare and to securely enjoy that which he had earned. As characterized by Sumner, this right is also a duty, because by failing to look after oneself, one's welfare becomes the responsibility of others. Thus for Sumner, the doctrine of liberty is contained in the command "mind your own business."

The natural laws of competition and natural selection led Sumner to a minimal conception of the state. To him, government institutions are essential to maintaining civil liberty, but must be limited to ensuring equal opportunities for economic competition and to providing freedom for labor and security for earnings. If it is to protect the rights of citizens, Sumner argued, government cannot become the vehicle of class-based claims. In this respect, both plutocrats and social reformers are guilty of illegitimately using the state to gain an unfair advantage in the competition over material resources. For this reason Sumner was equally opposed to welfare programs, protective tariffs, and government contracts or "jobbery," all of which interfere with the laws of free economic competition, and by extension, with the progress of society. Moreover, government interference rewards those who cannot succeed on their own and ultimately penalizes the "forgotten man," who works hard, accumulates what capital he can, and whose earnings are inevitably used to fund various class-based legislative schemes.

Although a politically and economically conservative thinker, Sumner falls solidly within the American liberal tradition; while his sociological thought emphasizes the importance of mores and folkways, he nonetheless insisted in his political work that freely chosen contracts rather than tradition or custom are the only source social obligations. Like social Darwinism generally, the influence of Sumner's political and economic ideas gradually faded as the progressive movement began to yield social reforms.

Supreme Court

Courts of "last resort," or "supreme" courts, derive from the idea that law, rather than politics or standing in a community, is the basis for the authority of government. The U.S. Supreme Court is an expression of this belief, as are similar courts worldwide, including those in Canada and South Africa. This institutional structure is particularly evident in political systems based on a written constitution. Systems in which courts are supreme—in the sense that they are the "last word" on the country's constitution—are often distinguished from parliamentary systems, such as the one found in the United Kingdom. In these systems, the parliament is the ultimate arbiter of political questions. Canada is somewhat of a unique case—it has been shifting from the parliamentary model to the model of a supreme court with its "repatriation" of the constitution of the United Kingdom.

The U.S. Supreme Court is an appellate court alone at the top of the judicial process in the United States. It has authority not only over the federal courts but also over the state courts. The Court is the final venue of appeal for the enormous number of cases generated in the United States. A rough estimate of the number of these cases would be approximately ten million per year. Of these, approximately three hundred thousand are appealed to the higher courts in the states and in the federal system. About five thousand of these eventually reach the

Supreme Court, but the justices actually choose fewer than one hundred cases on which to comment extensively. There are many theories about why certain cases are chosen and others are not, although it is clear that the cases have to be of interest to the justices and usually of some general significance.

Some have been joked that the Supreme Court is not final because it is infallible, but that it is infallible because it is final. Certainly, given its final say in legal matters, the Court has come to be viewed as special. When Americans are serious about a dispute, they say they are going to take the case "all the way to the Supreme Court." Because the Supreme Court is the last official word on the U.S. Constitution, short of a constitutional change through formal amendment, it deserves careful attention. However, the Court addresses relatively few cases, meaning that individuals must turn to a variety of other less visible sources of constitutional law for precedence and answers.

FUNCTIONS

The Supreme Court can be distinguished from other courts by several unique, specific functions. Most courts are primarily engaged in the resolution of conflict, but the Supreme Court is known to make policy and is, therefore, a source of constitutional law. In this sense, the "Constitution," understood to be the basis for U.S. law, is not primarily a historical document and series of amendments, but rather the product of judicial choices that construct the ongoing meaning and significance of the original document. The justices transform the law while applying it in individual cases.

As part of two legal systems, the federal and the state, the Supreme Court is the court of last resort. The justices are appointed by the president, and they are paid from the National Treasury. They serve as long as they exhibit good behavior, which in practice has meant tenure for life, and a decision to retire from this institution becomes a policy decision of some significance. The selection process is political, and a nominee's political party activity may influence the appointment decision. The president does not always get his first choice to fill a vacancy, however. This was the case in 2005 for President George W. Bush, whose first nominee to replace retiring justice Sandra Day O'Connor, Harriet Miers, withdrew amid controversy over her qualifications. This failed nomination was followed by the successful nomination of a more experienced jurist, Samuel Alito.

The Supreme Court has appellate jurisdiction in addition to original jurisdiction in "cases affecting ambassadors, other public ministers and consuls, and those in which a state shall be a party" (U.S. Constitution, Article III, Section 2). Congress sets the basic regulations and makes changes in the Court's appellate jurisdiction. Although direct limitation of the Court in substantive areas is difficult, in the early 1980s there were as many as thirty bills pending in each legislative session that sought to limit the Court's authority. Up until the 1920s, the justices had little discretion in the cases they took. Since then, they have been able to choose from among the thousands of appeals that come to them. This gives the justices the opportunity to influence the Court's docket (calendar) and to take a more active role in setting its agenda than courts usually have. In addition, statements in judicial opinions and occasional public statements by the justices may stimulate appeals by indicating judicial predispositions to decide particular issues. For example, the exclusionary rule, which prohibits the use of illegally obtained evidence, has been the subject of criticism by members of the Supreme Court since the 1970s. Challenges to the rule have been looked on favorably, although it has not been eliminated.

The Supreme Court's role in interpreting and applying constitutional law is a focus for debates over the meaning of the Constitution. In the twentieth century the Court realigned its political orientation more than once. As part of the struggle over New Deal reforms in the 1930s, a conservative Court was transformed by political appointments and pressure from President Franklin Roosevelt. This transformation was expanded in 1953 with the advent of the Warren Court and its dramatic decision in *Brown v. Board of Education* a year later, which signaled a shift in the federal/state relationship in regard to racial and other forms of discrimination. By the end of the century, the Court was experiencing a slow shift back to the right that began with President Richard Nixon's appointment of four justices. With President Ronald Reagan's appointment of Justice O'Connor and the subsequent elevation of Antonin Scalia, Anthony Kennedy, and William Rehnquist, the Court took on a solid conservative caste. The evolution to moderate or liberal positions by justices such as David Souter and John Paul Stevens and the appointments of Ruth Bader Ginsburg and Stephen Beyer by President Bill Clinton created a political mix again and a decisional turbulence that is likely to last for some time. Many recent appointments have simply continued past political arrangements. William Rehnquist was replaced by his former clerk, John G. Roberts Jr. in 2005. President Barack Obama appointed Sonia Sotomayor to replace Souter and nominated Elena Kagan to replace Stevens in 2010. The appointments of Sotomayor and Kagan (if confirmed) are not likely to change the overall political dynamic because they are replacing older justices who anchored the "liberal" wing of the Court.

JUDICIAL REVIEW

The distinctive feature of the Supreme Court's power is judicial review. This refers to judges applying the Constitution to ordinary law made by the executive or Congress or in the states. The practice of judicial review gives great weight to these judicial interpretations of the Constitution. In this sense, the convention in America has been to equate judicial review with judicial supremacy, the idea that the Supreme Court has the final word on the Constitution. The two practices will be distinguished here to highlight recent debates in constitutional interpretation.

The classic statement of judicial review is in *Marbury v. Madison* (1803). The case involved the status of judicial appointments in the last days of John Adams's administration. After President Adams was defeated by Thomas Jefferson, the

lame duck Congress, dominated by members of Adams's Federalist Party, created a number of new judgeships. The measure was hastily signed by the president, and some of the appointment papers were not delivered before Jefferson took office. One of the designees, William Marbury, sued in federal court to have James Madison, secretary of state in the new administration, deliver the papers. The case reached the Supreme Court, where newly appointed Federalist justice, John Marshall, presided. Marshall had been secretary of state during the Adams administration and by present standards of judicial conduct should have recused himself, that is, declined to hear the case because of a conflict of interest. Instead, Marshall took the opportunity to offer a sweeping claim for the power of judges to void those acts of Congress that conflict with the Constitution. His argument drew from Article III, specifically, "the supreme court shall have original jurisdiction in all cases affecting ambassadors, other public ministers and consuls, and those in which a state shall be a party. In all other cases, the supreme court shall have appellate jurisdiction." By Marshall's analysis, Congress could only add to the appellate, not the original jurisdiction of the Court.

Marshall went on to ask, rhetorically, "If an act of the legislature, repugnant to the constitution, is void, does it, notwithstanding its invalidity, bind the courts, and oblige them to give it effect?" His answer to this question is what has made the case a touchstone of American constitutional law. Marshall held, "It is emphatically the province and duty of the judicial department to say what the law is. Those who apply the rule to particular cases, must of necessity expound and interpret that rule." Therefore, while the Court had ruled that Marbury was entitled to his commission, Marshall was saying that it was the Supreme Court that determined what was or wasn't a constitutional law—and a law that gave the Supreme Court the power to rule on the case in the first place was against the U.S. Constitution. As a result, the Supreme Court did not have the power to make Madison give Marbury his commission.

That same year Congress shut the Court down for a year by changing the date of its sessions. This may have been to keep it from ruling on the validity of the repeal of the Federalist Judiciary Act of 1801. The debate surfaced again in 1832 in President Andrew Jackson's veto of a bill to re-charter the country's national bank, even after the Supreme Court had ruled in 1819 that the bank was constitutional. Jackson offered as a basis for his veto the proposition that the legislation was unconstitutional. Calling "mere precedent a dangerous source of authority," he referred to opposition in various branches of the state legislatures as well as his own (Jackson, "Veto of Legislation Chartering the Bank of the United States, 1832" in *American legal history: cases and materials.* 161)

Similar commentary is evident in Abraham Lincoln's First Inaugural Address in 1861 and in Franklin Roosevelt's Speech on Reorganizing the Judiciary in 1937. Each speaks to the right of the chief executive to contribute to constitutional interpretation. Lincoln, like Jackson, engaged with the Court and the people in a discussion of the meaning of constitutional law. Roosevelt's plan for a more youthful and sensitive Supreme Court included putting one new justice on the Court for every one who reaches the age of 70 and was seen as heavily partisan. In fact, though he demurred from referring to this as "court packing," that is the term by which it has come to be known.

These efforts by eminent U.S. presidents are often forgotten in the Court's own argument as to its authority. Culminating in *Cooper v. Aaron* in 1958, the justices of the Supreme Court and many commentators came to accept a "judicial supremacy." Yet, it is hard to look at the abortion controversy in the United States since 1973 and believe the Court is the last word on the Constitution in every case. This issue has been taken up by such scholars as Walter Murphy, Louis Fisher, and Susan Burgess. While conventional wisdom places the Supreme Court at the apex of constitutional interpretation, the work being done by these scholars, as well as tension between the Supreme Court and other political branches, continues to raise questions about the nature of the Supreme Court's claim as final arbiter.

It has long been held that, as judges in a democracy, the justice of the Supreme Court in the United States maintain or lessen that body's authority depending on how its judgment is perceived. One way judgment is assessed is in terms of whether the Court is responsive to the times in which it lives. Another is the special commentary by professional students of the Court. When these tendencies are in line, the authority of the Court is secure; when they fall into conflict or become misaligned that authority may be jeopardized.

INSTITUTIONAL IDEOLOGIES

Supreme courts in democracies face the challenge of justifying their role in politics. This is done through institutional rules or norms and interpretive frameworks. Rules include the expectation that cases be brought to the court, that is, the justices not seek business. In some countries, supreme court justices serve in advisory capacities on boards and commissions. In the United States this is rare. One exception was the commission investigating the assassination of President John F. Kennedy, which was chaired by Chief Justice Earl Warren. The perception that justices are the recipients of questions rather than generating them is important. One of the key features of the controversial decision in *Bush v. Gore*, which determined the outcome of the 2000 U.S. presidential election, was that the Supreme Court was considered the "end of the line" and its judgment was necessary to avoid a "constitutional crisis."

Interpretive frameworks are also important for establishing the legitimacy of judicial holdings, particularly in controversial cases. One justification for change is the idea that the U.S. Constitution is a "living document," and it is necessary for the justices of the Supreme Court to intervene and keep it up to date. Decisions based on this philosophy are associated with the "Due Process Revolution" of the 1960s, wherein the Supreme Court established the reach of the Bill of Rights and its promise of legal counsel and protection against cruel and unusual punishment. Another idea is that the justices simply

apply the text of the Constitution to the cases at hand as the original Founders would. That is, that they do not add anything to bring the Constitution up to date. Many scholars and legal professionals point to cases that developed a legal right to privacy as being in violation of this idea because the word privacy is not in the text of the Constitution.

THE FUTURE

Some social scientists and legal historians have turned away from the pronouncements of the Supreme Court and that of the other appellate courts, characterizing these holdings as atypical and unrepresentative of legal activity in the United States. For example, a generation ago Morton Horwitz considered constitutional law to be "episodic" and "buttressed by a rhetorical tradition that is often an unreliable guide to . . . legal change in America." (1977: xii). Due at least in part to this criticism of excessive attention given to appellate courts, there has been more attention to other things in recent years. This includes attention to the law in action, to the political behavior of judges, to the rulings of intermediate courts and local trial courts, and to the impact of judicial decisions in the community. The turn from the study of appellate courts among social scientists began as a healthy reaction to the perhaps excessive attention to appellate decisions in the law schools but may have led to the belief that there was little reason to study high courts at all.

For social scientists, there are many reasons to study the Supreme Court. The tradition of commentary on the Constitution is, among other things, an excellent guide to national ideology. Although appellate court opinions are not representative of the mass of legal or even judicial activity, these opinions are authoritative attempts to relate legal concepts to changing social and political conditions. And, if they are opinions of the Supreme Court, they get a great deal of attention. The resulting commentary attempts to reconcile contemporary issues and values with tradition. By revealing what the government thinks about itself, the opinions of the Supreme Court constitute a running commentary on fundamental political concepts. From this body of discourse, the student can observe change and/or continuity and examine the judicial contribution to the structure of U.S. Politics.

Surveillance

In its simplest form, *surveillance* refers to gathering information through watching people. This is counter to *forensics,* which consists of gathering information by examining clues left in a given location. In practice, surveillance is significantly more complicated. Historically, surveillance has been a direct process of watching people, as exemplified by a police stakeout. As technology and science has increased, the concept of surveillance has expanded to include activities that were never previously part of surveillance. In addition to traditional surveillance there is now citizen surveillance, military surveillance, "unofficial" surveillance, and Internet surveillance. In addition to these new areas of surveillance, computer technologies are being developed to aid in the surveillance process as well.

Citizen surveillance is simply surveillance by citizens rather than by agents of a government. This can take a number of forms, ranging from individuals coming together to employ surveillance to gain something to citizens within a society working against each other. An example of individual citizens working together is the typical neighborhood crime watch. In a *crime watch,* the citizens of an area receive special training and organization techniques to guard their neighborhood against criminals. This is generally considered a positive form of citizen surveillance. At the other end of the spectrum are totalitarian governments. One technique that totalitarian

governments employ for maintaining power is to encourage each citizen to watch other citizens and to report any suspicious activities. This technique often is accomplished using fear of an enemy and uses the citizens against each other.

Military surveillance is undertaken by combat forces. This often occurs in countries considered hostile by the military. However, it also can be used against the citizens of the country itself. Military surveillance often incorporates formal military intelligence services, spy agencies, and newer technologies. The newer technologies included in military surveillance include special aircraft and boats, satellites, and custom-made camera technologies.

In the course of normal operations, many businesses and institutions in the United States and other countries gather information about their customers. The surveillance conducted in these situations employs similar methods to those used by government and law enforcement agencies but not similar to military surveillance methods. All of these records are available to government agencies under the right conditions. In some countries, prerequisite legal processes are required, and in other countries the government simply asks for the information.

Finally, there is the newest form of surveillance, *Internet surveillance.* All of the unofficial surveillance that exists outside of the Internet also exists on the Internet. However, the surveillance on the Internet can be easier to obtain because of the ease of observation and of acquisition of observation conducted by others. Also, anything in electronic format is retained for a much longer period than paper records. Information posted to the World Wide Web or transmitted as e-mail tends to remain even longer. There is at least one project that is attempting to archive the entire Web, meaning that anything posted would exist indefinitely. One big difference between the other forms of surveillance and Internet surveillance is that it is often possible for individual citizens to acquire this surveillance legally, with some exceptions.

Computers have not only changed surveillance by increasing the length of time that records are retained and by enabling the Internet, they also have transformed the process through their ability to analyze data. The U.S. government is currently working on developing face recognition software to assist in antiterrorism activities. This software would enable public security cameras to recognize known terrorists and criminals and alert police to the current local of that individual. Computers are also capable of looking for patterns in data, and that has been used by government agencies.

It is possible to reduce the amount of surveillance being gathered on an individual. For example, using cash instead of a credit or debit card reduces the surveillance because there is now no electronic record of the money transfer, just of the purchase itself. The link between the purchase and the purchaser has disappeared. Several organizations advocate a reduction in surveillance both inside and outside the United States, including political parties. Currently countersurveillance activism ranges from companies selling products designed to block traffic cameras to public calls to reduce security cameras installations across Great Britain.

Survey Research

Survey research is one of the most important and most frequent types of quantitative social science research. In a typical survey, a researcher selects a sample of units of interest (e.g., individuals, households, families, political candidates, formal organizations) from a defined population and then collects information from them using a standardized interviewing technique, usually a written questionnaire. Surveys typically produce data amenable to computer-based statistical analysis. Both sampling and standardized interviewing are common in many research designs such as experiments, observation, and ethnography, but it is the combination of the two that gives surveys their unique character and popularity.

Sampling of the units from the population can be carried out using either probability or nonprobability sampling techniques. The choice of a specific sampling procedure usually depends on considerations of the characteristics of the target population, anticipated cost, and intended use of the data.

Surveys may consist of one or several waves of interviewing. The simplest surveys are *cross-sectional,* in which data are collected at one point in time only. Longitudinal designs are less common, but tend to be more powerful. *Longitudinal* designs consist either of repeated administration of the same (or a very similar) questionnaire to a series of samples drawn from the same population (e.g., periodic public opinion polls), or of repeated interviewing of the same sample (fixed-sample panel study).

The questionnaire can be completed face-to-face, by telephone, over the Internet, via e-mail, or standard surface mail. Sometimes questionnaires are administered to groups of respondents (such as school classes) to reduce the cost of interviewing. Individual self-administered questionnaires

(most recently also in the form of audio computer-assisted self-interviewing) are usually applied to investigate sensitive topics (e.g., drug use, sexual harassment) that respondents might find unsuitable for direct interpersonal communication with the interviewer. Various interviewing modes may be combined within one survey to reduce cost, increase representativity, encourage cooperation, enhance the sense of confidentiality, or effectively reach members of the target population.

Surveys are not amenable to the study of any research question. They require that the target population be clearly defined, usually with reference to a few, simple geographic or demographic categories. Surveys also assume that most respondents know and are able and willing to supply the information necessary to complete the questionnaire. Finally, surveys produce numerical data, which limits the range of subsequent analytical procedures. Survey data are suitable to describe and model selected population characteristics or to answer a narrow set of research questions.

The transparency and accountability of sample surveys makes them exceptionally attractive for both policy research and theoretical research. Survey procedures can be made visible and accessible to other parties and tend to be more easily replicable than other research designs. A key disadvantage of surveys is that standardized questionnaires constrain investigation into phenomena and analytical strategies anticipated by the researcher at the start of fieldwork. Surveys often are criticized for their limited validity, because numerical variables may not represent social reality accurately. Surveys also provide an appearance of objectivity and scientific purpose and can thus be subjected to political manipulation as well as other misuses.

Survey Techniques and Design

Survey data are collected in a variety of ways: face to face, self-administered, telephone, mail, and the Internet. Each has its own strengths and limitations. The choice of method begins by understanding how the final data will be used and how the responding population would most like to reply and how they can be reached. The approach considers time, money, and personnel. Understanding this allows a researcher to choose a method best suited to the task.

The most successful data collection efforts combine methods, so that respondents can participate in ways most comfortable to themselves. Research methods should provide:

- A standard method for contacting informants
- A standard method of administering the survey
- Repeated attempts to make contact with informants
- An appropriate data collection period
- A standard set of questions and response options
- Neutral word choice in all materials
- Training and oversight for data collection personnel
- Protection of informant confidentiality
- Protection of any data files from loss, theft, or damage
- Respect for the dignity of each individual.

There is plenty of knowledge about the willingness of various groups to cooperate by in-person, mail, phone, and Internet methods. For example, Elizabeth Tighe and colleagues looked at Jewish respondents, Jo Lindsay looked specifically at challenges of reaching young adults, and D. A. Ashe and colleagues report on challenges of getting physician cooperation. The mode will affect some responses, and some methods are not available to all potential respondents. Moreover, the mode will affect administration costs, which for most survey projects is limited. Researchers should familiarize themselves with research literature and the intended respondent population's access to the Internet or phones before deciding which combination of methods will work best. Testing can help anticipate how the mode of data collection will affect responses and cooperation.

Before choosing a method, it is important to understand the population of interest. Researchers should consider this when deciding how to administer a survey to senior citizens or children. Research involving physicians indicates that when given a choice, they are more likely to respond by mail than other forms.

MAIL
Don Dillman's *total design method* is standard procedure (2000). This method involves:

- An advance letter introducing the study
- A second mailing containing the survey
- A reminder postcard or phone call
- A final version of the survey mailed in a special package, like overnight express
- A token of appreciation, such as a cash incentive
- A postage-paid return envelope.

When possible, mailings should be addressed to a particular person. Word processors can personalize materials. A cover letter should discuss the nature of the survey and sponsorship, assure confidentiality, and suggest a deadline. It is good practice to provide a way to contact the research team. Mail is helpful in surveying businesses or other institutions. There is a risk

that mail may be opened by someone other than the intended respondent. Phone follow-through helps ensure delivery. The primary costs of a mail survey are postage (or express service) and printing, especially in color. The overall costs of a mail survey depend on the number of pages to be printed and delivered, the number of attempts to reach a respondent, the amount of data to enter, and whether the researcher is willing to use premium delivery services. Optical scanning systems can reduce costs associated with data entry, while limiting the nature of data collected. Usually data scanning will require bubble sheets, while clerks can key enter longer alphanumeric responses.

IN PERSON

In-person interviewing is effective in covering very sensitive subject matter and for surveys that may last more than thirty minutes. In-person interviewing ensures that the correct respondent is interviewed, allows interaction with respondent, and allows the interviewer to code some observations without having to ask. In-person interviews suffer fewer skipped questions or broken interviews. This method reduces data-entry errors, as trained staff enters most information into a laptop computer. Skilled interviewers can collect bio-specimens, abstract records, perform assessments, or conduct air or water sampling at the time of an interview. Modern computer devices allow for playing of recordings, so that respondents can hear sensitive questions without feeling embarrassed in front of an interviewer.

It is labor intensive and can easily cost more than $750 per complete interview. Consider the costs of travel, wages, intensity of interviewer training, duration of interviews, and the number of visits to each respondent to get a completion. Costs can be controlled by interviewing at busy locations (train stations or shopping malls). If considering this type of *intercept interview,* the loss of statistical precision should be weighed.

TELEPHONE

Computer-assisted telephone interviewing (CATI) has been in wide practice since the 1980s. This method is inexpensive for general-public surveys. Costs are determined by complexity of programming and the number of attempts that will be made to each sample member. Additional costs are associated with sampling. More sophisticated firms can generate their own random-digit dial lists. Others purchase lists from a vendor who generates the numbers and usually tries to eliminate cell numbers or unwanted numbers, such as business numbers for residential surveys.

The benefit of CATI is that it is easy to program complex skip patterns for tailored follow-up questioning and to program error checks. It allows for constant staff monitoring. Because telephone use is widespread, coverage error in most cases is small. CATI technology also can be enhanced with automated voice and touch-tone response features to help minimize respondents' nervousness about answering sensitive questions. Because answers in CATI are entered straight into a database, researchers have almost instant results.

With the proliferation of telemarketing phone banks (which sometimes take contract work for low-budget survey firms), CATI surveys have suffered dropping response rates. State and federal *do not call* (DNC) lists have reduced unwanted solicitation, while making exceptions for research. There is little evidence that DNCs improved response rates.

CATI surveys run into other barriers. Some sample vendors do not screen unwanted phone numbers (i.e., disconnected lines, data lines). Caller ID and answering devices make it difficult to contact respondents who screen calls. Researchers should think about coverage and the precise unit of analysis for CATI surveys of the general population and then decide whether inclusion of cell numbers is appropriate.

INTERNET

Like CATI, Internet surveys allow for programmed skip commands, errors-checking for illogical or missed answers, and quick access to analyzable of data. Graphics and hyperlinks can be added. Voice programs can be used to speak questions. The risks of Internet interviewing include hackers, fraudulent entries, and data interception. Vendors like Survey Monkey make Web-based survey research relatively cheap for researchers who want an "off-the-shelf" survey. This type of interviewing is useful only when the population of interest is computer literate, when the researcher does not need the upfront work such as developing and pretesting questions tailored to specific research needs, or when the researcher is willing to give up a lot of control of the day-to-day activities of monitoring and supervising the research activities. Some associations have good e-mail lists, but generally e-mail samples should be treated with greater caution than random-digit telephone samples. Invitations to participate may be delivered by mail with log-on instructions. The costs of Web-enabled surveys are about the same as other programmed data systems. There will be maintenance costs. Also, Web researchers should be aware of security features that can add to the protection of data and respondent the confidentiality, avoid the spread of viruses and the like, but also affect overall Web survey costs.

TRACKING AND DISPOSITION

The status of each case should be monitored so the case can be coded as completed, as a refusal, ineligible, or given other codes that help the research team. This allows for appropriate follow-up or termination of data collection on individual cases. At the end of the data collection period, each case should be given a final disposition as complete, incomplete, ineligible, or the like. From this, a transparent coding classification and response rate should be reported. The American Association for Public Opinion Research provides samples of disposition rules and calculating response rates.

TESTING

Testing involves surveying a small number of respondents prior to the full data collection. Testing helps identify errors in questionnaire design, delivery mode, and problems with the sample. Testing helps predict the number of bad addresses

or phone numbers in a sample. Testing is particularly helpful when there is a risk that respondents will be hard to find or might have difficulty with the questionnaire. Field tests generally run all survey procedures on a small subsample of the survey population. In some cases respondents are contacted to discuss their experience with the staff. Quality control measures before going live identify nonworking phone numbers, duplicate cases, and bad addresses and can help locate respondents who relocated.

Swift, Jonathan

Jonathan Swift (1667–1745) was a prolific eighteenth-century European satirist whose work took aim at many targets: the English government, the slave trade, the Whig party, and organized religion, just to name a prominent few. While his *Gulliver's Travels* (1726) and *A Modest Proposal* (1729) stand as his most famous works, his output as a whole reveals a keen mind and biting wit, one that spared no ridicule on the follies of political life past and present. Choosing to remain anonymous during the publication of many of his polemics, Swift eventually came to enjoy worldwide familiarity and acclaim as one of the leading (and most humorous) political writers of his day.

Swift was born in Dublin, Ireland, to Abigail Erick, months after her husband Jonathan's death. The details of Smith's early childhood are somewhat obscure. At some point, he came under the guardianship of his uncle, who paid his way to Kilkenny College in Ireland. Swift eventually ended up graduating from Trinity College, Dublin, in 1686 and departed Ireland for England as a consequence of the turmoil of the Glorious Revolution (1688). In England, Swift reunited with his departed mother and worked in various diplomatic positions for the government. Along the way, he earned a master's degree from Oxford and became a priest in the Church of Ireland. In 1704 he published *The Battle of the Books* and *A Tale of the Tub.* The political overtones to his early work were coincident with his involvement in English political life. A fierce critic of the Whig administration, Swift wrote and spoke out for Tory causes, temporarily earning him an informal advisory role when the latter party rose to power in 1710.

With the accession of George I to the throne in 1714, Swift left London for Ireland, where he penned a number of essays ridiculing the affluent and those indifferent to the plight of the poor. It was also at this time that Swift began perhaps his most famous work, *Gulliver's Travels.* A parody of the political life of England that highlights the complexity of man's nature, the book chronicles the escapades of Gulliver, an English wanderlust who accidentally voyages through four mysterious, often-comical lands. First published in 1726, it was widely read and praised throughout Europe for its nuanced balance between fiction and reality. As the book was published anonymously due to its sensitive subject matter, Swift had to enjoy the commendation privately.

While Swift left his greatest mark on English literature, his contribution to political philosophy is not insignificant. While many of his writings engaged contemporary social injustices, he also addressed the divisions between ancient and modern thought, ridiculed the ancient Greek philosopher Plato's faith in temporal happiness, and wrote skeptically of the human spirit's fulfillment in modern science. To the end, he displayed a humor and inspiration in his writing that continues to resonate with the world as much as it did during his lifetime. He died following declining health on October 19, 1745, in Dublin.

Syndicalism

Syndicalism refers to revolutionary unionism and represents a range of perspectives that view the economic organizations of the working class and workers' control of industry as the basis of revolutionary social transformations. Syndicalism has influenced diverse movements and perspectives that take the collective self-organization and direct action of the working class both at the point of production and within working-class communities as the basis not only for overcoming capitalism but for organizing a new, egalitarian society. While tracing its origins to the trade union movements of the nineteenth century (the term *syndicalism* coming from the French word for unionism, *syndicalisme*), it has come to signify a radical or revolutionary approach to labor organizing that seeks to overthrow the wage relationship, capitalists, and class society rather than collectively bargain workers' place within the wage relationship.

Historic anarchosyndicalist campaigns have provided significant evidence that class struggles entail more than battles over corporatist concerns carried out at the level of the

factory. Syndicalist movements have displayed attitudes of hostility toward the bureaucratic control of work, concerns over local specificity, and techniques of spontaneous militancy and direct action. Syndicalist struggles have, in different instances and over varied terrain, been articulated to engage the broader manifestations of domination and control. French revolutionary syndicalism placed an emphasis on radical democracy. Within syndicalism one can discern such themes as consensus formation, participation of equals, decentralization, and autonomy as an alternative to the bureaucratic and professionalized organization of mainstream trade unions. Rather than bargaining instruments, syndicalists view alternative unions as organizations that might contest capital on a revolutionary basis.

SYNDICALIST PERSPECTIVES

Syndicalist theories of capitalist power place emphasis on an alternative revolutionary worldview emerging out of working-class experiences and offering a challenge to bourgeois morality. Fernand Pelloutier, an important syndicalist theorist whose works influenced Georges Sorel, argues that ideas rather than economic processes are the motive force in bringing about revolutionary transformation. Pelloutier vigorously attempted to come to terms with the problem of cultural domination as a basis for capitalist power. Reconstituting social relations, in Pelloutier's view, becomes possible when workers begin developing revolutionary identities, through self-preparation and self-education, as the means for combatting capitalist culture. Thus, syndicalists have characteristically looked to labor unrest as an agency of social regeneration whereby workers challenge the cultural hegemony of class domination (e.g., deference to authority, acceptance of capitalist superiority, and dependence upon elites). Unlike versions of authoritarian communism, such as some variants of Marxism and Leninism that syndicalists challenged, syndicalism understood the transformation of power not in terms of the replacement of one intellectual elite by another but as a process of diffusion, spreading power out into the workers' own organizations. This displacement of power would originate in industry, as an egalitarian problematic, when workers came to question the status of their bosses. Toward that end syndicalist movements have emphasized *life* and *action* against the severity of capitalist labor processes and corresponding cultural manifestations.

It might be argued that, far from being economistic, syndicalist movements are best understood as countercultural in character, more similar to contemporary new social movements than to movements of the traditional left. Syndicalist themes such as autonomy, antihierarchy, and diffusion of power have echoes in sentiments of the new movements. This similarity is reflected not only in the syndicalist emphasis on novel tactics such as direct action, consumer boycotts, or slowdowns. It also finds expression in the extreme contempt shown by syndicalists for the dominant radical traditions of its day, exemplified by Marxism and state socialism, and in syndicalist efforts to divorce activists from those traditions.

Syndicalist unions, as opposed to bureaucratic unions, sought the organization of workers from the bottom up. Their strategies rejected large strike funds, negotiations, written contracts and the supposed autonomy of trades. Actions took the form of guerilla tactics, including sabotage, slowdowns, planned inefficiency, and passive resistance.

Perhaps the strongest and certainly the most enduring variant of syndicalism developed within anarchist movements in Spain and much of Latin America. *Anarchosyndicalism* viewed the revolutionary self-organization of workers in radical opposition to capital, outside of not only union bureaucracies but outside of mainstream union frameworks themselves, limited as they were by collective bargaining over workers' contracts as the means by which an anarchist society might be realized. Anarchosyndicalism reached its highest level of popular involvement in Spain in the early decades of the twentieth century. The Confederation Nacional del Trabajo (CNT) played a major part in the Spanish Revolution (1936) and the resistance to the fascist regime of General Francisco Franco during the 1930s. The CNT was especially active in Barcelona during the revolution, running industries and providing social services in the region while organizing the armed resistance to fascist forces on the front lines.

Syndicalism also developed powerful movements in North America, most notably the Industrial Workers of the World (IWW, or Wobblies) which was active in Canada, Mexico, and the United States, especially in the early 1900s, and the One Big Union, which organized the Winnipeg General Strike in 1919. Destroyed almost completely by the Red Scare of 1919, the IWW has enjoyed something of a resurgence in the twenty-first century, especially among precarious workers in service industries often unorganized by the declining mainstream industrial unions. IWW perspectives with regard to capital emphasize workers' abilities and encourage the self-determination of workers and the importance of self-directed initiatives against capital. The IWW asserts that workers must organize themselves to fight employers directly. The symbolic unity of the working class and its break from capital is stressed in the single qualification for Wobbly membership. The only restriction to membership in the IWW is that no employer can be a member.

REVOLUTIONARY SYNDICALISM

A primarily intellectual version of syndicalism was developed by the social theorist Georges Sorel in the 1910s and 1920s in France. Despite the academic attention it has received, Sorel's theoretical syndicalism is only one intellectual expression of syndicalism and has had an ambiguous relationship to actual syndicalist movements in France and elsewhere. Revolutionary syndicalism, as this variant was known, saw working-class direct action as the basis for a new society based on values of heroism and sacrifice, which stood counter to the apathy and social degeneracy of bourgeois society. Syndicalism, and worker direct action, stood also as a refutation of the rule of society by bureaucratic and technocratic professionals. For Sorel the general strike was most important not as a practical

approach to labor organizing but rather as a "revolutionary myth" that served to rouse the fighting spirits of the working class and provided them with an image of the power of their unity in struggle. The vitality of the general strike was not so much material as ideological.

Syndicalism has enjoyed a resurgence recently in many parts of the world as workers seek an alternative to mainstream unions that seem unwilling to fight against multinational corporations. Many workers, including younger workers and workers in small workplaces that often are overlooked by mainstream unions, have turned to syndicalist organizing.

Systems Analysis

Systems analysis is the actual application of different variants of systems theory to the inquiry into sociopolitical reality. Systems theory itself is based on the analogy of social phenomena and biological organisms, and it was one of three main approaches in the 1950s to the study of politics, besides behavioral and political culture studies. Systems analysis inquires into the structures and functions of systems. Analyses based on general systems theory emphasize the organizational structures of different systems, while those rooted in cybernetic systems theories focus on regulation and feedback processes based on communication. Systems analyses following the theory of political systems, such as *The Political System* by the academic David Easton, address the question through which processes of organization, differentiation, communication, and regulation a political system is able to transform societal demands arising on the input side into outputs that themselves can generate support and therefore can guarantee the survival of the political system. Politics is conceived of as "the authoritative allocation of social values," seen as the primary function of the political system. From the late 1960s, systems theory was increasingly criticized for its apparent focus on supraindividual rather than individual-level phenomena and for its preference for persistence of patterns over change.

Systems Structure

Neither the concept of system nor that of structure is original or unique to political science, yet each is a core concept in the field. The notion of the international system is crucial to the study of diplomatic history since the work of the historian Leopold von Ranke in the 1800s. In international relations, the system—normally divided into a central system of leading states and regional subsystems—is composed of states, organizations, and nongovernmental actors (NGOs), with the bulk of the power residing in the states.

Structure in international relations underlies the type of international system present in an historical interval. Britain, Russia, France, Prussia-Germany, and Austria principally composed the nineteenth-century balance of power system. The United States and the Soviet Union featured in the bipolar system (1945–1989). In a more controversial claim regarding the present system, unipolarity is sometimes equated with hegemony.

Neorealists argue that the number of leading states, the relative power of those states, the presence of ideological difference, the nature of balance or equilibrium among these states, and the perceived "rules of the game" are the irreducible minimum characteristics that determine systems structure. Liberals, neoconservatives, and constructivists would add that the domestic political identity of states is crucial, and in particular whether they are democracies.

An important legacy of neorealism is the view of the system as a structure of dynamically interrelated parts. Systems structure was defined by Stanley Hoffman (1968) as the "distribution and hierarchy of power," or equivalently by Kenneth Waltz (1979) as the "distribution of capabilities across the units," operationalized as percentage share of systemic power. According to David Dessler (1989), systems structure places bounds (constraints) on international political opportunity and behavior.

Another legacy of neorealist thought is the view that the type of systems structure determines the degree of world order. In an influential article in 1964, Waltz argued that bipolarity was for structural reasons more stable than multipolarity and, in a remarkable prophecy, that the international system would remain bipolar at least until the end of the twentieth century.

But does international system type determine the degree of stability? Where does unipolarity fit in this interpretation? First, there are serious limits on the degree to which hierarchy exists within the system, especially regarding the capacity to maintain order and to encourage progress from the top of the international system.

Second, perhaps the causal relationship between structure and world order does not operate through type of international system, with one type of system being more stable than another. Rather, the causal relationship to world order may operate through change in structure across time (*see* Systems Transformation). Movement from one type of international system to another may be the true source of structural impact on world order.

Third, as John Mearsheimer has argued (2001) and as many liberals as well as conservatives also claim, hegemony does not now exist, nor has ever existed, internal to the central system. Soviet hegemony existed in Eastern Europe. Other actors have imposed hegemony in regional terms, but never within the central international system, which remains decentralized. Hence, the structural equation between unipolarity (which does exist) and hegemony (which does not) is deceptive and false.

Systems Transformation

The thesis that systems transformation is a structural discontinuity caused by major war has been at the heart of much international relations theory. For classical realists, an international system is created by conflicts and destroyed by conflicts. Hegemonic stability, power transition, and long cycle theories identify major war as the vehicle whereby a new systemic hierarchy is born.

In all of these theories, each system possesses the identity and regime preferences of the reigning hegemon, the state with the greatest power. For Robert Gilpin (1981), systems transformation occurs when the dominant state is surpassed in power by a challenger, causing the declining hegemon to strike out at the challenger in massive warfare. The challenger is defeated, but the hegemon is replaced by a third power that enjoyed an increase in power as a result of the war. A new system is born. A. F. K. Organski and Jacek Kugler (1980) describe the same process involving pairs of states at the top of the system as a power transition, but argue that the challenger uses force to displace the hegemon. For George Modelski (1978) and William Thompson (1988), global war became a mechanism to resolve policy-leadership disputes in the fifteenth century. Systems transformation occurs when the dominant maritime, trading state defeats a large continental power, enabling

another maritime state to become the new global leader. Each of these theories holds that systems transformation involves violent confrontations between two principal powers at the top of the system vying for systemic leadership: war causes systems transformation.

Power cycle theory, developed by Charles Doran (1991), argues that causation works in the opposite direction, from structural transformation to trauma of adjustment, to war (*see* Power Cycle Theory). The power relations that will prevail in the new system were created by shifting tides of change within the structure of the system. Based on the assumption of a pluralist, competitive system of several leading states rather than of a dominant hegemon, and of balance among these actors rather than hierarchy, Doran argues that systems transformation results when several leading states experience sudden, unpredicted, high-stakes change on their power cycles in a rather short interval of history. Tension and uncertainty ricochet throughout the system as states confront dramatic alteration of foreign policy expectations. Failure to adjust to systems transformation causes massive warfare. In contrast to the other interpretations, Doran argues that war is not necessary for systems transformation.

History, nonetheless, reveals a very high correlation between systems transformation and war. Since the origin of the modern state system, six systems transformations have occurred. Five of these systems transformations led to warfare that was intense, broadly encompassing, and of huge magnitude: The Thirty Years War (1618–1648), Louis XIV's Wars (1660–1713), Napoleonic Wars (1795–1815), World War I (1914–1918), and World War II (1939–1945). Only the most recent systems transformation, that taking place in 1989 at the close of the cold war, has ended peacefully.

Systems transformations are created by structural undercurrents due to the differential growth of nations. The task of the scholar and the statesperson is to disengage systems transformation from the catastrophic events that in the past have often accompanied it.

Tactical Voting

Tactical voting, also known as *strategic voting,* is considered the opposite of *sincere voting.* Tactical voting occurs when voters do not choose their genuinely preferred candidates, but instead vote for their alternative candidates in order to help prevent an undesirable election outcome. In order for voting to be considered tactical, it must meet two conditions. First, a vote must be placed for a candidate other than the preferred choice. Second, the decision to vote strategically must have been reached based on perceptions of the electoral outcome.

There are different types of tactical voting. *Compromising* involves voting for a candidate, or giving a higher ranking to a candidate, other than one's preferred choice. The choice is based on the perception that one's preferred choice will lose anyway, thus resulting in a wasted vote. Compromising often arises in plurality-majority electoral systems. *Burying,* a technique that often happens in Borda count systems, occurs when a voter ranks a candidate even lower than the actual preference, with the purpose of defeating that candidate. The *push-over* technique is used when a voter gives a higher rank to a candidate who is perceived to be easily beatable by the preferred candidate in the next round. This occurs most frequently in run-off elections.

Talk Radio

Political *talk radio*—programs that emphasize political events, issues, policies, and public affairs—has been a feature of American politics since the 1930s. President Franklin Roosevelt used radio to address the public during economic depression and world war, while Father Charles Coughlin provided an opposing voice. Radio call-in programs, where members of the public can contribute to the on-air discussion, became prevalent in the 1970s. Call-in talk radio emerged as a political force in the late 1980s and continues to provide forum for discourse and debate. Talk radio facilitates interactions between callers moderated by program hosts. Such discussions can also take place on television talk programs, including those on cable channels CNN, MSNBC, and Fox News.

However, television programs that encompass call-in listeners, like *Larry King Live,* can limit audience members to questions for in-studio guests.

A number of factors expedited the development of talk radio as a new political medium. Radio stations experiencing financial difficulties experimented with call-in talk radio as an inexpensive format and found an audience among aging baby boomers whose tastes were shifting away from music. Advances in satellite technology also made talk radio cost-effective on the regional and national level. People were drawn to talk radio to learn about and discuss high-profile legal cases, including the O. J. Simpson trial, and key political events, such as the Gulf War (1990–1991) and the 1992 presidential election.

The talk radio audience has changed markedly over time. Studies conducted in the 1970s and 1980s indicate that call-in talk radio provided a surrogate community for people who were socially isolated, detached from formal institutions, and alienated from politics. The new political talk radio attracts older, male, college-educated listeners with higher socioeconomic status. Whites are only slightly more inclined to listen to talk radio than other racial and ethnic group members. Listeners are likely to identify politically as Republican and conservative. They have a strong sense of civic duty, keep informed about current affairs, vote regularly, and participate in other conventional activities such as attending political meetings and contacting officials. They tend to distrust government and are highly critical of the mainstream press.

Talk radio programs attract sizable audiences. At least fifteen million people tune into talk radio programs every day. Nevertheless, the audience for call-in talk radio has declined somewhat over the past fifteen years. Data from the Pew Research Center 2008 Media Survey indicate that the percentage of the public who identify as regular or sometimes listeners dropped from around 50 percent in the 1990s to 40 percent or less in the new millennium. The decline in listenership corresponds to the rise in online discussion opportunities, which attract people with similar profiles to talk radio listeners.

Talk radio can contribute to political discussion as it combines entertainment and information in a way that inspires some citizens to engage. According to a Pew Research Center study, nearly 60 percent of listeners claim they gain knowledge from talk radio that they attain from no other source. Further,

politicians listen to talk radio, which gives citizens a mechanism for having their opinions heard.

Alternately, talk radio has been criticized for discouraging legitimate political participation by substituting talk for action and for encouraging political discourse that is vitriolic, sensational, and misleading. Kathleen Hall Jamieson and Joseph N. Cappella, in their 2008 book *Echo Chamber,* observe that talk radio contributes to a politically conservative echo chamber, a "bounded, enclosed media space that has the potential to both magnify messages delivered within it and insulate them from rebuttal" (76). Regular listeners to Rush Limbaugh's talk radio program, in particular, become isolated from alternative viewpoints and can become politically polarized. Liberal and Democratic talk radio programs have been less successful than conservative shows in gaining an audience. Air America, which was launched as a progressive talk radio network in 2004, declared bankruptcy and shut down abruptly in January of 2010. Public broadcasting stations, such as NPR and C-SPAN, offer nonpartisan call-in radio programs that address current issues and events, but they reach a limited audience.

Talk radio can influence the political orientations of listeners and callers. They are motivated to tune into shows in order to reinforce and deepen their political beliefs. Audience members often adopt program hosts' views about political leaders, issues, and candidates. They can also shift their views about political candidates and leaders based on the views expressed on air.

Tawney, Richard Henry

Richard Henry Tawney (1880–1962) was one of the most influential social critics and reformers of the twentieth century. Born in Calcutta, India, and educated at Balliol College in Oxford, he began his career at Toynbee Hall, a university settlement in East End, London, where he worked as a lecturer for the Workers' Educational Association. He became a reader in economic history at the London School of Economics in 1920 and subsequently became a department chair, a position he held until his retirement in 1949.

A leading socialist, Tawney was the ideologue of the Labour Party, and he served on numerous government bodies under Labour administrations.

Tawney was a Christian and a socialist in an age in which socialism was considered the antithesis of Christianity. He viewed socialism in Christian terms, as a means of extending the kingdom of God on Earth. He believed that every human being is of infinite value, and no expediency can justify the oppression of one by another. One of Tawney's great contributions was his reconceptualization of equality. It was integral to his vision of socialism and it meant the largest possible measure of equality of environment, circumstance, and opportunity. The concept of equality rested on three pillars: (1) all human beings share a common humanity, (2) all human beings must be enabled to make the best of such powers as they possess, and (3) rewards should be linked to social purposes.

Tawney's analysis showed a solid appreciation of the nature of power and its dynamics. He was deeply opposed to centralization and was critical of overcentralization and collectivism as in the Soviet Union. Equally dangerous to Tawney was the fragmentation implicit in capitalism, which he characterized as a juggernaut that sacrificed human ends to the idolatry of material means. He believed that socialism, on the other hand, entailed the cooperation of free and equal citizens generating common purposes.

Tawney further held that a fundamental principle governing the way societies work was function. He argued that rights to property were not basic rights but should be conditional on the obligation to service. Indeed all rights, he wrote, should be conditional and derivative. In a healthy society, people are not owners of rights but trustees for the discharge of functions and instruments of social purposes. A functional or good society is contrasted with an acquisitive society in which production and accumulation become ends in themselves. Function is thus related to purpose and service is participation to further a function.

For Tawney, citizenship was more than membership; it meant relationships among equals resting on consent, accountability, and common humanity. It was the relationship of self-reliant and self-respecting equals in a society where the absolute claims of individuality are respected. Such fellowship could come only under socialism, because capitalist institutions generated acquisitiveness and a loss of social cohesion.

Tawney authored several influential works. In *Acquisitive Society* (1921), he pointed out the corroding influences of materialism and consumerism. In *Religion and the Rise of Capitalism* (1922), arguably his most important work, he examined the interaction between religion and the Industrial Revolution that led to the birth of capitalism. In *Equality* (1931), he tackled the thorny questions of social equality in circumstances and opportunity. In *Culture and Anarchy* (1932), Tawney advanced the thesis, first put forth by English cultural critic Matthew Arnold, on the nexus between culture and democracy.

Tawney had a lifelong commitment to education. He served as an executive with the Workers' Education Association for forty-two years and was president from 1928 until

1945. He authored key Labour Party documents on education and served on various public bodies. He believed education had a spiritual dimension that helped to shape a democratic social environment.

Taxation

Taxation is the collection of revenues by the state, on a basis not directly linked to the provision of goods and services in return. The term taxation is not usually applied to the sale of goods and services by the state or state enterprises, from which revenues may be earned through prices, fees, or charges. There is an imprecise boundary between taxation and the so-called individual contributions paid in many systems of social insurance; whether such contributions count as taxation depends on how closely individual future entitlements to benefits relate to individual contribution payments.

In most countries, taxation has increased substantially over the past century, and the level of taxation varies considerably between countries. Among the Organization for Economic Cooperation and Development (OECD) countries, revenues from taxation were 28 percent of gross domestic product (GDP) in the United States in 2005, and an average of 40 percent of GDP in the European Union.

Taxes are levied by applying a *tax rate,* generally specified in percentage terms, to a *tax base,* the measure of value or quantity subject to taxation. Tax bases employed in most countries include individual income; aggregate business payments of wages and salaries, known as payroll taxes; corporate net income, known as corporate income or profits taxes; and sales by business enterprises, including sales, turnover, and value-added taxes. Many countries also levy taxes on wealth; inheritance; the value of certain classes of assets; or changes in asset values, known as capital gains taxes. Much of tax legislation's complexity arises in achieving a clear and legally enforceable definition of the tax base; the definition of taxable income is, in particular, complicated by the need to prevent straightforward opportunities for tax avoidance—the artificial restructuring of activity so as to reduce tax liability—such as paying income in kind or converting incomes into capital gains. With these complications

in mind, taxation can be analyzed from both a positive and a normative perspective.

THE EFFECTS OF TAXATION

From the positive perspective, tax incidence concerns where the burden of taxation lies. *Formal incidence* lies with whoever is liable, according to the legislation, to pay the tax. Thus, for example, a shopkeeper may be liable to pay sales tax on the value of goods sold. *Effective* or *final incidence* concerns where the burden of taxation is ultimately borne; it may differ from formal incidence if taxes shift through changes in wages, prices, or other economic adjustments. Thus the customer may bear the effective incidence of the sales tax levied on goods sold if the shopkeeper raises prices to reflect the tax. The scope for tax shifting depends on the characteristics of the market. In a competitive market, formal incidence is irrelevant to the determination of effective incidence; altering the legal liability to pay a tax levied on a particular base does not alter where the burden is ultimately felt.

Most countries levy taxes on both individuals and companies. From the perspective of final incidence, all taxes levied on companies are ultimately incident on individuals—as customers, employees, or owners of the taxed companies.

The impact of taxation on behavior affects the incidence of taxes (i.e., large behavioral adjustments tend to be associated with tax shifting) and also affects the economic costs of taxation, in the form of the *distortionary* impact on the labor supply or savings behavior of individuals and on the production and investment decisions of companies. When taxes lead individuals and firms to make production and consumption decisions that would not be chosen in taxation absence, the economic cost of taxation exceeds the revenue raised. The *excess burden* of taxation is the net loss in economic welfare occurring when revenues increase through taxes that affect behavior rather than through a tax that has no distortionary impact on behavior (i.e., a lump-sum "poll tax"). Estimates of excess burden vary widely, but as a rough rule of thumb, taxes in most industrialized countries might have an excess burden of at least thirty cents for each dollar raised, and poorly designed taxes have considerably more than this.

TAX POLICY ISSUES

Normative questions concerning taxation include whether the burden of taxation should be distributed across taxpayers according to *ability to pay* or according to the *benefit principle.* Taxpayer ability to pay might be defined in terms of individual income or individual consumption (as advocated by Thomas Hobbes in *Leviathan*). The benefits taxpayers derive from public services are difficult to measure and probably vary widely. Benefit taxation may be most useful as a guide to tax policy for decentralized jurisdictions, since large departures from the benefit principle could induce substantial taxpayer migration to jurisdictions with a more favorable balance between individual tax payments and spending benefits.

The distributional incidence of taxation (i.e., how taxes relate to household ability to pay) may be assessed on a

current annual basis or a lifetime basis. Taxes with a percentage of income taken in tax increases at higher levels of income are said to have a *progressive* distributional incidence, and taxes with a percentage inversely related to ability to pay are called *regressive.* Income taxes have a greater potential for progressivity than taxes on sales.

Tax policy typically involves a trade-off between equity and efficiency; a higher marginal rate of tax on income (i.e., the additional tax paid when income increases) increases the distributional progressivity of the tax system, but also increases labor market distortions. The economics literature on optimal taxation, beginning with the work of James Mirrlees, considers the structure of taxes that will maximize a social welfare function, giving weight to both efficiency and equity goals. One insight from this literature is the fragility of the case for taxes on the sale of goods and services; if the government is able to levy sophisticated income taxes, taxes on sales make no useful contribution to achieving equity objectives and, in some circumstances, may have higher efficiency costs than equivalent income taxes.

Although tax policy frequently tries to avoid excessive distortionary impacts of taxes on individual and corporate behavior, there has been recent interest in the potential for using taxation to encourage certain types of behavioral change, in particular to encourage individual retirement provision and to discourage environmentally damaging production and consumption activities.

Taxes may be levied at various levels of government. Municipalities and other lower-tier government units frequently employ taxes on real estate, both because the tax base can be unambiguously assigned to an individual jurisdiction and because the tax base is largely immobile. Some other taxes are more complex to operate at a local level, because the tax base cannot easily be assigned to local jurisdictions (e.g., corporate profits may be earned through business activity in many localities). Also, behavioral responses to tax differences across jurisdictions may be more severe, so that jurisdictions are constrained by the tax rates set by their neighbors, and tax policies may compete to attract mobile tax bases. There are differing views whether such tax competition is desirable. Some see tax competition as a desirable constraint on excessive government; others emphasize the potential inefficiency of tax competition through "base stealing." With increasing globalization, issues of tax competition arise between countries as well as between subcentral jurisdictions within a country. Major issues include the tax treatment of the foreign earnings of multinational companies and the use of *transfer pricing* to shift a multinational's profits to low-tax countries.

A relatively underexplored area is the determination of the tax structure—why some countries rely more on certain taxes than on others. Some aspects of tax structure are very durable over time—and tax privileges for certain activities appear much easier to legislate than repeal. In addition, tax policy making in many countries is a highly politicized process, exposed to substantial lobbying and public debate, and differences in the political process may account for some of the differences in tax systems across countries.

Telecommunications Policy

Telecommunication refers to point-to-point or networked electronic transmissions of information—telegraph, telephone, wireless, and data (i.e., the Internet). Telecommunication networks can use both cable and wireless transmissions, although in the wireless realm telecommunications are still characterized as networked or person-to-person links rather than one-to-many broadcast media. Modern societies depend on reliable and efficient electronic communications to conduct critical economic and social transactions every day. In most countries, however, the genesis of telecommunication networks from early telegraph systems placed their function and regulation within state organizations or state companies associated with postal services. As digital telecommunications, especially telephone and data networks, began to grow and diversify, these systems first became independent of postal administrations and then mostly privatized as new, competitive services, such as mobile telephones, came into use.

Traditional means of distant, point-to-point communications were affected by the movement of written information overland or by sea. From the mid-nineteenth to the mid-twentieth centuries, telecommunication networks were nearly all analog systems: Transmissions by either wire or wireless radio were in the form of analog waves. When digital computers were developed and their performance increased so dramatically, the move to convert from analog to digital systems was justified initially by cost savings and versatility. In embedding such computer systems in telecommunication networks, it also became apparent that new, diverse services could be deployed rather quickly and easily. Related technologies, such as digital mobile telephone systems and packet-switched networks, could be easily connected to or overlaid onto existing network infrastructures. The open, generative nature of such digital transmission systems and their associated standards paved the way for competition, as market entry by new firms became much easier, and deregulation in one country created pressures for deregulation in others.

Developing societies traditionally viewed access and use of telecommunications technologies as a way to generate foreign exchange or manage centralized political economic functions. Now many emerging market countries realize that telecommunications liberalization can be a major factor

in accelerating growth, promoting innovation, and ensuring economic diversification. Governments worldwide now view reliable, technologically advanced telecommunications as a national resource for competitiveness and economic security. Due to the ubiquity of integrated digital multimedia resources and recognition that these resources offer a decisive competitive advantage, the stakes of decisions in telecommunications policies have increased. As organizations of all types discover new ways of employing telecommunications to further their objectives and strategies, some scholars observe that advances in telecommunications have transformed power relationships in favor of private organizations over traditional governmental functions.

TRADITIONAL POLICY FRAMEWORKS

Governmental policies—in constitutional, regulatory, and economic contexts—largely shape the design, operation, and diffusion of telecommunication products and services. Telecommunication policy primarily involves issues concerning the transmission facilities of electronic communication. Content issues and related policy concerns, such as freedom of speech, rights to communicate, censorship, and privacy, have not been within the primary jurisdiction of telecommunication regulatory agencies.

Ownership, access, standards, and spectrum management have been the primary areas of telecommunications policy regulation under government monopoly regimes and contemporary regulatory structures. As an outgrowth of government-provided postal services, most governments established agencies or parastatal corporations known as *PTTs (Post, Telegraph, and Telephone)* to provide national telecommunications services and associated telecommunications equipment to their users. PTTs that were organized as state-owned enterprises obtained their capital investment from general government revenues and were typically prohibited from raising capital from commercial sources. In the United States, the 1934 Communications Act established exclusive commercial telecommunications carriers for voice and nonvoice services—AT&T (the Bell System) and Western Union, respectively. The Federal Communications Commission (FCC) performed regulatory oversight, including approvals for establishing prices, for interstate rates, and state public utility commissions performed oversight for local services. Under the PTT model, rates were typically established to cover investment and operating costs.

As public utilities, telecommunications operators have had to contend with policy requirements for universal access, or universal service, and its consequent economic burdens. Dense transmission trunks between major urban areas or within densely populated areas are more economical to operate due to high demand and less costly supply. Providing public telecommunications access to rural or thin-route areas is more expensive than acceptable prices would allow. Users in such areas either have inferior coverage or pay higher prices unless regulatory policies enforce rate averaging and subsidies to offer comparable services.

Standards also heavily influence the types of products and services available to users. Requirements imposed by telecommunications policy makers have included prior approvals—known as *type acceptance*—or restrictions on the types of customer-premise equipment that can be connected to public networks, allowable technical interfaces, and service quality (e.g., average network availability).

Radio spectrum management has also been the domain of government regulators. The bands of the electromagnetic spectrum useful for electronic applications include wireless telecommunications, over-the-air broadcasting, satellite communications, and radars. Demands often compete for alternative services, such as frequency bands reserved for television broadcasting versus wireless data networks. Designation and registration of the radio spectrum has been an important policy function of governments and has developed into sophisticated international rules in the International Telecommunication Union for avoiding interference and in allocating frequency bands to their most efficient use.

THE DIGITAL REVOLUTION

With the widespread availability, growing performance, and decreasing costs of computers, telecommunication networks became more heavily automated, digital, and combined with information technologies. Digital networks allowed new providers to demonstrate how easily telecommunications services markets could be entered, diversified, and expanded. These types of technological opportunities subsequently caused a number of governments to reconsider monopoly service models. Customer-premise equipment was first opened to competition, followed by new services such as mobile telephony and most public services. State-owned telecommunication operators were also increasingly privatized, allowing them to compete in domestic and international markets and to raise investment capital in traditional commercial markets. Most countries have privatized their telecommunications services and have opened markets to alternative operators and suppliers.

The introduction of multiple suppliers and operators led quickly to a bifurcation of regulators and operators. To maintain impartiality, policy and regulatory agencies could not be associated with any single operator. These policy agencies also have had to adapt to new challenges created by competitive markets. These include equipment performance standards, interconnection rules among telecommunications operators, allocating spectrum bands among competing operators, achieving universal service, and accelerating the deployment of new services, such as broadband wireless access.

EMERGING POLICY ISSUES

The strenuous efforts in the late 1990s to liberalize telecommunications services, in the context of a global trade regime under the World Trade Organization (WTO), highlight the importance of global telecommunications. Under resulting agreements, about 90 percent of telecommunications services in over seventy countries were opened to competition. Some estimates by the WTO indicate that such liberalization has

added the equivalent of one trillion U.S. dollars to the world's gross domestic product.

Such a generation of wealth and its consequent dependence on the global telecommunications infrastructure lead to new and potentially contentious policy issues—national and global. Developing countries continue to worry about being caught in a *digital divide,* less able to compete in a communications-rich global economy. Other countries are concerned that the rules of global telecommunications governance are not fully institutionalized. Private organizations and individuals have concerns about how the benefits of widespread, affordable, unencumbered communications can continue. Issues affecting the content of communications are also surfacing, including the balancing of countervailing policies, such as privacy and electronic surveillance.

Television and Politics

The arrival of television heralded a new political era. Enthusiasts for the medium predicted that "live" visuals would allow citizens to participate more directly in public decisions. The reality turned out to be more complicated. Though television helped undercut the power of political bosses in selecting political candidates, it also overemphasized telegenic appeal and, as electoral campaigns were increasingly waged via video, the costs of campaigning skyrocketed. The American presidency has been at the epicenter of the political changes brought about by television, and the medium has both enhanced the profile of the office and shaped its directions. At times, the television coverage itself has become the subject of political controversy.

EARLY POLITICAL IMPACT

Estes Kefauver, an undistinguished U.S. senator from Tennessee, was among the first American politicians to explore television's political potential. The 1950 *Kefauver* hearings were intended to impress the prevalence of organized crime on the nation's conscience. In 1950, such televised coverage was still a novelty, as viewers watched a parade of crime bosses deliver carefully rehearsed Fifth Amendment pleas against self-incrimination. The indignation stirred by these appearances did not stir even modest political action, such as writing to congressional representatives, but it helped catapult Kefauver onto the Democratic national stage.

The next major American television event was a series of ticker-tape receptions given by celebrated World War II (1939–1945) General Douglas MacArthur, after his dismissal from the Korean War in 1951 for insubordination. His widely televised triumphal return was interpreted as prologue to a presidential campaign, but trained participant-observers documented that what appeared as an enthusiastic welcome on television did not reflect the dominant mood of the crowds. Managers of video technology had selectively imposed their own structure on the event, a pattern that would be followed in later years. Thus the reality conveyed to television viewers differed from that experienced by in-person participants.

TELEVISION AND THE AMERICAN PRESIDENCY

Television played a major role in 1952 electoral campaigns. With coast-to-coast video available, candidates planned their every move with an eye on the cameras, and the campaign also became the first in which television became the most important source of information for the majority of voters. The first televised debates between presidential candidates were held in 1960 and have become a staple even for lesser offices. They usually attract larger audiences than other campaign events, with a record 81 million following Jimmy Carter versus Ronald Reagan in 1980. A so-called winner has rarely been clearly decided, but performance can be important especially in a close election. In 1960, neophyte presidential candidate John F. Kennedy stood up to renowned debater Richard Nixon, helping to establish his presidential timber and win a slim electoral victory.

The next election in 1964, when incumbent Lyndon B. Johnson ran against Barry Goldwater, raised unfounded fears that computer-based projections by networks in eastern states would dissuade citizens from voting in western states, where

polls remained open. Despite preelection polls projecting a Johnson landslide, people still voted to express their partisan commitment, fulfill their citizen obligations, or to decide local contests. However, the impact of network projections did not fade away. Most notably, in 2000, networks prematurely named Al Gore the winner in Florida, and thereby the nation. Separated by only a few hundred votes, both parties turned to courts to judge the validity of ballots, but also reached out for public support as television reported all their moves, for five weeks, until the Supreme Court finally settled the dispute in favor of George W. Bush.

TELEVISION AND POLITICAL SCANDAL

The age-old phenomenon of political scandal came forcefully to television during Watergate, named for the break-in at the Democratic headquarters during the 1972 electoral campaign. Originally, few believed the president was personally involved, but televised hearings by congressional committees helped to convert the issue into a legal one, regarding what did the president knew and when. After Nixon fired special prosecutor Archibald Cox, Cox brought his case to television viewers and swayed public opinion. The national protest triggered by Nixon's defiance of public demands ultimately led to a televised impeachment debate and his televised resignation in August 1974. With the "whole world watching," Nixon resigned. Since Watergate, Americans have followed a parade of scandals playing out on camera, many with the suffix *gate* attached to the end. The advent of twenty-four hours of news in the last decades of the twentieth century accelerated the development of scandals and of all political news stories.

WAR ON TELEVISION

Television coverage has profoundly changed the politics of war. The brutal images filmed during the American Tet offensive in 1968 during the Vietnam War (1959–1975) undermined public support for the Vietnam War. Critics of the networks charged that a de facto American military victory had been depicted as a defeat, but others responded that, prior to Tet, few camera crews had ventured into danger zones to show casualties. In the Gulf War (1990–1991), commanders assured favorable coverage by organizing reporters into pools and chaperoning them to sites they wished to publicize, showing prisoners of war and burning tanks. Public trust in the military reached an all-time high. The Iran-Iraq War (1980–1991) was even more of a media event. Nightly briefings, carried live, depicted a surgical operation aimed at Saddam Hussein. Over time, television carried more realistic images of this deadly struggle.

Television's capability to focus attention on world events is not confined to war. Pictures of suffering alongside famine, natural disaster, or deadly conflict have evoked humanitarian intervention even when no national interest is at stake. These images may even affect foreign policy. The extent to which international coverage has sometimes driven diplomacy, the significance of a "CNN effect" in particular situations, remains an open question. The airing of images of 1994 genocide in Rwanda, for instance, did little to encourage foreign intervention; in the United States, the images of American soldiers dragged through the streets of Mogadishu, Somalia, in 1993 remained a powerful deterrent from another dangerous "peacekeeping mission."

From the Tet offensive onward, debates have swirled over the decision of major networks to show or not show disturbing images that may inflame ongoing conflicts; for instance, in 2004, CBS chose to show photographs of humiliating torture perpetrated at the U.S. prison camp in Abu Ghraib, Iraq. These same images were broadcast by Arab television stations across the world, who took them as emblematic of Western attitudes. While television makes it possible for the "whole world to watch," the whole world watches the same images through very different lenses, often provided by networks themselves; the same event on BBC news in English may be given a profoundly different significance according to Arab-language broadcasts from al-Jereeza.

Teratopolitics

The term *terato,* or monster (from Latin *monstrum,* Greek *teras*) in its wider meaning evokes the astonishment produced by an irregular and wonderful phenomenon. In this sense,

neglecting its significance is not only to ignore one philosophical question among others, but rather to miss one of the main philosophical problems. In fact, if philosophy arises from astonishment and wonder (*theorein* and *thaumazein*), as Plato argued, the monster raises questions at the core of the human experience of knowing, with important implications for the understanding of political life.

The discovery by modern anatomy that monsters belong to regular orders and laws of constitution challenges Christian metaphysics, which saw monsters as a free divine creation, used by God to make a kind of revelation to men, as discussed by Augustine of Hippo. In the modern age, the monster becomes the key figure to reflect on norm and anomaly, within both ontological and human order.

The permanence of the metaphor of the monster in Western culture and political thought extends from ancient times to the modern day and shows that the monster has not been domesticated. Rather, the monster continues to produce displacing effects and to redefine the relationship between the normal and the pathological, questioning also order and hierarchies within the universe of political ideas.

For conservative philosophers who seem to envisage order and life as a set of fixed and transcendent laws, the metaphor of monster is employed to blame the "other," to construct deviance and political pathology. The best-known example is Thomas Hobbes's *Leviathan* (1651), in which Hobbes likens the state to the monster evoked by God in order to silence Job, symbol of rebellion. One can also refer to Edmund Burke's monstrous multitude in his 1790 *Reflections on the Revolution in France* or Francis Bacon's *An Advertisement Touching an Holy War* (1586–1589), which uses Hercules's fight against the many-headed hydra as a metaphor for the necessary extermination of rebels. The metaphor of monster can be used in other ways as well, to denounce and uncover the inhumanity of reality, as Karl Marx does in *The Communist Manifesto* (1848), by employing the Gothic character of the vampire to describe capitalism, or the disturbing banality of monstrosity, as Hannah Arendt does in her 1963 book *Eichmann in Jerusalem: A Report on the Banality of Evil*.

From a theoretical point of view, however, the monster can also leave the realm of metaphor: Removed from the dialectic of deviation and conformity from the norm, the monster becomes an autonomous concept that challenges the idea of norm itself. Such autonomy of the monster can be found in the works of Niccolò Machiavelli; not, as his adversaries claim, in the monstrosity they call Machiavellianism, but in his use in *The Prince* (1513) of Cesare Borgia, supposedly a moral monster, as a new paradigm of political action. Machiavelli sees social conflict as a positive and productive phenomenon that produces good law and prioritizes political and social conflict over the traditionally enshrined values of societal harmony and concord. In the heart of the seventeenth century, Baruch Spinoza is the only philosopher to see Machiavelli as a thinker of freedom. More recently, in his 1969 article "Plato and the Simulacrum," Gilles Deleuze invokes the monstrous character of the simulacrum against the Platonic metaphysics

of the model-copy relation. Contemporary feminist theorists have made powerful use of the monster to analyze anomaly as an active and autonomous insubordination against the male normative model.

Term Limits

Under the Articles of Confederation, the first constitution of the United States, term limits were imposed for representatives. However, in 1787, when the new U.S. Constitution was drafted and debated in Philadelphia, the delegates to the Constitutional Convention decided against any term limit provisions in the Constitution. This thought reversal has provided fodder for a continuous debate ever since.

Term limits are restrictions bound by law that limit an elected official to a specific number of terms for a particular office. Term limits appear at both the federal and state levels. Although absent from the Constitution during the early part of the nation's history, President George Washington set the precedent for an unenforced presidential term limit of two terms. Every president since George Washington through Herbert Hoover recognized the significance of Washington's actions and limited their time in office to two terms. President Franklin D. Roosevelt was the first and only president to be elected to the presidency four times. His actions set forth a movement to legally restrict the president to two terms. In 1951, the United States passed the Twenty-second Amendment, which made it impossible for a president to serve more than two terms. Since its ratification, opponents of the measure, including several presidents, have questioned the constitutionality of the amendment and have voiced their objections to it.

Several state constitutions include provisions for term limits for state governors and state legislators as well. Beginning in

the 1990s, in response to a poor economy and an increasing cynicism toward an unresponsive government, states across the nation became witness to a democratic movement that sought to hold government accountable to the people. Several states introduced referendums and initiatives seeking to limit their elected officials to specific term limits.

Regardless of whether term limits are imposed at the state or federal level, the contentious issue has its share of proponents and opponents. Although term limits have become an integral part of America's political system, opponents stand behind several arguments in seeking its repeal. First, opponents assert that term limits are undemocratic: The very nature of limiting the right of voters to exercise their vote in the manner they choose and selecting the representative of their choice is undemocratic. If constituents prefer to reelect their representative, regardless of how many times the individual has served, democracy provides that right. If term limits are used to ensure that only the most experienced and upstanding hold office, the voters can perform the same task, by voting them out of office, without the need of restrictions. Second, opponents contend that term limits dilute the pool of experienced politicians: By imposing term limits, the pool of candidates is effectively limited to those with little to no elective office experience. As in any job, those with experience and seniority are better able to start exercising their duties on day one without the restrictions of a learning curve. Furthermore, those who perform well, have experience, and are not restricted by term limits can provide their constituents with greater benefits than their first-year colleagues. Third, opponents believe that if term limits are imposed to increase accountability, it actually fosters the opposite: Knowing that an elected official is coming to the end of the term, no incentive exists for them to remain accountable or responsive to the voters, instead they may forsake the voters' interest on behalf of others.

Those who support term limits often argue that term limits provide the opportunity for new people who have fresh ideas and are more innovative to serve in government. Further, term limits eliminate the need for politicians to consider political concerns when making decisions. Since they will not be up for reelection, term limited officials can freely exercise their vote and duties without fear of political reprisal. In addition, supporters contend that term limits reduce the power of incumbency because elected officials are no longer able to use the benefits of their office to ensure their own victory at the expense of a candidate who is less well known or is a financial underdog.

Terrorism, Financing of

Terrorism financing, or *reverse money laundering,* is the process of raising and transferring funds, from legitimate or dubious sources, for future criminal activity. Though there are similarities between money laundering and terrorism financing, there are also notable differences. Terrorists will minimize their use of regulated financial industries because of their need for anonymity, or in some cases because they live and operate in states where the financial system is underdeveloped. Sources of terrorism financing may be entirely legitimate, such as money obtained through regular business activities or charitable donations. Terrorists also may use couriers or send money through, often poorly regulated, remittance systems. In addition, there have been reports of cooperation between organized crime groups and terrorist organizations, especially in the drug trade. Terrorists have been known to raise money through the trade in gemstones, and there has been indication that ransom money paid to pirates may have been transferred to terrorist organizations.

The events of September 11, 2001, brought the issue of terrorism financing to the forefront of the political agenda. The international community had, however, already started to address the issue. The United Nations General Assembly adopted the Convention on the Suppression of the Financing of Terrorism in 1999. Shortly after the September 11 attacks, U.S. president George W. Bush launched the war on terror by signing an executive order blocking the assets of listed individuals and terrorist groups. The U.S. Congress then adopted the USA PATRIOT Act; title 3 specifically targets illicit finance. Internationally, the Financial Action Task Force's mandate was expanded to cover both money laundering and terrorism financing. States around the world subsequently amended their legislation on illicit finance to include terrorism financing. Conventional wisdom holds that following the money trail enhances security by allowing authorities to identify and keep track of suspect individuals and of their networks.

