Liberal Parties

The term *liberal* is often ambiguous. In the United States, the expression *liberal parties* refers to left-wing social democrats or socialists, whereas in Europe, the term applies to the centrist parties grouped in the European Parliament and the Liberal International. In the latter usage, the parties include the German Freie Demokratische Partei (FDP), the UK Liberal Democrats, and the French Radicals, among others. These parties are more like the U.S. Democratic Party than socialists, and they support a free market and European integration. However, there is a division between those with an interventionist and welfare agenda, such as the Liberal Democrats, and those that are more aggressively free market, such as the FDP. In the nineteenth century, liberals were the parliamentary parties pioneering representative institutions and developing constitutional human rights, but those positions are now common to all mainstream European parties. However, they remain important parties and potential components of government coalitions in most of the European Union states.

SECOND INTERNATIONAL AND SOCIALIST PARTIES

Second International social democratic "liberal" parties developed with industrialism in the nineteenth century and evolved as emanations of the working class, although expressing a socialist creed that was disseminated by evangelists across the continent. The socialist parties, which are now present on all continents and in most open systems, do not take orders from the Second International, which is more of a forum than a political institution. Socialist parties had emerged having strong links with the working class through

institutions such as trade unions and working people's associations, as well as through newspapers and books that disseminated the socialist message. Most socialist parties—apart from those in the former British Empire and Israel—initially adopted Marxism as their ideology, defining themselves as revolutionary working-class parties. Electoral success and the deficiencies of Marxism meant that in the early twentieth century, most had muted—or dropped—the revolutionary aspect and sought electoral alliances as a way into parliament and eventually government with the intention of influencing policy.

SOCIAL DEMOCRATS

At the time of the Russian Revolution (1917), the split between the revolutionary communists and the reformist social democrats was consummated with Bolshevik parties taking their orders from Moscow Communists. Social democrats took up the original socialist issues of employment conditions, social insurance, and discontent with the cycles of boom and recession that characterized the market economies, but they had no blueprint for how their aims could be achieved. By the 1920s, most were established parties and the major ones, including France, Germany, and the UK, had been in government or offered positions in government, but their lack of concrete policy found them struggling to respond to the Great Depression. By the 1940s, the social democratic parties had adopted Keynesian ideas about economic management and welfare state systems, although these should not be seen as exclusively socialist. The main difference between the social democrats and the other parties was the emphasis on equality, not the "equality of opportunity" that characterized the centrist liberal parties. By the middle of the past century they were the dominant parties or the main opposition in most western European states. In Greece, Portugal, and Spain they were in government shortly after the fall of the dictatorships in the 1970s. They were vote-seeking parties but also the principal parties of the working classes and the poorer sections of society, although large sections of the working class in Europe voted for conservatives and middle class support was always sought by socialists and usually found.

In postwar Europe, the left-right competition led to the description of these parties as "catch-all" parties, eclectically sweeping up votes from various sectors of society and not just from the working class. They were proponents of the postindustrial lifestyle issues of the late century, such as environment and women's rights, although these were not always welcomed by their core supporters. However, the parties needed to have a wide appeal if they were to enter government, and that necessitated some extensive ideological adjustments. Then with the inflation of the 1970s and the problems of unemployment and industrial restructuring in Europe, the parties were forced onto the defensive in economic management and many espoused free market ideas. New Labour is the most well known of these parties, but they had muted their antibusiness rhetoric by that time and had embraced privatization.

ANALYSIS

The swing toward free market ideas is in keeping with the idea that the parties would be unable to retain their position as working-class parties and attain electoral success. To have wide appeal, they had to drop their class aspects, which would alienate their core support. The change in the social makeup of Western society in which the manual and skilled working class was a diminishing force and the middle class was rising meant the social democratic parties were in terminal decline. In Europe, the idea of "dealignment" of the working class and the socialists has gained some support; however, they remain major forces in all European countries.

These parties have lost some of their connection with the working class. While the union link remains in most societies, it is weakened, and the institutions that bound the workers to the socialists have lost their force in the new consumer and mass societies of western Europe. In Europe, their vote has diversified and they have captured the new middle class vote that has, to an extent, compensated for the loss of the working class vote. In many European countries, the rise of the extreme right has made inroads into the traditional voting patterns. However, they remain the main working-class parties, and within that, the parties of the public service workers. This is a generalization across the continent and some exceptions stand out, such as the southern states of Spain, Portugal and Greece. European liberal parties are still well placed to become governing parties, so their capacity for making governing alliances remains undiminished.

Liberal Theory

Since its emergence in early modern Europe, the liberal tradition of political thought has spawned three major families of theory. The oldest, going back to the seventeenth century or earlier, comprises a set of ideas about political institutions. A second family, which originated in the eighteenth century and reached a zenith of sorts in the nineteenth, focuses on economic arrangements and social relations. The subject of

the third family of theories is the normative principles used to evaluate the other, more concrete subjects that are of interest to liberal theorists. Since the publication of John Rawls's *A Theory of Justice* in 1971, the third family, which this work exemplifies superbly, has overshadowed the others, at least in academic political theory. Yet the oldest of these families remains the most powerful and defensible member of the liberal clan.

EMERGENCE

As a recognizable doctrine, liberalism first developed as a theory of political institutions along with, and in response to, the territorial consolidation of political control that resulted in the formation of modern states. Two of the most prominent aspects of that consolidation were the replacement of relatively dispersed, overlapping, and warring centers of power by a high degree of concentrated power held and transmitted via dynastic principles, and the enforcement of uniform standards and rules in place of highly diverse local practices. The tradition of writing now recognized as liberal is united by the aspiration to limit the concentration of political power in order to prevent the emergence of tyranny. Liberals proposed to accomplish this objective in part by subjecting state officials, including monarchs, to a distinct set of rules and in part by securing protection for other, social centers of power that could challenge the power of the state. This strategy led to the development of theories of constitutionalism, including the separation of powers; to the idea of the rule of law; and to theories of individual rights.

EXPANSION TO ECONOMICS

In the eighteenth century, liberal writers extended the skein of their ideas to include economic arrangements. This extension was animated by two motives that overlapped with, but were distinct from, those that drove their forbears. Both motives are in plain view in the most celebrated representative of this second family of liberal theories, Adam Smith's *The Wealth of Nations* (1776). First, Smith aimed to show how legal and regulatory reforms could lead to the generation of much greater wealth than could be produced through the economic arrangements that had prevailed in the past. Second, he argued that the same reforms would undermine the relations of domination and servility that had prevailed under the old order, clearing the way for the emergence of a new mode of social relations based on norms of reciprocity and legal equality. Smith called the legal and regulatory regime he envisaged the "system of natural liberty."

In the nineteenth century, this combination of economic liberalism and a distinctively liberal conception of social relations blossomed into a powerful ideology. To its advocates, it seemed self-evident that the basis of human relations should be voluntaristic, so that human beings acquire obligations only through their own consent. The idea of a contract between independent and nominally equal agents became the dominant model of social relations. By the late nineteenth century, this ideal had given birth among historians and social scientists

to powerful narratives about the shift from ascribed status to freely agreed contracts that cast that transformation as the conclusion of a teleologically driven evolutionary process. At the same time, philosophers and other writers celebrated an idealized conception of persons to serve as a companion for this voluntaristic conception of social relations. According to this ideal, people are (or should be) autonomous individuals who form themselves and therefore are responsible for their characters as well as for the many decisions that determine the course of their lives. This ideology has been subject to challenges from the time of its inception, yet it remains highly influential today.

NORMATIVE THEORIES

The third family of liberal theories is united by a common interest in a more abstract subject, namely the normative principles that should be invoked to evaluate or justify institutions and other social arrangements. Since the 1960s, a great deal of academic writing about liberalism has sprung up from within this family, which has generated two principal approaches to the justification and criticism of political institutions and social arrangements. The *deontological* approach assumes the idea of society as a framework of rules within which individuals are or should be free to make decisions for themselves and to act freely, and then seeks to articulate principles that can be used to determine whether those rules are as they should be. Rawls's highly developed version of this approach is based on the idea of society as a fair system of social cooperation among free and equal persons. In contrast, a prominent *teleological* approach borrows from the voluntarist ideology described above to identify an ideal of persons as autonomous individuals as the basis for evaluating and criticizing actual institutions and practices. This approach to political philosophy is goal-oriented, with the cultivation of personal autonomy as the central goal, as distinct from deontological liberal theories, which are typically rights-oriented.

As powerful as it is, the liberal ideology of voluntaristic social relations and autonomous individuality is beset with difficulties. It underestimates the importance and positive value of relationships and obligations whose roots cannot plausibly be described as the results of voluntary choices by those on whom those obligations rest, such as the obligations of children to parents or of siblings to one another. Nor is there any evident reason to accept its claim that a life of individual autonomy is the uniquely highest and best kind of life a human being can have. Moreover, the history of the twentieth century suggests that the problems of concentrated power, and the value of contributions by theoretical writers to efforts to disperse power, are far from obsolete. Liberal theories are at their strongest when the motives that were at work at the origins of the liberal tradition remain within their sights.

Liberation Theology

Liberation theology is a movement born in the Latin American Roman Catholic Church out of the formation of the Roman Catholic bishops' conference, the Consejo Episcopal Latinoamericano (CELAM) in 1955, which helped the church to develop a new awareness of the problems of injustice and development across Latin America. Liberation theology received its formative manifestation with the publication in 1971 of *Teologia de la liberacion* (*A Theology of Liberation*) by the Jesuit priest Gustavo Gutierrez. This groundbreaking theological treatise built on the growing movement for openness and change spawned by the theological and political theorization in Europe following World War II (1939–1945), and by the major shifts in thinking and practice initiated in the Roman Catholic Church by the Second Vatican Council (1962–1965).

Gutierrez brought together new theological understandings of the role of the church in the world with modern developments in the social sciences to create Latin America's first indigenous theology. The core concept of Gutierrez' work and that of subsequent theologians such as Leonardo Boff, Juan Luis Segundo, Jon Sobrino, and Protestant theologians Rubem Alves and Jose Miguez Bonino is that Christian faith should be dedicated to fighting injustice and siding with the poor. Reflecting on the theme of liberation found in the story of the Exodus, liberation theology developed the idea that the poor and oppressed must be liberated from their condition through confrontation of the structural injustices of society, in particular those found in the underdeveloped countries of Latin America. The central tenet is that the praxis (practice) of faith in contemporary society, prophetically critiquing social injustice, should be the basis for theological reflection and, ultimately, the doctrines of faith. Liberation theologians applied a class analysis to understanding injustice, seeing structural foundations embedded in society as the root causes needing identity and radical change, including the possibility of class conflict and violence as necessary means of changing unjust social structures. This analysis borrows significantly from Marxist social and economic analysis, which places class conflict and alienation at the core of social structures and the primary cause of injustice.

The movement grew as Latin American clergy, bishops, and laity began to embrace the concept of challenging the injustices of their societies. Conferences of CELAM held in Medellin, Colombia, in 1968 and Mexico City in 1975 brought together liberation theologians, clergy, and bishops to continue development of the concepts into a more formalized set of doctrinal commitments to the poor.

Liberation theology influenced a number of political and social movements in Latin America, including the formation of Christian Base Communities, dedicated to grassroots efforts to raise literacy through bible study in poor urban and rural communities. The most significant example of a successful political movement was the Sandinista revolution in Nicaragua, which overthrew the dictatorship of Anastasio Somoza in 1979, and included the leadership of Ernesto Cardenal, a priest and expositor of liberation theology. The radical transformation of Archbishop Oscar Romero of El Salvador from establishment clergy to advocate for the poor also is credited to the influence of liberation theology (Romero was assassinated by a right paramilitary death squad while celebrating Mass in 1979). Death squads also assassinated six Jesuits, their housekeeper, and her daughter in 1989; those martyred included liberation theologians Segundo Montes and Ignacio Ellacuria.

The movement spread beyond Latin America. North American theologian James H. Cone developed black liberation theology, interpreting scripture from the perspective of slavery and the oppression of African Americans and persons of color in the United States. The Ecumenical Association of Third World Theologians was formed in 1976 at a congress in Dar es Salaam, Tanzania, serving as a forum for discussion of developments in liberation theology.

Liberation theology began to experience criticism from the church hierarchy under Pope John Paul II. During the CELAM conference in Puebla, Mexico, in 1979, liberation theology was criticized by the pope during his visit. His critique, informed and enforced by the Prefect of the Congregation of the Faith, Cardinal Joseph Ratzinger (now Pope Benedict XVI), centered on rejection of the notions of class conflict and other Marxist elements found in liberation theology. Cardinal Ratzinger subsequently suspended Leonardo Boff from teaching and writing, making clear that liberation theology was not supported by the Vatican. Despite efforts to limit debate, elements of liberation theology continue to influence social movements globally, including continued work by theologians and activists in Europe, India, Latin America, Sri Lanka, and the United States.

Libertarianism

A modern extension of the classical liberal tradition, libertarianism is the political ideology of voluntarism, a commitment to voluntary action in a social context, the rule of law, and the free exchange of goods, services, and ideas. Most libertarians tend to reject the left-right divisions of conventional politics; it is typical to find libertarian thinkers and sympathizers opposing government intervention in both the economic and social spheres. For example, Chicago school economist Milton Friedman was a strong free market advocate, a position often identified as right-wing, but he was also in favor of legalizing prostitution and the sale of illicit drugs and was among the foremost critics of military conscription—positions often identified with the left-wing.

Despite its unique challenge to the left-right political spectrum, libertarianism includes a diverse array of thinkers: old right critics of the New Deal such as John T. Flynn, H. L. Mencken, Albert Jay Nock, and Isabel Paterson; Austrian-school economists such as Freidrich A. Hayek, Ludwig von Mises, and Murray Rothbard; objectivist philosopher Ayn Rand and those neo-Aristotelians who were influenced by her, including Douglas J. Den Uyl, Tibor R. Machan, and Douglas B. Rasmussen, among others.

Many contemporary libertarians draw inspiration from the classical liberalism of John Locke and the American founders, and their stress on the individual's rights to life, liberty, private property, and the pursuit of happiness. Others, such as Hayek, draw from the evolutionary insights of Scottish Enlightenment thinkers, such as Adam Smith, Adam Ferguson, and David Hume, conservative thinkers such as Edmund Burke, Austrian theorists such as Carl Menger, and systems theorists such as Herbert Spencer, all of whom saw the free society as a spontaneous order, the emergent product of social interaction but not of deliberate human design.

Hayek argued further that free markets were necessary to rational economic calculation. He indicted socialism and central planning as constructivist rationalist systems dependent on a pretense of knowledge. In such books as *The Road to Serfdom* (1944), Hayek maintained that state intervention undermines individual choice and personal responsibility. When the state exerts a decisive influence over the direction of social life, state power becomes the only power worth having, and this must necessarily lead to the dominance of those who are most adept at wielding such power.

Mises was even more adamant in his opposition to state interventionism. An Austrian-school economist, Mises advocated laissez-faire capitalism, viewing private property and free markets as indispensable to the rational assessment of relative scarcities and to the flourishing of entrepreneurial innovation. He saw government intervention in the economy as destabilizing the market price system and the delicate, interwoven structure of production. His theory of business cycles rooted the phenomena of inflation and unemployment in government manipulation of the money supply.

The profoundly influential libertarian Murray N. Rothbard, a student of Mises, further developed the Misesian business cycle theory, focusing on its class dynamics. For Rothbard, central banking creates a structure of class privilege, in which systematic inflation of the money supply causes not only the boom-bust cycle but also a fundamental redistribution of wealth to some groups at the expense of others.

Rothbard sought to construct a science of liberty. He integrated Austrian economics with a neo-Aristotelian view of human nature and a neo-Lockean perspective on individual rights, grounded in the right of self-ownership. On the basis of a nonaggression axiom that no one has a right to initiate the use of force against others, Rothbard argued that the state was a fundamentally aggressive institution, opposed to individual rights as such. He advocated an anarchocapitalist alternative in which even judicial and defense services were provided by market forces, regulated only by an overarching libertarian law code barring the use of initiatory force from social relations. (An alternative form of anarchocapitalism is endorsed by David Friedman, son of Milton Friedman, whose 1973 book *Machinery of Freedom* advocates anarchism on consequentialist, rather than natural law, grounds.)

Rothbard's anarchism was influenced by a nineteenth century strain of individualist anarchist thought, which includes theorists such as Lysander Spooner and Benjamin Tucker. Spooner, a lawyer and abolitionist, argued that the U.S. Constitution had no authority; Tucker opposed state-sanctioned monopolies and was an advocate of unabridged free trade. Rothbard also integrated insights from an array of old right critics of Franklin Delano Roosevelt's New Deal, all of whom have had various degrees of influence on contemporary libertarianism. The old right thinkers (including John T. Flynn, Rose Wilder Lane, Albert Jay Nock, H. L. Mencken, and Isabel Paterson) repudiated the New Deal's massive intervention into American economic life. Nock's distinction between state power and social power, in particular, influenced Rothbardian and other libertarian perspectives on the essential polarity between state and market. The old right thinkers were also typically antiwar and anti-imperialist, crafting an opposition to the welfare-warfare state that was echoed in later years by certain new left revisionist thinkers, who also exerted a certain degree of influence on modern libertarianism.

Rothbardian libertarianism had a crucial impact on Robert Nozick, whose 1974 book *Anarchy, State, and Utopia* was written partly as a response to anarchocapitalist arguments. In this book, which won the National Book Award in 1975, Nozick defended not only the libertarian minimal state but also all capitalist acts between consenting adults.

Another important influence on contemporary libertarianism is novelist and philosopher Ayn Rand. Author of *The Fountainhead* (1943) and *Atlas Shrugged* (1957), Rand formally rejected the libertarian label, not only because she was a critic of anarchocapitalists, but also because she believed that libertarians failed to appreciate the larger philosophic and cultural context necessary to the achievement of human freedom. Her

defense of capitalism as an unknown ideal views freedom as an intellectual, political, cultural, and economic achievement. Her antipathy to libertarianism notwithstanding, Rand still had a decisive impact on a whole school of neo-Aristotelian libertarian writers, such as Den Uyl, Machan, Rasmussen, and others, who have carried on her legacy as advocates of both free minds and free markets.

Li Dazhao

Li Dazhao (1889–1927), also known as Li Ta-Chao, was the cofounder of the Chinese Communist Party and the mentor of Communist leader Mao Zedong. After studying at Waseda University in Tokyo, Li became an editor of the magazine *Hsin sch'ing-nien* (*New Youth*). In 1918 he was appointed chief librarian of Peking University and in 1920 he became concurrently professor of history. Inspired by the success of the Russian Revolution in 1917, Li became a Marxist and hailed the Bolsheviks in his 1918 articles "The Victory of Bolshevism" and "The Victory of the Masses." In turn Li influenced many of his students, one of whom was Mao Zedong, who was then employed by Li as his library clerk.

When the Marxist study groups he led evolved into the Chinese Communist Party in 1921, Li was instrumental in carrying out the orders of the Communist International and acting as the liaison with the Kuomintang. He was also one of the leaders of the May Fourth Movement, the followers of which sought reform of China's traditional culture. Li's leadership role was limited to North China. In 1927 he was seized at the Soviet Embassy in Beijing, where he had taken refuge, and he was hanged by Manchurian warlord Chang Tsolin.

Li was more of a theoretician than a strategist. He was intensely nationalistic and was unwilling to wait for the international proletarian revolution to liberate China. Therefore, he played down the doctrine of the proletarian class struggle. The communist revolution, in Li's thinking, was a populist revolution led by the peasantry against the exploitation and oppression of foreign imperialism. His ideas formed the core of the communist philosophy that inspired Mao Zedong's successful struggle against the Kuomintang. After his death Li became a venerated martyr in communist hagiography.

Lieber, Francis

Francis (Franz) Lieber (1798–1872) was an immigrant to the United States, yet he conceived, edited, and largely wrote the *Encyclopedia Americana* (1829) in the early nineteenth century. Born in Berlin, Germany, Lieber fought in the Prussian army during the Napoleonic Wars (1799–1815) and was wounded at the Battle of Waterloo on June 18, 1815. After leaving the army, he completed his doctorate at the University of Jena. Afterward, having acquired a reputation in Germany as a liberal agitator, he found it prudent to decamp with a crusade to liberate Greece from Ottoman rule. He returned from that abortive mission and attempted to enter academic professions in Prussia, but he was sufficiently suspect to be frequently imprisoned. He left Prussia, initially settling in England before relocating again to Boston, Massachusetts. Not quite two years after his arrival he began the *Americana,* becoming America's interpreter of itself. He then allied with French historian and philosopher Alexis de Tocqueville and French statesman Gustave de Beaumont, translating and annotating their 1833 *On the Penitentiary System in the United States.*

Lieber became a professor of history and politics at South Carolina College (University of South Carolina) in 1836 and remained there until 1856. This was a period of enormous productivity for him, but the approaching Civil War (1861–1865) forced him to navigate between his liberal and antislavery principles and his growing influence within state academic and political establishments. During these years he published *Legal and Political Hermeneutics* (1837), *Manual of Political Ethics* (1838), *Essays on Property and Labour* (1841), and *On Civil Liberty and Self-government* (1853). The last of these major works tacitly replied to Southern politician John Calhoun, whose *A Disquisition on Government* and *A Discourse on the Constitution and Government of the United States* provided the intellectual foundation for the secession movement. In his July 4, 1851, "Address on Secession" Lieber argued in principle against secession but without making an antislavery argument. At that point the debate was between South Carolina acting with cooperating states or acting alone. Lieber bolstered the argument of the cooperationists, who later prevailed.

Lieber's avoidance of direct commentary on slavery and his ownership of a few house slaves hid an antislavery perspective. He wrote an enthusiastic review of *Uncle Tom's Cabin* in 1853, but it remained unpublished, doubtless because of the sensitivity of doing so in South Carolina. However, his true beliefs emerged once he left the state for Columbia College in 1856. He became a strident defender of the Union and a voice against slavery.

Lieber coined the word *publicist* in application to himself. An active public intellectual, he advised on education, penal reform, "codes of war" (the Geneva Convention), arms sales, jury procedures, economic policy, and copyright law. He lobbied for in-depth statistics in the census and as a tool in political science. He was a philosopher, political economist, historian, and legal scholar. His best writings are perhaps his inaugural addresses at South Carolina College and Columbia College, describing the purposes of political economy and political history.

Lieber also maintained a private, philosophical correspondence in which he embraced Hegelian metaphysics (though not historical determinism) and had a more qualified view of religion than his public professions suggested. Author Walter Haushalter charges that Mary Baker Eddy, the founder of the Christian Science movement, plagiarized much of the content of the movement's primary text, *Science and Health,* from an unpublished Lieber manuscript, "The Metaphysical Religion of Hegel."

Limited Vote

City council members in the United States until the late nineteenth century were elected by a single-member or multimember ward plurality electoral system that facilitated boss and machine control. Reformers were disturbed by control of all council seats by one political party and commenced to advocate alternative electoral systems.

A number of city charters were amended to provide for an at-large or multimember election wherein voters are limited to casting fewer ballots than the number of contested seats. This system, currently used only in the United States, guarantees direct representation for members of the largest party or group with the representation dependent on the size of the council and the number of candidates for whom a voter may cast a ballot. Each vote for a candidate carries an equal weight, and a voter by casting additional votes may contribute to the defeat of the favorite candidate. Hence, the system encourages bullet or single-shot voting—voting for only one candidate.

The system was used by New York City commencing in 1963 to elect two members in each borough and resulted in one Democrat and one Republican elected until 1969 when three Liberals were elected to replace Republicans. Because the boroughs differ in population, the city abandoned the system following the U.S. Supreme Court's one-person, one-vote dictum in *Reynolds v. Sims* (1964) and *Wesberry v. Sanders* (1964). Nevertheless, the system currently is employed in several southern local governments. As of early 2010, the system was used in several Connecticut municipalities, several Pennsylvania counties, one county (Beaufort) in North Carolina, and twenty-one towns in Alabama.

Lincoln, Abraham

Abraham Lincoln (1809–1865), sixteenth president of the United States, was born February 12, 1809, on his parents' farm in Kentucky. In his early twenties, he moved to New Salem, Illinois, where he worked as a storekeeper, riverboat pilot, postmaster, and surveyor. Lincoln served as a militia captain in the Black Hawk War of 1832 and was elected as a Whig to the Illinois State Legislature in 1834. He was reelected in 1836, 1838, and 1840; in 1837 he began a law practice in the new state capital, Springfield. Lincoln married Mary Todd in 1842 and won election to the U.S. Congress in 1846. He declined to run for reelection to Congress two years later, in keeping with a Whig arrangement to rotate officeholders, and returned to Springfield to practice law.

Although primarily focused on helping build the nascent Republican Party organization in Illinois and tending to his increasingly successful law practice during the 1850s, Lincoln was drawn back into electoral politics, motivated by several important events, including Senator Stephen Douglas's

sponsorship of the Kansas-Nebraska Act of 1854 and the Supreme Court's 1857 *Dred Scott* decision. Lincoln's famous "House Divided" speech launched his 1858 senatorial campaign against Douglas, a campaign that represented the culmination of twenty years of political and personal rivalry between the two men that reached back to the state legislature and the courtship of Mary Todd. Though Lincoln lost the Senate campaign, his performance in contesting one of the nation's most prominent politicians put him on the national political map. The Cooper Union speech of February 1860, and the East Coast lecture tour of which it formed a part, put his name and the Republican approach to slavery—maintaining it where it was already established, but refusing to allow its spread into new territories and states—before a still wider audience. Lincoln garnered the Republican nomination for president in Chicago, Illinois, that spring and defeated three rivals to win the presidency in November 1860.

Lincoln faced a crisis from the moment of his election: ten Southern states had left him off their ballots entirely, and seven had seceded and formed the Confederate States of America before he was even sworn in. Hostilities erupted when Confederate troops fired on Union attempts to resupply Fort Sumter, off the South Carolina coast, in April 1861. Lincoln and the nation were shocked by the fiasco at Bull Run in July 1861, in which outnumbered Confederate forces routed Union troops. The year 1862 saw the president increasingly disillusioned by the inaction of General George McClellan and displeased with the lack of response from border states (Delaware, Maryland, Kentucky, Missouri) to his offer of compensated emancipation. In April 1862, Congress approved legislation ending slavery in the District of Columbia, but Lincoln was looking to make a more serious move against slavery, which he increasingly saw as incompatible with the future of the United States as a nation where all men were created equal. The Emancipation Proclamation, which took effect on January 1, 1863, freed slaves in Confederate territories in rebellion against the national government. In July of that year, the tide of the war finally turned after the Union victory at Gettysburg, and after nearly four years and more than six hundred thousand combined casualties, the Civil War (1861–1865) ended when Confederate General Robert E. Lee surrendered to Union General Ulysses S. Grant at Appomattox Courthouse in Virginia, on April 9, 1865. Just four days later, Lincoln was shot by Confederate supporter John Wilkes Booth while watching a performance at Ford's Theater in Washington. He died the next morning.

Despite an elementary-level education, an undistinguished early political career, and his own apparent lack of Christian faith, Lincoln crafted some of the most memorable speeches in the American political tradition and displayed a deep appreciation for the ability of religious imagery to provide comfort and meaning in the nation's darkest hour. Three of his speeches—the Cooper Union speech (1860), the Gettysburg Address (1863), and the Second Inaugural (1865)—have occasioned scholarly treatments all their own, and Lincoln's commitment to the ideals of the American Union continues to inspire struggles for liberty in the United States and around the world. African American activist and civil rights crusader Martin Luther King Jr., for example, acknowledged the importance of delivering his noted "I Have a Dream" speech in the shadow of the Lincoln Memorial in 1963.

Linear Model

Due to their simplicity, linear models are easy to understand and interpret, which makes them the basis for most of the statistical analyses used in applied political science and social research. The simplest way to understand them is with a two-variable case. Suppose that Y is a response variable (or dependent variable) and x is an explanatory variable (or independent variable). A straight line relating Y to x has an equation of the form:

$$Y = a + b\,x + e$$

In this equation, b is the slope, the amount by which Y changes when x increases by one unit, while a is the intercept—the value of Y when $x = 0$. The value e is the error term; i.e. the expression that captures the difference between the data observed and the model that fits the data. Linear models can be used to understand the relationship between the two variables and to predict the response of Y for a specific value that the explanatory variable x might assume. A more complex linear model would assume multiple independent variables as predictors of the response variable. The linear model is the foundation for the t-test, analysis of variance (ANOVA), analysis of covariance (ANCOVA), regression analysis, and many of the multivariate methods including factor analysis, cluster analysis, time series, and others statistics that are constantly used in political science and other social sciences.

Lipset, Seymour Martin

Seymour Martin Lipset (1922–2006) was an American political sociologist whose work won numerous awards. Lipset was born in New York City and earned his bachelor's degree from the City College of New York in 1943 and a doctorate in sociology from Columbia University in 1949.

Lipset entered college intending to become a dentist and switched to sociology after being convinced by a fellow member of the Young Socialist League that sociology could lead to a career in social work—a job that Lipset believed would always be in demand. While Lipset was one of a number of leftists at City College in the late 1930s, he later resigned from the Socialist Party in 1960 and became a very influential figure among neoconservatives.

Lipset taught at the University of Toronto in Canada from 1946 to 1948 while completing his doctoral dissertation on the Cooperative Commonwealth Federation (CCF) in Saskatchewan, which he published as his first book, *Agrarian Socialism* (1950). He also was on the faculty at the University of California (1948–1950); Columbia University (1954–1956); the University of California, Berkeley (1956–1966), where he was also the director of the Institute for International Studies (1962–1966); and Harvard University (1966–1975), where he was the George D. Markham Professor of Government and Sociology. In 1975 he left Harvard to become the Caroline S.G. Munro Professor of Political Science and Sociology at California's Stanford University from 1975 to 1990. After leaving Stanford, Lipset became the Hazel Professor of Public Policy at George Mason University in Virginia, a post he held until his retirement in 2004. Lipset was also a senior fellow at the Hoover Institution from 1975 until his death.

Lipset is the only person to serve as president of the American Political Science Association (1979–1980) and the American Sociological Association (1992–1993). He also served as president of the International Society of Political Psychology (1979–1980), the Sociological Research Association (1983–1985), and the World Association for Public Opinion Research (1984–1986).

Lipset's major works were in the fields of political sociology, trade union organization, social stratification, public opinion, the sociology of intellectual life, political extremism, and conditions for democracy from a comparative perspective. In this area, Lipset was an early proponent of the *theory of modernization,* which linked economic development and democracy.

Lipset received many awards, including the MacIver Prize for *Political Man* (1960), which sold more than four hundred thousand copies and was translated into more than twenty languages, and the Gunnar Myrdal Prize for *The Politics of Unreason: Right Wing Extremism in America, 1790–1970,* which he coauthored with Earl Raab. In addition to the many books he authored, Lipset edited twenty-four others and published more than four hundred articles.

Lipsius, Justus

Justus Lipsius (1547–1606), a Flemish humanist, philosopher, and classical scholar, was the founder of *neostoicism,* a key school of European thought in the late sixteenth and seventeenth centuries.

Born near Brussels, Belgium, Lipsius was educated at the Jesuit College in Cologne, Germany, and the Catholic University of Leuven [Louvain] in Belgium, where he studied law and Latin classics. His early publications of criticism and emendation of notables such as ancient Roman philosopher Cicero garnered Lipsius an appointment in Rome as Latin secretary to Cardinal Antoine Perrenot de Granvelle, one of the most influential church leaders and diplomats after the emergence of Protestantism in Europe in the mid-sixteenth century. While there, Lipsius's studies of philosopher Seneca, historian Tacitus, and Roman stoicism initiated a lifelong philological and philosophical obsession that subsequently led him to Austria and Germany, where he obtained a chair of history at the Lutheran University of Jena and also spent some time in (Catholic) Cologne. In the late 1570s, he went to teach history at the newly founded Calvinist University of Leiden in the Netherlands, where he spent the most productive period of his scholarly life, publishing, most notably, *De Constantia in Publicis Malis* (*On Constancy in Times of Public Calamity,* 1583–1584), or *De Constantia* for short, and the *Politicorum Sive Civilis Doctrinae Libri Sex* (*Six Books on Politics or Civil Doctrine,* 1589)*,* known more simply as the *Politica.*

De Constantia, Lipsius's first neostoic work, was a Senecan dialogue set in the violent religious and political struggles of the Netherlands that combined stoicism and Christianity in a new philosophy to help individuals cope. Repackaging stoicism as an antidote to the religious and political passions of the day and transforming stoic fate into divine providence,

Lipsius' brand of neostoicism became suitable for Christians. Effectively a work of practical psychology, *De Constantia* went through many editions and translations. Embodying elements of militant Calvinism as well as Jesuit arguments on free will, it became common cultural property during the Baroque period and influenced scholarship, poetry, and art until the Enlightenment.

A sequel to *De Constantia,* Lipsius's *Politica* instructed rulers how to govern principalities in an ethical context, just as the former instructed citizens to endure and obey. The *Politica* combines a wide range of classical, medieval, and Renaissance sources. Its six books are devoted to virtue and prudence (book one), the purpose (civil concord) and forms of government (book two), political prudence of prince and advisors (book three), the prince's military and civil prudence in matters human and divine (book four), and defense, just war, and civil conflicts (books five and six). In controversial sections dealing with the difficult relationship between state and church and religious tolerance, Lipsius expresses his views that peace and unity depended on a one-religion-per-polity approach; that the prince, without religious authority of his own, had the duty to ensure the unity of the church; and that peaceful religious dissidents were to be tolerated while those instigating civil unrest deserved no mercy. A supporter of monarchy and moderate absolutism, at least when based on stoic virtues, Lipsius thus, decades before English political philosopher Thomas Hobbes, placed political stability above civil liberties and personal freedom.

The *Politica* was most enthusiastically received in France, Germany, and Spain, but also provoked both Protestants and the Roman Inquisition, which placed it on the Index of Prohibited Books in 1590. Lipsius, seeking to avoid the resulting controversies, returned to Leuven in 1592 and, reembracing the Catholic faith of his youth, taught and wrote at the university until his death in 1606.

Lobbies, Professional

Lobbying might be defined as an attempt to influence the government decision-making process and to secure certain outcomes via individuals or firms (lobbyists) who act on behalf of a person or a special interest group. The First Amendment of the U.S. Constitution bars Congress from abridging the right of people "to petition the government for redress of grievances." Thus, for Americans, lobbying in the broadest sense of the word is a fundamental legal right.

It is important to distinguish professional lobbying from other efforts to influence public policy. In the United States, professional lobbying firms, located in what is called the K Street corridor, are companies that various groups or firms, usually called *special interest groups,* hire to lobby.

Other efforts to influence public policy are performed by groups that do not fall under the legal designation of lobbying firms in the United States and the European Union (EU). These include advocacy groups, business groups, labor unions, and farmers' organizations. Especially important in the United States are public policy research organizations, called *think tanks,* that are classed as nonprofit, nonpartisan, tax-exempt entities under section 501(c)3 of the U.S. Internal Revenue Code. Such groups by law are not allowed to lobby government, defined as calling explicitly for lawmakers to vote a certain way on legislation. But they are often funded by special interests groups—for example, labor unions or businesses. Such organizations can issue studies and reports, organize conferences and meetings, or have their scholars appear in the media to point out the advantages and disadvantages of particular government policies.

For many people, the word *lobbying* has a negative connotation. Many people picture special interest groups that act in some way that is opposed to the public good. For example, specific labor unions and companies might persuade policy makers to protect them from foreign competitors by imposing trade restrictions. Of course, one person's *special interest group* is another person's "deserving workers" or "crucial nation industry."

A deeper insight into lobbying is summarized as *concentrated benefits, diffused costs.* A company might secure millions of dollars in extra profits and workers might secure millions in higher wages through trade barriers, but the costs of trade restrictions to any given consumer for some product might only be a few dollars. Thus, a given consumer won't have the means or the incentive to lobby lawmakers for free trade, but a union or company would have both.

In such cases, the fact that governments have the authority to grant such favors is considered by many to be the root of this problem. But others would point out that lobbying is simply part of the competitive political process.

MEASURING LOBBYING
Lobbying can be difficult to measure because it often takes place precisely in "the lobby," (i.e., behind the scenes and hidden from public scrutiny). The measuring problem is especially serious in connection with unregulated lobbying, which is the

current state of affairs in the EU. Why, for example, do Chinese shoe producers face barriers to entry in the European market? Here, the responsible bureaucrat in the European Commission can collect information from the lobbyists of the shoe industry in southern Europe (who will argue in favor of protecting their own workplace) and from consumer organizations (who, in contrast, will argue in favor of the lowest possible shoe prices). In this way, the bureaucrat or the politician can obtain support to reach a solid basis for decision.

Still, the small groups (shoe producers) are more likely to hire a professional lobbyist and influence the political decision maker than the large groups (shoe consumers). Asymmetrical and nontransparent lobbying in favor of producers at the cost of consumers may explain the elaboration of distorting EU policies such as the Common Agricultural Policy in the EU.

In the absence of mandatory registration for lobbyists in Brussels, it is impossible to establish the actual number of professional lobbyists. The European Commission guesses that the number is around fifteen thousand, and acknowledges a need for formal regulation of the area.

In contrast, in the United States, where about thirty-five thousand professional lobbyists are currently registered, lobbying is far more transparent and measurable. The number of registered lobbyists in Washington, DC, has more than doubled since 2000 to more than 34,750 in 2005.

The Lobbying Disclosure Act was passed in 1995, replacing the Federal Regulation of Lobbying Act from 1946. The point is that in the United States the representatives of many special interest groups are legally required to register, and they have to report their activities to the authorities every six months, including areas of their lobbying activities, bureaucrats contacted, names of employed lobbyists, and total lobbying expenses. The reports also must be available to the public. For example, a search on the energy giant Halliburton from Texas shows that it spent $250,000 on lobbying between January 1 and June 30, 2004, in connection with, among other things, asbestos legislation, promotion of power-related aspects in the ongoing World Trade Organization negotiations, and continued cooperation with the U.S. armed forces. Due to the strict regulation of lobbying in the United States, lobbyist activities are much more directly measurable there than in the EU.

The political arenas of the United States and the EU can be characterized as pluralistic systems with free competition among the lobbying groups. This is in stark contrast to the Scandinavian corporatist model, for example, with its formalized rules for incorporating all affected interests—both producers and consumers—in the decision-making processes. Rational producers may in fact prefer pure pluralism and free competition among lobbyists to corporatism, which automatically involves the consumer side as well.

Lobbying plays an important role in a pluralistic system, and it is crucial for any interest group to hire the best lobbyists and build a base in, for example, Washington, DC, or Brussels. We know that most interest groups represent producers. Approximately 70 percent of all lobbyists in Brussels represent producer groups. Ten percent of all lobbyists work for consumers and nonprofit interests, whereas the last 20 percent represent regions, cities, and international institutions.

LOBBYING STRATEGIES

Professional lobbyists for industries or companies may operate with at least six different types of strategies that they may apply according to the specific circumstances. The first and most aggressive strategy may be called the *gunboat strategy,* which uses all possible threats; e.g., if the lobbyists do not have their way production will be relocated to countries outside the country. At the same time, lobbyists may run tough media campaigns. The second strategy, called the *Trojan horse,* implies that the lobbyist succeeded in getting inside the walls and at close quarters with the decision makers. Through this close contact and dialogue, it is possible to reach a negotiated settlement. The third strategy, the *good and the bad,* is applied if other competing lobbyists are acting like roughnecks. Then there is an opportunity to act nice and friendly yourself and to establish trust. The fourth strategy, the *dentist,* is applied when a producer group does not like a bill. It may try and pull out the worst tooth first and then come back after the rest later on. The fifth strategy, the *third party,* indicates a reaching-out strategy to nongovernmental organizations and unions to find a compromise on a disputed issue. The sixth and final strategy, the *donkey,* is a mixture of carrot and stick approaches according to which producer groups seek to win over political decision makers by understanding their interests and offering economic or careerwise reward or sanction; in the worst case, they try bribery.

In perspective, it is crucial to establish clear rules for lobbying in any country to ensure measurable and democratic control of how various professional lobbies influence political decision makers.

Lobbying

Lobbying is the practice of trying to influence a government policy by actors outside that particular government. The term arose from the practice of advocates gathering in the lobbies outside the U.S. Senate and the House of Representatives so that they could plead their cases to officeholders. While

all forms of government experience some form of lobbying, capitalist democracies, with their economies largely in private hands but subject to public-sector regulation and their governments concerned with public opinion, spawn entire industries aimed at influencing public policy.

LOBBYING IN THE NINETEENTH AND TWENTIETH CENTURIES

Lobbying grew rapidly in the United States after the Civil War (1861–1865), with the development of a modern industrial economy and the public sector playing an increasing role in regulating that economy. Railroads, banks, and other corporations sought favors from the federal and state governments—or found themselves "shaken down" by politicians—and the Gilded Age became notorious for its scandals.

The early twentieth century saw lobbying become increasingly professionalized. Overt bribery became less common, and lawyers gradually became the main actors in influencing government. Technical expertise became particularly important as progressivism, the New Deal, and the Great Society imposed regulation on business, and the "revolving door" became institutionalized as each presidential administration generated sets of well-connected insiders eager to capitalize on corporations' need for access.

The 1960s and 1970s marked a further explosion in government advocacy. The Kennedy, Johnson, and Nixon administrations greatly expanded Washington's role in civil rights, environmental, energy, health care, and consumer issues. A variety of mass movements mobilized millions of citizens as new technologies such as direct mail and computer databases greatly lowered the cost of forming large membership organizations. Large transfers of funds from Washington to state and local governments gave birth to a new industry of intergovernmental lobbying. The business-dominated culture of mid-century Washington collapsed, and corporations responded by increasing their lobbying and public relations efforts.

LOBBYING GROUPS

Despite the growth of citizens' groups, business remains the most important force in Washington lobbying, but these businesses rarely act as a coherent whole. Corporate lobbyists are often concerned with winning on narrow, low-profile issues in which conflict and publicity are minimal. Many of the most heavily lobbied issue areas—telecommunications, financial services—feature conflicts among corporations and highly technical matters that do not easily fall along ideological lines. Other issues—environmental regulation, tort reform, workplace standards—come closer to traditional liberal-conservative divides.

Trade associations usually focus on broader issues that affect most or all of their membership. The Pharmaceutical Research and Manufacturers Association (PhRMA) spent millions of dollars on lobbying and public relations to shape the Medicare prescription drug benefit passed in 2003. Professional associations take a broader focus than do corporations. The American Medical Association (AMA) claims to speak for all American physicians, and it dominated health care policy through the 1960s but failed to stop the creation of Medicare in 1965. The rise of specialty societies undermined the AMA's ability to speak for the entire medical profession, and today, the health care industry is fragmented in its representation.

Peak business associations claim to speak for the entire business world and usually speak out against government intervention in the economy. These groups are especially close to the Republican Party; the U.S. Chamber of Commerce often serves as a mouthpiece for Republican administrations. This group led the most expensive lobbying campaign in recent history in support of tort reform, leading to the passage of legislation in 2005.

Labor unions have long enjoyed a close relationship with the Democratic Party. Citizens groups, such as the National Rifle Association and the Sierra Club, often take a more ideological stance than do corporations and are more willing to mobilize their members as activists.

HOW LOBBYISTS DO THEIR WORK

Washington lobbyists include many former elected officials, government appointees, and political staffers. These individuals can trade in skills and connections developed in the relatively low-paying public sector for the far higher salaries of the lobbying world while maintaining an interest in partisan politics. Both at the federal and state levels, lobbyists focus their efforts on the legislative branch. Legislatures write laws and offer more access to outside actors than do the executive and judicial branches.

The most important commodity lobbyists can provide to policy makers is information. Members of Congress often confront legislation of which they know little. Lobbyists, by contrast, may have spent decades working on one particular issue and can transmit that knowledge to officeholders. Lobbyists also acquire information, however, whether it is through reading legislation, studying the *Federal Register* and other publications, or attending committee hearings or through personal contacts or reading journalistic accounts. Lobbyists often focus their efforts on congressional committees, known as the "workshops of Capitol Hill"—committees write the bulk of legislation, and their members and staff often know more about their specific issues than anyone else in Congress.

Much of lobbyists' time is spent building the relationships necessary to make their case on behalf of clients. They need to ensure that their phone calls are returned and that their requests for appointments are received favorably. So lobbyists attend the fund-raisers, they frequent the bars patronized by congressional staffers, and they throw the parties that can attract the "right" people.

Once in members' offices, lobbyists must make their case effectively. They need the technical expertise to understand legislation, and they need to be succinct. Above all, lobbyists need to engender trust. A member of Congress needs to know that any advice received from a lobbyist is, if not unbiased, at least reasonably accurate. Lobbyists who make the overloaded lives of members and staffers easier may become trusted advisers and be consulted on matters outside their narrow purview.

Lobbyists can raise money for members of Congress, through political action committees, through individual contributions, and by "bundling" the contributions of other donors. They also may contribute to party committees and think tanks and foundations with ties to important policy makers.

Academic studies of lobbying rarely show it to have profound influence despite lobbyists' strongest efforts; PAC contributions seem to only buy access, and lobbyists seldom dominate the legislative process. Their influence cannot compete with those of party, ideology, or constituent opinion. For this reason, much lobbying activity is defensive in nature, fending off legislation that might damage a client's interests.

Lobbying the executive branch poses challenges different from those found in legislative advocacy. In the executive branch, many of the key decisions are in the hands of career civil servants. Due to this, lobbying the executive branch must rely on policy arguments far more than personal affability. Among the most heavily lobbied entities in the executive branch are regulatory agencies and commissions, including the Food and Drug Administration, the Federal Communications Commission, and the Federal Trade Commission. These agencies make decisions that can be worth millions of dollars to corporations and trade associations, and they are notorious for their "revolving doors," with lawyers and other employees putting in a few years to gain the necessary expertise, and moving onto lucrative positions in the private sector.

LOBBYING THE EUROPEAN UNION

As the European Union has gained power (especially after the Single European Act of 1987 and the Maastricht and Amsterdam treaties), lobbyists have increased their activity in Brussels. As a means of providing greater democratic legitimacy for the EU, the European Commission (the community's executive body) has encouraged the growth of interest groups, both through direct funding and widespread consultation on policy making. The commission itself attracts the most attention from lobbyists. It drafts all legislation that will be considered by the European Parliament (EP); lobbyists especially seek to influence the early stages of this process, when many details are worked out. The commission has a highly fragmented structure, with thirty-eight directorates general and countless advisory committees allowing for multiple points of access. The commission also is chronically understaffed, giving lobbyists wide opportunity to exploit technical expertise.

The EP, once dismissed as inconsequential, acquired more power during the 1980s and 1990s. If lobbying the commission is much like lobbying the American executive branch in the emphasis on the low-key exchange of technical expertise, then lobbying the EP resembles working with the U.S. Congress in its embrace of public opinion and political horse-trading. Few lobbyists can gain access to COREPER (composed of member states' permanent representatives to the EU), the Council of Ministers (foreign ministers), and the European Council (heads of government).

Lobbying the European Union traditionally was dominated by large, well-connected peak business associations such as the Union of Industrial and Employer's Confederation of

Europe (UNICE), the European Roundtable of Industrialists (ERT), and the EU Committee of the American Chamber of Commerce (AMCHAM-EU). European Trade Union Confederation (ETUC) spoke for organized labor. But since the 1980s, a much broader variety of interests have emerged, including environmentalists and consumer activists, while an increasing number of individual firms now have offices in Brussels.

Local Politics

The term *local* may assume different meanings. As clarified by Nancy Ettlinger, it can indicate a neighborhood, town, or metropolitan area in the context of a region or nation; it can refer to a region in the context of a nation; and it can signify a nation or even a multinational region in the context of the global economy. Yet a common element exists among these: local politics expresses a political tension between autonomous multiple centers entitled with a certain degree of freedom and a legitimate power structure. Therefore, the concept is strongly tied to the dimension of centralization-decentralization in a given territorial organization of power—two poles of a continuum along which lie many experiences of center-periphery relations.

THE CONCEPT OF LOCAL POLITICS

The formation of the modern state has represented a process of evolving centralization of power that has reduced the level of fragmentation of politics. Before its rise, power was divided territorially among empires, kingdoms, principalities, cities, and other self-governing entities, as well as functionally

among the political, religious, and economic spheres. The slow and incisive process of state formation exerted normative and structural pressures to centralize cultural, political, administrative, and economic regulation capacities within societies. The principle of local liberty was never meant to be an obstacle to the national government's entry into local affairs. Yet state-building has been unable to conduct to a complete homogenization of political space. As Stein Rokkan has noted, the state is not distant from the notion of territory as a delicate combination of centers, the gathering places where the major decisions are made; peripheries, the areas controlled by these centers; and transactions among the centers and between the centers and the peripheries. Although the state provides a centered hierarchical system control over territory, this framework does not exclude the existence of local actors.

In the early twenty-first century, local politics remains an essential dimension of modern political life that represents an essential and integral part of existing nation-states. Locality is the main locus of citizen identification and participation, representing the institutional context closest to citizens. This is a position that partly echoes the assumption made by nineteenth- and twentieth-century theorists on local self-government. For instance, John Stuart Mill wrote that the very object of having a local representation is so that those who have any interest in common that they do not share with the general body of their countrymen may manage that joint interest by themselves.

Such a position was based on two main arguments. First, local elected institutions are essential because they widen opportunities for political participation and educate citizens in the practice of politics and government; second, these local institutions oversee the affairs of the locality—based on local knowledge, interest, and expertise—so that local services are provided more efficiently and effectively than if they had to come solely from a distant central government. Based on this normative view and ideological premises, the spread of democratization has emphasized the values of autonomy and self-determination rather than external direction from a central government.

This valorization of local government has continued, as institutional reforms in many Western countries have allocated competencies and powers to the municipal and regional levels. Since the 1980s especially, nation-states that in the past showed a more centralized model of administration have been evolving toward a more decentralized governmental system. For instance, Belgium arrived at a federal arrangement in 1993; the process of French *décentralisation* was begun in 1982; and Spanish local autonomies were strengthened in the early 2000s even in the presence of constitutional dispositions written in 1978. Also, the Italian case can be considered as a paradigmatic example, as at the beginning of the 1990s the valorization of local politics occurred through the introduction of direct election of the head of local executives. The strengthening of majors and regional presidents has provided a more immediate identification of local political power by producing a shift from collective to individual control over the formulation of governmental programs and from collective to individual accountability.

These trends are not limited to the Old World, where reduction of the role of central governments is functional to the state members' participation in the framework of the European Union. In the United States, the debate over federalism and the role of government is a prominent component of the political agenda. In this context there has been a revival of decentralization from the federal government to state and local governments. The influence and power of the national government grew continuously in the course of the nineteenth and twentieth centuries; in the early twenty-first century the pendulum began to swing back toward the states. Locality also has become a focal point of democratic political development in formerly communist countries in central and eastern Europe, central Asia, and Latin America. The establishment of local institutions in these countries has been seen as a way for democratic self-determination rather than top-down direction.

FROM COMMUNITY STUDIES TO CROSS-NATIONAL RESEARCH

Despite the centrality of this object of analysis, local politics has not been conceived as an autonomous field of research. Some classical contributions on power in the United States have been conducted at the microscale by considering local politics as the mirror of the whole society, and case studies by political scholars such as Robert and Helen Lynd, Floyd Hunter, and Robert Dahl concentrated attention from the 1930s to the 1960s on specific towns to study of power structure within given communities as well as in the United States. For instance, in their pioneering work on Middletown, the Lynds considered such specific aspects of social life as employment, maintaining a home, raising children, leisure, religion, and community activity. Middletown—an invented name for Muncie, Indiana—was selected by the authors as representative of the United States because it was of manageable size, ethnically homogeneous, and fairly self-contained. Given that it was a "typical city," it was argued that the findings of the Middletown study could be applied to other cities or to life in the United States in general with few reservations. Especially in the Lynds' second volume, *Middletown in Transition* (1937), the theme of social change was faced, analyzing the dramatic effects of modernization that between the nineteenth and twentieth centuries produced a growing separation between the business and working classes, undermining community solidarity and weakening consensus. Although the authors explained how the methodological features of their works did not permit inferences from the single case of Middletown to be made for the entire country, the spirit of their work nonetheless suggested that despite some local and sectional peculiarities, Middletown was the country in miniature, almost the world in miniature.

Also in other studies, local politics was not considered an autonomous field of study, yet a mirror of national politics. For instance, following the Lynds, in 1953 Hunter in *Community Power Structure* studied the regional city of Atlanta, Georgia, and reflected on the consequence of the presence of a power elite on the American democracy. According to the author, only

community studies permit scholars to observe power relations with precision and assess the strong connection between economic power and political influence. Hunter's analysis of the demographics of Atlanta sustained the ruling elite hypothesis that asserts that within some specific political system there exists a group of people who to some degree exercise power or influence over other actors in the system. He looked for the "real" holders of power rather than those in obvious official positions, by using the so-called reputational method, which consists of finding a panel of citizens believed to be knowledgeable about the community and asking them to rank the names of the most influential people in the community.

Dahl's 1961 *Who Governs?* focused on another American community, New Haven, Connecticut, but reached different conclusions from either the Lynds or Hunter. Dahl's book became the basis for an influential theory of pluralism that stated that participation in the decision-making process was rather widespread, at least widespread enough to preclude the characterization of the political process in New Haven as controlled by a ruling elite of social and economic notables. Dahl's student, Nelson W. Polsby, would subsequently pursue Dahl's line of reason further. In 1963 he published *Community Power and Political Theory,* which extended Dahl's conclusions on New Haven to other cities and even to the national level. That same year another scholar, Aaron Wildavsky, published an account of Oberlin University politics under the title *Leadership in a Small Town* (1964).

However, although Dahl himself encouraged comparison between more communities that show a different level of pluralism, rarely have community studies been dedicated to the comparison of communities within different national contexts. The study of local politics has been confined by national boundaries, and even the most theoretically oriented studies have not aimed at formulating generalizations beyond the limits of a single national system. It has only been since the late twentieth century that a body of political science literature has been dedicated to the comparative analysis of center-periphery regimes. For instance, Edward Page and Michael Goldsmith focused on a range of seven unitary states to demonstrate the differences between two center-periphery regimes: the northern countries regime, including Britain, Denmark, Norway, and Sweden; and the southern countries regime, including France, Italy, and Spain. Three aspects are regarded as particularly important in these regimes, namely the functions of local government, the discretion under which these are performed, and the access of local decision makers to central government. Countries in the first category show more functions and a higher degree of discretion in terms of regulation, controls and tutelages, and financial power and capacity. In particular, Britain represents the clearest example of dual politics, for its evident separation of central and local government, as opposed to France, which provides a sort of osmosis between central and local political powers. Italy and Spain subordinate local authorities to the upper level of government, despite institutional reforms to alter this equation. Starting from a cross-national comparison, some models of local governments also

can be identified. Goldsmith has proposed a classification based on three ideal types that signal different political cultures: the patronage model, which aims at allocating resources to specific individuals or groups, especially developed in southern Europe; the economic-development model, the main function of which is fostering economic development, with a neoliberal approach to market regulation (Australia, Canada, and the United States are closest to this ideal type); and the welfare model (empirically corresponding to the local government systems of Germany, Great Britain, the Netherlands, and Scandinavia), which is particularly engaged in satisfying social rights through the provision of public services to lower classes.

Such contributions help overcome one of the main limits of literature on local politics, which according to Jerzy Wiatr refer to within-nation rather than to between-nations comparisons, with the result being a narrowness of theoretical perspectives as well as of a tendency to present local political phenomena as if they were totally specific for every nation. Yet showing differences in terms of local politics—within or between nations—opens inevitably the debate on factors explaining such variance.

EXPLAINING VARIANCE IN LOCAL POLITICS

In the 1960s a new approach was defined that stressed a new role for political culture in determining political and economic performance. In some cases specific subcultures were investigated to explain the absence of political and economic growth. Edward C. Banfield's study of the southern Italian regions, *The Moral Basis of a Backward Society* (1956), concentrated on a specific community, Montegrano. This was done to show an explicit contradiction between the social conditions of Montegrano's inhabitants—poverty, ignorance, exploitation by the upper class, conservatism, distrust of the state and all authority, and fatalism—and the lack of initiatives of collective action, with significant absence of voluntary associations, scarce value attributed to political parties, an underdeveloped local press, and no lobbying activities directed toward improvement of community life. Citizens seemed to be directed only to maximize the material, short-run advantage of the nuclear family and assume that all others would do the same.

In the early 1990s, Robert Putnam and his colleagues compared fifteen Italian regions from their inception in 1970, based on the assumption of different administrative capabilities. Through a composite index of performance comprised of twelve indicators of institutional success and failure that combined qualitative and qualitative methodological instruments from elite and population surveys to statistical data analysis, Putnam measured different levels of performance of Italian meso-governments. They arrived at the paradoxical conclusion that regional reform appears to be exacerbating, rather than mitigating, the historical disparities between Italy's northern and southern regions. Discrediting the common economic determinist argument, they attributed the underdevelopment of southern Italian society to a lack of a culture

promoting civic engagement, trust, and ability to cooperate. Indeed, they traced the reasons for current disparities among Italian regions back to different historical paths—southern Italy was dominated in the Middles Ages by an autocratic and feudal government and a powerful church, whereas northern Italy showed traditions of *civic republicanism*.

If studies tied to the concept of political culture present the merit of questioning the relevant theme of the relationship between individual agents and political structure, they also conversely show some limits in presenting a restricted conception of social change. It can be argued that they propose a vicious cycle from which a territory with a given political culture cannot transform itself.

Other approaches better recognize how institutions shape politics. For instance, examining the ways in which institutions structure social and political behavior, *new institutionalism* argues that policy, politics, and behavior can only be understood in the context of the institutions in which they take place. According to this view, politics presents a certain degree of autonomy and may influence values, norms, identity, and roles. Indeed, as structures that regulate human interaction and define the incentives that determine the choices that individuals make, institutions also determine the performance of societies and economies over time. Such an approach has been applied in many fields of research, including local government: an example can be found in the Francesco Kjellberg's 1975 study of two Sardinian communities. Neoinstitutional perspective must be appreciated for its opposition to the tendency to portray politics as a reflection of society, political phenomena as the aggregate consequences of individual behavior, and action as the result of choices based on calculated self-interest. Yet some critics also have affirmed that neoinstitutionalism, tending to avoid monocasual explanations, has yet to produce a clear theory of political change.

CONCLUSIONS: LOCAL POLITICS AS UNITS OF ANALYSIS?

Literature on local politics has not been sufficiently developed as of the early twenty-first century. More particularly, three deficiencies can be identified in scientific contributions relative to this area. First, notwithstanding some classical political science works dedicated to the local dimension, contributions on the subnational level have shown little cumulativeness of results. Frequently, studies on local dimension have been used to test hypotheses on the functioning of the political system as a whole, and as a result, they approach scenarios from different perspectives and therefore reach incompatible conclusions. For instance, sharp distinctions exist between the elitist and pluralist schools in the field of community studies, and these provide very different interpretations of local decision making and politics in general. Arnold Rose noted that *The Power Elite* was almost a bible for a younger generation of new leftists, underlining a focus more on the "I believe" than on proof search activity (Pranger, 1969).

The second deficiency of the study of local politics is the low number of analyses devoted to cross-national research.

As noted earlier, adoption of a comparative research strategy has been limited, so that it is very difficult to generalize research results and to be certain that social-structural regularities are not merely particularities, the products of some limited set of historical or cultural or political circumstances.

Moreover, probably the main weakness of the study of local politics concerns the lack of autonomy of this field of research. Only rarely have local systems of government been adopted as an independent unit of analysis, yet, local politics is more than a component of national politics and possesses its own rules and functions. Following Frank Bealey's work, it is not difficult to recognize the relevance of some subfields, such as the organization of local institutions and their developments; the electoral politics of local councils, their meetings and decision making, their contacts with local interests and pressure groups; party organization; local elites and their exercise of power; center–periphery relations; and, in particular, the efforts of local politicians to obtain benefits for their localities by approaching central authorities. Future trends in local studies may concern several areas of interest for political science, shifting attention more fully onto a significant sphere of political life.

Locke, John

Known as the founder of modern liberalism, political philosopher John Locke (1632–1704) was born in Somerset, England. His greatest contributions were in the fields of political philosophy, as articulated in the initially anonymous work *The Two Treatises of Government* and in epistemology as presented in *Essay Concerning Human Understanding,* both published in 1690. In response to the tumultuous nature of British politics of the period, Locke rejected the theory of divine right and offered a radical reevaluation of the individual's role in governance. He contended that rational individuals have a God-given right to initiate a contract of governance and retain the right to rebel if the government ceases to honor the terms of the contract.

In *Two Treatises,* Locke rejects English political theorist Robert Filmer's philosophy of divine right and patriarchy. Locke believed that each individual owns the result of his labor. This notion, radical for its time, was embraced by Enlightenment theorists and is inherent in the development of classical liberalism and modern political thought.

Although Locke's ideas in *Two Treatises* were not initially popular in Europe, they were instrumental in the formation of American political thought. His theories of *natural rights* were written into the Declaration of Independence in 1776 by statesman Thomas Jefferson, who identified them as the right to "life, liberty, and the pursuit of happiness." Locke continued to be a major influence on American democracy when the U.S. Constitution was written in 1787.

Locke's *Essays on the Laws of Nature* was published in 1663, the year before he was named as Censor of Moral Philosophy at Oxford University. In 1664 Locke enrolled in medical school at Oxford. Before receiving his degree, he accepted the position of medical advisor to Lord Ashley, the future Earl of Shaftesbury. Locke's connection with Ashley continued for eight years and was responsible for his appointment to several minor political positions. The relationship also placed Locke in the company of leading English radicals. Locke was exposed to other innovative thinkers when he spent three years in France after completing his medical degree in 1674. He returned to England in 1681 but was forced to follow Ashley, who was accused of conspiring against King Charles II's brother, to the Netherlands to escape arrest. Locke's reputation was restored in 1686 and he returned to England.

An Essay Concerning Human Understanding, considered by many scholars to be Locke's most significant work, proved to be a watershed in English philosophy and launched the school of British empiricism. Locke used this work to express his support for King William, who had succeeded to the English throne with his wife Mary after the Glorious Revolution of 1688.

William and Mary introduced religious toleration in England, a notion heartily endorsed by Locke. In order to avoid expected controversy, Locke's *Letter Concerning Toleration* was published anonymously in 1689. *A Second Letter Concerning Toleration* was released in 1690, followed by a third in 1692. The letters expanded on Locke's support for the right of individuals to choose how they worshiped. Locke continued his examination of religion in *On the Reasonableness of Christianity* and *A Vindication of the Reasonableness of Christianity,* both published in 1695.

Locke's interest in a wide range of disciplines was evident by some of his other works, including *Some Considerations of the Consequences of the Lowering of Interest* (1691), *The Raising of the Value of Money* (1692), and *Some Thoughts Concerning Education* (1693). During the year before his death in 1704, Locke worked on *Some Thoughts Concerning Reading and Study for a Gentleman.* After his death, *Paraphrases on the Epistles of St. Paul* (1705) and *Fourth Letter Concerning Toleration* (1706) were published.

Logistic Regression

Logistic regression is a multivariate statistical technique used to study the relationship between a set of exogenous or independent variables on a binary endogenous or dependent variable. Sometimes called a logit regression or a logit model, a logistic regression is a special case of a discrete regression and is closely related to the probit model. The dependent variable in a logistic regression is usually an indicator variable that takes on one of two values. Logistic regressions are used to study the factors that predict candidate choice (Democrat versus Republican) in two-candidate elections, outcomes (alive versus dead) of medical trials, the causes of employment (employed versus unemployed), and so forth. The logistic regression is based on the logistic curve, a mathematical function that maps the real line into the unit interval. There are many extensions of the basic logistic regression, and these extensions are found in modern statistical software packages. Some of the more common extensions include the multinomial logistical regression, in which a categorical dependent variable of interest takes on multiple categories as opposed to only two; the ordered logistic regression, in which a categorical dependent variable of interest takes on multiple categories that have a natural ordering; and the conditional logistical regression, a model used to study individual choice in which features of the discrete options under consideration are modeled jointly with features of the individuals who are making choices.

Lowell, A. Lawrence

A. Lawrence Lowell (1856–1943) was an American lawyer and educator. He wrote two major studies of European political institutions: *Government and Parties in Continental Europe* (1896) and *The Government of England* (1908). In 1909 he became president of the American Political Science Association and in the same year president of Harvard. Lowell was a Republican and a Unitarian. He endorsed the League of Nations.

At the time of the expansion of the right to vote and the growing importance of competitive elections, Lowell pioneered the comparative study of the role of parties in government. To advance the understanding of party systems different from the Anglo-American two-party model, he examined continental European countries with multiparty systems: Austro-Hungary, France, Italy, Germany and Prussia, and Switzerland. While Lowell's books were atheoretical, they were informed by discussions with politicians involved in these systems and carefully documented. The appendix to *Government and Parties in Continental Europe* included the texts of constitutions in French, German, or Italian because he claimed much of value could be lost in their translation. His books remain relevant in providing a comparative understanding of how parties operated in the new circumstances of competitive elections that were also very different from those of the contemporary democratic political system.

Lowell's examination of politics in England occurred at the end of almost a century of gradual evolution from aristocratic government to party government dependent on success in competitive popular elections. As Lowell stated in *The Government of England,* it was a system in which the upper classes retained political privileges and ruled "by the sufferance of the great mass of the people and as trustees for its benefits." Prefaces to subsequent editions of the book showed an awareness that the debate over the governance of Ireland, imperial issues, and the presence of working-class Labour representatives in Parliament were creating pressures for the system to adapt.

After becoming president of Harvard, Lowell pushed through measures raising its standard of education, introducing residential accommodation that followed the Oxford model, and calling for more attention to research as was found in the German university model. He endorsed Harvard maintaining a quota restricting the admission of Jews and blacks. Lowell retired as president of the university in 1933 and died in 1943.

Lower Chamber

Legislative studies specialists argue that legislatures, in democratic settings, perform representative, legislative, and oversight functions. Of the three types of representative functions, the first is sociological. A parliament represents society because the social characteristics of parliamentary members resemble those of the population. Second, parliaments represent by being given a mandate to stand for and make decisions on behalf of the population. Third, parliaments represent by making decisions intended to promote the well-being of society. In addition to representative functions, parliaments also perform legislative, or lawmaking, functions as they have the power not only to discuss, amend, and approve government-sponsored bills, but also generally have the power to introduce bills and initiate the lawmaking process. Finally, parliaments perform oversight functions by monitoring the implementation of government policies and programs.

Legislative scholars have noted that while legislatures perform these three functions regardless of whether the political system in which they operate is parliamentary or presidential, legislatures in parliamentary settings also perform a fourth function: that of making and breaking governments.

Legislatures differ from one another depending on the number of chambers. According to the Inter-parliamentary Union (IPU), 60 percent of the world's legislatures are unicameral, while the remaining 40 percent are bicameral. In bicameral settings, spatial metaphor is employed to distinguish between two chambers: lower and upper. The distinction between the two applies only in the context of bicameral legislatures. Lower chambers are always elective and, hence, closer to the people, whereas upper chambers have generally been more insulated from the population.

Lower chambers differ from upper chambers in three basic respects. First, lower chambers are, on average, much larger than upper chambers. The data provided by the IPU on seventy-five bicameral legislatures show that the average size of upper chambers is 92.6 seats, and they vary from a minimum of 11 seats in St. Lucia to a maximum of 732 seats in the British House of Lords. The average size of lower chambers is 228 seats, and they vary from a minimum of 15 seats in Grenada to a maximum of 646 seats in the British House of Commons.

Second, the average terms differ between lower and upper chambers. Terms in lower chambers are typically shorter than those of upper chambers. The IPU data reveal that lower chamber terms average a duration of 4.5 years, with a range from two years, as in the case of the U.S. House of Representatives, to six years, as in the case of both the Liberian and Yemeni houses of representatives. Upper chamber terms are longer. According to the IPU, the average term of upper chambers is 5.3 years and varies from a minimum of four years, which is the duration of the term in 25 percent of the upper chambers for which the IPU collected information, to a maximum of nine years, as in the case of the Liberian Senate and the Moroccan House of Councillors.

Third, legislative studies specialists have shown that lower chambers are usually more powerful than upper chambers, with the exception of those whose formal powers are equal to those of lower chambers (such as the Italian and the U.S. senates). For example, lower chambers usually have the power to override upper chambers' vetoes. But lower chambers also have greater powers than upper chambers with regard to the making and breaking of governments. In bicameral systems in which the distribution of power across the two chambers is not symmetrical (such as in Australia, Austria, the French Fifth Republic, Germany, Great Britain, Ireland, Japan, and Spain), lower chambers have the power to affect the survival and the duration of the government by granting or revoking the confidence to the executive branch. Upper chambers do not have such power. These differences between lower and upper chambers exemplify how bicameral legislatures were institutionalized. Lower chambers were created as chambers of popular representation, while upper chambers were created, according to Dutch political scientist Arend Lijphart, "to serve as a conservative brake on the more democratically elected 'lower' houses."

Legislative oversight is one area in which the power differential between lower and upper chambers is remarkably less evident. In 2009, the IPU collaborated with the World Bank Institute to produce the *Survey on Parliamentary Oversight*. The survey's eighty questions addressed such issues as chambers' ability to oversee policy implementation, chambers' role in the budget process, the use of motions, chambers' ability to dismiss and impeach the executive, and the presence or absence of ethical regulations such as codes of conduct and disclosure rules.

The questionnaire asked respondents from the 120 chambers surveyed to indicate whether their legislatures had any of the oversight tools about which information was sought. All the lower chambers for which information was collected reported to have two or more tools; almost 90 percent of them had five tools or more and the lower chambers included in the sample had an average of 6.02 oversight tools—a value slightly higher than the average recorded, admittedly with a different survey questionnaire in 2001 and across both lower and upper chambers. These values are not much different, and are actually slightly lower, than the values registered in the upper chambers: all upper chambers had at least three oversight tools; 95 percent of them had at least five and upper chambers had an average of 6.55.

The evidence generated by this survey suggests that while it is true that lower chambers are larger, and traditionally more democratic, representative, and powerful in the government-selection and in the policy and lawmaking processes than upper chambers, they are equally, if not less, powerful in terms of their formal capacity to exercise legislative oversight.

Lukács, Gyorgy

Gyorgy Lukács (1885–1971) was a literary critic and Hungarian Marxist philosopher frequently considered to be one of the founders of Western Marxism. He made major contributions to Marxist thought and was an important figure in the Hungarian Communist Party.

Lukács was born in Budapest into a wealthy Jewish family. He studied at the universities of Budapest and Berlin, receiving a PhD from the latter in 1906. As a youth he was attracted to socialist ideas, and in Germany he made the acquaintance of figures such as sociologist and political economist Max Weber,

philosopher Ernst Bloch, and sociologist Georg Simmel. Lukács began publishing literary criticism in 1910, and on his return to Budapest in 1915 he led a left-wing intellectual circle that included social theorist Karl Mannheim and economic historian Karl Polanyi. His *The Theory of the Novel* (1916) is a seminal work in literary theory and the theory of genre.

After World War I (1914–1918) and the 1917 Bolshevik Revolution in Russia, Lukács turned to Marxism, joining the Hungarian Communist Party. He became part of the short-lived Hungarian Soviet Republic of Bela Kun, serving as People's Commissar for Education and Culture. When this government fell, he fled to Vienna, Austria, before settling in Berlin, Germany. He published several works on Marxist and Leninist thought, including *History and Class Consciousness* (1923). This book contributed to debates concerning Marxism and its relation to sociology, politics, and philosophy. It highlighted Karl Marx's theory of alienation before many of the works of the young Marx had been published. Lukács's work elaborates and expands on Marxist theories such as ideology, false consciousness, and class consciousness. For Lukács, ideology was a projection of the class consciousness of the bourgeoisie, which functions to prevent the proletariat from attaining its own real, revolutionary consciousness. Moreover, he emphasizes the concept of reification, in which, due to the commodity-based nature of capitalist society, social relations become objectified, precluding the ability for a spontaneous emergence of class consciousness. Rejecting dogmas attached to Marxist thought, he argued that Marxism was inherently dynamic, as it is based on dialectical materialism.

Although his work was attacked by Soviet leaders, Lukács left Berlin for Moscow in 1933, staying there through World War II (1939–1945). After the war, he was active in the creation of a communist government in Hungary and helped lead an assault against noncommunist intellectuals. He was, however, more liberal than others in the party, which led to him being purged from it in 1949. During the Hungarian revolution of 1956 he became a minister in the short-lived government of Imre Nagy. After the Soviets invaded, Lukács was exiled to Romania, but he, unlike Nagy, managed to avoid execution for his previous activities. Lukács returned to Budapest and professed his loyalty to the new government, although his defenders argued that his works such as *The Young Hegel* (1938) and *The Destruction of Reason* (1954) demonstrated his criticism of the Soviet version of communism. His final, unfinished manuscript, published in English in 2000 as *A Defence of History and Class Consciousness,* is considered one of the more important "discoveries" in Marxist thought in recent years.

Lusophone Africa

The term *lusophone* is closely associated with the Portuguese sphere of influence. It is used to refer to people and states across the world with a cultural background and language significantly influenced by the Portuguese. The spread of Lusophone culture can largely be attributed to the Portuguese explorations and colonial conquests around the world dating back to the fifteenth and sixteenth centuries. Presently, Portugal's former colonies continue to hold a keen cultural affinity with their former colonizer; most notably the Portuguese language remains the official language for many countries today, including Angola, Brazil, Cape Verde, East Timor, Guinea-Bissau, Mozambique, Portugal, and São Tomé and Príncipe.

Lusophone Africa specifically refers to the five Portuguese-speaking African countries once colonized by the Portuguese: Angola, Cape Verde, Guinea-Bissau, Mozambique, and the islands of São Tomé and Príncipe. These countries are members of the Community of Portuguese Speaking Countries, an organization created in 1996 to foster friendship and unity among Lusophone states throughout the world.

Of all the European powers involved in colonialism, the Portuguese were the first to seek territories in the African continent. Using trade as a motive and driven by the need to acquire riches for the crown, Portuguese sailors combed newfound territories in search of wealth for their small European homeland. On August 21, 1415, Portuguese seafarer Henry the Navigator landed at Ceuta, which is presently a Spanish territory enclave near Morocco. After Henry's arrival in Ceuta, further excursions along the west African coast followed as explorers sought gold and slaves. Portuguese Guinea, also known as Guinea-Bissau, became a Portuguese colony and a major source of slaves in 1447. In 1462 the uninhabited islands of Cape Verde off the west African coast were colonized. Slaves from the neighboring west Africa were shipped to the island to serve as a labor force. Next in line was Mozambique, a strategically situated nation on the east African coast, colonized in 1510. Other colonies included the islands of São Tomé and Príncipe, which served as a stopping place for long-distance Portuguese voyages headed to Brazil. Lastly, the resource-rich Angola was colonized in 1576.

Portuguese colonization in Africa would last for a total of 560 years, the longest surviving out of European colonies. The formal partitioning of Africa among European nations, widely referred to as the Scramble for Africa, was established during the Berlin Conference (1884–1885), which regulated European colonization and trade on the continent and helped to legitimize Portugal's hold over its African colonies for several centuries. Despite Portugal's reluctance to grant independence to the African states, unforeseen political events eventually forced the country to give up its African colonies in quick succession between 1974 and 1975.

Beginning in the 1960s, independent movements and armed guerrilla warfare in Angola and Mozambique hindered Portugal's ability to govern with ease. Further, a successful coup in 1974 ended Antonio Salazar's rule, as his regime was supporting an unpopular war against anticolonists in Africa. His overthrow brought a new administration that favored the idea of independence for the African colonies. In 1974, Portugal granted independence to Guinea-Bissau, followed by Mozambique, Cape Verde, and Sao Tomé and Príncipe in 1975. Angola gained independence on November 11, 1975, bringing to a close the long chapter of Portuguese colonialism in Africa.

Despite hundreds of years of control, the Portuguese failed to build political institutions or economic mechanisms to effectively assist the colonies' transition from colonial rule to independence. Without any viable industrialization and limited infrastructure, the former colonies experienced extreme poverty, corruption, and armed conflicts. Both Mozambique from 1975 to 1992 and Angola from 1975 to 2002 became submerged in ideological civil wars, which were drawn into the cold war as former rebels were supported by communist governments sponsored by the Soviet Union against insurgents groups supported by the U.S. and African cold war allies.

While Lusophone Africa is still relatively underdeveloped compared to other nations with European colonial roots, the end of the civil war coupled with the discovery of oil in Angola has rejuvenated the quest for development in that country. Likewise, the islands of Sao Tomé and Príncipe have benefited from oil resources located in the Gulf of Guinea, while Mozambique and Guinea-Bissau remain largely dependent on donor assistance. Cape Verde, on the other hand, relies mainly on the service industry, especially tourism, along with foreign donor assistance and support from its diaspora to sustain its economic growth. Notably, after centuries of governing Lusophone Africa, Portugal today has no substantial role in the governance of any of its former colonies.

Lustration

Lustration derives from the Latin word meaning "purification." In political and legal literature, this concept usually refers to the means by which countries deal with past experiences such as war and government regimes. For example, after 1989, in post-Soviet eastern Europe, those who aspire to obtain public positions are screened through specific procedures. This is done to exclude from public office former Communist Party functionaries and secret police collaborators. By the early twenty-first century, most countries in the region, including the Czech Republic, the former East Germany, Hungary, and Poland, had adopted some form of lustration.

At its center, lustration shares the normative and functional characteristics of the transitional justice measures: investigating and reporting on key periods of the recent past; transforming the military, police, judiciary, and related state institutions from corrupt instruments to instruments of public service; and raising moral consciousness about the past. In this context, lustration contributes to the improvement of the democratic consolidation process and to institutional change.

Lustration has been carried out in different ways across central eastern Europe. Its most systematic pursuit took place in the Czech Republic, Hungary, and Poland. Other countries, such as Albania, Bulgaria, and Romania, have had large public support for lustration, but the political elites did not act as forcefully as the public wanted. In these countries, given the fact that the postcommunist policies have not managed to exclude from the political scene the actors linked with the previous regimes, many lustration legislative projects were discussed, but none of them passed. For instance, during Romania's first postcommunist decade, the country's parliamentary political parties did not openly oppose the bill to access the former communist police (*Securitate*) files, but they proved through their votes that they preferred limited public access to the *Securitate* files. Therefore, in this case, in spite of public support of lustration, the political elite avoided the issue.

CONCEPTUAL APPLICABILITY

Among the countries that managed to implement lustration per se, the Czech Republic stands out. After 1991, the Czech Republic took an early interest in lustration and adopted a radical version of it. Accordingly, to avoid charges of revenge-seeking, lustration emerged as a mechanism for defending the fragile new Czech democracy. In this case, the purpose was to prevent former communist officials from gaining public positions in the new regime and not to criminalize activities that were legal in the communist era. Consequently, starting in 1991, lustration operated by excluding former communist civil servants and collaborators with the communist secret police from a range of public offices: the upper levels of the civil service, the security services, and top army positions, and from the management of state-owned enterprises, the central bank, and academic institutions. However, due to the loophole in the laws that regulated lustration in the Czech Republic, the screening process did not cover all sectors: candidates for the legislature did not have to be lustrated, and ministers from communist governments were not on any blacklist.

In contrast with the Czech Republic, Poland began relatively late to work on a lustration law. In 1997 the *Sejm,* or the lower house of the Polish parliament, passed the law and thus created the necessary procedures for screening people seeking public office. In addition, a lustration court was created. Its purpose was to verify whether top officials served

or collaborated with the former communist secret police. The court, made up of appellate and provincial court judges, has unlimited access to civil and military archives. Moreover, those found guilty of false statements are banned from public office for ten years and, depending on specific cases, sentenced up to five years in prison for perjury.

In Hungary, after its negotiated transition to democracy, there were immediate demands for lustration. In 1994, two months prior to the national elections, the country's parliament adopted a law in this regard. However, the Hungarian Constitutional Court removed particular provisions considered to be vague and arbitrary. Consequently, the parliament enacted a new law in 1996 that stated that all persons born before February 14, 1972, must be screened prior to taking an oath before parliament or the president. Moreover, the law stipulated that if an official was found carrying out activities for the former state security service, that official would be asked to resign within thirty days. If the official refused to step down, the findings were to be published in the *Hungarian Official Gazette*. Additionally, although the legislation was initially to expire in 2000, it continued to be extended until 2004.

Another former communist country, East Germany, made considerable efforts to create and implement a lustration law to give access to the former Secret Security Police (STASI) archives and bring in front of the Judicial Court persons accused of crimes in the communist era. According to German law, employers receive a summary on the individual's file from the Gauck Authority—the special ministry created to oversee STASI files. In this context, the employer makes an individual decision. However, if not satisfied, the employee can appeal to the labor courts. As a result of the lustration law, at the end of June 1996 the Gauck Authority had answered more than 1.7 million vetting inquiries.

THE LESSONS OF LUSTRATION

We can glean a number of lessons about lustration. On the one hand, in those countries in which lustration was fairly effective, such as the Czech Republic, it had a relevant impact on economic and political transformation. First, the law of lustration prevented the involvement of the former *Nomenklatura* members in the privatization process and in the liberalization of the market. Second, the enactment of lustration blocked former communist officials from crucial decision-making positions in the new regime, and the influences of the former political and security networks over the political parties were seriously diminished. As a result, the communists' loss of influence on the policy agenda allowed a consistent development of democracy; therefore, it can be argued that a positive relationship exists between lustration and the transition to a consolidated democracy.

On the other hand, the absence of a lustration law, combined with the complicity of the new authorities with the structures of the former communist state, has led to a series of political and economic failures. For instance, in some nonlustrated countries, such as Romania, many former communist officials have become highly influential in political life and managed to control the government policy agenda, with negative effects on administrative reform. Moreover, due to various influences of former communists on the privatization process, the economic transition to a free market took more than fifteen years. Consequently, it can be argued that the lack of a lustration law adversely affected the transition to a successful liberal market and consolidated democracy.

Luther, Martin

Martin Luther (1483–1546) was a German theologian, pastor, and professor. His public rejection of the Catholic Church's practice of selling indulgences ignited the Protestant Reformation in the sixteenth century, which led to a permanent schism in the church. Luther's actions and beliefs exerted great influence over subsequent theories on the nature and scope of secular authority and the right of subjects to resist their rulers.

Luther enrolled at the University of Erfurt in 1501. In 1507 he entered the Observant Augustinian house in Erfurt, where he took vows as a monk and undertook theological studies in the nominalist tradition. He received his doctorate in theology from the University of Wittenberg in 1512. That same year he took up a faculty position as professor of scripture at Wittenberg, a position that he held until his death. Between 1517 and 1521, Luther definitively rejected the path to salvation mapped out by the medieval Catholic Church in favor of his belief that salvation was attained by faith in God alone. This resulted in his break with the Catholic Church and his renunciation of the priesthood.

Luther's theological ideas had important implications for the social and political underpinnings of western Europe, and from the early 1520s until his death Luther grappled with these

implications. One key idea present in his early works was the rejection of a separate clerical estate and with it all ideas of the church's temporal authority. Instead he defined the church as nothing more than a congregation of the faithful. Luther conceived an expanded role for secular authorities in this power vacuum. In 1523 he turned to the nature of such secular authority in his tract *On Temporal Authority.* Drawing heavily on the teaching of St. Paul, he argued that secular authorities are ordained by God to keep the external peace and that even tyrants should not be resisted. However, he was also clear that secular rulers have no authority to intrude into the personal relationship between a believer and God. In this separation of spheres of influence lay Luther's doctrine of the two kingdoms.

While *On Temporal Authority* was to remain Luther's most coherent statement on the topic of secular authority**,** radical social and political ideas advocated by some reformers forced Luther to further define his ideas in the 1520s. Luther wrote several works that held steadfastly to his understanding of the teachings of the New Testament as requiring absolute submission to temporal authorities in the maintenance of public order and public peace. The most famous of these tracts, *Against the Robbing and Murdering Hordes of Peasants* (1525), legitimated the use of military force to suppress the insurgents in the Peasants' War (1524–1525). The peasants justified their rebellion in part through an alternative interpretation of the New Testament that emphasized the equality of all believers under Christ.

In the early 1530s, Luther returned again to the issue of legitimate resistance to secular authority, this time in response to the deteriorating political situation in the Holy Roman Empire that left the Reformed princes under increasing military threat from the Catholic emperor. In this case, Luther further refined his thinking by pronouncing a set of views that supported the rights of lesser princes to resist the emperor in their role as inferior magistrates.

Luxemburg, Rosa

Born in Zamosc, Poland, to assimilated Jewish middle-class parents, activist Rosa Luxemburg (1871–1919) demonstrated remarkable intellectual achievement and a highly rebellious nature from an early age. As a teenager she joined Proletariat, one of the first Polish Marxist groups. Forced to leave Poland in 1889, she enrolled at the University of Zurich and earned a doctorate in political science in 1897. Throughout her career Luxemburg opposed independence for Poland and other countries on the grounds that it was a diversion from the struggle for socialism.

Upon moving to Berlin in 1898, Luxemburg became the leading critic of Eduard Bernstein, leader of the German Social-Democratic Party (SPD) and Marx's literary executor, over his effort to "revise" Marxism. Although she endured underhanded attacks by some SPD leaders because of her gender and ethnicity, her *Reform or Revolution* (1900) was soon heralded as a Marxist classic for arguing that the apparent stability of capitalism was a temporary phenomenon. The height of her influence in the Second International (a federation of socialist parties and trade unions) was reached in 1904, when she was closely associated with August Bebel and Karl Kautsky in formulating policy.

Luxemburg followed up her involvement in the 1905 Russian Revolution by applying its lessons to western Europe in *The Mass Strike, the Party, and the Trade Unions* (1906). This led to her estrangement from the SPD, which became lukewarm about her enthusiasm for revolutionary spontaneity. She openly broke from Kautsky in 1910, when he declined to risk losing electoral support by forcefully opposing imperialism. She also played a central role in debates within Russian Marxism, critiquing Vladimir Lenin's organizational centralism while supporting the Bolsheviks against the Mensheviks when it came to emphasizing the leading role of the proletariat in any forthcoming revolution.

Luxemburg held that imperialism was an inevitable result of capitalism's tendency toward limitless production regardless of the amount of surplus product that could be consumed by the market. Her *Introduction to Political Economy* (1907) and *The Accumulation of Capital* (1913) attempted to show that continued capital accumulation depends on the exploitation of noncapitalist strata. Her detailed analyses in both works of the destruction of precapitalist communal formations in Australia, India, South America, and southern Africa are unique among Marxists of the period.

Luxemburg was actively engaged in the German women's movement and wrote for several of its publications. Jailed for opposing World War I (1914–1918), she helped organize the antiwar Spartakusbund political group and wrote *The Crisis of European Social-democracy* (1916) and *The Russian Revolution* (1922). The latter contained a sharp critique of Lenin and Leon Trotsky for dismissing democracy as a "cumbersome mechanism." After being freed from jail, she helped found the German Communist Party in December 1918. On January 12, 1919, she was murdered following a failed left-wing revolt against the SPD-led government. Her declaration, as stated in *The Russian Revolution,* that "freedom is always and exclusively freedom for the one who thinks differently" has made her a beacon for those defending political and economic liberty.

Lu Xun

Lu Xun (1881–1936) is generally acknowledged as China's greatest twentieth-century author. His sardonic humor, literary skill, and sense of the absurd made him an effective advocate of Chinese nationalism, the rejection of a self-satisfied traditionalism, and the need to embrace a pragmatic program of modernization. Communist leader Mao Zedong was an admirer of Lu Xun, and after Mao's victory in the Chinese Civil War (1945–1949), Lu Xun became "the chief commander of China's cultural revolution." This embrace by political power made him an ambiguous icon of the spirit of political and social criticism.

Born and raised in Shaoxing, Jiangan, as Zhou Zhangshou, Lu Xun belonged to a prominent family in financial decline. This made the less-expensive Westernized educational opportunities afforded by the Jiangan Naval Academy and, later, the School of Mines and Railways attractive educational opportunities for the young man.

During his scientific education from 1898 to 1904, Lu Xun mastered a technical curriculum and became familiar with various Western writers such as John Stuart Mill, Harriet Beecher Stowe, Sir Walter Scott, and evolutionary theorist Thomas Huxley. A hybrid of Darwinism and romantic idealism played a major role in Lu Xun's concept of nationalism.

Lu Xun studied in Japan from 1902 to 1909, which was important in reinforcing his commitment to nationalism. He initially studied medicine but became disillusioned with that career as he became more and more aware of the spiritual illness he perceived to plague the Chinese nation. Lu Xun prescribed art and literature as the medicine most likely to cure such an ailment of the spirit, and he abandoned medicine for a literary career. During this time, German philosopher Friedrich Nietzsche's *Thus Spake Zarathustra* inspired him, which led to Lu Xun penning "On the Power of Mara Poetry" (1908), a creative piece about the power of demonic writers to transform society.

When Lu Xun returned to China, his vision of the transformative artist set the tone for how he would confront the failings of the revolution of 1911 to remedy China's weakness. Some of his most appreciated short stories, including "A Mad Man's Diary," "Medicine," and "The True Story of Ah-Q," were written during this turbulent period. His criticism of Chinese tradition as being cannibalistic and his endorsement of pragmatic action made Lu Xun an icon of the sociopolitical May Fourth Movement that began in 1919. He also supported patriotic movements throughout the 1920s, including the May 30 (1925) and March 18 (1927) movements.

Through observing the dynamics of these movements, Lu Xun began to perceive the insufficiency of the creative superman and the forces of evolution to lead to progress in China's political situation, and he began to explore the usefulness of class struggle as a path to national survival. He engaged in various literary battles that forced him to forge a more solidly Marxist-Leninist identity and developed the political essay as his primary literary art form. The political positions he took during this period, particularly his support of Mao Zedong, would determine his legacy. Lu Xun died in 1936 of tuberculosis.

Despite the fact that he never joined the Chinese Communist Party, Lu Xun became a communist "saint" after his death. His spirit of attack and reform was invoked by Chairman Mao and found similar polemical use by a variety of future political reformers. Recent scholarship has focused on situating Lu Xun in the Confucian tradition of remonstrance, understanding the relation of evolution to his thinking, discerning the meaning of individualism in his thought, and clarifying his relationship with Marxism-Leninism.

Lyotard, Jean–François

Jean-François Lyotard (1924–1998) was a French theorist known for ushering the concept of *postmodernity* into the philosophical discourse. He gained international acclaim for his book *The Postmodern Condition: A Report on Knowledge* (1979). This volume, as well as other lesser known but equally sophisticated works such as *Just Gaming* (1979) and *The Differend* (1983), firmly planted Lyotard in the pantheon of significant and influential continental philosophers of the second half of the twentieth century.

Lyotard was born in France and went to the Sorbonne. His first academic position was in Algeria, and his experiences there helped inform his understanding of the complications of French colonialism. Thereafter, he attained a PhD and taught for nearly twenty years in Vincennes before teaching in the United States at the University of California-Irvine and Emory University, among many other universities.

The key aspect of Lyotard's work, and the one that made him famous to some and infamous to others, was his identification of a new philosophical perspective that expressed an "incredulity toward metanarratives." This statement from *The Postmodern Condition: A Report on Knowledge* forcefully questions the explanations that have usually guided and bounded philosophical inquiry since the Enlightenment. Lyotard rejects the assumption in Enlightenment philosophy and science that universal explanations to vexing moral and political problems exist. In Lyotard's view, the world is too complex and groups of individuals vary too greatly for the simplistic and universalistic arguments to carry the day. Further, Lyotard builds upon Austrian philosopher Ludwig Wittgenstein's concept of *language games* as a defining element of so-called postmodernity. In this view, varying streams of meaning and competing theories of ethics and of the good life cannot be adequately judged against a single moral code. Instead, Lyotard encourages the use of a multiplicity of perspectives in coming to terms with what constitutes just action.

Lyotard's views have been subject to much criticism. The first criticism is that his position is relativistic and, therefore, one society cannot judge another's behavior to be unjust. This angers supporters of absolute conceptions of justice, such as proponents of the work of German philosopher Jürgen Habermas. This critique is not without merit as Lyotard does use the rationality of the Enlightenment in his attempt to question it.

However, Lyotard sees this as a necessary step to understanding cultural difference. Another trend in criticism is to marginalize Lyotard's work as unintelligible or incomprehensible language that is not rigorous enough to be thought of as philosophy. In this case, the philosophers who assert this are unwilling to engage with Lyotard's work because of its nonuniversalist conclusions and dismiss it based on its differing philosophical style.

Overall, Lyotard's legacy to political thought is substantial because of his expansion of the debate of justice, ethics, and politics. Even if orthodox liberals and communitarian political philosophers question his applicability to their specific conversations, his work challenges the assumptions on which many of those debates are executed.

Machiavelli, Niccolò

Poet, raconteur, diplomat, historian, military and political theorist, and secretary to the short-lived Republic of Florence (1498–1512), Italian Niccolò Machiavelli (1469–1527) was much more than the author of *The Prince,* although this work, written in 1512–1513 but published posthumously in 1531, remains the centerpiece of his political legacy. All of his other works, covering Florentine history, poetry, political calculation, drama, military theory, and the primacy of republican values, have their essence concentrated in this slim volume.

The most controversial claim against *The Prince* is that it is at odds with the admiration for Roman republicanism exemplified in Machiavelli's *Discourse on Livy* (1532), but a careful examination reveals that in both works Machiavelli highlights the impossibly corrosive nature of monarchical rule, leaving republicanism as the only alternative. As he explicitly states in his *Discourse on Remodeling the Government of Florence* (1519–1520), a wise prince should protect his family and friends while he lives, yet provide for a republican government to assume control on his passing, thereby offering him temporal glory and eternal life in the histories of the state. That he offered eternal life to a sitting pope is only one example of Machiavelli's sly wit. Like his republican sentiments, it is rarely (outside of the *Discourses*) in plain sight, but the details are never buried so deep that a careful reader could fail to discover their fresh and irreverent bite.

Born in Florence to an established but poor family with no obvious political connections, Machiavelli's greatest political triumph—how an underage, political nonentity managed to become second secretary to the Republic of Florence—remains concealed from history. His skills as a political observer and diplomat kept him in office, but it was not until his banishment at the hands of the returning Medici family that he became a serious author, producing *The Prince* and *Discourses;* several plays, including *Mandragola,* which is considered a centerpiece of Italian drama; a military discourse favored by Napoleon; and a history of Florence completed in 1525 for the Medici Pope Clement VII that signaled Machiavelli's return to the favor of Florence's ruling family. However, by 1527 the Medici were overthrown again, and the new government, suspicious of Machiavelli's ties to the previous rulers, rejected his offer of service. Machiavelli died with his dream of an independent republic in ruins once again.

Although they are unable to agree on its underlying purpose and generally unwilling to endorse its precepts, nearly every critic agrees *The Prince* is a masterful composition. Whatever the focus of contemporary critical controversy, the historical fact remains that with it Machiavelli dislocated the stable political morality of the Middle Ages while at the same time exposing the public hypocrisy of the emerging mercantile elite. Political theorists and actors alike would never again be able to pretend that a political realm could exist free from the "dirty hands" of politics.

Machine Politics

Machine politics refers to politics in which votes are exchanged for discrete benefits. Under machine politics, voting is driven by a direct exchange between voter and political candidate rather than by opinion or ideology. (Hence, the term *machine politics* is related but not equivalent to *political machine.* The latter is a generic term for a tight political organization and does not specify its mechanism of mobilization; machine politics refers thus to a specific type of political machine.)

While machine politics was common in American cities in the nineteenth and twentieth centuries, the two most famous examples were Tammany Hall in New York (from the 1790s to the 1960s) and the Cook County Democratic Central Committee in Chicago (from the 1930s to the 1970s). In some settings, machine politics has been substituted by patronage that relies no longer on voters through the distribution of

welfare and payroll but rather on corporate interests through the distribution of contracts and favorable policies—a form of exchange also known as pinstripe patronage.

The term *machine politics* is typically deployed for analysis of U.S. cases, yet the phenomenon of machine politics is found also in other countries: Central and South America, southern Italy, and Japan offer especially rich literatures. The term commonly adopted to signify the phenomenon of machine politics in the comparative context is *clientelism*. However, clientelism is different from machine politics in two important respects. First, it is more specific than machine politics, because it focuses on a dyadic exchange (i.e., an exchange between two individuals), while machine politics can involve dyadic or collective exchange. Second, clientelism is more generic than machine politics, because the latter limits the exchange to votes for political office, while clientelism includes social exchange in realms outside of politics. Thus, the term *political clientelism* is a better equivalent to machine politics.

DEMOCRATIC MERIT OF MACHINE POLITICS

If the exchange under machine politics is dyadic—that is, two parties in the exchange can be isolated as the only beneficiaries, then it is hard to make the case that machine politics is democratic due to a lack of democratic accountability. This is exchange of rivaled and excludable private goods, for example, a job in exchange of a vote, and accountability is not to the electorate but to the specific individual with whom the political candidate made the deal.

The question is more complex if the beneficiaries are groups, such as lobbies or factions. In these cases, the exchange involves goods that are either nonrivalrous (club goods) or nonexcludable (common goods), for example, if in exchange for their support neighbors receive a new paving of their street. This exchange can be accountable to the public and thereby democratic. Indeed, factions' pursuit of their interests constitutes a basic feature of democracy. Therefore, the extent to which machine politics is democratic is undefined.

THE NUTS AND BOLTS OF MACHINE POLITICS

Politicians in machine politics seek to maximize their network of voters ready to exchange votes for particularistic benefits. The result is a hierarchical pyramid that links voters at the bottom and the political candidates at the top through mediators, who recruit and deliver the votes.

Machine politics faces diseconomies of scale, because each additional favor is more costly to satisfy. Politicians distribute all sorts of goods. In addition to jobs, they offer food (especially food packages before festivities) the payment of utility bills, and money according to established price lists; the amount depends on the tightness of a given race. In some cases, politicians directly purchase voter identification cards. Often, though, persuasion and fear are all that machine politics needs to function: Politicians are able to induce in voters the belief that their expected payoff depends on their individual voting choices—and this, in the mind of the voters, is a credible threat.

Fear of detection depends on the extent to which voters believe that mediators and politicians can learn about their voting choices. This is achieved in several ways; for example, mediators can personally accompany voters to the polls and thus make them feel observed. Machine politics develops interlocking clusters of votes around concentrated areas—neighborhoods, blocks, or even individual tenements—and this allows politicians a great degree of micromanagement. In the tight-knit communities that host such clientelistic machines, everyone seems to know everything about everyone else. Organized crime often manipulates this knowledge to exercise power over local inhabitants. Intimidation, perceived lack of alternatives, and the resulting grip that mediators have on their networks of voters are the most important obstacles to electoral reform.

UNDERMINING MACHINE POLITICS

Machine politics often emerges as a vehicle for political enfranchisement for marginalized communities (primarily immigrants, and outside the United States, also rural voters and the urban poor). Thus, a large part of the literature understands machine politics as the product of economic marginalization and advocates increasing local wealth and redistribution in order to break clientelistic machines. However, this strategy is rarely available in disadvantaged socioeconomic contexts. Moreover, if incentive structures are unchanged, this strategy can be counterproductive, because by feeding the networks of exchange, funding reinforces rather than undermines machine politics.

Other scholars believe that economic resources influence machine politics in the opposite direction. They argue that machine politics inevitably produces political and fiscal crises by expanding voter participation and the expenditure necessary to deliver favors to voters. Fiscal crises can undermine machine politics by prompting the emergence of reform movements mobilized by private actors with high stakes in the soundness of municipal finances. Inflationary pressure can also result from electoral reform, for example, through the introduction of direct mayoral elections, because of diseconomies of scale: The more votes a candidate needs to win, the more relevant the cost of acquiring support becomes, to a point where machine politics is no longer an effective strategy of vote mobilization.

Finally, machine politics can be undermined through cultural change when voters no longer conceive of politicians as offering services only with the expectation of personal reciprocity but rather because transgression would lead to disapproval or sanction by citizens, or because the service should be provided for intrinsic (ideological) reasons, regardless of sanctions. This change in culture can be due to a variety of factors—for example, reform, revolution, or electoral change that allow voters to perceive meaningful alternatives to the use of clientelistic channels for coping with problems of economic survival.

Macpherson, Crawford Brough (1911–1987)

Crawford Brough Macpherson (1911–1987) was a Canadian political theorist educated at the University of Toronto and the London School of Economics. After completing his studies in London, he returned to the University of Toronto, where he spent his academic career. Each year the Canadian Political Science Association awards the C. B. Macpherson Award for the best book written by a Canadian political theorist.

Macpherson, who wrote from a democratic socialist perspective, was a strong critic of liberalism and liberal democracy, particularly of their historical conflation with capitalist markets. In his political theory, he sought to retrieve the democratic elements of liberalism from the excessive influence of individual rights and commodification of social life.

Macpherson's most well-known contribution to political theory is his notion of "possessive individualism," which he contrasted with a more radical vision of democracy. By studying English political thought from the seventeenth century onward—particularly that of philosophers Thomas Hobbes and John Locke—Macpherson attempted to uncover an "underlying unity" of a view of humanity as possessive individuals. The tensions in liberal democratic thought and problems of legitimacy in liberal political systems are, Macpherson argued, due to the underlying assumption that individuals are fundamentally possessive.

Working from this critique, Macpherson developed a novel and controversial interpretation of Hobbes and Locke. Both, Macpherson contended, thought they could observe the characteristics and motivation of individuals in a market and infer from them the characteristics of the state of nature. The possessive picture of individuals entails that the individual owns himself and his capacities, owes nothing to society, and is free so long as this ownership is respected. Society is, thus, an aggregate of self-owning individuals, which reduces social relations to exchange relations. The purpose of the state is to protect property and provide a framework for exchanging. From this concept of independent and self-interested individuals, free of society, justice, and natural law, the extent of political rights and obligations are deduced. Thus, the constitutive elements of liberal democracy—freedom, rights, obligation, and justice—bear the influence of the unifying foundation of possessive individuals.

According to Macpherson's theory of political obligation, the self-interest of possessive individuals held until the middle of the nineteenth century, when growing socioeconomic inequality undermined the possibility of shared perceptions of some fundamental equality. The opportunity to vote was extended to the working classes, who experienced a growth in class consciousness and visions of alternate forms of social organization. These changes undermined the stability of institutions based on the self-interest of possessive individuals.

Macpherson contrasted the political culture of possessive individualism and competitive theories of democracy with a view of democracy freed from its liberal baggage. He advocated a neorepublican view of life and politics in which the development of "truly" human capacities, such as rational understanding, moral judgement, aesthetic appreciation, and emotional ties, was the primary goal. With this sort of democratization, Macpherson believed society could acknowledge its interdependence and replace competition with social cooperation.

Macroeconomics

Macroeconomics is a branch of economics that studies the economy as a whole. The "economy as a whole" means the aggregation of the activities of all economic actors and its subsequent treatment as if it were one unit. It can also analyze the economy's major parts, such as the government, the private sector, or households, but in aggregation. For example, all government agencies of a state are grouped together and treated as one unit called "government." The aggregating approach of macroeconomics differs from the other level of economic analysis, microeconomics, which examines the disaggregated choices of individual consumers, firms, or government agencies.

Macroeconomics attempts to uncover consistent relationships between such nationwide phenomena as total aggregate

expenditures, total unemployment, inflation (aggregate prices), total income, total output, and total investment using sophisticated mathematical models. Governments use both fiscal (spending) and monetary instruments to develop a macroeconomic policy in order to produce sustainable growth and higher living standards as well as to guide the economy out of recessions or depressions. Voters concerned with their living standards assess the performance of national economy by examining such macroeconomic indicators as gross domestic product (GDP), the rate of inflation, unemployment rate, and the relationship among them. For example, high inflation (rapidly rising prices across the economy) can significantly decrease purchasing power of some economic actors, particularly those whose savings are held in currency.

Madison, James

James Madison (1751–1836) was an American politician and the fourth president of the United States. Born into a prosperous family of planters in Virginia, he was the eldest son of Nelly and James Madison. As a student, Madison excelled in history and had a keen interest in law and government. In 1769 he entered the College of New Jersey in Princeton. Here he studied the works of the great philosophers of the Scottish Enlightenment and graduated in just two years. In 1772, Madison returned home, where he focused on politics and an emerging political career.

Madison made the acquaintance of his lifelong friend and mentor, Thomas Jefferson, due to his involvement with the Virginia House of Delegates. Although Madison lost his first bid for election to the House, he was chosen in 1779 to represent Virginia at the Continental Congress in Philadelphia, Pennsylvania. Madison returned to Virginia and was elected to the Virginia House of Delegates in 1784. In 1787, at the Constitutional Convention in Philadelphia, Madison submitted a proposal to abolish the Articles of Confederation and institute a new constitution. Often referred to as the "father of the Constitution," he was active in the subsequent debates, and his notes of the deliberations remain the most complete record of the proceedings. After taking a leading role in formulating the new constitution, Madison worked tirelessly to ensure its ratification. Together with fellow congressional delegates Alexander Hamilton and John Jay, he secretly wrote a series of articles advocating the benefits of the proposed constitution that became known as the *Federalist Papers.*

In 1789 Madison was easily elected to the newly created U.S. House of Representatives and served until 1797. He then returned to his home, Montpelier, with the intent of retiring from public service. However, he was unable to ignore national politics and accepted Jefferson's nomination to serve as secretary of state after Jefferson was elected president. In this capacity, Madison not only served as Jefferson's key advisor but also was recognized as his heir apparent.

In 1808 Madison was elected the nation's fourth president. As president, he faced a challenging international climate. He successfully acquired the western coast of Florida from Spain, which gave the United States control over the Gulf of Mexico. By June 1812, relations with Britain had deteriorated to the point that Madison asked Congress for a declaration of war. After his election to a second term in 1812, however, he found the prosecution of the war to be a daunting and difficult task, and, with American prospects looking dim, he was eager to end the hostilities. This was accomplished with the Treaty of Ghent, negotiated in December 1814. Madison focused on domestic affairs toward the end of his presidency, and in 1817 he retired to Montpelier. Active even in retirement, Madison occupied himself with the operation of his plantation and was involved in the founding of the University of Virginia. Upon Jefferson's death, Madison became the university's second rector. Madison died at Montpelier on June 28, 1836, at the age of eighty-five.

Maghreb

The *Maghreb* refers to the North African countries of Tunisia, Algeria, and Morocco, which formed the Maghreb Empire from the Arabization of these lands in the tenth century CE. The majority of people in the region share a common Arab identity, and Berbers represent the most significant non-Arab population. In the 1500s, Algeria was integrated into the Ottoman Empire, during which time its modern borders were established, and it remained nominally a part of the empire until its 1830 colonization by France. Morocco evaded Ottoman and Spanish conquest under the Alouite Dynasty (1666–1912) until it was colonized by France in 1912, while Tunisia was ruled from the 1700s until 1957 by Turkish governors (*beys*), notwithstanding its colonization by France in 1881.

The independence of Morocco (1956), Tunisia (1956), and Algeria (1962) from France continues to shape the contemporary political and economic landscapes of the countries.

Since independence, Algeria has been ruled by the same party, remaining tethered to the legacies of the anticolonial struggle. Morocco, while enjoying limited democratic participation, has been governed by a familial monarchy. Tunisia adopted a Republican system and has been ruled by the same party since 1957. Despite distinctions in governance, the countries continue to share similar sociocultural and linguistic characteristics.

Magna Carta

The Magna Carta, or "Great Charter," consists of a preamble and 62 clauses that English barons extracted from King John (1167?–1216) at Runnymede in 1215 in a fruitless effort to avoid civil war. Later monarchs, including John's immediate successor, Henry III, reaffirmed this document that lies at the root of both English and American ideas of constitutionalism.

Although many of the barons' specific concerns are now dated, other legal privileges that they wrested from the king became the basis for the liberties of all English citizens, especially as later jurists like Sir Edward Coke (1552–1634) interpreted them. Provisions 14 and 61, establishing representation of the barons, provided impetus for the development of the English Parliament. During the American Revolution, the English used the Magna Carta to support their claim of parliamentary sovereignty, whereas Americans distilled from it the principle of "no taxation without representation."

Provisions of the Magna Carta are tied to modern provisions for habeas corpus. For example, Article 39 provided that "No freeman shall be taken, or imprisoned, or disseized, or outlawed, or exiled, or in any way harmed . . . save by the lawful judgment of his peers or by the law of the land." The latter phrase has long been associated with American ideas of due process and trial by jury. Article 40 further provided that "To none will we sell, to none deny or delay, right or justice." Long after the demise of King John, the document's principles remain timeless.

Maistre, Joseph Marie de

Joseph Marie de Maistre (1753–1821) was a conservative writer, diplomat, and lawyer best remembered for his opposition to the French Revolution (1789–1799) and his defense of throne and altar. For the first half of his life, he lived in provincial obscurity as a lawyer and senator in the independent kingdom of Piedmont-Sardinia. Then the armies of revolutionary France invaded his homeland in 1792, and he fled into exile. He spent the next quarter century abroad in the service of his king, most of it (1803–1817) as ambassador to the court of Tsar Alexander I in St. Petersburg, Russia. There he was a popular *salonnière* who, at the zenith of his influence, briefly acted as an advisor to both the tsar and the exiled Louis XVIII of France. He returned to his homeland in 1817 and died not long afterwards.

Maistre's first major published work was *Considérations sur la France* (*Considerations on France,* 1797). Although its immediate purpose was to rally support for royalist candidates for the French Directory, it links events in revolutionary France to much broader themes and higher purposes that take it well beyond politics. It also displays Maistre's considerable stylistic talents as a writer, for which he was much admired, even by his opponents. *Considérations* is only superficially a counterrevolutionary work. Maistre situates the violence of the 1790s within a providential framework to reveal its true nature as divine punishment for the sins of the Enlightenment. In that sense, he welcomed the revolution as a way to expiate the crimes of modern civilization. He also describes bloodshed and conflict as the norm in both natural and human history, making the revolution quite unexceptional in that regard. What was distinctive about it for Maistre was its campaign to destroy Christianity, which he regarded as a political and spiritual disaster.

Du Pape (*On the Pope,* 1819), Maistre's uncompromising defense of papal authority and infallibility, was initially coolly received by the Vatican, although it enjoyed considerable posthumous popularity and influence under the conservative pontificate of Pius IX (1846–1878). Just as the only alternative to political authoritarianism for Maistre is political chaos, so the only alternative to a centralized religious authority is religious anarchy, which he called Protestantism, "the *sans-culottisme* of religion." Maistre understood papal infallibility to mean that the pope is the final court of appeal for Catholics in religious matters.

Les Soirées de St. Pétersbourg (*The St. Petersburg Dialogues,* 1821) is Maistre's most philosophical and imaginative book and the work of which he was most proud. While it ranges far and wide, its central theme is the problem of the existence of evil in a world created and governed by God. Maistre depicts the world as pervaded by violence, bloodshed, and sin, in which countless innocent victims are sacrificed to expiate the crimes of the guilty. Beneath this surface appearance of cruelty and injustice Maistre discerned the hand of Providence at work in ways inscrutable to man. For him, humans only have the appearance of agency; the events of this world are really guided by a divine will that is beyond ultimate human comprehension.

Majority-minority District

Majority-minority districts are political wards in which racial minorities compose the largest voting block. The districts are created to ensure that minority votes are not diluted and to increase the number of minority officeholders. In the United States, the 1982 Voting Rights Act requires that such districts be created where feasible. Guidelines on the creation of majority-minority districts were refined by the Supreme Court case *Thornburg v. Gingles* (1986). The case mandated that majority-minority districts should be compact and geographically coherent. After the 1990 census, a significant number of majority-minority districts were created in the United States and the number of minority officeholders at the federal, state, and local levels subsequently rose dramatically, including the election of an additional thirteen African American members of Congress. However, because the districts concentrated minority voters, the redistricting resulted in electoral gains for the Republican Party, which secured an additional ten seats in the House of Representatives in the 1992 and 1994 elections because of the new districts. In 1993, the Supreme Court ruled in *Shaw v. Reno* that race could not be the only determinant in creating new districts, but it could be a factor.

Malatesta, Errico

Errico Malatesta (1853–1932) was an Italian anarcho-communist whose writings remain influential within contemporary anarchist movements. Initially an advocate of an insurrectionary approach to social change emphasizing the agitational work of small bands of activists in fomenting uprisings or revolution, Malatesta came to argue that anarchists should be most active mobilizing within working-class communities. A writer and theorist in addition to a militant organizer and revolutionary activist, Malatesta edited several popular anarchist newspapers, presenting his views on unions, revolution, farm work, and peace.

Malatesta was born in Santa Maria Capua Vetere in southern Italy. His first arrest came at the age of 14, for writing a letter to King Victor Emmanuel II critical of local injustices. He went on to study medicine at the University of Naples but was expelled in 1871 for participating in a demonstration. A supporter of the Paris Commune, he joined the Naples section of the International Workingmen's Association (the First International).

In 1872 he met the great anarchist Mikhail Bakunin while participating in the St. Imier congress of the International. During the following four-year period, Malatesta was arrested twice for agitational work on behalf of the International.

In 1877 he was forced to flee Italy due to surveillance by authorities, beginning a lengthy period of exile. During this time Malatesta journeyed to Geneva, Switzerland, an anarchist center, where he met leading anarchists Elisee Reclus and Peter Kropotkin and helped in the production of the anarchist newspaper *La Revolte.* Expelled from Switzerland for his work, he made his way to London. Following his involvement in the 1881 congress of the International, he helped give rise to the Anarchist International, reflecting the growing split with Marxists in the First International and anarchist rejection of authoritarian socialism.

After a stint fighting British colonial troops in Egypt in 1882, Malatesta returned to Italy and founded the anarchist newspaper *La Question Sociale.* Fleeing a prison sentence, he once again left Italy, landing in Argentina in 1885. In Buenos Aires he resumed publication of *La Question Sociale* and helped to found the first radical labor union in Argentina, the Bakers Union. Malatesta's work with the Bakers Union would help lay the groundwork for a lasting anarchist influence on the union movement and working class organizing in Argentina.

Upon his return to Italy in 1889, he founded the newspaper *L'Associazione* before again fleeing to London, where he would live for the next eight years. His significant, and still published, pamphlet *L'Anarchia* was published during his time in London.

In 1907 Malatesta participated in the International Anarchist Congress of Amsterdam, an anarchist alternative to the Marxist party–dominated Second International, or Social Democratic International. During the congress, Malatesta took part in a significant debate with Pierre Monatte on the character of syndicalism and the relationships between anarchism and trade unionism. Monatte, a radical trade unionist, considered syndicalism to be revolutionary, providing the suitable organization for ushering in postcapitalist society.

For Malatesta, syndicalism itself is not sufficient for creating the conditions for social revolution. In his view, unions are typically reformist, seeking bread and butter gains for workers within the constricted framework of capitalist social relations and waged labor. The point is instead to end those relations and abolish the system of waged labor itself.

Even worse, unions were often conservative, working with employers as a low level management layer that served to impose the conditions of contracts and to discipline workers between bargaining periods. Unions served to divide workers

by trade, workplace, or skill set, with some workers using unions to maintain their relative privilege over other workers.

Malatesta advocated the development of explicitly anarchist organizations to sustain a unity of theory and practice that would encourage the revolutionary work of anarchists and support the theoretical and tactical development of anarchism, rather than succumbing to concerns over immediate day-to-day issues that come to dominate trade union work. He maintained a principled perspective of anarchism as a revolutionary theory and argued that violence, rather than a moral issue, was a necessity of working-class efforts to gain emancipation.

With the outbreak of World War I (1914–1918), Malatesta found himself opposing his comrade Peter Kropotkin, who had argued for the victory of French culture over German barbarism. For Malatesta, bourgeois wars were no option for working-class people who would be massacred in defense of the interests of one ruling class over another.

Malatesta died in 1932 in fascist Italy. His works have been picked up by activists in the contemporary alternative globalization movements, making him among the most influential anarchists within contemporary anarchist movements.

Mandarins

Mandarins were political, military, and judicial officials of the Chinese Empire. The term was coined by the Portuguese from the Malay term *mantra* or councilor. The mandarins were classified into 18 different ranks and gained office through a series of rigorous examinations that could last six weeks. Many who aspired to become mandarins began training and preparation as young as age five. The mandarin system was the world's first merit-based bureaucracy and provided a high degree of social mobility. Nonetheless, the offspring of mandarins or other elites typically had an advantage over commoners. The mandarin system was based on Confucianism and was responsible for the stability of the empire. Mandarins enjoyed status and privilege, and the higher-ranking officials became substantially wealthy.

However, in the empire's later years, the mandarins became increasingly reactionary and blocked reform efforts. In the twentieth century, the term *mandarin* was applied to a new class of political leaders and officials whose careers were based on merit and educational credentials. Noam Chomsky's *American Power and the New Mandarins* presented a highly critical appraisal of liberal intellectuals, such as Secretary of Defense Robert McNamara, who supported U.S. participation in the Vietnam War (1959–1975).

Mandate System

The mandate system was an innovative international procedure to assist the transition toward independence of former colonies and dependencies after World War I (1914–1918). The mandate system was established by the founding treaty of the League of Nations (1919) and represented a compromise between the new liberal principles of international politics, promoted mainly by American president Woodrow Wilson, and the assertions of influence by the countries that emerged victorious from the war. The Covenant of the League of Nations acknowledged the right of the people of these territories to self-government but made this conditional on their capacity to support statehood and sovereignty.

Under the mandate procedures, Germany and the Ottoman Empire lost all of their territorial possessions in the Middle East, Africa, Asia, and the Pacific. Mandates were divided into three categories according to the stage of development of the people, the geographical situation of the territory, its economic conditions, and other similar circumstances (League of Nations Covenant, Article 22, paragraph 3). The territories previously under the authority of the Ottoman Empire were included in Mandate A, as they had homogeneous and politically organized populations, and became *de facto* sovereign. Under Mandate A, national elites had the authority to self-organize and the right to choose their own mandate country, which was required to assist the territory in gaining independence. Most of the former German possessions in Africa were included in Mandate B, as they were considered to be less developed. The territories with sparse and small populations were included in Mandate C and were considered part of the territory of the mandate country.

Great Britain became the mandate country for the Mandate A territories Iraq and Palestine, including Transjordan (1992), and the Mandate B territories British Cameroon, Tanganyika, and a part of Togoland. France became the mandate country for the Mandate A territory Syria (including Lebanon) and the Mandate B territories French Cameroon and part of Togoland. Belgium became the mandate country for the Mandate B territory Rwanda-Urundi. Great Britain together with Australia and New Zealand became the mandate country for the Mandate C territories of Nauru, Australia for New Guinea, Japan for several South Pacific island groups (Carolinas, Marianas, Marshall Islands, and Palau), New Zealand for Samoa, and South Africa for South-West Africa.

The mandate countries had to be involved directly in the mandated territories' administration but only to assure the "freedom of conscience and religion, subject only to the maintenance of public order and morals" (League of Nations Covenant, Article 22, paragraph 5). The arrangements were coordinated through the league's specialized body, the Permanent Mandates Commission. The commission had the right to set the policies for each mandated territory if they were not specified in the treaties, and each country taking responsibility for a mandated territory had to submit an annual report to the commission. The mandate system, formally terminated in 1945 upon dissolution of the League of Nations, was replaced by the trusteeship system organized under the newly formed United Nations. The majority of mandate territories included in categories B and C, with the exception of South-West Africa, retained their semi-independent status under the new system. The Mandate A territories gained their independence: Iraq (1932), Lebanon (1943), Syria (1944), Transjordan (1946), and Israel (1948).

The significance and impact of the mandate system remain disputed. It was both a continuation of imperial/colonial practices in international politics and a recognition of the right of self-determination and the growing illegitimacy of colonial rule. Most of the territories included in the mandate system eventually became independent, but it is not clear to what extent the mandate system contributed to their overall stability and development.

Mandate Theory

The mandate theory of representation states that an elected representative should behave as a true agent to his/her principal, the constituency. Representatives are therefore expected to serve the interests of their constituents. Hence the theory requires that the policies adopted by incumbents be those preferred by voters. The theory also requires that political campaigns convey information to voters such that voters can make an informed choice between alternative policies. In addition, policies proposed in political campaigns should be those in the interest of the voters.

The theory rests on of a number of assumptions in order for representation to work properly. First, representatives must believe that they are obliged to behave according to the preferences found in the constituency or to have the same interests as their voters. If this requirement is not met, the constituency needs a credible sanction mechanism that can be used to induce the representative to act according to the interests of the constituency. One mechanism is electoral defeat of the representative, but with years between elections, this is a rather blunt and inefficient mechanism. Representatives may choose to breach campaign promises early in a term in hopes that voters will have forgotten by the next election.

A second assumption is that politicians should want reelection. Without such a desire, it is difficult, if not impossible, for constituents to sanction representatives. Hence, if term limits are imposed, it should be expected that representatives in their last term are much less representative than their first-term counterparts.

Third, it should be possible for a representative to get information on what constituents' preferences are on various issues. If this information is not available, either through the press or advocacy groups, it is extremely difficult for the representative to act appropriately. Furthermore, information asymmetries may cause problems: Information must be of sufficient quality that it reflects the distribution of preferences in the constituency. Deciding which information to rely on is therefore important, since a representative could be misled by his sources of information.

Finally, politicians must be concerned with the credibility of their promises. Since promises about the future are what opposition politicians have to offer, they must be able to credibly propose policies that voters believe will be enacted should the candidate gain office. Candidates need this credibility to send signals that their promises in campaigns can be trusted, and their signals must contain information on which choices between candidates can be based. Candidates who cannot send this signal cannot convince voters that their policies are in the interest of voters, even if this might be the case from an objective point of view.

Manifesto

A *manifesto* is a document that details the values, principles, and goals of an individual or political organization. Manifestos are generally written as public documents and provide people with information about a group or movement, but manifestos can also be secret and designed to provide internal guidance for an organization or government. Manifestos are often

issued to explain policy changes or to accompany the launch of a new political party or grouping. Examples of influential political manifestos include the U.S. Declaration of Independence (1776), the Declaration of the Rights of Man and of the Citizen (1789), the *Communist Manifesto* (1848), and the Contract with America (1994). For instance, the Declaration of Independence promulgated the founding principles of the U.S. political system, while the *Communist Manifesto* was instrumental in the development of communism as a political ideology. During election campaigns, parties and candidates typically develop manifestos that highlight policy stances and provide an overview of their legislative agendas. In the United States and other countries, such manifestos are commonly referred to as party platforms. Extremist groups and marginal political factions often endeavor to use manifestos to garner publicity.

Mannheim, Karl

Karl Mannheim (1893–1947), was a Hungarian-born sociologist. He is considered one of the leading figures in the development of sociology as a discipline and is regarded as the founder of the sociology of knowledge.

Mannheim, originally named Mannheim Károly, was born in Budapest, which was then part of the Hapsburg Empire. He studied in several cities before completing his doctoral dissertation, "The Structural Analysis of Knowledge," in 1922. From 1922 to 1925, he worked at the University of Heidelberg under Alfred Weber, the brother of German sociologist Max Weber. In 1926 Mannheim started teaching sociology courses at Heidelberg.

In 1930 Mannheim was appointed professor of sociology and economics at the University of Frankfurt. In 1933, as part of the Nazi regime's persecution of Jews, he was fired from his position at Frankfurt. Forced to flee Germany, he was invited to England by British political scientist Harold Laski. Mannheim became a lecturer in sociology at the London School of Economics, where Laski taught. In 1944 Mannheim joined the University of London's Institute of Education as a professor of education and sociology. He was appointed chair of education at the institute in 1946; he held this position until his death the following year. During his years in London, Mannheim edited the *International Library of Sociology and Social Reconstruction* series.

Mannheim is best known for his work on the sociology of knowledge. In 1929 he wrote *Ideologie und Utopie* (published in English as *Ideology and Utopia* in 1936). He believed that knowledge could not be isolated but was related to its social context. Mannheim called this approach "relationism," and it took into account the influence of social factors, status, and class. The objective is to explain how people frame, perceive, and interpret information. Knowledge is not conveyed to people unfiltered—they interpret knowledge though filters based on culture, position, interests, and ideologies. Mannheim distinguished between two types of ideology: particular and total. A particular ideology is composed of the ideas that reflect an individual's own specific interest. Total ideology is how people see the world around them.

Ideology was not a concept invented by Mannheim. He acknowledged German philosopher Karl Marx's theory of ideology. However, Mannheim was critical of Marx's belief that ideologies involve the conscious intention to distort reality and questioned Marx's view that ideologies emerged only from social classes. While Mannheim agreed with Marx that class stratification was a source of ideology, he believed it was not the only source.

After his move to England, Mannheim began to consider education and democratic social planning as critical to the survival of democratic society. *Man and Society in an Age of Reconstruction* (1940) and the posthumously published *Freedom, Power, and Democratic Planning* (1950) reflected this concern.

Maoism

Maoism refers to the body of thought and practices associated with Mao Zedong (1893–1976). As the leader of the Chinese Communist Party (CCP), Mao led the party to victory in 1949 by defeating the Nationalist Party under Chiang Kai-shek (1887–1975) in a protracted civil war that dated back to 1927. Maoism was thus inextricably linked to the Chinese Communist revolution.

When the CCP was first founded in 1921, it was directly under the command of the Comintern (1919–1943), an international communist organization founded in Moscow, and followed its prescribed Leninist-Stalinist revolutionary strategy. This entailed a temporary alliance with the Nationalist Party under the first United Front in 1924 in order to stage a bourgeois national revolution that aimed at forging national unity. But the alliance was short-lived. Chiang Kai-shek, who succeeded Sun Yat-sen as the leader of the Nationalists in 1925, launched a full-blown attack on the Communists in 1927. However, this major political setback for the party was to pave the way for the rise of Mao as its paramount leader, with his own distinctive brand of communism.

MAOISM AS A REVOLUTIONARY DOCTRINE

Under Mao, Marxism–Leninism underwent two important modifications. First was the systematic recruitment of the peasantry as a revolutionary class that was vital to the communist movement. Partly out of disillusionment with the workers, and partly because of firsthand experience in rural China, Mao provided a powerful account of what he considered to be progressive revolutionary acts of the peasantry in his well-known work, "Report on an Investigation of the Peasant Movement in Hunan" (1927). Second was the appropriation of what should have been an internationalist movement for a nationalist cause. As Mao put it, there is no such thing as Marxism in the abstract. Rather, there is only "concrete" Marxism, which is the "application of Marxism via a national form" (Mao, "On the New Stage," 1938).

These modifications were officially adopted by the CCP under the banner of Mao Zedong Thought in its 1945 Party Constitution. Mao Zedong Thought as such was Marxism-Leninism adapted to the Chinese reality, which entailed the fact that China was a premodern agrarian society. Moreover, since the mid-nineteenth century, its sovereignty had persistently been encroached upon by Western and, eventually, Japanese imperialism. But more important, underlying these modifications was a strong determination by Mao the leader to bring about a fundamental remaking of the Chinese polity and society in accordance with what he took to be the Marxist historical trajectory. Having been chased out of the Jiangxi Soviet (1931–1934) by the Nationalists and survived the Long March (1934–1935), Mao appeared to be more convinced that the human will, if engaged methodically, could overcome any obstacles that came into the way of this revolutionary endeavor.

Human will aside, Mao was also an astute strategist. Not only did he subscribe wholeheartedly to the Leninist notion of a vanguard party led by professional revolutionaries like himself, Mao was convinced that "political power grows out of the barrel of guns" (Mao, "Problems of War and Strategy," 1938). Maoism is thus known for its skillful deployment of guerrilla tactics, which capitalized on effective use of limited resources, including recruiting civilians for small-scale military operations. In addition, along with his chief military comrades, Zhu De (1886–1976) and Peng Dehuai (1898–1974), Mao built the legendary People's Liberation Army, which was marked by its ideological commitment to the revolutionary cause and its solidarity with the people. In short, strategic deployment of localized military operations and grassroots political work were all part of a larger war strategy. These elements of Maoism were widely adopted for colonial struggles in Asia and Africa after World War II (1939–1945) and continue to fuel insurgency in countries such as Peru and India.

MAOISM AND DEVELOPMENT

As a development strategy, however, Maoism has a much more troubled legacy. It was characterized by three elements: (1) a voluntaristic approach to change by mobilizing the people on a mass scale (*yundong*), often to the level of frenzy; (2) a commitment to level the differences between the city and the countryside, the peasants and the workers, and mental and manual labor; and (3) the conviction that socialism is capable of generating its own class enemies. Together, these factors were instrumental in orchestrating two of the largest human-made disasters of the twentieth century—the Great Leap Forward (1958–1961) and the Cultural Revolution (1966–1969). Tens of millions of lives were lost as a result.

Marcuse, Herbert

Herbert Marcuse (1898–1979) was a German-Jewish social theorist and political activist. He was a member of the majority faction of the German Social Democratic Party (SPD) between 1917 and 1919. After World War I (1914–1918), he participated in Berlin's revolutionary Soldiers' Council. However, he resigned from both the SDP and the council, ending his only organized political affiliations, and in 1919 resumed studies in German literature, philosophy, and political economy at the University of Freiburg, where he earned his doctorate.

In 1928 he began work as an assistant to well-known German philosopher Martin Heidegger. In 1933 Marcuse became a member of the Frankfurt Institute for Social Research at the institute's Geneva, Switzerland, branch. The following year he immigrated to the United States and continued his work with the institute at Columbia University in New York City. Between 1942 and 1950, Marcuse was a research analyst for the U.S. government. His first permanent academic position was at Brandeis University in Massachusetts. After his retirement from Brandeis, he became a professor of philosophy at the University of California, San Diego. Between the mid-1960s and his death, he attained his greatest fame as both an advocate and critic of new left theories and practices. He died in Starnberg, West Germany, in 1979.

Marcuse's first published works dated to his period with Heidegger. Marcuse attempted to synthesize Marxism with existential philosophy. When he joined the Institute for Social Research, he participated in the collective effort to develop a "critical theory of society." His primary task was the philosophical articulation of the fundamental principles of this critical theory, which culminated in his book *Reason and Revolution* (1941). When Marcuse resumed his academic career in 1950, one of the thrusts of his work was the analysis of the ideological obstacles to revolution. His book *Soviet Marxism* (1955) traces the Soviet transformation of Marxism from a form of critical thinking designed to guide revolutionary political practice into an ideological prop to the existing status quo. His controversial 1965 essay, "Repressive Tolerance," analyzes the degeneration of the liberal idea of tolerance. The masterpiece of Marcuse's ideological criticism was *One-Dimensional Man* (1964), his most famous work. Here Marcuse describes the smooth and comfortable totalitarianism of advanced industrial societies—including the development of the welfare and warfare state,

the mass media, and modern technology—which he believes has engendered a mass conformity and suppressed the development of genuine alternatives to the status quo.

If Marcuse's criticism of ideology emphasized the obstacles to revolution, the Freudian-Marxist thrust of his postwar work raised the stakes involved in revolution. In *Eros and Civilization* (1955), he put forth the belief that true revolutionary emancipation went beyond political and economic change to include the social, sensuous, and sexual emancipation of the instincts. Marcuse's critique of society exerted some influence on the protean movement of dissent known as the new left. The new left was opposed by the old socialist and Communist lefts and disavowed by most established intellectuals. But in *An Essay on Liberation* (1969) and *Counterrevolution and Revolt* (1972), Marcuse took a more favorable view. He never minimized the power of the forces opposed to revolutionary change, nor did he uncritically endorse the new left, but he was attentive to the spark of genuine human emancipation in the movement's goals.

Marcuse's last works explored the theme of art and revolution. He argued that art preserved an image of human freedom and happiness. His last book, *The Aesthetic Dimension* (1978), combated the orthodox Marxist tendency to trivialize art by reducing it to the status of a mere ideological reflection of social classes.

Marginal District

A marginal district is a legislative district in which the electorate is closely divided between supporters of opposing parties. The relative electoral fortunes of the parties in marginal districts serve as indicators of national trends, because the narrow margin of victory renders them more susceptible to change than so-called safe seats. These volatile districts also serve as test cases for theories of representation. For example, members of Congress elected from marginal districts seem more likely to be concerned about their electoral future than those elected from safer districts. Thus, marginal members' activities and success toward securing their seats provide insight into legislative behavior.

The decreasing number of marginal districts—traditionally defined as districts whose representatives have won their seats with less than 55 percent of the vote—has sparked debate among political science scholars. Explanations for this phenomenon include gerrymandering, increased constituency services by incumbents, and declining party affiliation in the electorate, resulting in an increase in the personal vote and incumbency advantage. Other scholars maintain incumbents' safety is no greater despite the increase in their average vote percentage since the 1960s.

Because the number of marginal districts is ostensibly linked to the number of seats likely to change partisan hands in an election, the decline of these competitive districts has inspired concern among commentators. In this view, an increase in safe seats deadens the electoral impact of shifting public opinion. Other scholars note that razor-thin victories produce a greater number of citizens dissatisfied with election outcomes compared to constituents in more lopsided districts.

Mariátegui, José Carlos

José Carlos Mariátegui (1894–1930) was a Peruvian activist, political theorist, and writer. He was born in Moquegua in 1894. His father abandoned his family, creating economic difficulties that were further exacerbated by a serious injury to Mariátegui's left leg that left him in poor health for much of his life. Mariátegui entered the newspaper trade as an errand boy, ultimately taking on the position of a writer. In 1916

he began working for a leftist newspaper, *El Tiempo,* before establishing his own newspaper, *La Razón,* two years later. *La Razón* published many articles on university reform and defended the young labor movement in Peru. This drew the attention of Peruvian officials, who invited Mariátegui to cease publication of his paper in favor of travel abroad.

Mariátegui traveled throughout Europe and settled in Italy for two years, long enough to gain exposure to Italian trade union activism and experience the dangers of nascent fascism first hand. He returned to Peru in 1923, committed to political action, and began forming connections with populist movements. In 1924 Mariátegui nearly died from a tumor in his left leg. The leg was amputated, and for the rest of his life he relied upon others to carry him and provide for his physical mobility. This episode seemed only to catalyze his intellectual energies, however, as he founded a new journal, *Amautu,* in 1926 to advance discussions of socialism and culture in Latin America. Two years later he founded what would become the Communist Party of Peru.

In 1928 Mariátegui published *Seven Interpretive Essays in Peruvian Reality,* which is his best-known theoretical work. In it he synthesizes his political experiences and observations into powerfully written and widely accessible essays. The work includes a lucid analysis of the particular economic legacies of different stages of colonialism in Peru. Mariátegui argues that indigenous practices had been a form of socialism that had largely been replaced by Spanish colonizers, who imported the structures of feudalism. While pockets of the old communal economies remained, Peru had "developed" into a feudal economy in the modern era, and further economic development would only exacerbate inequality, unless all feudal remnants were eradicated.

Mariátegui also examined the impact of Spanish colonial attitudes as they persisted in the universities. In *Seven Interpretive Essays,* he also argues that the universities guarded prestige and encouraged the study of rarified knowledge, with no concern for pragmatic education or progress of any kind. He states that the attempt to reform the universities in 1921 had failed because the colonial economy was still intact, claiming, "The problem of education cannot be understood in our time if it is not considered as an economic and social problem. The mistake of many reformers has been their abstract and idealistic methods and their exclusively pedagogical approach."

This discussion of education exemplifies Mariátegui's unique practice of Marxism: He combined materialist principles with the specifics of Peruvian colonial and cultural history and rejected abstract programs in favor of localized analysis. His work provides guidance and a methodology for political activists interested in land reform, indigenous peoples, and education. Mariátegui died in 1930 of complications from his earlier illnesses.

Maritain, Jacques

Jacques Maritain (1882–1973) of France was one of the most influential Catholic thinkers of the twentieth century, and he dominates Catholic social thought as a defender of human rights and freedom. Born in Paris, he was brought up as a liberal Protestant but converted to Catholicism in 1906 at the age of twenty-four. He was a professor of the Institut Catholique from 1914 to 1940, and thereafter he taught at Columbia, Princeton, and the universities of Toronto and Chicago. The author of more than fifty books, he was a preeminent interpreter of philosopher and theologian Thomas Aquinas and a creative thinker in his own right on such topics as metaphysics, moral philosophy, social and political philosophy, the philosophy of art, and the theory of knowledge. The main focuses of his writings were the defense of Catholic humanism, Thomism, and human rights.

Maritain's primary work in epistemology was *Distinguish to Unite: Or, The Degrees of Knowledge* (1932). Maritain insisted on the priority of epistemology over metaphysics and maintained that the structures and methods of the various sciences were determined by the nature of the object to be known. He called this view "critical realism," and it holds that what the mind knows is identical with what exists. When it comes to a knowledge of sensible objects, the mind has both a passive role (receiving sense impressions) and an active one (constructing knowledge from these impressions). Maritain's epistemology also sought to explain the nature of knowledge found in religious faith and mysticism. He believed there are degrees of suprarational knowledge that are beyond natural knowledge, such as revealed mysteries, theological wisdom, and mystical theology. Theological wisdom is built on faith and mystical knowledge or unmediated knowledge communicated by the deity.

Maritain's moral and political philosophy lies within the Aristotelian-Thomistic natural law tradition, which holds that there is an unwritten law remaining within nature derived from eternal law. Such a law is coextensive with morality and has a teleological character in which the end determines the function. Maritain held that a single natural law governs all beings, and it is known connaturally through a process called *synderesis.* Knowledge of this natural law varies according to a person's capacities and abilities and is progressively and incrementally appropriated by an individual.

Maritain's moral philosophy cannot be considered independently of his analysis of human nature. A key notion in his moral philosophy is freedom. He perceived the idea of freedom not as the license of pure autonomy but as harmony with the essential nature of each human being. He distinguished between a human being as a part of the human race and as a person who is an object of dignity. By virtue of their individuality, human beings have obligations to the social order, but by virtue of their personality, they cannot be subordinated to that order.

Maritain defined his political philosophy as "integral Christian humanism." The object of it was to outline the conditions necessary to make the individual more fully human and to bring all the dimensions of human personality together without diminishing the value of any. For Maritain, the best political order is one that recognizes the sovereignty of God. He proposed a theocentric humanism based on the recognition of all human beings as material and spiritual beings at the same time.

Maritain envisaged a political society under the rule of law. He distinguishes four types of law: (1) the eternal, (2) the natural, (3) the common law of civilization (*jus gentium*), and (4) the positive (*droit positif*). The natural law is universal and invariable and deals with rights and duties, but it is not founded on human nature. Instead it is rooted in divine reason and in a transcendent order written into human nature by God. Natural law becomes obligatory only because it is part of divine law. The *jus gentium* is an extension of natural law applicable to human beings as social beings. Positive law is the system of rules and regulations that assure general social order. It varies according to the stage of economic and social development. Neither *jus gentium* nor positive law can act against natural law, although they are not deducible from natural law alone.

Maritain's vision was that of Christian commonwealth, a new Christendom where Christian faith, by the integral character of its theocentric humanism, could unify, without denying the distinctiveness of, the temporal and the spiritual and could provide a positive framework for a personalist, communal, and pluralistic democracy. He called for a new integral humanism that would recognize all that is irrational in humans, in order to tame it to reason, and all that is suprarational, in order to have reason vivified by it and to open humans to the descent of the divine in them. Its main work would be to cause the Gospel leaven to penetrate the secular structures of life and sanctify the temporal order.

Maritain held that the natural law theory entailed the establishment of human rights. He believed since the natural end of each person is to achieve moral and spiritual perfection, it is necessary to have the means to do so and no one should be deprived of the rights necessary to achieve a good life. However, since such rights are not universally recognized, they can be acquired only gradually and incrementally. Because rights are fundamental and inalienable, they are superior to civil law. Rights are grounded in natural law in relation to the common good. It is this common good, not rights, that is the basis of the state. Maritain favored a democratic and legal theory of the state that was personalist, pluralist, and Christian. Thus a true democracy represents not merely the will of the people,

but the will of God. True and positive freedom comes from the equality of all, the rulers and the ruled, under a sovereign God and the use of the common goods for the common good. An ideal polity will consist of a number of civic fraternities founded on freedom, inspired by virtue, and exercising discipline and democratic values. In a global society, such a polity would consist of a network of a federation of such fraternities.

Maritain's works have been translated into twenty languages, and he continues to be influential in the early twenty-first century. The University of Notre Dame is home to the Jacques Maritain Center, which fosters the study of his work. Three journals are devoted to his work, *Etudes Maritainiennes/ Maritain Studies, Notes et Documents,* and the *Cahiers Jacques et Raissa Maritain*. There are also national associations in his name, including the International Jacques Maritain Institute in Italy.

Market Socialism

Market socialism is a political economic system employing the marketplace to distribute goods and services while still adhering to the basic egalitarian values of Marxism. Market socialism arose as an alternative to the centrally planned economy in the Soviet Union.

Karl Marx criticized capitalism and the use of markets to distribute goods and services for several reasons. In his *Economic and Philosophical Manuscripts of 1844* and *The German Ideology* (1845–1846), Marx leveled a philosophical and sociological attack on capitalism. Capitalism destroyed the essential bonds that connected individuals, producing a sense of alienation from oneself, others, the process of production, and nature. These initial philosophical criticisms matured into economic arguments in the *Communist Manifesto* (1848) and in several volumes of *Capital* (Volume 1, 1867).

In his economic critique, Marx contended that capitalism involved the exploitation of the workers or proletariat by the bourgeoisie. While the proletariat was the source of all value, their labor power had been purchased by the bourgeoisie, who owned the means of production. This extracting of what Marx called the "surplus value" from the workers impoverished them, and, over the long term, the development of capitalism would increase the size of the proletariat at the expense of the bourgeoisie. Capitalism, as Marx described it in the *Communist Manifesto,* produced the seeds of its own self-destruction. Overall, Marx and Marxists depicted capitalism and the use of markets as producing social alienation; class warfare; and economic misery, inefficiencies, and inequalities.

Because of Marx's attack on capitalism, the Marxist-socialist tradition was critical of markets. However, market socialism arose from three distinct sources. The first traces itself back to early efforts to revise Marxism to accommodate the theory to events that occurred after Marx died. One notable effort was by Eduard Bernstein in *Evolutionary Socialism* (1898). Bernstein's democratic socialism is not to be confused with market socialism. Bernstein essentially accepted Marx's criticism of capitalism and markets, yet the former's efforts to accommodate parliamentary democracy with communism left open subsequent attempts to make other revisions to Marxist theory and practice.

A second source of market socialism occurred in the early 1920s after the 1917 Russian Revolution. Here, Vladimir Lenin, following the revolution and the instability flowing from the transition to a centrally planned and controlled economy, instituted in 1921 the "new economic policy" (NEP). NEP allowed for some private ownership in agriculture and industry as a way to encourage production. Following Lenin's death in 1924, Nicholas Bukharin, another leading communist official, advocated many of the NEP reforms. In 1928 Joseph Stalin ended NEP and the use of markets when he instituted the first of several five-year plans.

Perhaps the most important theoretical arguments for combining Marxism or socialism with economic markets are in the works of Polish economist Oskar Lange (1904–1969). Rejecting Marx's labor theory of value, Lange sought to combine neoclassical economic theory, especially its concepts on pricing, with some of the central planning concepts of Marxism. In his most famous book, *On the Economic Theory of Socialism* (1936), Lange argued that central planning boards (CPBs) should set general pricing and goals for a national economy but that markets could be used to direct production. The state could run an efficient economy with markets that furthered socialist goals. It is this combining of macro socialist ideas and CPBs with markets that constitute the core concept of market socialism.

The most elaborate efforts at implementing market socialism came in Yugoslavia in the 1950s and 1960s under Josip Tito. The state had a CPB setting investment policies and goals, with workers' councils managing enterprises that competed against one another in the marketplace. Hungary, Poland, and Czechoslovakia, under Communist Party head Alexander Dubček, also experimented with market reforms while still under communist control, with varying economic success. Even the Soviet Union began to liberalize its economic policies to allow for some market reforms in the late 1980s before its breakup.

Today, the vestiges of market socialism may be found in European welfare states such as Austria and the Scandinavian countries, which combine the use of economic markets for some items and an extensive public sector delivery of basic goods such as health care and other necessities.