The fight against terrorism financing has not been immune to criticism. Committing an act of terror is not necessarily expensive, and there are no guarantees that tackling terrorism financing is actually an effective way to combat terrorism. Scholars also note that financing of terror is ingrained in political and geostrategic struggles, as is the case, for instance, with national liberation movements and state-sponsored terrorism. The identification of terrorists by public authorities, or financial services sector firms, is also subject to mistakes leading to potential abuse. Some critics maintain that the fight against terrorism financing has been used to marginalize minority groups, such as Muslims, and developing states, where terrorists are thought to hide, through increased surveillance of the financial system.

Terrorism, Political

Terrorism involves calculated outrage. It represents the power to hurt in its purest form, to use the classic description of Nobel laureate Thomas Schelling. The concept refers generally to the use or threat of violence to achieve political ends, but terrorism is meant not simply to destroy. It also communicates a message to a watching audience through the shock value of its transmission. The individual victims and physical targets of terrorism are representatives or symbols of larger collectivities—states, nations, communities, social classes, or other categories. The victims are usually defenseless and caught by surprise. They may be ordinary people in public places—shopping at a market, eating in a restaurant, riding a bus, or attending religious services—or they may be national or local leaders singled out for assassination by virtue of their positions. Harming the victims warns all who can see themselves in the victims' place. Most victims of terrorism are civilians, although the line between combatants and non-combatants is often blurry, especially in intense civil conflicts. Potential victims may know that they are at risk because of the community of people they belong to or the entity they represent, but they cannot know when or where the attack will occur or who the perpetrator will be.

The type of violence employed is deliberately shocking. Since the invention of dynamite in the late nineteenth century, terrorists have relied heavily on explosive devices, which have ranged from crude, short-range bombs to airplanes flown into buildings in the 9/11 attacks on New York and Washington. In the 1980s, the practice of suicide bombing, and thus *suicide terrorism,* developed as governments became more adept at preventing terrorists from leaving bombs in public places. Nevertheless, the bombing of Pan Am 103 in 1988 and the Oklahoma City bombing in 1995, the most deadly attacks against U.S. citizens before 9/11, involved bombs placed in an airplane luggage compartment or left in a vehicle. Bombings are shocking because of their indiscriminate nature and because of the horrible carnage and dramatic visual effects they produce. Bombs have the potential to cause massive casualties, as the 9/11 attacks showed, and many experts fear that terrorism could become catastrophic should its users obtain nuclear, chemical, biological, or radiological materials to explode or disperse.

Terrorism can also involve seizing hostages in order to bargain with governments. In the late 1960s, skyjacking; kidnapping diplomats, business executives, and reporters; and taking over public buildings such as embassies became almost commonplace. Terrorists typically demanded the release of prisoners and sometimes ransom or publicity for their cause.

A terrorist attack in New York City and Washington, D.C., on September 11, 2001, ended in the destruction of the two towers of the World Trade Center, damage to the Pentagon, and the loss of thousands of lives.

Terrorism is usually associated with nonstate actors—small groups who oppose the authority of the state. It is classically referred to as a "weapon of the weak," for those who lack the military forces or supporters to compel their adversaries to comply with their wishes. However, not everyone would exclude states as actors, and states have intervened directly through their own agents (e.g., Libya and Pan Am 103) or have assisted proxies (e.g., Iran and Hezbollah in Lebanon). Whether instigated by nonstates or states, the organization of terrorism is clandestine. The perpetrators conceal themselves and try to remain anonymous. The secrecy of the planning contrasts sharply with the spectacular resulting violence. The invisible becomes visible in one shocking moment.

Most terrorism is domestic, involving perpetrators, victims, and targets (i.e., those whom the act is designed to influence rather than harm directly) from the same country. Its users can include revolutionaries struggling to overthrow governments, nationalists, or ethnic minorities who want independence or secession, single-issue groups, or right-wing defenders of the status quo. In the 1980s, the term *religious terrorism* gained prominence in the aftermath of the Iranian revolution and the establishment of Hezbollah in Lebanon. With the emergence of al-Qaida and associated jihadist movements during the Soviet Union's occupation of Afghanistan, religious terrorism came to be associated with Sunni Islam, although there have been violent offshoots of all major religions. The desire to replace a secular regime with a religious one may be a variant of the same revolutionary drive that leads the followers of political ideologies to want to create a new constitutional order along the lines of principles they see as just.

International terrorism was recognized as a distinct type of terrorism in the 1970s. Victims, targets, and perpetrators were

of different nationalities, or the act was committed outside the boundaries of the territory in dispute. The attack at the 1972 Munich Olympics, when the Palestinian Black September organization assaulted Israeli athletes in Germany, represents this type of terrorism. In the 1970s and 1980s, Western governments, particularly that of the United States, were often targeted abroad through hijackings and kidnappings. Thus, for many years, the U.S. Department of State and the Rand Corporation tracked incidents of international, not domestic, terrorism.

CAUSES OF TERRORISM

The causes of terrorism lie at the individual, group, and environmental levels. Most students of terrorism would agree that a group or organization is the key agent behind campaigns of terrorism.

The idea that there are specific personality traits that determine or even predict an individual's propensity to engage in terrorism has largely been abandoned, along with the proposition that there is a terrorist psychopathology. Most "terrorists," even suicide terrorists who regard themselves as martyrs to a cause, seem to be distressingly normal. Instead, attention focuses on the social psychology of group dynamics. Identification with the group and the cause, the cohesiveness produced by danger and stress, conformity and peer pressure, and the small size of most groups influence individual and group behavior. Through belonging to the group, individuals overcome moral inhibitions against violence. Over time, groups may come to exist primarily in order to maintain themselves, rather than to accomplish a remote and elusive political objective.

It is extremely difficult to link terrorism directly to environmental conditions such as poverty, lack of democracy, or the pressures and frustrations associated with globalization. For one thing, those who engage in terrorism are few, while those who experience such conditions are many. In addition, the evidence is contradictory. Repression of nonviolent political dissent would logically cause terrorism, but democracies may attract terrorism because they do not exercise the level of social surveillance that would prohibit the formation of conspiracies, are target rich, and have a high media presence that guarantees publicity. Democracies provide opportunity, while repressive regimes provide motivation. In terms of links between economic conditions and terrorism, most members of terrorist organizations, especially the leaders, are not from the most disadvantaged sectors of their societies, although they often claim to act in the name of the dispossessed and may be genuinely committed to them.

A focus on groups as the primary unit of analysis usually assumes that terrorist organizations interact strategically with friends and adversaries. For groups seeking political change, the government is typically their main opponent, but they also engage in rivalries with other like-minded groups and hostilities with opposing groups (e.g., for revolutionary groups, paramilitaries supporting the government). They also seek popular support for their cause. Thus, terrorism is a deliberate

means to an end. It may intend to provoke a government into overreacting, coerce it into agreeing to concessions, arouse popular enthusiasm and demonstrate power, "spoil" peace processes, or simply attract international attention to local grievances that would otherwise be ignored. Terrorism does not require much in the way of material resources, nor does it necessitate the mobilization of large numbers of people, so it is a relatively economical choice. It may also be a way groups operating in a competitive environment distinguish themselves from their rivals.

Concentrating on the group raises questions about the possibility of establishing a typology of terrorist organizations. Most typologies classify groups in terms of their ideological orientation: left-wing, right-wing, nationalist, religious, or mixed. Overlapping categories muddy distinctions. The Palestinian Hamas, for example, could be defined as both nationalist and religious. It is also difficult to say which other traits or characteristics might be correlated with differences among goals. Religious terrorism may be more lethal and more indiscriminate than secular terrorism. Apocalyptic ends may encourage disdain for the number of casualties or degree of precision in targeting because pleasing an earthly constituency is perhaps irrelevant.

After the 9/11 attacks, some claimed that terrorism had been radically and fundamentally changed, that a new terrorism replaced the terrorism of the past. The so-called old terrorists, such as the Irish Republican Army, were presumed to be rational calculators with whom governments could bargain, whereas the new religious terrorists, such as al-Qaida, sought only destruction. But secular terrorists may not necessarily be more reasonable or casualty averse.

Another dimension to consider is the structure of the organization, in particular whether it is hierarchical or flatly networked. The development of al-Qaida after 9/11 may indicate that the classical centralized-cell structures of underground movements have been replaced by decentralized, even disconnected, and diffuse networks composed largely of local volunteers. The bombings in Madrid in 2004 and London in 2005 by small groups who appeared to be al-Qaida sympathizers may indicate such a development. If this is the case, individual motivations may become more important to terrorism, and studies of radicalization and deradicalization processes, especially in Western European Muslim diasporas, are critical. However, many groups, such as Hezbollah and Hamas, remain centralized and hierarchical with social service wings. Such welfare activities are most often associated with religiously oriented groups. A certain paradox emerges: Religious groups may be the most lethal to their adversaries and the most humanitarian to their constituents.

ENDING TERRORISM

Interest in the aspect of terrorism ending is much more recent than inquiry into its causes. How governments respond to terrorism is only part of the picture. The use of military force, actually rare, rarely succeeds in defeating terrorism; military force is too blunt an instrument for such a shadowy, adaptive,

and versatile adversary. More fine-tuned police and intelligence work is usually the key to arresting or killing enough members of an organization to cripple its operations. However, if terrorist organizations can continue to replenish their ranks through recruitment, then violence may not end. If the government's response to terrorism only creates more incentives for resistance, then it can be self-defeating. Furthermore, terrorism that crosses national boundaries cannot be contained exclusively through local security initiatives. Dealing with extended terrorist networks like al-Qaida and its cohort requires extensive international cooperation and coordination of security measures.

In some circumstances, groups abandon terrorism to enter the political process as legitimate players. The organization remains intact and viable, but its strategy shifts. This option may be associated with new, not necessarily immediately taken, opportunities for participation or resolution of civil conflicts in negotiated settlements that promote power sharing. The Irish Republican Army took many years to agree to enter politics through the implementation of the 1998 Good Friday accords. In Spain, Basque Fatherland and Liberty increased its violence when Spain transitioned to democracy in the 1970s. In Colombia in the 1980s, government overtures led April 19 Movement to become a political party, but the Revolutionary Armed Forces of Colombia continued its violent opposition and became extensively involved with the drug trade.

Suppressing terrorism through the judicious use of security countermeasures and opening political alternatives are not incompatible government responses. In fact, both may be necessary. The first policy makes terrorism too costly to continue, while the second heightens the rewards of participation. If terrorist organizations are instrumental, they will weigh costs and benefits accordingly.

Another path for terrorism's decline lies in the potential for groups to self-destruct or implode on their own. Sometimes the ideas they espouse have so little popular appeal that the cause dies with the group's members. This may be most characteristic of very small groups. An organization's activities may also alienate the constituency whose allegiance they seek. For example, the Red Brigade's 1978 kidnapping and murder of Italy's Christian Democratic Party leader Aldo Moro marked the beginning of their decline. As noted earlier, internal dissolution may proceed in tandem with government suppression.

Some government efforts to end terrorism stress the decisions of the individual rather than those of the group. Governments can offer amnesty and social reinsertion. Policies such as Italy's *pentiti,* or repentance, initiative, which offered shorter prison terms to members of violent organizations who confessed, seemed effective in drawing members away from their groups. Post-9/11 deradicalization programs aimed at individual disengagement operate in Muslim countries such as Yemen, Saudi Arabia, Malaysia, Singapore, and Indonesia.

9/11 AND THE CONSEQUENCES OF TERRORISM

Before September 11, 2001, terrorism was generally not considered a serious enough threat to warrant inclusion on the national or international security agenda. Certainly since the 1960s terrorism had troubled domestic order in many states, including Western liberal democracies, but it was typically an internal problem that did not threaten the stability or integrity of the state. The suffering and destruction caused by sporadic terrorist incidents was painful but minor in the grand scheme of casualty-producing events. After the Aum Shinrikyo sarin gas attacks on the Tokyo subways in 1995, concern mounted over the prospect of weapons of mass destruction, but terrorism was still not a priority. Israel's intense experience with terrorism after the 1967 war and its consequent permanent war footing were exceptions. No other state felt as vulnerable or reacted as strongly to terrorism. For Israel, military retaliation became almost a requirement of counterterrorist policy.

Just as terrorism was not a major concern for most governments, it was not deemed significant to the study of international relations and foreign policy even after the cold war ended. Terrorism by small nonstate actors seemed peripheral to the structure of the international system and the big issues of war and peace among nations. Genocide, civil war, and humanitarian intervention seemed much more important than terrorism.

It is impossible to exaggerate the worldwide effects of al-Qaida's 9/11 attacks on the World Trade Center and the Pentagon. Terrorism sprang to the top of the national agenda of the world's remaining superpower; the United States immediately declared a global war on terror. In its pursuit, the United States invaded and occupied Afghanistan in 2001 and Iraq in 2003. Intelligence and domestic security institutions were revamped, old agencies were merged, and new agencies were created in the most radical bureaucratic restructuring since the end of World War II (1939–1945).

America's allies supported the invasion of Afghanistan. Before the 9/11 attacks, the Taliban regime had refused to turn over al-Qaida despite increasing international pressure, and it remained obdurate even after 9/11. Most of the world, however, including the United Nations, did not approve of the invasion of Iraq, which the United States claimed was necessary because Saddam Hussein was close to acquiring nuclear weapons that he might pass on to al-Qaida. By invading Iraq, the United States sacrificed much of the sympathy and good will it had gained in the aftermath of 9/11. The transformation of U.S. goals for the global war on terror from eradicating terrorism to spreading democracy and ending tyranny around the world seemed to many to be an example of hubris and overreaching, although President George W. Bush claimed that U.S. policy was idealistic in its ends and realist in its means. The Obama administration took a more moderate approach to counterterrorism policy but continued the struggle to destroy al-Qaida.

The 9/11 attacks and subsequent al-Qaida–linked events around the world also focused scholarly attention on al-Qaida, its allies, subsidiaries, and the cause they espouse—the expulsion of "crusaders and Jews" from Muslim countries and the establishment of a pure form of Islamic law in these states. Analysis of *jihadi* or *Salafist* (puritanical) thought and practice has surged.

Terrorism, State-sponsored

Despite profound concerns over the growing lethality of terrorist acts committed by independent nonstate actors, far greater acts of destruction are possible when states assist terrorists. Indeed, many perceive that the most daunting threat facing society today is state assistance in terrorist acquisition of a weapon of mass destruction (WMD)—for example, a nuclear weapon.

A precise definition of state-sponsored terrorism is elusive because a universally accepted definition of terrorism does not exist. Nevertheless, most definitions of state-sponsored terrorism incorporate four features:

1. An action employing the deliberate use of violence or the threat of violence.
2. An action targeting noncombatants directly and indirectly. The former are the immediate victims of the act; the latter is the larger audience that the action is designed to intimidate, threaten, or coerce.
3. An action directly undertaken by a nonstate actor. While such a group is linked to and may be influenced by a state(s), it possesses a leadership and decision-making body that is separate from any state.
4. An action supported, in some fashion, by a state. Support can come in the form of financial backing, supplies, logistics, networking opportunities, intelligence sharing, training, diplomatic protections, physical basing of terrorists, or safe havens.

States have a long history of employing irregular forces to destabilize and intimidate their opponents. The primary advantage of using these forces is that they provide state officials with the ability to deny involvement in violent actions against their opponents. Some states have pursued the sponsorship of terrorism as a cheaper alternative to conventional armed forces. Weaker states also have used clandestine backing of nonstate actors as a weapon against opponents who possess stronger military and political power. When viewed through contemporary portrayals of *terrorism*—a term that only came into use in the last eighteenth century—some of these historical episodes fulfill many of today's definitions of state-sponsored terrorism. Russia's assistance to Slavic revolutionary groups in the eighteenth century is frequently portrayed as an antecedent to what is commonly referred to today as *state-sponsored terrorism*. The peak era of state-sponsored terrorism was the cold war, during which both superpowers—the Soviet Union and the United States—engaged in sponsorship of what many perceive to be terrorism. The former, along with some of its satellite states, most notably East Germany, funded, trained, and equipped terrorists active in Europe and the Middle East. In the 1970s, the United States financed right-wing terrorist paramilitary units in Chile as they sought to remove its leader from office. Similarly, in the 1980s, the United States offered extensive support to the Nicaraguan Contras who battled in opposition to the Sandinista regime. Most experts agree that some of the Contras's actions are best defined as terrorism.

Following the demise of the Soviet Union and the Warsaw Pact, state support of terrorism became more circumspect. However, important exceptions to this trend existed. Most important was the ruling Taliban government that allowed al-Qaida to base itself in Afghanistan from 1996 until late 2001 when both were ejected by U.S. military forces. Moreover, states such as Cuba, Iran, Iraq, and Syria were accused of using violent proxies to pursue their goals on occasion throughout the 1990s and into the twenty-first century.

Western nations in 2010 continue to direct their concerns with state-sponsored terrorism toward Iran and Syria. Both of these states are thought to offer Hezbollah—a Shia Islamist organization based in Lebanon—financial support and weapons. Suspicions that Iran's nuclear power program belies its true intent of fabricating nuclear weapons have led to concerns over its sponsorship of Hezbollah as well. Thus, despite

an overall decline in state sponsorship of terrorism, apprehensions today primarily revolve around terrorist acquisition of a state-supplied WMD.

State sponsorship of terrorism has had a large impact on international security. It has been used to topple governments and weaken states. In the twenty-first century, fears that states would assist their terrorist clients in obtaining WMD have fueled U.S. governmental action designed to change governing regimes, most notably in Iraq in 2003.

Thatcherism

Thatcherism, a term popularized in the 1980s, was initially used by political opponents of British prime minister Margaret Thatcher to derisively refer to the political philosophy, doctrine, and programs she introduced to the country from 1979 until 1990, when she resigned from office. The intent was to stigmatize Thatcher's programs, which her political enemies felt she advocated with great force and which they ultimately believed would lead to failure. Thatcher's supporters, however, took the term and made it their own, elevating it from a derisive term used by opponents to a positive reflection of the prime minster and her policies.

While no universal definition exists for Thatcherism, it is a term widely used by academics, politicians, and the press to identify what took place during Thatcher's tenure as prime minister. Numerous explanations have been offered to define the term, and several key features consistently appear in the different definitions proposed. Among them are a fiscal policy that promotes low inflation and a tight control on money supply, and a labor policy that favors privatization and limitations on labor movements, including trade unions.

Some argue that the principles of Thatcherism are nothing new and existed before Margaret Thatcher gave advent to the term. Regardless of how Thatcherism is understood as a phenomenon, it is clear that it had lasting effects on the United Kingdom.

It has been suggested that Margaret Thatcher may have alienated many of her own, the conservatives in Great Britain, with her brash and iron-fisted will to pursue what she saw as the true conservative doctrine, even if it clashed with conventionally held conservative doctrine. Not only did she clash with conservatives in her own party, but she also alienated progressives. Nonetheless, Thatcher ushered in several changes when she became prime minister, including raising interest rates to control inflation in a time of recession, attacking trade unions, and privatizing public transportation and social housing.

In many respects, Thatcherism was a conservative economic philosophy that was led by the market and reduced government intervention. Thatcher focused her energy on government reform, stating, "I was determined . . . to begin work on long-term reform of government itself. If we were to channel more of the nation's talent into wealth-creating private business, this would inevitably mean reducing employment in the public sector." In many respects she considered the civil service a "necessary evil" that needed to be downsized.

Thatcherism transformed the composition of the Conservative Party in the United Kingdom, reoriented the responsibilities of the civil service, and provided an interpretation or understanding of individualism and the capacity of human beings. It advocated well-known ideas such as the value of free trade, the benefits of lower taxes, the importance of patriotism, and support for individual responsibility (e.g., hard work, personal responsibility, forethought, and frugality). Thatcherism's focus on the individual fostered the idea of self-worth and individual entrepreneurship rather than a reliance on government. Moreover, Thatcherism sought to centralize power in the hands of the prime minister and reduce the influence of trade unions. Thatcherism increased the United Kingdom's international prestige and involvement and was widely accepted both in the United States and in other democracies around the world as an opponent of unbridled state growth.

In order to understand the legacy of Thatcherism, it is important to separate Margaret Thatcher from Thatcherism because each has endured quite different fortunes. Thatcher proved to be a far more successful and enduring figure in British politics even after her party lost control of Parliament and turned it over to the newly reformed Labour Party. If one analyzes the specific programs attempted by Thatcherism, it has a mixed and short-lived record. For instance, efforts to reduce the tax burden on British citizens failed to realize the long-term goals envisioned by Thatcher and her supporters. In 1996, the percentage of annual income devoted to taxation was higher than its 1979 levels. Nonetheless, Thatcherism provided a new orientation to government and individual responsibility that has lived on in the United Kingdom and reverberated beyond its shores.

Theater, Political

The term *political theater* refers to two separate but related ideas. The first is the idea of politics *through* theater: the use of theater as a vehicle for the expression of political action. The second is the metaphor of politics *as* theater: a resemblance of political action to the character of dramatic events enacted upon a stage. Both ideas date back to the emergence of theater itself in the ancient world, and both continue to inform contemporary political life.

POLITICS THROUGH THEATER

Theater, from its earliest incarnations, has had a decidedly political character. In ancient Athens, theater served as the centerpiece of an annual festival that was civic as well as religious in character—politics and religion not being so neatly separated in the ancient world as they are today. The tragedies and comedies presented at these festivals, at least the small fraction of them that have survived to the present day, typically addressed current political issues directly (e.g., Aeschylus's *The Persians* and Aristophanes's *Lysistrata*) and through myth (Aesschylus's *Oresteia* and Euripides's *The Trojan Women*). The potential disruptive effect of these dramas, and their centrality to the moral education of Athenian society, led Plato to famously feel obliged to banish these artists from his ideal city for fear of their corruptive effect on the character of the young.

The intervening centuries have seen powerful and compelling instances of political theater in this first sense, with its most profound political insights often accompanying its heights of artistic achievement. William Shakespeare's revision of the available dramatic genres to encompass the history play as well as the historical tragedy produced some of the most incisive studies of political action in all of literature. Henrik Ibsen's great dramas of psychological realism also included some of his era's most important political explorations, from *A Doll's House* to *An Enemy of the People.* The dramatic works of George Bernard Shaw and of Bertolt Brecht, though sometimes criticized for their didacticism, explicitly engaged in political argument through the ideologically laden monologues of their protagonists as well as the complex social situations they confronted. Great dramas of the mid-twentieth century, such as Arthur Miller's *All My Sons, Death of a Salesman,* and *The Crucible,* and of the late twentieth century, such as David Mamet's *Glengarry Glen Ross* and *Oleanna,* were notable for the way their political messages were integral to their artistic aims without overpowering them.

THEATER AS METAPHOR FOR POLITICS

More subtle, yet perhaps also more significant, is political theater in the second sense, as a metaphor for the nature of political life. One part of the metaphor involves the idea of *roles* and *character.* The claim that character matters centrally in representative government, particularly the American presidency, has been so widely repeated as to establish a resilient cliché. But this idea in turn draws on the notion that political actors are enacting roles separate from their own private selves, entailing their own internally justified standards of evaluation. This metaphor goes back to Cicero and the ancient rhetoricians, who frequently described the public official through the metaphor of someone enacting a role on a stage, as a way of emphasizing the importance of context and circumstance in the moral evaluation of political action—a metaphor widely repeated in the Renaissance by writers such as Erasmus, Thomas More, Montaigne, and Shakespeare. Martin Luther based his argument that Christians were entitled to exercise power and coercion in public life on an analogy to the theory of roles. Thomas Hobbes likewise argued that the state was the authorized representative of its citizens in the same sense that a playwright was the author of the deeds of the actor whose role he creates. More recently, Arthur Applbaum has criticized role-based moralities, arguing for sharp limits to the kinds of moral permissions that such arguments can provide.

Another element of the metaphor that has drawn attention particularly among political theorists is the idea of political life as an arena of tragedy and conflict. The roots of this aspect of the metaphor are several. One origin can be found in Hannah Arendt's account of action and the agonistic political theories it helped to inspire. Arendt's action, the central value of her political theory, bears a close resemblance to theatrical action: Its significance lies in the visibility of its memorable deeds to a public of appreciative spectators. Yet the unpredictability and irreversibility of such action places the possibility of tragedy at the center of public life. This tendency is exacerbated when combined with another important element of contemporary political thought, the value pluralism associated with such thinkers as Isaiah Berlin and Bernard Williams. For these theorists, society's deepest value commitments—to liberty and equality, justice and charity, utility and moral integrity—may simply be incompatible with one another, and tragedy, specifically the account of it offered by G. W. F. Hegel, captures artistically this core fact about the human moral experience. J. Peter Euben and Martha Nussbaum are two figures who have combined elements of these strains of contemporary political thought to offer an account of politics in which the idea of tragedy plays a conspicuous and important role. Of course, the idea that the deep value conflicts of tragedy may find their fullest expression in actual politics has come to be a theme of contemporary drama as well. It finds a striking illustration in playwright David Hare's 2004 work *Stuff Happens,* a dramatic rendering of the George W. Bush administration's march to war in Iraq in which most of the dialogue merely replicates statements actually made by President Bush and his advisers publicly during the run-up to the war.

STAGECRAFT

The most influential and widely appreciated aspect of the metaphor has been its implicit comparison of political action to the manipulative or deceptive aspects of stagecraft.

Political scientists frequently refer to leaders as political *actors* and to the public as the *audience* those actors are trying to sway. Almost half a century ago, historian Daniel Boorstin identified the emerging phenomenon of what he called pseudo-events: staged occurrences, such as campaign rallies, that existed for no other purpose than to be reported.

Today, pseudo-events in this sense make up the sizable majority of all the activities we collectively designate as constituting a political "campaign." Abraham Lincoln and Stephen Douglas may have gathered a crowd for the purpose of trying to persuade their fellow citizens, but at one of today's rallies, politicians instead contrive to stage-manage a noisy, enthusiastic, and vacuous pageant solely to produce suitable footage for the free media coverage for which the "rally" provides the nominal excuse. Reports abound of presidential candidates planting the audience with scripted questioners, and even the startling case in which U.S. Federal Emergency Management Agency (FEMA) administrators were caught staging an entire press conference—with FEMA staffers masquerading, by implication at least, as journalists—no longer falls outside the realm of believability. As a telling a sign of the times, the fact that a leading political columnist for *The New York Times,* Frank Rich, trained for the role by serving for many years as that newspaper's drama critic—the two roles are no longer so cleanly separable as they once might have been.

There is no doubt that we now treat the spheres of politics and entertainment as, if not interchangeable, then at least closely intertwined, with the skills gained in entertainment permitting actors such as Ronald Reagan and Arnold Schwarzenegger to transition seamlessly from one arena to the other. And there can be little doubt that this has proven Murray Edelman largely correct in viewing contemporary public life as being as much as anything else the task of "constructing the political spectacle." Whether this trend will prove to be entirely a negative for democratic politics, or whether some of the positive aspects of the theatrical metaphor can be tapped to balance against the negative ones, is a question yet to be resolved.

Theocracy

Theocracy includes forms of government claiming to be governed by God or by gods, usually through human lieutenants, or by the revealed law of God. Secular skeptics use the term derisively; however, theocracy has been very widespread as a political system. Political science has thus developed only a limited vocabulary for describing the many types of theocratic regimes. Most political systems have been based on tribal groups, kingdoms, city-states, or empires—many theocratic. Legitimacy of a theocracy is based on the faithful enforcement of divine rule. When the Chinese emperor lost the mandate of heaven, the regime was ripe for dynastic change. A similar idea operated among the Mayan Indians.

Titus Flavius Josephus (Joseph ben Matthias, ca. 37–100 CE) coined the term *theocracy* in his work *Against Apion.* In responding to a severe critic of the Jews, he replied that some may have their aristocracy or monarchy, but the Jews had their theocracy. The term implicitly demonstrates the inadequacy of Aristotle's six forms of government, which were based on the study of one hundred fifty Greek city-states, not all the regimes in history.

Often theocratic systems have been headed by a *living god* or by the representatives of a divine being, or they have been strongly influenced by religious leaders. *Divine rulers* have included the Inca in South America and the emperor of Japan, living gods descended from the sun god or goddess. In other theocratic systems, the divine ruler has been a lieutenant of the divine—a charismatic leader, king, priest, or other religious functionary.

Charismatic leaders such as Moses or Joshua of the Hebrew Bible, and others who exhibited great spiritual power in other systems, were viewed as divine agents but were not necessarily considered divine. The power or the spirit of the divine, signified by the successful exercise of power, legitimated their actions.

European monarchs usually claimed a divine right to rule. Arguments made by divine-right political theorists justified earlier ideas of kingship. Sir Robert Filmer (1589–1653) argued in his book, *Patriarchia* (1680), that the king was the father of the country. To disobey the king was to disobey the Judeo-Christian commandment to obey one's father and mother and, thus, merit the death penalty. In the United Kingdom, divine right was still the official doctrine in 1953 when Queen Elizabeth II was crowned by "the grace of God," not by the will of the people.

Rule by priests, or *hierocracy,* has occurred in a number of places. The Jesuits operated hierocracies in Paraguay, among

other places. Judah was ruled after the war of the Maccabees (167–160 BCE) as a priestly theocracy.

The revealed divine law, or *theos nomos,* is the legitimating authority in theonomic regimes. Ministers or devout laymen, such as John Calvin (1509–1564), a pastoral leader of Geneva, have often headed regimes described as theocracies. Calvin used his superior knowledge of the Bible to create a Christian city-state. William Penn's Pennsylvania and the Puritan colonies were similarly theonomic *bibleocracies.*

In the twentieth century, theocracies have existed in a number of places. The emperor of Japan did not renounce his claims of divine rule but merely ceased to appeal to them. There have been hints in recent decades that the claims could be renewed. The Wahhabis imposed Islamic theocracy on Saudi Arabia before the kingdom's founding by King Abdul Aziz al-Saud in 1932. Pakistan was created to be a Muslim theonomy in 1947. In the early 1950s, the Tibetan Buddhist theocracy led by the Dalai Lama was driven out of Tibet. In 1979, the theocratic leader Ayatollah Ruhollah Khomeini forced the shah out of Iran and reinstituted the *shariah,* or Islamic law.

Think Tanks

A *think tank* is a nonprofit, independent, public policy research institute. This very broad definition encompasses diverse organizations in terms of resources, personnel, and specialization. However, they all apply a model of expertise—using social science methods of inquiry to study public issues in order to give policy insights and advice to government and lawmakers and to educate the general public.

Originally, think tanks resembled "universities without students" (Weaver 1989). They employ experts with strong academic backgrounds and seek to convey an image of neutrality by following higher education norms of scientific rigorousness and objectivity. Over time, the work of think tanks has become more politicized, and some of them have tried to market their ideas through sophisticated advocacy strategies. The think tank model of expertise can now be encountered worldwide.

In the United States, think tanks are generally registered as 501(c)(3) nonprofit organizations, which grants them exemption from federal income tax and allows them to collect tax-deductible donations. This generous status can be a double-edged sword: Helping them gain access to funds was instrumental to their development. However, it also restricted their actions because it forbade them from conducting political campaign activities to influence elections and prevented

them from dedicating a substantial part of their activity to lobbying.

Some aspects of the U.S. political system are believed to have contributed to the emergence and growth of think tanks. Political features credited for the dynamism of the think tank in the United States include: a fiscal status favorable for securing financing for their operations, the openness of the country's legislative process, the expansion of the federal government and government contracts for research opportunities, the weakness of political parties agenda-setting capabilities, and the need for readily available government positions.

HISTORICAL DEVELOPMENT

The establishment of independent research institutes in the United States links closely with the professionalization of social sciences and traces back to the turn of the twentieth century. At a time when state bureaucracy was growing, independent research organizations were founded with the progressive idea that scientific analysis was the best way to promote efficiency in government. The Institute for Government Research (IGR), chartered in 1916, was one of the first organizations to produce this type of independent expertise for advancing governmental reform. Under the auspices of its chairman, Frank Goodnow, and its first director, William Willoughby, both renowned political scientists, the IGR was particularly influential in the establishment of an annual federal budget. In 1927, the IGR became the Brookings Institution.

Several progressive or liberal organizations followed suit in the first half of the twentieth century. In 1943, a group of businessmen, disgruntled by the New Deal and what they perceived as a liberal consensus, establish the American Enterprise Institute (AEI) to promote conservative principals under the same model of scholarly policy analysis and public education that Brookings had developed.

After World War II (1939–1945), the RAND Corporation—formerly a branch of Douglas Aircraft that provided research for the U.S. Air Force—gained its autonomy and popularized the term *think tank,* which the military had coined. RAND was the first organization that derived almost all its revenues from government contracts. From its original focus on defense strategies in response to the cold war, RAND expanded—on account of a substantial budget—to pursue a very broad range of research. Among its many accomplishments, the organization is credited with major breakthroughs in game theory. The Urban Institute, created in 1968 by the administration of U.S. president Lyndon Johnson to provide expert evaluation of the Great Society programs, is another organization whose research is primarily contracted by U.S. government agencies.

The 1960s and 1970s witnessed the rise of new think tanks that criticized the more neutral approach of their predecessors and decided to more forcefully assert their ideological standpoints. Founded in 1963 by two former members of the Kennedy administration who disapproved of the foreign policy pursued by the government, the Institute for Policy Studies (IPS) defends left-wing policy analysis, seeking to combine

with social activism. During the 1960s, IPS was particularly engaged in the civil rights movement and opposition to the Vietnam War (1959–1975).

Edwin Feulner and Paul Weyrich established the Heritage Foundation in 1973 to promote conservative ideas in more activist ways than AEI. Heritage brought a new "think tank culture" based on aggressive marketing of proposals that started what was described as a "war of ideas." Heritage asserted its influence in 1980 when it provided the newly elected President Reagan with its *Mandate for Leadership,* a study containing two thousand recommendations for furthering a conservative agenda. During the 1980s and 1990s, fueled by generous conservative foundations, conservative and libertarian think tanks like the Cato Institute flourished.

The Center for American Progress (CAP), created in 2003, is considered the liberal answer to the Heritage Foundation. Its funding came from a group of wealthy liberals headed by George Soros, who attributed part of the success conservatives enjoyed at the time to their strong presence in the think tank world. In order to advocate its ideals, CAP joined forces with a 501(c)(4) organization to gain more leeway for active lobbying.

ROLE AND INFLUENCE

Think tanks' direct impact on policy making is difficult to gauge. They are credited not only with a direct, measurable effect on specific decisions, but also with shaping what is known as the climate of the opinion, or the decision-making environment.

The role of think tanks is controversial because their involvement within the policy elite demonstrates the intricate relationship between knowledge and power. While some critics have denounced them as discourse conveyors for the dominant political and economic players, others praise them for helping democratize developing countries.

The intense politicization of some think tanks might be detrimental to the credibility and influence of research institutes because it damages their reputation for objective expertise. Nonetheless, a worldwide boom in think tanks has accompanied their increasing advocacy.

Third–Party Intervention

Third-party intervention can be defined as the coercive or cooperative intercession of an external actor into the affairs of a sovereign state in order to influence the outcome of an internal conflict. Third parties are nonparticipants in the primary conflict and may be individuals, state governments, international organizations, or regional associations; they may be *unilateral,* consisting of one main actor, or *multilateral,* consisting of multiple actors. The interventions themselves can be classified according to the role they play in managing the conflict. Thus, *conflict prevention* aims to resolve internal tensions before they lead to violence, *conflict resolution* is designed to persuade the combatants to halt an ongoing conflict, and *postconflict reconstruction* seeks to consolidate a newly brokered settlement in order to prevent the reemergence of hostilities. These interventions can take place simultaneously or consecutively, involving one or more third parties working separately or in concert.

In undertaking the intervention itself, third parties can choose between *cooperative* instruments, which require the agreement of the principal combatants, and *coercive* instruments, which do not require the consent of the combatants. The former includes technical and legal assistance; the provision of mediation or arbitration services; and "carrots" such as aid, loan guarantees, and membership in valued organizations. There is growing scholarly interest in the effectiveness of such incentives—sometimes called *political conditionality*—in inducing governments to adopt prominority policies, thereby reducing the risk of internal conflict. Third parties may also help to *socialize* governments into adopting the policies that promote interethnic peace.

In coercive interventions, powerful third parties use "sticks" to influence the outcome of the conflict. Rather than merely denying benefits such as European Union membership, trade preferences, or economic assistance, coercive instruments work by imposing costs on target governments until they adopt the desired behavior. These instruments include economic sanctions, logistical or financial support to one side of the conflict, and outright military intervention. Cooperative instruments are widely believed to be more desirable for conflict prevention, whereas coercive instruments are generally reserved for conflict resolution and postconflict reconstruction.

Much has been written about the motives of third-party interventions. A classic realist or instrumentalist prediction is that states intervene when intervention serves their economic

or security interests. Another possibility is that politicians intervene when they expect to achieve success, thereby scoring an easy political victory. A domestic politics explanation holds that states intervene in conflicts when there are perceived ethnic ties between an important domestic constituency in the intervening state and one side of the conflict. This *ethnic ties* argument has also been used to explain the intervention of a state on the side of its ethnic brethren in a bid to "rescue" them when they face a repressive ethnic majority. However, quantitative analysis has shown that homeland states are no more likely to intervene on behalf of their coethnics when they are repressed than when they are not. Ethnic conflict in one state may also weaken state structures to the point that it invites outside intervention by states seeking to profit from internal struggles. Interestingly, states facing their own conflicts are actually more likely to act aggressively than they are to be victimized.

A relatively new field of research concerns the determinants of successful intervention. Some scholars contend that helping the stronger side to win is the surest and fastest way to end violent conflict. However, others believe that third parties can best reduce the level of carnage by intervening against the perpetrators of atrocities—generally the more powerful side. There is also some debate over the role of third-party bias in intervention success. Some argue that interveners with a significant stake in the outcome of a conflict might be better able to commit to enforcing a peace settlement, at which point both parties feel safe enough to disarm. But others disagree, arguing that both parties must believe that the intervener does not have a stake in the conflict; otherwise, they cannot trust that the terms of the agreement will be enforced. This usually requires credible external security guarantees to both sides of the conflict. Data analysis shows that long-lasting peacekeeping institutions, such as demilitarized zones and dispute resolution commissions, tend to decrease the level of uncertainty for both parties and enhance the durability of peace settlements.

Third Sector

The term *third sector* refers to a set of social relations' organizations and networks distinct from the public and the market sector, as well as from private households and neighborhoods. Voluntary activities carried out in public in an organized form, with self-governed structures for societal instead of profit goals, characterize a positive definition of the third sector. However, many third sector organizations also rely on paid staff.

Charity, philanthropy, and voluntary help have a long standing tradition in the third sector, but a self-consciousness of such relations as a distinct sector only emerged in the early 1970s. Reports of the Filer Commission in the United States or the Wolfenden Committee in England triggered a new perspective on the diverse set of activities and stressed common features of organizations outside government and business enterprise. Related overlapping and competing notions refer to the *nonprofit sector* emphasis on private provision of services devoid of the profit motive; some include the nongovernmental sector, which sets third sector apart from governmental services and stresses advocacy of groups of citizens; while other notions refer to the *voluntary sector,* which puts emphasis on the type of resources provided by these organizations. Other related concepts are the *independent,* the *intermediate,* or the *civic sector.* These concepts share interest in the emergence from, or an orientation toward, civil society. Typical organizational forms for active citizens are associations and foundations. While the American understanding stresses the nondistribution constraint on profits, and therefore excludes mutuals and cooperatives, the European understanding centers upon a limitation of returns and includes limited self-serving economic activities and social enterprises.

SIGNIFICANCE AND POLICY

The third sector has gained attention of policy makers because of assumed positive effects on welfare, democracy, economy, and community integration. The provision of welfare services by third sector organizations promises closeness to people's needs and, by mobilizing third-party resources of time and money, disburdens governments of establishing public agencies. As a vehicle of self-organization and interest representation, the sector contributes to the development of civic skills and democratic participation. Further, the third sector influences economics in producing services and providing employment and meaning in times of decreasing full employment. Finally, it fosters community integration by creating bonds and social capital among citizens through shared activities.

Many countries have initiated third sector policies, with the goal to regulate activities and enhance its role. These policies include legal measures (e.g., nonprofit and tax law); financial measures (e.g., funding schemes and tax exemption); symbolic activities including speeches and public recognition for civic engagement (e.g., certificates and medals) and the provision of information as well as organizational measures such as the creation of supportive agencies or the reorganization of ministerial portfolios and governmental bodies.

RESEARCH

The establishment of networking and research institutions, such as the International Society for Third Sector Research, indicate increased significance for the third sector. Next to research on conceptual issues and microlevel studies of single organizations, efforts to produce a comparative overview of the third sector have advanced the knowledge on scope and crucial factors that shape third sectors in different countries. Research on third sector policy is a new field searching for a common framework.

Critical issues for research are particularism and accountability of third sector organizations; co-optation, dependence, and distortion of missions through governmental funding, contracting, and commercialization as well as their threatened civic character due to bureaucratization and professionalization.

Insight into limitations of the concept has grown over decades of research. Great internal diversity—human services, sports, culture, professional organizations—together with substantial similarities across sectoral boundaries in certain fields (e.g., commonalities between public, commercial, and nonprofit hospitals) have raised doubts whether form of ownership is central at all. The concept of the third sector suggests clear-cut distinctions, while in reality, blurred boundaries and hybrid forms of organization work in an intermediate sphere among the governmental, the market, and the household sectors.

Third Way and Social Democracy

The Third Way can be best described as an alternative to the old left and right. Today, it focuses on what can be considered "the four *E*s": education, ecology, ethics, and economics. As a political construct, the true meaning of the Third Way remains vague. It can imply an alternative to both capitalism and socialism; a middle way; or an alignment of new and heterodox ideas, such as the state as an enabler and not a direct provider of goods and services.

The term emerged at the end of the nineteenth century around Pope Pius XII. More recently, this expression conveys the ideas beyond the left or the right. It allows one to do certain things without bothering to find out about the "first way" or "second way." Unlike socialism, it does not aim to end the predominance of the capitalist system, nor does it aim to replace it entirely. Instead, it aims to reform the capitalist system democratically through state regulation and ameliorating some of the injustices inherent in the market economy. Many consider the Third Way as the modern version of social democracy or democratic socialism that became popular in international politics in the late twentieth century.

Though it is difficult to demarcate social democracy clearly from democratic socialism, some view the emergence of social democracy as a shift from capitalism toward the left, and democratic socialism as a shift from Marxism toward the right. Most parties with leftist leanings, faith in democratic means, and strong base in the working class can be described as social democrats. The social democrats and labor parties advocate the socialist option through democratic means in all aspects of life: political, social, and economic. The cardinal principles of social democracy have been (1) freedom from discrimination and freedom from dependence, (2) economic and sociocultural equality and social justice, and (3) solidarity in the sense of compassion for the victims of injustice and inequality (e.g., the Socialist International's Declaration of Principles).

CARDINAL PRINCIPLES

The Third Way now focuses on efforts to find a new interpretation of social democracy or democratic socialism to increase relevance in the globally integrated economy and knowledge-based and technology-driven societies. This was necessitated

by factors including growing individuation, inequities, social fragmentation, political apathy, rising consumerism, political violence, environmental degradation, private corruption by public authorities, alienation, and retreat of the welfare state. New interpretations require not a deterministic economy or polity but what is known as the *freedom to maneuver*. The Third Way emphasizes the role of the civic society, family, and communitarian values. Some believe that it can also have an adverse effect on the state's autonomy.

It is not surprising that most social democratic parties have shifted their emphasis from social justice to human rights and cleaner environment. Whereas the issue of equity and social justice are primarily economic and distributive, those of green environment, peace, gender issues, and human rights are primarily political and nondistributive. The modern social democrats also tend to support multiculturalism, secularism, multilateralism, civil rights, and civil freedoms. Most of the social democrats have also broadened their objectives to include some of the liberal, neoliberal, and even conservative values. For instance, Purshottam Trikamdas, one of the democratic socialists from India holds: "Socialism is a living faith, not a dogma. It can be achieved only by a process of trial and error. It cannot be something given once for all."

THE LEGACY

Many of the policies espoused by the social democrats in early twentieth century are now practiced in most of the advanced industrialized countries, such as nationalization, subsidized education, and health care. Sweden remains the prime example of social democracy under the leadership of Olof Palme. Norway, too, flourishes as a social democratic nation. Some of the Canadian provinces, such as Saskatchewan, British Columbia, Manitoba, and Nova Scotia, are closer to modern version of the Third Way mould of social democracy.

The Third Way implies moving away from some of the traditional elements of social democracy by supporting partial privatization of public sector enterprises and services and reductions in the regulations of the market. Those advocating this perspective include Bob Hawke, Paul Keating, Kevin Rudd in Australia; Tony Blair and Gordon Brown in the United Kingdom; Gerhard Schröder in Germany; Jens Stoltenberg in Norway; Göran Persson in Sweden; David Lange, Roger Douglas in New Zealand; Wim Kok in the Netherlands; and Ricardo Lagos in Chile.

The Third Way involves the pragmatic adaptation of social democracy to the realities of the modern world. It was difficult for most of the social democratic parties to survive on the basis of postwar Bretton Woods consensus in the wake of rising consumerism and middle-class aspirations. In the United Kingdom, for example, the Labour Party was rejected four times consecutively between 1979 and 1992. Tony Blair and his supporters had to disassociate from the strong democratic socialists incarnations of their parties to fight the emergence of neoliberalism in the form of Thatcherism and Reaganomics. Many social democrats tolerated economic disparities as inevitable. Many other countries, without the tradition of social democracy, such as the United States, still have certain regulatory programs, such as Medicare, welfare, and environmental protection.

Surprisingly, both the right and the left criticized the social democrats. The right criticized them for restricting individual freedoms, regulating the market at the cost of economic efficiency, and promoting wider choice as a result of budget deficits and taxing the middle class more as the rich resorted to what some called "tax evasion through sophisticated accounting." The left criticized the social democrats for being an obstacle to radical reforms. For instance, Tony Blair (UK), Gerhard Schröder (Germany), and Göran Persson (Sweden) were criticized for violating the principles of social justice and equity by implementing privatization of the welfare state and deregulation of the economy. Nevertheless, the social democrats succeeded in raising the living standards of the masses, increasing social mobility, enhancing the powers of the workers and the consumers, stabilizing the economy by providing social security, and eliminating extreme poverty.

Third World Debt

Since the fall of the Berlin wall in 1989, some consider the expression *third world* out-of-date. It was used in the past to describe countries that did not belong to the Soviet bloc or to the Western European and U.S. capitalist bloc. These countries are now called *emerging markets, developing countries,* or *emerging democracies,* the latter a term also used for former communist countries. The poorest nations are often called countries in transition.

Most of these countries have external debt, which according to the United Nations Conference on Trade and Development and the United Nations Development Program, grew fourfold from 1980 to 2000. Interest on the debt increased from $75.4 billion to $317.2 billion, an average increase of 13 to 15 percent. Data from the International Monetary Fund (IMF) show that the total external debt of emerging market and developing countries reached $2.93 trillion in 2004. The IMF estimates that, for 2007 and 2008, the total external debt for these countries will reach $3.5 and $3.8 trillion, respectively. These two figures correspond to an average of 25 percent of their gross domestic product (GDP).

The more optimistic analyst could see the IMF numbers for the emerging countries as promising, because the external debt as a percentage of GDP decreased from 33 percent

in 2004 to 24 percent in 2008. However, the IMF includes countries that face very different situations in the same group. For example, countries such as China, India, Mexico, Brazil, and Russia—which are rapidly engaging in the international markets as important game players—are grouped with Sudan, Togo, Chad, and Uganda—countries that face serious political, economic, and social problems.

Recently, developing countries' private debt has increased more than their public debt. Globalization allows capital to flow easily from one country to the other, thus facilitating indebtedness from trade more quickly than loans from other governments or international organizations. As a consequence, in addition to external debt, most developing countries have very high domestic debt; they owe high interest and commissions to creditors. As a result, the gap between rich and poor widens.

The public resources retained to pay debt vary according to how a developing country's government manages its foreign debt. Debt prevents governments from investing in basic and strategic infrastructure such as education, health, sanitation, roads, and ports that spur private enterprise and speed development. The United Nations Children's Fund estimates that in 2007, thirteen children died every day as a result of third world public debt. Private debt may also be an impediment, because governments frequently embrace or endorse it, or give companies discounts or privileges.

Some developing countries, such Argentina, which paid its debt, and Brazil have been struggling hard to relieve themselves of their external debt. The work groups formed by the Bank for International Settlements, the IMF, the Organization for Economic Cooperation and Development, and the World Bank consider the *external vulnerability* of a country to judge the importance of a country's indebtedness. If a country regularly pays the price of its debt (i.e., interests and other additional costs) without incurring new debt, it has *sustainable indebtedness.* The work group also monitors the performance of the twenty-two poorest countries in the world by developing devices and policies that may lead them to sustainable indebtedness, if not to long-term sustainability.

Thomas Aquinas

Thomas Aquinas (ca. 1225–1274) was an Italian Christian philosopher and theologian. Born into wealth and possessing royal connections, he became a Dominican friar after his father died, to the displeasure of his family. After studying in Naples and Paris, he became a respected teacher in Paris. He also taught in Rome and established a Dominican house of studies in Naples. He had an "experience" during a church mass at the end of his life that caused him to believe his work was insignificant, and he ceased to write after completing over sixty works. Aquinas was canonized by Pope John XXII on July 18, 1323. His political thought can be found in his *Summa Theologiae* (1947), Peter Lombard's *Sentences* (1484), commentaries on philosopher Aristotle's *Ethics* (2001) and *Politics* (1962), and a treatise by Giles of Rome titled *De Regimine Principum* (2008).

Until Aquinas brought Aristotle from Islam back into Western intellectual discourse, Western thought had relied on the Bible, principles put forth by Christian theologian Augustine of Hippo and ancient Greek philosopher Plato, and Neoplatonism. The church had banned Aristotle as contradictory to Christian teaching, but Aquinas synthesized the two and proposed there was no fundamental incompatibility between them. Aquinas assumed a Christian metaphysic and that the world is governed by divine providence and natural law, whereby the rational person participates in the divine purpose by obeying the natural law even when denying God. The role Aquinas gives natural law has attracted great interest in political theory.

A sophisticated analysis of virtue is core to Aquinas's thinking. Self-preservation and pursuit of God's knowledge direct human actions, with the goal of life being happiness ultimately found in God in the afterlife. Virtue is the disposition to do the right thing for the right reason, Aquinas contended, and the cultivation of virtue is the primary political end.

The political writings of Aquinas have been variously interpreted as absolutist, monarchist, republican, and mixed constitutionalist. Aquinas argued humanity needs social organization, which in contemporary times means the state. As a complete community in which members are also members of the church, the state must promote the common good. Aquinas portrays political life as natural to humanity, with government as the supreme person or body with power limited by jurisdiction, the common good, and the church. Church leaders have no jurisdiction over secular matters and the state has no right to direct religious affairs, unless the peace and justice of the state is wronged. Aquinas saw kingship as the best form of government, though the people should participate to avoid tyranny. The ruler must promote unity and peace, best achieved by one rather than many. Aquinas thus preserves the participatory nature of the Greek polis and the unity of rule found in the medieval kingdom.

Aquinas believed people are morally obliged to obey just laws and disobey unjust laws. State-authorized morally wrong acts are void and have no effect, suggesting grounds for forcible resistance, including a private right to kill the tyrant as a form of self-defense. An enduring element of Aquinas's thought is the just war theory. War is a just means to achieving peace, not as a virtue in itself but as an end. A just war must satisfy the three criteria of having the sovereign's authority, a

just cause, and a right intention. Aquinas also examined justice in its distributive and commutative forms and offered thoughts on economic justice, including the just wage.

Aquinas is often passed over in political study, as scholars skip from Aristotle to the Enlightenment; however, he has deeply influenced political thought, especially Catholic social thought, and the Christian Democratic parties of Europe and Latin America. His enduring contribution may be his rejection of an Augustinian tendency to treat government as a result of the fall—the doctrine that humanity became bound by sin through Adam and separated from God, offering a *via medea* (middle way) between conservative religious suspicion of rationalism and radical suspicion of divinity.

Thomist, Scholastic, and Medieval Political Thought

Between 1100 and 1400, the rudiments of a distinctively European approach to political theory, based on ancient Greco-Roman and Christian sources, and also the Arab and Jewish traditions, emerged in the writings of Latin authors. These texts framed the development of political ideas that remained influential well into the modern period of Western European history.

KINGSHIP

During the twelfth and early thirteenth centuries, little direct familiarity with the main political philosophies of pagan antiquity existed: The works of Plato, Aristotle, and Cicero were for the most part unavailable. Thinkers were thus compelled to cobble together the few known sources of classical political thought with the teachings of the Bible and of church fathers, such as Augustine, in order to invent a new approach to understanding government and public affairs appropriate to the emerging forms of territorial centralization and urbanization. Roman law doctrines, such as the teaching that the ruler was *legibus solutuis* (a law unto himself), were combined with Christian views about the divine origins of natural and human law to create a vision of governmental office as responsible to and limited by the common good, yet simultaneously answerable to no earthly power. Monarchy was assumed to be the only legitimate form of rulership; the king and his mirror image, the tyrant, were seen to be agents

of God. What distinguished them were the moral and spiritual orientations of their respective wills: The king personally acknowledged a binding duty to submit to law and to serve the welfare of his subjects; the tyrant rejected justice and mercy in favor of self-will and personal aggrandizement.

The English churchman John of Salisbury (ca. 1115–1180) exemplified this trend in his book, the *Policraticus.* John proposed an extended analogy between the political community and the natural human body that included all of the main elements of medieval society, including the king, the nobility, the royal servants (i.e., judges and tax collectors), soldiers, and peasants and artisans. When a good ruler governed, the body politic was ordained toward virtue and salvation as well as earthly well-being. However, when a tyrant came to power, vice and impiety reigned. Although John held that the tyrant's government reflected God's punishment of wicked mankind, he also countenanced the legitimacy of the killing of tyrannical rulers by their subjects under certain specified conditions.

THE ARISTOTELIAN REVIVAL

During the middle of the thirteenth century, Aristotle's *Nicomachean Ethics* and *Politics* were translated into Latin and soon circulated widely throughout Europe. Within a few years, Aristotle's works had become the official textbooks for the study of political questions, albeit often supplemented by the commentaries of Arab philosophers, such as Avicenna and Averroes, and the writings of Jewish thinkers, especially Moses Maimonides. The rise of university education and a formal scholastic curriculum facilitated this transition. Thereafter, the political theorists of the Latin Middle Ages acknowledged Aristotle as the supreme authority on political life and governance, even when they ultimately disagreed with his conclusions.

Specifically, Aristotle's reappearance occasioned two important advances. First, his writings systematized the intellectual status of political science and related topics. Politics was henceforth conceived to be the "master science of the good," facilitating the practical fulfillment of human virtue and happiness by specifying the laws and systems of rule that promoted the greatest earthly felicity of human beings. In contrast to the lessons of St. Augustine, government came to be viewed as a positive force in temporal life, both because it educated people in the virtues and because it could serve and protect the Christian Church.

Second, Aristotle's works reopened the "constitutional" question about the nature of the best regime. A central theme of *Politics* concerned whether and under which conditions one form of just government—kingship, aristocracy, or polity (i.e., a mixed constitution)—might be preferable. Scholastic authors fiercely debated this issue. Some of them, such as Giles of Rome (ca. 1243–1316) and John of Paris (ca. 1240–1306), held that kingship was best suited to pursue the ends of political life because it was the most "natural" form of rule, or because it had a long history or a divine inspiration that justified its legitimacy. Others—such as St. Thomas Aquinas (1225–1274), in his major treatise, the

Summa Theologiae, and Ptolemy of Lucca (ca. 1236–1327)—advocated a mixed, republican, regime as the preferable system of government. Some authors, like Dante (1265–1321) and Engelbert of Admont (ca. 1250–1331), even employed Aristotelian arguments to favor the rule of a universal empire. These differing views were always defended on the grounds that each was most consonant with the teachings of Aristotle and thus confirmed by his authority.

POLITICAL APPLICATIONS

Scholastic political theory during the later Middle Ages was by no means confined to dry and arcane academic debate devoted to uncovering the "real" doctrine of Aristotle. Many political treatises were devoted to taking sides in the deep disputes between the church and the earthly powers, as well as within the church itself, that roiled the period. For example, prominent teachers associated with the University of Paris wrote numerous tracts favoring or opposing the claims of the French king Philip IV to tax the property of the church without the permission of the pope. Likewise, the conflict between the Franciscan order and the papacy concerning the question of "spiritual poverty" led authors to apply scholastic lessons to the constitution of the church, especially in regard to the powers enjoyed by the pope.

The most famous late medieval example of scholastic engagement with the affairs of church and earthly government is probably the *Defensor pacis* (Defender of the Peace), written by Marsilius of Padua (ca. 1275–1343), finished in 1324. Using the language of Aristotle's *Politics,* Marsilius produced an extensive defense of the autonomy of temporal communities from the control or interference of the church with regard to the creation of law and the appointment of rulers. Moreover, he argued that the ultimate authority in ecclesiastical matters was a general council representing the entire body of Christian faithful, thus directly attacking and undercutting the claim of papal supremacy.

Thoreau, Henry David

Henry David Thoreau (1817–1862) remains politically salient due to his essays "A Plea for Captain John Brown," "Slavery in Massachusetts," "The Last Days of John Brown," and his energetic defense of "Civil Disobedience." He also derived significant notoriety from his writings on nature and his relationship with the transcendentalist movement, especially the poet Ralph Waldo Emerson. As Emerson noted in his eulogy, however, Thoreau aimed "at a more comprehensive calling, the art of living well" (53). Like Socrates, Thoreau lived the "examined life," most especially in his famous autobiographical reflections *Walden* (1854).

"Civil Disobedience" (1849) has had an enduring legacy; for instance, Mahatma Gandhi stated simply that "it left a deep impression upon me" (71). In it, Thoreau articulated the first theoretical argument for a form of resistance to oppression and tyranny that did not depend upon force of arms. Thoreau was not a Gandhi or a Martin Luther King Jr., though he did spend a night in jail for refusing to pay a tax out of protest for the U.S. invasion of Mexico as well as slavery. In fact, Thoreau's critique of the state is reminiscent of the anarchist tradition; it is more a general opposition to tyranny than a simple opposition to slavery or war.

Thoreau believed that there were two ways to judge human laws, either by expediency or by individual conscience. By expediency, Thoreau meant a simple majority of the electorate. Thoreau made it clear that, for him, individual consciousness meant far more than legislations, which regularly made men "the agents of injustice." These two different judgments—by expediency or by conscience—lead either to obedience or to disobedience. Thoreau, in *Walden and Civil Disobedience,* writes that "if [the injustice] is of such a nature that it requires you to be the agent of injustice to another, then, I say, break the law" (396).

From Thoreau's viewpoint, true power stems from the willing cooperation of people: "If *one* honest man, in this State of Massachusetts, *ceasing to hold slaves,* were actually to withdraw from this copartnership, and be locked up in the county jail therefore, it would be the abolition of slavery in America" (397).

Though Gandhi and other practitioners of nonviolent resistance to oppression have admired Thoreau for this sentiment, Thoreau's increasing antislavery activism led him to endorse violent resistance as well. Thoreau praised abolitionist John Brown, the leader of the unsuccessful raid on Harper's Ferry, Virginia (1859) as quoted in Milton Meltzer's *Thoreau: People, Principles, and Politics,* "like the best of those who stood at Concord Bridge . . . only he was firmer and higher-principled. . . ." (115). Thoreau wholeheartedly embraced Brown's attempt to use of violence to end slavery in the United States, but he died in 1862, before Abraham

Lincoln's 1863 Emancipation Proclamation and before the end of the bloody U.S. Civil War (1861–1865) brought to the end of slavery throughout the country.

Threat Perception

Threat perception in international politics is an enduringly important problem that has been somewhat slighted in recent years, in part because cold war rivalries tended to reduce uncertainty about the source of threat. By the end of the twentieth century, however, changes in the international environment—such as the end of the cold war itself, the demise of bipolarity, and the rise of nonstate sources of danger—made the question of how to identify threats increasingly pressing.

Traditionally, threat perception has been linked to national security and defined in terms of the capabilities and intentions of a potential adversary state; these can be further subdivided into such factors as the military balance, geographical proximity, and past and current behavior. A classic statement of the traditional view of threat perception was set down by Eyre Crowe of the British Foreign Office in his 1907 memorandum on British relations with Germany and France:

> History shows that the danger threatening the independence of this or that nation has generally arisen, at least in part, out of the momentary predominance of a neighbouring State at once militarily powerful, economically efficient, and ambitious to extend its frontiers or spread its influence. The danger being directly proportionate to the degree of its power and efficiency, and to the spontaneity or "inevitableness" of its ambitions.

Those who studied threat perception in the twentieth century, for the most part, adhered to this traditional model, while also developing many of the concepts that emerged in later work. Klaus Knorr, for example, pointed out that despite a common belief that it is relatively easy to perceive threats accurately, there are, in fact, numerous obstacles to doing so. For one thing, information about possible dangers may be unreliable, owing to its ambiguity or to deliberate attempts to deceive. For another, such information is likely to be interpreted by individuals according to what they already believe. Taking a different approach, Raymond Cohen stressed the importance for the perception of threat of a state's realization that another state had somehow broken the "rules of the game" of international politics. That is, for Cohen, the violation of a norm serves as a catalyst of threat perception in the sense that such behavior is linked to the expectation of future aggressiveness.

Subsequently, the traditional model of threat perception has received at least one serious challenge, as well as a spirited defense. Neorealists, led by Kenneth Waltz, focused exclusively on capability, holding that it is by far the most reliable indicator of threat and denying the need to be concerned with intentions at all. Given the anarchic structure of the international system, states must assume that those who can do harm, will. This assumption is, of course, likely to reinforce the preexisting tendency of decision makers to engage in worst-case analysis. In contrast to this view, Stephen Walt, while acknowledging the importance of offensive capabilities, theorized that states pay special attention to the aggressiveness of potential opponents, thus focusing the discussion once again on the "crucial role" of intent.

More recently, psychological approaches have contributed a number of insights to the understanding of threat perception. These approaches emphasize the role of the personalities of decision makers and their beliefs, including the cognitive and motivated biases that influence how threat is or is not perceived. In decision theory, threat perception can also be analyzed as part of the general area of problem diagnosis.

With respect to the various psychological biases affecting threat perception, the most compelling cognitive factor is, as Robert Jervis has stressed, the tendency of people's expectations to color their perceptions. Thus, "the decision maker who thinks that the other side is probably hostile will see ambiguous information as confirming this image, whereas the same information about a country thought to be friendly would be taken more benignly" (Jervis 1985, 18). This type of belief can have many different origins. One of the most important is the impact of international history, especially lessons drawn from a country's most recent war. Motivated biases may be determined by "the needs of decision makers and their states" (25). Domestic politics is often thought to be the source of this type of motivated bias.

While traditional sources of threat persist, recent developments, particularly the rise of terrorism and nonstate sources of threat that often have no discernible political goals, have made threat perception more difficult to analyze. The recent interdisciplinary interest in studying threat perception is, therefore, a welcome development.

Thucydides

Thucydides, son of Olorus (ca. 460–400 BCE), was a Greek author and historian. In spite of the renown of his *History of the Peloponnesian War* (1629), relatively little is known about him. The best available information, then, comes from his work in *History.* Rough evidence of his date of birth is provided by his remark that he lived through the entire war, which lasted from 431 to 404 BCE, "being of an age to understand what was happening." The apparent defensiveness expressed suggests that, although mature, he was relatively young when the war began and so probably less than thirty years old. Thucydides reports that he lived through the entire war, witnessing the final defeat of Athens in 404 BCE. However, *History* covers events only up until 411 BCE, and the final book, Book 8, is incomplete, which suggests that Thucydides died soon after the war ended. In his work, Thucydides reports owning gold mines in Thrace, and this fact, along with his election as general, suggests an upper-class background.

History of the Peloponnesian War has a strong claim to being the first extant "scientific" history. Thucydides corrects factual errors of his predecessors and takes pride in the care he took to assess his sources for accuracy. He also moves away from divine explanations of the events he witnessed, for example, attributing the outbreak of the war to "the growth of Athenian power and the fear this caused in Sparta."

An outstanding feature of *History* is Thucydides's use of speeches to reflect the thinking of the war's participants. The juxtaposition of the political leaders' reasoning and the relevant events produced powerful literary effects. In describing his method of reporting speeches, Thucydides says that, while he attempted to keep "as closely as possible to the general sense of the words that were actually used," he also made the speakers say "what, in my opinion, was called for by each situation." The clear conflict between these two remarks raises difficult issues of interpretation, although the language of all the speeches is clearly Thucydides's own. Many of the speeches have achieved independent renown. These include the Book 2 celebration of Athens in the funeral speech delivered by Athenian statesman and general Pericles, and the so-called Melian dialogue, in which unnamed Athenian envoys invoke brutal power politics to persuade representatives of Melos to surrender to Athens. According to the Athenians, "The strong do what they have the power to do and the weak accept what they have to accept." Views along these lines, expressed by numerous figures in *History,* have given Thucydides a claim to be a founder of political realism.

Aside from invaluable, detailed information on the Peloponnesian War and surrounding events, *History of the Peloponnesian War* provides a bitingly critical account of Athenian democracy. The Athenian population is depicted as highly emotional and inconsistent, easily swayed by self-interested orators. According to Thucydides, the power and success of Athens was due to the restraining influence of Pericles. Although the city was nominally a democracy, "Power was really in the hands of the first citizen." In spite of Thucydides's claims of objectivity, a strong case can be made that he shaped his account of the war to reflect badly on Athens's extreme democracy, as opposed to the kind of moderate oligarchy he claimed to favor.

Tiananmen Square

Spread across an open space of 4,736,120 square feet (440,000 square meters) in Beijing, Tiananmen Square is the world's largest urban plaza. To its north is the Tiananmen, Gate of Heavenly Peace, which was originally built in the 1420s as the southern gateway to the Imperial City. With the end of imperial rule in 1911, the space quickly became a revolutionary symbol when university students gathered to protest against the Versailles Treaty on May 4, 1919. Mao Zedong formally proclaimed the founding of the People's Republic of China (PRC) in the square on October 1, 1949. Since that time, Tiananmen Square has become the showcase of communist power with the construction of monumental structures both in and around the square while retaining its legacy as the site for popular protests.

These contradictory roles exploded in 1989 when university students launched the largest grassroots protest in the history of the PRC. From April 15 to June 4, these students, later joined by workers, demanded political reform, including an end to rampant corruption. The movement was put down abruptly when the army was called in to disperse the crowd by force. The final death toll was never confirmed, with estimates ranging from the Chinese government's estimate of two hundred to three thousand by other independent sources. To this day, the 1989 Tiananmen protest remains a tightly censored subject in China.

Ticket Splitting

Ticket splitting results when voters cast their ballots for candidates from different parties during a single election. There are two main forms of ticket splitting. *Vertical ticket splitting* occurs when a voter chooses candidates from different parties for office at various levels of government. For instance, a voter may support the candidate of one party at the national level, but a candidate from a rival party at the local or regional level. *Horizontal ticket splitting* occurs when voters endorse different candidates for similar offices. For example, a voter in a mixed-member system might endorse one party in the proportional list and a candidate from another party in the constituency race. Ticket splitting is generally a manifestation of weak party affiliations and is more common when individual parties have divisions or policy disputes. However, it may also reflect differences in the appeal of individual candidates. In the two-party system in the United States, vertical ticket splitting is common with voters often supporting one party in Congress, but the other party in presidential contests. Some scholars suggest that ticket splitting is often a deliberate voting strategy designed to achieve or maintain a balance in government.

Time–series Analysis

Time-series data are repeated, regularly spaced measurements over time. *Time-series analysis* is designed to leverage the longitudinal information contained in such data and involves examining questions about the effect of interventions on the data series and relationships among series. A starting point for time-series analysis is the characterization of the data-generating process (DGP). Determining whether the DGP is stationary, fractionally integrated, or integrated is an important first step. If a series is stationary, there is no systematic change in the mean or variance, and no strict periodic variations. Because most probability theory on time series is concerned with the case of a stationary series, analysis typically requires turning a nonstationary time series into a stationary one. An integrated or fractionally integrated series can be made stationary by differencing or fractionally differencing. Fractional integration provides a flexible characterization of the DGP by relaxing knife-edged distinctions between stationary and nonstationary series. Differencing to obtain a stationary series—or fractionally differencing with more precision— avoids spurious regression problems.

Error correction models are a common time-series approach and allow analysts to discuss both short- and long-term relationships among series. Vector autoregression is also popular, in particular due to its handling of endogeneity; it is less restrictive than structural equation techniques, as it does not impose exogeneity assumptions. Finally, generalized autoregressive conditional heteroskedastic models are prominent, and can be used to account for heteroskedasticity or volatility in a series.

Tocqueville, Alexis de

Alexis de Tocqueville (1805–1859) was a French philosopher trained in law, political philosophy, and history. His *Democracy in America,* first published in 1835, provided an incisive look into the character of America. Differentiating the American system from European systems, Tocqueville discerned in the American people a strong ethic of industry coupled with the tempering influence of religion and community. Tocqueville's keen observations and thorough documentation of the idiosyncrasies of the country established him as one of America's foremost political theorists.

Tocqueville was born into a well-bred family in Paris on July 29, 1805. His parents were both descendents of European nobility, and he enjoyed the trappings of aristocratic wealth in the form of private tutors and frequent traveling before enrolling in the College Royal in Metz at the age of sixteen. Over the course of the next several years, he studied philosophy, history, theology, and law. After obtaining a law degree, he gained a junior position on the Versailles court of law, serving as a deputy judge. He was soon sent to America to study the country's penitentiary system. With the July Revolution of 1830, in which French king Charles X abdicated power, Tocqueville became apprehensive about France's drift toward democracy. He, therefore, became highly interested in learning how America checked its own democratic excesses, gleaning from its government lessons for France's own development.

Arriving in America with his former classmate and fellow magistrate, Gustave de Beaumont, Tocqueville spent a total of nine weeks traveling around the country researching and recording the intricacies of American government at the height of the Jacksonian era. Observing the role of the federal government and local governments working in concert, Tocqueville also was able to see the significance of religion at the local level in bestowing the community's necessary balance to counteract the materialism so constituent of the modern commercial society.

The first of two volumes of *Democracy in America* was published in 1835 to widespread acclaim. In it, Tocqueville outlined in cool, detached prose the political makeup of America, often playing it against the monarchies and fragile aristocracies in Europe. *Democracy in America* paints the picture of a functioning republic that checks the tyranny of the democratic majority through the institutions of local government aided by distant, independent-minded federal legislators who weigh the rights of all the citizenry. The second volume, released in 1840, analyzed democracy and social equality in more general terms and drew a more subdued public reaction.

Following the release of the two volumes, Tocqueville returned to France, serving in the French Academy and the Constituent Assembly following the French Revolution of 1848. He continued to emphasize the importance of the role of religion in society and denounced French military expansionism. Exiled from politics following Louis-Napoleon's coup, Tocqueville spent the last few years of his life writing a history of the follies of the French Revolution. He died of tuberculosis in Cannes on April 16, 1859.

Toleration

Toleration—derived from the Latin verb *tolerare,* menaing to endure, to bear with—refers to "a deliberate choice not to interfere with conduct which is disapproved" (Horton and Nicholson 1992, 2). The term is generally used to describe the actions of both individuals and governments, and an extensive scholarly literature has explored the attitudinal structures, personal characteristics, and developmental influences that lead people to tolerate, to combine a negative judgment about something with a conscious decision not to interfere with or suppress it. Historians of political thought have explored the emergence of arguments and policies that either support or oppose policies of toleration, while empirical studies have focused on the shifting boundaries of the tolerable and intolerable, along with the dynamics that lead to the suppression of civil and political rights for members of unpopular minorities.

Toleration is a largely negative and minimal term; that is, it refers to the *absence* of something—coercion or punishment—and thus falls somewhere between persecution on the one hand and full liberty and equality on the other. Yet, this minimalist term has historically represented a crucial step in the protracted struggle for more expansive political rights. Tolerationist politics seeks to carve out a protected social space for unpopular groups, acknowledging the reality of diversity and disagreement within society; in this sense, a minimal term like toleration may require extensive government action to safeguard unpopular minorities. Reasons for tolerating vary widely and may include prudential, strategic, or instrumental considerations; religious convictions about the importance of free assent in matters of faith; weariness of the social costs of continued persecution; theories of epistemological skepticism or relativism; or philosophical commitments to autonomy as a fundamental value.

ORIGINS OF TOLERATION

Historically, toleration debates have most often been associated with matters of religion and have addressed the rights of marginalized or minority religious groups to worship undisturbed or persecuted. Scholars often trace the roots of toleration, especially in the liberal tradition, to the wars of religion in early modern Europe and to seventeenth-century England, where religious issues were intimately connected with the political disputes that led to the beheading of one king, Charles I, and the abdication of another, James II. Certainly, tolerationist systems of various sorts had existed in prior times and places: under the Roman Empire; in the Ottoman millet system, where religious communities received a measure of autonomy to order their own affairs; and in the work of medieval thinkers who envisioned adherents of diverse religions peacefully coexisting. But sixteenth- and seventeenth-century Europe saw two important and relatively simultaneous developments: the coalescence of a host of philosophical, political, psychological, theological, and economic arguments in favor of religious toleration and the political-military victory of protolerationist forces and, thus, the implementation of a measure of toleration in England, in France under the Edict of Nantes, and in other places across the continent.

Liberal theory has built its philosophical and political system on the primacy of toleration as a blueprint for addressing socially divisive phenomena. John Locke's *Letter Concerning Toleration* (1690) is generally considered the most prominent liberal defense of religious toleration, yet the importance of Locke's formulation lies not in its originality, but in the way that Locke digested over a century's worth of tolerationist arguments, and in the influence his work had on Jefferson and others in the American context. Indeed, Locke was just one of many important sixteenth- and seventeenth-century figures (e.g., Montaigne, Bayle, Spinoza, Milton, and Castellio) who contributed to the spread of tolerationist ideas in Europe. In the nineteenth century, John Stuart Mill's *On Liberty* (1859) broadened this defense of free religion and speech into a theory that championed the rights of individuals to act on their deepest beliefs in all matters that did not result in direct harm to others.

The liberal constitutionalist tradition, which owes such a debt to Lockean and Millian thought, places toleration at its cornerstone, a fundamental element of legitimate government:

In the words of David A. J. Richards, toleration lies "at the very moral heart of the dignity of constitutional law" (1986). John Rawls self-consciously styled his political liberalism on the model of Locke and claimed that his system "completes and extends" the struggle for toleration that began in early modern Europe (154). But questions of toleration extend beyond religion into other areas of social and political life, wherever unpopular or controversial groups face a hostile environment and stand in need of protection from state interference or menacing by their enemies. Over time, tolerationist arguments have been employed in attempts to protect groups marginalized on account of gender, sexual orientation, unpopular political views, and race.

CRITICISM OF TOLERATION

At the same time, the concept of toleration has not been without its detractors. Critical theorists have objected to the fact that "tolerance" of differences leaves in place powerful social disparities that remain uncontested because of its focus on the maximization of individual choice. Postmodern theorists and those seeking a more positive celebration of difference often criticize toleration as insufficient, grudging, and unsuitable for the complete respect of difference. Toleration, in this view, grants permission for difference but does not praise or affirm it.

Such critiques possess a degree of truth—even its defenders often admit that toleration is an "old-fashioned ideal" (Gray 1995, 27)—yet toleration's benefits should not be overlooked, such as the cessation of violence and persecution between groups with long histories of violence and the extension of basic political and institutional protections to unpopular groups. Toleration, according to this view, represents a necessary though not always sufficient political achievement. Surely the tolerationist ideal recognizes that political theory and practice involve the gradual, often halting, and always contested extension of civil and political rights, and the tradition of toleration continues to play a central role in the ongoing struggle for human freedom and dignity.

Tolstoy, Leo

Leo (Lev) N. Tolstoy (1828–1910) was one of the world's greatest novelists and exercised great social influence in his native Russia. In addition to fiction, his writings touched upon politics, religion, history, and philosophy, and he also lobbied for social and political reforms in Russia.

Tolstoy was born in Yasnaya Polyana, south of Moscow, into a family of the Russian nobility. His parents died when he was a child, and he was brought up by relatives. In 1844 he started his studies at Kazan University, but he dropped out, eventually joining the army in 1851.

Tolstoy began his literary career in the 1850s, and his first stories were based on his military experiences in the Caucasus region and in the Crimean War (1853–1856). Afterward, he traveled in Europe but returned to Yasnaya Polyana, where he started a school for peasant children. With the exception of a brief period in the 1860s, Tolstoy did not move in Russian literary circles, which were dominated by Western-oriented progressives. Tolstoy, in contrast, put his faith in the Russian peasantry.

His most famous work, *War and Peace,* appeared between 1865 and 1869. It is centered on Russia's experience during the Napoleonic invasion and includes over five hundred characters, including French emperor Napoleon Bonaparte and Russia's tsar Alexander I. Considered an exemplar of realistic fiction, the novel celebrated Russian traditions and the common citizen while advancing the idea that history cannot be shaped by even the most powerful leaders. Instead, Tolstoy suggests that all is predetermined and that humans only believe they have free will. Tolstoy's other epic work is *Anna Karenina*

(1873–1877), a critique of the life of the gentry and a reflection on the quest to give meaning to life. He produced numerous other novels and short stories, many of which, such as *The Death of Ivan Ilyich* (1886) and *Master and Man* (1895), stress the virtues of the Russian peasant and how individuals must assume a social responsibility beyond themselves.

In his later life, Tolstoy's writings acquired a more explicitly philosophical, social, and religious orientation. He acquired a worldwide reputation as a great moral thinker, adopting pacifism; Christian anarchism, for which he was excommunicated by the Russian Orthodox Church; and utopian communism. He committed himself to the belief that, as quoted in the 1978 Edmonds translation of *War and Peace,* "The one thing necessary, in life as in art, is to tell the truth." He ran afoul of the tsarist authorities for his political and moral views, and some of his publications were banned. Despite having over a dozen children, he railed against the institution of marriage, and in 1884 he left Yasnaya Polyana with the idea that he would become a poor, celibate peasant. His religious beliefs, gathered in such works as *A Confession* (1884) and *The Kingdom of God Is within You* (1894), sought to turn to the moral teachings of Jesus, emphasizing compassion toward others and rejecting the authority of the church insofar as it was linked to an oppressive state. His estate became a place of pilgrimage for many who admired him, and he gained great moral authority. His writings on pacifism and the example of his life would influence American civil rights leader Martin Luther King Jr. and Indian pacifist Mahatma Gandhi. Tolstoy died of pneumonia in 1910 while following his urge to become a poor, wandering ascetic.

Torture

The United Nations Convention against Torture and other Cruel, Inhuman or Degrading Treatment or Punishment defines *torture* as

> any act by which severe pain or suffering, whether physical or mental, is intentionally inflicted on a person for such purposes as obtaining from him or a third person information or a confession, punishing him for an act he or a third person has committed or is suspected of

having committed, or intimidating or coercing him or a third person, or for any reason based on discrimination of any kind, when such pain or suffering is inflicted by or at the instigation of or with the consent or acquiescence of a public official or other person acting in an official capacity.

Torture may be physical or psychological and is unique from other forms of punishment in its severity. While torture is almost universally condemned by civilized nations and societies as a barbaric practice, it continues to be used and its effectiveness debated.

Throughout history, torture has been used against prisoners of war, slaves, foreigners, and even citizens. The ancient Egyptians and Greeks tortured prisoners of war, though historical records show that the Greeks rarely did the same to free citizens. The torture of citizens was not generally used during ancient Rome's early period either, except for the crime of treason, but starting with the reigns of Tiberius and Caligula, the torture of citizens, slaves, and foreigners became more frequent. Despite the early Christian resistance to it under Roman rule, torture was institutionalized by the Catholic Church in medieval times through the infamous Inquisition. Torture became legitimized in many European nations in the twelfth century, but reform movements in the eighteenth century resulting from the work of such notable intellectuals as the French philosopher and writer Voltaire and the Italian criminologist Cesare Beccaria, who wrote *On Crimes and Punishments* (1764), culminated in the general abolition of torture. The practice, however, continued to endure. In the twentieth century, torture was an official tool of Nazi Germany and the Soviet Union. More recently, the United States came under criticism for the torture of prisoners at Abu Ghraib in Iraq and at Guantanamo Bay, Cuba.

Despite its continued use, torture is prohibited by numerous national and international laws and treaties. The primary international treaty against torture is the United Nations Convention against Torture and other Cruel, Inhuman or Degrading Treatment or Punishment, to which the United States is a signatory. The United States further prohibits torture as a criminal act under the Torture Act of 2000; yet an August 2002 Department of Justice memo noted that the torture of terrorist suspects abroad "may be justified" in the global war on terror.

DEFINING TORTURE

Since the scandals of Guantanamo Bay, Abu Ghraib prison, and extraordinary rendition in the United States, politicians, academics, and the law have failed to adequately define torture. Throughout the 1990s and since the millennium, numerous definitions of torture have been advanced, including memos by advisers to President George W. Bush that provided a limited definition of torture, allowing physical and psychological abuse of persons just short of death. United States law, in the Torture Act of 2000, defines torture as "an act committed by a person acting under the color of law specifically intended to inflict serve physical or mental pain or suffering

(other than pain or suffering incidental to lawful sanctions) upon another person within his custody or control."

The problem with this definition and that of the United Nations (UN) convention is that they do not state what specific acts constitute torture. For example, the George W. Bush administration employed waterboarding, which simulates drowning, as a lawful interrogation technique even though most authorities consider it a form of torture. Indeed, at the end of World War II (1939–1945) Japanese military officers were executed for employing waterboarding, and U.S. military personnel, prior to the Bush administration, have been court-martialed for using it.

Some of the more well-known methods of torture include the rack, where a person is strapped to a table and tied to wheels at both ends, whereupon the victim is stretched until the joints dislocate; the strappado, where a person's arms are tied behind the back and then the victim is tied to a rope through a pulley attached to the ceiling until the shoulders dislocate; the ripping out of finger and toenails; the burning of flesh and blinding with hot irons; the attachment and activation of electric cables to a person's genitalia; and the deprivation of food, water, and sleep. Some authorities try to justify torture as a gradation of the harms caused. Even the UN convention and U.S. law recognizes that torture involves serious or severe harm and not minor incidental injuries, such as bruising, to lawful punishments.

DEBATE AND JUSTIFICATIONS

In the early twenty-first century, the debate concerning the propriety of torture centers upon whether it is justified in the face of modern threats such as terrorism and the use of weapons of mass destruction. Some uphold that torture is justified to prevent possible terrorist attacks. The primary justification for this position is the balancing of the harms done to a few people subject to torture against the potential harm to hundreds or thousands from a conventional weapons attack or a nuclear, chemical, biological, or radiological attack. Most, but not all, authorities and laws hold the position that torture is never justified. Some critics claim that a person subjected to torture may confess to anything to make the torture stop, making the confessions unreliable.

Another major issue is that of extraordinary rendition, in which a nation where torture is prohibited transfers its prisoners for interrogation to other countries that do permit torture. Though the practice is illegal under the UN convention as well as under U.S. law, extraordinary rendition was allowed under the administration of Bill Clinton and increased dramatically under President George W. Bush, when more than one hundred foreign nationals were transferred to countries such as Jordan, Iraq, Egypt, and Afghanistan for interrogation. The practice continued early in the administration of President Barack Obama.

While the United States is often used as an example, it is not unique in its use of torture against suspects. Many nations around the world today, from the Americas to Asia, violate regional and international laws as they engage in torture of both foreigners and citizens. Among them are Syria, Iran, Saudi Arabia, Afghanistan, China, and North Korea.

Totalitarianism

Totalitarianism is an ideal that, in practice, applies to any regime that promotes total control of a people in pursuit of the ideological goals of the leadership. Totalitarian rulers seek control through the elimination or co-optation of independent business groups, labor unions, religious bodies, educational institutions, and challengers to the regime, such as legislators from competing political parties or an independent judiciary.

Totalitarianism is a twentieth-century phenomenon. Notable totalitarian regimes include Italy under Benito Mussolini (1922–1943), Germany under Adolph Hitler (1933–1945), and the Soviet Union under Joseph Stalin (1922–1953). Mussolini applied the term to his own regime, and Hannah Arendt (1951) used it to show parallels between Nazi Germany and Stalin's Soviet Union.

Origins of the concept may be traced to Aristotle's normative distinction in *Politics* between good and bad forms of government. However, the characteristics of this distinction also yield empirical attributes. Good governments were those ruled in the public interest—of all those governed. All classes were represented, and law was supreme. Bad governments were administered in the private interest of the ruler or ruling class, and the will of the ruler was supreme.

Aristotle identified six major forms of government, two of which involved the rule of many: *polity,* the good form, and its bad counterpart, *democracy.* In the seventeenth century, polity began its evolution into constitutional democracy, which is democratic because voters choose representatives in competitive elections and constitutional because government power is limited and the rights of individuals and groups are protected by law. A metaideology of the center, it includes liberalism, conservatism, and democratic socialism. Aristotle's notion of democracy developed into what Jacob L. Talmon (1952) termed *totalitarian democracy,* a metaideology of the extremes that includes orthodox communism on the left and fascism on the right. It arose to secure goals that constitutional democracy

could not: the articulation of the true will of all the people, which is expressed in utopian economic and social goals, rather than the "merely formal" political and legal goals of constitutional democracy. A totalitarian democracy is democratic because its governments claim to rule in the real interest of many, even while barring competitive elections, and it is totalitarian because an elite minority, which allows no rights against the regime's interests, controls government.

Some key characteristics of totalitarian democracy are

1. An ideology that promises a final solution to the problems of modernity by instituting a radical and revolutionary new order. It promotes a messianic civil religion that projects a utopian future of a united and happy multitude, based on the total reshaping of people and society. It also evinces relentless hostility to constitutional democracy in any of its permutations. Individual freedoms, rule of law, and open and competitive elections are anathema; ideology requires conformity, atomization of the masses, and unlimited regulation of everyday behavior.

2. A monopoly of violence, including control of the military and a terror system centered on secret police organizations that engage in widespread surveillance and punishment of suspected opponents.

3. State cooptation and control—collaboratively if possible, violently if necessary—of the economy, including raw materials and finished goods, business, and labor.

4. An elite one-party system tasked to staff the state's bureaucracy.

5. State monopoly of information and communication to promote propaganda in support of the regime and to minimize vocal opposition.

6. A charismatic, almost divine leader as the focus of a cult of invincibility, designed to make the leader invulnerable to opposition or criticism.

7. Imperialist conquest as necessary to achieve utopian goals.

Totalitarianism of the right, or fascism, differs significantly from orthodox communism of the left. The right limits citizenship to males of one nation, race, or religion. It is reactionary, maintaining a traditional class structure, permanent ruling elite, and mythic past. It permits regulated private ownership and enterprise.

Totalitarianism of the left is universalist and revolutionary. It looks to the future, and all are welcome to join the crusade, regardless of race, religion, or gender. Major goals include the abolition of private property, religion, and classes in favor of the full economic and social equality of all members. In the society of the future, the state will disappear along with its oppressive, coercive organs, which are merely temporary means to a utopian end.

Town Hall Meeting

The town hall in New England is the setting for a meeting that is a traditional celebration of community and an egalitarian legislative assembly of voters who make all town policy decisions. This type of meeting stands sharply in contrast to the staged gatherings some American politicians loosely call "a town hall meeting," but at which no decisions are made.

The equivalent of a genuine town hall meeting is traceable to the age of Pericles in the city-state of Athens in the fifth century BCE and the canton of Appenzell Landsgemeinde in Switzerland in 1378. In 1630, a *folkmoot,* an assemblage of freemen, governed emerging towns in the Puritan-founded Massachusetts Bay Colony without authorization of the colony's governing body, which within five years recognized them by directing named towns to initiate specific actions.

PROCEDURES

The elected board of selectpersons issues the warrant for the annual meeting typically held in the spring or for a special town meeting. The annual meeting warrant contains articles relating to the election of town officers and business matters, and voters may place articles in the warrant by petition. In many towns, a civic group hosts a meeting before the formal town meeting to discuss the warrant and to answer questions.

The elected moderator presides in an impartial and orderly manner to ensure voters understand warrant articles. Many warrant articles are routine, but others may be exceptionally controversial and necessitate an adjourned session or sessions to reach a decision on each. The amount of authority exercisable by a town hall meeting varies: Vermont grants the least functional discretionary authority, and Maine grants the broadest such authority.

ADAPTATIONS AND DECLINE OF TOWN HALL MEETINGS

Population growth led Boston to abandon the meeting in favor of a mayor and city council in 1822. Other large Massachusetts towns followed Boston's lead until 1915, when the

General Court authorized a *representative town meeting (RTM)* conducted in the same manner as an open town meeting with one exception: Only elected representatives could vote. Currently, thirty-nine Massachusetts towns, six Connecticut towns, and one Vermont town have an RTM; Sanford, Maine adopted an RTM with partial authority.

Direct democracy still continues to function in each New England state. Massachusetts, for instance, has 262 towns with an open town meeting. However, voter participation has declined sharply except in the smallest towns. For example, by 1996, the average attendance at sixty New Hampshire town meetings was only 20 percent, with small towns (population below five hundred) having the highest turnout (38 percent).

Several factors have produced the decline in town hall debate and decision making. The population has become more mobile with an influx of citizens from cities and other regions of the country lacking experience with town meetings. In some cases, town officers fail to provide adequate explanations and information, compounding the integration of this new population. More options for entertainment can also distract interest from town meetings.

REFERENDUM MEETINGS

Disturbed by the falling attendance, a number of towns have begun providing child and elder care, expediting the processing of noncontroversial articles, and improving the efficiency of meetings through tighter moderating. Vermont was the first state to allow some towns to experiment with a form called *referendum meeting (RM),* held before voters cast a secret ballot on the articles in the warrant, while New Hampshire was the first state to offer all towns the option of instituting an RM. While the RM is held prior to the referendum and allows voters to raise questions, discuss warrant articles, and amend them, in the sixty-three New Hampshire towns and seventy-five school districts that have adopted it, attendance averages 3.5 percent, with town officers and committee members constituting 75 to 90 percent of the attendees. RMs have not spread beyond Vermont and New Hampshire.

CONCLUSION

Referendum town hall decisions, in theory, should have more legitimacy than ones made by a primary assembly in which a very small percentage of the voters participate. New Hampshire data reveal, however, average voter turnout at the polls varies from 27 to 30 percent. In fact, majority decisions could be made by an average of 15 to 16 percent of the voters.

The act of referendum decision making, in itself, has destroyed deliberate democracy, even though the designers included a preliminary deliberative session in an attempt to preserve this conventional feature of town meetings. The accountability of elected officers to the voters is a key tenet of democratic theory. Deliberative democracy facilitates the ability of voters to hold elected officers accountable through a face-to-face town meeting, questioning and criticisms of officers' respective actions and inactions. The popular sentiment toward the scrutinizing role of the town meeting is lost when it is replaced by another decision-making mechanism.

Trade Blocs

A *trade bloc* is an intergovernmental agreement that brings together a group of countries with the purpose of obtaining mutual economic benefits in international trade. Benefits subsequently result from the reduction or removal of trade tariffs and barriers within member countries. Although most trading blocs are currently immersed in regional integration processes and institutions, there are also nonregional relationships, which tend to be bilateral as well as interregional.

In the 1930s, a wave of regionalism led to the formation of trade blocs in response to the detrimental effects of the Great Depression and the disintegration of the gold standard on the world economy. Another wave of trade bloc formation took place during the 1950s and 1960s with developing countries adopting industrialization strategies based on import substitution. Trade blocs permitted these countries to pursue self-sufficiency by creating regional economies of scale. Also during this period, European countries established the European Coal and Steel Community in 1951 and the European Economic Community in 1957. More recently, since the 1990s, there has been a surge of regional integration initiatives that prioritized market deregulation and privatization of state-controlled sectors; this aligns with the prevailing ideological imperatives of neoliberal globalization.

DIFFERENT FORMS OF TRADE BLOCS

Trade blocs take many forms, depending on the degree of incremental integration among the participating countries.

FREE TRADE ZONE OR FREE TRADE AREA

A group of countries that agree to set tariff preferences for trade with one another, covering most of their traded goods and services, constitute a free trade zone or area. Member countries retain sovereignty over the determination of their

respective trade policies vis-à-vis nonmember countries. Trade disputes and restrictions, which often occur between members, are resolved in dispute resolution mechanisms to which members have previously subscribed in the trade agreement. Local content laws are introduced these areas to prevent nonmember countries from initially exporting to a member country with a low external tariff, with the goal being to send the exports on to a member country that has a higher external tariff. Local content provisions require that a certain percentage of the value of the product must be sourced locally within the free trade area not to be subject to import duties.

Some of the more well-known free trade areas include the recently created ASEAN-China, North American Free Trade Agreement (NAFTA), Economic Community of West African States, and others. A U.S.-proposed Free Trade Area of the Americas (FTAA) was never created due to stiff opposition from governments and broad sectors of the Southern Common Market (MERCOSUR) countries—Argentina, Brazil, Paraguay, and Uruguay.

CUSTOMS UNION

In addition to a liberalized intrabloc trade, a customs union adopts a common external tariff structure to act as a common trade barrier toward nonmembers. Restrictions apply to the type of tariff protection that this kind of trade bloc can have. According to the principle of nondiscriminatory trade policies under Article 24 of the General Agreement on Tariffs and Trade (GATT), the level of common external tariff can be no higher than an average of previously existing tariffs of the member countries; otherwise, the group must offer compensation to adversely affected nonmember countries.

The Association of Southeast Asian Nations (ASEAN) exemplifies a currently functional customs union. Other examples include the Southern African Customs Union, MERCOSUR, Arab Customs Union, Andean Community, Caribbean Community, Economic and Monetary Community of Central Africa, the Gulf Cooperation Council (GCC), among others.

COMMON MARKET

In addition to the requirements of custom unions, common markets also include the free movement of factors of production: labor and capital. The 1957 Treaty of Rome that created the European Economic Community ultimately aimed to create of a common market—a goal that was substantially achieved by the early 1990s in Western Europe, known as the European Community.

ECONOMIC AND MONETARY UNION

An economic and monetary union represents a step higher in the regional integration pathway. The defining feature of economic and monetary unions is the harmonization of tax and currency policies of its members. The most well-known modern case is the Economic and Monetary Union of the European Union with the adoption of the euro as a single currency and a European Central Bank.

POLITICAL UNION

Political union represents the ultimate form of economic integration. An example of such a union is the former Soviet Union, though the best-known political union is the United States. The establishment of a European Parliament is a first step on the road toward the formation of a European political union, but whether a full political union will form remains an open question. Likewise, the Union of South American Nations, comprising MERCOSUR and CAN members, is moving toward a constitution of a South American political union encompassing trade, security, and political issues.

IMPLICATIONS FOR WORLD TRADE AND DEVELOPMENT

The proliferation of trade blocs raised various key issues for scholars. First, there is the question of the relation between trade blocs and the multilateral trade system. The issue centers upon whether trade blocs constitute stumbling blocks or stepping stones to multilateral trade liberalization. Advocates of worldwide free trade generally oppose trading blocs. They believe trade blocs encourage regional trade at the expense of weakening the multilateral trade system. The formation of trade blocs, therefore, sets incentives for other countries to seek membership in order to offset the costs of trade diversion affecting nonmembers. In this sense, trade blocs have been said to trigger a domino effect.

However, supporters see trade blocs as a means to advance the trade liberalization agenda in contexts when multilateral negotiations of trade liberalization from GATT and World Trade Organization are often slow and even stagnated. With a small number of countries, it is easier to exchange concessions and also to agree on effective enforcement mechanisms. Thus, according to this view, even if trade blocs may divert trade flows, they likewise enable trade liberalization to continue moving forward.

A second key issue is the concern about trade blocs contribution to the generation of welfare equitably distributed among the blocs members and economic sectors. This is particularly important in North-South agreements where trade integration involve countries with different levels of socioeconomic development. This problem affects the case of NAFTA, the failed FTAA project, and the Economic Partnership Agreements sponsored by the EU, among others. Critics argue that trade integration accentuates existing asymmetries in levels of development and power if it does not address inequalities through adequate policies and institutions. This applies to market-led models of integration that relegate the social and environmental impacts of trade and investments to lesser importance. Rather than advancing democratic, equitable, and sustainable development, trade blocs can also formalize a regional governance framework to grant citizen rights to transnational corporations, while reducing democratic accountability. South-South initiatives are not exempt from this development challenge. In particular, blocs like MERCOSUR and the proposed trilateral free trade agreement among India,

South Africa, and Brazil have the potential both to overcome as well as to reinforce interbloc asymmetries and inequalities.

Trade Diplomacy

As a field of study, *international political economy* seeks to understand the politics of international trade, finance, and monetary relations. *Trade diplomacy,* as one aspect of trade politics, relates to the process of trade negotiation between states and the influence of domestic and international actors on that process. According to Nicholas Bayne and Stephen Woolcock, trade diplomacy is concerned with process and "the negotiation of trade agreements in bilateral, regional, or multilateral contexts." The study of trade diplomacy thus primarily focuses on how the processes of international trade negotiation affect trade relations.

Scholars of international political economy who study trade diplomacy generally adopt a state-centered approach to highlight domestic politics and the strategies states pursue in negotiating trade. In his text *International Political Economy: Interests and Institutions in the Global Economy,* Thomas Oatley advances the utility of a state-centered approach by describing how national policy makers develop trade and finance policies both in response to and independently from the narrow, self-interested concerns of domestic groups. Trade diplomacy therefore involves the interests of autonomous states, state-society relations, and interstate relations. Trade diplomacy also includes state relations with regional and international trade bodies.

The tools of trade diplomacy lean heavily on the assumption of mutual cooperation between states, but can also include certain coercive measures. Informal negotiations, policy coordination, trade coalitions, and formal agreements dominate trade diplomacy, yet disputes can produce trade discord and the use of formal sanctions and trade embargos. The asymmetry of economic and political power between larger trading states and smaller ones lends the former much greater latitude to use such tools for their advantage over the latter. However, coercive measures involving trade policy are not always effective in producing the desired outcomes of larger trading states; these raise ethical questions about innocent victims who suffer under trade sanctions.

The basic strategies of trade diplomacy center on the real and perceived merits of bilateral, regional, and multilateral diplomacy. Most states generally engage in all three strategies in search of trade advantage in a competitive environment of global trade. Bilateral trade diplomacy affords greater opportunity for trading partners to achieve mutual agreement but can be costly in terms of time, effort, and diplomatic resources, especially for smaller trading states. Regional and multilateral trade arrangements rationalize the diplomatic process of trade negotiation but demand greater compromise among multiple partners, increase pressure from affected domestic interests, and result in difficult and lengthy negotiations. When they are institutionalized, regional and multilateral trade associations can facilitate more efficient trade diplomacy. Written into many regional and multilateral agreements, for example, are standardized principles and rules such as nondiscrimination between members, reciprocity in negotiations, and safeguard provisions to protect national interests.

Since the early post–World War II (1939–1945) period and the creation of the Bretton Woods system of global economic management, most states have sought participation in multilateral trade management as a means to rationalize trade diplomacy. Trade management initiatives such as the General Agreement on Tariffs and Trade (GATT) and the United Nations Conference on Trade and Development originated as forums to forge international agreement, but evolved over time into robust institutions with missions, rules, and agendas of their own. Expanding democracy and economic globalization have since led to a proliferation of political actors involved in trade diplomacy. Policy makers and state representatives wield the authority to formalize negotiations and sign agreements, but interest groups, multinational corporations, and nongovernment organizations (NGOs) increasingly influence the positions of state diplomats in trade negotiations.

The 1995 creation of the World Trade Organization (WTO), formed from GATT, represents the most ambitious attempt to rationalize multilateral trade diplomacy. Its 153 members agree to abide by standardized rules of trade and

the decisions of supranational dispute-settlement bodies when those rules are violated. Since its creation, many states, interest groups, and NGOs have come to view the WTO as a formidable independent actor because of its power to shape international trade and define the limits of state sovereignty. Calls for greater transparency in trade diplomacy have followed. Recent frustration with the WTO system, the entrenched positions of state coalitions, and the failure of the Doha Development Agenda have produced increased disillusionment with multilateralism. A trend of increasing bilateral and regional trade diplomacy now characterizes trade diplomacy, with over 250 regional trade agreements existing alongside an ever-expanding number of bilateral trade agreements.

Tradition

The term *tradition* has a significant history of usage in the field of political science and particularly in the subfield of political theory. There are, however, to two quite different uses of the term, which are sometimes reflected in dictionary definitions. The root of the term is the Latin *traditio* that refers to an act of handing over, and *traditum* connoting the thing transmitted or handed down from the past to the present. For example, *traditio* in Roman law was a method of transferring ownership of property.

The primary contemporary meaning of tradition can be labeled *indigenous,* and is a reference to an inherited pattern of thought and action, such as a religious practice, which involves concrete instances of the handing down of information, beliefs, and customs by word of mouth or by example from one generation to another. For example, in Christianity, and particular in Roman Catholicism, church authority is based on what is termed the *sacred tradition,* and many political and social practices ranging from Fourth of July celebrations in the U.S. to forms of political campaigning worldwide reflect this concept of tradition.

There is, however, a secondary and more general sense of tradition labeled *analytical,* involving scholars and other commentators specifying, according to their own criteria, general aspects of cultural continuity. This can apply to social attitudes, customs, and institutions or to characteristic manners, methods, and styles of behavior. When Louis Hartz wrote his influential work on *Liberal Tradition in America* (1955), he was not speaking about a consciously embraced and self-ascribed tradition, but instead about what he believed he had identified as persistent characteristics of American thought and social relations. Often when historians, social scientists, and political philosophers and political theorists write about something such as the Western tradition of political thought or about American political thought, they select iconic authors and texts among which they claim to perceive certain family resemblances.

The indigenous and analytical senses of tradition are, however, often mistakenly, and sometimes purposively, conflated. Although Hartz, for example, was at times clear about the fact that he was describing a liberal tradition from the external perspective of the historian, he often implied that what he was depicting was an actual historically indigenous pattern of thought—one that had been consciously and intentionally passed from generation to generation.

CONNOTATIONS OF TRADITION

The concept of tradition often carries either a positive or negative normative valence. In some cases, it is viewed as a conservative source of authority with varying degrees of acceptance regarding development and change. Edmund Burke defended this sense of tradition in his *Reflections on the Revolution in France* (1790), while, as in the case of the Enlightenment, the idea of progress often entailed the rejection of traditional authority and institutions. Edward Shils's *Tradition* (1981) was also a defense of tradition in the face of modern attitudes and particularly those he saw as characteristic of contemporary social science. In the social sciences, the term *traditional society* often neutrally contrasts with industrial, urbanized, capitalist modern society. The term is applied to a wide range of nonmodern societies, as varied as tribal groups on the one hand, and medieval European states on the other. It is also sometimes employed as a judgmental term, often implying negative traits associated with being backward and nonscientific. However, it is also occasionally valorized and associated with close-knit social units and communal values.

TRADITION IN POLITICAL THEORY

The issue of what constitutes a tradition has been most salient in the study of the history of political theory. The texts constituting the classic canon were incorporated during the mid-nineteenth century into the emerging field of political science as a historico-philosophical narrative of the progressive development of Western political thought. This narrative, inspired by German philosophy, provided a provenance both for American democratic political institutions and for the discipline of political science. Despite a fundamental shift, after the turn of the century, in the discipline's images of both

democratic theory and science, there was, until the middle of the twentieth century, no significant challenge to the symbiotic relationship between political science and the subfield of political theory.

This relationship was subsequently disrupted by two distinct intellectual movements. On one hand, the rise of behavioral political science, however, led to the depreciation of what came to be referred to as *traditional political theory* by political scientists who were intent on emulating what they believed were the methods of natural science. On the other hand, by this point, the image of what had become known as the *tradition of Western political thought,* which George Sabine celebrated in his 1937 *A History of Political Theory,* as a story of the triumph of liberal democracy, had been significantly altered by émigré scholars such as Leo Strauss, Eric Voegelin, and Hannah Arendt, as well as by others such as Sheldon Wolin. These scholars transformed the narrative into a story of the crisis and decline of both liberalism and political science. The study of the *great tradition,* from Plato to Marx, became devoted to an account of how the tradition had gone wrong and to the recovery of past truth.

By the 1970s, significant questions were being raised, from various perspectives—by a number of scholars such as Quentin Skinner, J. G. A. Pocock, and John G. Gunnell—as to whether the idea of the tradition, when viewed as progress or declination, was anything more than the retrospective imposition of rhetorical philosophical myths. These normative constructs, it was argued, distorted the meaning of both texts and contexts and neglected to recognize actual historical traditions of political thought.

CONCLUSION

Subsequent scholarship in the history of political thought has contributed significantly to more sophisticated debates and analyses regarding the nature of historical and textual interpretation; it has also contributed to the production of more credible histories of indigenous traditions of political thought and action. Although this has led to a better understanding of the concept of tradition and the difference between indigenous and analytical concepts, the problem of conflating the two has hardly been resolved in neither the literature of political theory nor political science in general. The different concepts to which tradition is attached remain open to considerable scholarly critical analysis and further clarification.

Tragedy of the Commons

Garrett Hardin popularized the term *tragedy of the commons* to denote a consequence of the population problem. Drawing on the work of William Forster Lloyd, Hardin describes a scenario in which an unregulated "commons" fosters decisions by individuals about its use that are designed to maximize each member's own short-term utility. The resulting actions are inevitably to the detriment of the collective interest, and the dynamic is presented to rebut the idea that an "invisible hand" guides individual decisions in the best interests of society.

This dilemma is most evident in decisions affecting shared resources such as the oceans and the food supply, while pollution is an example of the phenomenon in reverse. Hardin suggests that the solution lies, not in an "appeal to conscience," but in "mutual coercion mutually agreed upon." Economists, political philosophers, game theoreticians, and environmentalists continue to grapple with the problem, exploring regulatory means ranging from privatization to state control. Alternatively, a consideration of human behavior as being motivated by more than self-interest calls the inevitability of this "tragedy" into question. Empirical research by Elinor Ostrom and others in support of this more hopeful position uncovers examples of situations where communal arrangements regulate public behavior without government intervention.

Transitional Justice

Transitional justice includes approaches societies undertake to reckon with legacies of widespread and systematic human rights abuse, mass atrocity, genocide, or civil war as they move

from a period of violent conflict or oppression toward peace, democracy, the rule of law, and respect for individual and collective rights. Often used synonymously with *reckoning with the past, politics of memory,* or *decommunization,* transitional justice became an increasingly important field of inquiry in the 1990s after a growing number of countries shed dictatorship as part of the third wave of democratization. Its etymology is unclear, but the phrase is understood to refer to the interplay between political transition and justice. *Transition* could be a regime change from repressive rule to democratic rule or a major political transformation from conflict and instability to peace and stability. *Justice* refers to the broad range of methods through which perpetrators of human rights abuses are prosecuted or vetted, victims obtain compensation and the chance to heal from the past, and societies reconcile by overcoming distrust and division. Transitional justice occurs mostly in new democracies that reexamine their recent past, but sometimes consolidated democracies feel the need to come to terms with abuses in their more distant past (e.g., slavery in the United States, the Holocaust in Western Europe).

TRANSITIONAL JUSTICE APPROACHES AND METHODS

Transitional justice approaches can be judicial or nonjudicial in nature and can vary widely in scope, purpose, and effectiveness. First, former dictators, secret political police agents, guards, and militia members may be prosecuted in national or international courts of law. The trials of Slobodan Milosevic, Nicolae and Elena Ceausescu, Saddam Hussein, and the Berlin wall border guards who killed East Germans seeking to escape into West Germany, as well as the Nuremberg trials, are such examples. Trials might not result in conviction, can be flawed procedurally, and are seen as more or less legitimate. Second, lustrations allow postcommunist governments to deny former top communist officials and secret political police agents the right to be elected or nominated to public office for determined periods of time. By 2006, most Eastern European countries had adopted lustration laws, although the vetting process, resulting in job loss, was bitterly criticized for infringing a basic political right. Third, truth commissions can be established by presidents, governments, parliaments, political formations, or the international community to investigate the activity of past dictatorial governments, past political regimes, or specific historical periods of widespread repression. Commissions usually end their work by releasing a final report establishing the truth about the past, compiling victims' testimonials and oral histories, and naming—or not naming—the victimizers. Since the 1970s, more than twenty-five countries in Latin America (including Chile, Argentina, and El Salvador), Asia (Nepal and Sri Lanka), Africa (South Africa, Morocco, and Chad), and Europe (Germany and Romania) have set up such truth commissions.

Besides these three main approaches, there are other reparatory methods to reckon with the past. Local community courts of justice, or *gacaca,* were established in the wake of the 1994 Rwandan genocide to make the punishment of perpetrators faster and less expensive. Rehabilitation aims to reintegrate former political prisoners into the larger society and symbolically recognize their plight. Monetary and non-monetary compensation can help victims and their families cover health care costs related to political persecution or the education of children disadvantaged by the loss of their parents. Access to the secret archives compiled by the communist intelligence services has allowed victims to see the secret records, while effectively curtailing surveillance of former dissidents and forcing the retirement of secret full-time officers and part-time informers. The restitution of property and assets abusively confiscated by former regimes can also bring a measure of justice to owners seeking to recover private dwellings, land, businesses, artwork, or bank accounts.

The transformation of former prisons into commemorative museums, the organization of itinerant or permanent exhibitions, and the rewriting of the school history textbooks can all help societies reconstruct the geography of terror and educate the public about the particularities of each repression moment. On a symbolic level, the national and official commemoration of both repression and opposition episodes keeps the memory alive and helps to prevent future atrocities. Last but not least, the change in names of localities, streets, schools, and public institutions can also heal the wounds of a repressive past.

TRANSITIONAL JUSTICE AND DEMOCRACY

It is argued that new democracies engage in transitional justice because they seek to achieve justice for their citizens and to bring closure for victims; to establish civic trust and enhance social capital; to rewrite the historical record more truthfully; to renew the political elite and to marginalize public officials involved in human rights abuses; to reform their police, army, and secret police structures; to root out corruption and misuse of state resources; to show the international community willingness to break with an abusive past; to contribute to social reconstruction; to reconcile people and communities; to educate the national and international public; and to prevent future abuses. Thus, democratizing societies demand the halting, the investigation, and the prevention of human rights abuses through state-led systematic and often comprehensive transitional justice programs. Usually a combination of methods works best when trying to address the multiple legacies of trauma, but even in the most fortunate cases, the process is long, expensive, and tortuous, requiring sustained political will, committed popular acceptance, and a favorable international context.

Not all postauthoritarian countries have prosecuted and punished: A select few have chosen to forgive and forget. While sometimes the serious challenges faced by societies emerging from conflict and repression and their unique cultural and historical contexts have served as excuses for inaction, other times countries were unable to engage in transitional justice even if they wished to do so. Political conditions in postauthoritarian Spain and Mozambique prevented those countries

from reckoning with their past in the years immediately following democratization. Failure of transitional justice does not always indicate public apathy toward the subject or public unwillingness to find out the truth about the past and to prosecute offenders.

Transitional Regimes

During the mid-1970s, the *third wave of democratization,* a phrase coined by American political scientist Samuel Huntington, started in Western Europe; subsequently, it swept through Latin America and postcommunist Europe, including republics of the former Soviet Union. Many countries affected by this wave displayed democratic features, such as regular elections and civil liberties. Some retained characteristics associated with authoritarian regimes, such as a weak civil society, lack of government accountability, or absence of the rule of law. Others were never able to democratize and returned to authoritarianism. To capture the fluidity of political systems affected by the third wave, a new term—*transitional regime*—was invented. It became the central concept in *transitology*—an extensive body of literature that grapples with the question of why some countries democratize successfully and others do not.

DEFINING TRANSITIONAL REGIMES

In their 1986 book *Transitions from Authoritarian Rule: Tentative Conclusions about Uncertain Democracies,* Guillermo O'Donnell and Philippe C. Schmitter, leading scholars of democratization, defined transition as "the interval between one political regime and another" (2). Transitions start when authoritarian regimes begin to disintegrate, and they end when some kind of democracy is created, when a country returns to authoritarian rule, or a revolution starts. After the fall of communism, Juan J. Linz and Alfred Stepan defined *democratic transition* as the time when "sufficient agreement has been reached about political procedures to produce an elected government," when free and competitive elections take place, and when the government is capable of developing new policies (3). Most "transitologists" accept the minimalist definition of democracy implied in Linz and Stepan's work. However, the condition when "some kind" of democracy is created is only the beginning of a democratic transition. Successful transitional regimes achieve democratic consolidation.

For democratic consolidations to occur, democracy has to become "the only game in town." Linz and Stepan argued that consolidated democracies are distinct from other regimes because, when democracies are "consolidated," all important political and social actors acknowledge the legitimacy of the regime and do not try to secede from it. Using the established rules and procedures resolves domestic conflicts, and the majority of the public accepts the institutions of the state as the most appropriate way to govern collective life. Throughout the territory of the state, governmental and nongovernmental forces agree to solve conflict within the laws of the state.

MAJOR PERSPECTIVES

The literature on democratic transitions suggests that there is no one universally applicable formula to predict how a transitional regime becomes a consolidated democracy. At least two important processes take place simultaneously in transitional regimes: changes in political structures and economic changes. These complex processes are intertwined. Overall, the literature on democratic transitions suggests that economic development is a sufficient rather than a necessary condition for successful democratic transitions. According to Adam Przeworski and colleagues, the higher the level of economic development, the more likely a democratic regime is to survive. The risk that a transitional democracy will not survive increases ten times if the economy contracts in two consecutive years. It is also important to create strong state institutions and a vibrant civil society that will hold the government accountable to the voters.

The rich and diverse literature on democratization and economic development incorporates two main perspectives. The first, called *modernization,* focuses on the socioeconomic structures that shape the choices made by democratizing societies. For example, Yi Feng and Paul J. Zak argue that per capita income, the distribution of wealth, education, and preferences for political rights and civil liberties are crucial variables affecting the outcomes of democratic transitions.

The alternative perspective focuses on the preferences and interactions among political agents and tries to explain their individual choices. From this viewpoint, decisions made by the elites and cooperation between different factions are especially important and can impact socioeconomic structures. For example, in 1990, a group of Russian economists linked to Gorbachev and Yeltsin tried to develop solutions to the no-longer functioning Soviet economy. Their cooperation produced a 239-page document called "Transition to the Market" as well as a draft legislative package that argued for a speedy introduction of privatization and other laissez-faire reforms. Although Gorbachev and Yeltsin initially supported the document, Gorbachev's retreat from the program affected the dynamics of democratic transition and the scale of economic reform.

PREDICTING A SUCCESSFUL TRANSITION

Drawing on a comprehensive survey of the former communist countries, in *How Capitalism Was Built: The Transformation*

of Central and Eastern Europe, Russia, and Central Asia, Anders Åslund concluded that radical economic reform might produce better and more durable results than slow reform (i.e., transition from central planning to laissez-faire capitalism). In addition, radical economic reform is likely to contribute to establishing strong democratic institutions. In *Problems of Democratic Transition and Consolidation,* Linz and Stepan identified five supporting arenas necessary for consolidation of a democratic regime: a lively civil society (an entity with interest groups that are relatively independent from the state); a political society (where fight for political power is pursued according to legitimate principles, and actors such as political parties respect those rules); the rule of law; a bureaucracy to ensure the functioning of the state; and an economic society (a state-mediated market economy).

Studies of transitional regimes have identified other important variables that affect transition. These variables include the legacy of the past, since nondemocratic experiences in the past critically affect the path that a democratizing state takes; political leadership; and the scope of the agenda to be addressed by transition. Michael McFaul hypothesized that the wider the scope of the agenda for change, the less likely a new democratic regime is to emerge. It is extremely difficult to manage multiple complex transitions, such as the shape of emerging political institutions and the type of economic regime, at the same time. Successful transitions tend to focus simultaneously on a few problems, such as the shape of political institutions.

THE ROLE OF INTERNATIONAL ORGANIZATIONS

A significant number of works explore the role of outsiders in the processes associated with democratic transitions. During the mid-1990s, when the European Union (EU) and North Atlantic Treaty Organization considered expansion to the former communist countries of Eastern and East Central Europe, the so-called *geostrategic hypothesis* was put forward. This hypothesis—developed by Geoffrey Pridham, Adrian G. V. Hyde-Price, and others—suggested that in order to consolidate democracies within transitional regimes, a secure environment should be established to ensure democratic development. It was argued that a supportive geostrategic environment was a crucial variable explaining why some transitional regimes turn into consolidated democracies and others do not.

Numerous case studies exploring the impact of the EU on policies of applicant countries were conducted. According to Francis Fukuyama, the ability of the EU to make candidate countries incorporate democratic norms through membership criteria was described as "perhaps the most successful exercise of soft power in the world today" (84–86). However, attempts to promote democratization have come under scrutiny. After expansion in 2004 and 2007, the EU was not able to develop a successful strategy to deal with transitional regimes in its new neighborhood. Even the success of the EU in the new member states has been questioned—the elites may have adopted democratic norms to please outsiders for strategic reasons, without fully implementing the recommended reforms. There is an emerging consensus that successful democratization efforts should focus on local ownership and local participation.

CONCLUSION

Transitology is criticized for comparing transitional regimes in different cultural contexts with the state model associated with Western democracies. Social and cultural reality in countries undergoing political change may be too complex to be captured by elegant theories of transition. According to Thomas Carothers, when applied in practice, the assumptions about transitional regimes (e.g., an expectation to move toward democratization through certain stages) implicit in transitology are especially problematic. However, there is at least one important insight offered by numerous studies of transitional regimes: State building is crucial for democratic transitions, and it cannot be achieved without the willing involvement of local actors.

Transitology

Transitology is the study of the systemic change process from authoritarian regimes to democracies or to postauthoritarian regimes. Since the late 1970s, after the wave of political transitions swept Greece, Spain, and Portugal and similar changes subsequently occurred in South America, ambitious transitology literature on Latin America and southern Europe focused on generic scenarios of regime change in these two areas. The transitologists have made use of insights originally developed by Robert Dahl, Juan Linz, Dunkwart Rustow, Robert Putnam, and other theorists of democratization. Since the early 1990s, they increasingly began to compare transitions in Latin American and southern European regions with political changes in postcommunist Eastern Europe during the period between 1989 and 1991. By highlighting apparent similarities between these two kinds of transition, such works attempted to provide heuristic models for the study of interaction among political, economic, and social forces in various stages of the transition process in Eastern Europe.

Opponents of transitology argue that there are significant qualitative differences between the transitions in Latin America and southern Europe and that in Eastern Europe. These scholars describe the transition process in Eastern Europe as unique. In other words, they believe that other transitions generate irrelevant evidence for determining explanations of the events in the late-communist and postcommunist Eastern Europe.

Transnationalism

The turn of the twenty-first century has been met with a marked growth in economic, social, and political links among people, places, and institutions crossing nation-state borders and, indeed, spanning the world. Described as transnationalism, such patterns of sustained cross-border relationships, exchange, affiliations, and social activity have developed on various scales. Although people certainly maintained long-distance social networks, economic ties, and political loyalties in earlier periods, recent advances—not least a lowering of costs—in technology, telecommunications, and transportation have allowed expansion, intensification, and acceleration of such connections across large geographic and political spaces. It is not a coincidence that since the 1990s, the growth of social scientific concern with transnationalism has paralleled the growth of interest in globalization. Transnational ties, institutions, and social groups represent outcomes of globalization.

Interactions between national governments (e.g., formal agreements, conflicts, diplomatic relations), or the permanent transfer of people, goods, or other items from one nation-state context to another are still best described as international. Transnational realities can be distinguished as sustained social links and ongoing exchanges among nonstate actors based across national borders. This term thus emphasizes ties that function across nation-states and the borders, laws, institutional frameworks, and identity narratives they represent. The collective attributes of such connections, their processes of formation and maintenance, and their broader implications are referred to broadly as *transnationalism*.

Although the boom in transnationalism studies commenced in the 1990s, a significant precursor was Robert Keohane and Joseph Nye's (1971) edited volume *Transnational Relations and World Politics.* The book's contributors probed a set of transnational activities surrounding numerous kinds of border-crossing contacts, coalitions, and interactions that are not controlled by organs of government. As a whole, the volume importantly questioned a prevailing state-centric view of international relations. It emphasized the importance of global interactions—defined as movements of information, money, objects, and people across borders—and their impacts on interstate politics.

By the first decade of the twenty-first century, there was a massive proliferation of literature concerning transnationalism. Social scientists speak of a variety of types of social formation as transnational (e.g., varieties found in contributions to the journal *Global Networks: A Journal of Transnational Affairs*). These include dispersed social groups or communities (ethnic diasporas, religious congregations, social networks, families, migration networks); patterns of economic organization (e.g., capital flows, trade routes, commodity chains, modes of corporation organization and management); political structures (e.g., intergovernmental agencies, nongovernmental organizations, modalities of citizenship, political and social movements); global networks of law breaking and law enforcement (e.g., worldwide terrorist networks, organized crime syndicates, police initiatives); the so-called transnational capitalist class (e.g., corporate executives, state bureaucrats, professionals); and globalized occupational groups (e.g., domestic workers, seafarers, sex workers).

In the first decade of the twenty-first century, the study of social movements represents one field that some say particularly "went transnational." Transnational social movements themselves are nothing especially new. However, in recent years, there a globalization of social movement activities entails a widening repertoire of techniques for mobilizing support

and waging campaigns. The transnational repertoire includes networking activities over long distances, enhancing possibilities for pooling resources, intensifying processes of coalition building, and empowering people "at the base" by connecting them directly to people "at the top." Social scientists' interest in transnational social movements focuses mainly on activist networks that connect a range of actors sharing common values, discourse, and information.

Within business studies and the sociology of organizations, researchers are currently keen on studying transnational corporate structures and management styles, business networks, supplier commodity chains, production networks, and innovative networks.

Perhaps the foremost field of transnational studies, however, is migration. A shift has occurred from a preexisting, rather one-way, paradigm that largely focused on the ways migrants moved and adapted to new societies. Beginning in the early 1990s, migration studies now mean that scholars across sociology, anthropology, geography, economics, and political science place considerable emphasis on the ways migrants not only move and adapt, but maintain ties of various kinds to their communities of origin (e.g., families, villages, or nation-states).

Among many social theorists, questions remain regarding the superficiality of contemporary transnational linkages and whether they are simply accelerated versions of what already existed, or whether these are truly transformative forms and processes, affecting basic modes of identity maintenance, social organization, and political processes.

Transnational Movements

A decade ago, the term *transnational movements* would have seemed an oxymoron because the social movement was considered the quintessential accompaniment to the development of the national state. The rise of movements coincided with the rise of the national state; they grew up under institutional umbrellas such as elections and courts, and national states offered the opportunities and posed the threats around which they mobilized. As late as the mid-1990s, national politics focused on the concept of political opportunity structure in the social movement canon. Yet by the turn of the century, books with titles like *Transnational Social Movements and Global Politics* (1997) by Jackie Smith and colleagues, Margaret Keck and Kathryn Sikkink's *Activists Beyond Borders* (1998), Donatella della Porta and colleagues' *Social Movements in a Globalizing World* (1999), and John Boli and George Thomas's *Constructing World Culture* (1999) were making their appearance because of changes in international politics, academia, and activism.

Globalization—or the belief in it—was the first change. When people can board an airplane or open their computers and engage in collective action with others from elsewhere in the world, then the reality of transnational activism becomes a real possibility. Second, some observers and many activists extended the term *social movement* to a wide range of cross-border phenomena that would have gone by more prosaic names in previous eras: transnational nongovernmental organizations (NGOs), international advocacy campaigns, the diffusion of claims from one country to another, the representation of domestic interests in international institutions, and even the framing of domestic conflicts in "global" terms. Third, by the late 1990s, the domestic social movement politics of the 1960s and 1970s had become institutionalized. Dramatic events like the Chiapas insurgency in 1994 drew attention from the pedestrian world of domestic politics to more exciting conflicts elsewhere. These trends culminated in the series of social forums that began in Porto Alegre, Brazil, in 2001, which inspired many regional forums in the half-decade that followed. Finally, despite the resurgence of hegemonic interstate politics in the wake of the 9/11 and the World Trade Center bombing, there has been a rise in *internationalization*—defined as increased contacts among nonstate actors, links between governmental actors below the level of foreign policy makers, and a slow but steady increase in the adjudication of conflicts through international tribunals. Internationalization provides targets for contesting neoliberal international policies and makes "activism beyond borders" easier to mount and sustain.

SUCCESSFUL TRANSNATIONAL CAMPAIGNS
Since the mid-1990s, globalization and neoliberalism have become the foci of many activists and students of transnational contention. Although spectacular transnational events like the much-vaunted "battle of Seattle" target global neoliberalism, the most successful transnational campaigns are, for example, in the campaign against antipersonnel landmines, the struggle against HIV/AIDS in Africa, and the growth of international jurisdiction over war criminals and human rights abusers. Highly focused campaign coalitions like these appear to be far

more successful than the more sweeping demands for "global justice" on the part of activists who seek the reversal of globalization.

Campaigns in narrower sectors of transnational activism are more successful, first, because of the difficulty that global justice protesters have in locating globalization in a single, accessible target. Second, campaigners in more specialized fields can find significant state allies. Third, while antiglobalization protesters find only targets in the international arena (e.g., the World Bank, the International Monetary Fund, and the World Trade Organization), campaigners with more focused goals—against HIV/AIDS, for the environment, and against war and torture—find both opposition and support among international institutions.

The campaign to end the production and use of landmines in the 1990s illustrates all three factors: The target was clear and precise; a coalition of like-minded states worked closely with an international coalition of NGOs. Also, international institutions, such as the International Committee of the Red Cross (ICRC) and the United Nations, supported the campaign and lent it legitimacy. In fact, had it not been for a change in strategy on the part of the ICRC and the leading role of medium-sized states like Canada, Belgium, and France in favor of the treaty, the campaign would probably have failed.

TRANSNATIONAL CONTENTION

Relations between NGO "insiders" and social movement "outsiders" are an issue. Some argue that NGOs are, by definition, part of the institutional world of foundations, governments, and international institutions and are thus incapable of mounting effective challenges; others argue that social movements gain advantages from forming coalitions with NGOs that allow them to play on both sides of the institutional frontier. There are also long-term effects of external intervention on domestic activists after their international allies depart. While some NGOs and social movements claim a universal mission to struggle against wrongs, in practice, most of them choose their targets for intervention in the light of strategic goals and resource constraints. How violent forms of transnational activism relate to "good" global movements, which scholars studied in the late 1990s, is also of concern.

A final issue, and the broadest, is whether the growth of transnational activism reflects only the growing resources and inclination of domestic actors to move outward, or whether it reveals a more fundamental shift from a world of distinct domestic and international spheres to a fusion of domestic and international action. In the former case, transnational activism would not be fundamentally different from past transnational campaigns, such those against slavery and poison gas. In the latter, transnational activism may one day lead to the creation of a global civil society.

Transnational Voting

Transnational voting is the extension of traditional territorial enfranchisement, or suffrage, beyond national borders. It is typically considered an adaptation of the traditional voting system to global circumstances characterized by overlapping sociopolitical interactions.

The life of individuals is, for the most part, limited to domestic sociopolitical interaction. As a result, the focus of political arrangements has been on institutions with a similarly limited, national scope. Global transformations now alter the traditional boundaries of sociopolitical interaction, affecting almost all aspects of citizens' lives. State-only democracy has consequently come under increasing pressure for its incapacity to guarantee individual and collective autonomy when facing transnational issues related, for instance, to security or the environment. Challenged by increasing international interdependence, the principle of democratic congruence between rulers and ruled demands an extension of the traditional institutional arrangements to a more inclusive system. In order to avoid the democratic deficit, which characterizes

international affairs—known as *transnational exclusion*—an extension of democratic institutional arrangements to the global level is needed. The voting mechanism is key within such arrangements.

Extending the traditional method of voting to the transnational and global levels entails redrawing national constituencies to include further layers of regional, transnational, and global voting, thus envisaging new forms of transnational citizenship. Cosmopolitanism, according to which individuals are primarily members of humankind rather than of a specific nation or group, is the most prominent theory backing the extension of democratic principles. According to cosmopolitanism, the scope of justice should be universal because no discrimination is justified when considering the ultimate entitlement of all citizens to individually control their own destiny. Humanity is thus considered as a single ethical community, as belonging to a single polity. Rather than eliminating national allegiance, cosmopolitanism would only imply the addition of further international and transnational political rights toward more participatory institutional arrangements.

In the realm of transnational voting, there are debates about three main issues of cosmopolitanism: how to draw the constituencies, who the actors are, and which voting techniques to use. There are two approaches to follow for the delimitation of jurisdictional boundaries. *Global stakeholder democracy* would allow the bottom-up creation of jurisdictional boundaries that include, in any electoral jurisdiction, all those individuals whose interests are significantly affected by a specific interaction, regardless of their nationality. *Global federal democracy* would conversely include all individuals, regardless of their specific interest, in an overarching institution that would then have legitimacy to draw, top down, the jurisdictional boundaries in the lower levels.

Two principal proposals are advanced for the typologies of actors. While some argue for the inclusion of individuals only, others would extend the political enfranchisement (possibly with consultative status only) to collective actors such as multinational corporations or international nongovernmental organizations. Finally, as far as voting techniques go, more technologically sophisticated electronic voting sometimes replaces traditional ballot voting; this arguably overcomes some of the practical difficulties of transnational elections.

Transnational voting is contested, however, by a number of scholars from realism to communitarianism and liberal internationalism. While based on different norms, these positions share the view that voting cannot be extended to the transnational domain. There would be insurmountable technical problems, loosening of the social bonds essential to any political community, or a drift toward an authoritarian regime dominated by supranational powerful elites.

Within the European Union, citizens are granted political entitlements that transcend their national allegiances. Among these entitlements, the enfranchisement for the election of the European Parliament constitutes the clearest case of transnational voting. European citizens are currently entitled to vote for their local councils, their regional authorities, their national parliaments, and the European Parliament. Thus, they have political voice at several levels of political action. Migrants also vote transnationally, although they do not vote for a transnational constituency. They are entitled to vote in their countries of origin—possibly by mail—and in their countries of residence, though often limited to local or administrative elections (approximately forty countries now allow for local enfranchisement of migrants). Both the case of European citizens and of migrants allow a more inclusive and less parochial discussion about a number of political issues, especially in relation to multiculturalism.

Transparency

Transparency in the field of government is the ability of constituents to gain access to the facts, figures, documents, decisions, and other aspects of their government. Its meaning in this political context is, then, a derivative of its meaning in more common parlance—to see through an object. However, the definition in the context of politics has a deeper significance to the ways in which people are able to understand, participate, and control their country's government.

Of course, political entities have sought to limit transparency for most of the history of government. From the politically minded writers in ancient Greece to the works of Niccolò Machiavelli, political commentators have known that controlling information is central to maintaining political power. Therefore, the monarchs of Europe and similar rulers around the globe did not make it a priority to explain the mechanics of the state apparatus to their subjects; they did not need to maintain any sense of popularity, as they usually ruled through fear and brutal, violent oppression.

As more democratic forms of government arose after the American Revolution (1776–1783) and also after the French Revolution (1789–1799), transparency entered the political discourse as a priority for governments and citizens. The three branches of government in the United States, for example, were designed as a system that had checks and balances of power that support the principle of transparency. In this case, the legislative branch has oversight over the executive branch's actions. Therefore, transparency increases because each branch

must be willing to show each other and the public how it is working. There are, of course, exceptions to this rule.

Another element of transparency in modern politics is the role of the press. From the first pamphleteers to the most recent cable news shows and Internet outlets, journalists have played a role in fighting for increased access to public officials and their public policy decisions. Many countries have passed freedom of information legislation giving the public and journalists access to certain documents that the government would not normally make available. These laws have been instrumental in increasing the transparency of governmental actions and the motivations of elected and appointed officials.

The exception to transparency comes from a government's desire to still protect its power through the restriction of information to the public. In this modern era of greater transparency, governments around the world have used several means to cloud the political waters surrounding access to government documents. These strategies can include any one or combination of the following techniques: claiming to have lost the documents people are seeking; burying interested document seekers with tens of thousands of pages of documents unrelated to ones requested; stating that the documents are classified for some type of national security purpose; or claiming that the documents are beyond the reach of the transparency principle, by asserting executive privilege in the United States or hiding behind an official secrets law in other parts of the world. Of course, to most politically engaged citizens, these types of actions are seen transparently for what they likely really are—politicians still simply trying to protect their power by not allowing the public to know their actions while in office.

Trial Courts

Trial courts are legal forums where disputes between litigants, known as *cases,* are subject to a resolution by judge and jury through the process of a trial. With only a few exceptions, all cases are heard first in a trial court. Trial procedures vary substantially according to the type of legal system—common law, civil law, or religious law—in which the case is heard. In Anglo-American states that follow the common-law tradition, a trial typically involves a review of physical evidence and oral testimony, persuasive statements by the participating attorneys, and final resolution of the dispute by the judge or jury. Thus, the function of a *trial court* is to allow governmental determination of a legal conflict through the process of a trial. A trial court can be contrasted with an *appellate court,* which is the higher level court that reviews the findings of the lower tribunal through the process known as an *appeal.* An appellate court can reverse or alter the decision of the trial court or order additional hearings.

ADVERSARIAL VERSUS INQUISITORIAL MODELS

There are two general types of trial systems and trial courts found in the world, although there is substantial variation within those classes. The first system is known as the *adversarial model,* and it is most commonly used in Anglo-American states and former English colonies. The second trial system is the *inquisitorial model,* and it is most commonly found in continental European countries, as well as in Latin America, Africa, and Asia.

The Anglo-American adversarial system of trial procedure can best be described as lawyer-centered, while the European inquisitorial system can be portrayed as judge-centered. In the adversarial system, the attorneys for the parties select the witnesses and conduct the questioning of those witnesses, while the single trial judge acts as a neutral, and usually silent, referee; The jury, in felony criminal cases and some noncriminal matters, ultimately resolves the dispute. The adversarial process presumes that the truth in a disputed matter will be revealed most efficiently through a quasi competition between the parties, or adversaries. Thus, a trial in the adversarial system can resemble a battle, and indeed, the origins of the common-law jury trial can be traced to the ancient English ordeal by battle.

The European inquisitorial trial system, by contrast, relies upon a judge to control the proceedings, call and question the witnesses, and also make the ultimate determination as to guilt or innocence. As such, the role of the lawyer in the inquisitorial adjudicatory system greatly diminishes, in comparison to the adversarial trial system. The entire process is not confrontational as is the accusatorial system, but instead resembles an investigatory proceeding.

Although the inquisitorial system of trial varies considerably in practice around the world—as does the adversarial system—there are certain general differences between the two models. Most crucially, the role of attorneys significantly lessens in inquisitorial systems and the influence of the judge correspondingly increases. In most inquisitorial trial courts, there are no opening statements by counsel at the beginning of the trial. Rather, the presiding judge outlines the major legal issues and facts of the case. Furthermore, the judge may call certain witnesses if the witnesses have been identified by the parties, whereas, in adversarial trial courts, the witnesses are always decided by the attorneys.

Most importantly, the judge in inquisitorial systems is the primary person who asks questions of the witnesses during the trial, not the attorneys. The attorneys in an inquisitorial trial court do have the right to ask questions of the witnesses after the judge concludes questioning, but this inquiry is usually limited, because witness interrogation at trial is considered primarily the court's responsibility. Furthermore, there

A trial is held in 1735, New York. The adversarial model of the trial court system is found in Anglo-American states and former English colonies and is lawyer-centered.

is generally no right to cross-examination of witnesses by counsel in inquisitorial trial systems.

Another major difference between the two systems is that there is usually no jury in inquisitorial trial courts. However, there may be citizen participation in the form of lay judges in some countries. For example, in Germany, two lay judges with "full powers of interrogation, deliberation, voting, and sentencing" accompany the presiding judge at the lower-level court (Reichel 2005, 262).

ADVANTAGES AND DISADVANTAGES OF EACH MODEL

Scholars have criticized the adversarial trial system on a number of grounds. First, trials under the inquisitorial system are almost always shorter in length than those in adversarial trial courts; this is because the judge in an inquisitorial trial court controls the questioning of witnesses and because there is typically no cross-examination. Also, advocates of the inquisitorial process claim that this system produces far more reliable evidentiary results, that is, that the inquisitorial trial system does a better job at uncovering truth.

The reasons for this are several. The judge—who should be unbiased—controls the primary questioning of witnesses, rather than partisan attorneys and advocates. Furthermore, because the judge or judges determines guilt or innocence in inquisitorial trial courts, the biases and inherent limitations of juries may be avoided. Finally, supporters of the inquisitorial system note that this system's trial process depends less upon the skill of the attorneys involved in the case. That is, litigants with superior resources who can afford to hire a legal "dream team" would not be advantaged in inquisitorial trial courts, because these procedures are not as lawyer driven. In summary, advocates for the inquisitorial trial process contend that this system is not only more efficient, but also more reliable and superior at providing justice.

However, the inquisitorial trial model has been subject to several critiques from scholars. The first criticism is that the inquisitorial model places too much power in the hands of a single judge, who may be subject to certain biases. Furthermore, proponents of the adversarial trial system maintain that the adversarial process better protects minority interests because of the egalitarian nature of the trial jury, which may serve as a superior limitation upon any bias inherent in the judge or other governmental legal actors. In addition, it is possible that the nature of the adversarial trial system creates incentives for attorneys to serve their clients more aggressively than lawyers in inquisitorial systems, perhaps by working harder to discover evidence or flaws in the opposing counsel's case.

In conclusion, there has been a greater tendency in recent years for each of the two trial systems to adopt some features usually found in the other model. To be sure, the influence of the Anglo-American adversarial system has likely had a greater influence on inquisitorial courts than the reverse. A number of inquisitorial courts have adopted a limited jury system in certain types of cases, and a tendency for greater questioning

of witnesses by counsel has been observed in some inquisitorial trial courts. In the Anglo-American world, a more inquisitorial approach is being used in some courts. One example of this is the quasi-inquisitorial adjudicative process used by the new drug courts in some jurisdictions. Overall, it appears likely that the influence of each of these models will continue to exert a hybridizing effect on trial courts throughout the world as the process of legal globalization continues.

Trotsky, Leon

Leon (Lev) Trotsky (1879–1940) was a major Russian Marxist figure and key actor in the Bolshevik Revolution of 1917 that brought communism to Russia. Although sometimes described as Soviet leader Vladimir Lenin's most capable lieutenant, Trotsky found himself politically isolated after Lenin's death in 1924, was forced to flee Russia, and was eventually killed by agents of Lenin's successor, Joseph Stalin, in Mexico in 1940.

Trotsky was born in southern Ukraine as Lev Davidovich Bronshtein. He was drawn to Marxism as a teenager, joined a socialist organization in 1896, and was arrested in 1898 for his activities. He was exiled to Siberia, but escaped in 1902 using a forged passport with the name Trotsky, the head jailer of the Odessa prison.

Trotsky fled to Europe, meeting Lenin and other Russian Marxists in London and collaborating with them on various activities. In 1903, when Lenin formed the Bolshevik faction of the Russian Democratic Social Labor Party, Trotsky joined with the rival Mensheviks. In 1905, Trotsky returned to Russia,

organizing the first revolutionary council in St. Petersburg. He was arrested and exiled but again escaped, fleeing to Europe, where he worked as a journalist. In 1914, he condemned World War I (1914–1918) and led the internationalist wing of the Mensheviks.

Trotsky gained renown as a gifted Marxist thinker, orator, and political organizer. His major intellectual innovations were the ideas of uneven development and permanent revolution. By uneven development, he meant that capitalism in less developed countries evolved differently than in the developing West. In poorer states, the working class would emerge as a more powerful force than the local bourgeoisie, creating the possibility for these areas to skip stages in social and economic development. This idea influenced Lenin, who argued for an immediate communist revolution in Russia. Permanent revolution referred to the fact that a successful revolutionary movement in a poorer country, such as Russia, would require socialist revolutions in more developed states in order for the movement in the poorer state to succeed. Later, in the 1920s, this idea served as the ideological basis for the schism with Stalin, who advocated "socialism in one country."

Trotsky returned to Russia in 1917, after the tsar was overthrown. He became head of the Petrograd (St. Petersburg) Soviet, a council that represented workers and competed with the Russian provisional government for power. He joined the Bolsheviks in July 1917. Lenin admired Trotsky for his political and intellectual abilities, and Trotsky supported the Bolshevik seizure of power in November 1917. Afterward, Trotsky served as commissar for foreign affairs and commander of the Red (Bolshevik) Army, which successful defeated its enemies in the Russian Civil War (1917–1923).

After his death, Stalin and Trotsky were the leading figures to succeed Lenin. Stalin, however, had promoted his allies within the Communist (Bolshevik) Party, and Trotsky's ideas of permanent revolution were dismissed as impractical and unpatriotic. Trotsky's Left Opposition faction tried to mobilize the Russian workers, but this failed, demonstrating that he was no longer a charismatic mass leader. His influence began to decline, and Stalin removed him as head of the Red Army. Trotsky was expelled from the party in 1927; exiled from the Soviet Union in 1929; and later accused of plotting, from abroad, actions against Stalin and the Soviet state. He became one of Stalin's harshest critics, producing works such as *Permanent Revolution* (1930), *The History of the Russian Revolution* (3 vols, 1931–1933) and *Revolution Betrayed* (1937). He founded the Fourth Socialist International in 1938 and was assassinated in Mexico in 1940.

Trotskyite parties in the West defended his legacy and professed to offer an alternative to Soviet-style communism, but they never gained political power.

Trust and Credibility

The issue of trust gained greater attention with the culturalist turn of sociology, when soft variables and intangibles began to receive more attention. Central for social interaction, trust reduces complexity and therefore facilitates human capacity to act.

Trust is relational in nature—at least one participant in a trust relationship believes that individual interests are being considered. Mutual interdependence and the knowledge of reciprocal trustworthiness act as building blocks for a trust relation. *Credibility,* built through a patterns and perceived notions of someone's previous actions, can also lead to trust. The more someone follows up on words or promises, the greater credibility this person gains for future action. While credibility is based at least on some past action, trust may not have to be.

Trust is vested in people and their actions or capacities, not in objects or natural events. It evolves, especially, with one's future lack of control or uncertainty surrounding human-created events. Trust is defined in different ways: *Anticipatory trust* means that people consider others' interests when acting. *Responsive trust* implies the expectation of a positive response when trust is placed in others. *Evocative trust* signifies acting on the belief that trust is reciprocal.

Trusting others involves risk—others may not act according to expectations and adverse effects can occur. Trust usually targets individuals with whom one has direct contact and is often established along lines of gender, age, race, ethnicity, religion, or wealth. Trust may also emerge with social groups and social roles (e.g., mother, friend, priest, doctor of medicine) and also through organizations and institutions. At the most abstract, trust can be put in the qualities of a particular social system or a regime. These categories can mix and affect one another—personal trust can thus promote increased positional or institutional trust.

It is easier to build distrust than trust, and repairing the damage of a single instance of misplaced trust, or reestablishing trust, requires much more effort. A distinction exists between distrust and lack of trust, as distrust can also be protective and still allow for some cooperation.

Humans estimate the trustworthiness of others before placing trust in them, basing the estimate on reputation, or past behavior; performance, or present behavior and results; and appearance, or external features that do or do not express trustworthiness—especially personality, identity, and status. Relationships, familiarity, and visibility are also important factors. In addition, the external setting of an action influences trust, such as the degree of accountability or one's precommitments.

Structural conditions conducive to building trust are (1) a normative order for society, which increases incentives for a positive conduct conducive to trust; (2) stability of the social order, which creates reference points for social conduct and feelings of security; (3) transparency of the social order and operational rules, which induces feelings of predictability and assurance; (4) familiarity of surroundings, which builds certainty and comfort; and (5) accountability of people and institutions, which serves as insurance for backup options.

When stakes and uncertainty are high and trustworthiness cannot be estimated, some organizational or institutional mechanisms can enable trust. Yet, trust can also develop when uncertainty decreases, for example via repeated interaction.

Trusteeship System

The *trusteeship system* was a direct continuation of the previously mandated system, developed under the authority of the League of Nations. Under this system, the formerly mandated countries continued to assist the mandated territories in building their capacity to support statehood and sovereignty. The Charter of United Nations stated that trusteeship "will promote the political, economic, social, and educational advancement of the inhabitants of the trust territories, and their progressive development towards self-government or independence." Along with the mandated territories, the new system incorporated territories detached from the defeated states of World War II (1939–1945) and territories offered voluntarily by their administrators. Along with the existing mandated countries, the United States became a trust country for the territories administered by Japan, and Italy became a trust country for Somaliland, administered previously by the United Kingdom.

The original mandate system affected a substantive change in the dominant colonial practices; however, its resurrection under the new system was problematic. In the aftermath of World War II, the norms of self-government and independence were becoming dominant in international politics. The newly independent countries constantly pressured the United Nations (UN) to implement trusteeship arrangements and for a fast transition toward the trusted territories' independence. The trusteeship system differed from the mandate system in several respects. The UN abandoned the distinction between territories based on their level of institutional development and added a democratic element—the "freely expressed wishes of the peoples concerned"—to the criteria for capable self-government. The UN also placed a greater emphasis on human rights protection and in some cases assumed direct responsibility for the trust territories.

The trusteeship arrangements were coordinated through the United Nations Trusteeship Council, made up of equal numbers of representatives from trust countries and nontrust countries. Compared with the previous mandate system, the UN more closely scrutinized the trusteeship arrangements, and the council was more influential and active than the Permanent Mandates Commission that had predated it, accepting petitions from the trust territories and organizing regular monitoring missions.

All the trust territories eventually became independent, either in their own right or as part of a newly created state: British Togoland gained independence as part of Ghana (1957), Somaliland as part of the newly formed Somalia (1957), French Togoland as Togo (1960), and French Cameroon as Cameroon (1960). British Cameroon was split into two parts, which joined Nigeria and Cameroon, respectively (1961). Tanganyika gained independence in 1961 and later united with Zanzibar to form the United Republic of Tanzania (1964). Ruanda-Urundi split and formed the separate states Rwanda and Burundi (1962). Western Samoa gained independence as Samoa (1962), Nauru became an independent state (1975), and New Guinea gained independence as Papua New Guinea (1975). The Pacific islands (Micronesia, Marshall Islands, and Northern Marianas Islands) became fully self-governing countries in free association with the United States (1990). Palau was the last territory to gain independence in 1994, thus ending the United Nations trusteeship system.