Marshall Plan

The Marshall Plan was a broad package of economic and commercial aid that the United States granted to European countries in the aftermath of World War II (1939–1945). The aid was intended to provide Europe with money to restart international trade in food, to avoid starvation, and to buy from the United States food, fuel, and capital goods to rebuild the continent's devastated industrial base. It was also an effort to avoid the problems created in the aftermath of World War I (1914–1918) caused by a combination of high reparations imposed on the defeated Central powers and a wave of rising protectionism during the late 1920s and 1930s. The initiative, named after Secretary of State George Marshall and formally known as the European Recovery Plan (ERP), operated from 1948 to 1952 and was a cornerstone of the comprehensive foreign policy of the administration of Harry S. Truman in the opening days of the cold war.

The ERP was developed in reaction to proposals such as the Morgenthau Plan that argued for European reconstruction based on the extraction of resources from Germany. Marshall came away from the 1947 Moscow Conference convinced that the Soviet Union and the United States would not be able to reconcile their foreign policy priorities, and, therefore, it was imperative that the Truman administration undertake dramatic measures to rebuild Western Europe so that the region would be able to resist Soviet continental expansion and contribute to the larger needs of transatlantic security. The outlines of the plan were developed by U.S. Department of State officials, including George F. Kennan, and the proposal was approved by Truman despite concerns that Congress would be unwilling to provide the reconstructions funds. Marshall promulgated the plan at his commencement address at Harvard University on June 5, 1947. Truman was able to work with leading Republicans in Congress, including Senator Arthur Vandenberg, to gain bipartisan support, and he signed legislation authorizing the ERP in April 1948.

Multilateral planning for the Marshall Plan began in July, when all of the states of Europe, with the exception of Spain, were invited to a conference to discuss terms and conditions of U.S. aid. The Soviets declined to participate and prevented those states of Eastern Europe under their control from attending. Soviet concerns were based on U.S. demands for economic openness as a precondition for participation and the potential that the ERP could undermine Moscow's control in Eastern Europe.

Negotiations resulted in an agreement whereby the United States would provide aid and loans to sixteen countries in exchange for economic reforms, including tariff eliminations, and oversight by an American agency, the Economic Cooperation Administration. The multilateral Organization for European Economic Cooperation was created to coordinate planning and aid distribution. (The body later became the Organization for Economic Cooperation and Development). Over a four-year period, the United States provided more than $13 billion in aid to Western Europe. The ERP was critically important in rebuilding the shattered economies of Western Europe and binding those states to the United States during the cold war. The participating states experienced an average increase in gross domestic product of more than 30 percent and an increase in their industrial output by more than 40 percent. Subsequent U.S. efforts to develop similar multilateral or regional aid programs never met the level of success of the Marshall Plan.

Marsilius of Padua

Marsilius of Padua (1275–1343) was an Italian scholar, educated as a physician, whose intellectual outlook was typical of the secular, educated classes residing in the Italian city-states of his time. His major political work, *The Defender of the Peace* (*Defensor Pacis,* 1324), addressed such questions as the nature of the secular state, the idea of popular sovereignty, and the causes of political order and disorder. But his most important contribution was his account of the separation of secular and religious authority and his claims regarding popular sovereignty.

Marsilius was influenced by Aristotle, particularly the *Politics,* but also by later Averroist philosophers. The influence of Aristotle is reflected in his secular understanding of politics in the temporal world, the importance of empirical observation, and his suspicion of claims to dogmatic obedience to established belief. Like many medieval political thinkers, Marsilius accepted Aristotle's three-fold division of regimes into those that embody rule of one, rule of the few, or rule of the many. Each type of regime may exist in either its ideal form or a corrupted version. Hence, rule of the one can be either a monarchy or despotism;

rule of the few aristocracy or oligarchy; rule of the many either constitutionalism or mob rule. What distinguishes any type of regime is whether those in authority rule in the common good (the ideal form) or whether they rule in their own interests at the expense of the community (the corrupt version). This distinction became one of the defining criteria for distinguishing between tyranny and just political systems.

Marsilius also showed the influence of Aristotle when he argued for a radical separation between reason, philosophy, and knowledge on the one hand and faith and theology on the other. The latter, being nonrational, were irrelevant for temporal issues. Temporal affairs are known through human reason and governed by positive, that is, human-made law enacted by the body of citizens, its "prevailing part," or its representatives. In contrast, divine and natural law comes from God directly and concerns punishments and rewards in the world to come. Hence, Marsilius argued for limitations on the authority of the church in temporal affairs. Indeed, Marsilius actually claimed that one of the primary threats to civil peace came from those "Roman bishops" (i.e., popes) who sought to extend their coercive jurisdiction to temporal matters.

The distinction between natural/divine law and positive law further led Marsilius to emphasize the importance of the legislator with regard to temporal, secular affairs and highlighted two functions. The first is that of the "primary" or "absolute" legislator and refers to the source of ultimate or final constitutional authority. The second lies in the making of specific laws. Marsilius argued that the former lies with the people as a whole. In the making of specific laws, the people play a role in ratifying or rejecting laws passed by their representatives. In both cases the people as a whole are likely to make better decisions than a small minority alone, and their authorship of the laws is likely to guarantee greater compliance.

In separating reason and faith, limiting spiritual power to nonworldly affairs, and emphasizing the role and consent of the people in political matters, Marsilius helped lay the foundations for the separation of religious and secular authority and representative government that would subsequently be found in the works of modern thinkers, including Thomas Hobbes and John Locke.

Martial Law

Martial law consists of transitory rule by military authorities of a designated area inhabited by civilians during periods of emergency. In theory, martial law is temporary, but a state of martial law in a jurisdiction may persist indefinitely (as observed in Egypt, which has been under martial law for several decades.) Martial law is not to be confused with military law, which is a collection of legal principles and regulations that apply only to members of the armed services. Military law coexists with civil authority and does not override it—martial law, alternatively, does suspend civil authority and constrains both civilians and the military.

Under martial law, absolute power is placed in the military commander to reinstate security and safety to an area disrupted by violence or some other serious disturbance, such as a war, natural disaster, a political or economic crisis, or a widespread riot. With martial law, the decisions of military leaders and institutions of the armed services reign supreme and supersede those of all civil courts and civil laws—routine civilian administration of justice and law is deferred until normal conditions are restored and allow the military to return authority to the regularly constituted government. Typically observed in martial law is suspension of habeas corpus (wherein a judge rules upon the validity/legality of a detention), the imposition of curfews requiring persons to be in their homes for a set period of time during the day and night, and the banning of public protests and demonstrations.

Mere utilization of military forces by a civilian government to maintain order does not constitute a system of martial law. The legal status, specific declarations, and particular manifestations of martial law differ from nation to nation and state to state, but they all generally involve the suspension of citizens' normal civil liberties and civil rights and the placement of ordinary civilians under military law and military justice. The regularly constituted civil courts do not engage in judicial review of the decisions of military tribunals as organized during a period of martial law.

In the American context, the U.S. Constitution does not directly enumerate the authority by the federal government to proclaim martial law. The Constitution does imply this authority by granting the federal government the duty and obligation to protect the states from external invasion or internal insurrection, found in both Article I, Section 8, and Article IV, Section 4. Thus, the power to proclaim martial law rests with the U.S. Congress and the respective state legislatures. (A strong majority of state constitutions allow their governors to declare martial law within the state.) Such declarations can legally occur only during times of bona fide emergency, and martial law must terminate when the crisis has passed. Civilian government continues to exist during a period of martial law but does recede into the background until it can once again return to effective functioning.

The military's actions need to conform to constitutional requirements in the process of maintaining order, preserving lives, and protecting property. As the U.S. Supreme Court

held in the case of *Ex parte Milligan* (1866), military tribunals cannot try civilians for nonmilitary offenses if civil courts are still operating. Military commanders must conscientiously and properly exercise their authority to make sure individuals' rights are not illegally trampled. If they do not, criminal charges can be brought against offending troops and their military leaders. The most famous invoking of martial law in the United States occurred in some areas in the Northern states by President Abraham Lincoln during the Civil War (1861–1865) and in several sections in the South after the war.

It is important to recognize that martial law is not the same thing as military government. Military government is essentially government run by the armed forces on a relatively permanent basis and institutionalized as such, typically operating through a small group composed of the chiefs of each of the military branches (conventionally referred to as a junta) and normally brought about by a military coup d'état. Examples of this type of government have been found in Asia, Africa, and Latin America. The power of such military regimes derives from the use or threat of force. Martial law generally presupposes a near and eventual return to civilian-led government after emergency circumstances have come and gone, while military government does not.

Marx, Karl

Known as the father of socialism, political theorist and economist Karl Heinrich Marx (1818–1883) was born in the Rhineland area of Prussia (Germany) near the French border. Marx's Jewish family converted to Christianity and moved to England where he became a radical. In England, Marx met philosopher Friedrich Engels, and the two became close friends and collaborators. In 1848, after Marx returned to England from a failed revolution in Germany, he and Engels published *The Communist Manifesto,* in which they provided a rationale for class revolution. Marx ultimately produced over 100 works.

Marx subsequently turned his attention to political economy, publishing *Contribution to a Critique of Political Economy* in 1859. He and Engels further articulated Marxist theory in *Das Kapital,* published in three volumes: *Volume One: The Process of Production of Capital* (1867), *Volume Two: The Process of Circulation of Capital* (1885), and *Volume Three: The Process of Capitalist Production as a Whole* (1894).

Although Marx's ideas led to revolution in economic thought and to the development of socialist/communist governments in parts of Europe, Asia, Africa, and Latin America, his ideas were not original. Marx was directly influenced by German economist Georg W. F. Hegel and particularly by Hegel's contention that history provides answers to all philosophical questions. Marx used Hegelian theory to develop his argument that the mode of production is responsible for all the ills of given societies, which are prone to repeating the same mistakes throughout history. He presented socialism as the answer to the problem.

Marx lived during an intense period of industrialization, and he wrote to discredit raging capitalism and to refute classical liberal thought. Ironically, he was heavily influenced by some of the British thinkers he rejected. Marx owed particular debts to philosopher John Locke and economist David Ricardo. Locke's contention that workers should own the fruits of their labor provided the foundation for Marxian theory. Ricardo argued in *Principles of Political Economy and Taxation* (1919) that the value of any product was dependent on the labor used in producing it, stating in the "iron law of wages" that the wages of any given period tended to stabilize around the subsistence level. Marx believed that expanded profits for capitalists and mere survival for workers were bound to lead to alienation and political unrest.

Although Marx accepted that worldwide revolution might be possible to overthrow capitalism, he believed it would be unnecessary. He insisted that alienation from the capitalists (the bourgeoisie) would eventually cause the workers (the proletariat) to rebel against the capitalist system. The result, according to Marx, would be the destruction of capitalism and the creation of a temporary state that would wither away after establishing a worker-controlled market.

Karl Marx envisioned his socialist revolution taking place in his homeland of Germany, but it was in Russia that his ideas bore the most fruit. In 1917 Bolshevik revolutionaries overthrew the monarchy. After the Bolsheviks were absorbed into the Communist Party under the leadership of Vladimir Lenin, Marxist-Leninism provided the foundation for the creation of an all-powerful state. Contrary to Marxist theory, however, the communist state refused to wither away. In 1922 the Union of Soviet Socialist Republics (USSR) was created. Communism continued to expand, aided to a large extent by concessions made during peace talks at the end of World War II (1939–1945). The resulting cold war between democratic and communist nations lasted until 1991, when Soviet president Mikhail Gorbachev's perestroika precipitated the dissolution of the Soviet bloc, leveling a death blow to Marxist-Leninism in most of the world.

Marxism

Marxism is an ideology that derives from Karl Marx's (1818–1883) critique of capitalism. As the third child in a middle-class Jewish family, Marx studied law at the University of Bonn and wrote his dissertation, *The Difference between the Democritean and Epicurean Philosophy of Nature,* in 1841. Aristotle, who Marx referred to as that "towering genius," would play an inspirational role for many of his ideas on nature. Aside from these ancient thinkers, many modern thinkers also exercised a profound influence on Marx's thinking. Of these, Georg W. F. Hegel (1770–1831) was unquestionably the most important to framing Marx's critical social theory.

Marx's great achievement, in this respect, was to reformulate Hegel's dialectic (*Aufhebung*), which held that freedom was an idea whose concrete realization was manifested in the struggle to reconcile the contradiction or difference between one's given knowledge of the world (subject) and the objects in the world (institutions, property, and rules). In this way, Marx theorized about the workers' consciousness and material struggle to overcome the conditions of social deprivation and to establish the beginnings of a communist society.

NEO-HEGELIANISM AND HISTORY

In the aftermath of Hegel's death, a great struggle would ensue over the meaning and legacy of Hegel's ideas. The result was the creation of a new philosophical movement in the 1830s and 1840s called Young Hegelianism, featuring such thinkers as Moses Hess, Arnold Ruge, Max Stirner, and Bruno Bauer. The more conservative Young Hegelians argued for the compatibility of reason and religion that would reinforce the liberal bourgeois state. In *The Essence of Christianity* (1989), for instance, Ludwig Feuerbach argued that human imperfections were unique to the species, and the essence of humanity was the infinite joy that came with being conscious of oneself as the object of God's graces. Religion in this sense objectivized the human consciousness by providing a source of feeling that was needed to overcome the narrow tendencies or limitations associated with the human species (e.g., pride, glory).

Marx, however, largely dismissed these religious underpinnings of materialist thought, arguing that the essence of a human was what he or she produced. His famous dictum that "religion is the opium of the masses" suggested that religion had no place in the substratum of the workers' consciousness (of their own needs). Indeed, much like the state, religion remained a (culture) tool of the bourgeois class to oppress the proletariat (workers). It thus induced the proletariat to participate passively and preconsciously in their oppression, while at the same time it deflected attention away from the more crucial objective: the active promotion of a unified workers' consciousness.

For Marx, neither value explained the actual production of the commodity. Nonetheless, the purpose of theory was not simply to interpret society, but, as he famously stated in *German Ideology* (1845), "to change it." To this day, the motto remains an important feature of social action and historical materialism, the latter referring to how social and economic relations have evolved through various modes of production (i.e., feudalism, capitalism, and socialism). Driving this evolutionary process have been the many episodes of class conflict or the antagonism between labor and capital, whereby the bourgeoisie used its ownership of the means of production (property, capital, interest, and rent) to force the proletariat to work without due compensation.

The exploitation of workers, then, was not simply a fact of life in capitalist society; it also constituted the overlooked, yet vital consequence of the free market ideology of liberalism. Adam Smith (1723–1790), for instance, theorized that a free market was based on the maximum allocation of resources, or the unhindered exchange between buyer and seller (*laissez-faire*). Thus, if the seller and buyer, in this case, were allowed to trade freely on the market, the market would yield an optimal price for goods and services.

In his critique of liberalism, Marx theorized that surplus value was generated from the false exchange of the value of commodities, or rather how the price of commodities failed to register the actual value of labor power. His social theory of value was based on the structural forces of the base (economy, production, capital) that determined the content and value of the superstructure (culture, religion, rights, and laws). Marx expressed these material elements/divisions in terms of worker (self-) alienation or the worker's separation from the production process. In the *Communist Manifesto* (1848), Marx argued that the bourgeoisie used its ownership of the means of production to isolate or marginalize the proletariat from what the proletariat produced. More often than not, this involved lost compensation (surplus value) or work wages, which Marx referred to in terms of relative and absolute surplus value. According to Marx, the only way to emancipate the worker was to dissolve collectively the very class arrangement that allowed the bourgeoisie to exploit the worker. Communism, as he states in the *Communist Manifesto,* "deprives no man of the power to appropriate the products of society: All that it does is to deprive him of the power to subjugate the labor of others by means of such appropriation."

ALIENATION AND LABOR POWER

Nonetheless, while the Marx of the 1840s focused on the alienation of the production process, the older, more mature Marx turned to scientific thought to formulate his systematic critique of capitalism. In *Capital,* Marx (1867/1978) distinguished between the use value of labor ("production activity of definite kind and exercised with a definite aim," 309) and exchange value to explain the relationship between surplus value and the fetish of commodities. As the political

intellectual leader of the Communist Party, Marx would help to found and organize the First and Second International movements of workers, the platforms/agendas for the international struggle of workers. The First International (1848–1889), for example, met annually to discuss and adopt new goals for advancing the workers' movement and was born from the revolutionary and reactionary events of 1848. Marx fought vigorously to defend his radical and, at times, uncompromising views of the revolution, often referring to the competing views of revisionists and anarchists, such as Ferdinand Lassalle and Pierre Joseph Proudhon, as petit bourgeoisie. Such angry dismissals represented the many tensions not only between and among socialists but also within Marxism itself.

No one tension was perhaps greater than the role of national culture. Marx, in fact, believed that cultural factors should not determine the content of the worker's revolutionary goals. As noted above, his distinction between base (economics) and superstructure (culture) was designed to show how the meaning of the latter could be reduced to the former. Still, it would be remiss to say that Marx sought to oppose *tout court* the constitutive role of national culture. If nothing else, his views on the Jewish question and, even more important, his ambivalent position on the question of Irish independence, suggest that he had remained sympathetic to certain cultural factors throughout most, if not all, of his life.

Marx's tacit acceptance of nationalism would inform many of Lenin's views, which he expressed in *The Right of Nations to Self-Determination* (1914). Lenin, for instance, believed that the rights of nationalities needed to be framed as a tactical right of workers, albeit much to the dismay of Rosa Luxemburg, who remained steadfast in her denial that national or cultural rights could be subsumed under Marxism. The debate, however, became an important focal point of the Second International (1889–1914) and would turn on the issue of whether nationalism could play a practical role in advancing the goals of the revolution. In particular, the issue pitted the leading Austro-Marxists of the early twentieth century, namely Otto Bauer and Karl Renner, who argued that the proletariat had a right to cultural autonomy, against Lenin himself, who contended that all worker nations possessed an equal right to secession.

Lenin criticized Bauer's views of cultural autonomy, insisting that workers needed to organize into homogeneous national units. In his *Critical Remarks on the National Question* (1916), Lenin argued that the tactical alliances between workers and the local/national bourgeoisie were necessary to promote the right to self-determination of oppressed nations of workers, and that all national movements of workers were entitled to the right to secede from their oppressors. His views on the right to national self-determination thus remained a crucial part of his thinking on capitalism, especially with regard to his thesis that imperialism represented the last stage of capitalism.

MARXIST-LENINISM

Lenin's thesis on imperialism contains four main tenets:

1. The most powerful nation-states had divided the world into areas of colonial or territorial possession.

2. Financial or lending capital had led to the rapid overseas expansion or the monopolization of overseas resources.
3. Cheap labor was sought overseas to generate greater profits.
4. A worldwide revolution would result from continuing global expansion of capital and colonialism.

Marxist-Leninism, or Lenin's view on self-determination and imperialism, would resurface at the third meeting of the United Nations (UN) General Assembly (1948), where the Soviet bloc members insisted on an equal right to self-determination of all colonial peoples, while the Western bloc states maintained that the right of self-determination in the colonies was neither justiciable nor enforceable.

In 1960, the UN General Assembly adopted resolution 1514, which recognized the colonial peoples' right to determine their political destiny. This, however, did not immediately end the colonial wars at the time, including the French-Algerian War (1954–1962). One of the most brilliant leaders and thinkers of the Algerian resistance, Frantz Fanon (1925–1961), brought together many of Lenin's ideas with the existentialism of Jean-Paul Sartre to formulate a third world revolutionary model predicated on the idea of the absolute means of violence, or the synthesis of armed resistance and self-determination of all colonial subjects. The Third International (1919) was defined largely in terms of the right to self-determination of the oppressed, colonial peoples.

Still, the new Marxist-Leninism orthodoxy was not without its critics. In fact, not long after Lenin's victory, some Marxist thinkers would return to Hegel's holism or notion of totality to challenge the reductionism and positivism of orthodox Marxism. Western Marxism, as the reformist movement would come to be known, featured the contributions of Georg Lukàcs, Karl Korsch, and Antonio Gramsci and was one of the first intellectual movements to break with or to criticize Lenin's victory and the state of Marxist-Leninism in the early 1920s. More than anything, the movement constituted a vital link between the first-generation theorists of the Frankfurt school and Marxism. Lukàcs's return to Hegelianism, for instance, posited that orthodox Marxism had relied on the inert immediacy of facts to validate its laws and concepts. Lukàcs sought to relate these facts to a broader, more dynamic understanding of society as a whole. Much like Lukàcs, Gramsci sought to revise Marxism by demonstrating that civil society, rather than being subordinate to the state, was in fact autonomous from the state. His solution to class/cultural conflict or the dialectical tensions between the state and civil society was to formulate a counterhegemonic civil society (historical bloc).

FRANKFURT SCHOOL

The Frankfurt Institute of Social Research (Frankfurt school), which was established in the mid-1920s and which many consider the second stage of Marxism, built upon these ideas by theorizing about the themes of political and social oppression, in particular, totalitarianism and consumerism. The three most noted thinkers—Herbert Marcuse, Max Horkheimer,

and Theodor Adorno—understood that power of technical or instrumental reason constituted a distinctive feature of twentieth-century society, and that the totalitarian state (Nazism) represented its most virulent political form (ideological). An equally oppressive form of instrumental logic was consumerism, or the manipulation of cultural life and values by the so-called culture industry. In these two contexts, instrumental logic and reason had subverted the political consciousness.

The purpose of critical theory, then, was to expose the reification of societal relations, that is, to examine the social genesis of facts and the ideological dynamics of political structures. In his 1937 essay "Traditional and Critical Theory," for instance, Horkheimer argued that positivist science, which treated facts and values as separate, was based on a false objectivism that obscured the social content of facts and ideas. This would be a theme that would later inform Horkheimer and Adorno's 1947 work, *Dialectic of Enlightenment,* and their rejection of the liberating potential of the Enlightenment principles of freedom and rationality. By championing the negativity of dialectical thought, Adorno and Horkheimer believed that they were exposing the totalizing elements of instrumental reason. Whether there was a constructive lesson to be learned here, however, was never quite clear. As has already been suggested, Adorno was never a self-proclaimed political thinker, nor did he wish others to appropriate his own ideas. This might explain why he and Horkheimer preferred to expose the totalizing elements of society without offering an alternative that could unite theory with social action. Ultimately, their negative critique raised the following question: How were the oppressed to resist the status quo power that had fully colonized their own consciousness?

Jürgen Habermas's answer to this question was to resituate reason in an intersubjective, communicative framework. For him, to recover the lost, critical elements/dimension of reason was to uncover its cognitive dimension: communicative reason. In his view, when we struggle to reach mutual consensus, we also apply or draw from our existing cultural understandings of the world. These cultural understandings exist prior to and are communicated through our exchange of ideas, thereby reflecting a repository of cultural understandings. Habermas refers to this repository as lifeworld: a holistic and creative social force that is constantly shaping our views and determining how we rationalize.

This rationalization process can take many forms, but generally, it reflects the differentiation of systems functioning or the implementation, enforcement, and reproduction of rules, norms, and principles through institutions and political structures. When existing social institutions or mechanisms fail to respond to our interests and needs, this unleashes what some contemporary Marxist thinkers have referred to as a second stage of Marxism.

But the critical and innovative framework of the Frankfurt school also contained a dark side or deep skepticism concerning social progress. This would prove, in many ways, self-prophetic. Rather than endorsing a critical social theory of emancipation in the twentieth century, the first generation of Frankfurt school theorists would end up embodying the very nihilism that it sought to overcome. This negativity, combined with Habermas's revisionist account of Marx's theory of social value, would ultimately dampen interest in the Frankfurt school.

The Paris student riots of 1968, however, marked the resurgence of Marxism. By this time, Marxist thinkers had returned to the state to address its structural determinants (power and ideological function). Most notable of these thinkers were Louis Althusser, Ralph Miliband, and Nicos Poulantzas. For them, the question was not so much that the state would disappear but rather how Marxists had failed to realize the functional role of the state in advancing the interests of workers. As this structuralist turn suggested, Marxist thinkers had not explicated the relationship between the state and societal transformation. Accordingly, Marxist thinkers first needed to rethink the changing design and purpose of the state with regard to building social solidarity or a socialist society, because it was precisely the welfare state that had absorbed so much of the energy of the radical left. This statist trend would also be complemented by the rise of Marxism in international studies, most notably Immanuel Wallerstein's world systems theory, one of the first systematic theories of the international division of labor, which addressed the accumulation of capital in the metropole, semiperiphery, and periphery.

POSTSTRUCTURALISM AND GLOBAL POLITICS

Another challenge facing Marxist thinkers at this time was whether the social determinism of Marxism had eroded the radicality of Hegel's thought. Here the central question was whether the historical determinism of dialectical thought had undermined the capacity to locate (the margins of) the meaning of difference or the radical contingency of social arrangements. Indeed, by the 1970s and 1980s, the advent of poststructuralism would mark an important departure from many of the fundamental tenets of Marxism (i.e., Jacques Derrida and Michel Foucault), including the workers' consciousness, class division, and dialectical materialism, hence the Enlightenment ideals of reason, rationality, and dialectics. In valorizing difference and decentering the meaning of truth and the subject, therefore, poststructuralism sought to destabilize the universalist meaning of political structures. Critics have argued that this strategy works against the social empowerment of groups; that it disempowers the very oppressed groups whose difference and identity it sought to valorize.

Whether or not the politics of difference signaled the growing fragmentation of the radical left, it is important to stress the resilience of Marxist ideas. Indeed, while it could be said that the fall of the Soviet Union has diminished the prominence of Marxism, it has not undermined Marxism as a source of thinking in international politics per se. In fact, Marxism has continued to have a profound impact on the developing world with development theory and with the works of Raul Prebish, Gunthur Franck, and Fernando Cardoso. Most important, Marxism continues to play an important role in defining the

underlying issues of trade, health, poverty, and debt relief in the developing world. The rise of Hugo Chávez, the socialist populist leader of Venezuela, illustrates, for the most part, the continued importance of drawing on Marxist ideas to address the effects and structural problems of global capitalism and Western imperialism. What this should suggest is that Marxism remains influential in the developing world; that its spirit, as Jacques Derrida would later state in his political writings, still pervades society.

Marxist Parties

Karl Marx said little about the political party as such. Marx assumed that the party was the essential means of expression of the proletariat, the class he saw as having a vocation to usher in a new world. In the first chapter of his 1848 *Communist Manifesto,* Marx stated that the organization of the proletariat into a class "that is to say into a party" is continually being upset but continually remade. In Marx's theory the proletariat needed to be aware of its own interests, and this would be the work of the political party. Ultimately, the party organization would tip the balance of forces in favor of the working class and of revolution. As to the program of the party, this was equally vague and is confined to a few points in the *Communist Manifesto.*

But in the middle of the nineteenth century, Marx appeared to have provided the burgeoning workers' parties with a powerful theory about the nature of industrial society and of the forces that would lead to the socialist revolution and to establishment of the reign of the working class. These parties had extensive organizations associated with them, including unions, cooperatives, newspapers, and self-help societies. With only a few exceptions in Europe (including Britain and other countries of the British Empire), these parties rose on the back of the new industrial working class coming into existence. They expressed a belief that there would be a proletarian "revolution" and that it would be socialist.

By the 1900s, however, this belief had come under attack; the principal parting of the ways came with the Russian Revolution. On the one side were the mass parties of industrial Europe that saw parliamentary systems, human rights, and above all reform as the way forward, and on the other were the Marxist-Leninist communist parties that endorsed the revolutionary vocation. For the Western European parties, the idea of revolution was being diluted by the 1920s, turning the term from "violent uprising" to "big but benevolent change," and most had abandoned it altogether by the 1950s.

COMMUNISM

What are usually called Marxist parties today are the communist parties that signed up to the "21 Conditions" of membership of the Third "Communist" International (founded by Lenin after the Russian Revolution in 1919). These were revolutionary organizations run by the Moscow Third International (and then directly by the Soviet Union). They were, as befits "revolutionary" parties with a quasi-military discipline, hierarchical (the top being in Moscow), run by a caste of professional revolutionaries (permanent employees of the party), and secretive. The party core was the professional apparatus, but the lowest unit was the "cell," a group of members that would be organized in the workplace (the emphasis was on the industrial, not electoral, struggle) or district, and they were given orders from above through the centralized command structure known as "democratic centralism." This organization was well adapted to infiltration (of unions, for example) and to clandestine operations under, for example, dictatorships, when other parties were eliminated. These parties were set up to make possible the control of the state and to pervade civil society once they gained power. Their discipline and hierarchy were both the image of the future communist society and the means of controlling and running such societies.

Not the least of the ironies of communism is that its history is at odds with the direction predicted by Marx. Russia, in 1917, was not an industrial society; the communist parties did best in peasant and underdeveloped societies and made little progress in advanced western countries. In the mid-twentieth century, Finland, Italy, and France were the only industrial societies that had mass communist parties. There they found support in industries such as steel, mining, and metalworking (destined to decline in the late twentieth century) and in rural areas such as Alantejo, central France, and northern Finland. However, there were large communist parties where the system had been imposed by the Red Army (in Eastern Europe) and also in the third world (China, Vietnam, and Cuba, for example).

Two further splits among communist parties must be mentioned. The Sino–Soviet split of 1963 led to the creation of

"Maoist" parties of the same organizational form but taking their orders from Mao Zedong and the Communist Party in Peking. The Trotskyites belonged to parties set up by the devotees of Joseph Stalin's most important rival in the USSR, Leon Trotsky, and these parties were, if anything, more disciplined than the communist parties the Trotskyites despised. Their view, not obvious given Trotsky's complicity in early communism, was that if Trotsky had been in control rather than Stalin, the workers' utopia would have materialized rather than the Stalinism of the USSR. Trotskyites remained a marginal irritant on the far left, usually trying to outflank the communist parties in revolutionary zeal in strike movements and uprisings, but they did have some electoral success (notably in Sri Lanka) and have remained as a distinctive—albeit small—component of the far left in many European countries.

MARXIST PARTIES TODAY

With the collapse of communism and the end of the world communist movement, most communist parties have dissolved or transformed themselves into left wing defenders of welfare and workers' rights against globalization and the advance of the neoliberal ideology. This group of parties, among which can be counted the French Communist Party, the Portuguese Communist Party, the Italian Rifondazione Communists, and a number of Indian parties, refer back to the work of Marx but have little of the revolutionary ardor that animated the Moscow-run parties. Other parties reference Marx as a theorist and the predictions made in Marx's works (notably about "crisis") but those, too, are marginal aspects of current politics. Marx's value as a prophet seems, with the collapse of the socialist systems, to be played out. Former communist parties of the communist bloc, when confronted with free elections, had to change radically to avoid compete obliteration and retained little of their Marxist origins.

There are still some other groups for whom the Marxist outlook is important (notably the French Socialist Party, antiglobalization movements, and some green parties), but these are more moral condemnations of the capitalist system than plans of action. Maoist parties have been prone (more than other Marxists) to splits and rivalries but have continued in some societies as splinter or terrorist parties (like Shining Path in Peru) and in others as critical minorities within the left. Only perhaps Cuba and North Korea remain as authentic communist regimes, although in China the party remains in control despite a move away from central planning and state control of the economy.

Mashriq

The Arabic word for "the East" (literally, "where the sun rises"), the *Mashriq* (sometimes written "Mashreq") is a vague geographic term specifically used, particularly in modern times but in varying ways by earlier Arab geographers, for the eastern part of the Arab world. This sometimes extends as far west as Egypt and the Sudan and always includes the countries of the Fertile Crescent (Palestine, Lebanon, Syria, Jordan, and Iraq) and the Arabian Peninsula (Saudi Arabia, Yemen, Oman, the United Arab Emirates, Qatar, Bahrain, and Kuwait), as opposed to the Maghreb (from *Maghrib,* literally, "where the sun sets"), which includes the Arab countries of North Africa lying west of Egypt (or, at least, west of Libya). While the term *Maghreb* is widely used in English, the word *Mashriq* occurs less often. More common and essentially synonymous terms are *Arab East* or *Arab Middle East*, although the latter does not always exclude the Maghreb countries. The word *Levant* (of French origin and also meaning "rising [sun]") has a similar meaning, although in its broad usage it refers only to the region bordering on the eastern Mediterranean, sometimes including the non–Arab countries, while the term *Levant states* was used specifically for Syria and Lebanon during the period of the French mandate.

Mass Immigration

While human beings have migrated across the planet in large numbers for millennia, political concerns about immigration arose following the emergence of the modern nation-state, which increasingly desired to define its territorial boundaries, regulate who entered, and conscript and tax citizens. During the nineteenth and twentieth centuries, enormous population movements became a salient global phenomenon. Defined as the large-scale entry and usually permanent settlement of people in countries of which they are not native, mass immigration is characteristic of globalization in the twenty-first century.

Mass immigration, a corollary of mass migration and mass emigration, occurs for a wide variety of reasons, many of which are beyond the control of individual sending and receiving states. People leave their home countries en masse due to war, famine, poverty, underemployment, political oppression, religious persecution, natural disasters, forced expulsion,

overcrowding, lack of opportunity, and wanderlust. They enter and settle permanently in other countries for equally diverse reasons, including economic opportunities, political freedoms, hope for a better life for their children, and sometimes because they are forcibly moved. Often the combination of powerful global push and pull forces and the great difficulty of controlling vast borders make it nearly impossible for governments to stop large-scale immigration. Consequently, in 2000 there were an estimated 56 million immigrants in Europe, nearly 50 million in Asia, over 40 million in North America, and 5.8 million in Oceania.

Drawing a conceptual line between immigration and mass immigration is largely a subjective endeavor, raising the question of precisely when the former turns into the latter. On the historical spectrum of great population movements resulting in permanent settlement, the most prominent have been characterized by the immigration of millions of people over decades and centuries. Modern international migration can be classified into the mercantile (1500–1800), industrial (1800–1914), interwar (1914–1945) and postindustrial (1960 onward) periods. There is a distinction made between mass immigration before and after 1945, with an emphasis on post–World War II (1939–1945) immigration from less economically developed to highly economically developed countries.

PATTERNS OF MASS IMMIGRATION

Patterns of mass immigration vary in nature and scope across time and space, but the European settlement of Oceania and North America stands out as particularly significant. The United States, Canada, Australia and New Zealand are referred to as classic countries of immigration, because mass immigration was instrumental in the nation-building process and profoundly affected the culture, society, politics, and national identity of each country. Further examples of mass immigration resulting in lasting demographic change include European immigration to Latin America, in particular Mexico, Brazil, and Argentina; the forced immigration of approximately ten million African slaves to the Americas between the sixteenth and nineteenth centuries; the legal and illegal Mexican immigration to the United States from 1848 to the present; and post–World War II immigration within and to Europe.

The United States, which until the 1880s had few regulations restricting entry, is among the world's most prominent countries of immigration. The country's general attitude toward most European immigrants was articulated by the celebrated author Herman Melville: "Let us waive that agitated national topic as to whether such multitudes of foreign poor should be landed on our American shores . . . if they can get here, they have God's right to come; though they bring all Ireland and her miseries with them" (Zolberg 2007, 455). An estimated thirty million immigrants came to the United States between 1860 and 1920, when the number of foreign-born averaged between 13 and 15 percent of the total population. In 2006, over 37 million (12.5 percent of the total population) were foreign-born, with approximately 1.1 and 1.3 million immigrants legally entering the country in the fiscal years 2005 and 2006, respectively.

Many European countries, once the source of mass emigration, are now recipients of mass immigration. The number of foreigners living in the Federal Republic of Germany, for example, rose from 548,000 in 1950 to nearly 7.3 million in the year 2000. Currently, nearly 20 percent of the total Swiss population is foreign-born, while immigrants make up approximately one-third of Luxembourg's population. Although immigration to European countries, the United States, and Australia has been on a large scale, it is also offset by simultaneous emigration. For every ten people who immigrated to the United States in 2001, three emigrated; for every three people who entered Australia and Germany in that year, two left, and in the United Kingdom, the ratio of immigrants to emigrants was five to two.

If mass immigration happens quickly, and if immigrants are racially, religiously, or linguistically different from the host population, this can stoke fears about rapidly changing national identity and lead policy makers to conclude that the country has reached its immigration capacity. German chancellor Helmut Kohl threatened to declare a state of emergency in 1992, in part because the entry of over 438,000 asylum seekers in one year alone created a widespread sense that the country was being inundated by immigrants. Similarly, in response to persistent mass immigration from Mexico and Central America, 59 percent of California residents voted in 1994 for Proposition 187, which proposed to withhold public benefits from undocumented immigrants, and in 2005 the U.S. House of Representatives recommended—in bill H.R. 4437—the erection of a 700-mile fence between the United States and Mexico.

Mass immigration is a manifestation of globalization and will, in the future, presumably change. Rather than Europeans settling in sparsely populated continents, as they once did, Africans, Asians and others will likely immigrate in large numbers to Europe. War, global climate change, and colossal humanitarian catastrophes may lead to unprecedented forms of mass immigration. Should the Netherlands be flooded by rising sea levels, will millions of Dutch immigrate to neighboring European Union countries? Will a warmer Greenland, Canada, or Siberia be future destinations of masses of immigrants? With the worldwide population expected to rise to as many as ten billion people by the middle of the twenty-first century, mass immigration is sure to persist as a significant global challenge.

Mass Political Behavior

Mass political behavior, mass action, and collective action for political purposes take place when a large number of people choose to participate in an action for political ends. While time, effort, and risk can be great, pressure may be needed to secure an individual's limited participation or contribution. Often groups have several goals, which require mediation, agreement, and coordination.

Various forms of mass political behavior exist. Elections represent the most common form and extend legitimacy to democratic systems: The public expresses its preference or will for a proposed decision in an institutionalized way. Citizens have power to shape issues and elect or remove their representatives—if to a limited degree. Elections can be general or national, as well as legislative on different levels, and direct or indirect, secret or open, truly competitive in democracies or noncompetitive in totalitarian regimes. Elections require less effort from participants than strikes, demonstrations, and citizen movements, and they limit political inequality.

Voters may be confronted with the dilemma of choice, they may not be well informed or apathetic, or they may vote in line with their parents, peers, social class, or party. Voting according to issues and political ideology has increased. Ethnicity, age, income, education, gender, and residence determine why some people vote. Voting behavior is more constant than often assumed. Although people can feel pressured to vote, voting is personally satisfying.

Another form of mass political behavior is direct action, which is usually a nonviolent way of asserting demands through noncooperation or obstruction. Greater state power, increasing demands for representation, the market economy, industrialization, new communication technologies, and the spread of democratic beliefs have led to more direct action. When people perceive a democratic deficit, direct action can empower them to resist oppression, gain basic rights, safeguard democracy, or raise marginalized issues.

Direct action can be internationally coordinated or gain transnational support. Usually, it is a visible and explicit, often symbolic, and at times dramatic way to spread a message and gain access to political debate. Strikes and boycotts have been partially legalized in democracies as legitimate means of protest and ways to protect citizens from business interests. Rallies, marches, and vigils are only symbolic, but if banned, they are acts of civil disobedience. Hunger strikes can be mass political behavior. Consumer boycotts also express the public's wants or needs. Direct action may initiate parallel or alternative institutions or services. Social or citizen movements influence public opinion, public policy, citizen access, social awareness, and sometimes a government's stability. To communicate with their members, groups use publications, mailings, mass media, the Internet, personal contacts, meetings, phone calls, and demonstrations. A movement's goals and its implementation may be shaped by those in power, different agencies and interests, or competition with other groups. In addition, money and political interest groups are important. Political advertising and attempts to secure political support from the public and shape public opinion have increased over the years and often face criticism.

Mayor

A mayor is the highest-ranking official of a city or municipal government. A mayor can wield extensive power in large American cities such as New York and Chicago or play a mostly ceremonial role in, for example, a modern English borough or town. In most countries, mayors are either appointed by the city council or elected by the voters to serve a term. In a U.S. city with a strong mayor and council, the voters usually elect the mayor, who acts as executive, administrator, and titular head of the city. In a weak mayor-council form of government, the city council has the ultimate policy-making power. In this case, the mayor may be selected from the council, not elected by voters. In the council-manager form, the mayor is primarily a ceremonial figure, and the manager performs the role of the administrator. In the People's Republic of China, a mayor may be the administrative head of any municipality from the provincial to the county level. In Latin America, mayors have increasingly relied upon their personal campaigns, rather than party organizations, to win elections.

A strong mayor helps set policy, serves as a chief executive, and often has legislative veto power over the council. A veto can be overridden by a two-thirds vote of the council. A mayor also appoints administrators to head various departments—the police, waste management, or education—and fills positions such as treasurer or city clerk. A mayor's appointments are not subject to council confirmation.

In some countries, mayors are appointed by a branch of the federal or regional government. In the United States, cities may share some political power with states, but they normally must yield to state power. In practice, this political balance can be very difficult for big cities, because the mayor and the governor must negotiate political boundaries.

The success of mayors is measured by their ability to draw support and provide services to their urban citizens. Bosses of U. S. cities in the early nineteenth century, for example, were successful because they helped provide jobs, supported their constituents, and were personable. In the modern information era, mayors are constantly in the public eye. Every city is unique, and some cities are more governable than others. In South Africa, the nation's first black mayor, Nceba Faku of the city of Port Elizabeth, helped heal the country of its long history of racism.

To evaluate mayors, scholars emphasize mayoral leadership styles and historical contexts. Reconstructive mayors are innovators who change the system. Articulation mayors uphold the legacy of the innovative or reconstructive mayor. Disjunction mayors serve when a system is under attack or failing. Finally, preemption mayors challenge the existing regime, sometimes successfully and sometimes not.

Fiorello La Guardia, mayor of New York between 1934 and 1945, is regarded as a successful preemption mayor; some rank him as one of the top mayors in history. Frank Rizzo, mayor of Philadelphia between 1972 and 1980, and Dennis Kucinich, mayor of Cleveland between 1977 and 1979, on the other hand, are often considered two of the worst mayors. Richard J. Daley, another successful mayor according to many academic studies, was the mayor of Chicago from 1955 to 1976 and governed with a machine politics style, in which the hierarchy runs from the precinct level to the top, or the mayor's office. His oldest son, Richard M. Daley, who became mayor of Chicago in 1989, has a much different style. He is considered one of the new breed of mayors, for whom partisan politics is less important than in the past. His takeover of the Chicago public school system in 1995 has been heralded as a success. Many other mayors, such as Mike White of Cleveland, have cut wasteful spending. While many U. S. Democratic mayors are turning to market forces to replace civil rights era social policy priorities, Republican mayors, such as Michael Bloomberg of New York, have turned to so-called liberal tactics. This blurring of the partisan line has changed mayoral politics. The candidates themselves and the issues are all important.

McCarthyism

Senator Joseph McCarthy (1908–1957), a charismatic Republican from Wisconsin, became one of the most reviled and feared figures in the history of U.S. politics. His aggressive campaign to remove perceived communists from positions of influence during the anticommunist movement is known as *McCarthyism.*

McCarthy's campaign began with an unsubstantiated statement during a speech in Wheeling, West Virginia, in 1950, when he held up a piece of paper that purported to be a list of 205 subversives employed by the U.S. Department of State. The irony of McCarthyism was that the heyday of American communism had ended with the outbreak of World War II (1939–1945). Droves of communist sympathizers in the United States had withdrawn support for the movement after the Soviet Union signed a nonaggression pact with Nazi Germany in August 1939, and then Germany invaded Poland.

"Tail-gunner Joe," as McCarthy was nicknamed, was elected to the U.S. Senate in 1946. By that time, the House Un-American Activities Committee had been operating for eight years. The committee's unrelenting probes into anyone suspected of even the slightest link to communism served as a model for McCarthy, who accused the American left, most notably presidents Franklin Roosevelt and Harry Truman, of selling out Eastern Europe, betraying China, and precipitating the invasion of South Korea. Another target was George C. Marshall, a former U.S. secretary of defense, five-star general, and Nobel Peace Prize winner.

The post–World War II period was an ideal time for McCarthy's brand of conservatism. In highly publicized trials, the U.S. Department of Justice had used the Smith Act of 1940, designed to prevent the spread of communist subversion in the United States, to convict eleven communists of trying to overthrow the government. The discovery that Alger Hiss, a state department employee, had sold secret information to the Soviet Union had further outraged the entire country. Loyalty oaths requiring government employees to attest that they had never been members of the Communist Party had become commonplace.

Following the 1950 election, in which McCarthy claimed credit for the defeat of four Democratic senators, the Republican leadership selected him as the chair of the Government

Operations Committee, in which it was believed he would be forced to keep a low profile. Instead, McCarthy used that position to pursue his highly publicized campaign. One of his early targets was the Voice of America. He claimed that American libraries overseas were filled with communist doctrine.

Television had entered the homes of most Americans by 1952, and party conventions were broadcast nationally for the first time. Always a showman, McCarthy used the Republican Convention to accuse Democratic candidate Adlai Stevenson (1900–1965) of being a communist sympathizer. By 1953, McCarthy was insisting that communists had also infiltrated the Army Signal Corps. The Army-McCarthy hearings of the following year were broadcast on television, and by that time it was clear that McCarthy was on a witch hunt with few facts to back his outrageous claims.

McCarthyism lasted only half a decade. During that time, however, jobs were lost and lives were destroyed. Leftist Americans, particularly those in the entertainment and academic fields, were accused and convicted of seditious conduct in the minds of McCarthy and a segment of the public, without benefit of judicial process. It was only when McCarthy targeted the army that his own party turned completely against him and put a stop to his activities.

In December 1954, twenty-two Republicans and the entire Democratic delegation in the Senate censured McCarthy. His flamboyant political career was over. Afterwards, whenever he spoke on the floor of the Senate, his colleagues walked out. McCarthy's death, three years later due to alcoholism, was met with joy by many people. A British journalist wrote that America was made "cleaner" by the absence of McCarthy. On the other hand, the ultraconservative John Birch Society moved its headquarters to Appleton, Wisconsin, where McCarthy is buried, to pay homage to him.

Some scholars have tried to redeem McCarthy posthumously by pointing out that documents made public after the dissolution of the Soviet Union in 1991 have indicated that there were a number of communists in U.S. government positions in the 1950s, and they insist that activities of the Communist Party of the United States were financed by the Communist Party of the Soviet Union.

McKelvey, Richard

Richard McKelvey (1944–2002) was an American political scientist whose ideas influenced statistical methodology, game theory, coalitions, political information, behavioral economics, and the study of voting. Generally, he is best known for work that clarifies essential properties of democratic institutions. He received his degrees from Oberlin College, Washington University in St. Louis, and the University of Rochester. He taught at the University of Rochester and Carnegie-Mellon University before spending the majority of his career at the California Institute of Technology, where he was the Edie and Lew Wasserman Professor. He was a fellow of the American Academy of Arts and Sciences, the Econometric Society, and the National Academy of Sciences.

McKelvey's work on majority decision making was of particular note. It was part of a broader attempt to understand the relationship between which policy outcomes individual voters want and which policy outcomes voting majorities choose. An early result, Scottish economist Duncan Black's 1948 median voter theorem, identified a stable relationship between individual preferences and majority-preferred outcomes. Such stability matters, because without it, the concept of "majority will" has little or no meaning. Subsequent studies showed that majority decision-making produces stability only under very restrictive conditions. McKelvey's work clarified how individual preferences can relate to majority-preferred outcomes when these conditions are not satisfied. He proved that voting agendas (rules that specify the order in which alternatives are voted on) exist such that majority decision making can produce almost any imaginable policy outcome from almost any imaginable set of preferences. This insight helped political scientists appreciate the importance of institutions—particularly those concerning control of voting agendas.

In the mid-1980s, McKelvey and Peter Ordeshook examined how limits in voter information affect popular elections. They developed a model in which voters knew little about candidates for office, and candidates knew little about what voters wanted. In one version of the model, interest groups knew what the voters wanted and where the candidates stood. McKelvey and Ordeshook identified conditions under which candidate endorsements by these groups provided enough information to allow candidates to choose policies preferred by the median voter (i.e., a voting majority) and allow voters to vote as if they knew the candidates' positions. Experiments showed that interest group endorsements had the effects that their model predicted.

During the 1990s, McKelvey and Thomas Palfrey studied the "centipede game," in which two people divide a growing sum of money. The game has exactly one *Nash equilibrium* (defined as a set of strategies such that, once played, give no one any incentive to change his or her strategy). In actual play, however, few people choose these strategies. McKelvey and Palfrey discovered an alternate logic that explains how many people play the game. It entails a seemingly small, but well-defined, deviation from pure rationality. Typically, game

theory supposes that each player assumes that all other players are purely rational. McKelvey and Palfrey asked what would happen if players believed that there was at least a small probability that other players would *not* play purely rationally—a seemingly reasonable assumption given that virtually everyone actually does not do so. With this slight exception to pure rationality, they were able to develop a new equilibrium concept (*quantal response equilibrium*) that flowed from these newly modified assumptions and that fit the data they got from observing people actually playing the centipede game. This concept became foundational in behavioral economics.

Measurement Theory

Measurement—defined as the process of assigning numbers to objects in meaningful ways—is fundamental to the process of testing scientific theories. Measurement theory considers (1) the conditions under which such numerical assignments are possible, (2) procedures for making these assignments, and (3) appropriate interpretation of the resultant numbers, after the assignments have been made.

The first component involves establishing a one-to-one correspondence between objects in an empirical set and a subset of the real number system, such that differences between the numbers correspond to substantive differences in some attribute of the objects. The second component involves the scaling procedures (e.g., summated ratings, factor analysis, ideal point models, etc.) that are actually used to assign numbers to objects. The third component involves the levels (or "scales") of measurement (e.g., nominal, ordinal, interval, or ratio), as well as the validity (do the measurement values correspond to the attribute they are intended to represent?) and reliability (to what extent are the measurements affected by random errors?) of the measured values. In the social and behavioral sciences, measurement theory developed because of the need to measure attributes of objects that are not immediately quantifiable (e.g., attitudes, ideology, political involvement, power, status, etc.).

Media, Political Commentary in the

Political commentary, prior to the mass media age, was predominantly the preserve of poets and philosophers. Once the industrial age created the market and the means for mass communication, the demands of poetry on the reader led to it becoming increasingly marginalized.

For most of its existence, the term *mass media* was synonymous with newspaper coverage; newspapers traditionally offered commentary through their editorials. Newspapers were expensive businesses with generally limited commercial potential, so it was common for rich families, who enjoyed influencing political affairs through the manipulation of mass opinion, to own them. William Randolph Hearst, for example, initially tried to speak for the common man; he engaged in investigative reporting that uncovered municipal corruption and the vices of the rich and famous. Eventually, however, he fell to promoting the 1898 U.S. war with Spain, as well as his girlfriend's meager acting talents, which caused him to try to silence Orson Welles in the process. Less interfering proprietors, however, continued to act as gatekeepers, or interpreters of news, for their publics.

This bottleneck of editorial approval remained in place through the development of radio. The advent of television did little to alleviate it, although perhaps more power was given to legal departments to filter stories with potential liability for the networks. Television producers initially called upon public intellectuals from religious, academic or community institutions to comment on matters of public interest. These figures were presumed to be disinterested observers who spoke out of a sense of public duty. Unlike radio, however, television was a visual medium, and talking heads did not make for entertaining television.

The problem was compounded by the rise of twenty-four-hour news outlets, which unwittingly initiated opinionated, rather than ethical and insightful, cable news programming centered on controversial political commentators whose mandate was less about fairness and balance than it was about creating a sense of outrage in the viewer. Bill O'Reilly's *The O'Reilly Factor* is credited with starting this trend, and his show remains one of the most popular. According to results of a Pew Research Center survey (Pew Research Center 2007), 21 percent of Americans aged 18 to 29 turned to fake news outlets such as *The Daily Show* for news of the 2004 presidential campaign, while only 23 percent watched the networks.

The second problem was that, constrained by the imperative that the viewer not change channels, the already-narrow

window for in-depth commentary and analysis has become reduced as the news networks are pressed to entertain rather than inform. This created a demand for spokespersons who could be relied upon to provide a controversial sound bite in under a minute so that the news programs could return to more entertaining pictorial coverage. News editors discovered that authorities had trouble discussing complex political problems coherently in the time allowed, so programs gradually replaced them with professional pundits.

Despite several seismic shifts in technology, relatively few political commentators have interpreted the way in which citizens access the news media. However, with the advent of the Internet, exponentially more informed and unfiltered commentators have the opportunity to inform an engaged and growing audience on matters of specific interest to them. The true breakthrough in reviving the art of political commentary came with specialized blogs. Experts began to blog on their fields, and television news programs started to feature stories that broke on blogs. This practice, while it attracted a younger audience, threatened the networks' relevance.

Troubling as these issues are for Western democracy, the issues surrounding media in the developing world are of a completely different order. The historical foundation of the print-based culture of the West has been overlooked in much of the developing world, as illiteracy and the problems of rural isolation have combined to make radio the axiomatic medium for millions of people. In addition to relaying news and current events, radio is even used to teach literacy in eighteen developing countries in Latin America, the Middle East, Africa, and Australia (Bates 2005, 117).

More disturbing than the choice of medium is the fact that supplying the material to fuel it is an increasingly dangerous occupation. In the decade prior to 2007, the International News Safety Institute recorded 1,100 journalists killed on the job, with Iraq reported as the most dangerous places for a journalist to work, followed by Russia and Colombia (Clarke 2007). Despite the importance Western democracies place on the delivery of timely and unbiased information, the democratizing power of fearless and unbiased media in the developing world is underappreciated in the West and consequently poorly funded. UNESCO's International Programme for the Development of Communication (IPDC) is the only United Nations division to promote media access in developing countries, and it rarely donates more than $1 million per year across 137 countries (UNESCO 2005)

Media and Politics

This article first defines the media in the context of the rapidly changing contemporary environment and then reviews fundamental dynamics of media and politics within the framework of a three-way relationship among the media, politicians/government, and the public, paying attention to differences across political and media systems. It then briefly discusses key changes in the international media environment.

DEFINING MEDIA

At the outset it is important to realize that media systems vary across countries and political systems. Media are very much creatures of their political environment, taking on different characteristics in each society according to the development of literacy and other conditions that create markets for their products, the degree to which journalism has become professionalized in the society, the degree of political polarization within the society, and the degree of formal autonomy from government granted in that society. We therefore cannot easily generalize about the media's role in politics across different political systems.

The situation in the United States, where the fragmented structure of the political system requires politicians to win favorable attention from the mass media if they want to bring about major policy change, differs significantly from the situation in Russia, where political power is more concentrated and the media are not fully autonomous from the government, and it differs still more from the situation in North Korea, whose media have long ranked among the least independent in the world. Even across democratic political systems, we find substantial differences in, for example, media partisanship: While Americans typically expect news to be objective and nonpartisan, the citizens of many other democracies, from Great Britain to the Scandinavian to the Mediterranean states, are accustomed to news outlets that are openly partisan. This essay focuses primarily on the media's role in liberal democratic systems, especially the United States, while adding examples from other systems where relevant; we then explore the role of the increasingly globalized media industry—and its regional challengers in some parts of the world—in the international arena.

Defining the media has become rather complicated in an era when newspapers, magazines, radio, and broadcast television all compete with twenty-four-hour cable television and the Internet for the limited attention of the general public. Media can be defined as organizations that control the means of mass communication. In the United States, these organizations are mostly for-profit businesses; in other industrialized countries, fully or partially government-owned-and-operated media are more common, often operating alongside profit-oriented media. In

President Franklin D. Roosevelt spoke to the nation via "fireside chats" during the Great Depression to bolster public confidence in a difficult economic period. Reaching out to voters through the media, which today includes the Internet, plays an important role in political campaigns and elections.

SOURCE: The Granger Collection, New York

other words, "the media" are those who own and/or operate the technologies—the printing presses, airwave channels, cable networks—by which a society communicates with itself and with the rest of the world. This definition extends beyond the leading, mainstream media to cable networks and television shows that target particular audiences and subpopulations (such as Univision and Telemundo, the two largest Spanish-language networks in the United States) and to the millions of political websites on the Internet, some of which (those that tend to have the largest audiences) are owned and operated by the same corporations that dominate the mainstream media, and many more of which (with generally smaller audiences) are more individualized and user generated.

In democratic societies, the mass media carry a broad variety of political messages and information, ranging from news that is ostensibly independent of particular politicians to political advertising created by candidates, their opponents, political parties, and independent political groups. Thus, the media's role in politics also varies in terms of the types of

political messages the various media feature. When they produce independent political journalism and commentary, the media play a different role in politics than when they simply serve as a platform for various political actors' direct appeals to the public through political advertising or free air time for political speeches and events.

"News" has also become somewhat difficult to define. The lines between hard news and entertainment have blurred considerably over the past three decades, as economic pressures and audience changes have reduced the amount of airtime/space devoted to traditional hard news about elections and policy issues and increased coverage of "soft" news issues such as crime, health, and other human interest stories. The multiplication of media outlets, especially due to the development of cable television and the Internet, has fragmented the mass media audience so that various segments of the public are exposed to very different levels of political information. During U.S. elections, for example, elite newspapers like *The New York Times* carry a heavy dose of political news every day

but have a small national audience, while the evening network news has a much larger audience that sees less political news, and many local television news programs—the main source of news for many Americans—offer very little election news at all. In Great Britain, the publicly funded channel BBC One, which features high-quality reporting on public affairs, is a leading source of news, although the audience for the "broadsheet" newspapers and their serious news content is much smaller.

Meanwhile, competing sources of political news have arisen that challenge both the definition of news and the top-down, journalist-controlled method of producing it. Political websites and blogs (frequently updated interactive Web sites, often maintained by nonjournalists) and soft news TV shows such as *Entertainment Tonight* and *Access Hollywood,* now play an influential role in how citizens think about public policy and world affairs, while comedy and talk shows offer an alternative way for citizens to engage in politics. A significant number of young people in particular encounter politics through Internet-based social networking sites and on user-controlled media such as YouTube, where people can post everything from a candidate gaffe captured on their cell phones to professional-looking "ads" for their favorite candidates. The traditional media have responded in a variety of ways to the rise of user-controlled media. In Great Britain, for example, the BBC launched *iPM,* a version of its flagship radio program in which viewers were asked to "shape what you know" by determining the order of items on the program. At the same time, politicians in some countries are using entertainment formats to advance their political agendas. Venezuela's Hugo Chávez, for example, stars in his own weekly television program, *Aló Presidente* (Hello, President), in which he explains his government's policies, publicly embarrasses his critics, and even serenades his audience.

Thinking about the role of the media in politics therefore requires us to think in broad terms. *Media* is a plural noun that encompasses a wide array of organizations and individuals producing a wide array of content—some politically substantive, some less so, but all potentially affecting how citizens think about and engage with politics.

THE MEDIA, CITIZENS, AND GOVERNMENT IN ELECTIONS AND GOVERNING

To understand the role of the media in politics, it is useful to place that vast array of media organizations in the framework of a three-way relationship with the public and political leaders. During elections and during the course of day-to-day governing in today's industrialized democracies, the flow of most political communication passes through the mass media. A crucial question is the degree to which the media themselves make decisions about which stories and issues to cover and how to cover them. In liberal democracies, given the relative autonomy of the press from the government, the media become a filter through which most consequential political messages pass and an active mediator between the public and

political leaders. In authoritarian systems in which there is little meaningful media autonomy, the media are less a filter and more a megaphone for political leaders' policies, priorities, and pronouncements. These generalizations, however, gloss over the ways in which media organizations in authoritarian regimes may subtly seek to undermine the government's message (an interesting example is al-Jazeera, the Qatar-based network that has enraged authoritarian governments in the Arab world); such generalizations may also overlook the degree to which the media in liberal democracies may simply pass along government messages without much critical scrutiny.

In democracies in particular, the media's central position between the government and the public has important consequences for both elections and governing. During elections, the media play a central role in what voters learn about campaign issues and the candidates, who make their case to the voters primarily via the mass media, either through political advertising or by gaining news coverage (known inside the business as "earned" media). Indeed, the political consulting industry has grown dramatically in democracies around the world over the past two decades, as political leaders have had to learn how to communicate effectively via the mass media to voters. (Perhaps not coincidentally, voter disaffection with politics is on the rise around the world as well.)

The role of media in voter choice may not be as direct and powerful as is sometimes assumed, however. Decades of research have shown that in many cases, the main impact of media on voter choice is to reinforce people's preexisting attitudes rather than to change them. Very few voters with firm partisan commitments will be lured across party lines to vote for the candidate of the opposing party simply on the basis of exposure to political ads or election news. Rather, to the degree that they pay attention to politics, those voters' voting intentions will tend to be reinforced during the course of a campaign, because they will more readily accept congenial political messages while rejecting messages from the opposing side. This dynamic seems especially likely in countries like Great Britain and France, where the press is highly partisan, and voters often turn to news outlets that match their own political predispositions, thus making persuasion across party lines even less likely (a situation that some scholars argue increasingly pertains to the United States as well).

Thus the main *persuasive* impact of political ads and election news tends to be limited to that relatively small group of voters who pay attention to politics but lack partisan roots—the so-called swing voter. This media impact should not be dismissed, however. In many recent U.S. presidential elections, the margin of victory of the winning candidate has been relatively small, increasing the importance of swing voters and thus of persuasive messages in the media. Moreover, the media's role in helping candidates to *mobilize* their likely voters—getting voters interested and excited enough to turn out to vote—should not be underestimated.

The media play other important roles during elections, particularly in political systems like those of the United States in which campaign contributions play a vital role. Candidates

who win media coverage gain greater name recognition with the public—and thus improve their ability to raise campaign funds. The reverse also holds true: Candidates who cannot generate sustained media attention are unlikely to rank high in the opinion polls that help determine whether contributors will give them money. The tone, and not simply the amount, of media coverage is also important, since candidates who receive consistent, highly negative media coverage would be unlikely to gain broad voter support. Yet in this respect as well, the media's role in elections may not be simple. Indeed, in many U.S. presidential elections, the candidates who win the most media coverage are also subjected to increasing amounts of critical coverage as election day approaches. U.S. senator Barack Obama managed to buck this trend to some extent in the election of 2008—he was one of very few recent candidates to win generally positive news coverage throughout the election. But often, the winning candidate wins *despite* news coverage that is rather negative.

Ultimately, one of the most important implications of the media's role in contemporary elections is that the media can set the agenda of an election by determining which issues and candidate attributes will receive the most attention. In liberal democracies, the news media are expected to question and investigate candidates on behalf of the public, serving as the public's proxy in vetting the candidates and their policy positions. In reality, the issues and character attributes that dominate news coverage are largely determined by the media's professional and economic incentives. As competition among news outlets increases, news organizations need good *stories* that will draw the attention of an increasingly fragmented and distracted audience. Consequently, campaign news may be dominated by "horse race" coverage that focuses on who is winning and losing more than on complicated policy issues, and "character" coverage that focuses on candidates' personalities and campaign gaffes. In the United States, where voters' partisan attachments have become particularly weak and the political parties have decentralized the process of selecting presidential candidates, the media have become so central to elections that, it is often said, the road to the White House leads through the newsroom. Media-centered politics are not quite as pronounced in democracies in which political parties play a more meaningful role in structuring voter choice. One result of media-centered elections may be impoverished voter decision making. Ironically, media-centric elections may make it harder for voters to gain the substantive information that theorists of democracy often assume.

KEY MEDIA DYNAMICS

In the context of daily governing, we again find the media in a central position. In virtually all political systems, the general public will not learn about most of what the government does unless they learn of it through the media. In the United States, where there are no government-owned and government-controlled media whose job it is to disseminate governmental messages unfiltered, those in government who want to raise awareness about a public problem or mobilize public support for a new piece of legislation, or to defeat legislation, must win favorable media attention for their cause—no small feat in an era when most media organizations pay less and less attention to politics. Moreover, the American system of checks and balances, relatively weak political parties, and divisions of power among federal- and state-level institutions makes the media crucial to most major policy initiatives.

Conversely, the media may also communicate the public's views to political leaders. Thinking back to the three-way relationship proposed above, the media mediate communication traveling both down from government to the public and up from the public to government. Much of what politicians know about public opinion they learn through the media, especially through public opinion polls that the media conduct and/or report. Many of the same U.S. news organizations that transmit political news to the public also query the public on its views through public opinion polls (e.g., the CBS News/*New York Times* poll and the *Washington Post*/ABC News poll). Here again, the media's power to filter and shape political discourse must be noted, for media polls often reflect the issue agendas that the media themselves help to define.

Nevertheless, in most political systems, the primary direction of communication is from government through the media to the public. In authoritarian systems with little media autonomy, this process is rather direct. In more democratic political systems, political leaders must set the agenda by focusing public attention and political energy on the issues they want to address. To the degree that the media are autonomous from government, a crucial dynamic of media and politics arises, as various leaders and groups vie to win attention and support for their preferred policy agendas. While research shows that in many countries officials are the leading sources quoted in the news, the competition may extend to other political actors—interest groups, social movements, and activists—whose path to political influence also runs through the newsroom.

Research also shows that the public's sense of the important issues needing attention is significantly influenced (though not entirely determined) by media coverage. The public's agenda, in other words, reflects the issues portrayed most prominently in the news. Issues gaining heavy media coverage are also the issues most likely to influence how people evaluate their elected leaders. The first president Bush, for example, learned this law of media and politics when his public approval ratings dropped from historic highs when the first Gulf War (1990–1991) was the most prominent news story to lows in the mid-30 percent range once the war was concluded, and an economic recession became the main news story. As this example suggests, an additional challenge for elected leaders is to guide the media toward the issues that reflect best upon those leaders.

Another challenge for all those who would influence the news (during elections as well as in the course of governing) is to frame the issues to highlight particular attributes and concerns. The concept of framing is used to talk about how news stories emphasize or deemphasize different aspects of the reality they report on. Experimental research

has demonstrated that news frames can influence how people think about problems like terrorism, poverty, and racial inequality—for example, whether they view these primarily as problems of individual behavior or as problems affected and solved by governmental intervention. As with all media effects, however, framing effects are partial and contingent, and other research has shown that the public does not always adopt the frames emphasized in the news.

In most political systems, the frames found most often in the news are those put forth by political officials. One study of news coverage of conflicts in the Middle East, for example, concluded that Israeli political officials enjoy a metaphorical "royal gate" into the news arena, which gives them advantages over other groups that compete to enter the arena and frame the conflict. Even though in liberal democracies the media are formally independent from government, the media tend to follow the lead of high officials and limit news frames to those that elites are discussing and debating, particularly when covering matters concerning national security. Scholars call this dynamic, in which reporters tie the topics and slant of their stories to the views expressed by high political officials, "indexing."

Another powerful determinant of news framing of international conflicts is nationalism. We can see both indexing and nationalism at work in the differing coverage of the vexing issue of torture that arose during the war in Iraq (2003–). While many U.S. news outlets were hesitant to openly challenge the Bush administration's claims about the U.S. military's treatment of prisoners at Abu Ghraib, Guantanamo Bay, and other detention facilities, news coverage in European countries was routinely more critical. These examples remind us that across a variety of political systems, the media can be a powerful conduit of official messages and a key shaper of public perceptions of one's country and the world.

GLOBALIZED MEDIA AND INTERNATIONAL POLITICS

We cannot discuss the role of media in politics without also considering how the media matter in the international arena. In an era of globalization, in which national boundaries are less meaningful and the very concept of the nation-state seems in decline, the rise of global media conglomerates (most of which are Western owned) is significant. Indeed, these media conglomerates are often accused of colonizing local cultures, spreading (or imposing) Western political and cultural values, and subjecting the rest of the world to their "Western gaze." At the same time, the rise of nearly instantaneous global communication has profoundly impacted political decision making in the international arena, leading some to fear a "CNN effect" in which the hand of government is forced by media coverage of dramatic and disturbing events abroad. (The examples of U.S. interventions in Somalia and Yugoslavia in the 1990s are often given.) While research suggests that government policy has not followed media coverage in so simplistic a fashion, it is nevertheless true that citizens around the world, thanks to media technologies, are much more aware of one another's

plights than ever before, and governments must make decisions more quickly and deliberate less. (As former British prime minister Tony Blair once observed, leaders must now respond to international events "in real time.")

At the same time, old boundaries remain, especially around how national media cover their countries' perspectives on and involvement in international conflicts. Studies show that the U.S. media largely covered the initial phase of the U.S.-led war in Iraq (2003–) from a relatively uncritical perspective, focusing on the advancement of U.S. troops and the fall of Saddam Hussein. U.S. news coverage was considerably more favorable toward the war effort than were the German and British media, while Arab networks like al-Jazeera showed much more graphic imagery of civilian casualties and aired much more extensive criticism of the war.

Media Bias

Media bias is a tendency, subtle or overt, to advantage or over-expose one perspective (or selected person or point of view) when reporting any event, issue or debate, and/or to neglect

the other side. Media biases exist as well whenever journalists provide misguiding or incomplete coverage that can lead viewers or readers to a distorted conclusion, such as introducing some common clichés into evocative formulations that can automatically lead to a predictable conclusion.

In most western societies, the principle of objectivity in journalism implies providing a diversity of viewpoints, mixed sources of information, and a variety of perspectives to give a balanced view on current news, ongoing issues, election campaigns, and history. This postulate, frequently heard in democratic states, possibly finds its idealized origins in the agora of Ancient Greece, where free citizens could debate and be exposed to viewpoints other than their own. On the opposite side, media in totalitarian regimes (often under governmental control) tend to generate only one perspective or present the opposing views as without merit.

Media bias occurs whenever a medium tends to unfairly advantage one side of any topic, issue, or debate, either by offering unbalanced exposure or by retaining only the more positive comments from "neutral" experts or commentators. Apart from letters to the editor, editorials, some sport commentary, and some columns where writers may (and should) express their own views and opinions, general news coverage is expected to be neutral, so the audience can decide which perspective to adopt or reject.

MEDIA THEORIES

Like public opinion, the phenomenon of media bias is studied by sociologists, political scientists, strategists, political marketers, historians, and media experts. In their classic *German Ideology* (1846), political theorists Karl Marx and Friedrich Engels demonstrated that the thoughts and beliefs of the dominating class were imposed on the whole society through the dominant class's control over the production and distribution of news media. In this scheme, the perspective of the dominants was presented as representing the common good and therefore was proposed to become the ideology shared by a majority.

However, some non-Marxian observers argued that the media and journalists were often independent and free and therefore unlinked with the state. French philosopher Louis Althusser responded to this objection in his famous 1970 article "Ideology and Ideological State Apparatuses" by demonstrating that even within the independent media, the elites who controlled the main media belonged to the same upper class as the rulers of the state. Thus, both elites (the rulers of the state and the media) had the same values, beliefs, and worldview; this dynamic was coined the "ideological state apparatus." Pursuing his critique of the Western world, Althusser believed that although educators do not belong to the ruling class, they also contributed in an unconscious way to reproduce the same dominant scheme. Noam Chomsky and Edward S. Herman adopted similar arguments in their 1988 book *Manufacturing Consent: The Political Economy of the Mass*. As adherents of the "Frankfurt school" and continuing in the tradition of Marx and Engels, German theoreticians Max Horkheimer

and Theodor Adorno studied the propaganda and media bias that occurred during World War II (1939–1945). Using a neo-Marxist approach while working in Chile during the 1970s, scholars Ariel Dorfman and Armand Mattelart have demonstrated in their research "How to Read Donald Duck" that the local Chilean newspapers carried a procapitalist ideology, even in the daily Disney comic strips.

French sociologist Pierre Bourdieu wrote many books about media bias, criticizing the dominating position of speakers on television shows who control questions, time limits dedicated to each guests' answers, and even who is invited to the show. Incidentally, political leaders can use a comparable selection process during press conferences. In his 1987 book *Distinction*, Bourdieu demonstrated that average readers of any newspaper were more or less buying a collection of opinions that corresponded to their own opinions and position in society; for instance, a liberal thinker would likely select a left-wing daily, while a right-wing citizen would read a right-wing newspaper. In France, some respected newspapers have a political trend that their journalists clearly acknowledge: *Le Figaro* is more right wing and *Libération* is left wing, while *Humanité* is linked with the French Communists. The monthly *Le Monde Diplomatique* is obsessively anti-American.

In *The News Shapers: The Sources Who Explain the News* (1992), American scholar Lawrence Soley states that if journalists in search of objectivity always use the same reliable sources, they will reproduce the status quo; however, varying the sources of information used in reporting will bring a healthy critique of the legitimized institutions in any society.

NEW MEDIA AND THE INTERNET

Although alternative media are less cohesive and grounded than other media, they can sometimes be a source of diverging opinions, contestations, and debates. With the Internet, citizens have more access to diversified points of view, but blogs can sometimes contain unreliable information or misinformation. By definition, blogs are not made to be neutral or comprehensive: Some writers of blogs are in reality partisans disguised as journalists.

UNDERSTANDING MEDIA BIAS

An easy way to observe media bias would be to observe occurrences of anti-Americanism in foreign newspapers and television. Analysts can study whether the bias is generalized or targeted only to specific issues, themes, people, or nations. A recurrent "anti" trend is common to biased media; an example is anti-Zionism in many Arab media. Elsewhere, Canadians often feel the U.S. Fox television network is recurrently satirical toward Canada.

In rare occasions, media bias can exist simultaneously in many media that do not belong to the same group: In his 2002 work, *The Black Book of English Canada*, Canadian journalist Normand Lester provided a critique of the current and sometimes not so subtle Quebec-bashing (toward French Canadian communities) frequently appearing in many English Canadian newspapers, showing that journalists can sometimes be aware of an ongoing bias within their own profession.

MEDIA BIAS IN SCIENCE

The media coverage of issues related to bioethics, science, and technologies can sometimes become debated and biased. Because most journalists are not experts or scientists themselves, they frequently rely on experts' opinions, although scientists do not always agree one with another and usually work with hypotheses rather than theories. Therefore, facts, data, and diverging opinions of scientists are often summarized and transformed into stories during the reporting. Another risk of media bias occurs whenever journalists consult and rely on the same experts for any given issue: a familiar activist for environmental issues, a retired politician for current affairs, and so forth.

Degrees are not essential for being recognized as an expert; when using strategy and rhetoric, celebrities and some politicians can adopt a cause related to science and the environment, even if the issue appears to be in the middle of a larger debate among scientists and within civil society. For instance, millions of viewers watched former vice president Al Gore in his 2006 documentary *An Inconvenient Truth*, in which he disqualified his opponents by labeling them as "so-called skeptics" questioning the scientific "truth," ending the debate between two divergent perspectives related to climate change.

In partisan politics and especially during election campaigns, it becomes difficult to give appropriate measure to minor events or out-of-context reflections made by candidates, as the media can amplify an anecdote to bigger proportions. The overdramatization of casualties, excessive negativity, and transformation of single, isolated events into scandals are also forms (or symptoms) of media bias, especially during periods of slow news.

Media Effect

A media effect is a way in which the content presented by the mass media influences the interest, knowledge, attitudes, beliefs, or behaviors of an individual regarding politics. Early theories suggested that media had what was called a "hypodermic needle" effect on individuals; that is, they immediately and uncritically accepted information presented in the media. Subsequent research in the United States focusing on vote choice and the decision to vote found that media have minimal effects on political behavior. Later research broadened the concept of the media effect to more subtle influences on the political opinions of the individual and found that media have conditional effects on individuals, depending on individual characteristics. Three widely recognized political effects of mass media on individuals are framing, priming, and agenda setting.

Other recent studies have found the media effects approach too narrow, because it focuses on effects of particular outlets or stories and because it attributes too much power to the individual. The recent studies have focused more on the overall media environment created by institutions, and individuals have less power than was previously assumed to choose the media content to which they expose themselves. Though disputes remain over theory and methods in studying media effects, the approach to the study of politics and media has been a fruitful area of research in political science.

Megacities

A megacity is a large urban agglomeration with ten million or more inhabitants, according to the United Nations (UN) definition. The term was first coined by the UN in the 1970s to designate agglomerations with eight million or more inhabitants, a threshold raised to ten million in the 1990s. *Megalopolis* and *megapolis* are two other terms often used to describe this same urban form. Despite the increase in the number of megacities over the past several decades, the proportion of the world's population living in these urban agglomerations continues to be small: In 2007, megacities accounted for only about 4 percent of the total world population and for 9 percent of the world urban population; for 2025, the UN predicts that they will account for around 10 percent of the world urban population (see Table 1).

Megacities have high population densities but are not presently among the fastest growing cities in the world, and in the future, the UN prospects point to a slowdown in the growth of the major megacities, both in developed and less-developed world regions. They have a spatial pattern defined, in the case of metropolitan areas, by a highly dense core surrounded by external and sprawling suburbs, or by several highly dense centers in the case of conurbations. In developing countries, megacities also have extensive informal structures (e.g., infrastructures,

housing) with the corresponding high levels of poverty and social fragmentation.

Besides this demographic and spatial quantitative dimension—responsible for new social, economic, and environmental challenges and different from city to city and from country to country—a megacity is also a new form of urban socialization in the twenty-first century and an important economic engine in both developed and developing countries. These challenges are associated with physical degradation, social problems, economic decline, environmental risks, lack of appropriate legal instruments to control the rapid urbanization process, and a huge demand for housing and urban public services—which, in many cases, national and local governments are unable to provide. Megacities require, from national and local governments, new approaches and new instruments in the field of urban planning and in urban politics more generally.

Table 2 shows the two UN-identified megacities that existed in 1950 (New York and Tokyo) as well as the three in 1975 (Tokyo, New York, and Mexico City), eighteen in 2000, and nineteen in 2007, of which eleven are capitals of their countries. Asia has eleven megacities, Latin America four, North America two, and Africa and Europe one each. For 2025, besides these nineteen, the UN listed, in its 2008 World Urbanization Prospects, eight new megacities: five in Asia, two in Africa, and one in Europe (Jakarta, Guangzhou, Lahore, Shenzhen, Chennai, Kinshasa, Lagos, and Paris).

Menshevism

Menshevism refers to the beliefs of the Mensheviks, a Marxist faction that emerged in the Russian Social Democratic Labor Party (RSDLP) in 1903. Menesheviks are often portrayed as more moderate than the rival Bolshevik faction, but they were unable to play an important role in the politics of revolutionary Russia.

Menshevism dates to the second congress of the RSDLP in 1903. One prominent member of the party, Vladimir Lenin, argued for a more centralized and disciplined party, whereas others, including Lenin's former colleagues Julius Martov

and Pavel Axelrod, favored a more decentralized, inclusive approach. Lenin's faction, through a series of political maneuvers, gained a majority in elections to the party's leading bodies, thus becoming the Bolsheviks (from *bol'shinstvo,* the Russian word for majority), whereas Martov and his allies become the Mensheviks (from *men'shenstvo,* the Russian word for minority).

Further differences between the two factions developed over time. In 1905, during revolutionary upheaval in Russia, the Mensheviks supported the idea that the working class could and should make alliances with the bourgeoisie to help produce revolutionary change in Russia. The Bolsheviks, in contrast, argued that the workers and peasants should be the leaders of the revolution and that they should establish a revolutionary dictatorship of the peasantry and proletariat. While Lenin's arguments appealed to many because they foresaw an immediate communist revolution, adherents of Menshevism argued that the working class in Russia was too small to lead any revolution and that, following Marx, communism could only be established after Russia experienced bourgeoisie democracy. In judging the disputes between the Bolsheviks and Mensheviks, many believe the Mensheviks represent the more orthodox interpretation of Marx. Prominent figures such as Grigorii Plekhanov and Leon Trotsky joined the Mensheviks.

Many Mensheviks left the RSDLP altogether after the failures of 1905 and joined legal opposition organizations. Lenin accused them of destroying the party, and in 1912 he formed the Bolsheviks as a separate party. The Mensheviks did the same, but in 1914 the Mensheviks split over whether to support Russia's involvement in World War I (1914–1918). Trotsky assumed leadership of the antiwar, internationalist faction of the Mensheviks in the Russian exile community.

After the overthrow of the tsar in February 1917, the Mensheviks, led by Irakli Tsereteli, demanded that the government pursue a "fair peace without annexations" but in the meantime supported the war effort under the slogan of "defense of the revolution." Along with the other major Russian socialist party, the Socialist Revolutionaries, the Mensheviks led, throughout most of 1917, the emerging network of *soviet*s (worker councils), notably the Petrograd Soviet in the capital. Whereas some argued for a reunification of the Mensheviks and Bolsheviks, Lenin scrapped this idea upon his return to Russia in April 1917, when he took a more radical, antiwar position and refused to cooperate with the Russian provisional government. After the collapse of the first provisional government in May 1917, Tsereteli convinced the Mensheviks—over the objections of Martov who had returned from exile—to strengthen the government for the sake of a socialist-liberal coalition with Socialist Revolutionaries and liberal Constitutional Democrats. One of many socialist groups in Russia at that time, the Mensheviks had at least one representative in the provisional government until it was overthrown by the Bolsheviks in November 1917. However, the party, subject to a variety of internal struggles, was weak, winning only 3 percent of the vote to a constituent assembly in the November 1917 elections.

The Mensheviks condemned the Bolshevik seizure of power as an illegal coup d'etat, and the Bolsheviks refused to share power with the Mensheviks, dismissing the elected constituent assembly in 1918. Martov, however, did offer support for the Bolsheviks in 1918 as the Russian Civil War (1917–1923) began. The Mensheviks remained a small faction in Russia, gaining prominence in the region of Georgia, where they won over 80 percent of the vote in the 1919 elections. After the Bolsheviks occupied Georgia in 1921, many Menshevik leaders fled the country, setting up a government in exile in France. In 1930, Noe Ramishvili, one of the leaders of Georgian Mensheviks, was assassinated by a Soviet spy in Paris.

Menshevism was finally made illegal after the Kronstadt Uprising of 1921, although the Mensheviks themselves took no part in it. Many prominent Russian Mensheviks emigrated, eventually setting up a Menshevik newspaper, the *Socialist Messenger,* in New York, which published until 1965.

Mercantilism

Mercantilism is an economic theory of strict government control of trade that dominated the thought of the major trading nations from approximately 1500 CE to the end of the seventeenth century. European countries, in particular, enforced a strict mercantilist system of foreign trade. The basic tenet of mercantilism was that national power and wealth were best achieved by exporting more than was imported and through the subsequent accumulation of bullion.

As a consequence of the Renaissance, the medieval, feudal society in Western Europe was deteriorating in the sixteenth century and being superseded by mercantilism (especially in England, France, and Holland). Medieval, feudal institutions were destabilized by the escalating use of money and by greater dependence on trade within the economy. Whereas kings had formerly relied upon nobles, they became increasingly dependent upon the bourgeoisie and nation-states to support them. Kings hired armies and navies to maintain peace and order, which led to greater prosperity and the continual growth of nationalism.

TRADE AND GOLD ACCUMULATION

Growth in travel during this period led inevitably to more capital for financing commerce and trade. Ship captains had

improved navigational ability due to new inventions and were safer due to improved vessel design and construction. The surplus of goods transported across the Mediterranean Sea increased wealth and the production of even more goods, as commercial centers were developed. Mercantilist thought gave prominence to the construction of export centers, developing the power of national states. Export became increasingly important, since a steady supply of exported goods would result in increased accumulation of gold and silver. Whereas the accumulation of gold had previously been viewed as a sign of covetousness (one of the so-called seven deadly sins), gold and silver were now positively regarded as the means to wealth and national power. The mercantilist position was "foreign trade produces riches; riches power; power preserves our trade and religion."

If mercantilists were to acquire gold and silver, which would maintain national power and also allow safeguarding of one's religion, it was absolutely necessary for national states to trade. The commercial and religious wars of this era demanded large revenues to finance armies and the escalating expenditures of civil government. Moreover, as the Protestant Reformation challenged the role and teaching of the Catholic Church, the civil role of the state expanded. Eventually, religious disturbances and desire for religious freedom would result in explorers seeking settlement in the New World.

Mercantilism was endorsed by the new nation-states, and the mercantilist nations were impressed by the universal demand for precious metals, especially gold, as the means for obtaining other commodities. Accumulating bullion and making large investments in trade supported mercantile theory and was an aspect of the new politics in the rise of the nation-state. Mercantilist nations began establishing colonies (which they exploited) and trading posts for the benefit of the mother country, since the settlements could provide raw materials for domestic manufacturing that would otherwise have required importation from other countries. The settlements in turn needed manufactured goods, which encouraged ongoing exchange. Kings were ardent supporters of mercantilist theory, and governments supported exploration of the New World as a means of further augmenting the mother country. Ships bearing the flag of the mother country (encouraging monopolization of colonial trade) could transport goods.

CHILD LABOR AND ENTREPRENEURIALISM

Mercantilists desired a sizeable number of low-wage laborers, including children, to manufacture exports. Even children as young as age four were sent to workhouses for a mere two hours of teaching, only to exhaust the remainder of the day working according to their ability, age, and strength.

Governments also wanted powerful entrepreneurs, or firms, traveling to foreign countries and exporting goods. To facilitate these entrepreneurial firms, the government would grant special favors. The firms were essential for acting upon existing opportunities, creating new opportunities, and creating innovation in the market. The accumulation of gold was the determining factor for financing future trade enterprises and allowing companies to borrow money. If there were a lack of credit, then companies would be forced to borrow money at high interest rates. However, gold and silver in the treasury increased a nation's wealth, thereby allowing companies to borrow money for investing in new business enterprises.

DEFENSE AND DECLINE OF MERCANTILISM

The primary exponent of mercantilism in France was Jean-Baptiste Colbert (1619–1683). He held the position of minister of finance from 1661 until his death, under King Louis XIV. Colbert believed strongly in fixed government control over the country's economy, and his efforts made France stable financially. He upheld mercantilist beliefs regarding the expansion of commerce and the safeguarding of a favorable balance of trade as the means for creating and maintaining a wealthy nation. His policies, known as Colbertism, were all maintained according to mercantilist tenets. Colbert was responsible for the creation of a powerful navy that made France a tremendous power at sea. He was also responsible for sending explorers and colonists to America. Colbertism became synonymous with mercantilism, and Colbert's actions made it the most common European economic system of his day. Colbert sometimes used unscrupulous means to accomplish his purposes and was known for asserting the power of state.

Mercantilist thought did not decline until the advent of the Industrial Revolution and the rise of the laissez-faire physiocrats. Although mercantilist policies no longer dominate, the existence of large business subsidies, large trade surpluses, and low-wage workers demonstrate that certain characteristics of the theory remain prevalent.

Meritocracy

A meritocracy is a political, economic, or social system that rewards individuals because of talent and personal ability as opposed to factors such as class, nepotism, or race or ethnicity. Meritocracies typically require entrance exams or other measures to ensure that individuals meet minimum qualifications before they are appointed to public positions or the civil service. Promotion is subsequently based on merit.

The term was coined by Michael Young in his 1958 critical work *The Rise of Meritocracy,* but the principles of meritocracy have their roots in antiquity. Proponents of meritocracies include Plato and Confucius, who advocated ideal societies where wealth and status were tied to ability. Merit-based civil service systems were introduced in a number of countries in the 1800s as a reform effort intended to end cronyism and political patronage. For instance, in the United States, the 1883 Pendleton Civil Service Act created the modern U.S. civil service, based on meritocracy. Critics of meritocracy argue that structural advantages, including access to education, disproportionately favor wealthier classes. Opponents also assert that meritocracies reward groupthink and conformity rather than encouraging innovation. Consequently, they contend meritocracies tend to reinforce the status quo in societies.

Merleau–Ponty, Maurice

Maurice Merleau-Ponty (1908–1961) was a French philosopher mostly known for his work in phenomenology and existential philosophy. He attempted to maintain a political position that was neither communist nor anticommunist, and he spoke for the necessity of a philosophy of history for political thought.

Born on March 14, 1908, in Rochefort-sur-Mer, Merleau-Ponty attended the École Normale Supérieure in Paris. He was a devout Catholic, and his interest in politics developed slowly. In the early 1930s he joined the *Esprit* groups, which gathered left-wing Christians with the aim of developing different aspects of French philosopher Emmanuel Mounier's personalism. It was during his association with these groups that he first studied the work of German philosopher Karl Marx. Before earning his doctorate in 1945, Merleau-Ponty broke with his faith, read the works of Russian Marxist revolutionaries Vladimir Lenin and Leon Trotsky, and made friends in nonorthodox Marxist circles. During the German occupation, he also took part in intellectual resistance groups, which led to a friendship with existential philosopher Jean-Paul Sartre.

Together with Sartre and Simone de Beauvoir, another French philosopher, in 1945 Merleau-Ponty founded the journal *Les Temps Modernes,* of which he was the de facto political editor. As such, he published a great number of articles, mostly by noncommunists, strongly criticizing French and liberal politics. He himself wrote political editorials, and in 1946 he published a series of texts that were eventually published as *Humanism and Terror* (1947). In this work, he defines a noncommunist and humanistic Marxism that recognizes the inevitability of violence in politics and seeks to reorient violence toward achieving the recognition of man by man. He concludes by saying that since there is no immediate hope for a proletarian revolution, everything must be done to maintain the chances of the working class to once again become an important political force. Most important, war must be avoided. As long as the Soviet Union maintains and shows that it does not want war, liberal regimes must strive to coexist peacefully with it. Merleau-Ponty thus positioned himself to be able to end his sympathy for the communists if they were to seek war with the West. More generally, he adopted a phenomenological attitude toward politics, seeking to understand the present as completely as possible without prejudging its meaning. Instead he sought to find this meaning in the events and actions where it manifested itself and opened new possibilities for action.

In 1952 Merleau-Ponty was given a chair at the Collège de France. In his courses he defined a philosophy of history based on the concept of institution and on a new understanding of the dialectic. The reasons for his break with Marxism were published in *Adventures of the Dialectic* (1955). He defended then the idea of a new left-wing politics that would criticize capitalism as well as communism, abandoning the idea of revolution. He suggested an unending and progressive work against misery and exploitation, which would build on past political projects and make possible future radical critiques of capitalism. During this period he also grew closer to French politician Pierre Mendès France, with whom he collaborated.

In the preface to *Signs* (1960), Merleau-Ponty outlined the necessity of reading Marx as a philosopher and put forth the idea that philosophy and politics are interdependent insofar as through them, humans are in relation with others in the world. In manuscripts published posthumously as *The Visible and the Invisible* (1964), he sought to discover a new ontology aimed at understanding the foundations of such relations. Maurice Merleau-Ponty died in Paris on May 3, 1961, before finishing work on this project.

Merriam, Charles E.

Charles E. Merriam (1874–1953) was an American political scientist, presidential advisor, and author. A long-time professor at the University of Chicago, Merriam began his academic career as a graduate student at Columbia University in New York under the tutelage of the creators of the graduate school of political science, John Burgess and William Dunning. It was here Merriam learned that one could both teach politics and be politically active at the same time, and he is believed to be one of the first to bring together academia and politics. An example of this was most likely set for him by the president of Columbia University during his tenure there, Seth Low, a man who made the switch between academic and politician very fluidly. Merriam was also known to incorporate research in the fields of psychology, sociology, and economics into his work. In 1925 Merriam became president of the American Political Science Association.

During his time at Columbia, Merriam frequently tried to get into politics. Twice he ran for mayor and was defeated. However, Merriam held a number of other governmental positions, including councilman. He was an advisor to President Franklin D. Roosevelt when Roosevelt was designing the New Deal, and many of the specifics of the policy program came from Merriam's advice. He was also a member of the President's Commission on Administrative Management, the National Resources Planning Board under President Roosevelt, and President Harry S. Truman's Loyalty Review Board at the beginning of the red scare.

In addition to all of his other accomplishments, Merriam was also a successful entrepreneur. He was excellent at raising money and creating and presenting research projects in a way that attracted affluent donors. His fundraising efforts helped in the creation of the Social Science Research Council.

Merriam often argued with educational theorist George Counts over the role of the university in preparing students to be true citizens. Merriam disagreed with Counts's idea to teach the students how to reform or to overthrow American capitalism. Merriam saw no reason to teach students to revolt against the country. He instead tried to guide them in how to adhere to the principles of behavior established by the citizenry of America.

Charles Merriam was a valued teacher who left a memorable impression on his students. He helped begin the custom of political science academics by not only teaching political science, but participating in real politics in the surrounding community. This custom continues to be practiced in the early twenty-first century.

Mexican Immigration

Mexican immigration into the United States is increasing. In the 1960s Mexico lost some 27,500 people annually to its northern neighbor. With the North American Free Trade Agreement (NAFTA) in 1994, migration increased in the second half of the 1990s to 360,000, and between 2001 and 2005, to 396,000 people a year. According to data of the U.S. Department of Homeland Security, the U.S. Border Patrol, and the Mexican National Population Council, around 28 million people of Mexican origin were living in the United States in 2005, among them 10.6 million who were born in Mexico. Most are men (55 percent); 53.1 percent are between 20 and 40 years old. Though the majority of migrants have some primary or secondary school education, every third Mexican with a doctorate works in the United States.

The main reason for Mexican emigration is a relative lack of job opportunities in Mexico. The Mexican government considers migration a valve for its social and economic problems, and many families depend on remittances. In 2006, Mexican workers in the United States sent approximately $23 billion to their families in Mexico. After income from the oil business, remittances are the second largest source of income. Because of its huge demand for cheap labor, the United States still attracts Mexicans. In the United States, 80 percent of Mexican workers earn more than $20,000 a year, whereas in Mexico, 75 percent of them earn less than $20 a day.

Approximately six million Mexicans live as undocumented aliens in the United States. Annually, U.S. authorities deport one million immigrants back to Mexico. Between 1997 and 2005, over 3,100 Mexicans died attempting to cross the border illegally. This number increased after the United States reinforced border controls and constructed defense walls along its frontier with Mexico. Migrants try to cross the border illegally in dangerous desert areas between Mexico and the U.S. states of Arizona and Texas. Many die due to disorientation, hyperthermia, or human traffickers (so-called *polleros*), who charge migrants up to $3,000 to be smuggled into the United States.

There are many migration streams from Mexico to the United States: legal immigration, unauthorized or illegal immigration, and temporary immigration, which can be legal (through various temporary work programs) or illegal. Each of these three variants creates its own particular economic opportunities, relationships between the migrants and Mexico, and forms of migrant adaptation to the United States.

Many Mexicans opt for temporary migration, which is still high in spite of immigration restrictions. Approximately 380,000 people enter the United States to work temporarily,

principally in the agricultural sector. The majority are males (95 percent), 77 percent immigrate without permits, 41 percent contract a human trafficker, around 70 percent enter for the first time, 78 percent work illegally, and 60 percent get help from family and friends. Many come from central and rural areas of Mexico, such as Zacatecas, Michoacán, and Durango, to work primarily in California and Texas, and very often, they are part of new transnational social networks. Relatives and friends compose these communities, which permit cross-border mobility between the societies of origins and settlement. They offer mutual help and solidarity. Finally, they form new identities linking the two nations. According to anthropologists Nina Glick Schiller, Linda Basch, and Cristina Blanc-Szanton, these "transmigrants," linked by two societies, permit a synthesis of mother and host country. Yet their identities are often fragile and can be further threatened by the actions of so-called self-defense organizations such as the Minutemen of Arizona.

Since the implementation of Operation Gatekeeper in 1994, migration and security have become important parts of the U.S.–Mexican bilateral agenda. U.S. attorney general Janet Reno announced the operation in order to restore integrity and safety to the border in the San Diego area. As a consequence, illegal migration shifted eastward. Just days before the September 11, 2001, attacks on the United States, U.S. president George W. Bush and Mexican president Vicente Fox were preparing a migration agreement. However, after 9/11, the fear of new attacks changed the national U.S. interests. The politics of border militarization and preventing illegal aliens from entering into the United States culminated eventually in different bills and proposals in the U.S. Congress. On September 14, 2006, the U.S. House of Representatives passed H.R. 6061, the Secure Fence Act, which was signed into law by President Bush. It authorized the construction of a double-layered fence along one-third of the 2,100-mile U.S.-Mexico border. The following year, the U.S. Senate's proposed Comprehensive Immigration Act of 2007, which sought opportunities for undocumented migrants to obtain legal status, failed to pass. In the 2008 presidential election campaign, migration was a nonissue. Though Bush's successor, Barack Obama, promoted a new citizenship act and a new employment eligibility verification system, he favored additional customs and border protection.

Early in the Obama administration, migration remained part of the security debate. The economic and financial crisis that began in 2008 did not support new legal initiatives for illegal migrants from Mexico. President Obama suggested actualizing NAFTA and strengthening cooperation with Mexico in addressing issues around migration, economy, and security, especially in regard to drug and human trafficking violence. Mexican immigration continues to challenge the United States' border security and economic future.

Michels, Robert

Robert Michels (1876–1936) was a European political sociologist who started out as a Marxist member of the late-nineteenth-century German Social Democratic Party and ended up a professor in Italy and a proponent of fascism. He is best known for propounding the "iron law of oligarchy," which held that nominally democratic organizations such as mass political parties end up being controlled by oligarchs. Thus, democratic parties not only faced opposition from external forces but also contained obstacles to accountability within their own structures.

Michels was born into a prosperous family in Cologne, Germany, in 1876 and studied in Paris, France; England; and Turin, Italy, as well as at three German universities. He became a follower of German sociologists such as Max Weber and Werner Sombart and was an active radical until he left the socialist party in 1907. Unable to gain academic advancement in Germany because of his politics, Michels taught at the University of Turin and then the University of Basel, Switzerland, until 1926.

In *Political Parties,* first published in German in 1911 and in English in 1915, Michels set out a theory explaining why organization leads to oligarchy. Organizations with many members require full-time personnel to carry out their activities. Their officials have the technical skills, information, and position to exert great influence on what the organization does. In order to protect their power base, party elites moderate their radicalism and oppose demands by party militants. If challenged, they can use their organizational advantages to retain control of the party as long as they remain united. Michels invoked a social psychological form of elite theory to argue that the mass of individuals, because of their lack of education, skills, and organization, could not carry out activities on their own and thus desired to be led. Oligarchs provide the leadership.

Michels's emphasis on the assimilation of new elites into the status quo was consistent with Italian economist and sociologist Vilfredo Pareto's theory of the circulation of elites. However, by deeming his theory a "law," Michels made it overly deterministic. He neglected the possibility of a radical elite repudiating ruling elites and their institutions. This was the way in which Russian Bolsheviks and Nazi Germans seized power. Once in power, communist leaders exemplified the rule of oligarchies behind the facade of a democratic party of all classes chosen by popular (albeit one-party) elections. *Union Democracy,* published in 1956 and edited by Seymour Martin Lipset, Martin Trow, and James S. Coleman, showed that organizational elites could be subject to electoral sanctions by members, but the conditions in which this was possible were atypical of trade unions.

In the 1920s, Michels became an advocate of Italian fascism and professor at the University of Perugia. He asserted that Italian dictator Benito Mussolini, an exsocialist, had a charismatic appeal to the masses that provided a legitimate foundation for popular representation without the distortions resulting from the intermediation of party officials. Michels died in Rome in 1936.

Microeconomics

Microeconomics is a subdivision of the field of economics. The field has two distinct subdivisions: microeconomics and macroeconomics. Unlike macroeconomics, in which the entire economy is studied as a whole, microeconomics studies how the individual components of the overall economy (households, firms, or individuals) interact and make decisions in markets. For example, while a macroeconomist may study the relationship between the unemployment rate and the inflation rate, a microeconomist would examine the decision-making process of a firm considering whether to increase or decrease its workforce.

Typically, in microeconomics, individual entities and their effects on prices within the market are studied in relation to the more basic theories of supply and demand. Microeconomics also studies how individual firms influence and interact with each other within the larger economy. For instance, microeconomics can explain how the formation of an oligopoly (a small number of firms that dominate market share and prevent entry) affects prices and consumer utility. It can even explain why firms form clusters of similar businesses within close proximity. Microeconomic analysis relies on the assumption of a rational, utility-maximizing behavior, often

aims at mathematical rigor, and is closely related to rational choice theory in the field of political science.

Middle East Democratization

In the modern history of the Arab Middle East, there are four waves that can be identified with regard to constitutionalism: reform, liberalization, pluralism, and democratization (or the lack thereof). These are the pre–World War I (1914–1918) liberal tradition, the interwar period, the post–World War II (1939–1945) period, and the post–9/11 era. With regard to the literature on democratization in the Middle East, there are two contending schools of thought that can be identified as the exclusionary discourse and the compatibility discourse.

The exclusionary discourse of democratization advocated that the Middle East is an exceptional case and immune to democracy due to an alleged incompatibility of its political culture with the modern norms of democracy. Arab political culture and Islam are held responsible for the democratic gap in the region. The work of political scientists Samuel Huntington (1991, 1993) and Yehudah Mirsky (1993) represent this trend. On a foreign policy level, Ambassador Richard Haass acknowledged in a speech on December 4, 2002, that the U.S. government has for decades practiced "democratic exceptionalism" in the Muslim world, as it did in other regions and countries after the fall of the Soviet Union. Other Western democracies never deviated from this rule.

The compatibility school of thought advocated that Islam and the Arab political culture are not less compatible with democracy than other cultures and religions. Michael Hudson (1991), John L. Esposito (1994), Saad Eddin Ibrahim (1993), and other scholars and area specialists represent this trend. However, the most noticeable aspect of the third wave literature, as put by Tim Niblock, is that it extensively researches the "why" aspect of democracy rather than the "how." The research focuses on why the region is undemocratic instead of investigating how to bring about a successful process of transition to democracy in the Middle East and the Islamic world. This very element distinguishes the fourth wave—of democratization from the third—of pluralism.

The fourth wave's literature is more hopeful and relatively optimistic about the status and future of democracy in the region in comparison with the third wave's intellectual discourse. The following several trends can be identified within the fourth wave's framework.

• A literature that questions the very nature of the third wave's assumption and the rationale of the exclusionary thought. Alfred Stepan and Graeme B. Robertson (2004), Mark Tessler and Eleanor Gao (2005), and other political scientists examined the process of democracy in a more in-depth analysis, free from the dogmatic constraints of the clash of civilizations thesis and those of the third wave.

- An active Islamist intellectual involvement in the global debate over the universality of democratic values and the compatibility of Islam with democracy and modernity. Islamists in Turkey in particular have demonstrated the practical implementation of Islamist political discourse in governance, and there have been stunning electoral gains for Islamists across the Islamic world.
- An examination of the impact of external factors on the process of democratization in the region, and of the U.S. involvement in the process of transition to democracy in particular.
- Quantitative measurement of the advancements that have been made in the region toward the process of democratization. Several polling centers frequently measure public opinion, while scholars such as Saliba Sarsar (2006) have provided an in-depth quantitative analysis of democracy in the region.
- A questioning of the impact of the Arab-Israeli conflict on political reform in the region. Since about the 1950s, Arab ruling elites have been postponing reform on the grounds that a state of war exists between Israel and the Arab world.
- An examination of the linkage between democracy and terrorism, devoting special attention to the role of indigenous democratic arrangements and their impact on the process of democratization in the region.
- An investigation of the impact of the American setbacks in Iraq on democratization in the region.

DEMOCRATIZATION OF THE MIDDLE EAST AFTER 9/11

During its first eight months in office, the George W. Bush administration showed no significant interest in issues related to the Middle East. However, the terrorist attacks of 9/11 drastically changed American and European policy toward that region and the world. The Bush administration made democratization an integral aspect of its policy toward the Arab world. The European Union expanded the scope of its Mediterranean Partnership to the entire Middle East in 2003, and the partnership was declared to be strategic with respect to Europe's stability, security, and well-being.

Arab governments reacted in various ways to the fourth wave. While some governments responded to the pressure mounted by the Bush administration, others resisted political openness on security grounds. For example Algeria, Bahrain, Egypt, Iraq, Jordan, Mauritania, Morocco, Oman, Tunisia, Yemen, and United Arab Emirates conducted symbolic parliamentary elections, which were viewed mostly as undemocratic and not free. Other countries such as Kuwait, the Palestinian Authority, and Lebanon conducted transparent elections, but this step did not contribute to political stability or substantial political development in any of them. Other countries such as Libya, Saudi Arabia, and Syria were only marginally affected by the fourth wave, as regimes in these countries continue to resist change.

CONCLUSION

The future of the fourth wave of democratization seems uncertain. While there are encouraging signs of change in the region, there is no solid commitment to the success of the fourth wave. The distrust among participants, the American setbacks in the war in Iraq, and the refusal of the ruling elites in the Middle East to expand the basis for political participation has hindered the democratic potential of the fourth wave as of the early twenty-first century.

definition. Nineteenth-century British strategists coined the term during the heyday of the British Empire to refer to the territories between India and what is now Turkey. Both *middle* and *east* are relational categories that depend on what is the center or viewpoint. The phrase, now used by people from the Middle East, refers to the region from Morocco to Iran (on a west-east line) and from Turkey to Yemen (on a north-south line). Some people exclude North Africa (*Maghrib* in Arabic) or prefer the acronym MENA for Middle East and North Africa. The Middle East is larger than the "Near East" (the Levant, or *Mashriq* in Arabic) and sometimes includes the Muslim-majority countries of Central Asia as well as Afghanistan and Pakistan. Characterized for a long time as the place where "Arabs," or those who speak Arabic, were concentrated, the term has been increasingly linked to a place where Muslims are concentrated, although this characterization is not accurate, because most Muslims live outside of the Middle East, notably in Indonesia, India, and sub-Saharan Africa, and because not only Muslims live in the Middle East.

Since the Middle East witnessed the emergence of the three revealed monotheistic religions (Judaism, Christianity, and Islam—the so-called Abrahamic faiths), it might be read in religious terms. *En vogue* theories such as that in Samuel Huntington's *Clash of Civilizations* have further contributed to considering Middle Eastern politics in civilizational terms, whereby "the West" and Islam are fundamentally opposed. But it is incorrect to oppose a loose geographical concept, the West, to a faith, Islam. Instead, one should distinguish Islam, the faith, from Islamdom (a term historian Marshall Hodgson coined in analogy with Christendom)—the regions where Islam is the main religion.

It is also imperative to historicize Middle Eastern politics to avoid generalizations and essentialization (the reduction of various aspects of a given group into a very few characteristics that gradually become the kernel of their "essence"), which Edward Said critiqued in his 1978 classic *Orientalism*. Said distinguishes between studying "the Orient" and a style of thought that separates "the Orient" and "the Occident." In an "orientalist" reading, the Orient, or the Middle East, becomes the negative mirror of the Occident, or the West, and vice versa. No Orient exists, even geographically, if not as a reflection of the Occident. Many authors, sometimes unwillingly, fall into the trap of ethnocentrism by assuming that what is the case in the West either ought to be so in the Middle East,

or is lacking there because of so-called oriental characteristics, ideas, and norms. A neoorientalism that is a reactualization of older orientalist biases has put emphasis on the dead end of democratization in the region as well as on Islam as a total ideology—the political role that Islam is seen to play throughout the Middle East—and generalizes about the nature of Middle Eastern society to explain violence and political instability.

POPULATION AND DIVERSITY

Characterizing the Middle East according to geography is difficult, because landscapes, access to oil and hydrocarbons, and even rainfall vary tremendously across the region. Sparsely populated areas exist next to huge urban concentrations, such as Cairo, Tehran, and Istanbul, each host to more than twelve million people. Processes of modernization, urbanization, and massive production of oil led to profound reshaping of the social fabrics of Middle Eastern societies and a staggering contrast between high-tech service-providing centers and agricultural zones.

Contrary to neo-orientalist representations of the Middle East, its population is extremely diverse, not only between countries but also within each country, influencing local and regional politics. The diversity can be expressed in the following terms:

- *Religious terms.* Although Islam is the main religion in the region, the Middle East has historically been home to Christian, Jewish, Zoroastrian, and Baha'i minorities. Even within Islam, there exist many subgroupings within the Sunni and Shiite branches. The former branch is further subdivided into four different schools of jurisprudence, with more or less strict interpretation of religious texts, ranging from the puritan Hanbali (known at times as Wahhabism), to the Malaki, Shafeite, and more liberal Hanafi legal interpretations. There are also different orders of Sufism, a form of mysticism practiced in pyramidal units called *tariqa*s. The Shiite current is divided among Twelver Shiites (mostly represented in Iran and Iraq), Sevener Shiites (Ismailis), and Fivers, or Zaydis. Other Muslim splinter groups include the Druze of Lebanon, Syria, and modern Israel; Alevis of Turkey; Alawites of Syria, and Ibadis of present-day Oman. Some of these sectarian divisions have provided fluctuating and alternative social and political hierarchies. The divisions between the two main Kurdish factions active in Northern Iraq result from a long-term division between two historically contending Sufi orders, the Naqshbandi and the Qadiri. Similarly, much of the turmoil in Lebanon in the last five decades has resulted from sectarian strife and shifting political alliances among seventeen different communities that are legally recognized by the state. Of the non-Muslim communities, apart from the Jews of Israel, the Christian minorities are the most important, including the Copts of Egypt (about 5 percent of the total population), Maronites and Orthodox communities in Lebanon, and small Christian minorities in Palestine, Iraq, Jordan, Syria, and Turkey.
- *Linguistic differences.* Semitic languages predominate. Arabic is the dominant language in the Maghreb (North Africa) and in the Mashriq (Levant), but there are significant non-Semitic linguistic minorities, most prominently Berber speakers (Tamazight) in Algeria, Morocco, and Tunisia and Kurdish-speaking minorities in Iraq and Syria. Hebrew, the other Semitic language, is used only in Israel, where Arabic is also a national language. Outside of the Arab Middle East, Indo-Iranian languages are predominant in Iran (Farsi or Persian, Baluchi, Luri, etc.), in Kurdish regions (Kurdish dialects), and in Afghanistan and Pakistan (Dari, Pashtu, Urdu, etc.). Turco-Mongol languages are represented by Turkish in Turkey and by Azeri, Turkmen, and other languages in Central Asia.

- *Ethnic terms.* Often, ethnic distinction is premised on or reinforced by linguistic differences (Baluchi as opposed to Persians, Armenians or Kurds as opposed to Arabs or Turks, etc.). There also exist groups who are no longer distinguishable by language but are distinguishable by geographical or ethnic origins: Circassians in Jordan, Tadjiks and Hazaras in Afghanistan, and Arabized Kurds. Ethnicity also plays an important role in the internal dynamics of Israeli Jewish society.

- *Putative kinship.* A final source of intrasocietal differentiation is provided by putative kinship, namely, in-group feelings based on common genealogy or clan structures. This type of identity derives from more or less real genealogy or from the reinvention of a common historical origin. In the first case, tribal groups descending from a common ancestor constantly recreate internal divisions vis-à-vis external groups, while other groups claim direct descent from the Prophet— for example, the Sayyed in the Shiite world, or from other important religious figures, in the case of Sufi leaders. In the second case, Maronites and other Christian Lebanese claim thus to be "Phoenicians," not Arabs (a term associated in such reconstruction with Muslims, albeit in a problematic manner). Anthropologists have shown the malleability of putative kinship and have confirmed that certain groups have changed identities, be they from one tribal affiliation to another, Sunni to Shiite, or Christian to Muslim. According to the circumstances, tribalism or adhesion to a Sufi *tariqa* can also be a means of upward social mobility, as much as it can entrap individuals into them. Therefore, one should take these affiliations into consideration when studying local politics but should not allow them to explain everything in Middle Eastern societies.

To refer to the diversity of the Middle East, many have used the metaphor of the mosaic, whereby religions play an important aggregating and stabilizing role. But this has been criticized for being too static a vision and for reifying modes of social differentiation. For example, it has become commonplace to refer to the Iraqi divide along sectarian or ethnic lines, as Shiite versus Sunni or Arab versus Kurd, but this hides multilayered and negotiable identities, such as mixed marriages and the strength of Iraqi nationalism, which cuts across sectarian identities. Political entrepreneurs, in Yemen and Iraq, for example, have taken advantage of ethnic, religious, tribal, and other forms of identity to maintain or challenge authority.

TRENDS IN MODERN POLITICS

In order to avoid neoorientalist distortions, Middle Eastern politics must be understood in a historical light. In the late

modern period, most of the region was in the hands of the Ottoman or Qajar empires, which the European powers fought bitterly to destroy and eventually managed to include in their colonial dominions, beginning with Napoleon's conquest of Egypt in 1798 and ending in the first half of the twentieth century. Great Britain and France were the most successful colonial powers, while Russia, Germany, and Italy had only temporary influence. All countries of the region, except Turkey and Iran, have experienced colonial rule. This translated first and foremost into the creation of artificial states modeled on the European nation-state.

Europeans tried to buttress national cohesion very often by playing minorities against one another. France created republics in Lebanon and Syria, and Britain favored the emergence of monarchies in Egypt, Transjordan, and Iraq. In all cases, colonial powers imposed secularized regimes, a feature that has remained reality in all Middle Eastern states, with the exception of Iran and Saudi Arabia. The colonial legacy in the Middle East can be seen on any map of the region: Straight-line borders were drawn with little consideration for local populations, and drastic changes in the ethnic make-up of these new countries have generated numerous internal conflicts, including those between Palestinians and Israelis and the civil war in Lebanon. Indeed, these two hotspots are the legacy of colonial decisions: The support given by the British Crown to the establishment of a Jewish national homeland in 1917, the Balfour Declaration, paved the way to the creation in 1948 of a Jewish state at the heart of a region inhabited by an overwhelmingly Arab majority, while the redrawing of Great Lebanon's borders in 1920 was pushed forward by the French mandatory power so as to tip the internal demographic balance in favor of the Christian Maronites.

In many Middle Eastern countries (as in many third world countries), once the euphoria of independence was over, the regimes focused on modernizing ideologies with nationalist overtones, and the military often played an important role. Socialism proved very popular from the 1950s to the 1970s, and regional ideologies, such as Pan-Arabism, made popular by Egyptian leader Gamal Abdel Nasser or by the influential Baath party in Syria and Iraq, never managed to change the map of the Middle East. Instead, rhetoric and import-substituting industrialization policies paved the way to increased intrastate tensions, which in turn reinforced the role of the military in Middle Eastern politics.

Overall, modernizing ideologies failed to deliver dividends to the masses, and popular discontent grew and was augmented, from the 1970s onward, by economic crises and important military defeats to Israel. In most Middle Eastern states, the main contenders for power come from Islamic militant organizations. Islamism, a political ideology that includes nationalist and socialist elements and fashions politics according to strong religious precepts, has been the most successful dogma in the last thirty years, because it comprises two interlinked levels of criticism. On the one hand, it wields domestic power through its effective alternative network of welfare (a feature on which ruling regimes have been weak in delivering). On the other, it

manages to tap into locally accepted collective symbols that are in clear contraposition with Western principles that appear to guide the action of ruling elites.

Democracy has been on top of the research agenda since the late 1980s. Some scholars have argued, often in a problematic essentialist mode, that Muslim and Arab cultures are inherently resilient to liberal values central to the spread of a democratic ethos, while others have argued that there are reasons linked to blocked political economies that have favored autocracy over democracy. Far from being the only game in town, democracy has had a difficult time establishing itself in the Middle East. (Turkey and Israel are the exceptions.) Economic liberalization still has to pave effectively the way to political liberalization.

Instead, authoritarianism has proved very resilient, especially in the Arab world, and scholars have explored the strategies of enduring regimes in the region. Recent Western campaigns and justifications for exporting democracy through just and preemptive wars have awakened old colonial demons in much of the region's collective imaginary. Democratization has proved difficult because of the deadlock over the control of resources and the role of the state's institutions in this process. Political actors, Islamists included, have fought more to control the state than to enhance mechanisms of accountability and good governance. The study of contemporary Middle Eastern politics has to take into account how the struggle for the state has been central in generating fluctuating alliances, has led to a spiraling of conflicts, and has impeded the establishment of a sound system of representation based on the notion of tax extraction. Scholars have thus produced seminal work on Middle Eastern rentier states and the mixed blessings of large oil revenues on political participation and enfranchisement.

Trying to understand popular protest and Islamic factions in terms of social movements has shed new light on many political formations that have been dichotomously defined along, for example, modernist-fundamentalist lines. It also allows students of the Middle East to capture less visible social transformations, or changes that are not directly related to the "high" features of politics (state, democracy, political economy). Looking at claims made by low-level organizations or lay people has produced recent valuable studies on social movements and bears witness to the broader impact of globalization and regionalization of politics. Similarly, so-called Islamic feminism, with which Muslim women fight patriarchal control by reappropriating religious texts from within, is another form of informal protest that sheds a different light on constantly evolving societies, away from neoorientalist discourses about a homogenous society resilient to democratic principles.

Migration

The general understanding of migration as a description of the relocation of people from one country to another, especially the move from a developing country to a more affluent country, has extended in meaning to the process of these migrants settling down in the receiving countries. Migrant families' continued stay in their new homeland has changed the focus on migration, so it is no longer thought of as a "temporary" situation. These two dimensions of migration—one as a move from one country to another, and the other as a permanent stay in the new country—bring new challenges for the receiving countries. At the same time, globalization processes increase migration dynamics and affect the sending countries, for which brain drain and the relevance of remittances are cardinal issues.

FROM TEMPORARY TO LONG TERM

Migration has become one of the central challenges for the future; therefore, its meaning needs reevaluation. Migration as a move from one country to another is, in general, linked to the demands of the labor market in the receiving countries. Since the late twentieth century, industrialized societies have recruited unskilled or poorly educated workers, often from other countries, mainly for low-level jobs in factories and agriculture. Host countries that signed recruitment contracts considered migration a temporary situation. For this reason, many host societies were not prepared for the extended stay of the new inhabitants and the need to address issues of the migrants' living conditions, education, and language skills.

When the labor market later became saturated with foreign workers, many nations decided to stop the recruitment process or allow their agreements to expire. The governments of the receiving countries expected the foreign workers to return to their home countries at the end of the recruitment period. It should be emphasized that the end of the recruitment process dramatically changed the relationship between the population of the receiving countries and the new inhabitants. Contrary to the political expectations of the receiving countries, most of the workers decided to stay in their new homelands. When describing the identities of the new inhabitants, in particular their descendants, experts often speak of "transnational inhabitants" because of their knowledge of both countries—receiving and sending—and their ability to live in the cultures of both.

Using outside workers to meet labor demands in specific areas changed the makeup of the receiving societies. This change has been accompanied by civil rights movements, which have sought equal rights for the underprivileged immigrant groups. One outcome of these movements has been the opportunity for those with foreign backgrounds to become naturalized citizens. However, the criteria for naturalization depend on the history of each country.

Throughout the recruitment process, migrant workers and their families were referred to by differing names within political and public discourse and in different countries. In Germany, as one example, the new inhabitants were originally referred to as "guest workers" to highlight the temporary character of their stay. After it had become clear the workers and their families would not return to their country of origin in the near future, they were called "foreigners" and later were given the name "migrants." The changing names for the new inhabitants are deeply linked to their place in society and the majority society's view toward their new cohabitants.

CULTURAL AND SOCIAL DISPARITIES

The term *migrant* is used for a specific group of people. *Migrant* embodies the majority societies' perception of the unskilled workers who have come and stayed and now can command a certain place in society. It should be emphasized that there is a distinction between unskilled workers who have come and stayed long term of their own accord (migrants) and guest workers recruited to come and labor but not live permanently.

Differences in cultural backgrounds increase the gap between the majority society and the new inhabitants. People coming from a different cultural background may be perceived as much more of a "risk" than people from a similar background. Thus, the extent to which migrant groups are accepted in a receiving country depends not only on the perceptions and prejudices of the population of the receiving country, but also on the relationship between the migrants' receiving and home countries. Furthermore, the relationship

between the majority society and its minorities, as well as particular prejudices against certain groups, is often influenced by political and economic circumstances within the country as well as internationally.

SKILLED AND UNSKILLED WORKERS

Unlike unskilled workers, highly skilled and well-educated people who go abroad to work are usually not described as migrants. They are instead seen as "mobile" people able to adapt very easily to varying circumstances. In terms of integration into the majority society, highly skilled workers do not attract as much attention. This labeling of new inhabitants and their descendents as "migrant" or "mobile" illustrates the distinction in prestige and the potential for problems in integration. This difference also indicates who is not seen as a threat to the culture of the receiving country.

The differing views on migrants are principally based on whether the concerned people are considered skilled or unskilled. This difference has been generated because of the permanent stay of unskilled workers, which has made them a visible component of the receiving country.

In the early twenty-first century, governments focus on strict regulation of migration. In contrast to the recruitment process of the twentieth century, the more recent effort of industrialized societies is focused on recruiting highly qualified and well-educated workers. Some countries have considered temporary work and residence permits for selected workers. In order to minimize the possibility of unskilled workers and their families residing long term in the receiving country, nations have developed programs, such as providing limited residence permits, to ensure that the stay of such workers is temporary.

THE FUTURE OF MIGRATION

Besides the demands of the labor market, which is one of the important components of migration, a new wave of migration is expected due to climate change, especially in developing countries. Dealing with this new aspect means rethinking concepts of migration and asylum. It is the old question renewed: Will the affluent parts of the world open their doors only for well-educated people, and if so, for how long? The living modalities for migrants and their descendents in these societies can tell us about the fears and the possibilities of each majority society. This will become one of the important indicators of how able these societies will be to face new challenges.

Miliband, Ralph

Ralph Miliband (1924–1994) was a Marxist political theorist. Born in Belgium of Polish-Jewish parentage, he fled the Nazis to England in 1940. There, at the graveside of philosopher, social scientist, historian, and revolutionary Karl Marx, he pledged what became a lifelong allegiance to the "workers' cause." A year later Miliband began his studies at the London School of Economics, which, though interrupted by a three-year stint in the Royal Navy, led eventually to a PhD on popular thought in the French Revolution (1789–1799) under the supervision of political theorist Harold Laski.

Although Miliband considered himself a Marxist during this period, he never joined the Communist Party. He did, however, become a key intellectual voice within the British new left after 1956. If the new left aimed to trace a socialist path independent of both Stalinism and Social Democracy, Miliband's first contribution to this project was through his classic study of the British Labour Party, *Parliamentary Socialism* (1961). In this, arguably his most important book, he claimed that the Labour Party was amongst the most dogmatic of workers' parties, "not about socialism, but about the parliamentary system." It is interesting that whereas the book was originally intended to underpin a call to transform the Labour Party into a socialist organization, in its second edition Miliband concluded that this was a hopeless task, as the party was "irrevocably rooted" in the capitalist system.

In the 1970s Miliband's attention turned from social democracy to communism. In the wake of a 1976 essay that linked these themes—"Moving On," published in *The Socialist Register* annual that he coedited with historian and new left comrade John Saville—Miliband published one of the most important critical surveys of Marxist political theory and practice: *Marxism and Politics* (1977). Subsequently, he extended both his critique of capitalism and his interpretation of Marxism in books such as *Capitalist Democracy in Britain* (1984) and *Divided Societies* (1991) and through powerful essays, for instance those collected in *Class Power and State Power* (1983), in which he fraternally but critically engaged with others on the left.

The 1983 collection includes his contributions to one of the most important disputes on the academic left in the 1970s,

the Miliband-Poulantzas debate on the nature of the capitalist state. Opened by Greek Marxist theorist Nicos Poulantzas's review of Miliband's *The State in Capitalist Society* (1969), the debate continued with Miliband's review of Poulantzas's *Political Power and Social Classes* (1973). Between them, these two books and the subsequent debate on the pages of *New Left Review* were undeniably the most important contributions to Marxist state theory in this period.

Later, in important essays such as "The New Revisionism in Britain" (1985), Miliband countered what he took to be a mistaken shift away from class-based politics by sections of the academic left in the 1980s. And although toward the end of his life he softened his criticisms of the reforming strategy embraced by those socialists who continued to work within the Labour Party, he reiterated his commitment to socialism in the posthumously published *Socialism for a Sceptical Age* (1994).

Military Courts

Military units use special criminal courts to further discipline and order. The Uniform Code of Military Justice (1950, later amended), based on the U.S. Congress's Article I power to "make rules for the governance . . . of the land and naval forces," authorizes the military to create two kinds of military courts: courts-martial and military commissions.

COURTS-MARTIAL

Courts-martial exist in most Anglo-American militaries. They exist to try service personnel and not civilians; indeed, although defendants enjoy numerous procedural rights (including the right to know the charges, the right to present defense evidence, and the right to appointed military counsel and privately retained civilian counsel), the trials fall short of the requirements of the U.S. Bill of Rights. Courts-martial may try service personnel only if the offenses charged are "service-related."

Among these offenses are some, such as desertion or insubordination, that can be committed only by persons under military discipline. Others include ordinary crimes of violence or theft when committed by service personnel. The U.S. military processes some minor offenses through summary courts-martial, in which the accused self-represents before a single presiding commissioned officer. The accused can, however, refuse trial by

summary court-martial and instead go before a special court-martial, which includes a military judge (a specially trained military lawyer who presides and enforces due process requirements) and a panel of at least three members (officers or enlisted with no formal legal training who perform functions similar to those of civilian juries). Each of these courts includes limitations to possible punishments. General courts-martial must be convened for the military equivalent of felony trials and must include a judge and a panel of at least five members. These courts-martial can impose serious punishments, including death, for violations of crimes listed in the Uniform Code.

Convening authorities are commanders of large military units; they create military courts and assign personnel (both judges and panels) to them. The Uniform Code prescribes trial procedure in advance, including rules of evidence. After a conviction, the convening authority can order the sentence carried out, or decline to do so. If put into effect, the sentence is reviewed by a court of criminal appeals, staffed by military lawyers, that can reduce it. From there, the defendant may petition for discretionary review by the Court of Appeals for the Armed Forces, staffed by civilians, and, extraordinarily, by the U.S. Supreme Court.

MILITARY COMMISSIONS

However, military commissions can be created in extraordinary circumstances to try civilians or, more recently, noncitizens accused of terrorism. They were common during the U.S. Civil War (1861–1865), when parts of the United States were occupied by military forces, the danger of enemy raids made the military's order-maintaining role important, and civilian legal institutions had difficulty functioning. Since then they had been little used before the George W. Bush administration attempted to employ them to try terrorist suspects. Congress retained them in the Uniform Code in case the military occupies some hostile nation whose own institutions of justice have failed. Although the Uniform Code does not specify trial procedures for military commissions, it gives the U.S. president the power to prescribe them, and it presumes that they will be similar to those of courts-martial. The U.S. Supreme Court has held that American citizens can sometimes be tried by such courts, the Bill of Rights notwithstanding, but only in wartime cases in which citizens have committed serious crimes that aided the enemy, and it is not clear whether its approval would extend to less serious cases.

After the Bush administration's military commissions were blocked, Congress passed the Military Commissions Act of 2006 in order to try terrorist suspects outside the civilian court system. This proposal is similar to the use of international military tribunals, which have been conducted to try foreign nationals for war crimes (such as the Nuremburg Trials after World War II [1939–1945]). In the three years following the act, however, few defendants were tried, as opponents mounted a host of legal challenges, and the use of military commissions in this new role remained controversial.

Military-Industrial Complex

The term *military-industrial complex* refers to the intricate relationship between the governments, militaries, and defense firms of the United States, Europe, Japan, and other developed states. The phrase was popularized by U.S. president Dwight D. Eisenhower (1953–1961) in his 1961 farewell address, in which he warned of the dangers of the "military-industrial complex" that had created unheralded ties between the military and large defense manufacturers. Eisenhower asserted that the result was a security establishment that was compromised by the private sector and lacking an emphasis on national defense. The outgoing president warned that the social–economic–political triangle at the core of the military-industrial complex was seeking to develop weapons and armaments to benefit itself, rather than the nation it was supposed to serve. Many commentators would later see Eisenhower's remarks as a broad condemnation of bureaucracies that grew beyond the control or understanding of the citizenry.

ORIGINS OF THE MILITARY-INDUSTRIAL COMPLEX

The rapid advance of military technology during World War II (1939–1945) resulted in a dramatic expansion of the defense-industrial base in the wartime powers, especially in the United States. By the end of the war, the defense sector employed more than 20 percent of the U.S. civilian workforce. Although there was a significant decline in military output after the war, the onset of the cold war led to new weapons programs and renewed defense expenditures.

Industrialized states responded to the increased military needs in one of two ways: In most western European states, defense firms were either state-owned, or the government had significant economic interests in them. For instance, Finland, France, Italy, Spain, and Portugal to some degree owned national defense companies. The result was that the interests of these corporations became inexorably intertwined with the fortunes of government. Increased production by arms manufacturers meant corresponding increases in employment and wages. Countries such as France, Italy, and Germany actively encouraged arms exports and weapons transfers to benefit the domestic defense sector. Meanwhile, governments also became deeply involved in weapons production and military systems planning.

Within the United States and countries such as Australia, Canada, and the United Kingdom, governments did not have the degree of direct influence or ownership common among western European nations; however, significant connections emerged between the military and private industry as new requirements emerged for increasingly sophisticated weaponry and military technology. Through the 1950s and 1960s, the U.S. defense industry steadily grew. In the post–Vietnam War (1959–1975) era of the 1970s, cuts in military spending prompted the defense sector to become more organized. President Jimmy Carter sought to reduce the ties between the defense companies and the national security establishment, but his overall defense strategy emphasized new weapons systems concurrent with reductions in man power, thereby continuing the importance of research and development of new systems and weapons. Meanwhile, firms created new lobbies to promote increased military expenditures on programs such as the American League for Exports and Security Assistance (ALESA). Defense corporations in the United States and Europe expanded in the 1980s. For instance, from 1981 to 1986, U.S. defense expenditures increased by $1.6 trillion. The end of the cold war ushered in an era of mergers and acquisitions. By the end of the 1990s, the three largest U.S. companies—Boeing, Lockheed-Martin, and Raytheon—accounted for almost one-third of all defense contracts in an industry that domestically employed 2.2 million people.

POTENTIAL DANGERS OF THE MILITARY-INDUSTRIAL COMPLEX

Critics in the United States assert that the military-industrial complex has led to the emergence of an iron triangle—the U.S. Department of Defense, Congress, and corporations. Members of Congress and government officials support procurement programs that provide jobs or support industry in their home states or districts. Meanwhile, defense companies provide significant financial support for reelection campaigns—sometimes pay outright bribes—while cost overruns and delays plague the sector. Military officers and defense department officials offer broad support for new weapons and defense systems to improve capabilities or to gain lucrative jobs in the private sector. Scholars and reporters such as economist and industrial engineer Seymour Melman, sociologist Gregory Hooks, and journalist Andy Pasztor wrote about the problems and dangers of the military-industrial complex. Later critical works, including those by political scientists Rachel Weber and Chalmers Johnson, often linked the defense-industrial sector with increased militarism and an aggressive foreign policy.

By the late 1980s, there were more than fifty ongoing investigations into fraud and waste by defense firms in the United States alone. In addition, there was a series of sensational stories that emerged about cost overruns, including extravagant prices charged for common products—$40 for hammers and $600 for toilets. In response, the U.S. Congress enacted a series of procurement reforms in the 1990s and early 2000s designed to cut waste in procurement. The administration of U.S. president Bill Clinton promoted consolidation among defense contractors to preserve capabilities. The administration also embraced arms exports and weapons transfers to protect the industry and bolster U.S. exports. In 1995, Clinton made arms sales a national security priority and further stoked the debate over the role of the military-industrial complex. The wave of mergers within the industry spread beyond national borders as U.S.

and European firms acquired companies from other countries or from rivals. The result was the rise of large multinational defense firms, such as European Aeronautic Defense and Space (EADS), a joint Franco-German company, with British, Spanish, Dutch, Italian, and Polish subsidiaries and projects with a number of other countries.

Increases in military spending following the 2001 terrorist attacks drew attention to the military-industrial complex in the United States. U.S. vice president Dick Cheney's ties to the defense firm Halliburton highlighted the complex. In the 1990s, Halliburton was fined for illegally supplying dual-use nuclear technology to Libya and Iraq. Still, between 2003 and 2006, the corporation received contracts in excess of $18 billion to supply products and services for the occupation of Iraq. The iron triangle of the military-industrial complex will continue to influence policy formulation and implementation until there are stronger barriers between industry and individual national security establishments.

Military Rule

Military rule has been quite frequent, widespread, and endemic throughout history. Sixty countries (twenty-two in Africa, nineteen in Latin America, thirteen in Asia, and six in Europe) have experienced military rule, including Egypt, Fiji, Myanmar, Libya, Pakistan, Bangladesh, and Thailand. Military intervention in politics may take different forms, ranging from a one-party regime to a facade of democracy.

Military intervention must be distinguished from *militarism*. Military intervention means the constrained substitution of military personnel for civilian authorities; militarism means the acquisition of dangerous and sophisticated weapons. Militarism is a universal phenomenon, whereas the influence of the military differs from society to society, from minimal to total displacement of a civilian government with military rule.

In some cases, the military actually controls the political institutions; in others, it does not assume power directly. To establish military rule, the armed forces may carry out a coup to form a government whose main executive is a military officer. Much depends upon the relationship of the armed forces to the institutions. Under military rule, army leaders become the supreme decision makers.

The military can be classified into three types—personalistic, corporate, and socialist. Personalistic regimes center around a strong man, such as a *caudillo* (a Spanish word for an authoritarian political-military leader) in Latin America. In some Latin American countries, such as Brazil, Argentina, Peru, and Chile in the early 1960s, the military leaders were able to institutionalize their role by casting the political leaders as ineffective and corrupt. In the socialist type, in Gamal Abdel Nasser's Egypt (1956–1970), for instance, leaders aligned with the interests of the lower class rather than with those of the corporate world.

S. E. Finer, a renowned political scientist and the author of *The Man on Horseback* (1962, 3) identified four roles of the military in politics—"influence," "blackmail," "displace," and "supplement." In the first and the second roles, the military works through the civil authorities and remains in the background. In the third, it replaces one set of civilians with another. In the fourth, the military sweeps away the civilian regime and establishes its own rule.

THE MILITARY'S EVOLVING ROLE

Once the military regime settles, it finds itself confronting the same problems its predecessors faced—dealing with the same political groups and forces and shuffling the same limited policy options. Depending upon its political objectives, it may function as a constitutional caretaker, as a backer of civilian government, or as a reformer or revolutionary. For example, the military tried to set conditions for a civilian government in Brazil, was a constitutional caretaker in Syria, and was a revolutionary force in El Salvador.

Where the public attachment to civilian institutions is strong, military intervention in politics is rare. Military intervention takes place in societies with low political culture, where there are few widely accepted political values and where there is a division of opinion on the legitimacy of the regime or incumbents. In such regimes, military interventions take place because there are no moral constraints to prevent them. Usually, the governments are highly dependent on military support.

Samuel P. Huntington made an interesting statement about the evolving role of the military in consonance with socio-economic and technological changes. To him, the role of the military changes as society does. In an oligarchy, a soldier is a radical; in the middle-class world, he becomes a participant and arbiter; and in a mass society, he becomes the guardian of the status quo. According to Huntingdon, "The more backward a society is, the more progressive is the role of military" and vice versa (1962, 221).

However, many scholars have challenged Huntington's statement that military professionalism inclines the military toward a low political posture. Finer, for instance, maintains that the very nature of professionalism often leads to the military's collision with civil authorities. To put a check on the military, a society must have firm faith in civil supremacy. Similarly, Bengt Abrahamsson found that the Algerian coup in 1961 was carried out by some of the most professional elements in the French army.

Because military personnel are disciplined, organized, and have the best training possible, they can become the main agents of modernization. As a societal system, the military can also provide a framework in which traditionalism and modernism can be suitably blended. In a fragmented society, the military can serve as a focus of solidarity and nation-building. Through the military, developing countries may receive new ideas, values, skills, techniques, and strategies for political change.

However, sociologists such as H. D. Lasswell have challenged the idea that the army can be an agent of modernization. They feel that military regimes without civilian support are likely to reach an impasse sooner than civilian ones and to polarize soldiers and civilians. Moreover, modernization cannot be equated with Westernization.

Militias

Although its meaning has varied over time, customary definitions of the term *militia* typically describe an armed force composed of nonprofessional soldiers tasked with protecting a community during times of crisis. Traditional militias either (1) support a professional army in the midst of war, or (2) act alone against a foreign invader. In recent times, however, some militias—especially those found in the United States—have come to espouse doctrines revolving around perceived *internal*

security threats, including those seen as emanating from local and national authorities. Moreover, contemporary accounts of nonstate armed groups increasingly use the term *militia* to describe what some perceive as insurgent or terrorist groups. Thus an understanding of militias requires an appreciation of their historical purposes and their current manifestation in the twenty-first century.

For over two thousand years, militias have been a central pillar of community security. For most of that time, militias consisted of private citizens whose regular social obligations were augmented by military training and the perennial requirements of defending against invaders as well as conducting preemptive and punitive military expeditions. In addition to keeping their communities free from external subjugations, militia members often benefited from this arrangement via the booty and profit extracted from a vanquished foe.

In addition to territorial defense, militias have also been used to build empires, and, in some cases, they have consisted of fighters who were not ethnically or religiously similar to the larger military structure they were subsumed under. Both of these historical features of militias can be found in the Muslim Ummayad Caliphate (661–750 CE)—the second of four caliphates that arose after the death of Muhammad. Although it ultimately created the world's sixth-largest empire, early in its reign the caliphate's wartime efforts were hampered. Such was the case because many of its professional soldiers gave allegiance to their local tribes as opposed to the caliphate as a unit. The caliphate's eventual success in compensating for these internecine tribal-based conflicts was only achieved by creating ranks of non–Arab and non-Muslim militias.

More recently, militias have been used to gain independence from colonial powers as well as a means to safeguard state expansion into recently acquired territories. An example par excellence of these characteristics can be found in the history of the United States. Militias were used to extricate the North American colonists from British rule in the late eighteenth century. Distrustful of standing armies, the newly founded United States then used militias as a means to combat Native Americans and foreign powers as the new nation expanded territorially. When facing military defeat, states have also endeavored to use militias as a means of creating a stalemate. Nazi Germany, for example, unsuccessfully sought to use its militia—the *Volkssturm*—to stall Russian and Allied forces by transforming every city and village in Germany into a fortress, thus contributing to a military standoff.

There is considerable debate regarding the role of militias in contemporary U.S. society. Influential academics and private watch groups are almost unanimous in their belief that militia movements are a profound danger to social order. In addition, contemporary militias in the United States are perceived by most observers as being composed of not only dangerous but also deviant individuals with conspiracy-oriented ideologies. In contrast, defenders of U.S. militias often emphasize that creation of nonstate militias is a politically expressive conveyance of their First Amendment rights to freedom of speech and association. Moreover, such advocates often emphasize that militias

serve as safeguards against perceived governmental trespass of individual rights. In defending U.S. militias, proponents also claim to be exercising their Second Amendment rights under their strict interpretation of this amendment: "A well regulated Militia, being necessary to the security of a free State, the right of the people to keep and bear Arms, shall not be infringed."

Finally, since the end of the cold war, nonstate armed groups have proliferated globally. Many of these groups—such as militants active in Indian Kashmir, Iraq, Nepal, and Pakistan—are often called militias. While they sometimes possess many of the attributes traditionally associated with militias—nonprofessional soldiers providing security in an area devoid of state control—these groups are perceived by many to be better described as terrorist or insurgent in nature.

Mill, James

Scottish philosopher James Mill (1773–1836) occupies a major place in nineteenth-century British political thought. His writings covered not only the fundamentals of government, but also education, political economy, law, history, and prison reform. However, two of his contemporaries eclipsed Mill's standing as a political theorist: his friend and founder of utilitarianism, Jeremy Bentham, and Mill's eldest son, moral philosopher John Stuart Mill.

James Mill was born on April 6, 1773, in Scotland. His mother, Isabel Fenton Milne, changed the family name to the more English-sounding "Mill" to give her first-born son greater social opportunities. It was she who supervised his daily studies in composition, arithmetic, Greek, and Latin (a regime he later imposed on John Stuart.) With support from a wealthy Scottish patron, James Mill attended the University of Edinburgh in 1790. It was intended that he become a minister, but he soon became disillusioned with his religious instruction and left Scotland to pursue a "career of authorship" in London, England.

In 1805 Mill married Harriet Burrow. To support his growing family, he worked as a journalist and editor, writing some 1,400 editorials and hundreds of essays. It was shortly after the birth of John Stuart in 1806 that he began work on the book that eventually established his literary reputation. Published in 1818, Mill's three-volume *History of British India* was highly successful and won him a post with the East India Company. However, the intervening years prior to the book's publication were no less important to Mill's development as a political thinker.

In 1808 Mill met Jeremy Bentham, with whom he formed a long intellectual partnership. Mill, Bentham, and their followers maintained that basic "scientific principles" of human nature, namely, the desire to maximize pleasure and to minimize pain, should be applied to economic and political affairs. Their philosophical creed came to be known as utilitarianism, but as they also believed that the aim of all government legislation should be to seek the greatest happiness for the greatest number of people, the Benthamites were considered "philosophical radicals."

Although he was an enthusiastic propagandist of Bentham's utilitarian principles, Mill altered some of his mentor's views on political reform. He persuaded Bentham to shift his focus away from the British aristocracy as a force for social change and embrace instead a more radical democratic position. In Mill's *Essay on Government* (1820), originally written for the fifth edition of the *Encyclopaedia Britannica,* his arguments were mainly directed against "virtual representation," which, for Mill, resulted in a few aristocrats with "sinister interests" ruling at the expense of the majority's happiness. He maintained that only a representative democracy with frequent elections and an enlarged franchise provided a unity of interest between public officials and the community. That said, Mill limited political participation to the wise and virtuous members of society—educated adult males over the age of forty.

James Mill died on June 23, 1836. His *Essay on Government* had its critics, such as Whig historian Thomas Babington Macauley, who attacked Mill for using what he saw as bogus scientific claims to support radical political reforms, and the feminists who complained that Mill's advocacy of representative democracy excluded half the human race. However, the work remains a classic statement of utilitarian political theory.

Mill, John Stuart

John Stuart Mill (1806–1873) was one of the most influential political theorists of the nineteenth century. His defense in his essay *On Liberty* (1859) of the harm principle (which states the sole end for which power can be rightfully exercised over an individual against his will is to prevent harm to others) and his rejection of paternalism are cornerstones of modern liberalism.

The son of historian and economist James Mill, John Stuart received a rigorous education. Through his father, the young Mill met utilitarianism philosopher Jeremy Bentham. Mill says that reading Bentham's *Principles of Morals and Legislation* (1789) was one of the turning points in his life. At age twenty he suffered a mental crisis that he recovered from after realizing that one needs a purpose beyond one's own utility and must concentrate on making others happy and improving mankind. A prolific young writer, Mill edited the *London and Westminster Review* while in his twenties. In 1843 he wrote *System of Logic* and in 1848 *Principles of Political Economy*. In 1858 Mill saw the demise of the East India Company, for whom he had worked for thirty-five years. From 1865 to 1868, Mill served as a Member of Parliament.

Mill had a number of theoretical commitments. He was a rationalist, insisting humans decide policy by appealing to reasons and not mere feelings, and a utilitarian, believing actions are right in proportion to the degree that they promote happiness. But unlike hedonists, Mill gave a marked preference to higher pleasures: Quality and not just quantity counts. Mill was also sympathetic to socialism, and his utilitarianism beliefs dictated that society ought to defend property rights only if doing so promotes general utility, which he believed in some cases it would not.

Mill was committed to representative government, by which he meant each citizen takes part in government by personally discharging some public function. He also believed, however, that important decisions should rest on knowledge and not be settled merely by large representative bodies, which he thought ill-suited to make laws. In his *Considerations on Representative Government* (1862), he proposed a commission of legislation, though the representative body would retain ultimate power.

Mill was also committed to individual liberty, evident not only in his defense of the harm principle, but in his support of the liberty of speech. He believed that even speech expressing dangerous or false ideas should be protected, in part because only by allowing the contestation of opposing ideas could truth prevail and humankind progress.

In defending liberty, Mill criticized the subjection of women. Mill believed there is no essential human nature. Subjection results not because women are naturally inferior but because males use laws and social institutions to exert power over them.

Mill did defend intervention into countries he regarded as uncivilized, such as India. While Mill did not think that the uncivilized were unprotected by the harm principle, he did rule out self-government for them until they were raised to a condition where they would respect the rights of others.

Millennium Development Goals

At the beginning of the twenty-first century, the countries that compose the United Nations (UN) agreed to eight Millennium Development Goals (MDGs), which they pledged to complete by the year 2015. These goals were derived from the UN's *Millennium Declaration,* which was signed in September 2000. It is an attempt to create a cohesive development plan for the poorest nations in the international system and to link member states with international organizations such as the World Bank and World Health Organization. The UN member states promised to "free all men, women and children from the abject and dehumanizing conditions of extreme poverty." Through realization of the MDGs, the UN predicts that the least-developed countries will be able to escape the poverty trap.