The impact that the trusteeship system had on the stability and development of the trusted territories is unclear. Following the end of the system, many states experienced significant tensions, conflict, and economic degradation. While the UN Trusteeship Council was left without an agenda, the basic principles set out in the UN Charter remain relevant. They are still used in various intervention and reconstruction settings and considered a feasible option in dealing with failed states.

Turnout

The term *voter turnout* is often used in inconsistent ways to describe and account for the act, the qualities, the causes, and the significance of voter participation in democratic elections. Nineteenth-century journalistic accounts employed the term to recognize the presence of voters on election day or to describe the apparent capacities of political parties, groups, and candidates to mobilize their supporters in a particular election. Political scientists in the 1920s and 1930s ascribed additional evaluative meanings to the phenomena of voting once they began to collect and analyze election data more systematically with newly adopted quantitative techniques.

Today, the media and academics offer measurements of electoral participation, or voter turnout, to explain election results and indicate, in statistical terms, the relative presence of democratic conditions; yet this familiar term continues to reflect essential elements of its past and, thus, its definition remains contested. As a result, many who regularly employ the term incompletely acknowledge or understand the limitations and biases of various definitions.

VOTER TURNOUT IN EARLY TWENTIETH-CENTURY POLITICAL SCIENCE

An overview of the history of voter turnout can clarify how the term's usage reflects several developments within the discipline of political science. The first development occurred in the 1920s at the University of Chicago, where political scientists Charles Merriam and Harold Gosnell broke from the discipline's conventional legal-historical approach to initiate a new way to study voting. In 1924, they published their survey-based findings on the conditions effecting nonvoting behaviors within the eligible electorate. In several subsequent works, Gosnell followed others who concluded that voters were vanishing from active participation in elections, and he completed a novel experimental test designed to measure the positive effect of direct mail solicitations on *getting out the vote,* a common term for voter turnout even today. In 1930, Gosnell also authored *Why Europe Votes,* which included his analysis of voting in several European nations. Others subsequently extended the new field opened by Merriam and Gosnell, adopting increasingly sophisticated quantitative and survey-based methods aimed at accounting for relative differences in voter participation and addressing questions of why and how individuals or groups vote in particular elections.

New survey-based research programs on voting and elections emerged at Columbia University and the University of Michigan in the 1940s. These paralleled an increase in the use of polling techniques by private groups, the media, and political parties and candidates interested in winning elections. Not surprisingly given the immediacy of the data collected, almost all voter behavior and electoral studies completed during the 1940s and 1950s lacked a longer term comparative historical perspective. This deficiency was barely noticed because these research programs yielded new and robust insights concerning the contextual and psychological conditions closely associated with observed voting behaviors and aggregate electoral results. In particular, political scientists discovered that higher levels of education, income, socioeconomic status, age, and partisanship correlate strongly with higher rates of electoral participation—a set of findings that have been confirmed repeatedly ever since.

Before the establishment of the Columbia and Michigan research programs, there were several noteworthy efforts to compile historical data sets of election results; these were then analyzed for absolute and relative changes in voting and the electorate. In *Voting Behavior in the United States* (1935), Charles H. Titus's time-series analysis of voting from 1880 to 1932 led him to reject the so-called *vanishing voter thesis,* establishing it as an artifact of a limited temporal horizon and the biased definition of voter turnout when measured as a ratio of voters to the eligible electorate. Titus, moreover, extended his historical perspective to include the identification of what he referred to as the "rhythmic patterns" of voting behavior and partisan alignment across time. In the 1940s and 1950s, Titus's correction of the vanishing voter thesis was forgotten under the burgeoning survey-based voter behavior literature and several other studies of the relationship between voting and democracy—all of which the discipline and the public found more compelling. For example, Hermens concluded in 1941 that electoral democracy facilitated Hitler's rise to power; Schumpeter, in 1947, concluded that elites, not voters, controlled large-scale democracies; and in 1957 Downs formally demonstrated that it was irrational for any individual to vote given the improbability of casting the decisive vote for a winning candidate.

APPROACHES IN THE LATE TWENTIETH AND EARLY TWENTY-FIRST CENTURIES

In the wake of these disciplinary developments, the *American Political Science Review* published Walter Dean Burnham's "The Changing Shape of the American Political Universe" in 1965. This article reshaped the discourse on voter turnout in three significant ways. First, Burnham's work effectively rehistoricized the study of U.S. elections by compiling a new set of voting turnout ratios across the nineteenth and twentieth centuries. Burnham concluded that voting in the nineteenth century regularly reached 80 to 90 percent of the eligible electorate before declining dramatically throughout the twentieth century—a trend that others observed in subsequent U.S. elections and in other electoral democracies. Second, Burnham's thesis explicitly associated these voter turnout statistics with the systemic characteristics of the American political order; in particular, he identified the long-term turnout decline as an indicator of the conversion of a once populist American democracy into a broad-based oligarchy captured by the interests of industrial capitalism. Third, Burnham's data and conclusions about declining voter turnout contradicted the central findings of the survey-based voter behavior literature, which expected higher rates of participation given twentieth-century socioeconomic advances in the U.S. population. In 1978, Richard A. Brody famously identified this contradiction as the "puzzle of participation."

Contemporary political science research continues to employ quantitative methods, survey-based data, and cross-national perspectives to analyze the composition and behavior of the electorate in recent elections. A significant portion of this work also focuses on solving the puzzling combination of historically declining rates of voting with other findings that suggest the opposite should be occurring. Most studies accept the modern vanishing voter thesis first advanced by Burnham in 1965, explaining the turnout decline with quantitative analyses of new electoral data or newly emphasized individual and contextual variables. Others, however, contest the voter decline thesis in part or altogether, proposing alternative measurements, normative grounds, or explanations of the history and significance of voter participation in democratic elections.

Tyranny, Classical

In modern society, a *tyranny* is often defined as a political system in which one or a few persons hold power, opposed to a *democracy,* where many share power. The two most common representations of modern tyranny are Nazi Germany and the communist Soviet Union. Historically, tyranny has been present in human society at least since the beginning of recorded history and likely well before. Western ideas concerning classical tyranny were first formed in ancient Greece and tyranny, as it is understood in the modern world, was not necessarily evil.

CLASSICAL GREECE: ATHENS AND SPARTA

Generally, the classical period in Greece lasted from approximately 500 to 323 BCE, with the death of Alexander the Great. During this period, Athens, Sparta, Thebes and finally, Alexander's Macedonia alternately ruled Greece.

Prior to the classical period, Athens was ruled under a tyranny. The Greek *tyrannos* began as a term for a military leader and subsequently meant a ruler who took power neither by heredity nor by constitutional authority, but typically by military power. In approximately 510 BCE, the Athenian tyranny was overthrown with the help of King Cleomenes I of Sparta. Athens and Sparta then warred with each other, whereupon the Athenians instituted what is now called a democracy. The period that ensued is commonly called Greece's golden age. Other city-states also adopted democracy as a form of government, though Sparta did not. Athens and Sparta fought as allies in several conflicts before they once again warred with one another. Sparta achieved victory in 404 BCE and established control over Athens—ending its democracy—and the rest of Greece. Fighting continued and power shifted several times over the following years, and Alexander the Great held sole power until his death in 323 BCE. The classical understanding of tyranny extends from this period in ancient Greek history.

TYRANTS IN GREEK PHILOSOPHY

Greece spent much of its existence under the rule of tyrants, even though conventional wisdom applauds the Greek city-states for the development of democracy. Prior to Greece's classical period, a single ruler usually ruled Greek city-states; in Athens this system was called an *archon*. Over time, the city-states became oligarchical aristocracies with occasional rule by powerful figures who imposed their own wills upon the people. This is the quintessential example of a tyrant in classical politics. However, this did not mean that a "tyrant" was necessarily undesirable, as some tyrants used their power for the good of the people. The great ancient Greek philosophers, however, revolutionized the understanding of the word for subsequent millennia.

Plato (427–347 BCE) advocated, in his later work *The Republic,* a society and political system that mandated three very strict classes: the merchant class, the military class, and the philosopher-kings. The philosopher-kings obtained their position by merit along with their intellectual and philosophical abilities. Plato considered them the best-equipped people to discern truth and, thus, to rule justly. Plato's philosopher-king might be considered a *benevolent tyranny,* in the modern sense, as one or a few persons held power. However, under Plato's system, the philosopher-kings would not be tyrants in the classical sense, as they would take power in accord with the political system and still rule according to the law. For Plato, the true tyrant would be the ruler who ruled by whim and personal desire, as military tyrants tend to do, and not according to truth, which should be reflected by the law.

Plato's pupil Aristotle (384–322 BCE), in his *Politics,* expounded on the virtues of government. For Aristotle, one of the worst forms of government was unrestrained democracy. An unrestrained democracy was a society that held no firm values or principles. The desires of the mob held sway. Truth was not one of the goals of a democracy thus understood. For it was from such a democracy that a tyrant, who would pander to the whims of the public, would arise. For Aristotle, an aristocracy was a much more stable and better form of government and more prone to produce a society ruled by virtue and moderation.

CONCLUSION

These classical philosophical reflections on tyranny helped give the term, originally neutral, the strong pejorative sense it still carries today. Both Plato and Aristotle emphasized that the virtuous ruler ruled by law and for the good of the people and tried to distinguish their enlightened philosopher-kings or aristocrats from classical Greek tyrants. Modern proponents of democracy, however, have often attached that same negative connotation—originally given to a ruler who acts according to whims, not the truth—to any politics in which power is concentrated in the hands of a single person or a small group of persons.

The assumption made by the proponents of democracy is that, as Lord Acton famously said, "Power tends to corrupt, and absolute power corrupts absolutely." In other words, if a few people have power, they will inevitably use it to their advantage, and not for the common good. Yet, at the same time, political theorists have worried throughout the modern era that democracy itself can, paradoxically, become a kind of tyranny if the masses vote according to their whims and preferences and not according to the common good. Aristotle's perceptive analysis of the transition from pure democracy to tyranny remains relevant, even to the most iconic of modern

tyrannies—including Nazi Germany, which began through the democratic election of the National Socialist Party.

Tyranny of the Majority and Minority Rights

In his *On Liberty,* John Stuart Mill separates concerns about the tyranny of the majority into two distinct challenges for democracy. The first of these can be considered an institutional problem. According to Mill, even in a system of majority rule, governance might still reflect the abuses associated with individual tyrants. There is nothing inherent in majority rule, Mill argues, that prevents unjust outcomes. The second challenge, raised first in Tocqueville's *Democracy in America* and further developed by Mill, can be considered a cultural problem. This problem refers to a distinct form of despotism created by the culture of self-government.

Mill outlines these two problems as follows:

> [The] tyranny of the majority is now generally included among the evils against which society requires to be on its guard. . . . Like other tyrannies, the tyranny of the majority was at first, and is still vulgarly, held in dread, chiefly as operating through the acts of the public authorities. But reflecting persons perceived that when society is itself the tyrant—society collectively, over the separate individuals who compose it—its means of tyrannizing are not restricted to the acts which it may do by the hands of its political functionaries. Society can and does execute its own mandates: and if it issues wrong mandates instead of right, or any mandates at all in things with which it ought not to meddle, it practices a social tyranny more formidable than many kinds of political oppression, since, though not usually upheld by such extreme penalties, it leaves fewer means of escape, penetrating much more deeply into the details of life, and enslaving the soul itself.

Since the publication of *On Liberty,* the institutional problem and cultural problem have served as central dilemmas in liberal and democratic political theory. Political theorists Melissa Schwartzberg aptly labels the institutional problem one of "democratic autophagy," declaring that democratic rule might possibly consume itself by allowing despotism to result from majoritarian procedures. The transformation of Weimar Germany, which had democratic institutions, into Nazi Germany dramatically illustrates this possibility.

THE INSTITUTIONAL PROBLEM

Three common responses to the institutional problem are prominent in the literature of contemporary democratic theory. First, precondition theorists distance the idea of democracy from that of majority rule. Because majority rule itself is not enough to ensure self-rule, the very definition of democracy must include some precautions against majority tyranny. For example, John Hart Ely argues that "democracy reinforcing" rights, or rights that are preconditions of democracy, should be secured by nonmajoritarian means. In particular, Ely contends that courts should invoke judicial review to overturn majoritarian legislation that threatens these most basic rights. Another advocate of precondition theory is Alexander Mieklejohn, who argued that free speech was a precondition to self-government. Precondition theorists thus attempt to resolve the problem of majority tyranny by defining democracy so that it denotes certain rights that protect individuals from majoritarian abuses.

In contrast to precondition theorists, pure proceduralist theorists have concede the tyranny of the majority as a risk that must be born by those who seek self-government. Jeremy Waldron postulates that majority rule is the only appropriate response to the justification of coercion. According to Waldron, majority rule is the only way to respect citizens' equal capacity to decide for themselves how to make coercive law. For Waldorn, nothing inherent in democracy guarantees just outcomes, and this obstacle is a natural burden inextricable from self-rule.

A final set of democratic theorists attempt to resolve the problem of majority tyranny by resisting the tendency in the literature to define democracy exclusively in procedural rhetoric. In *Democratic Rights: The Substance of Self Government,* Corey Brettschneider asserts that democratic governments endeavor to respect the status of citizens as rulers. While such values require rights of participation, they also require substantive constraints concerning what qualifies as a democratic outcome. In *Freedom's Law,* Ronald Dworkin also responds to the problem of majority tyranny by distinguishing democracy from majority rule.

THE CULTURAL PROBLEM

Distinct from the institutional issues that descend from the tyranny of the majority, Mill raises concerns about the potential tyranny of democratic culture. He draws from observations about self-government espoused by Alexis de Tocqueville

in his *Democracy in America*. Mill worried that social norms might themselves become abusive even when democratic states were not institutionally tyrannical. For instance, even when all individuals are guaranteed freedom of expression, majorities might use social techniques, such as shunning, to suppress unpopular opinions.

One conundrum in Mill's reasoning lies in resolving what to do when cultural norms oppose the foundational values of democratic institutions. For instance, Mill maintains that law should not ban polygamy, but that citizens should oppose polygamy because of its inegalatarain nature. Thus the question remains as to how the populace could oppose polygamy without ensnaring their democratic society in the cultural trap of majority tyranny. One solution is that reasoning and persuasion advance intrinsic values that do not risk tyranny. Unlike shunning, an active attempt by citizens to persuade their country to forfeit an illiberal practice does not amount to tyranny for while persuasive, reason itself is not coercive.

In sum, the tyranny of the majority raises two fundamental concerns regarding democratic political theory. The institutional problem centers on the possibility that majorities will have the ability to violate rights. In response, democratic theorists attempt to theorize democracy in a way that guarantees protection of rights. The cultural problem, in contrast, focuses on the tendency of democratic culture to socially coerce minorities. The problem here concerns how democracies can balance the need to promote democratic values without citizens engaging in social coercion.

U.S. Political Thought

U.S. political thought encompasses different moral–political traditions largely organized around three different theories of politics: liberalism, republicanism, and ascription. Liberalism is a theory of the individual and the individual's right to private property and liberty, with liberty defined as an equal right to be free from the harm of others. Republicanism, a theory of social relations and institutions, conceives of political liberty not only in individual terms, but emphasizes individuals operating within institutions—systems of property, the economy, social relations, and so on—and therefore takes a broader view of political life. Ascriptive ideas emphasize the political, social, or cultural primacy of one group over others based upon racial, economic, ethnic, and gendered categories. These three theories are distinct analytically, but in actual American history have been combined and reformulated in various ways. U.S. political thought can thus be deciphered through the intermixing of these different traditions.

ORIGINS IN EUROPEAN POLITICAL THOUGHT

At its origin, U.S. political thought was most immediately formed by trends in English political thought developed during the seventeenth century. These ideas were themselves the product of the rich currents of Western political thought running back to ancient Greece and the republican era of Rome. The Framers of the U.S. Constitution and the political thinkers who created the American political project were therefore deeply connected to many of the core ideas in Western political philosophy. At that time, the most active ideas were the dual themes of liberalism and republicanism. In many ways, the development of U.S. political thought can be seen as an oscillation and recombination of different aspects of liberalism and republicanism and the ways they have confronted ascriptive impulses in American society.

RENAISSANCE REPUBLICANISM

At the heart of U.S. political thought is the creation of a society free from the forms of feudal domination and privilege that characterized European society. This impulse originated in England during the seventeenth century with the evolution of antimonarchical sentiment. In addition, this perspective was a product of political ideas inherited from the Italian Renaissance, particularly the rebirth of political liberty and
The Federalist Papers, first published at the end of the eighteenth century, had great influence on U.S. political thought. They detailed the philosophy and motivation for the new American system of government, though that philosophy was not without debate.

its centrality to the purpose of politics. Whereas the Middle Ages had relied on a Thomistic conception of politics that emphasized order and stability as the primary function of political institutions, the newer ideas generated out of Italy emphasized political liberty and human freedom as the central purpose of political life.

The rebirth of the notion of republican government in England during the seventeenth century had profound

1697

consequences for the politics of the time. Thinkers such as James Harrington in his *Commonwealth of Oceana,* John Milton's *Tenure of Kings and Magistrates* and his pamphlet "Readie and Easie Way to Establish a Free Commonwealth," along with Algernon Sidney's *Discourses concerning Government* among many others, put forth the radical idea that a free society can only occur if all forms of domination and servitude are removed from the relations between political subjects. For these thinkers, the notion of a commonwealth (the English word for the Latin term *republic*) meant that human freedom must contest the anachronistic notion of the monarchical state and feudal institutions. Also inherent in these ideas was for politics to become a form of civil association to promote political liberty.

REFORMATION LIBERALISM

The notion of human liberty was not a singular product of the force of republicanism inherited from Italy and classical sources; the theological impact of the Reformation on political thought was equally important. Reformation theology placed a primary emphasis on the notion that humans are born in a state of freedom. Martin Luther's notion of Christian liberty maintained that humans were born free, in the image of God himself. As a result, John Locke would compose his *Second Treatise of Government* along the lines of human's natural state of liberty. Whereas the republican thinkers of the first half of the seventeenth century were concerned with the problem of how to reshape the relations between political subjects, Lockean liberalism rethought the notion of liberty around the individual. Humankind, born free in a state of nature, would have to obey "no superior power on earth," in Locke's words. The idea was simple: since one is born free and possesses natural law, by which Locke defined the tendency inherent in human beings to not harm other persons, one's natural state is one of peace, goodness, and liberty. Locke had already made a clear case against monarchy in his *First Treatise of Government,* where he argued against the legitimacy of monarchy and the theory of the divine right of kings. However, it was in his liberal theory of property that Locke had, and still has, the most enduring impact on American thinkers.

Both liberalism and republicanism made a serious impact on what is most distinctive in U.S. political thought—yet it is liberalism that has had a very high degree of influence. For Locke, it was through the notion of work, or labor*,* that one can possess property—he termed this a natural right to property, with property constituting anything with which one mixes one's labor. The labor theory of property was central for the political liberal: if an individual could secure personal liberty through property—in the sense that no one would have the right to invade, interfere, or take from what rightly belong to that person—then the liberty of the individual is secure. Eighteenth-century American thinkers saw this as a crucial means to challenge feudal forms of privilege and order, since feudalism was based on the appropriation of one person's labor for the benefit of another. In this respect, the central problem of U.S. political thought has been the confrontation of the theoretical notion of equality with its actual presence in society. Equality of talents and ability were seen as distributed by nature, not institutions; as a result, a republic made of laws protecting each from the harm of the other was seen as the most important means to protect a liberal society, a theme very distinctively evident in *The Federalist Papers.*

EIGHTEENTH CENTURY: JEFFERSONIANS VERSUS FEDERALISTS

The project of eighteenth-century U.S. political thought was therefore the creation and maintenance of a liberal republic: to forge political institutions that would protect against tyranny and still allow personal freedom within civil society. These ideas, however, were abstract in nature and became problematic as the nature of economic life changed over time. This is initially apparent in the contest between the Jeffersonians and the Federalists. Thomas Jefferson saw modern economic life as an assault against the moral fabric that supported any republic. The agrarian republic envisioned by Jefferson and his followers therefore viewed the emergence of urbanization and economic development as anathema to America's republican civilization. Alexander Hamilton's idea was that developing modern forms of industry—and the emerging forms of banking and finance needed to support it—would allow human beings to develop a strong and prosperous society.

This disagreement worsened during the first half of the nineteenth century. As Jeffersonian republicanism began to lose out to emerging capitalist interests, industrialism and a new concentration of wealth began to form. Using the language and concepts of liberal republicanism, a radical critique of this new inequality evolved within an emerging workers' movement. Writers such as Langton Byllesby, Thomas Skidmore, Theophilus Fisk, Stephen Simpson, William Gouge, and many others began to argue that the emerging corporations endangered working people's ability to act as equals with others. Now, with the wage system, they argued, working people would be reduced to servitude. As their ability to maintain their economic autonomy was robbed from them, they saw their liberty eroding alongside it. This discourse was cut off with the U.S. Civil War (1861–1865), and the resulting triumph of the industrial transformation of the U.S. economy, but it showed how liberal and republican themes were important in combating the interests of a small, but wealthy, minority. These ideas also gave impetus to the labor movements of the late nineteenth century as well.

NINETEENTH CENTURY: SOCIAL DARWINISM VERSUS SOCIAL REFORMERS

Just as there was a reaction to the emergence of industrial and capitalist society, there were also new arguments attempting to legitimate it. Social Darwinism emerged in the decades after the Civil War while the industrial system ascended. Thinkers such as William Graham Sumner—the most articulate

theorist of this doctrine—argued that social outcomes were the result of certain natural inequalities in skill, intelligence, creativity, and so on. As a result, the industrial order of the late nineteenth century, one characterized by massive economic inequality, was not to be critiqued from a moral point of view. It was not only that it reflected the real differences between people, it was also legitimated from a liberal point of view: people who work harder and better ought to accrue greater rewards. This was a certainly a selective reading of the liberal doctrine, yet it illustrates how liberal ideas could also legitimate inequalities between people and classes.

Social reformers soon felt the economic and social inequalities, and the social disruption, caused by the impact of urbanization, immigration, and industrialization during the end of the nineteenth century. Throughout the nineteenth century, the prevailing philosophy of government held by elites was a kind of laissez-faire liberalism: the state was to resist interference in civil society and, more specifically, economic life. A perceived sense of social breakdown and crisis resulted, with responses including Edward Bellamy's deeply influential novel *Looking Backward*. Books like this put forth a new vision of political engineering and social cohesion that animated many of the next generation's reformers. This new generation of social scientists and social thinkers—many of them educated in the German university system—began to see things differently. For these thinkers, the American state had to become more involved in social affairs and public life, bringing about an acute departure from the classical liberal ideas toward a reworking of republican themes.

The emergence of what became known as the Progressive movement held that expansion of the state was necessary, both in terms of its size and scope as well as a transformation of its function. This turn was the result of the resurgence of, and renewed emphasis on, republican themes, which were being turned against utilitarian and classical liberal ideas. In books such as Herbert Croly's *The Promise of American Life* and Walter Weyl's *The New Democracy,* the vision of a more integrated society with collective efforts of all citizens ought to replace what they saw as the outmoded laissez-faire model. These views were in sharp contrast to the radicals of their time—such as Bill Haywood from the International Workers of the World (IWW), socialists, and Marxists—who argued that capitalism alone was the cause for the crisis. Instead, they asserted that a more regulated industrial society could redistribute social surplus and legislate to protect the rights of working people that ought to be protected from the harms inherent in the industrial system. Thinkers such as John Dewey, in his book *The Public and Its Problems,* extended these insights, which argued that the public needs protection from the consequences—intended and unintended—of a complex industrial society. George Herbert Mead, and other representatives of what came to be known as pragmatism, argued that the concept of the individual was not separable from society as a whole, since each individual was intersubjectively related to the social world. These shifts in social theory began to reflect and aid a modern reworking of republican themes and led, in time, to the New Deal and the modern welfare state.

NINETEENTH AND TWENTIETH CENTURIES: LIBERALISM VERSUS SLAVERY AND WHITE SUPREMACY

Economic forms of inequality were not the only forms of social life assailed by liberal ideas. Ascriptive theories of political life have had an equally deep impact on the development of U.S. political thought. From the start, the idea that equality existed as an idea, but only for a select few, was problematic for American society. A key element in ascriptive theories of society is the emphasis on an inherent inequality between certain groups or classes in society. As a result of this inherent inequality, a hierarchical status system emerges and becomes rationalized and defended. However, as liberalism and republicanism came to permeate more of U.S. society, ascriptive ideas about social relations and political power were increasingly challenged. This problem emerged most forcefully around the institution of slavery in the nineteenth century. Writers such as John C. Calhoun argued for a natural hierarchy between classes, justifying the institution of slavery in the process.

Liberal political ideas, more significantly, combated ascriptive notions of separateness, difference, and hierarchy. Religious concepts were important in raising a radical consciousness to slavery, with John Brown's radical abolitionism the result of a religious conviction easily seen as fanatical. Yet, religious ideas about slavery could go either way: denouncing the institution as inhumane or supporting it as part of the hierarchy of nature. Slavery became problematized most effectively in liberal politics since a response was workable through political, rather than merely moral, means.

Evident as far back as the Lincoln-Douglas debates of 1858, Lincoln argued against Douglas's claim for states' right to choose whether or not to be a slave state—specifically with respect to Nebraska and Kansas. Lincoln argued that black slaves, although perhaps not racially equal to whites, still deserved to keep what they labored for with their own hands, invoking a liberal natural right to property theory. Indeed, liberalism became a most effective language against the inequalities of race and gender, but republicanism also emerged as an attempt to create equality between blacks and whites. During Reconstruction, members of the Radical Republicans, such as Thaddeus Stevens, argued that plantation owners' land ought to be seized by the North and their properties divided and distributed among newly liberated blacks. This argument failed, and the South once again saw the rise of ascriptive notions of race manifest in Jim Crow laws.

Debates about the paths to freedom for blacks emerged around this time. W. E. B. DuBois, in his book *The Soul of Black Folk,* argued that liberation could be obtained through cultural enlightenment. He advocated for a "talented tenth" to serve as an educated elite able to promote the interests of the black population more broadly. Booker T. Washington, on the other hand, argued that adopting craft skills and an ethic

of thrift in economic life would give blacks social parity with whites; they could then advocate for further freedoms. However, it was not until the civil rights movement in the 1960s when figures such as Martin Luther King Jr. once again used liberalism to counter these ascriptive ideas about race.

The women's movement adopted a similar strategy, also arguing for equal rights under the banner of liberalism. During the Progressive Era, women's suffrage was granted along with a series of other popular democratic reforms (e.g., the direct election of senators). Yet this period also saw the emergence of tribal politics, in terms of populism and a new form of reaction against immigrants. But in each case, the victory of the rights for the disenfranchised was won through liberal arguments that emphasized equal rights along with toleration and acceptance of difference.

TWENTIETH CENTURY: RISE OF NEOLIBERALISM

After World War II (1939–1945), a new phase in U.S. political thought emerged. The defeat of fascism in Europe and the new bipolar relation between the United States and the Soviet Union influenced a shift toward pluralism and deepened democratic theory. Thinkers such as John Rawls in his *Theory of Justice* and Robert Dahl in *Polyarchy* forged a new understanding of liberalism and pluralistic conceptions of democracy. Their ideas signaled a new hegemony of a liberal idea emphasizing individual rights and the notion of fairness and a dispersion of power as essential to maintaining a democratic society. This current in democratic theory also attempts to merge certain aspects of liberalism and republicanism, since both try to show that individual liberty is also in some way bound with public and institutional responsibilities for the maintenance of individual rights and opportunities. These are axioms of democratic theory and remain the most robust attributes of contemporary U.S. political thought.

U.S. Politics and Society: African American Political Participation

Political participation is defined as an "activity that has the intent or effect of influencing government action—either directly by affecting the making or implementation of public policy or indirectly by influencing the selection of people who make those policies" (McKenzie). This includes activities such as voting, campaigning, contacting a government official, and protests. Examined from multiple angles, differences in participation include economic status, education, gender, and race. Basic texts on political participation agree that wealthy or well-educated Americans are much more likely to participate in political activities than low-income and not well-educated citizens; thus, socioeconomic factors have been indicators of political participation among African Americans.

From the antebellum period to the civil rights movement of the mid-1960s, American political and social institutions subordinated African Americans and largely excluded them from the formal processes of political participation and policy development. Consequently, African Americans sought political enfranchisement through various strategies and tactics such as violent revolt, mass protest, and accommodation. Their activism and vigilance, coupled with the civil rights movement, ultimately led to the influx of African American elected officials such as Carl Stokes of Cleveland, the first African American mayor of a major city, and political administrators such as Patricia Harris, the first deputy mayor of New York City and cabinet secretary in the Carter administration. While African Americans have historically been politically active—from the Reconstruction period to the election of Barack Obama—the challenge is to translate political participation to active participation in public policy development.

INCREASED PARTICIPATION AND REPRESENTATION

Both the Fifteenth Amendment in 1870 and the Voting Rights Act of 1965 contributed to much progress in African American political participation. While the Fifteenth Amendment granted African American men the right to vote, discriminatory measures such as the poll tax and literacy tests kept African American political participation limited. The 1965 Voting Rights Act banned discriminatory tests or devices to restrict voting and provided federal oversight of voting changes in the covered jurisdictions.

A 1982 analysis of U.S. Census Bureau data on registration and voting by African Americans from 1964 to 1980 reflects the positive influence of these changes on political participation. After the passage of the act, the number of registered African American voters increased more than 50 percent. Of African Americans and whites participating in presidential elections since 1980, African Americans living in the South are the only demographic reporting an increased level of participation between 1964 and 1980.

The number of elected African American officeholders increased tenfold from 150 in 1965 to 9,101 in 2001. This does not mean, however, that African Americans have achieved equal access to elective office. Fredrick C. Harris's 2008 *Survey on Race, Politics, and Society* indicates that, in three types of political activities—working for a party or political candidate, trying to persuade others to vote for or against a candidate, or contributing money to a campaign—African Americans participated at greater or at equal rates with whites and Hispanics during the 2008 campaign period. African Americans are twice as likely to have worked for a political candidate (14 percent) than whites (7 percent) and Hispanics (7 percent). Both blacks and whites have tried to persuade others to vote at roughly the same rates, 39 percent and 38 percent respectively. During the 2008 presidential campaign, African Americans contributed money to campaigns at a greater rate than other groups: 31 percent of African Americans report giving money to a candidate compared to 21 percent of whites—a difference of ten percentage points. During the same period, 16 percent of Hispanics reported contributing to a political campaign. The candidacy of Barack Obama as the first African American presidential nominee of a major political party accounts for high rates of political participation—over 95 percent of the African American electorate voted for Barack Obama over John McCain. Significantly, Michael Steele, former lieutenant governor of Maryland, was elected the first African American leader of the Republican Party. For the first time in American history, African Americans led the two major political parties.

EXAMINING THE DATA

Much of the research explaining the rise in African American participation began in the 1960s. In the 2006 book *Countervailing Forces in African-American Civic Activism, 1973–1994,* political scientists Fredrick C. Harris, Valeria Sinclair-Chapman, and Brian McKenzie present the first longitudinal study assessing African American political participation during the post–civil rights era, describing black political power and economic distress in African American communities as having a tug-of-war effect on grassroots activism. Their findings indicate that the political activism of African Americans since the 1970s illustrates how black political power succeeded in encouraging blacks to become part of the political mainstream, but has not been enough to sustain grassroots activism over the decades. Negative economic forces such as unemployment, inflation, and the growing income gap between poor and affluent blacks have undermined grassroots participation in black communities

since the activist 1960s. Wilbur Scott and Alan Acock's 1979 study on socioeconomic status, unemployment, and political participation indicates that lower-income individuals are less committed to voting, feel less efficacious, are less interested in politics, and are less politically active than persons of higher status regardless of employment status.

Sociologist Anthony Orum suggested, in his 1966 comparison of National Opinion Research Center (NORC) survey data of low-income African Americans in inner-city Detroit and low-income whites in inner-city Chicago, that the relationship between social class and organizational participation is not as strong for African Americans. Lower-income African Americans are far more likely than their white counterparts to belong to organizations, particularly those with political and religious affiliations. Orum indicates that low-income African Americans are more likely to join associations and actively participate than their white counterparts whose "joiners" seek membership but remain inactive members. Orum also suggests the rise of the civil rights movement and the proliferation of social action organizations such as the Southern Christian Leadership Conference, the National Association for the Advancement of Colored People (NAACP), and the Urban League are the motivating factors.

Examining individual-level data on African American political participation from 1980 to 1994, Matthew Platt reports that African Americans are more politically active when they face some external threat, have greater access to policy makers, and possess stronger social networks. In general terms, political participation among lower-income African Americans suffers during times of high inflation and unemployment, as their attention focuses more on economic survival than political activism. While the increasing number of African American elected officials helps, to some degree, in offsetting declines in African American activism during tough economic times, it has little impact on the African American poor. Thus, for the most marginal population in African American communities, there are even greater barriers to having their political voices heard than middle-class and upper middle-class African Americans who are educated and are part of social networks.

THE AFRICAN AMERICAN CHURCH

The study of African American political participation requires consideration of the role of the African American church, a prominent institution in the civil rights movement and considered an integral social, religious, and political fixture in the African American community. Political scientist Katherine Tate's 1991 analysis of the African American voter turnout in 1984 and 1988 presidential elections revealed that variables such as socioeconomic status cannot fully account for African American turnout variations; instead, involvement in African American churches elicited a stronger and more positive effect on political participation, indicating that church membership and involvement are integral in mobilizing African Americans. Tate showed the consistent positive effect of politically active African American churches

on African American participation through organizational resources, such as grassroots networks, that provide an arena for mobilization efforts (e.g., voter registration drives).

African American churches provide both cognitive-emotional resources that give churchgoers a greater incentive to participate and organizational resources that ease the mobilization process. For instance, internal religiosity, as expressed through church attendance and involvement, promotes a greater interest in morally charged political issues. All of the research on African American churches since the 1960s has underscored the institution as an essential part of mobilizing African Americans.

African American participation in U.S. electoral politics as voters, candidates, and office holders is at an all-time high. African American political participation is now similar to their mainstream counterparts. In the final analysis, however, socioeconomic status is still a driving force of political participation.

U.S. Politics and Society: African American Social Movements

In the early twentieth century, African American social movements emerged in response to the nineteenth-century conditions—de jure segregation, disfranchisement, lynching, and widespread poverty—in black communities in the North and South. In the late nineteenth century, African American journalist Ida Bell Wells-Barnett both nationalized and internationalized the antilynching movement, while the black women's club movement, exemplified by the National Association of Colored Women (1896), built schools, settlement houses, and other needed community institutions. In 1909, the National Association for the Advancement of Colored People (NAACP) and the National Urban League (NUL) expanded the antilynching campaign and the social welfare work initiated late in the previous century.

The experience of World War I (1914–1918), both at home and abroad, radicalized African American social movements. This radicalism, effectuated in part by black disenchantment with the leadership styles of both Booker T. Washington and W. E. B. Dubois, was known as the new Negro movement. Its most notable leader was Jamaica's Marcus Mosiah Garvey. Garvey advanced the idea of black pride and the slogan "Africa for Africans," attracting the attention of oppressed blacks worldwide. Although these earlier movements produced minor victories, they established a national network of organizations and raised blacks' racial and political consciousness, which would play a significant role in civil and human rights and anticolonial struggles during the 1930s and 1940s.

During the Great Depression and World War II (1939–1945) eras, organizations like the NAACP and NUL united with the Communist Party to challenge American racism and imperialism abroad. In the 1930s, in cities like Chicago, New York, and Cleveland, blacks started campaigns against discriminatory hiring practices to force white proprietors in black neighborhoods to employ black workers. These campaigns reflected a shift from the courts to the streets, from civil suits to civil disobedience. In 1937, Paul Robeson, W. E. B. Dubois, Max Yergan, and Alphaeus Hunton Jr. founded the Council of African Affairs, the most significant anticolonial organization in the United States. In 1941, civil rights activist A. Philip Randolph used the threat of a march on Washington, D.C. to pressure President Franklin Delano Roosevelt to issue Executive Order 8802, banning discrimination in defense industries and creating the Fair Employment Act.

In the postwar era, the Northern civil rights movement fought for legislation directed at police brutality, fair employment, and housing practices. In New York City, black activists lobbied for fair housing and employment practices as well as criminal justice reform and a law to end police brutality. U.S.–cold war imperatives, however, subdued the anticolonial and leftist politics of the civil rights movements. In 1950, the U.S.

State Department revoked Robeson's passport after he refused to sign an affidavit concerning his past membership in the Communist Party.

In the cold war era, the United States attempted to refashion its image from a nation that lynched black people to one that protected their civil rights. In the eyes of newly independent African, Asian, and Latin American nations, U.S. racism tarnished its global image. To improve this, the U.S. government filed an amicus brief in support of the NAACP's position that segregated public education was inherently unequal in the historic *Brown v. Board of Education* of 1954. This was further improved as the Eisenhower, Kennedy, and Johnson administrations became more open to working with the Southern civil rights movement.

Voter registration and desegregation campaigns by local people and organizations like the Student Nonviolent Coordinating Committee and others in Montgomery, Birmingham, and Selma, Alabama, and especially the freedom summer of 1964, not only mobilized local and national support for blacks' rights but also broadcast the severity of racial violence in the United States to the world. By 1964, with the strong support of President Lyndon B. Johnson, Congress passed the Civil Rights Act and a year later, the Voting Rights Act of 1965. But despite momentum gained in the South, conditions in the North worsened. In the 1960s, black Northerners were still as prey to police brutality, and racism in the labor market, as they were two decades before. In response to this situation, the Black Panther Party was formed in 1966 to promote black self-defense and political action. The broader black power movement voiced African Americans's sense of political and economic powerlessness at the local level, despite the passage of national civil rights legislation.

In the post–civil rights era, the need for local empowerment encouraged blacks, especially women, to participate in organizations that address issues often neglected by national civil rights organizations. During the late 1960s and 1970s, black women led local branches of the National Welfare Rights Organization in the fight for cost of living–adjusted stipends for welfare recipients, while in 2006 black women of Biloxi, Mississippi founded Coastal Women for Change, which aids neighborhoods devastated and people dislocated by Hurricane Katrina. The aggregate of these local and national social movements have bore fruit. The African American community celebrated a major milestone in 2009 with the inauguration of Barack H. Obama, who began his career as a community organizer in Chicago. Notwithstanding this achievement, African American activists have found it difficult to attack entrenched poverty and the resegregation of public schools.

U.S. Politics and Society: Latino Political Participation

For quite some time, the discussion of Latinos in the United States has focused primarily on their rapid population growth and recent residential location in nontraditional areas of the country. Now over 45 million strong, Latinos constitute more than 15 percent of the total U.S. population, and the population of sixteen states includes at least one-half million Latinos. The early and prolonged presidential politics of 2008 also brought notice to the role of Latinos' electoral political participation. Thus, four aspects are significant for political scientists: (1) Latinos' levels of electoral participation (i.e., registration and turnout) and contributing factors, (2) partisan affiliation and preferences, (3) the political engagement among the foreign-born segment of the Latino community, and (4) political mobilization.

THE GAINING LATINO ELECTORATE

In an earlier epoch of Latino politics, a descriptive saying was "if they vote, they count." In essence, relatively low levels of voter registration and turnout have characterized the predominant pattern of Latino electoral participation. At the same time, phenomenal growth is having an impact in the electoral arena. More noticeably, the current presidential nomination process has resulted in extensive direct or targeted efforts by presidential campaigns to attract Latino voters.

Latino immigrants head to an immigration rally bearing both Mexican and U.S. flags. Though foreign-born Latinos in the United States are considered to be uninvolved in domestic politics, research in the early twenty-first century indicates their political involvement is on par with native-born Latinos.

More attention is now given to this segment of the electorate for a number of reasons. Latinos reside in the larger electoral college states. Second, their proportion of the electorate is still small (in 2006, approximately 7 percent), yet their rate of share of the total electorate is growing faster than any other population segment. Third, the Latino electorate shows signs of greater interest and attention to politics, saliency of policy concerns, and keener interests in evaluating political parties and candidates. Fourth, Latinos' numbers as naturalized citizens are increasing.

Latino communities have been undervalued as an electoral base because of their more youthful population and higher percentage of foreign-born noncitizens. In 2006, 61 percent of Latinos were ineligible to register to vote: 34 percent were under the age of 18, and 26 percent were noncitizens. This compares to 24 percent and 35 percent respectively for ineligible Anglo-American and African American voters. Recently, levels of naturalization among foreign-born Latinos, especially

Mexicans, have risen. In addition to established factors of acculturation, English language proficiency, gains in educational attainment, more years in the United States, and accumulation of socioeconomic equity, the increase of anti-immigrant referenda and federal and state legislation have served as external "stimuli" for many immigrants to pursue naturalization as what some consider a defensive strategy.

PARTY AFFILIATION AND SUPPORT

Conventional wisdom says that most Latinos are Democrats, but that they have weaker party affiliation than other Democratic identifiers. The extant literature notes that the role of parental socialization, political orientations (e.g., trust in government, efficacy, etc.), public policy preferences and issues, along with retrospective political and economic evaluations, are key determinants of party preferences. However, factors such as national origin background, presence of panethnic identity, generational status in the United States, and English language proficiency are important additions. Demographically, with more females than males, being older, and, to a more limited degree, level of educational attainment correlate with being a Democrat. Ironically, social conservative appeals by the Republican Party, and emphasis on less government, contrasts from Latinos' support of a greater role for government. Ideologically, Latinos display moderate to liberal positions, but policy positions vary across economic, social, and foreign policy issue areas. For example, on the policy issues of immigration, education, and the economy, Latinos take a more liberal and governmental supportive stance. On the other hand, Latinos who identify themselves as Republicans exhibit higher levels of trust in government, and identify themselves as Americans more so than their Latino Democratic counterparts. Finally, the current partisan trend indicating an increase among Americans who call themselves Independents is evident among Latinos, being truer for younger Latinos.

Since the 2000 elections, more discussion about the higher level of Latino support for George W. Bush indicates a possible partisan shift. His campaign themes of traditional values—faith, hard work, family, socioeconomic mobility, and social conservatism are pillars of the Republican Party's appeals to Latinos. Yet, the gains of the 2000 national elections seem short-lived. Since 2002, there has been an eight to eleven percentage point shift of Latinos toward the Democratic Party. Contributing factors were the decline of President Bush's evaluations, anti-immigrant policies, and rhetoric by Republican leadership, favorable views for expanded government to solve problems, limited efforts by Republican Party leadership to invest in a Latino strategy, and lower salience of family values as a key determinant in candidate and political party choices. Finally, Latinos' assessment of which party is most responsive to their concerns is almost a ratio of five to one in favor of the Democratic Party—44 percent compared to 8 percent. At the same time, another 41 percent indicate no difference in either party's responsiveness.

IMMIGRANTS AND NONELECTORAL POLITICAL PARTICIPATION

For the most part, Latino immigrants have been viewed as economic migrants, seeking a better life in America, with the possibility of making their new country their permanent home, or perhaps returning to their home country with their economic successes. Either viewed as apolitical or civically isolated, the lack of citizenship status for Latino immigrants was considered synonymous for being politically removed from the U.S. political system. Yet both historically and in recent times, Latino immigrants have been involved in U.S. organizational and civic life. From mutual aid societies, labor organizations, neighborhood associations, and educational advocacy efforts, the political life of Latino immigrants has been evident in the nonelectoral arenas of U.S. politics. Individual factors such as greater English language proficiency, higher educational levels, being female, being older, higher income levels, and migration to the United States for better opportunities enhance a more politically active immigrant segment. The external negative climate directed toward undocumented Latinos has also activated their involvement in collective activities.

The recent vocal mood of anti-immigrant sentiments and policies has activated even more visible immigrant political behaviors. Significantly, the "hostile environment" toward foreigners, undocumented immigrants, and Latinos has resulted in a heightened political awareness and activism for both foreign-born and native-born Latinos. The extant research reinforces the view that all Latinos have lower levels of nonelectoral participation in comparison to non-Latinos. Native-born Latinos are seen as more engaged than their foreign-born counterparts, but recent works by Matt Barreto and Jose Munoz, along with Alejandro Portes and colleagues, document at least comparable levels of nonelectoral participation for all Latino subgroups. In addition, many scholars of Latino politics strongly suggest that a more complete characterization of Latinos' political domains must include nonelectoral arenas.

MOBILIZATION

The trend of greater political awareness and activism has carried over into electoral politics for those who can vote, and has been spurred by mobilization efforts of Latino-based organizations, labor unions, and, to a lesser extent, political parties and campaigns. The more effective mobilization efforts include direct contact, mobilizers of similar ethnic and cultural background, and effective use of Spanish and English media. During the 2008 presidential primaries, record numbers of Latinos registered and voted in state primaries. Latinos' share of the primary electorate has increased dramatically as well as increased attention to politics. This pattern carried over in the November general elections with Latinos highest turnout and proportion of the electorate. Nationally, 67 percent of Latinos voted for Democrat Barack Obama while only 31 percent voted for Republican John McCain.

Historically, Latino political participation has been lower compared to that of other groups. Yet since the mid-1990s, demographic growth, increased organizational involvement in political matters, clarity of issue priorities, an external negative political climate, and growing attention and targeting by organizations have contributed to an upward slope of Latino political involvement. The policy and partisan impact is still in the process of defining how successful support of partisan candidates and public policies can encourage a closer reflection of the policy preferences of most Latinos. That is, the impact of heightened political engagement in terms of affecting policy agendas and outputs remains to be seen. That success would include continued gains in the number of Latino representatives, greater political access, and greater influence in the policy-making process.

U.S. Politics and Society: Lesbian, Gay, Bisexual, and Transgender Political Identity

One of the most prominent civil rights movements of the last four decades has been the lesbian, gay, bisexual, and transgender movement, in part due to the influence of other successful civil rights movements and in part as a response to the political environment that explicitly marginalized gays and lesbians. The study of gay and lesbian political identity has included analysis of gay rights as a social movement, simultaneously creating a group identity while engaging in political activity. Scholars have examined the ways the movement has adapted strategies to changing political environments that have required not only challenging governmental policies but also challenging public opinion about sexual orientation and gender identity. Like many social movements, the pursuit of simultaneously political and cultural rights has also produced an internal struggle over the nature of the group's identity, its political interests, and the inclusiveness of the group.

COMING OUT: THE EARLY YEARS OF THE MOVEMENT

The roots of gay and lesbian politics can be found in the early twentieth-century social clubs, like the Mattachine Society and Daughters of Bilitis, founded to provide a safe space for individuals interested in same-sex relationships. Since gay and lesbian relationships were considered socially unacceptable and were often criminalized, self-identifying as a sexual minority was itself a political act. Most early gay and lesbian organizations were located in metropolitan areas, and while white professionals dominated many of these social and political organizations, areas such as Harlem also had a thriving gay and lesbian subculture. In the 1950s, local, state, and federal lawmakers increasingly targeted gay and lesbian populations with antisodomy statutes, and the Eisenhower administration expelled suspected gay and lesbian employees in the federal workforce and military.

The social movements of the 1960s profoundly influenced the organization of gay and lesbian politics. For example, the feminist movement had an ambivalent relationship with lesbian politics, caused by fears that association with lesbians would delegitimize the feminist cause and others arguing for a connection between gender equity and gay rights. The alliance between lesbians and feminists marked a divide within the movement between the priorities and interests of gay men and lesbian women. Gay liberationists, inspired by the sexual revolution of the 1960s, encouraged members to "come out" to make sexual minorities less stigmatized.

The 1970s saw an increase in activism, including the election of the first openly gay public officials and the decriminalization of same-sex sexual activity in many places, but also generated backlash. Much of the opposition was religious in nature, setting up a primary opposition between religious groups, mostly the Christian right, and the gay rights movement.

THE MOVEMENT MATURES: THE TRANSFORMATION OF GAY RIGHTS

In the 1980s, the AIDS crisis precipitated a dramatic transformation of gay and lesbian politics both in terms of focus and strategy. HIV/AIDS forced the movement to focus less on sexual freedom and more on health care, research funding, and policy. Gay rights organizations—from the Gay Men's Health Crisis (GMHC) and AIDS Coalition to Unleash Power (ACT-UP) to the Human Rights Commission (HRC) and the Lambda Legal Defense Fund—faced significant obstacles in a government reluctant to invest in an illness that was seen as primarily impacting an unpopular minority. In spite of the negative response, the AIDS crisis helped transform gay rights into a major civil rights issue in the United States as the emergent political organizations, especially the HRC and Lambda Legal, developed a coherent national strategy of legislative and legal challenges, and the Democratic Party adopted a more gay-friendly platform. The AIDS crisis also highlighted legal inequalities in areas such as access to health care and end-of-life decision making. On the social front, an increasing number of public figures came out of the closet to make gays and lesbians more visible.

The 1980s also saw growing rifts in terms of gay identity and group interests. The AIDS crisis highlighted the public health concern of primarily gay males, reinforcing a general feeling of exclusion voiced by women and minorities in the movement. Amongst activists themselves significant differences developed over the strategy and direction of the movement. ACT-UP had splintered off from the Gay Men's Health Crisis over a belief that the GMHC was too conciliatory and insufficiently radical, a split that would be reiterated in later struggles. Many felt the AIDS crisis had made the movement too focused on "normalizing" the image of gays and lesbians and assimilation into mainstream society, leaving behind the goals of sexual freedom and societal transformation. These differences also manifested in differences over the inclusion of transgendered persons in the movement. While the gay rights movement had always been identified with challenges to gender norms, the distinct concerns of the transgendered communities surfaced with some ambivalence within the gay and lesbian community over whether the embrace of transgender rights would interfere with public acceptance of gay rights.

A NATIONAL MOVEMENT: THE PROMISE AND PITFALLS OF THE GAY 90s

During the 90s, the gay rights movement saw some successes in passing state and local antidiscrimination laws and had their first major national success with *Romer v. Evans* in 1995, striking down a state initiative in Colorado that would have forbidden local measures protecting gays and lesbians. Nevertheless, gay activists were disappointed by

President Bill Clinton, who professed support of gay rights but nevertheless adopted the "don't ask, don't tell" policy in the military, under which gays and lesbians could serve only at the price of silence about their orientation. Further, legal backlash, led by conservative Christians, grew against same-sex marriage. Gay questions also received greater attention on the cultural stage with the increasing visibility of gays and lesbians in popular culture.

Lesbian, gay, bisexual, and transgender studies (LGBT) gained a foothold in academia with the first research center opening at the City University of New York (CUNY) in 1991 and the proliferation of academic research on LGBT populations during this time. Again, the expansion of the movement was met with resistance and concern over the development of gay and lesbian identity. Concerns remained over what was seen as an increasing assimilationist agenda amongst mainstream gay rights organizations that, in arguing for equal rights, emphasized gays and lesbians were a part of mainstream society, rather than making a case for changing society.

These rifts perpetuated into the first part of the twenty-first century, as same-sex marriage became the dominant item on the gay rights agenda, and some proponents argued for same-sex marriage as equivalent to the "normal" institution of marriage while others critiqued it precisely because it adopted an already oppressive paradigm. Others felt the focus on marriage distracted from other political goals such as antidiscrimination or hate crimes legislation.

LESBIAN, GAY, TRANSGENDER, AND BISEXUAL IDENTITY IN POLITICAL SCIENCE

The evolution of LGBT political identity has been of interest to political scientists for several reasons. The first is an examination of social movement strategy and evolution. As with any movement, LGBT political action has required a response to the political environment, in this case responding to the cultural politics of the twentieth century that placed gay rights alongside abortion, gender equity, and sexual expression as key debates in social policy. The gay rights movement has also responded to the institutional specificity of the U.S. political arena, having to develop strategies that were geographically specific, finding the greatest success in coastal and urban areas, and appealing to state and local governments as well as the federal government. Specific events such as the AIDS crisis have profoundly shaped the movement's goals and identity. The movement has, at different times, had to respond to political reaction to their successes, most notably reactions within the religious right. As with other social movements, gay rights activists have often found greater success as a political minority appealing to the courts rather than legislative or direct channels. The movement also demonstrates, however, that reliance on legal strategies can also make the movement highly dependent upon professionalized experts, moving away from grassroots and direct action.

Finally, LGBT politics also demonstrates that so-called identity politics are not premised upon a fixed political identity determined by difference from the mainstream. This identity may change over time, as the AIDS crisis prompted a shift from liberationist strategies to policy-oriented public health concerns, placing gay men at the center of the struggle. The identity may also be created by tensions and debate within the movement itself over its own identity, as demonstrated by the growing consideration of transgender issues and debates over the exclusion of women and minority from the movement.

U.S. Politics and Society: Minority Interest Groups

Interest groups representing racial and ethnic minorities are central to civil rights politics. Minority interest groups have mainly pursued a strategy of sponsoring litigation because the federal courts are insulated from electoral politics. Despite the prominence of the litigation strategy, evidence suggests that litigation is not necessarily successful, and minority interest groups have adopted other strategies, such as organizing protests and lobbying government officials.

LITIGATION

The National Association for the Advancement of Colored People (NAACP) is the quintessential minority interest group. Although minority interest groups can be traced back to abolitionist organizations, the NAACP, which W. E. B. Dubois and white civil rights activists formed in 1909, is the first modern group that sought continually to press the federal government to secure access to equal education, end employment discrimination, and establish universal suffrage. From its outset, the NAACP's national headquarters has set policy goals and directed strategy, and local branches address local discrimination issues and implement the national headquarters' strategies. Although the NAACP employed typical interest group tactics, such as protesting, lobbying, and mobilizing supporters, it initially focused on litigation to rectify racial discrimination because NAACP leaders recognized that the public and elected branches of government did not support their goals. However, this political disadvantage could be neutralized in the countermajoritarian federal courts, where success depends on skillful legal argument, not political support. In other words, the NAACP's litigation campaign was not a legal aid mission; instead the national leaders carefully and strategically sought and litigated cases that were winnable and would have important civil rights ramifications. For example, the NAACP sponsored litigation of cases that ended the white primary elections (*Nixon v. Herndon,* 1927 and *Smith v. Allwright,* 1944) and racially discriminatory real estate contracts (*Shelley v. Kraemer,* 1948).

During the early 1940s, the legal arm of the NAACP—the NAACP Legal Defense and Education Fund (LDF)—officially severed ties with the NAACP in order to focus solely on using litigation to end segregated education. The LDF illustrated that the legal standard of "separate but equal" was unworkable because states that segregated did not provide for genuinely equal education. After undermining the separate-but-equal standard, the LDF expanded its attack on segregation by arguing the landmark *Brown v. Board of Education* case in 1954. Using a creative mixture of cutting-edge legal argument and social science evidence, the LDF convinced a unanimous U.S. Supreme Court that state-sponsored segregation was contrary to the Equal Protection Clause of the Fourteenth Amendment. Although the *Brown v. Board of Education* decision did not by itself end segregation, it is undoubtedly one of the most important events in civil rights history, and the LDF's victory

set the model for using litigation as a means to improve civil rights for racial and ethnic minorities. The LDF has continued to litigate to advance civil rights in voting, criminal law, education, employment, and public accommodations.

Based on the LDF's success, other racial and ethnic minority groups have employed a litigation strategy to improve the civil rights of the people they represent. The Mexican American Legal Defense and Education Fund (MALDEF) argues cases on behalf of Latinos in order to influence policies concerning education and employment discrimination, immigration, and voting rights; the Native American Rights Fund (NARF) litigates civil rights issues for American Indians, such as protecting tribal identity and resources, ending discrimination against Indians, and negotiating with the federal and state governments on behalf of tribes and individuals; and the Asian American Justice Center (AAJC) argues cases concerning Asian American civil rights issues of discrimination and immigration.

NONLITIGATION ACTIVITIES

Despite its prominence, litigation is not the only method that minority interest groups employ. Despite some landmark litigation successes, such as *Brown v. Board of Education,* the evidence is mixed on whether litigation is an effective tactic. Comprehensive studies of minority group litigation demonstrate that groups, such as the LDF, are not necessarily likely to increase the chance of favorable court decisions, especially since the 1980s, as the ideology of federal judges has become more conservative hence less receptive to the goals of minority interest groups.

As litigation has become less prevalent, minority interest groups have employed alternative methods of ending discrimination. Some organizations, such as the National Urban League, are social service agencies that provide economic and educational assistance, but many of these groups have expanded their activities to include sponsoring litigation, organizing protests, and researching public policy issues. Other organizations focus on lobbying elected officials and bureaucrats, organizing public protests, or mobilizing grassroots members. After the NAACP and LDF split into separate groups, the NAACP focused more on public protests against discrimination and lobbying public officials to enact and implement policies to end discrimination. Furthermore, the Southern Christian Leadership Conference (SCLC), which was headed by Martin Luther King Jr., organized boycotts, marches, and sit-ins during the 1960s. The SCLC continues to advocate for human rights both in the United States and abroad. The League of United Latin American Citizens (LULAC) employs a variety of tactics, such as litigating, protesting, providing economic and education assistance, and lobbying public officials to fight discrimination committed against Mexican Americans. There are a variety of groups that have lobbied public officials on behalf of Asian-American nationalities. For example, in the 1980s, the Japanese American Citizens League (JACL) convinced Congress and President Reagan to pass a law apologizing and compensating for the internment of American citizens of Japanese

descent during World War II (1939–1945). In addition to each individual tribal government advocating on behalf of their members, pantribal groups, such as the National Congress of American Indians (NCAI), have lobbied Congress and educated the public concerning political and economic discrimination against American Indians. Finally, some groups, such as the Black Panther Party, shunned the approaches of the more traditional groups, instead focusing on provision of economic opportunities and a more confrontational approach against the government.

In conclusion, minority interest groups have played a central role in advancing civil rights, even if they do not always accomplish their goals. Traditionally, minority interest groups relied on litigation to bring about social change, but other methods, such as protesting, providing economic and education assistance, lobbying, and mobilizing voters, have also been useful to establish policies on behalf of racial and ethnic minority groups.

U.S. Politics and Society: Women, Political Participation of

Women comprise more than 50 percent of the U.S. population, but their political integration as voters, activists, and elected officials is a relatively new phenomenon. Not until 1920 did the Nineteenth Amendment extend voting rights to women, and not until 2008 did a woman—Hillary Clinton—win a presidential primary. When assessing women's political participation, therefore, it is important to examine not only current levels of women's political activism, but also the circumstances under which they have come to enter the political sphere, and differences in participation at the mass and elite levels.

WOMEN'S EMERGENCE IN U.S. POLITICS

Women's political exclusion, as well as their eventual participation, can be linked to their family roles. Throughout U.S. history, a clear division of labor has characterized household and family arrangements. Traditionally, men worked outside the home and, therefore, served in a more "public" role; women occupied a more "private" role, as the caretakers of the home and family. This gendered division of labor historically resulted in men's entry into, and dominance of, the public world of politics, and women's almost total absence from the political sphere.

As early as the women's suffrage revival in 1890, though, women began to rely on their distinct roles in this private sphere to justify their entry into politics. Government corruption and party machines dominated late nineteenth-century politics. Susan B. Anthony and advocates of women's suffrage argued that women possessed the characteristics needed to take the corruption out of politics. Women's exclusion from politics meant that they lacked party loyalty or relationships with party bosses. In addition, the characteristics that women's roles in their families demanded—benevolence, morality, selflessness, and industry—could serve the public interest. The suffrage movement's affiliation with the temperance movement also highlighted women's traditional roles as strengths. Because women bore witness to the trouble that liquor wrought in the private sphere, they were well-suited to encourage its prohibition. Women's adherence to these roles also served as an impetus for their involvement in the moral reform, antislavery, and women's rights movements.

By the 1960s, the relationship between traditional family roles and women's equality and political integration became more tenuous. Political activists, such as Betty Friedan, and scholars, such as Carole Pateman and Susan Okin, focused on dismantling the gendered conceptual framework of private and public spheres. They noted that men were not independent; their public sphere entry and success relied on women's familial care. Advocates of women's rights, therefore, argued that the private realm of women's lives must be made part of the public discourse. These efforts aimed to break down the dichotomy and integrate private-sphere issues, such as childcare and domestic abuse, into public-sphere policy debates. Over time, women's issues, often championed by female legislators, have gained prominence in national political discourse and debate.

MASS PARTICIPATION: WOMEN'S LEVELS OF POLITICAL ACTIVISM

In general, despite their relatively late entry into politics, women are as active as their male counterparts. Women outnumber men among registered voters, and in every presidential election since 1980 and every congressional election

since 1986, women have voted in equal or higher proportions than men. In 2008, for example, 66 percent of eligible women turned out to vote in the presidential election, compared to 62 percent of men. Furthermore, women sign petitions, attend public meetings and rallies, and write to elected government officials at rates similar to those of men.

Two noteworthy gender differences in political participation, however, merit acknowledgment. First, women are less likely than men to contribute money to campaigns. In the presidential election of 2008, women made up 44 percent of Democrat Barack Obama's donor base and 28 percent of Republican John McCain's donor base. Second, women are more likely than men to participate on behalf of Democratic candidates. Since 1980, women have been at least four percentage points more likely than men to favor Democratic presidential candidates. The largest gender gap was in 1996, when 54 percent of women, compared to 43 percent of men, voted for Democrat Bill Clinton. Compared to 49 percent of men, 56 percent of women cast a vote for Barack Obama in 2008.

For both women and men, the central predictors of whether a citizen participates politically are levels of education, income, and politically relevant civic skills. The differences in women's and men's political activism, therefore, tend to result from disparities in the factors that facilitate participation and not from their sex.

ELITE PARTICIPATION: WOMEN'S PRESENCE IN U.S. POLITICAL INSTITUTIONS

By 2010, it was difficult not to see women in U.S. politics on television, in the newspaper, or on the Internet. Nancy Pelosi, a Democrat from California, was the Speaker of the House, and former U.S. senator Hillary Clinton served as secretary of state. Also, former Alaska governor Sarah Palin, the first female Republican vice presidential nominee in 2008, remained in the news. Prior to 1978, no woman whose career was not linked to the death of her spouse ever served in the U.S. Senate. As of 2010, seventeen women served in the Senate and seventy-five occupied positions in the House of Representatives. The 1992 "year of the woman" elections, alone, produced a 70 percent increase in the number of women serving in the U.S. Congress.

Undoubtedly, an evolution toward the social acceptance of women running for office occurred in the last half of the twentieth century. However, women remained underrepresented in U.S. political institutions in the early twenty-first century, especially given their levels of participation at the mass level. When the 111th Congress convened in January 2009, 83 percent of its members were men. Large gender disparities are also evident at the state and local levels, where more than three-quarters of statewide elected officials and state legislators are men. Men occupied the governor's mansion in forty-four of the fifty states, and ran city hall in ninety of the one hundred largest cities across the country. The low numbers of women in politics are particularly glaring when placed in context. Whereas the 1980s saw steady increases in

the percentage of women seeking elected office, and the early 1990s experienced a rather dramatic surge, the last several election cycles represent a plateau.

Women's numeric underrepresentation in U.S. politics raises grave concerns over the quality of democratic governance. More women in positions of political power confer a greater sense of political legitimacy to the government, simply because it better reflects the gender breakdown of the national population. The inclusion of women in electoral and legislative processes also increases the likelihood that policy debate and deliberation includes women's views and experiences.

Ummah

In Arabic, *ummah* means community. In modern usage, ummah sometimes serves as the equivalent of the English word *nation*. But in Islamic religiopolitical thought (in which case it tends not to be translated) ummah refers to the worldwide body of Muslims, and according to Islamic doctrine, this body is supposed to be united under one Islamic government headed by a *caliph*. Although the ideal of political unity flies in the face of division in practice into rival Muslim states beginning early in Islamic history, the notion of one ummah that transcends sectarian, racial, tribal, ethnic, and political divisions persists and inspires pan-Islamic movements and, more generally, a broad identification with other Muslims when they are seen

as victims of aggression from non-Muslims (e.g., Palestine, Bosnia, Afghanistan, and Iraq). Although during much of the twentieth century, the notion of one ummah seemed to be superseded by separate ethnic nationalisms (e.g., Arab, Turkish, etc.) or by loyalty to countries such as Egypt or Syria, there has been a recent resurgence of identification with the Islamic ummah. This has inspired some observers, notably Samuel P. Huntington, to foresee the emergence of a world in which the ummah increasingly acts as a unit in relations with other civilizations or *supertribes,* such as the West and Orthodox Christianity.

Unamuno, Miguel de

Miguel de Unamuno y Jugo (1864–1936) was a Basque academic, writer, and philosopher. Even though both his political and philosophical views were subject to radical changes during his lifetime, he is considered a key representative both of European existentialist philosophy and the Spanish cultural and literary movement known as the generation of 1898, which heavily criticized the corrupt system of government imposed during the Restoration period (1874–1931).

Unamuno was born in Bilbao, Spain, in 1864 and witnessed the siege of the city during the Third Carlist War (1872–1876). Soon after completing his studies in Madrid, where he briefly transitioned from Catholic traditionalism to socialism, he joined the University of Salamanca as a professor. In 1901, Unamuno became rector of the university, the first of a series of academic appointments from which he would be subsequently removed due to his political and intellectual positions. He remained in exile during most of Primo de Rivera's military dictatorship (1923–1930) and was briefly engaged in active politics during the first years of the Second Spanish Republic (1931–1939). After being once again appointed a rector, he was elected to parliament as part of the socialist-republican coalition but soon came to despise Republican politics.

Initially, Unamuno welcomed the nationalist uprising led by General Francisco Franco in 1936, which he saw as a continuation of the Spanish "regeneration" movement to bring back the "pure values" and "Christian civilization." However, weeks after the beginning of the conflict, Unamuno once again witnessed the horrors of repression and revenge as friends, colleagues, and students were systematically executed. After an argument with Fascist general Millán Astray during the opening session of the 1936 to 1937 academic year in Salamanca, in which Unamuno publicly withdrew his support for the nationalists, he was again dismissed and placed under house arrest, dying weeks later, on December 31, 1936.

After his temporary support for socialism, Unamuno moved away from rationalist views. In *The Tragic Sense of Life* (1913) he developed the concept of *intrahistory,* which was based on orality and personal experiences of common people instead of prevailing official historiography. Under the influence of Danish intellectual Søren Kierkegaard, Unamuno sought to understand agony and anxiety as forms of struggle in each individual's search for faith, and, similar to other existentialist thinkers, he disregarded systematic or academic philosophy as misleading in the absurd quest for abstract rational knowledge. In spite of his religiosity, conflicts with the Catholic Church were frequent. Significantly, both *The Tragic Sense of Life* (1913) and *The Agony of Christianity* (1925) were banned by the church until the 1960s.

Even though Unamuno's essays reflect much of his thought, most of his writings are fictional, including a vast collection of novels, short stories, poetry, and drama. His political and philosophical views are condensed and can be deciphered through masterpieces such as *The Life of Don Quixote and Sancho* (1967), *Saint Manuel Bueno, Martyr* (1954) or *Abel Sánchez and Other Stories* (1956). In any case, his works had a deep impact not only on Spain's literary and political scene, especially visible through authors as Juan Ramón Jiménez or Antonio Machado, but also in the wider European context, where he was seen as an intellectual reference.

Unicameralism and Bicameralism

While legislatures are the most democratic of the institutions of governance, the second chambers of bicameral legislatures are typically less democratic, and thus have been supplanted by the main and newer chambers.

DISTRIBUTION

Historically, some parliaments have been multicameral. Sweden, until 1866, had four chambers, while South Africa recently had three, and Yugoslavia in the 1960s had five. Unicameral legislatures also become bicameral, as have Poland and Indonesia. The number of chambers, and especially the unicameral-bicameral choice, has varied not only among countries, but within a country through time. Of 181 national parliaments in 2000, sixty-nine (38 percent) were bicameral. While federations—in which subunits (states or provinces) have a constitutional status—usually have bicameral legislatures, almost one-third of unitary countries—in which

subunits (prefectures) exist for changing administrative purposes—are also bicameral. In federal systems, second chambers usually represent the component states within the federation, while the first or main chamber represents districts on the basis of population size. The European Union (EU), with the 2009 Treaty of Lisbon, created a multinational form of bicameralism though the codecision procedure in policy making between the directly elected European Parliament and the appointive Council of Ministers.

MEMBERSHIP AND SELECTION

The second chamber tends to be smaller than the main chamber, though the British House of Lords is an exception. Most second chambers are in the eleven- to one hundred-member range, while the main chambers may have fifty to two hundred members. Second chambers based upon governmental subunits, such as states, are more fixed in their size than those based on other and more flexible criteria.

Second chambers tend to have restricted qualifications for membership, a residue of the medieval European aristocratic origins of parliaments, and thus are often considered upper chambers. The most common current member restriction is age. The British House of Lords, by contrast, until the end of the twentieth century, retained its aristocratic membership through inheritance. Alternatives to this include the government appointment of all members to the Canadian Senate, and the king's appointment for the Jordanian second chamber.

Other distinctive member selection means for second chambers include indirect election by states or provinces (Argentina), by localities (France and Croatia), functional representation (Slovenia and Ireland), and direct membership from state-level governments (Germany) or from state legislatures (Pakistan).

Direct popular election to the second chamber, now the most common means of selection, occurs in many different variations. In most bicameral systems, both districts and election systems for the two chambers differ from each other. In some, illustrated by Poland and Romania, elections to the two chambers occur on the same day for the same length of term. In others, illustrated by the United States and the Czech Republic, one-third of the members are elected every two years, with each member holding office for a six-year term.

The combination of different selection means, different terms of office, different districts, and different election systems tends to produce different party majorities and different policy views in the two chambers. A related result is that membership in second chambers is often more stable across election periods than in the main chamber.

AUTHORITY AND BARGAINING RELATIONSHIPS

Bicameral systems vary both in the symmetry of authority in the two chambers and in the congruence of their selection systems. In strong bicameral systems, the chambers are symmetrical in power but incongruent in selection means. In weak systems, the chambers are asymmetrical in power, regardless of the congruency of selection.

In federal systems, second chambers are more active and important than in unitary systems, in that the powers of the two chambers tend to be symmetric. The U.S. Senate, however, has exclusive appointment confirmation and treaty ratification functions, while the more restricted German Bundesrat shares jurisdiction with the Bundestag on policies administered by the Laender.

In unitary nations, second chambers have largely become supplemental in function to the main chamber. Their legislative function is limited to propose amendments to, and to delay, bills from the main chamber, often within time constraints. Though usually asymmetric in authority, the main purpose of second chambers in unitary nations is to limit the power of political parties obtained through direct popular elections to the main chamber. A more basic function of second chambers in both unitary and federal systems is to limit the power of government cabinets and chief executives, whether as prime ministers or as presidents. Powerful chief executives, presidents or prime ministers, may form a triangular relationship with the legislature by seeking support from one chamber to counter opposition from the other.

The more important the second chamber, the greater the need to reconcile differences between the two chambers. One common method, the *navette* (France), requires different versions of legislation to shuttle between the two chambers until both accept a common version. A second frequently used method is a joint committee (United States and Germany) between the two chambers, which adopts a common version to be accepted by both chambers. In a third method, employed in asymmetrical legislatures (Britain, Poland, and the Czech Republic), the main chamber can accept amendments from the supplemental chamber or readopt its original version of a bill.

Constitution revision and adoption of constitutional laws (e.g., the election system), by contrast, often require both chambers' approval. In addition, in some systems (e.g., the Czech Republic), the supplemental second chamber cannot be dissolved by either the cabinet or the president. These system-protection provisions make second chambers more important in occasional crises than in the more frequent consideration of ordinary law.

INTERCAMERAL STRUCTURES

Bicameral systems function through distinctive organizational forms. The two chambers can meet together and vote as single bodies, illustrated by the Polish National Assembly in writing a constitution. Norway is distinctive in that the second chamber is a subset of members from the directly elected main chamber. Some have joint bicameral committees, as illustrated by the Joint Standing Committee on Defense of the South African bicameral parliament, or bicameral parliamentary party groups, as in Poland.

Second chambers have become the innovative, almost experimental, part of modern legislatures, especially in new political systems. The wide variety of specific activities goes far beyond the legislative activities of main chambers. The wide

variety of selection procedures likewise greatly diversifies the representational reach and policy views of parliaments. Paradoxically, the more marginal the second chamber, the greater the potential for innovations in both composition and activities of the supplemental chamber.

Unitary Government

The great majority of countries in the world utilize a unitary form of government, in which the central government, by constitutional arrangement, is the exclusive sovereign power: it has the legal authority to create, reorganize, or eliminate subordinate levels of government. In countries that use a unitary structure—for example, the United Kingdom, France, Ukraine, and Sweden—the central, or national, government reigns supreme and any constituent units in the form of subnational governments—such as local authorities—are not sovereign unto themselves and have limited autonomy. Central governments in unitary systems determine what subordinate layers of governance are necessary and to what extent power will be decentralized or devolved to them. Moreover, the central government retains the authority to abrogate the powers it has given to local entities at any time, or ultimately to abolish them.