The eight MDGs are extensive in scope. Committed states agree to work toward eradicating extreme poverty and hunger; achieving universal primary education; promoting gender equality and empowering women; reducing child mortality; improving maternal health; combating HIV/AIDS, malaria, and other diseases; ensuring environmental sustainability; and developing a global partnership for development.

The UN has developed eighteen targets that will determine if the MDGs have been met by 2015. These targets have each been associated with a given MDG. Goal One's targets include reducing by 50 percent the proportion of people who suffer from hunger and the proportion who earn under $1 daily. To meet Goal Two, all boys and girls must be able to complete a full primary-level education, and Goal Three is targeted to ending gender discrimination in primary and secondary education. Goal Four will be considered met when the mortality rate of children under the age of five has been reduced by 66 percent. Reducing maternal mortality by 75 percent is the target for Goal Five. Goal Six seeks to halt and reverse the spread of HIV/AIDS and malaria. Goal Seven has three targets: Sustainable development principles must be integrated into the domestic growth policies of underdeveloped countries, the proportion of the population who do not have access to safe drinking water must be reduced, and there must be fewer people who live in slum-like dwellings worldwide.

The UN Millennium Campaign claims that "for poor countries to achieve the first seven goals, rich countries must deliver on their end of the bargain with more and more effective aid, more sustainable debt relief and fairer trade rules." States must be willing to follow the rules regarding nondiscrimination. The UN also suggests that developing countries be granted leniency, such as a reduction of tariffs for their exports and debt relief for economic sustainability.

In conjunction with the UN Secretariat, Dr. Jeffrey Sachs, an economist from Columbia University, suggested the development of "millennium villages" in order for outside actors to help impoverished communities meet the MDGs. The UN has developed twelve villages (in Ethiopia, Ghana, Kenya, Malawi, Mali, Nigeria, Rwanda, Senegal, Tanzania, and Uganda) within distinct agricultural zones on the African continent to prove that development does not depend on the arability of land.

Many criticisms have been leveled at the Millennium Development program. The first is that the MDGs are nothing new. They were part of the "big push" programs of the 1950s and 1960s and the renewed UN development goals of the 1990s. The UN has also had a hard time getting developed nations to provide funds and materials. Finally, many economists claim that the MDGs will be of no use unless the root of the problem is solved—corruption of the governments of these least-developed countries.

Miller, Warren

Warren Miller (1924–1999) was an American scholar who focused primarily on political behavior but also made great contributions to the field of social science as a whole. Born on March 26, 1924, in Hawarden, Iowa, Miller did his undergraduate and masters work at the University of Oregon, receiving his degrees in 1948 and 1950, respectively. Miller's doctoral dissertation on issue-oriented voting, completed at Syracuse University, used data that he helped collect for the first comprehensive presidential election survey. He spent two years teaching at the University of California, Berkeley, before moving to the University of Michigan, where he taught from 1956 to 1980.

Miller first drew attention with two books he cowrote on electoral behavior—*The Voter Decides,* written in 1954 with Angus Campbell and Gerald Gurin, and *The American Voter* (1960). *The American Voter,* cowritten with Angus Campbell, Donald E. Stokes, and Philip E. Converse, and their subsequent collaboration, *Elections and the Political Order* (1966), defined what is commonly called the Michigan school of political behavior. This school of thought coined the term *funnel of causality* to identify a model used to examine decision making among groups and explored the predictors of voter participation and choice. Miller and his colleagues also posited that party identification was a stable predisposition that shaped issue positions.

In 1962, Miller created the Inter-University Consortium for Political and Social Research (ICPSR), after he and his colleagues received numerous requests for data used in *The American Voter.* As the first executive director of ICPSR, Miller made the survey data readily available, and through the years the consortium continued to collect data, so much so that by the early twenty-first century, it housed the largest collection of quantitative academic data in the world. Under Miller's auspices, ICPSR also trained new generations of scholars in survey methodology and data analysis through its yearly summer programs.

After stepping down as the head of ICPSR in 1970, Miller directed the Center for Political Studies for eleven years. The center encompassed ICPSR as well as the newly developed National Election Study (NES). As the principal investigator of NES, Miller sought to increase the scope and participation of the Michigan surveys first administered in 1952 and to standardize the questions and collection of the data in order to facilitate comparability between surveys. In 1978, Miller managed to get National Science Foundation funding for NES, thereby creating a national archive of electoral data. During the same period, Miller was elected president of the American Political Science Association (1979–1980) and president of the Social Science History Association (1979–1980), which he founded. Miller also served as a consultant for ABC News, and it was while he was serving in this capacity that he coined the term *projection* to describe election forecasts.

In 1981 Miller relocated to Arizona State University and began writing a series of articles on U.S. elections that were

published in the *British Journal of Political Science*. These articles were eventually collected in his 1996 book entitled *The New American Voter*. He died of complications stemming from diabetes in 1999, shortly before his last book, *Policy Representation in Western Democracies* (1999), an edited volume, was published.

Mills, C. Wright

American scholar Charles W. Mills (1916–1962) was one of the most influential sociologists of the twentieth century. Although he died at the early age of forty-six, he left a body of work that has not been equaled for its breadth of analysis and intellectual honesty. Mills was paradoxical: He was a radical who broke away from radical traditions, both a pessimist and an optimist, a sociologist who had little patience with academic minutiae, and an intellectual who was skeptical of intellectualism.

Mills was born in Waco, Texas, and did his doctoral work in sociology at the University of Wisconsin, where he came under the tutelage of German scholar Hans J. Gerth. Gerth led Mills to study the sociology of knowledge associated with the Frankfurt school, and over the next decade the pair produced a number of works, including *From Max Weber* (1946) and the groundbreaking 1953 *Character and Social Structure*. At the same time, Mills's opposition to World War II (1939–1945) branded him as an antiwar radical; he held this stance that he held for the rest of his life.

In 1945 Mills moved to New York City to join sociologist Paul Lazarsfeld's Bureau of Applied Social Research and later the Department of Sociology at Columbia University. Here he joined forces with J. B. S. Hardman, veteran labor journalist, who inspired in Mills a brief interest in the trade union movement. Mills then moved to the most mature phase of his writing, producing three great works: *The New Men of Power: America's Labor Leaders* (1948), *White Collar: America's Middle Classes* (1951), and *The Power Elite* (1956). In *The New Men of Power* Mills contended that labor had effectively renounced its opposition role and had become a subaltern of the capitalist system. In *White Collar* he expressed the belief that bureaucracies had overwhelmed the working classes, robbing them of all independent thinking and making them mindless robots. Power was concentrated exclusively in an axis of evil: the military, corporations, and politics. Yet, Mills shared the hope with many of his militant peers that history was still open to human intervention and that there was nothing inevitable about the corruption of the body politic. A condemnation of America's economic, political, and military elites, *The Power Elite* explored the insular nature of groups in power and claimed that they were predisposed to use unwarranted military force.

Mills followed up these works with two polemical tracts: *The Causes of World War III* (1959), which assailed U.S. foreign policy, and *Listen, Yankee* (1960), which defended Fidel Castro's Cuba against attacks from the administration of American president John F. Kennedy. His last two scholarly books, *The Sociological Imagination* (1959) and *The Marxists* (1963), dealt with the cultural apparatus of the intelligentsia.

In Mills' *Sociological Imagination* (1959), he excoriated the tendency of sociologists (and political scientists) to be obsessed with grand theories and abstract empiricism. However, he had a high sense of mission himself, not only his own but that of intellectuals in general and social scientists in particular. He considered science and politics as vocations. Because all other classes were mired in mediocrity, it was up to the intellectuals to deploy reason and intervene in imposing social order. Political philosophers needed not only to analyze society but also articulate an ethic and formulate ideals. Mills was not cynical about the possibility of social regeneration and felt that humans needed more rationality and enlightenment.

The central category in Mills's social thought was that of power, especially the structures that helped to perpetuate it and the mechanisms by which it was achieved and retained by the elites. He was a state theorist to whom the elites were an institution in themselves. Although corporations possessed some autonomy, the state was the principal locus of power. Thus the three institutional orders that are closely linked, but spatially and historically independent, are the military, corporate, and political. Together these three constitute a ruling class whose interests coincide with that of the ruled.

Mills was also a pamphleteer and a radical journalist. In the last decade of his life, he concentrated on manifestos and indictments of the prevailing social and political order to the exclusion of scholarly works. He rejected the prevailing conception of the scholar as politically neutral and uncommitted. Mills was an unabashed partisan whose values infused his research and writing, although he continued to be dedicated to critical theory and dispassionate, empirical inquiry. He was an inveterate critic of "old ideas," among which he included communism, soft liberalism, and market economics.

Mills was the best social commentator on the troubled 1960s, an era that exemplified the best and the worst of the new radicalism. He articulated the function of the intellectual in a society that was undergoing upheaval, and his final exhortation was for the new left to fight against the tired orthodoxies of the past.

Milton, John

John Milton (1608–1674) is considered one of the great poets of the English-speaking world and was a prominent statesman during the English Civil Wars (1642–1651) and their aftermath.

Milton studied at Christ's College, Cambridge, intent on entering the Protestant clergy. However, he began publishing poetry, and, after finishing his studies, began a period of solitary study followed by a tour of Italy and France. His travels cemented his distaste for Roman Catholicism, and when he returned to England he began writing in support of the Puritan cause. His earliest tracts concerned issues of religious doctrine, and his defense of liberty of conscience would ground his justifications for liberty in later political tracts. All these works demonstrated elegance and learnedness, qualities that, when applied to his pamphlets on English politics, made Milton one of the most formidable spokesmen for the English republican cause.

Milton's first, and perhaps best-known, major political work was *Areopagitica,* which appeared in 1644. The treatise denounced a Parliamentary decree that required printers be licensed. Citing each man's right "to exercise his owne leading capacity," Milton argued against censorship of the press and expressed a concern about the effect that it would have on the acquisition of wisdom.

As secretary of foreign tongues, Milton was commissioned to write a Latin response to Claudius Salmasius's defense of the divine right of monarchy and attack on the English Commonwealth. Milton's response, the *First Defense,* is an extremely learned chapter-by-chapter rebuttal that demonstrated his erudition and scathing wit. In this work, Milton argues that regicide could be justified through English law, which acknowledges that "there are situations in which the law itself arms the vassal against the lord, and delivers the lord over to be killed." He also argues for the primacy of the citizens acting through Parliament, whose power he deems the "highest in the land." That Parliament, and the citizens who elect it, should have such political liberty is justified by the fact that all

people have human reason and the ability to acquire wisdom. Other well-known works by Milton include *The Tenure of Kings and Magistrates* (1649), *Eikonoklastes* (1649), and *Defensio Secunda* (*Second Defense,* 1654)

Later in his life Milton dedicated himself to the composition of the poems for which he is most famous. His deep and foreboding poetical engagement with evil and the lesser side of human nature received some political expression via the polemic *The Ready and Easy Way* (1660). In this work, he ruthlessly chastised the English people for abandoning "a just and noble cause for the mixture of bad men who have ill manag'd and abus'd it" and laid out a case for maintaining a popular government instead of reverting to monarchy.

While Milton's poetry can be seen as a return to the religious concerns that dominated his early life and writings, these works are also rife with commentary on the politics of his time. Scholars have focused on the odd inversion in *Paradise Lost* (1667), in which Heaven appears monarchical and Hell republican, and questioned Milton's dedication to republican principles in his later years. However, author Armand Himy argues in *Milton and Republicanism* (1995) that Milton ultimately concludes that "Christian liberty and republicanism cannot be separated," for Milton believed that the individual right to follow a well-developed conscience could only reach its fullest expression in a republican commonwealth.

Minimal Effects Model

The *minimal effects model* is a political science theory that argues that campaigns generally have only a minor impact on voter choice. It is based on the work of Paul Lazarsfeld in the 1940s. Central to the minimal effects model is the contention that most voters have clear, strong opinions on issues, and campaigns mainly serve to reinforce those attitudes. It is premised on the idea that candidates will have unambiguous positions on issues, which allows voters clear choices. People with strong partisan opinions are especially susceptible to campaign messages that link candidates with their biases. Partisan voters even tend to ignore or tune out information or messages that run counter to their beliefs and reject information from rival campaigns that seeks to change their preference or party affiliation. Consequently, the hypothesis contends that the most significant impact that campaigns can have is on voter turnout.

New research in the 1980s and 1990s questioned the microfoundations of the original minimal effects model. Such scholarship examined, for example, the role of issue relevance and the propensity of voters to discount public information sources versus private sources. Our understanding of campaign effects remains incomplete—there is convincing evidence that campaigns matter overall, but much less evidence of the effect or the effectiveness of their parts and mechanisms.

Minimal State

The idea of the *minimal state* is associated with right wing political ideology and libertarian political theory. Its functions are limited to the protection of individual security and property rights along with external defense. Its ideal is the "night watchman" state. In a minimal state, the free market is the principal means of social organization and resource allocation. Supporters of the minimal state are generally most critical of the socialized elements and redistributive functions of the modern welfare state. However, the ideal of the minimal state is also without many of the regulatory functions of the modern state, such as modern environmental policies. And of course, any whiff of paternalism is noxious to supporters of the minimal state—seat-belt laws, for example.

It is useful to make a distinction between two types of defenses of the minimal state, call them contingent and principled arguments. It is important to note that the two types are usually presented together in a more general case for the minimal state. Contingent arguments make empirical claims and appeal to the consequences of different types of institutions in defense of the minimal state/free market system. To follow contingent arguments all the way to the minimal state entails a consistent belief in (1) the allocative efficiency of Adam Smith's "invisible hand" of the market in the organization of the production and distribution of virtually all goods and services and (2) the related allocative inefficiency of government, despite the apparent belief that it can successfully provide security for persons and property (thus distinguishing it from anarchism). The welfare state is criticized for creating dependency amongst recipients (as opposed to the independence that is thought to characterize satisfying needs and wants through market exchanges). The welfare state is thus argued to create the "moral hazard" of a diminished work ethic among its recipients, which has the effect of dragging down overall productivity.

Principled arguments for the minimal state, on the other hand, do not appeal to the consequences of institutions and come in prior to them. They do not appeal so much to the allocative efficiency of markets and the inefficiency of government as to the nature of legitimate political authority—the minimal state is the extent of justifiable public power. For libertarians, state control of different aspects of the economy, and other elements of social life, is political tyranny. It is this idea, the undermining of individual liberty through the creeping power of the state, that, according to F. A. Hayek, paves "the road to serfdom."

The political theory of John Locke provides the intellectual foundation for the minimal state as the extent of legitimate political authority. According to Locke, the ends of the state are the protection of life, liberty, and property. These limits correspond to the natural rights of individuals, which in the words of Robert Nozick constitute "side constraints" on political authority. By positing the notion of natural rights, Locke contends that individuals can acquire rights to goods and resources in the "state of nature"—that is, the situation preceding political society. The alternative to natural rights is viewing them as "conventional," created by the state and so imposing no prior limits on its authority. One of the primary purposes of Locke's *Second Treatise of Government* is to argue against the conventional view of rights. For Locke, individuals own themselves (the principle of self-ownership), and by mixing the right over themselves with the external world, they acquire rights to it as well. Over time, in the absence of central authority, individual natural rights become less secure, as the dispossessed increasingly violate them. As a result, individuals come together and consent to create a central authority in order to protect their natural rights. Any type of political authority that violates individual natural rights is considered illegitimate. It is the limitation to protecting prior individual natural rights that constitutes the minimalist nature of the minimal state.

Not all defenses of the minimal state, however, appeal to the natural rights of individuals. David Gauthier, for example, defends the minimal state from individual interests and the principle of mutual advantage amongst producers, thus leaving the nonproductive outside the scope of justice.

CONCLUSION

The proposal of the minimalist state owes its revival in the twentieth century in part to the backdrop of totalitarianism (as in the case of Hayek) as well as to the big government legacy of the 1960s (in the cases of Nozick and Charles Murray). It had a substantial impact on the 1980s conservative "revolutions" headlined by Prime Minister Margaret Thatcher in England and President Ronald Reagan in the United States. While both of those countries' policies are far from the minimalist state ideal, their states are noticeably less extended than the welfare states of continental Europe.

Mining Policy

Traditionally, mining policy dealt with ownership of extractive resources, including all minerals, metals, water, sand and gravel, and carbon-based fuels. However, by the end of the twentieth century in most countries, it had acquired a much broader scope, covering not only the ownership of the resources but also the surface needs of the mine or well developer, the safety of workers, the disposal of waste material, the consequences of water and air contamination plus their prevention, and taxation or royalties.

There are two broad approaches to extractive resource ownership and their regulation. In much of the world, the state reserves for itself ownership of all subsurface resources, and the terms for allowing resource exploitation include a percentage of production and/or profits for the state. A different conception of the subsurface is found in some common law countries such as the United States, Canada, and Australia. In these countries, surface ownership includes most subsurface resources. Still, as most hard-rock metal mining in these three countries is done on public lands, national and subnational legislation controls access. With both approaches, there is some truth in the observation of Herbert Hoover, mining engineer and U.S. president (1929–1933), that people with political power can be identified in any society by locating who benefits from mineral wealth.

In the Spanish American republics, mining policy traditionally sought to produce revenue for the state, not promote economic growth. The discoverer of a mine could make a claim on the land of any owner, including use of the surface for mineral processing. If work on the mine were suspended for more than a brief period, anyone could take over the claim. Taxation averaged 20 percent of production, not profit. This meant that in a time of low prices, mine operators necessarily continued producing even if at a loss, or they risked losing everything. These early codes were designed for gold, silver, and copper—they did not cover oil and coal. With the rise of late-nineteenth-century industrial production, the old codes were replaced by so-called liberal codes that granted permanent claim to extractive resources through payment of an annual patent fee.

The "Spanish" codes were replaced in the newly acquired western territories of the United States soon after the United States–Mexico War (1848). Extensive mineral discoveries made on these now public lands initially were under governance at the mine district level. Eventually the federal General Mining Law of 1872 created uniform terms based on a variety of existing local laws. The 1872 law remains in force for metal mining and is among the last major statutory milestones from the period of U.S. expansion. The code enshrined the patent fee system and required no royalty payment. Reform of this law has been an ongoing matter in the late twentieth and early twenty-first centuries.

Mining is almost always a disruptive activity in terms of the land surface. Waste rock or material is normally disposed of on the surface. This has the potential for long-term groundwater contamination as minerals oxidize or weather. Often metals are found in combination with sulfur, and the traditional method for its removal involved burning. During the early Industrial Revolution, smoke and sulfurous fumes were accepted as a price of progress. Prior to the twentieth century, defoliation by sulfuric acid around copper smelters was the norm, and legal problems with neighbors were commonplace. Air pollution and water contamination in the processing of minerals is a matter of major dispute in modern times.

Until the last quarter of the twentieth century, regulations were weak on mine closings. Once minerals were gone, and thus the income stream was gone that might finance a closing with cleanup in mind, mines were abandoned. Any problem fell to the original surface owner. After the Love Canal disaster in New York state in the late 1970s, which was not mining related, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), known as the Superfund program, was signed into law in 1980. This legislation has become the prime mining policy for the cleanup of old mines. Cultural heritage programs often clash with Superfund projects. In old mining districts, retaining the mine head frames, buildings, and mine openings can conflict with the effort to improve drainage by extensive grading of the land, usually mountainous, into new contours.

Minority Representation

The concept of minority political representation can take many forms. Primarily, the reference "minority" can denote a numerical or marginalized group identifier. Given the predominance of scholarship that focuses on the legislative branch of government in the United States, herein minority representation is defined as the congressional responsiveness to minority and/or African American interests in the United

States. To examine that concept, this entry briefly highlights research concerning members' voting ideologies, the role of voting legislation and redistricting in responsive to minority interests, and, finally, how the representation of minority interests has evolved over time.

DIFFERING PERSPECTIVES

A main goal of minority representation is to empower minorities by enacting policy preferences deemed substantively significant to their sociopolitical lives. How best that empowerment occurs and by which mechanisms has long been debated. For some, when it becomes time to redraw congressional district lines, it is important to create and sustain districts that have a majority-minority population. Many such scholars claim that those districts are necessary to elect a sizable number of African American and Latino representatives. For these scholars, this matters, because the descriptive presence of minority representatives suggests that they are more likely to support minority interests. However, other scholars disagree and argue that in some instances (e.g., white Democrats versus black Republicans), the political party of the representatives is as important as (if not more important than) their racial identification in predicting how they may vote on issues that matter to minority interests. Finally, some scholars caution that what is often in the interests of minority representatives is not necessarily in the interests of or of interest at all to minority voters.

For other experts, to some extent, the effective representation of minority interests rightfully assumes an ideologically homogenous district. While that homogeneity need not be limited to racial identity or political party preferences, some norms of similar values and interests between the representative and his or her constituents is most likely to produce the effective representation desired. Thus, a representative gauging his or her level of responsiveness by considering constituents' opinions in their voting behavior determines effectiveness (as opposed to responsiveness being a measure of electoral success in a competitively political environment).

A BRIEF HISTORY

Still, minority representation encompasses more than policy preferences. The history of race and minority representation has a long track record with the U.S. Congress and particularly the House of Representatives. The Congress has had an inconsistent and at times contradictory or ambivalent stance on minority representation issues since the drafting of one of the country's founding documents, the Declaration of Independence. For example, the same institutional body that wrote that all men were created equal also sanctioned slavery and the institution of second-class citizenship. The same institutional body that guaranteed equal protection of the laws and said that all persons were entitled to the full and equal enjoyment of public accommodations stood largely silent when the U.S. Supreme Court legally sanctioned the concept of "separate but equal" accommodations in 1896. With the brief exception being the historical period of Reconstruction following the Civil War (1861–1865), not until the enactment

of the Civil Rights Act of 1964 and the Voting Rights Act of 1965 did Congress begin to establish a more consistent record of at least responding on the basis of preexisting law to the representation of minority interests in the United States.

A LOOK TOWARD THE FUTURE

More often than not, the protection of minority rights that are established in the 1868 ratification of the Fourteenth Amendment has been applied in a limited way to groups other than African Americans and Latinos. However, the U.S. Congress will be continually pressured to apply its previous protections of minority rights to an increasingly powerful number of American minority groups that extend beyond the realm of race and ethnicity with a look toward the global future.

Misogyny

Translated from its Greek roots, *misogyny* literally means the hatred of women. More broadly, misogyny refers to cultural beliefs that men are better, stronger, more rational, more capable, and more authoritative than women, especially in the public sphere. These beliefs contribute to the dislike or mistrust of women and the idea that gender hierarchy is natural or functional for society.

According to some arguments, the idea that women belong exclusively in homemaking and parenting roles is caused by, or is an example of, misogyny. The belief that women are naturally more nurturing than men can be used to justify barring women from seeking employment or participating in other aspects of public life. Some also argue that efforts to glorify women's domestic roles, or attempts to protect women from perceived danger, can actually be disguised as misogyny. According to this line of thought, when men venerate or shelter women, men might think they are helping or revering women. Holding a door open, paying for a date, escorting a woman to her car at night, or guarding a woman's sexual virtue is often motivated by good intent. However, these acts may be perceived as infantilizing or condescending, because they minimize women's agency and full range of capabilities.

For these reasons, well-intentioned kindness by men can result in confusion and misunderstanding.

MISOGYNY IN POLITICAL THOUGHT

Although not all cultures are misogynistic, misogyny is found in most patriarchal societies and throughout the canon of political thought. Major figures in political philosophy have described women as lacking the ability to reason, conflated women with nature, or defined women through their biological capacity to reproduce. Because these same theories also generally claim that rationality is required for political participation, and that the natural world must be conquered or suppressed, feminist philosophers critique these theories on the basis of their misogynistic presuppositions.

Confucius (551–479 BCE), for example, believed in a hierarchical family structure and the idea that women's status was naturally inferior to that of men. Although Confucius did not express explicit hatred toward women, he wrote that ignorance was a woman's virtue. Some argue that Confucius's ideas, like those of his counterparts, provided a cultural foundation for devaluing women and girls.

Aristotle (384–322 BCE) claimed that women's ability to reason was unformed and lacked authority. This provided a rationale for excluding women from political participation and for Aristotle's proposition that men naturally rule over women. Arthur Schopenhauer (1788–1860) wrote that women lack a sense of justice and the ability to reason: Women are not meant for great mental accomplishment but, instead, are intended to obey men. According to Schopenhauer, women thus remain large children for their entire lives. Jean-Jacques Rousseau (1712–1778) argued that women are naturally dependent on men and are sexual objects that men control. According to G. W. F. Hegel (1770–1831), while men are like animals, women are like plants; that is to say, women lack independence or distinct interests of their own. In *Beyond Good and Evil,* Friedrich Nietzsche (1844–1900) frequently insulted women and controversially argued that higher forms of civilization involve stricter control over women.

CONTEMPORARY MISOGYNY

In contemporary culture, misogyny is expressed and reinforced through personal beliefs that women are naturally inferior, biased representations of women in popular culture, gender discrimination in the workplace, sexual harassment, sexual assault, or even femicide (the murder of women). Derogatory terms for women and women's genitalia are examples of misogyny, as are practices like female genital cutting or mutilation, "honor killings," or invasive cosmetic surgeries, including so-called vaginal rejuvenation. Music lyrics describing rape or sexual assault are considered misogynistic, as is advertising that hypersexualizes or objectifies women.

When popular media such as music videos, movies, or television shows depict women in submissive or subjugated roles, this creates a cultural climate that encourages men to think of women as inferior, and that enables the abuse and degradation of women. Patriarchal religion has also been a powerful vehicle for perpetuating misogynistic beliefs about women.

THEORIES ADDRESSING MISOGYNY

Addressing the sources of and solutions to misogyny is the primary focus of feminist theory. These theories address four general aspects of misogyny: First, feminist theory describes how misogyny justifies and maintains women's subjugation or domination by men. Second, feminism explains the ways in which misogyny, sexism, heterosexism, and racism are interrelated and reflect the dominant values in society. Third, feminist theorists argue that women who believe they are inferior, or who think they deserve to be objectified or abused, have internalized the cultural messages of misogyny. Finally, feminist theory explores how shifting misogynistic beliefs requires a willingness to challenge the social blueprint of cultures that encourage sexism and violence toward women.

Feminist thinkers claim that misogyny produces a diminished, one-dimensional image of women. According to some theories, contemporary pornography, for example, reflects this disregard by portraying women as existing only to satisfy men's sexual desire. As a result, misogynistic hatred is directed toward women for failing to uphold a culturally manufactured expectation that women are easy to control and naturally inferior to men.

Mission Civilisatrice

Mission civilisatrice ("civilizing mission") was the French colonization policy that emphasized efforts to transfer French political, social, and linguistic norms to subjected peoples. The approach was officially designed to "uplift" the lesser-developed peoples of the world and convert them into French citizens. The Portuguese empire also utilized a similar approach to its colonial territories.

The mission civilisatrice emerged in the late 1800s, concurrently with a renewed period of European imperialism that included the acquisition by France of new territory in Africa and Indochina. French political leader and two-time prime minister Jules Ferry was one of the foremost advocates of the mission civilisatrice. French citizenship was conferred on inhabitants of several colonies, including Dakar

and Saint-Louis in modern Senegal. These territories were subsequently incorporated along with other West African colonies into French West Africa, and the new formation was granted the right to elect representatives to the French National Assembly in 1946. The French view of colonialism differed from that of other colonial powers, who emphasized governance rather than integration of colonial peoples. The policy of assimilation was ultimately replaced by "association" in the late 1940s and early 1950s, in which the colonies were granted an increasing degree of autonomy in an effort to preserve the empire.

Mixed Method

Mixed method research involves the combination of qualitative and quantitative empirical methodologies within a single research design. (Although some consider the combination of quantitative theoretical methods with qualitative empirical methods to be mixed methods, the emerging consensus is that the term *mixed methods* refers to empirical analysis.) Political science long has used mixed methods—the study described in *The American Voter* (1960), for instance, used both statistical and qualitative analysis of survey questions—but specific acknowledgment of mixed methods has become increasingly popular in all sociobehavioral research in recent years.

One common claim is that quantitative research is useful for generalization about causality, and qualitative research is useful for the identification of mechanisms. Mixed method research can proceed concurrently (where qualitative and quantitative data are collected together), sequentially (where one type of analysis builds upon an already completed alternative analysis), or by converting data from one form to another for two separate analyses. Some mixed method research uses qualitative analysis, such as ethnographic or archival research, for the purpose of theory generation and then quantitative analysis for the purpose of theory testing. Nested analysis uses qualitative analysis of specific cases to either additionally test or else refine a theory already tested through large-N statistical analysis.

Mobilization, Political

Political mobilization is the process whereby political actors encourage people to participate in some form of political action. In its concrete manifestations, this process can take on many different shapes. Political mobilizers may typically persuade people to vote, petition, protest, or rally, or to join a political party, trade union, or politically active civic organization. Less frequently, they may propagate violent activities such as rioting or ethnic cleansing. Political mobilization thus covers a broad spectrum of public action, from the covert to the disruptive, and from the institutionalized to the unconventional.

MEANS AND ENDS OF POLITICAL MOBILIZATION

The tools that are commonly used to mobilize audiences are widely diverse, too. They include classic electoral campaigning through billboards, mass conventions, postal mail, and various types of television and radio communication, but mobilizing political actors may just as well rely on door-to-door canvassing, pamphleteering, mobile phone communication, or social networking on the Internet. In nondemocratic environments, rulers or particular nonstate groups may sometimes use (military) force to push people into certain collective political behavior.

All political mobilization has in common that it is initiated by mobilizing agencies looking for adherents to a collective cause. These agencies try to persuade potential adherents to take part in public actions in order to defend that cause. Therefore, political mobilization usually has a distinctly collective dimension to it. There is strength in numbers, mobilizers know, and so they seek to change the behavior of large groups of citizens in order to achieve well-defined political aims. These aims, however, may vary. There are myriad types of public action that are considered to best serve these causes, and many strategies are used to persuade people to participate.

RESEARCH TRADITIONS

Political scientists have studied political mobilization in several ways. One important strand consists of scholars who examine the mobilization patterns created by electoral politics. Their research interest is thus in institutionalized mobilization. Especially in the study of established democracies, political mobilization is often understood as the actions that elites undertake in order to create a stable group of supporters and persuade them to express their support through the ballot box. Among the questions these researchers ask are the following: What determines voters' decisions? To what extent is the success of electoral mobilization dependent on existing affiliations, organizational capacities, or persuasive ideas? The study of ethnic mobilization, for example, may weigh the relative importance of different potential sources of ethnic voting: cultural affiliation, political manipulation by elites, and existing socioeconomic divisions that coincide with ethnic boundaries.

Political scientists would have only a narrow understanding of the process of political mobilization if they were to exclude from their scope those forms of political action that are outside the electoral process, ranging from peaceful protest to violent revolutions. This is the field of unconventional political mobilization, or as it is sometimes referred to, contentious politics. Many now view extraelectoral action as an inherent aspect of political mobilization. Political scientists argue that such unconventional expressions of politics do not diminish with the advent of modernization. In fact, they are

increasingly viewed as a "normal" characteristic of politics, even in advanced democracies.

According to some scholars, in the early twenty-first century, the importance of unconventional political action has grown. Long-term declines in election turnouts and membership numbers in political organizations show evidence of an increasing disengagement from the channels of political participation that are traditional to advanced industrial democracies. In their place, new forms of mobilization—globalized activism based on international norms, consumer boycotts, participatory networks through the Internet, and so forth—have emerged. Perhaps, some scholars argue, democratic engagement is not declining, but being reinvented and even reinvigorated.

SOCIAL MOVEMENTS AND POLITICAL MOBILIZATION

The study of political mobilization outside electoral politics has deep roots in political sociology and, in particular, in the study of mass protest and social movements. This sociological view on political mobilization has allowed analysts to look for factors beyond electoral campaigns. These studies have examined the way in which protest waves and social movements have emerged, how they have developed, and what impact they have had on policy outcomes or social change. They have brought several new dimensions of mobilization to the attention of political scientists: the social grievances underlying collective action, the importance of resources, the role of meaning manipulation and ideas, and the political context (the opportunities and constraints) shaping such action. For example, contemporary researchers do not simply view the American black civil rights movement as a spontaneous mass response to social grievances. They have examined the political opportunity structures that have shaped this movement, the resources that have supported it, and the global spread of human rights norms that has given the movement's ideas, claims, and demands a universal validity.

Social movement research has thus considerably altered political scientists' understanding of what is "political" in mobilization. Political scientists are now increasingly inclined to question the neat division social scientists once made between the political significance of political parties and interest representation in state institutions, on the one hand, and the social and cultural (but supposedly less political) weight of social movements, on the other. Of course, social movements have important cultural and social implications, but they are also inherently political. The mobilization of people into nonelectoral and noninstitutionalized types of public action should be regarded as a form of political mobilization, since these actions may be signs of newly emerging interest cleavages. These interest cleavages, in turn, may serve as a new basis of electoral mobilization. In the 1960s, for example, environmentalism in Europe was exclusively a form of grassroots activism, yet it was also inherently political. This activism created possibilities for a new type of electoral politics in later times. In the 1970s and 1980s, "green" political parties were established across Europe,

and in some countries, notably in Germany, green candidates received the support of a substantial part of the electorate. In many current European party systems, the greens represent a small but relatively stable political force.

CONCLUSION

Political scientists have moved toward a more inclusive definition of political mobilization, which includes electoral as well as extraelectoral politics. They have also become more aware of the ways in which electoral and contentious politics may coincide and interact. Interaction is often subtle and covert. In some cases, however, it is more conspicuous, in particular when contested election results become a focal point for new forms of public protest, as has been exemplified in postelection unrest and clashes in Georgia (2003), Ukraine (2004), Kenya (2007 and 2008), and Iran (2009).

Modernization

Modernization theory is a term applied to several related social science theories that explain the process by which societies change from more traditional to more modern entities. Originating from classical social theory, including the writings of Max Weber and Karl Marx, U.S. social scientists built on the insights of classical social theorists of the 1940s and 1950s to understand the challenge of overcoming poverty in Africa, Asia, and Latin America. In its heyday in the 1960s, modernization theory informed government policy in the United States, influencing foreign aid doctrines and the creation of the Peace Corps. Modernization theorists share an optimistic perspective on the prospects for promoting development; early writers of the school expected a convergence

in the economic, social, and political characteristics of the world's many societies. After the failures of U.S. foreign policy in Southeast Asia, revelations of misdeeds by transnational corporations, and the emergence in Latin America and Africa of theories that emphasized dependency and neocolonialism, modernization theory came under intense criticism in the 1970s and 1980s. In recent years, scholars associated with the World Values Survey (WVS), principally Ronald Inglehart, have revived and modified the approach.

CLASSICAL ORIGINS OF MODERNIZATION THEORY

Karl Marx's historical materialism provoked emulation and reaction from many later writers whose work became the basis of this approach to development. He argued that through structural conditions and change, every country could become modern. Marx's writing about successive modes of production, each more technologically advanced and materially productive, and his view that economic change shapes political, social, and cultural change, caused some later writers, such as Max Weber in *The Protestant Ethic and the Spirit of Capitalism,* to search for cultural or attitudinal bases of economic change and inspired others to link closely the emergence of what they considered more advanced political regimes, such as democracy, with economic change. Internal Marxist critique, such as that of Russian leader Vladimir I. Lenin, recognized that imperialism kept some countries from modernizing.

The strong distinction drawn by modernization theorists between tradition and modernity has its roots in sociologist Ferdinand Tönnies's contrast between *Gemeinschaft* (traditional community in which kinship and other bonds sustain human connections) and *Gesellschaft* (modern society in which human linkages are mainly instrumental); historian Sir Henry Maine's contrast between an earlier world of *status* based on long-established group membership and modern societies in which autonomous individuals associated through *contract* and individual agency; and sociologist Emile Durkheim's discussion of change from *mechanical solidarity,* in which individuals' attachments are based on their similar, mostly agricultural occupations, to *organic solidarity,* in which connections are based on a more complex division of labor. American sociologist Talcott Parsons built on these conceptions to formulate a series of "pattern variables" that changed as a society moved from the pole of tradition to the pole of modernity. He expected variables to move from ascription, in which individuals are valued according to the social groups into which they were born, to achievement as the standard to determine social status; from particularism to universalism in political norms; from diffuseness to specificity in terms of social roles; from *affectivity,* or emotion-based attachments, to *instrumentalism,* or links based on utility, as the basis of personal relationships; and from a collective to a self orientation.

BASIC TENETS

Modernization theory tends to focus on the movement of whole societies from traditional to modern forms. Hence, writers in the school focused on urbanization, industrialization (with its attendant increase in the scale of investment), and the increasingly complex division of labor (with its consequences for specialization in occupations) as manifestations of development. However, modernization theory simultaneously emphasizes individual attitudinal change as the main driver of modernization. Formal education can serve as an instrument of attitudinal change; it is but the most obvious example of the diffusion of values to areas or social groups in which tradition prevails from regions or groups that have already modernized. The mass media are also effective in spreading modern values.

Diffusion is central to modernization theory. Early modernization theorists in particular accepted with little hesitation that individuals exposed to modern values would prefer them to traditional norms, with the exception of those who obviously benefited materially and politically from the traditional social structure. Modern values included openness to new experiences, independence from traditional authorities, a scientific outlook, ambition, punctuality and careful use of time, desire for civic engagement, and interest in public affairs. Some modernization accounts went so far as to suggest that traditional societies did not embrace modern economic rationality but saw modern values as widely shared in the West. Modernization implied diffusion of Western values and a cultural convergence of the already modernized West and developing countries.

Modernization theorists took as their unit of analysis the nation-state or individual national society. Aggregate individual change within a nation produced societal-level change. Modernization theorists did not heavily emphasize international forces, and to the extent they did consider factors beyond the individual society, they highlighted the positive roles that value diffusion and providing capital and technical know-how played in promoting development.

Although modernization theorists explored different dimensions of development, such as individual attitudinal change, urbanization and industrialization, political change, and economic growth, almost all agreed that modernization was a multifaceted process. Individual attitudinal change is a part of a larger process that includes shifts in social structure, the political order, and the economy. Hence, theorizing about modernization took place at a relatively high level of abstraction to avoid excluding any element of the process.

Two key processes of modernization were frequently identified as central: industrialization, which moved people from a seasonal agricultural existence dependent on weather to the assembly line with its time clock; and secularization, which separated an individual's spiritual life from his occupational, recreational, and political lives and undermined the authority of institutionalized religion.

SOCIAL PSYCHOLOGICAL APPROACHES

Sociologist Alex Inkeles's work focused on individual modernity and argued that socialization in schools and industrial workplaces helped "make men modern." Perhaps the most

influential scholar of this approach was psychologist David C. McClelland, who emphasized the achievement motive, arguing that societies are more likely to realize economic development if a large portion of their population has a high "need for achievement," a specific psychological trait.

Scholars of the social psychological school tend to identify principles such as honor and the quest for glory as relics of traditional society. They regard values such as acquisitiveness, thrift, and ambition as essential to economic development, and attitudes of interpersonal trust, moderation, and egalitarianism as critical to the emergence of democracy.

ECONOMIC APPROACHES

Rostow's *The Stages of Economic Growth* (1960) drew the notice of policy makers who hoped to promote development in what by then had come to be called the third world. Rostow laid out five stages of economic development: traditional society, the preconditions for takeoff, takeoff, the drive to maturity, and the age of high mass consumption. Rostow's approach fit modernization theorists' tendency to identify development as the movement from tradition to modernity, which happened to resemble the course of U.S. and western European societies at the time he was writing. Unlike the social psychological modernization theorists, Rostow stressed the importance of political will to build the "social overhead capital"—for example, human capital development, such as education, and national cohesion—necessary for development. Rostow's work also highlighted the growth of savings and investment during the take-off stage. Such capital might be gained from many sources, but to many practitioners of development, foreign lenders and foreign assistance became increasingly obvious sources of investment capital. Critics found Rostow's theory too tightly drawn from the experience of British industrialization and too linear in its prediction of the stages that growth would follow. His "noncommunist manifesto" read very much like Marx's historical materialism.

While economists in the modernization school saw many opportunities for governments to promote economic growth, they tended to favor the market system. Instead of the state control of the economy exercised by communist countries, they preferred policies that would lead people to take risks and become entrepreneurs. They generally saw the transfer of technology through transnational corporations and foreign assistance as a positive way to provoke traditional societies to modernize. The Point Four Program of U.S. president Harry Truman and the Green Revolution exemplify policy efforts to transfer technology to promote modernization.

POLITICAL DEVELOPMENT

Modernization theorists approached political development with two different conceptions of what constituted political modernity. According to one view, political development more or less equaled democracy. Political sociologist S. M. Lipset identified economic development as a "social requisite of democracy" in an *American Political Science Review* article of that title. He suggested that political modernization rested on

prior economic modernization and that as societies advanced economically, democracy would follow. His colleagues cited urbanization, industrialization, and the spread of literacy as the sources of social complexity in urban industrial society. Social pluralism, including a literate, often self-employed middle class, promoted political pluralism and participation. Individual writers stressed specific intermediary mechanisms linking economic development to democratic participation. After a comparative study of Middle Eastern countries in the 1950s, sociologist Daniel Lerner charted what he saw as the ideal development sequence: urbanization, spread of literacy, growth of mass media, inclusiveness in economic development, and political participation. Democratic development is the final step in Lerner's process of modernization.

A second view of political development, advanced by political scientist Samuel Huntington, focused on institutional development, arguing that more developed political systems had institutions more able to withstand the challenges posed by newly mobilized societies. According to this perspective, economic development and the urbanization it spawns lead new social groups to make demands on government for services and distribution of state resources. The participation of new groups will overwhelm the state unless it has created participatory institutions and a bureaucracy able to meet their demands. Huntington thus came to advocate order over participation in most developing countries. He suggested that political decay would result if governments refused to control excessive participation.

CRITIQUES OF MODERNIZATION THEORY

The most sustained critique of modernization theory came from Latin America's dependency school and analysts of neocolonialism in the former European empires, many of whom wrote on Africa. By focusing on traditional values and culture as key causes of underdevelopment in Africa, Asia, and Latin America, modernization theorists engaged in a form of blaming the victim, argued dependency writers. This tendency was due in part to modernization theorists' use of the national territorial state as the unit of analysis. By only focusing on individual national societies, modernization theorists failed to note the imperial relationships—formal colonialism and informal neocolonialism—that had deprived poor countries of capital and their people of the opportunity to make autonomous decisions about their own development. Writers such as economic historian Andre Gunder Frank and historian Walter Rodney argued that European nations underdeveloped the newly independent countries they formerly ruled and that they and the United States similarly underdeveloped Latin America, literally making countries poorer than they were before the imperial relationship.

Dependency theorists placed developing countries in the network of the global economy, noting that the way in which an economy was incorporated into the global division of labor strongly shaped its developmental prospects, in a manner impossible to reverse. Part of the incorporation of peripheral societies into global capitalism involved class relationships

across national borders; economic elites in developing countries collaborated with captains of industry and finance in the world's metropoles to appropriate the surplus value generated by the peasantry and working class on the periphery. All individuals were perfectly capable of acting in economically rational ways; those who failed to engage in entrepreneurship or to save and invest simply lacked the incentives or the capacity to do so. People did not need to be made modern; they needed to be released from exploitative international economic relationships.

Sociologist Immanuel Wallerstein, originally a student of African development, systematized the insights of dependency theory in his three-volume study, *The Modern World-System*. Wallerstein rejects modernization theorists' focus on development at the national level, arguing that since the sixteenth century, the world has had a single economy, the relevant unit of analysis of capitalist development, albeit existing alongside multiple political units. Strong core states exploit politically weak peripheral societies, whether as formal colonies or informal dependencies. World-systems theorists argue that semiperipheral countries like South Korea serve to deflect the revolutionary potential of the exploited periphery by giving the impression that convergence is possible for all while simultaneously providing locations of high investment yield for the core's capitalists. The convergence predicted by modernization theorists will not occur.

Political scientist Guillermo O'Donnell criticized modernization theory's argument that democracy would closely follow economic growth. O'Donnell observed that the wealthiest countries of South America fell to military regimes in the 1960s and early 1970s and suggested that the particular phase of industrialization through which they were passing demanded that these nations attract foreign capital and technology. However, the popular participation promoted by earlier industrialization threatened South American nations' capacities to attract foreign investment, with the result that both military and civilian elites preferred to impose harsh exclusionary regimes to quell labor mobilization and populist agitation. O'Donnell shared with dependency writers the view that the timing of economic development is central to the experience of modernization: Early industrializers faced different challenges than late industrializers, with significantly different consequences for modernization. Late industrializers required the state to promote economic development and could tolerate less labor unrest and popular participation. In essence, Rostow's model is empirically unfounded.

Postmodern scholars, like dependency writers, have criticized modernization theorists for ethnocentrism. By suggesting that development entailed movement from tradition to modernity and equating modernization with the industrial West, modernization theorists committed two errors. First, they implied that the West was somehow better. Second, by suggesting that all nonmodern societies were similarly traditional, they failed to differentiate among societies, which in many cases differed from each other more than they did from those in the West.

Some postmodernists take the argument further, arguing that by defining third world poverty as the problem, modernization theorists and Western policy makers following their lead devalued modes of living that have worked for millions throughout the ages. Problematizing poverty has imposed Western standards on other cultures, making it difficult for them to follow traditional ways even when they prefer them. The stress of conforming to Western constructs, which are the intellectual products of modernization theory, has profoundly disrupted the lives of people who never chose modernization.

REVISION OF MODERNIZATION THEORY

The World Values Survey's massive collection of attitudinal data about fundamental social values has allowed a reassessment of the conclusions of modernization theorists and their critics. Inglehart and his collaborators have posed a revised theory of modernization that places technological and economic change at the center and argues that changes in cultural values and political participation have followed economic development. The WVS, which has been administered in more than eighty countries on six continents, has produced comprehensive data.

Inglehart continues to argue, based on WVS evidence, that economic development promotes predictable changes in values, which he places at the center of his analysis and believes eventually lead to democratization. Where he differs from many modernization theorists is in his insistence that so-called traditional societies have distinct cultural attributes that do not disappear when they converge with a Western model of society and culture. Rather, he suggests that cultural differences continue to shape societies' responses to economic modernization. Change in the material conditions of life may cause change in attitudes toward authority, gender roles, sexual practices, and propensities to participate politically, but the changes take place in the context of preexisting cultures. Economic change will reshape values in Western Judeo-Christian, Confucian, and Islamic societies but will not result in one world culture.

Inglehart proposes that three dimensions of economic development produce cultural and political change. First, the growth of material productivity and the commitment of welfare states to supplement the consumption of the poor create levels of material security that allow individuals to prioritize values beyond those of earning money to buy food and shelter. Second, rising educational levels, the spread of mass media, and work in knowledge-based industries give individuals greater independence and desire for autonomy. Third, increasing social complexity causes individuals to become more socially independent. Inglehart argues that these processes have different impacts on what he calls the industrialization and postindustrialization phases of economic development. Under industrialization, these forces undermine the power of religion but often replace religious authority with state and industrial authority. In the postindustrialization phase, the dominance of secular authorities erodes before the demand for individual autonomy in all walks of life.

Based on the massive WVS, Inglehart's argument returns values to the center of the study of development, as a variable between economic development and changes in social practices and political behavior. Like modernization theorists, he argues that values do change in the process of development; unlike them, he does not assume that people abandon cultural particularities or that cultural zones will eventually disappear. He has built on the contributions of political science and sociology, particularly social psychology and political culture, to advance a sophisticated and empirically supported version of the argument made by Lipset half a century ago.

Monarchy

For much of human history, monarchy in one form or another was the primary system of government. A *monarchy* is a type of tyrannical regime in which all or most political power is concentrated in the hands of a single ruler, the sovereign. The monarch is generally the head of state and the chief executive. Historically, the sovereign and the state were seen as an indivisible entity. However, modern constitutional monarchies bifurcate power: The monarch remains head of state with a separate, usually elected, chief executive. This system has facilitated the survival of the monarchy in a largely ceremonial role, with a clear division between the state and the monarchy. In monarchial systems, power is typically hereditary, although some states elected sovereigns for life. Monarchies concentrate wealth, power, and privilege among a small, hereditary aristocracy whose members are bound to the sovereign by personal loyalty. Monarchies facilitated the rise of the strong central state in the countries of western Europe and Japan, but they also prompted democratic movements that either constrained their power or implemented alternative systems of government.

MONARCHY IN HISTORY

Throughout history, groups of humans were governed by the person who was the greatest warrior or especially skillful at politics. From early chiefs and tribal leaders, monarchial systems emerged as a means for a sovereign to transfer power to members of his or her family upon the monarch's death. Although elected monarchies were common at the dawn of the Middle Ages in Europe, they were gradually replaced by hereditary systems, with the notable exception of some of the German states, the early Holy Roman Empire, and the Vatican. By designating an official successor, groups or states could eliminate or minimize power struggles after the ruler's death. States subsequently developed complex rules of succession. In most areas, primogeniture, the transfer of power to the oldest male relative, became the norm.

Monarchs based their legitimacy and authority on a combination of military power and the personal loyalty of leading figures within the regime. This system of loyalty became increasingly codified through various versions of feudalism. However, the often-overlapping bonds that characterized the feudal system, by which an aristocrat's loyalty could be divided among multiple monarchs, also undermined the state. In response, sovereigns in kingdoms such as France and England increasingly sought to consolidate power through the Renaissance and Reformation periods. The growing authority of the central state necessitated an increase in resources, whether in the form of taxes or loans, in order to support larger militaries and growing overseas empires. The rise of colonialism reflected the emergence of mercantilism as an economic system driven by imperial rivalries between kingdoms such as France, Spain, and England. Meanwhile, the rising merchant class increasingly sought to limit expenditures by the monarch in order to concurrently constrain taxes. The Treaty of Westphalia (1648)

marked not only the rise of the contemporary nation-state, but also the beginnings of the end of the monarchial system. The growing merchant class increasingly sought greater access to political power and a legal framework that limited aristocratic privilege. In addition, as monarchs sought to limit the power of the Church, they also undermined the basis for their legitimacy.

TYPES OF MONARCHIES

Absolute monarchies grant the sovereign almost total control over the state and the populace. There are few legal or constitutional limitations on royal prerogative. Rulers justified such power by appealing to the divine right of kings and arguing that their authority came directly from God. Within absolute monarchies, there is no distinction between the ruler and the state; therefore, the resources of the nation are viewed as the personal property of the sovereign. One result was that colonies were often considered royal property and not components of the state. For instance, the Belgian Congo colony was the personal domain of King Leopold II (1835–1909) from 1865 to 1908, when he was forced to turn the area over to the national government. Proponents of absolute monarchy often refuted charges of tyranny by invoking the notion of enlightened despotism and the reign of philosopher kings as developed by Plato. Louis XIV of France (1638–1715) typified the ideal of the absolute monarch, while writers such as Thomas Hobbes (1588–1679) contended that absolute monarchy was necessary to forestall anarchy. By the mid-1800s, absolute monarchy was on the wane in most of the European states, except for some empires such as Germany and Russia.

Most monarchial systems were limited in scope by powerful aristocracies or rival claimants for the throne. For instance, following the Battle of Runnymede (1215), English barons forced King John to sign the Magna Carta (Great Charter), which limited royal powers. This was followed in 1265 with the first meeting of the English Parliament. From these beginnings, the system of constitutional monarchy developed, in which royal power was constrained by legal, constitutional, and political factors. The English Civil Wars (1642–1651) marked the last significant effort to reimplement absolutism in Great Britain, and the country instead transitioned to a constitutional monarchy. John Locke (1632–1704) strongly argued against the divine right of kings, while later philosophers such as Jean-Jacques Rousseau (1712–1778) asserted that governments should be based on a social contract, and the Baron de Montesquieu (1689–1755) wrote in favor of divided government, with separate executive and administrative branches. Gradually, the notion that governments should operate for the common good and be based on popular sovereignty became increasingly accepted. These ideas propelled the rise of democratic government and the demise of monarchies through rebellions, such as the French and Russian revolutions, or systemwide conflict, such as the world wars.

CONTEMPORARY MONARCHIES

The percentage of people living under monarchial systems has declined from 55.8 percent in 1900 (with an additional 30.8 percent in colonial territories) to approximately 5 percent in 2000. There are thirty-two monarchies in the world today. Most rulers in these states are either constitutional monarchs or ceremonial rulers. For instance, European states such as Denmark, Norway, and Spain, as well as Japan, have monarchs who serve as ceremonial heads of state. The United Kingdom exemplifies the contemporary system of constitutional monarchy: The sovereign presides over ceremonies and state occasions. The king or queen has a consultative role with the prime minister, the nation's chief executive, and serves as the titular head of the military. However, the monarch has little real influence on legislation or the day-to-day operations of the government. Instead, the British monarch and its counterparts generally serve as a source of stability within the political system. Monarchs in Portugal, Spain, and Thailand were important in transitions to democratic rule, and the British monarch serves as a link between the United Kingdom and the sixteen Commonwealth Realms, including Australia and Canada. There are seven formal absolute monarchies left in the world—Bhutan, Brunei, Oman, Qatar, Saudi Arabia, Swaziland, and Vatican City. Furthermore, monarchs in countries such as Kuwait, Swaziland, and Tonga continue to possess considerable political power and influence.

Monetary Policy

Monetary policy is a set of actions taken by a government authority to influence the supply of money and credit in circulation. Research indicates that changes in the rate of growth of the money supply affect unemployment, output, inflation, and interest rates. There is also a substantial political dimension to monetary policy. In the past, political scientists studied the effects that political parties, executive and legislative branches, and elections have *on policy outcomes.* What has not been widely studied by political scientists, however, are two other important monetary policy research issues: (1) policy maker use of economic targets in both policy and outcomes, and (2) policy implementation.

In the academic literature (largely done in economics) policy target research questions center on whether to stress

unemployment (output) or inflation stabilization. On the other hand, policy implementation research focuses on the economic trade-offs associated with the use of discretionary policy (e.g., responding to current circumstances) versus following a predictable course of action (termed a *policy rule*).

POLICY TARGETS AND POLICY IMPLEMENTATION: HISTORICAL DEVELOPMENTS

In the United States, legislation such as the Employment Act of 1946 and the Federal Reserve Act of 1977 mandated economic growth, employment, and inflation stability as objectives. During the same period, the most important legislation pertaining to policy implementation was the Accord of 1951. This "Accord" granted the Federal Reserve enhanced independence from political pressure. In their 1993 article, "Central Bank Independence and Macroeconomic Performance," Alberto Alesina and Lawrence Summers find monetary authority independence leads to lower inflation. The Accord of 1951, however, is silent on mandating discretionary policy or a policy rule.

EVOLUTION OF POLICY TARGET EMPHASIS

Due to the research of economist A. W. Phillips, unemployment reduction became the early policy target priority. Phillips demonstrated an inverse relation between wages and unemployment: Higher unemployment was associated with lower wages, while higher wages were associated with lower unemployment. This relation was graphically demonstrated on what is now called the Phillips curve.

However, a critique soon emerged of the assumptions underlying the use of the Phillips curve *and* discretionary policy. Milton Friedman and Edmund Phelps reasoned the Phillips curve was based on false assumptions about how people formed their expectations and, therefore, was bound to give incorrect predictions about inflation and unemployment. Friedman and Phelps argued that a stimulative policy reduced unemployment for a brief time if workers set their wage demands too low. This stimulative effect occurred if workers underestimated future inflation. Friedman and Phelps reasoned that workers could not be fooled for long; consequently, there could be no stable or predictable Phillips curve trade-off. The result would instead be a combination of higher and more volatile unemployment and inflation—a combination that came to be known as stagflation. During the late 1960s and for most of the 1970s, many industrialized countries ignored the Friedman and Phelps critique of the Phillips curve and, as a result, experienced stagflation.

THE ROLE OF PUBLIC EXPECTATIONS: CONSEQUENCES FOR POLICY IMPLEMENTATION

Friedman and Phelps's critique and the subsequent validation of their predictions highlight the importance of accounting for the role of the public and their expectations. These insights had implications for policy discretion. Discretionary policy, because it responds to current circumstances and puts less emphasis on past conditions and public expectations, was thought to create greater uncertainty and greater economic volatility. The reason is that policy changes and the use of policy maker discretion are sometimes at odds with anchoring and stabilizing public expectations. Discretionary policy is undermined by the threat of *time consistency*, since "a policy that may be the best thing to do in general may not be the best thing to do at a particular time."

RECENT DEVELOPMENTS ON POLICY TARGETS AND POLICY IMPLEMENTATION: INFLATION TARGETING

Policy rules, whether they involve money growth or interest rates, account for public expectations and can minimize the time consistency problem. In addition, policy rules have now shifted to targeting inflation. A policy rule involving inflation targeting has the monetary authority adjusting money growth and nominal interest rates in response to deviations of inflation from a prespecified target (e.g., 2 percent). Since the 1990s, many industrialized countries have adopted inflation targeting. Inflation targeting is effective, because it helps coordinate and stabilize inflation expectations. When policy makers achieve and maintain inflation stability, the public can substitute what they think is an implicit or explicit inflation target for past inflation. In this environment, plans (i.e., contracts) now exhibit (price/inflation) stability. For these reasons inflation targeting—and emphasizing inflation stability—in various forms have resulted in a reduction in the average extent and volatility of inflation in advanced industrial countries.

There also appears to be a relation between achieving and maintaining inflation stability *and* output stability. One manifestation of this relation is the length of business cycle expansions. If we examine U.S. peacetime business expansions recorded since 1854, we find the average duration is approximately 30.5 months. However, when we examine the average duration of the two peacetime expansions between 1982 and 2002, a period of policy-induced inflation stability, the duration is 106 months. These policy successes—in contrast to the policy errors of the 1970s and the economic crisis ongoing as of early 2010—suggest political forces encouraging inflation stability have the most salutary economic consequences. A new literature indicates political forces influenced monetary policy to deviate from promoting inflation stability (e.g., keeping interest rates artificially low) and created the conditions for the housing bubble that started to burst in 2008.

Monetary Union

A monetary union is an economic arrangement among states in which a single currency is adopted to replace various national currencies, and there is widespread cooperation on monetary policy. Monetary unions seek to stabilize fluctuations in the value of money in order to facilitate trade and economic cooperation. Through history, such unions have existed; however, in the more successful, monetary union has proceeded with political union. The contemporary European Monetary Union (EMU) of the European Union (EU) member states has significantly affected regional and global politics by redefining norms of national sovereignty and creating a currency capable of challenging the economic hegemony of the U.S. dollar.

THE FOUNDATIONS AND HISTORY OF MONETARY UNIONS

Throughout history, merchants and the commercial classes have sought means to ease trade with neighboring states. Even among the ancient Greeks and Romans, there were nascent efforts to create a single denomination of exchange for universal use. For instance, in 269 BCE, the *didrachm,* a Roman silver coin, was introduced to facilitate trade between Rome and the Greeks. It was later superseded by the *denarius,* which was widely used throughout the region. During the Middle Ages, there were more formal attempts to develop formalized monetary cooperation, including common currencies and reciprocal trade arrangements. These efforts were especially significant among the commercial cities and trade leagues of northern Europe and the Mediterranean, but these initiatives typically lacked the main features of modern monetary unions. In addition to a joint currency, a true union includes

a central, supranational monetary authority such as a central bank. Consequently, there is a high degree of coordination in monetary policy and usually standard principles in fiscal policy, especially in regard to taxation, tariffs, and trade practices.

The first major initiative to create a modern monetary union occurred in the New England colonies beginning in the mid-1600s. Each of the four colonies—Connecticut, Massachusetts, New Hampshire, and Rhode Island—accepted the printed currencies of the other colonies as legal tender for economic purposes, including tax payments. The colonies also coordinated efforts to maintain the value of their respective currencies. However, by 1750, Massachusetts, the largest of the economies, found its currency devalued as its neighbors began to print large quantities of their notes to fund a variety of projects. Massachusetts withdrew from the arrangement, and the union collapsed. In the 1830s, France endeavored to promote a monetary union among the states of Europe. Successive French governments encouraged the adoption of the franc as a common currency. In 1865, Belgium, France, Italy,

and Switzerland created a franc zone that included a common currency and fixed gold-to-silver conversion rates, as well as limitations on the printing and coinage of currency to control inflation. Eighteen countries eventually adopted the franc and some aspects of the monetary union. World War I (1914–1918) led to the demise of the union, which was disbanded in 1926, although many member states had previously reinstituted national currencies at fixed exchange rates. One continuing manifestation of the union is the French Central African (CFA) Franc Zone among the former African colonies of France. Their franc is pegged to the French franc (now euro), and member states must abide by a series of common monetary principles. Notable failed efforts at monetary unions include the Scandinavian Monetary Union (1873–1924) of Denmark, Norway and Sweden, and the East African Currency Area in the British region of Africa (1922–1972). In addition, efforts by Egypt to create a monetary union among Gulf states in the early 1990s failed, although Bahrain, Kuwait, Qatar, and Saudi Arabia revived the project and sought to create a union by 2010.

The most successful monetary unions were those that accompanied political union. For instance, the consolidation of the thirteen semi-independent U.S. states from the Articles of Confederation to the 1787 Constitution paved the way for the adoption of a single currency and a central source for national monetary and fiscal policy (and a central bank). A similar development occurred among the German states and principalities beginning with the 1818 customs union, followed by the more formal Zollverein in 1834 and culminating in German unification in 1871 with the creation of a central bank (the Reichsbank) and a national currency (the Reichsmark).

EUROPEAN MONETARY UNION

The trade and tariff disputes of the post–World War I era marked the end for most supranational monetary unions, but the idea gained new support in the aftermath of World War II (1939–1945). After repeated efforts, EMU was accepted within the EU through the 1992 Maastricht Treaty. The effort marked the largest and most ambitious supranational monetary union in world history. EMU was achieved in three stages. First, states increased cooperation between central banks but continued autonomous monetary policy and financial transactions. However, the European Currency Unit introduced a means to undertake financial transactions between banks in different nations. Second, in 1994, the European Monetary Institute (EMI) was created. The EMI served as forerunner to the European Central Bank (ECB) and was given the task of coordinating policy among the respective national central banks. The second stage involved a moratorium on the extension of credit by central banks. (That role was undertaken by the EMI and later the ECB.) Third, the currencies became fixed to specific rates of exchange, and the euro, the EU's common currency, was introduced in 1999. In addition, the ECB became operational through the 1999 Growth and Stability Pact, which required member states to keep deficits

at 3 percent or less of Gross Domestic Product (GDP) and national debts at less than 60 percent of annual GDP. Although many aspects of EMU have worked very well, in 2005, the Growth and Stability Pact had to be revised following the inability of major members France and Germany to meet the strict fiscal requirements.

The euro is the currency of EU members Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, and Spain. Denmark, Great Britain, and Sweden retained their national currencies. The ten countries that joined the EU in 2004 were required to adopt the currency when they met its economic criteria. The euro has been very successful at achieving its main goal—easing financial transactions between EU members. It has also redefined norms of national sovereignty, as the nation-states of the EU have surrendered a high degree of economic control to the supranational ECB. A secondary purpose was to challenge the global hegemony of the dollar in international monetary transactions. Successive U.S. administrations adopted a weak dollar policy in order to promote exports. As a result, the high euro-to-dollar value constrained European exports to the United States and hurt tourism markets in Europe but made the currency more attractive to financial traders.

Money Laundering

Money laundering is the process by which criminal organizations manage substantial and recurring illicit revenues to bring these monies back to the legitimate economy. It is traditionally understood as a three-step cycle: (1) the placement, in which the illicit funds are distanced from the crime that produced them and enter the financial system; (2) the layering, in which the origins of the funds are hidden through generally complex financial transactions; and (3) the reintegration, in which the money comes back to the economy appearing legitimate. Although it is particularly difficult to quantify the amount of money laundered around the world, an often-cited estimate from the International Monetary Fund (IMF) in the late 1990s suggested that 2 to 5 percent of global GDP is laundered yearly.

Traditionally, the banking sector has been the vector of most illicit financial activities. Other industries such as the securities sector, insurance and reinsurance, payday lenders, and currency exchanges are particularly vulnerable to illicit finance. Advances in technology such as Internet banking and trading have facilitated the process of washing the proceeds of crime. The continued existence of offshore finance is said to represent a major hurdle in combating illicit financial activities.

Governments around the world started to pay attention to the issue of money laundering in the context of the war on drugs. The United States adopted the Money Laundering Control Act in 1986, legislation that criminalized the laundering process. States around the world have now adopted similar legislation. The objectives of governmental intervention are both to minimize the threat from organized crime and to safeguard the integrity of financial markets. Public sector efforts rely on the participation of financial intermediaries, which must provide reports on large and suspicious transactions to financial intelligence units (who in turn may transmit relevant information to law enforcement agencies).

There is a large international regime that has been built to counter money laundering. This regime is particularly important, because it is generally assumed that one of the main reasons states have had difficulty in tackling this issue is the lack of collaboration among countries. The United Nations' Vienna Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances in 1988 outlawed money laundering and mandated mutual legal assistance across states.

The Financial Action Task Force (FATF), an offshoot of the Organization for Economic Cooperation and Development (OECD), has become central to the regime against money laundering and is composed of more than thirty member states. The FATF has elaborated forty recommendations, revised in 1996 and again in 2003, that direct national legislation against illicit finance. The FATF ensures compliance through self and peer assessment, a process that led in the new century to a blacklist of uncooperative countries and territories.

Other important international organizations in the fight against money laundering include the IMF, the World Bank, the Bank for International Settlements, and the Egmont Group (whose members are financial intelligence units). The private sector created the Wolfsberg Group of Banks to establish anti–money laundering principles. Since September 11, 2001, domestic and international efforts against money laundering have been reinvigorated as a result of states' attempts to limit terrorism financing.

The fight against money laundering has been controversial. Critics of stringent anti–money laundering programs argue that measures infringe on individuals' privacy rights and that they impose a high cost of compliance on financial intermediaries. Morally, it is quite clear that criminals should not profit from the proceeds of their activities. Yet, it can be argued that transactions involved in the laundering process actually represent the appropriate use of the financial system, to make more money, and as such should not be criminalized.

The legitimacy of state action has also been contested. It has, for instance, been argued that the United States has used the international regime against money laundering to bully smaller states with lax financial systems.

Finally, the fight against money laundering has not always led to tangible results, raising questions about the efficiency of such programs. After all, as is usually the case when states attempt to target organized crime, the innovative criminal is always one step ahead of the authorities.

Monroe Doctrine

President James Monroe's annual message to Congress on December 2, 1823, asserted a policy of opposition to colonization by foreign powers in the Western Hemisphere. This policy, known as the Monroe Doctrine, became the guiding principle for U.S. foreign policy in the Americas for generations. Specifically, Monroe stated,

> The American continents, by the free and independent conditions which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European powers. . . . The political system of the [European] allied powers is essentially different . . . from that of America. . . . We should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety.

The Monroe Doctrine represents common ideas and beliefs long held by the United States prior to 1823 but still unrepresented in a formal policy. Actions taken by the Russians in exploring the west coast of North America and the British attempts to colonize Cuba posed a threat to the United States, which prompted Monroe to articulate U.S. opposition to new efforts to colonize the Americas. It is interesting that the Monroe Doctrine mirrored a British policy, enforced by the Royal Navy, that prevented European powers from colonizing in America.

Montaigne, Michel de

Michel de Montaigne (1533–1592) was among the greatest thinkers of the French Renaissance. His most important intellectual achievements, which arose in reaction to the fanaticism and cruelty of France's religious wars, included ground-breaking views of skepticism, self-exploration, and toleration. Moreover, although he did not argue for democracy, separation of powers, or many of the political and civil rights associated with liberalism, his views played a key role in creating the ethos on which liberalism's institutions are based.

Montaigne published only one book, *Essays* (1575), in which he coined the current usage of the word *essay* (from the French "*essaier,*" to attempt or to try). The book is composed of a series of witty and erudite essays in which Montaigne tries to refine his judgment by probing human paradoxes and the contradictory character of humans. Famously dialogical, his essays explore several sides of every issue, often without apparent resolution.

Montaigne was the first great philosophical skeptic of modern times, but scholars disagree about the exact nature of his skepticism (academic, pyrrhonist, or fideist). He doubted humanity's ability to know God and the reliability of reason and the senses. This thoroughgoing doubt influenced French philosopher René Descartes, who followed Montaigne in turning to the subjective self as the basis for a contingent knowledge. But whereas Descartes used subjective perception as a building block for science, Montaigne doubted whether such a project would succeed. For Montaigne, if any knowledge was possible, it would only be subjective knowledge of the phenomenological self.

One of the earliest and most influential advocates of the characteristically modern subjective self, Montaigne called on mankind to accept the "human condition" (a phrase he coined), that is, to live with imperfect knowledge and not to despair. The source of human problems, he argued, is not in the economic system or the political regime, but in the self. A talented psychologist, Montaigne showed how reason and imagination conjure up fears, hopes, desires, and anxieties that lead people to embrace unverifiable doctrines to satisfy their longings for meaning and importance. Montaigne aimed to tame the hubristic and to expose vain claims. More important, he urged his readers to turn inward, to explore themselves, to go "home." Montaigne found nothing and everything in himself. What he thought he knew about himself dissolves under his (and the reader's) analytical gaze, but he also finds seeds of everything in himself such that he deemed self-exploration a never-ending source of wonder and delight and the greatest source of happiness for reflective individuals.

Montaigne's self-awareness led him to toleration. A self-knowing person identifies and empathizes with others, and Montaigne was extremely tolerant. He wanted to protect everyone, including religious believers of all kinds, ancient pagans, and the Indians of the New World. To protect individuals, Montaigne urged a separation of the private from the public sphere. He accepted some public conformity as necessary for peace and stability but insisted on freedom of conscience. He would give up the right to act publicly on his conscience in order to have his own *arriere boutique* (back room) in his soul where he could explore and judge freely. This call for self-cultivation and the creation of a private sphere of free conscience and free political judgment formed the kernel of liberalism as it was to develop.

Montesquieu, Charles-Louis

Born in 1689 to a noble family, French political philosopher Charles-Louis Secondat (1689–1755), Baron de la Brede and de Montesquieu, was educated mainly in the law. He occupied a hereditary seat on the *parlement* of Bordeaux while also pursuing scientific research. He achieved enormous literary success with *Persian Letters* in 1721. This work combines a brilliant satire of French society, as observed by fictional Persian travelers, with an examination of the moral horrors of the Persian seraglio, which, in Montesquieu's eyes, represented despotism more generally. The success of this work gave him access to the highest society in France and other countries, including England, where he spent two years. Montesquieu published *Considerations on the Causes of the Greatness of the Romans and their Decline* in 1734, and his most important work, *The Spirit of the Laws,* in 1748. When *Spirit* was attacked on religious grounds, Montesquieu responded with his *Defense of the Spirit of the Laws* (1748). In spite of his efforts, however, *Spirit* was placed on the Index of Prohibited Books, a list of works prohibited by the Catholic Church.

Montesquieu's reputation as a political theorist rests primarily on *Spirit of the Laws.* The product of twenty years' labor, the work is sprawling and somewhat disorganized, but it makes enormous contributions. Montesquieu was a pioneering figure in the development of social science. *Spirit* has a strong claim to establishing the sociology of law. According to Montesquieu, there is no such thing as a good law, in the abstract. Good laws must fit in with the overall systems of their countries and so vary accordingly. He analyzes a wide range of factors—geographical, economic, and religious, for example—that combine to give rise to the "general spirit" of a country, with which laws (positive laws) must be in accord. Different societies fall into three rough classes: the republic, monarchy, and despotism. Each has a distinctive "principle," a moral passion that animates its legal—and larger social—system and determines which laws will be effective. The principle of the republic is

virtue, or the love of equality; of monarchy it is honor; and of despotism, fear. Montesquieu's enormous labors are evident in his analysis of how laws concerning specific subjects, such as education, inheritance, criminal laws, and treatment of women, vary in accordance with overall systems. His analysis is infused with fear that France was degenerating from monarchy into despotism. To address this problem, Montesquieu primarily recommended returning to a more feudal system, in which a strengthened nobility was able to check the king. However, aware of the complex interaction of the factors that dominate societies, he preached only modest reform. His attention to the complexity of social forms was an important influence on subsequent conservative thinkers.

Spirit also presents a classic analysis of the British Constitution and how its separation of powers and checks and balances between executive, legislative, and judicial branches prevents abuses by government. Although somewhat idealized, this analysis has also been enormously influential. Book XII of *Spirit* provides a penetrating analysis of the conditions that must be satisfied by a system of criminal law that will not intrude upon people's liberty. For these and other contributions to the defense of liberty, Montesquieu is generally viewed as a great figure in the liberal tradition, in spite of his political preference for the nobility and the fact that he did not argue in support of democratic government.

Moore, Barrington, Jr.

Barrington Moore, Jr. (1913–2005) was an American political sociologist who spent most of his career as senior research fellow at the Russian Research Center, Harvard University. Moore's interests and intellectual ambitions covered many areas beyond the Russian case, although that was where his studies began. His *Soviet Politics* (1950) and *Terror and Progress, USSR* (1954) both examined the role of terror in political relations and became worth revisiting in the post-1989 world.

Moore's most well-known work is *Social Origins of Dictatorship and Democracy* (1966), which employs detailed historical and comparative analyses of Britain, France, Japan, India, China, and the United States as a way of developing and testing generalizations about how societies change. In this book, Moore argued that social interests and political structures that are declining may play an important part in structuring the new sociopolitical orders that take their place. The growth of large cities and the emergence of strong, centralizing states posed a major threat to great landowners and rural peasantry throughout Europe and Asia. They fought back or tried to avoid these changes. Moore studied how this happened and the historically significant choices that were made.

Moore showed that different responses to similar economic pressures led to very different political outcomes—democracy, fascism, and communism. He investigated the alliances that rural elites made with urban businesses and central governments. He also looked at the social structures of the peasantry and its historical fate. In some cases it was gradually eliminated (as in England). In others (France and China) it became a revolutionary force.

Unlike his friend, German-born political philosopher Herbert Marcuse, who treated bourgeois capitalism and totalitarian societies as being fundamentally in the same camp, Moore believed dictatorships and democracies were basically different in origin and structure. However, even this fundamental distinction was secondary to the basic question that guided his work: Which historical circumstances favor, and which inhibit, the making of modern societies that are decent and worth living in? The search for answers moved him to study anthropology, economics, history, and philosophy, leading to works of sustained analytical rigor and historical imagination such as *Political Power and Social Theory* (1958), *Reflections on the Causes of Human Misery* (1971), and *Injustice: The Social Bases of Obedience and Revolt* (1978). Moore continued working after *Injustice,* producing books such as *Privacy* (1984), *Authority and Inequality under Capitalism and Socialism* (1987), *Moral Aspects of Economic Growth* (1998), and *Moral Purity and Persecution in History* (2000).

In his work Moore maintained the empathetic but detached stance instilled by his early training in Latin, Greek, and both classical and medieval history. He credited the works of sociologists William Graham Sumner and A. G. Keller for his continuing concern with inequality, authority, ideology, and the causes of human misery. Moore was always alert for indications of emancipatory forces that might work in favor of the creation of rational and decent societies. In all his work, he demonstrated that objectivity does not mean neutrality.

More, Sir Thomas

Thomas More (1478–1535) was an English statesman and humanist. He was educated at St. Anthony's School in London, after which he entered into the service of the household of Cardinal John Morton, the archbishop of Canterbury. The archbishop had him pursue studies at the University of Oxford, presumably at Canterbury College (and/or St. Mary's Hall). While More was at Oxford, the 1519 publication of the second edition of the New Testament by Desiderius Erasmus caused a disagreement between two opposing communities. The so-called Trojans (primarily friars) opposed the revival of the biblical languages, since it was thought that such would negatively affect the influence of the Latin Bible, and that men would become pagans by studying Greek, and Jews by studying Hebrew. The so-called Greeks, conversely, embraced an entirely contrary view. Having been instructed by Erasmus, who was also an intimate friend, More supported the revival of the biblical languages and sought to suppress the Trojan movement. More returned to London by 1496 and studied law as a member of Lincoln's Inn.

In 1504, as a member of the Parliament at Westminster, More persuaded the House to moderate a grant to Henry VII in honor of the marriage of his daughter, Margaret (Tudor), to James IV of Scotland. More's actions earned him some political disapproval, which allegedly resulted in his father's brief imprisonment in the Tower of London until payment of a fine was made. Although the parliamentary achievement likely earned More both fame and favor in the city government, he would have been persuaded to leave England as a consequence of his opposition in Parliament to Henry VII's additional taxation, if the king had not died late in April 1509. When Henry VIII ascended the throne, More was regarded favorably by the new king and was allowed to hold a series of public offices with tremendous haste.

In 1523, when reformer Martin Luther began to question the dogma of the Roman Catholic Church and earned the ire of the king, More, then the speaker of the House of Commons, supported the king by writing *Responsio ad Lutherum*. However, his opposition to the king's divorce from Catherine of Aragon forced his resignation as Lord Chancellor in 1532. He returned to private life but continued a religious controversy with Protestant scholar William Tyndale.

More was imprisoned in the Tower of London in 1534 for refusing to swear the oath required by the Act of Succession, which sanctioned Henry's marriage to Anne Boleyn. During his imprisonment, he wrote *A Dialogue of Comfort against Tribulation* (1534) and experienced five interrogations. In the same year, he also opposed the Act of Supremacy, which established the English monarch as the head of the Church of England, and was tried at Westminster Hall for treason. More was condemned and beheaded on Tower Hill on July 6, 1535; his head was impaled on a pole and exhibited on London Bridge. In 1886, Pope Leo XIII beatified More, and in 1935 Pope Pius XI canonized him.

Sir Thomas More is renowned as a humanist during the Renaissance and for the 1516 publication of his influential work *Utopia.*

More is regarded as one of the foremost humanists of the Renaissance, primarily due to his reputation from the publication of *Utopia* (1516) in London, which was translated into English by Ralph Robinson in 1551. *Utopia* is the description of an ideal city-state that is revered by both Catholics and communists as their exclusive property.

Morgenthau, Hans Joachim

Hans Joachim Morgenthau (1904–1980) was a German political scientist best known for his work on international relations theory. Born in Coburg, Germany, he entered the University of Frankfurt in 1923 and later attended the University of Munich, obtaining a doctorate in law. He pursued postgraduate work at the Graduate Institute of International Studies in Geneva, Switzerland, and was admitted to the bar.

Between 1928 and 1931, Morgenthau worked as an assistant to Hugo Sinzheimer, a left-wing labor lawyer who was a leading Social Democratic Party member during the Weimar era. From 1932 to 1935, Morgenthau taught public law at the University of Geneva; then he moved to Madrid, Spain, for a year before returning to Germany. In 1937, fleeing Nazi persecution, he left Germany for the United States and became a naturalized U.S. citizen in 1943. Morgenthau taught at Brooklyn College in New York from 1937 to 1939 and then moved on to the University of Kansas City (1939–1944), the University of Chicago (1944–1971), the City College of the City University of New York (1968–1975), and the New School for Social Research in New York (1975–1980). He served as a visiting professor at Harvard, Columbia, Northwestern, the University of California, and Yale and was an adviser to both the U.S. State Department and the Defense Department.

Morgenthau, considered one of the founders of the "political realism" school of international relations, wrote *Politics among Nations* (1948), which is considered one of the seminal works in international relations theory. He contended that the power interests of nation-states were the driving force behind relations between them.

Morgenthau was an early critic of American involvement in Vietnam, arguing that the United States had put itself in a position from which it could not retreat without embarrassing itself. In a 1965 *New York Times Magazine* article, Morgenthau asserted that the U.S. intervention in Vietnam was intended to limit the influence of the Communist Chinese regime in Southeast Asia. However, he argued that "China is largely immune to the specific types of power in which the superiority of the United States consists—that is, nuclear, air and naval power." He suggested the only way to defeat China would be physical conquest, which he noted that no American president had ever suggested. Therefore, he argued, we in the United States "must learn to accommodate ourselves to the predominance of China on the Asian mainland."

After President Richard Nixon ordered the invasion of Cambodia in April 1970, Morgenthau was quoted in Robert J. Myers's 1980 article "Hans Morgenthau: the Quest for Justice" as follows:

> What will it avail us to save our face in a war without end if we cannot save our souls, if we cannot save ourselves as a nation worthy to be saved? And what kind of face would we be saving at the price of our souls and our purpose as a nation? I can see that face: ignorant, violent, brutal, lying, and mean—the face of some American Hitler.

Morgenthau provided a framework for understanding foreign policy. He adapted a European understanding of politics and foreign policy to the American experience and tried to explain the interrelationship between abstract moral principles and political necessities in world politics. Henry Kissinger, one of Morgenthau's students, wrote in his 1980 article "A Gentle Analyst of Power—Hans J. Morgenthau" that "Hans Morgenthau has turned contemporary study of international relations into a major science. All of us teaching in this field after him had to start from the ground he had laid."

Morris, William

William Morris (1834–1896) was one of the leading poets and prose writers of late Victorian England, an artist and craftsman, a translator of Norse sagas, a businessman, and one of the most important printers of his time. He was also a revolutionary communist who left behind him a rich and extensive legacy of libertarian socialist thought and practice. Morris's most original and lasting contributions to political thought were his critique of useless toil under capitalism and his utopian vision of a world in which all forms of labor, even the commonest, might be made attractive.

The most carefully considered and argued of Morris's indictments of capitalist society is that it promotes the treatment of labor as a commodity, and hence denies the greater part of humanity any pleasure in their work. According to his argument, artistic beauty and the pleasure of creation were natural and necessary accompaniments of certain forms of craft labor in the Middle Ages. Only with the evolution of specifically capitalist institutions were art and work separated. As capitalism has grown, the divide has deepened, and most people are now surrounded by ugliness and work and live in pain. The situation will be reversed only when artificial obstacles to pleasurable labor are removed, and all have the

opportunity to make their innate senses of beauty and value an integral part of their lives.

Morris developed his vision of a society in which work and art—and nature—blend harmoniously in a range of utopian writings, the best known of which is his socialist romance *News from Nowhere* (1891). "Nowhere," in this work, is a moneyless and stateless craft utopia, the most distinctive feature of which is the fact that nearly all the work done in it is pleasurable, either because of the hope of social honor, which causes pleasurable excitement; because it has grown into a pleasurable habit, as in the case of mechanical work; or, most important of all, because all people are artists insofar as they are able to take some conscious sensuous pleasure in the work itself. Unlike most literary works about utopias, *News from Nowhere* features a detailed and largely plausible account of how the changes it describes came about. The verisimilitude of this aspect of the narrative is no doubt due in large part to Morris's exceptionally active engagement in the English revolutionary socialist movement of the 1880s.

The most common criticism leveled against Morris by socialists and nonsocialists alike is that he was a backwards-looking thinker who failed to appreciate the labor-saving potential of modern machine technology. However, while Morris did indeed look back to premodern social and cultural values, he viewed them only as a source of inspiration for his utopian vision of the socialist future. And while he believed that the reunification of work, art, and nature in communist society would ultimately entail a resurgence of handicraft labor, he also recognized that the invention of modern factory machinery in the nineteenth century opened up tremendous opportunities for minimizing intrinsically unpleasant and painful labor—opportunities he felt were squandered by profit-driven manufacturers who used the new technology to save the cost of labor rather than labor itself.

Morris was for many years effectively dismissed as a sentimental and eccentric dreamer, but by the early twenty-first century, he had become widely acknowledged as a figure of major political importance. Over a century after his death, both his political writings and his personal example continue to inspire participants in a range of radical social movements, among them democratic socialism, anarchism, and radical ecology.

Mosca, Gaetano

Gaetano Mosca (1858–1941), was an Italian legal scholar and political theorist. He is known for having helped develop the theory of political elitism and described, in its context, the existence of a dominant political class. Mosca was also a politician and a journalist.

Mosca was born in Palermo, which was then part of the Kingdom of the Two Sicilies. (In 1861, the Kingdom of the Two Sicilies was annexed by the Kingdom of Italy.) Mosca studied at the University of Palermo and graduated with a law degree in 1881. From 1885 to 1888 he taught constitutional law at the university.

Mosca moved to Rome in 1887 and became the editor of the journal of proceedings of the Italian Chamber of Deputies, a position he held until 1897. He taught constitutional law at the University of Rome (1888–1896) and was the chair of constitutional law at the University of Turin (1896–1924). He returned as chair of public law to the University of Rome (1924–1933).

Mosca entered politics in 1909, winning a seat in the Chamber of Deputies as a member of the Liberal Party. He served as a junior minister in the cabinet of Antonio Salandra as the undersecretary for the colonies (1914–1916). After ten years as a deputy, Mosca was made a member of the Italian Senate by King Victor Emmanuel III in 1919. While many fascists regarded his work as an intellectual basis for their movement, Mosca rejected fascism and resigned from the Italian Senate in 1926. He was also a journalist, writing about politics for the *Corriere della Sera,* the most influential Italian newspaper of the day, and the *Tribuna* of Rome.

Mosca is best known for his work on elite theory. His works on this topic include *Sulla teorica dei governi e sul governo parlamentare* (1884); *Elementi di scienza politica* (1896, translated into English as *The Ruling Class,* 1939), and *Storia delle dottrine politche* (1936). Mosca contended that virtually all societies were ruled by a numerical minority, which he called the political class. According to him, the members of the political class possessed superior organizational skills that made it possible for them to secure power in modern societies. However, Mosca believed that the political class was not monolithic. Rather, it was divided, and its members competed against one another for power, resulting in what he called the "circulation of elites," where different groups of members of the political class would hold power for a time, only to be replaced by another group of members. He believed that political power was always in the hands of the elites but that they could be controlled by the rule of law.

Mosca maintained this ruling class justifies its power by developing what he called a "political formula," a guiding principle that follows the common ideals of the community. This political formula is the "myth of democracy," where the image of rulers and ruled working together toward a common moral or legal goal is offered as democratic freedom.

Mosca is considered part of the Italian school of elite theorists, along with Vilfredo Pareto and Robert Michels.

Motion Pictures and Politics

From its inception, cinema, as an art form, has been political. The works of George Méliès, who voyages to the moon in *Le voyage dans la Lune* (1902), and the Lumière brothers, who, in their short films (circa 1895–1900) send their cameramen throughout the world, reveal two varied approaches to cinematic art. Méliès attempted to create a world and then destroyed it through the fictional Selenite aliens. The Lumière brothers seek to document the world in its diversity, using overtly colonial language, and find themselves unexpectedly impressed by the "actuality" of these areas as they already exist. Both Méliès's creative approach and the Lumière brothers' documentary show that politics is inherent in cinema.

EARLY YEARS

Beyond its artistic dimension, cinema has always required means, capital, and a theater circuit. Bureaucracies, power, ideology, and financial interests thus affect the entire filmmaking process, from production, censorship, and distribution to viewing. Cinema is deeply influenced by questions of race (Griffith, *The Birth of a Nation,* 1915), technology (Lang, *Metropolis,* 1927), morality (Buñuel, *An Andalusian Dog,* 1929; *The Golden Age,* 1930), fear and alterity (Dreyer, *The Passion of Joan of Arc,* 1927), capitalism (Chaplin, *The Tramp,* 1914), war (Gance, *J'accuse,* 1919), and subversion (Vigo, *Zero for Conduct,* 1933; *L'Atalante,* 1934).

Throughout history, cinema has been political and has sustained enormous political pressure. Politics voices itself through cinema (Leni Riefenstahl in Germany, *Triumph of the Will,* 1934; *Olympia,* 1938), attacks cinema (the Hollywood blacklist), and attempts to build consensus through cinema (Lenin describing cinema as the most important of the arts). Despite politics' sway over cinema, many film artists have managed to elude censorship (Vertov, *Cinema Eye,* 1924; *Three Songs about Lenin,* 1934; and Eisenstein, *Strike,* 1925; *The Battleship Potemkin,* 1925; *October,* 1928; *Alexander Nevsky,* 1938; *Ivan the Terrible,* 1945 [unfinished]) or escape the cinema of a regime. From Italy come Blasetti's *A Walk in the Clouds,* 1943; De Sica's *Shoeshine,* 1946, and *Bicycle Thieves,* 1948; Visconti's *Obsession,* 1943, and *The Earth Trembles,* 1948. And from Japan come Ozu's *I Was Born, But . . . ,* 1932, and *Tokyo Story,* 1953; Kurosawa's *No Regrets for Our Youth,* 1946, and *Rashomon,* 1950.

AFTER WORLD WAR II

After World War II (1939–1945), cinema began to represent the unrepresentable—the Holocaust and the horrors of wartime (Resnais, *Night and Fog,* 1955; *Hiroshima Mon Amour,* 1959; *Last*

Year In Marienbad, 1961; and Rossellini, *Rome, Open City,* 1945; *Paisà,* 1946; *Germany Year Zero,* 1948). The link between politics and cinema remains, and cinematic masters continue to be influenced by the tragedy of the postwar world and the cold war, producing graphic and relevant depictions of violence and destruction. Youssef Chahine (Egypt 1926–2008) depicts corruption and war in *The Sparrow* (1973), society's transformations in *Cairo Station* (1958), gender issues in *Alexandria . . . Why* (1978) and Muslim-Christian relations in *Saladin* (1963). Haile Gerima (Ethiopia 1946–) uses film in order to interrogate black life and culture in *Bush Mama* (1976), colonization and resistance in both *Sankofa* (1993) and *Adwa: An African Victory* (1999), and politics and violence in his recent film *Teza* (2008). Jean-Luc Godard (France 1930–) portrays Marxism and revolution in his films *La Chinoise* (1967) and *Weekend End* (1967) and colonization and war in his films *Le petit soldat* (1960), *Les carabiniers* (1963), and *Notre musique* (2004). Elia Suleiman (Palestine 1960–) engages the very political issue of Palestinian life under Israeli occupation in *Divine Intervention* (2002) and the history of the Arab-Israel conflict in *The Time That Remains* (2009).

DIALOGUE BETWEEN POLITICS AND CINEMA

A filmmaker's subtle challenge of the political conditions of a society and overt political attack on current values reveal a constant dialogue between politics and cinema. Cinema expresses resistance and revolution, directly or indirectly, through suggestion (Angelopoulos, Bertolucci), through more direct political discourse (Pontecorvo, Spike Lee), or through poetic narrative (Makhmalbaf, Straub-Huillet). In its capacity to expand, condense, or stop time; distort perspectives and alter distances; transform appearances; and create and destroy realities, cinema collapses art and politics. In *The Social History of Art,* art historian Arnold Hauser describes the essence of cinema as "the intermingling of the temporal and spatial forms of the film" (1958, 152).

The fluidity of space and time, the quasi-temporal character of space, and the quasi-spatial character of time characterize cinema as the epitome of subversive art. The inherent political character of cinema is apparent not only in a film's content, but also in its various subversive forms. For example, Bunuel's (Spain 1900–1983) *Un chien andalou* (1929) and *Viridiana* (1961), Fernando Arrabal's (Spain 1932–) *Viva la muerte* (1970), Dziga Vertov's (USSR 1896–1954) *Man with a Movie Camera* (1929) and *Three Songs about Lenin* (1934), Orson Welles's (U.S. 1915–1985) *Citizen Kane* (1941), *Othello* (1952), and *The Trial* (1962) all challenge and revolutionize the language of cinema itself, thereby producing political forms.

CONCLUSION

In the early twenty-first century, with the advent of cell phone cameras and user-generated video-hosting Web sites, a shift has occurred toward democratizing filmmaking. The big screen has begun to function as an outlet for today's youth, who record performances on their cell phone cameras and upload them to the Internet and, therefore, to the world.

Actor Orson Welles as Charles Foster Kane gestures during a scene from the 1941 movie *Citizen Kane.* Motion pictures may reflect the political conditions of a society or address contemporary political issues.

Cinema continues to redefine politics. In a communications-based economy that blurs the distinction between production and consumption, the very form of movie going—downloading films to cell phones, watching DVDs in cars or on airplanes—is political. Cinema, "the seventh art," and politics are utterly and completely bound.

Multiculturalism

States and empires containing different cultural groups have existed for millennia; the word *multiculturalism,* however, is of recent origin. Possibly the first time it was used was in a speech by Charles W. Hobart, an American sociologist, to the Canadian Council of Christians and Jews in Winnipeg, Manitoba, in 1963. Hobart's speech, which congratulated Canada for its multiculturalism in contrast to America's "melting pot," was quoted extensively by Paul Yuzyk, a Canadian of Ukrainian ancestry, in a speech in the Senate of Canada on March 3, 1964. Yuzyk is sometimes regarded in Canada as the father of multiculturalism.

Canada in the early 1960s was intensely preoccupied with the relationship between its discontented French-speaking minority, mainly concentrated in Quebec, and the predominantly English-speaking majority of Canadians. In 1963 the Canadian government established the Royal Commission on Bilingualism and Biculturalism to study this question, but its terms of reference were criticized by many Canadians of European heritages other than British, Irish, or French. In response, the Royal Commission's terms of reference were extended to include "the contributions of the other ethnic groups," and in 1969 it published a volume of its report devoted to that subject. Two years later, Prime Minister Pierre Trudeau declared that his government was officially committed to multiculturalism, although it would retain official bilingualism, and in 1977 he appointed a minister of state for multiculturalism.

Many Canadians initially welcomed the concept, both as a means of celebrating Canada's increasing cultural diversity and as a means of distinguishing that country from the United States. Canadians had traditionally believed (on rather dubious evidence) that immigrants in Canada faced less pressure to assimilate to the majority culture than did immigrants in the United States. Before the word *multiculturalism* became popular, the expression "Canadian mosaic" had been used to indicate this belief. In 1982 a commitment to multiculturalism was incorporated into Canada's constitution. As Canadian immigrants by this time came mainly from Asia, Africa, and the Caribbean, the emphasis of the multiculturalism policy gradually shifted from the preservation of languages and cultures to the prevention of racism and the promotion of equal opportunity.

The first country other than Canada to adopt multiculturalism as a policy was Australia; it did this between 1972 and 1975. Subsequently, the word, and the concept, spread to the United Kingdom, whose support for multiculturalism is sometimes contrasted with the assimilationist policies of republican France, and to the Netherlands, Germany, and Ireland. It also spread to the United States, where the retreat from a commitment to the melting pot idea of immigrant assimilation had perhaps begun with President John F. Kennedy, who took pride in his Irish Catholic heritage and who published a book entitled *A Nation of Immigrants.* In the 1980s, the Reverend Jesse Jackson was one of the first prominent Americans to use the word *multiculturalism*.

In the late twentieth century and early twenty-first century, multiculturalism became increasingly controversial, particularly in the United States, but elsewhere as well. In the United States, the concept became associated with cultural relativism and political correctness, as well as with the controversial practice of affirmative action and the growing importance of Spanish as a second language. In Canada it has always been resented by Quebec nationalists, who view Canada as a binational state and argue that multiculturalism downgrades the significance of French-speaking Quebec as a distinct society. In all countries where the word is used, it is the target of increasing concern that immigrants, particularly those of the Muslim faith, are not integrating into the society that receives them and are retaining antiliberal attitudes and values. This concern has placed severe strains on the alliance between supporters of multiculturalism and supporters of other causes such as feminism and equal rights for homosexuals and lesbians.

Supporters of multiculturalism argue in response that it facilitates the integration of immigrants and minorities into the host society and that countries that reject multiculturalism, such as France, have performed no better in this regard than countries that accept it. The debate is not likely to end soon, particularly since both sides tend to define the word *multiculturalism* in ways that lend support to their own arguments.

Multilateralism

Multilateralism is "an institutional form which coordinates relations among three or more states on the basis of 'generalized' principles of conduct," relying on the indivisibility of agreed behavior among the participating states (Ruggie 1992, 571) and is characterized by "diffuse reciprocity" (cf. Keohane 1986). Multilateral solutions are suitable when clear common interests are identifiable and market-driven processes fail to achieve acceptable results. The international multilateral system is based on the international legal order and consists of an institutionalized body of norms, regimes, and multilateral organizations. Beyond pure institutionalized multilateral cooperation, multilateralism as an ideology comprises a belief in the benefit of associative problem solving in a world of interdependence. In this spirit, authority is exercised through a multilevel polity of interlocking institutions, including partial transfers of competence to supranational bodies when functionally appropriate.

Roots of the multilateral structuring of international relations can be traced to the nineteenth-century conference diplomacy of the Concert of Europe. Based upon the European balance of power after the defeat of Napoleonic France, it was organized between the powers of the Quadruple Alliance and consisted of a short-lived practice of regular summitry to maintain the reactionary peace. The twentieth century, especially the period after the world wars, was characterized by the quick expansion of the multilateral system, including treaty-based regimes and a growing number of international organizations. At the

same time, imperial disintegration and decolonization led to growth in the number of nation-states and, consequentially, in the membership of the United Nations (UN) and other international organizations. Even though nation-states are legally equal, diverse decision-making mechanisms exist to reflect an unequal distribution of power, ensuring the effectiveness of the multilateral system. The permanent veto-yielding members of the UN Security Council and the distribution of voting power according to financial shares in the World Bank and the International Monetary Fund serve as examples. Furthermore, the "minilateral" leadership of the most powerful actors characterizes many ad hoc arrangements and preparatory phases of vital negotiations under unanimity rule.

Most active states have traditionally been middle powers such as the Scandinavian and neutral countries that act as norm entrepreneurs and bear a high profile in the UN. To give just three examples, Norway, Sweden, and Switzerland have often been identified among these relatively affluent countries that are convinced of the benefit of international law and orderly relations among nations. Through investing their diplomatic and financial resources in institutional reform initiatives, mediation, and peacekeeping, they strengthen the effectiveness and credibility of the multilateral order and simultaneously augment their status within the system. Regionally dominant actors and global powers occasionally capitalize on their relative power unilaterally or through coalitions of the willing. Unilateralism has been exemplified by the U.S. rejection of diverse multilateral arrangements, such as the Comprehensive Test Ban Treaty, the Kyoto Protocol, and the International Criminal Court. Big powers are, nevertheless, essential actors in multilateral cooperation, because their support is vital for effective problem solving and rule enforcement, absent other institutionalized mechanisms. To give just one obvious example in the field of international security, any effective regime of nuclear arms control and disarmament has depended and will continue to depend on the initiative and compliance of the nuclear weapons states.

Multilevel Analysis

Multilevel models are extensions to regression methods designed to explicitly take into account the grouped (or clustered) structure frequently seen in observed and experimental data. Examples of such data in political science abound. In voting research, for instance, voters are nested within districts, which themselves may be nested within states. In comparative political economy, country-years are nested within countries. The hierarchical structure of data such as these is one reason why multilevel models are also known as hierarchical models. It is important, however, to note that multilevel models can also have non-nested grouping factors (e.g., individuals may belong to parties that cut across districts). Other names for multilevel models include *random effects models, random coefficient models,* and *mixed effects models.*

The fundamental idea of multilevel modeling is that individual observations in any particular group or cluster are more similar to each other than observations across groups. Furthermore, even though one might include covariates in a model that explain variation across clusters, they are unlikely to explain all such variation. When this happens, correlation in the error structure is introduced. Multilevel modeling is one way to take into account this correlation while still allowing for explanatory variables at the different levels of the model. When using multilevel models in practice, it is important to understand that many assumptions underlie the method, and they should be taken into consideration when constructing and interpreting these models.

Multinational Corporation (MNC)

The *multinational corporation* (MNC), also called *transnational corporation (TNC)* or *multinational enterprise* (MNE), is a corporation with operations in more than one country. The most notable, and often controversial, scenario involves a corporation headquartered in a developed country (most of the world's over 63,000 MNCs are based in the United States, Europe, and Japan) operating their production facilities in countries with the lowest labor costs (the developing countries of the global South). Proponents of economic globalization hail these transnational operations as an important pathway to global economic prosperity, while critics warn of the risks MNCs impose on poor countries and on the international order of states.

According to one central tenet of globalization, the liberalization of trade, through the reduction and elimination of tariffs, allows for the most efficient allocation of global resources. Now a widely accepted premise and goal, it heralds an important and significant shift on matters of international politics. With the power to impose duties and enforce tariffs, states were once the uncontested arbiters of global commerce. In today's world of liberalized trade and open borders, it is the multinational corporation, the primary purveyor of goods and services, that often holds the power to influence and dictate the terms of trade.

Multinational firms are corporations from a legal perspective, but their transnational supply chains cause them to differ from domestic corporations in one important way: Because they operate across borders, state-level regulations are often inadequate to control their behavior. This presents a significant regulatory hurdle, because legislative coordination at the international level remains weak and unenforceable. MNCs cause a conundrum for scholars and policy makers alike. While they play a necessary role in global economic growth and development, their ability to skirt state regulation by shifting operations from one country to another makes them practically ungovernable.

According to proponents of globalization, economic development relies on transnational capital investments by MNCs, a phenomenon referred to as foreign direct investment (FDI). For the receiving country, foreign investment is an important and positive contribution to economic growth, which explains why leaders of various stripes strive to attract FDI. Yet critics insist that many issues plague the ideal of FDI-led prosperity, issues that reflect many of the broader critiques of economic globalization.

First, there is concern that the benefits of MNC foreign investment are unfairly distributed to the benefit of political elites rather than the middle class or the poor. Second, firms involved in commodity extraction export local resources for significant profit while returning little benefit to the local population. Third, MNCs own the majority of the world's patents and intellectual property rights, giving them significant control over the diffusion of technology and skills. Finally, developed countries vying for FDI are often forced to reduce or eliminate regulations and restrictions on firm behavior, the result of which is a "race to the bottom" by firms seeking the loosest regulatory framework within which to operate.

While some scholars question the empirical validity of a race to the bottom, international competition for FDI is undeniable. Countries are reluctant to put restrictions on MNCs, resulting in the reduction of standards on matters of international import, including environmental regulation and the rights of workers. Not only are less-developed countries forced to loosen regulations, but developed countries have little transparency or control over the foreign activities of the corporations ostensibly under their jurisdiction.

The debate surrounding MNCs will surely continue. Paralleling the questions and concerns surrounding globalization, the benefits of MNC expansion must be balanced by the sober analysis of the threats they may also present to the international system of states.

Multiple Streams Theory

John Kingdon's (1995) multiple streams framework, which first emerged in the mid-1980s, is a model for understanding public policy agenda setting. Agenda setting is one of the stages of public policy process, even if "stagists" are criticized. Ever since Harold Lasswell's propositions of the 1950s, numerous authors have suggested various possible stages. In Vincent Lemieux's (2002) view, there are three recurring subprocesses: agenda setting, formulation, and implementation, with evaluation being more of a metaprocess.

Kingdon proposed a theoretical response to two questions often raised by those who wish to understand the process of setting public policy agendas: What shapes the emergence of certain ideas over others? And why are certain ideas used by governments to formulate public policies, and not others? To answer these questions, Kingdon used an approach defined by three streams. The framework was inspired by the "garbage can" model, in particular by the decision-making processes of organized anarchies, which are organizations characterized by problematic preferences, unclear technology, and fluid participation. According to Kingdon, public policies emerge when policy entrepreneurs seize windows of opportunity to couple a problem stream with a political stream. The policy stream is also present, but it is loosely coupled with the other two streams. Without this coupling, no policy can emerge. Problems remain unresolved; solutions may exist or be promoted by various stakeholders, but there is no receptivity to them. The national mood or current ideas cannot be capitalized on, because there are no recognized problems or solutions.

But when a window of opportunity appears in the problem or policy streams, a policy entrepreneur will do everything possible to couple these streams in order for a public policy to emerge. Problem solving is not utopian, as there must be known solutions for it to be possible, and so this third stream is not of secondary importance. Entrepreneurs may emerge from any of the streams, depending on the situation and the degree to which a certain stream predominates. Kingdon also states that the occurrence of a window of opportunity in a given area may increase the probability of another window opening in a related area. This is the concept of "spillovers." There is no longer any need to demonstrate the heuristic value of the framework or its related concepts.

However, the framework has only been validated in the context of wealthy countries for setting the agendas of national and international policies. Although policy implementation has been studied for thirty years now, few scholars have attempted to examine it using Kingdon's framework. Extending this interpretation, Lemieux (2002) suggests that while the policy formulation stage involves coupling the

policy stream with the political stream, implementation involves coupling the policy stream with the problem stream. In both cases, the third stream, that is, the politics stream, is always present but is loosely coupled. Although the scientific relevance and theoretical value of this extension have been demonstrated, they have only been empirically validated once in Canada.

In order to verify the proposition coming from the extension of the stream framework to understand an implementation gap in West Africa, a case study has been done in Burkina Faso. Empirical data confirm that the extension of Kingdon's multiple streams framework has been productive in explaining the failed implementation of a health policy in Africa. Although more empirical research needs to be done in order to definitively validate this theoretical extension, some research propositions have emerged from the study:

- Implementation of a public policy depends primarily on a coupling of the problem stream with the policy stream.
- If implementation does result from a coupling of the problem and policy streams, it can be completely successful only if the political stream is favorable to it.
- Institutions play an essential role in the political stream of public policies when policy agenda setting and formulation are international in origin.
- The occurrence and seizing of opportunities in order to find solutions to problems is a necessary but insufficient condition for successful implementation.

Municipal Government

Modern states have, in general, two or three levels of local self-government: The municipality is usually the lower tier, and the region or province is the middle level of government. Portugal has three levels, while many other countries in Europe and South America, for example, only have two subnational tiers of government. Countries differ from each other in the number and size of municipalities. Portugal and the United Kingdom have on average larger municipalities than France, for instance.

HISTORY AND ORGANIZATIONAL STRUCTURE

Municipalities date back to the Roman Empire and developed unevenly across Europe during the Middle Ages, according to the political and social conditions of each historical period. At the end of the nineteenth century and in the early twentieth century, municipalities expanded their powers and resources to face the industrial revolution and the exponential growth of urbanization. In the last decades of the twentieth century, municipalities underwent a new wave of institutional changes, a shift from traditional and hierarchical forms of municipal administration to networks of local governance, a process that can weaken local political accountability and policy coordination.

Municipalities typically have an executive (a council, a mayor, or both) and an assembly that controls and scrutinizes the activity of the executive. The assembly is usually directly elected by proportional representation by local residents, and its members elect the executive council and/or the mayor. In some countries, both organs—the executive and the deliberative—are directly elected. As a result of this diversity of institutional forms, there are numerous models of municipal political leadership, and the way each model functions depends on a number of factors, such as the local political culture, the existence of a political majority behind the mayor, and the social and economic characteristics of the local community.

The recruitment of municipal councilors and mayors is conditioned by electoral rules, selection procedures, legal constraints, requirements for equal opportunities, and time. As a result of these factors, most countries tend to have municipal councils with an uneven social composition, with members drawn excessively from certain social classes.

Administrative powers can be defined in one of two ways: most commonly by the principle of general competence in which the municipality can do whatever is considered to be in the interest of the local community, or by the principle of specialty, in which the municipality does what is explicitly defined by law. Administrative competence and financial resources vary from country to country, depending on the degree of administrative decentralization and political devolution, but in all cases, the municipal government has fewer powers than the national government. For example, in Europe, the Nordic countries have a far greater share of public resources than countries in southern Europe. Nonetheless, they all provide urban and social services.

RELATIONSHIP WITH OTHER LEVELS OF GOVERNMENT

Despite the autonomy of municipalities, they are under the control of the courts and under the tutelage of the central government, whose responsibility it is to verify compliance with the law. However, these control procedures are applied only afterward, and they are exclusively about the legality, not the merit, of political decisions.

The finances of municipal government usually come from within or from the state. Internal resources—generally favored—include local taxes, mainly taxes on immovable property, fees, revenues from municipal services, and loans. Transfers from the state budget can be made through a block grant, in which transfers are not assigned to specific expenditures. This allows elected municipal boards to decide what to do with resources. State monies can also be transferred conditionally, in which case the resources are assigned to specific expenditures.

Accountability, an important component of a fair municipal government, has two dimensions: internal accountability, carried out by the municipal assembly, members of opposition parties represented in the executive council, or an ombudsman; and external accountability, provided by a free press, citizen participation, and, ultimately, the courts.

Municipal or intermunicipal cooperation is a key feature of local government systems. There are basically two types of municipal associations: general purpose and specialized. In the first case, a board or third-party contractor implements specific municipal policies. In the second case, an association is created to carry out functions that the municipalities alone cannot do or are not interested in doing, for example, to use economies of scale. Municipal governments worldwide cooperate with each other, often through twin-city (or sister city) programs.

Music, Political

Political music comes in two general varieties: representational and associational.

REPRESENTATIONAL POLITICAL MUSIC

With representational political music, the composer (who may or may not be the performing artist) uses the music to make a political statement. That is, the composer is expressing his or her political views musically, sometimes with lyrics and sometimes without. A good example of representational political music would be the 1813 Wellington's Victory (Opus 91) by Ludwig van Beethoven, in which Beethoven celebrates the military victory of Field Marshal Arthur Wellesley (the Duke of Wellington). Wellington had led a combined British, Portuguese, and Spanish army against French forces led by Spain's King Joseph Bonaparte, who was the brother of Napoleon I. This piece is unambiguous in its message, and the sounds of battle (cannons, guns, etc.) are clearly heard in the musical portrayal of the battle. Similarly, the 1985 song "Russians" by Sting is another example of representational political music, in which Sting explicitly argues against an anti-Soviet cold war nuclear mentality.

ASSOCIATIONAL POLITICAL MUSIC

Associational political music is music that individuals other than the composer associate with explicit political ideas for the purpose of promoting a political agenda. This normally happens after a composer is dead and incapable of correcting the political association. A famous example of this type of music is the creation of numerous myths about Beethoven in Germany, especially during the times of the Weimar Republic and the Third Reich, when it was argued by various groups that Beethoven "supported" widely diverse ideological viewpoints. For example, the Catholic Center Party was able to point to Beethoven's masses as "evidence" that Beethoven was a deeply spiritual person. The Social Democrats (SPD) saw Beethoven's support for republican government in works such as his Ninth Symphony, and the Nazis transformed the image of Beethoven from top to bottom to argue that he was essentially a fascist.

Bob Marley sings with a raised and clenched fist during a 1978 concert. Marley's music includes an activist political agenda against corrupt regimes.

SOURCE: Corbis

While it is common to argue that dead composers would not normally agree with after-the-fact political associations of their music, this is not a requirement for the associational political category. For example, following the collapse of East Germany and the Berlin Wall, Leonard Bernstein led performances of Beethoven's Ninth Symphony in East and West Berlin on the 23rd and 25th of December 1989, respectively, in which the word "freedom" was substituted for each instance of the word "joy" in the ending chorus, thereby transforming the "Ode to Joy" into the "Ode to Freedom." One could argue (as Bernstein did at the time) that—considering the circumstances—Beethoven would neither object to the verbal modification nor the political association given the original orientation of the work, and perhaps this is correct.

MANIFESTOS

Within the representational and associational categories are numerous subgenres of political music, which include everything from musically sublime works that convey complex political viewpoints to more mundane works with simple messages. Within the representational category, the most potent subgenre is political manifesto music. Political manifesto music conveys a complex and cohesive political point of view, or even an entire ideology. Two classic examples of political manifesto music are the four *Der Ring des Nibelungen* or "Ring" operas (as a combined set) by Richard Wagner as well as the extensive collection of political music by Jamaican musician Bob Marley. The complex political perspective of

the Ring operas was famously described by George Bernard Shaw in his 1898 *The Perfect Wagnerite,* while Marley's music mixes his spiritual Rastafarian perspective with an activist political agenda. It is interesting that both Wagner and Marley argue in their music that corrupt political regimes will collapse on their own in the absence of a psychologically "enslaved" mass following. Thus, revolutionary activities in these musical messages focus not on military attacks against the state but rather on a psychological process of awakening on the part of the masses such that the masses are freed from a condition of mental bondage.

PATRIOTIC MUSIC

Nationalist and patriotic music (in combination) constitute another subgenre of political music, and such works can be either representational or associational depending on the context. Nationalist music is the broader category of the two, since patriotic music is often considered a subcategory of nationalist music. Nationalist music arose within the Romantic period (roughly between 1820 and 1900) following the classical era, in which the Vienna school (e.g., Beethoven, Joseph Haydn, and Wolfgang Amadeus Mozart) dominated European musical styles. The primary force behind the birth of nationalist music was the emergence and maturation of new European nations and cultures and the desire of indigenous composers to create music that spoke to the cultural sensibilities of their domestic audiences. Examples of nationalist composers are Franz Liszt (Hungary), Giuseppe Verdi (Italy), Modest Mussorgsky

(Russia), Jean Sibelius (Finland), Antonín Dvořák (Bohemia/Czechoslovakia), Felipe Pedrell (Spain), Ralph Vaughan Williams (Great Britain), and Charles Ives (United States). Nationalist music is typically multidimensional in the sense that it reflects complexities in the indigenous culture with which it is linked. Bruce Springsteen is a modern nationalist composer in this respect.

Patriotic music differs from the broader nationalist category in that patriotic music is one-dimensional, expressing a straightforward defense of nation. Much of American Romantic composer John Philip Sousa's music can be viewed as falling within the patriotic category, as well as, say, American country singer Toby Keith's song "Courtesy of the Red, White, and Blue (The Angry American)." National anthems fall within the patriotic category as well. While most national anthems are mundane in terms of both lyrics and music, some anthems are politically potent mixes of revolutionary fervor, such as "La Marseillaise" and "The International."

LABOR MUSIC

An important category of political music that catalytically evoked a great deal of subsequent political music is labor music. Much of this category dates back to the music of political activist Joe Hill (a.k.a. Joel Emmanuel Haggland), who wrote songs to support the recruitment and protest activities of the early labor movement in the United States. Most of these songs used well-known melodies in combination with motivational lyrics penned by Hill. A great deal of modern protest music can be historically tied to this early labor music. However, in strictly modern terms, modern protest music finds its predominant origins within the American civil rights movement as well as the protests against the Vietnam War (1959–1975) that coincided with the civil rights movement in the 1960s and 1970s.

POLITICAL HIP-HOP

The most modern form of political music can be found in the hip-hop genre, or alternatively, rap or gangsta rap. The early evolution of hip-hop into a vehicle for conveying political and cultural messages can be seen in the lyrics for "The Message," released in 1982 and rapped by Melle Mel (a.k.a. Melvin Glover) with Grandmaster Flash and his group, The Furious Five. This musical form emerged from the activities of early deejays on both the east and west coasts of the United States. The growth of the gangsta rap's hyperrealistic focus on ghetto warfare followed the early "classical" period of hip-hop. Later strands of hip-hop extended to rebellious white suburban youth who were attracted to the vibrancy of rap's approach to musical expression. The hip-hop style of political protest music has a clear cross-national global reach today.

Mutually Assured Destruction

The concept of Mutual Assured Destruction (MAD) emerged in the cold war era of bipolarity as the Soviet Union began to challenge the United States' position as the world's preeminent nuclear power. MAD was based on the assumption that two states possessing nuclear capabilities could forge a relatively stable relationship and thereby avoid the possibility of war. Decisions to go to war using conventional weaponry depend upon weighing the prospects and benefits of victory against the likelihood of suffering defeat. The presence of nuclear weapons, however, forces policy makers to make a different calculation. With the sheer destructiveness of an enemy's nuclear weapons rendering one's own annihilation a genuine possibility, employing force against that enemy would become a simply irrational decision. In this light, it would not even be necessary to achieve equality or parity of nuclear weapons with one's opponent. Sufficient nuclear power to launch a retaliatory strike following an initial attack would be enough to prevent that first attack from ever occurring. For these reasons, advocates of MAD view the limited existence of nuclear weapons as an important stabilizer in global politics in their capacity to remove nuclear powers from the security dilemma of an anarchical world order.

Mutualism

Mutualism is a political ideology on the fringes of anarchism, utopian socialism, and liberalism. Its central values are autonomy and equality of the individual, just exchange, and mutual support. These principles would empower people to govern their affairs unconstrained by market forces and a state. Mutualism favors cooperation based on a sense of community.

PROUDHON'S EARLY THEORY

The main proponent of mutualism was Pierre-Joseph Proudhon (1809–1865). His system of liberty sought to remedy the evils of the two main political ideologies of the nineteenth century. In his 1840 book *What is Property? An Enquiry into the*

Principle of Right and of Government, Proudhon stated, "Communism rejects independence and proportionality; property does not satisfy equality and law" (1966, 280). Instead, society under Proudhon's view would be based on a network of contracts among free individuals without a central sovereign such as the state. Small producers who possess the means of production would exchange products on the basis of the amount of labor incorporated. A people's bank would offer social credit without interests. Proudhon actually tried to establish such a bank but had to cancel the experiment when he was sentenced to prison for his radical views on government.

Karl Marx was originally attracted by Proudhon's sharp attack on property but strictly disagreed with his simplistic labor theory of values, which saw injustice as emerging only in the sphere of distribution. Marx and Proudhon were also opponents on the issue of a violent seizure of state power. Mutualists believe that a natural sense of solidarity would guarantee social cooperation and observance of contracts. Mutualism rejects aggression and coercion; where more complex cooperation of individuals is required, it relies on voluntary association.

MUTUALIST ORGANIZATIONS

Mutual enterprises are part of the nonprofit economy. Unlike cooperatives, such mutuals consist of members instead of shareholders. Their capital stock is built by membership fees alone. Each member has equal voting rights, and profits are reinvested for their members' benefit. Their origin dates back to self-help preceding the welfare state, with the establishment of friendly societies, unions, cooperatives, and clubs to secure the individual against misfortune. Mutual building and loan associations emerged in England in the late eighteenth century and in the United States in the 1830s, and they flourished a century later. Originally these societies dissolved when every member had acquired a house; later they continued to function as agencies for borrowing and lending money. Today, besides mutual savings and loan associations, mutual organizations mainly exist as health and insurance companies.

Since the 1980s, a process of demutualization has reduced the number of mutual enterprises. The main reasons for this are changes in taxation, ownership problems in mergers, and the remoteness of management. Nowadays mutuals rarely constitute a face-to-face community. Modern forms of mutualism can also be found in nonmonetary exchange circles. Members of such networks organize voluntary engagement to support one another on the basis of cooperation and exchange. The European Commission tries to promote mutuals as part of the social economy of its member states.

CRITICISM

The main criticism of mutualism from the point of view of political philosophy is its harmonious approach. For Proudhon, private and collective interests are identical; he underestimates social heterogeneity and overestimates reason as a guide for behavior. A society based on mutual contract alone would need an agency to enforce compliance; eventually such contracts themselves also restrict absolute liberty of the individual.

Proudhon argued from the perspective of a preindustrial society of farmers, craftsmen, and artisans. These are settings of limited complexity, such as mutuals today. Although Proudhon's understanding of the economic function of money was naïve, and the idea to abolish interests through free credit unrealistic, mutualism can claim a certain moral superiority, as it tries to abolish economic injustice.

NAACP Legal Defense and Education Fund

The NAACP Legal Defense and Educational Fund, Incorporated (LDF) began as the legal department of the National Association for the Advancement of Colored People (NAACP) in 1940. The fund's activities focus on four areas: education, voter protection, economic justice, and criminal justice. The LDF's headquarters are located in New York City, and regional offices are in Washington, D.C., and Los Angeles, California. The LDF has been involved in more cases before the U.S. Supreme Court than any other organization, with the exception of the U.S. Department of Justice.

At its founding, the NAACP was under the leadership of civil rights attorney Charles Hamilton Houston. Houston was the first black editor of the *Harvard Law Review* and vice dean of Howard University Law School. He joined the NAACP as part-time counsel in 1934 and played a role in nearly every civil rights case before the Supreme Court for over 25 years. Houston's plan to attack and defeat Jim Crow segregation was informed by his use of scholarly research about the damaging social and psychological effects of segregation on black children and showed the inherent inequality of the "separate but equal" doctrine. He designed a strategy of attacking segregation in law schools—forcing states to either create costly parallel law schools or integrate the existing ones. Houston sought to neutralize the age-old argument that allowing blacks to attend white institutions would lead to miscegenation or race mixing. His rationale was that by challenging segregation in graduate schools, the NAACP lawyers would bypass the inflammatory issue of miscegenation among young children. Houston's group of lawyers, most of whom had been trained at Howard, included future Supreme Court justice Thurgood Marshall. This group created precedents that ultimately led to the dismantling of *de jure* discrimination—laws enforcing racial segregation of public education facilities.

In 1938, Marshall succeeded Houston as NAACP special counsel; Houston returned to his Washington, D.C., law practice but remained counsel with the NAACP. Houston and Marshall were the architects of the LDF's most famous case; *Brown vs. Board of Education, Topeka* (1954) the landmark case in which the U.S. Supreme Court struck down racial segregation in public schools. In 1940, Marshall wrote the LDF charter and became its first director and chief counsel. The LDF became an independent organization in 1957.

During the 1950s and 1960s, the fund functioned as "the legal arm of the civil rights movement," representing Dr. Martin Luther King Jr., the Southern Christian Leadership Conference, Rosa Parks, the Student Nonviolent Coordinating Committee, and local organizations whose activities included organizing sit-ins in North Carolina and Tennessee, the freedom rides to Alabama and Mississippi, and voter registration programs in the deep South.

In the aftermath of the Mississippi freedom summer of 1964 (during which civil rights workers Andrew Goodman, Michael Scherer, and James Chaney were murdered by local officers in Philadelphia, Mississippi), LDF opened a branch office in Jackson, which was led by Marian Wright, the first African American woman admitted to the Mississippi bar.

In 1961, President Kennedy appointed Thurgood Marshall to the U.S. Court of Appeals for the Second Circuit. Marshall was succeeded by Assistant Counsel Jack Greenberg, who served alongside Marshall as cocounsel during *Brown*. During his tenure, Greenberg argued or oversaw groundbreaking cases, including *Alexander v. Holmes County Board of Education* (1969), which rejected the ethic of "all deliberate speed" used to stall desegregation efforts; *Griggs v. Duke Power* (1971), a test case for the application of Title VII of the Civil Rights Act; and *Furman v. Georgia* (1972), a landmark case that forced a countrywide reevaluation of capital punishment sentencing.

Under Greenburg's leadership, the LDF grew in size and resources, and the organization became involved in projects and litigation that broadened the scope of the LDF's mandate. Greenberg resigned in 1984 to become a professor at Columbia Law School. Julius L. Chambers was named director-counsel. Chambers was LDF's first intern and argued before the Supreme Court in *Swann v. Charlotte-Mecklenburg Board of Education* (1971), which led to federally mandated busing, helping integrate public schools across the country. Under Chambers's leadership, the organization fought for civil rights legislation and affirmative action programs that began in the 1970s and 1980s.

LDF's current priorities include challenging efforts to undermine affirmative action in higher education, battling the resegregation of public schools, protecting minority participation in the electoral process, pursuing the restoration of

the voting rights of persons convicted of felonies, combating employment discrimination, seeking to bring justice to African Americans through fair jury selection practices and adequately funded defense systems for the indigent, and advocating for victims of Hurricane Katrina.

In 2003, the LDF represented African American and Latino student interveners in the Supreme Court case challenging the University of Michigan's undergraduate admission affirmative action policy. Through LDF efforts, the Supreme Court's ruling upheld the use of race in admissions policies at the University of Michigan Law School.

On May 1, 2004, Theodore Shaw became the fifth person to lead the organization in its sixty-four-year history. In July 2006, LDF filed a friend of the court brief in the U.S. Court of Appeals for the Third Circuit supporting Mumia Abu-Jamal's claim of racial discrimination in the selection of jurors for his 1982 trial for the shooting death of a police officer in Philadelphia, Pennsylvania. In 2008, John Payton, a prominent civil rights attorney, was appointed LDF's 6th director-counsel and president.

Nation

Many studies exploring nations and nationalism have embraced constructivist or postmodern lenses, according to which belonging to a nation is seen as an erroneous belief in a myth that needs to be corrected. In the words of Aviel Roshwald (2006), "The stories peoples, communities, and movements tell about themselves are seen as masks that must be pulled away if their true faces are to be revealed." Nations have been portrayed as constructs, as "imagined communities" (Benedict Anderson's term, 1983) serving elites interested in manipulating the masses to obtain power. Such perspectives tend to ignore the role of the people in choosing which images to accept and which discourses to follow. In addition, they make it difficult to assess the tenacity of deeply rooted, historical traditions.

THE PRIMORDIALIST PERSPECTIVES

Recently there was a comeback of the so-called primordialist perspectives on nations and nationalism. Followers of scholar Anthony D. Smith tend to see national identity as an empirical fact, a social reality. They emphasize the stability of ethnic and national communities. Smith (1996) defined the *ethnie* (a feeling of kinship) as the core around which nations are built. According to Smith, "National sentiment is no construct. It has a real, tangible base. At its root is a feeling of kinship, of the extended family, that distinguishes the nation from every other kind of sentiment." Smith embraces a view of the nation as an enduring community of "history and culture, possessing a unified territory, economy, mass education system, and common legal rights."

Although Smith and his followers would probably agree that the majority of modern nations emerged during the eighteenth and nineteenth centuries—that is, "in the modern world inaugurated by the French and American revolutions"—they are likely to argue that the existence of ethnic origin myths, the mobilization of communities based on language, and similar phenomena suggest that modern nations have premodern ancestors. This is a major insight of the primordialist school of thought. According to this perspective, in order to understand modern nations, the development of nationhood must be traced over long periods of time, not associated with one particular historical period.

According to the primordialist theory, nations will never disappear. The main reason for the eternal livelihood of nations is their ability to build on the preexisting memories and ethnic myths that form the basis of every community. In short, to use a famous phrase coined by Ernest Gellner, nations as seen by Smith's school of thought have a "navel" or ethnie, which is unlikely to disappear any time soon. Globalization, the reemergence of regions, and the growth of international institutions, such as the European Union, are only going to strengthen the primordial sentiments that are at the core of modern nations.

ALTERNATIVE WAYS TO CONCEPTUALIZE NATIONS

An alternative way of conceptualizing nations is to explore them as the outcomes of modern social changes, as historically specific constructs, or as communities without "navels." Nations are perceived as constructs of historical, industrial, and communicative developments (i.e., the invention of mass media, print, and the spread of ideas). The modernists (included in this school of thought are also constructivists, postmodernists, and institutionalists) see primordialist approaches as "expressions of nationalism itself." Primordialist approaches are declared to be fundamentally flawed. Nations should be studied as ever-changing dependent variables, as outcomes of numerous complex historical processes, and as historical contingencies.

Scholars working within these schools of thought are likely to challenge the idea of a "unitary nation" and try to deconstruct the concept of the "nation-state." They are likely to point to the historical evidence showing that states have emerged without nations, and some nations certainly have emerged without the blessings of their own state. Nationalism strives

to make culture and polity (i.e., nation and state) congruent by providing a political roof for a culture, and the mythical imaginations of "nations" created by nationalists need to be destroyed.

The constructivist approaches are supported by the case studies conducted by Yuri Slezkine and Rogers Brubaker. Yuri Slezkine's 1994 path–breaking article "The USSR as a Communal Apartment, or How a Socialist State Promoted Ethnic Particularism" argues that despite the russifying element in the Soviet nationalities policy, non–Russian Soviet nationalities managed both to gain some power and to develop their national cultures within the USSR. Slezkine suggests that the Soviet regime suffered from "ethno-philia"; it suppressed individual rights but consistently promoted group rights by supporting national cadres and allowing education in non–Russian languages. In his view, the USSR institutionalized "ethno-territorial federalism." Slezkine expressed it this way: "If the USSR was a communal apartment, then every family that inhabited it was entitled to a room of its own." His argument (that instead of destroying the nations, the USSR constructed them) is one of the most convincing case studies supporting the constructivist definition of a nation as the product of state policies.

Similarly, Rogers Brubaker's *Nationalism Reframed* (1996) defines a nation as an "institutionalized form." According to Brubaker, instead of asking, "What is a nation?" the students of nations should dwell on how nationhood is institutionalized within and among states. This way of thinking would help to separate categories of analysis from practical categories. Nations are practical categories, not categories of analysis, and, according to his argument, categories of analysis do not need to be invoked to understand the power of nations.

IS THERE A SOLUTION?

Movement toward a middle position has become acceptable in the study of nations. Smith's recent writings on ethno-symbolism are part of this trend. Ethno-symbolism acknowledges the insights of constructivism and differs from primordialism in that it highlights the role of historical memory and symbolism instead of dwelling on "biological," unchanging characteristics of nations. John Hutchinson's 2004 *Nations as Zones of Conflict* is a noteworthy contribution to this emerging paradigm. Hutchinson reconceptualizes the nation as "a field of conflicting interpretations," thus drawing attention to the role of conflict and traumatic memory in the construction of nations. According to this view, competing loyalties have always been part of the processes of nation construction. Global processes, such as empire building, inspired the consolidation of populations into smaller groups (such as ethnic groups or nations). Later, the newly formed groups, such as nations, became the backbone of broader, more encompassing networks.

Hutchinson's critics, such as Gerard Gelanty (Gelanty et al., 2008), point to the importance of civic conceptions of nations (which is reminiscent of Ernest Renan's definition of the nation as a "daily plebiscite") and the existence of multicultural nations.

Gelanty argues that supranational projects such as the European Union may change the quality of national identity by inspiring most nations in Europe to adopt a different ("European") dimension, although these projects are not capable of "killing the nation" as a locus of identity. This observation suggests that scholars are likely to continue to debate the definition of the nation and its influence in the near future.

National Anthems

National anthems, songs, or hymns adopted by certain nations are performed at official functions of those governments or other public events (baseball games, concerts). Many evoke loyalty to the country or its head of state (king, queen). Text and melody are often written by two or more different people.

ORIGINS OF ANTHEMS

Occasionally there is a noteworthy composer, such as Josef Haydn (Austria, Germany), or Charles Gounod (Vatican), associated with a nation's anthem. The original Austrian anthem was composed by Haydn in 1797. Germany adopted this tune, applying the text in 1950. The current Austrian anthem, adopted in 1947, is attributed to Wolfgang Amadeus Mozart, although evidence shows it was composed after his death.

Former colonies sometimes use the anthems of the countries that colonized them, and sometimes multiple countries

in geographical proximity have identical anthems (Cape Verde and Guinea-Bissau). Some countries' anthems use words of the same author or poet: Rabindranath Tagore's text for the anthems of India and Bangladesh; Francisco Esteban Acuña de Figueroa's text for the anthems of Paraguay and Uruguay. Estonia and Finland use the same melody.

MUSICAL FORMS OF ANTHEMS

Today, there are five principal musical forms used in anthems, although others exist. Most tend to be in a duple meter (two or four beats per measure), and a few others in triple meter (three beats per measure).

1. *Hymns.* This form tends to be used in the oldest national anthems, including those of England, continental Europe, and their former colonies. Most noteworthy is Thomas Arne's 1745 rendition of *God Save the King,* the British hymn. Words have often been altered to reflect another nation's patriotism, as in America's version of the tune, *My Country 'Tis of Thee.* Denmark, Sweden, Switzerland, Russia, and Germany have also used this tune as their anthems. Liechtenstein does today. Until 1974, Australia used *God Save the King/Queen,* as did Canada until 1980.

2. *Marches.* France's *La Marseillaise,* adopted in 1795, is also the national anthem of nine other countries, from Martinique to New Caledonia.

3. *Folk music.* Cambodia's *Som pouk tepda* (*Heaven Protects Our King*), was adopted in 1941. Japan, Tibet, and Sri Lanka also based their anthems on folk music. Mauritania's national anthem, based on a traditional tune, is instrumental only.

4. *Fanfares.* These are often instrumental, without text. This form has been adopted by Middle Eastern nations, such as Qatar, Kuwait, and the United Arab Emirates. For Belarus, the words are not in use today.

5. *Operatic anthems.* These are prevalent in Central and South America, that of El Salvador being one of the longest.

CONTENTS OF ANTHEMS

Anthems may evoke different emotions, based on their geographic origins. Countries in peace have generally chosen anthems that highlight their scenic or natural beauty. These extol the virtues of the land. Australia refers to the radiant Southern Cross, Barbados to fields, and Burundi to a gentle country. Chile extols its blue sky and snow-covered mountains. China highlights the Great Wall.

Some focus upon a national hero, such as Denmark's King Christian. Similar to that of the United States (*Star-Spangled Banner*), the anthem of Honduras salutes its flag (*Tu bandera es un lampo de cielo* [Your Flag is a Strip of Sky]). Others describe the colors and features of their flag in song (Costa Rica, Djibouti, Ghana, the Maldives). Some praise their freedom or liberations—Andorra's reflects on eleven centuries of freedom. Those of Angola and the Comoros invoke their days of independence. Others identify the name of the nation (Malawi, Kyrgyzstan, Papua New Guinea).

Several anthems are prayers, such as *God Save the King* of Britain. In religious overtones, Bhutan's extols the Thunder Dragon and Buddha, while Brunei's exalts Allah. Many others speak to their gods, while India's finds salvation in seven major religions. *La Marseillaise* served as a call to arms, not only for France, but to some extent for the Confederate States of America.

UNOFFICIAL AND CHANGING ANTHEMS

At times, unofficial anthems have inspired allegiance to a new cause or produced ire in a nation's opponents. During the U.S. Civil War (1861–1865), *John Brown's Body,* set to a melody of William Steffe, was assigned new text by Julia Ward Howe as the *Battle Hymn of the Republic.* This tune and the *Star-Spangled Banner* were also used in temperance songs, with altered text suited to that political issue. When the Confederate States of America formed, several songs became unofficial anthems, the leading one being *I Wish I was in Dixie,* by Daniel Decatur Emmett, a northern minstrel performer. Another song, *The Bonnie Blue Flag,* composed by Harry McCarthy and harmonized and published by A. E. Blackmar in New Orleans, so infuriated Union General Benjamin Butler that in 1862 he destroyed the publishing house of Blackmar and fined any one even whistling the tune.

During times of crisis, other national songs become unofficial anthems, as when, in the post-9/11 United States, *God Bless America* was sung during baseball games. Some unofficial anthems are covert. A national anthem of Tibet, based on ancient Tibetan sacred music and with words by Trijang Rinpoche, is not used inside Tibet.

Regime changes have caused several anthems to change as well. In 1941, Cambodia adopted *Nokoreach* ("Royal Kingdom"), which started with the phrase, "Heaven protects our king." But in 1970 the Khmer Rouge chose an anthem that began, "Khmers are known throughout the world as descendants of glorious warriors." From 1975 to 1989, Kampuchea (the renamed totalitarian state of Cambodia) used another anthem. In 1993, Cambodia reverted to the 1941 anthem. In 1978, during its Cultural Revolution, China attempted to change its anthem's words, but the original words were restored by 1982. Cuba's anthem has remained the same for nearly a century and a half, having first been sung in 1868 during the Battle of Bayamo.

National Archives

A national archive is a government body charged with the storage, preservation, documentation, and general administration of governmental and historical records. National archives

may also store and preserve materials of special historic or cultural importance to a country, particularly if those materials are in the form of documents or other paper-based items that require special preservation techniques. The documents collected by the national archives are often kept in a central repository that is open to the public for research and general information; examples of such open repositories include the Public Records Office at Kew in the United Kingdom and the National Archives in Washington, D.C., in the United States. National archives may also have connections to national libraries, and both may even be administered by the same organization, as in the case of the Canadian government's Library and Archives Canada.

The history of the storage and preservation of important government papers for future reference dates back to the earliest written government records, and governments have been collecting administrative documents in central locations for many centuries. The Portuguese national archive, for instance, was established in Lisbon in the late fourteenth century. Yet the modern concept of national archives dates primarily to the late eighteenth and early nineteenth centuries. In 1785, King Charles III of Spain decreed that all historical documents pertaining to the administration of the Spanish empire in the New World were to be brought to a central location in Seville, collecting the files that had been spread out across a number of other, smaller archives. During the French Revolution, the private and public collections of documents seized by the revolutionaries were brought together in the *Archives nationales* in Paris, which in 1800 became an autonomous government body. In the United Kingdom, the Public Record Office was established in 1838 to collect various government documents that had been scattered throughout smaller archives of varying quality, from Westminster Abbey and the Tower of London to private houses and collections. The U.S. government centralized record keeping in a newly created National Archives in the 1930s; before then, each federal government department had been responsible for storing its own files and records. Today, most national governments have some body or organization that is responsible for archival management, though different national archives have differing restrictions on the accessibility and availability of the documents stored in their care.

Viewing documents that are kept in national archives may be as simple as making the journey to the archive in question and obtaining a public researcher's access card, but access conditions vary depending on the type of document to be viewed. Particularly fragile or delicate documents may require special permission and advance arrangements to ensure that appropriate preservation conditions can be maintained. Files that have specific copyright restrictions may require researchers to have prior clearance before the documents may be viewed or referenced in publicly available research. Documents on matters that are considered politically sensitive—such as classified government files—may also be inaccessible to the general public and available only to those who have been cleared to view them. In the United Kingdom, for instance, the thirty-year rule prevents public access to selected files that are less than thirty years old, though a reappraisal of the sensitivity of the files can be arranged if a researcher submits a review request under the Freedom of Information Act.

Some countries have had to pass special legislation to ensure that government documents of importance and interest to historians and policy makers are preserved by their national archives. In 1974, American president Gerald Ford signed the Presidential Recordings and Materials Preservation Act, which directed the U.S. National Archives and Records Administration (NARA) to take possession of materials from the presidency of Richard Nixon to prevent documents and tape recordings from being destroyed. The ensuing controversy over the question of which of the Nixon materials could be considered government property was only partially settled by the 1978 Presidential Records Act, which laid out more specific distinctions concerning the kinds of presidential documents and materials that NARA was entitled to administer. The role of national archives and archival administration continues to be a topic of debate, especially with regard to freedom of information and public access to the records of government and administration.

Nationalism

A nation is a group that identifies itself as such, based on a shared understanding of a common culture, history, land, and descent. Nationalism is the mobilization of a nation in pursuit of political goals. These typically include national survival and self-rule (meaning that the rulers come from the same nation as the ruled). Self-rule usually means having a sovereign state of one's own. The state, according to German scholar Max Weber, is an institution claiming to exercise a monopoly of the legitimate use of force over a given territory, and it is recognized by other states. Most states are unitary, with a single center of authority, but some are federal—having a hierarchy of units with shared sovereignty. Ninety percent of the states currently in existence are unitary.

After state sovereignty has been achieved, "nationalist" politics may involve particular concern for national defense against threats external and internal, electoral appeals based on national purity and betrayal, or defense of the rights of

compatriots outside the state's borders. Nationalist policies may include state ownership of economic assets, purging the country of minorities, or placing restrictions on immigrants. Current novelties include "resource nationalism" (such as that of Hugo Chavez in Venezuela) and "consumer nationalism" (e.g., Indian pride in Indian products).

Nationalism has a bad name. It is a word that has strongly negative connotations in the English language. It implies an excessive, irrational commitment to advancing the interests of one's own nation at the expense of others. Adolf Hitler is the prime example of nationalism pushed to the extreme. When a journalist asked if he intended to nationalize private industry, Hitler famously replied that he intended to "nationalize" the German people. Fascism effectively stripped nationalism of its place in the liberal worldview. (The word *patriotism,* meaning love of one's country, has more positive resonance, at least for the mainstream of American society.) And yet the nation-state is still the basic building block of the international state system. It has beaten out rival formations, such as the small city-state and the multinational empire. In 1919, the new global community of states chose to call itself the League of Nations, and then in 1945 the United Nations.

Nationalism is compatible with a wide variety of political positions: forward looking or backward looking, liberal or illiberal, egalitarian or racist. Nationalism was born as a philosophy of liberation. In 1789 the French people rose up against their king and demanded the right to rule themselves. Prior to the existence of nationalism, people were aware of themselves as being from a particular place, being a member of a particular religious group, and being subject to a certain hierarchy of rule (typically, a dynastic monarchy). But they were not aware of themselves as a nation in the modern sense. As John Stuart Mill noted, in order for a people to rule itself (the literal meaning of "democracy" in Greek), you have to first define who are "the people." And the people were the citizens of France—the French nation. The American republic was born at about the same time, but that emancipatory project focused on the rights of the individual, and of the states, without a clear sense of a nation as a collective actor. It was only later that the Americans started to think of themselves as a nation—or, as Seymour Martin Lipset put it, the "first new nation," based on a written constitution and not a national community.

In the course of the nineteenth century, spreading the rights of man was linked to spreading the rights of nations to rule themselves. Even though Napoleon's attempt to redraw the map of Europe was rebuffed, the Napoleonic wars led to the formation of a wave of nation-states in Latin America. In the 1820s the Greeks won their independence from the Ottoman Empire, but the Holy Alliance of Austria, Prussia, and Russia managed to beat back the tide of nationalism in the 1848 revolutions. Nationalism triumphed with the unifications of Italy (1870) and Germany (1871). But increasingly nationalism was being used by conservative rulers to suppress the rights of national minorities and to build support for their regimes in the face of challenges from liberal and socialist popular movements.

The surge of nationalism in the European states coincided with their colonial expansion. A nation's right to rule itself apparently included the right to rule other peoples, especially if they were of a different race or religion. World War I (1914–1918) was a body blow to imperialism, knocking down the Ottoman, Hapsburg, German, and Russian empires. In their place, a dozen new nation-states sprang up in central Europe, in line with President Woodrow Wilson's recognition of the interests of peoples under imperial rule. Even Vladimir Lenin, sensing the spirit of the times, paid lip service to national self-determination, and the Soviet Union was created as a federation of sovereign republics. Anticolonial movements in the British, Dutch, and French empires rallied to the call of national liberation, but they had to wait until World War II (1939–1945) had weakened their colonial masters.

The charter of the United Nations, approved in 1945, recognized "the principle of equal rights and self-determination of peoples." The United States—a noncolonial power—was now the dominant world player, and it encouraged the European states to dismantle their empires. Independence came speedily in India and Indonesia, but not without bloodshed. In Vietnam and Algeria, it required protracted wars. During the cold war, both sides appealed to nationalism in a bid to undermine the sphere of influence of their adversaries. The United States protested the Soviet occupation of Eastern Europe, as exemplified by the USSR's crushing of the Hungarian revolution in 1956. The 1959 Cuban revolution against dictatorial rule took the form of a nationalist movement under communist leadership, endorsed by the Soviet Union.

THE END OF NATIONALISM?

After the cold war abruptly ended in 1991, the West expected that the nations formerly under Soviet control would become democracies, and the past century of polarizing nationalism and state conflict would give way to a new era of international cooperation and respect for human rights. That was not to be. Nationalism was in fact a crucial force in causing the Soviet collapse, and the shift toward democracy coincided with an increase, not a decrease, in nationalist mobilization. Polish resistance against Soviet rule, which took the form of the Solidarity workers' movement, was a direct continuation of the nationalist projects of the nineteenth century. Estonia, Latvia, and Lithuania had been sovereign states after 1918 until their occupation by the USSR in 1940. Once glasnost started to take hold in 1987, they began agitating for their independence. Other nationalist conflicts erupted across the length and breadth of the Soviet Union: Kazakhs rioted because an ethnic Russian was appointed their party boss; Armenians living in the province of Nagorno Karabakh fought for freedom from rule by Azerbaijan.

A similar fratricidal logic played out in Yugoslavia in 1991. One after another, the republics of the Yugoslav federation declared their independence: Slovenia, Croatia, and then Bosnia. The Serbian minorities living in the latter two regions rose in revolt and received military support from the rump Yugoslavia. Brutal fighting caused 200,000 deaths while millions fled

their homes; finally fighting was stopped by a U.S.-led military intervention in 1995. A new phrase entered the English language: "ethnic cleansing."

The bloodbath in Yugoslavia forced Western elites to reexamine the question of nationalism. How was it possible, in this globally connected world, for this nineteenth-century philosophy to mobilize people to acts of extreme violence? The former Soviet Union and Yugoslavia were not isolated examples. All around the globe, nationalist conflicts were erupting. The struggle for power between Tutsis and Hutus triggered the horrific genocide in Rwanda in 1994. There were secessionist conflicts under way in Asia (Kashmir, Sri Lanka, Indonesia, and the Philippines) and Africa (Eritrea and Sudan). The Arab-Israeli conflict—a battle between competing nationalisms—showed no sign of resolution. The Gulf War (1990–1991) was fought to restore sovereignty to Kuwait and also created de facto self-rule for the Kurds of northern Iraq. Even Latin America was not immune to these trends. A new assertiveness by indigenous peoples fueled regional insurrections from Mexico to Bolivia.

THE QUEST FOR STATEHOOD

National self-determination is fine in the abstract. The problems start when it comes to deciding which nation gets sovereignty over which territory. There are more than 6,000 groups that can be identified as "nations" in the world of 2008 (based primarily on having a distinct language). But only 192 states are recognized as sovereign by the United Nations. Clearly, not every nation can have its own state. And what happens if two or more nations claim the same territory (as do the Israelis and Palestinians)? The global distribution of ethnic groups has a long tail: The eighty-three most commonly spoken languages are spoken in 80 percent of the world's population. The nation-state system is well established in Europe and East Asia, where more than 70 percent of the population belongs to the nation after which the state is named. In most states of the Americas and the Middle East, the largest national group ranges from 40 to 90 percent of the population. In Africa, South Asia, and Southeast Asia, such national homogeneity is quite rare. In sub-Saharan Africa, the largest ethnic group often amounts to less than 30 percent of the population of a state.

For all the talk of self-determination, the international state system that emerged in the twentieth century was extraordinarily reluctant to permit secession. Only a handful of states managed to secede: Norway (1905), Iceland (1918), Ireland (1921), Singapore (1965), Bangladesh (1971), and Eritrea (1993). The vast majority of new states were born from the dissolution of multinational empires. The three socialist federations (the Soviet Union, Czechoslovakia, and Yugoslavia) broke up into the preexisting republics that had made up the federation. The sole exception is Kosovo, an Albanian-populated region that had been subordinated to Serbia and that declared independence in February 2008. There are four regions inside the former Soviet Union (Abkhazia, Nagorno-Karabakh, South Ossetia, and Trans-Dniester) that have established de facto self-rule but have not been recognized as sovereign by any other country.

The largest group currently denied self-rule is probably the Kurds, whose twenty to twenty-five million members are scattered across Turkey, Iraq, and Iran. Taiwan has self-rule, but not international recognition. There are dozens of large ethnic groups within China and India that speak distinct languages, but they are not pursuing independent statehood. Secessionist movements are confined to proportionally small groups, such as the Sikhs in Punjab, Uighurs in Sinkiang, and Tibetans in Tibet.

Ethnicity can be defined as a subjective sense of group belonging. It is subjective in that it cannot be pinned down to objective criteria. If some people see themselves as a group and behave accordingly, the group exists. An ethnic group that develops political aspiration to self-rule becomes a nation. Ethnicity involves the perception of sharing the following characteristics: a specific territory (a homeland, which may or may not be where the group now lives), history (formative events, wars, heroes, what Austrian socialist thinker Otto Bauer called a "community of fate"), descent (links by ties of family, of "blood," perhaps extending to racial categories), culture (customs, food, rituals, clothing, etc.), language, and religion.

Any given nation will exhibit most but not all these attributes. For example, Irish nationalism was a potent force in the nineteenth century, even though by then 90 percent of the Irish spoke only English. Analysts disagree about whether these attributes constitute a "core" identity or merely an outward appearance. Are they innate or learned? Are they fixed or transient? Anthropologist Fredrik Barth argues that ethnicity is a boundary phenomenon, the product of interactions between groups rather than the expression of the group's inner core. Ethnic groups evolve through the selection of markers that serve to distinguish them from neighboring groups. David Laitin argues that language is a handy marker, because it is flexible (it can be learned) but not too flexible, (it takes time to learn).

COMPETING THEORIES

There is a broad spectrum of theories about nationalism. They generally agree about the facts in the historical record but disagree about how to explain the rise and persistence of nationalism.

1. *Primordialism*. Primordialism, now known as perennialism, is best represented in the works of Anthony Smith. Primordialists see ethnicity as an enduring and natural feature of human existence, one that preceded the arrival of the modern state. They cite evidence for the emergence of French and English identities as early as the ninth century. The term *nation* originated in the thirteenth century, when church delegates to the 1274 Council of Lyons were grouped by "nation." Nationalists themselves often invoke the premodern origins of their nations. Religious conflicts, such as that between Christianity and Islam, were key to the evolution of nations such as Spain, Poland, and Serbia. Primordialism has been criticized by writers, such as Robert Kaplan, who talk about "tribal hatreds" or "ancient enmities" when trying to explain modern conflicts. Ethnic identities are not fixed; they can shift quickly in response a changing political environment.

Walker Connor argues that all nationalists deploy the rhetoric of "blood" to some degree—a bloodline or blood sacrifice. This leads into sociobiological approaches, which see ethnicity as hardwired into our genetic code. Sacrifice for the kin group may be rational for evolutionary survival. Even nonhuman primates display intense group solidarity and xenophobia. Psychological experiments show an alarming propensity for human subjects to spontaneously develop group loyalty and antagonism toward the "other." However, in communities of more than 5,000 people, it is impossible to sustain links based on actual kinship, so people switch to mythical kinship, the nation.

2. *Structuralism.* Structuralists tend to explain away nationalism by treating it as a by-product of the functional requirements of some deeper social mechanism. Echoing Karl Marx, Ernst Gellner, and Eric Hobsbawm tie nationalism to the rise of capitalism. Gellner argues that industrialization requires a mobile workforce capable of learning new skills and trained through a public education system. It is more efficient to have one language. Hence, the state-sponsored education system forges a common national identity. Nationalism has the political advantage of diverting the workers from overthrowing capitalism into hostility toward other ethnic groups and nations. Michael Hechter notes the role that ethnicity plays even in mature capitalist economies in segmenting the workforce. Minorities who play a "middleman" role, such as the Jews in Europe, Indians in East Africa, or Chinese in Indonesia, have often been the target of pogroms.

Donald Horowitz argues that ethnic conflict in developing countries is driven by status anxiety, triggered by social changes such as urban migration that accompany economic development. Ethnic groups want to rule themselves, because it confers status and brings jobs and economic favors. It is often easy for the catchall anticolonial movement to be captured by the dominant ethnic group, who then rule in their own interest. In some societies, a multiethnic coalition may take root and survive for decades, as in Malaysia. In other cases, an ethnic minority that feels itself persistently excluded from power will rebel, as with the Tamils in Sri Lanka.

3. *Instrumentalism.* Instrumentalists see nationalism as a tool used by elites to pursue their own economic or political goals. In sixteenth-century England, monarchs appealed to nationalism to undercut the nobles and strengthen their own rule. Rising elites in nineteenth-century Europe used it to build a political coalition to dislodge the multinational empires. Jack Snyder notes that the spread of democracy has often coincided with an increase in nationalism. In countries such as Yugoslavia making a transition from authoritarian rule to competitive elections, it is easy for politicians to attract votes by appealing to the simple fact of ethnic identity. ("Vote for me because I will defend the Serbs.") If an excluded ethnic group turns to violence, then the logic of polarization becomes even more deadly. Those who favor compromise with the other side are condemned as traitors, perhaps even assassinated.

Rational choice theorists such as Hechter and David Laitin approach nationalism as a collective phenomenon rooted in the rational pursuit of individual self-interest. The incentive structures provided by political institutions are crucially important in channeling nationalism in one direction or another. For example, Russians living in the Baltic states after 1991 did not turn to violence to protect their group interests, because they faced strong incentives to assimilate and become citizens, which would bring higher living standards and a European Union passport. Nationalism is the product of social institutions and is not reducible to individual choices. For example, even though personal relations between ethnic groups in Bosnia prior to 1991 were typically good (with intermarriage quite common), the changing political environment forced most people to behave in new, ethnically exclusive ways.

4. *Deconstructionism.* Deconstructionists such as Benedict Anderson argue that ethnicity and nationalism are essentially artificial constructs, imagined communities that arose in the new media that accompanied economic modernization. The rise of mass literacy and the spread of newspapers made it possible for people to imagine nations into existence. In contrast to primordialists and structuralists, who stress the European roots of nationalism, Anderson points to the role of colonialism and the early emergence of nation-states in Latin America. He also draws on the case of Indonesia, which forged a new nation out of a vast, diverse archipelago and created a new artificial language for its colonial bureaucracy in 1928. But contra the postmodernists, it is important to note that Anderson is not describing "imaginary" communities. Once the community is imagined into existence, the social movements and states that result are real.

CURRENT DEBATES

Nationalism may be particularly hard for Americans to understand, since the United States is an immigrant society (where every group except Native Americans came from somewhere else) and unique in basing itself on a set of political principles, a social contract. These two factors mean that Americans tend to see national identity as voluntary and inclusive. Most nationalist conflicts around the world tend to be coercive and exclusionary. Rogers Brubaker and Liah Greenfeld have explored the distinction between civic and ethnic nationalism. Civic nationalism—as in America, Britain, or France—is inclusive, based on the assimilation of people of diverse ethnic backgrounds into a common culture and including strong guarantees for individual rights. Ethnic nationalism, such as that of Germany or Japan, stresses the group over the individual and ties the nation to a specific ethnic identity, making it hard for immigrants to acquire citizenship. Critics argue that even the "civic" nations do in fact have an ethnic core—note the long denial of civil rights to African Americans in the United States and the problems that France is now encountering with absorbing its Muslim minority. Also, in recent decades, the two models have converged, with the embrace of various forms of multiculturalism. In the United States, there has been a shift from talking about the "melting pot" to the "salad bowl." The United Kingdom has pursued multiculturalism, trying to bring

racial and religious minorities into the media, political parties, and educational system. France has stuck with its assimilation-ist approach, while Germany has generally pursued a "separa-tion" model, recognizing that the minorities (mainly Turks) are part of society but not adapting the national culture to bring them into the mainstream.

To what extent can a liberal society recognize and pro-tect group rights without violating individual rights (or the rights of other groups)? Will Kymlicka argues that society has a specific moral obligation to respect the rights of indigenous groups (now called "first peoples" in Canada) over immigrants. U.S. law has long recognized the "sovereignty" of the Native American nations, and similar steps have been taken in recent decades in Canada and Australia.

There has been a lively debate over whether skillful con-stitutional design can head off ethnic conflict. Does a federal structure give ethnic minorities the security they need? Or does it merely provide a framework for them to consolidate their political power and ratchet up their nationalist demands? Canada is still struggling to contain the demands of the French-speaking Quebecois, who came within a hair's breadth (0.58 percent) of voting for secession in a 1995 referendum. The ethnic federations of Czechoslovakia, Yugoslavia, and the Soviet Union collapsed as soon as they started to democratize. India is the prime example of a multiethnic society that has

been able to satisfy group demands within a democratic fed-eration, though periodic outbreaks of "communal violence" between Hindus and Muslims continue to occur.

Arend Lijphart advanced a consociational model, based on the Dutch case, involving power sharing between the lead-ing groups. Such arrangements are difficult to craft and quite rare in practice. Often, politicians who propose power sharing lose the support of their own ethnic groups. The first edi-tion of Robert Dahl's influential *Polyarchy,* published in 1971, included Lebanon and Sri Lanka as successful examples, but this proved premature, as both countries descended into vio-lence soon thereafter. Belgium, another common example, is looking more and more precarious as the two communities of Flems and Walloons are politically deadlocked. South Africa seems to be turning out well, with elements of federalism and consociationalism, but the most important institution in South Africa is the single dominant ruling party, the African National Congress, something that does not feature in the consocia-tional or federal models. There are of course many cases of ethnic minorities living more or less peacefully and harmoni-ously within multiethnic states, but these minorities usually have little or no access to state power.

Nationalist Parties

Nationalist parties are those political parties whose chief basis of appeal and whose raison d'être is to promote the interests of and emotional attachment to a nation. A *nation* refers to an aggregate of people who have a sense of common identity and some shared values or cultural distinctiveness, as opposed to a *state,* which organizes the institutions for selecting decision makers and making decisions regarding public policy. Conceived in this way, *nation* is a cultural concept, while *state* is a political one. The boundaries of a nation may or may not be congruent with the borders of a state; instead, the nation may exist as a subculture within a state.

Nationalist parties may promote the power and interests of a sovereign state, or they may promote the autonomy of subculture. Either type is concerned with the promotion of a distinct identity, a psychological attachment to a nation. Both types are considered in this essay to be nationalist parties that promote identity, rather than traditional mainstream parties, which have largely promoted class-based or religious issues. Both types of nationalist parties have increased their bases of support or vote share in the recent past, especially in countries where the opportunity structure facilitates the emergence of new parties.

RISE AND DECLINE OF PARTIES OF CLASS AND RELIGION

Some four decades ago, Lipset and Rokkan (1967) argued that the cleavage structure of western democracies was based on class and religious issues, and hence the party systems of these democracies represented those cleavages. Party "families" dominated the political arena of most Western democracies: Christian Democracy or similar parties of the center right, labor-based or social democracy parties, and parties of classic liberalism. Typically, the first two families won the vast majority of the legislative seats in countries like Austria, Canada, Germany, and Great Britain. While the dominance of two parties was not as pronounced in countries with more fragmented party systems, in general significantly fewer parties garnered a significant share of legislative seats than in countries where two parties did not dominate.

In recent decades, however, these "major" parties have been losing vote and seat share throughout the industrialized West, and new parties have been emerging in the lacunae left by the weakening of the "major" parties. The extent of the success of the emerging parties in any given country is in part a function of what has been called "the opportunity structure." This recent trend toward the success of nationalist parties is a function of cultural change as documented in the seminal work of Ronald Inglehart, among others (Inglehart 1977, 1990). This body of research postulates the declining salience of issues regarding class and the status of religion. Class-based issues have declined in salience as a function of the unprecedented period of postwar prosperity. Issues regarding wages, hours worked, and working conditions have become less of a concern to working-class individuals than social issues such as the protection of conventional morality. Religious issues have declined in salience as part of the general trend toward secularization of the Western world. Because Catholics in Europe can no longer be counted on to vote their religion, for example, overtly Catholic parties in the Netherlands and Italy dropped or played down that basis of their self-definition in the early 1990s.

POPULIST MOVEMENT TOWARD NATIONALIST PARTIES

As the parties promoting identity with either the sovereign nation or the subculture emerged to claim the vote share lost by the traditional parties of class and religion, the political arena of Western countries was transformed. Class-based issues were to a large extent displaced by lifestyle issues such as environmentalism, feminism, national pride, and middle class morality. (Economic issues have regained some salience in the face of the 2008–2009 recession.) As certain segments of the

population were marginalized by modernization, these people protected their self-esteem by identifying with a sense of belonging to the backbone of a community or nation. Thus, peasants, shopkeepers, clerks, owners of small family farms, and unskilled labor whose socioeconomic roles were marginalized could take comfort and self-esteem from an identification with the folk that defined their nation. Such people tend to be less tolerant of those who are not accepted as part of the folk. The inhabitants of what is now Germany had a strong element of *volkism* running through their political philosophy; this took the place of the state that did not exist to provide an outlet for the sense of belonging to a German nation for almost two millennia. The absence of a political outlet for the sense of a German nation resulted in an exaggerated glorification of the idea of the German nation-state in the writings of such German intellectuals as Georg Hegel.

This exaggerated pride in one's nation in many countries was expressed in a movement of the less-educated and marginalized segments of the country. Such movements are generally known as populism. While parties expressing strong nationalist feelings are frequently identified as the extreme right (Ignazi, 2002), the radical right (Kitschelt, 1995), or the far right (Karapin, 2002), they do not place well on the traditional left-to-right party ideology dimension. The attributes that have been shown to characterize the populist right (i.e., rejection of out-groups and distrust of elites) are distinct from those that characterize the traditional mainstream right, such as protection of property, maintenance of public order, and promotion of religiosity. Hence, it may be more accurate to describe these emerging nationalist parties, some of which promote policies that would seem to be on the left, as populist parties. These nationalist and populist parties, as a product of the trend toward postindustrial societies, may now be a permanent part of the political landscape.

Nationality

Nationality is the object of identification emanating from the growing salience of nationalist sentiments. It may be, but is not necessarily, expressed through citizenship or emotional attachment to a state, or it may be expressed in cultural terms. A nation, in this perspective, refers to people united by a sense of common identification, sometimes a sense of a shared heritage, and some shared values. In other words, a nationality is a state of mind or a psychological fact. *Nation* is therefore a social and cultural concept, as opposed to *state,* a political concept referring to the constitutionally designated structures setting the rules for choosing decision makers and making policy decisions.

NATIONALITY VERSUS CITIZENSHIP

The geographic boundaries surrounding the people composing a nation in this sense may or may not be congruent with the boundaries of a state. Thus, one's citizenship may or may not coincide with one's nationality. For example, French-speaking residents of Quebec identify themselves as citizens of the Canadian federation, but their nationality is Québécois. The former Yugoslavia was a state that was made up of several distinct nationalities: Croatian, Serbian, and Bosnian—nationalities so distinct that Serbia attempted to wipe out the Bosnian nation. Similarly, Belgium is a state that has virtually evolved into a loose confederation of the distinct nationalities of Flanders and Wallonia. The record of such multinationality states with respect to regime stability and effectiveness is not encouraging, especially when the nationality differences are buttressed by the lack of a common language.

The question of whether one's sense of nationality coincides with one's political citizenship is an important one that affects the stability of effectiveness of the political system in question. Where they do not coincide, segments of the population of a state defined by their nationality may feel isolated and alienated from their fellow citizens of that state.

GROWING SALIENCY OF NATIONALISM

The salience of the concept of nationality has sharply increased in the post–World War II (1939–1945) era, driven by the growing salience of nationalism, one of the strongest ideological forces in that postwar world. Therefore, one cannot understand the importance of the concept of nationality without understanding the importance of the concept of nationalism.

An understanding of nationalism begins with its definition. Perhaps the classic definition was that of Hans Kohn over five decades ago. Kohn declared that "nationalism is a state of mind in which the supreme loyalty of the individual is felt to be due the nation state" (1955, 9). As a state of mind, one's nationality is a cultural or psychological concept distinct from one's political citizenship. Nationality thus constitutes the way individuals define themselves.

Also five decades ago, eminent scholars were pronouncing "the end of ideology." The obvious weakening of the

ideological forces and principles that dominated political conflict in the Western world in the second half of the twentieth century was perhaps indicated by the declining vote share of the major political parties that had evolved to represent these principles. This weakening of the traditional ideological forces in the West accompanied the amelioration of the grievances these principles represented. Francis Fukuyama pronounced that the world was arriving at a consensus that our current form of liberal democracy constitutes the best form of government; hence, with the apparent triumph of the West, political evolution and even fundamental conflict would be a thing of the past. The unstated question raised by these end-of-ideology or end-of-history theories is whether the declining salience of the older classic ideologies will be accompanied by the emergence of new sets of principles.

POSTMATERIALISM AND THE POLITICS OF IDENTITY

This question was addressed by one of the most important and frequently cited bodies of research in recent decades, Ronald Inglehart's theory of the cultural transformation of Western countries from an orientation toward issues and conflict based upon class and materialist concerns to what he calls "postmaterialism." While Inglehart has not rigorously delineated the content of postmaterialist politics, lifestyle issues, such as tolerance of the counterculture that emerged in the United States in the 1960s, would seem to dominate the postmaterialist arena.

One of the most prominent issues of the postmaterialist world is identity. This could be expressed as identification with a sovereign nation-state or with a smaller subculture or nationality that seeks either autonomy or even secession from the larger nation-state. Therefore, parties that bitterly oppose one another within a given state might each be recognized as embodying a "politics of identity" focused on defending the interests and values of their particular nationality rather than on the state as a whole. The conflict between the populist Canadian Reform Party of the 1990s and the French Canadian Bloc Québécois epitomized this politics of identity, expressed in the conflict between distinct identities within a given state. Less-developed countries frequently contain several tribal nationalities. Nigeria, for example, contains over 300 distinct tribal identities speaking mutually unintelligible languages. Kohn and John Kautsky each stress the importance of a common language in building a shared sense of nationality.

The elites who lead these distinct nationalities within a state have a distinct interest in resisting their assimilation into a broader nationality or the nationality of the rest of the country. Thus, the leaders of the Scottish nationality have an interest in promoting Scotland's distinctiveness and autonomy from Great Britain and the government at Westminster. The growing pressure for devolution of power from Westminster to Scotland may threaten the coherence of Britain as a sovereign state. Although Great Britain and Northern Ireland may constitute a single sovereign state, England, Scotland, and Wales remain distinct nations.

CONCLUSION

Skeptics regarding the prospects of creating the political integration of Europe argue that the European Union constitutes an example of the failed attempt to create a European state without the prior development of a European nationality. The applicability of the United States as a model for Europe is limited by the fact that the residents of the thirteen colonies to a large extent shared a sense of a common nationality buttressed by a common language.

Thus, the growing salience of the new politics of identity in the face of the decline of classic bases of identity such as class and religion will continue to give prominence to the concept of nationality as a base of political conflict for the postmaterialist world.

Nationalization

Although there is no universal agreement on how to define *nationalization* precisely, this term is used to describe the government's actions to exercise control or ownership over assets such as private property, industry, land, or financial/business institutions. Theoretical works focusing on nationalization tend to emphasize government control of private property, government influence over financial/business institutions, and degrees of government ownership of industry and land.

In political science and political sociology, the term has been used in several other contexts. Nationalism studies use this term to refer to language, citizenship, migration, and similar policies pursued by nation-states to integrate multiethnic regions into one body politic or, alternatively, to create a monoethnic state without integrating ethnic minorities. In studies of political parties, this term has been used to describe the "increasing similarity of geographic units" in terms of the resemblance of voting patterns. The so-called nationalization of the vote is seen as an indicator of how politically integrated a country is. This approach attempts to establish whether the constituents tend to vote for the same parties at the regional and national levels.

The term *nationalization* is often used in studies of communism and socialism. In this context, it refers to the process by which the government assumes various degrees of control over private property. The government is conceived as the primary owner of industry and land (but not necessarily of all private property).

NATIONALIZATION AS CONCEPTUALIZED BY COMMUNIST AND SOCIALIST THEORIES

Communist and socialist theories of nationalization are based on Karl Marx's theories about the creation of a classless society, which, according to Marx, was the final evolutionary stage in the political development of humankind—a development that consists of a series of struggles between the haves (those who own the means of production) and the have-nots (those who do not own the means of production and are exploited by those who do). According to this theory, the stage when the government becomes the primary owner of industry and land (that is, the nationalization of the most important assets) is an important step toward the creation of a classless society.

A prominent critic of capitalism, Marx warned about the concentration of the means of production in the hands of one class (the bourgeoisie). He argued that this will lead to a revolution by the have-nots (the proletariat). Marx proposed the nationalization of the means of production as the strategy necessary to create a classless society. In *The Abolition of Landed Property* (1869), he wrote, "Leaving aside the so-called 'rights' of property, we affirm that the economical development of society … [renders] the nationalization of land a 'social necessity,' against which no amount of talk about the rights of property will avail." In *The Manifesto of the Communist Party* (1848), Marx (together with Friedrich Engels) identified the actors who will pursue nationalization—the working class (the proletariat). They will undertake this pursuit because "they have nothing of their own to secure and to fortify; their mission is to destroy all previous securities for, and insurances of, individual property."

HUGH CLEGG'S CRITIQUE OF SOCIALIST AND COMMUNIST APPROACHES TO NATIONALIZATION

In the late 1940s and 1950s, after the French and British governments took control of the coal, electricity, gas, and transport industries in their countries, nationalization attracted the attention of theorists and practitioners in Western democracies. During 1950 and 1951, Hugh Clegg, a former member of the British Communist Party and father of the Oxford school of industrial relations, published two works—*Labour in Nationalized Industry* and *Industrial Democracy and Nationalization*—that put forward a powerful critique of the Marxist concept of nationalization. *Industrial Democracy and Nationalization* outlined the expected benefits of nationalization that were predicted by socialist theories, such as better planning, better coordination, and happiness coupled with a feeling of freedom from oppression, which workers would experience because they would know that they were toiling for the public good. It pointed out major weaknesses in nationalization projects as conceptualized by Socialist and Communist theories—the lack of accountability, issues with productivity, and the difficulty of assessing the effectiveness of nationalized industries, because "their products are not fully determined by competition, [and] their accounts may be made to show profit merely by pushing up the price." Clegg made several suggestions about how to make nationalized industries more accountable to the people. These suggestions included creating national boards responsible to the appropriate minister and to Parliament as well as setting up special agencies. He also identified several other government strategies that might be able to achieve results similar to those expected by socialist theories of nationalization, such as the progressive taxation of incomes and the financing of social services from this taxation.

NATIONALIZATION IN PRACTICE

The best-known example of nationalization took place in Russia and the Soviet Union in the early twentieth century. During the Bolshevik revolution in 1917, the Russian government nationalized numerous industrial and banking institutions. After the creation of the Union of Soviet Socialist Republics (USSR) in 1922, the Soviet government became the primary owner of industry and land. Similar processes of nationalization took place in Soviet satellite states after World War II (1939–1945).

During the second half of the twentieth century, there were several famous nationalization projects that were aimed at getting rid of foreign control of industries and companies seen as vital to the national interest. These cases include the nationalization of foreign businesses by the Cuban government in 1960, the nationalization of the Suez Canal Company by Egypt in 1956, and the nationalization of the oil industry in Venezuela in 1975–1976.

Recently, the nationalization of oil assets has received a lot of attention. In 2004, the Russian oil company Yuganskneftegaz (a subsidiary of Yukos) was de facto nationalized by the Russian government, at least partly for political reasons. Those opposed to the nationalization of oil assets pointed out the dangers (some of which had been pointed out earlier by Clegg): a decline in management standards, reduced productivity, and increased investment risks. Those in favor argued that the nationalization of oil assets could benefit the country's economy as a whole by providing raw materials at affordable prices.

In 2008–2009, in the public discourse in the United States, the term *nationalization* has been used to describe increased levels of government control in managing the financial crisis. Examples include arranging mergers for troubled financial institutions and investing significant sums of public money in the banking sector. These actions, however, do not constitute full government takeover of these financial institutions and exemplify only low levels of nationalization.

National Security Policy

National security is a phrase that is used in many different ways. Classically, it has been defined as freedom from foreign interference or influence—military, economic, or political—in domestic affairs. Quite obviously, this definition primarily involves physical security from military invasion. However, national security involves not only the defense of a nation and that nation's safety but also protection of that nation's interests, whether they be political or economic. In order to understand national security, as noted by Tipson, these questions must be answered: Who is the foreign influence? What is being protected? What are the means of protection?

FOREIGN INFLUENCES AND ASSETS UNDER PROTECTION

Determining who is the foreign influence is not difficult. Historically, most authorities have defined a foreign influence as including any foreign nation. In the modern world, the "who" has been expanded to include nongovernmental groups with no legitimately recognized political or geographical identity, especially independent terrorist groups such as al-Qaida. National security in the early twenty-first century necessarily includes protecting a nation from the influence, attack, or dominion of such groups.

There are several basic categories of assets that must be protected as part of national security. The most basic of these assets is territory. National borders clearly define the territory of a nation (although some borders remain disputed and a source of conflict, such as the India-China border near Tawang). International law recognizes the right of a nation to be secure within its borders, as seen in Article IV of the United Nations (UN) charter. The second most important asset protected by national security policy is a nation's citizenry. International law extends protection to a nation's citizens. This protection usually applies whether the citizens are within that nation's borders or within a foreign country. Third, the safety and security of a nation's military forces, whether located domestically or in another country, has been recognized to be a legitimate concern of national security. The United States of America has entered into numerous treaties with other nations where its forces are located; these treaties are known as Status of Forces Agreements (SOFAs).

Further, although this claim is not recognized by all nations, the United States has maintained that access to certain militarily strategic or economically essential resources is a matter of national security. Finally, in the decision of *United States v. Robel* (1967), the U.S. Supreme Court recognized that national security includes the defense of American values and ideals. However, when other nations appeal to strategic resources or intangible values in their national security policy, they are actively opposed by more powerful nations. Thus, there is a question of relativity and power concerning these elements of national security.

MEANS OF PROTECTION

As to the means of protection, there are three basic methods: diplomatic means, legal means, and military means. Each of these means is usually instituted according to a policy.

Policy is an amorphous term and is used in many different contexts, especially in the realm of politics, but two meanings are helpful for understanding national security policy. First, a policy can be defined as a statement of the ultimate goals of a nation or government. For example, a government might announce that its nation's policy, as a matter of national security, is to protect access to vital and rare natural resources that are not located within the policy-making nation's borders but rather are found in a neighboring country. This would be a broad statement of policy goals.

Second, a policy can be defined as a coherent plan to guide specific decisions and actions, whose ultimate purpose is to implement broad goals. This definition of policy has been equated with the systematic procedures aimed at implementing the policy goals. To continue the previous example, one method to implement the policy goals of securing access to those vital and rare natural resources would be to diplomatically arrange a treaty ensuring such continuing access. Another method would be to enter into a contract, enforceable by international law or arbitration, that would ensure access to those resources. A third method would be to militarily invade the neighboring country and physically seize and secure the resources.

All policies have costs, some of which can make some policies untenable. When Iraq invaded Kuwait in 1990 to seize control of its oil supply, the world's military response was swift and devastating. In other cases, the costs are less tangible but lead to a policy being overturned. An example of such a policy would be the Bush Administration's use of techniques widely denounced as torture to further the national security interests of the United States. This national security policy including so-called enhanced interrogation was eventually deemed too costly for a variety of reasons (including legal actions by the victims, national opposition, loss of international reputation, and the possibility of retaliation by other nations). Thus, policy involves not only the ultimate goals of a nation but also how that nation executes and implements its policies.

METHODS OF DECIDING POLICY

There are many different methods of deciding upon policy, even within individual countries. In the United States, the

highest level of policy making lies with the Congress. The enactment of laws by the Congress is the highest statement of the legal policy of the United States. This is especially true of national security. For example, by the enactment of the USA PATRIOT Act, the Congress set the policy of the United States as accepting limitations on civil liberties to attempt to protect the United States from terrorism.

The executive branch, as vested in the president, is also a very important policy maker that can, at least for a time, bypass other policy makers. For example, the Bush Administration created and implemented the policy of torturing alleged terrorists, even though this policy conflicted with various domestic and international laws.

The judicial branch also contributes to policy. When the U.S. Supreme Court makes a ruling on the constitutionality of certain laws, it is, in essence, expressing policy. For example, when the Court invalidated the military commissions of the Bush Administration concerning Guantanamo Bay, it changed an important policy concerning national security.

The example of torture and Guantanamo Bay shows how the American "checks and balances" form of government can affect changes in national security policy over time. Most modern democracies similarly include mechanisms to avoid the long-term adoption of natural security policies that harm their citizens and violate international law. The international community faces a challenge, however, in countries like Iraq under Saddam Hussein, which claimed a right to resources beyond its borders, or North Korea, which claimed the right to develop nuclear weapons as a matter of national security.

National Socialism

National socialism is a political ideology that rose to great popularity across Europe during the interwar period. National socialism espouses supremacy of the state's interests as defined by the leader and total obedience by all classes to the state. In most cases, national socialist parties and movements embraced racist and ultranationalist ideologies. Out of the chaos surrounding Germany's collapse at the end of World War I (1914–1918) sprang the German Workers' Party. This party, which would eventually become the National Socialist German Workers' Party, was formed on January 5, 1919, in Munich under the leadership of Anton Drexler and Karl Harrer.

RISE OF NATIONAL SOCIALISM AND ADOLF HITLER

Over the span of a few years, the German Workers' Party grew in size, attracting a heterogeneous following. One of the party's early recruits was Adolf Hitler. Between 1920 and 1921, Hitler established his complete authority over the party. He added the words *National Socialist* to the party's name (it became known as the Nazi Party) and adopted the swastika as the party's symbol and flag, and in February 1920 the party issued its official twenty-five point program. It called for the union of all Germans within a greater Germany, repeal of the Treaties of Versailles and St. Germain, establishment of colonies for Germany's surplus population, exclusion of Jews from citizenship, appointment of only competent citizens to official posts (without regard to party affiliation), state promotion of the welfare and economic activities of its citizens, an end to non-German immigration, improvement of national health and fitness levels through obligatory physical activities, and promotion of the common interest above self-interest.

With regard to economic issues, the party demanded abolition of the "thralldom of interest," confiscation of war profits, nationalization of syndicates and trusts, introduction of profit sharing in industry, improved old-age insurance, establishment and protection of a healthy middle class of artisans and merchants, implementation of land reform by means of "confiscation without compensation," abolition of interest on mortgages, and prohibition of land speculation. The twenty-fifth and final point of the program called for the establishment of a powerful central government, along with diets and vocational chambers to implement the laws proclaimed by the Reich and the various German states.

The Nazi Party polled a meager 2.5 percent of the national vote in the 1928 election. The first major Nazi electoral breakthrough occurred in the general elections of September 1930. The party received 6,400,000 votes, or 18.3 percent of the total, and gained 107 seats in the Reichstag. After the general elections of July 1932, the Nazis replaced the Social Democrats as the largest political faction in the Reichstag, with 230 seats. In the July 1932 election, the party received 13,750,000 votes, or nearly 38 percent of the total. The Nazi Party's exclusion from government ended on January 30, 1933, when President Hindenburg changed his thinking about a Hitler-led government and appointed the Nazi leader chancellor of Germany.

APPEAL OF NATIONAL SOCIALISM: PREJUDICE AND KEYNESIAN ECONOMICS

Examinations of the ideology of national socialism have focused largely on Hitler's writings in *Mein Kampf* ("My Struggle"). Thus, it comes as no surprise that most treatments of Nazi ideology stress the primacy of general nonmaterial themes such as racism, anti-Semitism, anticommunism, hypernationalism, and xenophobia. We must ask, however, whether millions of Germans would have supported a party that offered only vacuous promises and generalities. The party positions that were enumerated in the official Nazi Party programs have been too often ignored. Unlike the frequently vague and outlandish ramblings of *Mein Kampf* (which relatively few people read before 1933), the party programs taken together are characterized by a substantial degree of coherence and considerable emphasis on material themes. This is not to say that racism, anti-Semitism, hypernationalism, and xenophobia played no role in Nazi ideology; nor that many people found the Nazi Party attractive because of its stance on these themes. By themselves, anti-Semitism and other racist and nationalist themes would not have made the Nazi Party into the most popular party in Germany. The Nazi Party leaders were savvy enough to realize that pure racial anti-Semitism would not set the party apart from the pack of racist, anti-Semitic, and ultra-nationalist movements that abounded in post-1918 Germany. The Nazi success can be attributed largely to the economic proposals found in the party's programs, which, in an uncanny fashion, integrated elements of eighteenth- and nineteenth-century nationalist-etatist philosophy with twentieth-century Keynesian economics.

Nazi economics sought to create a "third path" between Marxist centralized state planning and laissez-faire capitalism. The Nazis were not the first in Germany to advocate or even to implement both nationalist-etatist and Keynesian economic principles, but they were the first to merge the principles of both schools in a seemingly coherent and innovative program. Nationalist etatism is an ideology that rejects economic liberalism and promotes the right of the state to intervene in all spheres of life, including the economy. Among the ideas that the nationalist-etatist school contributed to Nazi economic planning were state socialism, economic protectionism, and territorial expansion (*Lebensraum*). Nazi economists found much to their liking in Keynesian economics. John Maynard Keynes's *The Economic Consequences of the Peace,* which was critical of the Versailles treaty and the financial obligations it placed on Germany, brought Keynes to the attention of many members of the Nazi leadership as early as 1920. The Nazi Party agreed with Keynes that if governments and central banks hoped to maintain full employment and reduce the likelihood of economic recession, they should urge investment in new capital goods, ensure a cheap money policy, and initiate public investment. Much has been written about Franklin D. Roosevelt's adoption of the Keynesian notion of "pump priming" in the mid-1930s as a means to jolt the U.S. economy out of the Great Depression. What may be less well known is that the Nazi Party had urged the use of pump priming to start the German economy several years before F.D.R. used it in the United States.

Nationalist-etatist principles and Keynesian economics made for a good match. Autarky was realizable, according to the thinking in the Nazi Party, through government-initiated investment in the nation's infrastructure, including public works, residential reconstruction, resettlement, and reagrarianization. In the end, the marriage of nationalist-etatist thinking and Keynesian economics allowed the Nazis to design some rather novel but nevertheless concrete economic policies.

Nation–Building

Nation-building refers to the general process of constructing a nation making use of the power and institutions of the state or the political community (polity). As an ideology and social mobilization, nationalism has often been attributed to earlier phases in the process of evolution of contemporary nation-states. Nation-building policies have generally been implemented so that a transition from traditional societies to modern polities could be realized.

Following a phase of boundary building and state formation, the process of nation-building generally seeks to socialize the people of the state into a nation. Such a task may take centuries, as the cases of Japan or the European nation-states illustrate, whereas in other instances (i.e., New World and postcolonial countries), developments were more rapidly implemented in contemporary times. However, nation-building is not merely a phenomenon associated with the past state formation. It continues to manifest itself in well-established states seeking to maintain their legitimacy and territorial integrity in the face of internal or external challenges. To this end, nation-building promotes national identity with the establishment of national symbols, such as anthems or flags, together with the (re)creation of historical myths or cultural markers.

A process of creating administrative and military centers and of consolidating territorial boundaries usually implies the enforcement of one central authority upon peripheral regions or subordinated political groups. As regards the case of Europe, there persists a controversy on whether the processes of nation-building were mainly the result of the French and Industrial revolutions in the eighteenth and nineteenth centuries, or if their origins can be traced back much further (to around the High Middle Ages). Indeed, it would difficult to deny the existence of "proto-nations" before the Modern Age. However, it would also be awkward to regard nation-building phenomena as the product of history beyond the paramount impact of the modern processes of social,

economic, and political changes (bureaucratization, colonization, industrialization, and urbanization, to name a few). The term *nation-building* came into widespread usage in the 1950s with reference to the creation of newly independent states in postcolonial Africa. In more recent times, it has become more controversial, being associated with U.S. efforts at postconflict reconstruction in Afghanistan, Bosnia, Kosovo, and Iraq.

Among the main policies deployed by state centers to integrate peripheries and to create nation-states, four can be underlined: (1) the active presence of an administration (particularly the military and security forces) in all the territory of the polity, (2) a common system of education and the promotion of a state language, (3) the extension of communications, and (4) the configuration of a national labor market and related welfare arrangements.

In modern times, the most dynamic sectors of the bourgeoisie and some elites of the peasantry have made use of the ideology of nationalism to fight old aristocratic privileges. The concept of citizenship drafted by the English Revolution (1640–1660) and articulated by both the American (1776–1783) and French (1789–1799) revolutions became essential in the conformation of the nation-building programs put into place during the nineteenth and twentieth centuries. The aim was to consolidate nations where citizens would become peers with equal access to a set of universal rights and obligations. Countries forged by this type of nation-building were to become the embodiment of modernity.

In the post-Enlightenment epoch, the cornerstone of nation-building, primarily in the European tradition, has often been the creation of a common national identity throughout a specified territory under one central authority. This idea of "one state, one people," which was transported worldwide as a result of European colonialism, has been far from being accomplished in countries with long-standing traditions of internal diversity and strong ethno-territorial collective identities. All-embracing and exclusive nation-state identities have in many cases become problematic, particularly in those heterogeneous countries composed of diverse cultural communities and stateless nations. Since the late nineteenth century, those advanced industrialized countries of welfare capitalism have made use of the great nation-building potential associated with the development of social policy institutions. For them, welfare institutions embody a common heritage of shared risks and mutual commitment, and a common project for the future.

Reports of the death of the nation-state challenged from above by the forces of globalization and continental integration have been greatly exaggerated. Political developments at a supranational level, however, do not necessarily point toward a command-and-control model of vertical governmental action. Much of the legitimacy of the modern nation-state depends on the efficacy and sustainability of national-building policies that seek to keep pace with the socioeconomic changes in the new global order.

Nation-State

The *nation-state* is the primary political unit in the contemporary global system. Nation-states have a near monopoly on sovereignty and the legitimate use of force under international law and custom. These political constructs emerged in early modern Europe as the result of the combination of both smaller political actors, including city-states and small kingdoms, and large empires, as well as the development of the strong central state. Meanwhile, nation-states competed with empires for power and influence within Europe and to ensure their own survival. Early nation-states such as France, Holland, and Britain concurrently sought colonial empires outside of Europe to counter the resources and power of the multinational Hapsburg and Ottoman empires. The rise of the nation-state occurred simultaneously with the decline of the Catholic Church as a supranational political actor following the Thirty Years War (1618–1648).

THE FORMATION OF THE NATION-STATE

The nation-state consists of a relatively homogeneous population (the nation) of individuals with similar ethnic backgrounds—including language, religion, culture, and traditions—who reside in a fixed geographic area (the state). Prior to the rise of the nation-state, political authority was diffused among many actors and often based on personal power. Monarchs and other elites typically had varying degrees of sovereignty that transcended established borders, and their reigns were often marked by multiple allegiances. The result was that national borders had little real relevance, and subjects had little loyalty to the state. Some city-states were able to elicit strong bonds of loyalty among their subjects, but these entities could not generate the military resources to defeat large empires (which had resources, but lacked loyalty).

In Europe, the broken geography and range of ethnic and linguistic nationalities precluded the rise of large empires and resulted in a collection of small feudal kingdoms during the Middle Ages. Almost constant war and strife prompted the development of ever stronger central bureaucracies that would allow governments to take advantage of an area's resources and mobilize populations. The nation-state emerged as the ideal European political organization, since it could combine the resources and size of the empire with the citizen loyalty, or nationalism, of the small city-states. The Treaty of Westphalia (1648) marked the start of the era of the nation-state.

Nation-states were different from earlier political organizations in three main ways. First, the nation-state's political authority came to be organized as separate from and supreme to that of other social actors, including the Church. This provided the nation-state with its high level of authority and legitimacy. Second, nation-states developed a significant degree of self-identification and state loyalty among populations that led to the rise of modern nationalism. Third, nation-states developed concurrently with the rise of the merchant class in Europe. As a result, intricate class structures, which extended beyond elite-peasant systems, created opportunities for pluralistic government and nondiscriminatory legal systems, and hence, the eventual rise of democracy.

THE MODERN NATION-STATE
The nationalism of nation-states contributed to both the scramble for empires and the great wars of the twentieth century. Nation-states that had high degrees of homogeneity at home nonetheless developed multiethnic empires that failed to develop the same degrees of loyalty and attachment to the home state. That nation-states were at their core ethnic entities contributed to ongoing ethnic conflicts, especially as the consequences of imperialism were manifested by the redrawing of ethnic boundaries and the dislocation of populations. After World War I (1914–1918), the empires of Germany, Russia, Turkey, and Austria-Hungary were dismantled by the victorious allies, and their former territories were either granted independence or came under new colonial mandates by the remaining imperial powers, France, Britain, and Japan.

In the post–World War II (1939–1945) era, the nation-state came under increasing competition in the global system. The empires of Western Europe disintegrated due to a combination of self-determination movements, nationalism, cold war politics, and empire fatigue occasioned by the increased costs in terms of lives and resources of combating resistance movements. The break-up of colonial empires and the subsequent demise of the Soviet Union and the end of the cold war caused the number of independent countries to increase from 75 in 1945 to more than 200 by 2000.

International organizations such as the United Nations (UN) and the European Union (EU) altered traditional notions of sovereignty and established competing centers of authority over political, economic, and security matters. For instance, in the early twenty-first century, the EU has taken over many of the functions formerly the domain of the nation-states, including monetary policy. The attractiveness of organizations such as the EU is that they allow small- to medium-sized nation-states to pool resources and magnify economic and security power. Nonetheless, this trend also undermines the nation-state's traditional role. In addition, the growth of multinational corporations (MNCs) has eroded the economic and political control of individual governments and offered new challenges to nation-states.

Contemporary scholarship remains divided on the role of the nation-state in the international system. Neorealists continue to assert that the nation-state is the main actor in global politics and that these entities are rational actors that seek to maximize power through cost-benefit analysis. Such scholars contend that international bodies are merely the reflection of the political preferences for the great powers and serve as a means to augment, rather than lessen, the power of the nation-state. Neoliberal-institutionalists counter that the nation-state is on the decline as global organizations and MNCs increasingly gain economic and political power. In addition, the growing interdependence among states has not only reduced nationalism and increased economic ties but fostered a nascent global culture that transcends traditional notions of self and ethnicities. Such manifestations of globalization are criticized by scholars who contend that the erosion of national norms and values undermines indigenous cultures and is a form of cultural imperialism.

Naturalization

Naturalization is a person's acquisition of the citizenship of a state whose citizenship he or she did not acquire at birth. Most individuals acquire citizenship automatically at birth through some combination of *jus soli* (citizenship based on place of birth) and *jus sanguinis* (citizenship based on parentage), the two elements present to varying degrees in every state's citizenship laws. By contrast, naturalization happens at some later point in time and involves an administrative decision or procedure.

Conditions for naturalization commonly include a minimum age, demonstrated time of residence, knowledge of the society as demonstrated by a test, language requirements, evidence of good character, and other evidence of integration such as family ties. Such conditions for individual naturalization are often relaxed or waived when state interests are invoked, and most states include provisions for accelerated naturalization in particular circumstances.

States extend or restrict citizenship for many reasons and alter their naturalization requirements accordingly. Most notably, naturalization policies tend to reflect the changing goals of immigration policy. In the United States, for example, naturalization was considerably easier until the 1920s, when both immigration and naturalization were restricted. Making citizenship harder to acquire is one way in which states can attempt to discourage immigration.

VOLUNTARY AND INVOLUNTARY NATURALIZATION

Many definitions of naturalization describe it solely in terms of the intentional choice of individuals to acquire a new citizenship, but naturalization can be involuntary as well as voluntary and can involve groups as well as individuals. Historically, some states imposed citizenship on noncitizens in order to enforce civic duties, such as military service. Territorial and border changes such as annexation often included large-scale naturalizations of the resident populations, such as the forced naturalization of residents east of the Curzon line, who became Soviet citizens following annexation of their territory by the USSR after World War II (1939–1945). (Many Polish residents instead left or were deported, often resettling in Poland's "recovered territories," which had been vacated by departing Germans). Such mass naturalizations usually include provisions for individuals to opt out. State breakdown or mass migrations caused by war provide other triggers for large-scale naturalizations.

The opposite of naturalization is denaturalization, the loss of citizenship resulting from an administrative decision or procedure. An infamous example of denaturalization is the Reich Citizenship Law of 1935, which stripped Jews and others not "of German or kindred blood" of their German citizenship. In response to this and other denaturalizations, Article 15 of the Universal Declaration of Human Rights provides both that everyone is entitled to a nationality and that no one may be arbitrarily stripped of his or her nationality. This does not prevent denaturalization: The laws of many states continue to provide for denaturalization, such as when a citizen acquires another citizenship through naturalization. Most citizenship laws also allow the voluntary renunciation of one's citizenship under certain conditions. Other states refuse to recognize naturalization of their citizens in another state.

There remains a gender component to naturalization flowing from the distinctions of citizenship law. Historically, it was commonplace for women (but not men) to automatically lose their citizenship when marrying a noncitizen. In their citizenship laws, many states continue to deny equality between women and men, although this is now uncommon in liberal democracies. Children are likewise a special category, including the question of the age at which a child becomes an adult capable of voluntary naturalization. The citizenship laws of many states provide for automatic naturalization through adoption or the recognition of paternity.

The distinction between supposedly natural citizenship acquisition at birth and non-birth-based naturalization becomes ambiguous as *jus sanguinis* is extended. For example, many states provide for repatriation or a right of return to coethnics abroad. Israel's Law of Return, which offers instantaneous naturalized citizenship to any Jew wishing to settle in Israel, was amended in 1970 to extend this right to "the child and the grandchild of a Jew, the spouse of a Jew, the spouse of a child of a Jew, and the spouse of a grandchild of a Jew." Other states similarly extend preferential access to naturalization on the basis of ethnic grounds (e.g., Italy's or Spain's privileging of emigrants and their descendants; Germany's policies favoring *aussiedler,* and Greece's policies favoring ethnic Greeks), linguistic grounds (e.g., Portugal's facilitating naturalization for people who speak Portuguese), or other grounds.

CROSS-NATIONAL VARIATION

Explanations for differences in naturalization rates include the costs and benefits of acquiring citizenship, the resources and networks of individuals, the bureaucratic procedures for acquiring citizenship, and the degree of political mobilization to encourage and facilitate naturalization.

The costs of acquiring citizenship often include the obligation to renounce one's previous citizenship. For example, when Germany eased its citizenship law in 2000 to allow dual citizenship, naturalization rates increased. Benefits of acquiring citizenship include the right to vote and access to more rights than noncitizens have. When the United States in 1996 restricted certain social benefits to citizens (previously, permanent residents also had access to many such benefits), applications for naturalization increased dramatically.

Declining mobilization by political parties and grassroots groups can be linked to falling naturalization levels, but institutional factors, such as differences in state intervention, also play a role. One case study comparing differential naturalization rates among Portuguese immigrants in Canada and the United States found that in Toronto, government bureaucrats and federal policy encouraged citizenship through symbolic support and instrumental aid to ethnic organizations and community leaders, while Boston area grassroots groups were expected to mobilize and aid their constituents without direct state support, resulting in lower naturalization rates.

The introduction of a supranational European Union (EU) citizenship does not constitute naturalization, because EU citizenship is acquired automatically upon acquiring the citizenship of an EU member state and is not a separate legal status. Some have proposed that EU citizenship should be granted based on residence rather than nationality of a member state, but this proposal has not been adopted. Nevertheless, the European Commission has promoted naturalization as a strategy for facilitating integration, arguing that immigrants should be helped to settle successfully into society through the acquisition of rights and citizenship of the member states.

Naturalized citizens generally enjoy the same rights as citizens who acquired citizenship at birth, though naturalized citizens are sometimes subject to denaturalization more easily than native-born citizens. The aim of policies favoring naturalization is generally to avoid the growth of large populations of long-term residents who do not possess citizenship.

Natural Law

Natural law is both a moral and legal theory that posits the existence of a law whose content is set by nature and therefore has validity everywhere. As a moral theory, natural law claims moral standards that govern human behavior are in some part objectively derived from the nature of human beings and the world; as a legal theory, natural law asserts that the authority of legal standards is in some sense derived from the considerations of the moral merit of those standards. While being logically independent of each other, the two theories do intersect with each other: Both claim that some laws depend for their authority on the relationship they have not to preexisting convention but to moral standards.

GREEK AND MEDIEVAL ORIGINS

Greek philosophers, particularly Plato and Aristotle, emphasized the distinction between nature (*physis*) and conventional law (*nomos*). While the content of law varies from place to place, the content of nature is the same everywhere. Natural law therefore not only functions as a standard by which to criticize the content of conventional law but also determines what the law said in the first place. As a result, the state is bound by natural law and becomes the institution directed at bringing its subject happiness, whether temporal or through other-worldly salvation. This classical conception of natural law was promulgated by the Roman Catholic Church as set forth by philosopher and priest Thomas Aquinas (1225–1274).

According to Aquinas, humans are social and political animals as well as naturally religious. The natural law applies to humans alone as conscious, rational, moral, and social creatures, teaching them to avoid ignorance and not to give offense to others. Through reason, all humans can naturally and equally know the one standard of truth in the natural law. But when it comes to particular conclusions drawn from the eternal moral principles of natural law, although the standard of truth remains fixed (primary precepts), the specific circumstances of its applications vary (secondary precepts). As history changes, the secondary precepts also change in particular cases, but the natural law is not altered but added to.

This concept of natural law had entered mainstream Western culture through the writings of medieval Islamic scholars like Averroes, whose Aristotelian commentaries influenced Aquinas's understanding of natural law. Averroes wrote that the human mind alone could know the higher intents of Islamic *sharia,* like the protection of religion and life, as well as the unlawfulness of certain offenses such as theft and murder. The concept of *istislah* in Islamic law also bears some similarities to Aquinas's natural law: Whereas Aquinas's natural law deems good that which is self-evidently known as it tends toward the fulfillment of the person, *istislah* calls good whatever is connected to the five basic goods of Islam. The largest Islamic school of thought that posits the existence of natural law is the Maturidi school, which teaches that the human mind can know the existence of God and the major forms of good and evil without the help of revelation.

MODERN NATURAL LAW AND LEGAL POSITIVISM

Aquinas's conception of natural law spread to the school of Salamanca, where, in the sixteenth century, scholars like Francisco Suárez (1548–1617) and Francisco de Vitoria (ca. 1483–1546) further developed a philosophy of natural law in the Catholic tradition. The Protestants Hugo Grotius (1583–1645) and Samuel von Pufendorf (1632–1694) also made significant contributions to natural law theory. Grotius based his philosophy of international law on natural law and insisted on the universal validity of the natural law even if God were not to exist. Likewise, Pufendorf based his theory of natural law not on God but on the sociability of humans and held that every person, on the basis of human dignity, had a right to equality and freedom.

In England, theologian and preacher Richard Hooker (1554–1600) adapted features of Aquinas's natural law theory into Anglicanism, and legal scholar and judge William Blackstone (1723–1780) used natural law in determining the contents of common law, although it was not identical with the laws of England. But it was English philosopher Thomas Hobbes (1588–1679) who had the greatest influence on natural law by seeking to replace it with legal positivism. According to Hobbes, law is not an expression of higher principles or morality but simply the articulation of the will of the authority that created it. Natural law therefore is subordinate to positive law: The natural law—how a rational human being could survive and prosper—could exist only if humans first submitted themselves to the authority that had created the law. For Hobbes, natural law was discovered by considering natural rights first, whereas previously it could be said that natural rights were discovered by considering the natural law first. The supremacy of legal positivism over natural law would be continued and advocated by such subsequent thinkers as Jeremy Bentham (1748–1832), Hans Kelsen (1881–1973), and H. L. A. Hart (1907–1992).

There is considerable debate about whether John Locke's (1632–1704) conception of natural law was more akin to Aquinas's as filtered through Hooker or to a revision of Hobbes's interpretation. According to Locke, God's natural law provided that no one ought to harm another in life, liberty, or possessions, and it therefore gave each person a natural right to his or her life, liberty, and property. If the sovereign went against the natural law, people could justifiably overthrow the existing state and create a new one. The notions of equality under the law, limited government, and the state's purpose to protect life, liberty, and property would influence subsequent liberal thinkers and seminal documents, such as the U.S. Declaration of Independence.

CONTEMPORARY NATURAL LAW

Contemporary natural law jurisprudence has been undergoing a period of reformulation with John Finnis, Germain

Grisez, Robert P. George, and Joseph Boyle as its leading scholars. This new natural law school focuses on questions of the intrinsic value and incommensurability of basic human goods, the resolution of conflict as an evolutionary process, and the content of law as determined by moral principles. It is this last question about natural law that has been particularly revisited by scholars who are preoccupied with natural law as a moral as opposed to a legal theory. As it divided Aquinas's views from those of John Duns Scotus, William of Ockham, and Francisco Suárez, the question of natural law's intrinsic moral authority continues to be an issue between the likes of Grisez and Finnis, on the one hand, and Robert Adams and John Hare, on the other.

Natural Rights

Natural rights are a direct corollary to the theory of natural law. Natural law can be viewed from four perspectives: (1) as a function of the physical laws of nature, (2) as a function of religion, (3) as a function of the nonphysical realm, or (4) as a function of reason or rational determination. A primary example of the first perspective would be the philosophy of Aristotle. An example of the second perspective would be the philosophy of St. Thomas Aquinas. The third perspective would be demonstrated by the philosophy of Plato and his theory of forms. The fourth perspective would be found in the philosophy of Immanuel Kant. From a more political perspective, the philosophy of Thomas Hobbes would also be a good example of the fourth category of natural law. Natural law is, essentially, the law applicable to human beings that is not a result of a government act or social norm. Natural law exists independently and is not based on the positive law, which is generally acknowledged to be the written law enacted by humans, even though the positive law may recognize the natural law. Natural law is generally considered to be a universal principle.

Natural rights are a corollary to natural law. Natural rights exist because of the natural law. Although there are many theories of natural law, the best example of natural rights, for the purposes of American politics and jurisprudence, is found in the writings of Sir William Blackstone. Blackstone was a legal commentator in Great Britain around the time of the American Revolution. He wrote the *Commentaries on the Laws of England,* a four-volume treatise on the laws of England that had developed over the years. Blackstone is very important, as he was one of the primary influences on the founding fathers who wrote the Declaration of Independence, Constitution, and Bill of Rights, which express the essential political principles of the United States of America.

In this work, Blackstone presented three absolute rights under the natural law: (1) the right to personal security, which included the right to life, health, and reputation; (2) the right to personal liberty, and (3) the right to property. However, these rights were not automatically enforced by a worldwide police force. Political reality dictated that human beings sometimes had to defend themselves and enforce these rights.

Recognizing that these rights had to be enforced, Blackstone also recognized five auxiliary natural rights. These rights were essentially political in nature, in that they attempted to express practical principles to help ensure theoretical liberty.

1.   The first auxiliary right was that the legislative power had to be independent of the executive of the government. If the legislators were not free of the executive, a tyranny would exist. Legislators also had to be free from bribery and corruption to be able to exercise independent judgment.

2.   The second auxiliary right concerned the executive branch of government. Blackstone thought that a monarchy was the best form of government. However, he still felt that an unrestrained executive was improper and that an independent legislature was necessary.

3.   For the third auxiliary right, Blackstone felt that all the people should have the right to present their complaints to a neutral court for a quick resolution. Further, any legal action should be in accordance with previously ascertained laws.

4.   The fourth auxiliary right concerned unusual cases that could not be addressed by the courts. To address this problem, Blackstone presented the right to petition both the legislature and the executive for relief.

5.   The fifth auxiliary right was the right to keep and bear arms. This right was necessary both for personal self-defense and to prevent tyranny and oppression. Essentially, it was the right to revolt.

There are, of course, a number of other important philosophers and political theorists who have advanced explanations of natural law and the associated natural rights, which may differ somewhat from those presented by Blackstone. However, given that Blackstone was one of the primary influences on the founding fathers, who expressed fundamental American political philosophy in the Declaration of Independence,

the Constitution, and the Bill of Rights; and given that all of Blackstone's absolute and auxiliary natural rights can be found, in one form or another, in these documents; it follows that Blackstone's work provides an excellent example of the concept of natural rights in American politics.

It is important to note that the idea of natural rights is closely linked with the concept that such rights are inalienable, in other words, they cannot be removed by an act of human government. They are inherent in every person and are considered fundamental.

The concept of fundamental rights is also present in documents of international scope. For example, in the United Nations Charter and the International Covenant on Civil and Political Rights, many of these fundamental and natural rights are specifically recognized.

Necessary and Sufficient Condition

Necessary and sufficient condition is a philosophical concept in the study of causation and the relationship between statements. A necessary condition is one that is required for a specific result. For example, a necessary condition for receiving an A in an academic course might be that a student earn an A on the final exam. Therefore, if a student does not earn an A on the final, he or she will not secure an A in the course. If a student receives an A in the course, he or she must have scored an A on the final.

A sufficient condition is one that if satisfied guarantees a result, but may not be the only path to that result. For example, a sufficient condition for receiving an A in a course is that a student earn an A on every quiz. Consequently, if a student receives an A on all of the class quizzes, he or she will secure an A for the course. However, achieving an A grade on all quizzes is not a *necessary* condition, because a student could also gain an A by receiving A's on all of the homework assignments.

Negative Campaigning

Negative campaigning refers to a candidate's or party's campaign strategy that attacks an opponent on the basis of his or her past political record, with particular focus on the opponent's character flaws, in contrast to simply highlighting the candidate's or party's attributes, promises, and ideological platform. Negative campaigning is widespread in American political campaigns and has become prevalent in the U.K. and continental European elections as well. Negative campaigning was heightened in the United States during the 1988 presidential elections, when Republican George H. W. Bush ran against the then-governor of Massachusetts, Democrat Michael Dukakis.

Usually, negative campaigning takes the form of a series of thirty-second ads during the election campaign period. Political parties and candidates who utilize these tactics do so because they believe that negative campaigning is the best strategy for gaining the upper hand in a campaign, by forcing the opponent to be on the defensive. Thus far, however, the research on negative campaigning has been rather inconclusive. It is still not clear whether negative campaign attempts exert any influence on election outcomes, while the literature on whether attack ads shrink or mobilize the electorate provides a rather mixed view as well. The research on turnout and negative campaigning is discussed below.

In their pioneering work, Ansolabehere and Iyengar (1995) employed controlled experiments, and their results suggest that negative campaigning demobilizes nonpartisan electorates. Though the authors acknowledge that negative campaigning enhances political information for voters, they argue that the decline in political efficacy and civic engagement turns off people, resulting in higher levels of abstention. These results apply primarily to nonpartisan voters. Thus, elections that are particularly plagued by negative campaigns tend to be decided by voters with a strong sense of party identification, not swing voters. These conclusions, however, have been challenged by Wattenberg and Brians (1999). Using data from public opinion surveys, they report that negative campaigning *increases* participation. Wattenberg and Brians further argue that negative advertisements are a source of political learning and will not demobilize the electorate in the process. As they see it, negative campaigns encourage voters to learn about the candidates and enhance the saliency of the election, which in turn tends to increase voter turnout.

The studies cited above suggest that the relationship between negative advertisements and turnout is not straightforward. The relationship is likely mediated by the specific

content of the negative campaign ads. In their investigation of U.S. Senate campaigns, Kahn and Kenney (1999) found that voters have the ability to distinguish between appropriate and harsh negative advertisements. For example, the effect on participation is different when a party or candidate criticizes the opponent's policy proposals than when the party or candidate simply disparages the opponent's character and personal life. Another plausible expectation is that a curvilinear relationship exists: A small dosage of negative advertising may enhance political sophistication, but excessive amounts disengage citizens. If this curvilinear relationship exists, negative campaigning might have implications for political participation and representation.

Negotiations and Bargaining

Negotiations are successive moves among two or more parties in order to resolve conflicts, address common problems, or change the behavior of one of the parties. Bargaining refers to the actual process or the techniques and moves within a negotiation and can involve persuasion, demands, and concessions. The classic paradigm of negotiations and bargaining is a car dealer selling a car to a buyer through persuasion. For the two parties to come to agreement, there must exist a zone of agreement, which is the set of outcomes to which they can agree. If the buyer is willing to spend up to $20,000 and the car dealer is willing to sell for as little at $15,000, then the zone of agreement exists between $15,000 and $20,000. The final price within that range will reflect the bargaining strategies

and tactics employed. In politics, negotiations occur among all kinds of political actors, from the grassroots level to international organizations. While negotiations can cost resources and time, they provide a superior alternative to coercion or use of force. When a zone of agreement exists or can be created through negotiations themselves, all parties are better off through agreement.

Negotiation theories derive their rationale from liberal political thought, insofar as liberal thought posits change in human behavior through interactions. Unsurprisingly, diplomacy (the formal process of interactions among nation-states) arises alongside liberal thought in the modern era as a move away from empires, where brute force or material power tended to determine outcomes among political units. A historical sociology of human interactions is necessary to understand the importance of diplomacy, negotiations, and bargaining in the modern era.

Bargaining power still matters, but its understanding in negotiations is nuanced. It is contingent upon reservations prices (such as those of the buyer and seller above), which are themselves contingent upon the best alternative to a negotiated agreement (BATNA). If a buyer's best alternative to what a car dealer offers is a free car from a relative, then that buyer may not agree to even the lowest price from the dealership. Similarly, if Iran or North Korea feels that it has little to lose from developing a nuclear program, or that it has more to lose by capitulating to demand from the United States, then the incentive to not strike an agreement with the United States will be high. In the last example, the United States holds more power than either Iran or North Korea but cannot make either of them comply with its demands, because their BATNA is high.

The overall stance of a negotiation party may be characterized as a negotiation strategy, such as overly aggressive or hawkish behavior versus gentle or dovish behavior. Formally, the term used in negotiations theories to describe hawkish behavior is *distributive* or *value-claiming strategy,* where one party seeks to gain over the expense of the other. Dovish behavior in contrast, is an *integrative* or *value-creating strategy;* both parties gain. A *mixed-motive strategy* features elements of both integrative and distributive strategies. Strategies are also defined as the sum total of bargaining tactics, which include the following: attempts to influence agendas, framing demands in persuasive terms, making trade-offs and linkages among negotiation issues, coalition building with like parties or allies, and promoting various packages of agreeable outcomes.

Game theory offers a formal way of understanding strategic negotiations, especially the effects of particular strategies. "Players" are posited as involved in games of strategy involving, in general, collaboration or coordination for a solution (agreement or no agreement). The most common solution is called a *Nash equilibrium* (named after Princeton mathematician John Nash), wherein each player's move takes into account the moves of other players. A Nash equilibrium therefore captures important elements of strategic interaction inherent in any negotiation. While highly instructive in revealing the logic of negotiations, game theory is nevertheless critiqued for being

abstract and rigid and for requiring each player to have well-defined preferences and strategies. Game theory may be too abstract to capture the interactive complexity of learning, preference formation, and behavioral change within negotiations.

International negotiations in the early twenty-first century feature a multiplicity of actors and issues. While nation-states are still featured prominently, a negotiating table often also features international organizations, civil society groups, business firms, and/or experts. Furthermore, there are usually two levels to an international negotiation: the international level, where negotiators from different countries meet, and a domestic level, where these international actors must negotiate with the people they represent in order to understand, narrow, broaden, or ratify their negotiation mandates. A U.S. trade or security negotiator, for example, must negotiate simultaneously with her foreign counterparts as well as with Congress and/or domestic interest groups. International negotiations are thus complex; further complexity comes from the varieties of negotiations—they can be bilateral, plurilateral, regional, or international in scope.

Negotiations feature in every arena of global politics, including security, trade, human rights, and the environment. Negotiation scholars closely studied the security negotiations between the United States and the USSR in the cold war era, while trade negotiation scholarship attended to the World Trade Organization and its predecessor, the General Agreement on Tariffs and Trade. The list of security and trade negotiations continues to grow, and new issue-areas are gaining ascendance. The Montreal protocol phasing out the use of chlorofluorocarbons is an important instance of successful global negotiations on an environmental issue, while the International Campaign to Ban Landmines is an example of international civil society groups urging disarmament.

Négritude

The future President of Senegal, Léopold Sédar Senghor, was in Paris writing about themes of exoticism in Baudelaire when he met Aimé Césaire, one of the future leaders of Martinique.

Both were poets who were working on the journal *Étudiant Noir* when they developed the concept of *négritude,* which Césaire first used in 1935. Négritude is the belief that all black people, regardless of location, nationality, and background, share a common essence and outlook. Both Senghor and Césaire were exemplary scholars in the French education system, but their experiences in Paris made both of them acutely aware of their status as second-class citizens.

The intricate connection of négritude to French colonialism is best demonstrated by the fact that both Césaire and Senghor wrote in French: This was the only choice to bring their message of a persisting African identity to a transnational audience. French assimilationist policies meant that talented writers and artists around the world came to study in Paris, but it was this experience that provoked the clear recognition of the boundaries of assimilationist policies. At the same time, recognition of both the diversity and the commonalties of the French colonial experience gave birth to ideas of unified identity. Césaire comments on the collective discovery of négritude:

> It was simply that in Paris at that time there were a few dozen Negroes of diverse origins. There were Africans, like Senghor, Guineans, Haitians, North Americans, Antilleans, etc. This was very important for me . . . as well as an awareness of the solidarity among blacks. We had come from different parts of the world. It was our first meeting. We were discovering ourselves. This was very important. (Césaire 1943/2000, 88)

Négritude refers back to an imaginary past, a quality of African life that existed before colonization and through colonization and that will succeed colonization. One interpretation of négritude is that it is a form of primitivism; this view is supported by the fact that Senghor begins his discourse on négritude by presenting thirty pages of anthropological and archeological evidence about early inhabitants of the African continent. However, négritude is not simply primitivism; it also has a very real political utility. Négritude is a strategy of reinterpretation, offering a new frame of reference for understanding personal identity and collective patterns of behavior. Most important, it asserts that black people have not been entirely changed or defeated by the experience of colonization.

Suzanne Césaire, Aimé Césaire's wife, who was an integral personality in the movement, remarked that surrealism was the revolutionary element within négritude: "Thus, far from contradicting, diluting, or diverting our revolutionary attitude toward life, surrealism strengthens it" (Césaire 1943/2000, 15). Surrealism brought the reality of appearances into question— it asserts things are not always what they seem to be. This is important, because it allows advocates of négritude to claim that black people are not defeated or oppressed, despite how things may appear. Therefore, it became a way to assert pride in one's identity and renounce subordination.

Négritude also provided a new way of understanding the experience of colonial subordination. Senghor's work had two very different aspects: The first was a presentation of

historical research to provide empirical evidence of shared, African characteristics. The second was a proposal that négritude was accompanied by a unique theory about ontology (the nature of being). Senghor develops his theory of African ontology by contrasting it with a European one. Europeans use what he calls "objective intelligence" and approach the world in the spirit of distinction: "He first distinguishes the object from himself. He keeps it at a distance. He freezes it out of time and, in a way, out of space. He fixes it, he kills it" (Senghor 1965, 29). The political ramifications of this mode of being in the world are that the European views the world as subordinate to self; "he makes a means of it" (ibid., 29).

In contrast, Senghor claims that the African embodies a sort of internal rationality, whereby the self is discovered through convergence with objects, space, and others around him. "Our subject abandons his *I* to sym–pathize and identify himself with the THOU. He dies to himself to be reborn in the *Other*. He does not assimilate, he is assimilated" (Senghor 1965, 32). This description provides an alternative explanation for the processes of subordination and objectification that characterized colonialism. Instead of colonialism being a matter of power, inferiority, or superiority, the history can be understood as a distinction between interiority and exteriority.

African ontology also suggests the ultimate contribution that Africans can make to the development of what Senghor calls the "universal civilization." The African form of perception and being will combine with the European form of knowledge, and their synthesis will create universal culture. Senghor presents a new interpretation of the history of servitude, develops an argument for the shared strengths of Africans based upon this principle, and outlines their future role in world politics.

Neoconservatism

Neoconservatism is one type of conservatism, the others being traditional or Burkean conservatism, with its emphasis on custom, habit, and tradition; modern free market or individualist conservatism, with its emphasis on individual competition within the free market; and religious right conservatism, which accords the central place to religion in social and political life.

ORIGINS AND THEMES

Neoconservatism originated in the 1970s as a reaction to the radical politics of the 1960s counterculture and its hostility toward tradition and authority. Like traditional or Burkean conservatives, neoconservatives value custom, tradition, and authority. They pay particular attention to broadly cultural matters and media—art, music, literature, theater, movies, and television—because it is through these means that a society defines itself and its values. Neoconservatives contend that Western societies, including the United States, are increasingly defining themselves as amoral, adrift, and degenerate. Violent and sexually explicit plays, films, television programs, and video games are symptomatic of the degeneration of Western culture. Rock and rap music lyrics feature four-letter words that have lost their shock value. The neoconservative sociologist and U.S. senator Daniel Patrick Moynihan called this "defining deviancy down." Behavior once viewed as immoral and unacceptable is now accepted as normal. For example, unmarried couples who have children out of wedlock are no longer shunned by society. Illegitimacy has lost its stigma.

Neoconservatives contend that such laxity reveals a broader and deeper cultural crisis afflicting Western civilization. Some neoconservatives trace this crisis to the Enlightenment, with its penchant for questioning authority, criticizing religion, and undermining traditional beliefs. Others blame the adversary culture that grew out of the student, civil rights, and antiwar movements of the 1960s. And still others blame well-intended but misguided government policies that give certain groups a sense of entitlement without a corresponding sense of responsibility. Neoconservatives agree with religious right conservatives that the current cultural crisis is due in part to the declining influence of religion in many people's lives. People who lack a sense of something larger and more meaningful than themselves, something transcendent and eternal, are likely to turn to mindless entertainment, to drugs or drink, and to act selfishly and irresponsibly. Religion at its best is a social cement, holding families, communities, and nations together. At its worst, however, religion can be fanatical, intolerant, and divisive, tearing communities apart instead of uniting them. Most neoconservatives thus believe that separation of church and state is a good idea that has been taken too far by liberals bent on banishing religion from the public square; and this has in turn provoked a backlash from religious conservatives.

ECONOMICS

In economic matters, neoconservatives favor free market capitalism as an efficient means of allocating goods and services. They do not, however, share modern conservatism's unbridled enthusiasm for free market capitalism. As Irving Kristol puts it, capitalism deserves "two cheers," not three. This is because, as Daniel Bell contends, capitalism harbors "cultural contradictions" that undermine its own social and ethical foundations. This most powerful of economic engines presupposes a willingness to work hard, to save, to invest, and to defer gratification; at the same time, however, advertising and other marketing techniques encourage people to indulge themselves, to spend money they don't have, and to pay little heed to the further

future. Unregulated capitalism, moreover, creates great wealth alongside dire poverty. And since great disparities of wealth lead to class conflict, labor unrest, and political instability, such disparities should be reduced (though not eliminated) by means of a steeply graduated income tax, the modern welfare state, and other means. At the same time, however, neoconservatives warn that well-intentioned government programs can produce unintended and unfortunate consequences for those whom they are meant to help. Such programs can create dependency instead of independence and undermine individual responsibility. The aim of such programs should be to provide temporary or short-term assistance, not long-term dependency on the part of recipients. Nor should the goal of social programs and tax policy be to "level" differences between individuals and classes. Neoconservatives like to say that they favor equality of opportunity but not equality of outcome.

FOREIGN POLICY

In the area of foreign policy, neoconservatives emphasize military might and the willingness to use it to promote American interests abroad. Power unused is power wasted. Usually acutely aware of the danger of unintended consequences in domestic policy, many neoconservatives seemed strangely unaware of or unconcerned about unintended consequences in foreign policy. The unintended but disastrous consequences that followed the invasion and occupation of Iraq led some neoconservatives to question their ideology, at least with regard to foreign and military policy. Most neoconservatives, however, continue to emphasize the need for a militant and muscular foreign policy backed by armed force and a readiness to use it. They downplay the importance of "soft power" (e.g., diplomacy) in favor of "hard power" (especially military force) in the pursuit of American interests around the world.

Nepotism

From the Latin *nepos,* meaning "nephew," *nepotism* is the practice of favoritism based on kinship. The term originally referred to the way relatives of the pope, often his illegitimate sons, were appointed, regardless of their merit, to the highest positions in the Vatican hierarchy. Nepotism, described as the undue preferment of relatives to other, better qualified candidates, is usually seen as a negative practice, because it implies that the person getting the job, promotion, or college admittance is usually not otherwise qualified enough to be effective in the position. Nepotism is typically found in political and educational systems, but it is also present in private business. In a democracy, nepotism is often looked at as a form of corruption. It is the public interest and those unfairly denied a position for which they were qualified that typically suffer as a result of nepotism. In any organization, nepotism can cause conflicts in loyalties within an organization, particularly where one relative is placed in a direct supervisory position over another. Laws regarding political nepotism vary from country to country, and also from state to state in the United States.

Nepotism is a common accusation in politics, even when the nominated person does have appropriate qualifications. For example, many cried nepotism when U.S. senator Frank Murkowski was elected governor of Alaska and appointed his daughter, state representative Lisa Murkowski, to fill the remaining two years of his term in the Senate. (Lisa Murkowski won reelection on her own in 2004.) John F. Kennedy was accused of nepotism for his appointment of his brother Robert Kennedy as attorney general in 1961.

Nepotistic practices are known to all ages and societies, and all ideologies and political systems. In fact, they have provided the basic organizing principles of politics for much of human history. Arguably, all aristocratic, dynastic, or ruling hereditary regimes share with nepotism the feature of elevating family members as successors regardless of their fitness for the inherited or bestowed position. Despite the spread of democracy in the twentieth century, in most of the developing world, notably in the Middle East, Africa, and central Asia, nepotism still exerts strong influence. Here family ties are essential for gaining access to power, state resources, and privileges, and they heavily skew the distribution of wealth and status. The Syrian hereditary dictatorship is based upon a family and tribal pyramid, as was Saddam Hussein's in Iraq. In North Korea and Azerbaijan, the sons of the highest leaders inherited their fathers' positions. The president of Maldives, Maumoon Abdul Gayyoom, once had thirteen of his brothers, brothers-in-law, and classmates as members of his cabinet.

CONTROVERSY

Similar to corruption, nepotism is perceived differently in different countries and cultures. "What would be considered as nepotism or shameless patronage in Britain, might be seen as fair practice or even a moral duty in other countries, including some countries of southern Europe" (Pujas and Rhodes 1999, 690) Although nepotism is seen as running counter to the principles of meritocracy and accountability due to the blurring of borders between the public and the private sphere, some social biologists have suggested that a tendency toward nepotism is a form of natural kin selection. According to another argument, in failed states where the government cannot provide security and justice, the common denominator

tends to be that the state structures organize around blood ties, since the highest level of trust is found within families.

Most European and North American countries, as well as international organizations (including the European Commission in the 1990s and the World Bank in the 2000s) have made nepotism a legal offense, through antinepotism laws, in explicit recognition that personal connections can be used to unfairly discriminate, distort, and corrupt. Also in the business world, some larger companies have instituted antinepotism policies, which prevent relatives from working together in the same department or firm. However, in many smaller, family-owned businesses, nepotism is viewed in more positive terms.

Network Society

Network society, which some call *technological society* and others *virtual community,* is a society in which technological media shape the primary modes of social, economic, and even political organization. The rise of network society began with the telegraph, radio, and telephone, but the growth of ever more effective and pervasive forms of communication (cell phones, computers, iPods, webcams, etc.) at the dawn of the twenty-first century has led to an unprecedented ubiquity of connectivity. The global interconnection of computers through the Internet (or World Wide Web) provides a 24/7 (24 hours a day/7 days a week) link to the rest of the world.

The network society manifests itself economically in the burgeoning of online shopping, electronic banking, electronic bill paying, and the pervasive reshaping of the business environment as office employees do much of their daily work using the Internet. Socially, the network society is marked by constant electronic access to friends, colleagues, and like-minded affinity groups. New social networking platforms, from Facebook and MySpace to blogs and Twitter, can grow in months to household names and essential aspects of life for people (especially young people) in advanced economies.

IMPACT OF NETWORK SOCIETY ON POLITICS

The flowering of the network society has already begun to impact politics, making it a fertile area for future political science research. Most directly, many European governments as well as those of Australia, Brazil, Canada, India, and Venezuela have made it possible to vote and to pay taxes online. E-mail creates a new and possibly more direct point of access to politicians, and advocacy groups are able to coordinate online petitions and communication to candidates with greater ease. It is quite common for politicians and citizens to create movements, raise money, and organize major electoral campaigns via the Internet. What has come to be known as "information politics" shows the power of the network. Traditional movements have been enhanced by access to online methods of direct contact mobilization as in the case of fundraising for the Obama campaign, which made it possible to raise millions of dollars on the basis of $25.00 online contributions. There is also digital direct action, which makes possible the nonviolent aspect of global civil society that employs technology in its world campaigns. It is said that technopolitics makes it possible for the anarchist to have common cause with trade unionists, ecologists with farmers, intellectuals with church groups, and so forth. Yet, for the most part, even though network society seems to be inspirational and exhilarating, it is still only a minor irritant as a global movement.

ADVANTAGES AND DISADVANTAGES OF THE NETWORK SOCIETY

Assessing the advantages and disadvantages of the network society began in the 1990s with the work of scholars like Castells, van Dijk, and Rheingold. One advantage of network society is that it seems to grant the individual more freedom to choose to which communities to belong, albeit virtually. Technological community or network society for some may be an enriching form of social interaction that allows for some commitment to the society but does not require the total commitment of being a face-to-face member of today's society.

Another advantage of the network society is the presence of up-to-the-minute information through a variety of sources, which should enable actors (including political actors) to make more informed decisions. This connectivity becomes especially important to evade government censorship in situations of oppression such as those in Tiananmen Square, Iran, and Myanmar; anyone with a cell phone can provide live camera footage of events as, or immediately after, they occur. Network technology can be a tool for citizens to ask government for better information and to become more involved in political decision making, thus bringing about the phenomena of *netizens* and *netizenship*—citizens of the network and network citizenship.

On the other hand, some analysts criticize the ideal of having the freedom to choose to become part of the virtual community, because individuals can easily opt out and thereby fail to form a genuine "society." In fact, the complexity of social networks and information can cause fragmentation, where each person finds a social niche and no longer needs to engage beyond it. If the more advantaged have the possibility to use their connectivity for political mobilization, they also have an unprecedented opportunity to use it for

diversion. Further, the scope of network society is limited by a digital divide that leaves many segments of society behind. The poor in advanced countries and the majority in developing countries have no access to the tools of connectivity and hence have no choice, and some argue this digital divide will continue through the twenty-first century with profound negative consequences.

Moreover, it is unclear what results actually come from the new technology. Despite all the faxes and text messages during the suppression of student riots in 1989 in Tiananmen, China still remains an authoritarian regime. In 2009, the opposition in Iran mobilized and was observed worldwide through network technology, but President Mahmoud Ahmadinejad remained in power. The segments of that country connected to the network society have not and maybe cannot generate a movement capable of regime change. More generally, if becoming part of the virtual community/network society is an individual choice, whether it translates to a strong enough force to bring about changes becomes a vital political question.

Further, the "freedom" of information and communication on the Internet is actually subject to substantial control in totalitarian regimes. Not only can governments monitor their citizens through all kinds of requirements for registrations and data mining facilitated by the computer, but large portions of the Internet are censored in countries like China, Burma/Myanmar, Cuba, Iran, North Korea, and Vietnam, according to the 2008 listing of the Kassandra Project.

Tapscott indicated that to not go online is to choose antiquation, anachronism, antiprogressiveness. And the choice may need to be made by the individual much sooner than later.

Neumann, Franz

Franz Neumann (1900–1954) was a German political activist and labor lawyer. He is linked to a school of other labor lawyers such as Otto Kahn-Freund and Hermann Heller who developed the "autonomous social law" tradition of legal scholar Hugo Sinzheimer. This was an attempt to materially institutionalize as actual legal practices the workers' self-governance provisions of the Weimar Republic Constitution.

This concept of autonomous social law ironically was influenced by German political theorist Carl Schmitt's jurisprudential concept of "complementary institution" (*Konnexinstitut*). The concept subsumed collective labor agreements, which forced into the background the principal institutions, such as the individual prerogative contract, which they originally intended to serve. The generation of collective bargaining agreements, labor courts, and works communities were understood as the vital institutionalizing undercurrent in social democracy. Neumann would go on to focus on the forces that defeated the movement for autonomous social law—a movement he saw as the next stage in the historically evolving project of the rule of law.

Neumann is chiefly remembered for his 1942 landmark study *Behemoth,* which depicts the synchronizing (*Gleichschaltung*) efforts of Nazi totalitarianism amidst the collapse of law as well as the absence of formal legal and state apparatuses in blanket clauses and discretionary decision making where classes and groups—not individuals—are referred to. The blanket clauses endowed "deformalized" state apparatuses with unlimited means to proceed against any and all opponents of the regime without the possibility of judicial review. Neumann is also known for the posthumous 1957 collection, *The Democratic and the Authoritarian State,* which included the 1937 essay "The Change in the Function of Law in Modern Society." In this work he focused on how a civil society evolves its forms and procedures. Also included were his 1950s writings on irrationalization, the cognitive-volitional elements involved in freedom, and the impossibility of a complete legal containment of political power.

Of equal and even more lasting significance are Neumann's early social law writings and his 1936 London School of Economics doctoral dissertation, *The Governance of the Rule of Law,* supervised by English political theorist Harold Laski and Hungarian-born sociologist Karl Mannheim. These writings reflect creative attempts at a pluralist jurisprudence. These were perspectives comprehending the reality of autonomous associations as multiple regimes operating within and beside the sovereign state. Conceptualized here is a "pluralist legal ordering" that functions as distinct subsystems of knowledge and practice. Neumann sought to transcend communitarian myths involved in natural law theories. His focus was on the norm-generating authority of autonomous associations and its relationship to the concept of the "rule of law" (*die Herrschaft des Gesetzes*). He emphasized the making of rules and laws that goes on within the civil society, where all is subject to open-ended rational discussion. This is in contrast with the

perspective of Schmitt, who understood the only authoritative set of laws (*Recht*) to be those established by a centralized sovereign state.

After leaving London, Neumann worked closely with German philosophers Max Horkheimer and Theodor Adorno at the Institute for Social Research, currently located at Columbia University, but his affinities were closer to Laski and Mannheim. Just after World War II (1939–1945), Neumann assisted chief prosecutor Justice Robert H. Jackson at the Nuremberg War Crimes Tribunal. He also participated in reconstituting the Social Democratic Party and the discipline of political science in the Federal Republic of Germany.

Neumann played a prominent role in efforts by the Rockefeller Foundation to make political theory a core component in the political science curriculum. In 1949 he was appointed to a continuing professorship at Columbia, where he and Robert Denoon Cumming developed a tradition of studying political theory as a sociologized history of ideas that remains relevant to theorizing.

In particular, Neumann probed the limits of the interpretive mode of collective labor law as the century unfolded as well as the emergence of practices of multipartite consultations and bargaining among plural associations. These practices characterize what political sociologist Gerhard Lehmbruch has labeled the "negotiated democracy" of advanced capitalism. Neumann's efforts also anticipated the idea of "reflexive law." This is a concept that classifies the norms, procedures, and rule making that those in plural associations design and establish to govern themselves and their relationships with other associations. They are what Adorno's student Jürgen Habermas referred to as the limitations that direct the self-steering governmentality mechanisms of social subsystems.

Neuroscience and Politics

The application of neuroscience to politics centers around the question of what political issues can best be addressed with biological, genetic, or cognitive neural approaches. Some common areas of investigation include sources of cooperation and aggression, the nature of altruism and punishment, and the potential heritability of important political and social preferences, including ideology. The field of cognitive neuroscience is primarily concerned with elucidating the physiological and neural architecture and functioning of the human brain. These processes include control over basic physical processes, such as breathing, as well as emotional responses centered in the limbic system, and more abstract cognitive processes involving memory, learning, language, and other analytic tasks. Better understanding of these processes can help inform specific political processes such as cooperation or status competition as well as larger questions such as how humans developed shared political and social environments.

Several research techniques exist in neuroscience. These include technologies such as functional magnetic resonance imaging (fMRI), electroencephalography (EEG), and positron emission tomography (PET) scans. Advances in behavioral genetics and research into the action of hormones have also informed this area. Much of this research finds theoretical unity and synthesis through evolutionary models and approaches to human development and behavior.

A great deal of work has been done using fMRI technology to map the geography of the human brain. This technology allows a physical probe of living neural brain tissue, but the measures themselves actually provide an indirect measure of neural activity. Most MRI studies depend on analysis of the BOLD (blood oxygenation level dependent) signal. Findings rest on the assumption that brain activity consumes oxygen, and changes in oxygen level in the blood can therefore signal neural activity. Functional MRIs can provide spatial resolution within about three to six millimeters, so they provide a valuable map of brain activity. They do not, however, provide good temporal resolution. Electrical signals, such as those provided by EEG technology, provide vastly superior temporal information, but inferior spatial orientation, so a combination of MRI and EEG technology is becoming increasingly common. In MRI research, central research strategies include attempts to correlate brain activity with various personality trait variables or political attitudes in order to discern where in the brain a certain decision may take place. For example, if some activity arouses activity in the amygdala, the part of the brain associated with emotional processing in previous studies, researchers might then infer that the given task engages some affective process. For political applications, the problem with MRI technology is that the number of subjects tends to be low, and subjects often repeat tasks, raising concerns about generalization and external validity. But such technology can be used to study the relationship between cognitive and affective processes in strategic voting and political party identification, for example, as well as social processes such as trust and cooperation. However, MRI remains a very expensive technology.

Research in behavioral genetics offers another avenue of potential interest for political scientists. Brains are created and operated by genes interacting with environmental forces. Genes activate continually in the human body, as RNA

(ribonucleic acid) reads DNA (deoxyribonucleic acid) to regulate a wide variety of activity. Such processes, for example, control the number of receptors an individual has for various hormones. Human behavior is set to turn on and turn off under certain conditions, the most notably universal of which is puberty, but such expression remains subject to reprogramming, including delay, based on environmental circumstances. The classic method of study in genetic research concentrates on twin studies, which examine the differences between identical (monozygotic) and fraternal (dizygotic) siblings. Twin methodology provides a natural experiment by allowing researchers to determine how much of behavior derives from genetic differences, shared environment, and unshared environment.

More recent advances in molecular biology such as PCR (polymerase chain reaction) technology, whereby a short strand of DNA can be replicated, allow researchers to take DNA from a subject using a cheek swab or a rooted hair sample. Attempts can then be made to correlate particular aspects of DNA with behavioral tendencies. As in all genetic studies, the central question revolves around the impact of particular genes on individual behavior. Hormonal studies can supplement such work as well, to examine individual differences in the number of brain receptor sites as well as differences in actual blood levels of particular chemicals, such as testosterone, oxytocin, or vasopressin.

Much of the work in the emerging area of neuropolitics involves the use of twin studies, experiments involving genetic markers, physiological or hormonal measures, and the use of fMRI technology to explore the nature of political and religious affiliation, ideology, various aspects of voting, and issues related to cooperation and aggression.

Neustadt, Richard E.

Richard Neustadt (1919–2003) was an American political scientist born in Philadelphia, Pennsylvania in 1919. After completing an AB degree at the University of California, Berkeley, in 1939, Neustadt attended Harvard University and earned a master's degree in 1941. He then worked for a short while in the Office of Price Administration as an assistant economist and, beginning in 1942, served as a lieutenant in the U.S. Navy during World War II (1939–1945). After leaving the navy, he served as assistant director in the Bureau of the Budget and remained there until 1950. Neustadt became a special assistant to President Harry Truman in 1950, and held this position until 1953.

While working for Truman, Neustadt completed a PhD in government at Harvard University in 1951. In 1953, he joined the faculty at Cornell University as an assistant professor in government. One year later he left Cornell to join the faculty at Columbia University, and he was there until 1965. While he was a professor at Columbia, Neustadt supplemented his teaching responsibilities by serving as a consultant to groups such as the Democratic Platform Committee, the Senate Subcommittee on National Policy Machinery, the Senate Subcommittee on National Security Staffing and Operations, the Bureau of the Budget, the Ford Foundation, the Atomic Energy Commission, the Department of State, and the Rand Corporation. He also served as an advisor to president-elect John F. Kennedy. Neustadt solidified his reputation as an expert on presidential politics and further established his lasting legacy as a top authority on the presidency with the 1960 publication of his book, *Presidential Power.*

Neustadt was one of the first to articulate a new approach to the study of presidential power. Instead of focusing on the constitutional powers of the office, which was commonplace in political science, in *Presidential Power* Neustadt argues that a president's power manifests itself in his ability to persuade. He maintains that all presidents come to power with the same constitutional powers; however, the personal abilities of the presidents are what distinguish them from one another. Those presidents adept at persuasion prove more successful, because presidents need to rely on such informal powers in order to execute their duties. This seminal work challenged conventional wisdom at the time and ushered in the concept of the "personal presidency," which looked beyond the static constitutional powers of the office.

After the publication of *Presidential Power,* Neustadt took an active role in the founding of the John F. Kennedy School of Government at Harvard University and served as its associate dean from 1965 to 1979. He was also a professor of government at Harvard until 1989. In addition to *Presidential Power,* which was still being widely used in college classrooms in the early twenty-first century, Neustadt authored or coauthored several more books, including *Presidential Power and the Modern Presidents: The Politics of Leadership from Roosevelt to Reagan* (1990) and *Preparing to be President: The Memos of Richard E. Neustadt* (2000). After a long and distinguished career, Richard Neustadt died in London, England, on October 31, 2003.

Neutrality

Neutrality is the act of remaining neutral and impartial and
not taking sides in a given conflict. The two main types of
neutrality are external and internal, and each refers to a dif-
ferent political sphere of action. Neutrality is most commonly
understood in the context of international relations. In this
arena, neutrality is external and understood as the act of not
engaging with warring parties through ideological, financial,
or military means. U.S. president Woodrow Wilson's appeal for
neutrality highlights this idea of remaining neutral in times
of war by arguing the American people should "remain neu-
tral both in thought and in action," as acting to the contrary
would be perceived as a preference for one of the parties in
the conflict. Wilson argued that

> America . . . should show herself in this time of peculiar
> trial a nation fit beyond others to exhibit the fine poise
> of undisturbed judgment, the dignity of self-control, the
> efficiency of dispassionate action; a nation that neither
> sits in judgment upon others nor is disturbed in her own
> counsels (Wilson 1914, para. 6)

INTERNAL NEUTRALITY

In domestic politics, neutrality is a normative consideration
geared toward impartiality in the daily workings of govern-
ments, whereby the government must remain neutral regard-
ing the conception of the public good as society struggles to
define it. For example, governments should not take punitive
action against minorities, whether racial, numerical, or ideo-
logical, in any given struggle and may not enter the debate
itself. A person should not get a traffic ticket from the police
because of personal beliefs about abortion, for instance. Yet
internal neutrality of action by governments does not mean
that the societal effects are the same for every citizen. The
personal situation of the ticketed person would alter the effect
of neutrality of the state; for example, if the ticketed person is
wealthy, the ticket might not have the same material effect it
would have if given to a person who is poor.

According to David Paris, "Internal neutrality (or impar-
tiality) involves the understanding and application of imper-
sonal rules and procedures within some specific or 'local'
cultural practice or set of principles" (2001, 912). This type of
neutrality refers mostly to the procedures applied internally
to organizations or groups that are in charge of applying a set
of rules in any given international or domestic setting. For
example, in the United States, the government is supposed to
fairly apply the law without prejudice toward its citizens, no
matter their ethnic background, religious beliefs, or linguistic

skills. Another example is that of a referee, in any game, who is
supposed to behave in a neutral manner toward teams or indi-
vidual competitors. In international organizations, there are
sets of rules that are specifically geared to neutrality, such as the
United Nations' (UN's) nondiscrimination rules in humani-
tarian and human rights cases. This type of neutrality does not
affect the outcome of whatever ruling is taking place. Yet while
the rules are neutral, the outcomes are not, and thus the results
may vary. A judge applying the same rules against disputants to
a claim can reach variable outcomes. Outcomes can be differ-
ent in games between competing teams in which the referee
applies the same rules. Naturally this is the case in humanitar-
ian law as applied by the UN or its members to human rights
abuses or humanitarian crises.

NEUTRALITY IN INTERNATIONAL RELATIONS

External neutrality is what practitioners call *principled belief,*
and it "does not involve the context of a local practice or set
of practices. Neutrality in this sense means placing oneself
outside a practice or issue, suggesting noninvolvement, disin-
terest, or indifference" (Paris 2001, 913). At an individual level,
external neutrality means to observe competing positions; an
example is the role of international organizations that par-
ticipate in international politics and do not favor one political
group over another. An individual may remain neutral during
wartime, but usually the term *neutrality* is used for interstate or
interorganizational behavior during times of conflict.

The archetypal modern example of neutrality is Switzer-
land, which has been neutral in European and global interna-
tional relations for nearly six hundred years. Neutrality for the
Swiss, one could argue, originally resulted from the realization
that the country would be unable to protect itself against sur-
rounding major European powers such as France. Additionally
the Swiss lagged behind their neighbors in creating cohesive
central government institutions, which would enable them to
create a military and defense strategy. Starting with the Thirty
Years War (1618–1648), the Swiss remained out of Europe's
conflicts even at the times when the entire world seemed at
war in World War I (1914–1918) and World War II (1939–1945).
The Swiss attempted to solve their problems by arbitration
and were successful in codifying their neutrality in interna-
tional law in the Hague convention of 1907. Even though the
Swiss were active in global humanitarian operations, because
of their view of neutrality, they did not become a member of
the United Nations until 2002.

While the Swiss have been able to protect their strict neu-
trality, other neutral countries such as Ireland have had a more
difficult time. Ireland is a prime example of a neutral country
whose neutrality is more diluted than that of the Swiss. While
the Swiss prevent any military action from their soil and even
flyovers by aircraft of foreign countries, the Irish traditionally
have not only participated in wars such as the two world wars
but also have given assistance to warring parties such as the
United States. In addition, Ireland is a member of international
organizations such as the UN and the European Union (EU),

and this sometimes creates difficulties for remaining neutral. For example, a neutral country that is a member of the EU would have to opt out of the European Security and Defense Policy (ESDP).

Beyond interstate relations, there are international organizations that also have claims to neutrality. The prime example of an international organization which is considered neutral is the International Committee of the Red Cross. Maintaining that neutrality, however, has been a challenge for them as well, even in the strictest humanitarian operations.

New Conservatism

New conservatism—sometimes called the "new right"—is an ideological perspective characterized by a collection of "fusion" or "neoconservative" ideas within the larger context of conservative movements and parties generally, and it represents a departure from the conservatism that developed from the late nineteenth to the mid-twentieth centuries. Though the specific arrangement of fusion or neoconservative ideas varies depending upon particular popular or academic expressions of new conservatism, these terms have come to be widely used throughout North America and western Europe over the past thirty years to distinguish self-described "conservative" parties and political movements from the traditionalist conservatism of Edmund Burke and other eighteenth-century critics of emergent liberalism.

Most of new conservatism can be broken down into two basic types. The first is characterized by a fusion of socially conservative beliefs (usually grounded in explicitly religious—mostly Western Christian—assumptions) with fiscal conservative beliefs that emphasize individual economic opportunity and property rights. This combination of ideas has never been very stable, as many social conservatives are willing to conceive of the state as a promoter or defender of customary social and religious mores, whereas fiscal conservatives are generally suspicious of any kind of explicit cultural regulation or promotion. This dispute thus pits more traditional-minded, communitarian conservatives against those who have embraced the "creative destruction" of free market capitalism. Nonetheless,

this fusion has resulted in a very successful conservative movement in electoral terms in the United States (and, to a lesser degree, in some other democratic states such as Great Britain and Canada), primarily because during the cold war, both sides of this combination saw the Soviet Union, and communist ideology generally, as a threat to both religious belief and economic liberty.

The second grouping of new conservative thought is that associated explicitly with neoconservatism in the United States. Neoconservatism began as a response by certain disenchanted liberal thinkers in the 1960s and 1970s to the social damage they felt was being wrought by many liberal egalitarian programs of the day. Of particular concern to the neoconservatives was the negative cultural impact that they believed extensive state involvement in the economy was having on the work ethic and family structure of the most at-risk members of the population: racial minorities and the poor. They also worried about the international consequences of the pacifism of the new left and other liberal movements at the time of the Vietnam War (1959–1975). (While neoconservatives were not always strong defenders of the war, they were highly dismayed at the criticism of the United States that opposition to the war frequently involved.) As these thinkers began to align themselves with conservative movements more thoroughly, a new line of argument emerged. This argument was characterized by an openness to liberal programs but also a suspicion of them: a suspicion not driven by a libertarian commitment to fiscal responsibility but rather by sociological concerns about the collapsing of patriotism, civic bonds, and family stability. Their emphasis on strength and discipline in both domestic and international matters, and their belief that the experimentation and innovation of liberal social and economic policies was helping to undermine the state's cultural strength, fit very well with the other, aforementioned form of fusion conservatism. This affinity led to some neoconservatives in the United States, Canada, and Great Britain going so far as to embrace elements of the socially conservative Christian perspective, though new conservatism or the new right in some other states is notable, on the contrary, for its eschewing of any social or Christian conservatism.

Fusion conservatism has been a successful enough ideology that social and fiscal conservatives have mostly made their peace with it and embraced the movements and parties that have carried the ideology forward. Similarly, the arguments of neoconservatives along with those of social conservatives have evolved into a variety of civic-minded, "compassionate conservative" policies, such as faith-based initiatives that make use of churches and other religious organizations to administer social welfare programs. Most new conservatives bring to conservatism generally a greater concern for pursuing egalitarian goals, so long as this can be done without doing damage to the cultural virtues and foundations that a capitalist society requires. At the same time, their belief in the importance and integrity of the nation has led them to embrace an ideological commitment to the appropriateness of using one's national strength to promote certain values around the world.

New Deal

One of the most crucial shifts in American social and political history, the New Deal was the name of a series of economic and social reforms as well as a new orientation of the U.S. federal government toward more active regulation of the national economy. Initiated by President Franklin D. Roosevelt, the New Deal programs were a set of policy responses to the massive economic crisis spawned by the collapse of the American economy in 1929 and the Great Depression that followed. Following his November 1932 election and with unemployment surging to nearly 25 percent in early 1933, Roosevelt proposed a set of reforms to stimulate economic growth and employment and to rebuild the structure of the American economy by expanding the government's capacity to regulate market activities.

The basic idea put forth by the New Dealers in Roosevelt's administration was that the Great Depression was not simply a blip in an ordinarily self-regulating economy that would soon correct itself. Rather, in their view, the problem was one of *too much* competition: Excessive competition within the industrial and agricultural sectors had the effect of lowering overall wages and prices. A key element of the New Deal was therefore to erect new government agencies and powers to regulate and coordinate economic and industrial activity in order to avoid catastrophic troughs in the business cycle and to insulate workers from the attendant economic hardships. This impulse to exercise greater regulatory authority over economic and labor markets had two main intellectual and historical roots that converged in the New Deal reforms.

ORIGIN OF NEW DEAL REFORMS

The first precursor was the steady drive for an expanded executive branch of the government during the Progressive Era, which was in part a response to the concentration of private, corporate power during the Gilded Age and political reform efforts that arose to restrain these corporate giants. President Woodrow Wilson had been one of the first presidents to expand the reach of the executive branch, and before Wilson, President Theodore Roosevelt had made an antimonopoly stance one of the core elements of his economic program. This trend in American political development had its roots in a new intellectual orientation that began in the last quarter of the nineteenth century and the early decades of the twentieth. This new approach to political economy was a decisive turn toward the creation of a more modern and expanded American state with the capacity to regulate the economy as opposed to the laissez-faire political economy of the nineteenth century. One of the central aims of progressive reformers was to empower the state to regulate the economy for democratic or public ends rather than for private benefit. Much of this populist and progressive ethos and regulatory impulse was embraced and refined by New Deal policy makers.

Organized labor, which had seen its power waning in the years of the Depression, was given new life under the New Deal. One of Roosevelt's central policy initiatives was the balancing out of the powers of capital and labor. Labor had largely failed for the previous fifty years to organize the bulk of the workers in major industries such as steel, textiles, mining, and auto manufacture. Ten years prior to 1933, the unionized workforce was approximately five million; at the start of Roosevelt's presidency, it had shrunk to about two million. Roosevelt's policies were designed to give new strength to unions, to collective bargaining, and to ability to unionize. These actions endeared organized labor to the Roosevelt administration and to the New Deal coalition for the next several decades, and this alliance had a major impact on the redistribution of wealth in American society.

A second influence on New Deal policy and thought was the economic theory of British economist John Maynard Keynes. Keynes's ideas were crystallized and published in 1936 in his *General Theory of Employment, Interest and Money,* in which he argued that in times of crisis, expanded public sector spending was crucial to stimulate economic growth. The central government had to infuse money into the macro economy, thereby creating what Keynes termed a "multiplier effect," with which money available for industry would spur employment, consumption, and broader economic recovery. This pump priming of the macro economy via deficit spending was not, however, accepted by many of the New Dealers themselves. Keynes viewed public deficits as a necessary and crucial component of such policies, but many New Dealers, including the treasury department's Henry Morgenthau, believed that balancing the federal budget was more important than following Keynesian policy prescriptions.

NEW DEAL IN ACTION

The New Deal was launched on March 3, 1933. The increased regulatory role of the state was evident in the first policies enacted. The Emergency Banking Act brought banks under the supervision of the treasury department, and the passage of the Federal Deposit and Security Act created the Federal Deposit Insurance Corporation (FDIC) to insure bank deposits. The Agricultural Adjustment Act created the Agricultural Adjustment Administration (AAA). The policies of the AAA

were also regulatory in nature: Prices were to be inflated by regulating the amount farmers produced. Farmers were paid to leave land idle, and the AAA set limits on the production of corn, wheat, rice, and pork. The reforms in both banking and agriculture were exemplary of the early ideas of the New Deal: that the federal government's central role is to regulate economic activity.

Yet another layer of New Deal policies was aimed at the reform of the industrial sector. Also created in 1933 was the National Recovery Administration (NRA). The reforms pursued by the NRA were sweeping: The limiting of the work week to 35 to 45 hours, the abolition of child labor, and the establishment of the minimum wage were all key reforms aimed at enlarging the power of labor and decreasing the hypercompetitiveness of the industrial sector, which Roosevelt saw as a key cause of the Depression.

Like other key New Dealers in his administration, Roosevelt was wary of running massive budget deficits, but he also saw the need for the state to become more than simply a regulator of economic activity. Roosevelt allowed certain budget deficits, and there was immense government spending; however, it was not as expansive and intense a pump-priming fiscal policy as Keynes had proposed. It is possible that the consistent requirement to balance the federal budget had much to do with the dull effect that New Deal policies had on stimulating economic growth. It is important to recall the general concerns that drove New Deal thought: Excessive competition, the weakness of labor's bargaining power vis-à-vis that of corporations, and the need for expanded federal regulation were the main elements of New Deal policy.

This was most evident in the last phase of the New Deal: Later New Deal reforms were less concerned with economic growth and more focused on support for labor and the protection of the public from economic insecurity. The Works Progress Administration (WPA), the Social Security Act, the creation of the National Labor Relations Board (NLRB), and finally the Fair Labor Standards Act were all intended to strengthen the bargaining power and working conditions of labor and create a more economically enfranchised and protected working class.

IMPACT OF THE NEW DEAL

In hindsight, the New Deal was both controversial and successful. The NRA and AAA were struck down as unconstitutional by the U.S. Supreme Court, and public support began to wane with the New Deal's apparent overreach into the economy. Although the New Deal did not succeed in reigniting prosperous economic growth (that would come with the war economy during WWII [1939–1945]), it did succeed in restructuring the American political economy. The notions that the state can and must intervene in economic affairs, play an active role in promoting equality, direct certain forms of development, and protect people from the harshness of market failures were all hallmarks of the New Deal. Many of its enduring programs—such as Social Security, the Securities Exchange Commission, and Fannie Mae—have been remarkably successful and enjoy enduring political support.

Despite these successes, the New Deal also had its critics, both then and now. The most prevailing critique of the New Deal while it was being enacted came from those who were fearful of the intervention of the state into society as a whole and into the economy in particular. Roosevelt utilized the newly expanded powers of the state, which had begun under the Wilson administration, in order to bring about reforms. Critics, however, saw New Deal policies as socialist and began to argue that it was an overreach of the executive branch. The big business community saw the reforms themselves, specifically the powers Roosevelt granted to labor, as endangering their own political and economic power. Today, these criticisms of the New Deal are still voiced, as is the charge that it did nothing to stimulate economic growth and is therefore, in economic terms, a failure. Nevertheless, there is no denying the changed pattern of American society and government after the New Deal reforms, especially in the way that it gave renewed power to organized labor as well as the new powers accrued by the state. In the end, it is this transformation of the orientation of government that makes the New Deal a seminal development in American political and social history.

New Europe

From the point of view of European politics, the term *New Europe* is generally used in relation to the post–Communist-era countries of Poland, Estonia, Lithuania, Latvia, Romania, Hungary, Slovenia, Slovakia, the Czech Republic, and Bulgaria. The New Europe theory emphasizes the support of this formerly communist Eastern bloc for the 2003 war in Iraq, although it is not limited to this. In contrast to the governments of some western European states, the governments of central and eastern European countries were sympathetic to President George W. Bush's hard policy line on Iraq. Additionally, in these countries, the Iraq war did not represent a major issue in domestic politics, nor did it generate significant protests. However, it should be noted that some western

European countries (e.g., Spain, Italy, United Kingdom, and Denmark) were also in favor of the war, but they were not conceived of as belonging to the New Europe.

According to Scott MacMillan, the New Europe concept can be further linked with the European Union (EU) integration. On the one hand, the central European states are viewed through the effort of national institutions and cultural identity preservation from the distant authorities in Brussels or from the Franco-German dominance. On the other hand, in the EU democratic and transparent institutional framework, central and Eastern European politicians attempt to take clear positions over the direction of the EU.

New Institutionalism

The renewed interest in institutions in political science over the last twenty years has been associated with a school known as new institutionalism. Institutions were marginalized in American political science during the 1960s and 1970s because of their association with a formal-legal style of scholarship ("old" institutionalism) that was criticized for being descriptive, a-theoretical, and parochial. In the context of the behavioralist movement, institutions seemed anathema to deductive logic, quantification, and grand theorizing or, in other words, to good and proper political science. New institutionalism emerged as a reaction against this orthodoxy and at the same time looked to take a broader and more dynamic view of institutions than the old institutionalism, which was focused on detailing their workings.

New institutionalism is not a coherent and unified theoretical school. Rather, it includes several branches that developed in relative isolation to each other: historical institutionalism and its idea of path dependency; rational choice institutionalism, which emerged as rational choice theorists increasingly stressed the importance of institutions in the strategic calculations of actors; and sociological institutionalism, which developed out of organization theory and stresses the cognitive dimension of institutions.

DEFINING INSTITUTION

One question that inevitably comes up with new institutionalism is how institutions are defined. The formal-legal scholarship understood institutions as material structures. They were constitutions, cabinets, parliaments, bureaucracies, courts, armies, federal or autonomy arrangements, and, in some instances, party systems.

This materialist definition is accepted by a great many new institutionalists. In *Structuring Politics* (1992), Sven Steinmo, Kathleen Thelen, and Frank Longstreth spoke of electoral rules, party systems, the structure of relationships between branches of government, and trade unions. Rational choice institutionalists depart somewhat from this definition by focusing more squarely on the "rules of the political game," which tend to be associated with material structures but in themselves represent less tangible parameters.

A more significant departure from the materialist definition consists of conceptualizing institutions in terms of norms and values. This was the avenue chosen by James March and Johan Olsen in their *Rediscovering Institutions* (1989), where they defined institutions as collections of interrelated rules and routines. Sociological institutionalists go the furthest in defining institutions in a nonmaterialist fashion, speaking of beliefs, values, and cognitive scripts. Historical institutionalists are generally closer to the view that institutions are formal structures, although some have brought ideas into their framework. Therefore, there is some disagreement within new institutionalism as to what degree of rigidity is required to have an institution.

STRUCTURE AND AGENCY

Another issue raised by new institutionalism relates to the structure and agency dilemma. More specifically, new institutionalism brings up three types of questions relating to structure and agency. What are the mechanisms through which institutions shape action? What is the extent of the weight of institutions on agents? What is the depth of institutional influence on political processes—that is, is the weight of institutions felt only on strategies or also on preferences?

The issue of how institutions affect agency is viewed in two different ways. The first emphasizes path dependency. At the broadest level, path dependency refers to the importance of the early stages of a temporal sequence. It is the idea that once institutions are formed, they take a life of their own and drive political processes. From this particular perspective, most often associated with historical institutionalism, *when* an event occurs is as important as what this event is. The second new institutionalist view on the issue of how institutions affect agency says that institutions shape action, because they offer opportunities for action and impose constraints. This angle, stressed first and foremost by rational choice institutionalists, although not ignored by historical institutionalists, suggests that the weight of institutions is felt on outcomes insofar as it affects individual and collective decisions. In this context, the theoretical importance of institutions stems from their mediating effect on the calculations of actors.

The question of the extent of the weight of institutions on agency or, in other words, the level of structuralism involved in institutional analysis is also discussed in at least two different ways. On the one hand, new institutionalists who adopt a

more rationalist perspective on the nature of the relationship between institutions and agents argue that political processes are really driven by actors. Institutions represent a context for action rather than an autonomous force per se. Path dependency, on the other hand, suggests a more overwhelming quality to institutions, as the autonomy of actors may be severely limited by the logic of institutional development and reproduction. Structuralism is even stronger when institutions are conceptualized in terms of ideas, culture, and norms, such as in the sociological institutionalism and some versions of historical institutionalism, since they become internalized by actors. March and Olsen have argued that behavior is driven by other elements than utility calculations—namely internalized principles and values, cultural features, identity, and habit. For the "logic of consequences," in which actors behave in accordance with expected results, they substitute the "logic of appropriateness," in which actors behave so as to conform to existing rules or values.

INSTITUTIONAL INFLUENCE

The issue of the depth of institutional influence ties into the first two questions. For the more rationalist-minded new institutionalists, the impact of institutions is felt strictly on strategies. The interests and preferences of actors are formed independently of the specific institutional environment; they follow a logic of power maximization. From a sociological institutionalist perspective, as well as from a historical institutionalist one, institutions affect not only strategies and interests but also patterns of relationships between actors, preferences, objectives, identities, and, indeed, the very existence of actors. In other words, historical and sociological institutionalists tend to problematize more aspects of agency than rational choice institutionalists.

How do new institutionalists theorize institutional change? One explanation focuses on exogenous shocks. It suggests that international events such as wars and global financial crises, in disturbing the unfolding of domestic processes, break the cycle of institutional reproduction, thereby opening up opportunities for, if not forcing, institutional transformations and political change. From this perspective, institutions are not created endogenously. Some new institutionalists, primarily those of the rational choice persuasion, have adopted a more utilitarian view on institutional change. They suggest that institutions are transformed when they become dysfunctional or yield suboptimal results. Sociological institutionalists have tended to view institutional change in terms of convergence. The key idea here is that of isomorphism, which suggests that coexisting institutions, more specifically institutions in a similar domain, will tend to look alike, whatever the differences in their immediate environment.

CONCLUSION

New institutionalism is a prominent approach to politics and related disciplines—Elinor Ostrom and Oliver Williamson, two scholars with strong new institutionalist leanings, were awarded the Nobel Prize for economics in 2009. New institutionalism is also fragmented. Nevertheless, scholars have argued that there is a theoretical core to new institutionalism, since all three different streams view institutions as the single most important variable in explaining politics.

New Left

The *new left* refers to an international movement, composed principally of students and other young people, which arose in the developed capitalist countries during the 1960s. It was "new" in contrast to the old, Communist left, which new leftists believed to have become ossified by orthodoxy and ideological dependence on the Soviet Union. New left theorists rejected both Communist orthodoxy and the anti-Communist ideology of the leaders of the capitalist bloc.

The new left was inspired by the U.S. civil rights movement, the Cuban revolution, the Chinese Cultural Revolution, and the writings of Herbert Marcuse, Ernesto "Che" Guevára, Régis Debray, Mao Zedong, and Ho Chi Minh. In the United States, its founding moment was the Port Huron (Michigan) conference of 1962 and its eponymous statement, which proclaimed that "people have a right to participate in the making of those decisions that affect their lives." The common element was an emphasis on politics from below, which was seen as more important than any particular formal democratic structure. The conference had been called by the Student League for Industrial Democracy (SLID), which was

refounded as Students for a Democratic Society (SDS). It indicated its rejection of cold war divisions by explicitly dropping SLID's ban on communists among its members.

SDS was only one part of the U.S. new left. Another important component, the free speech movement at the University of California, Berkeley, arose in the fall of 1964, when students who had taken part in the Mississippi freedom summer project of the Student Nonviolent Coordinating Committee (SNCC) were barred from raising money for the civil rights movement on campus; the resulting protest convulsed the campus and raised many broader issues, most notably the call for student power.

As the war in Vietnam escalated, antiwar protests became the central theme of the new left, particularly in the United States. Campus-based activists developed the concept of *university complicity* with the war effort, through war-related research, on-campus recruiting by war industries, and the provision of military training to students through the Reserve Officers Training Corps. This concept led to campaigns of nonviolent resistance, sometimes culminating in building occupations, campuswide strikes, clashes with police, and massive arrests; 1968 and 1969 saw many such events.

The term *new left* most commonly refers to the movement of college students, most of whom were white. However, the core of the campus new left saw itself engaged in a common struggle with community activists, particularly among African Americans, Latinos, and Native Americans, including the Black Panther Party, the American Indian Movement, and the Brown Berets, and to a lesser extent with radical activists in the labor movement. New left activists also saw themselves as part of an international movement, in solidarity with student activists in France, Germany, Japan, Mexico, and elsewhere, and with the national liberation movements in third world countries, most notably Vietnam. The French student-worker insurrection of May–June 1968 was a model for many in the U.S. new left.

The new left was only one part of the broader movement against the U.S. war in Vietnam. The latter was led by a coalition of liberals, pacifists, and the old left, and it sought to maximize participation by limiting its agenda to demands to "stop the bombing" and "negotiate now." The new left, in contrast, supported the concept of national self-determination for Vietnam. Different phrasings—from "immediate withdrawal" to "victory for the NLF"—reflected ideological divisions within the new left but posed an alternative to the slogans of the National Mobilization Committee and the later moratorium.

New leftists tended to prefer local actions over large national marches. However, many new leftists took part in the Chicago protests against the Democratic national convention of 1968, and in the presidential campaigns of Eugene McCarthy and Robert Kennedy in 1968 and of George McGovern in 1972.

SDS's quarterly national meetings were marked by lively debate and growing factionalism, which came to a head in the Chicago national convention of 1969, where the organization split in two, between supporters of the Maoist Progressive Labor Party and a number of groups (notably Weatherman

and the Revolutionary Youth Movement) that identified with Ho Chi Minh and the Black Panther Party. Neither faction thrived after the split, but new left activists went on to play central roles in a wide variety of movements during the following decades.

Newly Industrializing Countries (NIC)

The term *newly industrializing countries* (NICs) was used to describe a number of developing countries that experienced significant levels of economic development during the 1970s and 1980s. The key indicators that were often used to characterize the NICs included high rates of economic growth, rapid industrialization, and the expansion of exports in manufactured goods. The NICs became significant case studies in wider debates about the theory and practice of development. The question of which countries should be classified as NICs is not unambiguous, but the term has become most readily associated with the four "tiger" countries/territories in East Asia: Hong Kong, Singapore, South Korea, and Taiwan. They managed to achieve high levels of economic growth and low inflation combined with significant progress in adult literacy rates and life expectancy.

Two distinct positions developed in the debate over the interpretation of why the East Asian NICs were able to achieve such spectacular levels of development. First, there was the neoliberal view, which tended to focus on the efficient allocation of resources and the export-led nature of those NICs' development strategies. This view sought to portray the NICs as supporting evidence for the types of development policies being promoted during the 1980s by the International Monetary Fund and World Bank. The NICs were contrasted with many other developing countries that had followed the logic of dependency theory by protecting themselves from the international economy and following import substitution industrialization policies.

The second debate position is often termed the "developmental state" view. In contrast to neoliberalism, this view highlighted the political factors at play and in particular the

key role played by the state in the economic development of the NICs. Most of these countries were led by authoritarian governments that were involved directly in promoting the specific sectors of the economy selected for exports. The state invested heavily in education, training, transport, and communications. Trade protectionism and subsidies were also used to support the growth of exports.

Another issue that was debated in response to the rise of the East Asian NICs was the idea of "Asian values." Some scholars suggested that the NICs' success was chiefly the result of specific cultural factors. In particular, these scholars focused on Confucianism and how it encourages cooperative and consensual business relationships. This would make the achievements of the East Asian NICs hard to translate into a generalizable development model.

One of the problems with discussing the East Asian NICs as a group is that the diversity of their individual situations is lost. Hong Kong and Singapore, being small city-states, were able to follow more classic free market policies than South Korea and Taiwan followed; in these latter two, the state played a significant role, especially in land reform before the period of rapid industrialization. The external environment and historical specificities should also be acknowledged. In particular, the United States provided significant aid and access to its market as part of its broadened geopolitical interests during the cold war. The East Asian NICs can now be classed as "developed" with reference to any number of different indicators. However, the term has been replaced by other labels such as "emerging economies," which is often used to describe other developing countries that are currently experiencing significant economic development.

New Right

The *new right* refers to a set of political ideas or ideology that developed in the 1970s and that had considerable influence on political debate and public policy for over thirty years. In essence, the new right refers to the renewing and repackaging of classical liberalism as a response to the economic and political crises that affected many Western developed nations in the 1970s. In much of the West during the postwar period, governments developed increasingly interventionist economic and social policies that significantly increased the role and expenditure of the state. However, a combination of rising expectations, the collapse of the Bretton Woods fixed exchange rate system between 1968 and 1973, and the rise of oil prices led to a sense that postwar economic intervention was failing.

The new right, in developing the work of thinkers such as Friedrich Hayek, Robert Nozick, and Milton Friedman, provided a critique of the Keynesian welfare state, arguing that government intervention exacerbated economic problems by distorting market signals. Consequently, they rejected the idea that economy could be stimulated through government intervention. Instead they suggested that government spending was creating inflation in economies by expanding the money supply and artificially increasing the level of employment. For new right economists, there was a natural rate of employment that was determined by the market, and intervention artificially increased the price of labor and distorted production.

The new right also believed that government expenditure was crowding out the private sector by soaking up too much money and not allowing the private sector sufficient funds for investment. Other new right thinkers such as William Niskanen argued that politicians and bureaucrats were not public servants but acting in their own, rational self interest. Consequently, they increased the size of the state, because it enabled the politicians to secure reelection and the bureaucrats to increase the size of their budgets and their status. The consequence was increasing welfare dependency amongst citizens who depend on the state rather than individual initiative to resolve problems.

The new right maintained the need for a significant reduction in the role of the state. Indeed, many on the new right believed the role of the state should be limited to maintaining property rights and order. Because the aim of the new right was to maximize the role of the market and to reduce the role of the state, the new right advocated cutting public expenditure, reducing taxation, disengaging the state from the economy (particularly through privatization), and reducing the scale and extent of welfare programs. The view of the new right was that markets could provide for the more effective coordination of societies and hence produce collective outcomes that were more efficient and did not impinge on individual liberty.

With the apparent failure of welfare states to deal with the economic problems of the 1970s and 1980s, the new right was influential, because it offered a clear and coherent alternative to social and Christian democratic parties. Particularly in the United States and the United Kingdom, new right ideas were highly influential, and leaders such as Margaret Thatcher and Ronald Reagan promoted policies directly influenced by new right thinking. In Britain, Thatcher was elected in 1979 on a program of cutting public expenditure, reforming welfare, and reducing the role of the state, and Ronald Reagan was elected president in the United States in 1980 on the basis of a similar program. Both followed monetarist economic policy aimed at reducing the money supply and cutting taxation, and the Thatcher government implemented a long term policy of privatization. The liberal economic agenda became increasingly

influential around the world as the ideas of markets as the key organizing principle for the economy replaced the notion that the state could stimulate economic activity.

Nevertheless, the application of new right ideas in practice created significant problems. First, both the Republican and Conservative parties had highly conservative elements who rejected the liberalism of much new right thought. Consequently, new right ideas were married to traditional conservative concerns around issues of morality and social order. Second, rather than reducing the role of the state, the implementation of radical social and economic change often required strong state action, and there was little reduction in the overall level of state activity. Third, especially in Britain, the assault on the welfare state was severely constrained by the impact of economic policies that increased unemployment and the general high level of public support for many welfare measures.

Despite the problems of implementing new right proscriptions, new right thinking has become highly influential throughout the world. Many governments have accepted the importance of the markets and the need for welfare reform, and the managerial revolution has seen the implementation of market criteria in a range of public services. The establishment of the so-called Washington consensus has resulted in many new right policies being taken for granted, and Tony Blair and Bill Clinton both fashioned electoral success by accommodating their center left parties to new right policy prescriptions. Nevertheless, the financial crisis of 2008–2009 has led many governments to rethink the role of unfettered markets in economic coordination, and there has been an increasing backlash against the market-led approach to governance.

News, Construction of

Construction of news is the process by which information about events, people, and ideas is compiled into a format that allows it to be transmitted to an audience. The product of this process is the news, which the public consumes to varying degrees through media such as newspapers, magazines, television, radio, and the Internet. To view news as a construction is to believe that it does more than just reflect the objective realities of the world. Rather, from this perspective, the news emerges from a series of decisions, habits, and external forces; the product both reflects reality and, to some extent, constitutes reality. This conception of news has its roots in some of the earliest examinations of mass media and the public, including Walter Lippmann's *Public Opinion* (1922), and crystallized in scholarly thought during the 1970s with work such as Gaye Tuchman's *Making News: A Study in the Construction of Reality* (1978). In many commercial media systems worldwide, the primary factors that influence the construction of news are economic forces, journalistic norms, and the strategic communication practices of politicians and interest groups.

ECONOMIC FORCES

Typically, commercial news media are owned by large corporate conglomerates and supported primarily by advertising revenue. As a result, those involved in constructing the news pay close attention to what information and presentation style is likely to generate the largest audience. Large audiences are desirable, because they generate more advertising revenue and, consequently, greater profits for news organizations and their parent corporations. As the corporations that own news media grow larger and audiences face a rapidly expanding range of news sources—trends facilitated by government deregulation of media companies and the growth of the Internet—the pursuit of profits through news becomes increasingly pronounced.

There is little question that economic considerations influence the construction of news, but there are different views as to the extent of that influence. Some feel as though the business side of news organizations is generally uninvolved with the news side, while others argue that the concentration of media ownership increases the pressures of commercialism and has a deleterious impact on the quality of the news. Some common concerns are that economic pressures lead journalists to rely too heavily on official sources, offer insufficient contextual information, and focus on a limited range of topics, especially emphasizing the problems of the public sector over those of the private sector. One well-documented outcome of modern economic constraints is that traditional "hard news," such as politics and foreign affairs, has given way to more "soft news," which emphasizes entertainment and human interest stories. Even in less commercially driven media systems, news construction is based to some extent on perceived audience interest.

JOURNALISTIC NORMS

Like the employees of other organizations, journalists engage in a series of routines and practices that help them do their job. These journalistic norms influence the construction of news, because journalists act as gatekeepers; that is, their decisions about which stories to present and how to present them fundamentally shape the news that much of the public will receive. Studies of the gatekeeping process demonstrate that journalists' views about what is newsworthy, stylistically pleasing, and ideologically acceptable all affect the form and content of the news. As cable news and the Internet have expanded options for news consumers in many countries, the gatekeeping function of the press has diminished. Nevertheless, journalistic norms continue to play an important role in the construction of news.

Norms vary by country and change over time. Among the more common and consequential of these norms are the presumption of objectivity or neutrality, including the expectation that journalists will remove themselves from the story by relying on sources to present both sides of a given story; the tendency to favor sources that are deemed authoritative, especially those in positions of power; an emphasis on dramatic stories or the most dramatic elements within a given story, including crisis, conflict, or scandal; and the desire to find exclusive stories or "scoops" that will differentiate a story, journalist, or news organization from competitors. Journalists also have traditionally worked with limited time and space, which has led them to use the "inverted pyramid" style of presentation. This style frontloads the basic factual information of the story and limits further analysis.

STRATEGIC COMMUNICATION PRACTICES

Political leaders and interest groups often perceive favorable news coverage as crucial to achieving their objectives. Because of this, they work to influence the construction of news though various techniques. In countries with an independent press, such techniques include giving public speeches, holding press conferences, issuing press releases or video news releases, developing relationships with journalists, and serving as sources in journalists' stories. In countries that have more government involvement in the press, direct propaganda and censorship sometimes render such techniques unnecessary. Strategies for press management have become increasingly common and sophisticated over time, beginning in earnest during the early twentieth century and growing exponentially since then. Politics in particular are now practiced much more publicly than they were in previous eras, which has led politicians to devote a substantial amount of time and energy to news management.

Such attempts have mixed success. Journalists do use speeches, press conferences, press releases, and the like to generate ideas for stories. In some cases, news organizations will print such material in its original form. Further, in many news systems, journalists' tendency to seek out seemingly reputable or authoritative sources encourages a heavy reliance on official sources and ensures that political news coverage regularly gives voice to those in positions of political power. Nevertheless, journalists often reject overt attempts at news management, and voices critical of politicians and interests groups regularly find their way into news coverage generated in independent media systems.

There is no consensus as to which of these three factors—economic forces, journalistic norms, or strategic communication practices—exerts the most influence on the construction of news. Journalists tend to view themselves as fairly independent, though acknowledging the economic constraints they face and the symbiotic relationship they maintain with politicians and interest groups. Practitioners of strategic communication often assume their techniques are effective, though research confirms that the success of these approaches is highly dependent on context and often limited. Many scholars emphasize the economic structure of commercial news media as the decisive factor. Regardless of which is the most influential, each of the three factors contributes meaningfully to the construction of news.

New World Order

International relations realists and idealists disagree about whether the international system can be transformed from a conflictive anarchic realm to a *new world order* of peaceful cooperation. The meaning of system transformation varies by theory. According to structural realists, the international system is anarchic and will remain so unless all states surrender their sovereignty to a single world government. Marxists, by contrast, define the current order as capitalist and foresee its replacement by socialism.

Participants in the debate use different terms to describe themselves and the outcomes they foresee. E. H. Carr, for example, contrasted "realist" and "utopian" perspectives on the possibility of "peaceful change," while V. I. Lenin distinguished between "revolutionary" and "bourgeois" approaches to the "new economic order."

Debate about the new world order occurs in both academic and policy circles. Its most recent appearance on the public stage was at the end of the cold war, when U.S. president George H. W. Bush used the phrase to wrest the diplomatic initiative from Soviet president Mikhail Gorbachev. In a speech to Congress on September 11, 1990, Bush called for "a world where the rule of law supplants the rule of the jungle. A world in which nations recognize the shared responsibility for freedom and justice. A world where the strong respect the rights of the weak."

Niebuhr, Reinhold

Karl Paul Reinhold Niebuhr (1892–1971) was an American theologian and political theorist best known among political scientists for his contributions to the classical realist school of international relations and particularly to its Christian branch.

Niebuhr was born on June 21, 1892, in Wright City, Missouri. The son of a German Protestant pastor, at age fifteen he decided to follow in his father's footsteps and began his theological studies at the *Evangelische Proseminar* (now Elmhurst College) in Elmhurst, Illinois. After completing his education at Eden Seminary and Yale Divinity School, in 1915 he was ordained pastor of the Bethel Evangelical Church in Detroit, Michigan, where he remained for thirteen years. In this period—recounted in the autobiographical *Leaves from the Notebook of a Tamed Cynic* (1929)—Niebuhr's closeness to the city's working-class communities and his exposure to the injustices of early twentieth-century industrial capitalism (epitomized by the Ford factory) led him to abandon his early liberalism in favor of a growing sympathy with the principles of Marxism. His new convictions resulted in his becoming a leader of the Socialist Party of America.

In 1928, Niebuhr left his pastorate for an academic position at Union Theological Seminary in New York. There he began a twofold intellectual transition that would characterize his thought until the end of his academic career in 1960. First, he became even more interested in the problems and questions of international affairs. Second, from a fundamentally class-based view of society Niebuhr switched to a political realism founded on the idea of the original sin as a unifying and degrading element of humanity—a realism that, however, retained some Marxist nuances, especially when applied to issues of political economy. This vision of politics is expressed in the several works he published during these years, which placed him in the pantheon of classical realism with authors like E. H. Carr, Henry Morgenthau, and George Kennan. These works include *Moral Man and Immoral Society* (1932), *Christianity and Power Politics* (1940), the two volumes of *The Nature and Destiny of Man* (1941, 1943), *The Children of Light and the Children of Darkness* (1944), and *Christian Realism and Political Problems* (1953).

In addition to his focus on the theory of international relations—and unlike many of his fellow realists—Niebuhr had a strong interest in the problems of morality and its application to political practice. *An Interpretation of Christian Ethics* of 1935 is perhaps his main work in this field. He was also engaged as a public intellectual by contributing to periodicals such as *The New Republic, The Nation, Christianity and Crisis,* and *The New Leader.* Finally, throughout his academic years, Niebuhr remained active in politics as the leader of movements like the Fellowship of Socialist Christians and Americans for Democratic Action and as a consultant to American diplomat George F. Kennan's policy planning staff.

In 1952, Niebuhr suffered a stroke that gradually debilitated him and eventually led to his retirement from Union Seminary in 1960. After holding a few short-term positions at Harvard, Princeton, and Barnard College, he died in Stockbridge, Massachusetts, on June 1, 1971.

Nietzsche, Friedrich

German philosopher Friedrich Nietzsche (1844–1900) was born in Prussia in 1844, the son of a Protestant pastor. He attended Schulpforta boarding school and completed his PhD in classical philology in Bonn and Leipzig, where he became friends with composer Richard Wagner. In 1869 Nietzsche became a professor in Basel, Switzerland, and a colleague of Swiss art and culture historian Jacob Burkhardt.

In 1872 Nietzsche published *Birth of Tragedy,* which contained his analysis of art in terms of the Apollonian/Dionysian duality as well as effusive praise of Wagner. This was followed by *Untimely Meditations* (1873–1876), a study of European culture, and *Human, All-Too-Human* (1878), in which he explored such topics as religion, psychology, and social reality. In 1879 he retired from teaching for health reasons and lived for the rest of his life variously in Switzerland, Italy, and on the French Riviera, writing *The Dawn* (1881), *The Joyful Wisdom* (1882), his magnum opus *Thus Spoke Zarathustra* (1883–1885), *Beyond Good and Evil* (1886), *On the Genealogy of Morality* (1887), *Twilight of the Idols* (1888), *The Antichrist* (1888), *The Case of Wagner* (1888), and his autobiography *Ecce Homo* (1888). In 1889 he had a mental breakdown from which he never recovered, and he died in 1900. His sister rewrote portions of his works to reflect her own anti-Semitism, and in 1901 she published *The Will to Power,* a collection of his notes that she claimed was his magnum opus. Her distortions facilitated the reception of Nietzsche's thought by the Fascists and Nazis.

Nietzsche is best known for proclaiming the death of God in several of his works. He is also often identified with the concept of nihilism, a spiritual malaise that he believed was undermining European morality and would give birth to terrible wars. Much of his thought was devoted to explaining the

origin of nihilism, which he saw as a manifestation of declining life. Life, as he saw it, is will to power, a struggle between all beings for dominance over one another. In such a competitive environment, the strong flourish and establish themselves as masters, portraying themselves as "good" in contrast to the "bad" slaves. This master morality characterized the ancient world until it was overthrown by slave morality that portrayed the weak as "good" and the strong as "evil." This reversal of values began with the Greek philosopher Plato, was institutionalized by Christianity with its ascetic ideal, and culminated in modern social democracy.

With the death of God and the advent of nihilism, Nietzsche believed humanity faced a great decision—whether to return to a healthier way of life such as that of the Greeks or to pursue a pleasurable but aimless existence. The former choice leads to Nietzsche's famous superman, the latter to the last man. The superman, for Nietzsche, lives beyond good and evil, accepting the world as it is and rejecting all pity. The last man is driven and dominated entirely by his momentary desires. The path of the superman requires the acceptance and affirmation of the doctrine of the eternal recurrence of all things, or what Nietzsche elsewhere calls *amor fati,* love of fate.

While many have affirmed Nietzsche's critique of modern society, there has been considerable disagreement about whether the struggle for power and the wars he predicts are real-world events or metaphors for spiritual struggle. Regardless, he exercised a profound influence on many of the greatest thinkers of the twentieth century.

Nobel Peace Prize

The Peace Prize is one of five prizes endowed by Swedish chemist Alfred Nobel, who believed that the potential for devastation created by his invention, dynamite, would put an end to war. The first Nobel Peace Prize was awarded in 1901. Today it is worth about $1,650,000.

Over the years, the prizes have rewarded a variety of approaches to peace. The ninety-five individual prizes have been awarded to peace activists outside government, such as Jane Addams; to officials committed to international law, such as Dag Hammarskjöld; to opponents who agreed to negotiate, such as Anwar al-Sadat and Menachem Begin; and to those seeking justice and freedom in their own country but non-violently, such as Martin Luther King Jr. Twenty organizations have won, including the International Committee of the Red Cross, which has won three times. In nineteen of the years since 1901, the prize has not been awarded. In some years there have been multiple winners.

Until 1960, when Albert Lutuli of South Africa won, all winners but one were from the United States or Europe. Since 1960, the reach of the prize has become global. Twelve women have won; three were among the twenty American winners. Bertha von Suttner, the first woman to win, was an activist and author of the antiwar novel *Lay Down Your Arms;* she is credited with persuading Nobel to create the prize. Some prizes have rewarded accomplishment, some have encouraged further action, and some have provided protection for winners from their own government.

Nonalignment

Nonalignment refers to a policy of neutrality toward international security alliances. It is most commonly used to reference an organized movement of former colonies and developing nations formed during the cold war. A nonaligned country was by definition one that had no formal pact with either the

United States or the Soviet bloc, although in several cases, most prominently that of Cuba, this position was only nominal. The stark power difference between nonaligned countries and the cold war blocs forced many such countries to eventually take positions that challenged the movement's integrity, and in the opinion of some, undermined its effectiveness.

The earliest mention of the term *nonalignment* is credited to Indian prime minister Jawaharlal Nehru, who used it during a 1954 speech on Sino-Indian relations. India's definitive nonviolent liberation movement provided Nehru the political capital to voice the antiimperial, anticolonial, and antihegemonic values of the developing world. Joined in leadership with Prime Minister Sukarno of Indonesia and President Gamal Abdel Nasser of Egypt, Nehru convened a meeting in 1955 with the heads of 29 states—representing the first generation of postcolonial leaders—in Bandung, Indonesia, to discuss joint policies and positions on issues of international relations. Subsequent meetings held in Cairo in 1961 and Belgrade later in the same year formalized the organization of states and the objectives of the movement. In its eventual institutional form, the Non-Aligned Movement (NAM) expressed solidarity with principles beyond cold war neutrality, including independence, noninterference, support of national liberation movements, strengthening of the United Nations (UN), peaceful coexistence, opposition to colonialism and neocolonialism, and resistance to Western domination. These broad principles have allowed the organization to survive the cold war and continue to guide its positions on foreign policy and global economic issues.

Today, comprising 118 states and over half the world's population, the NAM provides a common international platform for most of the globe's developing nations. Although it is separate from the UN, the NAM focuses and coordinates much of its efforts through the UN. The rotating chair of the NAM—currently Cuba's Raul Castro—is passed to the nation hosting the organization's triennial summit. The chair is responsible for NAM administrative coordination, and that country's UN ambassador also acts as minister of nonaligned affairs at the UN. This revolving administration is said to reflect the equal and nonhierarchical spirit of the movement.

In addition to representation through the UN General Assembly, the NAM presents a common front at the UN Security Council, Human Rights Council, International Labor Organization, World Health Organization, UN Educational, Scientific and Cultural Organization, and other non-UN multilateral venues. While the movement claims to play a crucial role in supporting an agenda of global justice, international cooperation, support for the underrepresented, and respect for human rights, its actual degree of influence on international politics is difficult to measure and remains questionable to some. Despite these concerns, the NAM remains the oldest organization designed to promote the collective political and economic interests of former colonies and developing nations.

Noncombatant Prisoners

The term of *noncombatant prisoner,* while existing before, has expanded in meaning since September 11, 2001, and includes fighters not usually protected under international law. Noncombatant prisoners are typically not civilians but rather captured unlawful or illegal combatants or illegal enemy combatants—those who actively and willingly engage in fighting but do not follow all requirements for combatant status and therefore do not gain full rights of the Geneva Convention (GC) when captured. The term is contested and has not been formalized legally.

After the September 11th terrorist attacks, the idea of a new kind of war created a perceived need for new tools. Legal experts in the administration of U.S. president George W. Bush suggested that these attacks were not criminal acts but an armed conflict that required a response beyond traditional law enforcement. It was determined that under the 1949 GC (not signed by the United States), members of terrorist organizations like al-Qaida do not qualify as prisoners of war (POW). The presidential military order of November 13, 2001, classifies these fighters as unlawful combatants or illegal enemy combatants and, upon capture, as noncombatant prisoners. This decision was also applied to members of the Taliban, which had controlled Afghanistan and harbored al-Qaida prior to the U.S. invasion. It was argued that giving rights to illegal combatants could be seen as legitimizing terrorism as a just war tactic. The U.S. Military Commissions Act of 2006 gave the U.S. president broad discretion to determine the status of both al-Qaida and Taliban detainees. Since U.S. courts have no jurisdiction over enemy aliens outside U.S. sovereign territory, such as Guantánamo Bay, U.S. policy is controversial.

Critics see the U.S. war on terror being placed above international law. They are concerned about the potential for human rights abuses and question the correct application of the term *noncombatant prisoner.* Disagreement stems from different applications of *jus in bello* (law of armed conflict) and *jus ad bellum* (use of force). Armed conflicts exist when states (or national liberation movements) use and order violence against other states or movements to further their goals, even if they do not recognize each other's status. Irregular forces are only considered state agents if a state sponsors, directs, and supervises them on a level similar to that of a national army. *Jus ad bellum* is contested and applies only with difficulty to individual cases. An attack must be credibly attributable to a state, and perpetrators must be armed state organs. Since the Taliban controlled about 90 percent of Afghan territory, it arguably

exercised state powers. The United States, United Nations, and North Atlantic Treaty Organization (NATO) have invoked the right to self-defense since the September 11th attacks, and this stance may affect the concept of *combatant*. International law is now moving toward the granting of rights and obligations also to certain nonstate actors, in principle moving these fighters closer to combatant status and questioning U.S. policy.

The combatant-noncombatant distinction differentiates a soldier from a murderer. But difficulty in identifying combatants and their threat level have grown. To qualify for combatant and POW status, an irregular soldier must at a minimum openly carry arms or wear a recognizable sign. Guerrilla soldiers participating part-time in hostilities are combatants until fully demobilized. A combatant of a state participating in an armed conflict is protected from prosecution, except in the case of grave breaches. When the status is unclear, POW status is to apply until a competent tribunal decides on a definitive status. Legal suits have begun to challenge the current U.S. policy.

Nongovernmental Organizations (NGOs)

Nongovernmental organizations (NGOs) are private sector associations based in civil society pursuing policy advocacy goals and project management. Most frequently the term refers to associations with a transnational agenda or operations (for instance, *Médecins Sans Frontières,* a.k.a. Doctors without Borders), although some NGOs are oriented toward activities within a single nation-state (for example, the Urban League). NGO overlaps with concepts such as private association, voluntary organization, nonprofit or not-for-profit organization, the third sector, and more broadly, civil society. It is not usually a term applied to private for-profit commercial enterprises. The label is commonly used within the context of international relations, where NGOs are frequently equated with international nongovernmental organizations (INGOs), umbrella organizations based in more than one country. In the beginning of the twenty-first century, NGOs are widely regarded as agents essential for global governance, interacting in a transnational arena with states, international governmental organizations (IGOs), and private enterprises (corporations).

The term *NGO* entered the political vocabulary in connection with the Charter of the United Nations (UN) in 1945 (Article 71). In the UN context, the term takes on a legal quality and refers to organizations of special status. In particular, NGO status provides certain rights to different categories of organizations engaged in consultative relationships with the Economic and Social Council of the UN (ECOSOC; a total of 3,052 organizations had consultative status in 2007).

Use of the term *NGO* has gradually spread from the context of the UN and international law to international relations and global public discourse at large. At present it is used in many different ways and often at variance with the formal UN usage. As an artifact of international relations discourse, wherein it confines and highlights the secondary role of private associations in state-dominated international relations, NGO lacks some precision. For example, by many current definitions, trade union federations—the type of organization the drafters of the UN Charter primarily had in mind when they stipulated Article 71—are excluded from NGO classification. There has been a notable tendency to restrict use of the acronym to organizations concerned with sustainability and development issues and sometimes to those organizations focusing on the issues of peace, human rights, and cultural exchange. In such contexts, NGOs tend to be cast as forces for good. In the context of developmental programs and issues, NGOs are often distinguished from private voluntary organizations (PVOs) driven by the donors of development aid. At the same time, there is the opposite tendency, whereby NGOs are viewed differently than grassroots organizations (GROs). Some activists reject use of the adjective *nongovernmental,* because it defines their organizations in terms of what they are not, rather than what they are. These activists suggest that governments should be labeled *NPOs* (non-people's organizations), in contrast to

organizations grounded in civil society. Nevertheless, others embrace the term *NGO* because they see particular merit in the broad attribute *nongovernmental,* and NGO continues to be a standard term of self-description.

Relevant legal provisions define the formal limits of what nongovernmental organizations can do in intergovernmental negotiations. The actual formal status that NGOs have in practice is conditioned by the legal requirements and practices within the (host) nation(s) where the NGO is based. These legal forms are various and include entities organized as charities, trusts, and foundations, not-for-profit companies or corporations, unincorporated associations, and legal entities that conform to specific local requirements to qualify for NGO or nonprofit status.