RATIONALE FOR A UNITARY FORM OF GOVERNMENT

Culture, history, and geography are the most important factors for a country to select a unitary system. The most common way nations came to utilize the unitary form is via a transition from a prior system with a highly centralized structure. Countries that have chosen the unitary form typically have historical experience with monarchical systems of governance, whereby kings, queens, or emperors exercised dominance over the nation's administration. Unitary systems often have been adopted in the former colonies of such countries. This is a logical segue for societies that were first conditioned to embrace a consolidation of power under the divine right of kings or via a centralized imperial administration: unified sovereignty is retained as these polities move toward alternative conceptualizations of governing authority. Thus, a comfort level within the political culture, along with a centralized governmental apparatus previously in place, often work in tandem to motivate adoption or retention of the unitary form.

Other factors affecting the choice among systems include the size of the country's territory and its ethnic or religious homogeneity. Countries that have smaller populations, that are more compact geographically, and that contain within themselves minimal ethnic diversity and religious differentiation (i.e., with greater homogeneity) often choose unitary systems. Unitary countries, then, commonly do not have high levels of cultural or political division to reconcile inside their borders; this is reinforced by unitary states typically having only one-house legislatures, unlike the two-chamber norm in federal states.

More recently, the nations of Eastern Europe that broke away from the dominating shadow of the Soviet Union in the 1990s have opted for unitary systems after independence. Scholars posit that these newly freed nations viewed the old Soviet federal system as one of the leading mechanisms used by Moscow at the center to control the periphery (i.e., the former non-Russian Soviet republics). In this instance, unitary systems were chosen in reaction to specific historical experiences and perceptions of cultural imperialism.

UNITARY VERSUS FEDERAL OR CONFEDERAL SYSTEMS

Unitary systems are inherently more clear-cut and less complicated than alternative systems, and with no large territories to govern or deep ethnocultural divisions to manage, there is no perceived need for more complex constitutional arrangements. Generally speaking, unitary systems offer an unambiguous and readily comprehensible setting out of government authority—with less opportunity for extensive bargaining or power posturing (i.e., fewer veto points) amongst political actors compared to systems with multilevel governance structures.

The two other primary forms of government used by nation-states are federations (i.e., federalism) and confederations. These types are much less common than the unitary system. The essential element that distinguishes them revolves around the relationship between the central government and the other, more localized governmental entities operating within that nation.

Unlike unitary governments, federalism is a constitutional and structural arrangement designed to accommodate both a strong central government and strong subnational governments—in the form of provincial, state, or regional authorities—with sovereignty divided between them. Examples of federal systems are the United States, Australia, Canada, and Mexico. Both levels of government share jurisdiction over the same land and the same people, thus a citizen of the state of California and a citizen of the state of New York are also citizens of the United States in the same way that a citizen of the province of Nova Scotia and a citizen of the province of British Columbia are both citizens of Canada. These four sets of citizens are subject to both the state or provincial law and national law. Both levels of government are sovereign and cannot extinguish the other. Having several formal layers of governance is an essential component found in federal systems,

and in a bona fide federal framework, the ability of the central government to overrule decisions made by local or provincial governments is greatly constrained or nonexistent.

A confederation is a loose union of subnational political units, such as states or provinces that legitimately can be considered in this context as their own separate countries, where they alone are sovereign. The authority of the central government is derived from the member states, which can, at their will, redefine the authority of the central government. Thus, the central government fulfills the role as a simple emissary or representative of the collective will of the constituent members of the confederation. Leading contemporary examples of confederations are Switzerland, the United Arab Emirates, and the European Union (EU), although there is ongoing scholarly debate over whether they are more federation than confederation.

There are strong and weak versions of each of these three systems, and at times a highly decentralized unitary government can appear to be almost a federal system, such as Spain, Italy, and France, and a weak federal system, as seen in Austria, can appear to be virtually unitary. As well, in many countries, the relationship and the accompanying distribution of power between the national government and subnational governments are fluid and dynamic, not static—changeability and evolution in these governance connections are not uncommon, especially as they seek optimal ways of administering policies and distributing tax revenues.

EVOLUTION AND CHANGE IN UNITARY GOVERNMENT

In the modern era, unitary states have come to recognize the pragmatic considerations and increased administrative efficacy in decentralizing more governmental authority in terms of both policy making and policy implementation down to the lower, more localized levels. This change to more regionally based governance in unitary systems speaks directly to the ongoing challenges with which modern governments must contend in the twenty-first century.

This shift constitutes one of the major contemporary questions about the choice of system—as countries with unitary systems devolve more power and decision-making authority to lower levels of government, at what point are they no longer unitary and instead de facto federal systems? How does one decide which system, or which of its variants, is optimal for a particular country's circumstances? At the heart of these governance considerations is the necessity of managing disparate local, regional, and national interests. As nations cope with the vagaries of modern social, economic, and political life, they choose an increasing variety of structural means. When central government maintains the authority to ultimately veto and rescind decisions made by lower governmental officials, it can be said to be a unitary system; but the varying degrees and gradations within both unitary and federal systems render the definitional distinctions and empirical differentiation between these two forms murkier.

This trend toward less rather than more differentiation raises several theoretical dilemmas: Is federalism simply a stage in the path to a unitary system? Or the reverse, is a unitary system a step, a phase, leading ultimately to federalism? Moreover, why do some efforts at forming a federal system fail (e.g., the Caribbean Federation and the East African Federation) where others succeed?

Other questions about the optimal governance arrangements animate scholarly discourse. How much power should localities have in blocking important central government decisions? How much adaptive leeway should be placed in a nation's constitution to allow ready evolution and changes in the relationships between the central, regional, and local governments? How does one determine which one of the three methods for a central government to disperse authority away from the center—devolution, decentralization, or deconcentration—is the best course of action for a particular country? With the increasing popularity of the use of regional governments in the crafting of public policies, how much actual decision-making authority should regional actors have to implement or alter these policies after adoption? What is the appropriate filtering role for regional governments as intermediary between the central government and the localities?

The European Union constitutes an ongoing case study for political scientists on these challenging political relationships (e.g., the EU's relationship to its constituent nations and their subconstituent governmental units). Is the EU a federation or a confederation and what does its development imply for the future of unitary governments?

United Nations

The United Nations (UN) is the general multipurpose world organization and the backbone of the UN system of specialized agencies. Initially envisaged primarily as an instrument for collective security, the UN has served this aim mainly in an indirect manner. Constitutionally and in practice

The United Nations Security Council meets in New York City. The United Nations is a world organization facilitating diplomacy and engaging in peacekeeping operations around the world.

solely an intergovernmental organization and framework for multilateral conference diplomacy, the UN also represents an imaginary surplus as a "world executive," "parliament of man," or "world conscience." Due to the allocation of power mainly at the level of nation-states and the prevalence of tensions between them, the UN is an organization in a state of constant crisis. Only under exceptional circumstances has the UN lived up to the demand of evidently making a difference in world politics. Nevertheless, despite its seeming impotence, the UN has long been the single most important instrument of global governance.

The UN serves as a global discussion forum and clearinghouse, and thereby contributes to the emergence and dissemination of universal values and norms. It functions as a great legitimizer, as a face-saver, and as an important stage for symbolic politics. The UN has significantly smoothed the process of decolonization and facilitated the development of international law, in particular the law of the seas. However, rather than providing solutions to particular conflicts or problems, the merit of the UN is typically to keep controversial issues under lock. To a large extent, the agenda of UN organs consists of items that recur year after year. The various military missions since the establishment of the UN peacekeeping forces

(known as the blue helmets) in 1956 (with a predecessor in 1948) also bear witness to the intricacy of lasting conflict resolution. At the same time, these peacekeeping operations are a significant advancement of the world organization not provided for by the UN Charter. Albeit difficult to assess in relation to other relevant factors, arguably the greatest success of the UN is the nonescalation of the cold war. Since the end of the cold war, the UN has demonstrated an increased ability for action. However, it has been hampered by its lack of thorough institutional adjustment to the changing world order.

HISTORY

In World War II (1939–1945), the term *united nations* was still a synonym for the Allied Powers fighting the Axis Powers (Germany, Italy, Japan). At the UN Conference on International Organization, held in San Francisco in 1945, the UN was given a charter that came into force on October 24, 1945, and thus transformed the organization into an international organization. The forty-nine countries that had declared war on Germany or its collaborators were admitted as founding members of the UN. In addition, a special deal resulted in the Soviet republics Ukraine and Belorussia being given independent member status. This arrangement stemmed from

pronounced distrust among the major Allies coupled with the Soviet government's insistence, motivated by the fear of ending up in complete isolation. In contrast to the widespread myth of a prevailing naïve belief in the future of the world organization in 1945, the expectations in the UN were low key in all quarters from the outset.

A notable element of UN politics is avoiding reference to the UN's predecessor organization, the League of Nations, existing from 1920 to 1939, de jure until 1946. This disregard is a consequence of the League of Nations's failure to prevent World War II and its insufficient provision of congruence of power inside and outside the organization. Nonetheless, the UN, in practically all its basic traits, is a remake of the League of Nations. The only significant difference is that the UN affords the right to veto major decisions to five great powers: the United States, the Soviet Union (Russia since 1991), Great Britain, China (People's Republic of China since 1971), and France. As the five permanent members of the Security Council—the potentially most powerful organ of the UN— these countries enjoy the veto right as well as a number of other privileges. Having cast almost half of all vetoes, the Soviet Union remains the country with most such interventions to date (123 vetoes by 2007). However, since the mid-1960s, the United States has invoked the veto power most extensively (82 vetoes, frequently on draft resolutions concerning Israel). Britain (32 vetoes), France (18 vetoes), and China (6 vetoes) have been more modest in using this instrument.

Because nothing of significance can be done against the will of any of the "permanent five," the UN has had difficulties coming to terms with a substantial reform. Since the end of the cold war, there has been a perceived need to enlarge the Security Council in order to achieve better geographical representation as well as permanent membership of additional major international players such as India, Japan, Brazil, Germany, Italy, and one or two of the larger African countries (with or without the right to veto). These efforts culminated at the sixtieth anniversary session of the UN, from 2005 to 2006, without consensus. Another discussion surrounds the appropriate timing to merge the British and the French seat in the Security Council into a common seat of the European Union (EU). Ultimately, the UN conserves the global power structure considered legitimate in 1945, and there is an increasing tension vis-à-vis the present-day international setting.

LEADERSHIP AND MEMBERSHIP
The historic legacy of the U.S. Senate's defeat of U.S. membership in the League of Nations prompted the U.S. government to use utmost care in designing the UN in a way that would appeal to its home public. In the opening phrase of the UN Charter, "We the peoples of the United Nations," the very name "United Nations" echoes the United States. However, whereas such similarities mirror the tremendous influence the United States has had on the UN from the very beginning, they are misleading in regard to what is de facto solely an intergovernmental character of the UN. In 1946, the headquarters of the UN were established in New York City

(other major UN office sites are Geneva, Vienna, Nairobi, and The Hague). In the early years, the UN was thoroughly dominated by the United States. While developing nations' politics of sheer numbers later challenged this dominance, the United States never ceased to be the hegemonic power at the UN. While certain U.S. politicians and debaters often engage in either "UN bashing" or "UN glorification," they are frequently unaware of the vast influence their own country exerts on the UN by a variety of means. Not least, the U.S. Senate, in practice, acts as an organ exercising parliamentary control over the UN (e.g., irregularities in the oil-for-food program for Iraq).

The admission of new member states to the UN was slow in the first decade due to differences between the Western powers and the Soviet Union, yet the number of members has risen significantly since the mid-1950s. After the Republic of China (Taiwan) lost the Chinese seat to the benefit of the People's Republic of China in 1971 and after the admission of the two German states in 1973, the UN has virtually been a universal organization. In addition, after Switzerland's adhesion to the UN in 2002, no undisputed fully sovereign state remains outside the world organization (with the exception of the borderline case, the Holy See, which remains an observer state). UN membership has always been, and has increasingly become, an essential attribute of sovereign statehood. In 2006, the number of members rose to 192. The only country ever to withdraw (temporarily) from the UN was Indonesia, from 1965 to 1966, as a protest against Malaysia's election to the Security Council.

ORGANS OF THE UN
According to the UN Charter, the principal organs of the UN are the General Assembly, the Security Council, the Economic and Social Council, the Secretariat, and the International Court of Justice. The sixth principal organ, the Trusteeship Council, suspended operations in 1994. Activity ceased after the last remaining UN trust territory, the Palau islands, achieved independence.

Most powerful among UN organs is the Security Council, with its five permanent and ten (six until 1965) elected and regionally representative members—provided that a qualified majority can be mobilized and none of the permanent members cast a veto. The Security Council operates continuously, yet, was in stalemate during the cold war. The only exception in a case involving differences among the great powers was the Korean War (1950–1953); when the decision to intervene in Korea was made, an expedition under the UN flag could be formed due to the Soviet Union's unwise boycott of the Council. In the past two decades, the Security Council has been able to agree on more far-reaching decisions than in earlier years. The first major evidence of this congruence was the Council's authorization of a U.S.-led military coalition deployed to oust Iraq from Kuwait in the Gulf War in 1991. However, as yet, Article 43 of the Charter, which obliges member states to make available armed forces and other facilities to the Security Council, has never been implemented.

Arguably, the General Assembly has been the most relevant UN organ in practice. The General Assembly cannot adopt binding decisions for member states, and it only convenes periodically (annually, usually from mid-September to mid-December). Yet, it is the universal forum of the UN with regard to membership and scope of subject matter; it is a highly relevant stage for symbolic politics, and—despite making some controversial decisions—carries considerable moral weight as a sort of "world opinion." This moral authority is particularly notable when consensus is reached. The General Assembly controls the budget of the UN; reviews the annual reports of the other organs, including the Security Council; and elects their members. In 1950, the General Assembly changed the constitutional order of the UN by way of the Uniting for Peace Resolution and enabled itself to bypass the Security Council, if that council fails to act because of the veto of a permanent member. Despite all this, the term *revitalization*—in prominent use during attempts to reform the General Assembly over the past two decades—suggests a pristine vitality that never existed, apart from the special circumstances of the Korean War. The impression that the General Assembly has lost significance in recent years is accurate only in relative terms: The vitalization of the Security Council, which had earlier been even more paralyzed, after the end of the cold war has not been accompanied by a corresponding upswing of effectiveness of the General Assembly. The work of the General Assembly is organized in the plenary forum and six committees, in all of which each UN member state commands one vote.

The Economic and Social Council (ECOSOC) of the UN aims to promote and coordinate international cooperation in the fields of economy, social affairs, culture, education, health, and human rights. After an initial focus on recovery from the devastation of World War II, its main concern has long been to address problems faced by developing countries. Subordinate to the authority of the General Assembly, ECOSOC is composed of fifty-four members (eighteen until 1965, and twenty-seven from 1965–1973) that are elected according to a regionally representative key. Most of ECOSOC's work occurs in various standing committees, functional commissions, and regional commissions. Despite the scope of its mandate, which also comprises the coordination of UN specialized agencies (e.g., International Labor Organization [ILO], World Health Organization [WHO], Food and Agriculture Organization [FAO], United Nations Educational, Scientific and Cultural Organization [UNESCO], International Atomic Energy Agency [IAEA], International Monetary Fund [IMF], and World Bank), ECOSOC's authority in international policy making has been limited. Nonetheless, its committees have done important work in their fields (e.g., the Commission on the Status of Women and, until 2006, the Commission on Human Rights, which was then replaced by the UN Human Rights Council under the General Assembly). ECOSOC is also the UN organ with principal responsibility for liaison with nongovernmental organizations.

A particularly interesting instrument used by ECOSOC to good effect has been world conferences on particular subject matters. The United Nations Conference on the Human Environment, held 1972 in Stockholm, was a particular landmark in this respect. In 1987, the World Commission on Environment and Development continued this work, introducing the concept of sustainable development and laying the groundwork for the convening of the 1992 United Nations Conference on Environment and Development (i.e., the Earth Summit) in Rio de Janeiro. The adoption of the Framework Convention on Climate Change at this conference was the first step toward a global climate change regime, leading to the 1997 Kyoto Protocol. Ratified by 183 states, but, as yet, not by the United States, this protocol upholds a legally binding commitment for the reduction of greenhouse gases.

The Secretariat of the UN is the administrative organ of the world organization, and the domain for parties known as international civil servants. The Secretariat provides service to the other UN organs, for example, by preparing meetings and draft stipulations or by delivering relevant information; it administers the programs and policies established in other areas of the UN. Moreover, the Secretariat documents the work of the UN; publishes collections of material, reports, and statistics; and is responsible for public relations. Somewhat paradoxically, despite the idea of international civil service, the national background of UN staff members is a delicate and closely monitored issue. According to the UN Charter, the highest standards of efficiency, competence, and integrity are to be applied in the employment of the staff and in the determination of the conditions of service. However, at the same time, due regard must be paid to recruitment to ensure as wide a geographical representation as possible. In practice, despite the requested impartiality of officeholders, the staffing of the UN Secretariat is subject to the bargaining of governments.

The secretary-general heads the Secretariat, serving as the chief administrative officer and in practice also the highest representative of the UN, and appointed by the General Assembly upon the recommendation of the Security Council for a five-year, renewable term. Officeholders have been Trygve Lie (1946–1952), Dag Hammarskjöld (1953–1961), Sithu U Thant (1961–1971), Kurt Waldheim (1972–1981), Javier Perez de Cuellar (1982–1992), Boutros Boutros-Ghali (1992–1996), Kofi A. Annan (1997–2006), and Ban Ki-moon (since 2007). Compared to the secretary-general of the League of Nations, the UN secretary-general has a more active role, with a provision to bring any matter perceived by the secretary-general as a potential threat to maintaining international peace and security to the attention of the Security Council. This independent role was strengthened under the administration of the first two UN secretary-generals, allowing a far more proactive position than the authors of the UN Charter had intended. The tenure of Dag Hammarskjöld is remembered as one of particularly skillful maneuvering that maximized the influence of the UN and its highest representative. In the UN Congo operations, Hammarskjöld died in the field under circumstances never entirely clarified, thereby becoming a sort of martyr and saint for the UN.

The International Court of Justice (ICJ) is the principal judicial organ of the UN, based in The Hague, Netherlands. The statute of the ICJ is considered an integral part of the UN Charter. Despite its status in the UN, in order to observe the principle of judicial independence, the ICJ acts in its own capacity. It is the direct successor to the Permanent Court of International Justice, which was active in the interwar years. The fifteen judges of the court, no two of whom may be nationals of the same state, are elected independently of one another by the UN Security Council and the General Assembly for tenures of nine years. The judges are to represent the main forms of civilization and the principal legal systems of the world. The ICJ's role is twofold: (1) to settle, in accordance with international law, legal disputes submitted for its review by the states concerned (i.e., contentious cases), and (2) to give advisory opinions on legal questions referred by duly authorized UN organs and specialized agencies. During the period from 1946 to 2007, a total of 111 disputes and 24 requests for advisory opinion have been submitted to the ICJ—humble figures characteristic of the state of international law.

CONCLUSION

It is a truism that the UN is not more than the sum of its members and that it cannot accomplish more than its individual members permit. While this observation aptly explains many of the limitations curtailing the UN ability to act, it fails to realize the added value of the international machinery provided by the UN. The UN, through its international legal status and staff, is more than a permanent or periodically held conference of governments. Its very existence changes the parameters and channels for nation-state action. The discrepancy between the frequently bombastic and deceitful language used in the UN (e.g., recently the talk of the so-called millennium development goals) and humble practical achievements should not obscure its various indispensable attributes: a forum for the global exchange and dissemination of ideas, a context for mutual acquaintance of representatives of the nation-states of the world, and a space for incremental policy making and storage regarding nonsolvable international problems.

United Nations Educational, Scientific and Cultural Organization (UNESCO)

In November 1945, the United Nations Educational, Scientific and Cultural Organization (UNESCO) was created in London as a part of the United Nations (UN) system. Headquartered in Paris, France, and with bureaux in cities including New York and Geneva, UNESCO functions as more than just a branch of the UN, or its cultural arm. Since the reintegration of Singapore in 2007, 193 countries are member states of UNESCO.

UNESCO has national branches in most countries, usually labeled as national commissions for UNESCO, resulting in designations such as the U.S. National Commission for UNESCO, the Commission Nationale Ivoirienne (Ivory Coast) pour l'UNESCO, the Irish National Commission for UNESCO, and the Estonian National Commission for UNESCO. Each national commission has a director, not to be confused with a country's ambassador at UNESCO's offices in Paris.

The actions of UNESCO are countless and varied in terms of global policies: literacy campaigns in developing countries; museum studies; policy making; copublishing thousands of books, journals, and reports; organizing meetings and conferences; and promoting the protection of heritage, endangered languages, and cultures.

UNESCO's programs and branches also focus on natural, social, and human sciences; peace studies; the promotion of human rights; ethics; communication studies; and environmental education. Every year, UNESCO approves the creation

of research centers and research chairs. French, English, Castilian (Spanish), Russian, Arabic, and Chinese are the official languages of UNESCO; some publications and documents are translated in up to fifty languages.

The spirit of UNESCO is the strong belief that culture, education, cultural relations, tolerance, and dialogue are the most efficient ways to prevent conflicts and wars. As the 1946 UNESCO charter states, "Since wars begin in the minds of men; it is in the minds of men that peace must be constructed." The Declaration of the Governments and the Constitution of UNESCO states:

> A peace based exclusively upon political and economic arrangements of governments would not be a peace which would secure the unanimous, lasting, and sincere support of the peoples of the world, and that peace must be founded, if it is not to fail, upon the intellectual and moral solidarity of mankind.

The actions of UNESCO are usually diplomatic or symbolic, and therefore can sometimes be limited. Despite many calls for respect and tolerance, UNESCO could not avoid the Taliban regime destruction of the ancient Buddha statues of Bamiyan, from Afghanistan's pre-Islamic era, in March 2001, even though this historical site was protected on the UNESCO World Heritage List.

UNESCO was under the spotlight following the publication of what is known as the MacBride report in 1980. The report proposed a new global policy for the global media, the New World Information and Communication Order (NWICO). On December 28, 1983, the Reagan administration announced that the United States would withdraw from UNESCO, arguing that the organization was politicized, inefficient, and bureaucratic. The split also stemmed from conflicting perspectives regarding the concept of NWICO brought by the MacBride Commission in its report, *Many Voices, One World: Towards a New, More Just, and More Efficient World Information and Communication Order.* This report was discussed, but it was never adopted by the UNESCO Assembly. After an eighteen-year absence, the United States rejoined UNESCO in 2002; the United Kingdom followed the United States, leaving UNESCO from 1985 to 1997. Singapore did the same from 1985 to 2007.

For educators, academics, and nongovernmental organizations (NGOs), UNESCO is a web of valuable resources, networking, and contacts in international development, cultural relations, and global affairs.

Universal Declaration of Human Rights

According to the United Nations (UN), the 1948 Universal Declaration of Human Rights (i.e., the Declaration) is the foundation of international human rights law—the first universal statement on the basic principles of inalienable human rights and the world's most translated document. It has been influential in other key human rights documents and is part of the International Bill of Human Rights. This bill also includes the International Covenant on Economic, Social, and Cultural Rights and the International Covenant on Civil and Political Rights (adopted in 1966) and its two Optional Protocols.

The document that ultimately became the Declaration was taken up at the UN General Assembly's first session in 1946. The draft Declaration on Fundamental Human Rights and Freedoms was reviewed and then sent to the Economic and Social Council for reference to the Commission on Human Rights, where it would be considered as part of the process of preparing an international bill of rights. The Commission, in early 1947, authorized the formulation of a preliminary draft for the International Bill of Human Rights. Later, the work was taken over by a formal drafting committee.

The Commission on Human Rights included eighteen members and was chaired by Eleanor Roosevelt. Other members included René Cassin (France), who composed the Declaration's first draft; Charles Malik (Lebanon), who served as committee reporter; Peng Chung Chang (China), vice-chairman of the Commission; and John Humphrey (Canada), director of the UN's human rights division, who prepared the Declaration's blueprint.

The Declaration's first draft was proposed in September 1948 with over fifty member states participating in the final drafting. Member states voted a total of fourteen hundred times on various aspects of the text, with many debates. Some Islamic states objected to the articles on equal marriage rights and on the right to change religious beliefs, while several Western countries criticized the inclusion of economic, social, and cultural rights. On December 10, 1948, the General Assembly adopted the Declaration with eight nations abstaining from the vote but none dissenting.

The Declaration's preamble proclaims the document a common standard of achievement for all. It calls for the promotion of respect for these rights and freedoms and the securing of their universal and effective recognition and observance. Article 1 follows and states, "All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood." Under Article 2, everyone is entitled to all the Declaration's rights and freedoms without any distinction.

According to the UN, the Declaration's articles can be divided into three clusters. Articles 3 to 21 constitute the first cluster and outline civil and political rights. The right to life, liberty, and personal security, recognized in Article 3, is followed by political rights and civil liberties, including freedom from slavery, torture, and arbitrary arrest, along with rights to a fair trial, free speech and free movement, and privacy.

The second cluster, Articles 22 to 27, refers to economic, social, and cultural rights. Article 22 is of key importance, granting the right to social security and thus realization of economic, social, and cultural rights indispensable for dignity, and free and full personal development. Five articles elaborate the rights necessary for the enjoyment of the right to social security. These include economic rights related to work, fair remuneration, and leisure; social rights concerning an adequate standard of living for health, well-being, and education; and the right to participate in the community's cultural life.

Finally, Articles 28 to 30 provide a larger protective framework in which all human rights are to be universally enjoyed. Article 28 recognizes the right to a social and international order that enables the realization of human rights and fundamental freedoms. Article 29 acknowledges that, along with rights, human beings have obligations to the community that enable them to develop their individual potential freely and fully. Finally, Article 30 protects the interpretation of the articles from any outside interference contrary to the UN's purposes and principles.

Organizations such as Amnesty International have supported the Declaration but there has also been debate, such as over its compatibility with Islamic law. In 1993, representatives of 171 states adopted the Vienna Declaration and Programme of Action of the World Conference on Human Rights. This stated that human rights education, training, and public information were essential for promoting and achieving stable and harmonious relations among communities and for fostering mutual understanding, tolerance, and peace. Following this, the ten-year period beginning on January 1, 1995, was proclaimed the UN Decade for Human Rights Education, with simultaneous creation of the UN Office of the High Commissioner for Human Rights.

Universalism

Universalism is a philosophical concept that refers to a set of general moral principles. When political scientists use this concept, they usually place it in relation to political institutions such as democracy, human rights, and public policies. The implication is that, in political science, moral principles of universalism come via connections to political institutions and policies.

In political philosophy, universalism is historically connected to the Enlightenment project that was founded on the idea of universal human rights. Universalism's central historical document is the *Declaration of the Rights of Man and of the Citizen,* adopted during the French Revolution (1789–1799). Based on the philosophical idea of natural law, such rights, including those listed in the United Nations Declaration of Human Rights, are in this tradition said to be legitimate and valid independent of local cultural, economic, and social conditions. They are to be applied equally to all individuals regardless of race, ethnicity, religion, gender, nationality, cultural belonging, sexual orientation, or class and status. Such universalism can trace to an argument for a pluralist political liberalism, which has resulted in concepts like universal citizenship, universal suffrage, and universal legal rights. By creating such institutions, political universalists want to guarantee that all interests and groups in a society have the same chance to influence public policy. For example, impartially administrated "free and fair elections" in a representative democracy are thought to guarantee legitimacy for the political system thereby avoiding the type of civil conflicts warned against by Thomas Hobbes.

An alternative argument for universal human rights has been to base them upon the belief in a universal human nature, and the requirement to respect the dignity of the human person by guarding or securing one's basic needs; this is accomplished via an equivalent set of universal human rights. In this *natural law* universalism, human needs can be attributed to the existence of a common physiological human condition, such as the needs for food and physical integrity. Other human

needs thought to be universal are grounded in the liberal idea of a universal human self, such as the need for freely expressing ideas, the need for protection from discrimination, the need to be treated with dignity, and the need for freedom of religion.

UNIVERSALISM, INDIVIDUALISM, AND THE RULE OF LAW

Although historically connected to western liberal societies, universalists claim their theory is global in the sense that it applies to all humans and societies, in all times and places. The theory is anticollectivistic, since it starts and ends with the individual as the sole bearer of the universal rights and also as the sole interpreter on how to use these rights. Universalism also connects to the *rule of law* theory, implying that laws should be universally and impartially applied so that like cases are treated alike. The idea of equality before the law and impartial implementation of public policies is central to the political theory that follows from universalism. Universalism also puts restrictions on the construction of laws, regulations, and public policies that have to be formulated so that they are generally applicable to a large set of cases. A law or a rule directed to only one person is anathema to universalism. The universalistic principles pertain not only to national law but to international law as well.

ALTERNATIVES TO UNIVERSALISM

The importance of universalism can best be described when contrasted to three competing ideas. The first is communitarianism, which states that liberal universalism is metaphysically flawed and built on an unrealistic as well as undesirable idea of humans. Communitarians argue that universalism is too individualistic because humans are constitutively linked to the moral worlds and social goals of the communities they belong to. Without this connection, moral theory is void of any practical implications. A second and related criticism has been launched by multiculturalists, who argue that universalism is in fact a particularistic theory since it is historically connected to the capitalist, male-dominated, Judeo-Christian Western liberal tradition; it is thereby not applicable to societies in other cultures or for groups that have been marginalized. Postmodern theorists launch a third criticism, questioning the validity of the Enlightenment project on epistemological as well as ontological grounds. In this line of thought, the idea of the universal "self," as well as universal truths and rights is questioned in favor of a more relativistic notion of these concepts.

UNIVERSALISM AND PUBLIC POLICY

Universalism has also had an influence upon empirical studies of public policies, especially social policies. In rich Western democracies, such policies have either been universal or they have been targeted to specific groups. Universal policies are implemented by general rules that identify the whole or very large segments of the populations. Examples are universal child allowances, universal health care insurance, and universal pensions. Targeted policies rely instead on laws built on principles of means (or needs) tests, where civil servants must decide if the person seeking assistance belongs to the group that the law stipulates and, if so, how much assistance that person is eligible for. The argument for universal systems is that they are less stigmatizing and do not rely on large bureaucracies for implementation. The argument for targeted systems is that with scarce public resources, targeting increases policy efficiency in helping the poor. It is also argued that targeting makes it possible to single out the "deserving" from the "undeserving" poor. Empirical research has produced a counterintuitive result, namely that universal systems are better in producing redistribution of resources than are targeted. The reason seems to be that in targeted systems, the majority have no stake in the policies and will therefore not support them and accept the tax levels that they carry. Policies only for the poor tend to be poorly financed policies.

Universal Jurisdiction

Universal jurisdiction is one of the most problematic and misapplied concepts in international relations. One of the most notable definitional problems with this concept is its relationship to issues of extraterritoriality. Therefore, it is important to recognize, from the outset, that extraterritorial jurisdiction is not synonymous with universal jurisdiction. Instead, universal jurisdiction is one form of extraterritoriality. This becomes apparent when examining the defining conceptualizations of extraterritorial jurisdiction. In international law, there are five bases or fundamental principles of jurisdiction: (1) territoriality, (2) nationality, (3) passive personality, (4) protection principle, and (5) universality. The first four forms of jurisdiction are predicated on some sort of territorial or national link to the prosecuting state. However, universal jurisdiction lacks such limitations, thus making it the most expansive, but also the least employed of these jurisdictional justifications.

EXTRATERRITORIAL AND NOT UNIVERSAL

Once again, extraterritoriality does not necessitate universality. The only defining characteristic of extraterritoriality is that it entails jurisdiction that somehow extends beyond traditional state boundaries. The most widely accepted form of extraterritorial jurisdiction is based on the principle of territoriality. In these cases, the perpetration of a crime must occur within the territory of the prosecuting state. In other words, authority to prosecute is predicated on the location of the defendant's act. International law allows states to regulate the actions of any individual—regardless of nationality—or punish those individuals within its territorial boundaries. For instance, the United States can prosecute any individual who commits an illegal act, as defined by U.S. legal statute, within its territory.

Another widely accepted principle of extraterritorial jurisdiction is the nationality principle. This principle is predicated on a state's right to regulate or punish the actions of its citizens regardless of the location of the offense. For example, if an American citizen commits a crime, according to U.S. legal statute, in a foreign territory, the U.S. government retains the right to prosecute that person in the individual's domestic judicial system. The fundamental justification for this principle concerns the reciprocal obligations and rights that exist between the state and its citizens. The state must protect its citizens when abroad, but the state can also take punitive action when a citizen's conduct harms the interests of the state.

The third jurisdictional principle is the passive personality principle. This principle allows states to protect their citizens, through punitive action, from foreign nationals regardless of the location of the crime. Therefore, if a state's national is a victim of a crime that violates the state's domestic legal statutes, then the state may proceed with an investigation and prosecution of the perpetrator irrespective of where the crime was committed or who committed the crime.

The fourth form of jurisdiction is the protective principle. According to this principle, the state retains the right to protect its security interests abroad. A state may prosecute individuals, regardless of nationality, for acts that the state deems a threat to national security, political independence, or even territorial integrity.

Although all of these forms of jurisdiction are extraterritorial in nature, none of them espouses a right to prosecute for reasons beyond a territorial or national link to the prosecuting state. It is only with the inclusion of universal jurisdiction that extraterritorial principles extend beyond these traditional territorial or nationalistic links to a rationale—one that embodies the idea of *hostis humanis generis* (enemies of humankind).

UNIVERSAL JURISDICTION

Universal jurisdiction simply translates to instances in which jurisdiction is universal in nature—regardless of where the crime was committed, by whom the crime was committed, or whom the victim(s) might be. As defined by Kenneth Randall in the *Texas Law Review* (1988):

This principle provides every state with jurisdiction over a limited category of offenses generally recognized as of universal concern, regardless of the situs of the offense and the nationalities of the offender and offended. While the other jurisdictional bases demand direct connections between the prosecuting state and the offense, the universality principle assumes that every state has an interest in exercising jurisdiction to combat egregious offenses that states universally have condemned.

Unlike the other jurisdictional principles, universality does not require any relation to the prosecuting state, only that the crimes committed are considered *hostis humanis generis*. Thus, the nature of prosecution is based solely on the crime itself, and states are entitled, possibly even obligated, to the initiation of legal proceedings regardless of the perpetrators' or victims' nationality, or the location or origin of the crime.

The crimes that may result in the initiation of universal jurisdiction are the most heinous and abhorrent within international law and, therefore, remain limited in number. The most widely accepted list of crimes that may trigger universal jurisdiction includes: piracy, slavery, war crimes, crimes against humanity, genocide, and apartheid. Other crimes often included in this list include torture and crimes against peace.

In regards to the initiation of universal jurisdiction proceedings, the primary actor in applying this principle is the state, via its national legal infrastructure. International tribunals, whether they are ad hoc in nature or permanent, tend not to fulfill the basic requirements of universality. Ad hoc tribunals such as the International Criminal Tribunal for the Former Yugoslavia (ICTY) and the International Criminal Tribunal for Rwanda (ICTR) are predicated on the notion of universality but remain limited in their jurisdictional capacity because they apply to a particular territory. Therefore, these courts may exercise their jurisdiction over universally defined crimes, but the establishing states or institution—the United Nations (UN) Security Council in the case of the ICTY and ICTR—prescribe a territory in which the offense must have occurred. Therefore, there is a territorial limitation to the legal proceedings.

In the case of the recently formed permanent International Criminal Court (ICC), only the UN Security Council can grant the court universal jurisdiction (e.g., the initiation of an investigation in Darfur, Sudan). In all other cases, referred by the prosecutor or state party, certain territorial or nationality preconditions must be met prior to the court exercising its jurisdiction. These preconditions establish the jurisdiction of the court as extraterritorial, not universal.

CASES

One of the most famous cases invoking the principle of universal jurisdiction was the Adolf Eichmann case—although it remains debatable whether this case was predicated on pure universal jurisdiction. To date, the number of universal jurisdiction cases remains limited, but the numbers are growing. Currently, the Canadian government is prosecuting a Rwandan national, Desire Munyaneza, for crimes committed during the 1994 Rwandan genocide. Switzerland and France

have also prosecuted individuals for crimes committed during the Rwanda genocide, while Denmark, Germany, and the Netherlands have prosecuted individuals for crimes committed during the Yugoslavia conflict.

One of the most prominent cases of universal jurisdiction is Belgium's use of its universal jurisdiction law to prosecute four Rwandan citizens for war crimes committed in the Butare region of Rwanda. Over an eight-week period in the spring of 2001, a Belgian national court sat in judgment over Alphonse Higaniro, Vincent Ntezimana, Sister Gertrude (Consolata Mukangano), and Sister Maria Kisito (Julienne Mukabutera) for crimes committed during the Rwanda genocide. None of the accused were Belgian citizens, none of the victims were Belgian citizens, and none of the crimes were committed on Belgian territory. This truly was a case of universal, not simply extraterritorial, jurisdiction.

Uno Kozo

Uno Kozo (1899–1977) was the most influential Marxist thinker in Japan in the twentieth century. Born into a mercantile family,

Uno received a degree in economics from the Tokyo Imperial University and joined the Ohara Institute for the Study of Social Problems. During this period, Hajime Kawakami was publishing the journal *Social Problems Study,* which included translations of German philosopher Karl Marx's books. With his introduction to Marxism, Kawakami, who is considered the founder of Marxist economics in Japan, attracted young intellectuals such as Tamizo Kushida, Hyoe Ouchi, Itsuro Sakisaka, and Uno Kozo. Many of these scholars became major figures in the Communist or Socialist Parties, but Uno remained politically uncommitted.

From 1922 to 1924, Uno studied in Europe, primarily in Berlin. Upon his return to Japan, he joined the faculty of Tohoku, one of the seven imperial universities, and then moved to Sendai where he remained for fourteen years. His life's work thereafter was the study of the world capitalist development from a Marxian perspective, drawing a careful distinction between theory and policy. In 1936, Uno published *The Theory of Economic Policy,* in which he outlined his idea that the historical clash of class interests influenced the type of economic policy pursued by a country at any one time. Mercantilism, liberalism, and imperialism were three stages of capitalist development. These three stages, in turn, represented three types of capital: merchant, industrial, and venture capital. While he utilized Marxian terms in his work, Uno continued to dissociate himself from active involvement in the Communist and Socialist Parties. Unlike the Communists, he did not accept that the Japanese economy was semifeudal, and unlike the Socialists he did not hold that it was advanced.

In 1938, Uno's career came to a halt when he was arrested along with others associated with the dissident Marxist Rono-ha School, which had broken away from the Japanese Communist Party in 1927. After two years in jail, Uno was acquitted on appeal but did not return to Tohoku. In 1944, he moved to the Mitsubishi Institute of Economics and after World War II (1939–1945) he edited the institute's journal, *Economic Affairs.* Later he became professor at the University of Tokyo's Institute of Social Science and, from 1949, director of the institute. Although by this time he had broken from orthodox Marxism, Uno returned to the study of Marxian economics, seeking to systematize what he called a pure theory of capitalism. His later books included *The Theory of Value* (1950), *Studies in the Theory of Value* (1952), and his revision of Marx's *Das Kapital* entitled *Principles of Political Economy* (1964). In his *Theory of Economic Policy* (1954), Uno distinguished three stages of Marxist study: (1) the study of the basic principles of capitalism as it developed in Britain, the United States, and Western Europe; (2) the three varieties of capitalism—mercantile capital, industrial capital, and venture capital associated with imperialism; and (3) empirical analysis of specific current economic problems. Uno's three-step approach differed from traditional ones because it was modified to suit Japan's peculiar growth trajectory.

Uno retired from the University of Tokyo in 1958 to become a sociology professor at Hosei University. Many of Uno's students, such as Ouchi Tsutomo and Hiroshi Iwata,

have made substantial contributions to economic theory and the theory of values.

Upper Chamber

In 2007, roughly 40 percent of the world's national-legislature governments had two chambers, otherwise known as a bicameral assembly. The other 60 percent consist of only one chamber, a unicameral assembly. In these bicameral representative institutions, there is a lower chamber, considered the first chamber, and an upper chamber, considered the second chamber. For example, in the United States, the lower chamber is the House of Representatives and the upper chamber is the Senate; in the United Kingdom, the lower is the House of Commons and the upper is the House of Lords; in India, there is the House of the People and the Council of States; and Japan has the House of Representatives and the House of Councillors.

Bicameralism is quite common in countries with larger populations and that have had longer, more established histories of Western-style democratic institutions (e.g., the United States, Canada, India, and Germany), whereas unicameralism more frequently occurs in newer nations with small populations, that have less established experiences of democratic governance (e.g., New Zealand, Denmark, Hungary, Nigeria, and Iran). Interestingly, after the collapse of the Soviet Union, a number of the incipient democracies of Eastern and East Central Europe opted for upper chambers in their legislatures (e.g., the Czech Republic, Poland, and Croatia).

In bicameral legislatures, members of the upper chamber usually serve longer terms than those in the lower chamber. To ensure that the upper chamber is not simply a mirror reflection of the lower chamber, methods of member selection between the two chambers commonly differ. Members of the lower chamber take their seats via direct election by the people, and members of the upper chamber are selected by one or more of the following four procedures: direct election, indirect election by regional governments, appointment by the government, and heredity.

The logic behind having an upper chamber, in addition to the first chamber, traces to a state's fundamental decision; differing perspectives on democracy and the best way to achieve democratic goals usually drive this decision. At the heart of this are the two primary democratic considerations of majoritarianism versus protection of minority rights with the accompanying checks and balances. Questions surround whether a democratic system should be predicated on the strong advancement of majority will, or whether there should be empowered protections of the rights and wants of those not in the majority to help ensure tyranny—and unwise decision making—does not occur. Thus, unicameralism advances the majoritarian view of democracy: a second chamber should not hinder a legislative assembly directly elected by the people. With just one chamber, there is no potential hampering or stymieing of the people's will as it is manifested in their representatives' collective decisions.

Proponents of bicameral assembly structures disagree with this rationale. They contend that having an upper chamber provides an important democratic safeguard, as it serves as an effective check and balance inside the legislature. An abiding fear of a latently repressive majority in the lower "people's house" trampling on the minority's rights drives these arguments. The argument is also made that the upper chamber serves as a moderating force with thoughtful deliberation at a premium, and a longer-term, broader, and calmer view on the nation's welfare is given a place in the legislature, away from the more immediate and directly felt popular passions evinced in the lower chamber.

Having an upper chamber in a federal system ensures influence for constituent provincial units of the nation in the legislative process. This consideration was observed in the decision of the Framers of the U.S. Constitution to have the Senate be composed of two senators from each state, no matter the size of the state's population. This worked to assuage the concerns of the small-population states that feared their interests in the lower chamber—where representation is based directly on population—would be inherently overwhelmed by the interests of the large-population states.

There are two general models of bicameralism in the world today: strong and weak. In the strong model, the upper chamber has equal strength and authority with the lower chamber in the legislative process. A prime example of this is how the U.S. Senate plays an important and active part in the formation, development, and passage or thwarting of legislation. In weak bicameralism, the lower chamber clearly dominates lawmaking and the upper chamber plays a subordinate role with a constrained ability to set, shape, or affect the national legislative agenda. The House of Lords in the United Kingdom is a leading example of this form. Weak bicameralism is more frequently seen in the world than is strong bicameralism.

Urban Economic Development

Urban economic development denotes either a local government policy field or the level of economic activity in the city. As a public policy field, it is an important component of local government activity in developed—and increasingly also in developing—countries. The main purpose of an urban economic development policy is to build the conditions for local economic growth (e.g., to improve the business climate or increase productivity and competitiveness); to create jobs; and to adapt the urban economy to the regional, national, and global economic dynamics. Local governments get involved in this policy field for a variety of reasons, usually one or more of the following: the tax base of the local government is dependent on the city economic activity; the local government is under pressure from citizens and private enterprises to protect jobs; or the local government is forced to create more attractive conditions for private investors, especially when the city is confronted with the disinvestment strategy of private corporations, be they national or multinational.

The involvement of local governments in the urban economy until World War II (1939–1945) was rather limited due to the prevailing political ideology, which was not in favor of public aid to private enterprises. However, after the war the economic recovery forced local governments to engage in economic development initiatives. In addition, the recessions that cyclically affected the developed economies during the last century also favored the adoption of urban policy measures in support of the local economy. In this process, local governments expanded their portfolio of policy measures and less traditional policy tools were introduced and implemented in the decades following the end of the war. These measures varied from country to country and between cities in the same country. Therefore, the contemporary field of urban economic development policy encompasses different types of policy measures. Some of them have worked well in certain places and periods, while others have not. Policy measures in this field generally fall into one of four main groups: land and infrastructures, tax and financial aid, institutional capacity building, and broad external conditions.

The first group of policy tools for the promotion of urban economic development is associated with the provision of serviced urban land and other infrastructures (e.g., enterprise parks, business incubators, or nurseries) at a reasonable price or rent for the location and relocation of economic activities. It also includes the running of public transport networks to serve the new locations. Traditionally, these measures were implemented to support commercial and industrial activities and to attract new private investors from outside the city, but increasingly they have also been used to reinforce other activities, including tourism, leisure, cultural activities, housing, and urban renewal since these are also key dimensions in an urban competitive economy.

The second group includes tax and financial incentives and has been widely used in urban economic development policies, especially for those activities not attractive for private capital. This form of support includes, for example, tax reductions or tax exemptions during a certain period, interest rate reduction, loan guarantees, and seed capital for talented entrepreneurs that show potential. Tax incentives and financial subsidies are frequently provided according to the number of jobs created and usually give preference to private investments in low-income and distressed neighborhoods or for those that meet certain environmental criteria.

A third category of urban economic development measures normally intends to build local institutional capacity and social capital. This includes, for example, creating special agencies to work closely with all those benefiting from public support, giving them technical assistance in new projects and strategic guidance, or the implementation of partnerships among different levels of government and between public and private entities. Part of these efforts to create institutional capacity in the local economy also include participation in risk capital funds and other financial tools to stimulate investment in the local economy, and the creation of public municipal enterprises to invest in activities important for the local economy. Market research and marketing campaigns, support for the participation in fairs and exhibitions, and professional training for the development of the workforce are other examples of these types of policy measures.

More often than not, a fourth group of indirect measures is associated with less obvious issues that are also vital for urban economic success, such as social services for families, health care, education, security, and public transport. Finally, a local political leadership committed to economic development has also proved to be a key factor for urban economic development, encouraging other public and private stakeholders to become involved.

Urban Housing

Housing has always been a central issue for human welfare, in both rural and urban societies. Nonetheless, for many centuries it was marginally an issue for planners who were more focused on urban infrastructure and public buildings. The situation changed in the second half of the nineteenth century, in part related to the expansion of urban areas as a consequence of industrialization, and the concomitant public conscience over poor housing conditions. This was also a period in which urban housing became an issue for utopian, socialist reformers, philanthropists and for government too, namely through the production of housing for families with limited income. During the entire twentieth century, with the world moving to a predominately urban society, urban housing became a central issue in urban policies; with the need to adapt to the consequences of climate change, it will certainly be even more so in the future.

Some of the pioneer initiatives responsible for current urban housing and public housing policies include efforts of pioneers such as Jean-Baptiste Godin in 1859 with the Familistère de Guise in France, a model of family apartments in communitarian blocks; the influence of the writings of Charles Fourier and his followers in North America, who aimed to combine city and country and new forms of housing; Ebenezer Howard and the single family home, in the 1898 garden city model; and the urban housing for the working class provided by industrialist philanthropists to their workers, on both sides of the Atlantic. After these pioneering experiences, urban housing was built according to different house models. The French hotel, the London row house, the American apartment buildings, the family home of the garden cities, and the apartment block of the Athens Charter are just some of the numerous examples of urban house models in the last century and a half.

During the last two decades of the twentieth century, new approaches reflected housing characteristics of previous periods, under the name of neotraditional architecture, while at the same time, three other major developments are now likely to lead to a different type of future urban housing. These include, first, the development of an inclusive urban housing design more focused on persons with disabilities and the aging urban population, as well as other groups of users with special needs, including the special forms of accommodation for nomads, gypsies and travellers. A second feature entails the development of the digital or intelligent house—a rupture with traditional forms of housing due to information and communication technologies; this includes automation techniques for the security and comfort of the residents (e.g., control of light, climate, doors, windows, multimedia systems, etc.).

A third development relates to the concept of sustainable urban housing and green or bioclimatic architecture, which better uses natural conditions, as well as new materials and renewable energy sources—in new buildings and in-house renovation—and the application of new technologies to reduce energy and water consumption. In this context, the concept of a net-zero carbon home, a home that returns the same amount of power to the general energy network than the power it uses, over a period of time, is now central in any approach to urban housing. In practice, however, the concept of a net-zero carbon home has been used until now with a more pragmatic meaning to produce homes that will not contribute to global warming more than traditional homes, by having, for example, solar panels or wind turbines that produce electricity, among other features. In this sense, it is a label that means essentially reduction of carbon emissions. From the point of view of those who argue that there is enough empirical evidence of climate change and that it is caused by human action, the concept of a net-zero carbon home may prove to be an important contribution for the reduction of global warming, since more than a quarter of carbon emissions come from households. Therefore, in the context of the expected post-Kyoto vision on climate change, proposals in favor of a carbon-positive, digital, and all-inclusive home will probably find enough public and market support to become the twenty-first–century urban housing paradigm.

Urban Inequality and Poverty

Urban inequality and poverty have been subjects of political inquiry since industrialized societies became primarily urban, and began to exhibit many of the contemporary social and

political dynamics currently seen in the Western world. Ever since the urbanization of the world began in the 1800s, cities have been the centers of political action and protest, often resulting in major social movements. In industrialized countries, contemporary manifestations of these urban political processes were evident in periodic urban unrest in the United States during the late 1960s and early 1990s, as well as more recently in Europe.

Scholarly analysis of urban riots suggests common origins for riots rooted in the politics of inequality and poverty. The 1965 Los Angeles riots came when the fight for civil rights was at its height in the United States, and this incident was seen largely as part of a deep racial divide within the country between blacks and whites. The urban manifestation of this divide highlighted the existence of two societies, separate but unequal and coexisting in close proximity in urban areas across the country. These riots led to a period of federal policy attention to urban inequality focused on poor neighborhoods.

Twenty-seven years later, the Los Angeles riots of 1992 revealed not only the ongoing challenges of these urban inequality and poverty dynamics, but also how the ethnic and social dynamics of cities had shifted. These riots were the result of deep socioeconomic divisions within the metropolitan region in which African Americans were one of several ethnic and racial minorities with vastly different access to resources such as public schools, adequate police protection, and a local job market. The frustration stemming from this unequal access led to unrest exhibiting a distinctly multiethnic character, however, in which Latinos and whites joined African Americans in their protests, often targeting Korean immigrant businesses. Such diversity marked a divergence from 1965, which was primarily seen as an African American and white event.

Racial and ethnic urban riots, however, are not limited to the particularities of American history, and similar dynamics of unequal access to urban resources by ethnic and racial minorities could be seen in France in the early 2000s. The comprehension of why cities are hotbeds of political unrest requires an understanding of the social and economic dynamics inherent to urbanization.

Much of the debate on urban inequality and poverty has centered on the poverty of places as well as people. A racial analysis of poverty in the United States shows high rates of residential segregation for minorities, which has contributed greatly to residential instability, unemployment, and low home equity. Urban populations have been and continue to be segregated along a race-class axis, increasingly creating spatially isolated poverty and unemployment amidst generally prosperous cities. This segregation was the result of officially sanctioned "redlining" practices as well as social dynamics, both of which have played an important role in the creation of what some see as a permanent "underclass." This association between poor neighborhoods and socioeconomic isolation point toward the important intersection of race and place in the understanding of urban inequality and poverty, and the public policies designed to alleviate it that have centered on both people and places.

Residential segregation does more than simply arrange the poor into neighborhoods, however. Studies of the so-called underclass have long argued that the long-term unemployment characteristics of many poor neighborhoods can have effects well beyond the labor market; these can be socially and psychologically debilitating.

The alleviation of urban inequality has been a difficult task because of the spatial nature of urban poverty. The historic pathway out of poverty in industrialized countries has been through the labor market, yet residents of poor neighborhoods face a particular difficulty in accessing jobs. This is due to the persistence of what is known as a spatial mismatch between poor neighborhoods and the growing job market. Since the late 1960s, the spatial mismatch hypothesis has focused on long-term ghetto unemployment and the suburbanizing job market, arguing that residential segregation is a fundamental limitation in providing opportunities to the urban poor. Thus, as long as cities remain residentially segregated, it is likely that poverty and inequality—and their political manifestation in urban unrest—will remain one of the defining characteristics of cities in the industrialized world.

Urbanization

Urbanization is the process of transition from a rural to a more urban society in which a large proportion of the total population lives in cities. This means that urbanization is a process associated with the expansion of the built-up area and also related to the development of a new way of life characterized by social habits different from the rural world. It also goes along with the growth of the secondary and tertiary sectors in the economy.

Whatever the sense—physical or sociological—the definition of what constitutes an urban area differs from country to country, and there is no agreement about a quantitative measure to distinguish an urban area from a rural one. According

to the United Nations (UN), the criteria used by its member states to define what is urban can include the population size and population density; the extension and density of the built-up area; the percentage of nonagricultural economic activities; the administrative status; the existence of certain urban infrastructures, public services, or certain social amenities; or a combination of some of these criteria, which makes comparison between countries a difficult task.

The first human settlements that were densely populated and structured were established several thousand years ago. However, the turning point in the population growth and the respective concentration in urban areas worldwide occurred during the nineteenth century as a result of the profound changes introduced by the Industrial Revolution. In the beginning of the nineteenth century, estimates suggest that only 5 percent of the population lived in cities; this percentage jumped to 50 percent by the middle of the twentieth century in the more developed countries on both sides of the Atlantic. In the less developed countries, a similar trend toward urbanization of the population also took place, although at a slower pace.

The UN world urbanization prospects point to a huge increase in the urbanization of the world population in the near future. From a past in which the urban population grew from 13 percent in 1900 (220 million urban dwellers) to 29 percent in 1950 (732 million) and to 49 percent in 2005 (3.2 billion), the UN forecasts the world can soon expect an increase in the urban population up to 60 percent (4.9 billion) in 2030 and 66 percent (6 billion)—or two-thirds of the total population—in 2050. In 2008, for the first time, urban population represented more than half of the world's population, and this will probably mean the beginning of a new period, which the UN refers to as the *urban millennium*. However, the urbanization level, or the percentage of the total population that live in cities, and the urbanization growth rate vary across the world, reflecting the different development levels of each country. Until recently, the most urbanized countries were in Europe and in North and South America, but, according to the UN, in 2005 it was China and India, followed by the United States, that had the largest numbers of urban dwellers. In the next decades this trend will continue and, according to the UN forecasts, the urbanization of the population will take place mainly in Asia and Africa. Higher natural demographic growth and migration from rural to urban areas will account for 93 percent of this urban growth.

Another trend is the increase in the number of megacities, which are metropolitan areas with ten million or more inhabitants, of which Tokyo, Japan; New York City, United States; Seoul, South Korea; Mexico City, Mexico; Sao Paulo, Brazil; and Mumbai, India, are the six largest metropolises. However, while most of these are located in industrialized countries, according to the UN, the pattern is now changing and the new megacities are located in emerging and less developed countries.

This high concentration of the urban population creates huge social and environmental problems, well identified by national governments and international organizations. The United Nations Millennium Declaration recognized the present tragic situation of around one billion urban poor that live in slums, a problem that, if not properly addressed, is expected to affect three billion persons by 2050. This situation can be further worsened by the impact of climate change on water supplies, air pollution, and natural disasters.

Urban Land Use and Town Planning

Town planning, or urban land use, is concerned with the design and development of human settlements. It is a human activity with origins tracing back to antiquity, in Mesopotamia, Greece, Rome, and on up to the Renaissance and the baroque period in Europe. During these periods, major human settlements in these places were planned according to specific principles, using building standards that took into consideration wind direction, sun exposure, soil type, availability and quality of water, and other factors that affect life in urban areas.

ORIGINS OF CONTEMPORARY TOWN PLANNING

The principles and practices of contemporary town planning or urban land use planning, however, began as a reaction to the effects of industrialization and urbanization in the nineteenth century in Europe and North America. As a profession and as a discipline, it has existed for little more than a century, first in Europe where a university degree in civic design was introduced at the University of Liverpool in 1908, and was sponsored by William Lever, the creator of Port Sunlight, and later in North America, with visionaries such as Frederick Law Olmsted Jr. and all those associated with what later became known as the city beautiful movement.

Principles and social experiments carried out in the nineteenth and the early twentieth century were important for the constitution of this new discipline. Among these were the

social utopian ideas and experiments, such as those proposed by Robert Owen in New Lanark at the end of the eighteenth century and New Harmony in the early nineteenth century; Charles Fourier at Falansterium in 1832 and the subsequent initiatives in the United States, such as the suburbs Llewellyn Park and Riverside; Jean-Baptiste Godin at Familistère de Guise in 1859; Étienne Cabet at Icarie in 1840, among many others. At the end of the nineteenth century, geographer and anarchist Peter Kropotkin's ideas—including decentralized organization of production and social life, and the combination of industry and agriculture—influenced, among others, Ebenezer Howard. Howard later adopted the special model in his proposal of the garden city; this became the first urban model to be adopted worldwide in the rising profession of town planning during the first three decades of the twentieth century.

The first constitutive decades of town planning, as a profession and as a discipline, were the cities planned and built in the second half of the nineteenth century by philanthropist industrialists. This included Jean Menier (Noisiel-sur-Marne) in France, and Titus Salt (Saltaire), George Cadbury (Bourneville), and William Lever (Port Sunlight) in the United Kingdom. The works of authors such as Camillo Sitte were also influential in these early years.

Several urban models emerged during the first century of contemporary town planning. The Beaux-Arts movement—associated with the École des Beaux-Arts of Paris and teaching based on the imitation of order, dignity, and harmony—argued that urban renewal together with other policies would make it possible to control the problems associated with urban population growth: beauty would influence social behavior. The Beaux-Arts movement was the main inspiration for town planning at the end of nineteenth century and in the early years of the twentieth century. Its importance also to its influence on architects and landscape architects on the other side of the Atlantic (e.g., Daniel H. Burnham, Charles Robinson, Harlan Kelsey, John Nolen, and Frederick Law Olmsted Jr.) and on the planning movement known as city beautiful. Howard's garden city—first applied by Raymond Unwin and Barry Parker in Letchworth in 1903, and by Louis de Soissons in Welwyn in 1920—was the next influential planning model after the Beaux-Arts movement and was the one that had, for the first time, a real worldwide influence and expression.

THE CIAM MOVEMENT AND RESPONSES

Nonetheless, beauty was about to be substituted by efficiency as the key driver in the town planning profession. A group of architects, including Le Corbusier, met in 1928 in Sarraz, Switzerland, marking the start of the Congrès Internationaux d'Architecture Moderne, or CAIM movement, which envisioned that the city should be efficient as a machine. The principles for CAIM were laid down in the Charter of Athens, adopted in the fourth CIAM session, in 1933. The charter of principles became subsequently the reference for town planning in the twentieth century. Differences inside CIAM, which was never a monolithic bloc, between the old

generation and the younger members, eventually led to its end in 1959. Criticism also emerged from outside the movement, from Jane Jacobs in her book *The Rise and Death of American Cities,* among other critics.

These reactions to the CIAM discourse on urbanism led to the development of alternative approaches. The new urbanism movement, in particular, emerged as a paradigm of urban planning that reveals more sensitivity to the environment, green corridors, and urban biodiversity. New urbanism gives priority to pedestrians and places greater importance on mixed-use neighborhoods, the quality of public spaces, and public participation in the planning process. Cultural activities, seen now as the driver of the urban economy, are also emphasized.

CONCLUSION

The history of contemporary urban land use planning contains a narrative of continuities as well as ruptures in the idea of what constitutes the good community and how to achieve it. Contemporary town planning started with proposals that were essentially a reaction against the nineteenth-century city. These proposals, claiming to move people to new planned areas with strong connections to the rural environment, were a vision later substituted by modernism. New approaches in turn replaced modernism, aiming to avoid or to mitigate urban sprawl and environmental degradation of natural areas.

Urban Migration

Largely the result of migration from rural areas, urban growth can place tremendous burdens on urban institutions of governance, such as municipal authorities and community organizations, and also on the private sector. Rapid in-migration of new residents can significantly shift local political dynamics by creating new voting blocs, ethnic and cultural affinities, and new labor markets. These dynamics have played a significant role in shaping the politics and settlement patterns of North American cities after World War II (1939–1945), and currently shape the urban politics and settlement patterns of many cities in developing countries.

In the United States, the great migration north by agricultural workers during the 1930s and 1940s was prompted as industrialists in northern Midwest cities applied Fordist manufacturing principles in the car, steel, and other industries. This led to high rates of urban growth in cities like Chicago, Detroit, and Milwaukee. The migration fueling this growth then spawned the creation of new neighborhoods and settlements in these cities; these subsequently became segregated by race, ethnicity, and other forms of social status, with racial and ethnic tensions emerging as early as the 1950s. During the 1960s, however, North Americans began migrating out of central cities to suburban areas, drawn by affordable suburban housing. They also sought to escape issues such as urban fiscal crises; the redlining of poor, minority, and immigrant urban communities; and a range of other factors pushing for the development of what have become primarily suburban cities.

As suburbanization has become the norm, city centers have taken on an increasingly immigrant character, prompting scholars to focus on how ethnic and immigrant enclaves have come to characterize many North American cities. These immigrant sociophysical spaces have become cemented within host-country hierarchies and have played an important role in sustaining the economic viability of North American central cities. The important economic role that immigrants and immigrant neighborhoods have historically played is that of urban intermediaries for economies and communities, or *ethnic economies*. Scholars have defined such *ethnic enclaves* as important for understanding how immigrants build and retain enduring social ties within the majority culture. While such approaches have historically viewed immigrant neighborhoods as relatively insulated enclaves, there is growing anecdotal evidence that ethnic and immigrant neighborhoods are increasingly nodes of attraction. The existence of well-advertised Koreatowns across the United States, Little Havana in Miami, and Filipinotown in Los Angeles, for example, suggests that immigrant neighborhoods serve quite different functions in a larger urban mosaic of neighborhoods, and identities and created networks have both racial and spatial characteristics. These immigrant neighborhoods have attained an important role in urban government, and are now viewed as markers of cities' attractive forces to rural workers as well as immigrants.

The transition from a primarily agrarian to an urban society, while largely complete in North America, is only just beginning in many developing countries. Comparable processes of industrialization and urban migration are currently underway in many fast-developing countries where job availability in growing urban agglomerations has attracted large numbers of agricultural workers. The appearance of these rural populations in cities reflects more than simply population growth. Increasing population concentration requires the development of expanded sociophysical infrastructure to manage the inevitable conflicts and problems associated with higher density living. Since urban governments in developing countries have rarely been able to keep pace with these new demands for urban services, innovative community-level institutions have become important nonstate actors in governance, providing basic urban goods ranging from clean water supplies to housing. These institutions have taken on important intermediary roles in urban governance and have been forceful advocates for the poor.

This urban transition in developing countries describes societies that have rapidly changed from rural to urban forms of social and physical organization in relatively short time periods that are generally more compressed than those for North America and other industrialized countries. Some suggest that if they follow a similar trajectory to North American cities, their initial growth due to industrialization and consequent in-migration from agrarian regions will lead to residentially segregated neighborhoods, the loss of the industrial job base, and eventually the creation of long-term urban poverty and inequality. For these reasons, progressive urban policy and planning is a growing concern throughout the fast-growing urban centers in the developing world.

Utilitarianism

Utilitarianism is the philosophical theory that the morally right act or policy is the one that promotes the greatest happiness,

or well-being, counting equally the happiness and unhappiness of each person. In the context of utilitarianism, happiness and well-being may also be synonymous with *utility.*

In its early stages in the late eighteenth and nineteenth centuries, utilitarianism was a radical and progressive approach to social and political thinking. The idea of maximizing well-being was applied to social problems such as ignorance, sickness, and poverty to produce criticisms of the status quo. Consequently, the great British utilitarians, such as Jeremy Bentham (1748–1832) and John Stuart Mill (1806–1873), argued for reforms in the law, government, education, public health provision, and social welfare. Where the majority is living in poor conditions, utilitarianism can both describe what is wrong and defend proposals for change.

At its core, utilitarianism contains three elements: (1) an account of well-being, happiness, utility, or welfare; (2) a demand that well-being should be maximized; and (3) a requirement of equality, specifically that in the maximizing process, each individual's happiness or well-being should count for one and no more than one. Utilitarianism is therefore a forward-looking philosophy, since it focuses firmly on the consequences of individual acts or of actions undertaken within a particular system of rules or institutions. Act utilitarians claim that morally right actions are those that produce more utility than any other available option. Rule utilitarians, by contrast, think that utility will be maximized in the long run not by evaluating individual acts, but by establishing and upholding a secure set of rules, rights, or institutions and requiring individuals to recognize them.

DEFINING WELL-BEING

Utilitarians initially defended a view of well-being as pleasure and the absence of pain. In Bentham's version, the aim is to produce the highest net amount of pleasure, where no distinction is made between types or sources of pleasure. "Prejudice apart," says Bentham in Book 3 of *Rationale of Reward,* "the game of push-pin is of equal value with the arts and sciences of music and poetry" (chap. 1). John Stuart Mill suggests a different idea: some pleasures are qualitatively superior to others and it is best to maximize these higher pleasures over their inferior counterparts. Mill believes that it is better to be Socrates dissatisfied than a fool satisfied, and that which pleasures are higher can be determined by asking a qualified judge (i.e., someone who has experienced both sorts of pleasure).

Given technical problems with measuring mental states and normative problems with the claim that pleasure is identical to the human good, a different account of well-being focuses not on the "state of our minds" but the "state of the world." These are not subjective notions of well-being such as pleasurable or worthwhile mental states, but objective views of well-being, most importantly, the satisfaction of preferences. This view has its own problems, including that (1) people can get what they want without becoming happy, and (2) some preferences—for example, racist preferences—are themselves morally objectionable and so should not be satisfied at all.

MAXIMIZING WELL-BEING

Given some account of well-being, the distinctiveness of utilitarianism lies in its demand to maximize well-being, taking each individual into account equally. It is, therefore, a maximizing form of consequentialism (i.e., the view that consequences alone determine moral rightness). Utilitarianism can apply to a range of practical issues facing individuals and governments. On the question of political obligation, for instance, in *A Fragment on Government,* Bentham holds that subjects should obey "so long as the probable mischiefs of obedience are less than the probable mischiefs of resistance" (56).

Utilitarianism continues to be an influential approach to questions of economic justice, even though utilitarians disagree among themselves. Regarding how income and wealth should be distributed, utilitarians consider the evidence linking various arrangements with different levels of happiness. First, some claim that unrestricted markets are the most efficient way to generate the most happiness for everyone by increasing wealth. Free market efficiency, they argue, leads to productivity, and thus to happiness. On this view, redistribution to the poor is an unjustifiable limit on promoting utility; therefore, the just distribution of income and wealth results from unfettered market exchanges.

Second, defenders of an opposing view argue that money has a "diminishing marginal utility"; that is, a person gets less utility from each additional dollar. They argue that an extra dollar does the most good for the person who has the least. A homeless person benefits hugely from that dollar, but giving or taking a dollar from a billionaire would probably produce little or no effect on the billionaire. Consequently, the way to maximize utility is to redistribute income so that the overall pattern of distribution is roughly equal. Others support a third option: a market economy with a redistributive welfare state. Perhaps this option is likely to produce the most overall happiness, since it recognizes the efficiency and productivity gains of market-generated outcomes while allowing for redistribution that increases overall happiness by providing public goods that markets on their own would fail to generate.

OBJECTIONS TO UTILITARIANISM

Of the many objections to utilitarianism, three stand out. First, it measures the wrong sort of thing; as Amartya Sen has argued, focusing on utility or happiness fails to capture the arguably more basic information about a people's capabilities to function, including receiving adequate nourishment, living in secure surroundings, and developing their skills and talents.

The next two objections identify the flaw in the core utilitarian requirement to maximize utility. To begin with, utilitarianism is too demanding because it asks more than can fairly be required. Utilitarians recommend that happiness should be maximized, but this suggests that people should be spending all their time promoting the greatest happiness, since whatever good they do, it is likely that they can always do more. Next, utilitarianism is too permissive, since it allows individuals to

be treated unjustly, used as mere means to the production of the greatest happiness. It permits treatment of individuals that seems obviously unfair, unjust, or deeply wrong. For example, it is possible that overall happiness, counting everyone for one and no one for more than one, could be maintained by enslaving some identifiable minority of the population. The suffering of these slaves would be more than compensated by the utility gains for the majority of free citizens. According to this scenario, utilitarianism requires slavery. But, so the objection says and as John Rawls points out in *Justice as Fairness,* most people would agree with Abraham Lincoln's claim that "if slavery is not wrong, nothing is wrong" (29).

Utopias and Politics

A utopia describes a positive, but unrealizable, state. In this sense, all positive ideals or images of society that cannot be realized in practice are utopian. In a more restricted and technical sense, utopia designates a literary and political genre devoted to the construction of models of the perfect society.

FORMS OF UTOPIA

The term *utopia* derives from the homonymous book by Thomas More, which appeared in 1516. More coined this neologism to name the ideal society that he depicts in the book, probably consciously playing on the ambivalence of the term. Commonly used by European Renaissance intellectuals, *u-topia* derives from ancient Greek, and it can be a contraction of both *eu-topos* (the good place) and *ou-topos* (the no place). There is still dispute about the right interpretation, but More's *Utopia* allows both meanings: the best place one can possibly conceive is also, at the same time, the "no place" by definition. Irony pervades the entire work, emerging particularly in the names More uses: Amaurot is the city that cannot be seen, and its river is called Anyder, the river without water, and so on. The fact that the meaning of utopia is suspended from the very beginning between the *good place* and the *no place* would have enduring consequences.

Sir Thomas More's Utopia (1516) allows for two definitions of "utopia," as the best place that can possibly be conceived of, as well as "no-place."

Together with the definition of a literary and political genre—the restricted meaning of the term—in time, a broader view appeared. Utopia came to generally mean all that is good but nonexistent or even impossible. According to Karl Mannheim, who provided one of the most authoritative definitions of the term, a state of mind is utopian when it is incongruous with the reality within which it occurs, in the sense that it tends to break the bonds of existing social order. As such, Mannheim counterposes utopias to ideologies: The utopian mentality works in opposition to the status quo and aims at its disintegration. Ideology, on the other hand, even when it does not precisely correspond to the status quo, nevertheless tends toward its preservation because it is congruous with it. In other words, utopias are revolutionary because they tend to burst the boundaries of the existing order, whereas ideologies are always conservative.

The two meanings of the term are the two extremes of a spectrum within which different forms of utopias lie. In the

first sense, there are the works that followed the example of More's *Utopia*. Tommaso Campanella's *City of the Sun* (1602), Francis Bacon's *New Atlantis* (1627), and William Morris's *News from No-where* (1891) are all examples of the utopian genre. Campanella depicts an ideal city built on a pattern of concentric circles, in which citizens live a life devoted to knowledge and piety; Bacon envisages a perfect society, which is run by enlightened scientists, whilst Morris's utopia is an idyllic and rural society run on the basis of Marxist principles. In these works, the description of the ideal society often takes the form of a narrative by a traveler who discovers the land of "utopia," typically an island or a territory separated from other societies.

Parts of this literary genre are also negative utopias such as George Orwell's *1984* (1949). The book describes a disciplinary society: the no place in this case is not the best possibly imagined, but the worst. The society that Orwell depicts represents the dreadful view of a totalitarian future ruled by the Big Brother and has been interpreted in many possible ways—prophecy, allegory, satire, or parody. These kinds of work are at times also called *dystopias* insofar as they subvert the literary mechanisms of traditional utopias, transforming the "good places" into the "bad places"—the Greek *dys* meaning abnormal, faulty, or bad. Some people have also called them *inverted utopias.* Other examples include Franz Kafka's *The Trial* (1925) and Aldous Huxley's *Brave New World* (1932).

Next to utopias as a literary genre, also relevant are works that are not part of this genre, but nevertheless contain significant utopian moments. Jean-Jacques Rousseau's *Social Contract* (1762) or, more recently, Herbert Marcuse's *Eros and Civilisation* (1955) are such examples. Rousseau's *Social Contract* is not strictly speaking a utopia, as it is not the literary narration of the no place and good place. The book aims to set the conditions for the legitimacy of political power, which Rousseau saw in a democratic social contract between citizens who are free and equals. Yet, it contains an important utopian moment insofar as the society resulting from the social contract Rousseau describes is, in many respects, the best society that can possibly be envisaged as civilized human beings. Similarly, Marcuse's *Eros and Civilisation,* which is devoted to a critique of the concept of civilization put forward by Sigmund Freud, contains a significant utopian moment in that he opposes to it a model of society where emancipation from domination is achieved through the liberation of repressed instincts and imagination. Marcuse too envisaged the possibility of a "better place" yet to be realized, and therefore again a no place. To sum up on this point, a work contains utopian elements when it expresses the belief that some (or all) social evils can be eliminated and a good place created.

In this sense, there is great debate as to the extent to which Karl Marx's thought contains utopian elements. On the one hand, perhaps no other author has been as influential as Marx in spreading the belief that social evils can be eliminated and a better society developed. On the other hand, Marx's prospect of a communist society does not derive from mere wishful thinking, but is grounded on a scientific analysis of the historical condition of the proletariat. In their *Manifesto of the Communist Party* (1848), Marx and Engels put forward a severe critique of utopian socialists such as Comte de Saint-Simon, Charles Fourier, and Robert Owen. Having theorized about the emancipation of the proletariat in an epoch when the material conditions for such emancipation were not yet ripe, utopian socialists necessarily failed to identify the economic presuppositions for such a transformation; their social criticism thus remained a mere fantastic picture of future society. To such utopian socialism, in which personal inventiveness takes the place of historical action, Marx and Engels opposed their scientific communism, in which the prospect of a future communist society is the result of a scientific prediction based on the analysis of the economic conditions of the proletariat. In synthesis, Marx and Engels's social criticism contains significant utopian elements, despite the fact that their systems of thought are not in the utopian genre.

Another distinction recently proposed for grouping different forms of utopias is that between major and minor utopias. According to Jay Winter, *major utopias* are those utopias that radically aim at extirpating all social evils from the world and resort to unconditional violence to realize their projects. Stalin and Hitler are examples of such major utopians. Their totalitarian visions and their commitment to the ruthless removal from the world of those malevolent elements blocking the path to a beneficent future, even at the price of extermination, render them major utopians. *Minor utopias* are instead imaginings of liberation on a usually smaller scale, which also sketch out a world very different from the one in which people actually live, but from which not all social conflicts and evils are eradicated. Examples of such minor utopias are the drafting of the Universal Declaration of Human Rights (1948) or the ecological movements of the 1970s. Minor utopians are therefore people who envisage good places, but with the awareness that they could remain, to a great extent, no places if the price to be paid for their realization is too high.

QUESTIONING THE FUNCTIONS OF UTOPIA BEYOND POLITICS

Utopias perform very important functions within society. The primary function of utopia is to exercise a critique of the status quo. By depicting an ideal of good society, utopias reveal where people do not stand and therefore also how far away societies are from such an ideal. This is very clear in More's *Utopia*. The first part of the book analyzes the evils affecting the society More lived in, and it is only in the second part of the book that the contours of the new land of Utopia are depicted. Although not all utopias make such explicit social criticism, this remains their primary function. Even if utopians do not explicitly make an accurate description of what they consider to be the evils of society, such criticism is implicit in the radical alternative to the existing order that they put forward. Utopias transcend reality, but only apparently departing from it.

Another way to express this is to say that utopias have a regulative function. As *regulative,* the capacity of an idea serves as a guiding ideal for human conduct independently of its content

of reality. Utopias in this sense are not necessarily blueprints for the creation of a radically new society. They are means to measure the good and bad that existing societies contain. The presupposition of such a critique is the conviction that the current state of affairs is modifiable. This can be the result of a belief in the malleable character of human nature (i.e., its perfectibility), or of the idea that the fundamental structures of the social world are subject to the possibility of change.

Within this more general regulative function, further distinctions can be made between *partial utopias* and *global utopias.* Global utopias aim for a radical eradication of all social evils toward the construction of a perfect society in its entirety. The typical example is Plato's description of the perfect society ruled by philosophers in his *Republic.* Partial utopias are instead those depicting societies as an alternative to the existing ones in some limited respects only. An example is ecologist utopias, where it is only the relationship of humans with their natural environment that is criticized and remedied.

Some authors have criticized utopias by arguing that their critique is too radical and that they tend to generate totalitarian modes of domination. According to Karl Popper, for instance, utopias such as Plato's idealized republic endorsed visions of a "closed" society, which anticipates that of modern totalitarian thinkers such as Hegel and Marx and must therefore be repudiated. Utopias can, however, in many ways be defended against their critics. First, the accusation of totalitarianism holds, at best, only for global and major utopias. Partial and minor utopias are by definition alien to any attempt to encapsulate societies in a closed scheme of functioning. But, most important, the majority of utopian thinkers are fully aware that utopias are destined to remain "no places." This is clear not just in the irony of More's neologism, but also in the fact that most utopian thinkers did not even think of trying to enforce their schemes of the perfect society. Even those who have actually tried (or thought of trying) to transform their no places into something real have most often favored means such as education and small-scale experiments. Those who have in actual fact tried to realize them through a violent revolution remain a tiny minority.

Together with their regulative function, utopias also help in developing new ideals. Utopias do not only explain where societies stand, but also reveal new directions that societies may take. Utopias are the result of the work of imagination. They disclose alternative scenarios and, as such, they enrich the sense of human possibility. As Victor Hugo once said, "Today's utopia is tomorrow's reality." The aphorism is usually understood in the sense that utopias can be realized, at least to a certain extent. But this can also be reversed, by saying that "tomorrow's realities are today's utopias." Indeed, most important social conquests such as the abolition of slavery or universal suffrage were all utopias once. In a sense, all ideas that contribute to social progress have to go through a utopian stage, one in which they are still no places.

Notwithstanding the two important functions of utopias—that is, to put forward a critique and disclose new ideals—some authors have questioned the political nature of utopias.

First, they consider imagining a radically alternative society as a flight from politics. They observe, for instance, that utopias are often devoted to depicting societies where politics would become superfluous. In a perfect society such as the one envisaged by Thomas More, there would be no need for politics. Similarly, according to some interpreters, a truly socialist society is a society where politics understood as the domination of one part of society over the rest would no longer exist.

By reading the descriptions of utopian societies, which quite often dwell on almost every detail of social life by describing the tasks of all of its inhabitants, one can get the impression that utopias go beyond politics. This view, however, reflects a very limited conception of both politics and utopias. As illustrated, utopias do not only include works in the literary genre of utopia, but also, more generally, all those that express the belief that the evils of society can be remedied by a better social arrangement. Moreover, the charge of dismissing politics reflects a very limited view of politics, as if the latter can be limited solely to the government and administration by the few over the rest of the society. If, by politics, one more generally understands everything concerning the life of the polity, of living-in-common existence, then there is no need to argue that utopias are apolitical. In this sense, they rather constitute an important and vital part of politics.

THE REAL OR UNREAL PROSPECT OF UTOPIAS

In a sense, utopias—at the same time good places and no places—transcend reality, but do not radically depart from it. Utopias break away from the current state of affairs, but only in order to criticize it. One could therefore even say that they are realistic inasmuch as they reveal where a society is not. By saying how existing societies differ from ideal ones, utopias help explain real conditions in societies, but also point to the possibility to change them.

Of course, utopias can be more or less realistic in this sense. If the literary utopias of the golden age or the paradise lost often have very little grasp on reality, the most significant utopias of modernity have all contributed to the critique of existing societies and the disclosure of new directions for their development. For instance, in the epoch of the French Revolution (1789–1799), many utopias, such as that of a society of free and equal individuals, appeared to a great extent realizable. It was then that ideals such as that of a democratic social contract or form of redistribution (if not abolition) of private property ceased to be perceived as impossible no places.

The degree to which such utopian ideals have been realized in history is a matter of empirical analysis. Inspiring actions and institutions that have been historically acknowledged, some people have directly tried to envision integral utopias. Although this remains a small phenomenon, there are utopias that have inspired the design of experimental communities. These *living utopias* range from religious communities such as the Oneida community in the United States, first formally established in 1848, to the socialist phalanxes inspired by Charles Fourier that were created in France and the United

States in the nineteenth century, to the kibbutz, a form of Jewish settlement that began early in the twentieth century.

Yet, many authors claim that humans live in an epoch of the death of utopia. Despite the fact that the utopian genre is far from vanishing, this only seems to be true of literature and fiction. This is partly due to the high degree of specialization in the social sciences that has rendered global utopias unacceptable to the academic community. Yet according to some interpreters, behind the alleged death of utopias, there are more structural reasons. Marcuse, for instance, observed that the concept of utopia is becoming obsolescent in the contemporary world because any transformation of the technical and natural environment today is a real possibility. On the opposite front are those who consider utopia dead because they see no possibility of a radical alternative to the status quo. In an epoch when many celebrate the end of history, there seems to be no space, but also no need to embark on a journey to the land of utopia. However, the state of societies being far from perfect guarantees that there will always be the possibility and the need for utopias.

Validity

Validity is the degree to which a measurement procedure captures a theoretical concept being measured. Validity determines whether one is measuring what one intends to measure. The problems of measurement arise from the nature of social science processes that are complex and, therefore, difficult to delineate unambiguously along numeric dimensions. Assessing three types of validity—content, construct, and criterion—demonstrates what a particular procedure can and cannot do with respect to the quantitative measurement of a theoretical concept.

Content validity is the degree to which a quantitative measure covers the features of a theoretical concept being measured, and nothing relevant to the theoretical concept is omitted. One type of a content validity is sampling validity, which refers to the degree of sufficient accounting for a theoretical concept's characteristics in a quantitative measure.

Construct validity is the degree to which a measure of a variable corresponds to the general theoretical framework of a concept. Criterion validity concerns the relationship between a quantitative measure and an empirical analysis using the measure. This includes predictive validity, reflecting the degree to which the results predicted by the particular numeric measure correspond to the results derived from measuring related variables.

Veblen, Thorstein

Thorstein Veblen (1857–1929) was a critic and satirist of U.S. economic society and its system of capitalism. An economist, social scientist, and social critic, he sought to apply the idea of evolution to the study of economic institutions in order to develop evolutionary economics. Both Darwinism and social Darwinism were fresh concepts during the period, and he applied them to economics, using them to present economic behavior as deterministic in a similar process to that of human evolution.

Veblen was born July 30, 1857, in Manitowoc County, Wisconsin, to recently immigrated Norwegian parents. He grew up on a farm in a Norwegian farming community in Minnesota. He learned English after he went to school and always spoke it with a thick accent. He graduated from Carleton College in Minnesota, and in 1994, he completed a PhD at Yale University, where William Graham Sumner, the American champion of social Darwinism, directed Veblen's doctoral work.

Unable to find an academic job, Veblen spent the next seven years at home reading. In 1888 he married Ellen Rolfe, the daughter of a wealthy business family. This was a rocky relationship that interrupted his teaching career several times and eventually ended in a divorce.

In 1891 Veblen returned to higher education. He entered Cornell University as a graduate student in order to be educated in something that could gain him employment. At Cornell, he greatly impressed one of his teachers, American economist J. Laurence Laughlin. Veblen subsequently went to the University of Chicago as a fellow in economics when Laughlin became the head of the economics department. Veblen's first book, *The Theory of the Leisure Class* (1899), was written while he was at the university. The book is both scholarly and satirical. In it Veblen criticizes what he believed were the false values of the wealthy upper classes, arguing that they were socially wasteful. His use of phrases such as "conspicuous consumption" and "pecuniary emulation" won him literary fame and a wide audience.

In 1904 Veblen published *The Theory of the Business Enterprise,* which was also written at the University of Chicago. Here, he uses evolutionary analysis to enable criticism of the capitalist system, which he predicted would be eliminated as economic conflict evolved into socialism. He also opposes business finance, which he finds to be irrational, but praises industrial production.

From 1911 until 1918, Veblen taught at the University of Missouri. He published several works during this period, including *The Instinct of Workmanship and the State of the Industrial Arts* (1914), *Imperial Germany and the Industrial Revolution* (1915; a favorite of the Progressives), and *An Inquiry into the Nature of Peace and the Terms of Its Perpetuation* (1917).

The Engineers and the Price System (1921) was a series of articles that were first published in an economic journal, *The Dial,* during 1919. In *Engineers,* Veblen assigns the important task of building a new planned economy—one that would govern a wholesome society—to scientists and engineers.

Veblen died on August 3, 1929, near Menlo California, on the eve of the Great Depression. This period marked the peak of his popularity, when he was most widely read for his understanding of the great economic crisis. His thought was used for reforming capitalism and not for adopting socialism, which he preferred.

Virtue Theory

Virtue theory refers to theoretical accounts of the concept of virtue and its role in ethics. It addresses such questions as: What is virtue? How is virtue acquired? What is the moral status of virtuous acts? What is a virtuous character? Although related, virtue theory is not the same as virtue ethics. Virtue ethics is the prescriptive stance that gives precedence to the importance of character and the virtues in moral life, often questioning how humans should act and live. Not all virtue theorists are proponents of virtue ethics, and interest in virtue and character are not the exclusive concern of the advocates of virtue ethics.

Most modern discussions of virtue begin with the ancient Greeks, to whom virtue occupied a central place in moral life. The philosopher Aristotle, in particular, reflected at length on the nature of virtue and the importance of moral character, which he regarded as essential conditions of a good human life. In his *Nicomachean Ethics,* Aristotle links the good life to a state he called *eudaimonia*—usually, if inadequately, translated as happiness. This is a broad conception of human well-being that requires the full development of one's natural capacities. Eudaimonia's proper development depends on the cultivation of excellences of character and intellect, primarily by means of moral education and good habituation that dispose individuals toward virtuous feelings and conduct.

Although virtue ethics served as the dominant form of morality in the West among ancient and medieval philosophers, it was eclipsed in the modern age by conceptions of morality that focus on abstract rules and universal principles applicable in all situations, rather than on the cultivation of moral character and the virtues. The two most important forms of these modern moral theories are consequentialism (particularly utilitarianism), which judges the moral worth of actions based on their effects, and deontology (especially as found in the works of Immanuel Kant), which judges the morality of actions based on their intentions, regardless of their effects. However, virtue theory has enjoyed a resurgence in popularity and interest in the West since the late 1950s, in part as a reaction against these dominant theories of morality. G. E. M.

Anscombe's seminal 1958 essay "Modern Moral Philosophy" is usually credited as the starting point of this renewed interest in virtue theory, primarily because virtue theory emphasizes the role of the moral emotions in ethical life—something both deontology and consequentialism have marginalized. Virtue ethics has also challenged the rule-based approach to ethics typical of its modern rivals, favoring instead the cultivation of good practical judgment to guide agents through complex ethical dilemmas that are not always amendable to the application of abstract moral principles in concrete cases.

This revival of virtue theory has not only stimulated interest in virtue ethics, but has also prompted greater attention to the role of virtue and character within the dominant forms of moral philosophy that have traditionally ignored or marginalized it. For example, Kant's later work, particularly the neglected "Doctrine of Virtue" section of his *Metaphysics of Morals* (1797), has recently attracted a great deal of awareness from scholars interested in revising the common perception of Kant as a typical deontologist indifferent to questions of character and virtue. In fact, Kant considered the cultivation of virtue to be an important means of strengthening the individual capacity to perform one's duties. The same interest in the role of the virtues can be found among some contemporary consequentialists, such as Julia Driver, whose outlook is in striking contrast to that of Jeremy Bentham.

In the early twenty-first century, doubts are being raised about the robust conception of character that is usually assumed by virtue theory. Some studies by social psychologists strongly suggest that moral character is not very stable, consistent, or fixed but is actually extremely variable in different situations and highly sensitive to context. If true, then the goal of cultivating strong moral character may be psychologically unrealistic. Also, modern thought tends to be very skeptical about objective theories of the human good, particularly when they are rooted in an essential conception of human nature, as they were for Aristotle. For this reason, modern proponents of virtue theory tend to abandon a single view of the human good in favor of a plurality of conceptions.

Voegelin, Eric

Eric Voegelin (1901–1985) was an Austrian American political philosopher and philosopher of history. He is best known for his *New Science of Politics* (1952), in which he characterized modern civilization in terms of the ancient Christian heresy, Gnosticism. In his magnum opus, *Order and History* (1956–1987), Voegelin developed a theory of politics and history meant to understand equivalent experiences across Western and non-Western cultures. He stated his thinking was an act of resistance against "stop-history" ideological systems such as those of Enlightenment intellectuals Georg Hegel and Karl Marx.

An eclectic range of sources inspired Voegelin, including ancient Greek philosopher Plato, German political economist and sociologist Max Weber, medieval mysticism, ancient Egyptian meditations on death, and prehistoric cave paintings. The theory of humanity Voegelin developed over his career consisted of an attempt to understand the wide range of experiences conveyed by these sources. He believed that a political science that failed to understand such sources—or found ways to ignore them—was not genuine science.

Voegelin was born to a Lutheran family in Cologne, Germany, in 1901. In his book *Anamnesis* (1966), he recalls nineteen childhood experiences that opened up his later philosophical reflections. One of these was learning, at the age of five, about the Monk of Heisterbach, who had gotten lost in meditation for one hundred years; to the monk, this only seemed to last a few hours in the afternoon. Voegelin considered this a source of his interest in differing modes of historical time. In *Anamnesis,* he also recalls seeing Halley's comet when he was seven or eight, and the apocalyptic fear it caused his neighbors. This prompted his interest in apocalyptic movements and the paradox of how something so beautiful could also be so fearsome.

Voegelin spent his early career at the University of Vienna, where he received his doctorate under the supervision of legal scholar Hans Kelsen. He also came under the influence of Max Weber and members of the Stefan-George literary and academic circle. His time in Vienna was punctuated by the events of World War II (1939–1945). During this time, he published books and newspaper articles critical of Nazi race ideology as well as his *Political Religions* (1938), which examined the religious nature of revolutionary ideology. These publications prompted the gestapo to seek his arrest in 1938, and he fled from Austria.

Voegelin immigrated to the United States and taught at Louisiana State University between 1942 and 1958. During this time, he published the first three volumes of *Order and History* (1956 and 1957), which covered the ancient Near East, Israel, and Greece. From 1958 to 1969, he directed the Institut für Politische Wissenschaft in Munich, Germany, and attempted to introduce the study of political science as part of the postwar reconstruction of German society. While at the University of Munich, he delivered his controversial lecture series, "Hitler and the Germans," which indicted a wide spectrum of German society for Nazism.

Voegelin returned to the United States in 1969 by joining the Hoover Institution at Stanford University. During that time he published the fourth volume of *Order and History* (1974), along with numerous articles detailing the theory of consciousness he regarded as the basis for a genuinely empirical political science. He died in Palo Alto, California, on January 19, 1985. The fifth volume of *Order and History* was published in 1987, and the University of Missouri Press published the *Collected Works of Eric Voegelin* (thirty-four volumes) between 1990 and 2009.

Voltaire, Francois–Marie

Voltaire (1694–1778) was the pseudonym of Francois-Marie Arouet, a French scholar and satirist. Voltaire was born to a family of some standing, as his father was in government service and his mother came from a line of aristocrats. The Jesuit order guided his early education, with teachings that included the requisite elements of classical language and history. While Voltaire's father had planned a future for him as a lawyer, the rebelliousness that came to characterize Voltaire's writings against government and orthodox religion echoed the same attitude that led him away from the career of his father's choosing.

Voltaire was employed as an aide to a French ambassador for a short time before returning to Paris and actively pursuing his career as a writer. Although he became a popular party guest among the aristocracy, his wit became too biting in several cases, and he was imprisoned in the Bastille and then exiled to England for embarrassing the wrong nobles. This incarceration and treatment was undoubtedly formative in his

political thinking and the urgency he felt toward prison and legal reforms. While residing in Britain, Voltaire gained admiration for the English system of government, and he eventually produced *Philosophical Letters on the English* (1733).

The next period of Voltaire's life was the most productive in terms of literary and other scholarly works. Of particular note were several short stories he penned that are often considered some of the first works of science fiction, such as "Micromegas" (1752) and "Plato's Dream" (1756). The former features a stranger from another planet who attempts to understand odd human customs; the latter has a protagonist who designs the planet Earth and its creatures.

Voltaire also developed his interest in the natural world through his study of English physicist and natural philosopher Isaac Newton's ideas. Voltaire sided with Newton's empirical views over those of German philosopher Gottfried Leibniz on the grounds that Liebniz's optimism—that the existing world was the best one possible because it was designed by an omniscient and benevolent deity—was unwarranted. Voltaire's criticism of Leibniz was further explored in *Candide, or Optimism* (1759). *Candide* has been canonized and is still considered a great book of the Enlightenment period for its satirical pillaring of philosophical optimism and religious orthodoxy. Voltaire remains known for his witticisms, including his most famous, from his 1770 "Epistle (To the Author of the Three Imposters)": "If God did not exist, it would be necessary to invent him."

Many critics, both contemporaries of Voltaire and present-day scholars, have stated that his work was largely synthetic and simply a patchwork of reiteration of other more innovative thinkers' ideas. Even if this line of attack were true, it is difficult to plausibly deny Voltaire's influence on advancing the causes of freedom and justice as essential elements of the modern liberal democratic state. Further, his writing remains a crucial exemplar of the importance, as well as the costs, of being willing to speak truth to power.

Vote, Transferable and Nontransferable

A vote represents the expression of an individual preference for one or more candidate, or party, selected relative to those candidates and parties not selected. It also is one individual's contribution to the collective choice of who will be elected. Although thresholds, whether effective or statutory, may introduce an element of complexity to expressing one's preference while also contributing to a meaningful collective choice, generally these two aspects of vote mesh without problem in list proportional representation (PR) systems. In the class of electoral systems that focus on candidates rather than parties, however, this often is not the case.

Single member plurality (SMP) elections illustrate the problems that may result when votes are cast for individual candidates rather than for party lists. With SMP, the voter has a single vote to be given to a single candidate; at the end of the election, the candidate with the most votes wins. SMP elections have two consequences often seen as serious negatives: first, in a race with three or more candidates, a candidate may be elected with substantially less than half of the total votes; second, substantial numbers of votes are "wasted" in the sense that had these votes not been cast at all, the result would have been the same.

There are two ways to ameliorate these problems, while retaining the basic principle that each vote is cast for a single candidate. The first is to use a *single nontransferable vote*—single because the voter has only one vote, and nontransferable because it is given absolutely to a single candidate when cast—in multimember districts. The second means is to use a *single transferable vote*—again single because the voter has only one vote, but transferable in that it is effectively cast with instructions concerning for whom it is to be counted, contingent on the distribution of the votes cast by other voters.

SINGLE NONTRANSFERABLE VOTE
SMP is the simplest, or degenerate, case of the single nontransferable vote (SNTV) system in that the nontransferable vote is cast in a single member district. The use of SNTV to identify an electoral system, however, generally is restricted to multimember districts, in which rather than only the one candidate with the most votes being elected, the first M candidates—where M is the number of representatives to be chosen from the particular district—ranked in order of their individual vote totals, are elected. While this increases the likelihood of minority representation (compared to SMP), and therefore is sometimes identified as a semiproportional system, it also increases the importance of strategic behavior both on the part of parties and of voters. In particular, if a party (or any other body that favors the same group of candidates) has too many candidates and thus fragments its vote—or has a candidate who is too popular and wins by a large margin through attracting votes that otherwise would have gone to other candidates of the same party—that party is likely to win fewer seats than it would if the party could manage both the number of its candidates and the distribution of votes among them.

SINGLE TRANSFERABLE VOTE
The first of the negative consequences of SMP could be eliminated, and the second mitigated, if voters knew in advance how their fellow citizens would vote. In that case, voters whose first preference was destined to lose could concentrate their votes on a candidate with a better chance of winning,

until the ultimate winner surpassed the 50 percent threshold. With SMP, there is some expectation that voters will attempt to anticipate the distribution of preferences and vote strategically—deserting parties that are expected to finish in third place or lower to support the less disliked of the two most popular candidates. This, however, requires that the voters can reasonably predict not only of the preferences of other voters, but also of those voters' own strategic decisions. With two-round majority systems, the voters receive a "second chance" to choose between the two candidates who finished first and second in the first round, but there is no assurance that either of those candidates will be particularly popular, only that they are the first choices of more voters than any of the other, potentially numerous, candidates.

Another method is known as the alternative vote (AV) system, also commonly called instant run-off in the United States. In this system, voters cast a vote with instructions concerning for whom it is to be counted contingent on the distribution of the votes cast by other voters. In effect, the voter says, "Count my vote for X, but if X is not going to be elected, then count it for Y, and if neither X nor Y will be elected, then count it for Z." The voter ranks the candidates, and the vote transfers in order of the voter's preference as succeeding candidates are eliminated. The candidates are subsequently ranked according to the number of first preference votes they receive, and then eliminated in reverse order of strength; each eliminated candidate's votes transfer to the next available candidate until one candidate wins one vote more than 50 percent and is therefore declared elected.

With a single transferable vote (STV) more generally, the voter still has a single vote initially given to a single candidate. To be elected, a candidate needs a number of votes equal to the Droop quota, which in an M member district is the smallest integer greater than the number of valid votes divided by M plus one. This is the smallest number of votes that each of M candidates could win while assuring that no other candidate could have as many. In a single member district, the Droop quota would be 50 percent plus one, demonstrating that AV is simply the degenerate case of STV. As with AV, the voter ranks the candidates. If a candidate has more votes than the quota (e.g., if some supporters could have voted for another candidate without imperiling that candidate's election), the surplus votes are transferred to the next available candidate; if no candidate has a surplus, then the candidate with the fewest votes is eliminated (as with AV) and those votes are transferred. This process repeats until M candidates have reached the quota, or until only M candidates remain (e.g., in Ireland, where votes can become nontransferable by exhausting the expressed preferences).

According to its early advocates, the advantage of STV over simple plurality systems is that STV minimizes the number of wasted votes. According to its later advocates—emerging after political parties became more prominent—STV also allows roughly proportional representation among parties while retaining voter choice of individuals. If voters rank candidates strictly within a single party and then allow their ballots to become nontransferable, STV would be exactly equivalent to open–list Droop quota largest-remainder PR. (Hence in Ireland, the STV system often is identified as PR–STV, or simply as PR.)

DEGREES OF PROPORTIONALITY

If SNTV can be seen as a generalization from SMP (i.e., the district magnitude is allowed to vary), it can also be considered a special case of the limited vote system in which the number of votes given to each elector is restricted to exactly one. The intention is to facilitate minority representation from multimember districts relative to what would be expected with a block vote system, in which each elector has as many nontransferable votes as there are seats to be filled. Allowing accumulation of these nontransferable votes (i.e., allowing the elector to give more than one vote to a single candidate) also facilitates minority representation. Sometimes identified as semiproportional systems, as with SNTV, the degree of proportionality depends on the capacity of parties to control the behavior both of their candidates and their voters, as well as to anticipate their raw, or undirected, popularity.

Voter Registration Drive

A voter registration drive is a campaign to register eligible voters. Such efforts are particularly common in countries such as the United States, where there are significant populations of unregistered, eligible voters. Voter registration drives may be nonpartisan or partisan. Since voting is seen both as a basic right of citizenship and a duty, nonpartisan groups routinely seek to register new voters to expand the franchise and elevate voter turnout rates. Partisan groups may also undertake voter registration drives on behalf of parties or individual candidates. These campaigns typically seek to increase voter numbers among specific populations likely to support the group's candidates.

During the 1950s and 1960s in the United States, one aspect of the civil rights movement aimed to register African Americans who had previously been disenfranchised by a series of state laws. For instance, in Mississippi in 1964, only 6.7 percent of eligible African Americans were registered to vote. After successive voter registration drives, that figure rose to 66.5 percent in 1969. Voter registration drives are also common in new democracies as the government and civic society groups endeavor to educate citizens about the importance of voting and political participation.

Voting Behavior

Voting behavior is the primary determinant of political outcomes in democratic politics, and has been studied extensively in political science literature. It is considered not only an individual act but also a collective phenomenon, since it involves aggregating individual choices into an overall electoral result. The analysis of voting behavior focuses on decisions that include whether to vote or not, whom to vote for, and how to vote. Thus, voters need to consider whether it is worthwhile to vote based on the associated perceived costs and benefits, and their attitudes toward voting. The decision to vote for a specific candidate (or party) usually involves evaluation of candidates on the basis of voters' preferences. Making this evaluation is complex and is influenced by factors such as voters' socioeconomic characteristics and attitudes, candidates' policies, as well as electoral institutions in a polity. Voters also need to determine whether to vote sincerely, by choosing their most preferred candidate, or strategically, by choosing a candidate who is more likely to win so that their vote is not wasted.

SOCIAL CLEAVAGES

S. M. Lipset and S. Rokkan observed in the 1960s that once a social cleavage structure was established, it served as a frozen base for electoral competition and voting behavior. The main social cleavage studied in the literature is class, although scholars also acknowledge the influence of religion- and gender-based cleavages on voting behavior. A prominent view in the literature is that voters vote for a party that naturally caters to their class interests. Thus, the working class, which favors redistribution of income, is expected to vote for leftist parties, while the middle class prefers voting for rightist parties. Opponents of this view argue that the importance of class on voting has diminished over the years, leading to class and partisan dealignment. Thus, due to growing affluence, the working class often has reasons

to vote for a rightist government, and similarly, being often employed in the public sector, large sections of the middle class can "unnaturally" support leftist parties. Accordingly, it has been noted that the valence of issues, and not class, has become the principal determinant of voting behavior.

Scholars on the other side of the debate, however, contend that claims of declining social influence on voting behavior are overstated, and that class dealignment is a result of partisan dealignment rather than its cause. While research on the impact of gender on voting is relatively limited, studies have found evidence of a gender gap where women voters are more supportive of leftist parties than men in the United States and Scandinavian countries. The effect of religion on voting, though still relevant, has declined due to a general trend of secularization—especially in Europe—and affluence brought about by economic growth. Although the debate on the effect of social cleavages on voting behavior is sharply polarized, it is difficult to deny that these continue to be an important determinant of voting behavior in democratic elections.

RATIONAL CHOICE EXPLANATIONS

Anthony Downs's rational voter model is an important theory of voting behavior, which finds an "instrumental" basis for voting. However, with instrumental costs of voting (i.e., time and resources) being higher than its instrumental benefits, and the probability of a single vote making a difference to the election outcome being very low, voting becomes an "irrational decision." The reality is that voters do vote in large numbers, and this paradox is explained by rational choice theory by adding an experiential element to voting behavior. Accordingly, voting behavior is also affected by factors such as sense of duty; fear of social stigma for abstention; and general social, political, and moral satisfaction individuals derive from voting.

Spatial models of electoral competition predict voting behavior based on voters' and candidates' ideal points on a two-dimensional policy space. Downs's *proximity model* predicts that voters vote for candidates whose "ideal point" is the closest to theirs, while George Rabinowitz and Stuart Elaine MacDonald's *directional model* predicts that voters also consider candidate's intensity on issues while evaluating candidates. Scholars have also developed mixed spatial models that combine elements of proximity and directional models to improve their predictive power regarding voting behavior and electoral competition. Thus, rational choice theories contribute to understanding incentives faced by voters while deciding to vote or abstain from voting. Furthermore, spatial models of electoral competition provide a framework to understand how voters evaluate candidates' policy positions and choose their preferred candidates. This in turn influences the way parties compete in the electoral arena and frame their policy agenda.

ELECTORAL SYSTEMS AND STRATEGIC VOTING

In simple plurality elections, candidates' ability to win drives voter expectations, which encourages strategic voting. However, as Gary Cox demonstrates, when the size of the voting

district is small enough, voters in proportional representation (PR) systems, too, are concerned with the prospects of their preferred candidate being left out of the newly formed legislative body. Furthermore, in PR elections, if voters perceive certain coalitions as more likely to form than others, they might vote strategically for a party other than their most preferred one. Thus, strategic voting can happen both in plurality and PR-based electoral systems, which suggests that voters ultimately focus on the policy consequences of their behavior, and on which parties are likely to have influence on policy outcomes after the election.

OTHER EXPLANATIONS

According to the *resource model*, resources such as time, money, and civic skills facilitate voters' participation in elections. The *mobilization model* complements the resource model and focuses on how parties, interest groups, and candidates mobilize and influence people to vote. Voting behavior can be based on habit; that is, it depends on whether the individual voted in the previous election. Kevin Denny and Orla Doyle point out that persistence in voting behavior is also driven by characteristics such as gender or parental background—observed heterogeneity, unobserved characteristics such as personality traits, or an intrinsic motivation to vote. Authors who write on the topic of party identification (e.g., Morris Fiorna) argue that partisan preferences, based on socialization experience early in life, can lead to stability in voting behavior, although some argue this identification can change based on voters' evaluation of parties' performance. Access to information, including print and electronic media, also affects one's propensity to vote and to support a certain party or candidate. There can also be contextual factors specific to country and election that influence voting behavior and this can cause voter turnout and nature of party competition to vary across countries and elections.

CONCLUSION

The study of voting behavior is an important subfield of political science, and scholars use many different approaches to analyze and explain what affects voting behavior. It is a complex process and has important consequences in terms of political representation and government formation in democratic politics. Voting behavior determines the level of political participation and voter turnout, and can lead to meaningful representation, depending on the extent to which the perceived positions of the parties actually reflect the true policy positions.

Voting Cycles and Arrow's Paradox

The idea of democracy closely relates to the method by which group decisions are made and managed. In this sense, democracy relates to the rules that transform individual preferences into a group preference through voting. However, there are considerable differences between individual decisions and group decisions. While individual voters are rational, meaning that they have complete and transitive preferences, the collective choice—the aggregation of individual preferences—could end in intransitive results.

Marie Jean Nicolas Caritat, Marquis de Condorcet (1743–1794), noted the irrationality of collective decisions that can originate from rational individuals. He demonstrated the possibility of an election becoming a paradox in which a corrupt triangle, or voting cycle, could be formed with no winner. For instance, if A beats B, B defeats C, and C beats A, the collective ranking is circular, creating a paradox in which no candidate obtains a clear majority.
For example, three individuals (1, 2, and 3) are deciding on three alternatives (A, B, and C). Their order of preferences is as follows:

Individual 1: A > B > C

Individual 2: B > C > A

Individual 3: C > A > B

Individual 1 prefers alternative A rather than B, B rather than C, and consequently, A rather than C. The same logic applied to the other individuals. For this reason, individuals 1, 2, and 3 are rational. Nonetheless, following Condorcet's rule, as a group decision, any alternative could be the winner. The result is a paradox.

The one candidate who should win is the one who can top each of the others, as was the case in South Korea's 1987 presidential election. Voters chose between several candidates, but none received the majority of the vote (50 percent plus one). Instead, Roh Tae Woo won the election with a plurality of 36.6 percent, more than any other candidate, but far short of a true majority of all votes. Barring a plurality, a voting cycle may be broken by a runoff election.

Condorcet demonstrates that it may become difficult and even impossible to learn the opinion of a group through the vote of individuals. Paradoxical results may be due to the intransitivity of opinions from individuals to groups. It is important to note that intransitivity may occur in the collective decision, but not in the individual decision. Transitivity is an important condition that provides coherence to the individual decision-making process.

In a voting cycle, it is possible that no candidate clearly wins an election. All the combinations of plural voting (i.e., choice among several) or majority voting (i.e., choice among a pair, or successive pairs) may present defects or voting cycles. The voting methods used that result in voting cycles often produce no result or unfair, defective, or corrupt results.

Jean Charles de Borda (1733–1799) suggested the consensus-based voting system to avoid such failure. Supposedly it could avoid voting cycles because it combines plural voting with a double-rating system in which not only the result of the voting is considered but also a rating according to the grade in scale of majority—first, second, and third candidate would have successive less rating besides the voting result. Thus the voter is asked to rank candidates in order of preference and this preference is combined to the rank majority pointed.

Voting cycles were more recently better formulated and analyzed by Kenneth Arrow, 1972 Nobel Prize winner in Economic Sciences. In 1951, Arrow sets five postulates to all democratic regimes: universality, citizen sovereignty, nondictatorship, positive association of social and individual values, and restriction of irrelevant alternatives. The postulates are considered reasonable for collective decision making that takes, as its basis, individual preferences expressed by voting. Arrow's paradox is also called an axiom since, once compliance is achieved with the five postulates, the voting method used becomes irrelevant; any method would work fairly, but none perfectly. In this sense, Arrow also demonstrates that it is impossible to have the majority desire to prevail without breaking at least one of the postulates.

Voting cycles and Arrow's paradox also connect directly to the importance of holding the agenda power in legislatures or other decision-making bodies. In theory, if the person that builds the agenda knows individuals' preferences on different issues, the agenda could be manipulated in order to achieve a winner that might not represent the collective desire.

Voting Machines and Technology

In the age of technology, elections have come a long way from the days of voting for someone in a loud voice—*viva voce.* Paper ballots served their purpose, but as of 1996, only

Mechanical lever machines were used in a 1944 election in New York City. These machines remained popular through the 1960s before new technology phased them out.

Modern voting technology relies on electronic voting machines. Touch screens have been used increasingly in the early twenty-first century.

1.7 percent of the registered voters in the United States still made use of them in small communities and rural areas, and for absentee balloting. Ever since the 1990s, several countries—including Australia, Portugal, Spain, and other European countries—engaged in nonlegally binding trials for electronic voting conducted in localities, municipalities, and universities. In 2001, Australia reported that 8.3 percent of the electorate used electronic voting. However, many still do not consider it secure enough for use in all types of elections, especially national or parliamentary elections.

For reasons of convenience, paper ballots have been progressively replaced by punch cards (first introduced in 1964), optical scanners in the 1980s, and touch screens in the 1990s. However, continued research in the United States seeks to provide appropriate methods of voting for those with disabilities, those who do not primarily speak English, and those who do not have a high literacy rate.

In the early twenty-first century, voting machines are commonly used for two main reasons: to provide secrecy and to simplify vote counting. Various types of voting machines exist, including mechanical levers, punch cards, electronic scanners, optical scanners, and direct recording electronic (DRE) voting systems that make use of computers and cell phones. The changing technology has sparked ongoing analysis of the positive and negative aspects of relying on the evolving machines and technology for determining an election's outcome.

DEFINITION

Voting machines are the various instruments used to cast a vote and count it. In the modern technological world, a voting machine usually connotes an electronic voting machine (EVM) and implies the electronic means of casting the votes and counting them. Electronic voting technology can include punch cards, optical scan voting systems, and specialized voting kiosks (including self-contained DRE voting systems). It can also involve transmission of ballots and votes via telephones or cell phones, various computer networks, or the Internet.

Polling-place electronic voting, or Internet voting, has taken place in numerous countries, including Australia, Belgium, Brazil, Canada, Estonia, the European Union (EU), France, Germany, India, Ireland, Italy, the Netherlands, Norway, Romania, Switzerland, the United Kingdom, and Venezuela.

HISTORY OF VOTING METHODS IN THE UNITED STATES

Voting is a democracy's method to determine the will of the people on issues as well as on representation for resolving society's political problems. The U.S. history of ballot

casting, as outlined in Paul McCaffrey's *The United States Election System* (2004), may be said to have started with the use of a quill pen and since evolved to the current use of a touch screen.

In the U.S. colonial days, voting was a matter of assessing shouts and shows of hands to determine a winner. By the time the new nation was born in the 1770s, actual balloting would replace this show of hands or voice votes. Voters wrote out the names of their candidates in long hand, gave their ballots to an election judge, and trusted that their vote was recorded accordingly. In the 1850s, political parties dispersed preprinted lists of candidates to enable even the illiterate to vote. The ballot resembled a train ticket since it came out as a long strip of paper. In 1869, Thomas Edison received a patent for his invention of the voting machine, intended for counting congressional votes. In 1888, Massachusetts printed a ballot at public expense, listing the names of all candidates nominated and their party affiliations. Most states would adopt this landmark improvement within the next eight years.

The first official use of a lever-type voting machine, known then as the Myers automatic booth, occurred in Lockport, New York in 1892. Four years later, these machines were used on a large scale in the city of Rochester, New York, and soon were adopted statewide. By 1930, lever machines had been installed in almost every major city in the United States, and by the 1960s, over half of the nation's votes were cast on these machines. In the 1996 presidential election, mechanical lever machines were used by 20.7 percent of registered voters in the United States. Because these machines are no longer made, computer-based marksense, or DRE systems sometimes referred to as optical scan systems, are emerging as one of several methods for recognizing marks on paper through optical reading techniques. Marksense systems were used by 24.6 percent of registered voters in the United States for the 1996 presidential election, and their use is on the rise.

The punch card ballot was introduced in two counties in Georgia in 1964, and by the 1996 presidential election almost four in ten voters used punch cards to vote. Punch card systems employ a card (or cards) and a small clipboard-sized device for recording votes. Voters, using a supplied device, punch holes in the cards opposite their candidate or ballot-issue choice. After voting, the voter either places the ballot in a ballot box, or the ballot is fed into a computer vote-tabulating device, at the precinct.

Michigan in the 1990s was the first state to switch to optical scanning devices, which have been used for decades in standardized testing. About 25 percent of voters used the technology in the 1996 election. As a result of the storm over the 2000 presidential election results, when Florida's punch card ballots and Palm Beach county's butterfly ballots marred the results, new federal laws in 2002 authorized funding to help states upgrade voting technologies and phase out punch cards and lever machines. Georgia was the first state to use DRE touch screen technology exclusively. In 1996, 7.7 percent of the registered voters in the United States used some type of DRE voting system.

VOTING METHODS AROUND THE WORLD

Some developing countries have been effectively using electronic voting machines for longer than the United States. Brazil prides itself on the reputation of being the first country in the world to have fully electronic elections in all levels since 2002. The chief goal for Brazil's use of EVMs is to make voting as simple and straightforward as using a public phone booth.

Though India first used EVMs in its 1989 elections, it was only in the May 2004 elections that they have been used in all of India's 543 parliamentary constituencies. The Indian electorate is so large that it required 700,000 voting stations, open for five days of voting. The use of electronic voting led to quicker voting and faster tallying of votes with results obtained in hours versus days. Finally, in Estonia, 1.85 percent of voters used electronic voting in the 2005 elections.

INTERNET VOTING

A public network DRE voting system is an election system that uses electronic ballots and transmits vote data from the polling place to another location over a public network. Vote data may be transmitted as individual ballots as they are cast, periodically as batches of ballots throughout the election day, or as one batch at the close of voting. This includes Internet voting as well as telephone voting. Internet voting can use remote locations, voting from any Internet capable computer, or can use traditional polling locations with voting booths consisting of Internet-connected voting systems.

Despite the speed at which the vote can now be cast and counted with the help of such voting machines, there are concerns that a lack of testing, inadequate audit procedures, and insufficient attention given to system or process design with electronic voting leaves elections open to error and fraud, especially when the accuracy, honesty, security, and verifiability of votes cast cannot be guaranteed—as shown by the experience

in the 2000 U.S. presidential elections. There are those who argue further that the cost of the validation processes for software, compiler trust, installation, delivery, as well as the validation of other steps related to electronic voting is complex and expensive. Thus electronic ballots are not guaranteed to be less costly than printed ballots.

In order to ward off such problems, legislation has been introduced in the U.S. Congress appropriating funds to states for EVMs, for precinct audits in federal elections, as well as for mandating some form of voter-verifiable paper audit trail by the year 2012 on any type of voting technology. Verifiable ballots are necessary because no technology is error proof. Computers can and do malfunction. The consensus is that optical scan systems are the most efficient provided they include a *precinct counter*, which tells the voter about possible voting errors such as no recorded vote or too many votes and allows them to correct their mistakes.

THE GROWING USE OF ELECTRONIC VOTING

In the age of electronic voting, it is quite clear that electronic entry devices are replacing paper ballots, punch cards, and lever machines. The most commonly used EVMs in many parts of the world are optical scan, touch screen or DRE machines, and smart cards. In countries such as France and Germany, the EVMs manufactured by different companies such as the Dutch firm Nedap do not print receipts like those in the United States; these have therefore been a source of protest and skepticism. The Estonian e-voting system utilizes an ID card, which serves as a regular and mandatory national identity document as well as a smart card with an integrated electronic chip. It has a state-supported public key infrastructure allowing for both secure remote authentication and legally binding digital signatures that can be used for voting and other purposes.

Despite the direction toward a process beyond the use of paper, according to the World Bank, about 85 percent of electronic voting projects in developing countries have failed in some respect. Likewise, numerous e-voting inconsistencies in developing countries, where governments are often eager to manipulate votes, have only added to the controversy.

Voting Procedures

Voting is a necessary, yet not sufficient, condition of democratic governance. Voting takes a wide variety of forms—from oral expression of opinions in mass gatherings to electronic recording of preferences in computer terminals. Voting procedures comprise a balloting system as well as a method of determining the winner once the ballots have been cast. The modern theory of voting procedures focuses primarily on the latter component, that is, on the methods of determining the winners.

It is common to distinguish between electoral and voting systems. The former refer to methods applied in determining winners in mass elections, such as parliamentary or presidential ones, while the latter focus on committee, parliament, or group decision-making methods. These may result in the choice of one winner (candidate or policy alternative) or a group of them.

Voting procedures can be classified into three groups: (1) binary, (2) positional, and (3) multistage procedures. Binary procedures are based on pairwise comparisons of alternatives. In some procedures, the comparisons are actually performed according to an agenda. The amendment procedure used in the U.S. Congress is based on a binary procedure. According to a predetermined agenda, the alternatives are voted upon in pairs so that the majority loser in each comparison is eliminated, while the pairwise winner proceeds to the next comparison until all alternatives have been voted upon at least once. Sometimes the binary winner is determined on the basis of reported voter preferences, such as by finding out for each alternative how many others it would defeat in pairwise comparisons if all voters voted according to their reported preferences.

The best-known positional procedure is the one-person-one-vote, or *plurality*, method in which each voter can vote for just one alternative and the winner is the alternative that has been given more votes than any of its competitors. Another example is the *Borda count*, in which each voter indicates a preference ranking and the Borda scores are determined as follows: Assuming that the number of alternatives is K, each voter's first-ranked alternative's points are K minus one, second ranked receives K minus two points, and so on, with the last ranked alternative receiving zero points. The Borda score of an alternative is the sum of points received from all voters. The Borda count winner is the alternative with the largest Borda score. Approval voting can also be viewed as a positional procedure. In this system the voter may give each alternative either one or zero votes. The alternative with the largest vote sum is the winner.

Various runoff methods are examples of multistage procedures. The most widespread is the plurality runoff system, used notably in presidential elections in France, as well as in many

other countries. This system is typically implemented in two rounds of balloting in which each voter may vote for one and only one candidate. If some candidate receives more than 50 percent of votes in the first round, this candidate is elected and no second round of voting occurs. Otherwise, the two candidates with the most votes on the first round compete in the second round, during which voters again vote for only one candidate. The candidate with the most votes on the second round is the winner.

The primary theoretical tool used in analyzing voting procedures is social choice theory. This theory deals with rules assigning best alternatives to any preference profile, such as a set of individual preferences over alternatives. Voting procedures clearly align with these kinds of rules. Social choice theory suggests a number of criteria for evaluating voting procedures. Of these, perhaps the best-known is the Condorcet winner criterion, which requires that an alternative that would defeat all other alternatives in pairwise majority comparisons (i.e., a Condorcet winner alternative) is to be elected whenever such an alternative exists. Many binary methods satisfy this criterion, whereas many positional methods (e.g., plurality, Borda count, and approval voting) do not. On the other hand, the criterion called *consistency* is satisfied by many positional systems, but in general not by binary ones. Consistency criterion is defined for two separate voting bodies considering the same alternatives. If both bodies agree on the chosen alternatives when acting separately, consistency requires that they should also come up with the same chosen alternatives when acting together.

The history of research on voting procedures is relatively long, but not continuous. The earliest analytic and comparative studies appeared in the late eighteenth century, when the fundamental discrepancy between two intuitive ideas of winning was discovered: one emphasizes the success of candidates in pairwise comparisons, and the other pays attention to the positions of candidates in the voters' preference rankings. This discrepancy continues to underlie much of the contemporary debate on virtues of various voting procedures.

Voting Rights and Suffrage

The term suffrage is derived from the Latin *suffragium* and the ancient Roman political practice of displaying direct support for a candidate or legislative proposal through one's vote. Voting, however, was formalized first as a public decision–making device in ancient Greek juries and political assemblies in the sixth century BCE. In these political bodies, only citizens were eligible to vote and participate in political deliberations, which then meant that all females, children, foreign-born, and enslaved persons were excluded (estimated to be approximately 85 percent of the population of Athens, the city-state conventionally recognized as the birthplace of democracy). The Roman right to vote was similarly limited and became even more so with the territorial expansion of Roman power as voting occurred only within the city of Rome. Despite these severe restrictions, individuals' regular and direct voting on public matters was a legal and political innovation that distinguished ancient Greek democracies and the Roman Republic from the then-dominant methods of creating political authority based on individual charisma, social custom, and brute force.

These early exemplars of voting as a political practice were abandoned with the advent and eventual collapse of Roman imperial rule, making the revival of regular voting practices in Europe over a millennium later a remarkable political achievement. The idea and practice of voting were not wholly forgotten during this interim period, but they were associated almost exclusively with the selection of new popes, the decisions of church councils, and popular participation in the appointment of local diocesan bishops. By the twelfth century, Catholic religious orders such as the Cistercians and Dominicans regularly elected their leaders independent of secular and other religious authorities. During the Middle Ages, the Catholic Church also developed and employed the ideas of contractualism, the common good, consent, and representation as well as various forms of majority rule voting, use of the secret ballot, and the requirement of procedural regularity in their elections—all direct precursors to modern, secular forms of electoral democracy. Ironically, although the early Catholic Church always aspired to achieve unanimity in its decisions, persistent encroachments by secular powers prompted restricted voting in 1179 for papal elections to its College of Cardinals.

The emergence of representative assemblies throughout Europe from the thirteenth through eighteenth centuries—for example, the various Cortes on the Iberian peninsula, the British parliament, provincial assemblies in France, the Polish Sejm, and the Swedish Riksdag—restored the regular practice of voting on public matters, especially where consent became necessary for monarchical requests for tax revenue. Voting

rights within these national or provincial bodies typically were held by individuals of recognized noble classes or clerical offices, appointed or elected representatives of religious orders, or geographically defined communities. Voting rights in Italian city-republics, by contrast, were restricted to citizens and, for many, required membership in one of the many recognized guilds. Although all of these assemblies relied on the idea of representation to sustain their claims to act legitimately on behalf of their members and societies, only a small fraction of the population possessed the suffrage: at best, 6 percent in the city-republics and typically far less in elections for delegates to the national assemblies. In addition, throughout this time period, voting rights in Europe were rarely extended; in fact, they often became more restrictive and exclusionary. In 1297, for example, the city-republic Venice made the suffrage an exclusively hereditary right; by 1430 only freeholders, defined as those who owned property that yielded an annual profit of at least forty shillings, were permitted to vote in English parliamentary elections.

Whereas commitments to voting rights subsequently waned in most countries in Europe, the English tradition of deriving political consent through locally elected representatives strengthened throughout the seventeenth century, extending into the governmental structures of its new American colonies. Interestingly, in the first colonial election ever held, not only were legal efforts in 1619 to exclude non-English residents from voting in Virginia overturned, but one illegal resident was elected and, after an official inquiry, seated in the colony's first House of Burgesses. In the American colonies, and later the U.S. states, the effects of the freehold requirement also grew less severe due to inflation, the availability of land, and the redefinition of property qualification in less restrictive terms. Moreover, in contrast to the suffrage in Europe, the number of Americans eligible to vote and those voting steadily increased throughout the colonial and early national eras. To be certain, the American electorate remained small by modern standards because individuals often were barred because of their gender, age, enslaved status, religion, race, ethnicity, citizenship, residency, tax payment, literacy, mental competence, criminal conviction, and military service. There were exceptions to these exclusionary standards, including these several noteworthy ones: women, for example, were permitted to vote in New Jersey from 1776 to 1807; several American states never adopted racial or religious restrictions on the suffrage; and in the first half of the nineteenth century, property and wealth requirements for voting were eventually abandoned.

Although often misnamed universal suffrage, popular participation in nineteenth-century U.S. elections set both historical and contemporary benchmarks. In the 1840s, for example, approximately 14 percent of the U.S. population voted in presidential and state elections, whereas less than 5 percent of the British population was eligible, even after the 1832 Reform Act. More important, as French political theorist Alexis de Tocqueville speculated in his political study *Democracy in America,* the general tendency toward universal suffrage continues to gain momentum once started, for not only will excluded groups be energized, but the democratic ideals of equality and consent offer no clear qualifications for remaining exclusions. The United States unquestionably led the expansion of suffrage rights for most of the nineteenth century, although two dozen mostly European nations guaranteed women's suffrage before the United States finally did in 1920. Moreover, the voting rights of African Americans were not fully recognized in the United States until the 1965 Voting Rights Act, nor were those of eighteen- to twenty-year-olds until 1971. The 1948 United Nations Universal Declaration of Human Rights specified that "the will of the people shall be the basis of the authority of government" as "expressed in periodic and genuine elections" and "by universal and equal suffrage," and these rights and freedoms are to be honored "without distinction of any kind, such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth, or other status." Today, close to 60 percent of the population in the world resides under some form of electoral democracy, a suggestive but not decisive empirical indicator of the global momentum of Tocqueville's historical speculation.

War, Distraction Theory of

Commonly referred to as the diversionary theory of war or the "scapegoat" hypothesis, this theory posits a close causal relationship between political elites' domestic political situation and their interest in fostering an external conflict. States that are domestically unstable are more likely to start wars than domestically stable polities. Building on insights developed by Georg Simmel and Lewis Coser on the relationship between in-groups' cohesion and their relationships with out-groups, the distraction theory of war predicts that conflict with out-groups will increase the cohesion of an in-group. External conflict is a means for embattled politicians to maintain their offices while neutralizing their domestic opposition. The incumbents hope that external conflict will allow them to either maintain or restore domestic stability by distracting the public from its grievances and rallying political support to themselves or their political party. The creation of a rally is contingent on political elites' ability to demonstrate their competence in foreign affairs and use the external conflict to shift blame for the nation's problems onto an out-group. Although referred to as a single theory, it subsumes multiple theories and insights that share its logic, including the "rally-'round-the-flag" phenomenon and lateral pressure theory.

War Crimes

War crimes can be defined as violations of the laws and customs of war entailing individual criminal responsibility directly under international law. From the start of warfare to advent of contemporary humanitarian law, more than 500 cartels, codes of conduct, covenants and other texts to regulate hostilities have been recorded. Wars in the nineteenth century encouraged international attempts to address their horrific consequences. In 1863 an international committee for the relief of military wounded—renamed the International Committee of the Red Cross (ICRC) in 1876—was established. Also in 1863, the Lieber Code, the first attempt to codify the existing laws and customs of war, came into force. The following year, the 1864 Geneva Convention aimed to protect wounded and sick soldiers on land during war, and four years later the 1868 Saint Petersburg Declaration prohibited the wartime use of certain projectiles declared contrary to the laws of humanity.

The momentum of international conventions against war crimes continued into the early twentieth century. The 1899 Laws and Customs of War on Land (Hague II) and 1907 Laws and Customs of War on Land (Hague IV) made reference to laws of humanity. A Geneva Convention in 1906 also aimed to protect wounded, sick, and shipwrecked military personnel at sea during war. After World War I (1914–1918), the Treaty of Versailles accused William II of Hohenzollern, the former German emperor, of a supreme offense against international morality and the sanctity of treaties. However, William II was not put on trial as he had gone into exile in the Netherlands. The treaty referred to prosecuting those accused of violating the laws and customs of war. In 1921 some Germans were tried in Leipzig, Germany, on charges that included the poor treatment of war prisoners. The 1925 Geneva Protocol prohibited the use of asphyxiating, poisonous, or other gases and bacteriological weapons, and the 1929 Geneva Convention protected war prisoners as well as strengthening protections for medical personnel in wartime. During Italy's conquest of Abyssinia (1935–1936), the Spanish Civil War (1936–1939), and Asian conflicts, the ICRC attempted to help victims.

WORLD WAR II CRIMES

At the end of World War II (1939–1945), the problem of crimes committed during the war was addressed by an international military tribunal established by France, the Soviet Union, the United Kingdom, and the United States. The tribunal defined war crimes as violations of the laws or customs of war. Such violations included murder, ill-treatment, or deportation of the civilian population of an occupied territory, murder or ill-treatment of prisoners of war or persons on the seas, killing of hostages, plunder of public or private property, and wanton destruction of cities, towns, or villages when such devastation was not justified by military necessity.

Trials were conducted in Nuremberg, Germany, from 1945 to 1946, in which sixteen Nazi leaders were found guilty of war crimes. The proceedings of the separate international military tribunal for the Far East were held in Tokyo from 1946 to 1948, wherein twenty-five Japanese war criminals were found guilty of at least one charge (such as conspiring to wage war, waging war, atrocities, and breaching laws of war). Adolf Eichmann, who headed the office administering the extermination of European Jews and other "undesirables," was not captured until 1960. The following year he was tried in Israel and found guilty of charges that included war crimes, for which he was executed in 1962. All of these trials set the stage for a more permanent International Criminal Court.

Meanwhile, the international community saw the aftermath of World War II as a time to revise the Geneva Conventions. The first 1949 Geneva Convention protects wounded and sick soldiers on land during war. The second convention protects wounded, sick, and shipwrecked military personnel at sea during war. War prisoners and conditions of captivity are covered by the third convention, while the fourth convention protects civilians, including those in occupied territory. This marked a change from earlier conventions, which had focused on combatants. Article 3 in the conventions covers noninternational armed conflicts such as civil wars.

POST–WORLD WAR II

Widely publicized and graphic war crimes continued to occur after World War II. Under the Khmer Rouge regime in Cambodia (1975–1979), up to three million people are believed to have been killed. In 2001 the Cambodian National Assembly created a court to try serious crimes committed during the Khmer Rouge regime. The Extraordinary Chambers in the Courts of Cambodia for the Prosecution of Crimes Committed during the Period of Democratic Kampuchea (ECCC) became fully operational in 2007, and three of the five suspects named in its introductory submission were charged with war crimes. The ECCC covers such crimes as the unlawful treatment of civilians or prisoners of war, attacks on civilian targets, and destruction of educational and religious institutions.

During the 1990s, mass atrocities occurred in Croatia, Bosnia, and Herzegovina. These led to establishment of the International Criminal Tribunal for the former Yugoslavia (ICTY) in 1993. This was the first war crimes court created by the United Nations, and the first international war crimes tribunal formed since those in Nuremberg and Tokyo after World War II. According to the ICTY Statute, the tribunal has the power to prosecute persons violating the laws or customs of war. Such violations include using poisonous weapons or other weapons designed to cause unnecessary suffering, the wanton destruction of cities or devastation not justified by military necessity, and the plunder of public or private property. By November 2009, the tribunal had indicted 161 persons for serious violations of international humanitarian law.

The Rome Statute of the International Criminal Court (ICC) entered into force on July 1, 2002, and established the ICC. It is the first permanent international institution with jurisdiction to prosecute individuals responsible for genocide, crimes against humanity, and war crimes. In July 2009, 110 countries were states parties to the Rome Statute. These ranged from Japan and the United Kingdom to New Zealand. However, major powers including China, Israel, Russia and the United States were not states parties. For the purpose of this statute, *war crimes* means grave breaches of the 1949 Geneva Conventions, namely, any of the following acts against persons or property protected under the provisions of the relevant Geneva Convention: willful killing; torture or inhuman treatment, including biological experiments; willfully causing great suffering or serious injury to body or health; extensive destruction and appropriation of property not justified by military necessity and carried out unlawfully and wantonly; compelling a prisoner of war or other protected person to serve in the forces of a hostile power; willfully depriving a prisoner of war or other protected person of the rights of fair and regular trial; unlawful deportation or transfer or unlawful confinement; and taking of hostages. Three states parties to the statute (the Central African Republic, the Democratic Republic of the Congo, and Uganda) have referred crimes on their territories to the ICC. The United Nations Security Council also has referred the situation in Darfur, Sudan.

CONTROVERSY

The wide-ranging and graphic impact of war crimes and their highly emotive nature contribute to the controversy that often surrounds them. The definition itself and interpretation of war crimes is often controversial, with much debate over what constitutes such a crime and the need for prosecution. For instance, Israel has faced demands from some senior UN officials and human rights groups for an international war crimes investigation in Gaza over allegations over the "reckless and indiscriminate" shelling of residential areas. Likewise, the United States has been accused by some of war crimes in Iraq since the 2003 U.S.-led coalition invasion.

Other issues include the failure of the international community to punish some high-profile alleged offenders. This has been highlighted by the concern expressed by the ICTY over Ratko Mladić as of November 2009 continuing to evade justice despite continuous calls for his arrest since indictments were issued in 1995. Charges include violations of the laws or customs of war during the Bosnia and Herzegovina conflict. There has been much debate also over the power held by tribunals, their legal authority and costs, whether they infringe on sovereignty, and the fairness of prosecutions.

Warlordism

Warlords are nonstate actors who control people and territory through de facto military rule. The militarized groups that the warlords control are similar to gangs or other domestic illegal organizations. These organizations steal from and engage in illicit economic activity. Warlords tend to operate in weak states, where the government is unable to contest powerful nonstate actors. Warlords can benefit from patronage and illegal trading to clients both inside and outside of the state they inhabit.

A major distinction between warlord rule and the government of a weak state is that the warlord's organization seldom seeks public goods and projects and concentrates on accumulating private wealth. While warlords do make strategic decisions, they do not act on behalf of the general population. Warlord rule is typically highly personalized. The death of a warlord may create a power vacuum, which then results in in-group fighting and domestic political chaos. In some areas controlled by warlords, local groups enforce a patronage structure of the warlord in return for protection and economic stability. However, most warlords do not require the assistance of local populations and prefer to directly control territory. One of the most famous examples of warlord rule is in early twentieth century China, when the Qing dynasty dissolved into a collection of feuding generals. Likewise, early modern Japan was under warlord rule during the relatively stable Edo period (1603–1868). Contemporary states in Africa and South America also have been ruled by warlords. These weakened states can give rise to warlords, such as in Somalia (1991–present), as well as areas in present-day Columbia and Mexico.

Warlords may emerge in any failing political system, and several preconditions help define when a warlord may assume power. Often, warlords fill power vacuums created when other personalized regimes collapse, or when a state begins transforming to a new style of government. Individuals with personal power bases and support by prominent economic leaders may militarize their organizations. A crumbling state apparatus may no longer protect private interests, and opportunistic business leaders may take advantage of this weak state by interfering with or removing either political or economic rivals.

Warlords tend to seize power when a state is in decline or in newly formed states. Warlords may take advantage of weak state structures to build a power base outside of state influence, such as areas of the country where the state's military forces neglect. States, either for social, economic, or strategic reasons, may fail to enforce laws or even exhibit a presence in parts of a state. Here, opportunistic criminals build support and gain de facto political and military rule over a region. Warlords are especially likely to arise when public services are declining and the overall wealth of the people is declining. Warlords then seize control over a region and offer supporters positive rewards or negative incentives for their support. They may take advantage of existing social cleavages and gain the support of one ethnic, religious, or regional group at the expense of other groups.

Some warlords have maintained their rule throughout their lifetime, dying while in control of different territories. Successors can be preappointed lieutenants or relatives. However, another common fate is that their status as a de facto military rule is cut short. Rival militants may kill or exile a warlord to assume control of a territory. Sometimes, warlords are incorporated into a formal central government. Central governments may find incorporating existing warlords is necessary to gain back the state's sovereignty. For instance, coalition governments seeking legitimacy across the state may find it impossible without the warlord's consent.

States may offer incentives for warlords to coordinate their rule in an ad hoc governing council. In such situations, the state pragmatically acknowledges the warlord's legitimacy and may work toward a peaceful state rather than a lawful one. Here, fighting a warlord may lead to an internecine conflict, which results in a weaker state, impoverished people, and, perhaps, more support for the warlord.

War Powers

War powers, broadly construed, refer to the authorities and responsibilities to initiate, conduct, and terminate hostilities

or other military measures taken to defend and preserve the safety of an organized political territory. They include the authority to begin or initiate military hostilities, the authority to mobilize resources necessary to create wartime military forces, the authority to take measures to prevent or hinder an adversary's ability to operate, command, and conduct operations with armed forces, and the authority to conclude a peace agreement that ends hostilities. The term *war powers* frequently is used in a narrower sense, referring only to the initiation or declaration of war and not its conduct and termination. At other times, the term can be used in the singular, referring broadly to all measures taken by the government to ensure its self-preservation in the face of hostilities. Early in the U.S. Civil War, President Abraham Lincoln famously referenced "calling out the war power of the government," by which he meant taking extraordinary military measures to save the Union.

Because they entail risking the safety and property of its citizens for some common purpose, war powers are among the most sovereign and significant responsibilities of government. War powers have traditionally been considered an extension of a nation's foreign relations and therefore falling within the executive purview. This traditional view is an extension of the British monarch's royal prerogative over matters pertaining to foreign relations and war. War powers also are, among the vast powers of government, viewed as the potentially most dangerous and prone to abuse. The power to wage war against enemies—foreign and domestic—also can be used to overthrow the existing political order for the personal gain of those wielding it. Yet these powers are necessary for modern government to provide for the security of its citizens. Restricting the government's power to wage war could impede a nation's ability to defend itself.

Seeing the power to wage war as necessary but dangerous, constitutional democracies have sought to divide war powers among the different branches of government to mitigate and check against their potential abuse. The most explicit and oft-referenced example is the U.S. Constitution's divided assignment of war powers and responsibilities among the Congress, the president, and the judiciary. Congress constitutionally holds the power to declare war and to raise and support armies. Once the Congress declares war, the president has full responsibility for the conduct of the war as commander-in-chief. The president, moreover, uses a military that the Congress created and continues to fund through legislative acts. The president and the Senate have a role in the treaty-making process, suggesting that both branches must be in some agreement to end a war. The judiciary can review the constitutionality of specific congressional and presidential actions, such as the suspension of *habeas corpus* in wartime, the wartime seizure of private property, military conscription, and the detention of enemy combatants.

However, the extent of the presidential power to initiate hostilities or deploy military forces, short of declaring war, remains a point of serious debate within the United States. Some argue for limited presidential power over military actions because the Constitution subordinates the president's role to Congress. David Gray Adler, for example, suggests that the Constitution "makes Congress the sole and exclusive repository of the ultimate foreign relations powers—the authority to initiate war" (Fisher 2004, 15). The president, therefore, may only use the military once Congress has officially declared war. If an official declaration of war is not issued, Congress would still need to authorize the president to engage in military acts.

Others argue that the president's broad latitude and discretion over foreign relations and national defense should include the use of military force short of full-scale war, in order to achieve the nation's foreign policy goals. They observe that the executive and legislative are equal and independent branches assigned separate but related powers that could overlap or conflict in some circumstances. The Constitution, thus, invites "an open and dynamic struggle" between the president and Congress over war, and foreign affairs more broadly, by assigning each of them broad war-related powers (Yoo 2005, 17–22). A declaration of war is only necessary when mobilizing the entire society for total war. Military engagements on a lesser scale, they hold, are well within the inherent powers of the presidency to conduct foreign relations.

The Framers of the U.S. Constitution did grant some leeway to the president, suggesting that it had the power to "repel sudden attacks" and defend the nation from obvious invasion. Extrapolating broad presidential war powers from this emergency provision, however, only further complicates the boundary between executive and legislative authorities over war, because it is most often the president who would determine if an attack were imminent. Through the Presidential Oath, moreover, the Constitution assigns the president the unique duty to "preserve, protect, and defend," which could serve as an overriding source for extensive presidential powers in wars that pose an existential threat to the United States.

In reaction to the Vietnam War (1959–1975), Congress passed (over President Nixon's veto) the War Powers Resolution, also known as the War Powers Act, in 1973 in an attempt to "insure that the collective judgment of both the Congress and the president will apply to the introduction of United States Armed Forces into hostilities" (United States Code). Though often touted as an attempt by Congress to "reassert" its role, the resolution actually recognizes that the president may introduce military forces into existing or imminent hostility, even in cases where there is no congressional declaration of war. The president is required to report to Congress upon the introduction of forces into hostilities, but they remain in place for up to 60 days (or 90 should the president deem it necessary) before the resolution requires Congress to authorize an extension.

Wars of Independence

The term *war of independence* is generally used interchangeably with *war of national liberation.* Since the rise of nationalism, wars of independence have become one of the notions that draw the contours of today's world order. The wars of independence started as particular nations' fight against imperial powers and then evolved as wars against colonial or occupational powers.

Even long before the rise of nationalism, wars of independence were fought against imperial and colonial powers. Chronologically, it is possible to argue that the history of the phenomenon of war of independence goes back to earlier periods of history. The first ever war that can be called independence war was the War of Scottish Independence (1296–1357), which was a series of wars fought between the Kingdom of Scotland and the Kingdom of England in the late thirteenth and early fourteenth centuries. The first War of Scottish Independence began with England's invasion of Scotland in 1296. At the end of the War of Scottish Independence, Scotland retained its status as an independent nation. Another historically significant war of independence was the American War of Independence (1775–1782), which was the conflict between Britain and its American colonists. The American War of Independence led to the end of European control of both North and South America. In spite of the existence of these earlier examples of wars of independence, the concept found its place in international relations scholarship after the development of nationalism.

According to the Article 1(1) of the first Protocol of 1977, Protocol Additional to the Geneva Conventions of 12 August 1949 and relating to the Protection of Victims of International Armed Conflicts, wars of national liberation are defined as "peoples . . . fighting against colonial domination and alien occupation and against racist regimes in the exercise of their right of self-determination" and determine that they should be treated legally, as if they were engaged in an international armed conflict.

Many theories of warfare claim that wars result from the intimate connection between the nation and the state. According to Max Weber (1948), the *state* is a territorial organization exercising legitimate control over its own bounded territory, unchallenged by internal power competition or external intervention. Weber then defines the *nation* as "a community of sentiment which would adequately manifest itself in a state of its own" and hence "tends to produce a state of its own" (176). The link between the nation and the state is established by the doctrine of *national self-determination,* which has become the major legitimacy of states. National self-determination was the main principle on which political boundaries of eastern Europe and Balkans were determined after the end of World War I (1914–1918). Moreover, self-determination was the principal idea behind the anticolonial movement of the post-1945 period. In the 1950s and early 1960s, the struggle of subject peoples against colonial powers took the form of wars of independence. During this period, different national revolutionary groups engaged in struggle against Western rulers or against indigenous regimes deemed to be dependent on outsiders at the expense of their own populations. The phenomenon of independence wars of the third world against Western domination is geographically, culturally, and ideologically a broad one. The most prominent examples of these are the Chinese revolution, which culminated in the establishment of communist power in 1949; the Vietnamese struggle against the French (and later against the United States); the Algerian War against the French; civil violence in Latin America; and convulsions in southern Africa. All of these struggles were waged by indigenous movements and their external allies in the name of national liberation and independence.

It is this intimate link between nationalism and statehood that triggers wars of independence, because the ideal of the nation-state is never fully achieved. In no historical case have all members of a particular nation gathered within one state's boundaries. On the contrary, many states contain a considerable number of national minorities. The lack of full correlation between the nations and the states frequently gives rise to tensions that can lead to war. Even in the twenty-first century, there are still nations without states whose warriors and militants are fighting for their independence—the Basques, Kurds, Catalans, Palestinians, Timorese, and countless others.

Generally, national minorities who feel dissatisfaction with the existing regime claim self-determination and fight for their separate states. For these national groups, greater emphasis is put on the independent existence of their particular nation. In fact, through the creation of armed wings and leader cadres these national groups have established proto-states. For national minorities the establishment of armed bodies and leadership structures indicate that national liberation is no longer a matter of private sentiment but a serious aspiration.

War Termination

War termination is the cessation of any conflict with a minimum of one thousand battlefield casualties per year. Disagreements exist within the literature on war termination over how to identify when a conflict has been terminated as well as the causes of war termination. Various theories of war termination focus on different means of war termination, which range from cease-fires to comprehensive peace settlements.

Theories of war termination seldom conceptualize or explain war termination as the obverse of war initiation for three reasons. First, in contrast to decisions to initiate or join wars, war termination is seldom brought about through unilateral action. Wars are only terminated through unilateral action when one of the participants eliminates the other participant or coalition on the battlefield. In many cases, both sides must cooperate to bring a war to an end. Second, as Fred Charles Iklé argues in *Every War Must End* (2005), the parties seldom consider the cessation of hostilities when contemplating the initiation or actually initiating hostilities. Third, war initiation and war termination do not necessarily share the same causes. Wars may bring about the emergence of new conflicts of interests. After a war has begun it is possible for it to widen or to incorporate issues in addition to those that sparked conflict in the first place. It is also possible that the issues over which the war was initially fought may not necessarily be resolved by the time the conflict is terminated.

Theories of war termination differ over how to identify whether a conflict has been ended. Some theories of war termination conceive of the cessation of hostilities as a discrete event that occurs at a specific time. Other theories of war termination conceptualize the termination of a conflict as a process that includes a series of events that occur over a given time rather than a single event.

Although the levels-of-analysis problem informs disagreements over the causes of war termination, because wars cannot be unilaterally terminated, both first-image and second-image theories of war termination take the form of two-level games. First-image theories emphasize the centrality of individual leaders' personalities and idiosyncrasies, but examine the interaction between leaders' personalities and constraints imposed by the international system. Similarly, second-image theories argue that interactions between second-image and third-image

variables are responsible for states' decisions to prolong or terminate. By contrast, neorealist theories argue that the continuation or termination of wars is due to uncertainty surrounding competitors' capabilities and present (as well as future) intentions, as well as the size of participants' war aims. When the participants in a war possess expansive rather than limited war aims, neorealists argue that wars are more likely to be prolonged because the sides will perceive one another as implacably aggressive. When participants possess limited objectives, absent escalation or war widening, it is likely that the war will be terminated when either side attains its objectives. Participants' possession of limited objectives also makes it possible for both sides to negotiate a settlement rather than prolong the conflict because reaching a bargain over a particular issue is not as injurious as acceding to the demands of an ambitious or imperialistic state.