For NGOs engaged in issues on a global scale, the annual budgets can be large, often in the hundreds of millions or even billions of U.S. dollars. NGOs fund their activities in various ways, including membership fees, private donations, provision of goods and services, and grants from governments or international institutions. This last funding source highlights the ambiguous "nongovernmental" status of these organizations: While they usually do not permit direct government representation or control of their activities, the existence of government subsidy in some NGO budgets, and the contracting work some NGOs perform for international institutions, jeopardizes their independent status.

That there are multifarious types of NGOs is evident in the manifold extensions of the acronym, such as GONGO, QUANGO, BINGO, and MONGO (government-organized NGO, quasi NGO, business interest NGO, and my own NGO) that have sprung up to characterize their activities. Despite the obvious intent of discrediting the mission of certain NGOs, these acronyms do provide an illuminating characterization of the conflict and demarcation within the sphere of NGOs, and also of the different paradoxes and types of nongovernmental organizations. Evidently, the variety of NGOs blurs the elusive boundaries between the government sector, commercial interests, and the civil society sphere.

Nonstate Actors

Over the last two decades of the twentieth century and the first decade of the twenty-first century, the concept of *nonstate actors* has become an indispensable part of the terminology of political science. The diffusion of finance and technology that has been fuelled by globalization has enabled nonstate actors to claim functions traditionally performed by nation-states. Both policy networks and policy arrangements have come to consider nonstate organizations as an intrinsic part of international relations. Given the empirical evidence, nonstate actors are increasingly involved in international affairs in various significant ways. Since they are part of the political and institutional arrangements, nonstate actors, negatively or positively, influence political discourse, agenda setting, law making, and decision making. In some cases, their information and expertise helps nation-states struggling with problems. The impact made by nonstate actors depends on several factors, such as the political or legal framework of which they are part, the organizational structures they have built, their network interactions, and their actual presence.

Nonstate actors are nonsovereign entities that exercise significant economic, political, or social power and influence at national, and in some cases international, levels. Nonstate actors come in various shapes and forms that operate transnationally. There is no consensus on the members of this category. Nongovernmental organizations (NGOs) are the most well-known nonstate actors. NGOs are private, self-governing, voluntary, nonprofit, and task- or interest-oriented advocacy organizations. Within those broad parameters, there is a huge degree of diversity in terms of unifying principles, independence from government, operating procedures, sources of funding, and international reach and size. NGOs can implement projects, provide services, defend or promote specific causes, and seek to influence policy. Particularly after the end of the cold war, the growing emphasis on human security has underlined the social and humanitarian issues in which many NGOs have unique expertise.

In addition to NGOs, other nonstate actors include multinational corporations; international media; armed groups, including rebel opposition forces, militias, and warlords; terrorist organizations; criminal organizations; religious groups; and transnational diasporas. Most types of nonstate actors would be considered part of civil society, although some function within the context of the international economy.

Multinational corporations, one of the most influential categories of nonstate actors, are enterprises that manage production or deliver services in at least two countries. The traditional multinational is a private company headquartered in one country and with subsidiaries in others, all operating in accordance with a coordinated global strategy. Today, a growing number of multinationals based in emerging market countries such as China, India, Russia, Brazil, Mexico, and Turkey have become influential in their own right.

The concept of the nonstate actor is not always positive, given the existence of many armed nonstate actors, for example, rebel opposition forces, militias and warlords, and terrorist organizations. They operate without state control and are involved transnationally in activities against state actors. The prevalence of these groups in armed conflicts has added layers of complexity to traditional methods of conflict management and resolution. The diversification of violence and prevalence of multiple armed groups complicates traditional conflict management and resolution and poses a significant challenge for international security governance more generally. Most contemporary conflicts are intrastate, involving by definition at least one nonstate actor, and many are fought without state involvement between two or more armed groups. Nevertheless, international laws and norms governing the use of force are still understood primarily on the state level. Hence, the existence of nonstate actors at the local and international levels has further complicated international relations.

The proliferation of nonstate actors in the post–cold war Era has challenged the traditional nation-state–based international system, nation-state borders, and claims to sovereignty. The relationship between nation-states and nonstate actors has paved the way for the reconsideration of traditional international relations theories such as neorealism, which views the state as the main unit of analysis and regards nonstate actors as being negligible in the anarchic international system. In reality, NGOs participate in international decision making and implementation processes and affect policy outcomes; the activities of transnational criminal or terrorist groups trigger international responses; multinational companies take positions and lobby regarding global issues. The significance of nonstate actors is seen not only in the ways they affect international relations but also in the ways they are institutionalized in political, legal, and policy terms. Today, nonstate actors are part of the institutional structure of international politics and policy making.

Nontariff Barriers to Trade

Nontariff barriers to trade (NTBs) are human-made barriers to trade other than simple tariffs. These restrictive practices are designed to evade free-trade rules imposed by regional or international agreement. They include obstructive customs practices, quotas, product standards that are often justified on health and safety grounds, requirement of licenses, government subsidies or procurement policies, and voluntary export restraints (VERs). What distinguishes NTBs from tariffs is a lack of transparency, which makes their use difficult to prevent. They have proliferated in recent decades, partly because the multilateral trading system has been quite effective, for manufactured goods at least, in reducing the use of tariffs. In response, the General Agreement on Tariffs and Trade (GATT) and more recently the World Trade Organization (WTO), guided by the principle of nondiscrimination in trade, has significantly extended the coverage of its rules to try to regulate NTBs.

THE GROWTH OF NONTARIFF BARRIERS

The multilateral trading system that resulted from the GATT agreement in 1947 did not originally identify NTBs as part of its mandate. It was only in the 1960s during the Kennedy Round of GATT negotiations that they were first considered. During the 1970s, the world economy went through a recession, and the use of trade protectionism to save domestic jobs and industry became politically attractive. It was during this period that the use of NTBs grew at a significant rate, as countries sought to bypass the rules of the GATT. In particular they were used by countries in the West to discriminate against imports from the developing world.

During this period of economic turmoil, the use of VERs also increased substantially. They were usually developed as a response to political pressure from domestic industries that felt threatened by the growth of competitive imports. VERs were most often arranged on a bilateral basis with the exporting country "voluntarily" limiting the quantity of its exported goods to its trade partner. The United States, for example, had already been using VERs as part of its trade policy, but their use escalated in the early 1970s. VERs also began to be used for trade between developed economies in industries such as steel and automobiles. The Tokyo Round of the GATT (1973–1979) attempted to address the use of NTBs by creating six voluntary codes. However, these Tokyo codes, as they became known, were not very effective, because they were separate from the main rules of the GATT and applied only to those countries that chose to sign them. As a result, by the early 1980s it was clear that the GATT had become increasingly irrelevant in the face of these new forms of trade protectionism.

THE WTO AND NONTARIFF BARRIERS

The final round of the GATT led to the creation of the WTO at the beginning of 1995. This agreement made significant

progress on the regulation of NTBs. The Tokyo codes that had proved rather ineffective were developed and made compulsory for all member states. Because of this, the WTO is now increasingly involved with domestic policies and institutional practices. Examples include the agreement on Technical Barriers to Trade and the agreement on Sanitary and Phytosanitary Measures (SPS). The latter tries to balance the need to ensure that food imports do not pose a threat to the health of consumers with the desire to make sure that health and safety standards are not being used to protect domestic producers. These standards tend to reflect those used in developed countries, and it is therefore developing countries that tend to bear the majority of the implementation costs. A similar problem faces developing countries in complying with the agreement on customs valuation. This aims to ensure a uniform procedure for estimating the cost of products when they reach customs. The Doha Development Round (named after Doha, Qatar)—the current trade negotiation round of the WTO—has stalled over disagreements on major issues, including NTBs.

Some critics of the WTO's regulation of NTBs are unhappy with the intrusion into areas previously considered domestic politics. One particularly contentious case relating to the SPS agreement is the dispute between the European Union (EU) and the United States over the European ban on beef imports from cattle that have been injected with a growth hormone. The ban was justified by the EU on scientific grounds that the meat posed a health risk to consumers. The WTO's Dispute Settlement Panel took advice from the World Health Organization and ruled that there was no health risk. The EU has continued the ban, and the WTO has allowed retaliatory trade measures by the United States and Canada.

Nonviolence

Nonviolence is both a moral principle and a pragmatic means of achieving social and political transformation. Nonviolence and pacifism are often considered synonymous ideas, but in fact they are conceptually and politically distinct. The preeminent scholar of nonviolent action is Gene Sharp, who identified the strategic principles and tactical methods through which nonviolent resistance can undermine oppressive systems of political power. Sharp defined the categories of nonviolent action as protest and persuasion, mass noncooperation (in economic, social, and political spheres), and nonviolent intervention. Commonly used forms of noncooperation and intervention include boycotts, strikes, illegal marches, blockades, and sit-ins.

Mohandas Gandhi, leader of India's nationalist movement, pioneered the method of mass nonviolent action, *satyagraha,* as a tool for resisting oppression and injustice and a means of applying pressure for political change. Most who participate in nonviolent action campaigns are not pacifists. They support nonviolent resistance in the manner of Jawaharlal Nehru, an acolyte of Gandhi, who wrote in his 1941 autobiography, *Toward Freedom,* "We accepted that method . . . not only as the right method but as the most effective one for our purpose" (80).

Gandhian nonviolence goes far beyond mere civil disobedience. It is a method of seeking and upholding truth through the application of social pressure and the interaction of contending forces. It follows a set pattern of action that includes the documentation of grievances, dialogue and negotiation with the adversary, the dramatization of injustices, disciplined training for followers, and the resort to nonviolent collective action.

The civil rights leader Reverend Martin Luther King Jr. and his followers famously applied Gandhian methods to advance civil rights for African Americans in the United States. Other examples of successful nonviolent transformation include the "people power" movement of the Philippines in 1986, the "velvet revolutions" in central and eastern Europe in the late 1980s, the flowering of democracy in Chile and other Latin American countries during the 1980s and 1990s, the overthrow of Slobodan Milosevic in Serbia in 2000, the so-called orange revolution in Ukraine in 2004, and the April 2006 overthrow of the monarchy in Nepal. Failures of this strategy for change also can be cited—the Tiananmen Square massacre of prodemocracy demonstrators in Beijing, China, in 1989; the isolation and collapse of nonviolent resistance in the Kosovo region of Serbia in the 1990s; and the as yet unsuccessful struggle for democracy in Burma—but the overall record of strategic success of nonviolence is impressive. Nonviolent resistance has been described by Ackerman and DuVall (2000) as "a force more powerful." The alternative to armed violence is not surrender or appeasement, but the fight for justice through nonviolent means. It is a third way, distinct from armed conflict and inaction, for addressing injustice.

Maria J. Stephan and Erica Chenoweth (2008) confirmed the advantages of nonviolent action in a major empirical study

examining 323 historical cases of resistance campaigns over a span of more than 100 years. The cases involved sociopolitical movements, sometimes lasting several years, that contended against governments to gain specific political concessions. The study showed that nonviolent means were twice as effective as violent means, achieving success 53 percent of the time, compared to a 26 percent success rate when violence was employed. Moreover, nonviolent action is also more likely to expand political freedom and democracy. An empirical study by Adrian Karatnycky and Peter Ackerman (2005) at Freedom House examined sixty-seven late twentieth-century political transformations and found that nonviolent revolutions were three times more likely than armed struggles to create conditions of increased political freedom.

The key strategic advantage of nonviolent action is the ability of disciplined unarmed movements to withstand government repression. Unjustified brutality against nonviolent action tends to backfire and generate public sympathy and support for the resisters. The repression of nonviolent movements by political authorities can create an atmosphere of disaffection among regime supporters and generate shifts in loyalty that make it easier for nonviolent campaigns to gain political concessions. Sharp emphasized the importance of winning the loyalties of third parties as the key to eroding the power base of corrupt and repressive political regimes. The presence of an audience is crucial to the workings of this third-party effect. Effective public relations and the careful crafting of media messages are therefore crucial to the success of nonviolent action.

The nonviolent method, Gandhi and King emphasized, is a strategy best employed by the strong, not the weak. To challenge injustice and stand unarmed against oppressors requires courage, endurance, fearlessness, and a willingness to sacrifice. It also requires well coordinated effort. Such traits are necessary to mobilize mass action and are keys to the moral and political effectiveness of the nonviolent action method.

Normative Theory

The term *normative theory* gained currency in American political science in the post–World War II (1939–1945) period as a consequence of the behavioral revolution and the rise of positivist-empiricist political science. Behavioralists sought to draw a distinction between scientifically oriented political inquiry and evaluative forms of political inquiry that they claimed focused on questions of what the political system ought to look like. Hence, they claimed to distinguish between those forms of political inquiry that only describe the world in a value-neutral fashion, that is, empirical theory, from those that offered normative implications or recommendations about political life, including recommendations of which types of political systems were best, what the nature of justice is, and so forth. The impulse to enforce this distinction in political inquiry derived from the assumption that science was value neutral and that one sign of the scientific maturity of a discipline is the extent to which it has purged itself of normative influences. Scientists do not approve or disapprove of the nature of the objects under investigation; they seek only to describe them and how they operate, function, or behave.

NORMATIVE VERSUS EMPIRICAL THEORY

The dichotomy between empirical and normative theories was itself rooted in a philosophy of language borrowed from the philosophical movement called *logical positivism.* Logical positivists, drawing on the philosophies of David Hume and Immanuel Kant, held that statements could be of two types, meaningful and meaningless. Meaningful statements are also of two types, analytic and synthetic. Analytic statements are those that are true by definition (e.g., all bachelors are unmarried). Synthetic statements are those that make testable, empirical claims about the independent, objective world and may be either true or false. Statements that fit into neither of the above categories are deemed meaningless. These meaningful-meaningless, analytic-synthetic dichotomies were the foundation of another dichotomy, that between facts and values. Factual statements were deemed to be synthetic and therefore meaningful. Value statements are those that merely reflect the speaker's opinion or emotive preferences, but are otherwise meaningless. The assumption was that scientific inquiry must consist only of meaningful statements and exclude normative or value-laden statements (Ayer 1952). In the end, normative statements were deemed to be not rationally grounded, that is, they could be neither empirically verified nor demonstrated to be true through reason.

However, no sooner had this view of language become incorporated into the self-understanding of positivist-empiricism political science than it was shown to be unsustainable. Influenced by the later work of Wittgenstein, philosophers such as W. V. O. Quine (1953) and Wilfred Sellars (1956) challenged the analytic-synthetic dichotomy, the fact-value distinction, and what Sellars called "the myth of the given," that is, the idea that the world we can know exists independently

of our theories about it. In doing so, they undermined the very foundations of empiricism. Subsequently, Thomas Kuhn's work challenged the view of science rooted in the positivist and empiricist account of epistemology and philosophy of science. Unfortunately, these developments were either largely ignored or, in the case of Kuhn, largely misunderstood by the discipline of political science. Hence, the logical positivist account of facts versus values and empirical versus normative theory remains central to positivist accounts of political science (e.g., see Johnson and Reynolds 2008, 27–59).

Needless to say, the dichotomy between empirical and normative theory did not go unchallenged. Despite significant differences among them, a number of theoretical perspectives emerged to emphasize that there are inherent normative dimensions to all political explanation that can be traced to four factors. First, much of the language of explanation of politics itself is formed from a normative—that is, ethical, moral, or political—point of view, and it actually describes from a normative, moral, or political point of view. In other words, the point behind such terms is not only to render an evaluation of social and political practices but also to render a richer description that takes into account the moral dimensions to some forms of political phenomena. Hence, attempts to purge such vocabularies of their normative denotations are bound to fail or seriously disfigure the meaning of political-normative terms. The result can be a misunderstanding of politics and often issues in tacit moral commitments that are ignored.

Second, the terms of political discourse are often internally complex, connoting or denoting a family of meanings that overlap. In such cases, the terms in question are not reducible to any one of the common or intersubjective meanings associated with them. The attempt to reduce the meaning of such concepts to one operationalized meaning can be not only misleading but often is accompanied by a tacit normative commitment. For example, behavioralists tended to define political power in terms of overt, observable conflicts and events within the public realm. Such a definition ignores cases where those in a position of political subordination are so intimidated that they do not even venture to challenge those in political power, a situation common in the race relations in the United States after Reconstruction and through to the civil rights movement. Not surprisingly, behavioralists tended to see American democracy in Panglossian terms ("the best of all possible worlds") and often adopted a critical perspective on social and political dissent such as the civil rights movement. In addition, because of the internal complexity of the terms of political discourse and the normative implications of accepting one definition of a concept rather than another, many theorists argued that the language of political discourse was essentially contestable in ways that further undermine the dichotomy between empirical and normative political theory.

Third, the goal of political science is not simply the description of political phenomena but the explanation of them as well. The explanation of phenomena requires not only that one give an account of why some states of affairs pertain but also why others do not. Such an account is an interpretation of

why some states of affairs or political arrangements are natural, rational, reasonable, or normal, while others are less sustainable. Because any such explanation distributes the range of political possibilities one way rather than another, explanation by its very nature distributes the normative burden in favor of some states of affairs while denying others. For example, empiricists tended to interpret American pluralism as the most reasonable possibility for representative democracy, more inclusive forms of democracy being deemed irrational or unstable (Taylor 1985).

Finally, insofar as political explanation necessarily deploys a vocabulary that distinguishes between rational and irrational behavior, it is necessarily normative. For to say that a practice, institution, or mode of behavior is rational is to make a prima facie case for saying that it is desirable, and to say that it is irrational is to suggest that it should be changed or ceased.

PHILOSOPHICAL CHALLENGES TO A VALUE-FREE INQUIRY

Among the first to challenge the dichotomy between value-free and value-laden political science was Leo Strauss (1959). Drawing on the classical tradition and Plato in particular, Strauss argued that the explanation of political life requires a proper understanding of the nature of political knowledge. Acquiring such knowledge is the task of political philosophy, and it is by its very nature a normative enterprise. Specifically, political philosophy is "the attempt to replace opinion about the nature of political things by the knowledge of the nature of political things. Political things are by their nature subject to approval and disapproval, to choice and rejection, to praise and blame" (1959, 7–8). The political nature of things is not properly reducible to merely subjective evaluations. Rather, political knowledge of things, even if it is never perfectly attainable, can nonetheless be grounded in rational deliberation. From this perspective, the claim of positivist political science to have separated the description of political things from the evaluation of political things is both wrong and dangerous. It is wrong because such attempts must of necessity make choices about the nature of the political that in fact have evaluative elements to them. It is dangerous because in the end it denies that there is a natural, normative dimension to political society that is discoverable by reason, understood in the classical sense. This can lead to moral relativism that can be used by the most unethical forms of political life.

A second challenge to the dichotomy between descriptive and normative theory emerged in the work of Sheldon Wolin. Wolin (2004) argues that there is a distinctive tradition of political theory and philosophy that has among its primary tasks the definition of the political. Such an enterprise is not only normative but is also descriptive and explicative from a political point of view. Specifically, in advancing an account of the political and related concepts such as authority, power, freedom, consent, and so forth, the political theorist, and the study of politics generally, renders some political facts of more significance than others: "The concepts and categories that make up our political understanding help us to draw connections

between political phenomena . . . they create an area of determinate political awareness and thus help us to separate the relevant from the irrelevant." (2004, 7) Such an activity can never be politically or morally neutral. This leads Wolin to make a distinction between *vita methodica,* or methodism, and *bios theoretica,* or political theory (1969). The former is deflationary of theory and mistakenly presupposes that the choice of methods is value neutral. In point of fact, much of what passes for scientific accounts of politics is steeped in normative assumptions and implications that underwrite the political status quo. Political inquiry informed by the tradition of political theory, on the other hand, fully addresses the normative dimension of its explanations. It recognizes that "because facts are richer than theories, it is the task of the theoretical imagination to restate new possibilities" (1969, 1082).

Yet a third approach to political theory that challenged the distinction between description and normative theory emerged in the work of John Rawls. In *A Theory of Justice,* Rawls offers an account of the conclusions concerning political life that free and rational individuals would arrive at if they were placed behind a veil of ignorance, that is, placed in a situation in which they evaluated the alternatives for political life from a disinterested situation. Hence, the conclusions he draws about justice are not simply subjective preferences but rather are rationally grounded decisions that anyone in a similar situation would come to. Moreover, primacy of justice is not a question of mere opinion or subjective preference. Rather, it is the point behind social institutions in much the same way that the pursuit of truth is the point behind the pursuit of knowledge. "Justice is the first virtue of social institutions, as truth is of systems of thought. A theory however elegant and economical must be rejected or revised if it is untrue; likewise laws and institutions, no matter how efficient and well-arranged, must be reformed or abolished if they are unjust" (1971, 3). In effect, Rawls argued that in a well-ordered society, there would be widespread agreement on moral beliefs and in particular on the primacy of justice over other political values, such as notions of the good. In subsequent work (1993) Rawls revised the theory of justice, arguing that liberal political societies committed to some form of representative democracy and characterized by reasonable pluralism would be united by a political conception of justice rather than a moral one. In this later work, Rawls attempts to answer the question, "How is it possible that deeply opposed though reasonable comprehensive doctrines may live together and all affirm a political conception of a constitutional regime?" (1993). If Rawls's analysis is correct, the conclusion is not simply a matter of subjective choice or personal preference, it is a matter of the conclusions that rational individuals would come to in a pluralistic, liberal society.

POSTMETAPHYSICAL POLITICAL ACCOUNTS

In more recent years, a number of approaches to the explanation of political life have embraced the term *postmetaphysical* to describe their account of political explanation and evaluation.

Postmetaphysical refers to the claim that although all theories make ontological assumptions about the nature of human existence and political life, there is no one theoretical perspective that can deliver on the claim to represent what is essential or exclusively fundamental about social and political life. This means that no single perspective can offer the privileged or exclusive foundations of social and political inquiry. Thus, no single account can claim objectivity in the strong sense; each account is a prescription of how political life ought to be studied, what is most significant in the study of political life, and how that account of the political influences political practice. Among the most important perspectives that fall into this category are Habermasian discourse ethics, interpretive-hermeneutic political theory articulated by thinkers such as Charles Taylor, and genealogical perspectives exemplified by the work of William Connolly.

In his theory of communicative action and discourse ethics, Jürgen Habermas argues that although there is no single objective account of politics, any attempt at communication, that is, any speech act, necessarily presupposes three normative validity claims. In engaging in the act of communication, the speaker draws upon claims to sincerity or truthfulness, truth, and appropriateness. When normative prescriptions that meet these criteria are agreed upon by social agents, the decisions or behaviors that result can be deemed to be rational in a strong, noninstrumental sense of the term. Moreover, Habermas argues that these validity claims are universal, that is, they are pragmatically implicit in every act of communication. If Habermas is correct that there are universally valid criteria for judging the rationality of normative claims and actions, claims about statements meeting these criteria can be deemed to be true, though subject to revision.

Interpretive or hermeneutic approaches take a somewhat different approach to normative theory. Thinkers such as Charles Taylor argue that human beings are by nature self-interpreting beings. Much of the language of self-interpretation is conducted of necessity in moral and ethical terms. In addition, that self-interpretation often takes the form of what Taylor describes as strong evaluation. Strong evaluation is that which poses the choice between two alternatives in morally contradictory or competitive terms. This element of human being, that is, moral self-interpretation, is no less true of the practice of social science than it is of everyday political life. Insofar as social and political theory are attempts to make sense of our political world, to clarify the inchoate or imperfectly understood, they will sustain some established activities and undermine others. Hence, to offer an interpretation of social and political action is to endorse one set of political alternatives and to deny others.

The last perspective, sometimes unfortunately labeled *postmodernism,* is best described as genealogical social theory. Indebted to the work of Friedrich Nietzsche, Michel Foucault, Jacques Derrida, Gilles Deleuze, and William James, among others, thinkers such as William Connolly adopt genealogical approaches that embrace the idea of the "death of God" in the sense that no single theory can claim to offer an account of

political life that is exclusive and exhaustive without remainder. All theories involve gaps and blind spots and illuminate some aspects of our lives while denying others. Moreover, since social and political life is always in the process of development, even though subtle and slow at times, vocabularies that have explanatory purchase at one point do not have explanatory purchase at another. The result is that each theoretical perspective is sustained not only by evidence and argument but by an act of existential faith that one's account is correct. One ethical implication is that the proponent of any particular theory must of necessity look to engage other perspectives and cultivate an ethos of agonistic respect toward new perspectives and new ideas from alternative accounts of social and political life. Moreover, all must be attuned to the ways in which their own theories sustain some forms of political practice, morality, and behavior and undermine others.

NORMATIVE ACCOUNTS OF POLITICAL PHENOMENA

If the proponents of explanatory-normative theory are correct, then several implications would seem to follow. First, a good deal of what passes for science in political science masks an implicit normative and in some cases explicit normative account of political phenomena. Second, claims to have achieved a science of politics that is devoid of value positions must be taken with a dose of skepticism. Such positions are grounded in epistemologies and philosophies of language that were refuted long ago. Finally, in light of the normative implications of all theoretical perspectives, the cultivation of greater theoretical pluralism and not just methodological pluralism is warranted. In particular, it is incumbent upon political scientists to seek out critical, agonistic, respectful engagement with other theoretical perspectives. Such an approach enhances the possibility of becoming attuned to one's own normative commitments and of challenging contestable boundaries of the ethical and political, and the prospect emerges of forms of knowledge that enhance a deeper and broader understanding of politics.

North American Free Trade Agreement (NAFTA)

The North American Free Trade Agreement (NAFTA) is a regional agreement between Canada, Mexico, and the United States to implement a free trade area—the world's largest, according to the Office of the U.S. Trade Representative. It was officially signed in 1992 and entered into force on January 1, 1994, with the final provisions fully implemented on January 1, 2008. With full implementation, the last remaining trade restrictions on agricultural commodities, such as U.S. corn exports to Mexico and Mexican exports to the United States of sugar and certain horticultural products, were removed.

A North American free trade agreement had been advocated for a number of years prior to NAFTA. U.S. president Ronald Reagan proposed a North American common market in 1981, and in 1985 Canadian prime minister Brian Mulroney announced that Canada would try to reach a free trade agreement (FTA) with the United States. Negotiations started in 1986, and a Canada-U.S. FTA was signed in 1988 that took effect the following year. In 1990, the United States and Mexico announced that they would begin discussions aimed at liberalizing trade between them, and in February 1991, U.S. and Mexican negotiations aimed at liberalizing trade officially became trilateral at Canada's request.

Trade negotiations among the three countries started in June 1991. NAFTA was officially signed in December 1992 by Mulroney, U.S. president George Bush, and Mexican president Carlos Salinas de Gortari, subject to its final approval by the legislative bodies of the three countries. Key provisions cover market access for goods, protection for foreign investment, protection for intellectual property, easier access for business travelers, access to government procurement, and rules of origin. The NAFTA partners also negotiated two side agreements: the North American Agreement on Environmental Cooperation and the North American Agreement on Labor Cooperation.

Various institutions work to implement and provide daily oversight of the agreement's provisions. The Free Trade Commission (FTC) supervises the implementation and further elaboration of NAFTA and helps resolve disputes arising from its interpretation. Canada hosted the FTC's twelfth meeting in 2007. In their joint statement, the ministers agreed to examine new and creative ways of further promoting regional trade and business opportunities. The FTC also oversees the work of the

NAFTA committees, working groups, and other subsidiary bodies. NAFTA coordinators are responsible for the day-to-day management of NAFTA implementation. Over 30 working groups and committees have been established to facilitate trade and investment and to ensure the agreement's effective implementation and administration. The NAFTA Secretariat is an independent agency responsible for the impartial administration of dispute settlement provisions.

According to the U.S. Department of Agriculture, "NAFTA is one of the most successful trade agreements in history and has contributed to significant increases in agricultural trade and investment between the United States, Canada and Mexico and has benefited farmers, ranchers and consumers throughout North America." The World Bank has also stated that NAFTA has helped Mexico's development (though not enough to achieve economic convergence with Canada and the United States). However, there has been criticism of the agreement, including allegations that NAFTA has resulted in job losses, has harmed workers by eroding labor standards and lowering wages, has undermined national sovereignty and independence, has not helped the environment, and has hurt manufacturers and the agricultural sector. These allegations have been denied by NAFTA.

North Atlantic Treaty Organization (NATO)

The North Atlantic Treaty Organization (NATO) is an alliance of twenty-eight countries from North America and Europe committed to fulfilling the goals of the 1949 North Atlantic Treaty. In accordance with this treaty, NATO's fundamental role is to safeguard the freedom and security of its member countries by political and military means. It also provides a forum in which countries from North America and Europe can consult on security issues of common concern and take joint action in addressing them.

HEADQUARTERS IN BELGIUM

The NATO headquarters in Brussels, Belgium, is the alliance's political headquarters and the permanent home of the North Atlantic Council, NATO's senior political decision-making body. This council brings together high-level representatives of each member country to discuss policy or operational questions requiring collective decisions. Decisions are agreed upon on the basis of unanimity and common accord. All member countries participating in the military aspect of the alliance contribute forces and equipment, which together constitute NATO's integrated military structure. These remain under national command and control until they are required by NATO for a specific purpose. NATO does possess some common capabilities owned and operated by the alliance.

ORIGINS AFTER WORLD WAR II

The origins of NATO were shaped by the cold war. After World War II (1939–1945), anxiety grew in western Europe as Soviet influence spread and communist governments took power in eastern European countries. In March 1948, the Treaty of Brussels was signed by Belgium, France, Luxembourg, the Netherlands, and the United Kingdom. It pledged them to establish a joint defensive system and strengthen their economic and cultural ties. The supreme body of the Brussels Treaty Organization was to be the Consultative Council, consisting of the five foreign ministers.

In July 1948, preliminary talks that led to the North Atlantic Treaty began between the U.S. state department and the ambassadors of Canada and of the Brussels treaty powers. The talks ended in September 1948 with a report to governments recommending inter alia that the proposed treaty should promote peace and security, express determination of the parties to resist aggression, define the area in which it should be operative, be based on self-help and mutual aid, be more than military, and provide machinery for implementation. The following month, the Consultative Council announced complete agreement on the principle of a defensive pact for the North Atlantic and the next steps in this direction.

The actual drafting of the treaty started in December 1948. On March 15, 1949, the Brussels treaty powers, Canada, and the United States formally invited Denmark, Iceland, Italy, Norway, and Portugal to adhere to the treaty. On April 4, 1949, the treaty was signed by Belgium, Canada, Denmark, France, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, the United Kingdom, and the United States. It was ratified by the legislative bodies of the member countries within five months.

Since 1949, NATO's membership has increased from twelve to twenty-eight countries. In 1952, Greece and Turkey acceded to the treaty, the Federal Republic of Germany joined in 1955, and Spain in 1982. In 1990, with the unification of

The twenty-eight member states of NATO share a mutual defense pact and also participate in peace missions around the world.

Germany, the former German Democratic Republic came under NATO's security protection. The Czech Republic, Hungary, and Poland joined in 1999. In 2003, Bulgaria, Estonia, Latvia, Lithuania, Romania, Slovakia, and Slovenia were invited to begin accession talks, and they formally acceded to the treaty in March 2004. Albania and Croatia formally became members in April 2009. Moreover, in March 2009, France submitted a formal request to rejoin the NATO command structure, which it had left in 1966. In July 2009, NATO announced the appointment of French General Stéphane Abrial as Supreme Allied Commander Transformation.

POST–COLD WAR MILITARY INTERVENTIONS

Throughout the cold war, NATO acted as a deterrent against military aggression. (NATO forces were not involved in a single military engagement.) With the cold war ending and the Soviet Union collapsing in 1991, NATO's role was reevaluated, and it became increasingly involved in peacekeeping and peace-support operations. According to NATO, it now deploys in support of the wider interests of the international community and works closely with other organizations to help resolve deep-rooted problems, alleviate suffering, and create the conditions in which peace processes can become self-sustaining. The NATO Response Force evolved from a 2002 U.S. proposal; it can be tailored to individual missions and deployed rapidly wherever the North Atlantic Council requires.

Since its first military intervention in 1995, NATO has been engaged in increasingly diverse operations. NATO's first three peace-support operations took place in Europe (Bosnia and Herzegovina, Kosovo, and the former Yugoslav Republic of Macedonia). As of April 2009, approximately 70,000 military personnel were engaged in NATO missions internationally. These forces were operating in Afghanistan, Kosovo, Iraq, the Mediterranean, and Somalia. NATO's operation in Afghanistan is the alliance's most significant undertaking to date. The International Security Assistance Force (ISAF), which was established by a United Nations (UN) mandate in 2001, has been under NATO leadership since August 2003. ISAF has some 55,000 troops from over forty different countries deployed in Afghanistan. Its mission is to extend the Afghan central government's authority to create an environment conducive to functioning democratic institutions and the rule of law. With regard to Iraq, the NATO Training Mission–Iraq was set up in 2004 to help develop a democratically led and enduring security sector.

ONGOING ISSUES

Various issues face NATO. One such issue is the development of a missile defense system to protect NATO territory. At a Bucharest summit in April 2008, allied leaders agreed that the planned deployment of European-based U.S. missile defense assets should be an integral part of any future NATO-wide missile defense architecture. The system has been opposed by Russia and created tensions. The United States said in September 2009 that it would no longer move forward with parts of the system being based in Poland and the Czech Republic, and NATO Secretary General Anders Fogh Rasmussen called for a new strategic partnership with Russia. Similarly, the enlargement of NATO into Eastern Europe and the joining of former Soviet Republics have been sources of contention with Russia. There is also ongoing debate over the role of NATO in the "war on terrorism" and its operations in Afghanistan.

Northern Ireland

When Ireland gained independence from the United Kingdom in 1921 after two years of violent "troubles," six counties in the northern province of Ulster remained within the United Kingdom. Northern Ireland, with a population of around one and one-half million, was established to satisfy the demands of a Protestant Unionist minority in Ireland that wished to remain within the United Kingdom, but it included a sizeable Catholic and Irish nationalist minority composing one third of the population. The new entity enjoyed a high level of autonomy, and the Northern Ireland Parliament and government at Stormont, on the outskirts of Belfast, was insulated to a large degree from "interference" by the British Parliament. For the next fifty years, the Ulster Unionist Party, a party of Protestant unity, won every election and formed every government in Northern Ireland, while the Catholic minority was almost completely excluded from the exercise of power at all levels.

VIOLENT CONFLICT

In the late 1960s, a civil rights movement that enjoyed strong support in the minority community presented an innovative challenge to government control. A police force

The six counties of Northern Ireland remained under British control after Ireland gained its independence in 1921. Decades of violence ensued between loyalists preferring British control and republicans wanting unification with Ireland.

closely associated with the Unionist party and dominated by the Protestant community came into increasing conflict with protestors and rioters on the streets. Sectarian rioting compounded the conflict, and by August 1969 the breakdown of order was so severe that British troops were deployed on the streets. In 1970 the newly formed Provisional Irish Republican Army, recruiting among a freshly radicalized minority, launched a campaign of violence aimed at ending British sovereignty and reuniting Ireland. By 1972 violence had escalated dramatically, and in March 1972 the British government instituted "direct rule," suspending the Parliament and government of Northern Ireland.

A further two decades of low-intensity conflict followed, during which almost 3,500 people were killed, more than half of them by Irish Republican groups, mainly the Irish Republican Army (IRA), and almost a quarter by Ulster loyalist groups that sought to illegally augment state efforts against the IRA. Repeated initiatives to end direct rule and reestablish a stable form of regional autonomy that guaranteed participation in government to both Protestant and Catholic communities failed.

THE PEACE PROCESS

The IRA ceasefire of 1994, followed by a loyalist ceasefire, opened the way for inclusive negotiations on a political settlement involving the British and Irish governments with significant international support from the United States and the European Union. The 1998 Belfast Agreement, or Good Friday Agreement, established consociational structures for governing Northern Ireland and was accompanied by conflict resolution measures, including the early release of prisoners and radical reform of policing. The agreement was endorsed in separate referenda in Northern Ireland and in the Republic of Ireland, thereby addressing long-standing Irish nationalist demands that the Irish people as a whole should decide the future of the island. The agreement also established new structures to manage relations between the two Irish jurisdictions and relations between Ireland and Great Britain.

CONTEMPORARY ISSUES

The current political settlement brings together Irish republicans, including former IRA activists, with their most outspoken Ulster loyalist opponents in a mandatory coalition that guarantees seats at the cabinet table to all significant parties. High levels of discontent with this compromise among a large section of the Protestant majority, and a resurgence of violence by "dissident" Irish republicans seeking to restart a campaign, pose ongoing challenges to the settlement.

The consociational arrangements have been criticized for embedding sectarianism in the structures of government and rewarding extremism, but it has also been argued that these agreements have in fact drawn the extremes toward the center and generated cross-community cooperation, at least at the elite level.

As a settlement that determinedly internationalizes Northern Ireland by creating interlinking internal structures and cross-border institutions within Ireland, the new structures of government are an innovative attempt to resolve an ethno-national conflict by simultaneously softening and securing a contested international border within a European Union context, in which borders between members states have shed many of the functions and meanings they used to have. It provides an example of conflict resolution through negotiation rather than military victory that has been frequently cited by actors and analysts in other conflict situations in recent years.

North–South Relations

The term *North-South relations* refers to the relationship between the advanced industrialized countries in the global North and the developing countries of the global South. It is used in contrast to the superpower conflict between East and West. Of course many parts of the global South became directly involved in the superpower rivalry of this period. In particular, the term is often used to describe the multilateral relations between these two groups. Historically, the key focus of North-South relations has been the various attempts made by the global South to alter the nature of the postwar international economic system. Since the end of the cold war, it seems that North-South relations, especially given the growing levels of poverty in the South, have moved higher up the international agenda.

DECOLONIZATION

During the 1950s there was dramatic change, as a number of former colonies became independent. A key meeting was the Bandung Conference held in 1955. In attendance were twenty-nine Asian and African states. This conference set the main agenda for North-South relations for the next decade.

Two key issues were most prominent. First, there was the need to continue the process of decolonization by putting more pressure on the old imperial powers. Second, many of these newly independent states wished to avoid taking sides in the cold war, and as a result, after Bandung, the Non–Aligned Movement (NAM) was formed.

As the process of decolonization continued during the 1960s, the focus of North–South relations began to change. The most important new issues were economic. This was demonstrated by the South's collective resistance to the dominance of world trade by the global North. The formation in 1964 of both the United Nations Conference on Trade and Development (UNCTAD) and the Group of 77 at the United Nations (UN) gave the global South a more audible and coherent voice in the multilateral system.

INCREASING CONFRONTATION

The focus on economic issues became more significant in the 1970s. The global South became influenced by dependency theory and the view that the world economy was the main obstacle to their development. The oil crisis that saw prices quadruple between October 1973 and January 1974 also demonstrated to the global South the possibility of collective action. The raising of oil prices by the Organization of Petroleum Exporting Countries (OPEC) stimulated the prices of other commodities and convinced other developing countries of the idea of "commodity power."

The result was the call by the global South for a New International Economic Order (NIEO) in 1974, via two resolutions in the UN General Assembly. The initial reaction of the global North was hostile, and the debate over the NIEO became a confrontational feature of North–South relations during the rest of the decade. The reforms demanded in the NIEO included changes in the terms of trade and greater access to markets in the global North, reforms to the major international financial institutions, and demands for more aid and recognition of the economic sovereignty of states, especially with regard to nationalization and greater regulation of multinational corporations. Although the global South secured some minor changes, in the main the NIEO was not implemented. It was clear that oil was an exception, and that commodity power did not really exist. The confrontational approach of demanding change had clearly not been a success. A number of key developments in the early 1980s were to end this period of North–South relations.

CRISIS

During the 1980s the global South went into retreat. The beginning of the decade marked a significant shift in the dominant economic ideology in the West. Neoliberalism, with its emphasis on free markets and its belief in export-led development, became popular. This approach was in direct contrast to the ideas behind the NIEO and its desire for intervention and redistribution in the world economy. The impact of this change was exacerbated by the debt crisis that profoundly altered the balance of power within North–South relations. With many developing countries facing high levels of indebtedness, the World Bank and International Monetary Fund (IMF) provided loans that were conditional on following structural adjustment programs. Most developing countries began to follow liberal economic policies devised primarily by the United States, World Bank, and IMF—a situation that became known as the Washington consensus. These developments limited the independence of many developing countries and severely weakened the South as a coalition.

This fragmentation of the South as a united voice continued throughout the 1980s. The newly industrializing countries in East Asia achieved rapid growth largely by integrating into the world economy, welcoming foreign investment, and exporting manufactured products to developed countries. The interests of these countries increasingly departed from those of the poorer countries, especially in Africa, which experienced increasing poverty, resulting in a reliance on foreign assistance for their survival.

A NEW ERA OF PARTNERSHIP?

In recent years there have been attempts to develop North–South relations that are based on cooperation rather than simply Northern dominance. Since the end of the cold war, international development has moved up the agenda and is now regularly discussed within numerous multilateral institutions. In response to sustained criticism, the Washington consensus has been replaced by a less overtly neoliberal policy agenda. The World Bank, in particular, has sought to refocus its approach from economic growth toward poverty reduction. Rather than imposing conditionalities upon developing countries, it now seeks to formulate a development strategy in partnership with them.

During the last twenty years, another key issue that has been high on the agenda of North–South relations is the environment. Despite its contested nature, the term *sustainable development* has come to dominate much of the discourse. This was clearly demonstrated at the most recent UN World Summit on Sustainable Development held in Johannesburg in 2002. However, achieving sustainability in the developed world would require a radical change in current patterns of production and consumption. The situation for developing countries is quite different. The logical implication of sustainable development is that the South should not follow the environmentally destructive development path that has been historically employed in the North. As a result, the question remains as to how the South can marry its development needs with the environmental pressures on the planet.

Nove, Alec

Alec Nove (1915–1994) was an influential British scholar and one of the key founders of the discipline of Soviet studies. By the early 1960s, he was internationally recognized as the leading Western authority on the dynamics of the Soviet centrally planned economy. The author of eleven widely regarded books, he was an eloquent writer and an engaging lecturer. Apart from his economic expertise, Nove was also deeply immersed in Russian history, culture, and folklore.

Nove was born into a Russian Jewish family in St Petersburg, Russia, in 1915. His father, a member of the Menshevik faction that opposed the Bolshevik party, took the family into exile in London in 1922, changing their name from Novakovsky to Nove. Nove graduated from the London School of Economics and then served in the British army during World War II (1939–1945). After the war he worked for four years at the Board of Trade in London, where he learned the practicalities of economic planning. In the 1950s he began direct study of the Soviet economy, spending some time at the British embassy in Moscow. After teaching at the London School of Economics, in 1963 Nove was appointed head of the Institute for Soviet and East European Studies at Glasgow University in Scotland, a post he held until 1982.

Nove's most important works were *The Soviet Economy,* first published in 1961, and *An Economic History of the USSR,* which appeared in 1969. Each book went through several revised editions over the next twenty-five years. Unable to conduct work in the field due to the cold war, Nove mined the Soviet press and academic publications for insights into how the Soviet system really worked with regard to both industry and agriculture, and he was expert at dissecting the arcane and often misleading data put out by the Soviet statistics agency. He uncovered numerous telling examples of the informational asymmetries and perverse incentives of central planning. A typical example was a glass factory that produced very thick panes when its output targets were set by weight. When its output targets were changed to square footage instead of weight, it produced very thin panes, which shattered before they reached their customers.

Nove was wary of applying Western models and assumptions to the Soviet case. Despite the inefficiencies of Soviet planning that he exposed, he was prepared to grudgingly concede that the Soviet system had served the political objectives of the country's leaders and had propelled the USSR to superpower status. This argument over whether or not there was some sort of logical consistency to Joseph Stalin's modernization strategy was laid out in Nove's books *Was Stalin Really Necessary?* (1964) and *Stalinism and After* (1975). A true political economist, Nove had the great strength of being able to place economic activity in its political context. As the Soviet system began to reform after 1985, Nove was more cautious than most other Western experts in advocating a rapid shift to competitive markets. Nove himself was a social democrat, and in 1983 he published his own speculation about a possible alternative to both Soviet planning and Western capitalism, *The Economics of Feasible Socialism*. He also wrote a critique of the market criteria used in state-owned industry in Britain, *Efficiency Criteria for Nationalised Industries* (1973).

Novel, Political

American literary critic and political activist Irving Howe defines the political novel as a novel in which the dominant element is either political ideas or a political milieu. Howe's pioneering study, published in 1957, still serves as a point of departure for studies of connections between politics and literature (although the first study to include the term *political novel* in its title was published by American scholar Morris Edmund Speare in 1924).

One question is whether the political novel constitutes a distinct genre of fiction. Howe argues against the use of any inappropriately dichotomous classifications. Another important question is how the primarily literary aspects of the political novel are related to its political content. For some critics, the political novelist attempts to serve two masters—literary quality and political verisimilitude. In Howe's view, a sort of continuum can be arranged, with novels best illuminated by literary analysis at one end and novels best studied by means of ideological analysis at the other. Scholars who insist on at least some distinction of this sort appear to understand politics as a more or less determinate area of human experience, to be given its due in fiction, but which can corrupt and destroy fiction as well.

However, there are other scholars who understand politics to be all-pervasive. From this standpoint, as Marxist theorist and literary critic Frederic Jameson insists, since "everything is 'in the last analysis' political," it is pointless to identify some

works as political and others not (1981, 5). For theorists like Jameson, the problem of genre vanishes, because genre itself is no longer a useful concept in literary theory. Other scholars, such as John Whalen-Bridge, however, prefer to retain distinctions that permit articulations of relations between politics and aesthetics, without dissolving all differences between them.

It is often argued that political novels constitute a significant source for the public's understanding of politics. Literary critic Mary McCarthy contends, for example, that most Americans learn about politics from reading political fiction. For Bernard Crick, contemporary political thinking is as likely to be found in novels as in philosophical treatises, and in novels it is certainly in a more accessible form. Many of the questions addressed in political philosophy are present in some form in political fiction. Political fiction addresses questions such as the nature of authority, political conflict, the possibilities for and obstacles to political transformation, and the extent to which the past imposes decisive limitations on political action toward the conditions for a good way of life for human beings. The turn to political novels has been explained and defended as a potentially fruitful response to what some scholars see as the abandonment by both academic philosophy and academic political science of any significant intellectual interest in informing political thinking in the wider culture, a theme anticipated in part by American intellectual historian H. Stuart Hughes in 1958.

A TYPOLOGY OF POLITICAL NOVELS

GOVERNMENT INSTITUTIONS AND POLITICAL MOVEMENTS

Several different sorts of novels may be identified as political novels, although a number of the works listed could easily be placed in more than one category. Some are novels that have settings in political movements or institutions of government. Such novels began with nineteenth-century examples, including British statesman and writer Benjamin Disraeli's *Coningsby* (1844), Anthony Trollope's six Paliser or "parliamentary" novels (1864–1879), Henry Adams's *Democracy* (1880), and Robert Penn Warren's *All the King's Men* (1946). Among the more recent so-called insider novels are Allen Drury's *Advise and Consent* (1959), Billy Lee Brammer's *The Gay Place* (1961) Gore Vidal's *Washington, D.C.* (1967), Lynne Cheney's *Executive Privilege* (1979), Norman Mailer's *Harlot's Ghost* (1991), Richard Perle's *Hard Line* (1992), and Joe Klein's *Primary Colors* (1996).

Political movements across the ideological spectrum have been the settings for a number of well-known novels, such as Stendahl's *The Red and the Black* (1830), Ivan Turgenev's

British author Salman Rushdie found himself subject to an Iranian death sentence for the publication of his 1988 book *The Satanic Verses* due to its alleged disrespectful treatment of the Islamic prophet Muhammad.

Fathers and Sons (1862), George Eliot's *Felix Holt, the Radical* (1866), Fyodor Dostoevsky's *The Possessed* (1872), Henry James's *The Princess Casamassima* (1886), Joseph Conrad's *The Secret Agent* (1907), André Malraux's *Man's Fate* (1933), Ignazio Silone's *Bread and Wine* (1936), Ernest Hemingway's *For Whom the Bell Tolls* (1939), Arthur Koestler's *Darkness at Noon* (1940), Ayn Rand's *Atlas Shrugged* (1957) Yukio Mishima's *After the Banquet* (1960), Raymond Abellio's *The Tower of Babel* (1962), Dominique de Roux's *The Fifth Empire* (1977), and many others.

EXPERIENCES OF OPPRESSION OR MARGINALIZATION AND PROTEST

Many political novels are written from within or against experiences of marginalization, oppression, colonization, protest, nationalism, and revolution, and they include feminist, racial and ethnic, gay, and postcolonial fiction. A few examples of these are Joseph Conrad's *Nostromo* (1904), Upton Sinclair's *The Jungle* (1906), John Steinbeck's *The Grapes of Wrath* (1939), Richard Wright's *Native Son* (1940), Ralph Ellison's *Invisible Man* (1952), Graham Greene's *The Quiet American* (1955), Chinua Achebe's *Things Fall Apart* (1958), James Baldwin's *Another Country* (1962), Carlos Fuentes's *The Death of Artemio Cruz* (1962), Gabriel García Márquez's *One Hundred Years of Solitude* (1967), Alejo Carpentier's *Reasons of State* (1974), V. S. Naipaul's *A Bend in the River* (1979), Nadine Gordimer's *Burger's Daughter* (1979), Athol Fugard's *Totsi* (1980), and Salman Rushdie's *Midnight's Children* (1981).

The tangible impact of fiction on political change has also been explored in evaluations of such novels as Harriet Beecher Stowe's *Uncle Tom's Cabin* (1852), Ivan Turgenev's *A Sportsman's Notebook* (1852), Upton Sinclar's *The Jungle* (1906), Ignazio Silone's *Fontamara* (1931), and Salman Rushdie's *The Satanic Verses* (1988).

UTOPIAN AND DISTOPIAN NOVELS

Among the most popular of political novels are those identified as utopian or dystopian fiction, beginning with Thomas More's *Utopia* (1516), Jonathan Swift's *Gulliver's Travels* (1726), and Denis Diderot's *Supplément au voyage de Bougainville* (1772) and including Samuel Butler's *Erewhon* (1872), Charlotte Perkins Gilman's *Herland* (1915), Yevgeny Zamyatin's *We* (1927), Aldous Huxley's *Brave New World* (1932), George Orwell's *1984* (1949), William Golding's *Lord of the Flies* (1954), Ernest Jünger's *The Glass Bees* (1957), Monique Wittig's *The Guerillas* (1969), Thomas Pynchon's *Gravity's Rainbow* (1973), Margaret Atwood's *The Handmaid's Tale* (1985), and Kazuo Ishiguro's *Never Let Me Go* (2005).

Many utopian or dystopian novels overlap with science fiction, which has often been regarded as an important source of political novels. Kingsley Amis drew the attention of literary critics to this aspect of science fiction in 1960. A scholarly literature is emerging in which students of political theory examine science fiction. Such prominent science fiction authors as H. G. Wells, Frederik Pohl, Robert A. Heinlein, Ursula K. LeGuin, Philip K. Dick, and Kim Stanley Robinson are objects of critical discussion.

The American Political Science Association has a Politics, Literature, and Film section. An indispensable resource for the study of relations between politics and literature is a three-volume encyclopedia containing entries on authors, literary movements, issues, and critical perspectives published in 2005 by Greenwood Press.

The role of fiction as an expression of and commentary on the political conditions of human existence is both older than the political novel and continues to be exhibited in the political novel. As the twenty-first century unfolds, political novels will without a doubt continue to be vehicles by means of which the responses of persons to their political situations are articulated, and by means of which political thinking and action will be stimulated.

Nozick, Robert

Robert Nozick (1938–2002) was a twentieth-century American political philosopher who worked at Harvard University. He is most well known for his 1974 book *Anarchy, State and Utopia,* in which he defends the libertarian ideal of the minimal state against utilitarianism, egalitarian, and socialist redistributive politics.

He famously questioned the utilitarian position of pleasure seeking and pain avoidance, or the priority of happiness, in human motivation, and so also of the principle of utility in ethics and politics. He asked if given the choice, would humans trade life in the real world for life in an "experience machine" that could flawlessly reproduce any conditions or experiences that resulted in happiness? His intuitive answer was that few if any persons would choose the unlimited happiness in the machine over the uncertain happiness of the real world. Life, then, must be about more than seeking pleasure and avoiding pain.

Nozick's main focus, however, was the redistributive politics of egalitarian liberalism and socialism, particularly that of his Harvard colleague, John Rawls. According to Rawls, the principles of equality and social justice require substantial redistribution of wealth. Nozick calls such a scheme a "patterned" theory of justice, since the just distribution matches some prior principle. Nozick preferred a historical view of justice and presented his entitlement account of a just distribution: So long as a current distribution and holding of goods is just, then whatever distribution results from personal exchange is also just, and political interference with that distribution (as in a patterned theory) is unjust. In identifying justice in initial acquisition, Nozick adopts British philosopher John Locke's proviso of "enough and as good," meaning anyone appropriating unowned resources or property would have to ensure the appropriation showed no prejudice to any other person. Nozick also borrowed Locke's principle of self-ownership, through which rights are extended to resources through labor.

He believed that once justice in initial holdings is established, the distribution resulting from the free exchange of individual holdings will be just, and redistribution in this new situation will be unjust—persons are entitled to their holdings resulting from exchanges in a just initial system. To explain the fairness of distribution resulting from free exchange, Nozick developed his famous "Wilt Chamberlain argument." When persons voluntarily give some portion of their just holdings to Wilt Chamberlain to watch him play basketball, Nozick argued that Chamberlain is entitled to this income. On the other hand, taxation for functions beyond those necessary to maintain the system of free exchange (security) is illegitimate, since individuals are entitled to their justly acquired holdings. Therefore, taxation amounts to forced labor. Individual rights are thus "side-constraints" on the range of the legitimate functions of the state.

Nozick's libertarianism is unique in the sense that it is based on the egalitarian foundation of equal moral worth and the inviolability of persons, which gives rise to the political demand of equal respect for individual interests. He shared this foundation with Rawls, although Nozick drew extremely different conclusions as to its implications for the demands of social justice.

Nuclear Club

The term *nuclear club* is used in various ways. Before 1970, any state that developed nuclear weapons was considered a member of the nuclear club. Since the Nuclear Nonproliferation Treaty (NPT) came into effect in 1970, the term has been used to refer to the nuclear states acknowledged by the treaty. Because a number of states obtained nuclear weapons after 1970, there is now a gulf between the members of the nuclear club authorized by the NPT and the group of states that possess nuclear weapons. India has especially challenged the fact that it has been excluded from the club.

According to the NPT, the only legal nuclear weapons states are those that had declared nuclear programs when the treaty was written in 1968, namely the United States (which developed nuclear weapons in 1945), Russia (1949), the United Kingdom (1953), France (1964), and China (1964). All other state parties to the treaty agreed to pursue nuclear programs only for energy, not for weapons (NPT 1968, Articles II and IV). In exchange, the five existing nuclear states promised under Article VI to "pursue negotiations in good faith on effective measures relating to . . . nuclear disarmament, and on a treaty on general and complete disarmament under strict and effective international control."

Since 1970, a number of states have developed or otherwise obtained nuclear weapons, including Israel, India, Pakistan, and North Korea. Of those, only North Korea was ever a party to the NPT. North Korea ratified the treaty in 1985 but withdrew in 2003 in response to U.S. allegations that it was enriching uranium for weapons use. In 2005, North Korea declared itself a nuclear weapons state. In October 2006, it conducted a nuclear test. In 2006, the Natural Resources Defense Council (NRDC) estimated that North Korea had ten nuclear weapons and the capability to manufacture one per year.

In 1968, when the NPT was opened for signature, both Israel and India had made significant progress toward development of nuclear weapons. Neither signed the treaty. Pakistan, India's rival, also abstained. In 1999, the U.S. Defense Intelligence Agency estimated that Israel had approximately 70 nuclear weapons. In 2006, the NRDC estimated that India and Pakistan each had approximately 50 weapons.

Policymakers disagree about whether new nuclear states should be considered members of the nuclear club. In 1998, when India and Pakistan tested nuclear devices, U.S. secretary of state Madeleine Albright argued that neither was a club member. According to her, because their tests occurred after 1967, their nuclear weapons programs were illegitimate. By contrast, Jaswant Singh, a senior Indian policy advisor, argued that "India is now a nuclear weapons state, as is Pakistan. That reality can neither be denied nor wished away. This category of 'nuclear weapons state' is not, in actuality, a conferment. Nor is it a status for others to grant. It is, rather, an objective reality." In 2008, the United States took the latter view and lifted sanctions imposed on India after its first nuclear test in 1974.

Despite frequent discussions in the United Nations General Assembly, no progress has been made on general and complete nuclear disarmament. According to many observers, this raises questions about the legitimacy of the arsenals of the original five nuclear weapons states.

Nuclear Proliferation and Nonproliferation

Nuclear proliferation—the spread of nuclear weapons around the world—represents one of the central challenges to contemporary international peace and security.

DEFINITIONS OF NUCLEAR PROLIFERATION

The standard definition of *nuclear proliferation* was set by the 1968 *Treaty on the Non-Proliferation of Nuclear Weapons,* or NPT. The NPT implicitly defines proliferation as the manufacture and explosion of a nuclear explosive device by any state (or, conceivably, by a nonstate actor) that had not done so beforehand. In short, proliferation occurs upon a state's first nuclear test.

This standard definition has been challenged from a number of perspectives. First, it is often remarked that in addition to the problem of "horizontal" proliferation, there is also the problem of "vertical" proliferation—the accumulation of nuclear weapons stockpiles by the existing nuclear powers. This argument may be intellectually valid, but in common parlance, *proliferation* is used exclusively to mean horizontal proliferation, and other terms such as *build-up* or *arms race* are used to mean vertical proliferation.

Second, some contend that proliferation might be better conceived more as a continuous process than as a discrete outcome. The so-called proliferation ladder ranges from the acquisition of basic nuclear scientific and technical skills to the development of a bomb-manufacturing capacity and finally to actual bomb manufacture, testing, and deployment. There has been a concerted push to roll the proliferation "red line" back from the first nuclear explosion to the production of fissile material. These efforts remain controversial, however.

CAUSES OF NUCLEAR PROLIFERATION

Broadly speaking, there are two competing explanatory camps for the phenomenon of nuclear proliferation: realism and idealism. The first, traditionally dominant realist camp takes the view that states are ultimately driven toward the bomb by the inescapable requirement of self-help in the anarchic international system. In short, in a dangerous world states must seek to arm themselves with the most dangerous weapons. But in contradiction to realist expectations, fewer than ten of the fifty or so states that are widely estimated to have the potential to have nuclear arsenals by now actually do have them. At present, the nuclear weapons states include the United States, Russia, the United Kingdom, France, China, Israel, India, Pakistan, and possibly North Korea. In addition, South Africa secretly held a few nuclear devices before destroying them at the end of the 1980s, and three post–Soviet successor states briefly inherited weapons at the start of the 1990s but quickly gave them up. Meanwhile there is no credible evidence that any terrorist group has ever been close to obtaining a nuclear weapon.

The persistent small number of nuclear weapons states has caused resurgent interest in the alternative, idealist perspective on proliferation. Different idealist theories focus on different levels of analysis. International-level idealists stress the effects of international norms of nonproliferation and nuclear nonuse on depressing demand for the bomb, with the caveat that these norms cannot restrain so-called rogue regimes that reject international society. Meanwhile, domestic-level idealists note that many important societal constituencies oppose nuclear weapons. Finally, individual-level idealists argue that going nuclear is a revolutionary act in world politics, which only oppositional nationalist leaders may have the motivation and certitude necessary to carry off.

EFFECTS OF NUCLEAR PROLIFERATION

The vast majority of policy makers are convinced that proliferation is a source of world disorder, but academics are divided between nuclear proliferation optimists and pessimists. Proliferation optimists contend that mutual assured destruction prevented the cold war from descending into World War III. This experience suggests to them that a nuclear-armed world could actually be a more stable world. By contrast, proliferation pessimists argue that the nuclear stability of the cold war was more apparent than real, with numerous close calls due to miscalculation, misperception, organizational dysfunction, and sheer brutality. Moreover, they argue that whatever nuclear stability did exist during the cold war is likely to be unsustainable as the nuclear club expands—and will certainly break down if nonstate actors get the bomb.

EFFORTS AGAINST NUCLEAR PROLIFERATION

There are numerous international efforts to rein in nuclear proliferation. At the center of these efforts is the multilateral treaty instrument of the NPT. NPT membership is almost

universal, with nearly 190 parties, even though membership can be costly to the non–nuclear weapon states. Under the NPT, non–nuclear weapon states are required to safeguard their nuclear facilities against military uses, subject to inspection and verification by the International Atomic Energy Agency (IAEA). The IAEA's safeguards system was long criticized for being too lax, but it has tightened considerably over the years. Indeed, that tightening has caused a slowdown in the expansion of the global civilian nuclear energy market, which the NPT was supposed to protect. There are growing fears that treaty membership may become unattractive to non–nuclear weapon states if it does not help them to advance their civilian nuclear power ambitions.

In addition to the formal multilateral instruments of non-proliferation are the export control clubs, the Zangger Committee and the Nuclear Suppliers Group, which include most of the main states engaged in international nuclear commerce. These clubs have also significantly tightened their rules over the years. Meanwhile, the important American initiative for "cooperative threat reduction," and more recently joint "global partnership" efforts by the G8 states, have tackled the difficult problem of reinforcing post-Soviet states' capacity to hang on to their nuclear materials and not seek income through dangerous technology exports.

In addition to supporting nonproliferation, the United States has also pioneered the development of counterproliferation efforts, which attempt to utilize the threat or actuality of military force to roll back nuclear weapons programs or at least to minimize their strategic value. Some aspects of U.S. counterproliferation policy have found widespread international support, notably the proliferation security initiative, which aims to interdict trade in nuclear and dual–use materials. Other aspects have been hotly contested, especially the deployment of ballistic missile defense systems and the Bush doctrine of preventive war against nascent nuclear weapons programs. Whether counterproliferation policy complements or detracts from nonproliferation policy remains an open question.

Numeraire and Dollarization

Numeraire and *dollarization* are both terms that refer to a country's adoption of a foreign currency as a numeraire and/or legal tender instead of a national currency. Numeraire is a unit of account, against which all goods and services are valued and priced. The new foreign currency (typically, dollar, euro, etc.) becomes a measure of the relative worthiness of goods and services. As a result, the domestic medium of exchange, national currency, becomes different from the numeraire, the new adopted currency. The most-often adopted foreign currencies are the U.S. dollar and the euro.

There are three types of dollarization, official or full, semiofficial, and unofficial. Official dollarization is a complete substitution for a local currency of a foreign currency, which becomes the only legal tender in a country. Examples of official dollarization include Panama (1904, U.S. dollar) and Nauru (1914, Australian dollar). Semiofficial dollarization, or a bimonetary system, is characterized by simultaneous usage of national and foreign currencies as legal tenders. Examples of semiofficial dollarization include the Bahamas (1966, Bahamian dollar and U.S. dollar) and Bhutan (1974, Bhutanese ngultrum and Indian rupee). Unofficial dollarization is the use of a foreign currency in private transactions without official acceptance of the foreign currency as a legal tender. Many developing countries have experienced unofficial dollarization.

Oakeshott, Michael Joseph

Michael Joseph Oakeshott (1901–1990) was a British political philosopher interested in the philosophical questions raised by the study of history. His first published work, *Experience and Its Modes* (1933), examined three modes of experience: history, science, and practice. He argued that each of these modes or perspectives afforded a comprehensive, albeit circumscribed, way of thinking about the world. Each, therefore, tells more about how humans think than about what they should do, a perspective very much in keeping with Oakeshott's view of philosophy, which held that people should be concerned with clarifying their own thoughts rather than trying to persuade, let alone convert, others.

Oakeshott studied history at Caius College in Cambridge and became a fellow in 1923. Amidst the turmoil of the 1930s, he enjoyed nonpolitical pursuits, including horseracing. With a Cambridge colleague, he coauthored *A Guide to the Classics* (1936), the aim of which was to pick Derby winners. While he publically defended the individual's right to refrain from political activity, Oakeshott volunteered in 1941 to serve in the British army's intelligence unit, Phantom.

Oakeshott returned to Cambridge after World War II (1939–1945) and completed his introduction to British philosopher Thomas Hobbes's *Leviathan* (1946) that established his reputation as a leading scholar on Hobbes. In 1951, Oakeshott succeeded political theorist Harold Laski as the chair of the government department at the London School of Economics and served until his retirement in 1969.

Oakeshott's best-known book, *Rationalism in Politics and Other Essays* (1962), secured his place as a leading conservative thinker. Rejecting historical predestination, natural law, and other metaphysical abstractions, Oakeshott's conservatism, however, sprung from a deeply rooted skepticism. No golden age in the past or in the future beckoned him. On the contrary, one must "delight in what is present rather than what was or what will be." For him, this is what it means to be a conservative.

This skepticism, along with his "irredeemable secularism," set Oakeshott apart from other conservatives. But neither did it endear him to radicals who, for the most part, did not delight in the here and now. His political philosophy, they complained, presupposed a world not so different from the one Oakeshott inhabited, but very different from the one inhabited by most people.

Oakeshott, however, had his reasons for not entirely embracing any one political philosophy. To do so, he believed, would close himself off from the unexpected insights that might result from keeping a conversation ongoing. Conversations do not require that the participants share the same philosophy. What Oakeshott desired was for people to be able to differ without disagreeing. Conversations, he implied, may not bring the participants closer to the truth, but they may bring them closer to each other. Quite possibly this outlook is what made him such a revered teacher and colleague.

Oakeshott died in his nineteenth-century cottage in Dorset, England, on December 19th, 1990.

Obligation, Theories of

Political obligation is one of the oldest and most persistent problems of political philosophy. The Greek tragedian Sophocles raised it in *Antigone,* first performed around 440 BC, and Plato's dialogue *Crito* recounts the philosopher Socrates's response to the problem, in the face of his own death, some forty years later.

Philosophers who maintain that most citizens or subjects of a reasonably just state have an obligation to obey its laws have advanced several different theories of political obligation. Socrates hints at some of them in the *Crito*—consent, utility, fair play, and gratitude—but the first to become influential in Western political thought was *divine command* theory.

Divine command theory holds that people have an obligation to obey the law because God (or the gods) commands

them to obey. In Christian political theory, this conviction is rooted in Paul's Epistle to the Romans (13:1–2). Problems arose, however, when the political authorities were hostile to Christianity. One response was to insist on obedience, for God must have given power to hostile or vicious rulers as a sign of his displeasure with a wicked people. Another response was to distinguish political authority from the persons in authority. That is, God orders humans to respect the office, but the officer who occupies it may be disobeyed or even deposed if the individual is a tyrant.

Since the Protestant Reformation, the *consent* (or social contract) theory has been probably the most influential. As developed by Thomas Hobbes (1588–1679) and John Locke (1632–1704), in particular, this theory grounds political obligation in the individual's consent to be a part of a political society governed by laws. In response to the observation that few people have expressly consented to place themselves under a political obligation, consent theorists argue that most people have given tacit consent, perhaps by voting or, as Locke says, by traveling freely on the highways.

Dissatisfaction with this answer has prompted philosophers to devise other theories. According to the *utilitarian* view, one should obey the law because—or as long as—more good is likely to come from obedience than from disobedience. The other theories are less concerned with consequences, however, than with what the citizen owes to others. On the *gratitude* theory, someone is obligated to obey the law because this person owes a debt to the political society for the education, protection, and other benefits it has provided. The *fair play* (or fairness) theory rests on the claim that a reasonably just polity is a cooperative enterprise in which the participants receive benefits but must also bear burdens—especially the burden of obeying the law when one would rather disobey. Because the polity can produce its benefits only when most people cooperate, the person who receives the benefits owes a duty of fair play to the others to cooperate in turn by obeying the law. The *membership* (or associative) theory of obligation turns directly to considerations of belonging or identity. To be a member of a polity, and to think of oneself as a member, is to have an obligation of membership, much as being a member of a family entails an obligation to one's parents and siblings. Finally, the *natural duty* theory begins with the claim that everyone has moral duties, including a duty to support just institutions, without regard to such considerations as consent, membership, or fair play. Someone who belongs to a just polity or state thus has a duty to obey its laws.

Most political philosophers seem to agree that there is a moral obligation to obey the law, at least in a reasonably just state. There have always been doubters, however, and they have become increasingly prominent in recent years. Some of them are outright anarchists, who deny the existence of political authority, and therefore of political obligation. Most doubters, though, either associate themselves or flirt with *philosophical anarchism*. According to this view, one may admit that political authority is justified and yet deny that there is any moral obligation to obey its laws. There are good reasons to obey laws against murder and robbery, on this view, but there is no moral duty to obey a law simply because it is a law. Whether philosophical anarchism is persuasive, or whether there truly is a general obligation to obey the law, is now the subject of a lively debate.

Occupation and Annexation

Occupation and annexation are central concepts in the study of international security. Both are common outcomes when military force is employed, yet both pose difficult practical, legal, and moral questions for states in international politics.

OCCUPATION

In general, *occupation* is legally defined as the effective control of a state, or group of states, over a territory to which that power has no sovereign title, without the volition of the sovereign of that territory. As opposed to annexation, occupations are, by definition, temporary. They can occur during war for the purpose of holding territory or they can occur after war for the purpose of transforming a former adversary. Military occupations can be divided into five unique types: security occupations, comprehensive occupations, restorative occupations, collateral occupations, and caretaker occupations.

TYPES OF OCCUPATIONS

Security occupations seek to prevent the occupied country from becoming a threat to the occupying power or to other states, as well as to ensure that the occupied territory does not become a destabilizing influence in its region. They refrain, however, from remaking the political or economic system of the occupied country, aiming instead only to prevent the occupied country from posing a threat to international security. For example, the Allied occupation of the Rhineland in the aftermath of World War I (1914–1918) was primarily intended to prevent the reemergence of a powerful Germany. While France initially advocated Rhenish independence,

none of the occupying powers ultimately hoped to install a particular government in the Rhineland; instead, their goal was simply to limit the ability of Germany to again pose a threat to their security.

Comprehensive occupations also seek primarily to secure the interests of the occupying power and long-term stability, but they are distinct from security occupations in that they also aim to introduce a stable political system and a productive economy. Thus, comprehensive occupations are closer to what might be thought of as state-building. The U.S. occupation of Japan and the four-power occupation of Germany after World War II (1939–1945) are the best-known examples of comprehensive occupation. More recently, the U.S. occupation of Iraq after the 2003 war is typical of a comprehensive occupation. In contrast, the U.S. occupation of Afghanistan has sought success without occupying all of Afghanistan, but the goals of the two missions share much with comprehensive occupations of the past.

Restorative occupations seek to restore order in another country without imposing a new political system. Often, the motive of these occupations is to protect either the security or the economic interests of the occupying country within the occupied state by bolstering a threatened leader. These occupations may pursue the replacement of an unreliable leader, but they are not intended to install an entirely new political system. The American intervention in Nicaragua between 1927 and 1934 to oust Augusto César Sandino is an example of a restorative occupation.

Collateral occupations hold foreign territory until some indemnity is repaid. For example, following the Franco-Prussian War (1870–1871), fifty thousand German troops occupied six departments of France until the French paid 1.5 billion francs in war reparations. When the French finished paying on September 16, 1873, the German troops withdrew.

Finally, caretaker occupations are designed simply to hold a territory until a long-term settlement of the status of the territory is devised. The only evident cases of caretaker occupations are the British occupations of Cyrenaica, Tripolitania, Eritrea, and Somalia in the wake of World War II. In these cases, London had no intention of retaining these territories nor did they have particularly ambitious objectives while they controlled them. Instead, Britain simply was holding these territories until the United Nations (UN) could decide their postwar fate.

ANNEXATION

In contrast to occupation, *annexation* refers to the permanent acquisition of a territory by a foreign power. Unlike occupation, annexing powers usually have no intention of returning sovereignty to the people of the annexed territory. Many great powers have historically been built through the process of annexation.

For example, in the nineteenth century the United States grew from its origins on the eastern coast of North America to a continental power through the process of annexation. Some of this land, such as the Louisiana Purchase, was acquired through simple financial transactions while other land was more contentiously seized from other groups and powers.

OCCUPATION AND ANNEXATION AT ISSUE

Both occupation and annexation are at the center of important debates in international relations. These debates center on the practical impediments to successful occupation and annexation, the legal requirements of states undertaking occupation or annexation, and the moral dilemmas that the occupation or annexation of foreign territory pose. With regard to military occupation, some focus on the legality of military occupation under the Hague Conventions and the consequent responsibility of military occupiers during the time in which they occupy a foreign territory. Others focus on the reasons why military occupation has been more or less successful under certain conditions. In particular, in the wake of the U.S.-led occupation of Iraq after the 2003 war, scholars and practitioners alike have examined whether military occupation can be an effective tool for building stable and sustainable nation-states. This debate divides into arguments about the most effective ways to counter an insurgency, on the one hand, and whether postconflict military occupation is a wise instrument of foreign policy. Meanwhile, in Afghanistan, debates continued in 2009 over whether more troops alone can enable an occupation to succeed. Finally, some scholars of international relations identify occupation as a potential cause of other important phenomena, such as terrorism. According to the logic of one argument, occupation breeds nationalist resentment that often manifests itself in violent attacks against occupying powers.

Debates over annexation largely focus on the value of annexation in the emerging postindustrial age. When economies were largely based on agriculture and traditional heavy industry, conquest and annexation could provide significant benefits to an annexing power. Arguably, the growth of information economies has undermined the value of traditional territorial conquest. For some, however, annexation continues to be viewed as a valuable way of increasing a state's material power.

In the future, debates about occupation and annexation are likely to continue. The complex practical, legal, and moral questions that they raise guarantee that they will remain contentious concepts.

Ogg, Frederick Austin

Frederick Austin Ogg (1878–1951) was an American political scientist. He was the longest-serving editor of the *American Political Science Review* (1926–1949) and also edited *PS: Political Science and Politics.* Ogg developed both as flagship journals of the American Political Science Association (APSA) and as forums for the discussion of political ideas and theories.

In 1904, Ogg published his first book, *The Opening of the Mississippi: A Struggle for Supremacy in the American Interior.* Four years later, he received his PhD from Harvard University. He subsequently held academic positions at Harvard University, Boston University, and Simmons College, with his fields of interest encompassing American history, American politics, and comparative government. After publishing *Governments of Europe* (1913) and *The Life of Daniel Webster* (1914), Ogg relocated to the University of Wisconsin where he remained until his retirement in 1948. During this time, in 1941, he served as president of the American Political Science Association. Ogg was also the editor of the *Century Political Science* series, which included thirty books, many of them his own.

Ogg's political output was remarkable for its range and diversity. He wrote on medieval history, American history, the social and economic development of Europe, American and European politics, and government. His best-known work is *Introduction to American Government* (1922), written with P. Orman Ray, which provided a lucid survey of American political thought and institutions. It was a standard text in American political science classes and went through numerous editions. Ogg also published many major works on comparative government. His output consists of over sixteen works, including *Economic Development of Modern Europe* (1912), *American Council of Learned Societies Devoted to Humanistic Studies* (1928), *English Government and Politics* (1934), *European Government and Politics* (1934), and *Modern Foreign Governments* (with Harold Zink, 1949). Ogg was honored upon his retirement with *The Study of Comparative Government: An Appraisal of Contemporary Trends; Essays Written in Honor of Frederic Austin Ogg*, edited by Jasper Berry Shannon (1949).

Ogg represents a generation of distinguished political scientists in the interwar years who pursued descriptive politics. Unlike prescriptive politics, descriptive politics mapped the political terrain and its landmark political institutions in a comparative context. Ogg's knowledge of European history and politics enabled him to provide insights into the unique features of American political culture.

Okin, Susan Moller

Susan Moller Okin (1946–2004) was a feminist and political theorist who brought to bear the importance of the family on twentieth-century dialogues of justice. In criticizing contemporary theories of justice as overly focused on gender neutrality, she highlighted a neglected dimension of private life—namely, the domestic role of women—that must be attended to in order to establish a form of liberalism that truly included all of society's members. From these conclusions, Okin engaged the practical dilemmas of multiculturalism, arguing for more female and minority participation in public deliberation over, for example, the right of Muslim women to wear *hijabs* (headscarves) in the workplace in Norway and the proper distribution of World Bank funds in India.

Okin was born in Auckland, New Zealand, on July 19, 1946, and was linked to higher education for virtually her entire life. She graduated from the University of Auckland in 1967, earned a master's degree in philosophy from Oxford University in 1970, and received a doctorate degree in government from Harvard University in 1975. She taught at the University of Auckland, Vassar College, Brandeis College, Harvard University, and Stanford University prior to her last appointment at the prestigious Radcliffe Institute of Advance Studies in Cambridge, Massachusetts.

Okin's writings could be polemical and provocative. Her first book, *Women in Western Political Thought* (1979), analyzed the work of major political philosophers, both ancient and modern, and their overall failure to include women in their political theories. Drawing on the overlooked division between political life and family life, Okin expanded on this initial evaluation in *Justice, Gender, and the Family* (1989), which focused on contemporary debates about the meaning of liberalism between advocates of strict neutrality and communitarianism. Okin trained her criticism primarily on leading liberal philosopher John Rawls. According to Okin, Rawls's renowned *Theory of Justice* (1971), in spite of its heavy emphasis on equal rights and opportunities, largely disregarded the private division of labor that often undermined such values. In Okin's eyes, a comprehensive expression of a just society demanded more attention toward the traditionally unequal divisions of gendered labor that invariably subordinated the social status of women. *Justice, Gender, and the Family* was widely acclaimed at the time of its publication, winning the American Political Science Association's Victoria Schuck Prize for the best book on women and politics.

Okin extended her focus on female empowerment into international politics, traveling with the Global Fund for Women in 2004 and calling attention to the need for the world to redefine how monetary funds were distributed and the necessity for full female participation in politics—respect for cultural traditions and norms notwithstanding. These pleas found expression in her final book, *Is Multiculturalism Bad for Women?* (1999).

Okin was also a devoted teacher, winning Stanford's Bing Teaching Award in 1994, the Allan V. Cox Medal for faculty

excellence in fostering undergraduate research in 2002, and numerous other accolades. Today, her name continues to recall one of the leading lights of feminist thought in contemporary political theory. She died March 3, 2004, in Lincoln, Massachusetts, of natural causes.

Old Europe

Old Europe, which is often used in junction with or in comparison to New Europe, is a term used in 2003 by U.S. secretary of defense Donald Rumsfeld to refer to those European countries that did not support the American military invasion of Iraq, especially Germany and France. He claimed that the center of gravity of Europe was moving eastward, to the New Europe, where the new democracies supported the U.S. actions in Iraq.

This divide between Old Europe and New Europe was increased with the North Atlantic Treaty Organization (NATO) member state expansion. The treaty, signed in 1949 by ten countries, including the United States, Canada, and ten European nations (Belgium, Denmark, France, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, and the United Kingdom) that constituted the *Old Europe*, in Rumsfeld's assertion. The subsequent enlargement increased the number of NATO members to twenty-six and included Greece, Turkey, Germany, Spain, Czech Republic, Poland, Hungary, Bulgaria, Estonia, Latvia, Lithuania, Romania, Slovakia, and Slovenia.

The cleavage between Old and New Europe also denotes the recent augmentation of the European Union's (EU) member states. From this perspective, Old Europe indicates the six EU founding countries and the next four waves of enlargement (1973, 1981, 1986, 1995), while New Europe includes the ten countries that acceded in 2004 and the later ones, which became EU members in 2007.

Oligarchy

Oligarchy is a system of government in which power lies in the hands of a few individuals or a single class. The term *oligarkhia* comes from the Greek words *oligo* (few) and *arkhos* (rule). It entered the political science lexicon through its use in Aristotle's *Politics* (1981), in which Aristotle classified governments based upon the number of rulers and whether the rulers ruled in their interest or for the common good. Governments with rulers who ruled only according to their own interests were deemed "corrupt" or "debased" forms of government. An oligarchy is thus a form of government in which power is held by a small group of people (like an aristocracy) that rules only in its interest (unlike an aristocracy). Aristotle noted that oligarchies typically were led by the wealthy, although they could also be the product of heredity or be controlled by military elites; aristocracies, in contrast, were led by what Aristotle considered the "virtuous."

In more modern usage, an oligarchy, which is usually predicated upon a closed, narrowly based leadership, is generally taken to be the opposite of a democracy, which aspires for political openness, equality, and opportunity for all to participate in political life. However, many political thinkers have pointed to a gap between the rhetoric or ideal of democracy and its actual practice, which, in many respects, may resemble an oligarchy. On the political left, many writers have focused on the tendency for economic elites to emerge as powerful forces in capitalist, democratic states, thereby producing potentially deleterious effects for democratic government. German philosopher Karl Marx (1818–1883), for example, argued that the state in capitalist systems reflects the underlying economic reality of the unequal relationship between the bourgeoisie, or capitalists, and the proletariat, or working class; the state thereby becomes little more than what he referred to as the executive committee of the bourgeoisie. Therefore, in Marx's view, democracy in capitalist states is a sham. In the American context, sociologist C. Wright Mills in *The Power Elite* (1956) argued that democratic governance was being usurped by linkages between corporations, the military, and the government bureaucracy, all of which were not directly accountable to voters. These institutions, to Mills, hijack the government to serve their own narrow interests at the expense of the common good. Political scientist Charles Lindblom similarly argued in *Politics and Markets* (1977) that business interests invariably—thanks to their resources—play a "privileged role" in any democratic state, and the political and economic elites conspire to offer a limited number of choices to the public. Although many thought Lindblom went too far in his analysis, the goal of removing the influence of money from politics has been widely advocated, with campaign-finance reform a popular topic in many democratic states.

More general arguments regarding oligarchy were made by Italians Gaetano Mosca (1858–1941) and Vilfredo Pareto (1848–1923), both considered fathers of the elitist school of politics. In his *The Ruling Class* (1896), Mosca argued that any sizeable society will be ruled by a small minority, what he called the political class, which possesses superior organizational skills that enable it to take control of the state's bureaucratic apparatus. Pareto would make a similar argument in *The Rise and Fall of Elites* (1900), in which he took aim at contemporary ideologies for being smokescreens used to advance the interests of a self-interested elite. Pareto was a skeptic of

democracy, arguing that despite the claims by some groups to serve the common good, ultimately all political elites were interested in power only for their own purposes.

Perhaps the most widely cited employment of oligarchy in more modern times was made by German–Italian sociologist Robert Michels (1876–1936). In his classic work *Political Parties* (1911), he utilized the German Social Democratic Party as a case study and argued that there is an *iron law of oligarchy*. He maintained that all large organizations (e.g., political parties, bureaucracies, government institutions, and civic groups) tend to become oligarchic as power concentrates at the top, where leaders have access to information and funds and can thereby direct the organization to their own ends. The fact that Michels observed such a phenomenon in a party ostensibly committed to equality and democracy led him to suggest that real democracy, simply because of the organizational requirements of modern government, is impossible to achieve.

Whereas features of oligarchies can be found virtually everywhere, some political systems, arguably, were or are more obviously oligarchic than others. Apartheid South Africa, in which the minority whites ruled over the majority blacks, was a clear case. Iran, ruled by a small number of Islamic clerics, would also qualify, as would many states that have experienced military government in which a small, unelected clique of military officers runs the government. The term has also been frequently used to describe postcommunist regimes such as Russia or Ukraine where extremely wealthy individuals, or *oligarchs*, play a leading and often corrupting role in political life.

Oligarchy, Iron Law of

Iron law of oligarchy is a theory of organization first developed by German sociologist Robert Michels in his 1911 study of the German Social Democratic Party. According to the theory, no matter how democratic at the start, all forms of large-scale organizations—democratic or nondemocratic—eventually and inevitably lead to oligarchic governance with authoritarian and bureaucratic structures. Therefore, because of this iron law of oligarchy, any form of large organization is doomed to be dominated by a small, self-serving group of people.

MICHELS'S THEORY IN CONTEXT

The iron law of oligarchy, Michels argues, emerges from bureaucratic and technical necessities of modern times. Complex modern organizations cannot be run by the mass membership on a day-to-day basis. According to this theory, especially in large organizations, a small group of people is given the responsibility of decision making. Although, in theory, the leaders of the organization are subject to control of the mass members through delegate conferences and membership voting, in practice, under the iron law of oligarchy, the membership is too big and decision making too cumbersome for the mass membership to make most decisions. Therefore, because the success of the organization requires their expertise, leaders are able to consolidate and monopolize their power.

In his theory, Michels is heavily influenced by German sociologist Max Weber's argument that the differentiation, and probably isolation, of an organizational elite from their rank and file was a product of the technical division of labor necessary in complex mass organizations. Nevertheless, Michels challenged Weber's assumption that organizations would pursue official objectives in machinelike fashion by means of expert knowledge and bureaucratization. Rather, these individuals start using their power for their own interests instead of for serving the will of the people they represent. Michels advocated a second, subordinate law suggesting that, regardless of the purpose for which the organization is founded, preservation of the organization and its oligarchy will ultimately take precedence. For Michels, bureaucratization, centralization, and conservatism under oligarchic rule are inevitable ends for any organization. It is important to emphasize that the theory says nothing about the organization's relations with external entities. It is concerned with the situations internal to any single organization.

Michels's theory also assumes that bureaucracy and democracy do not mix. Accordingly, an autonomous and self-perpetuating leadership cadre is incompatible with true democracy. According to Michel, despite its democratic ideals and provisions for mass participation, the German Social Democratic Party in the early twentieth century is a good example of the inevitable process of bureaucratic conservatism. It is observed not only in leaders' wishes to maintain their prestige and influence, but also in the careerism of the self-interested salaried officials in the same organizations. Even the most radical and socialist parties and labor unions, which strive for equality between all individuals, experience this disparity of power distribution and bureaucratic conservatism. Communist parties in the Soviet bloc during the cold war era also serve as good examples of bureaucratic conservatism in party organizations.

Another premise of the theory of the iron law of oligarchy is that elites gain the ability to co-opt dissent through control over patronage as well as the media. The ability of elites to gather power, Michels continues to argue, is also strengthened by what is called a mass psychology of leadership dependency. According to this psychological approach, the masses have a basic psychological tendency or need to be led. Michels's

theories bear resemblance to other elitist theorists, such as Vilfredo Pareto, who mentions psychological and intellectual superiority obtained by elites in modern society; Gaetano Mosca, who characterizes elites as an organized minority; and Moisey Ostrogorski, who stresses the pathological tendencies of democratic mass parties toward bureaucratic-oligarchic organization. One possible flaw in Michels's theory is its attempt to generalize to all parties and organizations a process observed in one particular case, the German Social Democratic Party. Another is the degree to which it depends on controversial psychological claims: the universality of leaders' lust for power and of followers' willingness to be led. It should be noted that Michels's thought eventually led him to a strong commitment to fascism.

THE THEORY SINCE MICHELS

French thinker Maurice Duverger, while staying faithful to Michels's general view, uses a comparative approach that considers all types of parties and reaches the conclusion that the leadership of political parties tends naturally to assume an oligarchic form—an inner circle that is hard to penetrate. Duverger, however, stresses the extreme variability of the political party structure and challenges the theory of the iron law of oligarchy's homogeneous view of party organizations.

In his analysis of the German Social Democratic Party, Carl Emil Schorske argues, in his 1955 book *German Social Democracy,* that conservatism, which Michels attributes to bureaucratization, in fact reflected the dominance of a faction representing a certain constituency. Accordingly, it is argued that factionalism rather than bureaucratization is the structural basis for the indispensability of certain party leaders. Samuel Eldersveld, in his 1964 book *Political Parties: A Behavioral Analysis,* also contrasts the theory of the iron law of oligarchy with what he calls "stratarchy" by saying that in party organizations, political power is not accumulated in the hands of a centralized elite power, but is diffused across different levels of the party. Mayer N. Zald and Roberta Ash Garner, in their 1987 article "Social Movement Organizations: Growth, Decay and Change," contend that oligarchy is only one possible outcome depending on the character of the leadership, the organizational structure, and membership participation.

Many other objections to the theory of the iron law of oligarchy can be cited, but it is especially important to observe the possibility of compatibility between modern organizations and the idea of institutional democracy, which Michels had denied. Accordingly, the contingent and plural nature of power in organizations should be emphasized as well. Judith Stephen-Norris and Maurice Zeitlin noted that in industrial unions, where there was a history of insurgency from below against craft unionism, internal democracy and democratic communication between the leaders and members had been prevalent. Therefore, the history of industrial unions suggests that internal democratic structure with open communicative channels and discourse between leaders and members can prevent any oligarchic tendencies or developments in organizations. However, it is Michels's contribution to organizational theory that, under certain conditions—such as lack of communications and discourse between the leaders and members and the absence of democratic mechanisms that effectively hold the governing power accountable—there always exists a tendency for oligarchic ruling in any given organization.

Olson, Mancur

Mancur Olson (1932–1998) was an American economist. After receiving degrees from North Dakota State University, Oxford University, and Harvard University, he started his academic career teaching at the United States Air Force Academy and then took a post at Princeton University. In 1969, Olson joined the economics faculty of the University of Maryland, College Park, and remained there as a distinguished professor, making frequent forays to think tanks, lecture platforms, and downtown Washington. He also established the Center on Institutional Reform and the Informal Sector at Maryland.

Olson used three social sciences—economics, political science, and history—to answer questions about how major institutions of society develop. From economics, he took certain concepts, such as the incentives for individual action, and a rigorous respect for the logic of cause and effect models. History provided him with evidence of big events that required explanation. From political science, he took a concern with institutions and power. Olson believed that the best way to advance intellectually was to break out of narrow disciplinary boundaries and make use of whatever intellectual tools were relevant to the problem at hand. He demonstrated this in his first book, *The Economics of Wartime Shortages* (1963), a study of why Britain won wars against opponents with more sophisticated military machines: His answer was that Britain had a better fiscal and administrative system for mobilizing the range of resources necessary to win a long war.

In his 1963 journal article "Rapid Growth as a Destabilizing Force," Olson contrasted sociologist Talcott Parsons's priority for social stability with the economists' preference for economic growth. In *The Logic of Collective Action* (1965), Olson demonstrated the importance of individual self-interest opposed to political values as a motive for people to join pressure groups; for example, membership can provide discounts on car insurance or travel. This logic was applied to trade unions and farm cooperatives. The approach was greatly expanded in a pathbreaking study, *The Rise and Decline of Nations: Economic Growth, Stagflation, and Social Rigidities* (1982).

In 1967, Olson was named deputy assistant secretary in the federal Department of Health, Education and Welfare, with responsibility for developing social indicators as a complement to economic indicators used in policy making. Olson's work in this capacity, *Toward a Social Report* (1969), drew on existing social indicators and stimulated worldwide action by governments to take into account social as well as economic indicators when evaluating the quality of life. Over the years, Olson sought to produce a unified system of indicators that went beyond the measuring rod of money, but this was never fully realized.

Just before his death, Olson finished writing *Power and Prosperity: Outgrowing Communist and Capitalist Dictatorships,* which cut across conventional thinking to address the question of why some governments provide public goods that strengthen markets while others do not. The book mixed politics, economics, and history in striking ways.

Olson was a founder and past president of the Public Choice Society, which has influenced the development of the rational choice school of political science. Describing himself as an economics educator, his personal manner was well suited to this role; he was always willing to listen to and reflect on criticisms of his works as well as provide a clear and logical restatement of his ideas.

Ombudsman

An ombudsman is an official, usually appointed by the government or by parliament, who is responsible for investigating and addressing public complaints reported by individual citizens. As an advocate for the citizens, the ombudsman can play an important role in checking possible abuse of power by government officials. Several countries have established the office of the ombudsman, as has the European Union (EU) and even nongovernmental entities such as newspapers, broadcast media, and corporations.

The origin of the word *ombudsman* comes from the Old Swedish *umbudsmann,* although officials similar to an ombudsman existed in ancient China and Korea and in early Islamic states. Modern use of the term comes from the Swedish experience, where the Swedish parliament established its parliamentary ombudsman in 1809.

The ombudsman functions as a supervisory agency independent of the government and was intended to advocate for citizens who pressed claims against the government. By ensuring that the public administration serves the public and that it is held accountable for its actions, the ombudsman performs an important role to safeguard rights and ensure that the government properly administers the law. The ombudsman can be thought of as a supplement to the judicial system.

Depending upon the office's precise mandate, the ombudsman—sometimes called the *ombudswoman* or just *ombuds*—may handle complaints on illegal government activity; denial of rights to citizens, especially with respect to discrimination; and maladministration, meaning problems such as bureaucratic carelessness, delay, or procedural irregularities. After a complaint is filed, the ombudsman investigates the validity of the charges. If a complaint is substantiated, the ombudsman publishes a report to that effect. The ombudsman may offer some sort of remedy to rectify the complaint and in many cases can give financial compensation to the harmed party. However, the ombudsman is not a court, and cannot impose legal sanctions. Any decision to initiate formal legal proceedings is typically not at the discretion of the ombudsman, although the ombudsman can support the aggrieved party by forwarding the findings to a court.

The major advantage of an ombudsman is independence from the state. However, the system relies heavily on the diligence of the individuals selected to serve in the office of the ombudsman and on the cooperation of at least some members of the state itself. Arguably, if the state functions well enough to have a strong and effective ombudsman, it may have less need of the ombudsman. Conversely, if the civil service is truly poor performing or corrupt, it is hard to imagine that the ombudsman alone will produce much of a difference. Perhaps for these reasons, outside Scandinavian countries such as Sweden, Norway, Finland, and Denmark, the introduction of ombudsmen has tended to produce somewhat less impressive results than initially hoped, and in nondemocratic settings, the actual influence of an ombudsman is quite limited. As they are primarily investigatory institutions, ombudsmen cannot substitute for the courts.

The first ombudsmen were in Sweden and in Finland, which created its own ombudsman in 1919. Today they exist in over seventy countries in the world. After World War II (1939–1945), well-established democracies such as Denmark, Norway, Great Britain, France, Israel, New Zealand, and Australia created ombudsmen as an additional means to protect citizens' rights and fight against various forms of discrimination. They have been an especially popular innovation in the newer

democracies that may have problems with corruption, lack of respect for the rule of law, a weak court system, and a political system with weak checks and balances among government institutions. Thus, ombudsmen were created as democratic government spread to southern Europe (e.g., Greece, Spain, Portugal) and to postcommunist Europe, where ombudsmen serve in Estonia, Poland, Macedonia, Romania, the Czech Republic, Ukraine, Croatia, and Bulgaria. Among other states, the Philippines, Namibia, and South Africa also have ombudsmen. The Maastricht Treaty of 1992 also established an office of ombudsman for the European Union, which provides a critical link between the citizens and the pan-European government and legal structures. In sum, ombudsmen exist on some level in over seventy-five countries in the world. In Canada, there is no national ombudsman, but they do exist on the provincial level. Similarly, the United States has no national-level ombudsman, although some states and local governments, as well as the U.S. Navy, utilize this type of system. Without question, however, use of ombudsmen is most firmly entrenched in Sweden, which has separate ombudsmen to prevent discrimination and advocate on behalf of gender equality, children's rights, the physically disabled, homosexuals, consumer protection, and ethnic minorities. There is also an International Ombudsman Institute, which promotes the work of national ombudsmen.

Other institutions besides governments use the office of an ombudsman. Ombudsmen can be found in private companies, universities, and the print and broadcast media. Like those associated with the government, organizational ombudsmen are supposed to be independent, answering to the board of directors and investigating complaints by those inside and outside the concerned institution. This type of ombudsman can assist with whistleblowers or employees who have concerns with management, mediate conflict, ensure standards of fairness and professionalism, and assist in customer relations. Ombudsmen working with the media are often charged with investigating claims of inaccuracies or alleged bias.

In addition to offices with the formal title of ombudsman, governments and public institutions may employ citizens' panels, outside reviewers, and other entities to provide expertise, investigate complaints, and evaluate the effectiveness of programs and policies. Some of these (e.g., the U.S. government panel to review social security in the 1980s or the 9/11 commission in the 2000s) can be quite high profile. These bodies, however, will be more ad hoc than a government ombudsman, whose office and scope of mandate is established by law.

Ombudsman, Parliamentary

A parliamentary ombudsman is an official who has been appointed by the state to supervise public authorities and receive and investigate complaints and charges of improper government activity. In most cases, these complaints are made by individual citizens against public officials or government bodies. The stated purpose of the ombudsman is to provide an extra level of protection for the rights of citizens against actions taken by the government.

The word *ombudsman* is of Old Swedish origin—*umbuðsmann,* meaning representative—and appears in similar forms in Norwegian, Danish, and Icelandic. Although observations on the potential usefulness of an ombudsman date back to the Roman era, the origins of the modern-day ombudsman lie in eighteenth-century Sweden. King Charles XII of Sweden created the office of supreme ombudsman in 1713, an office that would eventually become the chancellor of justice. The Swedish *Riksdag* would later establish the parallel office of parliamentary ombudsman, an institution that survives with some modification into its present form.

The ombudsman's role is to oversee investigations into citizen complaints of improper government activity. The ombudsman will first examine the complaint to ensure that it is not made with malicious intent and is substantial enough to stand up to further investigation, then issue a call for further evidence and evaluate the administrative action that is the subject of the complaint. If the ombudsman rules on the strength of the investigation that a particular complaint is correct in its charge of maladministration, unfair treatment, or unjust action, then the ombudsman's office will publish a report with the results of the findings. Yet even if the report finds that maladministration has indeed taken place, ombudsmen often do not have the power to prosecute, initiate legal proceedings, or even call for specific disciplinary action against the accused official or department. Financial compensation, or even any further action apart from the published report, is at the discretion of the existing laws of the country in question.

Outside of the Scandinavian countries, parliamentary or other legislative ombudsmen are relatively recent innovations and often face restrictions not found in the original concept of the position. The United States does not have an ombudsman or equivalent office at the federal level. The United Kingdom's parliamentary commissioner for administration, the equivalent of an ombudsman, cannot accept petitions directly from members of the public; all requests must be made through a member of Parliament, a practice which severely restricts the parliamentary commissioner's role as a forum for direct public complaint. In contrast to these circumscribed roles, ombudsmen are becoming more common

in local governments and in both the banking and health care sectors, serving as central clearinghouses of any complaints directed against these institutions.

Even though a parliamentary ombudsman may provide an essential service as an impartial official who safeguards the rights of individual citizens, the very fact that the office exists may pose problems for countries that wish to establish an ombudsman's office. The presence of an ombudsman suggests that established, traditional avenues of complaint are inadequate to deal with public complaints of maladministration, and by extension suggests that the existing system of administration itself is not capable of providing the necessary checks on government action. Another problem faced by countries or parliaments considering the appointment of an ombudsman is the selection of an appropriate individual. An individual who has existing ties or previous experience with the institution in question may have the necessary knowledge to evaluate complaints fairly, but those connections may leave the ombudsman open to accusations of leniency or insider dealings. An individual without such connections may possess a sufficient level of impartiality to inspire public confidence, but the lack of institution-specific knowledge may render the ombudsman unable to fully assess the merits of public complaints. Nonetheless, the appointment of parliamentary ombudsmen allows a government to demonstrate a commitment to proper administration and a willingness to remain open to public accountability.

One-party Systems

One-party system is an imprecise term used to refer to a broad range of political phenomena, ranging from the communist states, such as the former Soviet Union, to party systems in which one party always dominates, as illustrated by Liberal Democratic Party (LDP) predominance in Japan. As Giovanni Sartori argues, when speaking in terms of *party* systems, a one-party system cannot exist since the concept of system implies multiple parts. When speaking of *political* systems or regimes, however, a one-party system suggests a regime in which only one political party operates. Despite these apparent definitional inconsistencies, scholars and political actors alike employ the term to refer to many political regimes in which one organization that labels itself a political party regularly occupies all or most important political positions in a given country.

ONE-PARTY STATES

One-party states are political regimes in which one and only one party is allowed to exist. Typically, this situation results from legal proscription of alternative parties or constitutional prescription of a leading role for the one party that does operate. The communist single-party states serve as the most common example, although the German Nazi Party and Baathist parties have also been parties of the state. In the communist states, such parties typically defined their role to be to serve as the vanguard of society, leading the citizenry rather than representing it. In its 1977 constitution, the Communist Party of the Soviet Union was described as "the leading and guiding force of the Soviet society and the nucleus of its political system" while the Syrian constitution describes the Baath Party as "the leading party of society and state." Ideological conformity may be stressed more or less in one-party states, with the more ideologically unitary and totalizing regimes called totalitarian. In authoritarian one-party states, such as some African party states, ideology has been less central to the regime's self-definition.

In one-party states, where elections only serve to confirm the next occupant of an electoral position, parties nevertheless perform a key recruitment role. Career advancement in the communist regimes was often tied to membership in the party. At important moments, single parties have proved extremely effective at mobilizing the society to accomplish collective tasks identified by the leadership. However, because of the constant threat of repression of dissidence, single parties' capacities to provide their leadership with accurate information about their own societies tended to degrade over time, as party functionaries told their superiors just what they wanted to hear. This tendency became manifest in the rapidity with which the communist states as well as Iraq's Baathist regime collapsed.

HEGEMONIC-PARTY SYSTEMS

Observers have used the term *dominant party* imprecisely to refer to cases that fall into both hegemonic-party systems and predominant-party systems, as well as any situation where one party easily outpolls the others on a regular basis. More specifically, Sartori uses Jerzy Wiatr's term *hegemonic-party system* to refer to situations in which multiple parties exist but only one is permitted de facto to win most offices. The other parties exist to provide the semblance of competition; effectively they are licensed as minor parties. The governing parties in hegemonic-party systems may be either ideological or pragmatic in their orientation. Hegemonic parties play a key political recruitment role in their societies. Because they permit some pluralism of political representation, they allow for more effective political

communication to flow between elites and masses than do their counterparts in one-party states.

The Polish United Workers' Party, the governing party in communist Poland, despite claiming the "leading role" in that society, permitted two smaller parties to operate as part of its governing coalition. In Mexico, the long-ruling Institutional Revolutionary Party (PRI) allowed several small opposition parties to exist, some of which offered genuine—though loyal—opposition, others offering nothing more than token opposition in return for congressional seats. For decades, the PRI resorted to fraud both to defeat genuine oppositionists and to create congressional seats for unpopular nominal opposition parties. Taiwan, under the Kuomintang (KMT), was initially a noncommunist one-party state but became a hegemonic-party system when the KMT began allowing opponents to operate in the 1980s. In Mexico and Taiwan, parties that were once token opposition eventually developed strategies that allowed them to take power from the hegemonic parties.

PREDOMINANT-PARTY SYSTEMS

Where genuine political competition exists but rarely wins office or fails to take a significant number of legislative seats, a *predominant-party system* may be said to operate. Examples include India under Congress Party dominance, Japan under the LDP, and postwar Italy during which the Christian Democrats led most governments. Some scholars would include state- or regional-level party systems in the United States, such as the one-party South. Observers often refer to such situations as one-party systems because those parties other than the one that dominates have little access to decision-making power. In such contexts, the politically ambitious will be naturally attracted to the predominant party and that party must serve as a so-called big tent. This gravitation of the politically ambitious to the regular winner reinforces other factors that favor predominant parties; these factors can include the ideological sentiment of the voters, the capacity of governing parties to distribute pork or patronage, and electoral rules that can encourage opposition fragmentation.

Open Government

The term open government indicates a governmental activity based on transparency and freedom of information. Although for centuries the principle of secrecy has constituted a pillar of public administration, more recently an innovative paradigm seems to be emerging. Starting in the late 1960s, and especially spreading in the Anglo-Saxon countries, a reform movement has struggled against government secrecy, considered as "a deliberate act on the part of those who govern to preserve or to add to the value of information that they possess by keeping the governed or parts thereof from knowing it at a given point in time" (Galnoor, 299).

Campaigns to reduce official secrecy have broad and ill-defined objectives, but share four basic values: to promote more ethical conduct, to enhance executive and legislative accountability, to advance more informed policy making, and to help individual citizens and groups advance particular rights and interests. Such campaigns have also led to the adoption of legal acts—such as the U.S. Freedom of Information Act (FOIA) of 1966—that provide legal rights for public access to government information.

In recent years, new instruments have been introduced to involve citizens in the deliberation process on which public policy is based. For instance, a wide range of *open-space meetings* and *town hall meetings* let citizens meet to exchange information and opinions on a theme of public interest. Such initiatives have often been based on intensive use of new information and communication technologies, which create additional spaces for public scrutiny and debate.

Opposition Politics

Opposition politics involves the various ways in which the opposition in a democratic legislature can influence what happens in government. In some countries, the opposition can influence legislation considerably, while in others the opposition is practically ineffectual. A strong opposition potentially prevents a government from realizing its first policy preference. While an opposition may not force a government to abandon its original proposal, a strong opposition can impose a more consensual legislative outcome. This reality challenges the conventional wisdom that the government always governs, while the opposition always opposes.

In parliamentary systems, in which the legislature and executive are fused, the executive offers bills that the legislature debates and amends before final voting. Presidential systems function somewhat differently, but the dynamics within the legislature, and their implications for opposition strength, should

still be relevant and valid. The key difference is that the president in the presidential system still retains an important veto on legislation passed in parliament. For this reason, opposition parties in parliamentary systems can be especially important.

In a party-free and rules-free environment, the median preference of the legislature—the position that divides the group into two equal halves—will most likely be the final decision. Any deviation from this median creates an alternate majority. Modern legislatures, however, are neither party-free nor rules-free. Individuals are often organized in several competitive parties that compete for electoral votes based on various political ideologies. Parliaments also function according to prespecified procedures and structures. As a result, the median outcome for a decision is not automatic. There may be opportunities for parties whose preferences differ from the median to influence the final outcome.

OPPOSITION STRENGTH

Opposition parties can and may exercise influence during the legislative process when certain political and institutional conditions are met. The most important of these include greater levels of ideological polarization and party fragmentation (party-system factors) and the presence of several decentralized institutional resources that allow parties and individuals access to the content of policy—specifically legislative committees, a second house of parliament, agenda-setting capabilities, generous amendment procedures during floor debates, and the ability to introduce private member bills (institutional factors).

When these conditions are present, two nonstandard outcomes that deviate from the standard notion of parliamentary practice may result. The first occurs when the party system encourages bargaining among different parties or when institutional conditions give parties access to important and decisive decisional mechanisms. In such cases, parliament itself becomes an important actor in the policy process and bills face scrutiny before final acceptance. For example, extreme party fragmentation within parliament may encourage shifting majorities for certain issue areas. Smaller groups can offer alternative proposals and potentially sway an outcome. Coalition building thus involves bargaining and compromise. These interactions empower opposition parties because they may abandon or join new majorities. Furthermore, extreme ideological polarization within parliament may compel governments to fashion broad policies to reflect as many interests as possible because competing interests could alter or sabotage a bill. In highly polarized parliaments, bills representing a minority of interests could face competing majorities. For these reasons, legislative fragmentation and party polarization potentially challenge the straightforward use of majority rule.

There are also several institutional arrangements that provide opposition parties opportunities for policy influence. Committees are important arenas for policy debate where opposition parties can challenge government bills or offer alternatives. Bicameral systems are designed to provide additional assessment for government policy and opposition parties in the upper house may find additional opportunities to scrutinize government policy. Some parliaments grant political minorities important rights during the agenda-setting process. Furthermore, minority groups may be procedurally permitted to initiate referenda or to introduce amendments and private member bills.

These particular attributes of legislative life—political and institutional—may encourage opposition parties to participate in normal legislative affairs to secure policy benefits within the legislature. Under such conditions, governments may face three undesirable outcomes: the content of government-sponsored legislation becomes vulnerable to external influence, government bills do not get passed at all, or private member bills that contradict government priorities pass without government approval. When this happens, an opposition is strong. Opposition activity may thus sway the fate of government legislation.

The second nonstandard scenario occurs when the party system and particular institutional conditions discourage party unity within government parties. Strong opposition parties may emerge when government party leaders cannot control government party members in parliament. In the modern conception of parliamentary practice, party members are expected to vote along predetermined party mandates. Developing clear voting mandates for party members produces stability and enhances outcome predictability. But governments are not always assured systematic, stable majorities in parliament because not all government members vote with their party every time a vote is taken. When this occurs, the opposition has the potential to secure periodic policy benefits in the legislature. Once government party members are available for policy negotiation with opposition parties, the government cannot guarantee that its policy will pass unaltered in the legislature, and numerous policy options become viable. Governments again face three undesirable outcomes: government bills are either revised, blocked, or the new majority passes a motion of its own. The final option depends on the opposition's willingness to compromise with rogue backbenchers from government parties to form a new, temporary majority for a particular policy benefit. In these cases, the opposition is also considered strong.

The amount of polarization and fragmentation in the party system and the presence of particular institutionalized rules and structures therefore combine to provide incentives for (1) opposition parties to participate directly in parliamentary affairs and (2) government party members to defect from party unity and align temporarily with the opposition. Both scenarios increase opposition strength in parliament.

Given these conditions, some opposition parties participate in normal legislative affairs rather than opposing the government at all times. In such cases, parliamentary roles are not simply predetermined by the occupants of the government and opposition or by the occupants of the government and legislature. Behavior and outcomes are not always predictable based on these roles alone. Specific attributes of the party system and specific institutional opportunities should be evaluated for a more complete picture of how legislatures function in a real-world setting.

Organization for Economic Cooperation and Development (OECD)

The Organization for Economic Cooperation and Development (OECD) is a thirty-member international organization promoting economic liberalism and policy coordination amongst developed states. The OECD grew from the Organization for European Economic Cooperation (OEEC) established in 1947 to administer American and Canadian Marshall Plan contributions to European postwar reconstruction. In 1961, the OECD was created with an expanded membership and policy portfolio. Traditionally, membership included democratic states committed to economic liberalism: Western Europe, the United States, Japan, Canada, Australia, and New Zealand. In the 1990s, Mexico, Korea and a number of Eastern European states were added. In 2007, several states—including Chile, Israel, and Russia—entered formal membership negotiations. Brazil, China, India, and Indonesia have all been formally discussed as candidates for the next stage of enlargement.

A council comprised of representatives from member states and the European Commission governs the OECD. Council decisions, such as whether to support specific policy initiatives, are made by consensus. However, much of the real work is conducted by the more than two-thousand-member secretariat based in Paris. The secretariat provides most of the research and advice to the committees that oversee the OECD's activities in specific policy areas. The committees can include representatives of member states, drawn from relevant public agencies; representatives invited from nonmember states; and representatives of other organizations.

The OECD's founding convention gives it responsibility for researching virtually all areas of public policy, providing data and recommendations for best practices to member states based on policy experiences in other jurisdictions. In its more than 250 yearly publications, the OECD's goal is invariably to promote domestic economic liberalism and to coordinate domestic policies supportive of economic integration. However, the OECD is not simply a research organization. The OECD pursues several strategies promoting the adoption of OECD-recommended policies by member states—making it a key site of global governance.

At one level, based on its well-respected research activities, the OECD uses peer-review processes to measure the success or failure of member states in adopting OECD-recommended polices. This surveillance is intended to move reticent nations forward with OECD-recommended norms. The OECD also uses its research credibility to try to influence the broader international agenda. For example, it issues agenda-setting reports prior to major international trade negotiations trying to help states identify the basis for successful agreements that will remove barriers to trade and investment. Finally, although understudied, in a number of areas, the organization has created formal agreements that member states are obliged to adopt. These can include treaties, or at a lower level, recommended guidelines and models promoting standards for policy coordination.

While the OECD's policy portfolio is wide ranging, major areas of focus include social policy, primarily relating to education and employment; economic policy, particularly areas in which successful international markets require policy coordination; and issues relating to international finance. Indeed, the OECD's activities in promoting policy coordination of international taxation to avoid disputes amongst states, and thereby reduce the risks involved in international finance, are often cited as one of the more successful areas of OECD activity.

Organization of American States (OAS)

The Organization of American States (OAS) is the intergovernmental organization of the thirty-five independent states of the Western Hemisphere. Founded at the Ninth International Conference of American States, held in Bogotá, Colombia,

in 1948, the antecedents of the OAS date back to the First International Conference of the American States convened in Washington, D.C., in 1889. The founding members of the OAS were the eighteen Spanish-speaking republics of South and Central America and the Caribbean, Brazil, Haiti, and the United States. Canada joined the OAS in 1989, and the former British, French, and Dutch colonies in the region came into the organization after they gained their independence. While formally a member, Cuba has been suspended from participation in the organization since 1962. The OAS is headquartered in Washington, D.C.

The OAS's institutional structure includes a general assembly that convenes annually, a permanent council made up of ambassadors from each member that meets regularly throughout the year, a general secretariat that runs the organization, foreign ministers' meetings called at the request of any member, a council for integral development promoting cooperation on economic development, a juridical committee coordinating the development of international law in the hemisphere, a human rights commission, and a human rights court. The OAS also has specialized agencies to address issues related to children, women, indigenous peoples, agriculture, and health.

From its origins until the mid 1960s, the OAS, following the leadership of the United States, emphasized mutual security concerns. In 1954, the organization adopted the Declaration of Solidarity for the Preservation of the Political Integrity of the American States against the Intervention of International Communism. The subsequent 1962 suspension of Cuba took place in the context of Cuba's closer relations with the Soviet Union. In 1964, the OAS applied sanctions against Cuba, although Bolivia, Chile, Mexico, and Uruguay voted against the measure. The U.S. emphasis on mutual security against intervention from outside the hemisphere ran into resistance as the Latin American members stressed the principle of nonintervention in the domestic affairs of sovereign states, especially from 1965 onward in response to the U.S. intervention in the Dominican Republic and its interference in Chilean politics in the early 1970s.

In the 1970s, the OAS turned to human rights issues, and in the 1990s to democracy assistance. Resolution 1080, passed by the OAS General Assembly in 1991, states that representative democracy is the only acceptable political regime in the Americas and sets forth defense and promotion of democracy as an OAS responsibility. While the OAS has established means to mediate during political crises in member countries, its most common way to promote democracy has been electoral observation. The OAS has sent teams to observe nearly one hundred elections in the Caribbean and Central and South America since 1990. As the result of this commitment to promoting democracy, the OAS—seemingly moribund in the 1980s when the United States ignored it while interfering in Central American civil wars—has found a new purpose and risen to new prominence in the hemisphere.

Organization of the Islamic Conference (OIC)

The Organization of the Islamic Conference (OIC) is an intergovernmental organization with a membership of fifty-seven states. The organization was established in 1969 to facilitate cooperation among Muslim states in the political, economic, scientific, and cultural spheres. It is the only intergovernmental organization founded on a common religious ideology.

The OIC is composed of three main bodies. The highest authority within the OIC is the Conference of Kings and Heads of State and Government, which meets triennially to determine the OIC's policies. The Conference of Foreign Ministers meets annually to formulate policy implementation strategies and to review financial and programmatic matters. The General Secretariat is charged with the implementation of the policies decided upon by its other bodies. The organization consists of numerous committees, secondary organs, and institutions that address the cultural, scientific, economic, legal, and educational spheres, as well as the OIC's social and humanitarian activities. The OIC also has established several Islamic colleges and cultural centers.

The organization has achieved moderate success in the realms of technical and cultural cooperation over the years, but serious and protracted differences among its member states continue to be a formidable obstacle to its political progress. Despite frequent political stonewalling by its member states, the OIC has continued to take an active role in conflict prevention and resolution in recent years by sending delegations to mediate conflicts in Africa, Southeast Asia, and the Middle East. It also funds various reconstruction and humanitarian aid projects throughout the Muslim world.

Despite its modest successes, however, criticisms against the OIC persist. In the five interstate conflicts it attempted to resolve, the OIC was unable to find a peaceful resolution. Until the OIC amended its charter in 2008, there were no formal membership criteria, and no significant movement could be taken on political issues without the unanimous consent of its member states. Further, its legal jurisdiction remains questionable, its countries often do not pay dues, and it does not maintain communication with some member states in order to encourage attendance at its conferences. OIC states rarely criticize each other within their own meetings, and until the recent announcement of its planned human rights body, its members seldom raised issues of human rights, fair elections, or women's rights.

In response to these criticisms, the OIC adopted its Ten Year Programme of Action in 2005, which outlines the

strategies needed to address the challenges facing the Muslim world. In accordance with its new mission, the secretariat has attempted to increase its capacity for peace building, human rights monitoring, economic cooperation, humanitarian aid, and good governance. Emerging issues such as combating Islamophobia and terrorism also have become increasingly high-priority areas for the OIC.

The OIC has gained greater attention in recent years, in part because Islam continues to take a more prominent role in international affairs. To date, however, the OIC has responded only to political crises that threaten to undermine the religious and political legitimacy of its member states, such as foreign occupation, Islamic opposition groups, or incendiary comments made by politicians and religious leaders against Islam. Nevertheless, the OIC represents an interesting example of how religious norms—in this case Islam's process of group consultation (*Shura*)—interface with the secular, state system.

Organization of the Petroleum Exporting Countries (OPEC)

The Organization of the Petroleum Exporting Countries (OPEC) is an intergovernmental organization founded in 1960 by Iran, Iraq, Kuwait, Saudi Arabia, and Venezuela to regulate the world supply and to stabilize the price of oil by unifying and coordinating members' petroleum policies through the establishment of production quotas. Venezuela first suggested such an organization in 1949 as a counterbalance to the market power of Western oil companies.

OPEC had seven additional members as of late 2009: Qatar (1961), Libya (1962), United Arab Emirates (1967), Algeria (1969), Nigeria (1971), Angola (2007), and Ecuador (1973–1992 and 2007). Previous members include Gabon (1975–1992) and Indonesia (1962–2009), which withdrew since it became a net importer of petroleum. As of 2009, Syria and Sudan were applying for membership, and Norway, Bolivia, Mexico, Brazil, and Canada have been invited to join.

In 1965, OPEC's headquarters moved from Geneva to Vienna, where it now holds its regular meetings each March and September, as well as extraordinary meetings as necessary. Resolutions are taken by unanimity—one state, one vote—provided that at least three-quarters of the members are represented.

Often defined as a cartel, OPEC institutionalizes the oligopoly in the oil production market; its members control an estimated two-thirds of world oil reserves and 40 percent of world production. OPEC uses its market share to protect the economic, and also political, interests of its members, whose economies heavily rely on oil export revenues. Saudi Arabia plays a decisive role, with its productive capacity in 2009 three times higher than Iran, the second most oil-producing OPEC member. The next countries in order of production were Kuwait, the United Arab Emirates, Venezuela, and Nigeria.

The political power of OPEC reached its zenith in the 1970s, in part due to the formation of the Organization of Arab Petroleum Exporting Countries (OAPEC) in 1967. After the Six-Day War (1967), the Arab members of OPEC joined with Syria and Egypt to form OAPEC with the aim to exercise pressure on the West against its support of Israel. This proved effective when, following the 1973 Yom Kippur War, OAPEC imposed an embargo on Israel's allies, causing a fourfold increase in the price of oil, inflationary spirals, and an economic crisis in the West. At the same time, OPEC joined the movement of developing countries calling for a New International Economic Order (NIEO) and the democratization of North-South economic relations.

However, after this period of influence, the organization's ability to exercise its oligopolistic power for political purposes has been steadily decreasing. OPEC's share of world supply has been affected by the discovery and developments of oil fields in the Gulf of Mexico, the North Sea, and the opening up of Russia after the end of the cold war. Alternative energy and environmental-friendly policies in a number of Western countries threaten to reduce petroleum demand in the future. Moreover, the divisions caused by the Iraq-Iran War (1980–1990), the Iraqi invasion of Kuwait, and the Iraq War (2003–) have seriously damaged the cohesion of the organization. Member compliance with official production decreased significantly in the first decade of the twenty-first century, and in 2008 Saudi Arabia openly flaunted the quotas that OPEC had unanimously approved.

Despite sharp fluctuations in the price of the crude oil and the weakness of the dollar (OPEC currency of reference) in relation to the euro, the upsurge from less than $10 in the 1990s to more than $150 a barrel in 2008 caused a drastic increase in revenues. However, the fact that nearly all members were pumping close to capacity indicates that OPEC may no longer be able to control the supply and influence the prices as the twenty-first century continues.

Organization Theory

Scholars of organizations are fond of pointing out the ubiquity of organizations in everyday life. As sociologist Amitai Etzioni elegantly put it in his 1964 book *Modern Organizations,* "We are born in organizations, educated by organizations, and . . . spend much of our lives working for organizations" (1). On top of this, people choose to belong to affinity group organizations, such as religious congregations, political parties, and recreational clubs; depend on organizations like the police, fire departments, and the military for their security; and are taxed and regulated by the government—a singularly large and multifaceted organization. Organizational theory provides an understanding for how organizations operate, both internally and in the larger environment, and thus is critical to understanding the dynamics underlying much of modern society.

The world of organizations is diverse. Organizations include both formal and informal groups, nonprofit and for-profit businesses, private entities, and the government itself. Partly because of this diversity, there is no single definition of what counts as an organization. Existing definitions vary in regard to how much emphasis they put on issues such as formalization, goal specificity, interdependence with other organizations, and internal culture, which in turn means that each definition tends to capture the essence of some organizations better than others. The study of organizations is also highly interdisciplinary. Organizational theory benefits from contributions of political scientists, sociologists, management scholars, and psychologists, among others.

THREE CLASSICAL VIEWPOINTS ON ORGANIZATIONS

In political science, where much current organizational work is carried out in schools of public affairs or public administration, the focus of research is often on institutional organizations such as political parties and legislatures, interorganizational relationships, and organizational form. Scholarship in political science also puts comparatively more emphasis on the study of public and nonprofit organizations than for-profit organizations. From these diverse perspectives, three viewpoints have emerged that at various times have dominated research on organizations: W. Richard Scott and Gerald F. Davis call these the rational, natural, and open system perspectives. Although all three perspectives inform current research in the field, they are also historically situated and loosely reflect the evolution of thought on organizations.

RATIONAL SYSTEM PERSPECTIVE

The rational system perspective emphasizes the utility of organizations, and definitions emerging from this perspective tend to highlight formal structure, specificity of goals, and purposeful action. In this viewpoint, organizations are seen as efficient solutions to managing complex tasks. They have clear objectives and are created to accomplish specific goals. Historically, this perspective is strongly associated with the early work that served to define the field of organizational theory, which began emerging in the late nineteenth century. The classic writings of Max Weber on bureaucracy come from a rationalist perspective, as does the work of Frederick Taylor and other proponents of scientific management, which attempted to use scientific methods to uncover the most efficient approach to accomplishing specific tasks, such as how to design a factory in order to produce minimum waste of time and materials. The work of Herbert Simon and James March on decision making in organizations and the work of Oliver Williamson on transaction costs and vertical integration also come from a rational system perspective.

NATURAL SYSTEM PERSPECTIVE

By contrast, the natural system perspective, which emerged partially as a critique of the rational system perspective, is more concerned with human interaction, informal structure, and social order. Definitions emerging from this perspective emphasize the collective nature of organizations and the goal of maintaining the organization itself, as opposed to accomplishing the output goals of the organization. Proponents have argued that this more holistic view, which takes into account nonrational behavior and interpersonal relationships, is more revealing of the real agenda and functioning of any given organization. Two influential schools of thought that emerged from the natural systems perspective are Elton Mayo's human relations school, which emphasized social cohesion and the work environment, and sociologist and legal scholar Philip Selznick's institutional approach, which looked at organizations as adaptive structures that, through the process of institutionalization, become "infused with value beyond the technical requirements at hand" (Selznick, 17).

OPEN SYSTEM PERSPECTIVE

Much of the historic work stemming from the rational and natural systems perspectives tended to overlook how organizations were impacted by the environment in which they operated and therefore either implicitly or explicitly viewed organizations as closed systems. The open system perspective emerged in contrast to that assumption. Most research done since the mid-twentieth century recognizes organizations as open systems, while also having a preference for the instrumental focus of the rational system perspective or the informal processes focus of the natural system perspective. An open system perspective recognizes that organizations are influenced by their larger environment and that they, in turn, influence that environment. This perspective has been greatly shaped by general system theory, which is a large interdisciplinary field with relevance to organizational theory in that it sees

organizations as one of many types of systems—social, biological, electrical—that can be studied scientifically. System theory has contributed to our current understanding of organizations as open, complex, goal-directed, and loosely coupled systems.

Definitions that have emerged from the open system perspective emphasize not the formal or informal structure of organizations, but rather their interdependencies and boundary-spanning behavior. According to an open system perspective, organizations are constantly changing to adapt to dynamic environments. For example, contingency theory, as articulated by scholars Paul R. Lawrence and Jay N. Lorsch, emerged from this perspective and is concerned with organizational form. According to this theory, there is no one "best" organizational form; rather, organizations should be designed in order to suit their specific environment. An open system perspective also recognizes that, while all systems are comprised of smaller subsystems and embedded in larger macrosystems, they cannot be understood by studying each part individually. System dynamics, best associated with the pioneering work of Jay Forrester, is a method of creating computer models that clarify the functioning of complex systems. System dynamics, used frequently in policy analysis and design, focuses attention primarily on feedback loops and information flows and has provided important insights on issues ranging from the U.S. economy to urban poverty to curricular design in public schools.

LEVELS OF ANALYSIS

Methodologically, organizations have been studied in a variety of ways. There are studies on organizations that use experimental methods such as Mayo's classic research revealing the Hawthorne effect, large scale surveys, ethnographic case studies such as Rosabeth Moss Kanter's landmark 1977 book *Men and Women of the Corporation,* and innovative network models. The method chosen is generally related to both the theoretical framework of the study as well as the level of analysis of the study. These levels of analysis can be roughly broken down to three categories: microlevel studies of social psychology and intraorganizational relationships, studies of organizational-level structure and processes, and ecological or macrolevel studies of interorganizational relationships and the interaction of organizations with their larger environments. These categories are not exclusive and the boundaries between them are quite porous.

Research at the social psychological level has focused on individual participants in organizations, as well as group processes, team dynamics, leadership, and intraorganizational networks. This type of research looks at the organization as context and is concerned with the impact of the organization on individual or group members. Twenty-first-century concerns about job design and achieving balance between work life and home life often fall into this category.

Organizational level research looks at the structure and processes of organizations themselves. Research can focus on the whole organization, various departments or units within the organization, or how the organization interacts with its environment. This level of analysis focuses on such issues as organizational goal setting, the impact of organizational age and size, use of technology, and organizational structure. Contemporary concerns include how race and gender impact hiring practices, communication networks within organizations, and organizational innovation.

Research at the ecological level looks at groups or populations of organizations and tends to focus on how they interact with their environment and with each other. Studies of interorganizational networks, organizational fields, industry level beliefs, institutional logics, social movements, and markets are all examples of this level of research. The increasing boundary-spanning behavior of organizations is an area of contemporary concern, as is how organizations learn from one another, and changes in market development.

Many lines of research cross these boundaries, however. One of these areas is the study of organizational decision making—an area of research that has been particularly important to political scientists. For example, one of March and Simon's key innovations is the concept of bounded rationality. In their view, formalization—an organization level variable—produces rules, routines, and constraints on individual action and decision making. Rational behavior is thus bounded by the context in which it takes place. Jonathan Bendor has extended the notion of bounded rationality by investigating experimentally how norms and bureaucracy—the set of rules, structures, and procedures in place that guide administrative labor—ultimately help shape individual action.

DOMINANT STRANDS IN CONTEMPORARY LITERATURE

Several major approaches to studying organizations have been particularly influential since the 1960s and merit further discussion. Four in particular—transaction cost economics, resource dependency theory, network analysis, and new institutional theory—all recognize organizations as open systems and tend to focus on the organizational and ecological levels of analysis, rather than the social psychological. Although each has a different emphasis and they are often used alone, the theories are not mutually exclusive and there are many examples of research that have attempted to draw connections between them in order to further advance the field.

TRANSACTION COST ECONOMICS

Transaction cost economics (TCE), based largely on the work of Ronald Coase and Oliver Williamson, is concerned with questions of why organizations exist, how they draw and redraw boundaries, and how interorganizational relationships and organizational form are structured. Scholars of TCE see organizations as engaged in multiple exchange relationships with one another—indeed, from this perspective, organizations exist in part to manage complex exchange relationships. Two examples of an exchange relationship are the relationships between a manufacturer and a supplier of raw materials, and the relationships between the same manufacturer and the distributor of their finished product. These exchange relationships come with transaction costs—essentially, the costs

involved in contracting, planning, and monitoring these relationships with other organizations.

TCE asserts that organizations will always want to minimize transaction costs, which become higher either as transactions become more uncertain or frequent or as they must account for the opportunistic behavior of others. Such opportunistic behavior can occur when organizations are overly dependent on one another. If transaction costs become too high, organizations may opt for vertical integration, which is when one firm owns or controls multiple steps in a value chain, creating a hierarchy. For example, manufacturing is vertically integrated when the same company owns both the supply and the distribution chain. Government is vertically integrated when it provides mandated services or produces needed goods directly; it is vertically disintegrated when it contracts out for services to be provided or produces goods itself.

RESOURCE DEPENDENCY THEORY

Based on the work of Richard Emerson and explicated largely by organizational behavior scholars Jeffrey Pfeffer and Gerald R. Salancik, resource dependency theory is concerned with how organizations negotiate the environment in which they operate, highlighting the interplay between the political and the economic as well as the importance of power. As with the TCE perspective, in this framework, organizations are seen to be in multiple exchange relationships with other actors in their environment. If these exchanges become unbalanced, in particular, or if organizations become too dependent on one particular source of resources such as a supplier or a funder, then power differences arise that can have a deleterious impact on the organization. To resolve this problem, organizations must constantly monitor their environment and find ways to reduce dependency and maintain power over providers of key resources.

Research using resource dependency theory highlights several tactics that organizations can use to help maintain control over their environment. One tactic is to attempt to control the behavior of other powerful players through what are known as bridging mechanisms, such as through the use of co-optation, which is incorporating outside stakeholders into the organization, or through mergers or alliances. This control can be accomplished by vertical integration. Alternatively, organizations can coordinate their action with others by joining or forming associations, such as trade associations or coalitions. By joining with others who face similar power-dependence relationships they can exercise more control over resources, share information, and take steps to heighten legitimacy. A third option is to try to influence government and other policy-making bodies to achieve beneficial legislation or regulatory changes. Some organizations can also try to reincorporate, change identities, or even move their base of operations. All of these are attempts to gain control over their environment, particularly to gain a power advantage in key economic and political relationships in ways that will allow the organization maximum flexibility and room for growth.

NETWORK ANALYSIS

Due to rapid improvements in computing power, as well as methodological advances, network analysis—more a methodological approach than a theory—has been a large growth area in organizational studies. Emphasizing the relational elements of the organizational environment, this line of research explores how an organization's position in a larger network of actors, as well as the structure of that network, can impact the organization and its behavior in a variety of ways. Network analysis can also usefully help explain interpersonal relationships inside of and across organizations. In network analysis, actors—organizations, people, or departments—are called *nodes* and those nodes are connected by *ties*. A tie can be defined in many different ways, from geographical closeness, such as who sits nears whom, to friendships, to financial connections. Looking at networks helps us understand how it is not just the characteristics or attributes of a node that matter for its behavior, but also its ties to other entities.

When looking at networks, specific features are often measured when analyzing the impact of network position. At the most basic level, these include (1) the distance between nodes—whether they are directly connected, or whether they are only connected through a separate node; (2) centrality in the network—how many direct ties a single node has compared to other nodes in the network; (3) clustering—how tightly connected everyone in the network is to each other; (4) and structural equivalence—two or more nodes are equivalent when they share a similar pattern of relationships, even if they are not connected directly to one another, such as in the case of competitors. Network models of analysis have been used to study many different kinds of issues that involve organizations. Some examples include the influence of network relationships on federal policy making, the role of interlocking members of boards of directors, and the coordination of government and nonprofit organizations in providing publicly funded human services.

NEW INSTITUTIONAL THEORY

The new institutional theory of organizational analysis, primarily associated with sociology but engaged by scholars in many different social science disciplines, relates to but is not the same as institutional theories in economics or the institutionalism talked about in positive theory or regime theory in political science. It is, however, arguably the most influential theory of organizations found in the modern literature. It arose partly in response to scholars Peter R. Berger and Thomas Luckmann's 1966 book *The Social Construction of Reality,* and it focuses on how cultural elements of an organization's environment impact and, to some extent, constrain its behavior.

Scholars working in this area argue that organizational fields—which consist of all organizations operating in a given functional area plus other relevant organizational stakeholders and exchange partners, such as funders, suppliers, and regulators—become highly structured and institutionalized over time in ways that decrease diversity and constrain action.

Institutional rules and expectations are thought to be enforced in three broad ways: (1) Regulative elements consist of material consequences or other sanctions, outlined in rules and laws, for noncompliance with institutional expectations. (2) Normative effects promote conformity through moral order and social obligation, such as when internalized ideas about appropriate action guide behavior. (3) Cultural-cognitive elements guide organizations and their leaders to act in culturally proscribed, taken-for-granted ways. This effect explains the process of how shared understandings lead organizations to discount some forms of action as inappropriate or impossible.

In a classic 1977 paper titled "Institutionalized Organizations: Formal Structure as Myth and Ceremony," sociologists John W. Meyer and Brian Rowan initiated this vigorous line of research when they pointed out that institutionalized rules regarding work practices, policies, and technologies function as myths in organizational fields, to which organizational members must conform. They argue that many organizations conform in ways that are more ceremonial rather than functional, however, create divisions between formal structure and everyday work activities, which are only loosely coupled.

This argument was followed up by an influential 1983 article by scholars Paul W. DiMaggio and W. W. Powell, "The Iron Cage Revisited: Institutional Isomorphism and Collective Rationality in Organizational Fields," in which they explore why there is so much homogeneity rather than variation in organizational forms and practices. They argue that there are three different forms of isomorphism—the process by which organizations come to resemble one another—and that organizations are susceptible to each in their efforts to be seen as legitimate members of an organization's field. Isomorphism guides organizational practices and decision making even when it is not necessarily the most efficient course of action, because it confers legitimacy, which in turn helps grant the organization access to the resources it needs. The three forms are coercive, mimetic, and normative. In coercive isomorphism, pressure is exerted upon an organization by political influence, by other organizations on which they are dependent, or by cultural expectations that are impossible to violate. In mimetic isomorphism, organizations imitate the practices of other successful members of their organizational field. Organizations may frequently do this under conditions of uncertainty or goal ambiguity. In normative isomorphism, processes of professionalization occur; many organizational fields are dominated by professionals who have already been socialized into certain understandings of what legitimate action entails in a given industry.

Research in the new institutionalist tradition has largely focused on problems stemming from these arguments, such as how organizations acquire and maintain legitimacy, the process of social reproduction, and the impact of these processes on organizational and field-level practices. Over time, however, critics came to argue that new institutionalists did not explain sufficiently how organizational actors work to change their environment. Critics thus suggested new institutionalists

needed to engage more with the concepts of agency and power. More recent work has tried to address these concerns with the recognition that some organizational fields feature competing logics from which individual organizations can choose, as well as a recognition that organizations can and do often choose how to respond to institutional pressures, and they do not always do so in strictly isomorphic ways.

EMERGING FIELDS OF STUDY

This long and fruitful history of research and theorizing has produced a substantial body of literature on organizations. Sociologists W. Richard Scott and Gerald F. Davis, in their 2007 book *Organizations and Organizing: Rational, Natural, and Open System Perspectives,* point out several trends in the world of organizations to which scholars will need to pay increasing attention. These trends include an increasingly mobile workforce, increased interdependence between organizations, the breakdown of traditional distinctions between the non-profit, for-profit, and public sectors, and changing modes of communication due to changes in information technology. Improvements in transportation and an increased focus on global markets and development have made organizations themselves more mobile as well. These developments have resulted in the fact that organizations have changed over the years, as have the theories used to study them, but they have not diminished in significance. Organizations remain a singularly important component of economic, political, and social action, and their study remains an exceptionally productive and interdisciplinary line of social science research.

Organized Crime and Mafia

The United Nations Convention against Transnational Organized Crime defines organized crime as "structured groups of three or more people acting in concert to commit one or more serious crimes for material benefit." However, many criminologists suggest that this definition is too simplistic, as street gangs and white-collar criminals could fit this description. Street gangs are usually not classified as a form of organized crime because they are not organized enough, nor are their primary aims to accumulate and reinvest capital. Likewise, white-collar criminals do not appear to use deliberate violence to maintain territorial dominance, nor are they structured in a manner that allows the continual perpetuation of their activities, even if certain members of the organization are arrested or otherwise removed.

Thus, a criminological definition of organized crime might add the following characteristics to the United Nations (UN) definition: the deliberate use of violence to maintain territory and protect interests, the accumulation and reinvestment of capital, and a hierarchical structure that allows for durability over time, regardless of the removal of certain members.

Transnational organized crime has globalized alongside the globalization of the world economy. Trade agreements and unions have created new markets as well as easier movement between these markets. A major feature of organized crime groups or syndicates is their adaptability to change. As the world becomes increasingly globalized, so does organized crime.

Despite the vast array of activities engaged in by organized crime groups in today's global world, four common activities appear to be trafficking illicit goods, extortion, human exploitation, and money laundering. Throughout history, organized crime groups have thrived from supplying illicit goods on the black market—including supplying alcohol during Prohibition to the current illegal trafficking of firearms, illicit drugs, stolen vehicles, people, and diamonds or gemstones.

Another central activity of organized crime groups, extortion, involves forcing individuals or businesses to pay portions of their profits in exchange for protection. If the individuals or businesses refuse or are unable to pay, they face threats of physical or financial harm. Extortion has been widely represented in mafioso films, whereby the local organized crime syndicate goes around collecting money from all of the businesses in their territory in exchange for protection or vigilante justice. A third common activity of organized crime groups is human exploitation, which can take several forms, including the trafficking of women and children for sexual purposes, worker exploitation, and debt bondage. According to the United Nations, the trafficking of human beings—the transportation and harboring of human beings by means of coercion and abduction, primarily for the purposes of sexual exploitation or prostitution—has become one of the most serious forms of crime in the modern world. Some victims, who are essentially enslaved through human trafficking, might be forced to work under exploitative conditions in workshops or agricultural settings. Debt bondage is one of the primary means by which people become enslaved into trafficking. Individuals, families, or businesses unable to pay back a high-interest loan from an organized crime group offer themselves, their wives, or their children to participate in prostitution or carrying drugs and other illicit goods across borders.

A final common activity of organized crime groups is the laundering of money. Through both legal and illegal enterprises, organized crime groups can generate millions, even billions, of dollars of revenue. However, to avoid the scrutiny of law enforcement these groups must ensure that money appears to have been legally earned so it must be passed through legitimate sources. Money laundering is done primarily through three main steps: placement, layering, and integration. Placement involves putting the dirty money into the legitimate market, such as buying an expensive painting or car in cash. Layering then involves moving further from the dirty money by selling the goods to buyers with legitimate money. This legitimate money can then be reinvested, which is what is referred to as integration.

Oriental Despotism

Throughout the history of political thought, non-European civilizations have become a part of major philosophical debates in Europe concerning government, economics, and religion. Within this context, the concept of oriental despotism was mainly developed by European thinkers to explain the economics and politics of non-European civilizations.

Since ancient Greek philosophers Plato and Aristotle, the terms *despot* and *despotism* have been associated with either the relationship between master and slave or the forms of oriental political organization. Despotism, a form of government dependent on a single authority, is an obscure concept of the pre-twentieth-century political thought and is today considered an archaic concept in academia. However, the concept of oriental despotism as a despotic form of government that opposes Western tradition has continued to evolve in Western political thought.

The social thinkers of the Age of Enlightenment during the eighteenth century discussed oriental civilizations. During the Enlightenment, the core components of oriental despotism were the following: first was the idea of an agrarian despot emperor; second was the empirical belief that such despots were to be found only in the Orient. French political thinker Charles-Louis de Secondat, Baron de Montesquieu, argued in his 1748 *Spirit of Laws* that of the three kinds of government—republic, monarchy, and despotism—all Asian societies were unequivocally in the last group. Following Montesquieu, most European thinkers commenting on Asia accepted the thesis of oriental despotism, and the concept became one of the commonplaces of Western political thought in the later Enlightenment. François Quesnay, the French leader of the philosophical school called the physiocrats, described China as an example of despotism in his work entitled *Despotism in China* (1767).

During the nineteenth century, theoretical attention focused on locating despotism and other political forms as stages in a scale of human progress. Within the context of evolutionist conceptions, despotism was regarded as a necessary step on the road to freedom. The location of despotism as an early stage in the evolution of societies was especially prevalent in late-Enlightenment German writings, such as those by Immanuel Kant, Johann Gottfried Herder, and G. W. F. Hegel. Kant described some of the Asian states as despotic and shared the emergent sinophobia of the late Enlightenment in Germany. On the other hand, Herder overtly associated agricultural work, and the prevalence of the agricultural phase of human development, with despotism. For both German philosopher Karl Marx and Hegel, despotism retained its negative connotations, particularly since Hegel's politics and philosophy are partially indebted to Montesquieu. Marx developed the idea of oriental despotism into his theory of the Asiatic mode of production, in which he asserted that there was no private property but rather a despotic, centralized state that controlled indispensable public goods like irrigation. Asiatic society was based on the idea of self-sufficient villages that preserved the unchanging mode of production. Marx's main examples for his theory were India and China. Britain played two contradictory roles in India, according to Marx. While destroying India through exploitation, Britain caused a social revolution and triggered the annihilation of the Asian mode of production in India.

In the twentieth century, German philosopher Karl Wittfogel revamped the concept of oriental despotism in *Oriental Despotism: A Comparative Study of Total Power* (1957) by attempting to establish the idea of a distinctive, non-Western system of despotic power. He has interpreted communist totalitarian regimes as much more despotic variants of oriental despotism. Wittfogel argued that the transition from feudalism to oriental despotism was prompted mainly by the expansion and intensification of agriculture by means of large-scale irrigation, control that necessitated coordination by a centralized state. This so-called hydraulic hypothesis states that irrigation is a major cause of the emergence of centralized political authority and is thus a significant force in the development of early civilizations. Wittfogel developed this thesis in relation not only to China but also to the wider Marxist arguments about the Asian mode of production.

More recently, discussions over the concept of oriental despotism have been devoted to pejorative images of the Orient associated with the concept of despotism. Controversy has centered on Western philosopher Edward Said's *Orientalism* (1978), which has been criticized as neglecting the history and function of despotism, both as a regime type and as a political concept.

Original Intent

Original intent, often used as a synonym for originalism, is the doctrine holding that judges have no power to interpret foundation documents or constitutions except in accordance

with the intent of the people who created them. In theory, while any court can use it as a method for interpreting any constitution, the doctrine has generated the most controversy more generally in terms of how courts should interpret the U.S. Constitution.

HISTORY

The Framers of the U.S. Constitution aimed for original intent to apply in courts and required the judges to be bound by it. Although they knew that this application of the document to specific cases would require interpretation of the text, they did not prescribe any specific interpretive method. From the beginning, judges often considered the intent of the Framers when they applied the Constitution, but they used other interpretive methods as well. Neither scholars nor judges gave much thought to interpretation in the abstract until the 1980s; only then, and only gradually, did the words *originalism* and *original intent jurisprudence* replace such synonyms as *interpretivism* and *intentionalism* in legal writing.

In the 1960s, the activist Supreme Court led by Chief Justice Earl Warren declared certain common government activities unconstitutional, such as prayer ceremonies in public schools. To conservatives, it seemed unthinkable that the Framers intended to forbid such things; consequently, they called for a return to the original intent. If judges ought to be bound by that intent, then the school prayer decisions, and other Warren court innovations, were wrongly decided and a later court could overrule them. From the beginning, political figures such as former attorney general Edwin Meese III and former appellate judge Robert H. Bork led the originalist movement. Justices Antonin Scalia and Clarence Thomas are other leading adherents of original intent as are many members of the Federalist Society, a conservative membership organization dedicated to legal reform.

SUPPORTING VIEWS

Originalists argue that constitutional interpretation ought to be controlled by original intent because the U.S. Constitution is a contract—a deal between the rulers and the ruled—and courts always interpret contracts in light of the intentions of their makers. Moreover, the Constitution is the social contract, creating the government, authorizing it to use some powers, and explicitly denying it the right to use others. The government, supporters believe, has no powers except what the Framers agreed to in 1787. A court decision not in line with the intent of the Framers risks giving government more power than it is supposed to have.

The most serious violation of original intent, originalists argue, is the expanded role of the U.S. Supreme Court itself. The Framers intended the three branches to be in balance, and the federal government to be in balance with the states. But in the twentieth century, the Supreme Court took on the power to strike down long established and popular state and federal laws (e.g., those requiring school prayer), greatly diminishing the power of the other branches and levels. Neither public opinion, nor constitutional checks and balances,

nor law itself could control this "imperial court." Instead of balance, originalists perceived judicial supremacy. They argued that since there were no external checks left on court powers, judges had to check themselves. Adopting a rule of original intent, they thought, would bring greater deference to Congress and the states, and a restoration of balance.

Edwin Meese III argues that the Framers had very specific views of how the government was to work, and they left evidence of those views in their voluminous writings. In 2005, Meese and colleagues edited *The Heritage Guide to the Constitution,* which examines the text on a line-by-line basis and tries to recover the intent behind each clause.

However, historians have demonstrated that the Framers were not so precise. They were fairly specific about many of the structural details of the government they were creating, but they left little evidence of the purpose behind some features. Although they recorded some of their views, they conducted the constitutional debates in secret; the deliberations, reconstructed from fragmentary notes, may have distorted or omitted some of their original intent. In some cases, they also disagreed on how the government was to work. Sometimes they used vague phrases such as "in accordance with due process" precisely because they could not agree. Finally, it is impossible to determine how they thought the government should relate to total war, space exploration, organ transplants, or other recent innovations.

Realizing these difficulties, most contemporary originalists follow Robert Bork in asserting that there are general principles that the Framers followed when they created the government rather than trying to find some literal meaning behind each clause. These principles, such as respect for individual autonomy, remain applicable. In Bork's view, the task of an originalist is to find and apply these principles to how the government deals with new problems. If the Framers expected their respect for individual autonomy to forbid unreasonable searches in the home, where people feel secure, then the rule can be applied to police searches of automobiles as well. In legal thought, *original intent jurisprudence* thus gives way to original principles, original values, original meaning, original public meanings, or objectified intent. In this form, it figures in contemporary debates over interpretation.

OPPOSING VIEWS

Scholars who generally support the idea of a living, or evolving, U.S. Constitution oppose the originalists' views. Justices Oliver Wendell Holmes and Louis Brandeis, and also President Woodrow Wilson, are considered early advocates of the living Constitution. Justice William Brennan, who strongly endorsed the concept of the evolving Constitution, followed these early scholars. Evolutionists argue that the Constitution, as a social contract, is different from an ordinary promissory note. It is law, but it is also more than law; judges apply it, but it must win the allegiance of people who will obey it willingly and perhaps risk their lives for it in war. In the final analysis, evolutionists contend, the Constitution is not authoritative because Alexander Hamilton and James Madison swore

allegiance to it; it is authoritative because the generation now living accepts it. Therefore, the Constitution must adapt itself to the values of the living.

Ortega y Gasset, José

José Ortega y Gasset (1883–1955) of Spain was a leading philosopher during the first half of the twentieth century. He had a considerable influence on the works of other sophisticated thinkers such as German philosopher Martin Heidegger, but his ideas and publications were also accessible to larger sections of educated citizens not necessarily trained in technical philosophy.

Ortega was born in Madrid, Spain, into a family with a liberal and patrician background. He was educated at a Jesuit college and the University of Madrid, where he was awarded his doctorate in philosophy in 1904. He then went to Germany and spent the next five years in universities in Berlin, Leipzig, and Marburg. In 1910, Ortega was appointed professor of metaphysics at the University of Madrid, where he taught until the outbreak of the Spanish Civil War (1936–1939), at which time he went into exile. He returned to Spain in 1945 and died in Madrid ten years later. In addition to being a prominent philosopher and social thinker, Ortega was also a prolific writer and an active journalist and politician during the Second Spanish Republic (1931–1939).

For Ortega, the task of the philosopher is to propose new ideas and to explain reality, leaving behind previously existing beliefs and prejudices. He put forward the idea that human beings are nothing without the social milieu around them, or, as he put it: "Yo soy yo y mi circunstancia" (I am myself and my circumstance.) In this sense, life is the result of the interaction between freedom and constraints. Humans ought to be active in order to create a "project of life" and, by so doing, avoid a conventional life of habits and preestablished structures.

In his *The Revolt of the Masses* (1929), Ortega's focus of attention is the *mass-man* and the new forms of meanness and brutal behavior that he saw as the result of changes in the social structure of contemporary times. As a consequence of these changes, mass-men lack the mediation of the traditions and institutions of civility and, in situations of acute crises, they engage in frenzied and destructive activism against the political parties they dislike, which is contrary to what creative action is meant to be. Mass-men take the state for granted and do not regard it as the creation of centuries of civilization and, in modern times, the product of a certain bourgeois rationality which seeks to guarantee freedom, privacy, and social variety. Mass-man is a barbarian, yet this barbarity is based on the technological phenomenon of the specialization of knowledge. There is a correlation between the increase of the aggregate body of knowledge and the increase of the relative ignorance of the human beings. For Ortega, the specialist as a "learned ignoramus," not the proletarian, is the epitome of the mass-man.

Ortega coined the expressions *razón vital* (vital reason), referring to a new dimension of reason that has life as its paramount basis, and *raciovitalismo* (rational vitalism), a theory in which knowledge is based upon the reality of life, one of the essential components of which is reason itself. To Ortega, reason is essential to plan and develop the project of life, and vital reason is also historical reason, as individuals and societies cannot detached from their past. It follows from this perspective that, in order to comprehend reality and create a future for themselves, human beings need to look into the past and understand their history.

Orthodoxy in Political Thought

The contribution of Eastern Christian Orthodoxy to political thought is often either ignored or simply dismissed by Western scholars convinced that, because its historical experiences have

no exact parallels in the modern Catholic and Protestant traditions, Orthodoxy was unable to formulate a coherent position towards politics, law, and society. While Eastern Europe did not directly experience the Reformation or the Enlightenment, Orthodoxy did encounter modernity, totalitarianism, and democracy.

The meeting of Orthodoxy with modernity began in Russia during the reign of Peter the Great (1682–1725) and expanded once Russia emerged as a dynamic European cultural center and smaller Orthodox nations won their independence from the Ottoman Empire. As a result, a broad and rich discourse about church, state, and society was cultivated in Orthodox circles. Many leading Orthodox thinkers dealt with fundamental questions of law, politics, society, and human nature with novel insights, often giving distinct readings of the biblical, apostolic, and patristic sources. In the twentieth century, the advent of communist regimes in the predominantly Orthodox Russia, Ukraine, Serbia, Romania, and Bulgaria stifled intellectual debate, restricted religious instruction, censored religious publications, and thus deprived Orthodox thinkers of their audience. Orthodox churches were dismantled or co-opted by communist states, and many Orthodox theologians served long prison sentences for resisting state-sponsored antireligious campaigns. The collapse of the communist regimes in the Soviet bloc between 1989 and 1991 revitalized Orthodox intellectual debate regarding those countries' totalitarian past and democratic future.

Of all Orthodox countries, Russia has had the richest intellectual tradition, drawing on the writings of the church fathers or modern Western philosophy to wrestle with the situation of Orthodoxy in the global civilization produced by the scientific and political revolutions of the Enlightenment. The first Russian Orthodox modern theologian, Aleksandr Bukharev (1824–1871), was also the first to discuss the challenge modernity posed to the church as defender of the "right" faith. Philosopher Vladimir Soloviev (1853–1901) worked out an intricate philosophy of law that grounded law and political order in morality, anchored morality directly in a Christian theology of salvation, and mediated between Orthodox tradition and modern critical thought. An outspoken proponent of reconciliation, *sobornost*, between the Orthodox and Catholic Churches, Soloviev preferred social pluralism to the traditional Orthodox theology of theocracy, which tied church, state, and nation into an organic whole. Communist authorities were little inclined to tolerate independent intellectuals, so in 1922, prominent Orthodox thinkers Sergii Bulgakov, Nicholas Berdyaev, and Vladimir Lossky were driven into exile from Russia. Bulgakov (1871–1944) built on his experience as an economist to develop a comprehensive theology of God's humanity and a philosophy of economy. Some of his most important books were published in Paris and remain relevant for current debates on the engagement of intellectuals in political life; the theology of the wisdom of God, or *sophiology*; and even land privatization in Russia.

Berdyaev (1874–1948) worked out a complex new theology of human nature anchored in an ethic of creation, redemption,

and law, and an original theory of human dignity and salvation grounded in the Orthodox doctrine of deification, or *theosis*. Lossky (1903–1958) formulated a new theory of human dignity, freedom, and discipline anchored in the Orthodox doctrine of the Trinity, and he challenged the church, compromised by association with the repressive communist regime, to reclaim the freedom to discharge divinely appointed tasks. A significant, but lesser known, contribution to Orthodox thought was made by Romanian theologian Dumitru Staniloae (1903–1993), who drew on the works of the church fathers to build a theory of the meaning of human freedom and sinfulness, including the symphony of natural and supernatural sources of law and authority. Despite spending long years in communist prisons and suffering prolonged persecution, Staniloae had little to say about the political compromises of the Romanian Orthodox Church during communism and supported Romanian ethnic nationalism.

Since democracy has returned to formerly communist countries, theologians have debated the role of the church in democracy and the European Union (EU) enlargement process; the morality of new reproductive methods and the legalization of homosexual behavior; the proper relationship between church and state and between minority and majority religious groups; and the role of the state in defending traditional religions, while faced with increased competition from new religious movements. While Orthodox theologians from different countries have joined in the debate, to date none has proposed a coherent political theology. Orthodox theologians and Orthodox churches prefer to stress the persecution they suffered at the hands of the communist regimes and are reluctant to consider critically the role of the church in aiding and abetting repression and in persecuting smaller denominations.

During the late 1990s and early 2000s, the most vigorously debated topic within Orthodox circles was *symphonia,* the Byzantine concept of theocracy also known as Caesaropapism. The concept traditionally described ties between the state and the Orthodox churches, which faithfully upheld it after the collapse of the Byzantine Empire in 1456. Symphonia presupposed the existence of a Christian emperor who stood at the center of the Christian Empire and at the helm of the church. For Eusebius of Caesaria (260–340), the Christian emperor was God's representative on earth, a position reminiscent of the ancient Roman institution of the god-emperor, who played the role of *pontifex maximus* (high priest) in the state cult. On the one hand, the church recognized the emperor as protector of the church and preserver of the unity of faith, and limited its authority to the spiritual domain; on the other hand, the emperor was subject to the spiritual leadership of the church as far as he was a son of the church. While some Orthodox theologians maintain that symphonia is hardly appropriate for democratic, religiously pluralist countries— either because the society is unwilling to grant churches so much power or because a strong church-state relationship would benefit the state but compromise the church—other clergy members insist that the state should maintain privileged ties to the Orthodox Church leadership.

Orwell, George

George Orwell was the pseudonym of Erich Arthur Blair (1903–1950), a journalist, essayist, literary critic, and novelist. His writing career culminated in the dystopia presented in his novel *Nineteen Eighty-Four* (1948), originally titled *Last Man in Europe.* Although *Nineteen Eighty-Four* received mixed reviews, it continues to be widely read and has contributed new words and phrases to the modern vocabulary of politics. These include *doublethink*, an ability to embrace two contradictory beliefs simultaneously; *newspeak*, a partisan tool for limiting thought by eliminating undesirable words or concepts; *Big Brother*, a name for autonomous, unaccountable governmental authority; and *Orwellian*, referring to any idea or action incompatible with a free society.

Erich Blair was born in India on June 25, 1903. Most of his youth was spent in a private preparatory school in Sussex, England. After attending Eton College on a scholarship, he took up his father's profession and joined the Indian Imperial Police force. However, his distaste for British imperial rule, coupled with an intense desire to be a writer, led him to abandon a career in the civil service. After resigning from his post in 1927, Blair lived in the East End of London and in the slums of Paris, the gathering places, he later wrote, as quoted in the 1956 *Orwell Reader,* "for eccentric people—people who have fallen into solitary, half-mad grooves of life and given up trying to be normal or decent." Poverty, he believed, had freed "them from ordinary standards of behavior, just as money frees people from work." These experiences living and working among the poor provided material for Blair's first book, *Down and Out in Paris and London* (1933). It was the first of his nine books published under the pen name George Orwell.

By the mid-1930s, Orwell had established himself as a journalist and political writer. In *The Road to Wigan Pier* (1937), he vividly described the poverty in England's industrial north. He also declared his commitment to the values of socialism, even while remaining critical of socialism's disciples. When war broke out in Spain, he set aside his political differences with fellow socialists and traveled to Barcelona to join the Marxist Workers' Party (POUM) militia in their fight against fascism. A few months later, when the communists began their purges of the leftist party, he was forced to flee Spain. After arriving in France in 1937, Orwell began writing *Homage to Catalonia* (1938). Fellow left-wing intellectuals, who regarded the

communists as war heroes, took issue with Orwell's account of events in Spain. Although a life-long socialist, Orwell continued to distance himself from the British radical intelligentsia, many of whom, he thought, had blindly accepted communist doctrines. His satirical novel *Animal Farm* (1945) used allegory to further attack the Russian Revolution (1917) and the Communist Party's subsequent betrayal of socialist ideals.

After World War II (1939–1945), the world appeared to Orwell to be headed for disaster, and he sought to change the course of events by inventing a language that might enable its inhabitants to better grasp their predicament. He started the first drafts of *Nineteen Eighty-Four* in early 1947, laying out a futuristic totalitarian world. After the novel's publication in 1948, it became, for many of his readers, not how far away society was from the physical and psychological brutality of Orwell's imaginary Oceania, but how close the approximation was. Orwell died from tuberculosis in a London hospital on January 21, 1950.

Otsuka Hisao

Japanese economic historian Otsuka Hisao (1907–1996) was the founder of the Otsuka School of Economic History, which represents a convergence of Marxism and the sociology of Germany's Max Weber. The focal point of Otsuka's studies was the analysis, from an Asian standpoint, of the development of modern capitalism and the transition from a semifeudal society, as occurred in Japan, to capitalism. His studies were designed to provide a theoretical basis for understanding the distortions in Japanese political development that led to the country's ill-fated military adventures before World War II (1939–1945). In his university days, Otsuka came under the influence of Japanese religious philosopher Uchimura Kanzo and was converted to Christianity, which informs much of his scholarship. Otsuka served as a professor at Hosei University, Tokyo Imperial University, and the International Christian University in Tokyo.

Otsuka's scholarly studies went through five phases. His early studies are explored in his first book, *On the Category of So-called Early Capital* (1935), which describes the transformation of mercantile and usury capital common in underdeveloped societies to industrial capital found in advanced economies. In the second stage, Otsuka sought to establish the evolution of modern industrial capital by analyzing English economic history. In *Preface to the Economic History of Europe* (1938), he used the case study of weaving and textile making in English villages, towns, and manors to examine the reasons for the successes of the Industrial Revolution in England. He continued his studies on the genesis of capitalism in *The Ancestry of Modern Capitalism* (1946). Before the third stage of his studies began, Otsuka became an admirer of Max Weber's classic *The Protestant Ethic and the Spirit of Capitalism* (1904), and he produced *The Position of Commerce in the History of the Development of Capitalism* (1941) and its sequel, *Introduction to the Economic History of Modern Europe* (1944). Otsuka pursued these ideas in two more books, *The Ancestry of Modern Capitalism* (1946) and *Religious Reform and Modern Society* (1948), in which he offered his own insights into the nature of not only Western forms of capitalism but also the Japanese state, which was becoming more hostile to liberal ideas.

In his fourth period, Otsuka concentrated on the intersection of economics and politics. In his *Basic Theory of the Kyodotai* (1955), he used the peculiarly Japanese concept of *kyodotai* (community) to investigate the basic processes that facilitate the division of labor in an economic society, along with the resulting emergence of economic classes within a primitive community. Here he reflected the ideology of the prewar communist faction, the Kozaha. In the 1960s, as he was nearing retirement, Otsuka was heavily involved in the protest movements against the United States–Japan Security Treaty. During this fifth phase, he published *Religious Reform and Modern Society* (1961), in which he combined German revolutionary philosopher Karl Marx's concept of alienation and Weber's concept of domination to produce a withering critique of the ossified bureaucracy that dehumanizes modern society. In *The Method of Social Science* (1966), Otsuka applied sociological analysis to the development problems of the third world.

Otsuka's last book was *The Spirit of Capitalism: The Max Weber Thesis in an Economic Historical Perspective* (1976). His complete works were later published in ten volumes.

Oversight

Ever since U.S. president George Washington recognized that "the House is an inquest" while Congress sought to review activities in the departments of the Treasury, war, and foreign affairs in the 1790s, Congress's right to oversee the executive branch has been common knowledge; that is, Congress reviews the decisions made and the processes used to make them. Oversight plays a potentially important function in a chain of accountability linking the public to public policy decisions; in theory, oversight can align the otherwise conflicting interests of legislators and agencies. Whether that potential is realized depends on when Congress performs oversight and on the effects it has on agencies.

OCCURRENCE AND FUNCTION

The Legislative Reorganization Act of 1946 charged Congress with exercising "continuous watchfulness" over executive organizations carrying out the law. But conventional wisdom pointed to a dearth of oversight in practice. Two simultaneous currents in the literature, one empirical and one theoretical, challenged this view in the 1980s.

First, Mathew McCubbins and Thomas Schwartz's 1984 landmark paper, "Congressional Oversight Overlooked: Police Patrols vs. Fire Alarms," distinguishes two types of oversight: *police patrol*, which they liken to a beat cop watching out for transgressions before problems arise, and *fire alarm*, which they compare to firefighters called to address problems only after they are recognized. McCubbins and Schwartz contend that legislators can and do empower interest groups to observe and participate in agency proceedings and trust these groups to "pull a fire alarm" to alert Congress to problems requiring congressional attention. They also argue that both the fire alarm approach and police patrol model can ensure agency

accountability, but the fire alarm approach is more efficient for Congress, given the opportunity cost of legislators' time.

Second, Joel Aberbach's important empirical analysis, *Keeping a Watchful Eye* (1990), established that on-the-record oversight, in the form of hearings of congressional committees, does in fact occupy a substantial and growing share of Congress's time. Aberbach's overall time series findings have held up well in subsequent analyses with more recent data sets and alternative statistical models, such as his 2002 article "What's Happened to the Watchful Eye?" and Sean Gailmard's 2007 paper "Oversight and Agency Problems in Legislative-Bureaucratic Interaction." This literature makes clear that time spent on oversight hearings increases under divided government and with increased federal bureaucratic activity (e.g., the volume of new regulations issued), while—controlling for other factors—resources such as committee staff have little effect. Nevertheless, even accounting for these factors, oversight activity strongly tends to increase over time for reasons not fully explained in the literature.

Oversight in congressional committees comprises one important channel of oversight. Government Accountability Office (GAO) investigations provide another. The GAO is a nonpartisan staff agency of Congress created in 1921 (originally as the General Accounting Office) to audit expenditures and analyze programs implemented in the executive branch. In her 2007 report, "Auditing Politics or Political Auditing?" Anne Joseph O'Connell documents that congressional requests for GAO studies increased dramatically in the 1970s and again in the 1980s. Together with Aberbach's work on committee hearing activity, these findings indicate a marked increase in congressional oversight of the executive branch from the 1970s to the early 2000s.

EFFECTS

Research on determinants of oversight does not in itself identify effects of oversight on executive organizations. Suggestions as to these effects are provided by (among others) Barry Weingast and Mark Moran in their 1983 article "Bureaucratic Discretion or Congressional Control: Policymaking by the FTC." In this work, they show that decisions of the Federal Trade Commission (FTC) respond to changes in ideology on congressional committees with jurisdiction over the commission. There are a variety of tools Congress could use (e.g., agency or program funding, agency statutory authority) to assert its will in this sense following oversight, though evidence that ties effects on agencies, or their responses, specifically to congressional oversight is largely circumstantial.

Broadly speaking, oversight can reveal two types of information about agencies to Congress: it can bring to light agency actions that would otherwise be unobserved, and oversight can reveal information that agencies possess about benefits of alternative policy actions, or about costs of maintaining programs, to legislators. Regarding agency actions, if agencies anticipate negative repercussions from taking actions congressional overseers do not favor—actions that will be revealed in oversight—they are less likely to take those actions in the first place. Regarding

agency information, in their 1992 article "The Political Control of Bureaucracies under Asymmetric Information," Jeffrey Banks and Barry Weingast contend that, by revealing information about agency costs of maintaining programs, oversight can limit inefficiencies. In their 1993 article "A Signaling Theory of Congressional Oversight," Charles Cameron and Peter Rosendorff note that oversight can also send information from Congress to agencies. They argue that oversight signals a committee's level of interest in a policy to the bureaucracy and therefore its commitment to follow up on implementation problems. This can itself motivate better agency performance.

Finally, Gailmard, in his 2009 essay "Discretion Rather than Rules: Choice of Instruments to Constrain Bureaucratic Discretion," and Ethan Bueno de Mesquita and Matthew Stephenson, in their 2007 "Regulatory Quality under Imperfect Oversight," note that oversight does not lead to greater agency accountability in any simplistic way. Gailmard points out that agencies anticipating oversight may have less incentive to reveal policy-relevant information through their regulatory policies than relatively insulated, "oversight-proof" agencies. Oversight can allow Congress to apply revealed information to meet goals the agency does not necessarily prefer, giving agencies incentives to conceal information more deeply. Bueno de Mesquita and Stephenson contend that oversight can cause agencies to allocate effort toward observable tasks and away from unobservable ones—because only the former can inform the reactions of the overseer—but this can lead to lower quality policy than if there were no oversight at all.

Owen, Robert

Robert Owen (1771–1858) was a successful nineteenth-century Welsh industrialist, philanthropist, and social reformer who invested his large fortune in creating a workers' utopian community in America. Owen believed that factory workers were helpless victims of capitalist society. Nonetheless, his writings held out the hope that *rational* human beings could and would change their circumstances.

Owen was born in Newtown, Wales, on May 14, 1771. At the age of ten, he was sent to work in London. After his apprenticeship to a draper, he quickly moved up from a shop assistant to managing a cotton-spinning mill in Manchester. Owen then served on Manchester's board of health in 1786 and witnessed the inhumane working conditions of many factories, which reinforced his belief that bad social institutions corrupted human beings. He saw the factory workers as innocent victims of an industrial system that drove them to drunkenness and impropriety.

In 1812, Owen became the predominate manager and owner of the cotton mills at New Lanark, the largest textile factory in Scotland. He enhanced New Lanark's existing reputation as one of the more humanely managed factories in the British Empire by improving employment conditions for child laborers, who numbered nearly three thousand of the mill's roughly fourteen thousand workers. He stopped the practice of hiring pauper children, reduced the children's working hours, and saw to their education. He also required supervisors to maintain "books of character" on all factory workers. No pubs were permitted in the village, and fines were imposed for drunkenness. Within a short time, public interest in Owen's philanthropic paternalism grew, and the village and factories of New Lanark received thousands of visitors, including cabinet ministers and foreign dignitaries.

Despite his success at New Lanark, Owen was dissatisfied with the slow progress of reform. By 1817, he became convinced that the entire economic and social systems were corrupt, including the institutions of marriage and organized religion. He published his first utopian plan in a *Report to the Committee of the Association for the Relief of the Manufacturing and Labouring Poor* (1817). He called for the creation of workers' communities, where all shared equally in the wealth produced. In 1824, Owen left New Lanark and sailed for America, hoping to build a model community of unity and mutual cooperation in New Harmony, Indiana. Despite Owen investing nearly his entire fortune on the social experiment, New Harmony ended in disaster, and he left America.

After returning to England, Owen gained a new following among the literate working classes. For a few months in 1834, he led the national federation of trade unions and continued to draft proposals for a new society. The so-called Owenites, encouraged by their benefactor, publicized their socialist proposals in various journals, including the *New Moral Order.* At the height of Owen's influence during the 1830s and 1840s, *Owenism* was virtually synonymous with British socialism.

Toward the end of his life, Owen became a spiritualist and published *The Future of the Human Race* (1853), in which he predicted the coming of a peaceful revolution through the intervention of "departed spirits of good and superior men and women," including poets Lord Byron and Robert Burns, Thomas Jefferson, and the Duke of Wellington. Owen died on November 17, 1858, near his birthplace in Newtown.

Pacifism and Conscientious Objection

Pacifism is the belief that humanity can live peaceably whilst rejecting warfare as a means of settling disputes. It is the belief that violence is morally wrong, and that conflicting interests can be mediated through exclusively nonviolent means. Conscientious objection to military service is the natural outworking of opposition to war and violence.

THE HISTORY OF PACIFISM

Pacifism has a long history dating back at least to the first century and the teachings of Jesus. In the Sermon on the Mount, followers are exhorted to be peacemakers, not killing or resisting "one who does evil" but rather turning the other cheek and loving their enemies (Matthew 5). The early church followed this instruction until becoming the official religion of the Roman Empire. Thereafter, mainstream Christian theologians, including Augustine and Aquinas, recognized the right of rulers to go to war but constrained the parameters for appropriate initiation and implementation of warfare. Just war theory prescribes the circumstances in which countries can go to war, *jus ad bellum,* and the conduct that is acceptable in war, *jus in bello.* This tradition provides the foundation for subsequent international treaties on warfare, including the United Nations (UN) Charter. This theory is anathema to pacifists, however, who contend that all war is wrong.

Anabaptists and Mennonites have upheld the Christian tradition of pacifism since the sixteenth century; they advocated separation from the world and nonviolence. In subsequent centuries, Quakers and the Brethren have joined these groups, arguing and campaigning for nonviolence and against war. The Quaker peace testimony, the denomination's response to war, has been influential in American and British society and includes active participation in peace and reconciliation initiatives throughout the world. Quakers worldwide and the American Friends Service Committee, for example, established the Quaker Peace Network Africa in 2000, dedicated to preventing violent conflict across the continent.

These earlier initiatives informed the establishment of the peace societies that emerged in the nineteenth century. These campaigns centered on five interdependent and interrelated concepts: peace could be advanced and defended by arbitration, treaties and clauses in treaties, international authority, codifying international law, and disarmament. Throughout the nineteenth century, pacifism made faltering progress, with the first International Peace Congress convening in London in 1843, and an Inter-Parliamentary Union in 1892. Both shared the goal to advocate for peace, but progress was frustrated by the prevalence of war throughout the century.

Christian organizations were joined by socialist antimilitarists in the second half of the nineteenth century, as the latter group declared that war was a vehicle of organized capital that was opposed to the interest of labor. Nevertheless, organized labor overwhelmingly responded to appeals to country, rather than class, in abandoning pacifism during World War I (1914–1918).

Conscription then led the peace movement to support conscientious objection. In addition, the horrific death toll during the conflict led to international calls for an end to war. President Woodrow Wilson then produced the Fourteen Point Plan, calling for the elimination of conflict; the League of Nations was also formed to maintain international peace. Pacifism thus experienced a renaissance and many nations agreed to renounce war as an instrument of policy and to settle disputes through exclusively peaceful means under the Kellogg-Briand Pact (1928). In India, the independence leader Mohandas Gandhi demonstrated the efficacy of nonviolent resistance to British rule. Inspired by the pacifist teachings of Leo Tolstoy and world religions, Gandhi taught a doctrine of *ahisma,* nonviolence, that was later adopted by Martin Luther King Jr. in the United States.

However, unsuccessful policies of appeasement and the advent of another world war challenged pacifist values as leading advocates, including the English philosopher Bertrand Russell and the German physicist Albert Einstein, supported the war. After World War II (1939–1945), pacifists increasingly concerned themselves with disarmament and played a leading role in campaigns for nuclear disarmament across Europe and the United States. They became actively involved in the antiwar protests against the Vietnam War (1959–1975), and more recently the Iraq War (2003–).

ABSOLUTIST AND PRAGMATIC PACIFISM

Although all pacifists oppose war and advocate peace, there is considerable disagreement over the practical implications of

such a stance. It is probably most helpful to consider pacifism as a continuum with absolutists at one end and pragmatists at the other. Absolutists consider all forms of war and violence as wrong and unjustifiable. At the extreme, this may entail acceptance of violence and injustice suffered while practicing nonresistance, as exemplified by Mennonites and Amish communities. Other absolutists, including Gandhi and King, differentiate between pacifism and passiveness and advocate the use of nonviolent forms of resistance to overcome injustice.

Pragmatists prefer flexibility in their approach to war and violence. Some may oppose specific conflicts but acquiesce or support others—defensive wars in particular. While pragmatists adhere to the general principle of nonviolence, they are prepared to countenance war or violence where the consequences of nonresistance would result in a greater harm; for example, appeasement resulted in much of Europe being subjugated under fascism during World War II. Pragmatists, unlike absolutists, adhere to pacifist principles of nonviolence for themselves but do not insist on them for the rest of society.

CONSCIENTIOUS OBJECTION

Conscientious objection to military service is founded on a consistent opposition to all wars based on moral or religious reasoning. Alternatively, it can be prompted by specific objection to a particular war. The historic peace churches—comprising Mennonites, Quakers, and Brethren—have resisted military service throughout the major conflicts of European and American history including the Revolutionary War (1776–1783), U.S. Civil War (1861–1865), both World Wars, the Korean War (1950–1953), and Vietnam. In the earlier two conflicts, such conscientious objectors could buy themselves out of military service and were required to provide taxes, goods, and services to support the various war efforts. Many refused to do so and were imprisoned or pressed into service. By World War I, the historic peace churches were joined by other religious groups opposed to violence as well as socialists and humanists. In America and Britain, conscientious objectors were required to prove their opposition to all war and if convincing, were able to take part in alternative nonmilitary service. Absolutist objectors, who refused to participate in the war effort in any capacity, were court-martialed and imprisoned. By World War II, civilian public service programs were in place as an alternative to military service for objectors.

Until 1965, conscientious objectors were only excused from the draft if they could prove their belief in God. After 1970, this was extended to include moral and ethical objections, with conscription ending in 1973. Thereafter, regular servicemen and servicewomen have conducted U.S. military operations.

Paine, Thomas

The words and deeds of author and revolutionary Thomas Paine (1737–1809) made him one of the most famous and, in some quarters, infamous defenders of liberty. As political writer and Paine's contemporary, Joel Barlow proclaimed, "The great American cause owed as much to the pen of Paine as to the sword of Washington" (cited in Bratton, 123). Paine, however, believed he was fighting not solely for American liberty, but for the liberty of people everywhere. "My principle is universal," he exclaimed. "My attachment is to all the world and not to any particular part, and if what I advance is right, [it is right] no matter where or who it comes from."

Thomas Paine was born on January 29, 1737, in Thetford, England, into a Quaker family. By the time he met Benjamin Franklin in 1774, Paine had failed to secure a steady job, lost two wives, and was penniless. Franklin advised him to settle in America and provided him with letters of introduction. Paine took this advice, and arrived in Philadelphia in 1774 and became editor for the *Pennsylvania Magazine.* He wrote many critical essays attacking slavery, the anachronism of monarchy, and British colonial rule. He quickly proved himself a popular social critic with a remarkable ability to explain complex issues in a language that ordinary people could understand.

Paine's most celebrated contribution to the American revolutionary cause was his pamphlet *Common Sense* (1774). Using simple arguments, common sense, and easily understood facts, he demanded complete independence of the American colonies from England. *Common Sense* sold several thousands of copies and inspired the Declaration of Independence. Paine refused to accept any money for his revolutionary pamphlet, and instead donated the royalties to General George Washington's army. To boost the morale of American troops during the American Revolution (1776–1783), Paine wrote a series of papers entitled the *American Crisis.* It was in one of these papers that the words "the United States of America" first appeared.

After the war, Paine returned to England in 1787, and turned his attention to defending the French Revolution (1789–1799). His book, *The Rights of Man* (1791–1792), defended the natural rights of individuals against intrusion from the state. He believed only authority resting upon the continuous consent of the people was legitimate. *The Rights of Man* became extremely popular among the common people, which made it all the more subversive. Consequently, Paine
Thomas Paine's pamphlet "Common Sense" urged Americans to declare independence from Britain.

was charged with treason in an English court. On the eve of his arrest, he sailed for France, where he was granted citizenship, but later was jailed and nearly executed, this time by the Jacobin revolutionaries, for opposing the execution of the deposed King Louis XVI. While in prison, Paine wrote *The Age of Reason* (1795). Although it was denounced as an atheist manifesto, the work held that God had blessed human beings with the capacity to scrutinize any religious authority claiming a monopoly on truth.

After James Monroe, minister to France, secured Paine's release from the French prison, Paine returned to the United States only to find himself vilified in the popular press as a liar and a drunk due to the uproar caused by *The Age of Reason*.

Thomas Paine, a British subject charged with treason, a French citizen condemned to the guillotine, and an American patriot ostracized for supposedly being an atheist died on June 8, 1809, in New York City.

Palestine

The name Palestine historically traces as far back, at least, as the writings of Herodotus and applies to the territory between the Mediterranean Sea and the Jordan River (part of a larger area sometimes called Syria). This now includes the state of Israel, which was established in 1948, following the adoption in 1947 by the United Nations General Assembly of a plan (never implemented in its original form) for the partition of Palestine into a Jewish and an Arab state with an internationalized Jerusalem and the West Bank (including East Jerusalem) and Gaza Strip, both of which also came under Israeli rule in 1967 but, aside from East Jerusalem, have not been formally annexed. Proponents for making the whole area a permanent part of Israel sometimes call this, together with other areas ruled since 1967, "greater Israel."

The name, as is apparent from its Arabic form, *Filastin*, is derived from one of its ancient and long extinct peoples, the Philistines. They settled the coastal area in the thirteenth century BCE (at about the same time the Israelites, at least according to the biblical account, invaded the interior of what then was called the Land of Canaan). The variant word *Philistia* is applied in the Old Testament, specifically to the coastal region. Following the end of the Jewish rebellion in 135 CE, the Romans made "Syria Palaestina" the official name of what had been the province of Judea. In subsequent centuries, its precise geographical boundaries have varied considerably, but it has remained the usual term for that geographical region, otherwise known as the *Holy Land* and, by Jews, as the *Eretz Yisrael* (land of Israel), a term that sometimes has included parts of adjacent countries.

Following the Arab conquest in the seventh century, Palestine formed part of various Muslim empires, aside the interregnum of crusader control from the late eleventh century to the late thirteenth century. Its existing population (including Jews) gradually was Arabized, as was the case in adjacent countries, although it always had at least a small Jewish population. Palestine came under Ottoman control in 1516, but much of the country temporarily gained de facto independence during the eighteenth century, when the reach of Istanbul had grown too weak to control it. In the latter years of Ottoman rule, southern Palestine constituted the Sanjak (subprovince) of Jerusalem, while northern Palestine was part of the Vilayet (province) of Beirut.

Although there already had been a growing Palestinian identity among its people, Palestine as a political entity dates back to the post–World War I (1939–1945) peace settlement, when the country was assigned to Great Britain as a Class A mandate under the newly created League of Nations. The mandate included a provision for developing a Jewish national home in Palestine while respecting the economic and civil

rights of others (i.e., the Arab Palestinians, who constituted about 90 percent of the population).

Although the area east of the Jordan River (i.e., Transjordan) originally was included in the Palestine mandate, it was governed separately and came under the rule of the Hashimite Emir (and later the king) Abdullah in 1921. While Transjordan technically remained part of the Palestine mandate until its formal independence in 1946, the term *Palestine* came to be applied specifically to the area west of the Jordan River, and the only people in Transjordan (today's Jordan) known as "Palestinians" are those who originated on the other side of the river.

With the emergence of the goal of a "two-state solution" to the Palestine question, "Palestine" has sometimes come to be used specifically for the Arab Palestinian state that many expect eventually to emerge in the West Bank (including East Jerusalem) and Gaza Strip. While representatives of the Arab Palestinians previously aspired to create a state that would include all of historic Palestine (and a few now espouse the idea of a unified, binational Israel-Palestine), the goal is now mostly limited to one in the West Bank and Gaza. Also, "Palestine" sometimes now refers to the Palestinian National Authority that was established in parts of this area subsequent to the Oslo Accords of 1994; the group hopes to develop into the government of a sovereign state.

Residents of Palestine, in general historically, were called "Palestinians." This was no less true of the Jews, whose numbers were growing as a result of immigration during the period of the mandate. Since the establishment of the State of Israel in 1948, Jewish Israelis no longer call themselves Palestinians. Instead, the term refers to the Arab Palestinians. Arab Palestinians include those in the diaspora, the occupied West Bank and Gaza Strip, and the Arab minority in Israel proper.

Pan-Africanism

Pan-Africanism literally means "all Africanism." It is a sociopolitical worldview as well as a movement, which seeks to unify both native Africans and those of the African Diaspora as part of a global African community. In recent years, continental pan-Africanism, the aspiration of political integration within the continent, has returned to the forefront of African politics and lies at the heart of many of the African Union's political projects.

Initially developed outside the African continent, the concept of pan-Africanism was meant to mitigate and reverse the impact of European colonialism on peoples of African descent. Heavily influenced and promoted by the activists Henry Sylvester Williams, Edward Wilmot Blyden, W. E. B. du Bois and Marcus Garvey, the movement gained momentum between 1900 and 1945. The fifth Pan-African Conference held in Manchester in 1945 adopted pan-Africanism as a rallying cry for Africa's independence from colonial rule and fostered African leadership of the movement, most notably in the person of Kwame Nkrumah.

When Ghana finally gained its independence in 1957 and Nkrumah became its first prime minister, he immediately began to promote the idea of complete political integration among the countries of Africa. However, many of these countries jealously guarded their newly won sovereignty and opposed Nkrumah's goal of establishing a United States of Africa with a centralized power structure. Following several divisive years, representatives from thirty-two African countries finally met in Addis Abeba in May 1963 and founded the Organisation of African Unity (OAU) as a loose federation of independent African states committed to the liberation of the remaining colonies and continentwide cooperation. For several decades, political differences among the independent states, the unfinished nature of the continent's liberation and external interference by non-Africans prevented collaboration on a continental level. Instead, countries increasingly cooperated in regional bodies, such as the Economic Community of Western African Countries (ECOWAS) and the Southern African Development Coordination Conference (SADCC).

The end of the cold war and consequent geopolitical changes, however, helped to reinvigorate the pan-African idea. In response to the economic impact of globalization, waning superpower interest and the prevalence of humanitarian catastrophes on the continent, Africa witnessed revived pan-Africanism in the mid-1990s. Aided by the end of apartheid in South Africa and the all-African intervention of ECOWAS in Liberia in 1991, pan-Africanism was complemented by a process of continental self-emancipation. This process, coined "African Renaissance" by South African president Thabo Mbeki, led to increasing attempts to provide "African solutions to African problems" and eventually paved the way for a reappraisal of continental unity. As a result, the institutional limitations of the OAU, with its focus on regime security and noninterference, caused self-declared pan-Africanists, such as Libya's leader Muammar al-Gaddafi, to renew calls for a wider political union of the continent, based on Kwame Nkrumah's dream of a United States of Africa.

The resultant transformation of the OAU into the structurally more promising African Union (AU), with a focus on human security and nonindifference, fundamentally changed

Africa's institutional landscape. The modeling of the AU on the European archetype, the European Union (EU), marked a new drive for political integration in Africa. Ever since its foundation in Durban, South Africa, in 2002, the AU has based its political legitimacy on pan-Africanist ideology and has overcome many of the obstacles that hindered previous attempts at continental integration. In July 2007, the AU summit once again reviewed the establishment of a United States of Africa and formulated a framework for a AU government to serve as a transitional political arrangement towards a continental union. The AU also proposed to offer associate membership in this arrangement to all non-African states with a sufficient African population, and thus included the African Diaspora in the project to strengthen pan-Africanist ideology.

Pan-Arabism and Pan-Islamism

Since the advent of Islam, Arabs have been torn apart between their ethnotribal loyalty and their devotion to their faith. In pre-Islamic Arabia, poetry glorified tribal loyalty, the Arabic language, tradition, and history. However, the arrival of Islam on the Arabian Peninsula's scene altered the sociopolitical and cultural context of Arabia.

MUHAMMAD AND EARLY HISTORY

The prophet Muhammad (570–623 CE) delivered a message that suggested universal applicability, and called on Arabs to spread their religion to foreign lands. Islam replaced narrower loyalties with fealty to the ummah (global Muslim community) inspired by its universal mission. When Muslim Arabs displayed distinctively Arab culture in a racial fashion, the Prophet condemned it as "bigotry." The Quran states:

> We . . . made you into nations and tribes, that you may know each other (not that you may despise each other). Verily the most honored of you in the sight of Allah is (he who is) the most righteous of you. And Allah has full knowledge and is well acquainted (with all things). (49:13)

During the era of the righteous caliphs (632–661), Islam continued to be favored over Arabism. Abu Bakr, close companion to Muhammad, fought Arabian tribes in the war of apostasy in the name of Islam. Arabian tribes believed that their loyalty was to the Prophet himself, and Islam had died with his death. However, Abu Bakr presented them with Islam as an enduring framework of governance, culture, and spirituality. The second caliph, Omar, expanded the realm of Islam, and argued that Muslim Arabs shouldered the greatest responsibility toward both Islam and Muslims. The third caliph, Othman, continued his predecessors' policies, but favored his relatives, most of whom were previous enemies of the prophet Muhammad. His nepotism led to widespread corruption in the government prompting disillusionment in the Muslim community. Othman was subsequently brutally murdered at the age of eighty-two. His assassination was indirectly responsible for the creation of the Sunni-Shiite divide.

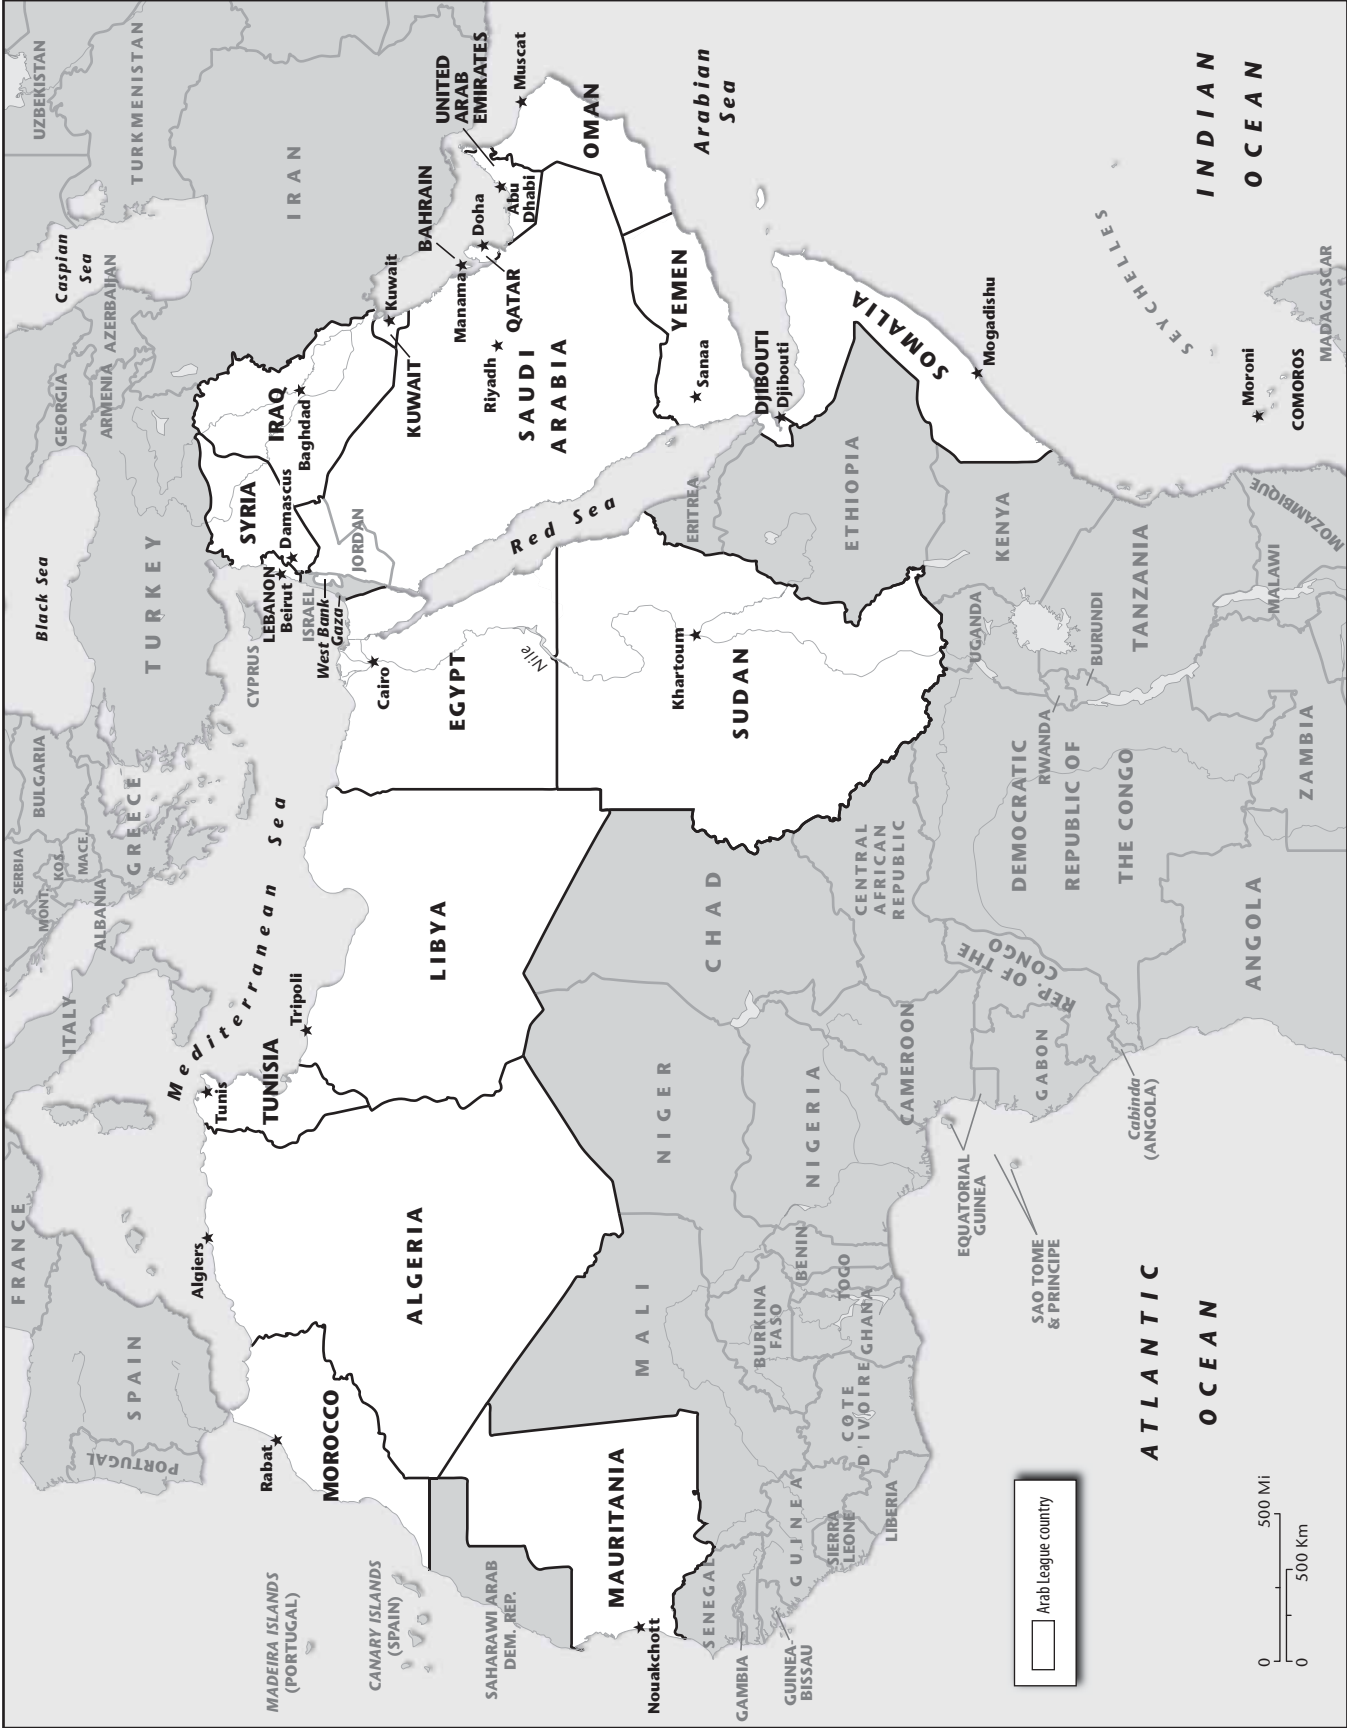
Muhammad's cousin and son-in-law, Ali, the revered Shiite martyr, succeeded Othman; he too was killed in 661. As Roy Andersen and colleagues observe, "The death of Ali was a turning point for Islam. The last of the Prophet's close personal followers was now gone. The initial unity of Islam was forever shattered" (28). Ali was succeeded by a cousin of Othman, named Muawiya, who declared Ali an illegitimate caliph for failing to prosecute his cousin's murderers. Those who supported Ali called themselves as partisans of Ali or *Shi'at Ali*, while those who supported Muawiya called themselves *Sunna*, or followers of the path.

Muawiya moved the capital of the Islamic Empire to Damascus, Syria and made it the center of Arab culture. He reversed Islam's views with regard to the concept governance and the ummah (nation) and narrowed it down to its Arab context (i.e., pre-Islamic Arabia). Under the Umayyad rule, Arabism flourished once again; Arabs were privileged, favored, and empowered by a wealthy royal court. Within less than a century, from 661 until 750 CE, Islam conquered two major contemporary empires, the Persian Empire and the Byzantine Empire. It later expanded further into Europe, central Asia, China, and Africa.

DECLINE AND REVIVAL

The collapse of the Umayyads in 750 gave birth to the Abbasid dynasty, which built the city of Baghdad and made it the center of their civilization. Though the Abbasids gave special attention to Arabic language and history, the general posture of their civilization was Persian, and multicultural, not Arab. This trend lasted from 750 until 1258, when the Islamic world succumbed to the Mongol invasion and the emerging threat of the crusaders. The decline of Arabism continued and was highlighted by the emergence of the Ottoman caliphate in Turkey, which marginalized the role of Arabs in the state, a condition that continued until the early years of the twentieth century.

For the thirteenth century until the twentieth century, pan-Arabism faced progressive erosion. The final blow came on the hands of Western colonialism, which countered pan-Arabism as well as pan-Islamism with its Westernization model of development and subordination.

In the nineteenth century, an Arab reform movement attempted to reconcile Western principles of nationalism with


Pan-Arabism aims for political unification of Arab nations in the Middle East.

Islam, reviving pan-Arabism in its Islamic context. They also believed that reviving Arab culture and language was essential to resisting colonialism.

The collapse of the Islamic caliphate in 1923 ended the political reality of the Islamic ummah. However, the collapse of the caliphate in response to Turkish nationalists suggested a new purpose for pan-Islamism. Muslims have become accustomed to the idea of being under different types of political arrangements, but they consider Islam as the unifying element to Muslims worldwide.

The modern Islamic movement in the Arab world and the Indian subcontinent followed the collapse of the Ottoman Empire. In 1928, Hasan Albana, an Egyptian schoolteacher, began preaching about the necessity of Islamic revival and the reactivation of Islam's role in the state and society. In less than a decade, Albana managed to establish the most powerful Islamic organization, the Muslim Brotherhood, which has been integral to the politics of the Islamic world over the past eighty years. The Muslim Brotherhood, in its early years, was targeted by colonial powers, Britain in particular. The suppression of the group resulted in the assassination of Albana in 1949, but the group has remained influential to the present day.

SPLIT BETWEEN PAN-ARABISM AND ISLAMIST ARABISM

After World War II (1939–1945), a split emerged between Islamist Arabism, and the national socialist interpretation of pan-Arabism. At the time, socialism appeared to be on a collision course with Islam. Arab leftist forces waged a war against colonialism primarily on nationalist ground, highlighting the influence of ethnonationalism on the Arab national liberation movements in the postwar period. Egypt took a leading role when the Free Officers toppled the monarchy, and Abdel Nasser declared himself as the undisputed leader of Arab nationalism. He sought to control and exterminate the Muslim Brotherhood, though it was instrumental in the success of the military coup against the monarchy.

During Nasser's rule from 1956 until 1970, Islamists went underground to avoid the wrath of nationalism for no avail. The execution of Islamic philosopher Syyaid Qotb in 1964 represented the triumph of Arab nationalism over Islamism. However, it proved to be detrimental not only to Nasser and Egypt, but to the larger world as well. The resentment to the unjust execution of Qotb fueled bitterness among Islamists toward the nationalist state and created an extreme reaction that inspired current Islamically inspired terror. As American political scientist Monte Palmer explains:

> The message of Arab nationalism was both simple and powerful: The Arabs are one people united by a common history, a common culture, a common language, and for the most part, a common religion. Once powerful, the Arabs were now fragmented into a multitude of petty countries manipulated by Western imperialists and Israel. All that was required for a resurgence of Arab power was the reunification of the Arab people into a single state. (52)

Animosity and distrust between Nasserism and Western imperialism were mutual. Foreign policy scholar Shibley Telhami describes it neatly, stating, "During that period the United States and the West viewed secular national movements in the Middle East as the primary destabilizing political force in the region" (27). Nasser and Arab nationalists had also made the liberation of Palestine the cornerstone of their movement, and Arab masses believed in them. However, the utter defeat in the Six-Day War (1967) undermined Arab nationalism and its leaders. Since the late 1960s, a movement calling for a return to Islam has thus occurred. This led to the resurgence of Islam as a political force, expressed through the Islamic revival movement.

The Islamic revival movement was critical of pan-Arabism and held it responsible for the humiliating defeats in the wars with Israel. Therefore, Muslims across the world began a movement of return to the tenets of Islam. The mosque became the center of Muslims's lives. The Islamic movement led the Islamic project, and called for Islam as the only "solution" to challenges confronting Arabs and Muslims. In order to ensure the success of the Islamic project, the movement provided its own educational systems, an economic base, global charitable networks, and active political parties. The movement flourished in the 1980s, particularly in response to the Soviet-Afghan War (1979–1989) in particular. Islam was a close ally to the West, and Islamists assisted in securing the defeat of the former Soviet Union in Afghanistan. Islam was very effective in mobilizing global support for the Jihad Movement in Afghanistan, which rejected communism. However, the collapse of the Soviets put Islam in a direct collision course with the West.

Since 1991, the interests and objectives of Western civilization and Islam have diverged. Both the Iran-Iraq War (1980–1990) and the 1990 Iraqi invasion of Kuwait and the subsequent clash of civilization discourse underlined the weaknesses of the nationalist paradigm when Arabs not only sided with foreign forces, but also killed fellow Arabs. The most striking example was Syria's membership in the international coalition put together by the United States to fight a fellow Baathist Arab country, Iraq. Subsequently, some leading Islamists such as Hassan Turabi of Sudan called for serious dialogue among Islamists and nationalists. His call was well-received but did not lead to significant support to mend the historical division between the two sides. Given the limitations of nationalism for resolving enduring problems such as the Arab-Israeli conflict, governance, and development, Islam will continue to represent the most comprehensive framework for interpreting contemporary Arab-Islamic politics and culture.

Panchayat

Panchayat refers to a village council commonly found throughout South Asia. The term is derived from Hindi meaning "five elders." In ancient times, this referred to a group of trusted village members who were responsible for resolving any conflict between village members or other villages.

The most well-known panchayat system is in India. The Indian constitution adopted in 1950 states that "the State shall take steps to organize village Panchayats and endow them with such powers and authority as may be necessary to enable them to function as units of self-government." However, it was not until the seventy-third amendment of the Indian constitution that the *panchayat raj* system was considered legitimate. Until then, several mandates for organizing panchayats were not fulfilled. Many that did exist were not organized effectively and elections were infrequent. The panchayat system continues to provoke controversy, as proponents note that the system has played a major role in granting women and members of the lower castes access to governance that they would otherwise be denied. Critics, however, counter that panchayats place power into the hands of a select few and therefore counteract the potential advantages of a system of decentralization.

Panel Studies

Panel studies collect information from the same individuals, the *panel*, at two or more time points, or *waves*. Experimental research design incorporates a panel insofar as the same subjects are tested before and after application of the treatment. In survey research, panels of respondents are reinterviewed, and there is usually a good deal of continuity in the content of the questionnaire. Because panel studies follow the same respondents, they are well-suited to addressing such topics as individual-level attitude change and political learning. Panel designs can also help resolve questions of causal order among variables of interest and are generally considered superior to repeated cross-section designs for testing causality. Most panel studies in political science are based on a *prospective panel* design in which the first wave establishes a baseline for investigating subsequent change, such as increased knowledge about candidates. Some panel studies include a *retrospective panel* design in which respondents are questioned about a period prior to the initial wave.

Panel studies vary considerably in their number of waves and the time between waves. Some panel studies cover only a few days or weeks, while others cover many years. The American National Election Study (ANES) typically interviews a panel of respondents shortly before and again shortly after election day. For the 2008 presidential election, ANES conducted a six-wave panel survey from September 2007 through May 2009, which allowed researchers to track citizen assessments of candidates throughout the campaign. An especially ambitious panel study, known as the generations and politics project, followed high school seniors and parents beginning in 1965, with follow-up interviews in 1973 and 1982. The high school senior panel was contacted a final time in 1997. This is an example of a special kind of panel study, sometimes called a cohort study because it followed specific age cohorts—the high school senior cohort and the parent cohort—with repeated interviews. The long time span covered by the panel study has proven especially valuable in distinguishing between generational, life cycle, and period effects on continuity and change in political orientations. These effects are difficult to disentangle with repeated cross-sectional data.

Although panel studies can provide rich data and powerful leverage over longitudinal research questions, they can be difficult to execute. Simply keeping track of large numbers of panel participants can be a daunting administrative task. An inevitable part of panel studies is *panel attrition*. Respondents may drop out of a panel for a variety of reasons: they cannot be relocated, poor health prevents them from continuing, or they simply tire of being asked the same questions several times. Panel attrition can introduce biases into a study's sample if the respondents who fall out of the panel are systematically different from those who continue. Experience suggests that several types of respondents are more apt to drop out of panel studies: younger and older participants, as well as those of lower socioeconomic status and low political interest. Panel attrition can aggravate the biases that are introduced by initial nonresponse in surveys (i.e., refusals or noncontact), so researchers employ an assortment of techniques to preserve panel participation, ranging from gentle persuasion to cash payments. If panel attrition appears to be problematic, a *refresher sample* can be drawn from the same population and used to supplement the original panel.

Care should also be taken that panel respondents are not overly sensitized by repeated waves covering the same topics and asking the same questions. For instance, some respondents who report increased campaign interest over the course of a panel study may have been motivated to follow the campaign because of their study participation.

The analysis of panel data raises some special issues. For example, when a respondent is asked the same question in two panel waves, it is likely that the measurement error associated with that survey question in the second wave will be correlated with the measurement error associated with the question in the first wave. This *autocorrelated error* violates important assumptions underlying ordinary least squares regression. Thus, researchers may need to consider other analytic techniques,

such as two-stage least squares. Despite these caveats, a well-designed and carefully executed panel study will provide superior data for longitudinal research.

Panethnicity

In the simplest sense, panethnicity means all ethnicities in a particular category. From this perspective, *ethnic groups* are usually collections of people with origins in the same nation-state: for example, Americans of Japanese descent would comprise one ethnic group, and Americans of Korean descent would comprise another. Members of those two groups, along with other Americans of Asian ancestry, could be placed together under the panethnic label "Asian American."

In some cases, however, groups may have roots in multiple nation-states (e.g., Kurds), while individuals with origins in the same nation-state are comprised of a wide variety of subpopulations (Asian Indians, for example), each of which can be considered to constitute a different ethnic group. Because of this, panethnic groups can be categorized differently, although the most common approach in the United States uses panethnic labels very similar to the ones used to identify racial groups—so, for example, "Asian American" and "Latino" are labels used both when referring to racial groups and when referring to panethnic ones.

DISTINGUISHING PANETHNICITY FROM RACE

The concept of panethnicity differs significantly from the idea of *race,* however: panethnicity is a chosen identity, while race has frequently been imposed. Implicit in this is the idea that a panethnic group can be thought of as a collectivity comprised of smaller groups. Group names that reflect this—for example, pan-African or pan-Asian—call attention to the fact that their members may choose to identify in different ways.

The concept of panethnicity helps to highlight that individuals can embrace or reject these broader identities. For example, some choose to identify as Mexican American rather than Latino. For many individuals, the choice may vary with the situation. An individual with ancestral roots in Cambodia might identify as Cambodian in certain settings, while in others, the same person might identify as Asian American.

In contrast, racial identity has been imposed by others and has been used to deny opportunities to certain categories of people. For example, for African Americans, the "one drop" rule—which declared that any African ancestry made one "black"—was part of an effort to deny opportunities by eliminating any chance of assimilation into the more privileged segment of society. When racial categories created for blacks and whites were confronted with significant immigration from China and then Japan, another category— sometimes labeled "Oriental"—was formulated and defined as "non-white," thereby making it easier for public officials to deny equal treatment to those of Asian ancestry.

When governments require individuals to use these broader categories, this is most appropriately defined as an act of racialization. Since many respondents would not voluntarily opt for labels such as "Asian American" or "Hispanic," asking them to choose only from among those labels is imposing an identity, even though the rationale may be to benefit those upon whom the identity is imposed.

Because the political behavior of those who choose the broader labels may differ in significant ways from those who do not, it is important to have terms that distinguish between these two groupings. Without terms to differentiate between someone choosing to identify with a larger category and someone who has a larger category imposed on them, there is risk of conflating subpopulations whose political behavior and attitudes differ in significant ways. For example, an American of Vietnamese ancestry who chooses to identify as Asian American may have significantly different political orientations from an American of Vietnamese ancestry who chooses to identify as Vietnamese, but government data will typically lump both of them into the category Asian American.

FACTORS PROMOTING A PANETHNIC IDENTITY

The concept of panethnicity highlights how immigrants may not categorize themselves the way that many native-born Americans would. Research has found that newcomers from Asia and Latin America usually do not identify panethnically, at least when they first arrive. Growing immigration from Africa emphasizes this point, as new African immigrants will often see many differences between themselves and African Americans whose ancestors arrived three centuries ago, despite the tendency of most Americans to lump them all into an undifferentiated "black" category. Recent immigrants are much more likely to choose national identities rather than panethnic ones—for example, Vietnamese rather than Asian American—although, over time, they may come to feel that they have some things in common with the larger panethnic group.

Some scholars suggest that politics can be an important factor in developing bonds that connect individuals to a panethnic group. Pei-te Lien argues that an Asian American identity has been greatly enhanced through political involvement, and Felix Padilla's study of Chicago Latinos concluded that a pan-Hispanic coalition was fueled by shared political goals. Since the larger panethnic constituency is likely to wield more influence than individual ethnic groups, political participation may encourage panethnic thinking.

The development of a panethnic identity is not certain, however. Although political pundits speak of the "Latino vote" or the "Asian American vote," implying panethnic unity, there is in fact considerable political diversity among Latinos and Asian Americans. African Americans do appear to have greater political similarities, reflecting conditions that have imposed a more powerful racial identity and given them a greater sense that their fate is linked to that of other African Americans. As immigration brings in growing numbers of people not familiar with the American notions of race and ethnicity, however, identification cannot be taken for granted, and understanding panethnicity will be increasingly important to understanding the politics of this country.

Papacy

The papacy is the institution of the pope of the Roman Catholic Church, based in Rome. As the official seat of the head of the Roman Catholic Church, the papacy has historic prestige and global authority. The papacy has long boasted a unique role as both a religious and political institution.

According to Roman Catholic tradition, the apostle Peter was the founding bishop of the Christian Church in Rome. It also holds that Peter was appointed by Jesus Christ to lead the Christian Church based on a passage in Matthew 16:18, in which Jesus tells Peter that he is the rock upon which Jesus will build the church. This has been interpreted to mean that the office of the bishop of Rome is the ultimate authority of the Catholic (universal) Church. While the Roman Catholic Church maintains that this authority was implicit from the foundation of the church in Rome, historic evidence suggests that it arose over time, based upon the practice of appealing to the bishop of Rome for arbitration in disputes regarding doctrine and competing claims for authority.

Theodosius, in 381, recognized Papal preeminence, and by the sixth century, the practice of endowment of lands upon the death of parishioners had made the Catholic Church one of the greatest landowners in the Italian peninsula. The Catholic Church developed political power over large areas of Italian territory even as Roman power was in decline. Pope Gregory the Great (590–604) led the reorganization and reinvigoration of the Catholic Church, which spread to the barbarian regions of northern Europe. The political alliance of the papacy with northern European kings reached a high point with the establishment of the Carolingian dynasty under Pepin, king of the Franks. Pepin's intervention in Italy, in 756, led to the formal establishment of the Papal States, kingdoms under the temporal authority of the Pope, and the designation of Pepin's son Charlemagne as the new Holy Roman Emperor. This mixture of political and spiritual power proved to be damaging to the papacy. By the tenth century, the papal office had been captured by a group of venal aristocrats who brought it into great disrepute.

THE MEDIEVAL PAPACY

The papacy was reborn under a succession of activist popes during the eleventh century. Under Leo IX (1049–1054), the Eastern Orthodox Church finally split from the Roman Catholic Church in the "great schism." In response to the erosion of Roman authority in the east and the expanding threat coming from Muslim invasions of Asia Minor, Pope Urban II called for the first crusade in Clermont in 1095. Several more followed over the next three centuries.

From 1309 to 1377, the popes were compelled to take up residence in Avignon in response to political instability in Rome. The Avignon papacy ushered in a period of intense controversy over the papal office. The Italian popes of the fifteenth century restored the stability of the papal office but also oversaw a church that had not reformed despite the growth of education and culture that took place during the Renaissance. From 1517, a growing number of opponents to papal authority followed in the footsteps of Martin Luther, bringing about the Protestant Reformation. The Reformation challenged the supremacy of the Catholic Church throughout Europe, with tremendous political and religious consequences. The power of the papacy was undermined by Protestant claims that the church had no authority to forgive sins or to mediate the relationship between God and believers. Protestants countered the legitimacy of leadership through apostolic succession from Peter with the claim that justification before God was through faith alone.

Under Paul III (1534–1549), the Council of Trent was convened to respond to the theological challenges of the Reformers and to codify Roman Catholic teaching. During the attendant Counter-Reformation the Catholic Church refashioned itself to constrain the growth of the Protestant Church. Perhaps most notable of these developments was the establishment of the Society of Jesus (the Jesuits) by Ignatius of Loyola (1491–1556) in 1534. This religious order dedicated itself to extending Roman Catholic presence through missionary and educational work, thereby limiting the spread of the Protestant Reformation.

THE MODERN PAPACY

The following four centuries saw the gradual rollback of papal authority in both spiritual and political spheres. The Peace of Westphalia effectively limited the authority of the church in favor of raisons d'état, or national interest. Reformation teaching likewise strengthened the notion of the separation of church and state. Internal divisions within the church arose due to pressures from state authorities, leading to the suppression of the Jesuits from 1769. Throughout Europe, anticlerical attitudes pervaded Enlightenment philosophy and charged the revolutionary movements of the day. The introduction of the Civil Constitution of the Clergy in 1790 brought severe constraints against the church in France. Under Napoleon in 1798, French troops invaded Rome and abducted Pope Pius VI, who died in custody in 1799. His successor was likewise imprisoned by the French, later to be restored to his authority in Rome after Napoleon's defeat.

Italian nationalism arose as the next challenge to the power of the papacy. While the Papal States had been defended against annexation by threatening neighbors throughout the 1800s, the defeat of France (then defending Papal States's independence) and the Italian annexation of the Papal States's territories in 1870 brought an end to the independence of the Papal States. However, it was not until Pope Pius XI signed the Lateran Treaty with Mussolini's government in 1929 that the Papacy negotiated its final status in Italy. Under the treaty, the Pope was granted a small independent state known as the Vatican City inside the city of Rome.

The modern papacy is shaped strongly by the limitations and rights of the Lateran Treaty. The institutions of the papacy are granted both spiritual and temporal importance by virtue of representing both the worldwide Roman Catholic Church and the Vatican City. The pope, once elected by a conclave, becomes the ex officio ruler of the Vatican City. The bureaucracy of the Holy See known as the Roman Curia support the pope's role, and he is represented abroad by official legations and permanent special representatives known as nuncios. The Holy See maintains observer status at the United Nations and several other major international gatherings.

In the last three decades, the papacy has been increasingly involved in international diplomacy. It has played an important part in mediating conflicts in areas such as the Middle East and South America and has lent support to democratic transition in Eastern Europe and Southeast Asia. Recent popes John Paul II and Benedict XVI have enjoyed worldwide renown as promoters of ecumenical dialogue and conservative social doctrine.

Parametric Statistical Model

Parametric statistical model, or a set of assumptions, is a family of distribution functions indexed by a set of unknown parameters. In other words, parametric statistical model is the distribution derived from the set of probability distributions that corresponds to the set of variables reflecting the variables' relationship in the model.

It is assumed that the set of parameters uniquely identifies the resulted distribution, parametric statistical model, and the estimates of parameters are based on data from the resulted distribution, parametric statistical model. For example, the normal parametric statistical model is the normal distribution, one of the important probability distributions in statistics. Other examples include the exponential model (the exponential distribution), the log-normal model (the log-normal distribution), the Weibull model (the Weibull distribution), and the gamma model (the gamma distribution).

The main advantage of parametric modeling is the availability of the estimators based on the assumed probability distribution, which makes statistical inferences easier. However, a parametric model might not accurately represent the true distribution of data, which could lead to the biased estimates of parameters and erroneous statistical inferences. By contrast, nonparametric statistical model is distribution free, and therefore could capture better the true distribution of data, though not without some drawbacks: it is less efficient or powerful than parametric models and unable to extrapolate beyond the available data sample, which prevents making strong quantitative statements.

Pareto, Vilfredo

Vilfredo Federico Pareto (1848–1923) was an Italian sociologist and economist. He is known for helping to develop the theory of political elitism, as well as many concepts in the field of economics.

After receiving a degree in mathematics and a doctorate in engineering, Pareto began writing on economic problems

and studying politics and philosophy. During time spent in Florence, he was politically active in opposing the ruling Italian Democratic Party. His views reflected classical liberalism, rejecting government intervention in the free market. He was considered, along with French Swiss economist Leon Walras, the leader of the Lausanne school, a school of microeconomics based on equilibrium theory. This theory states that in the free market, prices of all goods, including the price of money and interest, are interrelated.

Pareto joined the faculty of the University of Florence in 1886 as a lecturer on economics and management. After resigning from this position, he began writing and speaking against the government. His critiques made it impossible for him to obtain another academic position in Italy and the police often disrupted his public lectures. He became chair of political economy at the University of Lausanne in Switzerland. In Lausanne, Pareto continued his criticism of the Italian government's economic policies through his column in the journal *Giornale degli Economisti*.

Though Pareto was never a member of the Fascist Party, his ideas were admired by Italian dictator Benito Mussolini, who had attended some of Pareto's lectures at Lausanne, and Mussolini's followers. After Mussolini came to power, he nominated Pareto for a seat in the Italian senate and designated him as a delegate to the Geneva Conference on Disarmament. Due to poor health, Pareto declined these appointments but did, through written correspondence, offer Mussolini advice on economic and social policy.

Pareto was a significant contributor to the fields of economics and sociology. He published *Cours d'economie politique,* a three-volume work (1896, 1897), which was a compilation of his lecture notes. In this work, he offered Pareto's law of income distribution. According to Pareto, the distribution of income and wealth followed a logarithm: $\log N = \log A + m \log x$, where N is the number of income earners who receive incomes higher than x, and A and m are constants. Pareto also questioned the concept of utility, suggesting that when people make economic decisions, they are guided by what they think is desirable for them, not what necessarily corresponds to their well-being. He developed what has become known as Pareto optimality. The Pareto optimal allocation of resources occurs when it is not possible to make someone better without making someone else worse.

In 1916, Pareto wrote *Trattato di Sociologia Generale* (English translation published in 1935 as *The Mind and Society)*. In this work, he contends that human activity could be reduced to what he called residue, referring to actions based on nonlogical sentiment, and derivation, which stood for the logic people offered for their actions after the fact. It was also in this work that he explained his idea of "circulation of elites," whereby governments were in equilibrium when there was an equal number of what he considered class-1 people (those who favored innovation) and class-2 types (conservatives) serving in the government. Pareto believed that when the government is dominated by one of these classes of people, eventually the opposing class will take power.

Along with Italian philosopher Gaetano Mosca and German sociologist Robert Michels, Pareto is considered part of the Italian school of elite theorists.

Parliamentary Democracy

The central feature of parliamentary democracy is the interweaving of the executive and legislative branches. Candidates from two or more parties contend for election to the legislature. The resulting legislature chooses the executive from the leading party or coalition. The executive members remain in the legislature, present their policies to the legislature, and stay in office only as long as they retain the support of the legislature.

A secondary feature is the separation of functions between the governmental leader (i.e., prime minister or chancellor) and a mainly ceremonial monarch or president. The Framers of the U.S. Constitution considered adopting this model. In deciding instead on separate elections for the executive and legislative branches, they created a system that is lauded for its ingeniously contrived balance between power and constraints. Critics of the system charge that, on the one hand, it established legislative gridlock, and on the other hand, it created an "imperial presidency."

Though parliamentary democracies avoid the particular problems of the American presidential system, they still face the fundamental democratic dilemma of how to provide for effective action yet set appropriate limits to power. Of the various efforts to address this problem, most fall into one of two contrasting types.

THE WESTMINSTER MODEL
In this original version of parliamentary democracy, typified by the British political framework, a *first past the post* voting system allows the two dominant political parties to control the parliament. The division of power is exemplified by the physical design of the legislature, in which the government party sits on one side, confronting the opposition parties across a divide.

Power is concentrated in the prime minister and a cabinet selected by the prime minister. This leadership is supported by strong party discipline, the prime minister's right to call an election any time within five years, the weakness of parliamentary

committees, a second chamber able to delay but not to veto, and a unitary system placing many regional and local decisions in the hands of the national government. A mostly unwritten constitution is subject to changes by simple acts of parliament.

The model is admired for its ability to take fast, effective action based on clear policy choices. Yet it is criticized as unfair to all but the two leading parties and it commonly produces governments based on pluralities. It is also sometimes described as an "elective dictatorship," with too much power concentrated in the hands of a one-party executive dominated by the prime minister.

This latter argument overlooks the vigorous pluralism embedded in British political culture. Nonetheless, the criticism has led to changes in the British system itself, including devolution to Scottish and Welsh parliaments, which are elected according to proportional representation. The executive's power has been further limited by the acceptance of European Union (EU) jurisdiction over several aspects of individual rights and social and economic policies. While some of the essential features of the Westminster model have been adopted by former British dependencies, federalism is the rule in Canada, Australia, and India.

THE EUROPEAN MODEL
In the version adopted by several Western European states, proportional representation voting produces legislatures with multiple parties that bargain to produce governing coalitions. The legislatures' semicircular designs contrast with the confrontational layout of the British parliament. Committees of the legislatures exercise considerable power. Parliaments are bicameral with an influential, but less powerful, upper chamber. Federal systems divide power between central and state governments. Written constitutions are enforced by judicial review.

Admirers of the Westminster model see the European versions as slower to act, requiring incessant haggling behind the scenes, and producing unstable, constantly changing governments. After World War I (1914–1918), German and Italian governments underlined the potential consequences of instability in the system. However, others see the European model as much fairer, more consensual, and more representative than the Westminster system. While it has produced upheaval in some countries, there are also examples of long-lived coalitions and rotations of power that have retained policy continuity for issues upon which there is a consensus, such as in the management of energy resources, economic transition, or key relationships in foreign affairs. This continuity is sometimes achieved through retaining cabinet ministers from the previous coalition.

Parliamentary Discipline

As purposive political actors, legislators or members of parliaments in democratic legislatures typically join and work within political parties. To talk about parliamentary discipline is then to talk about *parliamentary party* discipline. Parties offer legislators the possibility of structured collective action with like-minded copartisans, identification with a brand name that can enhance their electoral prospects, and access to potentially significant legislative resources (e.g., promotion to committee and leadership positions, patronage, etc.). For their part, political parties are meaningless entities unless they act collectively with reasonably well-defined policy and electoral goals, organize the legislature or parliament, and behave cohesively in the electoral and legislative arenas to promote their brand and interact with the executive or government. In parliamentary systems—where executive and legislative powers are fused—single or multiparty governments cannot survive without disciplined parties; in presidential or separated systems, presidents' bases of legislative support become less stable when legislative parties are not cohesive.

While most legislative scholars view "party" as crucial to understanding legislative politics, some dissent. Most notably, Keith Krehbiel insists that party cannot be disentangled conceptually and empirically from legislators' preferences, because party cohesion or discipline is nothing more than preferenceship within the host chamber. Krehbiel's trenchant critique has, however, not been generally accepted by most legislative scholars who see legislators agreeing with one another either because of shared policy preferences (cohesion) or as a result of persuasion or coercion (discipline), although in practice the effects of cohesion and discipline are indistinguishable.

LEGISLATIVE PARTY COHESION AS SHARED POLICY PREFERENCES
Those who interpret intraparty legislative or parliamentary cohesion primarily as shared policy values and preferences emphasize the influence of copartisans' prior ideological convictions, emotional loyalties, party solidarity, socialization, and moral commitments. Thus, studies demonstrate that even when legislative parties are not subject to tight discipline—as on many free or conscience issues—intraparty cohesion and interparty positions are underpinned by shared policy preferences. Other studies point to the reinforcing impact

of common party nomination and selection processes, and legislative leaders' activities in promoting shared values and preferences in many legislatures. However, conversely, in the national legislatures of Italy, Japan, or the United States, electoral mechanisms and the parity of central party campaign resources combine with the reelection motive to discourage legislators from cohering ideologically and identifying strongly with a national party.

PARTY DISCIPLINE AS A CONSEQUENCE OF LEADERSHIP INTERVENTION

When legislative party members do not gel on a specific issue, legislative leaders or whips in a democratic legislature—and especially, majority party or coalition leaders—resort to strategic incentives and coercion to reach intraparty accommodations that keep the party together and facilitate promotion of the party's brand and collective goals. They use their tactical skills to structure debate by emphasizing specific votes and political messages that tap copartisans' shared values and preferences; buy off dissidents; limit policy side payments (e.g., pork barrel, regulatory relief, or special executive interventions); truncate legislative deliberations through control of parliamentary timetables, special rules, and votes of confidence; reward loyalty and punish disloyalty through preferential distribution of significant political resources (e.g., committee assignments, executive positions); or insist on casting all party votes for their party. These strategies and tactics, however, are not bound to succeed. Achieving legislative party discipline may be impossible; if cohesion is irreparable, invoking discipline becomes too risky and, therefore, unenforceable, as, for example, in the Italian Camera dei Deputati in the late 1990s, when the imposition of discipline was always qualified by the real risk that legislators would quit their parties if discipline were too strict. Only where the ideological, cultural, or pragmatic basis exists for constructing a winning intraparty coalition will copartisans be willing to grant their leaders disciplinary powers to promote the party's collective interests.

Legislative parties create disciplinary regimes of varying strengths across systems and time. These range from strong systems, where legislators are expelled from the party (e.g., the postcommunist Polish Sjem) or dissent is suppressed when issues threaten party unity or generate discomfort for the government (e.g., the African National Congress [ANC] in the National Assembly of South Africa), to weak ones, where sanctions are rarely imposed effectively, as in the U.S. Senate and the Brazilian Câmara dos Deputados and Senado. Between these poles lie most other systems. But, even where fairly strong disciplinary powers are available, as in the British House of Commons, the degree to which they are invoked and are effective depends on the specific policy issue and other situational factors, including the position of the opposition parties.

IDENTIFYING AND MEASURING LEGISLATIVE PARTY UNITY

Most studies of legislative party unity analyze single legislatures or, as in the United States, rely almost exclusively on analysis of roll call votes. In consequence, the disparate findings derived from analyzing different legislatures—exhibiting diverse rules and decision-making styles, technology, patterns of legislative organization, and party competitiveness—are often difficult to reconcile or synthesize. Regardless of methodological difficulties, the overwhelming body of research on legislative party unity shows that most legislators in most democratic legislatures accept the benefits of joining and organizing legislative parties, and most cohere strongly with their copartisans. The most prominent outliers are the national legislatures of Brazil, Colombia, Ecuador, Estonia, Guatemala, Honduras, France (1945–1968), Italy, Japan, the United States, and Uruguay.

EXPLAINING VARYING LEVELS OF LEGISLATIVE PARTY UNITY

Comparative analyses show that the incidence of legislators sticking with their parties is related to their strategic environment, which includes the nature and structure of their national political and party system, electoral rules, and party leaders' control over access to and orderings on ballots. Simply being part of a parliamentary system, which ostensibly requires disciplined governing parties to facilitate enactment of their program, patronage, and sustaining the government in office, does not necessarily induce greater legislative party unity than in presidential or separated systems, which purportedly generate fewer incentives to value collective party goods or provide legislative support for the executive. Similarly, being part of a federal system does not necessarily depress unity levels, as studies on Australia, Canada, or Germany demonstrate. Much more critical is where, and to what extent, different political actors exercise veto power over decision-making processes and policy choices, and how executives in both parliamentary and presidential or separated systems encourage intraparty discipline through policy appeals, pork barrel, patronage, and other resources that are highly valued by legislators in pursuit of their goals.

Party level and situational factors also account for variations in unity levels both across and within systems. Some parties are less unified than others but neither the ideological complexion of a party, whether or not it is a majority or governing party or coalition, nor the size of a party or coalition's majority in the legislative chamber is apparently significant. However, highly salient issues to the electorate, and important to a party or coalition or different groups of constituents, tend to generate high levels of intraparty unity. When, as well as which, issues reach the agenda is also important.

Parliamentary Government

Parliamentary government refers to a specific system of governance found across many parts of the democratic world. Most stable democracies have parliamentary systems of government, including Australia, Canada, India, Israel, Japan, New Zealand, and most Western European countries. The United Kingdom's Westminster model is an example of parliamentary government. Among newer democracies, parliamentary forms of government are dominant in southern, central, and Eastern Europe, and have been adopted by former British colonies such as Malaysia and Jamaica. While parliaments or similar types of legislative assemblies may function under authoritarian rule, they do not generally constitute the supreme governmental authority in nondemocratic regimes.

PARLIAMENTARY GOVERNMENT STRUCTURE

Parliamentary government has at least four distinguishing, interrelated features that set it apart from presidential forms of government. First, unscheduled general elections are held periodically, allowing voters in a parliamentary system to elect the legislature or parliament. They do not directly elect the government or core executive. Second, the government is then formed out of the dominant group in parliament, generally made up of one or more political parties, with the consent of the legislature. The resulting overlap in membership between parliament and the government means that there is no formal separation of powers between legislature and executive, as with presidential systems of government. Generally, a separate, independent head of state—often a constitutional monarch or

British prime minister Gordon Brown speaks in the House of Commons in 2009. The British parliamentary system, known as the Westminster model, possesses two chambers, the House of Commons and the House of Lords.

figurehead president with a limited set of ceremonial rather than substantive powers—formally approves the new government. Governments in parliamentary systems may either hold a majority or a minority of seats in the legislature. Minority governments are most likely in situations where no one party receives more than fifty percent of the seats in parliament, but conditions favorable for forming a coalition government are lacking. Governments in parliamentary systems may also be either single party or multiparty in nature, with multiparty or coalition governments common in countries where the electoral system tends to lead to more than two or three political parties represented in the parliament.

Third, the core executive in a parliamentary system, referred to as the cabinet, is plural in nature. This means that it is formed out of a designated number of parliamentary representatives belonging to the governing party or coalition, and consists of a prime minister or chancellor as head of government, and a number of other cabinet ministers who take on primary responsibility for specific policy areas. In parliamentary systems, the prime minister or chancellor has historically been considered the "first among equals" in the cabinet, rather than a supreme leader, although there is an observable tendency in a number of countries toward the "presidentialization" of parliamentary politics in which power is increasingly concentrated. Fourth, since there is an overlap in membership between the legislature and the executive, and government power rests on the consent of the legislature, parliamentary governments can be dismissed by a no-confidence vote on the part of the legislature. A dissolution of government is more likely if the governing party or coalition forms a minority government or has a slim and unstable majority in the parliament. Consequently, unlike presidential systems, there are no fixed election dates in parliamentary systems. However, most countries with parliamentary systems of government hold regular general elections every three to five years, depending on what is mandated by electoral legislation, with the possibility of early elections occurring in the case of government collapse.

Parliamentary systems may be unicameral or bicameral, meaning that they may have either one or two chambers of parliament. In many parliamentary systems, the upper house has comparatively less influence over legislation than the larger, lower house of parliament. Over time, there has been an increasing tendency in such parliamentary systems to abolish the upper house or limit its powers. New Zealand opted to abolish an already weak and ineffectual upper house in 1952, while the United Kingdom has recently moved to replace its traditionally hereditary House of Lords largely with politically appointees. In some federal countries with parliamentary systems, including Australia, Canada, Germany, and Malaysia, the upper house represents subnational units such as states or territories, much as is the case in the United States, and is thus less vulnerable to attempts to further limit its powers.

VARIATIONS AND CRITICISMS

An important variation on parliamentary government, usually referred to as semi-presidentialism, blends elements of parliamentarianism and presidentialism, creating a hybrid system in the process. Semi-presidential systems divide executive powers between the prime minister and cabinet on one hand, and a separately elected president on the other. This model is most closely associated with the constitution of the French Fifth Republic, adopted in 1958, with similar models also adopted in Portugal and Finland. The Republic of Ireland is also sometimes considered a case of semi-presidentialism after the French model, although none of these three European countries has gone as far as France in concentrating power in the hands of the president. A number of the new democracies in central and Eastern Europe have also opted for semi-presidentialism.

Critics of parliamentary government argue that since voters do not directly elect the political executive, there is a lack of direct democratic accountability, since it is usually possible for political parties or cabinets to replace their leaders, and hence the prime minister or chancellor, in such systems. Second, it is argued that since there is an overlap in membership between the legislative and executive branches of government, parliamentary systems are not based on the concept of a separation of powers and thus lack the strict system of checks and balances attributed to presidential systems. Advocates of parliamentary government counter this by arguing that this helps avoid political deadlock, which is frequently experienced in presidential systems. Third, critics argue that parliamentary government, since it lacks fixed electoral cycles and makes governments dependent on the confidence of the legislature, is prone to instability. However, regular government collapse ahead of scheduled general elections rarely happens in mature parliamentary democracies, and disintegrations often reflect upon a fragmented party system rather than the parliamentary mode of government itself. Some countries, most notably Italy, have reformed their electoral systems in order to reduce the number of parties represented in parliament, and thus the likelihood of instability. Advocates of parliamentary government also argue that the system is superior to presidentialism since, especially in situations of minority or coalition government, it encourages compromise between political parties or factions and increases policy flexibility as a result.

Parliamentary Immunity

Parliamentary immunity is the privilege of legislators to be free from partial prosecution while they are in office. Either legislative action or a superior court ruling can usually revoke this privilege. The practice was developed to ensure the executive could not exert undue pressure on the legislature by targeting individual members for investigation or prosecution in order to persuade voting outcomes. The origins of parliamentary immunity date to efforts by the British House of Commons in the late 1300s to protect members from prosecution by the Crown.

Parliamentary immunity usually includes nonliability, sometimes known as nonaccountability, for speech, motions, votes, or other official acts while in office. Political systems in the United States, the United Kingdom, or the Netherlands, limit parliamentary immunity to speech and charges of libel and slander. However, some systems, such as France, Belgium, and Spain, offer inviolability or freedom from arrest or detention for criminal or civil matters without prior consent of the courts or legislature. Exceptions to inviolability exist if the parliamentarian is caught in the act of a crime. Critics of parliamentary immunity assert legislators often abuse the privilege and it elevates parliamentarians to a superior status from other citizens, placing them above the law they are intended to support and protect.

Parliamentary Privilege

Parliamentary privileges refer to a collection of rights and immunities held by legislatures and their members, meant to allow a legislature to function effectively without outside interference. Although these privileges have ancient origins, they remain controversial in their scope and application. At their heart, they pit the legislature against the executive and the judiciary, declaring certain areas of activity in which legislators claim full protection from interference from the other branches of government.

Some parliamentary privileges create immunities that shield against laws that would otherwise impose penalties for wrongdoing and responsibilities in the treatment of others; as such, these immunities run the risk of protecting corruption or oppression instead of protecting legislative independence. As well, many legislatures claim the power to punish those held in contempt of the legislature, including fines and imprisonment. The most controversial aspect of modern parliamentary privileges is whether they must yield to the courts' enforcement of the constitutional rights of citizens.

ORIGINS OF PARLIAMENTARY PRIVILEGE

The origins of parliamentary privilege are usually traced from British history, with claims of immunity from arrest dating from at least the mid-fourteenth century. Some of the privileges, particularly punishing for contempt committed against either house, arise from the British parliament's historical origins as a court. The High Court of Parliament enjoys the powers of a superior court to control proceedings, compel attendance of witnesses, the production of records, and punish contempt. While these powers may have once had judicial origins, they are more practically thought of in the modern era as powers necessary for parliament to function effectively in its legislative capacity.

Freedom of speech is considered the bedrock for meaningful parliamentary debates in a democracy. For legislators to speak freely, they must be protected from defamation suits that might otherwise have a devastating chilling effect on forceful debates and questions. This privilege was embodied several centuries ago in the 1688 British Bill of Rights. Section 9 proclaims "that the freedom of speech and debates or proceedings in Parliament ought not to be impeached or questioned in any court or place out of Parliament." The legislatures in former colonies of Britain enjoy many of the same range of privileges as the British parliament. While still colonial legislatures, their privileges were considered to be only a subset of those of the Westminster system, although a few legislatures, such as Jamaica's, successfully challenged this distinction as early as the eighteenth century. Modern legislatures in former British colonies now enjoy a wide range of privileges. Some countries, such as Canada and Australia, have entrenched privileges equivalent to the British parliament's into their constitutions. A number have enumerated specific privileges, such as the freedom of speech, but not all the British equivalents into either constitutional or statutory law; for example, India protects free speech in parliament in Article 105 of their constitution but leaves other matters of privilege to statutory law. Free speech and a limited immunity from arrest are protected for members of both houses of the U.S. Congress by the debate clause of Article I of the U.S. Constitution, which provides that members of Congress "shall in all Cases, except Treason, Felony, and Breach of the Peace, be privileged from Arrest during their attendance at the Session of their Respective Houses, and in going to and from the same, and for any Speech or Debate in either House, they shall not be questioned in any other Place." Several jurisdictions, such as California, however, still rely on the common law inherited during the colonial era as a base for some privileges and immunities.

IMMUNITIES

A separate tradition of parliamentary privileges grew through the experience of the French Republic and spread to a number of other countries. A big difference between the French and British models of parliamentary privileges relates to the scope of immunities enjoyed by legislators. The French developed a concept of inviolability when the National Assembly declared in 1789 that "the person of each deputy shall be inviolable." In this tradition, criminal charges can only proceed against members with the permission of the National Assembly. Legislators have no immunity against criminal charges in the British model. Other countries have

adopted the French concept of inviolability to shield their legislators against criminal charges. At times, immunity from criminal prosecution can have very dubious applications. For example, the prime suspect in the 2006 murder of Russian exile Alexander Litvinenko in Britain won a seat in Russia's lower house in 2007 and consequently enjoyed immunity from any potential prosecution; in theory, however, the Duma can strip this immunity from one of its members.

In the British tradition, legislators do enjoy immunity from arrest in civil matters, but this is more theoretical than practical since civil arrests are virtually unheard of in the modern era. A more tangible immunity is the right not to be compelled to be a witness in a civil trial during a parliamentary session, and for a certain period before and after a session. Some jurisdictions extend this immunity to legislators who are lawyers in civil matters. In both instances, the notion is to ensure that legislators are not prevented from attending to state business because of vexatious lawsuits designed to tie up the legislators' time and attention. However, this immunity can also be misused. For example, a frequent tactic for delaying a trial for months in Texas is to enlist a lawyer who is also a member of the state legislature; in 2005, there were 319 continuances filed for this reason.

CHALLENGES FROM THE COURTS

The definition and enforcement of parliamentary privileges must inherently pit the courts against the legislatures in an ongoing contest for the final say of what immunities and special powers, beyond the ordinary law, should be enjoyed by legislatures. The most famous showdown occurred when the British House of Commons decided in 1836 to publish a report that an indecent book by John Stockdale was circulating in prisons; Stockdale then sued the printer of the report for libel. The 1839 *Stockdale v. Hansard* case held that no privilege protected this report's publication. Parliament replied with the Parliamentary Papers Act in 1840, which granted immunity to anything published under its authority.

The courts have a necessary role to play in defining the reach, although perhaps not the application, of constitutionally entrenched privileges. However, there is a more controversial role for the courts when they have to decide whether common law or statutory privileges conflict with the constitutional rights of others. The European Court of Human Rights heard a seminal case in 1991, when they ruled in *Demicoli v. Malta* that the Maltese parliament had infringed the rights of a magazine editor when it held him in contempt of parliament for an article he published. The court concluded that the legislature's decision to fine the individual essentially constituted a criminal charge and was, as a result, subject to the European Convention on Human Rights. Furthermore, the Court held that Parliament had not acted as a fair and impartial tribunal to hear the case.

Parliamentary Rhetoric

For the famous English journalist Walter Bagehot, parliamentary government was a "government by discussion." The rhetorical procedure of comparing alternative policies, or speaking *pro et contra,* is the key activity of the parliamentary deliberative assembly. The parliamentary procedure offers regular chances to persuade the adversaries or become persuaded by them, as argued by the Austrian scholar Josef Redlich in 1905. Free elections, the free mandate, and the free speech of parliamentarians form rhetorical conditions for the working of a parliament.

Classical rhetoric served as a model for parliamentary speaking. According to William Gerard Hamilton's maxims in *Parliamentary Logick* (1808), which was derived from the practices of the eighteenth-century English parliament, speakers employ "words [which] often bear more than one sense, and are true or false according to the sense which they are taken." A main persuasive strategy is the rhetorical redescription that revalues or devalues a concept: "Run a vice into a virtue; and vice versa," as noted by Quentin Skinner when discussing *paradiastole* in 1996.

The eighteenth-century Westminster master speakers—such as William Pitt the Younger, Edmund Burke, and Charles James Fox—carefully prepared their speeches in advance. Later, the parliamentarization of government altered the style of parliamentary speaking in the nineteenth century. Speeches became largely spontaneous and improvised interventions in the debate, mixed with replies to opponents and interruptions from the floor. In the course of the parliamentarization of government and the democratization of elections, the rhetorical competence of parliamentarians has advanced the professionalization of the occupation, as argued by Max Weber in *Politik als Beruf* in 1919.

Parliamentary eloquence forms both a rhetorical genre and an inherent part of parliamentary politics, especially in Britain and France, as discussed by Louis-Marie Cormenin (pseudonym Timon) in *Le livre des orateurs* (1844) and Earl Curzon in *Modern parliamentary eloquence* (1913). The National Assembly of the French Third Republic was the purest example of a *parlement de l'éloquence,* with some scholars, including Nicolas Roussellier in 1997, arguing that persuasive speaking in the

plenum regularly altered majorities and dissolved governments. Still, as illustrated by Thomas Mergel in 2002, the regimes were not necessarily unstable, but followed different political principles than purely electoral regimes, such as Weimar Germany.

In the postwar parliaments, governmental stability was more highly valued than lively debates. Parliaments were frequently seen as negotiating rather than deliberating assemblies. However, for example, due to the new interest in rhetoric and the increasing personalization of politics, the role of deliberation and debate has again grown in the practices of contemporary parliaments.

Parsons, Talcott

Talcott Parsons (1902–1979) is regarded as the most significant American sociologist during the 1950s and 1960s, and is considered the founder of the functionalist school of sociology. He viewed society as an organism where the parts of the social body have a role in maintaining its equilibrium.

Parsons was born in Colorado Springs, Colorado. He studied at Amherst College, receiving a BA in 1924, and he majored in biology. However, he decided to pursue graduate study in economics, studying at the London School of Economics from 1924 to 1925 and the Ruprecht Karl University of Heidelberg, from which he received his PhD in 1927.

Parsons then returned to the United States to teach economics, joining the faculty at Harvard University as an economics instructor in 1927, and remaining there until his retirement in 1974. He was elected president of the American Sociological Association in 1949 and served as secretary from 1960 to 1965.

In *The Structure of Social Action* (1937), Parsons asserts that social action is one of society's four *subsystems*—the others being culture, personality, and behavior. According to Parsons, the structural-functional approach to sociology is the way to develop a systematic theory of social action for the field as the four subsystems *interpenetrate* one another. In this book, Parsons also introduced the work of French sociologist Émile Durkheim and German social theorist Max Weber to American sociologists.

In 1951, Parsons published *The Social System,* where he presented his theory that society could best be understood by the researcher asking what the functions were of its social institutions, and understanding that these institutions contribute in some way to the maintenance of stability of the social system. This contrasted with structuralism, the idea that humans can discern the underlying structures behind the changing appearances of social reality. His later writings include *Structure and Process in Modern Societies* (1960), *Social Structure and Personality* (1964), *Societies: Evolutionary and Comparative Perspectives* (1966), *Sociological Theory and Modern Society* (1967), *Politics and Social Structure* (1969), *Social Systems and the Evolution of Action Theory* (1977), and *Action Theory and the Human Condition* (1978).

Partial Least Squares

Partial least squares (PLS) is a structural equations modeling (SEM) technique and, therefore, allows simultaneous testing of the measurement and structural models. In PLS, constructs can be modeled as reflective or formative. Formative constructs refer to situations in which the observed variables *cause* the latent variable and each of the corresponding indicators represents different dimensions of the construct. They are similar to indexes. In contrast, reflective constructs represent situations in which the observed variables *are caused* by the latent variable and indicators are unidimensional and correlated with each other. They are similar to scales. The following three equations illustrate a formal specification of the PLS model, as given by Jan-Bernd Lohmöller (1989):

$\eta = \beta_0 + B\eta + \upsilon$ (structural relation)

$y = \pi_0 + \Pi\eta + \varepsilon$ (measurement relation for reflective constructs)

$\eta = \omega_0 + \Omega'y + \delta$ (measurement relation for formative constructs)

Where:

η = latent variables (LVs)

β_0 = location parameters for LVs (structural relation)

B = path coefficients

υ = inner residuals (structural)

y = manifest variables (MVs)

π_0 = location parameters for MVs

Π = loading pattern coefficients

ε = outer residuals (measurement for reflective constructs)

ω_0 = location parameters for LVs (measurement)

Ω = weight coefficients

δ = validity residuals

PLS minimizes the differences between observed and calculated data values. It assesses how well the variance of the dependent variables is accounted for by their corresponding independent variables. In contrast to covariance-based structural equation modeling, PLS can be used for exploratory as well as confirmatory analysis. PLS can also work with small samples and is less sensitive to deviations from normality. In fact, some observed variables (or indicators) can be categorical. However, the model should be recursive (all arrows in one direction). PLS is also useful in situations where the researcher works with a complete population instead of a representative sample.

PLS does not have well-accepted overall model fit measures. Instead, the model should be evaluated by examining the size and significance of (1) loadings from reflective constructs to their indicators, (2) weights to formative constructs from their indicators, (3) standardized regression coefficients between constructs, and (4) coefficients of multiple determination (R-squares) for endogenous constructs (dependent variables).

Finally, there are several conditions in which PLS is preferred over covariance-based SEM. Some examples are: (1) when a strong theory about the phenomenon does not exist, (2) when the model will include some categorical manifest variables, (3) when there is some degree of unreliability in manifest variables, and (4) when data come from nonnormal or unknown distributions.

Participant Observation

Participant observation is a qualitative research method that researchers use to collect data in group settings. Researchers are active participants in a group and become thoroughly immersed in group activities. In this way, the researcher gains an in-depth understanding of the group members, members' activities, and organizational nuances. Researchers interview group members informally, record and detail events that take place in the group or the organization under study, and then interpret their activities. An effective participant observer needs to gain an appreciation about individuals within the group, learn about the ways in which the group as a whole functions, and understand the organizational culture as well as any other factors that allow the observer to develop a relationship and become an accepted member of the group.

Through participant observation, researchers often gain insights missed when using other research methods. Participant observation has several advantages: it allows researcher to collect data more easily, and it may be less expensive than other methods of collecting data. On the other hand, it is also fraught with disadvantages. It may take a researcher an excessive amount of time to collect data, and the researcher may lose objectivity in collecting data, thereby possibly affecting the overall outcome of the process.

Participatory Democracy

The notion of participatory democracy indicates a form of democratic theory that emphasizes the active involvement of citizens in all aspects of decisions that affect them. Much like advocates of direct democracy, those who favor participatory democracy reject the adequacy of contemporary forms of representative government as largely undemocratic as well as authoritative or centralized forms of social and cultural control. The ideas of participatory democracy drew on the work of twentieth-century theorists as diverse as C. Wright Mills, Hannah Arendt, John Dewey, and members of the Frankfurt school.

Precursors to modern understanding of participatory democracy might include ancient Greek notions of assembly democracy, and Jean-Jacques Rousseau's conception of direct democracy. In the former, all citizens could actively participate and make decisions as an assembly. In the latter, all citizens met periodically in order to discuss, approve, or reject laws. However, both of these models of direct democracy depended on smaller communities, as well as the theoretical assumption of a community sharing a common republican ethos.

Modern theories of participatory democracy rose with the influence of the new left in the 1960s and 1970s. Advocates of participatory democracy are committed to individual rights as well as modernist ideals of self-realization through individual creativity and self-expression. Under this ideal, political solidarity is not achieved through a preexisting ethos but through the ongoing cooperation of like-minded individuals.

C. Wright Mills's observation of the decline of public life in America influenced new left founders such as Tom Hayden. The

Port Huron Statement of Students for a Democratic Society, the first statement of the new left, criticized American democracy as largely undemocratic. The new left charged that "representative democracy" in America was, in most respects, not very representative at all, and that it isolated individuals from both government and community. Proponents argued that U.S. democracy rested on the creation of a passive citizenship, despite the view of the United States as an international model for democratic states.

Political theorist Arnold Kaufman is generally credited with coining the term *participatory democracy* to describe forms of democracy in which each citizen has a direct responsibility for decisions. Kaufman's radical liberalism joins with developmental democracy in advancing the notion that democracy is to maximize the development of individual powers and individual responsibility in order to maximize social solidarity. This radically modernist version of developmental democracy defines theoretical participatory democracy. Drawing on the civil rights movement, it aimed to reestablish the action-oriented participation as the norm.

Ideas of economic democracy were central to the early vision of the new left. Later, theorists like Carol Pateman drew upon Rousseau and John Stuart Mill to elaborate a view of participatory democracy that stands in contrast to the competitive elitist conception of democracy, and an American postwar pluralism that ostensibly undermined popular participation. Participatory democracy in this view linked to extensive economic democracy and worker's control. The Praxis philosophers of Eastern Europe, who stressed worker's democratic participation in production, also informed this line of thought. Developing another line of thought, the American professor Jane Mansbridge contrasted adversarial character of Western parliamentary representation and elections with a model of unitary democracy, based on consensus building, that employs direct and informal methods of decision making.

Elements of participatory democracy have also been an important component of environmentalist political theory. Green parties often laud grassroots democracy, which stresses participation and small-scale organization. Many ecological political theorists— such as Murray Bookchin, Robert Paelke, and Douglas Torgerson—have been advocates of participatory democracy.

Critics of participatory democracy question its viability in larger, more complex societies, and express skepticism about the capacity and commitment of ordinary citizens to sustain extensive participation. Many U.S. democratic theorists reject populism or popular democratic theory. Notable alternatives include pluralists, who favor balancing large interest groups; rational choice theorists, who argue that politics of the general will are impossible; and neoconservatives, who see participatory democracy as making excessive and unwieldy demands on the political system.

Party and Social Structure

Political parties are the main interlocutors between citizens and government in all modern democracies, making them a central concern for political scientists. In the first half of the twentieth century, the study of the relationship between society and political parties was minimal, given the prevailing view of parties as reflections of negative factionalism or the oligarchic expression of self-interested elites. Following World War II (1939–1945), the study of parties was taken more seriously and parties were viewed through a less negative and more scientific lens. Parties became recognized as essential agents of representation that were not only functional, but also essential to the operation of democracy.

The modern study of the relationship between society and parties began with the evolving notion that parties emerged organically from deeper social divisions in society. Seymour Lipset and Stein Rokkan's work on social cleavages is the most classic and concise elaboration of this idea. They argue that social divisions generated by early stages of national development in Europe crystallized in the form of political parties. The national revolutions that occurred with the foundation of nation-states and the industrial revolution were central to creating the social divisions that eventually underwrote

European party systems. Furthermore, they went on to assert that the party reflections of these social divisions remain beyond the existence of the social divisions themselves.

Other scholars questioned the centrality of social cleavages in explaining the emergence of parties and criticized Lipset and Rokkan's idea that cleavages become "frozen." Some contended that cleavage literature ignored the possibility that political parties were actually independent variables that shaped the preferences of the electorate, others pointed to a good deal of electoral volatility, undermining the argument for the persistent of older cleavages, while still others contended that the freezing argument left theorists unable to explain party change. Nonetheless, cleavage analysis left a long-term imprint on the study of parties, and was employed by scholars who later analyzed value change, democratic transitions, and the existence of distinct cleavages in the developing world.

Electoral realignments in the United States and increasing volatility in Western European party systems led to a shift in the study of the society-party relations, with an increasing focus on value change. Ronald Inglehart developed a much used dichotomy that distinguished materialist from postmaterialist values, arguing that generational change combined with growing affluence led to changes in the values of the citizenry, translating into different types of divisions that could explain party change. While materialists tended to be concerned with the traditional left-right ideology and the role of the state, postmaterialists were more concerned with noneconomic social issues like the environment, abortion rights, and issues of equality of gender and sexual orientation.

While debates rage as to whether parties will continue to perform their roles as the main connections between the governed and the governing, there is a general consensus that while forms of representation are in flux, parties continue to be the main agents of democratic representation. Further, while the basic cleavages underlying what are customarily considered the right and left are subject to debate, the idea that social and value differences translate into different types of party systems remains.

Party Discipline

Party discipline is an essential feature of modern democracy and government, and refers to the efforts parties exercise in monitoring their members—keeping them as a cohesive group rather than as disparate individuals. Party discipline reinforces party loyalty among members who may otherwise be capable of independent action and be tempted to act individually. While party discipline may also describe a given party's disciplinary efforts in extraparliamentary contexts or mere intraparty decision making—basically with regard to administrative sanctions for actions harming the party—it most commonly refers to the mechanisms involved in maintaining party cohesion in a parliamentary context. More precisely, it relates to the way and manner party leaders exercise control over the legislative members of a party in order to guarantee unified voting in parliament by party affiliation.

INVOKING AND UPHOLDING PARTY DISCIPLINE

There are various methods for parties to invoke party discipline. By way of sanction, these include, for example, the disciplining effect of whips or other officers responsible for keeping party members informed and requesting them to toe the party line, sometimes under threat of expulsion from the party organization or denial of speaking or question time. Other means to uphold party discipline known to all parliamentary systems include the denial of promotions, the cutting of resources or, ultimately, the withdrawing of support in the preselection of the seat at the next election and expulsion from the party.

In addition, there are also more positive reasons for conforming to party discipline; these stem from either the individual party legislative member's interest in policy influence; career advancement; and reelection, an interest that the representative sees as intrinsically tied to the party's need for cohesion (as a necessary condition for electoral success); or a strong belief in norms of intraparty solidarity, loyalty, and teamwork. There are thus two main approaches to explain party discipline: (1) the rational institutional approach highlights the self-interested nature of an individual's option to conform to the party line arising out of organizational and institutional constraints and incentives, and (2) the behavioral or sociological approach emphasizes norms and roles (e.g., solidarity) as responsible for legislators acting in unison. The former is more closely linked to Westminster parliamentary systems where government is much more dependent on legislative voting and, consequently, party discipline tends to be "strong," while the latter is better suited to explain party discipline and unity in congressional and presidential systems with a more autonomous executive where party discipline is "weak." The evolution of disciplined parties in the United Kingdom, for example, is largely the result of what Walter Bagehot labeled the "efficient secret" of the English constitution: to affect legislative action, parliamentarians had to unite themselves to one or other of the major parties with a chance to form the government; their incentive

was the cabinet's control over the legislative agenda of parliament. In contrast, the evolution of parties in the United States is often referred to as a *norms-based outlier* in a deliberately antipartisan environment, even though authors such as John Aldrich show how party loyalty and discipline developed as a rational response to instability in voting, mass mobilization, and organizational demands.

THE RATIONALE FOR PARTY DISCIPLINE

Maintaining party cohesion through party discipline is seen, within certain limits, as a necessary condition for a smooth functioning of parliamentary systems. As Shaun Bowler, David Farrell, and Richard Katz argue:

> Cohesion and discipline matter in the daily running of parliaments. The maintenance of a cohesive voting bloc inside a legislative body is a crucially important feature of parliamentary life. Without the existence of a readily identifiable bloc of governing politicians, the accountability of the executive to both legislature and voters fall flat. It can be seen, then, as a necessary condition for the existence of responsible party government.

However, tightened or even legally established party control over elected representatives can be dangerous for electoral accountability. It also potentially undermines a key principle of parliamentary democracy and competitiveness: the latent threat to and control of the government by the capability of elected representatives to express dissent. Thus, many see party discipline as distorting the Burkean notion of a parliamentarian's independence and freedom of conscience.

The lack of party discipline in countries such as India or postcommunist Poland has brought legislatures to the brink of collapse and in some cases triggered the introduction of antidefection laws. In contrast, many see the absolute party discipline required from African National Congress (ANC) members in South Africa as contradicting the principle of electoral accountability and executive oversight.

FREE VERSUS IMPERATIVE MANDATES

The most fundamental way to conceptualize the debate over whether party discipline is a necessary condition for stable and responsible party government or whether it is a distortion of the elected representative's free will relates to the question of accountability: To whom is a parliamentarian primarily responsible? To whom does the seat of an elected candidate "belong"? In all parliamentary systems, there is a tension between multiple responsibilities of the sitting member of parliament (MP). The tension splits between responsibility to the voters, to the party, to the MP's conscience, and the so-called common good.

The basic principle in representative democracy trying to resolve this tension is the decision for or against giving an elected candidate a *free mandate* or an *imperative mandate*. In the case of a free mandate, representatives are not bound by any mandate whatsoever, whether originating from the electorate or from the party. They are free to exercise the mandate in the national interest and are bound only by their conscience. In contrast, under an imperative mandate, representatives are bound by the mandate they receive from the electorate and can thus be forced to resign if they do not act in accord with the party that nominated them for election to the legislature.

PARTY DISCIPLINE AND THE ELECTORAL SYSTEM

The legitimation for imposing an imperative mandate or granting a free mandate to a legislator ties to the prevailing electoral system. In a list system of proportional representation, parties are elected, rather than individual candidates. Consequently, it is the party that is accountable to the electorate and "owns" the seat and not the individual candidate, who is considered a mere unit on a party list. In contrast, a constituency system puts more weight on the representative's individual accountability to the electorate or constituency; this justifies to the representative's right to abandon the party line whenever if deemed in the interest of individual accountability. The electoral formula prevailing in a given system is an additional factor impacting whether campaigning takes place on a personal rather than party reputation.

John Carey and Matthew Shugart rank electoral systems from most party centered to most candidate centered. They link this to the control-party leaders exercise over access to their party's label (open vs. closed lists); the extent of vote pooling; the type of vote (single partisan, multiple, or single subpartisan vote); and district magnitude. Accordingly, a closed-list system, where votes are pooled across the whole party and voters cast a single vote for one party, enhances personal rather than party-based vote seeking.

Party Finance

Party finance refers to all funds spent in order to influence the outcome of party competition, be funds expended on individual election campaigns for any public office, or on the maintenance of party organizations, nationally and in the field. This includes all funds raised from individual citizens, interested money (e.g., businesses or trade unions), public subsidies or—occasionally even—corrupt exchanges. The term *campaign funds*—preferred by many American authors—is too

narrow for cross-national analysis. Alexander Heard's 1960 text, *The Costs of Democracy,* highlights the expense side of the subject. Many scholars have also studied the notion of *political financing*. In particular, Arnold Heidenheimer, Khayyam Paltiel, Herbert Alexander, and Arthur Gunlicks advanced cross-national comparisons.

POLITICAL SPENDING

The concept of political party helps to identify the manifold orbit of political competitors, and party finance offers a term to summarize or aggregate all items of expenditures on political competition. Although most dimensions of political spending (e.g., a variety of campaigns, a party organization with national headquarters and local chapters) are common to all democracies, detailed features are quite specific. The mix of voluntary party workers and paid staff, expenses for offices, and public relations and communication vary considerably and data are rather patchy.

Among the democracies for which the costs of political competition can be established, there is a considerable spread of per capita spending totals for party competition. Austria, Israel, Italy, Japan, and Mexico spend about ten times as much as Australia, the United Kingdom, and the Netherlands, as illustrated by Karl-Heinz Nassmacher in *The Funding of Party Competition*. Many democracies operate at an intermediate level of political spending, including Canada, Denmark, France, Germany, Ireland, Poland, Spain, Sweden, Switzerland, and the United States. Most countries have not changed their level of political spending in about five decades.

The earlier a democratic government was established, and the more a country can afford economically, the less likely it is to spend much on its democracy. Party activity in (majoritarian) Anglo-Saxon style democracies is less expensive than it is in the multiparty (consensus) democracies of continental Western Europe (and in non-Western countries). Generous government expenses and government regulation of the economy go along with higher party spending.

Many observers believe that paid TV advertising, new campaign technology, or a growing party apparatus with full-time staff have caused unavoidable financial needs. Per capita expenses for some decades, however, reveal that current levels of political spending fall short of earlier peaks. Competing parties may sink lots of money into new items just because they can afford to do so—due to citizens' generosity, public subsidies, or corrupt exchanges.

PARTY REVENUE

Popular financing can be an important source of political revenue, but it is not a constant and reliable one. Just like voters, party members and small donors are volatile sorts of citizens. Grassroots revenue will never suffice to cover all costs of politics. However, this source of funding can supply large amounts if parties and candidates put in some organizational effort. Various alleys have been explored successfully to raise voluntary contributions from individuals: recruiting party members, direct mail drives, neighborhood solicitation, lotteries, and social events at the local level.

The free flow of money into political competition is both a hazard and a necessity for democratic politics. The financial support of policies, politicians, and parties is an expression of economic and political freedom. However, as plutocratic financing, influence peddling, and corrupt exchanges happen, the flow of political funds needs transparency. In most democracies, cash contributions from trade unions, which are rare in many countries, as well as contributions from the business community (i.e., "corporate donations") have declined and are widely substituted by public funding. Public disincentives to discourage the flow of interested money into political competition (e.g., disclosure, limits, and bans) reinforce this trend. However, there are still relevant cases of political graft, among them the abuse of public resources for partisan purposes and the extortion of private business.

In general, public subsidies are neither a mere stopgap nor an all-purpose solution to funding problems. Some countries apply rules to enforce the legitimacy of this source of political revenue, especially the matching principle, while others issue a specified responsibility for transparency. Very few modern democracies forgo state aid as a means of political funding. Party organizations, caucuses, or candidates receive public support. There is indirect funding (i.e., subsidies-in-kind and tax benefits) as well as cash aid. If subsidies are allocated, access needs to be fair and distribution takes party size into account. Taxpayers in Europe and non-Western democracies provide higher amounts toward party activity than Anglo-Saxon countries. Many party headquarters cover between 40 percent and 60 percent of their annual budget via public grants.

IMPACTS

If money is a means to succeed in political competition, the candidate who, or party which, is able to spend the most should be the winner—at least most of the time. However, empirical data does not consistently support this plausible hypothesis. The same applies to the more sophisticated theory that public subsidies lead to an ossification of the party system. New parties have entered the party system in many democracies. Established parties have lost and gained electoral support with and without state aid. An arrested distribution of power between parties of government and parties of opposition has occurred solely in Japan, but not in Austria, Germany, Israel, Spain, or Sweden—which, due to a high level and long duration of public subsidies, are the likeliest candidates for such suspicion.

Traditional sources of political revenue such as membership dues and small donations provide linkage between parties, candidates, and their local supporters. Public subsidies are expected to interrupt these links. The most important evidence on both sources of income is that public subsidies have not destroyed grassroots linkage across the board. Available data suggests that the present situation is more mixed than a one-dimensional cause-and-effect relationship suggests.

In general, there is a shift of party activity toward professional operation at the center and in the field. As a consequence, the distribution of power within party organizations

will continue to move toward all units that wield the purse strings, especially those able to raise additional funds—be it from individual supporters, corporate donors, public funds, corrupt exchanges, or by assessment of officeholders.

Party Identification

Party identification is the psychological allegiance by a voter to a political party. While a debate continues to rage over how stable party identification is, most political scientists continue to conceptualize it as a long-term commitment, opposed to shorter-term factors such as candidate and *retrospective evaluations*. Retrospective evaluations are subjective judgments by voters on the performance by a party or officeholder in power. Common subjects for retrospective evaluations include the economy, war, and scandal. In the conventional view, first expounded at the University of Michigan in the 1950s and 1960s (most famously in *The American Voter*), citizens form their allegiances in young adulthood, and then mostly remain loyal to their party. The pattern of *political generations* reflects this, where cohorts may reflect their era of political socialization for their entire lifetime. For example, in the United States, the "New Deal generation" who grew up under Franklin Roosevelt remained heavily Democratic throughout their lifespan, while the "Reagan generation" that came of age in the 1980s remains the most Republican age-group in the electorate.

More recently, Morris Fiorina and other scholars have offered a competing, *retrospective perspective* to explain party identification as a "running tally" of experiences with Democrats and Republicans. This school is more open to the possibility of change over time. There is some evidence from recent political history to support the retrospective view. For example, Republican Party identification fell during the unpopular impeachment of Bill Clinton, soared with George W. Bush's popularity after 9/11, and fell again during George W. Bush's second term.

However, all scholars of political behavior unite in their belief in the centrality of party identification. It is the single strongest predictor of vote choice. For example, in both the 2000 and 2004 U.S. presidential elections, more than 90 percent of self-identified Republicans and Democrats voted for their party's presidential nominees. It serves, then, as a central organizing principle in voters' understanding of the political world, telling them who the "good guys" and "bad guys" are, and helping them decide which information to accept and which to reject. Party leaders give *cues* to voters as to what the "correct" views are for Democrats or Republicans. Especially in this polarized era, Democrats and Republicans differ systematically in their assessments of the political world, including the most basic facts.

Party identification is generally measured along the seven-point scale. This is derived from a two-stage series of questions. First, respondents are asked whether they normally think of themselves as Democrats, Republicans, or none of these. (Studies have shown that very few citizens identify with a minor party.) Those who identify with one of the major political parties are asked whether they identify strongly or weakly. *Strong partisans* almost never desert their party. Those who do not identify with a party are asked whether they "lean" towards one party or the other. The *leaners* behave much like *weak partisans*, usually supporting their party, but not as consistently as strong partisans. Leaners behave so much like party identifiers that they are often called *closet partisans*.

Hence, the seven-point scale includes:

Strong Democrat

Weak Democrat

Democrat-leaning Independent

Pure Independent

Republican-leaning Independent

Weak Republican

Strong Republican

Citizens who identify with a political party consistently vote and otherwise participate in politics at a higher rate than do independents. They tend to be more interested in politics, more informed about current events, and more likely to hold coherent views on a variety of issues.

The Michigan school placed party identification at the heart of U.S. politics, downplaying the role of ideology and personality. Indeed, early studies of political behavior found exceedingly low levels of political knowledge among voters, little impact from media exposure, and almost no capacity for issue-based voting, let alone ideological constraint. Accordingly, the Michigan researchers adopted a rather nonideological notion of party identification, seeing it as an almost ascriptive identity usually acquired through parental socialization. While this fit the placid politics of the 1950s well, it failed to account for ideological turmoil of the 1960s and

1970s, which also saw a significant decline in party allegiance. By 1976, in *The Changing American Voter*, Norman Nie, Sidney Verba, and John Petrocikthe were challenging the Michigan model, instead emphasizing the role of ideology, candidate evaluations, and retrospective voting.

More recently, there has been a revival of interest in party identification, both due to developments in the academy and in the political world. Bruce Keith and colleagues show, in *The Myth of the Independent Voter,* that many leaners are indeed closet partisans, not behaving like the fickle "ticket splitters" they were assumed to be. The 1980s and 1990s saw a revival of partisan voting, this time with a more ideological cast; 2000 and 2004 saw the highest levels of party loyalty on record. Larry Bartels and Marc Hetherington, among others, have demonstrated that partisans have become more loyal and that party identification is based more on perceived ideological differences than it once was. There is even some evidence that the percentage of strong partisans has risen and the number of pure independents has fallen.

While many of the conclusions of *The American Voter* have come under criticism in recent years, its essential insights about the importance of party identification remain intact. Party identification may be the single most important opinion held by American voters, driving them to the polls and shaping the decisions they make, structuring their worldviews and helping them understand the political universe.

Party Law

Party law, in one sense, refers to governmental regulations concerning the organization, operation, and activities of a nation's political parties. A contrasting definition sees party law as internal rules formulated by individual political parties to govern themselves. As nations have increasingly regulated political parties, scholars have increasingly focused on the legal aspect of party law.

PARTY LAW AS AN EMERGENT FIELD

Systematic cross-national study of how governments regulate political parties through legal instruments is relatively new to political science. The nineteen-volume *International Encyclopedia of the Social Sciences* (1968) did not list party law in its index, nor did the nine-volume *Handbook of Political Science* (1975). When studied at all, party law was cited to explain how a country's legal framework uniquely shaped its party politics. Scholars began to study how legal frameworks could affect party systems in general after the mid-1980s, when the world was swept by a wave of democratization.

In the 1990s, cross-national analyses of party law appeared in works by Wolfgang Müller, F. Leslie Seidle, and Dan Avnon and in publications by U.S. governmental agencies charged with aiding democracy abroad, such as the U.S. Agency for International Development (USAID). By the 2000s, the definition of party law as government regulation occurred in writings by Richard Katz and Kenneth Janda, and cross-national surveys of government regulations of party activities also emerged. By 2006, the one-volume *Handbook of Party Politics* accorded party law a chapter of its own.

INSTRUMENTS OF PARTY LAW

Nations govern political parties through various legal instruments. Some nations have comprehensive statutes—such as Germany's law on political parties and Jordan's political parties law—that prescribe how parties must organize and operate. Often these statutes are formally or informally known as the nation's party law. When used as a proper noun, "Party Law" is narrower than party law as a common noun embracing the entire body of legal instruments governing party politics that derives from a nation's Party Law (if it has one) and from legislative statutes, administrative rulings, court decisions, or even national constitutions.

Sometimes nations enact separate statutes to govern elections, campaigns, and political finance. Codified *electoral, campaign,* and *political finance laws* are often studied separately from party law, but they typically regulate party politics and thus overlap with party law. A great deal of party law derives from electoral laws—especially legislation that specifies how parties get on the ballot and how votes are counted for election. A considerable overlap also occurs between party law and campaign finance laws—especially limitations on how parties can raise and spend money. Less overlap occurs between party law and campaign laws. Rules specifying how individual candidates can campaign lie outside party law—but not rules about parties' conduct in election campaigns.

Among the various sources of party law, national constitutions deserve special discussion. Scholars always allowed that national court rulings, by citing constitutional principles, shaped party politics, but they downplayed the relevance of constitutions themselves as a direct source of party law. Later research found that constitutions often contain highly detailed provisions concerning political parties—especially constitutions of developing countries.

MODELS OF PARTY REGULATION

Some scholars developed models of party regulations to encapsulate the legal frameworks that govern political parties across nations. These models are idealized conceptions; nations may not follow any one of them exactly in making party law, and specific laws may fit different regulatory policies. One model uses criteria of *regulatory intensity* (from minimalist to maximalist) plus both quantitative controls and qualitative controls to reflect formal requirements and ideological compatibility. Another model contends that nations tend to follow policies that proscribe, permit, promote, protect, or prescribe parties and party activities. Nations that proscribe parties forbid parties by law from operating; nations that permit parties allow them to operate freely; nations that promote parties actively support them; nations that protect parties favor certain ones over others; and nations that prescribe for parties seek to control how they operate.

It is easy to identify nations, often in the Middle East, that proscribe or forbid parties. Yet it is difficult to summarize how well nations fit the other five models. One-party states, of course, protect the ruling party by law, but some democratic nations also protect certain parties. For example, a framework of state laws in the United States protects its two major parties. Many democratic nations promote parties by subsidizing them or having electoral laws that encourage multiple parties. Increasingly, nations with little experience with competitive party politics have taken to prescribe, in great detail, how their parties must organize and operate. Often, these prescriptions are enshrined in national constitutions, making them very difficult to change. When applied to emerging democracies, the prescription model of regulation can have a chilling effect on party politics.

REGULATING VERSUS ENGINEERING PARTY SYSTEMS

Party laws in Germany and Jordan illustrate two purposes of party law: *regulating* party systems versus *engineering* them. Regulating a party system through party law comes after observing the system in operation—thus party law becomes responsive, or reactive. Engineering a party system through party law brings the system into being—thus party law is anticipatory or proactive. Party law can produce unanticipated or undesirable consequences in either instance, but democratically dysfunctional outcomes are more likely when engineering a system.

The comprehensive and prescriptive German Party Law was enacted in 1967 after five elections (1949, 1953, 1957, 1961, and 1965). Based on more than thirty-five years of party politics, it qualifies as regulating parties informed by feedback, and Germany has maintained its competitive party system since. The comparably detailed and prescriptive Jordanian Party Law was enacted in 1992, when legal parties did not exist and had not existed since King Hussein banned them in 1957. When Jordan's first multiparty election since 1956 was held in 1993, more than twenty parties registered under the law's stringent requirements. However, only 18 percent of the candidates explicitly represented parties, and parties only won small minorities in the 1997 and 2003 elections. Nevertheless, the law seemed to satisfy the Hussein regime. The Jordanian law did not seek to regulate political parties as much as to engineer an acceptable party system. Having detailed party law does not ensure having competitive party politics.

Party Membership

Early cadre or elite political parties included members of legislative chambers who met to choose leaders, participate in the organization and management of the chamber, and perhaps to coordinate or procure resources for their

electoral campaigns. With the expansion of the right to vote, the attendant need for extensive campaign organizations, and particularly the rise of parties of extraparliamentary origin, the concept of party membership is now applied less to elected officials (who remain members of party caucuses or other similar organizations, but who are more often identified simply as "Social Democrats" or "Conservatives") than to those who have joined an extragovernmental organization.

In most countries, party membership is acquired in the same way that membership is acquired in other voluntary organizations: the would-be member applies for admission, is accepted, and accepts both the rights and obligations of the party. Most common among the obligations is the payment of a membership fee, but others (frequently ignored) may include a number of hours of party work or public support of the party's nominees. Most common among the rights of membership is the right to participate, either directly or through internally elected representatives, in such party decisions as the selection of candidates, the choice of party leaders, and the formulation of the party manifesto. In many cases, formal party membership—often of some specified duration—is a prerequisite to nomination as a party candidate for public office. For example, the rules of the major Australian parties require that anyone seeking a party's nomination for office must have been a paid-up member for between six and twelve months (depending on the party).

In addition to individual members, some parties also have corporate or affiliated members—those who are regarded as members of the party by virtue of their membership in a related organization, for example a trade union affiliated with a Social Democratic Party. In some cases, members of the affiliated organization must *contract in* before they are considered party members, while in others they are given the opportunity to *contract out*. While affiliated members may have the same rights within the party as individual members, often they are represented by their organization's leaders rather than participating in party governance directly.

Parties in the United States are exceptional in that they are often surrounded by *party clubs*, which, while they do have formal membership, are not formally part of the party itself. For example, the Central Baltimore County Democratic Club is a membership organization; it has *Democratic* in its name and is made up of Democratic Party supporters; but, legally it is not part of the Democratic Party of Maryland. Rather, U.S. party membership has been identified with electoral support and institutionalized in state-run systems of partisan registration. Party registrants are different from members, however, in that they do not have any obligations to the party, and the party cannot refuse their membership or expel them. In states without partisan registration, the idea of membership is even more vacuous, given that the quintessential party decision, candidate selection, is made by primary elections in which any registered voter can participate. In a number of cases, parties outside of the United States are adopting more American-like practices (e.g., the use of party-organized primaries to choose candidates) and allowing individuals who are not formal members to participate, thus blurring the distinction between members and supporters.

Despite the importance of party membership to the self-conception of many parties and the sometimes considerable efforts made to boost membership, levels of membership generally are both low and declining. At the end of the 1990s, on average less than 5 percent of the electorates of twenty European countries were party members, ranging from a high of 17.7 percent in Austria (the only country in which the figure was as high as 10 percent), to under 1.2 percent in Poland. Ten of the twenty countries showed figures under 4 percent. Moreover, in fifteen of the countries, the proportion of the electorate who were party members had declined over the previous two decades (or less in the case of the new democracies), and in many cases this decline may be better described as a collapse, with the median case showing a decline of more than 25 percent in the raw number of members, even as the pool of individuals eligible to become members increased.

Party Organization

Political parties are inevitable in representative democracies, and both their organization and activities influence the functioning of democracy. Organizations are not formally required for parties to present candidates at elections for public offices, their main assignment, but in practice, all parties have some kind of organization. However, the sizes, structures, degrees of institutionalization, and various other characteristics of these differ. Organizational characteristics vary over time, among countries, and among parties due to—among other factors—differences in political systems, regulation of party finance, electoral systems, party size, party leadership, and the ideological base of parties.

THREE FACES OF PARTIES

Party organizations are not unitary actors, but make up a political system in themselves. Richard Katz and Peter Mair distinguish between three faces of a party. First, there is the party on

the ground, that is, the party as voluntary membership organization. Second, there is the party in public office, or the party as governing (or opposing) organization. Electing representatives to public offices is, according to most party definitions as well as parties in practice, the essence of what parties do. When assessing the party organization as a governing organization, focus is on the party's representatives holding public office, for example the parliamentary groups. Third, there is the party in central office, that is, the party as bureaucratic organization comprised of staff such as secretaries, personal assistants, policy advisers, economists, journalists, and other communication and marketing specialists. In general, party headquarters grow, hence contributing to party professionalization.

MULTILEVEL ORGANIZATIONS

The relationship between and within the party on the ground, party in public office, and party bureaucracy may be structured in several ways. The formal structure of the party is laid out in party statutes. In many parties, the national congress is the highest authority while the national executive takes care of organizational matters between congresses. At the most local level, branches hold meetings and campaign. Party organizations are multilevel organizations conducting party activity at several levels such as the local, regional, national, and maybe even the international, as seen within the European Union (EU). The territorial pervasiveness of party organizations is, among other things, affected by the ideological stand and size of the party. Smaller parties might not be able to establish an organization or fight elections across the nation to the same extent as larger parties.

The competencies and assignments of the various levels of the party organizations vary; party organizations vary in the degree of decentralization or centralization of internal decision-making procedures. In some parties, the party leadership makes all the important decisions, while in other parties members have a say on everything. Important decisions and tasks include the selection, or election, of party leader or leadership and candidates for elections to public offices; the formulation of party platforms, election manifestos, and party statutes; and campaigning for public offices at the various levels of government.

PARTY TYPES

Parties and party organizations thus vary in their characteristics, and this variation influenced the development of various party models or party types. Some types are "ideal types" developed on the basis of, for example, party goals or genetic origin, whereas other types are more or less successful attempts to sum up the major empirical characteristics of parties and their organizations at a particular time. Naming these various party types emphasizes different aspects of party organizations. However, the plethora of types may be summed into fewer groups with common if not completely identical, characteristics in terms of organization.

Elite or cadre parties, common in the nineteenth century with limited franchise and a dominance of bourgeois parties, include a group of notables or selected citizens and no permanent organization. Mass parties are formal, permanent organizations, characterized by citizen mobilization and influential party membership. Classic mass parties are the class-based labor parties of the twentieth century. Catch-all or professional-electoral parties have dominant party leadership and professionalization of both the campaign efforts and the party organization. Cartel parties are weakly anchored among citizens and strongly anchored in the state—blurring the distinction between members and supporters—and depend on public financial support for the party organization. Business-firm parties, franchise organizations, and entrepreneurial parties create ad hoc organizations, or political entrepreneurs overtake the organization for the purpose of gaining election (e.g., Canadian parties and Forza Italia).

While many of these party types are unclear on the exact empirical parameters to assess characteristics and changes in parties, they provide types to summarize the organizational variety of party organizations. The party types thus inspire further theoretical and empirical studies of the character and development of party organizations.

THE THESIS OF PARTY DECLINE

The thesis of party decline is a recurrent theme within party research, and some of this research focuses on the organizations and vitality of parties. However, analyses of party organizations allowing for the diversity of party types indicate that party organizations are changing rather than declining. How parties change depends primarily, but not only, on party ideology, leadership, and available resources such as members and money. Parties with access to greater financial resources accommodate for declining membership figures by professionalizing the party bureaucracy and engaging in more capital-intensive campaigns. Organizational adaptation and change counteract the tendency to decline when organizational forms become less adequate due to societal changes and changes within parties themselves.

DEMOCRATIC IMPLICATIONS

To what extent party organization is a democratic necessity depends on the normative concept of democracy on which the party and the political system is based. Organizations assist parties in the assignments, or functions, allocated to them either formally (e.g., in party law as in Germany) or in practice (e.g., due to the electoral system); functions may also emerge from the party's own ideology. Parties that enroll members, and allow them to elect the party leader and candidates for public offices and decide on the party manifesto, provide a channel of participation and hence support the participatory aspects of representative democracy. However, parties that do not seriously enroll members, but emphasize campaigning and vote structuring, support the competitive aspects of representative democracy. In sum, the extent to which party organizations contribute to various aspects of representative democracy varies not only among parties but also among political systems.

Party Systems, Comparative

A party system is defined as the collectivity of political parties, which participate in governing a democratic state. Thus, when studying comparative party systems, the system as a whole and its effects on society are analyzed rather than the individual parties that comprise the party system. Differences in party systems can have major consequences for a democratic state, as many deficiencies found within democracies trace to the way that the party system and the parties within it function.

DEVELOPMENT OF RESEARCH IN COMPARATIVE PARTY SYSTEMS

Debates over the structure of party systems date back to nineteenth-century England. Walter Bagehot was one of the first to voice concern that proportional electoral systems would increase political polarization, fragmenting society into extreme and opposing views. However, Bagehot's analysis was not comparative, as it was based only on England, and comparative studies began in the twentieth century. Classical works from an institutionalist perspective that emerged in the 1940s and 1950s include Ferdinand Hermens's *Democracy or Anarchy? A Study of Proportional Representation* and Maurice

Duverger's *Political Parties: Their Organization and Activity in the Modern State*. Both authors argued that the primary factor in shaping a party systems was the nation's electoral system.

In the 1960s, Seymour Lipset and Stein Rokkan took another stance and argued traditional cleavages had shaped party systems in Western Europe. These systems were frozen along these lines. With the rise of behavioralism, political culture and attitudes were recognized as important explanatory factors. Party systems subsequently moved to the center of attention again in political science, during the 1980s and 1990s, as part of broader research on democratic transition and democratization. To conduct this research, political scientists developed typologies and a number of formulas to measure and compare different aspects of party systems.

MEASURING AND DESCRIBING PARTY SYSTEMS

For analytical purposes, party systems are often grouped in typologies. Giovanni Sartori proposes the best-known typology and includes seven types: (1) one-party (2) hegemonic (3) predominant (4) two-party (5) moderate pluralism (6) polarized pluralism and (7) atomized systems. Klaus von Beyme further subdivides this typology, distinguishing between moderate pluralism with coalitions, without coalitions, or those with grand coalitions or polarized pluralist systems with and without a center capable of governing. For each type of party system, three dimensions describe and distinguish a system from one another and compare them: fragmentation, polarization, and institutionalization.

FRAGMENTATION

Fragmentation refers to how splintered a party system is, and is measured by the number of individual parties which exist within a system. This is an important indicator of a state's stability and system functionality, since a highly fragmented party system comprised of numerous parties may inhibit the development of a stable government. Fragmentation can be measured in different ways. The simplest method counts every party at face value; however, this method does not account for differences in size. Sartori proposes counting only those parties that have potential influence on government formation or execution, but it can sometimes be difficult to define which parties actually have such influence, as a party's power can fluctuate.

Taking party size differences into account, Markku Laakso and Rein Taagepera's index of effective party numbers is the most common way to describe and measure fragmentation. This is calculated by squaring each party's share (a_i), summing the results and inverting the sum, as the result is a number that gives larger parties more weight than smaller ones:

$$F = \left(\sum_{i=1}^{n} a_i^2 \right)^{-1}$$

Fragmentation can be measured both with vote shares and parliamentary seat shares.

Disproportion effects of the electoral system cause differences between a party's vote share and seat share. In almost all cases, they concentrate on the voter's choice and lead to a lower fragmentation on the seat level compared to the vote level. The only possible exception is when parties run in alliances but act individually in parliament, in which case fragmentation on the seat level may be higher than on the vote level. The degree of disproportionality can be measured through Gallagher's index by subtracting the vote share (v_i) of each party from its seat share (s_i), squaring the results and summing them, dividing the sum by 2 and taking the square root:

$$D = \sqrt{\frac{1}{2} \sum_{i=1}^{n} |(v_i - s_i)^2|}$$

Similar to Laakso and Taagepera's index, this gives a large deviation a bigger weight than many small ones. The index runs from 0 to 1, with higher values indicating increased disproportional rates.

POLARIZATION

Polarization describes the ideological bandwidth of a party system from one extreme to another. The greater the polarization, the less accordance between parties. While polarized systems are usually fragmented, the reverse it not always valid; fragmented systems are not necessarily polarized. The direction of competition connects to the question of polarization. Competition can either be centripetal, meaning the parties within the system compete for the political center, or centrifugal, meaning the parties try to outbid themselves by advocating extreme positions. Centrifugal competition is considered highly problematic for the stability of a party system.

INSTITUTIONALIZATION

The last dimension used to describe a party system is its degree of institutionalization. This concept emerged with the so-called third wave of democratization starting in the 1970s. Researchers noted many parties in these young democracies were detached from society, and party systems as a whole were volatile. Parties appeared, disappeared, or changed their positions frequently. Institutionalization, then, measures this degree of volatility of a party system by focusing on the change of vote shares over two election periods. One way to measure volatility is to use Pedersen's index. A party's share ($p_{i,t}$) at one election is subtracted from that party's share at the previous election ($p_{i,t-1}$). The results for all parties are summed and divided by 2:

$$V = \frac{1}{2} \sum_{i=1}^{n} |p_{i,t} - p_{i,t-1}|$$

This is, however, only a vague approximation for the complex concept of institutionalization.

Scott Mainwaring and Timothy R. Scully define a number of qualitative criteria for institutionalized party systems: Parties should have some stability in their existence and in their patterns of competition with other parties. Parties should also be anchored in society with a core group of supporters and voters, and be ideologically consistent—meaning they should not make radical realignments in a very short time. Party leaders should accept elections as the only method of gaining power in a country, and last, parties should not be solely dependent on a single leader, but have a solid apparatus and well-defined structures.

CONCLUSION

Using these tools of analysis has not settled the debate; there remain two main theories in political science to explain what determines the structure of a party system. The first theory still sees institutional factors as key, primarily the electoral system. The other theory emphasizes societal causes, such as the number of cleavages or divisions within society. Empirical evidence shows neither of these theories alone explains the structure of a party system; rather, the explanation derives from interaction of both institutional and societal factors. Further investigation on the interaction between institutional and societal factors in determining party systems is a continuing question for future research.

Paternalism

From *pater* (the "father" in Latin), paternalism refers to a state's authoritative tutelage or guidance. In a broader sense, any welfare state might be considered paternalist, as it provides services to its citizens to meet some of their basic needs. However, the term is mostly reserved for political and socioeconomic systems in which the state not only provides minimal unemployment or social assistance and health care, but also creates the whole network of services (of whatever quality), rules, controls, and expectations. These provisions make the citizens dependent on the state, without giving them adequate rights and responsibilities.

Typically associated with states in the former communist Soviet bloc, such a dependency is often the purpose of the system in the first place. This type of tutelary—or an overprotecting state that thus limits its citizens' life choices—contrasts with a state in which everyone takes responsibility for their own fate. Since virtually any state is paternalistic in the sense that it is interventionist and protects its citizens, a rational democratic state's soft paternalism is widely considered as justified.

Path Dependencies

Path dependency is a concept of social analysis that tries to capture why history and context matter in politics. A path dependent analysis shows how early incidents and factors play an important role in shaping later, even seemingly unrelated events. These incidents and factors help condition political actors, their decisions, and the contexts that affect events later in history. Path dependent accounts closely link to historical institutionalism in political science and stand in contrast to much neoclassical political economic theory, which seeks to explain political behavior based on the rational calculations of individuals acting for their own benefit.

CLASSIC EXAMPLES

Path dependent analyses have been employed in economics, biology, and political science. The classic example of path dependency is the choice of which side of the road to drive on—from a rational point of view, the choice is arbitrary, but either driving on the left or right becomes cemented in a state's institutions. Another famous example to demonstrate path dependency with an "irrational" outcome is the story of the QWERTY keyboard, as told by Paul David. The current, standard keyboard on computers and typewriters is not a function of efficiency. Rather, according to David, this style of keyboard and letter arrangement came about because early typewriters jammed if the keys were struck too fast. The QWERTY keyboard slowed typing by placing commonly used letters further apart, thus preventing keyboard jamming. QWERTY became the industry standard, as more and more firms bought QWERTY machines. While this style was made for people who used early typewriters, it persists in the modern era.

The QWERTY keyboard, according to David, remains in use because the decision to use alternative keyboards would require individual decisions against a status quo. The QWERTY keyboard became the de facto standard, and remains so because the decision to change the industry standard is decentralized. Individuals have little incentive to learn another style of keyboard if they or their firm alone use it.

The QWERTY keyboard illustrates technological changes that are path dependent. The QWERTY keyboard came about through earlier technological changes, and gained popularity within the industry. Rational individuals chose the QWERTY-style keyboard because it offered superior performance. However, firms and individuals continued to use it even after its original advantage became irrelevant with later technology. Even though there is no threat that computer keyboards will jam, people continue to use the QWERTY keyboard because the costs of coordinating a new arrangement are perceived as too great compared to the potential benefits. This is referred to as *lock-in* phenomenon.

REINFORCING TRAJECTORY

A path dependent analysis traces a particular process and identifies important moments and evolutionary steps in the process' development. Prior events help structure how later events unfold, and typically, earlier events are more important in an outcome than later ones. Also, the initial events create a self-enforcing set of conditions that increase the likelihood of later events or factors occurring, and therefore more deeply entrench a particular historical trajectory or institution.

Proponents of path dependency argue that outcomes may not be determined a priori, but that the likelihood of an event increases with successive choices along a path of decisions. Small and seemingly trivial events or factors that occur early on may prove to be important in later development. These events or factors may accumulate through time and then later alter an existing institution or help create institutions of their own.

Many authors relate path dependence to the idea of increasing returns. The idea of increasing returns is comparable to "like attracting like": a minor event early on in a process may reoccur and draw similar factors until it is systemwide and it has reached an equilibrium point. Increasing returns help perpetuate a process, creating a self-reinforcing effect. However, the sequence, timing, and context of the event are all critical in determining what factors become important and influential and which ones do not. Not every event or historical actor proves to be important, and not every process is equally susceptible to how factors or events might change its historical trajectory.

CRITICAL JUNCTURES

The instance where important events shape development trajectories is called a critical juncture. A critical juncture occurs when the circumstances that place an institution's development along a given path take shape, as well as when the mechanism that creates increasing returns forms or becomes important. These increasing returns allow the institution to

exist even after the initial conditions that created it deteriorate or disappear. The path is, in part, structured by earlier events and factors, but solidifies during the critical juncture. Path dependent and critical juncture analyses provide a broad diagnostic lens to apply to different social questions; therefore, they do not point to particular actors or mechanisms. Rather, they provide a framework with which to qualitatively evaluate events and consequences.