Theories deriving their content from rational choice approaches do not serve as an addition to the three different types of theories discussed above. Instead, rationalist explanations for war termination have utilized both second-image and third-image variables. For example, H. E. Goemans (2000) accounts for war termination through the creation of a theory that fuses rational choice and regime type, while other rationalist explanations for war termination combine theories of bargaining with neorealist emphases on power shifts.

War termination may come about as the result of the destruction of one of the side's forces, a cease-fire, or a comprehensive peace settlement. Cease-fires are agreements to stop fighting but do not necessarily involve resolving the conflict(s) responsible for compelling states to fight, while comprehensive peace settlements attempt to resolve the underlying conflicts responsible for war.

Washington, Booker T.

The most powerful African American leader of his time, Booker T. Washington (1856–1915) preached and practiced a gospel of economic self-uplift. In an era when southern states were disenfranchising blacks and rolling back the civil rights they had won during Reconstruction, he encouraged African Americans to suspend the quest for social and political equality and focus instead on economic development.

Booker T. Washington, a former slave, contributed to the creation of the Tuskegee Institute as an institution of African American higher learning.

Born into slavery in Franklin County, Virginia, in 1856, Washington worked in the salt furnaces and coal mines of West Virginia after Emancipation (1863). After hearing of the recently established Hampton Normal and Agricultural Institute for black freedmen, he journeyed five hundred miles to enroll. Graduating in 1875, Washington so impressed Hampton's faculty that, in 1881, the school's principal recommended him to Alabama authorities to head the newly established Negro Normal School in Tuskegee. Washington held his first classes there in a dilapidated shanty, but over the course of two decades he gradually built the Negro Normal School into the Tuskegee Institute, a world-famous institution of African American higher learning that, by 1900, boasted sixty-six buildings, eighty-six faculty members, and a half-million-dollar endowment.

Tuskegee became a platform for Washington to advocate industrial education as the most promising avenue of African American self-uplift. Rather than pursue a classical curriculum, students at Tuskegee mastered basic subjects and developed the virtues of thrift, self-discipline, and industry through vocational study. Washington promoted the Tuskegee model on speaking tours throughout the 1880s and early 1890s, but it was his 1895 Atlanta Exposition Address that catapulted him to national prominence. In that address, he called on the South to increase educational and economic opportunities for African Americans with the understanding that blacks would henceforward refrain from seeking social equality and challenging white political supremacy. "It is at the bottom of life we must begin, and not at the top," Washington said, "In all things that are purely social we can be as separate as the fingers, yet, one as the hand in all things essential to mutual progress" (Washington 2003, 143). Applauding his proposed "compromise," white society recognized Washington thereafter as the leading spokesman for his race.

Washington published his autobiography, *Up from Slavery,* in 1901, cementing his reputation as an African American exemplar of America's rags-to-riches possibilities. Philanthropists showered Tuskegee and allied institutions with large donations, and presidents Theodore Roosevelt and William Howard Taft solicited Washington's advice on race relations. Many of Washington's African American contemporaries, however, lamented his acquiescence to social inequality and second-class citizenship. Some regarded him as a self-interested political boss who used his widespread power and influence to enhance his own position and stifle dissent. The disclosure of Washington's personal papers since his death, however, has allowed scholars to arrive at a more nuanced view of Washington—as a trickster figure who ingeniously navigated the landscape of racial

segregation in the United States to maximize African American opportunity. The discovery that Washington secretly financed legal challenges to early-twentieth-century efforts to strip black citizens in Louisiana and Alabama of the vote attests to the fact that Washington was more sympathetic to the African American quest for political equality than his public statements suggested. Behind the mask of accommodation lurked a politically subversive spirit. Washington died of nervous exhaustion and arteriosclerosis in 1915.

Ways and Means

Ways and Means is the name of a committee in the U.S. House of Representatives. The House Ways and Means Committee is the oldest standing committee in the U.S. Congress and is arguably the most powerful. This committee was first established in 1789 as an ad hoc committee directed at reviewing the revenue needs of the federal government. According to Article I, Section 7 of the U.S. Constitution, "All Bills for raising Revenue shall originate in the House of Representatives. . . ." This constitutional requirement is a primary reason for the importance and significance of this particular committee. Essentially, this committee has jurisdiction over all issues involving the raising of revenue including, but not limited to, taxation, bonds, international trade, and tariffs. Furthermore, this committee also has jurisdiction, among other things, over the Social Security program, Medicare, Temporary Aid to Needy Families (TANF), unemployment benefits, child support enforcement, and child welfare and adoption assistance. The House Ways and Means Committee currently has six subcommittees: Trade, Oversight, Health, Social Security, Income Security and Family Support, and Select Revenue Measures. Many state governments also have ways and means committees within the state legislatures that perform a variety of revenue-related tasks.

Weapons of Mass Destruction

The term *weapons of mass destruction* (WMD) is often used to refer to nuclear, biological, chemical, and radiological weapons as a group. Yet there is no widely accepted scholarly or legal definition of WMD. Even the independent, international Weapons of Mass Destruction Commission did not define the term in its final (2006) report. In recent years, a number of scholars have abandoned the term because it glosses over important differences among these weapons. While it is vital to understand the differences among nuclear, biological, chemical, and radiological weapons, it is also important to retain the analytic concept of WMD. Otherwise it would be easy to overlook the potentially similar military and political effects of nuclear and biological weapons.

WMD AS AN ANALYTIC CATEGORY

The concept of WMD allows scholars to abstract from the attributes of particular weapons to consider three broad categories of weapons: conventional or *relative* weapons, which fight other weapons; unconventional weapons, which target entire populations or geographic areas; and *absolute* weapons, which, regardless of how targeted, have destructive effects that cannot be limited by offensive or defensive military strategies or operations. Only the latter are WMD.

WHICH WEAPONS ARE WMD?

According to military strategist Bernard Brodie (who coined the term), an absolute weapon has "enormous destructive potency" that "concentrate[s] . . . violence in terms of time" (1946, 28–29). Today most scholars agree that the lethality, survivability, and deliverability of nuclear weapons make them absolute weapons. They further agree that, of the other weapons often classified as WMD, biological weapons are the most likely to have mass effects. Chemical and radiological weapons are more limited in their effects and thus best not considered WMD.

Nuclear weapons are clearly WMD. According to physicist Richard L. Garwin, a hypothetical one kiloton (kt) nuclear device exploded at ground-level in Manhattan would kill approximately 210,000 people "mostly from prompt radiation within a week or so. Of these, 30,000 would have died from the blast earlier, and about 100,000 from burns" (2002). The uranium bomb exploded by the United States over the Japanese city of Hiroshima in 1945 was thirteen kiloton; according to the U.S. Strategic Bombing Survey (1946), that bomb killed 30 percent of the city's population of 245,000 and seriously injured another 30 percent. Contemporary U.S. and Russian strategic nuclear weapons are approximately 150 kt.

Radiological weapons, or "dirty bombs," use conventional explosives instead of nuclear chain reactions to disperse radiological material. Because their blast is limited, the main effect of radiological weapons is to increase the long-term death rate from cancer. As a result, such weapons have little coun-

terforce utility. Yet this does not make them absolute weapons. Radiological weapons are much less lethal than nuclear weapons. According to Garwin, after "a hypothetical attack on Munich with one kilogram of plutonium dispersed by high explosives . . . 120 people would die of cancer after 40 years or so. . . . For a lifetime of exposure in the contaminated area, an additional 1% of the population would die from cancer" (2002).

Chemical weapons disperse substances such as mustard gas (a blister agent), phosgene (a choking agent), and sarin (a nerve agent) to kill or incapacitate soldiers and civilians. Although such weapons can be deadly to individuals, their effects on populations are far from absolute for two reasons. First, it is difficult to control the dispersion of chemicals in air and water, which are the vehicles most likely to affect large populations. Second, authorities can protect populations by monitoring air and water, advising people to wear masks and protective suits, administering antidotes, and evacuating affected areas. The fundamental difference between chemical and nuclear weapons that makes these defenses possible is the concentration of lethality in time. As Thomas L. McNaugher explains, "there is no defense against nuclear blast. . . . In sharp contrast, . . . to the extent that chemicals spread their destruction relatively slowly rather than instantly," it is possible to warn and evacuate "at least part of the target population" (1990, 31).

The limitations of chemical weapons were apparent in the 1995 sarin attacks on five Tokyo trains by the Aum Shinrikyo religious sect. Although the group had experience with aerosols, it chose to drop and puncture bags of liquid sarin, which limited exposure to those within evaporation range. As Jonathan B. Tucker explains, this "caused mass disruption but limited fatalities: twelve people died, fewer than would have been killed by an explosive device" (2000, 6).

Biological weapons use living organisms such as bacteria and viruses to kill or incapacitate target populations. Infectious biological agents such as anthrax have the same limitations as chemical weapons: it is hard to control their distribution and possible to protect people from exposure. Contagious biological agents are more potentially absolute in their effects, especially those such as glanders (Burkholderia mallei) for which there are no vaccines. To have mass effects, these agents must be kept alive in great numbers, dispersed widely, and allowed to incubate in unsuspecting populations. According to Garwin, high-efficiency air filters can reduce exposure by a factor of one hundred, and maintaining positive indoor air pressure can reduce it by a factor of one thousand. Yet, because contagious biological agents are difficult to detect, can be engineered to be drug-resistant, and can mutate and multiply, biological weapons have more potential than chemical or radiological weapons to act as WMD. Unlike nuclear weapons, biological weapons would not have immediate effects. But if a disease gained momentum, it could concentrate destruction in ways that could not be mitigated. Thus, as Susan B. Martin (2002) explains, biological weapons may have some of the same military and political effects as nuclear weapons.

MILITARY AND POLITICAL EFFECTS OF WMD

According to Brodie and other deterrence theorists, absolute weapons have revolutionary military and political effects. In particular, they make innovation and superiority in numbers and quality of weapons meaningless. Moreover, they transform the purpose of strategy from winning wars to averting them. According to Brodie, since the advent of nuclear weapons, militaries have "almost no . . . useful purpose" other than developing second-strike capabilities so potential aggressors will fear retaliation (1946, 76).

Scholars and policy makers who question the strength of deterrence fall into two camps. First, there are those like former U.S. Defense Secretary Robert McNamara who disagree with the distinction between conventional and absolute weapons and argue that offensive and defensive strategies remain viable. Second, there are those who agree with the distinction but worry that deterrence is weak. For Hans Blix and the other members of the WMD Commission, WMD designates a class of weapons that should be eliminated or controlled because, if used, their effects would be devastating.

Webb, Sidney, and Beatrice Potter

Sidney Webb (1859–1947) and Beatrice Webb (1858–1943) were British social reformers and founding members of the Fabian Society, with which their names are inextricably linked. They came from disparate backgrounds but married in 1892 and began a celebrated fifty-year partnership.

Sidney's father was a radical who had worked for British philosopher and economist John Stuart Mill. In 1865, at the age of sixteen, Sidney became a clerk for the city of London, educating himself by attending evening classes. He took an external law degree and was called to the bar in 1885. He was a professor of public administration at the London School of Economics from 1912 to 1927.

Martha Beatrice Potter was born to wealth and privilege. Though not formally educated, she had a desire for knowledge and an intelligence that was aided by her friendship with English philosopher Herbert Spencer. Influenced by Spencer's individualism, she adopted many humanist ideas.

Once Sidney and Beatrice were married, he resigned from the Colonial Office. Beatrice's private income permitted them to work on a series of books, of which the first was *The History of Trade Unionism* (1894). It was followed by *Industrial Democracy* (1897) and a monumental series of volumes in the *History of the English Local Government* (1906–1929). Beatrice was a member of the Royal Commission on the Poor Law from 1905 to 1909, and she and Sidney also authored the commission's minority report on the elimination of poverty. This report influenced successive British governments in their social policies.

Sidney played a central role in the formation of the Labour Party, serving on its executive board from 1912 to 1925. He wrote both its constitution and its manifesto, *Labour and the New Social Order,* in 1918. He was a Labour member of Parliament from 1922 to 1929, president of the Board of Trade in 1924, Dominions Secretary from 1929 to 1930, and Colonial Secretary from 1929 to 1931. He was created Baron Passfield in 1929.

The Webbs believed the best way to improve politics was to combine popular control and administrative efficiency. They maintained the ideal method to achieve these twin goals was through education, depending on the inevitability of change in human societies to transform the social order. This was the mission of the Fabian Society, which the Webbs were instrumental in founding and to which they dedicated much of their later life. As a Progressive member of the London County Council and as chair of the council's Technical Education Board, Sidney created the London school system that became the national model until 1944. He also helped to design the comprehensive plan for the University of London and founded the London

School of Economics and Political Science, which remained in the early twentieth century as one of the premier institutions in the United Kingdom. The Webbs also founded the influential journal, *The New Statesman,* in 1913.

The Webbs were reformers, not agitators, and they made only one significant foray into public controversy. Destitution—often compounded by sickness, unemployment, and old age—had been the main problem confronting Victorian society, and the Poor Law System had virtually broken down in addressing this issue. The Webbs' minority report to the Royal Commission on the Poor Law had made radical recommendations that were struck down by David Lloyd George, at that point president of the Board of Trade, despite the Webbs' vigorous opposition. It was not until 1945 under the postwar Labour government that many of the Webbs' recommendations were implemented.

The Webbs cowrote *A Constitution for the Socialist Commonwealth of Great Britain* (1920) and *The Decay of Capitalist Civilization* (1923). Beatrice also wrote her autobiography, *My Apprenticeship* (1926), based on the diary she had kept from childhood. The Webbs' last years were clouded by their adulation of Stalinism, although the Soviet system was the very antithesis of everything for which they had always stood. After a conducted tour of the Soviet Union in 1934, the Webbs published *Soviet Communism: A New Civilization?* in 1935, even as Soviet dictator Joseph Stalin was forcing millions of peasants into poverty.

Although the Webbs' endorsement of Stalinism was a sad postscript to a life guided by idealism, they left a solid legacy in the Labour Party, the London School of Economics, and the *New Statesman,* all of which continue to flourish in the early twenty-first century. Only the Fabian Society had ceased to exist. In 1947 the ashes of Sidney and Beatrice were interred in Westminster Abbey.

Together, the Webbs wrote more than one hundred books. In addition to those previously noted, they wrote *The Co-operative Movement in Great Britain* (1891*), The History of Trade Unionism* (1894), *Industrial Democracy* (1897), *The Manor and the Borough* (1908), *The Break-up of the Poor Law* (1909), *The English Poor Law Policy* (1910), *Works Manager Today* (1917), *The Consumer's Cooperative Movement* (1921), and *Methods of Social Study* (1932). Sidney authored alone *Facts for Socialists* (1887), *Problems of Modern Industry* (1887), *The Restoration of Trade Union Conditions* (1917*),* and *Grants in Aid: A Criticism and a Proposal* (1911). Beatrice wrote *Cooperative Movement in Great Britain* (1891), *Wages of Men and Women: Should They Be Equal?* (1919), and *Our Partnership* (1948).

Weber, Max

Max Weber (1864–1921) was a German historian, political economist, and sociologist. Educated at the University of Berlin, he taught at the universities of Freiburg (1894–1895), Heidelberg (1896–1899), Vienna (1918), and Munich (1919–1921). He also worked for many prolific years as an independent scholar, a mode of life that he chose after experiencing six years of mental difficulties and scholarly paralysis from 1897 to 1903. Weber also played an active role in German politics, including participating in the peace treaty negotiations at Versailles and in the drafting of the Weimar constitution.

Although Weber is justly remembered as one of the founders of twentieth-century positivistic social science, he himself was wary of using the method of natural science as a model for social science. He denied that the discovery of laws of social behavior is the chief purpose of social science, because such a focus turns attention away from understanding important and sometimes unique phenomena, such as the emergence of capitalism in the West. Similarly, his notion of interpretive (*Verstehen*) sociology was far from purely empiricist approaches. According to Weber, knowledge of the causes of social action requires the establishment of ideal-types that describe rational behavior under specific circumstances. Only by comparing actual actions with actions dictated by the ideal type can one know the true causes (which often include irrational factors) of actual actions.

Nonetheless, Weber is linked with social science positivism because of his treatment of the distinction between facts and values, which has become the foundational premise of positivistic social science. Believing that science cannot resolve the conflict between ultimate values (goals) and knowing that values determine the subjects of social scientific investigation, Weber sought to give an account of an objective social science that was both value-free and yet worthy of being chosen as a vocation. Despite his profound personal commitment to social science, however, this activity became problematic for him because he was aware that human reason cannot establish the superiority of the scientific outlook over the religious outlook. Accordingly his discussions of the methodology of social science have a tragic pathos that is missing in his positivistic followers.

Weber's most influential empirical work is his 1905 essay "The Protestant Ethic and the Spirit of Capitalism," in which he traces the origin of the spirit of capitalism (the moral view that gave rise to capitalism) to an interpretation of French theologian John Calvin's teaching, which maintained that worldly success is a sign of salvation. After completing this work, Weber turned to the study of the religions of China, India, and ancient Judaism in order to understand why they did not foster the spirit of capitalism. His study of religion as a whole was somewhat at odds with the prevailing spirit of social science positivism as well as Marxism, because it ascribed causal efficacy to religious ideas and because he refused to understand the secular order that these ideas unintentionally created as a change for the better.

Weighted Vote Systems

Weighted vote systems are systems of decision making by taking a vote in which the principle of equality of the vote (i.e., the principle of "one man, one vote, one value") is not observed. Instead, electors are divided into groups that are differentiated in the voting process. This can be the case with regard to the raw number of votes electors from different groups can cast (narrower definition of weighted voting) or the seat-elector ratio for the respective group (wider definition). The weight differentiation can be implemented according to certain prespecified criteria characterizing electors, such as region, property, tax burden, religion, sex, social status, or education. As a consequence, in weighted or asymmetric voting systems, electors from the different subsets by definition will have a differential impact on electoral outcomes simply by virtue of their belonging to one or the other of the groups into which they are divided. Depending on their design (i.e., whether individual citizens or whether representatives are endowed with different weights), such systems can be designed to implement or undermine the equality of citizens in the voting process.

Historically, several of the constitutional monarchies in the nineteenth century, as well as the United States before 1865, employed some form of weighted voting system. Prussia employed a three-class electoral system from 1849 to 1918 that divided voters into classes according to their annual tax burden. Although voters of different classes had the same raw number of votes, each class de facto elected the same number of representatives to the Prussian state assembly, thus giving each voter in the highest class (4.7 percent of the electorate) considerably higher representation than voters of the lowest class (82.7 percent of the electorate).

In the United States before 1865, voters in those states that allowed slavery indirectly had a higher influence over the presidential and House of Representatives elections than voters in states that had outlawed slavery. Due to the Three-fifths Compromise of 1787, the composition of the House of Representatives and the electoral college provided for

representation of the states on the basis of proportionality to the total population of the United States. This was done without a simultaneous enfranchisement of slaves themselves. Indirectly this had the effect of voters in the southern states electing more representatives per voter, giving them a higher weight in the process, without an increase of the electorate in the South.

In the modern era, examples of political bodies providing for a different raw number of votes include the European Union's Council of Ministers (each country's representative has a different absolute number of votes), the German *Bundesrat* (*Länder* governments have votes weighted by population size in combination with bloc voting), the electoral college in the election of the president of India (in order to ensure parity between the electors from the national parliament and those from the state assemblies, national representatives' votes are weighted, and in another step all electors votes are weighted by a factor on the basis of the size of the respective districts' electorate that they represent), as well as the U.S. electoral college (electors from all but two states currently vote *en bloc* and states have different numbers of electors based on their share in the total U.S. population). Despite these comparatively prominent cases, in more recent times, examples of weighted voting systems being used in national or subnational legislative or other political bodies have become increasingly rare.

Weil, Simone

Simone Weil (1909–1943) was a French social, political, and religious philosopher whose writing continues to influence contemporary social ethics, theology, and political theory.

Born into a nonreligious Jewish family, Simone showed a gift for languages and moral reasoning at an early age. She studied philosophy at the Lycée Henri IV secondary school and the Ecole Normale Supérieure. Weil was influenced by her mentor, Alian (Emile Auguste Chartier), a philosopher who taught the importance of imagination and logic, the close reading of texts, and the avoidance of ideological thinking and the easily summarized argument—all directives that become characteristic of Weil's own written work.

As a university student, Weil became active in French politics and the trade union movement. Although not a communist (in fact, Weil was critical of party organization and materialist explanations of class conflict) she nevertheless drew from German philosopher Karl Marx's radical critique of society. She worked as a provincial school teacher, factory worker, field hand, and journalist. Though she was a pacifist, she experienced the Spanish Civil War (1936–1939) first hand, feeling it was necessary to bear witness to the major events of her time. Weil opposed French colonialism and was a Christian mystic who refused baptism on the grounds it would separate her from nonbelievers as well as limit her freedom of thought. She has been described by the literary scholar Leslie Fiedler, in his introduction to Weil's *Waiting for God* (1951), as the "patron saint of outsiders."

Central to Weil's political thought, much of which is gleaned from posthumously published essays, notebooks, and letters, are ideas concerning the importance of suffering, affliction, oppression, and force as independent variables in human history. In her 1934 essay, "Reflections Concerning the Causes of Liberty and Social Oppression," and other writings, she argued, not unlike thinkers Jean-Jacques Rousseau, Friedrich Nietzsche, and Sigmund Freud before her, that modern civilization is plagued by "disequilibrium" caused by a separation from God and nature, a growing reliance on technology, and a slavish attachment to the "collectivity," be it the "Great Beast" of the state or society itself. Weil argued that progress is an illusion and that the only hope for society was in greater social cooperation and decentralization of authority. In one of her most highly regarded essays "*The Iliad* or the Poem of Force" (1940), Weil argued that Homer's underlying message (not unlike that of the Gospels) is that reconciliation can only be achieved when warring parties recognize the limits of power and the need to empathize with enemies. In *The Need for Roots* (1952), written in anticipation of the end of World War II (1939–1945) and published posthumously, Weil argued for a reawakened spiritual politics based on the cultivation of community, self-denial, compassion, and mutual obligation over rights.

Weil's strength as a political thinker is found in her nuanced reflections on what she referred to as the *metaxu,* or mixed blessings, of the "in-between" institutions of family, home, work, church, and country (as opposed to state) that she believed nourish the roots of civic life; her failure was in not fully coming to terms with the role that public debate, interest group politics, parties, and competitive elections play in the establishment and maintenance of democratic regimes. In that sense, Weil brilliantly confused her longing for grace or "what ought to be the case" in politics, for the harder, more mundane gravity of "what is."

Weil died in a London sanitarium of tuberculosis and heart failure after refusing to eat more food than what she mistakenly believed noncombatants ate under German occupation.

Welfare Rights

Welfare rights are a modern phenomenon in which citizenship is extended to the social reproduction functions of the state. Premodern social protection was often punitive, removing recipients from mainstream society and citizenship. Welfare rights secure entitlement as a matter of citizenship and are constitutive of the welfare state. The major welfare rights are in the areas of basic income, health, pensions, and so forth, while the extent of goods and services that are distributed as a matter of entitlement rights varies across the welfare states.

Welfare rights are often attributed to the democratization of social reproduction, whereby the disadvantaged classes demand more fair forms of treatment and entitlement. Perhaps the most well-known statement of welfare rights is that of T. H. Marshall, a twentieth-century British sociologist who addressed the question of the impact of citizenship on social inequality (Marshall referred to welfare rights as social rights). Modern citizenship, he argues, unfolded in a three-stage process: it began with the eighteenth-century civil rights revolution, was furthered by the nineteenth-century extension of the political rights, and was completed in the twentieth-century construction of the welfare state and social rights. Marshall argues that in premodern (feudal) times, social protection came at the expense of civil liberty. Spurred by the Industrial Revolution and liberal ideology, civil freedom was connected to self-ownership of labor power and thus the free contracting of labor. With this transformation, Marshall argues that social protection had to reformulate itself in ways consistent with the commodification of labor.

According to Marshall, welfare rights developed to bridge the disconnect between the equality implied by citizenship and the inequality produced by free markets. However, welfare rights do not replace market-based incomes or fundamentally alter the class structure of market societies. Welfare rights leave in place inequality of "money incomes" (though it is diminished by progressive taxation) while equalizing "real incomes"—the basket of social goods individuals are entitled to regardless of market income. Welfare rights thus alter individuals' experience of market-based (class) inequality. Marshall, then, was optimistic of the capacity of welfare rights to solve the problem of legitimation posed by class inequality to states that are legitimated by equal citizenship.

Social democratic political reformers used the strategy of universal welfare rights to create a sense of social solidarity among citizens and democratic majorities behind the welfare state. Delivering equal goods and services to all citizens, regardless of income and means, diminishes the political importance of class position while strengthening ties and loyalties to the state. As such, a primary political function of welfare rights is to diminish the salience of class position in political interest formation by extending social entitlement to the middle class. By creating shared interests and bases for political mobilization around social entitlement, welfare rights function as "power resources" for the stability and further expansion of the welfare state.

Welfare rights are not, however, a purely social democratic creation. Elites of all political persuasions have extended welfare rights in nation-building and state-building efforts. A well-cited example of conservative-led efforts to legitimize the central state through the extension of welfare rights is Otto von Bismarck's effort to combat class-fragmentation, head off socialism, and secure working-class interests to the German state. Welfare rights also have been used by nation-building elites to work against other divisions such as territorial and cultural fragmentation. Welfare rights thus have the dualistic character of at times being "won" or acquired by citizens and at others imposed onto them.

It is suggested by many that it is inappropriate to conflate social entitlement and obligations with citizenship. Positive welfare "rights," it is argued, differ in type from negative civil and political rights, as they are conditional on production levels and the revenue-raising capacity of the state, and so require prior productive duties. The ongoing politics of welfare state reform are characterized by the rise of conditionality on social entitlement, as expressed in the Third-Way slogan of "no rights without responsibilities" and seen in workfare policy reforms. Despite the politics and rhetoric of retrenchment, it is universal policies, those distributed as a matter of citizenship right, that have proven to be most stable by constructing cross-class solidarities behind them.

In addition to emerging in the context of the nation-state, welfare rights also have developed as part of the formation of international human rights law. For instance, the Universal Declaration of Human Rights (1948) includes rights to certain standards of living (housing, food access), opportunity resources (education, employment), and economic freedoms (collective bargaining, workplace safety). Such welfare-related human rights have become part of international law through treaties such as the European Social Charter (1961); the United Nations' International Covenant on Economic, Social, and Cultural Rights (1966); and the Protocol of San Salvador amendment to the American Convention on Human Rights (1988). Like in the nation-state, international welfare rights function both as formal entitlements and aspirational goals modeled on progressive implementation, thereby addressing the issue of state capacity.

Welfare State

The welfare state was an essentially European invention that spread and developed in the states of western Europe and some of their New World offshoots. What is today known as the welfare state, *Sozialstaat, l'état providence,* or *folkhemmet* was most aptly described by historian Asa Briggs in a 1961 article as a state

> in which organized power is deliberately used . . . in an effort to modify the play of market forces in at least three directions—first, by guaranteeing individuals and families a minimum income . . . ; second, by narrowing the extent of insecurity by enabling individuals and families to meet certain "social contingencies" (for example, sickness, old age and unemployment) . . . ; and third, by ensuring that all citizens . . . are offered the best standards available in relation to a certain agreed range of social services." (228)

ORIGINS OF THE WELFARE STATE

The Western concept of the welfare state emerged during the last quarter of the nineteenth century, when European societies were undergoing fundamental social, economic, and political changes—what historian Karl Polanyi called the "Great Transformation" in his groundbreaking 1944 book of the same title. Industrialization, the rise of capitalism, urbanization, and population growth had undermined the traditional forms of welfare provision offered by family networks, feudal ties, guilds, municipalities, and churches, creating a new class of disenfranchised poor. At the same time, the formation of nation-states, secularization of governance, and spread of mass democracy was creating an institutional framework for political articulation of social needs, and the gains in productivity resulting from industrialization provided the resources to meet them. This transformation was occurring in similar fashion throughout western Europe and parts of the New World, but the political responses to it, and the moral incentives for providing welfare and coping with what came to be known as *die soziale Frage* (the social question), varied widely.

There was remarkable diversity in the national trajectories of welfare state building and resultant social policy constellations. In the authoritarian European monarchies that pioneered social security legislation in the 1880s, social programs were imposed from the top down, while in the democracies of Switzerland and the New World, they emerged from the bottom up. Policy goals, types of institutions and financing mechanisms, program types and administration, the blends of public and private provision, and the use of cash transfers, social services, and regulatory policies all differ dramatically between nations. These multifarious manifestations of the welfare state are part of the varied legacy of state and nation building: of specific political contexts and cultures—particularly with respect to public trust, or lack thereof, in the state's capacity to solve problems; of differing patterns of social cleavage based on class, ethnicity, or religion; and of different constellations of political and social actors and institutions.

When the first welfare states emerged in the nineteenth century, many social scientists, most notably the German economist Adolph Wagner in 1893, considered the phenomenon to be the direct fallout of industrialization and its accordant social and economic changes. According to Wagner's Law, public expenditure in industrial economies was bound to consume ever larger portions of the gross national product, and this is exactly what happened over the course of the twentieth century. In the nineteenth century, the lion's share of most national budgets went to military expenditures, and social programs just barely registered their presence. In 1890, for example, military expenditures in the industrialized countries comprised an average of 25 percent of total public expenditure, whereas social expenditures were only 4 percent. But by the beginning of the twenty-first century these warfare versus welfare spending priorities had been turned upside down. Among the countries of the developed world in the year 2000, the average spent on the military had shrunk to 4 percent, whereas that spent on social programs had increased to 40 percent of total public expenditure.

Wagner's Law and the economic and social theories that built on it in the 1950s and 1960s were what social scientists call *functionalist* arguments in that they presumed social policy was driven exclusively by structural changes in the economy and society. According to such theories, welfare state expansion should have been a steady process that followed similar trajectories in all industrialized countries. In fact, however, expansion occurred in a sporadic manner, with spurts of growth and stagnation, while national welfare states came in a plethora of different sizes and shapes. In 2005, for example, U.S. public expenditure was only 15.9 percent of gross domestic product as compared to Sweden's 29.4 percent. Modern theories of the welfare state account for these temporal and national idiosyncrasies by focusing on political determinants such as the partisan complexion of government, political institutions, and international influences. According to social scientist Walter Korpi's Power Resources Theory, for example, the ways that labor parties and unions put their organizational capacities to use was a deciding factor in determining the trajectory of welfare state development. However, as historian Peter Baldwin (1990) has noted, no single configuration of socioeconomic variables or group of actors can fully explain the development of the welfare state. "Industrialization, free trade, capitalism, modernization, socialism, the working class,

civil servants, corporatism, reformers, Catholicism, war—rare is the variable that has not been invoked to explain some aspect of [welfare state] development" (36–37).

In most countries, the welfare state's first big growth spurt occurred between the two world wars. With the establishment of the International Labour Organization (ILO) in 1919, the first efforts to internationalize some aspects of social policy went into effect. The collapse of the central powers monarchies in World War I (1914–1918) and the subsequent democratization of Europe meant that huge new segments of society had a voice in government. Unions and parties representing laborers gained access to the corridors of power, and parties based on Christian social doctrines rose to the fore. In most countries, the Great Depression (1929–1939) put an end to this first phase of welfare state expansion, but in the United States and Scandinavia it actually provided an impetus to development. In the United States, where the postwar period saw relatively little welfare state development, the Great Depression unleashed the first major wave of expansion, what political scientists refer to as "welfare state takeoff."

POST–WORLD WAR II DEVELOPMENT

World War II (1939–1945) and the subsequent drive to establish an internationally sanctioned world order to ensure peace and security had a major impact on welfare state development. European welfare states experienced their second massive growth spurt during the so-called *trentes glorieuses,* from 1945 to 1974. The ruling paradigm during this period was that increased economic integration and trade among European nations would forestall future conflicts, but European integration was a gradual process, and this second wave of welfare state expansion, which was episodic, took place in economies that were still relatively closed. Companies could not relocate beyond national borders to avoid taxation, nor was it easy for workers to migrate abroad in search of better wages. Solidarity was a requisite component of such economies, and governments of all partisan complexions took advantage of the opportunity to impose redistribution. The war had paved the way for public support of the Keynesian economic model, which had been developed during the depression. With whole societies in need of rebuilding, it was easy to justify high taxes and public expenditures if they promoted high employment and cared for the disabled and destitute. The idea that capitalist economies required government intrusion in economic and social affairs to manage demand and stabilize business cycles was widely accepted. Exceptionally high rates of postwar economic growth and a relatively even balance of power between labor unions and business interests tended to mitigate conflict over the distribution of wealth. The period has, in retrospect, been described as the "golden age" of welfare state development. Existing social programs were extended to cover new groups of beneficiaries, such as peasants or the self-employed, entirely new social welfare schemes were adopted, and there was a general increase in social benefits throughout the developed world.

Even as nations became wealthier and welfare states expanded, the national differences in social expenditure levels and institutional patterns persisted and new ones developed. Various attempts have been made to classify the different types of welfare state, but sociologist Gøsta Esping-Andersen's 1990 typology has proved the most useful. He defined three ideal types of welfare that encompass the full range of actual welfare states, what he calls three "worlds of welfare." These worlds are distinguished by the impacts that a given social insurance arrangement has on *decommodification:* that is, the extent to which survival and well-being are independent of an individual's labor market participation; its impact on *stratification,* meaning the amount of economic class division within a society; and who is responsible for welfare provision, whether the state, the market, or the family (see table 1). The distinctions between these three regimes, which are associated also with different systems of production and education, can be traced to the history of welfare state building, most notably to how effective the labor movement was at building cross-class coalitions (Korpi's Power Resources Theory) and to the manner in which the Catholic Church's social welfare system was or was not incorporated.

CRITIQUES AND CHALLENGES

In the early 1980s, welfare capitalism began to falter and the golden age came to an end. The international political economy had undergone a fundamental transformation, beginning in the early 1970s with the collapse of the Bretton Woods financial system and the economic slowdown that the oil-price crises had triggered. Deteriorating economic performance and governments' failure to cope with stagflation led to mounting public skepticism about the state's role in social and economic affairs. The welfare state came under fire from all directions. Criticism came from across the political spectrum, but the biggest challenge came from proponents of neoliberalism and a new, morally engaged conservatism. They viewed high cash transfer rates as a distortion of the labor market that discouraged business investment and inhibited economic growth. From this perspective, the best way to deal with the new international economy was to "roll back the state" to its core functions. As neoliberal parties gained and wielded power in the 1980s, deregulation, the internationalization of capital markets, and escalating trade liberalization became the norm. The 1990s were characterized by the emergence of a truly global economy that included the Single European Market and European Monetary Union.

In Europe the deepening of integration imposed constraints on fiscal and monetary policy that precluded Keynesian macroeconomic programs at the national level. It also meant that national welfare states lost a degree of sovereignty and became embedded in an emerging multilevel social policy regime. More generally, economic globalization created more competition between nation-states for footloose capital and investments, which depended in part on low labor costs and intensified pressures on national social standards. Enhanced exit options for capital made taxation and redistribution more

difficult to implement and created an asymmetric balance of power between labor organizations and business interests.

In addition to the external challenges posed by the emergence of the global economy, mature welfare states also have been confronted by a number of internal domestic challenges that are related to societal modernization and the transition from industrial to postindustrial economies. Service sector productivity is generally lower than industrial sector productivity. This means that the service sector generates lower rates of economic growth and smaller wage increases, both of which have negative feedback effects on public revenues. Private service sector jobs also tend to be less well-compensated than industrial jobs. Gains in employment in the private service sector can only be achieved by generating higher inequality, unless the public sector exercises a compensatory function. Some scholars have diagnosed these problems as the "trilemma of the service economy," which they characterize as a trade-off between employment growth, income equality, and sound state finances.

Competing in the global economy requires a flexible labor force that can be upsized, downsized, and transformed by retraining or replacements as demand changes and competitive advantages shift away from established industries. This need, as

well as greater labor market participation by women, has led to the proliferation of part-time, temporary, and fixed-term jobs. The welfare state was not designed to accommodate these alternative forms of labor, which can be expected, in the long-run, to produce large numbers of elderly poor. The increase in the number of women in the labor market also has decreased the capacity of families to provide welfare, as women who stayed at home were traditionally responsible for the care of children, elders, and the infirm. An increase in the numbers of single-parent households has had similar effects. At the same time, the erosion of traditional family forms and changes in male and female contributions have generated new social risks and needs, placing new demands on social care. Single parents and families with many children, for example, now comprise a significant percentage of the poor.

The two other potential challenges to national welfare states are demographic. Life expectancies have increased dramatically over the past decades, while fertility rates have declined. The result is an aging population and increased demand for the most expensive welfare state programs—pensions, health, and long-term care—that will require greater expenditures in the future. Scholars such as Alberto Alesina and Edward L. Glaeser also expect the increasing ethnic heterogeneity in European

societies to pose problems for social-democratic and conservative welfare states. They maintain that these welfare states are based on a set of common values and political community, and that increasing ethnic heterogeneity will undermine this solidarity and make legitimation of redistribution impossible to achieve, pushing continental Europe toward American-style liberal social policy. Many scholars, however, disagree with this assessment.

RECENT REFORM TRENDS

National welfare state regimes have exhibited varying degrees of vulnerability and resistance to the problems and challenges that have plagued them since the 1980s, and they have followed quite different pathways to accommodate them. Nevertheless, there have been common trends in welfare state restructuring that stretch across the different types of regimes.

None of the established national welfare states were completely dismantled—popular support of the welfare state made it impossible to achieve legitimation for such measures—but retrenchment was common, with widespread reductions in benefits. Ironically, benefit cutbacks were outpaced by increasing expenditures due to rising unemployment, aging populations, and the emergence of new social risks. In almost all Organization for Economic Cooperation and Development (OECD) nations since 1980, public and private social expenditures have increased. But while public social spending levels in the different types of welfare state regimes have converged over time, levels of private social expenditure have not. Furthermore, reductions in benefits have been asymmetrical, among programs within regimes, as well as among regimes, and in some areas benefits were increased or expanded. Since the mid-1990s, for example, most Western welfare states have attempted to increase employment rates and recognize the role of the family in welfare provision. There has been a general expansion of family policy, with a focus on paid parental leave programs, more social services for children, and the use of cash transfers and tax breaks for families with children.

With respect to old age pensions, there has been a general shift toward multipillar pension schemes. As attempts were made to decrease state liability for supporting aging populations, the reliance on private pension schemes increased. Most health reforms focused on cost containment. Here there was a curious tendency to cope with the inefficiencies of the established health care system by borrowing components from foreign systems: state-run health care systems introduced competition in the form of "quasi-markets," social insurance systems encouraged competition between insurance carriers, and liberal health care regimes in the United States and Switzerland allowed for more state involvement. Labor market policies generally shifted away from passive support toward active and activation policies aimed at integrating the unemployed into the labor market, and at generally reducing welfare dependency. Worker training programs, wage subsidies, and job placement services for the unemployed have been greatly expanded. Typical coercive components of these policies include cutbacks in cash benefits, stricter conditions for

benefit eligibility, shorter benefit duration for the able-bodied unemployed, and weaker employment protection and working time regulations.

These common trends in welfare state restructuring have led to some blurring of regime types, but the demarcation lines with respect to modes of financing, personal coverage, and benefit generosity persist much as they had during the postwar golden age. If we take into account the various private forms of provision and the impact of different tax systems, we see that major divides between contemporary welfare state regimes persist, determined not by their net amount of social spending, but rather, by differences in structure and institutional make-up. International comparisons of income distribution, poverty, and inequality make this readily apparent. While the distribution of market incomes has developed almost in parallel across OECD countries, the OECD showed for the early 2000s that inequality in *disposable* incomes was reduced by 40 percent in Sweden and only 5 percent in Korea—these were the two extremes. The impact of the particular mix of public and private benefit provision, for example, is readily apparent in a cross-national comparison. Poverty and inequality are significantly lower in Nordic and Bismarckian welfare states, where public provision is dominant, than in most liberal welfare states, where markets play a greater role. Indeed, Gøsta Esping-Andersen's three worlds of welfare capitalism are clearly reflected in the OECD's 2008 Gini-coeffcients of three representative countries: 0.38 for the United States, as the liberal welfare state; 0.30 for Germany, as the conservative one, and only 0.23 for social democratic Sweden.

West, Decline of the

A pessimistic book translated into many languages, *The Decline of the West* was a two-volume essay published by German philosopher Oswald Spengler between 1918 and 1922, though the first chapters ("Form and Actuality," or "Gestalt und Wirklichkeit") in the first volume were certainly written around 1906. The second volume, *Perspectives of World-History* (*Welthistorische Perspektiven*), was written only after the end of World War I (1914–1918). In *The Decline of the West,* Spengler argued that Western civilization was entering into a cycle

of decay, which was collateral to the decline of the classical culture. Spengler mainly used a comparative method and often referred to other societies, especially ancient Rome, insisting on the importance of economics. Spengler's formulas can sometimes be seen as an inspiration for postmodern thought; for example, he wrote in his introduction that "There are no eternal truths." English-speaking readers should be aware that *The Decline of the West* was published in abridged versions as well. Although less important, Spengler's following book, *Man and Technics: A Contribution to a Philosophy of Life* (1932), was shorter and kept a similar pessimism regarding progress.

If he was influenced by Goethe and Friedrich Nietzsche, Spengler himself was a major influence for philosophers like Siegfried Kracauer and expressionist writers like Georg Trakl. Half a century after Spengler, Manfred Fleischer borrowed his famous title and added a question mark for his own book *The Decline of the West?* (1970).

Today, the expression of a hypothetical "decline of the West" has been reused in various contexts to refer to decadence or the end of an era. During recent decades, more than one hundred books had a title beginning with the expression "The end of. . . ." With a title similar to Spengler's, the Canadian movie *The Decline of the American Empire* (1987), directed by Denys Arcand, was a huge success worldwide and was celebrated at the Cannes Film Festival.

Westminster Model

The Westminster model of democracy refers to the British system of government in which executive power is derived from and is accountable to the legislative power. This model of democracy is closely associated with the United Kingdom, and elements of it have been present in the political systems of Canada, India, Israel, and New Zealand. The Westminster model also was popular in the first postcolonial decade (the 1960s) in the African independent states.

The term *Westminster model* was coined by Arend Lijphart in his work *Democracies: Patterns of Majoritarian and Consensus Government in Twenty-One Countries* (1984) as a contrast to consensus democracy, where he uses it interchangeably with the term *majoritarian democracy.* According to Lijphart's definition, "the essence of Westminster democracy is majority rule, e.g., government by the majority and in accordance with the majority's wishes comes closer to the democratic ideal than government by and responsive to a minority" (4). Describing the Westminster model of democracy, Lijphart distinguishes nine basic interrelated elements and he illustrates them with features from the British political system, particularly as it operated in the period from 1945 to 1970. These elements are: a concentration of executive power

(e.g., one-party cabinets or bare-majority cabinets); a fusion of power and cabinet dominance; an asymmetrical bicameralism (one body of representatives has far more power than the other); a two-party system; a one-dimensional party system; a plurality system of elections; a unitary and centralized government; an unwritten constitution and parliamentary sovereignty; and an exclusively representative democracy.

Acknowledging that his majoritarian model is drawn from British and New Zealand examples, Lijphart emphasizes the possibility "to derive all of the characteristics of the majoritarian model logically from the principle of concentrating as much political power as possible in the hands of the majority" (207). That is why this model could be described as a *rational* one, a political system that can be constructed from an actual system; e.g., the British one. Taken to its logical extreme, the majoritarian (Westminster) model would include each of the following characteristics: minimal winning or one-party cabinets supported by a strong and cohesive legislative majority; a unitary and centralized government; a unicameral parliament; and a two-party system with one-issue dimension politics dividing the party in power and its opposition. The electoral system that maximizes this concentration of power in the hands of the one party is plurality method voting. Constitutional flexibility is very important too; e.g., Lijphart stresses the importance of an unwritten constitution (211–213).

Lijphart also argues that the model could be understood as a *prescriptive* one, because it includes "a set of basic choices that have to be made by democratic constitutional engineers in countries that attempt to introduce or strengthen a democratic regime" (209). Accepting this interpretation, a major deviation from the majoritarian model in Britain and New Zealand has to do with the fact that neither is a completely homogenous society (e.g., the political influence of regional and national parties like the Scottish national party and Plaid Cymru in the United Kingdom, or the Maori movement in New Zealand). According to Lijphart, the third way to understand the Westminster model is *empirically,* as all "logically coherent elements of majoritarian model should be found together in the real world" (211).

The Westminster model was widely admired in the immediate postwar years as an example of what a liberal polity should be, and in the 1950s and 1960s this model migrated to the ex-colonies in Africa and Asia, where it seemed for many the very touchstone of democracy. Many African politicians in the beginning of the 1960s believed that they could use the majoritarian model for building newly independent governments on the foundation of Western ideas. As Vernon Bogdanor pointed out in an interdisciplinary introduction to British constitutionalism in 2003, for nationalist entrepreneurs such as Kwame Nkrumah in West Africa, "the 'Westminster model' fitted this outlook, since it represented their only idea as to how a political kingdom might be organised; as a slogan, it also helped to deflect any danger that they might be fobbed off with something less than untrammelled independence."

Nevertheless, Lijphart's definition of Westminster democracy is suitable only for homogenous societies, none of which can be found in postcolonial African countries. That is why many political and social scientists—such as James B. Christoph—criticize these tendencies, arguing that a "true" majoritarian model should incorporate not only parliamentary democracy as practiced at Westminster but embody the Western political worldview in general, whose specifics cannot be transferred to other societies.

Wheare, Kenneth C.

Kenneth Clinton Wheare (1907–1979) was an Australian-born political scientist who spent his career in Great Britain and for most of his adult life was associated with Oxford University. He is best known for his work on the English constitution and on federalism.

Wheare received a bachelor of arts (honors) in Greek and philosophy from the University of Melbourne. He was selected as a Rhodes Scholar (1929) and studied at Oriel College of Oxford University, earning a "first class" baccalaureate degree in philosophy, politics, and economics (1932). He won a masters (1935) and a doctor of letters degree (1957) from Oxford.

Wheare's professional association with Oxford began immediately after he completed his final examinations in 1932, when he was offered a position as a tutor in politics. The many positions he subsequently held there included Gladstone Professorship of Government and Public Administration at All Soul's College, rector of Exeter College, vice chancellor of the university from 1964 to 1966 (the first Australian to hold the post), and a Fellow of All Soul's College (1973–1979).

From 1967 to 1971, Wheare was president of the British Academy. In 1972 he was appointed chancellor of the University of Liverpool. He also served as an academic advisor to the Interim Committee of the Australian National University (1949) and chaired the Rhodes Trust (1962–1969). He was appointed a member of the Most Distinguished Order of Saint Michael and Saint George (CMG) in 1953 and was knighted by Queen Elizabeth II in 1966.

Wheare was an adviser to political leaders on constitutions, notably working with the National Convention of Newfoundland from 1946 to 1947. The convention was established to decide the future of the British colony, which since 1934

had been governed by a British-appointed government commission. He was also an advisor to the Central African Federation from 1951 to 1953. Wheare believed that new constitutions came about because people wanted to make a "clean break" with the institutions that had governed them in the past.

Wheare was one of the leading experts on the English constitution. His first book, *The Statute of Westminster* (1933), explained how the statute granted the dominions legislative equality with the Parliament in Great Britain. His subsequent works discussed the evolution of the colonies into independent states. He also analyzed the workings of the British government, describing it as a "parliamentary bureaucracy."

Wheare was also a leading authority on federalism. His book *Federal Government* (1946) went through four editions. According to Wheare, federal states were regimes where each level of government had its own sphere of authority, and one of the principal challenges was to ensure coordination rather than conflict between the national and subnational levels of government.

Whip

Whips are the members of the party leadership in legislatures who are charged to organize members to vote and to enforce party discipline. The term originated in the British Parliament from the phrase "whipper in," a hunting assistant who was charged with keeping the dog pack together. In both the U.S. Congress and Westminster systems, there is usually a chief whip for each party (known in the United States as either the Majority or Minority Whip) and a varying number of assistant or deputy whips. The main responsibility for whips is to ensure that members in the legislature are present and support the party during critical votes. Whips are responsible for providing the leadership of their party with realistic estimates on support or opposition for measures. In the U.S. system, whips may recommend the removal of a member from a prized committee or leadership position, but in general have far less power to punish or cajole than do their counterparts in parliamentary systems. For instance, in the British Parliament, whips have the power to expel members from the party, although not from

Parliament itself. In the Westminster system, whips also serve as the initial point of contact for negotiations between the parties on legislative matters.

White, Leonard D.

Leonard D. White (1891–1958) is recognized as the founder of the academic discipline of American public administration. A native of Acton, Massachusetts, he was a professor at the University of Chicago and a civil servant who held several positions in different levels of government. He received a baccalaureate degree from Dartmouth College in 1914, a master's degree from Dartmouth in 1915, and a PhD from the University of Chicago in 1921. He also had honorary degrees conferred upon him from Dartmouth (a DLitt in 1946) and Princeton University (an LLD in 1952). White also had the honor of having the Commander of the Order of Leopold II from Belgium bestowed upon him in 1948. White received the Woodrow Wilson Award from the American Political Science Association in 1948 for *The Federalists* (1948) and the Bancroft Prize of Columbia University in 1955 for *The Jacksonians* (1954).

White's academic career began at Clark University in Massachusetts, where he was instructor of government from 1915 to 1918. He then served as an assistant professor of political science at Dartmouth College from 1918 to 1920. White then joined the University of Chicago in 1920 as an associate professor of political science. He was promoted to full professor, ultimately holding the Ernest DeWitt Burton Distinguished Professorship in public administration until his retirement in 1956 and then serving as an emeritus faculty in political science until his death in 1958. White also served as chair of the Political Science Department at Chicago from 1940 to 1948. He was very active in university governance.

In addition to his substantive contribution to the University of Chicago during his long tenure there, White had tremendous impact in the founding of the academic discipline of public administration in the United States. In 1926 he authored *An Introduction to the Study of Public Administration,* which was the first textbook published in the field. He was the founding editor of the *Public Administration Review.* He served as the president of the American Society for Public Administration from 1947 to 1948 and as president of the American Political Science Association from 1943 to 1944. The Leonard D. White Award presented by the American Political Science Association for the outstanding doctoral dissertation in the field of public administration is named in his honor.

White also was active in government administration, and he served as a U.S. civil service commissioner during the Franklin D. Roosevelt administration. White also contributed to *Trends in Public Administration* (1933) for President Herbert Hoover's Research Committee on Social Trends.

In his 1965 article "Leonard D. White and the Study of Public Administration," Herbert J. Storing wrote of White that he was "concerned with a fundamental contradiction that lay and still lies at the heart of the study of public administration, and that in the work of his later years he provided his best advice on the approach to that study" (38). This maxim calls for attention to the founding and use of the historical method for understanding administrative organization and its values, to what White termed the *art of administration*. White defined four major *assumptions* about public administration: that it is a single process and substantially uniform; that it should start from the base of management rather than the foundation of law; that it is still primarily an art yet has a significant tendency toward science; and that administration continues to be the heart of the problem of modern government. As Storing remarked, "These assumptions are still perhaps the best concise statement of the foundations of the discipline."

White's contributions endure as seminal works to the field of public administration and continue as central works in public management, organization theory, and administrative history. His work on administrative history and the historical development of government organization from its founding principles makes him indispensable to students of public administration and policy.

White Primary

The White Primary was used in some southern states to prevent black citizens from voting. Shortly after Reconstruction ended in 1877, the Democratic Party, which was largely controlled by white citizens, regained dominance of state and local offices throughout the South. Many members of the Democratic Party in Texas decided to exclude all nonwhite citizens from voting in the Democratic Party's primaries, as at this time, most of the elected offices in Texas were held by candidates from the Democratic Party. This practice, known as a White Primary, effectively excluded black citizens from voting in the Democratic Party's primary. A series of court cases eliminated the Democratic Party's ability to exclude citizens from voting based on color.

In 1923, the Texas State Legislature enacted a law requiring all voters in the Democratic primary to be white. In 1944, the U.S. Supreme Court in *Smith v. Allwright* invalidated the law as violating a black citizen's right to vote in a primary election, as guaranteed by the Fifteenth Amendment.

White Supremacy

White supremacy is actualized white racism. Its core tenets include a belief in inherent racial inequality, white superiority, antipathy toward people of color, and a willingness to maintain it through legal and, if necessary, extralegal means. It includes, but cannot be reduced to, prejudicial attitudes and ethnocentric preferences because it is deeply embedded in the social structures, economic institutions, public policies, and ideologies that perpetuate white authority in all spheres of social, economic, and political life. According to Joe Feagin and Hernán Vera, white supremacy in the United States can be defined as "the socially organized set of attitudes, ideas, and practices that deny African Americans and other people of color the dignity, opportunities, freedoms, and rewards that

Members of the Ku Klux Klan promote white supremacy and the racial inferiority of people of color.

SOURCE: Corbis

this nation offers white Americans" (1995, 7). While people of color may hold prejudicial or antipathetic attitudes toward white people or other people of color, this is distinct from white supremacy.

Historically, white supremacy has several sources. European exploration and colonialism reflected views that Native Americans were uncivilized heathens. Some Enlightenment philosophers posited that Europeans alone possessed the necessary capacity of reason in contrast to Africans, indigenous peoples of the New World, and Asians who were ruled by caprice or custom. Scientists in the seventeenth and eighteenth centuries, such as Carolus Linneaus, explained human variation with typologies that invariably placed Europeans at the pinnacle of intelligence and beauty, with Africans, Asians, and Native Americans representing lines of "degradation" from this ideal. In the late 1800s, pseudo-scientific definitions of race and intelligence were offered by Samuel Morton and Paul Broca, who ranked races on the basis of brain size and facial features. And Christianity in the United States justified both the enslavement of Africans, based on the Curse of Ham and belief that slavery would Christianize Africans, and the expulsion of Native Americans from their land on the basis of "manifest destiny."

White supremacy can take an overt, direct, and substantive form, such as slavery and Jim Crow–era *de jure* racial segregation in the United States, "White Australia" policies, apartheid in South Africa, and the ideology of Aryan supremacy that led to the Holocaust in Nazi Germany. These policies were official doctrines of the state and were institutionalized through culture, policies, and laws, and rested on assumptions of the biological, genetic, or cultural inferiority of the various groups that were to be subjugated or eliminated. While such policies have been officially changed and these assumptions rejected, there remain avowed white supremacists who are proudly racist and willing to engage in violence (e.g., hate crimes, lynching) on the assumption that their government is sympathetic to and infiltrated by people of color and their allies.

White supremacy also can take a covert, indirect, and procedural form that may be harder to expose, such as de facto racial inequalities and institutionalized discrimination that persist in the United States even after landmark civil rights legislation ended legal segregation. Although overt racism has been repudiated by most, as is evident in the decline of overtly expressed prejudice measured in surveys, white supremacy persists in latent assumptions of the allegedly inherent character flaws (e.g., "laziness" and "criminal propensities") that are used to explain and justify racial inequalities in an era of color-blind laws and equal opportunity. Further, some scholars suggest that equating white supremacy with violent racists such as skinheads ignores how it is covertly and deeply embedded in cultural, economic, and political practices to the point that it assigns "white privilege" to all white people, even those who do not consider themselves racist. Whiteness as a racial identity thus becomes racial privilege and allocates social and material resources such as the best education, access to housing, and employment to white people that when accumulated and transferred to future generations reinforces itself over time.

White supremacy can be found on multiple levels. On a personal level it includes racist acts by individuals ranging from discriminatory hiring to hate crimes perpetuated by members of white supremacist groups such as the Ku Klux Klan or neo-Nazis in the United States and Europe. On a sociocultural level it includes racist ideologies and beliefs that are expressed and perpetuated in religion, popular culture, and the news media. Lawrence Blum states that on an institutional level, white supremacy includes the "racial inferiorizing or antipathy perpetrated by specific social institutions such as schools, corporations, hospitals, or the criminal justice system as a totality" (9). Depending on the level, it can be counteracted through litigation, legislation, consciousness-raising, debunking pseudo-scientific racial hierarchies, moral arguments for the oneness and equality of humanity, and economic programs aimed at alleviating the systematic disadvantages and barriers against which people of color struggle in white dominated societies.

Wildavsky, Aaron

Aaron Wildavsky (1930–1993) was an American political scientist who spent the majority of his career teaching at the University of California at Berkley. The son of Jewish immigrants, he attended public schools in Brooklyn, New York, through his childhood. After his graduation from Brooklyn College, where he became interested in politics, Wildavsky joined the military to serve in the Korean War (1950–1953). After the war, he attended Yale University and attained his doctorate. He began his teaching life at Oberlin College and at the age of sixty-two joined Berkeley as a professor there until his death in 1993.

In addition to teaching, Wildavsky also had a deep appreciation for writing. He wrote or cowrote at least forty books, 204 articles and book chapters, seventeen newspaper articles, and numerous other essays and reports. Other accomplishments include serving as chair of Berkley's Department of Political Science, founding its Graduate School of Public Policy, and serving as president of the American Political Science Association. Wildavsky also won several awards in his field, among

them the Charles E. Merriam Award, the Paul F. Lazarsfeld Award, and the Harold Lasswell Award.

Having written or cowritten nine books and forty articles on the topic of fiscal policy and budgeting, including *The Politics of the Budgetary Process* (1964), Wildavsky is considered one of the biggest contributors to the subject. In *Politics,* he writes about the basics of budgeting and explains power politics and budgetary culture. He teaches readers how to cooperate to reach a budget that spreads its good and bad aspects fairly to every group involved in the negotiation. He also shows the reasoning behind different moves made by various players in a budgetary negotiation and theorizes that procedural reform could help the process to create better policy.

Another area of study in which Wildavsky broke new ground was policy implementation. In his 1973 book *Implementation: How Great Expectations in Washington are Dashed in Oakland: or, Why It's Amazing that Federal Programs Work at All,* he writes about the large difference between the hopes and expectations of public policy in Washington, DC, and the actual results in the area where the policy took effect. He focuses on a case in which the federal government had budgeted more than $20 million dollars in Oakland, California, to increase the social calm and create a more stable community. Wildavsky finds that only 10 percent of the $20 million was actually spent. His diagnosis of the problem is that too many government officials had to give the "okay" before any program was implemented. He refers to this as "multiple clearance problems." By avoiding the politics of program creation and focusing on results, Wildavsky improved the study of policy implementation.

William of Ockham

William of Ockham (c. 1285 to c.1347) was a Franciscan friar and philosopher. He was born in the southern English town of Ockham, entered the Franciscan order, and later was educated at Oxford University, although he never received his theology degree. His early career yielded several significant philosophical works, including commentaries on Peter Lombard's *Sentences* (1318) and Aristotle's *Physics* (1322–1324), several theological treatises, and a major work on logic, *Summa Logicae* (c. 1323).

The effects of Ockham's philosophical writings on political science are important but indirect, principally because his works are not fully understood or, until recently, were not widely accessible. The term *Ockham's razor,* nonetheless, has remained a conventional reference to the principle of parsimonious theoretical construction reflecting Ockham's work on logic, which advocates against the inclusion of unnecessary assumptions or explanatory components. Ockham's novel philosophical arguments against the real existence and essence of universals, his consistent recognition only of particulars, and his emphasis on the autonomy of voluntaristic will ordered by reason and the common good are reflected in modernist commitments to the ideas of methodological individualism, personal liberty, and coercive minimalism. At the same time, Ockham's metaphysics of particulars and his philosophic-theistic understanding of radical ontological contingency stand in stark contrast to the generalizing intentions and methodologies of modern political and social science. Regularly yet debatably referred to as a nominalist, Ockham argued that human knowledge was based on direct empirical experience of particulars and their attributes, and that observed generalities or group similarities are mental conceptualizations only. In addition, his philosophical deconstruction of public authority opens a pathway for the idea of individual rights, which for Ockham, however, are never divorced from their divine origin, or the individual's responsibilities to the common good and moral accountability.

In 1323 Ockham was summoned to Avignon, France, to defend his theological writings before the papal court of Pope John XXII. The inquiry lasted for several years without any apparent resolution. While in Avignon, Ockham became involved in a controversy concerning recent papal pronouncements against Franciscan practices and views of poverty, a still radical Christian perspective against the right of private property. Ockham rejected the papal arguments as inconsistent with scriptural and previous papal teachings. In 1328 Ockham left Avignon with several Franciscans, including the order's superior general, Michael of Cesena; the specific conditions prompting this departure remain unclear. Ockham and the others were excommunicated for their departure, and they accepted the protection of King Ludwig of Bavaria, who was involved in his own controversy with the pope and others over his disputed 1314 election to the throne of the Holy Roman Empire and his military occupation of Rome in 1328. Ludwig also protected Marsilius of Padua, author of *Defensor pacis* and a vigorous proponent of conciliar over papal authorization of imperial power. Ockham remained under Ludwig's protection for the next twenty years, and his subsequent writings focused almost exclusively on political topics, although they continued to reflect his prior philosophical and theological commitments. In his *Work of Ninety Days* (c. 1332–1334) and a letter to the Franciscan Order at Assisi (1334), Ockham defended

the Franciscan perspective on poverty and systematically identified the errors of the pope's arguments. Over the next thirteen years, he wrote additional treatises and the massive but unfinished *Dialogus* in which he concluded that Pope John XXII and his successors heretically promoted false doctrines, thus disqualifying themselves from the office. Ockham argued for consequentialist ethics for public authorities and a separation and limitation of both papal and secular powers. However, he was not antipapist and he clearly rejected the practice of conciliar and theological majoritarianism, as well as the idea of representation employed by Marsilius of Padua.

Williams, Raymond

Raymond Williams (1921–1988) was a literary critic and political commentator whose work had a substantial impact on the political left of the United Kingdom in the years after World War II (1939–1945). Williams excelled in the cloistered academic spaces of Oxford and Cambridge universities, but his work always drew him out of that arena and into the real-world struggles of everyday people. He explored these interests through a diverse set of writings that includes novels, plays, and literary criticism.

Williams was born in Wales to a working-class family. His father worked on the railroads and was a staunch Labour Party supporter. Both of these elements would figure prominently in Williams' later life. He would often remark about his Welsh heritage and its grounding effect on his later accomplishments. Similarly, his Labour roots undoubtedly affected his early political leanings and lifelong dedication to exposing inequality's cultural roots through criticism and literary expression. Williams served in World War II and then returned to Cambridge to complete his education. Subsequently, he taught for a number of years in adult education programs. During this period, he began writing, and he was offered a position at Cambridge where he would remain until retirement.

Williams' prominent volume that captured the attention of academics was *Culture and Society* (1958). In this work, Williams dove into English literary history from the 1700s to the 1900s, examining changes in the concept and meaning of culture. Through the works of British philosopher Edmund Burke, English poet William Blake, and English author George Orwell, Williams fashioned a new way of thinking about the evolution of the term *culture* as well as the social structures it was used to describe. Chief among the reasons for the development and change to the notion of culture was the massive upheaval led by the Industrial Revolution. In 1976, Williams's *Keywords: A Vocabulary of Culture and Society* was published. It was intended to be an appendix to *Culture and Society* but has become a classic text on its own.

Among the many other works of note in Williams' oeuvre, two others are of special note. One is a brief volume on Orwell. This text is important because many casual observers might assume that Williams had special appreciation for Orwell, but this was not the case. Although they held a number of similar ethical and political commitments, the volume is critical of many aspects of Orwell's work. The other key text is *Marxism and Literature* (1977), which spells out Williams's views on the emerging field of cultural studies and delineates his ideas from ones relying on structuralism.

Williams's influence on the politics of the left was apparent during his lifetime, and his importance has only grown since his death. He has been a tremendous influence on literary, social, and political theorists across the globe. The field of cultural studies owes him a huge debt, as do scholars in disciplines such as political science, anthropology, sociology, and law who seek to understand the interconnections between culture, society, and the ever-changing forms of human expression.

Winner–Take–All

Winner-take-all is an electoral system (used generally in the United States and Canada) in which a winning candidate receives a majority of votes at the general election. The United States inherited the majority election system from Great Britain, where the process for parliamentary elections is termed *first past the post.* Forty-eight of the fifty United States generally receive all of that state's electoral votes (that is, the majority rules at the state level, with the exceptions being Maine and Nebraska). The electors assigned to the candidate who is the winner of the majority of votes in their state are all represented in the Electoral College. The casting of votes against the winning candidate at the state level is negated by the delegation of electoral votes. The

federal principle in presidential elections is a fundamental structure of the U.S. Constitution. All of the national elective offices are based on the federal principle, or elections based on the state, in accordance with the national motto, "e pluribus unum." The federal principle in presidential elections forces candidates to focus attention on smaller states, which may be otherwise ignored, by developing extensive cross-national political coalitions. Consequently, the president of the United States will have the ability to govern because of the ability to develop widespread cross-national support. The notion is to protect the freedoms and prerogatives of the few (as opposed to the many). As former British colonies, Australia and India also utilize majority voting. Continental European countries—in addition to Ireland, Japan, New Zealand, and South Korea—have implemented forms of proportional representation.

Withering Away of the State

The *withering away of the state* is a concept that places classical Marxism in a differentiating position in socialist political thought from both the statism of other forms of socialism and the antistatism of anarchism.

Marxism views *the state* as an instrument with which one social class maintains its power over other social classes. A socialist revolution therefore requires the destruction of the capitalist state by the working class. However, the working class will need its own state (the "dictatorship of the proletariat") to consolidate its power and move toward a communist society, but such a social order will abolish social classes and thereby undermine the need for a specialized state structure. As a result, the state will progressively "wither away," as expressed by nineteenth century German philosopher Friedrich Engels in Part 3, Chapter 2, of *Anti-Duhring:*

> The interference of the state power in social relations becomes superfluous in one sphere after another, and then ceases of itself. The government of persons is replaced by the administration of things and the direction of the processes of production. The state is not "abolished," *it withers away.*

This concept of a withering away of the state reflects a tension within Engels's and nineteenth-century German philosopher Karl Marx's views between a deep antistatism and a belief that a state structure is needed in the transition from capitalist to communist society. The antistatism view is expressed throughout the philosophers' work, taking its sharpest form in Marx's writings on the French state. The latter view of a necessary state structure emerged whenever they outlined a concrete program for the working class, as in Marx's 1848 *The Communist Manifesto.*

Marx and Engels attempted to resolve this tension: first, by insisting that the existing state had to be destroyed; second, by advocating its replacement by a workers' "semistate" based on the model of the Paris Commune that minimized repressive functions and bureaucracy; and, third, by arguing that even this limited state form would eventually disappear. (This all depended on a major development of the productive forces and the collapse of the division between mental and physical labor—the social foundation of bureaucracy.)

The logic of this approach rests on two problematic assumptions: first, that the state is dominated by its repressive functions (and hence the need for it will decline once social conflict is marginalized); and second, that under socialism public functions can be reduced to "administration" based on rational calculus, without the intrusion of social interests and values. As several contemporary writers have pointed out, this is closer to the views of Engels (and, following him, Russian Bolshevik leader Vladimir Lenin) than those of Marx, but the issues seem not to have been explored sufficiently during their lifetimes to expose tangible differences.

This attitude toward the state differentiated Marxism sharply from anarchism, which shared Marxism's hostility to the capitalist state. However, anarchists saw the repressive character of the state as inherent by its very nature rather than as a product of its connection to class society. Moreover, they believed that it was possible to move immediately to decentralized and cooperative social institutions once the oppressive state has been overthrown and were highly suspicious of any discussion of creating a postrevolutionary state, suspecting that it would recreate elitist institutions and new forms of exploitation.

Somewhat surprisingly, given the later development of the Soviet Union, Lenin vigorously embraced the concept of the withering away of the state. In his classic 1917 *State and Revolution,* Lenin emphasized the need to "smash" the existing state machine and replace it with a minimally bureaucratic state, also modeled on the Paris Commune. The actual development of the Soviet state followed a very different course, which its leaders justified both by the need for defense against internal and external enemies and the tasks of socialist construction. Lenin however continued to be concerned by the bureaucratization of the state and before his death tried to champion institutions like the Workers and Peasants Inspectorate as a counterweight. Despite the accelerating bureaucratization of Soviet society under the leadership of Joseph Stalin, the issue persisted in Soviet Marxist discourse. As late as 1939, in his "Report to the Eighteenth Party Congress," Stalin found it necessary to argue against the idea that the socialist state should "die away," justifying its role by the "capitalist encirclement" of the Soviet Union and asserting that under such circumstances the state would continue even into mature communism.

Wittgenstein, Ludwig

Ludwig Josef Johann Wittgenstein (1889–1951) was an Austrian philosopher well known for his work in a number of fields including logic, language, and mathematics. He studied engineering at the University of Berlin from 1906 to 1908 and then moved to Manchester, England, where he engaged in aeronautical research. While studying in England, he met British philosopher and logician Lord Bertrand Russell, whose influence led to Wittgenstein's move into the study of mathematical philosophy.

During World War I (1914–1918), Wittgenstein served in the Austrian army. While in the field he wrote *Tractatus Logico-Philosophicus* (1921). The book describes his picture theory of language in which the words of a language were mental pictures in the mind that actually mirrored the realities of the world. After the war, he came in contact with the Vienna Circle, a group of philosophers whose *logical positivism,* an attempt to reconceptualize empiricism using contemporary scientific advances based on the theory that knowledge comes only from the five senses, was derived from a misunderstanding of Wittgenstein's thought.

In 1929 Wittgenstein returned to Cambridge University and became a professor there in 1939. During his tenure at the university, two notebooks, the *Blue Book* and the *Brown Book,* were circulated among students of language. These notebooks expressed radical revisions of Wittgenstein's earlier thought.

Wittgenstein died of cancer on April 29, 1951, at Cambridge. After his death his latest philosophical ideas were published in 1953 in *Philosophical Investigations.* In this work he made unique contributions in the areas of logic and the philosophy of language. Wittgenstein theorized that most philosophical problems are due to linguistic confusions. Communication takes place in "language games" that have their own rules, which means that languages such as French or Hindi have different rules of grammar that are like the differences in the rules of soccer or basketball.

Although Wittgenstein's political views were sympathetic to the communism of the 1930s, politics was not a major focus of his. However, his thought has been used to discuss political issues. For example, human rights cannot be explored or explained using the five senses. Some linguistic philosophers and positivist legal thinkers would, as a consequence, argue that claims to the rights of life, liberty, and the pursuit of happiness are merely expressions of emotions or matters of taste and do not represent anything substantial in reality. However, the failure to defend human rights has often had dreadful consequences throughout history. Rights are claims that people make that have powerful consequences. Duties are correlatives to rights. If there is a right, then someone else has a duty to protect that right. To attribute disputes about rights to the linguistic confusion that sometimes occurs in political issues is, in the view of many political theorists, a failure to understand that rights rest upon God, nature, or human nature and not the use of words.

For analytic philosophy the confusion over the great variety of conflicting meanings for words such as *freedom* (which has more than two hundred meanings), *power, justice,* and *rights* are the result of verbal misunderstandings. However, political theorists believe that there is something permanently substantial at stake in these words because they point to different aspects of the richness of the human experiences of freedom.

Wittig, Monique

Monique Wittig (1935–2003), a French novelist, philosopher, poet, and activist, made important contributions to feminist and gay and lesbian theory by developing an original approach that she labeled *materialist feminism.* Under this heading, she sought to expose sexual difference as a political division that masquerades as natural and serves to legitimate the subordination of women. Her work called for doing away with categories of sex and engaged in linguistic experimentation designed to undermine the masculinist structure of language itself. Wittig is perhaps most famous for her depiction of lesbianism as a revolutionary project that aims to overcome sexual difference altogether. In one of her most widely read essays, "One Is Not Born a Woman" (1992), she writes, "Lesbianism provides for the moment the only social form in which we can live freely. Lesbian is the only concept I know of which is beyond the categories of sex (man and woman), because the designated subject (lesbian) is *not* a woman, either economically, politically, or ideologically. For what makes a woman is a

specific social relation to a man, a relation we have previously called servitude. . ." (1993, 20).

Born in Alsace, France, in 1935, Wittig moved to Paris in her teens, later studied at the Sorbonne, and eventually received a doctorate from the École des Hautes Études en Sciences Social in 1986. Her first novel, *L'opoponax* (1964), on the experience of childhood, was a critical success and won the prestigious Prix Médicis. Her subsequent fiction, *Les guérillères* (1969), a feminist epic, and *Le Corps Lesbien* (1973), which reimagines the female body from a lesbian perspective, are notable in part for Wittig's efforts to expose and challenge the gendered character of language itself. In *Les guérillères,* for example, Wittig deploys *elles,* a traditionally feminine plural pronoun, as a universal, collective pronoun signifying simply "they."

While living and writing in Paris, Wittig helped to create the Mouvement de Libération des Femmes (MLF). She organized and participated in the August 1970 demonstration that is often cited as the inaugural event for the second wave feminist movement in France. In 1976 she immigrated to the United States where she held a number of university teaching positions. She continued to work in various genres, but focused primarily on producing theoretical essays, written in English, many of which were published first in the journal *Feminist Issues.* A collection of Wittig's most important essays is collected in the volume *The Straight Mind,* published in 1992. She was a professor of Italian, French, and women's studies at the University of Arizona, where she taught for many years until her death in 2003. She was survived by her partner and collaborator, Sande Zeig.