A path dependent analysis allows similar investigations for other inquires and in other disciplines. Further, by employing a path dependent analysis and developing counterfactual examples, an analyst may ask if a process is the most efficient possible. Analysts can examine the historical record to find alternatives and possibly increase its performance. Indeed, in path dependent solutions, the most efficient and most desired outcome does not necessarily persist. Institutions may persist because costs of altering the process are inhibitive, because the sequencing or timing of different factors have obstructed another development path, or for a variety of other reasons. Path dependent analysis investigates causal paths and conditioning factors that contribute to the history of a process.

CRITICISMS

Path dependency has critics in each of the disciplines that use it. In political science, critics of path dependency argue that it is overly deterministic. These critics take issue with a seeming lack of efficacy to individual actors to make individually rational choices, independent of history and contingent outcomes. Also, critics of path dependency argue that it is too broad to be a formal theory, and that attempts to formalize it have not succeeded. As a full theory, path dependency lacks a specific unit of analyses and also fails to select particular mechanisms through which networks of path development are to operate.

A last potential problem with path dependent analyses is that they lack the ability to be falsified. Political scientists must be able to somehow show that the causal arrangement outlined in path dependent analyses is true. However, history has only one empirical output, and it is impossible to alter past events to understand what causal mechanism or set of events lead to a particular outcome. In an effort to better understand the importance of processes and events, scholars who employ path dependency rely on counterfactual arguments to confirm an instance is a critical juncture or that certain early permutations of events were important.

Patriarchy

Patriarchy is the government of fathers. In ancient Greece and Rome, the patriarch—or male head of household—was considered to have the "natural" authority to make family decisions. His family included all dependents: wives, children, relatives, servants, and slaves. Although philosophers and officials debated the unlimited or limited nature of his authority, they agreed that the family patriarch set the rules for family life, enforced them, and punished family members for any infractions. The patriarch's main obligation was to enhance the welfare of the family and protect it from internal strife and external threats by whatever means he found necessary. He enjoyed extensive discretion. The main restraint on his governing powers was the common expectation that he would use his authority for the good of his household rather than as a tool of malice or vengeance.

HISTORICAL LEGITIMATION AND LIBERAL CRITIQUE

The history of Western political theory offered three main ways by which the patriarchal authority of family fathers was used to legitimize the political authority of ruling monarchs. *Anthropological patriarchy* suggested that primitive family associations evolved into larger societies and, simultaneously, the male heads of the households evolved into the heads of kingdoms. Family fathers became reigning political patriarchs. *Moral patriarchy* was based on the premise that political authority belonged to the original generation of fathers, such as the biblical Adam, and they bequeathed to their successors the right to rule. Authority passed from fathers to sons. This was the argument of Sir Robert Filmer who, in seventeenth-century England, published the most famous defense of political patriarchy, *Patriarcha: A Defence of the Natural Power of Kings against the Unnatural Liberty of the People.* Finally, *ideological patriarchy* involved using the language, metaphors, and images of fatherhood to claim political authority. Teachers, masters, employers, and magistrates assumed the role of fathers, portrayed themselves as fathers, claimed the authority of fathers, and sought to parlay individuals' loyalty towards their households' fathers into citizens' obedience to their political fathers.

Seventeenth-century social contract theory, especially John Locke's *Two Treatises of Government,* disputed the legitimacy of patriarchal political authority. Locke's social contract theory

argued that the natural authority of family fathers did not transfer to political rulers. Adult sons had natural rights rather than any obligation to obey their fathers. To protect their natural rights, men consented to submit to a limited government that would maintain order and settle disputes. For Locke, the convention of consent legitimized political authority and the defense of individuals' natural rights was the main guideline and limit for the exercise of political authority. By the late eighteenth century, particularly in America, social contract theory provided the intellectual foundation for an emerging liberalism that emphasized individual rights, a free market economy, and limited constitutional government. This classical liberalism rapidly gained influence at the expense of patriarchal reasoning and institutions.

PERSISTENCE DESPITE LIBERAL REFORM

Nonetheless, important elements of patriarchy persisted even where liberalism thrived. First, the liberal idea that all men were political equals was counterweighed by the patriarchal belief that particularly "masculine" men deserved to govern other men and were usually successful in doing so. The Australian social scientist R. W. Connell identifies the emergence of a modern male hierarchy with at least three main elements: "hegemonic masculinity, conservative masculinities (complicit in the collective project but not its shock troops), and subordinated masculinities" (110). Even when congresses replaced kings, some men continued to proclaim their dominance and persuaded other men to recognize and respect it.

The second patriarchal element that persisted stemmed from the social contract that left the subordination of women to men intact. Carole Pateman suggests that a "sexual contract" preceded the social contract. The sexual contract was an agreement among men to maintain male authority over all women; the men deemed these women deficient in the qualities necessary to grant consent and exercise independent citizenship. Only after men agreed that women were to be sequestered and subordinated in patriarchal households did the theorists make their case for a social contract—this contract contested the patriarchal authority of kings and sought to replace it with a fraternal society in which equal rights, free market transactions, and limited government constituted the basis for male interactions.

A third element of patriarchy was due to the Anglo-American jurisprudence that contained common-law guarantees for husbands' authority over their families and, equally important, for governments' patriarchal authority to intervene in society to ensure "the due regulation and domestic order of the kingdom." English legal scholar Sir William Blackstone explained, "The individuals of the state, like members of a well-governed family, are bound to conform their general behavior to the rules of propriety, good neighborhood, and good manners; and to be decent, industrious, and inoffensive in their respective stations" (162). When citizens did not conform to the norms of good behavior, officials had a fatherly duty to intervene. Political leaders invoked this duty when they sought to regulate virtually all aspects of people's lives.

CONCLUSIONS

An understanding of patriarchy—whether as the government of kings over subjects, or as the rule of hegemonic men over subordinated men; or as the dominance of men over all women; or as the intervention by public officials in the lives of citizens—has a significant impact on one's historical analysis. For example, was the American Revolution (1776–1783) an "antipatriarchal" revolution? Most historians would answer in the affirmative. They focus on the weakening of fathers' powers in their families and on the defeat of the British monarchy. They highlight the rise of liberal norms and institutions that emphasize liberty, equality, and opportunity. Where they find traces of prerevolutionary patriarchy, they treat these phenomena as vestiges of the past or as anomalies doomed for extinction. Other historians are more reticent to declare the defeat of patriarchy. Those who are interested in gender often see little change in patterns of male domination or in relevant laws (e.g., "coverture") after the Revolution.

Scholars who focus on state and local governments in the late eighteenth and early nineteenth centuries often note that U.S. civic leaders and political officials' concerns about individual rights and government limits were quieted when confronting issues crucial to community welfare. The rise of liberalism notwithstanding, patriarchy as a concept and as a practice persisted in the centuries following the American Revolution. Globally, it continues in all of its varied aspects in many nations. Its remarkable durability in the face of widespread modern opposition contradicts the Enlightenment belief that the world is progressing toward greater liberty, equality, and democracy.

Patronage

Patronage is a commonly legal but ethically questionable practice of using state resources to provide jobs and services for political clientele by those in control—the so-called patrons—in return for support. Patronage shares a common factor termed *clientelist linkage* with other criticized exchanges, such as pork barrel politics and spoils in the bureaucracies of several developing and developed states of the world. In many studies, the terms *patronage politics* and *political clientelism* are used interchangeably; in fact, patronage is a form of clientelism.

The established anthropological usage of the clientelism mostly refers to the reciprocal and dyadic exchange between notables and dependents. Its use in political science is distinct because it is not based on traditional roles or socioeconomic dependence. In a clientelist structure, patrons provide access to benefits and favors, and their clients are expected to provide returns politically or otherwise in a reciprocal and asymmetric exchange. The clientelist relationship is asymmetric, as there are more clients than patrons; the relationship is reciprocal because the exchange is essential. There is inequality as a result of the unequal status of wealth and influence of the parties to the exchange.

In political clientelism, political support is traded between voters and politicians in democratic political systems and it is associated with the privileged use of party and public resources. The clients provide political support in the form of voting, working in party organizations, attending party meetings and rallies, distributing propaganda texts, and providing personal help to their patrons or brokers. In modern democratic systems, the clients are in huge numbers and the patrons need "brokers" who act as go-betweens to arrange the exchange of benefits to run the patronage network. The work of the broker links dyadic clientelist relations and contacts between patrons and clients; it thus helps to build the patronage network. The patrons provide benefits and services such as government jobs, public contracts, public or personal loans, funds, and access to better education and health care. Herbert Kitschelt and Steve Wilkonson argue that politicians must decide what resources they can offer to clients in exchange for electoral support. The authors further explain, that to underline the importance of confidence between patrons and clients, politicians "must construct organizational devices and social networks of supervision that make direct individual or indirect group based monitoring of political exchange relations viable" (8).

Patronage refers to the aim of this exchange and it is a limited form of the distribution of benefits and services in exchange for votes in a more apparent method than clientelism. As a limited form of distribution, patronage can be used as a proxy for clientelism. The state and parastate resources are directed toward a particular electorate in exchange for political support. Academic Susan Stokes writes that in patronage, the patron holds public office and distributes state resources; but in clientelism, the patron or broker may or may not hold public office and as a result may or may not be able to realistically promise to secure public resources (opposed to, for instance, party resources) for the client. Political jobbery and state development projects are good examples of patronage. Political scientist Scott Mainwaring argues that patronage can be seen as the primary glue that holds modern clientelism together.

A more restricted definition limits patronage to a particular policy in the distribution of public jobs. Politically motivated groups demand favors in hiring decisions for public employees: in 1990, Robin Theobald cited an estimate of four million patronage positions in state and local government in the United States through the early 1980s.

The general conclusion is that power of patron-client networks correlates with the conditions of low productivity, high inequality, starkly hierarchical social relations, political culture, and the size of the public sector economy. Patronage politics dominates the politics and government as a system of patron-client ties and networks, and this contrasts with the norms of universal rationality. It is related to the loosening of moral standards, and thus provides encouraging conditions for corruption with its vast network, which includes politicians and civil servants.

Some scholars argue that the creation of an ideal or rational bureaucracy will be the end of clientelist relations, or at least of patronage. However, patronage changes and adapts to new structures, and thus survives even in developed states. While clientelism and patronage run counter to universalistic standards, several scholars emphasize that patronage politics serve as a tool to mobilize masses, with clientelist relations providing a sense of political participation for the people. If an individual chooses not to be a part of the system, that person will be barred from a distribution network of benefits contrary to the unconditional sharing of public goods. Yet, the patronage mechanism is the best way to access public goods and services in several societies. As Ayşe Ayata notes, the patronage system brings flexible solutions oriented toward individual needs, takes private concerns into consideration, and also integrates everyday concerns as public issues. Jorge Gordin adds that it is incorrect to consider patronage as an abnormality in the political system; on the contrary, it would be more realistic and theoretically more productive to consider it as a key element.

Patron–client Networks

Patron–client networks are formed between individuals of unequal social status for mutual gain. Patron–client ties involve two-person, face-to-face relationships in which individuals of higher social status or political power (the patron) use their resources or power to give material benefits or provide security to individuals of lower social status or influence (clients). In return, as a condition of the relationship, clients offer political support such as votes and services such as unremunerated labor to the patron.

Political recruitment and upward mobility within political organizations often takes place through hierarchical networks of patron–client relationships, with aspiring politicians and persons newly elected to local or even national office serving as clients of more established politicians, and those established politicians themselves supporting those higher in the organizational hierarchy, such as party leaders. Camarillas of the Mexican Institutional Revolutionary Party (PRI) and factions of the Japanese Liberal Democratic Party (LDP) are prominent examples of patron–client networks. These networks eventually reach down to the individual voter.

Patron–client ties are built on both instrumental and affective considerations between the partners to the relationship. Scholars debate the extent to which these links are built on a norm of reciprocity, with clients valuing the personal and ongoing character of the relationship and expressing deep feelings of loyalty to the patron, or on the basis of the client's fear that benefits distributed by the patron may be disrupted if the patron fails to provide support. Patron–client relationships are both voluntary and, because of the asymmetric character of the bond, exploitative. In contrast to formal citizenship norms in modern political regimes, which stress universalism and equality of access to public resources, patron–client ties are highly personal and particularistic; indeed, patron–client relationships have value precisely because they allow individuals to circumvent the universalistic rules of modern societies and gain access to public resources on advantageous terms.

Patron–client networks operate most effectively where the patron—whether an individual or an organization, such as a political party—can verify that the client has fulfilled the quid pro quo, whether that be to vote for the patron's preferred candidate or to support the patron's faction in an intraparty leadership contest or to campaign for the patron's party. The secret ballot, if truly confidential, can thoroughly undermine patron–client networks. However, because patrons often have multiple clients—often unknown to each other, since the relationship is vertical and dyadic—they often have means to confirm whether particular clients provided the requisite support. Patron–client ties become more important when ideological divisions fail to motivate individual political choice (i.e., where parties do not differ much programmatically, they may have to call on their patron–client networks to buy votes).

Patron–client networks imply that the clients' support can be bought, which suggests that clients are more likely to be poor. As a parallel point, patrons or the organizations acting as patrons (e.g., parties in government) must have significant divisible resources to distribute selectively. Mexico's PRI found its capacity to maintain its clientelist networks eroded when the state pursued neoliberal economic policies after 1985, selling off many of the sources of clientelist distribution, such as jobs. In Japan, the LDP's capacity to reproduce patron–client networks has been reinforced by the incapacity of local governments to generate significant revenues, hence leaving them reliant on local politicians elected as national legislators to act as brokers for discrete distributions to the locality. Well-connected client politicians in the LDP more effectively gain such distributions from party leaders who control the legislature than do opposition party representatives.

Certain political institutions favor patron–client relationships. The personal vote, practiced in Japan and Brazil, has been linked to the clientelism rife in those societies. The lack of civil service professionalization allows parties to use public jobs as the patronage they can distribute to clients; the latter is particularly likely if the franchise was broadened before civil service rules came into force.

Political parties that are little more than unions for legislative cooperation—run by politicians operating patron–client networks—tend to be ideologically inconsistent, politically fragmented, and subject to defections when in opposition. They tend to favor the creation of publicly funded private goods—those they can distribute via their networks in lieu of public goods provision.

Pax Americana

Pax Americana (Latin for "American peace") describes the absence of world-scale war as the United States emerged as the major economic, military, and political power in the world following World War II (1939–1945). The term is a play on *Pax Romana*, or Roman peace, used to describe a period of relative peace in the Mediterranean area in the early years of the Common Era.

From the early twentieth century, the United States exerted strong influence in Latin America. After World War I (1914–1918), U.S. president Woodrow Wilson challenged Europe's hold on their Asian and African territories under the banner of self-determination of peoples. That campaign, conducted most specifically in the context of the Versailles conference that followed World War I, has been variously analyzed as an exercise in idealism and as an effort to break into the markets represented by the French and British colonies.

PROJECTION OF INFLUENCE AFTER WORLD WAR II

After World War II, the United States replaced the European powers as the dominant outside power in Africa, the Middle East, and Asia. It even stationed troops in Europe itself, becoming the preeminent military force there. As Torbjørn Knutsen explains in a chapter titled "Pax Americana" in his book *The Rise and Fall of World Orders,* the United States, by 1965, had 375 major military bases and 3000 minor military installations around the world. The United Kingdom's commonwealth states, like Canada, Australia, and New Zealand, came to ally as much with the United States as with Britain. When these expansions of influence were added to the previous U.S. predominance in Latin America, the United States, and in particular its multinational corporations, attained what some scholars call *global reach.*

The cold war fueled the U.S. projection of military, political, and economic power. The United States viewed itself needing to ensure against an expansion of influence by the Soviet Union. As civil war raged in Greece in 1947, President Harry Truman put the United States in the position of supporting pro-Western elements against those who appeared to side with the Soviet Union. Truman proclaimed that the United States would defend nations threatened by outside forces. "It must be the policy of the United States," he told Congress, "to support free peoples who are resisting attempted subjugation by armed minorities or outside pressure."

National Security Council Document 68, issued in April 1950, called for military buildup and military engagement, with a level of "military readiness which can be maintained as long as necessary as a deterrent to Soviet aggression, as indispensable support to our political attitude toward the USSR, as a source of encouragement to nations resisting Soviet political aggression, and as an adequate basis for immediate military commitments and for rapid mobilization should war prove unavoidable" (289). In June 1950, Truman extended the reach of this pledge to east Asia when he intervened militarily in Korea.

Motivation the military intervention has been identified variously as relating to concern about expansion by the Soviet Union, a need for access to raw materials for an expanding economy, and idealism reflected in a desire to protect foreign nations. Following Truman's lead, President Dwight Eisenhower expanded U.S. commitments and activity. In Latin America, the Central Intelligence Agency intervened covertly in Guatemala in 1953 against a government that had taken measures against the U.S.-owned United Fruit Company. In the Middle East, Eisenhower moved against perceived Soviet influence under what came to be called the Eisenhower Doctrine. As embodied in a 1957 resolution of the U.S. Congress, the Eisenhower Doctrine held:

> The United States regards as vital to the national interest and world peace the preservation of the independence and integrity of the nations of the Middle East. To this end, if the President determines the necessity thereof, the United States is prepared to use armed forces to assist any such nation . . . requesting assistance against armed aggression from any country controlled by international communism.

In 1958, Eisenhower sent the U.S. Marines to Lebanon to counter a perceived effort by Syria to promote leftist elements. In Indochina, the United States replaced France in opposing nationalist elements friendly to the Soviet Union and China.

In Latin America, the United States continued the control it had exerted in earlier times. President Lyndon Johnson intervened successfully in the Dominican Republic in 1965 to restore to power friendly military elements who had overthrown the country's president, but were in danger of being removed by civilian elements seeking to restore the overthrown president. A few years later, an unsuccessful intervention followed this incident, commenced by Eisenhower and continued by President John Kennedy to try to overthrow the Soviet-oriented government of Cuba.

Other countries were encouraged to orient their economies to the United States and the West, rather than to the Soviet Union. They were encouraged as well to follow U.S. political principles rather than those of the Soviet Union. Despite all this political and military activity, the United States managed to avoid direct military confrontation with the Soviet Union, hence justifying use of the term *Pax Americana.*

IDEOLOGICAL USE

Supporters of the U.S. posture, its critics, and analysts who took no particular stance, but simply sought to describe the role of the United States in the world, all used the term *Pax Americana.* Supporters of the U.S. posture regarded the U.S. approach as beneficial to the United States economically, and also viewed it as helpful in opposing what they viewed as an expansionist Soviet Union. For example, Jan Prybyla views Pax Americana as improving life around the globe. Prybyla credits implementation of the concept as having brought "theretofore unmatched prosperity and overall … peace to those willing and able to work together on this vast undertaking and accept the not overly demanding prescripts for the attainment of the desired ends."

Critics use Pax Americana as shorthand for what they see as neocolonialism—the United States seeking to replace France and the United Kingdom in the unfair exploitation of resources and labor in the poorer countries of the world. Critics view the stated aim of opposing the Soviet Union as a cover for expanding economic and political influence. Aleksandr Iakovlev, a Soviet analyst, contends that Pax Americana signifies the aim of the United States to gain a new "world empire" by military means.

Even though the term *Pax Americana* is associated with the cold war, it survived the demise of the Soviet Union. It applies to the unipolar situation thus created. Nonstate actors who engage in acts of violence against the United States challenge Pax Americana, as reflected in the attacks of September 11, 2001. The United States subsequently declared a war on terror, and military actions were undertaken in Iraq and Afghanistan. Some analysts view U.S. hegemony as beneficial to the Middle East, while others regard American use of military force as counterproductive and destabilizing.

Peace

Peace is a transversal concept with a long history of theorization. It is perceived as a plurality and regarded as a state, a process, a value, or an aim associated to the absence of violence and the satisfaction of human needs.

HISTORY

As early as in the Roman time, *pax* was interpreted as *absentia bellum* (absence of violence) through order and unity based on the power of the center. This conception was to be reconsidered by the theological system that dominated Europe from the end of the Roman Empire until mid-seventeenth century. Peace—as conveyed by Pierre Dubois, Dante Alighieri, and Pope Gregory VII—was to be attained through a "Christian empire" with no necessary separation between temporal and spiritual power. This was related to the *pax ecumenical* or *pax ecclesiae* of the Christian commonwealth, outlined in Augustine's *De Civitas Dei.* It was also during Christian political dominance that the idea of *just war* flourished. First developed by Aristotle, and further conceptualized by Augustine, Thomas Aquinas, and Francisco Suarez, the doctrine determined whether a war could be justified from a moral standpoint.

The Christian vision of peace was shaken during the Renaissance and Reformation. The most enlightened representatives of this era, Erasmus Rotterdamus, Thomas Münzer, Sebastian Franck, Crucé and Grotius, initiated the idea that peace is more than lack of war; it means the improvement of life and the achievement of social justice, freedom, and equality.

These ideas paved the way to an unparalleled debate, during Enlightenment, over the concept and the attainability of peace. William Penn's "An Essay Towards the Present and Future Peace of Europe" (1692), Saint-Pierre's "Project for Setting an Everlasting Peace in Europe" (1713), Jean-Jacques Rousseau's "A Project of Perpetual Peace" (1761), Jeremy Bentham's "A Plan for an Universal and Perpetual Peace" (1786), along with Immanuel Kant's "Perpetual Peace" (1795), tailored a new trend toward creating a global federation based upon the national independence and sovereignty of states. This has led some authors to assert that it was during the Enlightenment that peace was "invented." Although visionaries throughout history have aspired for peace, "it has been regarded by political leaders as a practicable or indeed desirable goal only during the past two hundred years" (Howard, 2).

The outbreak of two World Wars dominated the nineteenth century and the first half of the twentieth century. The peace projects during this period were developed on distinct political ideologies. Whereas Marxists made peace contingent on *social reorganization*, liberals urged for democracy and free market economy. Also in the twentieth century, Gandhi articulated a vision of peace in which justice is an inherent and necessary aspect. The American civil rights movement later extended this idea.

Outside the Western sphere, peace has been regarded somewhat differently. In the Hindu tradition, the word *shanti* is understood as a well-ordered state of mind. In the tradition of Buddhism, a step forward is taken from *ahimsâ* (noninjury to all living beings) to an interpretation in terms of compassion,

good works, and reconciliation. Similarly, the Confucian doctrine directed the attention inwards; it was unconcerned with the outside world and peace was associated to the inner state of mind and the inculcation of personal virtue in the individual. Finally, the Japanese concept of *heiwa* (and its parallel, *wahei*) has a double meaning that implies adaptation to a social order, both in social action and in state of mind. In the Japanese tradition, social order has a nationalistic and pyramidal connotation.

PEACE THEORY

Despite its centrality, it is only in the twentieth century that peace received the trappings of a scientific framework, based upon empirical and theoretical assumptions. In the beginning of the century, political scientists such as Theo Lentz, Quincy Wright, Lewis Richardson, and Pitirim Sorokin contributed heavily with new theories of war and peace.

Following the original work of these authors, peace research was further developed in the United States, and primarily in Scandinavia. In the United States, Kenneth Boulding accompanied by Anatol Rapoport, Herbert Kelman, and Robert Angell, created the *Journal of Conflict Resolution* in 1957, and subsequently founded the Center for Research on Conflict Resolution in Michigan in 1959. In Scandinavia, Johan Galtung, a mathematician and sociologist, founded the Oslo International Peace Research Institute in 1959 and the *Journal of Peace Research* in 1964, which was followed by the 1966 establishment of the Stockholm International Peace Research Institute.

Arguably the most important doctrinal innovation of this period is the distinction between *negative peace* versus *positive peace*. Negative peace refers to the absence of direct and physical violence, whereas positive peace is associated to the successful transformation of structural violence. According to Galtung, structural violence occurs whenever people are disadvantaged by political, legal, economic, or cultural traditions; or, as Galtung puts it, structural violence refers to any constraint on human potential due to economic and political structures.

Peace research embraces a wide range of issues and its borders are constantly expanding. This wide embrace, which could be a symptom of lack of cohesiveness and theoretical solidity, is, in fact, quite the opposite. It is a notable indicator of the fruitfulness, importance, and richness of the discipline and the progress occurring.

From a methodological point of view, peace research is approached both from a quantitative and qualitative point of view. Databases such as the Uppsala Conflict Data Program, International Crisis Behavior Project, and the Correlates of War are well-established quantitative sources in the study of peace and conflict.

DEMARCATION OF PEACE

Despite the kaleidoscopic nature of peace, some aspects are generally accepted as key demarcations. First, peace can be seen as having a both passive and active component. As early as during the Roman Empire, peace was conceived as absence of direct violence, or negative peace; it had a passive component, in the sense that peace's existence was contingent on

the nonexistence of something else. During the Renaissance, violence was not only related to the infliction of physical harm but also encompassed a structural component. In this context, peace and social well-being could only be attained with positive peace, occurring when the forces that administered economic, political, and social injury were successfully transformed. More recently, peace is gradually surpassing its initial passive component. Beyond a state that is achieved when violence (direct and structural) is no longer inflicted, peace is increasingly gaining an active orientation and a life of its own. Peace can therefore be interpreted as enabling—as making something happening. By being at peace, one is bestowed with the capacity to amplify and project well-being.

A second key demarcation of peace is that it is positively value loaded. To be at peace or to feel secure is, indeed, considered positive, a state that individuals aspire to attain—something that most authors regard as "good." During the Greek era, philosophers characterized peace as "the greatest good." The categorical favorability of peace is so tangible that resorting to violence, when not promptly criticized, is generally acceptable only on the condition that it would serve as a means to ultimately attain peace. Within peace studies, this leaned on the *positivity* of peace with the idea of positive peace entering the political discourse, enriching a narrow concept with material prosperity, humanism, democracy, and social justice. This has roots in the seventeenth century, as Thomas Hobbes posited that in a world without peace and security, life would be "solitary, poor, nasty, brutish, and short."

A third distinguishing characteristic of peace is that it is a derivative concept—meaningless in itself. To have any meaning, peace necessarily presupposes something to be in peace; as a realm of study, it cannot be self-referential. Moreover, although it is used to characterize an object, peace reflects a relationship between at least two objects. In a globalized world where processes and agents are tightly interconnected, to be at peace presupposes that violence (physical or structural) would not be inflicted on "the other." To Galtung, this relational ingredient of peace is fundamental. According to Galtung, in the West, peace is seen as "something pertaining to relations within the in-group, and war is something referring to relations between in-group and out-group" (184). This possibly derives from the Greek concept of *eirene,* which reflects and may be translated by "in-group harmony."

Peace Corps

On March 1, 1961, United States president John F. Kennedy signed an executive order establishing the Peace Corps. The mission of the Peace Corps includes three goals: helping the people of interested countries in meeting their need for trained men and women; helping promote a better understanding of Americans on the part of the peoples served; and helping promote a better understanding of other peoples on the part of Americans. Nearly 200,000 volunteers have served in 139 host countries to work on issues ranging from HIV/AIDS education to information technology and environmental preservation. According to the Fallen Peace Corps Volunteers Memorial Project, as of November 2009, over 270 volunteers had died serving.

Five years after the Peace Corps was established, over 15,000 volunteers were working in the field, the largest number in its history. In 1971, President Richard Nixon moved the corps and several other federal volunteer programs into a new federal volunteer agency, and by December 1974, there were corps volunteers in sixty-nine countries. In 1979, President Jimmy Carter signed an executive order that granted the Peace Corps full autonomy, and in 1981 it became an independent federal agency. The following year, the number of volunteers fell to 5,380 (the lowest number since 1962), but by 1986 had increased to 6,264. In 1989, President George H. Bush announced that volunteers would go to Hungary, thereby establishing the first Peace Corps program in an Eastern European country.

Changes continued into the 1990s and twenty-first century. In 1992, the first group of volunteers left for the former Soviet Union to work in small-business enterprise projects in Lithuania, Estonia, and Latvia. The first group of English teacher volunteers left for China in 1993 and the Crisis Corps, a new program allowing returned volunteers to provide short-term assistance during natural disasters and humanitarian crises, was launched in 1995; this program was renamed the Peace Corps Response in 2007. By 1996, nearly 7,300 volunteers were serving in ninety-four developing countries. Volunteers were deployed domestically for the first time in 2005 when the Crisis Corps aided relief operations in the Gulf Coast region following Hurricane Katrina and Hurricane Rita. That year, volunteer numbers reached a thirty-year high with 7,810 Americans serving in the Peace Corps in seventy-seven countries.

In September 2009, there were 7,671 volunteers and trainees. The average age of volunteers was twenty-eight years and 60 percent were female. The highest percentage of volunteers worked in education (35 percent), health and HIV/AIDS (22 percent), business development (15 percent), and the environment (14 percent). In December 2009, Peace Corps's members served in seventy-six countries, particularly in Africa (37 percent) and Latin America (24 percent). Under the directorship of Aaron S. Williams, the Peace Corps's fiscal year 2010 budget was $400 million.

The Peace Corps has occasionally been a target for criticism. In October 1961, protests arose in Nigeria over a letter written by a volunteer who described primitive living conditions in the country. In 2008 Robert L. Strauss, a former Peace Corps country director, said that the organization lacked a strategy, volunteers were rarely sent where they were most needed, and the quality of volunteers was questionable.

Pentecostalism

Pentecostalism describes a diverse group of Protestant Christians, distinguished theologically by a particular emphasis on the role of the Holy Spirit. Allan Anderson, in his *Introduction to Pentecostalism,* defines Pentecostal as "all churches and movements that emphasize the workings of the gifts of the spirit, both on phenomenological and on theological grounds" (13). Pentecostalism also frequently reflects local culture through adapting distinctive regional elements to its practice of Christianity. While some scholars suggest that Pentecostalism should be considered a third form of Protestantism distinct from the traditional division of mainline and evangelical, Pentecostalism is traditionally considered a subsection of Evangelicalism.

Two key factors can help distinguish Pentecostals from other Evangelicals. Most notably, for Pentecostals, spiritual authority and authentic experience as a Christian come from direct interaction with the Holy Spirit. Pentecostalism takes its name from the events of the Day of Pentecost recorded in the second chapter of Acts, which recounts that an outpouring of the Holy Spirit on the apostles allowed them to preach the gospel to a crowd in the native languages of the listeners.

In contemporary practice, signs of the presence of the Holy Spirit within an individual serve as evidence of faith. Practice from church to church varies widely. It may entail visible external signs of the Spirit, such as speaking in tongues, healing, ecstatic movement, and prophesy, or be demonstrated through prayer, meditation, and fasting. Further, Pentecostal theology tends to be developed through experience and personal revelation of the Spirit rather than being mediated through the interpretation of sacred texts. Rather than theological training, the blessing of the Holy Spirit is the most important quality of a Pentecostal leader. In terms of ecclesiastical organization, Pentecostal churches frequently exhibit great independence even when working within a denominational structure. In contrast to the majority of evangelical and mainline Protestant churches, which possess highly organized denominational structures and

parachurch organizations, many Pentecostal churches have only tenuous, if any, links to a central governing body and largely operate independently. Rather than a denominational convention or synod, the independent megachurch is a hallmark of Pentecostal organization.

This loose organization results in significant differences between different Pentecostal denominations, in terms of both theology and practice. To the extent that a central authority structure exists in Pentecostal movements, this authority frequently relies on personality-driven leadership from a powerful individual or a small group of leaders. Particularly in the developing world, Pentecostal leaders often exercise tight control over their congregants, claiming sweeping authority from the anointing of the Holy Spirit.

Pentecostal Christianity is one of the fastest growing religions in much of the developing world, including Latin American, sub-Saharan Africa, and parts of Asia. In some areas of Africa, Pentecostal Christians likely form a majority, whereas in many other cases they comprise a strong minority of 10 to 25 percent of national population. Huge individual congregations are common; indeed, the largest Christian congregation in the world is currently a Pentecostal church in South Korea. Pentecostalism has also made relative gains in some parts of the developed world.

The interaction between Pentecostalism and politics is a complex relationship that depends greatly on both the dynamics of individual denominations and particular regional circumstances. Many Pentecostals embrace political activity, either through participating in faith-based political parties or by seeking to influence traditional political parties. However, such political participation is not a given. The American Foursquare Church, a large American denomination with significant ties to missionary-planted churches overseas, eschews political involvement on behalf of the church. There is no prohibition on political participation of individual members, but the church as a whole will not take political positions. Some large denominations in the developing world hold more radical positions, for example, the Brazilian Christian Congregation, which proscribes the political participation of members, but such a position places the denomination in a small minority of churches.

One factor that decisively shapes the form of political involvement of Pentecostals who desire such a role is the numerical and social strength of Pentecostals in a given country vis-à-vis other faith positions. In the developed world, Pentecostalism is rarely the dominant expression of Protestantism, and in areas where Pentecostalism is strong, its numbers are usually a small minority of the general population. Possibly due to this situation, it is often difficult to distinguish the political activities of Pentecostals from other evangelical groups with similar beliefs in developed nations.

In the developing world, the state of Pentecostal politics reflects the great variety in the status of Pentecostals from country to country. A variety of common political tactics include affiliating with traditional political parties, forming a Pentecostal political party, or creating parachurch political organizations.

Often, the great diversity of Pentecostal churches leads different groups of Pentecostals to compete politically within one country. Political structures and alliances frequently shift; for example, a party formed along Pentecostal religious lines may later ally with a major party, as in the case of the Camino Cristiano in Nicaragua, or a formally powerful parachurch political organization that brings together many different Pentecostals and other Evangelicals, such as Brazil's Evangelical Association, may lose its influence. The importance of personality-driven leadership among Pentecostal religious leaders leaves the Pentecostal political landscape particularly susceptible to frequent change.

Class also plays an important role in shaping political involvement. The majority of Pentecostals in the developing world are members of the working class, and thus are often excluded from the top levels of leadership in traditional parties, which are frequently the domain of the elite (though important exceptions exist in traditional parties). However, in cases such as Guatemala and South Korea, where members of the elite or the upper-middle class have joined a Pentecostal movement in significant numbers, Pentecostal leaders have taken prominent positions within existing political parties.

The diversity of Pentecostalism has understandably spawned a variety of political goals. Pentecostal churches have a tendency to be conservative doctrinally, particularly by literally interpreting Christian scripture. This conservatism is often reflected in social goals such as strong opposition to abortion and homosexuality, positions that a majority of evangelical Protestants share. However, while conservative social norms are common, other political positions vary widely. For example, Nordic Protestant parties with a strong Pentecostal representation tend to favor a stronger welfare state and additional proenvironment policies, whereas prominent Pentecostals in the United States have called for limited government. Some Pentecostal leaders have worked with prodemocracy movements, as in South Korea, while in Guatemala, the Pentecostal elite closely identified with the authoritarian regimes of the 1980s.

Such a diversity of political practices and political goals suggests that understanding the politics of Pentecostalism requires a deep understanding of both the local milieu of a Pentecostal denomination and how it specifically believes its faith should interact with politics. Pentecostalism's global growth suggests that the relationship between Pentecostalism and politics will continue to have great importance. The loose composition of Pentecostal churches and denominations, along with the wide range of models of political action and beliefs about the integration of faith and politics among Pentecostals, imply that this relationship will remain fraught with complexity.

Perestroika

Perestroika was the slogan that came to symbolize Mikhail Gorbachev's effort to reform the Soviet Union. The fifty-three-year old Gorbachev was appointed general secretary of the Communist Party of the Soviet Union in March 1985 because the leadership in the ruling committee (Politburo) wanted a young, energetic leader who would tackle the country's mounting problems. By 1985 the Soviet economy had almost stopped growing, and the country was dependent on imports to feed its population and to renovate its aging industrial base. Additionally, Moscow felt threatened by the arms buildup launched by United States president Ronald Reagan and by the ongoing war with Afghanistan.

In 1985, Gorbachev launched a crackdown on alcohol consumption and tried to boost economic growth through investing in new technology imported from the West. He encouraged the media to criticize bureaucratic inertia through a campaign of *glasnost,* or openness. In 1986, he initiated the more ambitious program of economic restructuring, *perestroika* in Russian—the word *reform* was unacceptable because in communist ideology, a *reformist* is someone who has abandoned the revolutionary path.

With these new endeavors, Gorbachev called for a decentralization of decision making, with responsibility shifting from central planners to factory managers. A new May 1988 law on cooperatives subsequently lifted some of the restrictions on individual entrepreneurship, and a wave of small businesses sprang up in Soviet cities. However, perestroika did not envisage the privatization of state-owned business or the creation of competitive markets. Most factory directors abused their new freedom and avoided plan targets while paying themselves, and their workers, higher wages. Slack financial discipline and a fall in the world oil price—the Soviet Union's main source of export revenue—led to inflationary pressures. Because prices were still controlled, this pressure manifested as shortages in goods. By 1989, rationing was introduced in many regions for basic food products, and workers were starting to protest their declining living standards.

On the political front, perestroika meant competitive elections—at first for positions inside the Communist Party, and then for local and national legislatures. Gorbachev tried to separate the role of party functionaries from state officials and to hold the latter accountable through the competitive elections. A new Congress of People's Deputies was elected in March 1989. Gorbachev's problem involved growing instances of political issues that had nothing to do with his economic agenda now dominated the debates in the now-free media and the new congress. Primary among these issues were the demands of nationalists in the Baltic republics of Estonia, Latvia, and Lithuania for more autonomy, if not outright independence, and a territorial dispute that erupted between the republics of Armenia and Azerbaijan. Gorbachev tended to side with conservatives in suppressing these nationalist protests, and this alienated him from the rising Russian Democrats—whose support he needed for his economic reforms. By the time Gorbachev was willing to compromise with the nationalists, in 1991, it was too late to save the Soviet Union.

Gorbachev had introduced perestroika with the goal of improving the Soviet economy, thus ensuring that the country would preserve its role as a preeminent world power. Ironically, his reforms unleashed economic and political instability, which brought about the rapid collapse of the Soviet system—precisely the opposite of what he had intended.

Performance Management

Performance management is the use of resources to create the environment and the potential to achieve organizational objectives in an efficient manner. Resources may include personnel, finance, and technology for achieving the organization's goals through strategic planning. The need for good governance, accompanied by outsourcing and privatization, has led the public sector to increasingly demand an emphasis on performance management.

An effective evaluation of performance focuses on results, rather than the traditional focus on productivity. However, in the public sector, where organizations provide services to citizens rather than make a product, it is difficult to measure performance. In public sector organizations, the results may be judged by the quality and the accessibility of the service delivery system, with the goal of performance management in the public sector to provide government services in an efficient manner.

Performance management differs from performance evaluation, in that the latter emphasizes individual performance, rather than the organization as a whole. Performance management, or measurement, requires continuous monitoring of progress through frequent and efficient diagnosis of any shortcomings. Performance management in the public sector involves first determining goals and objectives, and then identifying the measure of performance. Organizations can then assess the following six elements: (1) development potential, (2) performance incentives, (3) performance culture, (4) public values, (5) technological competence, and (6) customer orientation.

To begin, an organization first determines the organizational goals against which performance will be measured. These goals are best identified through full participation of

the employees. Although voters' representatives determine broader public sector goals, respective agencies can set specific goals. Once goals are established, specific measures for evaluating performance are chosen and clearly communicated to the employees. The measures should be achievable based on the available resources.

Addressing areas for potential development includes diagnosing poor performance and steps to eliminate the causes of poor performance through training and other development options. Ideally, there should also be adequate incentives for good performance so that the motivation is continuous. Effective incentives encourage both the individual and the wider organization to achieve the goals set before them.

Organizations can next develop and promote a performance culture so that the employees in the organization socialize into performance management. A successful performance culture in an organization helps to eliminate any possible employee resistance and engenders acceptance of performance measurement.

For optimal performance management, employees in public sector organizations should be aware of the values of public service. These values include accountability, participation, social equity, and efficiency. Transparency, rather than traditional bureaucratic control, ensures accountability. Both vertical and horizontal participation with the stakeholders is also important. Taking account of the strategic plans for recruiting and promoting diverse employees promotes social equity, which can in turn influence improved efficiency for delivering services. Successful performance measurement also addresses adaptation to technology, and how technology, particularly e-government, can make services more effective.

While customers in public sector organizations cannot withhold the services because they are the beneficiaries, the quality of the service delivery is still subject to constant improvement. In order to improve performance, public sector organizations can solicit feedback from the citizens on the services provided. This feedback from the public is a good indicator of performance.

In the face of limited resources, public sector organizations need to constantly improve performance, particularly in times of economic crisis. When jobs are scarce, people demand more justification for each dollar spent by the government, resisting projects that could add to the budget deficit. For example, the Tea Party movement the United States illustrates public resentment against government spending and lack of accountability. Performance management, however, can help legitimate government programs. The critical task for the organization is to develop feasible and reliable methods for performance management. The measures need to correspond to the goals and mission of the organization that are established in the beginning. Through performance management, organizations can improve their responsiveness to the public.

Peronism

Argentina's Peronist movement was founded in the mid-1940s by Colonel Juan Domingo Perón. Organizationally, Peronism has usually involved a personalistic leader (Perón from 1945–1974, Carlos Menem from 1988–1999, and Néstor Kirchner from 2003–2007), a group of powerful labor unionists, and a political party (the Partido Peronista before 1955; neo-Peronist parties from 1955 to 1973, and the Partido Justicialista since 1973). Until the 1970s, Perón and the unionists overshadowed the politicians, but Perón's death in 1974, coupled with a deep economic crisis in the 1970s and 1980s that weakened the labor movement, ultimately expanded the role of the politicians.

Peronism's ideology, *justicialismo*, is summarized in its motto "social justice, economic independence, and national sovereignty." Diverse policies are compatible with these ideals, and the movement's personalist leaders have always had considerable leeway in choosing among them. Perón admired aspects of Mussolini's Italy, where the army sent him to study from 1939 to 1941; Peronism, like fascism, was personalistic and anticommunist. Unlike fascists, however, Perón and his allies were not explicitly anti-Jewish or racist. Their policies were in most respects prolabor, and they restricted but did not suppress organized opposition.

After building worker support as the labor secretary in a military government (1943–1946), Perón won the presidency in 1946 in a fair election and again in 1952 in an irregular one. The death in 1952 of Eva ("Evita") Duarte de Perón, Perón's charismatic wife, weakened the government, and in 1955 Perón was deposed in a military coup. From 1955 to 1973 Perón lived in exile, mostly in Madrid. In Argentina, meanwhile, the military dissolved the Partido Peronista and passed a law that prevented Peronists who took orders from Perón from assuming the presidency or important governorships. With Perón out of the country and with Peronist party activity constrained, factions of Peronist union leaders and neo-Peronist politicians competed to gain the blessing of the exiled leader and to control the movement's resources in Argentina. In the 1960s Peronism spawned violent groups on the extreme right as well as on the extreme left, some of which had overlapping memberships. From abroad, Perón skillfully used and even encouraged conflicts among his followers to avoid being reduced to a symbolic figurehead.

Argentine president Juan Peron casts his ballot during a 1948 constitutional election. Among the characteristics of Peron's rule, known as Peronism, is a strong labor movement.

A military coup in 1966 banned all political parties, not just those associated with Peronism. In late 1969 the economy began to falter and violence involving guerrilla groups, including the Peronist Montoneros, escalated. In 1972 the military allowed Perón and his third wife, Isabel, to return to Argentina, hoping that he could tame the guerrillas, and in 1973 Perón won the presidency again in a fair election. In 1974 Perón died, however, leaving the presidency to his vice president, Isabel, whose government had shadowy ties to death squads. Hyperinflation and rising political violence led to another coup in March 1976 and to a harsh military regime that became notorious for human rights violations. When civilian rule returned in 1983, Raúl Alfonsín of the Radical Civic Union won the presidency and Peronism split. On one side were "renewalists" who wanted to democratize the Partido Justicialista, to prosecute military leaders accused of human rights violations, and to suspend payment on the foreign debt. "Orthodox" Peronists opposed these policies, and in 1988 Carlos Menem, the swashbuckling Peronist governor of La Rioja, drew on orthodox support to defeat a renewal candidate in the Partido Justicialista's first-ever presidential primary. A bout of hyperinflation

before the May 1989 presidential election gave Menem an easy win over the candidate of the incumbent Radicals.

Menem had run as a Populist, but hyperinflation persuaded him to enact free market economic reforms, setting aside the statist and nationalist model that Perón had initially favored. Menem's reforms initially improved the economy, but the currency became overvalued and the country grew more dependent on skittish short-term foreign capital. Economic discontent allowed Fernando de la Rúa, a Radical, to win the 1999 presidential election, but ongoing economic turmoil forced him to resign. In 2003 Néstor Kirchner, a Peronist, won the presidency, enacted more nationalist and statist economic policies, and renewed the prosecution of military leaders accused of violating human rights. During his presidency from 2003 to 2007, Kirchner combined Perón's (and Menem's) predilection for personalistic leadership with center-left domestic and foreign policies, and in 2007 he supported his wife, Cristina Fernández de Kirchner, in her successful campaign to succeed him as president. In the first decade of the twentieth century, Peronism remained a heterogeneous political movement with a personalistic leader supported by a shifting coalition of ideologically diverse union leaders and politicians.

Petition

A petition is a formal request to a political official or governing body. Petitions typically request that officials address complaints or grievances, take action on an issue, or confer a special dispensation. The right for citizens to petition the

government has roots in the English Magna Carta (1215) and was more formally codified in the 1689 English Bill of Rights. In the United States, King George III's failure to take action on a series of petitions developed by the colonists is cited as one of the reasons for the Declaration of Independence. The right to petition was subsequently enshrined as part of the First Amendment of the U.S. Constitution and incorporated in state constitutions.

In contemporary political systems, petitions are used to place candidates or referendums on the ballot. Such petitions generally require a minimum number of signatures. Often a means to express public displeasure toward a government policy or action, petitions may also be part of the recall process to force officials from office; they are used in the legal system to seek court action.

Peuchet, Jacques

Jacques Peuchet (1758–1830) was a French political philosopher who was highly influential in shaping public administration in his country. It is likely that he coined the term *bureaucratic* around 1798, approximately a decade after the word *bureaucracy* was first introduced.

Born in Paris, Peuchet matriculated at the College of Louis-le-Grand. He followed his classical studies with study in law. After graduating, he assumed legal and administrative posts, prior to and continuing throughout the French Revolution (1789–1799), with intervals of self-imposed exile during periods when he felt he was in danger. He came to focus upon political economy as the chief area of his contribution and successfully introduced substantial systematic statistics to French administrative procedure.

Peuchet produced two notable works, *Statistique élémentaire de la France* (1807) and *Description Topographique et statistique de la France* (1807). In these works he labored to develop a disciplined approach to public administration, laying thereby the foundation for the discipline to emerge. His influence is reflected in German philosopher Karl Marx's translation of Peuchet's treatise on suicide from Peuchet's *Mémoires tirés des archives de la police de Paris* (1838), which Marx viewed, in *Marx on Suicide* (1818–1883) as holding the "great advantage of having placed in evidence the contradictions and the monstrosity of modern life, not only in the conditions of particular classes but in the entire sphere and form of the actual social relations."

Peuchet's greatest contribution is perhaps his authorship of entries in the *Encyclopédie Méthodique* (1782–1832), most significantly those in the ninth volume, the 1791 *Dictionnaire de police et municipalité,* under the heading "Jurisprudence." Also to note, the "Police" entry contributes two important concepts. The first clarifies the meaning of "public opinion," which had become a vital part of the thinking of *les idéologues* of the French Revolution era and had also influenced the

thinking of politician and philosopher James Madison in the United States. The second contribution applies to the meaning of the term *police* itself. Peuchet presents the single, most comprehensive account existing in the literature of political science on the topic, examining the word from its broadest meaning as constitutional and moral order all the way to the maintenance of public order, health, and safety.

Peuchet's influence extends from political economy and public administration to fictional literature. His worked as a publicist and also edited the *Gazette de France* and the *Mercure.* His service as archivist for the Préfecture de Police led to the publication of memoirs that provided the inspiration for Alexandre Dumas's novel, *The Count of Monte Cristo.* In addition, Peuchet authored the fictional work *Mémoires de Mademoiselle Bertin sur la reine Marie-Antoinette, avec des notes et des éclaircissements* (1824). This pseudonymous account (which draws upon the factual record contained in an earlier work of his on Marie Antoinette) served to complete Peuchet's transition from a representative in the general assembly during the 1789 revolution to a royalist quietly sympathetic to the executed queen.

Pillarization

The phenomenon of pillarization is commonly associated with the social, political, and cultural organization of society into separated strata—along different religious denominations and ideological attachments—that manifested in the Netherlands and Belgium during the first half of the twentieth century. The term *pillarization* derives from the idea of a society consisting of pillars. This concept may have first been coined in the late 1930s by Dutch civil servants who invented the word *pillars* as shorthand for designating groups in society whose interests had to be accommodated in a party-political negotiation process. Since then, it grew into common usage and came to be studied as a self-standing concept in academia.

Pillarization may be roughly defined as the process whereby social interactions are separated into various cultural, religious, or political spheres where each has its own institutions. These include churches, political parties, schools, sports clubs, and

the media. Within a society characterized by vertical pluralism, pillars coexist in the same geographical areas. Certain zones are predominantly Catholic or Protestant, while certain cities may be known as socialist bulwarks. It would be a misunderstanding to see the separations within society among different strata as creating a kind of segregation where one pillar dominates the others. The idea is that pillarization preserves a given diversity and that alterations in relative size or political differences between pillars do not immediately transpire into social tensions.

One of the questions that occupies social scientists, political theorists, and historians is to what extent pillarization impacts politics. Pillarization is not constitutionally anchored unless freedom of religion and political opinion are viewed in this light. Yet, its capacity to impinge on democratic representation has led to considerable debate. On the one hand, some writers interpret pillarization as galvanizing democracy, by virtue of its capacity to bridge gaps between contrasting views in different pillars on morally laden or otherwise controversial topics like abortion, labor and wage politics, and child care benefits. On the other hand, critics question the scientific methods used by these writers as lacking rigor; these critics instead argue that consociationalism, by its very nature, is undemocratic and is a tool of the elites to exercise control. These critics argue that, since the 1960s, the process of depillarization clearly exposed the consociationalist reality behind pillarization.

The question of whether pillarization optimizes political accommodation in a democratic fashion or whether it is a cynical tool to exercise political control echoes the original guise under which sociologists consider the subject. Early academic outlooks on pillarization focused on the idea that it was a problem—a barrier to modernity and a hindrance to national state-building. The counterpart to this view was that religious pillarization serves as a control mechanism to appease the working classes. Pillarization, on both counts, was seen as a perversion of an ideal course of history; it either stood in the way of normal national state development or of a proper unfolding of the class war.

Rather close to the first view is the popular idea that, historically speaking, the principles of pillarization, neocorporatism, and the welfare state can be traced back to the time of the Republic of the United Provinces. Only recently have historians researched the subject and found that actual manifestations on local levels of early twentieth-century pillarization hardly corresponded to the kinds of functions ascribed to it for decades. It appears that a historically sensitive approach to pillarization, developed against a longer background of the transformation of European political discourses, may not only result in new insights on the origins and nature of pillarization, but also provide a relevant perspective on the current crisis of Dutch social democracy and the welfare state, precisely by opening up late nineteenth-century centralized state-building theories.

Plato

Plato (427–347 BCE) was a highly influential Greek philosopher and writer. In his autobiographical *Seventh Epistle* (ca. 350 BCE), he describes his early desire to enter into politics, but his disillusionment with what he viewed as unjust regimes that came to power in the period at the end of the Peloponnesian War (431–404 BCE). He goes on to say that, given the corrupt nature of existing societies, the only hope for a good society is one in which philosophers rule as kings.

Plato's main works are in the form of dialogues, generally featuring his revered teacher, Socrates, as the main spokesperson. There are continuing questions of authenticity in regard to various works, although the combination of philosophical and literary brilliance of most dialogues, including the major political ones, leaves no doubt about their authorship. However, Plato's use of the dialogue form has resulted in irresolvable issues of interpretation, including the extent to which Plato's "Socrates" represents the historical Socrates, opposed to being a vehicle for Plato's own ideas.

Many of Plato's contributions to philosophy center upon his theory of forms (or ideas), which represent perfect moral, epistemological, and metaphysical standards. These exist beyond the phenomenal world and are accessible only intellectually. Plato's political theory revolves around repeated contrasts between corrupt existing political systems—including Athenian democracy—and visions of reformed polities, in which people achieve their full moral development. Plato's withering

criticisms of Athenian democracy in the *Gorgias* (ca. 385 BCE) and to a lesser extent in other works, such as the *Apology of Socrates* (ca. 395 BCE), culminate in detailed exploration of a completely just city in the *Republic* (ca. 375 BCE), Plato's best-known political work. In order to further an inquiry into the nature of justice, Plato's Socrates develops a complex system based on a three-class division: farmers, auxiliaries, and philosophers. For the two latter classes, both property and families are communal, to allow them to more easily devote their lives entirely to the welfare of the city. In keeping with Plato's long-held aspiration, the philosophers rule as philosopher-kings, in accordance with knowledge of the forms, which they alone possess. Their main task is to oversee an all-embracing system of education, intended to raise all members of society to the highest levels of justice possible for them. The just city of the *Republic* provides a timeless model of an ideal city, in regard to both the nature of just institutions and the costs they incur.

Plato's later political works, the *Statesman* (ca. 360 BCE) and *Laws* (ca. 347 BCE), evince far greater interest in existing Greek political institutions and how they could be reformed. In *Laws,* his last and also longest work, the main speaker, an unnamed "Athenian Stranger," discourses on laws and institutions for a new city to be founded on Crete. The political system in this "second best" city is based on the government of laws, rather than of philosophers, in the form of a modified democracy with a complicated system of checks and balances preventing political abuse. Ideals of community of property and of family have given way to more traditional Greek institutions for all citizens, including the rulers, although again, enormous attention is paid to education.

Ever since ancient times, Plato's works have been the focus of intense scholarly and popular interest. The history of European political philosophy may be viewed as Alfred North Whitehead famously described it in his 1979 work, *Process and Reality,* as "a series of footnotes to Plato."

Plebiscite

A plebiscite, also known as a referendum, is a direct vote where the electorate in question is asked to accept or reject a government policy, piece of legislation, constitution or constitutional amendment, or the recall of an elected official. In the context of legislative inaction, public demand for a plebiscite is also known as an *initiative.* A plebiscite can be politically obligatory or advisory. It is a form of direct democracy, which emphasizes the importance of citizen involvement and direct political participation. In contrast, representative democracy stresses the role of elected representatives.

However, a mutually exclusive differentiation of the two forms of democracy is not accurate, since plebiscites have been included successfully in representative democracies. Within complex systems of representative democratic institutions and processes, the use of government-initiated plebiscites at the national level has continued to increase in many Western democracies. Citizen-initiated plebiscites are still much less common. This is not necessarily an indication of increased democracy through direct measure, but rather, it could be indicative of strategic decisions and motives of governments. Governments may be motivated to consolidate power, resolve internal party divisions, pass legislation that would otherwise not be passed, or secure public approval of policies so as to avoid damage to government legitimacy.

With regard to the increase in government-initiated plebiscites, there is greater demand for citizen access to political decision-making processes. This focus on increased citizen action relates to increasing resources and political skills within the given electorate. Electorates who are more "adept" can be reliably involved in complex, political decision making and democratic processes. At the same time, there is a growing level of public cynicism toward government and government officials. This trend has resulted in greater disaffection toward politics and political institutions, ultimately resulting in reduced public confidence in traditional modes of democracy. Consequently, plebiscites are used increasingly as protective mechanisms for the public. In other words, plebiscites help to ensure that citizens' rights are secured while their opinions and demands are conveyed to their political leaders. By extension, the use of plebiscites may have increased based on *faux populism,* wherein various political groups and interest groups see plebiscites or referendums as new devices to "bend the use of popular political action to their own narrow purposes" (Craig, Kreppel, and Kane, 25–26).

Despite the increase in plebiscites, the outcome of these direct votes is still relatively uncertain. A few comparisons with elections are useful in this regard. For instance, the issue position of voters with regard to ballot content or its underlying political ideology is important in both plebiscites and elections, as is public trust in leaders and government. However, in plebiscites, political parties may align themselves with different sides of the debate, often in unexpected ways and ultimately complicating voter choice, especially given voters' party identification. This can cause a greater degree of volatility and uncertainty for the outcome of plebiscites, since voters do not have the expected partisan *cues* that are normally present during elections.

Additionally, various campaign effects and media coverage can result in greater levels of volatility and uncertainty in plebiscites than in elections. When plebiscites deal with issues that are familiar to the public, and which fall along previously defined ideological cleavages and core beliefs in society, the

outcome tends to be more certain. Where issues are unfamiliar or complex, increased volatility and uncertainty result.

Overall, plebiscites that deal with public policy issues or legislation are more likely to receive public support than those that revolve around constitutional changes or implementation. Plebiscites on constitutional issues are very different from policy plebiscites; the former deal with fundamental changes to government and institutional structures, while the latter are often relatively minor in nature. As a result, constitutional changes through plebiscites are more likely to fail than plebiscites that deal with other matters.

Plekhanov, Grigorii Valentinovich

Grigorii Valentinovich Plekhanov (1856–1918) was a Russian writer and political activist often considered the "Father of Russian Marxism." Plekhanov began his revolutionary career during his university studies, joining the Land and Liberty organization, which hoped to foment revolution among the Russian peasantry. When this organization split in 1879, Plekhanov helped found Black Repartition, which rejected terrorism and advocated socialist propaganda campaigns. He was forced into exile in 1880, and in Europe he helped introduce Marxism into Russian revolutionary circles.

In 1882, Plekhanov published a translation of German philosopher Karl Marx's the *Communist Manifesto,* which included a foreword by Marx himself. A year later, Plekhanov cofounded the Emancipation of Labor group in Geneva, a Russian Marxist organization that turned away from the previously popular idea of peasant-based socialism and instead emphasized the potential for Russia's nascent working class as a force for change.

Plekhanov subsequently became the intellectual leader of the Russian Marxists. He insisted that a successful communist revolution in Russia would require two stages. Recognizing that Russia was not a leading capitalist state, he argued that the country would have to pass through a democratic-bourgeoisie revolution to eradicate remnants of feudalism and autocracy. Then, once working-class structures had developed more fully, Russia could produce a socialist revolution. Recognizing the weakness of the Russian bourgeoisie, he asserted that the country's working class would have to take the lead in both revolutions. To this end, he helped create the Russian Social Democratic Labor Party (RSDLP) in 1898. In 1900, together with Russian revolutionary Vladimir Lenin, Plekhanov began publishing *Iskra* (Spark), a journal that was smuggled into Russia in attempt to convince Russians of the need for a socialist revolution.

A split occurred in the RSDLP at its second congress in 1903. Lenin argued for the creation of a small vanguard party of professional revolutionaries to bring a socialist revolution to Russia. Plekhanov, taking the mass-based Social Democratic Parties in the West as his model, disagreed. Lenin then formed his own party, the Bolsheviks, with Plekhanov joining the Mensheviks. Afterwards, Plekhanov used *Iskra* to attack Lenin for what he viewed as radical and dangerous ideas, predicting that Lenin's course would lead to a communist dictatorship over the Russian people.

After his hesitant support for the 1905 revolution in Russia, Plekhanov's influence in Marxist and revolutionary circles waned. In 1914, again in contrast to Lenin, he spoke in favor of Russia's involvement in World War I (1914–1918), and he returned to Russia only in March 1917 after the tsar had been overthrown, giving his support to the bourgeoisie-dominated Provisional Government. He condemned Lenin's seizure of power in November 1917, arguing that thrusting such power upon the Russian working class would lead to calamity.

Plekhanov's influence was most widely felt in his innovations to Marxism, and many would rank him as Russia's foremost Marxist intellectual. He produced works such as *Anarchism and Socialism* (1895) and *Fundamental Problems of Marxism* (1908). His *Development of the Monist View of History* (1895) traces the evolution of modern social thought and emphasizes the influence of German philosophers Georg W. F. Hegel and Ludwig Feuerbach on Marx, leading Plekhanov to be the first to characterize Marxism as a form of dialectical materialism.

Plekhanov asserted that this method could be applied to social, philosophical, and literary studies. Defending Marx's fundamental insights, he rejected the efforts of German political theorist Eduard Bernstein and other revisionist thinkers to "improve" Marx. Despite his disagreements with Lenin, many of Plekhanov's writings on Marx were held in high esteem in the Soviet Union, where his works were widely read.

Pluralism

The notion of pluralism emerged in England and the United States during the early twentieth century as a conceptual response to the increasingly associative character of society, the rise of governmental interventionism, the lobbying activities of organized groups, and the nascence of immigrant subcultures. Pluralism may be defined as both a descriptive, or positive, theory and a prescriptive, or normative, theory of individual participation by social association in the political process. Positively, the concept establishes (1) the existence of a plurality of interests and corresponding social groups which, as latent centres of power, may organize into associations; and (2) the transformation of this diversity into public policies by means of pressures exerted on each other and on governments. Normatively, the concept endorses the formation of interest groups as subjects of democratic politics and the sequence of group conflict, bargaining, and compromise that characterize the shaping of public policies, on the condition that basic rights and principles of justice remain respected and protected.

TWO EARLY VARIETIES: SOCIOPOLITICAL AND ETHNOCULTURAL PLURALISM

British Labour Party intellectual Harold J. Laski gave the name *pluralism* to the approach in 1915. He borrowed the term from the pragmatist philosophy of William James, who had used it to describe the character of a "distributive" reality, contrasting with monist ideas, particularly Georg W. F. Hegel's, about a unified "block universe." Likewise inspired by James's philosophy, Horace M. Kallen introduced the term *cultural pluralism* into the American debate in 1924. Starting from the premise that unequal social resources will translate into unequal political resources, both Laski and Kallen advocated for reformist programs. Laski, in *Grammar of Politics* (1925), focused on diminishing the discretionary exercise of organizational power by economically powerful minorities. Kallen, in *Culture and Democracy* (1924), aimed at doing away with assimilationist pressures by culturally privileged majorities discriminating against immigrant ethnic groups.

Both agendas favored a politics of inclusion, in the sense that policy making in pluralist democracies should embrace, on an equitable basis, as many societal interests as possible. However, cultural pluralism should not be perceived as an exact analogue of political pluralism. The "identity-bearing communities" of the former contrast with the voluntary associations, or groups "by choice," of the latter variety. A potential conflict exists here between group life and the development of individual capacities, which is absent from political pluralism, and which public policies need to take into account.

Both varieties were rediscovered—in substance, if not through explicit recourse—after World War II (1939–1945). American political scientist Robert Dahl revived Laski's variety; Dahl, in his later works (*Dilemmas of Pluralist Democracy,* 1982; *Democracy and its Critics,* 1989), returned to pluralism and the democratizing dimension that the British thinker had first supplied. This included industrial self-government and an employee-controlled economy as the main prerequisite of a more participatory democracy.

A succession of theorists rediscovered Kallen's notions; these theorists include Tariq Modood in Britain and Will Kymlicka in Canada, who both supported progressing toward multicultural acceptance, and avoiding both fragmentation and conformity. They promoted a plural state, informed by a *politics of recognition*, as the vehicle for achieving true multicultural citizenship.

GROUP THEORY AND ITS REEMERGENCE WITH THE COLD WAR

Even before Laski and Kallen, Arthur F. Bentley had presented an approach in 1908 that essentially reduced human behavior to group action. If the immediate impact of his book *The Process of Government* (1908) was negligible, that situation changed after a considerable number of pressure group studies were published in the United States between World War I (1914–1918) and World War II, and after the New Deal had finally established organized labor and organized agriculture as political players alongside business in bargaining for political benefits. Bentley's work was resuscitated in the 1950s by David B. Truman (*The Governmental Process,* 1951), Earl Latham (*The Group Basis of Politics,* 1952), and others who judged that organized interest groups made up the principal ingredient of present-day government. At the same time, against the backdrop of the cold war, the need was felt for a comprehensive theoretical perspective designed to explain and justify the political systems of the "free world," meaning the United States and Western Europe. Stripped of most of its prescriptive implications, elevated to the status of an antitotalitarian public philosophy, the concept of pluralism seemed to serve the purpose perfectly. The 1950s to 1970s were the heyday of the academic and political discourse on pluralist democracy.

Both Truman and Dahl, even in his early works, conceded that political activity, including control of group leaders and access to government, was determined—to a considerable extent—by income, education, and status. Cross pressures, resulting from conflicting group loyalties, might lead to political apathy. Political resources were unequally distributed between business and labor. Capitalist democracies thus offered extensive opportunities for "pyramiding" such resources into structures of social power and political influence. In view of these limitations, beginning in the mid-1970s, two avenues for further theorizing suggested themselves.

NEOCORPORATISM VERSUS DEMOCRATIZATION OF ECONOMY AND SOCIETY

One avenue to structure social power and political influence was to unequivocally embrace "realistic" Schumpeterianism,

fitting groups into a model of elitist democracy where governments would explicitly privilege the organizations of capital and labor as partners in policy making over associations with weaker political resources. Group leaders would manufacture consent for policies resulting from interest intermediation. Group members would consequently be controlled from above. Such liberal conceptions *neocorporatism*, as they came to be labelled, were particularly developed in, and focused on, Western Europe, with Philippe Schmitter and Gerhard Lehm-bruch (*Trends Toward Corporatist Intermediation,* 1979) in the forefront of neocorporatist writers.

The second alternative, according to Dahl, consisted in raising the normative question how one might remedy the so-called defects of pluralism. Looking for possible solutions to what "authority in a good society" might be like, Dahl—ever more critical of institutional rigidity, social inequality, and political apathy—suggested a "radical" alternative to the present status quo. The large business corporation became the major target for structural, participatory reforms, aimed at enfranchising blue- and white-collar employees.

Largely evolving separately from the debate on sociopolitical pluralism, discussions of ethnocultural pluralism have raised a number of thorny problems, not least among them the question of how to balance individual against group rights. Any determined movement in the direction of group rights might work to endanger individual autonomy, and bar individuals from opting out of their group by adopting ideas and practices running counter to their ethnocultural heritage. To be effective, policies of differentiated group treatment (e.g., affirmative action) may need to show an awareness of the connection between economic and cultural power. A more equitable distribution of social and political resources could, then, help individuals to make meaningful choices—including the choice to exit a group perceived as confining.

Put in a nutshell, what might be termed *successive pluralist research* has amounted to nothing less than a persistent inquiry into the theory and practice of democracy under changing socioeconomic and sociocultural conditions.

Poetry and Politics

The relationship between politics and poetry predates written poetry with Homer's critical view of the Trojan War. However, its public policy significance was dormant until Plato theorized the benefits to society of banning poets in the *Republic.*

Plato was reacting to the unacknowledged yet real authority retained by Homer as offering the only communally accepted version of epiphanic moments in Greek social and political history. Plato goes so far as to describe poetry as "crippling to the mind," since its persuasive powers rest on the received pleasure of the reader rather than philosophically rigorous renditions of "the truth."

The view that the poet is the "unacknowledged legislator of society" is borne out of the view that the poet had historically legislated the parameters within which the cultural—and thereby the political—imagination was permitted to function. Humans cannot act rationally before they imagine an action and its consequences within those social parameters. The issue for Plato is that people are vulnerable to influences on their imaginative faculties by a persuasive third party. Such third parties now operate principally through the television or the Internet. However, for most of Western history, poetry remained the most effective genre of imaginative persuasion. The diminution of the influence of poetry has more than superficial consequences for the quality of political imagining, since poetry demands much more engagement than any contemporary media.

POETRY AND POLITICAL THOUGHT

Direct narrative or analytical approaches are *monological* in their effect. Their criterion of value is that the singular thesis of the author transmits as cleanly and completely into the mind of the reader as possible. The reader is required only to accept or reject the thesis, not to contemplate consequences other than those that the author or auteur presents. The well-written monological piece delivers all of its insights on the first reading. Considered visually, a monological reader's experience over time resembles a cylinder, with each reading experience as circular as the previous one. Poetry, on the other hand, is *helicoidal,* or screwlike, in nature. It assumes that a reader will read a poem several times over a given period of time, and each time the meanings embedded in the poem will become more tightly focused for the reader. As the reader becomes more familiar with the poem, its meaning becomes clearer—eventually resulting in a fine "point" of understanding, resembling the point of a screw.

These meanings do not necessarily correspond to the intentions of the author, since the reader seeks answers to questions that may not have occurred to the author when the poem was written. However, an inspired and sensitive poet was expected to have spoken the truth on any given subject—and even in some cases, such as Dante or John Milton, to have been divinely inspired to do so. Therefore, any political actor could not fail to encounter something of value to them by rereading a poem several times over. Indeed, for the allegorical author, the reader was expected to impose an individual interpretation on the text, beyond the narrow range of clues that the author provided. A medieval reader of Dante, for example, expected to read the *Commedia* not only at the literal level, but also at the typological, (allegorical), tropological (morally instructive), and perhaps, if the text permitted, at the anagogical level, which is the moment of insight that recognizes the presence of God.

Medieval political allegory was not primarily about finding universally valid answers to politically contingent problems; rather, it intended to illustrate broad aspects of the human drama, allowing an investigator to examine an issue from a multitude of different perspectives. The process is similar to that which one undergoes in appreciating a cubist work of art. While there is a more or less coherent image on the canvas, only by tracing the multiplicity of perspectives and surfaces presented, and then recombining them in the imagination, does one gain a sense of the profound depth of the object studied. One may never gain the full perspective of the artist, but one cannot help becoming more engaged than is possible with a masterful "realist" rendition of an object.

By providing no finality of thought, end position, or conclusion, political poetry presages many of the perspectival and positional insights offered by advocates of postmodern epistemology. Through an ongoing process of contemplation, it allows new and uncertain outcomes to be continuously evaluated and best-case scenarios to be worked out in advance of an actual crisis.

THE PLACE OF POETS IN POLITICS

No one elects poets to their posts, although popular acclaim provides the democratizing limits to their influence. In the nineteenth century, politically attentive poets enjoyed the benefits of a dramatically increased level of literacy among the lower orders, which encouraged them to investigate the romantic allure of individual liberty, universal suffrage, and democratic rights. Included in this democratizing trend were William Blake, William Wordsworth, Samuel Coleridge, Lord Byron, Percy Shelley, and John Keats. Although historically the bane of authoritarian regimes, poets are not exclusively prodemocratic in orientation. Modernist poets such as W. B. Yeats, T. S. Eliot, and especially Ezra Pound formed a famously antidemocratic collective with some members consciously verging on the fascistic. This tendency likely reflected the twentieth century's growing popular disinterest in poetry in favor of more visual—and thereby passive—media, returning poetry to the hands of highly educated elites with more rarified political interests. However, in less developed societies, authors continue to threaten authoritarian regimes (e.g., Václav Havel) and occasionally still die for their trouble (e.g., Ken Saro-Wiwa). In the West, poetry has largely lapsed into the indulgence of self-expression, which negates the broader application Victor Hugo or Robert Browning might once have had.

Polanyi, Karl

Karl Polanyi (1886–1964) was a Hungarian historian and political economist. His pathbreaking critique of neoclassical economics is regarded as one of the most important contributions to social scientific thought in the twentieth century. Raised in Budapest and educated at the University of Budapest and the University of Kolozsvár, Polanyi obtained a doctorate of law at the latter in 1909. His participation in the socialist student movement—especially his capacities as president of the progressive student group, the Galilei Circle—helped shape his intellectual development. Polanyi's early political life, which included a position as secretary of the National Bourgeois Radical Party, was interrupted by World War I (1914–1918) and two years of active military service on the Eastern Front as a cavalry officer in the Austro-Hungarian army.

Severe illness resulting from his military service left Polanyi hospitalized for a time. Upon his recovery, he made a living in Vienna, Austria, as a writer and editor for various academic and journalistic publications until he was forced into exile for the second time in 1933, fleeing to London in response to the rise of fascism in East Central Europe. This period is often considered to be a formative one for Polanyi's thinking, as it was in Vienna that he first became interested in neoclassical economic thought. In his exchanges on socialist accountancy with Austrian economist Ludwig von Mises, Polanyi set out to formulate a socialist theory of price formation that he believed would serve as a feasible democratic alternative to capitalist price theories based on supply and demand.

A three-year research grant from the Rockefeller Foundation for the years 1940 to 1943 afforded Polanyi the time to complete his magnum opus, *The Great Transformation* (1944), in the United States. The book analyzes the breakdown of the nineteenth-century laissez-faire liberal market order—an era which Polanyi argued was the single instance where efforts to impose a self-regulating market on society became a historical reality. The success of the book led to an appointment as a visiting professor in economics at New York's Columbia University in 1947, a position he held until his retirement in 1953. Because of his wife's past involvement in the Communist Party, Polanyi and his family settled in Canada, obliging him to commute to New York.

In recent years, debate has proliferated over how to interpret Polanyi's argument in *The Great Transformation*. One position holds that Polanyi's main purpose is to demonstrate how the self-destructive process of disembedding the market from society—achieved by subjecting the "fictitious commodities" of land, labor, and money to market discipline—is inevitably met by a countermovement of social protection seeking to reembed the economy in social relations. Achieved historically with the post–World War II (1939–1945) emergence of

the Keynesian welfare state, this countermovement serves the essential function of stabilizing capitalist social relations.

Another position accepts that Polanyi's purpose is to illuminate the destabilizing tendencies of the self-regulating market, yet it offers a fundamentally different interpretation of his arguments about the relationship between social protection and that market. Rather than seeing social protection as a "taming" force under capitalism, this position argues that Polanyi wants to demonstrate how all historical countermovements for social protection in the laissez-faire context, such as the poor laws of the 1830s, only exacerbate crises if they do not lead to the complete decommodification of the three fictitious commodities.

These competing interpretations lead to divergent assessments of the normative character and empirical validity of Polanyi's work: the former regards Polanyi as a reformist who insightfully understood the necessity of social policies in capitalist societies; the latter sees him as a revolutionary who, given the relative prosperity and social consensus of the postwar "golden age," had underestimated the prospects for capitalist stability.

Police Powers

In the United States, police power refers to the authority granted to state governments giving them the ability to make laws that maintain order and safeguard the health, morals, public safety, and welfare of state citizens. This term is interpreted expansively and does not refer simply to the narrow subject of law enforcement. The source of this type of state authority stems from the Tenth Amendment of the U.S. Constitution, which declares: "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." In other words, this constitutional provision says that those powers not assigned to the national government end up residing with the states.

These so-called reserved powers as guaranteed in the Tenth Amendment operate to protect the states' role in the U.S. federal system. Police powers are an important aspect of these reserved powers. State legislatures exercise their respective police power by directly enacting statues as well as by delegating such authority to their subordinate governmental entities in the form of counties, municipalities, and special districts. Much of what state and local governments do is a function of their police powers' authority.

CLARIFICATION BY THE COURTS ON THE RANGE OF POLICE POWERS

The constitutionally acceptable range and reach of police powers is a challenge to precisely determine. It covers various governmental regulations of myriad activities and various relationships. Leading examples of the legitimate exercise of police powers include regulations placed on the following: speed limits on roadways, the licensing of professions and trades, zoning and land use, marriage, gambling, prostitution, discrimination, parking, alcoholic beverages, education, health, business and contracts, sanitation, the workplace, and crime. Disputes have inevitably arisen over how far government can go in the exercise of this power.

Generally speaking, in the last several decades, the courts have ruled in favor of the government when the laws in question are concluded to truly advance the public good. This comes with the recognition that the state must have the necessary discretion to determine for itself what constitutes the public need and the best way to reach that goal via its statutes. Thus, in the current era, the courts manifest some deference to the legislature in this regard—all levels of the federal courts have demonstrated a reluctance to strike down such laws, except for statutes seen as infringing upon free speech, free exercise of religion, and fair hearing procedural protections.

To be constitutionally acceptable, a particular exercise of the police powers by the state must be congruent with both the U.S. Constitution and the relevant state constitution, especially in terms of the protections as laid out in the due process clause found in the Fifth and Fourteenth Amendments of the U.S. Constitution. Thus, if a law is enacted on the basis of police powers, and that law does not promote the health, morals, safety, or welfare of the public, it is more prone to be struck down as an unconstitutional violation of due process guarantees of life, liberty, and property. The typical grounds for such litigation is the contention that such a law constitutes the government's illegal "taking" of a private citizen's actual property or otherwise hinders the citizen's use of that property.

POLICE POWERS AND FEDERALISM VERSUS STATES' RIGHTS

According to traditional constitutional theory, the federal government does not possess police powers per se in the same way that state governments do. The federal government is considered one of the directly expressed or enumerated powers as laid out in the Constitution, coupled then with implied powers that allow the federal government to carry out those enumerated powers. The "necessary and proper" clause in Article I of the Constitution, then, has been interpreted by some as

serving as the functional source of federal police powers, with the qualifier that federal laws must find some relatively specific basis in the enumerated powers set out in the Constitution. State laws can find their legitimacy in the more open-ended notion of police powers, as part of a state's reserved powers.

State and federal court decisions constitute one of the primary sets of constraints on state police powers and the U.S. Supreme Court has played a particularly salient role in clarifying the extents and limits of police powers as well as the nature of federal-state relations in this regard. There is a dynamic and evolutionary quality to this area of jurisprudence, as membership changes on the high court bring about differing perspectives and subsequent legal precedents on such state regulations. Before 1937, dominated by business-friendly and conservative justices, the Supreme Court was quite willing to strike down as unconstitutional many state laws that drew their inherent police powers as their authority. A prime example is *Lochner v. New York* (1905), when the Court rejected the "liberty of contract" as an abridgement of a New York state law that limited the number of hours bakers could work on a weekly basis— this "liberty" abridgment for the Court was a due process violation. This trend abated when membership on the Court changed and President Franklin Roosevelt was able to appoint more liberal justices who abandoned the prior orientation and started to uphold such state laws.

This remains an ongoing legal and societal debate in the current era about what constitutes the appropriate extent of state police powers. Contemporary examples include political controversies and court cases revolving around regulation of smoking in public areas, regulation of pornography online, and government surveillance after the attacks of September 11, 2001. The question over the proper level of tradeoff between individual liberty, on one hand, and the ability of government to ensure order, on the other, remains at the heart of police powers debates and discussions.

Police State

Police state signifies a highly centralized form of government, with the state pervading virtually all components of society. Political dissent and opposition are aggressively suppressed, and the populace's fear of and intimidation by the government are a constant. For police states, governmental authorities' control over society is at a premium and any means available to do so are used with no regard for individual civil liberties or fundamental human rights—including unconstrained mass surveillance, no free press, meaningless elections, detention without trial, and the use of state terror on its own people. Governmental power is extraordinarily concentrated, state propaganda is at its most cultivated, and ruthless repression is essential. Police state is generally considered as a disparaging synonym for totalitarianism.

Political scientists Carl Friedrich and Zbigniew Brzezinski promulgated the now classic and widely accepted definition of the police state, or totalitarian, pattern in their seminal 1956 work *Totalitarian Dictatorship and Autocracy.* Their totalitarian criteria consist of the following primary elements: an official, dominant state ideology with the purpose of bringing about an improved and ultimately perfected set of conditions for society; a dictator who commands a single ruling political party; an all-powerful secret police whose methods include terror; government monopolization of the mass media; government monopolization of the possession of arms; and complete state control of the national economy.

Leading examples of police states include both fascist and communist dictatorships, such as Italy under Benito Mussolini, from 1922 to 1945; Germany under Adolph Hitler, from 1933 to 1945; the Soviet Union under Josef Stalin, from 1930s until 1953; Romania under Nicolae Ceausescu, from 1974 to 1989; and North Korea under Kim Il-Sung and followed by his son Kim Jong-Il, from 1948 until the present. Leaders in these police states commonly attempt to take on a heroic, almost divine, aura around them as they symbolize, personify, and represent the incarnation of the state. Brutal repression and silencing of any political opposition is a given in this type of statist regime.

As adduced, a police state or totalitarian regime has a specific and technical political science definition. In more common parlance and daily political discourse, the term is more readily bandied about when a critic wishes to denounce actions taken by a government that are interpreted to intrude upon individual liberties or political expression. There is no strict tipping point or threshold that directly determines whether a nation can be considered as a police state per se; that is, there are degrees of being a police state depending on the governance dimension under examination, but the historical examples are clear manifestations of a police state in operation. A country possessing police state attributes in some aspects does not necessarily fall into this category—the totality of the governance structure and regime orientation must be assessed before the political science categorization can be accurately applied.

Political activists, in their rhetorical choices as part of their own country's or international political debates, are much less

constrained when using this term, such as accusations that the United States is becoming a police state in its use of warrantless mass surveillance in the aftermath of the attacks of September 11, 2001, or its use of indefinite detention without trial or *habeas corpus* of suspected terrorists. Invoking the term *police state* with the past specters of Nazi Germany or Stalin's Soviet Union shadowing such rhetoric is intrinsically incendiary and emotively powerful. Recipients of such political expression or analysis must evaluate the speaker's accuracy or relevance of such categorizing pronouncements.

Policy Analysis

Policy analysis is a method of inquiry to examine governmental activity that provides a systematic way to assess the consequences of past policy actions and the alternatives available to address societal problems. Hence, it can be used for both retrospective and prospective purposes.

The field of policy analysis has evolved considerably. Early policy research focused almost exclusively on the economic elements of governmental actions. Over the years, policy analysis expanded to incorporate a wider range of factors, drawing from such fields as political science, sociology, and geography. A number of factors have driven the development of policy analysis research, including advancements in analytic techniques, greater citizen demands for more systematic information about government, and the wider availability of relevant data. As of the early twenty-first century, policy analysis incorporated an array of different analytical procedures and methodological approaches.

One of the main questions about policy analysis concerns whether it should be performed by those who make or implement policy decisions—such as legislative staffs and administrators—or by those who work outside of the policy process—such as consultants, academics, policy advocates. Internal policy analysis can produce more useful, detailed

information, but it might also be less independent and comprehensive. On the other hand, external policy analysis may yield more objective information, but it may be less useful, timely, and relevant for policy makers.

Another question is whether policy analysis should focus only on the technical aspects of a problem and avoid any political elements. Some question whether policy analysis can be apolitical. Although it aims to provide an objective, systematic account of governmental activity, it can also be used for political purposes to generate support for existing governmental programs and future policy proposals. Hence, it is difficult to separate the technical and political components of policy analysis.

Policy analysis has become an integral component of the contemporary policy-making process. It produces information that allows assessment of the consequences of past decisions, and helps determine the merits of future governmental actions.

Policy-centered Entrepreneurship

Policy-centered entrepreneurship, or simply policy entrepreneurship, refers to opportunity-driven activity with the aim to influence policy. Policy entrepreneurship is a discrete and observable process in politics consisting of recognizing an opportunity to change policy, acting on the opportunity, and, consequently, materially affecting policy.

The policy-entrepreneurship process begins with any sort of political actor—be it a politician, civil servant, interest group, a citizen activist, or anyone with a stake in a particular policy—being alert to an opportunity to influence policy in some meaningful way and then seizing that opportunity. The recognized opportunity must be acted on; simply being aware of an opportunity is not by itself sufficient to constitute policy entrepreneurship. There is little evidence that policy-centered entrepreneurs are a select group. Rather, policy-centered entrepreneurship is better characterized as a universal behavior that can be carried out by any political actor in the policy process, ranging from "street-level" bureaucrats and lobbyists to legislators and presidents. The nature of the opportunity to change policy can be objective (e.g., becoming aware of new needs of a community or demands from a constituency) or subjective (e.g., realizing that sudden attention to a policy area or a shift in the political winds makes it the right time to introduce specific policy change). Some well-known examples of policy entrepreneurship in the United States include Robert Moses leading the establishment of the New York Port Authority, William Mulholland setting up the water supply system for Los Angeles in the early 1900s, and Admiral Hyman Rickover's reinvention of the U.S. Navy. The idea of policy entrepreneurship in political science and policy studies has evolved differently than the modern conception of entrepreneurship in economics, though there are some recent indications of possible convergence in the future.

THE MODERN CONCEPTION OF ENTREPRENEURSHIP IN ECONOMICS

The modern conception of entrepreneurship in economics principally derives from the work of three economists: Joseph Schumpeter, Ludwig von Mises, and Israel Kirzner. In his two major works *The Theory of Economic Development* (1934) and *Capitalism, Socialism, and Democracy* (1950), Schumpeter conceives of *creative destruction*, in which entrepreneurship consists of new combinations of existing resources that drive economic development, such as introducing a new good or a new method of production, opening of a new market, taking over a new source of supply of raw materials or half-manufactured goods, and carrying out the new organization of any industry.

The other two economists—Mises and Kirzner—belong to what is usually considered the Austrian school of economics. In his magnum opus *Human Action* (1949), Mises identifies entrepreneurship as a behavior universal to all activity. Entrepreneurship, he writes, "is not the particular feature of a special group or class of men; it is inherent in every action and burdens every actor." Consciously expanding on Mises's conception, Kirzner in his primary works on entrepreneurship theory—*Competition and Entrepreneurship* (1973), a book chapter in *Method, Process, and Austrian Economics: Essays in Honor of Ludwig von Mises* (1982), and a journal article in *Journal of Economic Literature* (1997)—locates entrepreneurship as the driver of all market processes in that entrepreneurial market participants acquire "more and more accurate and complete mutual knowledge of potential demand and supply attitudes," thus *equilibrating,* or stabilizing, a market by moving it closer to equilibrium between supply and demand. Only a few recent political scientists—including Mark Schneider, Paul Teske, and Adam Sheingate—explicitly incorporate the modern conception of entrepreneurship in economics into their research involving policy entrepreneurship.

ENTREPRENEURSHIP IN POLITICAL SCIENCE AND POLICY STUDIES

The idea of policy entrepreneurship in political science and policy studies originated independently and evolved separately from the modern conception of entrepreneurship in economics. The earliest conceptions of policy entrepreneurship appeared in the 1960s and continued through the 1970s as largely public choice conceptions. For example, Richard Wagner in his review of Mancur Olson's *The Logic of Collective Action* identifies political entrepreneurs as the broad group of individuals who supply collective benefits for an unspecified "political profit." For another example, Norman Frohlich, Joe Oppenheimer, and Oran Young amplify this public choice conception by arguing that public sector entrepreneurs should be considered economic actors, rationally calculating the personal costs and benefits of providing public goods hoping for later political payoff. These earliest conceptions of policy entrepreneurship are significant in recognizing that there is significant public sector activity with material policy impact not adequately accounted for with the available stock of political science and policy studies terminology and concepts.

The idea of policy entrepreneurship began to solidify into a powerful theoretical construct with the work of William Riker and John Kingdon in the 1980s as they both developed distinct functional conceptions. Riker endows his conceptualization of policy entrepreneurship with the function of destabilizing previously stable voting situations, culminating in *The Art of Political Manipulation* (1986) and its notion of *heresthetics* as the art of "managing and manipulating and maneuvering" a voting situation in order to accomplish a desired policy outcome. Kingdon in *Agendas, Alternatives, and Public Policies* (1986) offers an influential conception of policy entrepreneurship with the function of *coupling*, or joining the streams of problems, policies, and politics either by promoting preferred policy alternatives or by "[lying] in wait for a [policy] window to open." Riker and Kingdon also can be jointly credited with conceiving of the term *policy entrepreneurship*.

Since the 1990s, political scientists and policy researchers continue to develop Riker and Kingdon's construct of policy entrepreneurship while pushing the idea in new directions. Frank Baumgartner and Bryan Jones explicitly build their theory of policy entrepreneurship for punctuated equilibrium theory on Riker and Kingdon's previous work. In *Agendas and Instability in American Politics* (1993), policy entrepreneurs seek out alternative, more receptive institutional venues for their policies in the hope of favorably influencing the policy image. Daniel Carpenter devises a theory of *bureaucratic entrepreneurship*, which he defines as "the incremental selling of new program ideas through experimentation and piecemeal coalition building," in order to account for the forging of bureaucratic autonomy. In addition, Adam Sheingate renders political entrepreneurs as "individuals whose creative acts have transformative effects on politics, policies, or institutions." Sheingate's political entrepreneurship is one of the recent works that incorporates Schumpeter and Kirzner, potentially indicating some future convergence between the modern conception of entrepreneurship in economics and policy-centered entrepreneurship in political science and policy studies, as well as providing a boundary for the term.

Policy Evaluation

A policy evaluation is the last step in the policy-making process, after agenda setting, policy formulation, decision making, and implementation. It refers to the use of empirical social science research methods to assess the success or failure of policies for feedback or termination.

A policy evaluation can be conducted within a government, by nongovernmental organizations (NGOs), by think tanks, or by researchers in academia. The purpose of an evaluation is to determine the effectiveness of a policy. In other words, an evaluation must ascertain the extent to which a policy has reached its stated, as well as its unstated, objectives. Conclusions about this can only be reached through the solid understanding of the logic or theory underlying the policy.

The concept of effectiveness must be understood in a broad way to refer both to the policy's outcomes and its efficiency. To effectively measure outcomes, researchers take into consideration the policy's outputs as well as its short- and medium-term impact. Responsiveness to the policy, or the way it is being received by the targeted audience, are also part of a thorough evaluation. In order to measure efficiency, some form of cost-benefit analysis is most often employed. When

considering efficiency, the evaluation may also refer to the efficiency of the policy process itself and focus particularly on implementation.

Policy evaluations can be done using either qualitative or quantitative research methods or a combination of both. Although experimental designs were preferred in earlier years, pluralist and participative approaches have since gained in popularity.

At the very least, two practical issues arise when conducting an evaluation. First, policy objectives, as well as the policy logic, are not always clearly stated or obvious. This lack of clarity is compounded in cases where the policy has been in effect for many years and the policy logic is assumed but not clearly explained. Second, there are difficult methodological issues pertaining especially to the use of quantitative methods that arise when attempting to measure outcomes and efficiency. In particular, it is complicated to control for all relevant intervening variables, which makes it difficult, though not impossible, to determine the long-term impact of a policy.

The most important impediment to proper policy evaluation, however, is political. There are no fixed criteria for defining policy success. The results of evaluations rest with decision makers who decide on the appropriate course of action to follow in responding to them. Ultimately, decision makers also react to current political circumstances. In an age of intense popular and media scrutiny, governments are hard-pressed to acknowledge errors and recommend appropriate changes. Opposition parties believe that it is their role to highlight policy failures. An evaluation is, therefore, and often unavoidably, tainted by partisan considerations. Although evaluations aim to be neutral, the results can also reflect the policy preferences of the researchers. These considerations suggest that it may be better to think of policy evaluation as policy learning—an essential element of policy debates.

Policy evaluations, along with audits and program evaluations, reflect the continued trend towards ever-increasing governmental accountability.

Policy Innovation

Policy innovation refers to a political system's adoption of a policy that is different from past policy actions. Although other jurisdictions may have already initiated similar measures, policy innovation occurs when a government enacts a policy that is new to that particular governmental unit. This definition derives from the ideas of some of the first social scientists to examine this topic, such as Lawrence Mohr, Jack Walker, and Everett Rogers, and it continues to encompass key elements of contemporary research on policy innovation.

A number of models explain why policy innovation occurs. In many of these frameworks, the causes or stimulants of policy innovation are divided into two categories: internal characteristics and external pressures. Internal determinants are factors within a governmental jurisdiction that stimulate innovative activity. These incorporate political characteristics such as executive leadership, bureaucratic professionalization, citizen ideology, governmental structure, and partisan competition, as well as socioeconomic factors, which can include financial resources, physical capacity, and the demographic characteristics of the population.

Policy innovation can also occur because of external factors that originate from outside of a political system. These external determinants often deal with the actions of other governmental units, either within the same political system or in other political systems. Some scholars contend that external factors help to simplify policy making, allowing decision makers in one political system to copy or emulate the actions of others; other scholars believe that external determinants create a competitive environment in which comparable governmental units compete against each other to adopt certain policies quickly; still others think that the process works "horizontally" with governmental jurisdictions at higher (or lower) levels exerting influence on others within the same political structure.

Much of the political science research on policy innovation focuses on the adoption and spread of public policies within the United States. Although the findings of this research vary somewhat from study to study, there are some consistent results. States are more likely to innovate if they are in good fiscal health, if they have professional bureaucracies and legislative systems, and if they possess the political will to do so. External determinants are also quite important. However, scholars present different conclusions about which external stimulants are most relevant and how they operate across different policy areas. Some scholars believe that regional factors are most important (i.e., the proximity of neighboring states that have already adopted a policy), while others identify the influence of the national government on state-level behavior. Still others focus on channels of communication that exist between state-level actors as the key determinants of subsequent policy adoptions.

Policy innovation is also examined using different conceptualizations of the process (i.e., interactions between governmental jurisdictions within the same political system) and within different political systems outside of the United States. This research indicates that national-level actions can spur innovativeness at the state and local levels. Similarly, subnational actions can propel national governments to pursue new policy initiatives. Also, the policy innovations of one nation can stimulate other nations to adopt similar policies.

Many unanswered questions remain about the process of policy innovation. Part of this is because scholars use different approaches and methodologies, focus on different types of variables, look at different policy areas (e.g., welfare, health care, energy, environmental regulation, and taxation), and focus on different aspects of the process (i.e., the initial adoption of a policy, the sequence of subsequent adoptions, or the spread of adoptions). As a result, it is difficult to synthesize this research, derive generalizations across policy areas and political systems, and present clear explanations about the process of policy innovation.

There are still many aspects of the process that require further study. How should one measure and analyze policy innovation? Should one look at aggregate-level factors of a political system or individual-level attributes of decision makers within a governmental jurisdiction? Should a researcher incorporate both internal and external determinants within the same analysis? Does policy innovation work the same way across political systems as it does within a given political system? Does policy innovation vary across program areas? Does policy innovation operate differently at different points in time? What impact will contemporary pressures, constraints, and problems (i.e., globalization, economic recessions, internal domestic conflicts, international tensions, etc.) have on the propensity of governmental systems to innovate?

Policy Meta-analysis

Policy meta-analysis is a research method that involves the quantitative analysis of independent data sets or other studies. It seeks to develop a synthesis of existing information and conclusions. The approach typically uses quantitative software or other computer programs to conduct large-scale reviews of primary studies or sources, or existent databases.

Policy meta-analysis was created in an effort to apply a strict methodology to reviews of literature and secondary sources. Nonetheless, it is difficult to achieve true objectivity since shared research biases or subjectivity in the original studies can shape of influence the outcomes of policy meta-analysis, often referred to as *garbage in, garbage out*. In addition, flaws or mistakes in the original data will be replicated in any resultant meta-analysis. Any inherent bias or subjectivity of the meta-analysis can color the outcomes. For instance, researchers make decisions on the size, boundaries, and scope of the analysis. Critics also assert that many meta-analyses bring together disparate studies that should not be analyzed together.

Policy meta-analyses do, however, provide a number of benefits to researchers. The approach allows scholars to identify trends or phenomena across multiple studies that may not have been apparent in the original analyses.

Policy Networks and Communications

While there are several definitions of policy networks, there is widespread agreement among scholars that these networks are formed by the patterns of relations between interdependent actors—most commonly identified as politicians, interest groups, public citizens, corporations, or foreign figures—involved in processes affecting the design or implementation of public policy. By definition, the interdependency characterizing these relationships requires actors to engage in communication exchanges with one another. Hence, the study of policy networks always goes hand in hand with the study of the communication processes occurring within those networks.

Earlier sociological studies on interorganizational theory produced in the 1940s and 1950s, as well as by the work of resource exchange theorists dating to the 1960s, influenced research on communication and policy networks. The underlying assumption in resource exchange theory is organizations or individuals do not have the totality of resources they need to guarantee their own survival or reach their political goals. As a result of such scarcity, organizations or individuals engage in exchanges with their peers, and attempt to acquire scarce resources in exchange for those they hold in abundance. The exchange of resources rests in the establishment of clear communication channels between the actors in the network.

EVALUATING SOCIAL NETWORKS AND COALITIONS

Despite its early roots, the first explicit efforts to systematically study communication in policy networks did not take place until the mid-1980s. Edward Laumann and David Knoke's (1987) seminal study on the U.S. energy and health policy domains presented the first detailed exploration of how communication inside policy networks affect the behavior of the individual components of those networks. Furthermore, this study also evaluated how communication impacted the overall performance of these policy networks. Using social

network analysis (SNA) techniques, the authors demonstrated how communication between parties unfolds, capturing the frequency and duration of such communication exchanges and then observing the effects on organizational behavior.

Through SNA, it was established that observed lengthy communication channels between parties can help identify potential coalition partners, and successful collective action depends on the trustworthy transmission of information from each party. Additionally, Laumann and Knoke reported the common finding that communication among some nodes in a network was only possible due to the mediating role of one or more central organizations that formed the core of the network. When considered together, these findings point to information flows affecting policy outcomes, and to the importance of certain actors in some circumstances as regulators, brokers, or managers of communication flows.

This research tradition impacted newer theories and frameworks that study policy processes. For example, the advocacy coalition framework (ACF), developed by Paul Sabatier and Hank Jenkins-Smith in 1993, proposes actors in policy subsystems form coalitions based on shared policy core beliefs that will translate to specific policy views. The establishment of clear communication channels among the members of a coalition is critical to maintain its stability, as well as its capacity to influence the policy-making process. However, communication does not happen inside coalitions alone. In fact, coalitions must remain informed about the policy positions and potential moves of their opponents, therefore communication between coalitions must also be secured.

Policy brokers are usually the ones in charge of securing such communication. In general, this proposition agrees with the empirical results obtained from the initial studies of policy domains. In addition, students of the ACF's emphasis on brokers echoes other work in political science that has unearthed the importance of brokers in policy systems as the main facilitators of collaborative relationships among the actors that partake in policy networks.

EXAMINING SPECIFIC LINES OF COMMUNICATION

Communication in policy networks is also discussed in the realm of public management studies, which pay special attention to how communication in policy networks affects the performance of actors who are active in fragmented decision-making systems. However, despite the interest of scholars regarding communication processes in policy networks, it is not common to see precise descriptions of how such communication processes unfold. A notable exception from a conceptual standpoint is the 1997 work of L. Schaap and M. J. W. van Twist, which portrays communication as a complex double process, where exchange of information occurs between each individual actor and the network as a whole but also between actors on a dyadic level.

The former type of communication simply occurs when an actor makes its presence known to others in the policy domain. This facilitates the process of *subjectification* of the

actor, or its recognition as a legitimate part of the network. The second type of communication between actor to actor is much more specific because it involves two parties. In this second variant of communication, actors expose each other to their *frames of reference*, or the cognitive filters used to process and understand reality. This exchange nurtures the building of coalitions and the construction of common identities. There are clear parallels between this proposition and the process of coalition building described by Sabatier and his colleagues.

Finally, researchers who explain the diffusion of policy innovation also make an important contribution to the study of communication in policy networks. For instance, Michael Mintrom and Sandra Vergari find policy entrepreneurs in the United States are highly active in policy networks and more likely to achieve their goal of promoting education reforms at the state level because their participation in the networks allows them to: (1) gather novel information about innovative policy responses to problems, and (2) communicate the need for such reforms more effectively to policy makers who can affect change. The role of communication channels on the diffusion of innovation has also been studied in other policy domains. For example, Jacqui True and Michael Mintrom found the transnational networking activities of nonstate actors is the primary force driving the diffusion of gender mainstreaming bureaucracies in many countries.

Despite the abundance of research studies on how communication unfolds in policy networks, the field still lacks a comprehensive theoretical structure. Further research needs to present precise hypothetical relationships linking communication structures in the networks to individual behavior and policy outcomes. This remains the task for the next generation of policy networks' scholars.

Policy Theory

Policy theory is the set of principles and rules regarding public policies. Such definition immediately highlights the product of political action. Indeed, according to Harold Lasswell and Daniel Lerner's classical 1951 definition, policy represents "a systematic attempt to shape the future" (ix).

THE PRAGMATIC PERSPECTIVE OF POLICY ANALYSIS

Policy sciences have developed only recently, when the necessity of state intervention for correcting economic deficiencies—the presence of what Alfred Chandler termed in 1977 the *visible hand* in market activities—has led to the formation of a field of research aimed at locating data and providing interpretations relevant to the policy problems. In the United States, Roosevelt's New Deal in 1932 was one of the first political programs to require allocative rationality, contributing to the affirmation of a scientist approach to problem solving.

Thus, as far as the ideological roots of policy theory are concerned, John Dewey's pragmatism and Rudolf Carnap's logical positivism constituted natural attitudes for a political scientist. Also, a normative and quasi-ethic dimension often combines with such a rationalist tendency, considering that policy analysis seems to represent a practical philosophy that guides public action to design better systems of government. Consequently, "changing the world with knowledge" represents an implicit objective of policy analysis.

POLICY SCIENCE IMPERATIVES

Describing policy science in a few statements includes three main imperatives: (1) a belief that the consequences of governmental action are important and predictable, (2) a holistic approach to political processes, and (3) the idea that knowledge may be useful for improving public decision making and for the quality of democracy.

Theodore Lowi's contributions to policy science reflect such imperatives. He considers public policies as an instrument for political action, the first imperative, defining them in 1972 as "deliberate coercion-statements attempting to set forth the purpose, the means, the subjects, and the objects of coercion" (86). Some years later, in 1985, Lowi clarified that such statements are rules "formulated by some governmental authority, expressing an intention to influence the behavior of citizens, individually or collectively, by use of positive or negative sanctions" (70).

Lowi's attempts to formulate a classificatory definition of public policy denote an encompassing approach to political process—reflecting the second public policy imperative of holism. This aspect is present in Lowi's classical articles, which

have provided the most relevant effort to analyze public policies, based on two variables: likelihood of coercion, which may be concrete or remote; and proximity of governmental coercion, which may be connected to individual or environmental application. In his view, different areas of policies—regulatory, constitutive, distributive, or redistributive—are capable of producing specific "arenas of power."

In this way, Lowi's categorization explains the rich and scarcely cumulative literature of case studies diffused in the American political science literature up until his work emerged. Instead of attempting to find relationships that hold across the entire range of public policies, he argues that one should focus investigation within one of the four policy classifications. This is because relationships among important concepts or variables that may be quite strong when policies of one kind are involved may be much weaker, or even totally absent, when other types of policies are concerned. For the first time, the hypothesis "policy determines politics" is introduced—an important and alternative way to look at the political life.

James Wilson presented a similar approach in 1980, although his public policies typology focuses mainly on cost-benefit analysis. Indeed, his classification represents the base for defining four types of politics: interest group politics, client politics, entrepreneurial politics, and majoritarian politics. Yet according to some critics, such taxonomy leads to underestimation of the classical themes of political research—power, conflict, consensus—for leaving the place to cost-benefit considerations.

THE PRESCRIPTIVE DIMENSION

Other theories seek to unpack public policy process in developmental stages. Interpreting policy as a problem-solving activity, most authors find a forerunner in John Dewey and his pragmatic philosophy when they break up decision making in several steps: problem identification, research of solutions, decision, implementation, and evaluation. A research strategy helps to analyze complex processes and cope with the multiplicity of involved actors. Although the stage model accompanies the institutionalization of political science as a discipline, descriptions of policy cycle are often criticized as depicting a sequential model process when, in fact, policy making is complex and interactive.

Although public policies are determined by the continuous interaction between various actors, public and private, in each phase of policy process, policy theory tends to reduce political complexity, concentrating on the solution for problems that is perceived as publicly relevant and thus requires a *collective solution*.

The third imperative of policy science is its constant reference to the improvement of democratic policy making. Indeed, another core element of policy studies is that they present a frequent tendency to translate what Hugh Heclo considers "theories into concrete policy guidance, or short of guidance, into 'methodological' advice about policy making." Policy studies are about the production and application of multidisciplinary knowledge *of* and *in* policy: for this reason

"speaking the truth to power" remains their main mission—and promise.

More generally, the development of policy theory strongly ties to a pragmatic conception of democracy, which emphasizes the dimension of responsiveness by giving centrality to outputs of a political system and to its capacity for problem solving. It pays attention to themes of political performance more than to competition, social conflict, and ideological contraposition. Rediscovering its functionalist basis (i.e., the sociological paradigm that considers all parts of society necessary for the survival of society as a whole), policy theory denotes a sort of satisfaction with political systems: the real question seems to be how to improve social life, ignoring the problem of how to change it.

Political Action Committee (PAC)

In the United States, political action committees (PACs) allow individuals to band together to contribute money to candidates. Federal law never actually mentions political action committees, which it instead refers to as *multi-candidate political committees.* Such a committee must have at least fifty-one members, have been registered with the Federal Election Commission (FEC) for at least six months, and must contribute to at least five candidates. Such a committee may collect up to $5,000 from any individual per campaign cycle and may give $5,000 per candidate per campaign. PACs may be nonconnected, or they may be sponsored by another organization, such as a corporation, trade association, or labor union; however, corporate treasury funds and union dues may not be contributed to a PAC.

Political action committees arose as a means to circumvent restrictions on political contributions by corporations and labor unions. In the late nineteenth century, political parties became increasingly dependent upon big business for financing electoral activity, which led to calls for reform. The Tillman Act of 1907 and the Federal Corrupt Practices Act of 1925 both banned corporate contributions to federal campaigns; neither law had much effect, as corporations found numerous ways around them. During the New Deal era, labor unions became major financial supporters of Franklin Roosevelt and the Democratic Party, and in 1943, Congress passed the War Labor Disputes Act—usually known as "Smith-Connally" after its sponsors—which forbade direct contributions by labor unions to federal campaigns.

In order to circumvent Smith-Connally, the Congress of Industrial Organizations (CIO), the more politicized of the nation's two labor federations, created the CIO Political Action Committee, which could solicit contributions from union members. Soon, the American Federation of Labor (AFL) founded its own PAC, and by 1968, there were thirty-seven labor PACs, spending $7.1 million in that year's elections.

Few corporations found it advantageous to create political action committees, but this changed dramatically in the 1970s because of the actions of organized labor. A federal court decision, the so-called Pipefitters case, threatened unions' ability to operate PACs. Organized labor persuaded Congress to add provisions to the Federal Election Campaign Act (FECA) of 1971 that formally recognized the right of corporations and labor unions to form political action committees. FECA and the Supreme Court's overturning of the Pipefitters decision led to a boom in corporation PAC formation. After the fundraising abuses of the Nixon campaign of 1972, Congress revisited FECA in 1974, restricting individual contributions to $1,000 per candidate per campaign. Donors could give up to $5,000 to PACs, which could, in turn, give the same amount to candidates. In 1975, the Federal Election Commission informed Sun Oil that it could use corporate treasury funds to pay for the administrative and overhead costs of its PAC, and this action accelerated the PAC explosion, particularly among corporations. From 1974 to 1986, the number of PACs almost quadrupled, from 1,146 to 4,157 and their contributions surged from $12.5 million to $105 million. Since then, the number of PACs has leveled off, but contributions continue to grow. According to the FEC, PACs contributed about $310 million to federal candidates in the 2003 to 2004 cycle. In recent years, PACs have contributed about one-quarter of all funding for congressional campaigns; about two-thirds of such contributions come from PACs sponsored by corporations or trade associations.

PACs may pursue either legislative strategies, using contributions as an adjunct to lobbying, or electoral strategies, using contributions to sway the results of elections. Most PACs pursue legislative strategies, courting influential incumbents, such as party leaders or committee chairmen. PACs sponsored by corporations and trade associations usually follow such a path, and they tend to favor Republicans, though not overwhelmingly.

Labor and ideological PACs typically pursue electoral strategies, concentrating their giving in close races, and often giving to challengers. They also usually favor candidates of one party—unions contribute almost exclusively to Democrats. Members of Congress often operate leadership PACs, which allow them to contribute to other officeholders and party committees, employ staff, and fund travel. Lobbyists may give to leadership PACs as a means to court powerful legislators.

Many journalists and reformers have alleged that PACs buy Congress votes, but political science research has mostly found such claims to be overblown. PACs tend to reward friends, rather than seek converts. Compared with the influence of party, ideology, and constituency opinion, the effect of PAC donations appears to be slight—but not nonexistent. It appears to be greatest on narrow, technical issues, such as provisions of the tax code or government contracts, that do not cut along partisan lines or arouse the feelings of voters, but which may be critical to a corporation or trade association. Above all, PAC contributions help lobbyists establish the relationships that can give them the necessary access to make their case to legislators or staff.

Political Agents

Political agents are actors within the political arena who possess a special role and capability for advising elected or appointed policy makers. Many political agents are individuals with unique accessibility to politicians, often representing a specific agency or corporation, or some specific cause. By consulting with policy makers on their personal or representational political viewpoints and influence, political agents are, to a varying degree, indirectly involved in the process of political decision making. A political agent's influence and involvement can be individual or collective, as in organizations or unions.

MOTIVATION
The most important political actors or agents are political parties, interest groups, government bureaucrats, and parliaments' committees and commissions. Agents are specialized to act on behalf of those they work for or represent. All political actors follow the current trends, interests, and strategies of politicians to take part in political decision making. By doing so, they follow an individual politician's value orientation, goals and preferences, as well as contextual capacities. They can choose different strategies to guide policy makers who approach them for problem-solving techniques, mediating, or negotiating offers; they also rely on persuasion. The emphasis on seeking consensus or resolving a potentially conflicting situation varies, depending on the interests or parties involved. The decision-making processes and the political context shape relations among political agents, which can take the nature of competition, coalition, or a network.

A political agent is motivated by a certain goal. Usually, there is more than one goal and these are prioritized. In choosing how to act, an agent may encounter a conflict between private interests and collective, shared interests; at times, political agents use their personal emotions or ideas to guide their degree of policy influence. The view on the relevant factors of influence is divided between that of a *homo oeconomicus* and of a *homo sociologicus.* The homo oeconomicus is assumed to make decisions solely based on individual cost-benefit calculations and ability to prioritize preferences, while social norms and expectations guide the homo sociologicus.

DIFFERENT TYPES
Political representatives, voted into office by their public, are political agents. They are to act on behalf of the constituents they represent and channel their public interests. The public perceives these representatives to oversee the government. In government, the representatives organize into committees to address specific issues. The government at large is then the largest political agent of a nation, interacting with other foreign national leaderships.

Political leaders serve as principle political agents for their followers as long as these followers see the particular leader's performance as satisfactory, creating a codependency. Leaders are to coordinate and secure the goals and interests of their followers, similar to political representatives, but with a larger constituency. They also manage group activities and defend the group against opposition. However, at times, leaders work for private or personal gains superseding the public interests. Given this type of political agent's concern for public reputation, in order to guarantee reelection and maintain popular

support, this agent may be susceptible to outside control or pressures when protecting or sustaining the public image.

Political parties are another form of political agent. They not only produce government candidates but also mobilize support for and influence key political agenda issues. Political parties within the political system of a state manage and control their government. They do so by following the ideas shared by their party members. They have officeholders and activists and they influence their electorate. Parties inform the electorate of decisions in a democratic political system and create participatory expectations; as with representative democracies, they strongly mobilize the public.

As political agents, an interest group may form to redress a deficit felt by a private or public organization. This type of political agent, then, serves on behalf of the shared of that organization. Interest groups are to influence public opinion and policy making by increasing political participation. For example, labor unions may use public rallies to inform their constituents, or potential sympathizers, of a certain preferred electoral candidate, or a cause specific to their union's members.

Finally, social movement or grassroots activists pursue reforms in the social, political, or economic realms to promote certain causes. These are found globally and such movements are not limited to appealing within a single state; some also advocate for increased international oversight or widespread global change. These types of political agents are powerful in influencing public opinion and public policy via their tactics to strengthen citizen access, increase social awareness, or challenge governments. These tactics may include publications, mailings, mass media and the Internet, personal contacts, meetings, phone calls, and public events, such as demonstrations.

Political Anthropology

Political anthropology emerged through intellectual engagements between the disciplines of political science and anthropology. Political scientists working in this area first developed the field through an engagement with Clifford Geertz's interpretive approach to the study of culture. Drawing on interpretive methods, political anthropologists have developed new understandings of political behavior, producing a wide range of scholarship that has contributed to a rethinking of central paradigms in political science, including the politics of identity, social movements, political and economic transitions, and the state.

GEERTZ AND THE STUDY OF CULTURE

Clifford Geertz's *The Interpretation of Cultures* (1973) is a foundational work that shaped the emergence of the field of political anthropology in the discipline of political science. Within the discipline of anthropology, political anthropology has a much longer intellectual history. However, political scientists have shaped the field of political anthropology in distinctive ways through an engagement with Geertz's work. Geertz argued that the study of culture required an in-depth analysis of the system of meanings that shape people's identities and actions. According to Geertz, culture is defined as a set of complex *webs of significance* that provided the context necessary for understanding social and political systems in comparative contexts.

Geertz's approach differed from existing approaches that political scientists used at the time to study political culture. These approaches viewed political culture as an independent factor or variable that casually shaped patterns of behavior and political processes. For instance, scholars studying political culture sought to measure civic culture in comparative contexts and argued that the strength of civic culture explained the relative success or failure of democratization (e.g., Gabriel Almond and Sidney Verba's *The Civic Culture,* 1989). Geertz, on the other hand, argued for an approach that focused on systematically analyzing the signs and symbols that make up the webs of significance of specific societies. Culture, in Geertz's view, is fundamentally public because the meanings that make up such webs are shared by societies. Actions carry meanings only when such meanings are shared and understood by groups. The task of the political anthropologist, then, was to sort out these structures of meaning in a particular society.

This approach, or what Geertz called *thick description*, is one of the central methods adopted by political anthropologists to study political behavior and processes. Contrary to what the term implies, thick description does not simply involve accumulating comprehensive empirical details about particular societies in a purely descriptive manner. Rather, thick description involves a method of interpretative analysis in which political anthropologists decode the signs and symbols through which social relationships and structures of authority function in various societies. In this endeavor, political scientists have used ethnographic methods (the central methods used by anthropologists) to engage in the close, in-depth qualitative study of specific cultures. Ethnographic data can include quantitative forms of research (e.g., collecting census data and carrying out surveys in villages). However, ethnography usually involves long-term participant observation in which the anthropologist lives in the context being studied. The ethnographer interacts with the subjects being studied over an

extended period of time and observes and participates in local activities. Observations gained through this process provide the data for the analysis of the structures of meaning of the society in question.

ETHNOGRAPHY, INTERPRETIVE METHODS, AND CONCEPT FORMATION

Political scientists use interpretive methods to inform studies of political behavior, institutions, and identities. Early work in political science used ethnographic methods to rethink some of the central concepts in the discipline. For instance, one of the classic examples of political anthropology is James Scott's *Weapons of the Weak: Everyday Forms of Peasant Resistance* (1987). Scott used an in-depth ethnographic study of a rural village in Malaysia to fundamentally reconceptualize existing conceptions of social movements and political resistance. Conventional studies of social movements at the time focused primarily on large-scale or organized protest movements. Scott argued that such studies were narrowly focused on movements that either were marked by formal organizational features (e.g., formal leaders and institutional structures) or were able to mount large-scale protests that challenged the state.

Drawing on two years of extended field research in rural Malaysia, Scott demonstrates that patterns of social conflict and resistance did not take this form. His systematic observations of village-level behavior show that class conflict occurred through daily conflicts and acts of resistance that were usually anonymous. Marginalized villagers could not afford to overtly challenge their landlords and resorted instead to "everyday acts of resistance" such as work slowdowns and ideological challenges through culturally specific languages (e.g., rumor and folk stories).

Scott's study illustrates the contributions of political anthropology in terms of both the methodological and conceptual significance of the research conducted. Scott's extended ethnographic research on everyday practices and politics in a particular village in Malaysia provided him with a view of the daily forms of resistance that were being missed by scholars. Existing research had assumed that an absence of political protests by rural villagers meant that peasants were a politically compliant social group. Scott's immersion in the social and political life in rural Malaysia enabled him to challenge this understanding. For instance, by observing the everyday meanings used to express class politics, he was able to demonstrate that poor rural villagers engaged in resistance through localized, daily practices that could not be measured by membership in formal organizations. This use of interpretative methods enabled Scott to both challenge existing depictions of peasant political behavior and, more significantly, to provide a new conception of political resistance.

Scott's ethnographic approach is an example of one of the central methods that political anthropologists use to produce interpretive studies of social and political behavior and processes. However, other political scientists use other methods and forms of qualitative research to engage in the interpretive study of politics and culture. Scholars of comparative politics, for instance, use mixed methodological approaches to produce new understandings of political phenomena and theoretical concepts. These scholars use historical and sociological data instead of ethnographic research to provide an interpretive understanding of the cultural signs and symbols that shape political life in comparative contexts. Two of the foundational examples of these approaches are studies that emerged as classic texts on modernization and on modern nationalism.

One of the earliest examples of this approach is Lloyd Rudolph and Susanne Rudolph's *The Modernity of Tradition* (1967). These researchers used a combination of sociological and historical data on political behavior in India to rethink the paradigm of modernization. Modernization was one of the central paradigms that scholars were using to understand and study non-Western societies and political systems. Most scholars of modernization at the time were basing their models and approaches on the assumption that one of the central challenges that newly developing societies in non-Western countries faced was the ability to move beyond old cultural traditions and embrace modern forms of economic development and political institutions.

Drawing on an interpretative analysis of sociological data on caste associations and historical data on Gandhi's culturally rooted organizational strategies in India, Rudolph and Rudolph illustrate the ways in which such traditional forms of organization provided the institutional foundations for modern forms of behavior. For instance, they argue that caste-based associations allowed particular caste groups to press for social equality in ways that integrated them within modern democratic political institutions in India. Drawing on this analysis, they challenged scholars to rethink concepts such as modernity and tradition.

A second foundational text in the field of political anthropology is Benedict Anderson's *Imagined Communities* (1983). As with work by political scientists such as Rudolph and Rudolph, Anderson drew on a combination of forms of research methods including historical analysis and ethnographic observations. Drawing on such research, Anderson traced the rise of the modern nation and argued that the primary characteristic of the modern nation was that it represented a formation that rested on horizontal links between people who imagined that they were part of a single cultural identity.

Anderson was also interested in using interpretative methods that had often been used to focus on specifically rural or local cultural practices to understand and explain broader modern political phenomena. Anderson, for instance, focuses on explaining why the nation had emerged as the universally legitimate political unit by the twentieth century. As Anderson notes, even the Marxist revolutions in countries such as China and Vietnam had defined themselves in national terms and had thus rooted themselves "firmly in a territorial and social space inherited from the pre-revolutionary past" (12). Drawing on a Geertzian-style analysis, Anderson points to the ways in which modern monuments such as war memorials serve as

the cultural symbols that produce the shared cultural identification between people who otherwise do not share kinship ties. Thus, Anderson argues that nationalism operates differently from traditional political ideologies such as Marxism and liberalism. He argues that nationalism is a cultural formation rather than a political ideology. National identity is formed through a set of cultural symbols that make people imagine that they are members of a distinctive community. The cultural roots of nationalism thus explain the power of this identity and its ability to move millions of people not just to kill, but also to willingly die for their nations.

A shared approach to the study of politics characterizes the classic examples of studies in the field of political anthropology such as those by James Scott, Lloyd and Susanne Rudolph, and Benedict Anderson. These researchers all use interpretative analysis to rethink central concepts in political science. While such approaches contribute to the discipline's interest in producing explanations of particular outcomes, they do so primarily by interpreting the data to refine categories and concepts used by political scientists. For instance, by rethinking the concept of resistance, Scott provides an alternative explanation of peasant behavior as rooted in everyday protest rather than consent to authority. This approach to social science explanation is distinct from competing approaches within subfields, such as comparative politics, that have focused on developing causal explanations by isolating and identifying independent variables that can explain a particular political outcome. Some scholars have sought to combine interpretive approaches associated with political anthropology with this model of causal explanation that has been dominant in fields such as comparative politics.

POLITICAL ANTHROPOLOGY AND CAUSAL SOCIAL SCIENCE EXPLANATION

A well-known example of a combined approach is David Laitin's *Hegemony and Culture* (1986). Laitin's study uses fifteen months of extended ethnographic research conducted in Yorubaland, Nigeria, to intervene in political science debates that sought to explain when and under what conditions ethnic and religious conflicts occur. Laitin sought to explain a particular puzzle in the Yoruba case—why there had been religious tolerance despite the existence of social forces that usually produced religious conflict in other contexts. Laitin argues that an explanation of this anomaly required a conception of what he calls the "two faces of culture" (12). The first face of culture draws on Geertz's conception of the symbolic webs of significance, which Laitin argues reveals how cultural meanings shape the ways in which social groups order their political priorities. The second face builds on an instrumentalist understanding of cultural identity as a political resource. Such a rational actor approach focuses on how groups or political actors instrumentally manipulate cultural symbols and people's cultural identities. Laitin argues that a successful explanation of a political culture characterized by nonpoliticized religion must account for both faces of culture.

By combining these two approaches, Laitin also sought to combine the interpretive depth of Geertz's conception of culture with social scientific concerns with the development of systemic causal explanations that could be tested and falsified. He demonstrates that neither the rational actor approach nor the Geertzian understanding of culture adequately explains or predicts the nature of religious politics among the Yoruba. Laitin argues that his ethnographic study thus contributed to the creation of a theory of politics and culture that was based on social scientific objects of causal explanation.

The question of how political anthropology fits within this model of social science explanation is a central area of debate among political scientists. Critics of political anthropology question both whether the findings of single case studies based primarily on ethnographic research can be generalized, and whether interpretive methods can contribute to theory building when the explanations cannot be falsified. Scholars drawing on such methods respond in a number of ways. Some scholars combine ethnographic research with other methods. They build on the kind of model exemplified in Laitin's work, seeking to produce mixed methods and often use ethnographic research to supplement other forms of data. Other scholars argue that political anthropological work provides a distinctive approach that is best able to address particular kinds of research questions. Rogers Smith, for instance, argues in his chapter in *Problems and Methods in the Study of Politics* (2004) that understanding the politics of identity requires methods that draw primarily on interpretive approaches based on ethnographic methods.

SUBJECTIVE KNOWLEDGE

While Smith argues that interpretivists such as political anthropologists must address how their work contributes to the objectives of social scientific explanations, some scholars contend that political anthropology challenges scholars to rethink some of the disciplinary conventions of political science. In their 2003 article, "Engaging Subjective Knowledge," Lloyd Rudolph and Susanne Rudolph argue for new approaches that more consciously address various forms of subjective knowledge. Drawing on an analysis of an extended historical diary by Amar Singh, a colonial subject who wrote about his experiences living under British colonial rule, Rudolph and Rudolph argue that this subjective diary can be treated as a form of ethnography. In their view, such forms of subjective knowledge deepen understandings of identities, conceptual categories, and the politics of recognition. They note that such forms of subjective analysis provide a unique form of access to marginalized groups who may remain outside the public sphere of politics, or as they put it, "those whose behavior is not easily observed or counted by objective political science" (689). This kind of political anthropology, they argue, blurs the line between subjective and objective knowledge and also challenges political scientists to question what counts as knowledge.

New approaches in political anthropology elaborate on the ways in which such interpretative approaches can provide

understandings of political phenomena that other social science approaches may be less well-equipped to grasp. In this endeavor, they move beyond Geertzian interpretative approaches to the study of politics and culture. For instance, political anthropologists note that Geertz's approach to culture as a complex set of webs of significance rests on an assumption that the inhabitants of the cultural context implicitly accept or consent to these meanings. They argue that Geertz generally failed to explore the ways in which such meanings are often disputed or rejected by particular social groups.

While Geertz tended to think of culture in more consensual and normative terms, scholars now focus on how cultural meanings are contested. Political anthropologists are now concerned with analyzing the ways in which such multiple and contested cultural meanings provide new understandings and explanations of political behavior. For instance, Geertz discussed the ways in which ritual was an embodiment of various forms of authority. However, more recent work shows how rituals are often interpreted in different ways by different social groups, and are also often the source of culturally specific forms of resistance. For example, scholars illustrate how social movements have used religious rituals as means to express political protest.

POLITICAL ANTHROPOLOGY AND SOCIAL CONSTRUCTION

These new approaches converge with the rise of social constructivist approaches to the study of political phenomena. Social constructivist approaches broadly address how concepts, categories, and knowledge are constructed or created by social relations. For instance, political anthropologists such as Michel Foucault (1980) build on poststructuralist approaches that call attention to the relationship between power and knowledge. Poststructuralist theorists argue that texts both reflect and produce relationships of power. Drawing on this theoretical approach, political ethnographers seek to show how an adequate conception of political power requires an interpretative analysis of various cultural texts (e.g., films, television programming, political cartoons, novels, and advertising images). Scholars working in this tradition treat these texts as the cultural signs and symbols through which relationships of power are expressed and produced in modern and postmodern contexts. At one level, such texts make up the political languages of authority and protest. At another level, political ethnographers argue that these texts do not simply reflect underlying relationships of power but also "produce" these relationships.

In her study of authoritarianism in Syria, Lisa Wedeen argues in *Ambiguities of Domination* (1999) that the state uses visual spectacles (e.g., state festivals, royal rituals, and state-sponsored mass demonstrations) to discipline citizens. Such spectacles are not simply reflections of state coercion; these spectacles shape people's identities as citizens and "regiment their bodies" in ways that produce obedience to the state (19). State power, in this approach, is exercised not only by coercion and ideological manipulation, but also by teaching citizens the

acceptable political scripts and behaviors they can use in public. Such visual spectacles thus "produce" citizens.

CONCLUSION

Political ethnographers have pushed political scientists to expand their definitions of what counts as empirical evidence when studying the nature of power and politics in modern nation-states. Scholarship in political anthropology now encompasses a broad range of methods, forms of research, and theoretical approaches. With this, political anthropologists use interpretive analysis and ethnographic methods to rethink theoretical categories and concepts, provide alternative explanations of political phenomena, and challenge definitions of social science knowledge.

Political Attitudes and Behavior

Political attitudes are mental positions about political objects, such as political leaders and parties, policies and proposals, or political groups and institutions. They are relative, enduring evaluations containing a cognitive and an affective component. The study of political attitudes engages with themes like political ideology, egalitarianism, support for democratic values, political tolerance, racism, political efficacy and political alienation, political trust, nationalism, and patriotism. It also involves the study of dispositions like political information and party identification, which lead to political behaviors.

The study of political behavior, on the other hand, focuses on actions or intentions of action and also covers a large span of activities: from passive acts, such as staying informed about politics and media attentiveness, to citizen engagement

activities, such as working to solve community problems or raising money for charity. Political behaviors can be conventional political participation activities that occur near election time, like voting, donating money to a candidate, fundraising, or even running for public office, but they can also be nonconventional activities like attending a public protest or demonstration, or boycotting commercial products.

SIGNIFICANT DEBATES IN RESEARCH

Behaviorism dominated the analysis of political attitudes in the 1960s, proposing a stimulus–response model of political behavior, while the cognitive revolution dominated the analysis in the 1980s, focusing on information processing and the structure of cognitive systems. As David Sears and his colleagues explain, social cognition studies using self-reports and thought listing find that, while some attitudes are generated from cognitive elaborative processes, others are created without much thinking, but rather rely on affective processes.

While research on political attitudes is, at heart, concerned with the process of decision making, research on political behavior is mostly interested in predicting its outcomes, particularly voter turnout. The act of voting is often used as a proxy for other political behaviors, and organizational membership provides evidence of involvement with nonelectoral groups. In addition, new domains, such as consumer activism and cyberspace, provide opportunities to record novel political activities.

Political attitudes are studied to understand how the attitudes change systematically or randomly over time and through different contexts. Since attitudes are not directly observable, scholars turn to their qualities. Attitude *accessibility* indicates the speed or easiness by which an attitude can be brought from memory or, in other words, its response latency. Attitude *strength* research finds that strong attitudes demonstrate persistence and stability over long periods of time, resistance to opposing arguments, and impact on cognitive processes and behavior or behavioral intentions. Attitude strength is often confused with another feature of attitudes, their *extremity*. An extreme attitude is positioned at a high distance from the midpoint, either toward the very positive or the very negative end of the attitude continuum. On the other hand, attitude *ambivalence* generates on the basis of positive and negative evaluations of the same attitude object, which are independent of each other. In addition, *uncertainty* denotes how confident or sure individuals are about their attitudes. Finally, *salience,* or importance, is the degree of personal significance of the object under evaluation.

One of the central debates in political attitudes research is that of their stability, which was raised by Philip Converse in 1964 after examining the American National Election panel data from 1956 to 1960. He suggested that the majority of citizens do not hold stable ideological attitudes, but seem to provide opinions at random on the basis of the considerations that are salient at that point in time. These opinions were labeled *nonattitudes* and were shown to be prevalent among the nonsophisticated segments of the electorate.

Converse's work on belief systems is now a classic segment of the political attitudes' research, as it generated serious concerns

on the public's political abilities. His controversial conclusions set in motion a series of studies during the next forty years that offered methodological or historical counterexplanations to his original pessimistic findings of nonattitudes in the United States. Revisionist scholars blamed the inadequate measures rather than the citizens. Others argued that social modernization generated higher levels of sophistication. This contextual explanation aligns with Western European studies showing that the ideological positions of citizens are more stable. As Russell Dalton and Hans-Dieter Klingermann show, European publics appear overall more consistent in their political attitudes. The jury is still out, and some studies show the glass half empty while others show it half full, often drawing on the same data sets.

Political schema, a related controversy, provides an alternative conceptualization of the way citizens think about politics. Schema scholars argue that people use abstract categories like religion, social class, or race to make sense of the complex political world. James Kuklinski and his colleagues assert that citizens handle information via these organized and interconnected memory structures that allow for efficient and economic processing, but also introduce biases in citizens' judgment processes.

John Zaller, who was interested in how attitudes are made, also challenged the ideal of a fully informed and rational citizenry. Zaller argues that citizens construct attitudes on the basis of a sample of considerations that are available in their memory at that point in time. When they are tasked with providing a judgment, people recall what they like and dislike, and on the basis of these considerations, they provide an answer. However, not everyone agrees. The *online model* proposed by Milton Lodge and Charles Taber argues that evaluations form automatically when new information is received, and they are stored in memory as a running tally of the target object. When citizens are asked to provide a favorable or unfavorable evaluation, they are able to do so, despite the fact that they often have forgotten the pieces of evidence that made up its cognitive content.

MEASUREMENT APPROACHES AND DATA

Surely, the study of attitudes does not send a single message, and as in most matters, no model or study is a cure-all, particularly in such an interdisciplinary and data-rich field. The World Values Survey (WVS), the International Social Survey Program (ISSP), and the Comparative Study of Electoral Systems (CSES) provide globewide, cross-national survey questions on political attitudes and behavior. Regional surveys like the Afrobarometer, East Asian Barometer, Latinobarometer, and the New Europe Barometer include a large number of countries. In addition, comparative data are available from the Eurobarometer survey, which includes all member states of the European Union (EU). Scholars in search of measurement instruments can consult the *Measures of Political Attitudes* series, edited by John Robinson, Phillip Shaver, and Lawrence Wrightsman, which contains reviews of about 150 attitude measures.

THE COMPLEX ATTITUDE-BEHAVIOR RELATIONSHIP

The investigation of the relationship between attitudes and behaviors is not without its own caveats. First, researchers cannot directly observe attitudes, and must rely on self-reported measures that contain some form of interference. As James Kuklinski notes, when people are asked to express themselves, "pure" attitudes do not exist. Survey researchers often experience citizens offering "improvised" positions when trying to relay their attitudes toward public matters.

While most behaviors are observable physical things, limitations similar to those with attitudes occur when measuring *intentions* of behavior. Intentions might not truthfully reflect behaviors when social desirability concerns are in place. Citizens are motivated to appear virtuous and report having engaged in desirable behaviors, even when they have not done so, or done so less often. Characteristically, voting turnout in surveys is consistently overreported by ten to fifteen percentage points.

Relying on memory and recall also creates problems, particularly when a behavior occurred a long time period before the measure is taken. An additional complication is that several attitudes might drive a particular behavior, and political researchers have to identify which is the right one. Another acknowledged limitation is the reciprocal causal relationship between attitudes and behaviors, with attitudes determining the behaviors, and behaviors influencing the attitudes.

Scholars will continue to debate these issues and seek solutions. The expansion of theoretical and empirical knowledge toward new fields like neuroscience, genetics, evolutionary psychology, and research on political emotions offers rich opportunities for exploring exciting puzzles and new debates on political attitudes and behavior.

Political Change

Political change often occurs as major events—such as wars, economic crises, and sudden electoral shifts—lead to punctuated *turning points*, which are then followed by enduring ideological, institutional, or coalitional transformations. Indeed, across international and domestic contexts, whether one addresses security crises like those that marked the commencement of the cold war or war on terror, economic crises such as the great crash of 1929 or subprime crisis of 2007 to 2009, or the critical elections that transformed U.S. party systems in 1932 or 1968, certain moments in *political time* stand out as having a particular impact. These events often lead to lasting changes in international relations, economic policy, or coalitional alignments. In addressing these sources of change, scholars have sought to not only identify the key mechanisms through which such events acquire a particular significance, but also highlight broader implications for agency, policy progress, and reform.

Over the past several decades, as scholars have addressed such mechanisms of change, a basic theoretical divide has given rise to a broad debate. From the former vantage, *materialists* highlight the exogenously given, preinterpretive sources of change, such as shifts in the distribution of power, economic recourses, or demographic trends. Where shifts in such relative power relations alter the balance of power among state and societal actors, materialists argue that they help to determine the outcomes of international or domestic struggles over "who gets what, when, and how." In justifying this approach, materialists assume that political agents make efficient use of information in reacting to military, economic, or societal changes, and that those who do not correctly act on their real interests will be "selected out" of their competitive systems.

In contrast, from the latter vantage, *constructivists* highlight the social sources of change—rooted in shifts in shared ideas, economic ideologies, or cultural understandings. Constructivists assume that ideas of these sorts matter because agents are plagued by what John Maynard Keynes termed the fundamental *constraint of uncertainty*. With respect to a number of important potential developments (e.g., the price of oil in ten years, the likelihood of a terrorist attack) agents simply cannot form any meaningful expectations, and so must fall back on "conventional" judgments for guidance. In other words, agents must interpret crises before they react to them. Moreover, as agents interpret events as legitimating ideological changes, this can lead to transformations of their own interests—or beliefs about how to meet needs—in ways that assume lives of their own. Put differently, from the constructivist vantage, political struggles do not simply pertain to who gets what, when, and how, but also involve arguments over the meaning of events in ways that can reshape agents' views of who they are and what they want.

To be sure, materialist and constructivist perspectives are not monolithic, and—given these broad assumptions—varieties of each exist. For example, from the materialist vantage, while realist approaches cast hegemonic wars as mechanisms

that restore equilibrium to the balance of power, alternative Marxist frameworks highlight the role of wars and crises as sources of dialectical change from more imperialist orders to more emancipatory or socialist alternatives. Likewise, constructivist frameworks vary from those stressing the role of more elite-based, paradigmatic ideas to those stressing the preconscious, affective influences on a wider range of agents.

Nevertheless, setting aside such differences, the underlying debates over material or social forces prove quite enduring, having broad parallels in economic debates between classical and Keynesian perspectives, and psychological controversies over the importance of behavioral incentives or socialization processes. In the largest sense, these perspectives reflect different views of the human condition, as to whether agents are materially or socially constructed, whether material constraints limit possibilities for change, and whether ideas can assume evolving "lives of their own."

INTERNATIONAL SECURITY: FROM HEGEMONIC TO CONSTITUTIVE WARS

In the security realm, scholars have long noted the association between major wars and postwar settlements that reshape international orders. Perhaps most prominently, Robert Gilpin argues that hegemonic war serves as "the principal mechanism of change throughout history." In this view, periodic hegemonic conflicts, reinforced by postwar conferences and accords, determine which "states or states will be dominant and will govern the system." Questions arise, however, about how a victorious hegemon might define its interests—along more conservative or liberal lines, or in more benign on more predatory fashions. Materialist approaches, at a systemic level, are likely to be underdetermining.

One materialist solution offers a supplemental stress on domestic material influences, rooted in the domestic institutional and societal characteristics of major states. For example, G. John Ikenberry concedes that "historical junctures . . . come at dramatic moments of upheaval and change within the international system, when the old order has been destroyed by war and newly powerful states try to reestablish basic organizing principles." However, Ikenberry elaborates, "Democratic states have greater capacities to enter into binding institutions" and that hegemonic settlements established by democratic regimes can support more stable, legitimate orders. Nevertheless, despite its merits, Ikenberry's legal shift to the domestic realm fails to offer a fundamental solution to theoretical problems of how institutional agents define their interests. Even the meaning of democracy itself is variable, and no theoretical fundamental precludes the emergence of violent differences over the meaning of democracy itself—as between the United States and Germany in World War I (1914–1918).

In a broader sense, materialist arguments remain wanting to the extent that the meaning of power and the nature of institutions are always endogenous to a social context. First, "major" asymmetries in the balance of power cannot be abstracted from the social context of, for example, friendship or enmity between states. While rivals or enemies may shift alliances to prevent any single state from attaining dominance over the system, states enjoying socially grounded ties of friendship may simply ignore the ostensible incentive structure of the distribution of power. As Alexander Wendt argues, U.S. policy makers view North Korean missiles differently than they do British missiles. Secondly, even "major" wars occur in meaningful contexts, as when Harry Truman cast the cold war as a struggle over "ways of life" or when George W. Bush emphasized the implications of the ostensible war on terror for the United States's "deepest beliefs." Conversely, even apparently "minor" crises can carry disproportionate lessons during periods of uncertainty, as when the post–cold war "Black Hawk down" incident in Somalia prompted an isolationist backlash. In this light, even wars that fundamentally disrupt the balance of power cannot be understood outside some social context.

To the extent that uncertainty complicates the interpretation of material incentives, constructivists have stressed the need to more directly examine the understandings that give wars and crises meaning. Providing the foundation for such an approach, John Ruggie argues that hegemonic wars might often be better seen as *constitutive wars* that can reshape notions of sovereignty itself. Indeed, Ruggie argues that the emergence of the sovereign state system can itself been seen as having "resulted in part from a transformation in social epistemology" following from the Thirty Years War (1618–1648) and Peace of Westphalia (1648). From this vantage, Ruggie argues that pre-Westphalian *epistemes* and "the mental equipment that people drew upon in imagining and symbolizing forms of political community underwent fundamental change." As Ruggie puts it, "the very ontology of the units—that is to say, what kind of units they would be" provides the focus of constitutive wars. In contrast, in *configurative wars,* the nature of the units is accepted, though "their territorial configuration remain[s] contested." Finally, Ruggie defines as *positional wars* all of "the familiar strategic and tactical wars ever since."

However, to the sense that the Westphalian era has been characterized by continued debate over the meaning of sovereignty—whether to advance the rights of monarchs, nations, workers, or theocratic designs of varied sorts—wars might still be seen as having ongoing, constitutive significance. For example, Bruce Cronin and J. Samuel Barkin suggest that modern struggles from the Napoleonic Wars (1803–1815) to the cold war have played a key role in reconciling tensions between *statist* or *nationalist* views of sovereignty, which alternately locate authority in "the territories over which institutional authorities exercise legitimate control" or in varied "communities of sentiment."

In this view, it is not shifts in power, but tensions over prevailing understandings that drive war and change in world politics. Indeed, such social understandings provide the focus of debates over the lessons of conflict, most recently in U.S. settings in cold war–era debates over the lessons of Vietnam. What Vietnam "meant" with respect to definitions of vital or peripheral interests had important implications for policy debate during the Nixon, Carter, and Reagan administrations. In more recent post–cold war debates over the meaning of

the war on terror, the shift from the Bush to Obama administration can similarly be seen as accompanying a shift from a view of the September 11 attacks as highlighting the need for a more unilateral or multilateral definition of the national interest. In the absence of mechanisms for managing systemic change, wars and threats do not "speak for themselves," but must be given meaning to advance state and societal change.

INTERNATIONAL POLITICAL ECONOMY: THE MEANING OF CRISES

Paralleling these views of wars as revealing shifts in the distribution of power or in prevailing ideas, scholars of the international political economy have engaged in an ongoing debate over views of crises as disrupting the economic distribution of power or prevailing ideological frameworks. From the materialist vantage, *hegemonic stability* theorists like Gilpin cast the rise and fall of great powers as the most important factor in explaining stability. However, as in the security realm, other materialist scholars have recognized the indeterminacy of systemic incentives and argued for a greater stress on domestic incentives. Indeed, Gilpin himself concedes the role of ideology and stresses the need for a "dominant liberal power" to enable economic cooperation. From this vantage, in the nineteenth century, British hegemony might be seen as having supported the classical gold standard, until interwar British collapse undermined the classical order. Likewise, in the twentieth century, the post–Great Depression rise and (as some argue) decline of U.S. hegemony might explain international monetary change, from the Keynesian Bretton Woods fixed-exchange rate system to the current order.

More explicitly highlighting the material sources of domestic preferences, Peter Gourevitch stresses the effects of economic crises—defined as "major" economic downturns and shifts in the "geographic distribution of production"—on domestic preferences and transnational support for international regimes. Given some fluctuation in relative factor endowments, political agents will apply their reallocated resources to successfully (or unsuccessfully) defend their policy preferences. Gourevitch argues that material shocks alter the bases of *domestic* coalitions, as "social actors, affected by their situation, evaluate alternative policies in reaction to the likely benefits or costs." Thus, to explain post–Great Depression Keynesian cooperation, Gourevitch stresses the effects of the crises of the 1930s on the relative position of capital and labor, arguing that labor-led coalitions advocated the adoption of Keynesian policies as alternatives to austerity.

Offering a somewhat greater stress on the autonomy ideas from a comparative vantage, scholars like Elinor Ostrom and Douglass North provide a more nuanced view of the interplay of power and ideas. They cast competitive pressures as often mediated and constrained by formal institutions (e.g., constitutions, rules, and laws) and informal structures (e.g., conventions, norms, and standards of behavior). To be sure, such institutions, even if they can exert a path dependent effect on behavior, still leave the fundamental material impediments to collective action in place.

In this light, despite their merits, these international and comparative analyses ultimately remain wanting for the same reason as basic materialist theories of hegemonic war. First, the effects of the distribution of capabilities in abstraction from the social context are indeterminate. Where states share a sense of the common interest, no hegemonic capabilities may be needed to maintain stability. Conversely, where such positive identification is lacking, no level of capabilities may be sufficient to guarantee stability. Second, the shift to a focus on domestic interests and practices does not resolve the problem of the indeterminacy of incentives, since domestic incentives are often equally unclear. For example, neither firms, nor unions, nor representatives of civil society can identify their "true" interests in abstraction from some intersubjective setting. Through much the era following the depression, for example, representatives of business and capital came to recognize the existence of shared interests in rising wages as a means to bolster demand. Finally, concerns for "major" crises run aground on the inability to precisely define what counts as a "major" change. Even exogenous shocks must be interpreted in a larger context, requiring a more explicit stress on paradigmatic debate over varied Classical or Keynesian economic theories.

In light of these objections, constructivists have stressed the importance of the social context to stability and change. Ruggie has once again played a key role in developing such arguments, reflected in his stress on not only "power" but also "purpose" in explaining the rise of the Bretton Woods system after the depression, in which the state assumed an active role in advancing shared corporate and labor interests in rising employment, demand, and output. Mark Blyth builds upon Ruggie's insights, introducing a dynamic stress on the construction of crises to explain "great transformations" in economic arrangements in international and comparative settings. Blyth rejects frameworks that treat international political development as progressing through a series of self-apparent exogenous shocks. He instead defines crises in terms of their intersubjective impact, arguing that they occur during periods of uncertainty, when agents "are unsure as to what their interests actually are, let alone how to realize them." Blyth argues that, given uncertainty, state and societal interests can only be defined in terms of the ideas agents themselves have about the causes of uncertainty.

Drawing on the insights of Keynes, constructivists thereby cast uncertainty as a condition under which there is no scientific basis to form any calculable probability. In this light, economic crises matter as they reshape the terms of policy debate. In other words, as Keynes once put it, "the ideas of economists and political philosophers, both when they are right and when they are wrong, are more powerful than is commonly understood. Indeed the world is ruled by little else." Indeed, reactions to the subprime crisis of 2007 to 2009—as it drove the Bush and Obama administrations alike to engage in Keynesian "lender of last resort assistance"—cannot be understood outside an understanding of Keynes's own ideas. The subprime crisis did not "speak for itself" in compelling such policies, but

rather spurred debate over the role of the state in society and has legitimated a renewed acceptance of deficit spending and the need for financial reform.