The materialist feminist position Wittig developed in her theoretical writings has been influential in contemporary feminist and queer theory internationally. Reworking Marxism, Wittig argued for the recognition of women as a distinct, oppressed class and called for the abolition of the categories of sex (men and women) as a political project. She believed such a task entailed confronting the social contract—heterosexuality itself—which founds the current order and sanctifies the division of men and women. While there can be no complete escape, there is nonetheless, Wittig suggests, the possibility that we can "renegotiate daily, and term by term, the social contract" (1993, xiii).

Wollstonecraft, Mary

Mary Wollstonecraft (1759–1797) was an eighteenth-century British writer best known for her passionate defense of women's moral and intellectual equality. The author of texts in multiple genres, her most influential work, *A Vindication of the Rights of Woman* (1792), argues that women's inferiority to men is not sanctioned by nature but is instead the product of corrupt social institutions and mores, which must be radically reformed. Her critical stance against women's subordination, coupled with her unconventional personal life, make Wollstonecraft a seminal figure in the history of feminist thought.

Born in London into a large, volatile middle-class family, Wollstonecraft left home at the age of nineteen. Although initially employed as a governess, she was determined to support herself as a writer. Her first three books, published in 1787 and 1788—a conduct manual, a novel, and a children's book—all criticized European society for fostering weakness and superficiality in women and insisted on the importance of education in rectifying this tendency. Wollstonecraft also worked as a translator of French and German philosophical texts and as a reviewer and editor for the journal *Analytical Review.* An affair with a married artist ended when his wife rejected Wollstonecraft's suggestion that they form a three-person relationship. In the years that followed, Wollestonecraft wrote her two major works, *A Vindication of the Rights of Men* (1790) and *A Vindication of the Rights of Woman,* as well as a history of the French Revolution (1789–1799) and a narrative of her travels through Scandinavia. In 1792 she moved to France and acquired a new lover, Gilbert Imlay, an American writer with whom she had a daughter out of wedlock. After Imlay left her, Wollstonecraft returned to London and attempted suicide twice in 1795 before becoming involved with William Godwin, the anarchist philosopher. Godwin and Wollstonecraft were married in 1797 after learning she was pregnant, although both had previously criticized marriage. Their short-lived and unusual marriage (they kept separate residences) was by all accounts happy, and Godwin was devastated when Wollstonecraft died at the age of thirty-eight due to complications from childbirth. Their only child would later write the novel *Frankenstein* (1818) under her married name, Mary Shelley.

Although *A Vindication of the Rights of Men,* which attacks Irish philosopher Edmund Burke's defense of hereditary rule by forwarding a doctrine of universal natural rights, remains an important text, it is *A Vindication of the Rights of Woman* that articulates the position for which Wollstonecraft is best known. In the work she paints damning portraits of women's

vanity, passivity, and poorly developed intellect to argue for the alteration of this condition. Contending that women suffer from an "artificial weakness" encouraged by dominant beliefs and habits, Wollstonecraft calls for significant changes in education, politics, and family life so that women may develop their reason, and in turn, their virtue. Although she encourages women to take an interest in political and humanitarian matters and argues for their equal citizenship, she also affirms women's unique roles as mothers. She offers a revolutionary vision of domesticity in which educated, moral, and independent women oversee the care of children and act as "rational companions" to their husbands. She insists, as in all her works, that women, like men, are endowed with the faculty of reason, which can flourish only if existing norms and customs are transformed.

Womanism

Womanism is a framework for understanding the matrix of race, class, and gender. This framework explains how groups and individuals experience power and oppression depending on their identity within this matrix, and on their status within the social hierarchy. Womanism uses this concept as a base for advocating social change. Womanism appeals to those interested in gender politics, but who prefer an addition or alternative to feminism. Some have argued that feminism discriminates by focusing on the issues of white women and by its concern with white perspectives. Womanism provides an option for social and political analysis that makes black women and other women of color central. Womanism, feminism, black feminism, and woman of color feminism are all approaches to sociopolitical transformation. They use similar tools of political analysis and share a commitment to confront sexism. Womanism, however, is not a subset of feminism.

The earliest reference to womanism is Alice Walker's 1979 short story, "Coming Apart." Two other authors independently used the term in their writings: Chikwenye Okonjo Ogunyemi, and Clenora Hudson-Weems, whose work is associated with Africana womanism. Africana womanism, like womanism more broadly, is a proposed new vernacular focusing on consensus, compromise, and cooperation, and that brings women of African descent to the center of the discourse. The concept of womanism was popularized by Alice Walker in her book, *In Search of Our Mother's Gardens: Womanist Prose* (1983), and is generally attributed to her. The term, *womanism,* derives from the West Indies and the U.S. southern black folk expression, "You acting womanish" (xi) (i.e., like a woman, or grown, as opposed to girlish or frivolous). According to Alice Walker, a womanist is a responsible, courageous, and audacious "black feminist or feminist of color" (1983, xi). She loves other women sexually or nonsexually, yet is "not a separatist, except periodically for health." A womanist, in Walker's view, loves music, dance, the moon, the spirit, food, and herself. A "womanist is to feminist as purple is to lavender" (xi–xii).

Womanism contains five key components. It is opposed to oppression. It is centered on everyday language, politics, experience, and people. It is not dogmatic or rigidly ideological. It seeks to optimize the welfare of all members of the community. It recognizes that spirituality is a significant and legitimate aspect of human life and political action.

Womanism is global in scope, yet simultaneously uses a grassroots approach to sociopolitical transformation that appreciates the life-enhancing features of ethnic and cultural diversity. Its purpose is antioppressionist social change. Its methods are based on the experiences and problem-solving

approaches of black women and other women of color rather than privileging the highly formalized or centralized techniques of institutionalized politics.

Womanism understands that body, mind, and spirit are interconnected. Progressive change cannot be achieved unless problems in the political, environmental, and spiritual worlds are addressed. The process of womanism is dynamic and fluid. It rejects ideological rigidity and recognizes instead that contradiction is an inherent component of the human condition.

Womanist methods of social and political change may include nonviolent communication, mediation, self-help, and mutual aid. Womanism is interested in seeing individuals and communities flourish. It considers both physical and psychological well being as necessary for achieving social justice.

Womanist issues include war, poverty, violence, education, health care, xenophobia, ageism, and other problems related to identity, power, and experience. There are concerns that womanism contains elements of unacknowledged homophobia, in part, resulting from theological issues and precepts of black Christian faith. Womanism is not, however, necessarily allied with black Christian churches, and a perspective that accepts lesbians and homosexuality is more consistent with the womanist principles of inclusivity.

Examples of groups incorporating womanist principles, methods, and viewpoints include The Underground Railroad, mutual aid societies, and reparations activism in the late 1800s, The Combahee River Collective, the Women of Color Resource Center, and the National Black Women's Health Project (Phillips, 2006).

Some claim that womanism is exclusively by and for black women. Others believe that anyone is free to identify as womanist provided they are committed to eradicating sexism and racial injustice, working toward improving the universal community, and acknowledging that individual standpoints are at least in part derived from ethnicity and culture.

Because womanism considers everyday and spiritual knowledge to be valid sources of information, womanism is sometimes dismissed by academic and political traditions as naïve, misinformed, or eccentric. Womanists understand this dismissiveness as the result of sexism, racism, and classism. Contemporary womanist theory and politics is integrated into work by authors such as Zora Neale Hurston, Paule Marshall, and Toni Morrison, and continues to undergo development and change through the grassroots work exemplified by popular online blogs such as Renee Martin's Womanist Musings, Monica Robert's TransGriot, and Tamara Winfrey Harris' What Tami Said.

Women, Violence Against

Because women are physically weaker than men and because the majority of women around the world live in societies where power resides in the hands of men, females of all ages remain vulnerable to violence. The United Nations estimates that one in every three of the world's women has been beaten or sexually abused. Violence against women (VAW) is a crime that crosses all age, class, racial, ethnic, educational, and national barriers. VAW covers a wide range of practices, including battering, emotional abuse, rape, human trafficking, public beatings, stonings, bride burnings, and forced pregnancies and abortions.

The most notorious forms of violence against women have included female infanticide (particularly in China and India), Chinese foot binding, African female genital mutilation, the virtual enslavement of British women identified as "sinners" by the nineteenth-century Catholic Church in Magdalen laundries and asylums, and the so-called honor killings performed in some Muslim countries. Among some tribes in Benin, Ghana, Nigeria, and Togo, the practice of *tro-kosi* has allowed families to provide young girls for use as slaves by fetish priests to atone for offenses committed by family members. If these young girls die in service, families are honor bound to replace them with other young girls.

Women in war-torn areas and refugee camps who do not have access to stable political and social infrastructures are particularly vulnerable to various forms of violence. Women and children make up the majority of casualties in modern-day warfare. Even in the most developed countries, VAW is a major societal problem. For instance, a whole body of literature deals exclusively with the violence among members of the Canadian military.

Since the 1980s, the trafficking of women has increased, spreading from Asia where it was historically acceptable to other parts of the world. This increase has been partially a response to the economic crises and rise in organized crime experienced when the Soviet Union collapsed in 1991. Women from Russia and the Ukraine have been trafficked into Asia, Latin America, and even into parts of western Europe and the United States to be sexually exploited either by choice or because they were lured into believing they were headed toward legitimate jobs.

In response to pressure by women's groups, the European Union became involved in the effort to stop human trafficking in the 1990s. The United Nations adopted a protocol against trafficking in women and children in 2000. That same year,

bipartisan efforts in the United States led to the passage of the Victims of Trafficking and Violence Protection Act.

According to the United Nations International Research and Training Institute for the Advancement of Women (INSTRAW), violence against women exacerbates in a wall of silence because of the stigma involved, the lack of access to legal information and power, the inability of governments to protect women through adequate legislation and enforcement, and a shortage of education that provides ways of dealing with the causes and consequences of violence.

The UN commitment to ending violence against women resulted in the 1993 adoption of the Declaration on the Elimination of Violence against Women, which declared that

> Violence against women is an obstacle to the achievement of the objectives of equality, development and peace. Violence against women both violates and impairs or nullifies the enjoyment by women of their human rights and fundamental freedoms. The long-standing failure to protect and promote those rights and freedoms in the case of violence against women is a matter of concern to all States and should be addressed.

In 1993, the European Union (EU) launched a campaign to wipe out VAW, beginning with an acknowledgement by the European Ministerial Conference that violence against women violated the basic human rights of women and interfered with the right to fully participate in the democratic process. The Comprehensive Plan of Action on VAW was initiated in 1997. Today, the EU requires all members to commit to ending violence against women.

In the United States, the attempt to curtail VAW led to the passage of the Violence against Women Act (VAWA) in 1994. The law set federal penalties for interstate stalking and spousal abuse, created the National Domestic Violence Hotline, and increased penalties at the federal level for repeat offenders. The law also earmarked grant money for building and improving battered women shelters, expanding rape crisis intervention, hiring additional police officers, and providing training on rape and domestic violence. In 2000, the Supreme Court overturned the provision of VAWA that allowed victims of VAW to sue their attackers for violation of their civil rights in *United States v. Morrison* (529 U.S. 598).

Women and Security

The inclusion of women in security studies results from the confluence of several trends in both the study and practice of international relations. Within the academy, there has been a growing realization that disaggregating along gender lines (along with other identities) is analytically useful. In the policy and practice world, security studies in general are expanding from a narrow examination of armed conflicts and elite actors to a more expansive approach. Finally, women have increasingly been participating in international conflicts and peacekeeping efforts at all levels.

By the late 1980s, women's studies and gender issues had a significant presence in the academy with the recognition of "gender as a useful category of analysis," which staked the claim that women and gender are integral to our understanding of social processes and power dynamics. In conflict and security studies, using women as an analytic category has been particularly useful, showing that the treatment of women is valuable as an early warning indicator of potential conflict, revealing that women and children bear disproportionate burdens in conflict itself, recognizing rape as a weapon and crime in war, and so on.

Academic work on women and security has primarily been located within a wider feminist discourse, using the concept of patriarchal systems to critically examine gendered aspects of war and security. By disaggregating gender, this work drew attention to how constructs of masculinity and femininity have been used to legitimize war, as well as the different ways in which war impacts men and women, and it shone a light on gendered aspects of militarization. Using the argument that valuing masculine qualities such as aggression has led to rampant militarization, this literature initially tended to claim that women's inclusion in security concerns will mitigate these trends. Authors on gender and international relations—who variously agree and disagree with this perspective—include Jean Bethke Elshtain, Cynthia Enloe, V. Spike Peterson, Laura Sjoberg, Jill Steans, and J. Ann Tickner.

Concurrently with this academic shift, international organizations were turning their attention to the specific topic of women and security. Traditionally, security studies have focused on what is known as "hard" security: specifically dealing with outright armed conflicts and the threat of the same. However, there has been a recent trend to recognize HIV/AIDS, population growth, the persecution of different identity groups, and environmental degradation as significant security threats. This expansion has included the recognition of the different ways men and women experience and participate in conflict, and how gender is implicated in these nontraditional threats.

Part of this development has been international meetings, resolutions, and agreements that have served to both encourage and compel parties engaged in conflicts to recognize the role of women and the importance of including a gender perspective in conflict transformation processes. Major international agreements include the United Nations Convention on the Elimination of Discrimination Against Women (CEDAW), adopted in 1979, which set the stage for the fourth World Conference on Women in Beijing in 1995 (known as Beijing '95). The topic of women, peace, and security is outlined in Chapter 1 of the Beijing Declaration and Platform for Action, which specifically calls for the inclusion of women at all levels of conflict resolution and transformation by drawing on the United Nations Charter, and by framing women's inclusion as part of the organization's fundamental mission. Termed *gender mainstreaming,* this concept has been adopted almost universally by intergovernmental organizations (IGOs) and nongovernmental organizations (NGOs). As stated in the Beijing Declaration and Platform for Action, "it is a strategy for making the concerns and experiences of women as well as of men an integral part of the design, implementation, monitoring, and evaluation of policies and programmes in all political, economic, and societal spheres." Subsequent to Beijing 95, a large network of IGOs, NGOs, and academics developed to work on women, peace, and security. By October 2000, momentum and pressure had built to the point that United Nations Security Council Resolution finally recognized the specific rights of women in conflict by unanimously adopting resolution 1325. This is one of the major outcomes of the growing awareness of the different ways in which men and women are victimized by and participate in conflict. Impetus for SCR1325 included the war in the former Yugoslavia—in which rape and sexual violence were used as weapons of war (later prosecuted for the first time as war crimes at the International Criminal Tribunal for the former Yugoslavia)—and the shifting role of women in the elite levels of conflict negotiation in the conflicts in El Salvador, Guatemala, and Ireland. The ad hoc nature of women's agency and empowerment in these peace processes is evidenced by their exclusion from the 1995 Dayton negotiations despite major lobbying by NGOs, but women played a pivotal role in the Northern Ireland peace negotiations and were centrally involved in the 1998 Good Friday Agreement.

Women also have become more involved as participants in conflicts, not least because they are becoming members of the military in growing numbers. An example of this shift is that, as of 2004, women represent approximately 14 percent of the United States armed forces, an increase from 2 percent in 1950. Women have been more involved also in combat and as agents of conflict. As the frontlines of wars become blurred and conflicts increasingly take place in areas inhabited by civilians, women are becoming more involved in the actual fighting, regardless of the policies of individual armies as to whether women should or should not see active combat. Institutional policies in international governmental organizations such as the United Nations now actively call for greater participation in both their police and peacekeeping forces.

There are numerous developments in the field of women and security. One is the slowly increasing number of women teaching in the field of international relations, where they have been traditionally underrepresented. Academically, the lens through which women and security is viewed is changing, as essentialist conceptions of women as peacemakers are no longer the only ones used to analyze both women's impact on security studies and the impact of conflict on women. In addition, as women are increasingly present in leadership positions and in military operations, the future study of women and security likely will focus on these areas. In the policy world, 2008 and 2009 saw the adoption of three new UN Security Council resolutions on women, peace, and security—SCRs 1820, 1888, and 1889—that aimed to better address the specific rights and interests of women in conflict. One element that is not changing, however, is that women, be they civilian bystander or participant in the conflict, continue to bear a disproportionate burden of war as refugees and as targets of widespread sexual violence in conflict areas, while continuing to be excluded from the peace processes that seek to end such conflicts.

Women in Islamic Nations

Women living in Muslim countries, secular and nonsecular, spread over fifty-seven countries in four continents. These Muslim countries are referred to as *Islamic nations,* meaning the majority of their population is Muslim, although many of these countries have substantial non-Muslim minority populations of varying sizes. Political, economic, legal, and sociocultural dimensions of women's status and rights greatly

vary within and among these countries. This is partly due to a range of interpretations of the Quran and the lack of a single authoritative reading of religious principles and law(s), and partly due to variations in cultural practices.

This area of study is of great importance but also highly controversial, due to tensions between Eurocentric, anti-imperialist, and anti-Western viewpoints. On the one hand, religious practices regarding marriage, adultery, and divorce are often explicitly discriminatory toward women. For instance, men are permitted multiple wives while women are not. Men can divorce their wives while women need their husband's consent. These examples, and many others, lead to the conclusion that *patriarchal fundamentalism* or *fundamentalist patriarchy* institutionalizes unequal division of gendered roles in Muslim societies. Furthermore, women from Islamic nations are presented, especially in the Western media, as powerless and exploited individuals, and are explicitly and intentionally contrasted with their liberated sisters from the West. Both of these approaches disregard women's agency and the growth of Islamic feminism, as well as what Huma Ahmed-Ghosh (2008) calls "hybrid feminism," which brings together different forms of Islamic, secular, and other discourses in a hybridized form to serve women and their lives better. Both approaches also fail to acknowledge the drastic change of the positions of women and lively debate taking place during the final decades of the twentieth century and into the new millennium.

CONTROLLING WOMEN

The "women question" has in many ways been central to resistance to the Western political, economic, and cultural dominance in Islamic countries, as well as among Euro-Muslims in the West. As documented by Anne Phillips (2007), this resistance has been significantly strengthened after the attacks on the World Trade Center and Pentagon on September 11, 2001 and the Iraq war. Religious extremisms, fuelled by global events, empowered the family, tribe, and the community to dictate Islamic norms, led to an invigorated discussion of women's human rights. Increases in honor killings, blood money, forced marriages, forced veiling, and polygyny are all means of controlling women's sexuality that have been documented in the Middle East and Southeast Asia.

To some degree, higher numbers stem from a more regular reporting of the incidents, mainly thanks to the strengthening role of the women's movement in many Islamic countries. Even so, these activities do seem to be on the rise, and the increases are by and large perceived as a backlash to Western *Islamophobia*. For instance, Euro-Turks tend to be targeted by racism and xenophobia in Europe. These migrant populations respond by engaging in the politics of identity, ethnicity, and religiosity, all of which include at their core traditional notions of women's honor. Their reaction is shared by many in Islamic countries who hear of their mistreatment in and by the West. The resurgence of these traditional notions of honor affects the actualization of women's rights in a very negative way.

HETEROGENEITY AMONG ISLAMIC WOMEN

However, although both fundamentalists and Islamophobes present Islam as a homogenous belief system and way of life, especially regarding the rights of women, legal experts and sociologists extensively demonstrate the heterogeneity of women's experience in Islamic countries. Organizations like Women Living under Muslim Laws (WLUML) contend the fact that the more repressive situations in Islamic nations have a cultural rather than religious grounding, thus paving the way for modification and negotiation. Such organizations aim to dispel the notion that religiously based movements are inherently less open to negotiation, modification, or compromise, and internal reforms movements as a possible avenue for egalitarian change.

Similarly, some scholars argue that it is possible for religiously inspired Islamic political movements to become agents of democratization and even of liberalization, especially Islamic and hybrid feminist scholars who insist that secular ideas and institutions must be adapted through a process of internal reform necessary to establish a liberal and democratic system in Muslim societies. On the other hand, secular feminist scholars focus on universal ideas of women's human rights and propose subjecting to open public debate and to political contestation any religious discourses that legitimate patriarchal customs or discriminatory gender practices. The latter group of scholars wishes to establish systematic limits to the autonomy conferred on religious communities based on equality of rights, and to discover what constraints can be legitimately imposed on religions to prevent gender-based discrimination.

Nevertheless, even in countries where strong secular reforms have been implemented, Islam's informal power and its unofficial impact on people are far reaching and complicated. Many people may still opt to settle their disputes on gender relations, such as marriage and divorce, with the aid of religious leaders. In Turkey, for instance, a secular country with a strong women's movement, although it is illegal to conduct a religious marriage before the civil one, some people still avoid the civil ceremony altogether.

Women Legislators

The process of granting formal political rights to women, including the right to vote and stand for election, began in the latter half of the nineteenth century. The first self-governing country to introduce unrestricted women's suffrage was New Zealand in 1893. At this time women did not, however, have the right to stand for election—it was not until 1919 that this right was granted to women in New Zealand. In 1906 Finland was the first European country to give women both the right to vote and stand for election.

The introduction of formal political rights for women does not automatically mean the start of a process leading to a high number of women elected into office. The situation in western Europe serves as an example. Most countries in western Europe had introduced formal political rights for women—both the right to vote and stand for election—before the end of the Second World War in 1945. Yet as of late 2009, women made up an average of only 21 percent of legislators in the national parliaments of that region. However, notable variations exist between countries. Recent research points out that conscious acts—from quotas to informal goals for achievements—implemented by actors such as political parties with the specific aim of getting more women elected are important for high numbers. The literature in the field also reveals important interplay between political parties and interest groups such as women's organizations and between these kinds of actors and structures of society. The type of electoral system matters for the number of women elected as does the type of welfare state; proportional representation (PR) systems are, for example, more favourable for women than majoritarian electoral systems.

There is a current global trend to introduce formalized quotas to speed up processes concerning the number of women elected. A common distinction in research is to separate between legal quotas and party quotas. Legal quotas refer to prescriptions written into the constitution of a country or into that country's electoral laws, whereas party quotas refer to prescriptions voluntarily introduced by parties themselves in their own statutes. Quotas also can differ in that prescriptions can refer to a fixed number of seats for women in a legislative body or the occurrence of a certain number of women on election ballots. Investigations show that legal quotas are currently used in forty countries; major political parties in another fifty countries have instituted party quotas.

Finland was mentioned before. Together with Denmark, Iceland, Norway, and Sweden, Finland represents a group of countries where changes in the number of women elected can be described as incremental; they have come about stepwise over a long time. Already in the 1970s, the average number of women in Nordic parliaments passed 20 percent, and in the early twenty-first century, the average number in that region is 43.2 percent. A contrasting example is then to be found in Rwanda, which represents a "fast-track" model. In 1994 women made up 17.1 percent of the national parliament in Rwanda. As of late 2009, 56.3 percent of Rwanda's legislators were women. Thus, developments in the Nordic countries have been taking place over many decades, whereas the number of women elected in Rwanda more than tripled in only fifteen years.

The contemporary global trend to introduce quotas for the election of women can to a large extent be characterized as a fast-track trend and is most commonly found in Latin America and Africa. The distinction between different models is interesting because in some parts of the world there is, as of the early twenty-first century, a strong divergence between changes in the number of women elected and changes in the status of women in society more generally, and this situation is rather new.

Empirical results demonstrate that an increased proportion of women legislators contribute to strengthening the positions of women's interests in the legislative process. Societies that elect large numbers of women tend to be more gender-equal also in other respects than societies that elect few women. However, so far this research has mostly been based on comparisons between Western democracies. A pending question in comparative research on women legislators is therefore to what extent the impact of women legislators on society and political life at large is conditioned by factors like stability and level of democracy in a country.

Women's Movement, Comparative

It is useful to both historical and sociological understanding to use the term *feminist* to describe the organizational activities, as well as the intellectual dialogues, of those networks of women that have consciously challenged male hegemony.

EIGHTEENTH AND NINETEENTH CENTURIES

Feminist networks have been international and cosmopolitan in scope. Nineteenth-century feminists made use of different technologies, such as postal mail and steam powered trains and ships, as compared with twentieth and twenty-first technologies of the telephone, electronic mail, Web sites, and air travel. English-based feminist scholar Dale Spender argues that there has "always" been a women's movement—her time frame is the English-speaking world of the eighteenth, nineteenth, and twentieth centuries. She argues that women's activities have been historically marginalized by the media and the academy. In this she has a commonality with British writer, Virginia Woolf, who wrote passionately about the "puffery" of the male world of the academy and politics that so often ignored the writings of women and mocked the activities of political women such as the suffragists and those early women members of the British Parliament. In that climate a woman speaker, like a woman writer, was a contradiction in terms.

Feminist activism had often been prompted by other causes, such as the antislavery movement in the United States. Feminist networks from the mid-nineteenth until the early twentieth centuries also were organized around "domestic" issues, notably restricting the availability of alcohol, and they generally lobbied the political world of politicians, party leaders, and members of parliament. While the focus was on national governments, the networks and organizations were often international. The Women's Christian Temperance Union (WCTU) was politically active in Australia, Canada, New Zealand, the United Kingdom, and the United States,. The WCTU quickly saw that change would be achieved more quickly if women had the vote: politicians would be forced to listen. Hence, in New Zealand the WCTU in concert with the Women's Franchise League was instrumental in organizing a petition for women's franchise, which resulted in the suffrage of both European and Maori women in 1893. Australian women gained the right to vote and to be nominated for parliament in 1902. However, Aboriginal women were excluded until the 1960s.

EARLY TWENTIETH CENTURY

Then, as now, women's groups debated important matters of public policy. The WCTU, for example, was not clear whether it was necessary for women themselves to participate in public life as candidates and MPs; flurries of letters were exchanged when feminist Vida Goldstein was nominated by the Women's Party for the Australian Parliament in 1903. She and three others running in the same election are generally credited as being the first women to run for elected national office in the British Empire. Victoria Woodhull was nominated for the U.S. presidency in 1872, before women could vote.

In the United Kingdom and the United States, feminists argued over prostitution and birth control. In the United Kingdom, for example, an innocuous sounding bill, the *Infectious Diseases Bill,* designed to force prostitutes to submit to "health" examinations, split feminists. Some—opposing prostitution—saw it as a move to close the industry; whereas, others saw it as a massive infringement on the common law rights of those individuals.

Much feminist activism in the West was designed to win the vote for women and to allow them to run for elected office. The phase "removing the barriers" was accompanied by strong attempts to change national laws and often to improve international relations. The Women's International League for Peace and Freedom was founded in 1915 as a response to the horrors of war and has continued to be active with branches in thirty-seven countries and consultative nongovernmental organization (NGO) status with the United Nations. Once adult women gained the vote—generally after the First World War (1914–1918)—feminist activism was increasingly linked to international peace movements. British writer, and later MP, Vera Brittan, has described her active involvement in issues such as the Spanish Civil War (1936–1939) (anti-Franco) and the League of Nations Association, the predecessor of the UN. Feminist activism also focused on equal pay, infant welfare, and antipoverty campaigns.

Most feminist activism was conducted by educated women of European extraction, although the role of African American women in the United States has been described by Mary Hawkesworth, and the role of Maori (indigenous) women in New Zealand discussed by Patricia Grimshaw. The Global Fund for Women—headquartered in the United States and cofounded in 1987 by New Zealander Anne Firth Murray—has an international fourteen-person board.

COLD WAR ERA

The cold war era, which followed the Second World War (1939–1945) and lasted until the 1980s, and which prefigured the emergence of the so-called second wave of feminism, encouraged its citizens to focus on national survival, rather than on internationalism. Western citizens who participated in international peace movements tended to be seen as potential security risks. However, the focus on domestic issues, especially equal pay, and the reform of marriage and divorce laws, continued unabated. The national-feminism of this period was an exception and was already being transformed by the United Nations. Thus began the UN's role as a forum and a promoter of feminist activism. It is impossible to overestimate the UN's role in making women's issues visible, in establishing crucial international congresses, and in promoting new networks of feminism. Jane Bayes and Nayereh Tohidi have examined the activities of religious women around the UN's Fourth World Congress on Women at Beijing in 1995, specifically on sexuality, reproductive health, and women's rights. They found that women adopted a range of approaches

and strategies around issues of sexuality, reproduction, health, and women's rights, and developed interesting new dialogues across traditional religious divisions.

POST–COLD WAR ERA

Globalization, which fully emerged in the post–cold war era, created new types of inequalities between men and women of different races, creeds, and ethnicities, and its responses have resulted in new networks, sometimes linked to UN agencies such as the United Nations Development Program. Key issues have emerged, such as people trafficking, including the sexual trafficking of women and children, that have generated activist and research networks. Globalization has encouraged strong networks across national boundaries, as compared with the previous cold war era. This has been particularly important for those strands of feminism that have conceptualized themselves as international in nature. Whereas historically the peace agenda had constituted an important cosmopolitan theme, debates surrounding development and environmentalism were additional themes in the 1990s. Feminists had historically constructed international dialogues and debates around common issues, and globalization has permitted those discussions to be conducted in real time.

Women's Representation

Women's representation explores the gendered aspects of representative or parliamentary democracy (as well as other less democratic regime types)—specifically, how the interests and aspirations of women *qua* women are reflected in patterns of public office holding or in public policy outcomes. One primary question within contemporary research concerns the connection between the numbers of women in office and the substance of politics: Does an increase in the number of women elected (or in the governing elite) lead to changes regarding the character of politics or the content of policy? Following in the path suggested by Hanna Pitkin's *The Concept of Representation* (1967), the scholars who address these issues commonly distinguish between a descriptive (quantitative) aspect and a substantive (qualitative) aspect of the representation.

DESCRIPTIVE REPRESENTATION

The focus on women as a group must be understood from the historical context in which women were excluded at some time in the past from national politics on the basis of their sex. In most countries, women now are granted formal political rights; at the same time the world average for women serving in national parliaments is only 19 percent (whereas women make up about half of the world's population). There is only one country in the world where the number of women in the national legislature surpasses the number of men; however, in some countries the gap between the sexes is almost closed. In Rwanda, the number of women in the national parliament is, as of late 2009, 56 percent, and in Sweden it is more than 47 percent. At the other end of the spectrum are well-established democracies like Ireland and the United States, which have rates as low as 13 percent and 17 percent respectively.

Empirical studies of descriptive representation have typically examined either changes in one country over time or variations across countries. A further strand of research has focused on variations across entities within the same political system, such as the number of women elected to powerful positions in different parties or in subnational governments. Previous models more or less regarded an increase in women's representation as a "natural" consequence of changes in society like women's expanded participation in the labor force or in higher education. A growing body of empirical findings challenges that older claim. The new findings suggest that targeted actions (for instance, quotas for women or some other promotion strategy) undertaken by central political actors like political parties are important catalysts for change in descriptive representation.

SUBSTANTIVE REPRESENTATION

On the issue of substantive changes in political patterns or outcomes, there is less consensus about the most fruitful approaches to the study of representation for women. Research on substantive representation is more difficult to operationalize and measure than descriptive research—if for no other reason than there is no monolithic definition of what policies or issues are exclusively "women's issues." Moreover, scholars realize the pitfalls of essentialism—the assumption that women officeholders bring a monolithic set of experiences, values, and ideological dispositions to office, and thus a common agenda. Other political identities (like race), ideologies (partisanship), or experiences may mitigate an affinity for pursuing such an agenda once in office. In addition, the way political power is wielded within institutional settings (the national legislature or the leadership structure of a political party) may dampen incentives

1786 Women's Rights

to pursue such an agenda. Nonetheless, empirical research on women's political representation demonstrates a clear link between office holding by women and action by these women to promote women's interests, however broadly or narrowly these interests are defined.

This link between descriptive representation and substantive representation is complex. The notion that a critical mass of women in office will generate change in political outcomes for women is not universally supported by research. Recent studies in U.S. legislative settings show that a more complex set of factors beyond the head count affect the opportunities for women officeholders to effect change for women. More information is needed about the factors that may hinder women to act as representatives in the ways they might desire after they are elected, as well as the factors that can empower them to effect change.

One clear empirical result is that female members of parliament tend to prioritize issues that also generally are prioritized by female voters (e.g., issues of social policy, policy on the family, care of the elderly, and gender equality). On a more abstract level, these issues reflect policies that, in most contemporary societies, are of importance for securing the autonomy of women in their everyday life. Research in this area also has focused on gender differences regarding political stand-points. The different subfields are directed toward the question of which issues reach the political agenda and the status they are given, or toward the question of what solutions are favoured once an issue is on the table.

On a more abstract level, contemporary research emphasizes that gender is not a fixed category and therefore an analysis of women's representation from a substantive perspective needs to be contextualized in time and space. Analysis of women's representation and definitions of women's interests must take into account that gender is interlinked with other social factors (like age and level of education) and political identities (like race and ethnicity).

Women's Rights

Discussions of women's rights center on three areas: civil, political, and social. Civil rights are necessary for individual freedom that includes personal liberty as opposed to slavery, debt enslavement, or serfdom; freedom of speech, thought, and religion; the right to own property and conclude valid contracts; and the right to justice. Political rights are part of being included in the decision-making process in a democracy, such as voting. Social rights are the rights to a decent standard of living, personal security, and health care, education, and welfare.

Promotion of women's rights is a relatively recent phenomenon. Prior to the 1800s, society generally considered women as inferior to men. Men dominated the *public sphere,* which encompassed the political and economic fields. Women were relegated to the concerns of the *private sphere* of hearth and home and fulfilled the roles of wife and mother. However, due to expansion of economic progress and educational opportunities, women began to carry their private sphere skills and abilities into the public sphere. During the 1800s, women in Britain and the United States began to challenge laws that denied them the right to own their property once they married, launching the movement toward women's rights.

FIRST WAVE FEMINISM

Scholars identify three waves of feminism. The beginning of the first wave is identified as the first women's rights convention in Seneca Falls, New York, in 1848. The convention issued the Declaration of Rights and Sentiments, outlining grievances and setting the agenda for the women's rights movement. Women reformers of that time were concerned about two issues: obtaining the right to vote (suffrage) and attaining equality for all citizens through the abolition of slavery. During this wave, women reformers initially concentrated on abolitionism and then worked toward women's right to vote.

After the U.S. Civil War (1861–1865) concluded and slavery was abolished throughout the country, Susan B. Anthony and Elizabeth Cady Stanton in 1869 formed the National Woman Suffrage Association. Its primary goal was an amendment to the Constitution. Lucy Stone, Henry Blackwell, and others would form the American Woman Suffrage Association focusing on amendments to individual state constitutions. By 1890 the two organizations merged to form the National American Woman Suffrage Association (NAWSA), which waged state-by-state campaigns to obtain the right to vote. The Congressional Union, later renamed the National Women's Party, worked for the passage of a federal amendment through picketing the White House and other forms of civil disobedience. In 1919 the federal woman suffrage amendment, originally written by Susan B. Anthony and introduced in Congress in 1878, passed the House of Representatives and the Senate and was sent to the states for ratification. By 1920 the Nineteenth Amendment to the U.S. Constitution, granting women the right to vote, was signed into law.

SECOND WAVE FEMINISM

The second wave of feminism, or *women's liberation,* is considered to have begun in 1963 and lasted through 1980. By the 1960s, women practiced birth control, attended college, and joined the workforce in far greater numbers, but these gains were met by strong social stereotypes from the previous era. In 1963, Betty Friedan published her highly influential book *The Feminine Mystique,* which describes the dissatisfaction felt by middle-class American housewives about the role expected of them by society, especially the drudgery of housework and childbearing. The best-seller galvanized the modern women's rights movement, leading to the founding in 1966 by a group of feminists including Friedan of the National Organization for Women (NOW).

Reformers wanted the same pay as men, equal rights in law, and the freedom to plan their families or not have children at all, but their efforts met with mixed results. On one hand, the U.S. Supreme Court in *Roe v. Wade* (1973) identified a constitutional right to safe and legal abortion within the general right to privacy, overriding the antiabortion laws of many states. On the other hand, the Equal Rights Amendment (ERA), proposed to enshrine women's rights explicitly in the Constitution, was not adopted. Originally drafted by Alice Paul in 1923, the ERA was passed by Congress in 1972, but it also required ratification by a minimum of 38 states, a process that closed without the necessary votes in 1982.

THIRD WAVE FEMINISM

The third wave of feminism seems in part a backlash against the "radical" approaches of the 1960s and 1970s. Third wave feminists are more willing to accept differences in experience and even abilities between men and women so long as no one is considered inferior. Third wave feminism includes a growing recognition of the differentiation of women's experience according to race, class, and sexual orientation. The third wave also recognizes the international dimension of feminism and acknowledges the role played by globalization in issues such as female genital mutilation, dowry deaths, and honor killings in certain parts of the world as important issues women face in other cultures.

Nevertheless, the concerns for equality have continued on issue areas such as reproductive rights, sexual harassment and violence, and equality in the workplace, led by NOW, which through the beginning of the twenty-first century was the largest women's rights group in the country seeking to end sexual discrimination, especially in the workplace, through legislative lobbying, litigation, and public demonstrations.

Progress continued in education and professional opportunities. By the end of the twentieth century, women had overtaken men in U.S. college graduation rates. Fields such as medicine, law, and science opened to include more women. At the beginning of the twentieth century about 5 percent of the doctors in the United States were women. As of 2006, over 38 percent of all doctors in the United States were women, and women made up almost 50 percent of the medical student population. An increasing number of women also were

elected to serve in government at the state and national levels, in large part due to EMILY's List (Early Money Is Like Yeast), a financial network for prochoice Democratic women running for national political office founded in 1984. Women elected to positions of state and national power have allowed for more of the issues important to women—such as education, health care, and the environment—to be brought to the forefront of the political agenda.

Despite the progress that has been made in women's rights, challenges continue into the twenty-first century. The concerns of women have focused on economic equality and justice, violence against them, as well as having the ability to make sound and educated sexual choices. Advocates for such issues need to be found in order to bring them to the forefront of the political agenda nationally and internationally.

Women's Studies

Women's studies is an interdisciplinary, multidisciplinary academic field devoted to topics concerning women, feminism, gender, and politics. The rise of programs in women's studies stems from the acknowledgment that prior to the 1970s formal education was primarily focused on a patriarchal structure that emphasized contributions of men and neglected roles played by women. As women in the second wave of feminism worked toward the women's liberation movement, there was a realization that for women's accomplishments in history, economics, psychology, and so on to be fairly recognized, a major overhaul in the education of students was necessary.

As an academic discipline, women's studies was modeled on the American studies, ethnic studies (such as African American studies), and Chicano studies programs that had arisen shortly before it. The first women's studies program in the United States was established in May 1970 at San Diego State College (now San Diego State University). Throughout the 1970s, many universities and colleges followed suit and created departments and programs in women's studies, including professorships that did not require the sponsorship of other departments. By the late twentieth century, women's studies was formally recognized as an academic institution, and such courses were available at many universities and colleges around the world. A 2007 National Women's Studies Association survey included 576 institutions that offered women's or

gender studies at some level. Currently, there are 678 listed in its online searchable database, with fifteen institutions offering a doctorate in the United States.

The field of women's studies in the twenty-first century seems to have reached a crossroads and there is much talk about the discipline outliving its initial, original purpose of highlighting the historical accomplishments of women. Some claim that because education now focuses equally on the contributions of women and men, there is no need for a separate discipline, while others argue that focusing on women's studies only raised the stigma of antifeminism. As a result, some programs have shifted their attention to the international impact of women's studies, some have gone into an active service learning component to ground graduates in the grass roots, and some have taken advantage of the movement into distance education and online learning.

Regardless of the transition in which women's studies finds itself, many programs have found that they need to be more inclusive not only of men but of those with different sexual orientations and focus more on gay, lesbian, and transgendered issues. As a good compromise, some women's studies departments have refocused themselves as women, gender, and sexuality studies programs. No matter the name, the need to consciously consider the contributions of different members of society and not just the dominant majority has been the key contribution of women's studies programs the world over.

Women's Suffrage

Historically, the right of women to vote was limited by patriarchal systems that treated women as the property of their fathers or husbands. Without political voices, women remained dependent financially and socially on males, and issues deemed important to women were often ignored by male decision makers. Adult women in the developed world tend to take the right of suffrage for granted, but this basic right was won only through prolonged battles involving women who challenged the right of males to dominate the political world. In the developing world, many women are still fighting for the right to be recognized as political equals.

Even as eighteenth-century Enlightenment thought and classical liberalism, which introduced the notion of males as rational beings able to govern themselves, grew in popularity, women were generally perceived as too emotional and intellectually inferior to exercise the right of suffrage. The most notable exception to the denial of women as rational beings was found in the writings of Mary Wollstonecraft, the British author of *A Vindication of the Rights of Woman* (1792), who contended that women were not inferior by nature but by socialization, which promoted perceptions of female irrationality.

The fight for women's suffrage began in Great Britain, the leading industrial power of the day, in the mid-nineteenth century. Political philosopher and economist, John Stuart Mill, author of *The Subjugation of Women* (1869) and *On Liberty* (1859), was instrumental in a partial reevaluation of women's roles. Mill argued that governments cheated themselves by denying half the population participation in the political process. The first women's suffrage bill was introduced in the British Parliament in 1851. The movement gained momentum over several decades, but it was not until the early twentieth century that it became radical under the leadership of Emmeline Pankhurst and Annie Kenney, who called attention to their cause by orating, marching, heckling, lobbying, burning, and bombing.

In the United States, the early women's movement was strongly allied with the temperance and abolitionist movements. The first formal organization of women's rights arose from the indignation of Elizabeth Cady Stanton and Lucretia Mott, when women were not allowed to take an active role in the World Antislavery Convention in London in 1840. Their outrage led them to hold the first women's rights convention in Seneca Falls, New York, in 1848, where Stanton's introduction of a women's suffrage resolution was considered too controversial by many attendees. The American woman most closely associated with the suffrage movement is Susan B. Anthony, who devoted most of her life to this cause. Like their English counterpart, the American suffrage movement turned radical in the early twentieth century as younger women like Alice Paul took over the reins of leadership.

As European and American families established new colonies and states, they often challenged patriarchal notions of women's roles. Consequently, women in these areas were the first to win political rights. New Zealand granted women's suffrage in 1893, followed by Australia in 1902. The western part of the United States followed this same pattern. For instance, Wyoming, the Equality State, refused to be admitted to the Union if it entailed rescinding women's right to vote.

Before World War I (1914–1918), the only European nations to grant female suffrage were Finland (1906) and Norway (1913). The war proved to be a turning point for women's suffrage in both the United States and Europe as perceptions of women's roles changed in response to participation in the war effort and in industries where women replaced men who had joined the military. In 1918, the Representation of the People

Act granted limited female suffrage in Britain and Canada. In 1920, white women in America won the right to vote with the ratification of the Nineteenth Amendment. While black males had theoretically been granted suffrage in 1870 with the passage of the Fifteenth Amendment, black women and men did not gain the right to vote in much of the American South until 1965 with the passage of the Voting Rights Act.

In 1928, Ecuador became the first country on the South American continent to grant women the right to vote. Three years later, Senegal became the first African nation to grant women's suffrage. The Philippines was the first Asian country to give women the right to vote, in 1937. World War II (1939–1945) served as a turning point for many non-Western nations. Japan and China granted female suffrage in 1945 and 1947 respectively. In colonized nations, independence often precipitated universal suffrage. By the twenty-first century, only Saudi Arabia and Kuwait continued to deny women the right to vote.

Workers' Rights

Workers' rights are the entitlements individuals have in their roles as employees. In most industrialized societies these guarantees protect such things as freedom of association at the workplace, a minimum wage, and a safe and healthy workplace. The primary obligation for protecting these rights rests with employers. Employers also are the most likely violators of workers' rights. The government regulates the employer-employee relationship, adjudicates employee grievances against employers, and implements a remedy if necessary. The status of workers in a country is a bellwether for the status of human rights in general, because it is rare that a government will respect other human rights if it does not respect workers' rights.

Workers' rights are recognized in international human rights agreements such as the Universal Declaration of Human Rights; the International Covenant on Economic, Social and Cultural Rights; and the International Covenant on Civil and Political Rights. They are elaborated in more detail in the conventions and recommendations adopted by the International Labour Organization (ILO), the UN agency that is focused on labor issues. These international human rights agreements and the ILO provide lists of rights workers ought to have everywhere in the world. The actual rights workers can exercise with government protection vary from country to country. They can be found in each nation's constitution, statutes, bureaucratic regulations, and judicial opinions.

The ILO was formed in 1919 to promote government protection of the rights of workers all over the world. It is the oldest of all international organizations promoting government respect for human rights. Today, almost all members of the UN are also members of the ILO. The institutions of the ILO produce conventions and recommendations describing the policies member states ought to enact and enforce if they want to protect the basic rights of workers against abuse by employers. The bodies that draft and approve these recommendations comprise representatives of governments (50 percent), employers (25 percent), and workers (25 percent). The goal is to ensure that ILO standards represent meaningful and practicable targets for both more developed and less developed countries. Conventions are designed to be ratified like an international treaty. A ratifying state undertakes certain binding legal obligations. A recommendation does not create legally binding obligations, but provides additional guidelines for national policies. Employers generally favor recommendations. Workers favor conventions. Protocols are partial revisions of conventions. The term *International Labour Code* is used to refer to the whole body of conventions, recommendations, and protocols adopted by the International Labour Conference.

The ILO's 1998 Declaration of Fundamental Principles and Rights at Work requires all ILO members to "respect, to promote and to realize in good faith" five core rights that are considered fundamental workers' rights and should be respected by all governments of the world, rich and poor, even if they have not ratified the relevant ILO conventions. These core worker rights are: freedom of association, the effective recognition of the right to collective bargaining, the elimination of all forms of forced or compulsory labor, the effective abolition of child labor, and the elimination of discrimination in respect of employment or occupation.

The United States was a founding member of the ILO and continues to be a member state. However, the United States has ratified few of the ILO conventions, declaring most of them to be within the domain of the states. Only a handful of other nations, such as Brunei and Myanmar, have a poorer record of support for ILO initiatives supporting workers' rights. Moreover, if the rights of American workers are compared with the absolute standards set by the ILO, one finds many areas where protections of workers' rights in the United States do not meet international standards.

World Bank

The term *World Bank* refers to the International Bank for Reconstruction and Development (IBRD) and the International Development Association (IDA). The term *World Bank Group* incorporates five closely associated entities working collaboratively to reduce poverty: the World Bank (the IBRD and IDA), the International Finance Corporation, the Multilateral Investment Guarantee Agency, and the International Centre for Settlement of Investment Disputes.

The IBRD was established in 1944 as the original institution of the World Bank Group. It seeks to reduce poverty in middle-income and creditworthy poorer countries by advocating sustainable development through loans, guarantees, risk management products, and analytical and advisory services. The IBRD is structured like a cooperative owned and operated for the benefit of its 186 member countries. The IDA, established in 1960, strives to reduce poverty through interest-free loans and grants for programs that increase economic growth, reduce inequalities, and improve people's living conditions.

The World Bank was conceived in 1944 primarily to facilitate postwar reconstruction and development. The following year, the IBRD Articles of Agreement became effective upon signature by twenty-eight governments, and formal operations began in 1946. In 1947 the executive directors approved the bank's first loan; this was to France for reconstruction. Since its inception, the World Bank has expanded from a single institution to an associated group of coordinated development institutions. Its mission has evolved to global poverty alleviation, and projects have broadened from focusing on heavy infrastructure investment to include work such as social sector lending projects.

The World Bank compares itself to a cooperative with member countries as shareholders. The shareholders are represented by a board of governors, the ultimate policy makers. As the governors only meet annually, they delegate specific duties to twenty-four executive directors. The five largest shareholders (France, Germany, Japan, the United Kingdom, and the United States) each appoint an executive director, while other member countries are represented by nineteen executive directors. The World Bank's president is responsible for overall management. By tradition, the president is a U.S. national and is nominated by the United States, the bank's largest shareholder. The president is elected by the board of governors for a five-year, renewable term.

According to Robert B. Zoellick (World Bank president as of November 2009), the World Bank Group's vision is to contribute to inclusive and sustainable globalization. This aims to overcome poverty, enhance growth with care for the environment, and create individual opportunity and hope. Assistance is focused on the poorest countries, fragile states, the Arab world, and middle-income countries. It also seeks to solve global public goods issues and to provide knowledge and learning services.

There has been wide-ranging critique of the World Bank from various sources. This includes critics arguing that the bank reform policies can harm economic development and erode traditional economic structures and values, and a small number of economically powerful countries dominate the bank and promote their own interests. There were major protests against the World Bank during 2002 in Oslo, Norway, and Washington, DC, in 2007. The World Bank has sought to address issues that have encouraged criticism.

World Trade Organization (WTO)

From 1948 to 1994, much of the world's trade was governed by the General Agreement on Tariffs and Trade (GATT). GATT as an international organization was replaced by the World Trade Organization (WTO) in 1995, but remains in an updated form the WTO's umbrella treaty for trade in goods. According to the WTO, its overriding objective is to help trade flow smoothly, freely, fairly, and predictably. This involves the WTO administering trade agreements, acting as a forum for trade negotiations; settling trade disputes, reviewing national trade policies, assisting developing countries in trade policy issues, and cooperating with other international organizations. Any state or customs territory with full autonomy in the conduct of its trade policies may join the WTO, but members must agree on the terms. As of July 2008, the WTO had 153 members.

The top level decision-making body is the Ministerial Conference, which meets at least once every two years. Below this is the General Council (normally ambassadors and heads

of delegation in Geneva, Switzerland), which meets several times a year in the Geneva headquarters. The General Council also meets as the Trade Policy Review Body and the Dispute Settlement Body. The Goods Council, Services Council, and Intellectual Property Council report to the General Council. Specialized committees, working groups, and working parties deal with individual agreements and other areas. The WTO Secretariat is headed by a director-general (in November 2009 Pascal Lamy). Its main duties are to supply technical support for the councils and committees and the ministerial conferences, to provide technical assistance for developing countries, to analyze world trade, and to explain WTO affairs to the public and media.

In Doha, Qatar, WTO members in 2001 agreed to undertake a new round of multilateral trade negotiations, the previous round occurring 1986 to 1994 (the Uruguay round). The Doha Development Agenda (DDA) aims to reduce trade barriers and assist developing countries through trade liberalization. The negotiations have been characterized by differences between the United States, the European Union, and developing countries on major issues. These have included agriculture, industrial tariffs and nontariff barriers, services, and trade remedies. As of October 2009. the DDA had yet to be concluded. The WTO in 2009 identified various key issues warranting discussion. These included the WTO and the multilateral trading system's role in addressing the global economic crisis, the Doha round's relevance during the crisis, and the main challenges facing the multilateral trading system after the crisis. Another issue was the impact of the crisis on developing countries, especially those least developed.

There has been critique of the WTO on various grounds, and major protests occurred during the 1999 Ministerial Conference in Seattle, Washington. The WTO itself has identified what it calls common "misunderstandings" regarding its work. These include critics arguing that the WTO dictates to governments what to do; promotes free trade at any costs; ignores development; prioritizes commercial interests over environmental protection; dictates to governments on issues such as food safety and human health and safety; causes unemployment and widens the gap between rich and poor; is the tool of powerful lobbies; and is undemocratic. The WTO also indentifies a common critique that small countries are powerless in the organization and that weaker countries are forced to become members.

Wright, Quincy

Philip Quincy Wright (1890–1970) was an American political scientist and a pacifist. He is well known for his role in the early development of quantitative and interdisciplinary studies on human conflict and international relations. In spite of his normative and legal foundations, he soon found himself affiliated to Chicago's positivist behavioralist approaches to research, crystallized through his monumental and far-reaching work *A Study of War* (1942). Wright was convinced that the scientific understanding of war was a prerequisite for its complete abolition from human life and focused his efforts on the development of such a program.

Wright was born in Medford, Massachusetts, in 1890, and grew up in a family that always fostered scientific creativity. In 1923 he joined the Department of Social Sciences at the University of Chicago, where he remained for the whole of his academic career. While at the university, he cofounded the first international relations graduate program to be introduced in the United States (1928). He was instrumental in the establishment of the International Political Science Association, becoming its first president (1949–1952), and also served as president of the American Association of University Professors (1944–1946), the American Political Science Association (1948–1949), and the American Society of International Law (1955–1956).

Beyond his academic career, Wright was an advocate for U.S. participation in the League of Nations and was also an active member of the United Nations Association during the cold war. As a fervent opponent of fascism, he supported the Spanish Republic and acted as an adviser to Justice Robert H. Jackson during the Nuremberg trials. He also opposed U.S. involvement in the Vietnam War (1959–1975) from its early stages and openly challenged its legal, political, and moral basis, providing further grounds for the growing antiwar movement.

Wright's *A Study of War* is a vast encyclopaedic effort that combines a large series of statistical data with an in-depth analysis based on such disciplines as anthropology, biology, economics, history, psychology, and geography. His explanatory theory for deadly conflicts is laid out through four levels of analysis: technological, legal/normative, sociopolitical, and biopsychocultural. Following Wright's approach, deadly conflict is more likely to occur when the mechanisms that control human relations at any level, preserving a nonviolent equilibrium, are overloaded and fail to perform. Peace,

defined as a state of "equilibrium among many forces," must be intentionally organized, carefully maintained, and promptly restored if broken. Even thought it did receive criticism for inconsistencies regarding its technological determinism, most scholars agree that more than half a century later *A Study of War* is still a valuable resource and a model for interdisciplinary research.

Wright has been considered a forerunner of peace research, anticipating the health sciences model that identifies war and violence as a preventable disease. Other works by him, such as *Mandates under the League of Nations* (1930) and *The Study of International Relations* (1955), also had a wide readership and were frequently used as standard texts in university curricula. Wright was nominated by Czech political scientist Karl Deutsch and fourteen other colleagues for the Nobel Peace Price in 1970, the year of Wright's death.

Xenophobia

Xenophobia has come to be defined as the fear of foreigners. Etymologically, *xenophobia* can be broken down into the Greek terms *xenos* (stranger) and *phobos* (fear). In common usage xenophobia refers to a disdain for individuals or groups of persons that are different from oneself. This dislike can range from simple rude comments to much more dangerous forms of intolerance. Therefore, the term can have varying levels of severity in the amount of the fear of the foreign population, as well as in how this fear is manifested in thought and action. Several examples of both state and nonstate manifestations of xenophobia are warranted.

Immigrant groups are often subjected to xenophobic attitudes of existent populations in countries around the world. If a historical view is taken, it can be remembered that during the colonial periods colonists often held xenophobic views of native populations. In each of these cases, individuals and groups frequently associated cultural and ethnic stereotypes with the feared groups. This practice exacerbated cultural misunderstandings and has only served to increase the levels of narrow-mindedness that enter into these groups' interactions in everyday life, as well as in social and political institutions.

Whole societies have experienced times in which xenophobia was ostensibly state governmental policy. Japan from the seventeenth to nineteenth centuries is a prime example of this policy. During this period almost all foreigners and foreign influences were removed or banned from the country. While this policy ended in the mid-nineteenth century, it serves as a stark representation of xenophobia as governmental policy.

However, most xenophobia is not expressed through governmental policy. It is usually articulated on a more direct, personal level. An example of this type of xenophobia can be found in the successive waves of immigrants to New York City in the nineteenth and twentieth centuries. Each new population of immigrants was subject to the xenophobic attitudes of the present inhabitants, many of whom also had immigrated recently and had been subject to xenophobia themselves. This xenophobia expressed itself through epithets, violence, and general discrimination, such as the "Irish need not apply" signs found in many shops.

In more recent times, immigration has continued to be a source of xenophobia. In the United States, for example, many groups have come together to protest illegal immigration, primarily from Latin America. Many observers have noted the xenophobic messages hidden superficially below the surface of the rhetoric in such publications and on such Web sites.

There are also many instances of xenophobia existing within the boundaries of one country, but among different factions, cultural minorities, or regional populations. For example, the Kurds of northern Iraq, as a population, have experienced xenophobic policies from governmental entities as well as a general social climate of xenophobia from other social and religious groups in that country. These exclusionary policies and less formal prejudices, for example, have contributed to the splintering of Iraq.

As countries experience increasing levels of social, political, and economic interdependence, the world is becoming ever more multicultural. This elevated level of interaction among diverse members of different communities may lead to a more tolerant and socially beneficent global population. Many signs indicate that the world is on the march to less xenophobia because of this increased contact and integration. However, many trends point to the unfortunate fact that xenophobia will continue to exist because of increased competition for resources, commerce, and political power.

The relative levels of xenophobia in and among countries are difficult to directly quantify. However, measures that investigate levels of perceived discrimination and the number of hate crimes in a population (although many countries do not yet have adequate tracking systems) can provide transferable evidence of the persistence of xenophobia. For example, a 2008 study by Human Rights First revealed that Finland, Ireland, the Slovak Republic, Sweden, the United Kingdom, and the United States showed moderate to high rises in the overall numbers of hate crimes in 2006 and 2007. Further, evidence of the problem of xenophobia was addressed in conferences sponsored by the United Nations in 2001 and 2009.

The future of xenophobia as a human condition is unlikely to end. This, of course, is a sad report on human relations that people fear what is not directly familiar to themselves and their normal experiences. One can only hope that the future
Demonstrators protest against racism and xenophobia in South Africa after a series of xenophobic attacks in 2008. Xenophobic views create cultural and ethnic stereotypes, misunderstandings, and intolerance that at times lead to violence.

Xenophon

A citizen of classical Athens from the *deme* of Erchia, Xenophon (c. 428–354 BCE), son of Gryllus, was a political philosopher and an active participant in the affairs of ancient Hellas. Generally neglected by scholars of politics for many years, Xenophon's writings have been the focus of renewed scholarly attention during the past two generations. This rekindled interest is both driven and justified by the wealth of political insight preserved in his texts.

It is recorded that Xenophon, while a young man, encountered the Greek philosopher Socrates and was persuaded to keep company with him as his pupil, investigating with him what sorts of things led to the nobility and goodness of men. Xenophon's Socratic education was the most formative experience of his life and is the crucial reason why he is significant to scholars of politics. This education inspired Xenophon to write several texts chronicling Socrates' life and activity, texts that complement Plato's account of this first political philosopher and reflect Xenophon's own engagement with Socratic questions.

In *Oeconomicus,* Xenophon presents Socrates' conversation with Ischomachus, a gentleman farmer devoted to the life of civic virtue. Through the speeches of this text—speeches that represent the conversation Socrates had on the day he made his "turn" to study human issues—Xenophon gives an account of the Socratic examination of virtue that reveals marked differences between the philosopher and the citizen. In Xenophon's *Symposium,* Socrates is shown participating in a lighthearted drinking party during which the attendants discuss the serious subject of the concept of goodness. The purpose of the *Apology of Socrates to the Jury,* Xenophon's work based on a portion of Socrates' defense speech at the famous trial at which he stood accused of corrupting youth and dishonoring the ancestral gods, is to account for the reasons why Socrates was seen to be a boastful or arrogant speaker. Finally, in *Memorabilia,* Xenophon recounts a number of his own recollections about the life and deeds of Socrates, recollections that appear random but in fact deal with major themes such as piety, justice, and education. If Plato's dialogues seek to render Socrates in the most pleasing light, then the *Memorabilia* may be said to present him warts and all.

Xenophon the practical statesman emerges in the *Anabasis of Cyrus,* which relates the march of a small group of Hellenic mercenaries from the coast of Asia Minor to the heart of the Persian Empire and then back again to Hellas. After setting out in support of Cyrus the Younger in his quest to usurp power from his brother, the Great King, the troops must make the arduous journey home after Cyrus falls in battle in 401 BCE. It is Xenophon, himself a member of the mercenary force, who provides the leadership necessary to bring his men home safely. Political leadership is the chief theme also of *The Education of Cyrus,* a text about a different Cyrus, the great founder of Persia, on whose life, education, and virtue Xenophon expounds.

Yoshino Sakuzo

Yoshino Sakuzo (1878–1933) was a Japanese political thinker and leader of the Taisho democracy movement. He is best known for his formulation of the political theory of *minpon-shugi,* or "politics of the people." Born into a middle-class merchant family, Yoshino was converted to Christianity in high school. During his years as a law student, he joined the Hongo Church, where he came under the influence of Christian socialists Abe Isoo and Naoe Kinoshita. Two years after Yoshino's graduation in 1904, he went to China as a private tutor to the son of Yuan Shikai, a Chinese warlord. Yoshino returned to China in 1909 to become an assistant professor at Tokyo Imperial University. He was in Europe from 1910 to 1913, during which time he came into contact with European intellectuals.

While at Tokyo Imperial University, Yoshino began writing articles on politics in the *Chuo Koron* (*Monthly Review*), calling for the establishment of a constitutional government. In 1918 he founded the *Reimeiki* (Enlightenment Society) and held lectures with another leader of the democratic movement, Oyama Ikuo. They called for the introduction of adult suffrage and a reduction in the constitutional powers of the Upper House of the Diet, the Privy Council, and the military. The Bolshevik Revolution of 1917 brought challenges to the democratic movement and Yoshino was forced to resign from the university and take a job as an editorial writer for the newspaper *Asahi Shimbun*. However, his articles were censored and he was once again forced to resign. He then founded the *Meiji Bunka Kenkyukai* (Meiji Culture Research Association) and published under its auspices an encyclopedic twenty-four-volume work titled *Meiji Bunka Zenshu* (1929–1930). During this period he worked to create a united front of noncommunist liberal democratic parties.

Arguably Yoshino's most important work was *On the Meaning of Constitutional Government,* which defined his career. Although he was a democrat, his vision of Japanese democracy differed from the European models. While critical of imperial authoritarianism, Yoshino rejected the concept of natural rights as the basis of democracy because the concept was alien to Japanese traditions. Instead, he based his argument on the well-being of the people. According to Yoshino, democracy was based on two fundamental premises: the first, *minshu shugi,* held that sovereignty was vested in the people. The second, *minpon shugi,* held that the welfare of the citizens was the ultimate goal of the state. This reasoning made it unnecessary for the Japanese to accept the theories of European philosophers John Locke and Jean-Jacques Rousseau, among others, regarding the philosophical content of democracy; it was enough to borrow the democratic institutions and modify them to the Japanese environment. Even this idea of a constitutional monarchy was a radical one in pre–World War II (1939–1945) Japan. It was only after Japan's humiliating defeat in the war that Yoshino's ideas were validated. Yoshino's collected writings have been published in eight volumes.

Young, Iris Marion

Iris Marion Young (1949–2006) was a feminist political philosopher and social theorist whose impact on issues of justice, gender, and equality went far beyond traditional academic boundaries. Her work was highly praised by colleagues in philosophy and political science, but she also advanced debates in fields from urban planning and public health to education and law. The consistent exemplary quality in her scholarly writing was the ability to connect often technical and abstract theories of justice to the politics of everyday life.

Young's passion for ideas began early in life and led to her studying philosophy at Queen's College in New York. She continued her education at Pennsylvania State University, receiving her doctorate in 1974. Afterward she taught at Worcester Polytechnic Institute, Miami University, and the University of Pittsburgh, before her appointment to teach political science at the University of Chicago.

Many books have contributed to the discussion of justice in political philosophy over the past thirty years, but few have changed the terrain of the debate in the ways that Young's *Justice and the Politics of Difference* did in 1990.

This volume explores the dominant perspectives on justice and critiques them where they fall short. In an attempt to remedy their deficiencies and advance the conversation in a new direction, Young argues for supporting the differences among social groups. Whereas many political theorists would often overlook the complicated parts of social diversity, Young suggests that these differences be understood as an essential component of completing explanations of justice. Further, she demands that a new set of criteria be employed to judge the justness of institutions and the opportunities they provide to adequately address injustices of a system built on biased norms.

From this work, Young's scholarly focus turned again to ideas that have implications in the international realm and on global justice. In *Inclusion and Democracy* (2000), she highlights the ways in which present forms of democracy all too often curtail the freedom of participation of marginalized groups. She maintains this inadequacy of many democratic governments must be addressed to make the process of deliberation and policy making more inclusive to voices that come from nontraditional sources or from outside the dominant political paradigms. One of the most intriguing aspects of her discussion is the need for some type of global democracy to combat the political forces that actively support the oppression of marginalized groups and that prohibit democracies from rectifying the injustices that occur when inclusion is not a political priority.

Many of Young's ideas continued to permeate grassroots activism on issues of social diversity, equality, and human rights in the early twenty-first century, and her determination to advance the cause of justice continued through her works and the students she taught.

Zetkin, Clara

Clara Zetkin, born Clara Esner (1857–1933), was an influential German socialist and one of the pioneer feminist activists. Until 1917 she was active in the Social Democratic Party. Thereafter she joined the Independent Social Democratic Party and its far-left wing, the Spartacist League, which later became the Communist Party of Germany (KPD). Zetkin represented the KPD in the Reichstag during the Weimar Republic period from 1920 to 1933.

Zetkin was born in Wiederau, Saxony, to Jewish parents. At the age of twenty-one she met Osip Zetkin, a Russian émigré, and joined his Socialist Workers Party, which evolved into the Social Democratic Party (SPD) in 1890. When Chancellor Otto von Bismarck banned socialist activity in Germany, the Zetkins fled first to Zurich, Switzerland, and then to Paris, France, where they played an important role in the formation of the Socialist International group. She also adopted the name of her lover (although they never married), with whom she had two sons. Osip died in 1889 and later Zetkin married Georg Friedrich Zundel.

Zetkin formed an alliance with Marxist theorist and philosopher Rosa Luxemburg and worked with her closely in opposing German political theorist Eduard Bernstein. She was very interested in women's rights and was responsible for launching the Social Democratic Women's Movement in Germany and editing the SPD magazine, *Die Gleichheit* (*Equality*). She was the leading theorist, after German social scientists Friedrich Engels and August Bebel, of the so-called women's question in the international socialist movement before World War I (1914–1918). She started the International Women's Day in 1911 and headed the Women's Office in the SPD. In 1907 she founded the Socialist Women's International organization. During World War I, Zetkin refused to collaborate in war efforts and was arrested several times. Even among socialists she was considered extremely radical. She never wrote a book, but many of her positions were outlined in speeches and articles in the bimonthly magazine *Die Gleichheit*.

During Adolf Hitler's ascent to power, Zetkin was a member of the Reichstag as a representative of the German Communist Party and its Central Committee. She was also a member of the Communist International from 1921 to 1933. In 1925 she was elected president of the German left-wing solidarity organization, Red Aid. After the arson attack on the Reichstag building in 1933, which led Hitler to blame and ban the Communist Party, Zetkin went into exile for the last time to the Soviet Union. She died in Moscow in 1933 and is buried near the Kremlin.

Zionism

The term *Zionism* is derived from the Hebrew word *Zion,* an appellation for the city of Jerusalem (and sometimes symbolically the land of Israel) that appears in the Bible and throughout Jewish religious literature. It was coined in 1890 by Jewish publicist Nathan Birnbaum in his journal *Selbstemanzipation.* Rather than a single coherent doctrine or political program, Zionism encompasses a constellation of ideologies and factions, set along a wide political spectrum, with varied tactics and goals. The Jewish national movement came into being in the context of the breakdown of the traditional Jewish community in modern times, the influence of Enlightenment and liberal thought, the tensions of Emancipation in western and central Europe, and the rise of nationalist movements throughout Europe. It has concerned itself theoretically with a rejection of the Jewish Diaspora and the analysis of anti–Semitism, and practically with the revitalization and resettlement of the Jewish nation. In general, Zionism has striven for liberation from persecution, the establishment of a Jewish national home, and the recovery of national dignity and self-esteem.

HISTORICAL LEGACY

Throughout the centuries, Jews maintained a deep connection to the land of Israel. The ingathering of the exiles and

the restoration of Jewish sovereignty had long been central to Judaism's messianic vision, and continual existence of a Jewish community and intermittent small-scale immigration. Emerging in the later decades of the nineteenth century, modern Zionism represented a significant break with traditional Jewish religious values and expectations, rejecting the theological interpretation of Jewish history, the notion of exile as divine decree and attendant withdrawal from political affairs, and the culture of the ghetto.

According to Zionism, the Jews were first and foremost "a people, one people," as Theodore Herzl, the preeminent leader of the Zionist movement, maintained, bound by filial attachments, language, and shared historical memories—though a significant undertaking of the Zionist project was to recover the Jewish language and regain a territory. Zionism rejected the traditional theological account of *galut* (exile) and the justification of Jewish powerlessness. Rather than a tragic yet divinely ordained dispensation, Zionists viewed the exile as an aberrant and perilous condition that needed to be "negated" by human activity in order to normalize the Jewish nation and to be able to determine its destiny.

ANTI-SEMITISM

One of the central elements of Zionist theory was a diagnosis of the nature and persistence of anti-Semitism. In the wake of the Russian pogroms of 1881 and the precarious condition of Emancipation elsewhere in Europe, evidenced by growing anti-Semitic movements in German-speaking countries and the Dreyfus affair in France, some Jewish intellectuals came to believe that the Jews were hated, not on account of their religion, but because of their nationality. Therefore, neither religious reform nor conversion could provide a viable solution to the Jewish question.

Responding to the Russian pogroms of 1881, physician and activist Leon Pinsker argued in his pamphlet *Auto-Emancipation* that anti-Semitism (or Judeophobia) was a mass psychological response to the abnormal situation of the Jews. The Jews, Pinsker claimed, comprised a "ghost nation," foreigners ever dependent on host societies, in perpetual economic competition with the local population. They therefore incurred the fear and hatred of the native population. The solution would be for the Jews to become a normal nation, through concentration in their own territory, though Pinsker doubted that the land of Israel would be suitable for this purpose.

THE ZIONIST MOVEMENT

Theodor Herzl came to a similar conclusion in his epochal 1896 pamphlet *Der Judenstaat* ("The Jewish State"). Herzl maintained that the vast majority of Jews would be unable to assimilate, and would thus always remain an irritant in their respective societies. The solution to this problem would be the relocation of Jews to an underdeveloped territory, the establishment of a Jewish homeland that would serve as a refuge for the surplus Jewish population of Europe. Herzl regarded the plight of the Jews as an international political problem to be dealt with chiefly through diplomacy rather than through small-scale settlement and Jewish philanthropic projects. Herzl hoped to obtain a charter that would grant international recognition to a Jewish territory, and worked to create the infrastructure of a political movement: the establishment of the Zionist Congress, the Jewish Colonial Trust, and an official press.

The political Zionism of Herzl was driven by *Judennot,* the "need of the Jews," and not by cultural concerns. In contrast, *cultural* or *spiritual* Zionism had at its center "the need of Judaism" brought about by the deterioration of traditional Jewish society and collective identity and advocated a cultural renaissance. The "agnostic Rabbi" Ahad Ha-Am ("One of the People," the pen name of Asher Ginzberg) supported the establishment of a "spiritual center" in Palestine from which new cultural products would emanate. Other thinkers engaged in the revitalization of Jewish culture included radicals such as Micah Joseph Berdyczewski, Joseph Hayyim Brenner, and Jacob Klatzkin, who struggled to liberate Jewishness from the religious tradition and the ghetto culture that they believed had stifled its spirit.

Arguably the most practically significant trend was socialist or labor Zionism, which strove to create a "new Jew," grounded in land and labor, and to establish a new Jewish society driven by a humanist faith. Its leading ideologists were the utopian socialist Nachman Syrkin, Ber Borochov, who developed a synthesis of Marxism and Zionism, and A. D. Gordon, whose "religion of labor" was influenced by Leo Tolstoy. Labor Zionism was responsible for the development of the collective (*kibbutz*) movement, and much of the leadership of the Jewish settlement in Palestine and later of the state of Israel came from this group.

While early activities for a reinvigorated settlement in Palestine had rabbinic sanction, the movement for a secular national revival and political activity met with significant resistance from traditional religious quarters. Many Orthodox Jews regarded the Zionist movement as a secular messianic heresy. This opposition found institutional expression in the *Agudah Israel* movement, founded in 1912. A religious Zionist faction, the *Mizrahi,* emerged in 1902, to work alongside the secular groups in the World Zionist Organization. Other religious authorities, such as Rav Abraham Isaac Kook, the Chief Rabbi of Palestine under the British Mandate, saw in the Zionist movement the beginnings of the redemptive process, and therefore advocated an alliance with the secular pioneers.

THE STATE OF ISRAEL

Opponents of Zionism, particularly in the Arab world, have regarded the movement as a Western transplant and have criticized what they regard as an illegal occupation of Arab land and the displacement of a large part of the indigenous population (leading to the Palestinian refugee problem). Opponents consider United Nations General Assembly Resolution 3379 of 1975, which stated that "Zionism is a form of racism and racial discrimination" to support their position, and partly as a result, they continue to reject the legitimacy of the Jewish state.

With the establishment of the state of Israel in 1948, the Zionist movement achieved some of its principal objectives. Yet, the question of the Jewish character of the state and religious authority, the status of the Arab minority, and the relationship to Diaspora Jewry continued to be negotiated in the early twenty-first century. Since the mid-1980s, such tensions have given rise to a "post-Zionist" ideology, claiming that Zionism has fulfilled its ideological mission, encouraging critical revision of the historical narratives regarding the early Zionist settlement of Palestine and the establishment of the state of Israel, and envisioning Israel as a secular, democratic, non-Jewish state.