CONCLUSIONS

Scholarly debates over the sources of political-scale change broadly concern the importance of material or social forces. From materialist perspectives, while agents might adapt with greater or lesser degrees of skill to exogenous shifts, they cannot fundamentally evade the exogenous constraints of the balance of military or economic power. In contrast, constructivist perspectives highlight the influence of the shared ideas that shape interpretations of material incentives. Perhaps more important, these frameworks have important implications for the scope of agency, progress, and reform. Materialist approaches arguably obscure the full scope of agency, limiting it to mere adaptation. These approaches suggest that agents can only respond to material shifts with differing degrees of skill, and that efforts at transforming international or domestic systems in fundamental ways are likely to be frustrated as proponents are selected out of the system. In contrast, constructivists highlight the role of agents in giving meaning to material changes, in ways that can reshape shared understandings, state and societal interests, and institutional possibilities. In this sense, the materialist-constructivist debate is rooted in enduring controversies over not simply the nature of structural constraints, but broader questions of agency, progress, and change.

Political Communication

The term political communication is used to refer both to a set of practices and a well-developed interdisciplinary field of research. Although closely tied to political science, the theory and practice of political communication is truly interdisciplinary, drawing from varied traditions in political sociology, political psychology, public opinion research, political marketing and advertising, campaign strategies and management, rhetorical studies, and media studies.

The boundaries of the field vary in breadth, depending on the empirical and theoretical definitions used. Much of the research on political communication focuses on political reporting and on the political institutions and media institutions that shape messages about political actors. Indicators of the large footprint of political communication studies include divisions dedicated to the subject in major academic associations in political science and communication, and the influential interdisciplinary journal *Political Communication*. Widely used texts in the contemporary study of political communication include those by W. Lance Bennett and Robert Entman (2004), Doris Graber (2007), Daniel Hallin and Paolo Mancini (2004), Brian McNair (2007), and Pippa Norris (2000). As a profession, the field of political communication employs many highly skilled media strategists, public opinion pollsters, and campaign managers and activists who are experts in the communicative practices of politics.

The role and function of the nation-state is central to the vast body of political communication research, particularly through emphasis on the strategies and practices of those who govern and those who seek public office, along with research about effects on the political judgment of citizens, as measured by such outcomes as opinion formation and voting behavior. A major area of research literature on political communication focuses on the relationship between mediated political messages and voter preferences. A classic early work in this tradition was Paul Lazarsfeld, Bernard Berelson, and Hazel Gaudet's groundbreaking study in 1944, *The People's Choice,* which revealed the limited effects of newspapers and radio in influencing voter behavior. An unanticipated but often-cited finding of the study revealed that many people make their voting decisions on the basis of the personal influence of opinion leaders and not as a direct result of their media consumption.

Not surprisingly, scholars have maintained a steady interest in the effects of media on voter decisions ever since, developing increasingly elaborate methods for gathering and analyzing data,

testing more complex models, and arriving at more sophisticated conclusions. An important subfield of political communication research has focused on the agenda-setting function of the media by demonstrating correlations between the political priorities of the media and those of citizens. The field of public opinion research focuses largely on how political influence is exercised through the uses of the means of communication and how such influence manifests in forming political will.

HISTORICAL PERSPECTIVE

Although the term *political communication* is used primarily in reference to contemporary political practice and related research in advanced societies, the range of practices and scholarly awareness of their importance has a much longer history. The Greek historian, Thucydides, highlighted the masterful skills of oration used by Pericles (495–429 BCE), the powerful Athenian statesman and general. Aristotle's *The Politics* and *The Rhetoric* discuss strategies, techniques, and illustrations of effective political communication. The Roman statesman Cicero (106–43 BCE) is considered to have been one of history's greatest and most influential orators. The Roman rhetorician, Quintilian (35–100 CE), wrote twelve volumes on the subject of rhetoric, *Institutio Oratoria*. In Book 12, Quintilian fondly quotes Cato, who describes a good orator as "a good man, skilled in speaking." In this context, a "good man" is a citizen who engages in ethical speech. Quintilian notes that eloquence can be pernicious if the tools of rhetoric are forged "not for a soldier, but for a robber." The Western tradition of political oratory remains vibrant and continues to be a subject of scholarly attention, with canonical contemporary texts now including the speeches from John F. Kennedy, Martin Luther King Jr., Ronald Reagan, and Barack Obama.

Alongside the deep tradition of political oratory is the history of the power of political publishing. Canadian historian and political economist Harold A. Innis demonstrates how the means of communication, particularly various forms of writing and printing, have been integral to the rise and fall of empires. Other historians, most notably Lucien Febvre (1976) and Elizabeth Eisenstein (1986), have examined closely how the printing press and the book became powerful tools in the standardization of vernacular languages in Europe and how the increased availability of printed texts correlated with the spread of literacy, marking a broad shift of political power from the clergy and nobility to the bourgeoisie.

Eisenstein emphasizes the essential role that was played by the printing press in the spread of Enlightenment thought, and how printed texts became means by which the Protestant Reformation challenged the power of the Catholic Church, particularly as it was exercised through a monopoly over the dissemination and interpretation of religious texts. According to Eisenstein (1968), Martin Luther referred to the printing press as "God's highest act of grace." Febvre's account of the history of the book demonstrates how, once the European market for texts published in Latin was relatively saturated, "the geography of the book" was a matter of publishers finding the broadest possible markets for texts published in a particular vernacular language. Benedict Anderson (1991) takes Febvre's account further by arguing that the rise of a sense of national identity and nationalism in early modern Europe was shaped, in part, by the rise of print capitalism.

Political communication was fundamental to the European Enlightenment. Immanuel Kant's 1784 essay, "What is Enlightenment?" emphasized the importance of the public use of reason by which citizens put ideas to the test of public scrutiny and debate. In multiple accounts of the public sphere of the Enlightenment, the printed word functioned to sustain what Jürgen Habermas called "the literary public sphere." As well, the salons, table societies, and coffee houses of eighteenth-century Europe were themselves means, or channels, through which political thought was conveyed and debated. With the rise of industrial capitalism, the technologies of communication also became industrialized. The early nineteenth-century invention of the steam-driven rotary press made it possible to mass-produce newspapers at an unprecedented scale and speed, and at lower cost. These developments occurred in Europe as well as North America and, with the rise of commercial advertising, newspaper ownership became big business. The fact that the class interests of the owners of the major means of communication were those of the rest of society's elite lends support to Karl Marx's often-quoted statement that "the ideas of the ruling class are in every epoch the ruling ideas: i.e., the class which is the ruling material force of society, is at the same time its ruling intellectual force" (Marx, 172).

The role of the press in industrial modernization, and the urbanization that accompanied it, was a matter of some interest to classical social theorists besides Marx. In *Gemeinschaft und Gesellschaft,* Ferdinand Tönnies characterizes the community life of premodern Europe as rooted in locality. However, while he compares the rural agrarian community with urban industrial society, he also sees *gemeinschaft*, or community, as actually and potentially translocal. Tönnies was aware in his own time that communications media were used to bind space beyond the local community, to maintain communities of interest, and to pose a challenge to the autonomy and sovereignty of nation states. In 1887, Tönnies asserted that the means of communication could, and eventually would, contribute to a variety of forms of transnational political identification, referring to nations as "but a temporary limitation of the boundaryless Gesellschaft" (221). In his comments on the press, he writes that the press "can be conceived as its ultimate aim to abolish the multiplicity of states and substitute for it a single world republic coextensive with the world market, which would be ruled by thinkers, scholars, and writers and could dispense with means of coercion other than those of a psychological nature (221). This is not far removed from the cosmopolitan vision articulated in Kant's "Perpetual Peace" (1795), or that of his contemporary heirs.

Similar to Tönnies's reflections about a German and a global gesellschaft, John Dewey emphasized the distinction between the categories of gemeinschaft and gesellschaft, or society, in the United States, a country described by Tönnies as "the most modern and Gesellschaft-like state" (221). But unlike Tönnies,

Dewey sounds more of an alarm about such a condition. In *The Public and Its Problems* (1927), Dewey worries over whether the accelerating mobility of the "great society" of the United States, a paragon of modernity, threatened to destroy the stable and democratic public life of local communities. As the antidote, Dewey envisions the "great community," which would rely on the press to sustain it: "Communication alone can create a great community" (142). In Dewey's view, the conditions of modernity necessitated a material and conceptual shift in the scale of political community: "We have inherited, in short, local town-meeting practices and ideas. But we live and act and have our being in a continental national state" (113).

In addition, Dewey saw the press as the means to bind a national community. Opposing the view of Walter Lippmann in 1922—who dismissed what he saw as a misguided romantic conception of an "omnicompetent citizen" who would be capable of knowledgeable and effective political engagement in a complex modern society—Dewey believed that the civic competence of the average citizen is worthy of cultivation and trust rather than suspicion and underestimation. In Dewey's argument, the right and the ability to participate as listener and speaker in public debate is essential to competent citizenship, and he believed it could be mobilized on a national scale. This famed Lippmann-Dewey debate remains at the core of normative judgment about the possibilities and limitations of democratic political communication. Unfortunately, Dewey's idealism did not anticipate the destructive, racist *volksgemeinschaft* that emerged and prevailed in Nazi Germany, which was mobilized by a powerful media propaganda machine that generated a crude but effective nationalist populism. Lippmann's pessimistic view goes further to explain it.

Although the research literature on political communication has tended to focus on rational ideals of citizenship and the public sphere, political art and entertainment have been vital means of creating public knowledge and stimulating political passion and engagement. The comic plays of Aristophanes (446–386 BCE) were believed to have had significant consequences for the lives of those who were ridiculed in them. The eighteenth-century French philosopher and satirist Voltaire had a similar effect in his country, so much so that he was forced into exile in England. Similarly, Jonathan Swift used his wit to condemn many policies of the British government. Today, television is a principle medium through which the foibles and judgment of politicians become fodder for public consumption and ridicule. Fake news shows that satirize actual news programs, and late-night talk show hosts supply an endless stream of often well-researched commentary and exposé about the weaknesses and failures of political leaders.

PROPAGANDA

There is a significant body of literature about the uses of advanced means of communication as tools of propaganda, particularly as it pertains to politics and war. The term *propaganda* tends to be associated pejoratively with manipulation and deception. For example, Walter Benjamin argues that when the industrialized means of communication are used for the aestheticization of politics and the depoliticization of the class structure, it is an expression of fascism: "The logical result of Fascism is the introduction of aesthetics into political life" (141). One of the great legends of political propaganda is based on reports of an exchange during the Spanish-American War (1898) between American newspaper magnate, William Randolph Hearst, and illustrator and correspondent, Frederick Remington. Remington was sent to Cuba to report on supposed great battles between Spanish rulers and Cuban locals, but he reported to Hearst that he had found no evidence of war and wished to return home, to which Hearst replied, "Please remain. You furnish the pictures and I'll furnish the war." Whether or not it is accurate, this account is used often in education to illustrate the use of mass media as tools of political propaganda.

Propaganda analysis has tended to point to harmful effects, particularly in the form of populist appeals to bigotry and hatred, and government manipulation as a means to marshal public support for military aggression. Controversies of this nature implicate media institutions for their collusion with government agendas and their failure to provide accurate accounts of war opposition. By contrast, Jacques Ellul, in 1965, acknowledged the great potential for harm posed by propaganda, but he does not infer that this is a necessary outcome. Rather, propaganda is a means by which political beliefs and messages are made palatable and popular in a technological society; this is essential for forming political will, but it does not necessarily result in harmful effects. For Ellul, the technical mastery that characterizes propaganda in modern society is a cause for ambivalence, because propaganda is not only an instrument of public manipulation and deception, but as he defines it, propaganda is a necessary means by which institutions are able to match the scale of major societal problems. In either case, propaganda is properly understood as a modern manifestation of instrumental reason.

The creator of propaganda's biggest challenge is not to decide whether a message is correct or good; rather, the challenge is how to make the message effective. This conception of political communication is one in which there is a clear hierarchy and distinction between media producers and media consumers, the latter of whom are viewed as objects of political control by competing political actors. In a harsh 1979 critique of the field of public opinion research, Pierre Bourdieu argues that there is no such thing as public opinion. Rather, there is only mobilized opinion, often among those who lack sufficient knowledge, let alone previously formed opinions, about an issue. For Bourdieu, the valorization of polling data in turn becomes itself a means by which other forms of group formation and opinion formation, such as strikes and political protests or demonstrations, are made to seem less valid as indicators of public opinion, political consensus, and political will.

CITIZEN PARTICIPATION

Contrasted with this view of a hierarchical relationship between media producers and media audiences is a belief

in the value of breaking down the distinction to enhance democratic deliberation and political participation through innovative uses of communication. Recalling the Lippmann-Dewey debate, rather than assume that public knowledge about social issues and participation in the process of public deliberation is beyond the cognitive capacities of the average citizen, a combination of political will and innovative uses of "old" and "new" media has contributed to enthusiasm about the potential for enhancing citizen engagement. For example, the civic journalism movement of the late 1990s was an attempt to make newspapers into more responsive facilitators of public deliberation about issues of local importance, although this movement has lost much of its luster and momentum in light of the commercial imperatives that motivate the business decisions of newspaper publishers.

More expansive conceptions of political communication take into account a wide range of discursive practices, including media strategies aimed at contesting the power of nation-states, intergovernmental organizations, and corporations. Under authoritarian governments in central and Eastern Europe before 1989, there was an active underground system of publishing and distributing political literature. The Iranian Revolution of 1979 relied heavily on mobilization through the use of such small media as mimeograph machines and audiocassettes. In the United States and many other parts of the world, radical media have been shown to be vital means for mobilizing and sustaining many alternative and oppositional movements.

Citizens now use the Internet to reach large audiences as a means to promote a wide range of political causes. In recent years, the growth in political importance of the Internet has led to experimentation with electronic democracy, and recently has attracted attention to the uses of social media like Facebook, MySpace, Twitter, and YouTube to involve citizens more directly in the selection, framing, mass dissemination, and deliberation about political news. In addition, political leaders and their supporters are finding ways to make use of these same media to reach target audiences with well-defined messages.

Political Correctness

Early twentieth-century Marxists pioneered the concept of political correctness, or PC, using it literally and positively to denote the single correct stance, or line of action, on a specific political issue under prevailing conditions. A seminal example is Chinese revolutionary Mao Tse-Tung's 1927 speech "On the Rectification of Incorrect Ideas in the Party," which begins by criticizing "various non-proletarian ideas which greatly hinder the carrying out of the Party's correct line."

In the 1980s, conservatives in the United States, Europe, and Latin America appropriated the term from the Marxists in an ironic critique of dogmatic tendencies of liberal and leftist groups. Purporting to be open-minded and tolerant, conservatives came to satirizing these groups for claiming to have discovered the single correct view on a wide range of controversial issues, including affirmative action, crime, parenting, multiculturalism, hate speech, feminism, welfare, economic regulation, and environmental protection.

THE ESSENCE OF POLITICAL CORRECTNESS

Conservatives thus deflected longstanding criticism of themselves as rigid and intolerant, invading the traditional liberal turf of reasonableness, flexibility, and tolerance. However, despite its leftish connotations, political correctness is best conceived as an ideological narrowing, intolerance, and silencing of dissent all across the political spectrum. Although conservatives have succeeded in exposing small-mindedness among "progressives," the latter have countered that conservatives exhibit their own PC.

A telling sign of all PC is its tendency, especially among activists and ideologues, to discourage rather than engage diverse opinions and to proscribe offending topics as off-limits for open and frank discussion. A common example of left-wing PC is depicting critics of affirmative action as necessarily racist or sexist. On the right-wing side, after the 9/11 attacks, PC conservatives portrayed critics of U.S. foreign policy as unpatriotic and even treasonous. Similarly, PC centrists often depict any views that stray from the middle of the road as inherently flawed and "extremist." In a sense, PC is a thoroughly democratic tool available all across the ideological spectrum, as anyone can use it—or derision of it—to pummel adversaries without requiring any special authorization.

PROBLEMS OF POLITICAL CORRECTNESS

In the 1970s, a smattering of the new left self-critically referred to their own politically correct tendencies—a critique of the left virtually taken over by conservatives a decade later. By the late 1990s, an increasing number of progressives were expressing renewed doubts about left-wing PC among their peers. An awareness grew that PC, while providing clarity and comfort for the like-minded and according respect to the marginalized, could also undermine one's own cause by limiting one's field of vision and discouraging self-correction.

For instance, after Republican president Richard Nixon used the racial preferences of the 1969 Philadelphia Plan for affirmative action to divide and conquer the Democrats's two main allies—labor unions and civil rights groups—liberals' increasing support for affirmative action in the 1970s and 1980s may have unwittingly promoted the conservative agenda. By stifling dissent about group preferences and their divisive effects, liberal PC possibly played into the hands of supporters of the socioeconomic status quo.

Similarly, conservative PC within George W. Bush's administration arguably damaged the long-term electoral prospects of the Republican Party by silencing internal critics of the Iraq War (2003–) and of deregulative, supply-side economics, leading to the Republican electoral catastrophe of 2008. More generally, the ideological blinders of PC narrow the alternatives and possibilities under consideration by whoever uses PC to stifle debate and promote political uniformity. This pattern suggests a self-defeating cognitive and behavioral process reflecting Harold Lasswell's psychological formula for political activism: unresolved personal conflicts displaced onto public objects and rationalized in terms of the public good.

This analysis, if accurate, suggests the counterintuitive inference that political groups might do well to tolerate or even encourage the PC proclivities of their opponents while striving to reduce their own. Ironically, Mao's iconic speech promoting PC within the Communist Party of China offers, perhaps unwittingly, a corrective to the excesses of PC. While anchored in Marxist scientism alleging a single correct conclusion, Mao also criticized dogmatism and urged his comrades to engage in open and vigorous debate within the party—to be followed by strict party discipline in enforcing the view that ultimately prevailed. He explicitly discouraged the currying of favor with one's political associates by politely taking safe positions in public.

THE PRICE OF CHALLENGING AND ENFORCING POLITICAL CORRECTNESS

Throughout history, the politically incorrect have paid a heavy price for their deviation from accepted norms. Socrates, for instance, paid with his life for encouraging Athenian youths to think for themselves in opposition to the thinking of powerful individuals and groups within their society. Since the 1980s, conservative organizations such as Accuracy in Academia have targeted numerous examples of political discrimination against conservatives who spoke or acted "incorrectly." In 2002, Bill Maher's network television show *Politically Incorrect* was canceled after Maher denied on air that group behind the 2001 attacks were cowards. In 2008, Christopher Buckley was fired from the conservative magazine *National Review,* founded by his father, William F. Buckley, for crossing party lines to endorse liberal Barack Obama for president.

Less often noted is the price paid by those who enforce PC, a point stressed by John Stuart Mill in his 1859 classic, *On Liberty.* Opinions are seldom completely right or wrong, Mill

argued, and open discussion is the only way for partially correct opinions to come nearer to the truth. Even if a particular view happens to be correct, he went on, "if it is not fully, frequently, and fearlessly discussed, it will be held as a dead dogma, not a living truth." It is the group, or the entire society, that suffers most by shielding itself from a wide and potentially enriching diversity of "correct" and "incorrect" views.

POLITICAL CORRECTNESS AND RELATED PHENOMENA

It may be helpful to connect, yet distinguish, political correctness and four related phenomena. First, PC is a historically situated special case of *political dogmatism*. Second, the *culture wars* of the late twentieth and early twenty-first centuries exhibit a good deal of PC from both the right and the left, but conservative defense of traditional values, like progressive promotion of multicultural ones, can be conducted in either an intolerant and dogmatic, PC, or open-minded and tolerant, non-PC, way. Third, PC constitutes a form of *censorship,* but unlike official or legal censorship, it works in mostly informal and even unconscious ways, as Lasswell, Eric Hoffer, and others have implied in hypothesizing neurotic bases of political zealotry. Finally, many laypersons think of PC as a form of politeness, either appropriate or excessive, that militates against using offensive language or derogatory names, especially regarding groups with history of discrimination against them.

POLITICAL CORRECTNESS: THRIVING BUT CHALLENGED

As the first decade of the twenty-first century gave way to the second, references to political correctness continued to abound in the mass media. A 2009 Google search yielded millions of current or recent references to political correctness. The most widely read satirical periodical in the United States, *The Onion,* returned to Mao's legacy by devoting an entire issue to contemporary Communist Chinese political correctness. The lead article, "China Strong," reads satirically:

> According to all sources, the People's Republic of China is strong. The nation is united, the military unmatched, the economy vibrant, and the people ever joyful. Similarly correct sources verified that China has always been triumphant. In other news, the Chinese government is fair, all-knowing, and wise, propelled by the strength of two billion loyal hands, all pulling together as one under the Great Celestial Bureaucracy high above. Experts all agreed that there can be no question of this claim, as this claim is the truth.

Despite the partial accuracy of this mock claim, twenty-first–century Communist Chinese authorities have in fact been facing tens of thousands of grassroots rebellions annually all across the country—a warning, perhaps, of the costs of substituting political correctness for political correction.

Political Culture

Political culture, in one classic formulation of the concept put forward by Gabriel Almond and Sidney Verba, refers to the deeply held orientations that people have toward their political system. In this conception, which reflects the behavioralist approaches of 1960s modernization and political development scholarship, political culture is a product of the history of a given nation as shaped by important events (for instance, a violent conflict such as a civil war, a revolution, or major social upheaval), and peoples' characteristics, shared values, beliefs, and perspectives. This approach, which identifies the attitudes of individual citizens as the important indicator to be measured in the aggregate and then compared across political systems, has framed much of the subsequent research in comparative politics on the relationship between culture and politics. In its most essentialist form it has become a frame for arguing that conflict between macrocultural patterns, or civilizations, is driving global political change. In more nuanced studies, these cross-national indicators have been used to help explain how national political cultures may change over time with changes in other social, economic, and political indicators.

More recently, scholars such as Lisa Wedeen have adapted critical approaches from cultural anthropology to argue for a more interpretive framework for studying political culture. In this framework, political culture is conceived as a relational or dialectic process in which political meaning is constructed in the interplay between the practices of political agents and the language and symbolic systems in which they are embedded. This approach is less focused on citizens' psychological attributes (that is, attitudes) or orientations toward government. Rather, it focuses on how language and systems of symbols (semiotics) may operate to create and reproduce political meaning and how choices and actions by political agents can alter or construct meanings with demonstrable political effects. Empirical investigations using this approach require the use of mixed–methods research to uncover the most salient symbols within a particular context, to map the discursive and symbolic practices at work, and to capture the dynamics driving change in them.

POLITICAL SOCIOLOGY AND POLITICAL CULTURE

Almond and Verba's book broke ground for the concept of "political culture" as being important to the study of comparative political systems. Their work was a product of the political sociology prevalent in postwar scholarship that sought to catalog and reproduce the conditions for the spread

of representative democracy. They argued that five attitudinal dimensions were most salient for assessing political culture: a sense of national identity and attitudes about the self's participation in politics, attitudes toward fellow citizens, attitudes about the government's performance and output, and attitudes about and knowledge of decision-making processes. Almond and Verba defined several types of political cultures, and these are still widely cited.

One of these types is a parochial political culture, which in its most elementary form involves the least formal kind of political rule, such as an African chief or a shaman in other societies. This could be likened to Somalia in the early twenty-first century, where warlords rule without an established central authority. During the same time period in Afghanistan there have been attempts to meld warring tribes into a central political system.

A second type is the subject political culture, in which there is a specialized governmental authority with no voice from citizens. Feudal societies are illustrative this category. Citizens are "subjects" with duties, but few rights. They pay taxes—and perhaps are called on to fight in a war—but they have no voice in deciding these matters.

A third type is the participant political culture. In this culture the citizen is an active participant in the political process, expressing support for or rejection of government decisions. This type is associated with "democracy."

These three main types have numerous variations. African nations as well as Asian, Latin American, and even European countries move in and out of these different categories. For instance, attempts to move from a parochial to a participant culture can be seen in several African societies. And in 2006 there was a military coup in Thailand that resulted in an apparent move to free and open democratic elections to determine political leadership. Latin American nations slip into and out of democratic experiments and military rule. Chile in the early twenty-first century is rated as a free political system, but this comes on the heels of a military dictatorship. France is now in its Fifth French Republic—in which the people rule—but it has slipped into emperorship and external occupation in past iterations of its republics.

Almond and Verba acknowledge that there is no pure participant political culture and describe the United States as a civic political culture in which parochial, subject, and participant types are mixed in the society. Americans can be categorized as apathetic, subject, and participant. The apathetic may rarely get involved in politics and may not even register to vote. These citizens tend to come from the less educated and lower income segments of society and may be candidates for protest movements if they are convinced that such actions will improve their circumstances. The subject citizens are trusting of the political process and are oriented toward dutifully paying their taxes, serving their nation during times of war, and voting. These individuals generally are not overly active in interest groups, and the subject citizen would hardly ever get involved in protest movements. Participants are usually more highly educated, with upper middle to high incomes, and they perceive their political involvement as a rational way to preserve their status in society. Many nations besides the United States would fit the mixed or civic culture model to varying degrees, but any such society would need a minimum number of participants to become a democratic nation. As of the early twenty-first century, Freedom House listed approximately 46 percent of the world's nations as free. These nations have civic cultures sometimes referred to as civil societies. A civil society is one in which there is citizen and interest group autonomy from government and unhampered citizen and nongovernment organization (NGO) involvement in running the government.

Almond and Verba define the process of political socialization as shaping national political culture. The political socialization experience shapes the kind of adult citizen who exists in a particular nation. This socialization includes latent and manifest experiences that children undergo as they mature. Latent political socialization includes informal experiences with, for example, family authority patterns, whereas manifest political socialization includes overt attempts through, for example, family efforts to inculcate specific political orientations such as political party affiliation.

POLITICAL CULTURE AND WORLD POLITICS

In *The Clash of Civilizations and the Remaking of World Order* Samuel P. Huntington claims that since the end of the Cold War the major cleavage framing military and ideological conflict in international politics is conflicting cultures, expressed as competing "civilizations." Civilization is a cultural concept that includes the values, intellectual endeavors, and moral qualities of a society, standing in contrast to "barbarism." There are Western, Latin American, African, Islamic, Sinic (Chinese), Hindu, Orthodox (Eastern), Buddhist, and Japanese civilizations.

In Huntington's account, the world is now divided into these civilizations instead of the two opposing superpowers of the Cold War world order, and globalization has brought these cultures into closer contact. The West often is viewed as being in conflict with the Islamic and Chinese cultures; less so, but nonetheless still, in conflict with African, Hindu (primarily India), Orthodox (primarily Russian), and Japanese cultures; and not at all with Latin American cultures. The Islamic world frequently is seen as being in conflict with most of the other groups, but less so with China and Latin America.

In Huntington's world there are "fault lines," lines of demarcation between different groups and civilizations. For example, such a division currently exists between Western/Central and Eastern Europe. The Baltic States (Estonia, Latvia, and Lithuania); parts of Belarus, Ukraine, Romania, and Bosnia; and all of Central Europe (Poland, Slovakia, Hungary, Croatia, Slovenia, and the Czech Republic) and Western Europe are on one side of a cultural fault line with the rest of Eastern Europe, Turkey, and Russia. Western Christianity, ideas of democracy, and higher economic development contrast with the Orthodox religion, more authoritarian rule, and less economic development.

The divide is partially illustrated in the memberships of international political and military alliances. When the North Atlantic Treaty Organization (NATO) first began expanding from its original membership in the late 1990s, Hungary, the Czech Republic, and Poland were the first former communist countries given approval to join, in part because their culture, political, and economic systems were the most in line with those of existing member countries. The fault line continued to shift as other former communist countries became more Westernized; however, Turkey is the only country east of the current fault line to be approved for NATO membership. Despite this, Turkey is not a member of the European Union (EU). While the EU has included many formerly communist Central European nations and the Baltic States and may be extended to include others in the future, Turkey has serious human rights violations with its Kurdish ethnic minorities, a severe penal system in which torture is still practiced, and an ongoing struggle acknowledging equal rights for women. Yet the inclusion of nations on both sides of the European fault line may bring more cooperation among the various nations.

That the culture clash between the West and parts of the Islamic world is a reality can hardly be debated after the September 11 attacks on the United States and the U.S. response. That it will always be "clash" instead of cooperation remains to be seen.

FROM THE MODERN TO THE POSTMODERN WORLD

Ronald Inglehart's 1997 *Modernization and Postmodernization* argues that culture developed by political socialization is a major variable in explaining movement toward democracy and postmodernization. This major cross-national study, however, includes no Islamic nations and few nondemocratic nations (the totalitarian People's Republic of China and authoritarian Nigeria). Nevertheless, the study yields important information about the role of culture in politics and the trajectory of change for the more developed nations.

The findings, based on aggregated surveys in these nations, indicate that Northern European countries; the English-speaking nations of Canada, Britain, the United States, and Ireland; and Catholic Europe, including Belgium, France, Austria, Italy, Portugal, and Spain, are moving toward a new set of cultural, political, and economic values. A mix of shifting cultural norms and values, developed economies, and democracy are producing this change. The resulting postmodernization is a rejection of traditional values and forms of authority associated with the rise of a modern, industrial age. Postmodernization embraces a preference for nongovernmental organizations to influence politics. It is a more direct participatory form of democracy in which there is a distrust of traditional political institutions. Abortion, divorce, homosexuality, prostitution, extramarital sexual relationships, euthanasia, suicide, and soft drugs are more widely accepted under the purview of postmodernization, and postmodernists are less attached to formal religions and are less likely to attend church and state that God is important in their lives. They also are less concerned with economic well-being; that is, they are postmaterialist as well. It is interesting that postmodernists express a seemingly contradictory belief in two-parent households as best for raising children given that this is normally seen as a "traditional" value. Postmodernists enjoy a democratic political environment and economic security born of highly successful economies, and their values generally are not embraced in nondemocratic, less economically developed, and/or tradition-oriented nations.

It is also evident that within postmodern nations, especially in the United States, there is a reaction against the loss of what are considered traditional values. Age is a major factor in this regard. Inglehart gives a political socialization generation interpretation to his findings. Youth in general are embracing postmodern values, whereas older individuals frequently reject them. Other, more recent surveys show the same trend. Polls in the United States, for example, show that among Americans age 55 and older, relatively few accept same-sex marriage, whereas many who are 30 years old and younger do accept it.

The Inglehart data indicate that Nigeria, South Africa, India, Turkey, and the former communist states of Central Europe are more oriented toward scarcity values. Individuals in these countries are more concerned with making a living than with experimenting with postmaterialist values. Brazil, Chile, Argentina, and Mexico fall somewhere along the spectrum of scarcity values, traditional authority, and postmodernization. China, Japan, and South Korea have in common a high achievement motivation along economic lines, but they differ greatly on democracy rankings, with Japan and South Korea moving more toward postmodernization values.

POLITICAL CULTURE AND POLITICAL ANTHROPOLOGY

For scholars who approach the concept of political culture from an anthropological perspective, the concept of political culture advanced by political sociologists downplays the importance of culture in analysis. Moreover, it incorrectly categorizes the role of political culture as a reflection of individual attitudes. For cultural anthropologists, political cultures are dynamic systems of meaning that shape and constrain perceptions of people who interrelate in political contexts. Looking at aggregated survey data may not be the best indicator of how meanings are constituted in a particular political system or subsystem or even across political systems. Moreover, the political sociologist's tendency to treat political culture as a more or less fixed national attribute directs attention away from the variations within a nation and impoverishes the ability to explain cultural change within a polity or variations across polities with similar social or economic characteristics.

Lisa Wedeen's conception of a critical approach to political culture is reflected in her field research in Syria and Yemen. This research attempts to explain how Yemenis form strong national attachments in the absence of strong state institutions and how Syrians under the Asad regime reinforced obedience to the autocratic leader even when they shared a recognition that the required rituals of obedience were not genuinely performed. She argues that such an interpretive approach helps

uncover the semiotics at work within a cultural context. This involves using a range of qualitative methods to identify which practices, symbols, and rhetorical frames are politically significant and to narrow the range of possible meanings of those practices, symbols, or frames. The benefit of this practice-oriented cultural approach is greater explanatory power for new and persistent puzzles in political research, such as how political identities are generated, how symbols and rhetoric can generate compliance or conflict, why some political appeals work more than others, and why some ethnic identities become radicalized and others do not. "By paying attention to the ways in which certain meanings become authoritative while others do not," she argues, "political scientists can use this [method] to help explain why recognizable events or empirical regularities occur" (714).

This line of inquiry is relatively new in political science and thus is not as established compared to the frameworks of Almond and Verba and Inglehart. Nonetheless, by paying attention to emerging puzzles and variations within type, deploying mixed-method research designs, and carving out an interpretive position on how to study the nexus between cultural and politics, it generates new and provocative questions not easily addressed by the classic approaches.

Political Discourse

Political discourse is a dimension of, and a tool for, political action. Discursive acts are a significant and indispensable part of political practices. A political scientist is therefore often led to analyze political discourses, broadly defined as sets of ideas and processes of policy formulation and communication. These can take the form of oral communication (e.g., electoral speeches, radio or television interviews, parliamentary questions and debates, etc.), written communication (e.g., political platforms or manifestos, bills and laws, etc.), as well as meaningful symbols (e.g., demonstrations, commemorations, flags, etc.).

The nature and the role of political discourse can be construed in different ways. Some research designs informed by theoretical approaches focusing on other explanatory factors—such as preferences, political and institutional capacity, or policy legacies—tend to see discourses as epiphenomena with no autonomous or significant causal influence (e.g., rational choice theories, historical neoinstitutionalism). Opposite theoretical approaches stress, on the contrary, that discourses and ideas exert a key causal influence (e.g., social constructivism). Some pluralist approaches argue that studying discourses, when combined with other factors and perspectives, helps complete an understanding of political processes and outputs.

Several distinct or complementary functions have been assigned to political discourse, including transmitting information and exchanging views on political issues, political agenda setting, altering public opinion as well as behavior (notably electoral behavior), and politically socializing citizens. Most of these functions connect with two intertwined political imperatives: on the one hand, the legitimization of political actors, systems, and policies; and, on the other hand, the shaping of perceptions of reality.

Discursive acts are inherent in the practices of power. According to Murray Edelman, "The employment of language to sanctify action is exactly what makes politics different from other methods of allocating values." Political power is never exclusively based on might and constraint, as asserted by Jean-Jacques Rousseau: "The strongest is never strong enough unless he turns might into right and obedience into duty." Political discourse contributes to legitimizing political action and political actors. Because it presents political actors and political decisions as the driving forces of social life, it legitimizes political action as such. Political actors also use it strategically, willing to gain or retain political support and legitimacy. Those in power claim that they are responsible for current positive developments while promising future achievements. On the other hand, the opposition and advocacy groups criticize those who govern or put forward alternative courses of action.

Political discourse is not a neutral way to pass information to rational actors in order to help them make informed decisions. It aims at making specific interpretations of political issues prevail. It influences the way people think about and perceive political life. It makes social life intelligible by reducing complex and multidimensional issues to a limited number of options and a few unidimensional oppositions (e.g., the left versus the right, or ecology versus productivism). Within a political system, some symbols, words, and arguments are associated with political ideologies. Using those meaningful signs, political discourse takes a part in building and reinforcing political identities. It asserts and helps identify actors' political positions and preferences.

Several elements constrain political discourse—notably, the role and status of the speaker, the audience, and the media as well as the political, social, or economic context. The political status or aspirations of the speaker influence the style and the content of the discourse. Within a political culture, different public roles (e.g., president, member of parliament, mayor, etc.)

raise different expectations. For instance, high profile mandates attract more numerous, more contradictory, and more intense demands, which decrease the margins of maneuver.

Political actors seeking electoral support have to adapt their discourse to their audience. Depending on its homogeneity (e.g., general public, specific interest groups, etc.), the discourse can be designed to address specific demands or remain general and flexible enough in order not to alienate one's potential supporters.

The development of new communication technologies since the nineteenth century (e.g., the press, radio, television, Internet) has dramatically modified the dynamics of political discourse. Information can transmit almost instantly and reach large and heterogeneous audiences through mass media. Political discourse has become an endless and highly interactive process, and political actors must make statements under the pressure of current events. In contemporary mass-mediated societies, political discourse is omnipresent. The study of its production, its content, and its effects is a vast and continuously renewed field of research.

Political Ecology

Political ecology is a relatively new interdisciplinary field. It initially developed through the merger of cultural ecology with political economy.

ORIGINS OF THE FIELD

The central concern of cultural ecology in the 1950s and 1960s was to introduce the theoretical constructs of biological ecology into the study of preindustrial cultures. Scholars soon began to question the foundations of cultural ecology, noting that few societies functioned as independent, autarkic systems. Nature and society relations in agrarian cultures, it was argued, are best understood through political economy, focusing on the social relations of production under capitalism. A broadly Marxist political-economic scholarship guided this reorientation, originating from several fields and disciplines. In particular, Marxian development studies in the 1970s increasingly questioned prevailing demographic explanations of developing countries' environmental degradation, offering an alternative political-economic explanation that focused attention on wealth distribution, social patterns of accumulation, interclass relations, and the role of the state.

Out of this political economy approach to environmental degradation emerged a set of methods and questions that provided the foundation for a new field. Although the term had been used in other contexts, two geographers, Harold Brookfield and Piers Blaikie, are widely recognized for initially defining political ecology as linking ecology with political economy in their 1987 book on land degradation. Their central premise was that environmental problems are fundamentally social and political problems, not technical or managerial, and therefore demand a theoretical foundation for analyzing the complex social, economic, and political relations in which ecological change is embedded. Because of the complexity of the phenomena under investigation and the interdisciplinary character of the field, there is no single methodology or set of theoretical concepts that could be used to define political ecology. Nonetheless, political ecology is distinguishable in its particular blend of multiscaler, ecological, political-economic, historical, ethnographic, and discourse analyses.

THEORETICAL EVOLUTION

Political ecology became a distinct field during a period of revolutionary theoretical shifts in both the social and biophysical sciences, specifically the rise of poststructural social theory and nonequilibrium ecology. Political ecology was soon caught up in poststructuralist debates, especially those addressing the social construction of nature. The phrase, "the social construction of nature" highlighted the role of representation, discourse, and imagery in defining and framing knowledge of the natural world.

Political ecologists have staked out the middle ground between extreme relativist and extreme realist views of nature. The prevailing position, borrowed from critical realist philosophy and feminist science studies, accepts the existence of a material world independent of human consciousness and sensory perception, while at the same time recognizes that knowledge of that world is always situated, contingent, and mediated. Poststructuralism introduced the role of discourse analysis in exploring the ideological roots of claims about the causes of environmental change. Since the early 1990s, it has become widely recognized within political ecology that material analyses cannot be conducted in the absence of, or separately from, discursive analyses.

Biological ecology, almost simultaneous with the emergence of poststructuralism in the social sciences, experienced its own revolutionary theoretical shift. For most of the twentieth century, the dominant view of environmental change was that ecological communities progressed through a linear series of stages, which ultimately culminated in a final, climax stage

of stable equilibrium. Any force—natural or anthropogenic—that altered the normal equilibrium state was characterized as a disturbance. In the twentieth century, the equilibrium view of ecology came under increasing scrutiny as more and more empirical findings contradicted it. A new ecology—nonequilibrium opposed to equilibrium—subsequently emerged, which rejected the assumption of stability as the norm for all ecological communities. The new ecology replaced assumptions of equilibrium, predictability, and permanence with instability, disequilibria, nonlinearity, and chaotic fluctuation. Disturbance is not viewed as anomalous or as an event from which a system recovers, but rather it is considered commonly integral to the system's functioning. Finally, the linearity and predictability of ecological change can no longer be assumed in complex natural systems that are highly sensitive to initial conditions.

In the wake of these theoretical developments, political ecologists have identified convergences in nonequilibrium ecology and poststructuralism that can provide the basis for a synthetic treatment of nature-society research. Four themes emerged among these efforts at synthesis. First, researchers are combining nonequilibrium ecology and critical social theory to demonstrate the weakness, or in some cases, the complete absence, of scientific evidence to support widely accepted claims about nature-society interactions. A second theme emphasizes how incorporating the insights of nonequilibrium ecology can bring a renewed focus on nature's agency in shaping nature-society interactions. A third theme highlights the importance of temporal and spatial scales in both nonequilibrium ecology and social theory, underscoring the nonlinear and noncyclical character of environmental change. Finally, advances in social theory and nonequilibrium ecology have produced a new appreciation for localized resource management systems in environments defined by extreme spatial and temporal variability.

RECENT TRENDS AND FUTURE DIRECTIONS

Political ecology is rapidly expanding beyond rural concerns and developing countries into new research contexts and new areas of theoretical and philosophical inquiry. First, a strong focus on urban political ecology has developed in recent years, partly in recognition of the rapid urbanization of large regions of developing countries and the consequences of globalization. Urban environments are characterized as hybrid forms, requiring vast inputs of capital and labor, yet still linked to and dependent upon biophysical processes. Second, political ecologists have recently developed a potent critical assessment of environmental security thinking, along with a cogent argument for an alternative analysis of the relationship between environmental change alongside war and armed conflict. Third, recent developments within and outside of the academy suggest that engaging with formal ethics—including social justice, animal rights, bioethics, and consumer responsibility—will provide an important trajectory in political ecology.

Finally, debates over indigenousness, property rights, and stewardship have sparked a range of work that more deeply probes the relationship of identity and environment, raising new questions about how to theorize culture and nature. Future political ecology studies will need to be aware of the instabilities and cultural constructedness of group self-identification, while at the same time remain sensitive to the validity of local historical narratives, practices, meanings, and attachment to place.

Political Economy

Political economy means different things even to informed scholars. Like a Rorschach ink blot, one's favored definition reveals much about one's background and interests. For some, it means Marxism, derived from Aristotle's conceptions of the moral foundations of exchange and production. For others, it means neoclassical economics, with a focus on choice and efficiency, expanded to account for political outcomes that shape, and are shaped by, market processes. There is merit in each view.

Until the late nineteenth century, political economy was the joint study of politics and economics. John Stuart Mill and Karl Marx exemplify scholars who combined the study of politics and economics, but the study of politics and economics later became separated, both in focus and method. Recent developments in each field have moved toward new connections.

Any society, at any time, must come to grips with the central political economic questions: What activities will be collective, organized either through command or democratic choice, recognizing that individual incentives still matter? What activities and rights will be individual, focused on self-interested, private voluntary exchange, recognizing that collective consequences still matter? The theories of markets and market failure provide one framework for analysis and understanding, but political economy is much older than the theory of market failure.

THE ORIGINS OF POLITICAL ECONOMY

Aristotle believed that in a just exchange, each party receives equal value. Yet, questions remain about what constitutes "value," and how one might judge if it is equal. In Chapter 5 of Book 5 of *Nichomachean Ethics,* Aristotle claims that exchange establishes communication and social connection among citizens. Political relations are thus closely tied to exchange relations, which create a consciousness of cooperation in society.

Aristotle then raises a problem, however—one that still vexes modern scholars. Voluntary exchange may often yield unequal rewards, as one party benefits more than the other. Over time and across many exchanges, especially if some citizens come to specialize in trade, these differences create social and political distinctions that are powerful but morally arbitrary. Aristotle concludes that "nothing . . . can prevent the product of one of the parties being better than that of the other, and in that case therefore *they have to be equalized*" (143).

Unfortunately, this is logically incoherent. If exchange is voluntary, then what each party receives is strictly better than what is given up. One questions what essential value there is in transactions, other than the value parties subjectively attached to the commodities. Alternatively, if money is value, then the only way to ensure justice is to exchange equal monetary values. Yet, this is true only if money is exchanged for money. What about an exchange of money for bread? Are the values equal? Is the exchange just? Aristotle recognized the problem, but never solved it. Thomas Aquinas, in question 77 in *Summa Theologica,* inquires as to "whether it is lawful to sell a thing for more than its worth?" (1507–1508). But again, "worth" appears intrinsic, and objectively observable. Aquinas is unable to make a coherent claim for why value differs from whatever price a buyer is willing to pay and a seller is willing to accept.

This formulation of *just price* preserves the contradiction of whether price and monetary value, in the judgment of those trading, are or are not the true "worth of things." The question was finally answered fully only by Karl Marx. In *Capital,* Marx argued that equal labor values could balance just transactions. However, exchange in capitalist wage labor systems is not balanced. The buyer of wage labor derives disproportionate benefits from the transaction, and is able to accumulate large quantities of capital. Further, just as Aristotle claimed, these disparities have social and political implications. Over time, profits for capital engender disparities in social and political

class and constitute the basis for a system of domination of both the economy and the polity.

Further, Marx recognized the great power of capitalism to create wealth and amass capital—a key stage in the development of any nation. His unique contribution rests in his conception of the metastasis of disparities of economic power into political and social control of the nation. Vladimir Lenin extended this idea in powerful ways to account for what he saw as the international expansion of capitalism through colonialism and imperialism. The argument concludes that capitalist nations and the capitalist system will, over time, tend toward greater instability, and ultimately an eschaton where the internal contradictions of capitalism are resolved in favor of a more just and economically sustainable system of exchange and allocation.

Therefore, while many scholars conclude that view defining value as labor is unworkable as a purely economic theory, the core elements of the Marxist-Leninist theory of economic history remain important elements of modern political economy. Modern scholars have extended this synthesis, both correcting some problems in the framework and applying the framework to problems that Marx did not explicitly foresee, such as globalization and culture.

NEOCLASSICAL ECONOMICS AND SUBJECTIVE MARGINALISM

Neoclassical economics, beginning with William Stanley Jevons, Carl Menger, and Leon Walras, solved the defining-value problem very differently. As Menger frames it in *Principles of Economics*: "Value is thus nothing inherent in goods, no property of them, nor an independent thing existing by itself. . . . Hence value does not exist outside the consciousness of men" (120–121).

Subjectivism unshackles price from intrinsic value, and allows both production cost and product demand to be accounted for in the calculus of price determination. Even in the subjectivist world of modern microeconomics, the cost of production is still the core concept because, under perfect competition, the price will always be driven to the cost of production. Jevons, Menger, and Walras were the first to argue specifically that a subjective concept called *utility*, not objective physical or moral goals, drove economic actors. Indeed, they went further, and claimed that the economics of consumer choice was properly the study of utility at the margin.

Alfred Marshall formalized the intuitions of subjectivism and marginal utility and combined them with the optimization conditions now learned in basic economics classes. Marshall's unique combination of talents allowed him to describe the foundations of economic theory clearly and precisely. It is difficult to imagine modern economics without Marshall's contributions, which, for individual actors, parallel the mathematical achievements of Walras at the level of an aggregate economy of many actors. In fact, Marshall was either the last political economist of the normative school or the first true economist of the mathematical and positivist tradition now found in university economics departments all over the world. Not until the innovations in mechanism design at the end of

the twentieth century were the ancient interests in political institutions and the economy reconnected.

In Marshall's benchmark world of perfect competition, the stylized *invisible hand* of Adam Smith reconciles competing goals and directs resources to their highest valued use. Every exchange makes both traders better-off, and in equilibrium, there is no feasible additional trade that could make anyone better-off. The first and second welfare theorems capture the normative properties of this mathematical world.

Such proofs illustrating the welfare consequences of operating perfect markets represent important contributions by Walras, Kenneth Arrow, and others. The static and dynamic forms of the theory of *competitive equilibrium* have an important place in the pantheon of scientific political economy, and they continue to play a role in many areas. While this is not a world that many observable markets resemble, it is the basis for a strong presumption in favor of markets by many economists and citizens.

However, for decades, a parallel school—including Austrian economists such as Ludwig von Mises and Friedrich Hayek— argued that the focus on equilibrium, with abstract assumptions invoked simply as a means to prove equilibrium results, were a distraction from real-world market processes. In fact, beginning with Adam Smith's simple pin factory example, assumptions like perfect competition and decreasing returns appear suspect. Smith's division of labor, with its resultant specialization and economies of scale, is the motor that creates wealth and improves the human condition.

The title of Book 1, Chapter 3 of the *Wealth of Nations* contains a dynamic challenge to the same static competitive equilibrium theory for which Smith himself was the inspiration. The chapter title is "That the Division of Labor is Limited by the Extent of the Market." Smith envisioned that the use of production lines and specialization creates a surplus of trade goods. To transform this surplus into wealth, distant people who had no previous connections now began to trade those surpluses and to become more interdependent. Still, there are downsides to this increase in prosperity. Real markets—driven to expand by division of labor and returns to scale in production, innovation in transportation technology, and improvements in product packaging and durability—have proved to be enormously corrosive of local customs and traditional exchange relations.

Joseph Schumpeter identifies and analyzes the role of the entrepreneur. Though driven by profit, the entrepreneur is also an innovator, the force that animates the story that Adam Smith told about division of labor, expansion of markets, and increases in wealth. Schumpeter describes the process of *creative destruction*, where new products and cheaper production processes expand consumers' menu of choice and society's prosperity. Schumpeter's *Capitalism, Socialism and Democracy* reflects an instinct that the study of economics implies a study of politics, but he does not take it very far.

There are signs, however, that the integration of these two fields is accelerating. Douglass North, John Wallis, and Barry Weingast point out that developed societies always have developed economies and developed polities, and that this suggests that the connection between politics and economics must be a fundamental part of the development process.

THE MARKET FAILURE PARADIGM

The so-called market failure paradigm brings government back into markets in a focused way. It takes the competitive equilibrium model as a starting point, assuming that markets and private allocation of scarce resources organize activity efficiently. Government action is justified when markets fail to produce efficient outcomes. Where Marxists see markets as inherently exploitative, market failure theorists view markets as the engine of prosperity, though in need of direction when the assumptions are not met.

Along with an unstated underpinning of law, property, and order, competitive equilibrium theory makes the following four assumptions: (1) all goods are private; (2) there are no negative externalities; (3) there are so many buyers and sellers that no one can influence a price; and (4) information is free and universal.

Violations of these explicit assumptions are the market failures. Taking these in turn, many goods are not private, but are collective goods in that they are jointly supplied and those who do not pay cannot be excluded from their enjoyment. National defense is the canonical example. Because of the temptation to *free ride* on the contributions of others, less than optimal amounts of collective goods will be supplied. One solution to this market failure is to have the government provide national defense.

Negative externalities are the costs over and above the price paid by a buyer to the seller, and suffered by people who are not party to the transaction, such as air pollution. Possible government solutions include regulation of the process producing the pollution, taxing emissions, or a cap and trade system that creates tradable rights to emit, but imposes the full social cost on polluters.

In regard to the many buyers and sellers, violations of the condition that no single actor can influence a price are not easy to resolve. The efficiency of markets rests on active competition in both the static and dynamic senses. In the static sense, competition implies that products are priced at their cost of production, satisfying Marshall's marginality conditions and Aquinas's intuition about just price. The difference is that economists have demonstrated that there are costs, termed *deadweight loss*, associated with monopoly and market power on the producer side. In the dynamic sense, competition requires new investment and innovation, and it is not clear how firms in a classical competitive environment with zero profits can take on the implied research and development.

Once the need for innovation is recognized, the problem of competition policy is harder to solve. In the presence of sharply increasing returns to scale, competition may result in a winnowing out of firms with only a few survivors, each possessing the power to raise price above marginal cost. There are two implied government actions to prevent this trend toward concentration from becoming too extreme. First, antitrust

policy may seek to prevent the extreme concentration of economic power when it can be avoided, as in the case of trusts. The second implied government action is regulation in cases when a few producers is the most efficient result, as in the case of long-run economies of scale, such as utility companies.

The last category of market failure is information asymmetry. It may be difficult or expensive for consumers to learn whether a product or service is safe or effective. Further, the harmful consequences may be large enough to make ex ante, rather than ex post, sanctions necessary. Free market advocates tend to favor ex post sanctions, such as personal injury lawsuits, for fraudulent claims or harmful products. Liberal consumer advocates, on the other hand, gravitate toward ex ante regulations, including licensing of providers, health inspections, and lengthy clinical trials before a product can legally be offered for sale.

In all four cases of market failures, there are questions of what, how much and where. How much national defense is enough? When are negative externalities big enough problems to merit government intervention? When should government deal with the competition problem with antitrust, when with regulation, and when should it just leave well enough alone? When should government protect consumers from real risks to life and health, and when should it allow markets and the reputations of businesses to work in resolving information asymmetries? There are no right answers because these questions are matters of political belief, ideology, and partisan competition. However, while there may be no identifiable best practice, there is no assurance that government will make the best decisions, even in the absence of overt corruption.

THE POSSIBILITY OF GOVERNMENT FAILURE

Arthur Pigou, one of the high priests of market failures, noted in 1920:

> It is not sufficient to contrast the imperfect adjustments of unfettered enterprise with the best adjustment that economists in their studies can imagine. For we cannot expect that any State authority will attain, or even wholeheartedly seek, that ideal. Such authorities are liable alike to ignorance, to sectional pressure, and to personal corruption by private interest. (296)

Typically, market failure was a basis for government intervention to correct the failure, but there was an inconsistency between the selfish motivations assumed in markets and the benevolent and public-spirited motivations assumed for government. The public choice movement resolved this inconsistency by assuming that government officials are, like economic agents, selfish utility maximizers. Putting the institutions on an equal footing with respect to the assumed motivation of key actors led to considering the possibility that government may not solve market failures, and may even make them worse. There are thus three components to the public choice response. The first is the information problem; the second is the incoherence of majority rule; the third is the problem of limits.

As Hayek pointed out, markets depend on very widely distributed information about demand and willingness to pay. No central planner or government can possibly have as much information as is aggregated in the millions of choices made daily in consumer, labor, and financial markets.

Since Condorcet, it has been known that under many conditions, majority rule is cyclical. Arrow, who helped identify the conditions under which competitive markets fulfill the theorems of welfare economics, proved there is no voting method that satisfies some innocuous conditions, such as universal admissibility of preference orderings and nondictatorship. This means that any complex social-decision rule must have elements that are incoherent or arbitrary.

The third problem of government intervention is that majority rule is not self-limiting. James Buchanan and Gordon Tullock point out that once public decisions are rooted in the will of the people, whether expressed directly or through their representatives, constitutions are needed to protect individual rights and to limit the arbitrary scope of majority rule.

BRINGING POLITICS AND ECONOMICS BACK TOGETHER

In December 2007, three economists, Leonid Hurwicz, Eric Maskin, and Roger Myerson, gave separate acceptance speeches, acknowledging the Nobel Prize for mechanism design as an innovation in economic theory. Each recognized, in different ways, that the reintegration of political institutions with market institutions was largely accomplished. A mechanism is a process for determining outcomes—whether it is a game, a set of rules, or some social convention. Pure markets are a mechanism and so are utopian collective farms.

Myerson gives an explicit account of why a focus on economics is necessary, but incomplete in isolation. He argues that mechanism design expands the scope of analysis beyond technical and resource constraints into the realm of incentive constraints. Any social institution is a mix of incentives and a mix of political and economic considerations. Good social institutions foster communication and coordinated collective action in the face of adverse selection and moral hazard problems.

The bifurcation of economics and politics, in the public mind and in academic research, has been fruitful because generations of scholars working independently have constructed and tested separate analytical frameworks. Yet, the separation has never made sense from a practical perspective because neither politics nor economics exists separate from the other. The road toward a full reunification, toward the creation of a comprehensive theory that deals seamlessly with incentives and constraints in both politics and markets, has now been opened. It will likely be well-traveled in both directions.

Political Economy, Comparative

Comparative political economy (CPE) studies how political determinants influence socioeconomic outcomes and how economic determinants shape political behavior. The political economy of the welfare state is a particularly interesting area for illustrating CPE, as it both shapes socioeconomic outcomes and is shaped by them.

MODERNIZATION AND THE ORIGIN OF THE WELFARE STATE

Without the presence of socioeconomic influences, the welfare state in today's advanced, industrialized democracies would probably not have emerged. Modernization—encompassing industrialization and democratization, and specifically involving rapidly changing working conditions and the emergence of the free labor contract—is the central factor here, as it led to the loss of income security among weak groups and to unemployment. Since neither the market nor the family provided the collective goods to cope with these new insecurities, large parts of population turned to the state to demand social protection. The increasing concentration of people in factories and cities and the extended means of communication enabled the population to mobilize itself through protest or establishing social and political organizations. In a nutshell, industrialization dislodged masses of people and made them dependent on the whims of the labor market. In turn, they demanded more socioeconomic security, to which the welfare state is a response.

A socioeconomic factor (modernization, or more specifically the establishment of a full-fledged labor market) thus shapes a political outcome (welfare state development), illustrating why a political economy perspective is so helpful for studying welfare state development. Interestingly, the common experience of modernization did lead to different outcomes.

It is here where *comparative* enters political economy. A comparative political economic analysis examines to what extent socioeconomic factors relate to political ones in different cases, and vice versa.

VARIOUS MODELS OF THE WELFARE STATE

Due to modernization, all advanced, industrialized democracies introduced social security programs such as sickness insurance, old age pensions, and accident insurance during the nineteenth or twentieth century. However, the countries differ substantially in the degree to which the different insecurities are covered and who is eligible for a benefit. Welfare states come, so to speak, in different flavors.

In the 1950s, Richard M. Titmuss proposed a typology of welfare state models or regimes. First, there is the *residual welfare model,* which offers social protection only once the private market and the family fail to fulfill the needs. The welfare states in Anglo-Saxon countries are an empirical example of this model. Second, there is the *industrial achievement-performance model,* which links welfare rights and benefits to the employment relation. The continental European "male-breadwinner" countries such as Germany and the Netherlands in the last century typify this model. Finally, there is the *institutional redistributive model,* in which social welfare institutions are integral parts of society and which offer universalist services outside the market when needed. The Scandinavian countries exemplify this model.

There is a considerable overlap between this typology and the one proposed by Gøsta Esping-Andersen in *The Three Worlds of Welfare Capitalism* (1990). In this seminal book, Esping-Andersen distinguishes three welfare state regimes—*liberal, conservative,* and *social-democratic*—and these correspond largely to Titmuss's residual welfare, industrial achievement-performance, and institutional redistributive models.

A particular type of welfare state regime or model emerged because the socioeconomic changes of modernization depended, among other factors, on whether or not the middle class was included in the pro–welfare state coalition and, if the middle class was included, how this came about and was arranged politically. A comparative political economy perspective —one that examines the interplay between socioeconomic determinants and political ones—is thus crucial for understanding the origin and subsequent development of the different types of welfare states.

VARIATION IN POVERTY AND EQUALITY

Comparative political economy also proves valuable for understanding the variation across countries or types of welfare states in socioeconomic outcomes, such as poverty and equality. Many recent empirical studies, for example, show that the type of welfare state regime matters for the level of poverty and equality in a country. There seems to be a consensus that the most pronounced effect derives from the degree of univeralism. The mechanisms behind this are manifold. For instance, good benefits and services—especially

education and health care—that tailor to the standards of the better off rather than to the poor are good for the poor and help to increase social mobility. Moreover, fragmented, targeted, or particularistic systems (i.e., separate systems for separate groups) reinforce inequality rather than reduce it. How universal social programs are varies across the types of welfare state regimes. A political determinant—how the welfare state is organized—affects the socioeconomic outcomes of poverty and equality.

The welfare state is but one of the topics upon which comparative political economy focuses; other topics include voting behavior and the relation between economic development and democracy. Regarding voting behavior, comparative political economic analysis assesses to what extent economic considerations influence election results. Why, for instance, did the economy have such a large effect on the 1980 presidential election in the United States but hardly an influence twenty years later? With respect to economic development and democracy, comparative political economic analysis studies to what extent economic development fosters, or hinders, democracy and to what extent the reverse may be occurring (i.e., democracy stimulating or retarding economic development).

Political Geography

Political geography is a field of inquiry concerned with the geographical organization of government, the ways in which geographical imaginations figure in world politics, and the spatial basis to political identities and associated political movements. Geography is often understood as the distribution of such physical features of the earth as mountains, rivers, and oceans, but it also includes human reactions to and impacts on the physical environment—from settlement and economic-development patterns to human-induced climate change.

Political geography is that part of human geography involved with politics. Compared with political sociology and political science, political geography is less concerned with the politics of social groups and the political preferences of individual persons and more with how social groups and people organize and orient themselves in space for political purposes. Examples of this include the field's long-term focus on such phenomena as the dynamics of interstate borders, the history of modern statehood, electoral geography (including the geographical organization of elections), and the strategic ranking of world regions in foreign policies. Historically, the field has focused on the links between space, regions, and the natural environment, on the one hand, and politics (and polity), on the other. Such linkages were important to ancient and early modern political theory but have weakened in recent political theory, as its practitioners have tended to become largely state focused. Political geography, therefore, recalls a historically more integrative and perhaps more wide-ranging approach to understanding political phenomena.

TRAJECTORY, 1890 TO PRESENT

As a modern field of study, political geography dates from the 1890s as initially an "aid to statecraft" in organizing their empires and confronting their adversaries on the part of the great powers—Germany, Britain, France, the United States, Russia, and Japan. Largely analogous to what was also known after 1899 as *geopolitics,* this political geography took contemporary national political identities and reason of state as givens. The "needs" of territorial states, and their relative location on the earth's surface alongside the resources available in driving and determining the outcome of competition between the states, were the main concerns of the field. Lurking in the early history of political geography is the history of thinking about how nature relates to nation-state as inherited from the eighteenth-century European Enlightenment and the early nineteenth-century Romantic reaction against it. If the idea of levels of development associated with different national territories comes from eighteenth-century Enlightenment thought, then that of hierarchies of national territories on a racial-natural basis competing with one another for domination comes out of nineteenth-century German idealism.

This intellectual trajectory long dominated the field. Indeed, until very recently, many political geographers were either cameralists—advocates of state-based economies that maximize their self-sufficiency and minimize their transactions with others—or imperialists—promoters of empire-building and controlling distant territories). There are still some of each around, even if many advocates of cameralism now think of themselves as on the political left rather than on the nationalist right. Changing times can produce strange bedfellows, but over the past twenty years, liberal perspectives that pit states against markets, and social perspectives that look to a plurality of forms of governance, have tended to become more influential. Of course, disputes among cameralists (both nationalist and state socialist), imperialists, liberals, and romantic localists have deep roots in many genres of modern political thought.

However, it is not only the range of implicit political projects informing the field that has changed. The intellectual attitude has moved 180 degrees. Since the 1960s, a more independent and critical approach has begun to develop, acknowledging the need to critically question rather than actively serve the particular interests of the political geographer's "home state."

At the same time, the empirical scope of the field has widened to consider questions about the origins, spread, and support for political movements and parties, the links between places and political identities, and geographies of nationalism and ethnic conflict. Along with many other parts of political studies, political geography has gone from presuming that states, particularly one's own state, are everything to seeing "the political" as everywhere. This intellectual leavening of the field has simply transformed political geography from a particularly state-centered field at its origins to one interested in the range of ways in which geography intersects with the broadly construed sense of the political: from the material and discursive construction of states and their interrelations to the connections between places and political identities.

GEOPOLITICAL CONTEXT AND POLITICAL GEOGRAPHY

A good case can be made that the geopolitical context of the time has been crucial for the emergence political geography over the past one hundred years. The field has not evolved simply as the result of an internal dynamic, as one paradigm simply replaced another because of intellectual fancy or academic competition. It is not that such considerations have been absent, but they have been relatively less salient to the making of the field than the nature of the world that political geography has claimed to directly report on and interpret. The time of modern political geography's founding in the 1890s was one of burgeoning interimperial rivalry and arms races between a set of great powers that reached its twin peaks in the two world wars. This period gave rise to the political geography that privileged the role of physical geography and relative global location in determining or conditioning state prospects and limits. Major features of political geography during this phase included arguing for control over oceanic sea-lanes and articulating geopolitical pretexts based on the relative propensity of different states to expand.

The cold war from 1945 to 1991, with its emphasis on global ideological competition between two models of "modernity"—the democratic capitalism of the United States and the state socialism of the Soviet Union—initially produced a diminished interest in the study of political geography. The field as it had existed before World War II (1939–1945) did not seem to offer much food for thought in the new circumstances. Of course, the period did encourage freezing political boundaries and a seemingly permanent standoff between the two sides. Ideology, not geography, was what mattered. Nevertheless, even during this period, geopolitical claims to spheres of influence and the definition of *buffer states* between the two "sides" were important parts of the overall conflict. As the cold war slowly eroded, however, political geography underwent something of

a revival in the United States and elsewhere, as questions of state territoriality and electoral geography emerged from the long sleep of the postwar period. The social upheavals of the 1960s focused on civil rights and the Vietnam War (1959–1975) provide something of the context for this shift.

In the aftermath of September 11, 2001, a geopolitical context is emerging in which states, however mighty, confront shadowy networks of discontented and fanatic groups often based in *failed* or *quasi states*, following this or that utopian objective, often of a religious or ethnic nature. As this new world disorder—and other dimensions of it such as increased worldwide flows of money, goods, and people—take geographical shape, political geography can be expected in turn to change its shape to address the changes.

FROM NATURALIZED TO CRITICAL KNOWLEDGE

Political geography had a history before the term itself came into more widespread use in the 1890s. For example, the seventeenth-century Englishman William Petty's idea of *political arithmetic,* and his book *Political Anatomy of Ireland* (1672), are historical precursors of late nineteenth-century political geography. In mid-eighteenth-century France, Anne-Robert-Jacques Turgot used the term *political geography* to refer to the relationships between the facts of geography, seen as all physical and human features of spatial distribution, and the organization of politics. It is also apparent that many of the great figures in the history of political thought—from the ancient Greeks Aristotle and Thucydides to the early modern Florentine Machiavelli and later writers such as Thomas Hobbes, John Locke, Charles-Louise Montesquieu, A. R. J. Turgot, James Madison, Jean-Jacques Rousseau, Georg F. W. Hegel, and Karl Marx—had ideas about political territoriality and the effects of geographical location and access to resources on conflict and war. These ideas can be regarded as basic elements of political geography. They picked up on the practical realities facing political elites and offered their solutions in the context of the historical periods in which they lived. Thucydides's great work, *The Peloponnesian War,* concerns the two decades of war between Athens and Sparta (431–411 BCE) and forms the first example of use of the opposition between sea and land powers that later political geographers such as Halford Mackinder (1861–1947), in his famous work on control of the Eurasian heartland, used as a basic organizing principle of world politics.

The founders of modern political geography could therefore draw upon many centuries of relevant thought to inform their research and writing. Yet they were also creatures of their time. An important continuity across the early twentieth century is the naturalized understanding of knowledge that tended to dominate geography in general and political geography in particular. The university field of geography as a whole was invented in the late nineteenth century, in part, as an offshoot of the growth of national geographical societies devoted to exploration, collecting information about exotic peoples, and the opening up of foreign lands to commerce

or conquest (or both). The other part of its origins lay in detailed mapping and portrayal of the regions and landscapes of national territories. This allowed communication of the material basis of national identity in the burgeoning elementary schools of the era. In this respect, geography was one of a panoply of subjects with ancient roots that were reinvented under their old names to service the needs of statehood and empire-building: from anthropology's measuring of physical differences between human groups and literature's capture of national literary genius, to history's telling of distinctive and noble national histories. New fields such as sociology, economics, and political science acquired their own niches in the national service.

An increasingly prestigious and dominant thrust in all of the new disciplines, however, was toward a *naturalization* of knowledge claims. This is the tendency to want to explain human and social phenomena largely, if not entirely, in terms of natural processes, either physical or biological. In other words, scholars wanted to use processes assuredly not of mental construction outside the questionable "human" realm in which values, interests, and identities were all subject to divergent interpretations, and hence less amenable to "expert opinion." The German thinkers who initially dominated the field, such as Friedrich Ratzel (1844–1904), were particularly given to this sort of approach.

Naturalization of knowledge claims had two vital intellectual preconditions. One was the separation of the scientific claim from the subject position of the particular writer. Claims were made to universal knowledge that transcended any particular national, class, gender, or ethnic standpoint. So, even as a particular "national interest" was addressed, a perspective that put it into the realm of nature, rather than that of politics or society, framed it. This "view from nowhere" was by no means new, but it was very important to the new university fields in supporting their assertion of expertise and relevance to addressing the problems of the age.

The second precondition was preference arguments drawn from the natural sciences to explain social and political phenomena. Thus, Charles Darwin's principle of natural selection filtered down into popular culture, and into fields such as geography, largely in terms of the idea of survival of the fittest. This not only encouraged organic conceptions of nation-statehood (i.e., the state as a type of organism) but also stimulated ideas about racial competition, degradation, and dominion. Much of what passed for social Darwinism, however, was inspired by the older evolutionary ideas of Jean-Baptiste Lamarck (1744–1829). Compared to Darwin's reliance on variation over extended time periods, these were both more open to the immediate effects of the physical environment on social processes and, crucially, to the impact of *will*, or intervention, in creating more successful organisms. This allowed packaging seemingly contradictory elements into a single study, such as races as biological categories arrayed according to their superior "consciousness" for which there was no natural basis whatsoever. Such ideas were widely shared among elites, not least the new academic ones, across all of the great powers.

After World War II, such ideas began to fall into disfavor, particularly in the United States. There had always been those who thought such logic limited or fallacious. However, particularly in light of the way supporters of German and Japanese expansionism in the interwar period expropriated the term *geopolitics*—undoubtedly influenced in their reasoning by precursors such as Mackinder—political geography was tarred with the brush of a now defeated geographical determinism.

Political geography thus went into somewhat of a slump. It started to recover under two influences in the 1960s and early 1970s: One was the attempt to bring to bear classical concerns with territory back into political geography, but without the biometaphysical bias. Crucial to this innovation were such figures as the French American geographer Jean Gottmann (1915–1994) and his 1973 *The Significance of Territory,* and the Norwegian political sociologist Stein Rokkan (1921–1979) in a 1980 article titled "Territories, Centers, and Peripheries." The emphasis on state territories as the outcome of historically institutionalized and geographically variegated processes involving sovereignty claims and nationalism marked a break with previous biological conceptions of territory. Later work, such as Robert Sack's *Human Territoriality* (1986), both deepened appreciation for this contribution and extended it theoretically in new directions.

Another influence came from a revival of electoral geography, first explored by Andre Siegfried in France in the early 1900s, with its focus on geographical patterns of election results and what they said about how people came to vote in the ways they did. Kevin Cox, Ron Johnston, and Peter Taylor were particularly influential in this regard. This later developed into a more fully articulated connection between popular political views and the place settings or contexts in which people live, particularly as presented in John Agnew's 1987 *Place and Politics*. If the approach of Sack and others tended to intersect heavily with positive political theory, electoral geography related more to research in fields such as political sociology and political science. In both cases, however, knowledge was seen as the outcome of human agency rather than of the direct effect of natural process.

Perhaps the most important theoretical departures, however, date from the 1980s when, respectively, Marxist ideas about statehood and capitalism, and feminist and postmodern ideas about the discursive construction of geopolitics and political identities, acquired increasing influence. In identifying the central role of the state in global capitalism and the social construction of political identities as a process beyond the realm of what was conventionally considered "politics," these self-consciously critical approaches to knowledge called into question both the restriction of the "political" to a separate sphere and the independence of the state from broader economic and cultural considerations.

As a result, political geographers referred to the limits of thinking about states in purely territorial terms, argued for thinking about geopolitics in "critical" discursive terms, and refused to separate the economic from the political, although often with a tendency to privilege the former. Much of

political geography's renewal in the late twentieth century owes to factors including: explicitly normative critiques of the modern state system and the competitive war machines that drive it, proposals for transnational democracy, and increased attention to looming global environmental disasters for which the geography of existing political arrangements seems ill-prepared to respond.

CONTEMPORARY POLITICAL GEOGRAPHY

Three general approaches tend to dominate the field today even though the lines between them are not hard and fast. Indeed, more innovative research tends to work across them. The first, spatial analysis, involves the correlation of spatial patterns showing how a dependent variable, such as a vote for a specific political party, covaries geographically with various presumed independent or predictor variables. These variables include class, ethnicity, religion, and age. Stressing empirical data collection and analysis, this is akin to much of quantitative political science except, crucially, the emphasis is on how geographical variance fundamentally affects the nature of the correlations; closer locations are more highly related to one another than to more distant ones. Debates about important theoretical–methodological questions, such as the dependence of individual political preferences and behavior on spatial context (e.g., the local economy); the "levels" or geographical scales at which variance is more or less concentrated (i.e., whether differences are local or regional); and the clustering of different political phenomena (e.g., votes, riots, strikes, civil wars, territorial disputes, diffusion of different political institutions) in different places, tend to animate the approach. The popular idea of a United States divided up into so-called red and blue states reflects a primitive version of the notion that where one lives can have an independent effect on how one thinks and acts. This notion treats location as politically separate from simple demographic indicators added up irrespective of how they intersect in people's everyday lives in particular places.

A second approach more clearly commits to political-economic analysis that foregrounds the geography of uneven development at a variety of geographical scales—from the global to the metropolitan. From this viewpoint, geographical space constitutes a surface on which processes of capital accumulation and political resistance are inscribed but which also, over time, become embedded. These factors thus contribute to the difficulty of resolving inequalities in wealth and power between different places. The cycles of global economic expansion and contraction are seen as particularly influential in structurally shifting geographical patterns over time, as new places are incorporated and old ones shed their historic roles. By way of example, political parties can be viewed as arising to represent distinctive political-economic interests; these groups tend to cluster in different places because of the history of uneven development.

Finally, a third perspective tends to reject the overt rationalism of the first two perspectives. In a register that emphasizes the role of the observer, the world is seen as written about, rather than discovered or explored. Although writers under this rubric differ in the degree to which they see an "external world" as having an independent reality, the commonality is the rejection of the simple correlation and cause-effect relationships that are the basis to the other two. In a postmodern vein, language and discursive strategies become the focus. So-called critical geopolitics, for example, involves deconstructing the representational and communicative strategies employed by politicians in constructing foreign policy crises, situations, and wars. From this viewpoint, these things never "just happen." Some of the narratives help anchor national identities, whereas others relate to the global agendas of elites in pursuit of this or that interest or policy.

Political Law

The term political law refers to a growing branch of the study of the state and of governing that (1) compiles all the legal and other types of instruments dealing with the structure of the state and the processes of governing besides the constitution itself; (2) examines the interactions among law, public policy and administration, and politics; and (3) investigates the influence and impact of law on the other forces at work in democratic governing. Political law transcends the intellectual boundary between law and political science and draws on both social disciplines. In a related context, political law

describes the area of practice of some law firms addressing legal matters pertaining to statecraft.

RELATIONSHIP TO OTHER FIELDS

Political law is intrinsically linked, first, to constitutional law and administrative law. In another direction, political law clearly ties to political science and to public policy and administration. While it is related to these fields, it is conceived of as a self-standing, interdisciplinary, and comparative field of study of democratic governing—distinct from each of these sources.

Democracy is more than a system in which citizens elect their government through free and fair elections; rather, it is best understood as an entire regime of government in which public institutions are established and function on the basis of rules for the public interest. The most fundamental type of such rules is the law; thus, the cornerstone of democratic governing is constitutionalism and the rule of law. In democracy, every component of governing includes a legal aspect and law is an indispensable factor. In a modern state however, laws are not the only types of rules. Other rules emanate from public policy and administration; these are often based on the use of authority or discretion allowed by law. Yet other rules arise from politics and deal with the use of power allowed by law. The various types of rules are set out in instruments of governing and constantly interact.

Law, public policy and administration, and political science or politics all look at the state and at governing from within their respective fields. The essence of political law is that it analyzes the relationship among legality, discretion, and power through the use of the governing instruments emanating from each. Following developments over the last few decades, a number of academics have addressed the trends of the increasing legalization and judicialization of politics and the politicization of law, but most have continued to view law and politics as separate and parallel societal forces. Because the study of law and politics no longer seems adequate to address the social phenomenon, some scholars, including Canadian Gregory Tardi and American David H. Rosenbloom, have proposed political law as a new manner to look at the legal aspects of the state and governing. As governing comprises the selection and use of legal, policy, and political instruments, the approach now taken in *political law* thus goes beyond treatments of *law and politics*. Thus, a unified, integrated perspective on statecraft contributes to knowledge of the democratic state. The aim of political law is analysis leading to better understanding of the rule of law and of the role of law in democratic governing; it is not to propose a particular ideology.

The need for political law arises, first, from the incomplete vision that law, public administration, and political science each offer for statecraft. It is also meant, specifically, to address the difficulty in understanding democratic governing, arising from politically motivated challenges to the rule of law. One of the fundamental issues at stake is that democracy is flawed if it relies on political will to the detriment of the rule of law. In the context of such discourse, political law aims to shed light on the importance of the legal aspects of government and governing.

COMPILATION

The first necessary step in the study of political law is establishing its contents and parameters. While the traditional subject matter of constitutional law is well-known, the survey of legal instruments, other than the constitution itself, that deal with governing is far less common. In a modern state, the plethora of such instruments consistently increases in number and complexity. Study, analysis, and comprehension of the law of democratic governing requires not only that the relevant laws, regulations, orders, and jurisprudence be catalogued, but also that they are ordered in a way that is useful for looking at the structure and functioning of the state.

The legal elements of democratic governing can thus be enumerated in the following broad categories so as to subsequently enable study of their interaction, influence, and impact:

- defining the legal components of democracy;
- creating a legal framework for the electoral system and process;
- balancing law and politics in the legislature as a branch of government and in the legislative process;
- applying the general law to legislative institutions, and integrating the general law and the legal rules specific to legislative institutions;
- choosing legal or other instruments for governing;
- accommodating the law with other types of instruments to manage the executive branch of government;
- enforcing the law through legal means of electoral, political, or policy promises;
- determining whether and when the use of judicial process, litigation, prosecution, or judicial inquiry is warranted and appropriate;
- relative weighting of legal, policy, and political influences in staffing the judicial branch of government, in adjudicating judicial disputes public governing issues, and in prosecutions involving political issues;
- combining law, public policy and administration, and politics in the constant reform of government institutions and process.

This method of classification deliberately varies from the traditional categorization of subject matters (e.g., torts or obligations, contracts, property and civil status) in the study of law and is more suitably adapted for an interdisciplinary study of the state. These categories are thus more closely akin to a political science perspective on legislative, executive, and judicial functions of the state.

Bearing in mind that the legal instruments are not the only authoritative ones setting the norms, terms, and conditions of governing, an even more comprehensive survey could, to the extent possible, also comprise policy and administrative instruments such as governmental institutions' policies, guidelines, directives, and programs; as well as political instruments, such as government's annual or sessional declarations of intent; the budget; legislative branch committees or governmental

commissions' recommendations; and political parties' constitutions, platforms, and resolutions.

Compilation enables comparison and contrast of the characteristics proper to each type of instrument of governance. The ground for such comparison is the binding nature of each type of instrument. As their title indicates, legal instruments have the force of law and are therefore inherently binding. They entail necessary compliance, enforcement, and sanction in case of breach. Most important, legal instruments apply generally, as they impact the governors and the governed alike.

By contrast, policy and administrative instruments apply more particularly. Public institutions, rather than the legislature, determine these rules, designed to affect their own internal functioning and conduct. They are meant to be binding, but on a different basis, with different methods of compliance, enforcement, and sanction. Applying policy and administrative rules can be characterized as more limited than that of legal ones; they are subordinate to the law.

The political aspect of democratic governing is also not based solely on expediency. It also comprises rules and instruments, albeit more flexible and fluid than those of a legal or policy and administrative nature. The binding characteristic of political rules and the instruments that contain them is based on the use of power. It is therefore least binding of all. The essence of democracy still requires, however, that political instruments be subject to law.

Compiling instruments is also useful for mapping the evolution of issues over time. As topics arise in the public life of democratic states, they are often initially dealt with through politics, gradually becoming the subject matter of policy instruments and eventually becoming enshrined in legislation. For example, rules of ethics for public servants and parliamentarians often emerge first as policy admonitions to address individual circumstances. Over the course of time, sets of ever more complete and binding guidelines evolve, which eventually become formally legislated.

INTERACTION

Within the parameters of political law, one of the fundamental questions concerns the interaction among legal, policy and administrative, and political influences in democratic governing: How do law, public policy and administration, and politics interact in the work of legislators, elected public officials, and appointed public servants? A certain number of criteria come into play in the attempt to respond to this question.

Based on the doctrine of the rule of law, the most important criteria in the analysis of this interaction are the objective ones. The constitution, the laws, regulations, orders, and jurisprudence are independent of politics, inherently applicable and determinative of the issues they rule. Legality should therefore be given primary consideration. Whatever the permutations of any fact pattern, the adage that ignorance of the law is no excuse always applies. In democracy, all those in public life are deemed to be aware of, and knowledgeable about, legal rules and instruments, even if only through the advice of counsel. There can be no democracy without legality.

Criteria are also necessary to take account of the characteristics of public policy and administration, and political rules and instruments. This includes examining whether other rules and instruments, less binding than legal ones, exist to deal with the issue at hand. If they do, the interaction among the various types of rules is greatly affected by whether the relevant instruments of different types are complementary or conflicting.

While the professional obligation of everyone involved in public affairs is alternatively defined as "life, liberty, and the pursuit of happiness" in the United States or as "peace, order, and good government" in Canada, every individual undertakes one's own tasks in the public domain on the basis of a personal background. Subjective criteria therefore also play a large role in the interaction of the instruments as applied and administered. The most prominent factors include personal beliefs and political ideology, education, profession and professionalism, secularism, attitudes vis-à-vis the state and democracy in general and for any particular issue. Even when a legislator or an official objectively accepts the primacy of law, these subjective personal influences affect the individual in determining whether and how to interpret, weigh, and apply the law. One of the aims of pure democracy is to restrict the importance of subjectivity in public decision making, but such subjective criteria cannot be eliminated from human nature.

A set of criteria closely related to subjectivity is loyalty both to democracy and to the ideal of the rule of law. Going beyond the personal considerations, a public official's acceptance or rejection of legal goals, requirements, and norms greatly influence the interaction of law, policy and administration, and politics. Often, such acceptance, circumvention, or avoidance reflects the struggle between loyalty to a particular institution and willful adherence to democratic forces and the rule of law. This dilemma can be prevalent in institutions with a strong, self-enclosed, or hierarchical *esprit de corps,* such as the armed forces and the police. It may also be prevalent in processes for legally mandating disclosure of state information that may be considered detrimental or embarrassing to one's institution. In this context, freedom of, or access to, information has become a powerful tool in supporting not only legality in government, but even more extensively, for supporting democracy itself. Custom, established practice, precedent, and administrative inertia thus act as restraints on legality.

The specific facts of any issue at hand also affect the interaction among the various types of instruments used to deal with the issue, as does the environment of the case. Observers must look at the significance of the issue to the government of the day, to the citizenry, and to the electorate. The more difficult the resolution of an issue is perceived to be by public decision makers, the greater the potential for conflict among the law, the brokerage of institutional authority, and the use of power. Similarly, the more urgent, controversial, or divisive an issue, the greater is the strain against legality and in favor of other forms of resolution.

A further set of criteria relates to public decision makers' risk assessment. In modern democratic systems, legislative time is scarce and energy is difficult to marshal. Resort to litigation,

while popular in some countries, is increasingly expensive. Resolution of issues through legal rules and instruments involves formalism and greater distinction among options than resort to policy and administrative or political ones. Moreover, the risk of noncompliance with existing legal instruments is greater than noncompliance with other types of rules. By contrast, resolving public issues and problems through rules and instruments other than law is often perceived as more flexible, alterable with time, cost-effective, and low risk (in case of breach). Accommodation and negotiation are thus often more viable alternatives than using the law.

Examining the criteria that influence the interaction of legal instruments with other types of rules and governing instruments invites additional questions that are fundamental to a better understanding of democracy. First, is law a source or a consequence of governmental decisions, or both, or sometimes one and sometimes the other, depending on circumstances? Second, is law a goal in itself in democracy, a means to an end, or both, or sometimes one and sometimes the other, depending on circumstance? The answers to these broad underlying questions are likely variable on a case-by-case basis, much like applying the criteria for the interaction of types of instruments.

INFLUENCE AND IMPACT

Examining the interaction among law, public policy and administration, and politics enables observers to gauge the rule of law and to affirm its role as a factor in the conduct of governing. By contrast, examining the influence and impact of legality affords the opportunity to assess whether and to what extent the rule of law is actually applied in the state, or the extent to which law plays a role in governing.

What is the evidence of law's influence and impact? In short, it is the consistent practice of democratic legality and the presence or absence of residual legal dispute. Governments, political parties, voters, and citizens all hold views on how the state should function and on various issues of public life. Most often, these views are founded on belief, ideology, experience, self-interest, and other factors, rather than on points of law. Resolving and accommodating the divergent views held by public actors in government, and in society, can often be achieved through politics and sometimes by means of instruments of public policy and administration. However, in states adhering to the rule of law, when stresses and conflicts in public society cannot be resolved by other means, the law is the last resort—thus demonstrating the importance of the rule of law as the cornerstone of democracy; the law can be seen as the final arbiter of disputes relating to governing.

In democratic states, the influence and impact of legality means that enacting legislation or rendering a final judgment in litigation is more determinative of an issue than any other form of public decision making. This does not mean that a statute or a court judgment definitively resolves every public debate and controversy. Issues of public governing evolve over time and often continue or reemerge. The use of law does mean, however, that in a democracy, at the time a decision of

a legal nature is made, it is more formal and public, it is better reasoned and justified, it is more likely to be definitive and permanent, and it is perceived by the state and by the citizenry as being more resolutive than if policy and administrative or political resolutions had been achieved. The evidence of law's influence and impact comes from systematic observation of state practice. Observers must look to see in what instances laws are enacted. On what occasions is litigation conducted to its end? More generally, by what means, how permanently, and how extensively are issues of public affairs resolved in a legally valid manner?

This portrayal of the rule of law's impact and influence must be put in further context. If the role of law was less, and if the law did not rule with primacy over other types of instruments, what would be the alternatives? Rule of administrative fiat, rule of power, rule of ideology, rule of class, and an absence of any rule are all possible models for a state. Indeed, there are states that, in the early twenty-first century, espouse each of these ways of governing, but only rule by law provides the circumstances necessary for democracy to flourish.

States that consistently make governmental decisions on the basis of their so-called vital national interest, to the exclusion of legal norms and standards, seek to justify their actions on the basis of the doctrine of *raison d'état*. Democracy requires, rather, that states apply a doctrine that could be entitled *raison de droit*—a legal imperative, in order to retain their democratic nature. Indeed, raison de droit is the necessary requirement for there to be an *état de droit*. This requirement holds true whether a state espouses the doctrine of the rule of law, of état de droit, or of *Rechtsstaat*.

While it is incontestable that democracy requires the influence and impact of law to be greater than that of the other types of instruments, it is also important to have a wider perspective on the proper role of law in governing than the true claim of democratic theory that legality is primarily a restraint on the use of governmental power. Law is, and ought to be, perceived in a more positive fashion as a vehicle for the proper use and application of power by the state. Legality does not block the use of power; it channels it. There is greater danger for democracy in government's nonobservance of the law than in government's too strict adherence to the law. This also entails that law cannot displace public policy and administration or politics. It is best used by government as its most important, but not sole, type of instrument.

ACCOUNTABILITY TO LAW

All those involved in governing must draw two conclusions from analyzing the interaction of law with the other types of instruments of governing, and also from examining the influence and impact of law on these instruments. The first is that as a system of rules and instruments, law differs from both policy and administration, and from politics, in that it is compulsory rather than optional. Public officials may not choose to apply the law or ignore it at will, without entailing legal consequences. The second is the general application of law. Legal rules regarding public institutions are as applicable to

the state itself, to its institutions, and to its officials as are those upon citizens that aim to regulate their conduct. An integrated manner of expressing the duty of those involved in governing flows from these conclusions: as a core part of their professional mandate, all public officials owe accountability to the law.

First, this is a matter of democratic principle. Moreover, it is also a matter of quid pro quo. In current times, popular culture places great emphasis on the civil and political rights of citizens. Both within the internal logic of legal systems and in terms of political analysis of the state, it must be underscored that rights cannot exist without commensurate obligations. Thus, if citizens or voters have civic and political rights, the public officials who operate the state owe their citizens civic and political obligations commensurate to their rights.

This accountability comprises several elements. The most obvious is respect for legal rules, norms, and standards in the face of policy and administrative convenience and necessity, and in the face of political will. Furthermore, all public officials are required, either on their own or on the basis of the advice of counsel, to have some basic knowledge of those elements of the legal system that relate to their work. Likewise, in order to apply the primacy of legal instruments, they need to have sufficient awareness of, and sensitivity to, the role of law vis-à-vis other types of instruments that guide the execution of their tasks. Ideally, public officials should also voluntarily and willfully abide by established legal norms to be proactive in their compliance with the law. The fact that officials occasionally do not fulfill these requirements is one of the factors leading to litigation. A positive application of the role of law depends on a perception of legality as an organizational factor of the democratic state and for governmental action, rather than as a hindrance to the achievement of political or partisan goals. Finally, senior officials have the obligation to make their subordinates responsible to the rule of law.

As part of the notion of accountability to law, government lawyers who are bound by these obligations have an additional duty. They must integrate their legal advice into the public policy and administration plans and into the political projects devised by government, as fully as feasible.

Political Network Analysis

Political networks are defined as all those networks that are politically relevant. Networks are specific types of relations (e.g., communication, support, influence, command and control, self-organization, persuasion, coalition, trade flows) between actors—individual, collective, corporate, private, public—and between actors and objects (e.g. issues, court sentences, committees, candidates, events), and between objects (e.g. semantic networks, cognitive maps). *Politically relevant* means that the contents of these relations refer to collectively binding decisions—be it in the pre- or postdecision phase. Hierarchies, markets, as well as any other governance form of self-organization can be conceived as networks. The analytical divide is, therefore, not between hierarchies and networks, but between different network structures representing politico-administrative hierarchy and self-organizing networks.

Public network analysis (PNA) accentuates the interdependent nature of individual expectations and choices—instead of assuming atomistic actors. Instead of reifying macrophenomena, it traces the microfoundations of their often unintended emergence. Thus, PNA focuses on the structure and dynamics of networks of individual actors (so-called ego-centered networks), of whole systems, as well as of subgroups within systems.

EVOLUTION OF POLITICAL NETWORK ANALYSIS IN POLITICAL SCIENCE

For years, sociology and graph theory nearly exclusively provided a constant inflow of network concepts to be applied in political science. Most of the early work remained descriptive—such as

centralities, subgroups, or connectivity—rather than hypothesis testing, which entails networks as dependent and independent variables, respectively. Since the 1990s, several new trends cross-fertilized network analysis in political science. Some of these trends include theoretical progress in physics and informatics, availability of analytical statistical procedures and respective software packages, and availability of large-scale data sets. PNA is meanwhile an acknowledged original pacemaker in applied network analysis. New questions include: how do multiple networks (e.g., trade or organizational membership) interact and coevolve? How do networks emerge as the result of stochastic individual choices? Which impact does the specific structure of networks have on diverse dependent variables (e.g., individual choices, organizational performance, international conflict)?

In his 1955 dissertation, Peter M. Blau, one of the forgotten pioneers in PNA, recorded the informal pattern of collaboration and communication in two government agencies. This type of network analyses of public administrations is a precursor to quantitative, partly large-scale comparative studies on the structure and performance of administrations, relating them to formal and informal organizational features.

In retrospect, electoral research, community studies, and international relations (IR) applications proved to have the most extensive impact on the development of PNA. Inspired by the group approach of the Columbia school of electoral research, Robert Huckfeldt and collaborators translated its implicit research program into a veritable network approach to voting behavior. In their famous 1995 South Bend study, Huckfeldt and John Sprague were able to determine the impact of discussion networks on voter turnout and voters' choices. Their main research questions still continue to inspire current investigations, for example, under which communication structures persuasion is effective, and why preferential disagreement and opinion diversity persistently occur. More recently, the increasing complexity of these research questions (i.e., varying heterogeneity of environments, varying credibility of discussants, varying network structures) led to new designs requiring the application of laboratory experiments and agent-based simulations.

The other influential stream of research has been community power and community influence studies. One of the most prominent studies was Edward Laumann and Franz Pappi's 1976 analysis of community decision making in a small German town. The study detected closed subgroups, such as cliques, that were considered able to act collectively.

This type of local policy studies successively extended to the national and the international level, inducing a series of theoretically, as well as methodically, more elaborated quantitative policy case studies. Edward Laumann and David Knoke's 1987 pathbreaking study on the U.S. energy and health policy in the Carter era during the late 1970s took into account the whole set of relevant organizations in order to detect the differing structures of so-called policy domains. Thus, PNA allows context-specific fluidities and dynamics of policy making and precludes popular reifications.

Analytical questions focused on the comparative causal impact of factors like relative interest, with regard to issues versus network position for involvement and mobilization effectiveness of the organizations. Identification of central groups, the specific structure of conflict, the detection of differently institutionalized coordination patterns, and the explanation of outcomes are only few of the many targeted research objectives. Meanwhile, availability of process-produced data led to ingenious and sometimes spectacular new perspectives. In this respect, James Fowler conducted one of the most stimulating analyses in 2006. Fowler investigated the whole cosponsor network of legislative proposals in U.S. Congress for the period from 1973 to 2004. Thus, it is possible not only to depict the most influential legislator, but also cross-validate the impact of the connectivity of the resulting network on roll call choice.

For the area of international relations, in the 1960s Steven J. Brams had already proposed to take the prominent system concept seriously, and to operationalize it via PNA. In his sophisticated 1966 study, he investigated three different kinds of transaction flows: diplomatic exchanges, trade, and shared memberships in intergovernmental organizations. Numerous follow-ups in the next two decades tried to identify the block structure of international trade in order to detect dependency structures and sources of international inequality. Only more recent studies used the emerging international network structures as the independent and dependent variable, respectively (e.g., in order to explain the formation of transgovernmental networks or to predict militarized interstate conflict). Meanwhile, IR seems to be the most dynamic sector in inventing new research questions related to issues such as terrorism and counterterrorism, proliferation, alliances, and fungibility of different sources of power and designs.

Political Obligation

The term political obligation generally means a moral requirement to obey the laws of one's country. Such a requirement must encompass more than self-interested or prudential considerations, especially concern that one will be punished for violations. In addition, political obligations are generally viewed as requirements to obey the law because it is the law, that is, because of the authority of the lawmaking body as opposed to the content of particular laws.

HISTORY

Throughout much of the world and for much of Western history, the dominant view has been that political authority is part of the God-given or natural order, simply to be obeyed. Ideas along these lines dominated medieval Europe, based especially on the belief—forcefully expressed in Chapter 13 of St. Paul's *Epistle to the Romans*—that every soul must submit to political authorities, which are instituted by God.

Questions of political obligation assumed a central role in Western political theory in roughly the sixteenth century, with the rise of liberal political theory and its criticisms of what were viewed as unjust governments. Within the liberal tradition, obligations have been traditionally believed to be rooted in the consent of the governed, which is closely related to the theory of the social contract or contract of government, into which citizens supposedly entered upon leaving the state of nature. Opponents of political authority commonly argued that if individuals have not consented to government or if the conditions of their consent have been violated, political obligations either do not exist or cease, and resistance is justified.

CONSENT THEORY

In the locus classicus of consent theory, *The Second Treatise of Government* (1689), John Locke argues along these lines, in order to justify resistance to the English monarchy. Strongly affirming individual freedom, Locke argues that political authority can be based only on consent—and the consent of each individual, as opposed to a one-time agreement at the founding of society. Locke recognizes that few members of society have "expressly" consented to government. He therefore introduces a doctrine of *tacit consent*, according to which individuals can incur obligations through additional means, such as owning property in the community or merely being within the state's territory. However, David Hume called tacit consent into question in his essay "Of the Original Contract" (1752). Hume argues that poor peasants, who know only the language and customs of their own country and are without financial resources, lack the means to leave their own country for another. Because they do not voluntarily choose to reside in their own countries, continued residence can hardly constitute consent.

Since Hume's time, theorists have struggled to explain how people have consented to government. A range of additional actions have been proposed as constituting consent, such as voting or otherwise taking part in the political system, but all of these are subject to criticism. In the late eighteenth century, Immanuel Kant achieved a considerable theoretical advance in viewing the contract of government as purely hypothetical, rather than an actual historical occurrence. According to this line of argument, the decisive consideration is that one *would* consent to government, if given the opportunity.

CONSEQUENTIALISM

With actual consent called into question, theorists have attempted to provide other bases for political obligations. The *consequentialist*, or utilitarian, tradition, epitomized by Jeremy Bentham, bases requirements to obey on the benefits of obedience. According to this approach, people are bound to obey the law in most cases, even though they have not agreed to do so, because a smoothly working society requires obedience. However, this account has difficulties requiring the compliance of given individuals. In many cases, the consequences of some individual's disobeying the law are undetectable, while the individual receives tangible benefits from disobedience. Consequentialist reasoning, then, will often require that people disobey.

RECENT DEVELOPMENTS

In the light of problems with consent and consequentialist explanations, scholars have introduced additional lines of argument to account for political obligations. Recent years have witnessed new theories of obligations based on principles of consent and also gratitude, while additional arguments have been developed based on a so-called natural duty of justice and, simply, the fact that one is a member of a given community. In 1955, H. L. A. Hart developed an influential line of argument based on the principle of fairness, or fair play. According to this view, if individuals receive benefits from the cooperative efforts of others, it is only fair that they make similar sacrifices themselves. Since everyone benefits from general obedience to the law, it is only fair that everyone obeys as well.

So-called philosophical anarchism has also highly influenced contemporary debates about political obligation. Unlike traditional anarchists, such as Mikhail Bakunin, who

declare themselves enemies of the state, these theorists support much that the state does, in spite of the absence of requirements to obey the law because it is the law. Although they reject political obligations, they argue that the state may still be *legitimate*, that is, justified in taking morally appropriate actions. These theorists argue that questions of obedience should be decided on a case-by-case basis. They contend that there are moral reasons to obey many laws, not because they are laws but because of the benefits of obedience, mainly so as not to harm or inconvenience other people.

In recent years, scholars have increasingly questioned the need for political obligations in the traditional sense. Many scholars now agree with the philosophical anarchists about the importance of distinguishing between a state's having *legitimacy* and *authority*. As noted, the former refers to the state's ability to take morally appropriate action, for instance, to aid people in need or to punish moral malefactors. Although in pursuing these tasks, the state cannot claim rights to anyone's obedience merely because it passes laws; people are morally required to comply with specific laws because of the value of the laws themselves. Authority adds to legitimacy the state's right to claim obedience because it commands this, without appeal to other moral considerations. These scholars argue that authority is not necessary, and that important state functions can be accomplished without political obligations in the traditional sense.

In spite of the influence of philosophical anarchists, scholars have come to criticize their approach. Theorists skeptical of political obligations generally proceed by criticizing the traditional theories from a particular perspective, examining and rejecting them *seriatim,* one after another. What this strategy overlooks is the possibility that general reasons to obey the law can be established by combining different principles, and thus overcome the weaknesses of theories based on a single principle. As scholars have moved away from traditional conceptions of political obligation, the future of the subject has opened to new possibilities.

Political Participation

Citizen participation is essential to democracy. It is difficult to imagine stable, ongoing democracy on a national scale without the citizens' right to vote for their political leaders and to take part freely in politics in many other ways. Through their political participation, citizens have an opportunity to control who will hold public office and to influence what policy makers do when they govern. When they are active politically, citizens in a democracy communicate information about their preferences and needs and generate pressure on public officials to respond.

THE AMBIGUOUS BOUNDARIES OF DEMOCRATIC POLITICAL PARTICIPATION

Voluntary political participation refers to citizen activity that has the intent or effect of influencing government action, either directly by affecting the making or implementation of public policy, or indirectly by influencing the selection of people who make those policies. Citizens in a democracy who wish to have an impact have a variety of participatory options. They can communicate their concerns and opinions directly to policy makers, for example, by signing a petition, joining an organization that advocates on behalf of issues of concern, sending an e-mail, or attending a demonstration. Alternatively, they can seek to affect policy indirectly by influencing electoral outcomes by voting or supporting a favored party or candidate. As they engage in such activities, they can donate, on one hand, money, or, on the other, time, brains, and sweat. They can use conventional techniques or protest tactics. They can employ a variety of media ranging from face-to-face conversations to electronic means, including the Internet, to communicate with other activists or with public officials. They can work locally, nationally, or, increasingly, transnationally with others or on their own, in an informal effort or in the context of a formal organization.

Each of the three defining components of the domain of behavior known as voluntary political activity has porous, ill-defined borders with the result that the definition itself is contested territory. First, with respect to the *political* nature of this domain of endeavor, it is essential to recognize that the distinction between political and nonpolitical activity is by no means clear, and voluntary activity in both the religious and secular domains outside of politics intersects with politics in many ways. For one thing, because voluntary associations and religious institutions often take stands on public issues, organizational and religious activity can themselves be forms of political participation. In addition, participation in these spheres is, in many ways, a politicizing experience. Those who engage in voluntary activity outside politics may develop organizational and communications skills that are transferable to politics; they may make social contacts and, thus, become part of networks through which requests for participation in politics are mediated; they may also be exposed to political cues and messages—as when a minister gives a sermon on a political topic or when organization members chat informally about politics at a meeting. In addition, even those who engage in conventional participatory techniques may not be animated by political concerns, but may instead make a campaign donation to satisfy a friend who asked, attend a demonstration to have fun, or join a labor union to acquire job benefits rather than to support its political stands.

Furthermore, some activists deliberately choose extragovernmental means for seeking to achieve public purposes. They might take public positions aimed only indirectly at policy makers, for example, by wearing a political button, displaying a bumper sticker with a political message, writing a letter to the editor of a newspaper, or calling a radio talk show. Although not targeted explicitly at government officials, such acts have the purpose not only to express opinion, but also to persuade others and, thus, indirectly influence public outcomes. Some activists circumvent the governmental sphere entirely. For example, they may volunteer in a social service agency that aids the needy rather than press the state to deliver such assistance. Or, in an era when the behavior of multinational corporations may be regulated by many governments or none at all, some may engage in political consumerism, that is, deliberately make purchases, or refuse to make purchases, from a company on the basis of its employment practices or environmental sensitivity.

Activity that is *voluntary* is not obligatory and receives, if any pay at all, only token financial compensation. Once again, both aspects of the definition contain ambiguities. For one thing, the boundary between choice and coercion is indistinct. When a request for participation accompanies leverage—for example, when it comes from the boss—the boundary of the voluntary may be breached. Similarly, the distinction between voluntary activity and paid work is not always clear. It is possible to serve private economic purposes through social and political activism. Many people seek to do well while doing good, undertaking voluntary activity for which they receive no compensation in order to make contacts or otherwise enhance their careers, or to pursue policy goals with consequences for their pocketbooks.

Finally, with respect to *activity,* it is sometimes difficult to distinguish the point at which actually doing politics shades into being attentive to politics. Thus, working for a party or attending a peace march are clearly political acts. However, the line is not as clear for private communications, such as engaging in political discussions with friends or attempts to acquire political information by, for example, following political events on the Internet or watching public affairs programs on television.

THE IMPORTANCE OF DEMOCRATIC PARTICIPATION

Discussions about democratic participation, and civic engagement more generally, are ordinarily conducted as if the reasons why it matters are self-evident. There are three broad categories of reasons for caring about levels of political activity: the creation of community and the cultivation of democratic virtues, the development of the capacities of the individual, and the equal protection of interests in public life.

First, political participation, and voluntary activity more generally, have implications for community and democracy. Those who make this argument stress several themes. When people work together voluntarily, whether for political or nonpolitical ends, democratic orientations and skills are fostered: social trust, norms of reciprocity and cooperation, and the capacity to transcend narrow points of view and conceptualize

the common good. Thus, when there is a vigorous sector of voluntary involvement—and the strong associational foundation that underlies it—it becomes easier for communities, and democratic nations, to engage in joint activity and to produce public goods. Communities characterized by high levels of voluntary activity are, in many ways, better places to live: the schools are better, crime rates are lower, and tax evasion is less common. Moreover, a vital arena of voluntary activity between individual and state protects citizens from overweening state power and preserves freedom. Those who are concerned about declining rates of civic participation in democracies emphasize these multiple beneficial consequences for politics and society.

The other two reasons for concern about levels of political participation shift attention from social benefits to individual benefits. Not only does the community gain when citizens take part but, as John Stuart Mill pointed out, individuals grow and learn through their activity. Political participation builds individual capacities in several ways: those who take part learn about community and society; they develop civic skills that can be carried throughout their lives; they can also come to have a greater appreciation of the needs and interests of others and of society as a whole.

The third rationale for concern about civic engagement acknowledges the conflicting interests of individuals and groups, and focuses on equal protection of interests. Through the medium of political participation, citizens communicate information about their preferences and needs for government action, and apply pressure on public officials to heed what they hear. Of course, public officials in democracies act for many reasons, only one of which is their assessment of what the public wants and needs. In addition, policy makers have ways other than the medium of citizen participation to learn what citizens want and need from the government. Nonetheless, what public officials hear clearly influences what they do.

The emphasis on equal protection of interests raises somewhat different questions than those raised by a focus on the nurturance of community and democracy, or on the development of the individual. First, the cooperative voluntary activity that promotes community and democracy, or fosters individual faculties, need not be explicitly political. In contrast, when equal protection of interests is at stake, the voluntary activity that counts is necessarily political. Furthermore, when it is a matter of the cultivation of democratic habits or the education of individuals, the aggregate quantity of civic engagement is critical. Questions of representation arise when moving from a conception of congruent community interests to one of clashing individual and group interests and, thus, to a concern with equal protection of interests. What matters is not only the amount of civic activity but its distribution—not just how many people take part but who they are.

QUANTIFYING POLITICAL ACTIVITY

Because the relevant surveys vary in terms of the number of countries and number of political acts they cover, it is difficult to make ironclad generalizations about levels of political participation across all democracies and all forms of political

activity. Nevertheless, it is clear that, for most citizens, political participation is episodic and relatively infrequent. Across democracies, there is only one political act, voting in national elections, in which a majority consistently takes part. For other kinds of participation, minorities of differing size are involved. More common participatory acts include signing petitions, contacting politicians or civil servants, and boycotting. Much less frequent are activities such as working for a political party or taking part in a protest, especially an illegal one.

Not only are there differences among activities, but there are also differences among polities with respect to the frequency of political participation. A nation's ranking with respect to the most frequent political act, voting, is not necessarily a good predictor of how politically active its citizens are when it comes to taking part politically in other ways. For example, the United States and Switzerland are widely observed to have both frequent elections and relatively low levels of voter turnout, but rank high when it comes to other forms of political participation. In contrast, one nation with compulsory voter participation and a high rate of electoral turnout, Italy, does not have notably high levels of nonvoting activity. In general, the Scandinavian countries and the Netherlands tend to have high rates of participation across the board. Reflecting a variety of factors, some individual countries have relatively high rates of particular participatory acts. For example, France has a long-standing tradition of direct-action participation and ranks higher with respect to protest than it does to more conventional varieties of political activity. With a distinctive electoral configuration that includes weak parties, candidate-centered campaigns, and an absence of public financing, Americans are much more likely to make campaign contributions than are citizens elsewhere.

One area of controversy is whether there has been erosion in political participation over the last generation in stable, advanced democracies. According to one perspective, civic life in many countries has been characterized by a diminution in a variety of kinds of voluntary activity—not only political but also religious and secular nonpolitical—in particular among younger citizens. An alternative point of view stresses transformation rather than simple attenuation. Especially among the young, the mix of participatory acts has shifted to reflect decreased emphasis on addressing public problems through governmental action and, thus, a greater role for such forms of activism as political consumerism. A development with particular potential for altering the nature and volume of political participation is the Internet, which lowers the cost of acquiring political information and communicating with large numbers of people including like-minded citizens and public officials. While the full meaning of the Internet for citizen politics continues to unfold, it is clear that its impact will be much more substantial for new citizens than for their elders.

ACCOUNTING FOR DIFFERENCES IN INDIVIDUAL PARTICIPATION

Using multivariate statistical techniques, political scientists—especially in the United States where a number of detailed surveys of participation have been conducted and a deep federal tradition implies considerable variation in institutional arrangements—have had some success in explaining individual differences in activity. These inquiries demonstrate that, in the United States, the origins of political participation are complex and involve a variety of individual and contextual factors and that different kinds of participatory acts require different explanatory models. For example, strength of partisanship has a more substantial effect on voting than on getting involved in a community problem-solving effort. Income is also much more strongly related to campaign giving—and, in particular, to the size of the gift—than to working in a campaign. In addition, educational attainment matters more for contacting a public official than for protesting.

Models seeking to account for why Americans choose to take part in politics include a large number of individual characteristics as explanatory factors. Among them are such resources as time, money, and civic skills—those organizational and communications capacities that make it easier to get involved and that enhance an individual's effectiveness as a participant. In addition, several psychological orientations facilitate political activity. All else equal, individuals are more likely to participate if they are politically informed, interested, and efficacious, that is, if they know and care about politics and if they think that their participation would make a difference. Moreover, those who have intense issue commitments—for example, those who take a strong pro-life or pro-choice position on abortion—are, not surprisingly, more politically active. Furthermore, recruitment plays a role in political participation: those who have the wherewithal and the desire to take part in politics are more likely to do so if they are asked. Requests for political activity may come from politically motivated strategic elites such as party activists; from the leaders and staff of nonpolitical institutions; or from those who are familiar—relatives, friends, neighbors, coworkers, fellow organization or church members.

Studies of political participation across polities find an association between political activity and socioeconomic status—that is, income, occupation, and, especially, education. This association is particularly strong in the United States, where labor unions are weak and there is no social democratic or labor party to mobilize those of limited income and education into politics. Studies of political activity in the United States demonstrate why education is so central to the participatory process. Not only does education have a direct impact on political activity but, more importantly, education also has indirect effects through its consequences for the acquisition of nearly every other participatory factor. The well educated earn higher incomes on the job; are more likely to develop civic skills at work, in organizations, and, to a lesser extent, in church; are more likely to receive requests for political activity; and are more politically interested and knowledgeable.

With respect to the most common form of citizen participation, voting, the substantial cross-national variations in electoral turnout suggest that attention must be placed not only on the attributes of individuals, but also on the participatory consequences of electoral laws and arrangements. Many

practices not in place in the United States—among them holding elections on Sundays and, especially, making voting compulsory—are associated with higher levels of turnout. Within the United States, studies use the states as laboratories to consider various electoral reforms designed to raise turnout: among them, easing the requirements for registration and the casting of absentee ballots and permitting mail-in ballots and other forms of early voting. A number of institutional reforms have shown to have a positive, though modest, impact on turnout. Less permanent aspects of the political context also have potential consequences for participation. It is well-known that turnout is higher when there is a presidential contest at the top of the ticket. In addition, having attractive choices on the ballot seems to raise voter participation. Otherwise, empirical inquiries reach no consensus on how such attributes of elections as competitiveness, negative campaigning, or levels of campaign spending affect the propensity to go to the polls. Moreover, even when the context of electoral characteristics is favorable, turnout in the United States does not approach the levels that are common in other developed democracies.

IDENTIFYING CITIZENS ENGAGED IN COMMUNICATING WITH PUBLIC OFFICIALS

The processes by which people come to take part imply that, taken together, activists are in various respects not representative of the public and, thus, that public officials are disproportionately likely to hear from people with certain politically relevant characteristics. Across democracies, participatory input may be stratified not only by socioeconomic status but also by race or ethnicity, gender, age, and immigration status. Although there are variations across polities and across particular political acts, those who have high levels of socioeconomic status, men, members of the dominant racial or ethnic group, and the middle aged are especially likely to be politically active. It is often possible to account for such group differences in terms of disparities in such participatory factors as education and income, or political orientations such as political interest, information, and efficacy. However, understanding the origins of group differences in participation does not put the matter to rest. Knowing, for example, that disparities in participation among ethnic groups within a particular polity stem not from ethnicity per se but from group differences in participatory factors, most of which are rooted in class, does not obviate the fact that policy makers are hearing less from members of ethnic minorities. Members of such ethnic groups may have distinctive political preferences and participatory agendas: they may differ in their opinions on public matters and, when they are active, they may be concerned with a different mix of issues. That the sources of these group differences in activity lie in characteristics other than ethnicity does not vitiate the political significance of disparities in participation.

The same logic obtains for participatory differences rooted in groups defined by gender, class, age, or such politically relevant characteristics as dependence on government benefits.

Although policy outcomes inevitably hinge on many factors, only one of which is what policy makers hear from citizens, when the messages to public officials are skewed, then the democratic norm of equal responsiveness to all is potentially compromised.

Political Parties

Political parties have been described as the core institutions of democracy and necessary for its flourishing. Such claims echo earlier statements about democracy as unthinkable without parties. Even if the way in which parties function has received severe criticism, there is also a widespread consensus that parties are necessary and that it is difficult to imagine democracy without them. Hence, representative democracy has become the norm and a decline of parties is seen as detrimental to democracy.

Understanding of what is meant by a party must be established before entering the debate on whether and how parties

have changed. A minimal concept of a party entails a certain level of organization, a more or less coherent program, and a procedure to select representatives. A number of functions can then be added to this. These, however, are not strictly necessary to speak of a party, yet this does not imply that a party is explained from the functions performed, or its absence if certain functions are not performed. Most authors mention recruitment, aggregation, and mobilization as functions. In addition, parties have to find a balance between the goals of votes, office, and policy. This would mean that a party typically is defined by these goals simultaneously: winning elections, gaining representation, and being in government.

DEFINING PARTIES AND THEIR FUNCTIONS

One of the oldest and most famous definitions of party is that of Edmund Burke: "Party is a body of men united for promoting by their joint endeavours the national interest upon some particular principle in which they are all agreed" (40). Burke importantly assumes that parties strive for the same goals (i.e., the national interest), and only differ on the policies to achieve this. Taking this one step further, Anson Morse argues that a party advances "the interests and realisation of the ideals, not of the people as a whole, but of the particular group which it represents" (91). Hence, contrary to Burke, Morse claims that parties pursue their own objectives. These objectives are, first, distinguishing themselves from their competitors and, second, gaining a large share of the popular vote.

The well-known critiques of parties from Moisey Ostrogorski and Robert Michels give another twist to this debate on general versus specific interests. Both authors focus in particular on how parties operate as organizations and with what effects. Michels's description of the elitist and oligarchical tendencies within parties, or Ostrogorski's depiction of the vicious influence of the party "machine" and the caucus imply that parties evolve in such a way that the interests of the masses make way for the particularistic and narrow interests of the few.

After World War II (1939–1945), the discussion on the nature of parties reemerged, but it was more oriented toward conceptualization—especially the necessary features to speak of a party. This led to various typologies of parties and party models. For instance, Otto Kirchheimer's *catch-all* concept largely focused on the characteristics of mass parties, whereas Maurice Duverger distinguishes between *membership parties* and *cadre parties*. More recently, other types of parties have been put forward, like *cartel parties* and *business-firm parties*, where membership is less important and resources are derived from state subsidies or individual donations.

Joseph La Palombara and Myron Weiner define parties by a certain level of organization (locally and nationally) and by their office-seeking and vote-seeking characteristics. They distinguish the modern party from the "cliques, clubs and small groups of notables" (8) that can be identified as the antecedents of the modern political party. This combination of organization and programmatic goals is also found in Richard Rose's work, identifying a party as "an organization concerned with

the expression of popular preferences and contesting control of the chief policy-making offices of government" (3).

This conceptual and empirical development tends to blur the difference between what parties are and what parties do. A party will thus be defined here as an organized group of people who select candidates for parliament or government by participating in elections. This is the main function, or task, that sets parties apart from social movements, trade unions, or interest groups. Parties may perform all other functions, but they are not exclusive for a party.

PARTY FUNCTIONS

In his discussion of the role of parties in the political system, Morse distinguishes two main functions of political parties: the education and organization of public opinion, and the administration of government. Moreover, he introduces what has later become known as the *linkage* function of parties, or the integration of interests. His contemporary, Lord Bryce, distinguishes five functions. All parties share four of these functions: union (keeping the party together), recruitment (bringing in new voters), enthusiasm (exciting and rousing voters), and instruction (informing and educating voters). Interestingly, Bryce argues that a fifth function, the selection of party candidates, is rather unimportant for European parties, while it is central to American parties.

In the classic article, "Political Parties in Western Democracies," Anthony King provides an authoritative overview of the debate on party functions. Whilst being critical toward the functionalist approach, he does not suggest to do away with the study of functions altogether, but rather turns this into an agenda for empirical research. King's main problem with functionalism is that parties are considered to produce consequences, and this has two main flaws. First, if certain hypothesized consequences are absent, one might believe that the party is not present. Second, there is the risk of inferring the existence of a party from the presence of the consequences—a general critique of functionalism.

The literature in the years that followed King's contribution focuses less on party functions, but rather on the empirical study of how political parties performed in terms of vote-seeking, office-seeking, and policy-seeking actors within representative democracies.

EMPIRICAL DEVELOPMENTS

In spite of these critical notes, party functions have remained central to analyzing parties. In fact, many authors have incorporated the objections raised, but as Russell Dalton and Martin Wattenberg argue, it is a *functional* rather than a *functionalist* approach. Party functions are used to measure what parties do, but functions are not seen as the constituting or defining elements of what a party is. Party functions become tools to measure change, transformation, or adaptation of parties, thus following King in his advice not only to draw up a list of party functions, but also to critically examine if and when parties carry out these functions. Table 1 presents an overview of the functions that several authors have ascribed to parties.

TABLE 1: OVERVIEW OF PARTY FUNCTIONS FROM 1969 TO 2000

1969, FROM ANTHONY KING	1985, FROM KLAUS VON BEYME	1995, FROM JEAN BLONDEL	2000, FROM PETER MAIR
– structuring the vote – integration and mobilization of the mass public – recruitment of political leaders – organization of government – formation of public policy – aggregation of interests	– goal attainment – interest articulation and aggregation – mobilization and socialization – elite recruitment and government formation	– general mechanisms by which conflicts are handled – institutions within which policies can be formulated – major part in recruitment of the "political class"	– integration and mobilization of the citizenry – articulation and aggregation of interests – formulation of public policy – recruitment of political leaders and nomination of persons to public office – organization of parliament and government

Table 1 illustrates considerable overlap with King's functions, but none of these amounts to as many as six functions. This is no surprise: if the environment of parties changes, new functions may emerge while others become less relevant. One example of this is the education, or information, function, which was crucial for scholars at the end of the nineteenth century, then moved into the background for a long period, but recently reappeared in a different form in an era of mass media and modern technology.

Jean Blondel's inventory has a slightly different presentation: rather than identifying functions, it basically describes group characteristics. Blondel speaks of mechanisms and institutions and refers to specific tasks that parties fulfill: handling conflicts and formulating policies. This inventory is parsimonious, as it leaves out specific reference to vote structuring, mobilization, and organization of government. Peter Mair stays closest to King's inventory: aggregation of interests combines with articulation, the role of parties expands to the organization of both parliament and government, and nomination of persons to public office is added to the recruitment function. The main difference is that Mair, like several others, leaves out the function of "structuring the vote."

On the whole, there is a striking congruence from the 1960s onwards. Most scholars assume that parties still perform roughly the same functions as they did thirty or forty years ago, even if the balance between these functions may have altered. On the basis of this overview, there are three essential functions:

- integrating and mobilizing the citizens to vote
- recruiting a political class to govern
- articulating and aggregating societal interests

This list contains functions related to both representation and governance, while it also refers to the tasks of a party in policy making and during elections. The functions emphasize the link between parties and voters, and the competition between parties. Finally, they allow for comparative analysis over time and across countries.

HOW PARTIES DEVELOP: DECLINE VERSUS TRANSFORMATION

A perennial debate concerns how parties have developed and continue to be omnipresent in Western democracies. Moreover, in many countries, parties have also been instrumental in the transition toward democracy and in providing legitimacy after its establishment. As Stefano Bartolini and Mair describe it, parties are important within a democratic political system since they concurrently "control political behaviour and harmonize different institutional orders" (342). In addition, the authors see no credible alternative to parties, which begs the question of what happens to democracy if parties no longer perform this political and institutional integration. After 1945 parties were regarded as indispensable for making democracy work.

The general idea that parties are essential for democracy still stands fast. Ian Budge and Hans Keman consider parties the "irreducible core" of democracy. José Montero and Richard Gunther state that parties are "essential for the proper functioning of representative democracy" (3), and they cite a number of other recent publications that put forward comparable claims. In other words, parties and democracy are seen as inseparable. A possible decline of parties—especially if this concerns functions of representation considered essential for making democracy work—is then often seen as a "crisis" of democracy. The often observed lower levels of trust in parties indicates this decline.

THE QUESTION OF PARTY DECLINE

Montero and Gunther point at a paradox in the party literature: an increased attention for parties at the end of the 1990s accompanies a claim that parties are in decline. Another interesting point is that writings on party "crisis" mainly stem from the United States. American scholars such as Tim Aldrich have been more alert in this respect, contrary to scholars in Western Europe. Yet, Hans Daalder in 1992 mentions possible causes of *party decline* as:

- The legitimate role of parties is questioned, since they are considered counterproductive (in problem solving by policy making that reduces "good governance").
- Selective perception of party competition: certain party systems are considered "good," others "bad."
- Redundancy of party: parties become irrelevant as other actors or institutions (e.g., interest mediation and representation) take over their functions.

In summary, it is argued that parties cannot exist or ought not exist (anymore). The first line of reasoning relates to what Daalder labels the *redundancy* of parties, while the second is seen as a result of distrusting parties.

These arguments come together in Joachim Raschke's claim that the limits of what parties can do have been reached and that there is party "failure" in various aspects. First, there is *overadaptation,* and parties are not vehicles for change but enhance the status quo. Second, *overgeneralization* causes parties to no longer represent specific interests. Third, *overinstitutionalization* broadens the gap between citizens and parties. This party failure would explain the lower rates of electoral participation and of dealignment of voters across Europe and the United States.

Likewise, Mair's analysis narrows the central aspects of party change to *identity* and *functions.* He argues that how parties present themselves to the electorate and the way they compete makes it increasingly difficult for voters to find ideological differences, or understand how these differences relate to their own interests. For the second element, party functions, Mair makes distinguishes representative and procedural functions and argues that the former type of functions—integrating and mobilizing the citizenry, articulating and integrating interests, and formulating public policy—have been drastically reduced. Conversely, the procedural functions—recruitment of candidates for office, organization of parliament and government—have remained important and may even gain significance. Thus, parties are changing from representative agencies into governing agencies: they have become parties of the state and are less part of society.

Aldrich considers the problem as emanating from a paradox where parties no longer match collective choice and related action by means of collective decision making. In the eye of the public and electorate, a party becomes redundant because they view "parties [that] are designed as attempts to solve problems that current institutional arrangements do not solve and that politicians have come to believe they cannot solve" (22). Hence, parties and their representatives are no longer capable to represent or to govern.

The conclusion can be drawn that the term *party crisis* concerns, in particular, the representative functions of parties. First, parties are less relevant for the information, education, and mobilization of the electorate. The role of cyberspace is but one example of how new technologies absorb this function. Second, parties are less successful in integrating interests. This problem relates both to the apparent inability of parties to adapt to new societal concerns and demands for other forms of participation, and the vanishing of ideological differences. Third, this development reinforces electoral volatility in many countries and points to processes of dealignment and realignment of individual voters vis-à-vis established parties or even departing from political life altogether.

PARTY ADAPTATION AND SURVIVAL

There are three flaws in the debate surrounding party crisis, or party decline. First, using the term *party crisis* implies a view on what a party is, or a standard against which parties can be judged. Yet, it is unclear what this standard should be, and whether or not such a standard might well be contextually dynamic. Paul Webb qualifies the arguments about party crisis in a very succinct way:

In the absence of compelling systematic evidence that parties' scope for autonomous action has diminished we would argue that most probably there never was a Golden Age of party government, and that it is therefore a misconception to speak in terms of "party decline" in this respect. (447)

Research on party crisis or decline should therefore start with a conscientious inventory of the roles and functions parties play. As Dalton and Wattenberg have argued in their "functional approach to party politics," certain functions may indeed have eroded, but this is compensated for by gaining others. Many authors tend to link the citizenry with the state as the crucial function of parties and from such a perspective, any loosening of this linkage is seen as decline. Yet, considering all party functions equal implies that a shift from representative functions to recruitment and governance is not the same as decline. Katz and Mair show that the main drawback of this perspective is that relations between parties and the state are ignored. Speaking of decline or failure is misconceived, and they see change as few signs that the role of parties has really diminished.

The third flaw in this type of reasoning is its emphasis on stability: it suggests that a party should remain more or less the same over time. Yet, the ability to change and adapt—to attract new groups of voters, to change the internal organization, or to renew the party ideology—can also be seen positively. This is Klaus von Beyme's *functional efficiency* argument: parties have been able to adapt their organization and role to new circumstances. In a traditional view—putting the citizen-party linkage at the center—this is, however, seen as party decline. Trends of increasing electoral volatility and decreasing membership demonstrate that fewer people identify strongly with one particular party, and that voters are increasingly volatile. Yet, calling this party decline is biased toward the status quo.

Several other authors have also consistently qualified the arguments of party crisis or party decline. Daalder is therefore right in warning against writing off parties too hastily, and he makes a plea in favor of analyzing their actual functions and how these may change. The challenge is to understand to what extent there is a response to external factors and in how far it signifies a deliberate strategy of parties. Thus, the adequate picture that emerges is not so much crisis or decline, but rather a *transformation* of how parties shift attention to different functions.

A potential answer to the question of party survival is offered by the cartel thesis. Katz and Mair contend that the problem of the literature on party crisis and party survival stems from the questionable assumption that parties should be "classified and understood on the basis of their relationship with civil society" (93). Parties move away from civil society and become part of the state, which is the vital point of the cartel model.

Probably the best way to describe the process behind the survival and adaptation of parties is proposed by Von Beyme's *institutional efficiency.* Some parties may disappear, other parties may emerge, but the organizations as such and the party systems in which they function stay put. Hence, both functional and evolutionary arguments are acknowledged: parties are

necessary for the functioning of democracy, and they manage to adapt to new circumstances.

Political Party Platform

Political party platforms in the United States are drafted before the party convention and presented to convention for approval. Approval is not always pro forma, as debates have occurred on war and social issues. Platforms in the United States are not always read; in fact, presidential candidates and members of Congress may ignore them. The separation of powers system also makes party control difficult, if not impossible.

Platforms are instruments of ideology and party stands, and they reflect the views of those in control of the convention that year. Summarize and crystallizing the character of party coalitions, platforms are programmatic rather than ideological. Platforms may also be a way for party factions to agree on a common agenda. Writing in 1964, V. O. Key Jr. contended that platforms are "electioneering documents," not "blueprints for action." They indicate the party's general direction but ordinarily leave wide latitude for discretion after the election. The platform contains retrospective judgments and future pledges, with varying degrees of detail and specificity. During the campaign, the presidential candidate amplifies and amends the platform; this is especially true today when conventions occupy a lesser role in the election process.

Platforms provide useful guides to party positions on issues —such as taxes, health insurance, nuclear proliferation, education, abortion, and social security—and there is considerable consistency in their focus over the years. For example, Democrats look to government for solutions, while Republicans look to the private sector. The 2000 and 2004 platforms made exceptions for George W. Bush in areas where he strayed from traditionally conservative principles. By contrast, the 2008 platform accommodated John McCain's maverick positions on issues like immigration and climate change without accepting his views as the official positions of the Republican Party. On some issues, the party was less accommodating. The 2008 platform called for a constitutional amendment banning marriage between gays and lesbians, and a ban on all embryonic stem cell research, even though McCain did not favor either. Perhaps the most striking difference between the 2004 and 2008 platform documents is the removal of any references to the candidate running for office. In the 2004 document, Bush was mentioned more than 250 times, with the committee finding something about him to "praise," "commend," "hail," or "applaud" more than 70 times. By comparison, neither McCain nor Bush is mentioned at all in the 2008 documents, except in the preamble.

About 79 percent of platform promises become policy in one form or another, often involving partial opposed to complete fulfillment, yet the national plan is taken seriously and influences the policy agenda. Platforms in the United States can help vent group views and act as a safety valve. However, they may affect the party's broad-based appeal if interests not reflective of the party's broader constituency dominate.

The British parliamentary system, represented by Westminster and other systems, may provide an opportunity for elections to be about competitive programs. Electoral success is based upon approval of these platforms, and party discipline is needed to enforce the policies advocated. Strong party government, as in United Kingdom, provides a more accountable system of policy pledges because majority party members tend to vote as a bloc in fulfilling pledges in opposition to the other party. In this system, a majority of each party opposes the other. Even in the United Kingdom, where party platforms are known as manifestos, party conferences articulate policy, but it may not always be binding. However, the task is made easier because the prime minister is the leader of party and parliament. The party can deprive recalcitrant members of renomination, which tends to ensure greater compliance.

Party manifestos began with Robert Peel in 1834, and in 1906, the Labour manifesto was the first of its kind based on leader declarations. According to Richard Rose, election manifestos have become more specific in content over time; however, they may be rhetorical or doable. They no longer rely on single principles, but, once a party is in office, it may feel committed to principles it sees as impractical or undesirable.

Manifestos are an exercise in party management. Voters rarely consult them, but politicians may view them as an authoritative statement of party policy intentions and party collective responsibility. They result from a search for consensus within the party, and, in large measure, are a proclamation of what leaders want. They represent a statement not of what the party will achieve but what it intends to achieve. Most commitments are implemented into policy—90 percent for Conservatives and 73 percent for Labour. The manifestos may be adversarial, but not necessarily point-for-point oppositional. Most legislation is prepared apart from the manifestos, and often, parliamentary legislation represents consensus rather than adversarial party conflict.

Political Philosophy

Political philosophy is the branch of philosophy devoted to reflecting on the contents, values, and conditions of political life. Specific methods of political philosophy are distinguishable from other disciplines, such as political science and history, with various forms and varieties emerging in contemporary political philosophy.

THE OBJECTS OF POLITICAL PHILOSOPHY

It is a common practice to define a discipline either on the basis of its specific *objects* or on the basis of its *methods.* By looking at its objects, political philosophy can be defined as the specific branch of philosophy devoted to the study of politics. The main questions that political philosophers then raise concern (1) legitimacy, (2) modes, and (3) limits of political power.

With regard to the first, the *legitimacy* of political power, the most fundamental questions that political philosophers raise surround the very existence of politics: Why should there be a political power in the first place? Why do people live under governments? Would it be preferable to live in a condition of anarchy? These are questions that touch on crucial philosophical problems and that have been raised at least since individual human beings realized that the political arrangements they live in are not eternal and unchangeable; rather, they are temporary and subject to the possibility of change. In antiquity, the typical answer showed that political power derived from the place of human beings in the chain of beings, whereas modern philosophers typically looked for a justification of power in the will of human beings. The typical example of the first approach is Aristotle (384–322 BCE), who in *Politics* famously defined the human being as a political animal, while Thomas Hobbes (1588–1679 CE) exemplifies the second approach. By grounding the existence of political power in a social contract that individuals stipulate in order to exist apart from the natural condition of war and anarchy, in *Leviathan* Hobbes justifies the existence of power in the will of individuals.

The second question concerns the *modes* of exercising political power. What fundamental values should uphold one's political life? What political arrangements best promote them? These are also crucial questions that political philosophy has been raising since its inception. An example of the typical answer in antiquity to the question is Plato's depiction of the perfect republic. Plato (427–347 BCE) argues in *The Republic* that justice is the most important value in human life and that it should be the ordering principle of political arrangements. Drawing on an analogy between the equilibrate soul ruled by reason and the just republic ruled by philosophers, Plato depicts an ideal political community by assigning a specific position to every social group and describing in detail each one's task. An example of the typically modern answer to this question is Niccolò Machiavelli's theory of the separation of politics from morals in *The Prince.* If the antiquity sees them in continuity, Machiavelli (1469–1527) argues that politics should

be autonomous from morals and should promote its own values. In Machiavelli's view, the best political arrangement to promote the liberty of individual human beings is the republican one.

Finally, there is the question of the *limits* to political power. Are there limits to what political power can legitimately do? If these limits exist, what are the criteria for defining them? The question has also been raised since the inception of political philosophy, but it gained prominence in the modern epoch. If political power is not derived from the position of human beings in the chain of beings, but is instead the consequence of their will, it follows that this very will is also entitled to set the legitimate limits to politics. Liberal philosophers have paid particular attention to this question. Among them, John Locke (1632–1704) argued in *Two Treatises of Government* that together with the limits posed by nature itself, every legitimate government is also meant to respect the fundamental rights of individuals, such as their life and their private properties.

THE METHODS OF POLITICAL PHILOSOPHY

At this point, questions may still arise regarding the difference between political philosophy and other disciplines also devoted to the study of politics. As the question itself suggests, it is not sufficient just to look at the objects of political philosophy. It is only by considering its specific methods that a full-fledged definition of political philosophy emerges, setting it apart from other disciplines.

If political philosophy is a form of philosophical reflection on politics, then it follows that its methods can be as many as those that philosophy can actually provide. In the first place, the difference emerges between those political philosophies that are derived from entire philosophical systems and those that focus on a specific issue. An example of the first kind of political philosophy is Plato's already mentioned conception of the ideal polity, which derives from his more general philosophical views, while Machiavelli is an example of the second. Indeed, while Plato contributes to many fields of philosophical investigation (from ethics to metaphysics and theory of knowledge), Machiavelli's contributions to philosophy, aside from his political writings, are negligible. Furthermore, if in the first case, the difference between political philosophy and political science clearly emerges, the former the result of an entire system of thought and the second a discipline mainly focused on specific issues. In the second, there is a significant convergence. In exploring whether Machiavelli's *The Prince* is a work in political philosophy or in political science, in the context of works written before the emergence of a separate discipline of political science, a significant overlap between the two emerges.

The next task then involves identifying the difference between political philosophy and political science, methodologically speaking. If by Machiavelli's time, the two disciplines were still to a large extent intertwined, the difference emerges more clearly with contemporary examples. In the last century, political science has acquired a methodological status well distinguished from that of political philosophy. To a certain extent, its specific method is defined in opposition to that of political philosophy.

In the first place, as it is usually put, political philosophy is a *normative* enterprise, which reflects on how best to arrange one's political life. In contrast, political science aims to be value free, to simply describe and explain facts. The distinction goes back to the positivist distinction between three kinds of propositions: synthetic, analytic, and evaluative. The first are the propositions that describe facts (e.g., "there are 156 towns in this country"), the second are those that analyze the content of other propositions and therefore contain no advancement of knowledge (e.g., "the GDP is the gross domestic product of a country"), and the third are propositions that contain judgments of value (e.g., "justice is the most important political value"). The idea is that since philosophical propositions cannot be subsumed under the first two kinds of propositions, they must be evaluative. Many, such as Hilary Putnam, have questioned the distinction, in particular with observations that factual descriptions also contain more or less hidden judgments of values. For instance, going back to the earlier example, it could be sustained that the very definition of *towns* instead of mere *villages* contains a judgment of value.

Yet, the distinction still obtains between a discipline that primarily aims at describing the facts of one's political life (political science) and another, political philosophy, which directly aims at defining how to best arrange it. This does not mean that political philosophy is only normative; this is only one kind of political philosophy, and even in this case there are rarely only pure judgments of values. This means that the two disciplines have a different methodological attitude toward political life. Political science aims to tell how the world *is,* political philosophy aims to assess how it *should* be.

This also leads to another difference between political philosophy and political science. Whereas political philosophy could also do without a reference to experience, works in the field of political science are based on a systematic reference to the world how it actually is. Indeed, it is a striking characteristic of purely normative political philosophers that they often neglect actual politics in their works. Whereas political philosophers are offered this option—with another question about whether this is a good or bad political philosophy—this is unthinkable in the case of a political scientist. Both qualitative and quantitative methods in political science are based on a systematic and nonoccasional reference to the empirical world.

The normative character of political philosophy and its nonsystematic reference to the actual world also sets it apart from history. Although it is disputable whether a completely value-free historical research has ever taken place, it is a fact that the aim of a historian is primarily to tell how things have been, and not how they should be. Thus, although it is possible to have works in political philosophy that project in the metaphysical or utopian *no places*—first coined by Thomas More 1516 in his classical *Utopia*—this is unthinkable in the case of history. The historian looks at the past, although this research

can be more or less subtly guided by a certain view of the present and of the future.

MODERN VARIETIES OF POLITICAL PHILOSOPHY

One of the most common distinctions proposed for grouping available political philosophies is that between analytical and continental political philosophy. Not only is the distinction geographical (the philosophy done in the Old Continent opposed to the approach prevailing in the United States), but it also aims to distinguish the sort of enlightened, science-oriented political philosophy done in the aftermath of authors such as David Hume, Gottlob Frege, and Jeremy Bentham from those who follow the philosophical style of authors such as Jean-Jacques Rousseau, Georg W. F. Hegel, and Friedrich Nietzsche. Many sides have questioned the distinction. In the first place, the term *continental* is misleading in as far as emblematic analytical philosophers such as Frege lived in the Old Continent. The term *analytical* is equally misleading because the works of alleged continental philosophers such as Rousseau and Hegel are also analytical if analytical simply means an enterprise devoted to the analysis of concepts. Thus, the distinction seems to be more a means to criticize philosophical adversaries than a conceptual distinction. The label of "continental" philosophy has often been used to accuse adversaries of lack of method and rigor, whereas the label "analytical" refers to accusation of offering sophisticated argument, but lacking any grip on reality. According to some, David West, for example, beyond such a distinction there is the ideological opposition between a "West" perceived as free, prosperous, celebrating human rights and the American way, and an "East" that has been totalitarian, stagnant, and oppressive.

A more fruitful distinction is that between the different methods of contemporary political philosophy, among which one can distinguish at least four: (1) the normative prescription of standards of conduct, (2) the construction of theoretical frameworks for the use of political concepts, (3) the deconstructive unpacking of concepts and paradigms, and (4) the history of political concepts. All are philosophical methods in that they aim to clarify concepts, be it through disclosing their normative potential, reconstructing the more general framework for their use, deconstructing overall, or reconstructing their history.

Normative political philosophy, after a long period of stagnation, was revived by the publication of John Rawls's *Theory of Justice* in 1971. Rawls's attempt to set the normative standards of a just society through the conceptual tool of a hypothetical social contract gave rise to a huge debate that did not cease to attract the attention of political philosophers. The only work comparable in influence is Jürgen Habermas's 1992 *Between Facts and Norms*. Habermas's attempt to ground democracy in the ideal conditions of speech and deliberation has attracted increasing attention on both sides of the Atlantic so that some authors speak of a deliberative turn in political philosophy.

However, the so-called normative political philosophy does not exhaust the entire contemporary scenario. If it is true that

political philosophy always contains a normative part, there are still political philosophers who do not see their primary task in setting the standards for conduct. Chiara Bottici's *Philosophy of Political Myth* (2007) offers an example of political philosophy understood as construction of philosophical framework for the use of political concepts (i.e., the second type). Whereas both Rawls and Habermas see human beings as primarily rational actors, Bottici argues that human beings do not only act on the basis of rational considerations, and therefore a philosophical framework needs to be constructed to adequately account for this fact. Hence Bottici's proposal of a philosophy of political myth explains both what political myths are, and why human beings should or should not make recourse to them. Together with the analysis of the conditions for public reason, political philosophy has therefore also been analyzing those for public imagination.

Yet, according to some authors, the primary task of political philosophy is not the construction of theoretical frameworks but rather their deconstruction (i.e., the fourth kind of political philosophy). The concept of deconstruction is primarily linked to the work of Jacques Derrida, and the main example of a political philosophy based on deconstruction is his *Politics of Friendship* (1997). In this work, Derrida deconstructs the concept of friendship by showing that brotherhood and fraternity have consistently served as the paradigm of friendship and political relations throughout the history of Western philosophy; the result is a systematic exclusion of women from all of them.

Finally, whereas Bottici distinguishes between the methods of history and those of political philosophy, according to some authors, political philosophy should be an enterprise essentially based on history of concepts. The main idea here is that political philosophy cannot be a free-floating intellectual enterprise, but must always reflect the contingency of the specific historical context in which it takes place. There are two main versions of this approach. The stronger one says that because it is impossible to transcend one's own historical context, political philosophy should be nothing more than conceptual history. The weaker form says instead that because there is no real progress in the discipline, but instead the perpetual recurrence of the same problems, rethinking the classical authors is a fruitful starting point for rethinking about more contemporary issues.

The four types of political philosophy are ideal types. Although it is possible to point to exemplary works for each of them, most of the time, works in political philosophy contain more than one single method. For example, Habermas's *Between Facts and Norms* contains both a political philosophy of the first and of the fourth kind, and Plato's *Republic* contains elements of the first and the second.

An epoch of rapid change often call the boundaries of the disciplines into question. Among the works that are on the forefront of questioning boundaries, at least three kinds of political philosophy stand out: (1) the poststatist, (2) the feminists, and (3) the green political philosophy. Although these kinds of political philosophy also make recourse to one

or more of the methods described earlier, they stand out in the contemporary panorama of political philosophy for their innovative and boundary-questioning potential. The poststatist political philosophy questions the centrality of the sovereign state in modern political philosophy, envisaging forms of justice and democracy beyond traditional state boundaries, as explained by David Held. Feminist political philosophy questions instead the traditional boundary between the public and the private sphere, arguing that such a distinction is a means to perpetuate the domination of men and segregation of women, especially as presented by Carol Pateman. Finally, green political philosophy challenges traditional ways of conceiving the boundaries between human beings and their natural environment, arguing that the latter can no longer be conceived as the mere passive theatre of human beings' political action. In the face of events such as climate changes, particularly as put forth by Val Plumwood, new political philosophies are necessary to assure not only justice among human beings but also their very survival.

Political Prisoners

Political prisoners are people imprisoned for political beliefs or political actions as a result of a government's criminalization. The government is one of political differences, and these differences are thought to threaten the established order of government; holding or articulating political views antagonistic to the state is thus seen as a crime. A closely related term is *prisoner of conscience*, which refers to those incarcerated because of their beliefs, color, sex, ethnic origin, language, or religion. At the shared definitional core of political prisoners and prisoners of conscience is their detainment by the state for the purpose of silencing dissent, or constraining opposition to orthodoxy as propagated by the state. Some political prisoners are simply arrested and incarcerated for an indefinite period of time, while others go through judicial proceedings before they are imprisoned. Extrajudicial killings and state-sanctioned "disappearances" are also observed.

POLITICAL PRISONERS AND CIVIL RIGHTS

A usual tactic seen with political prisoners is to charge or accuse them with contrived, nonpolitical, common criminal acts so as to help the state present a more acceptable facade of legitimacy for a prosecution or a jailing. Critics of such proceedings commonly invoke the pejorative terms *trumped-up charges, fabricated evidence, kangaroo court, show trial, sham trial*, and the like. The state's political motivations in bringing about such prosecutions and trials are an important element in determining whether a detainee is indeed a political prisoner. There is a level of inherent subjectivity in assessing the depth and influence of politics in such prosecutorial decision making, and these commonly remain issues of contention and debate between the state and supporters of the accused. For example, at what point does legitimate dissent from political orthodoxy become illegitimate treason and betrayal of one's country? Should there be a global standard to constrain governments, or should these concerns be more appropriately evaluated within a particular country's own values and perspectives?

In an effort to put forth an international standard to clarify these considerations and to prevent governments from rationalizing politically motivated prosecutions and imprisonments, the United Nations (UN) promulgated the Universal Declaration of Human Rights in 1948. This was the first time in international law that all people were recognized as possessing rights that transcended a state's sovereign imperatives. According to this declaration, no person may be subjected to arbitrary arrest, detention, or imprisonment—detention is understood to be arbitrary when there is no ostensible legal foundation for the detention or there are serious breaches of the right to a fair trial.

However, in the wake of these international legal provisions, a debate between Western and non-Western, or developing, countries emerged. Western states generally contend that political and civil rights are absolutely essential and critical, whereas non-Western detractors argue that political liberties are irrelevant and worthless if the fundamental needs of the people, such as freedom from hunger and basic security, are not provided. Thus, generally speaking, non-Western and developing countries show a lessened commitment to political rights as limned in the Universal Declaration of Human Rights.

Along with the United Nations, the International Committee of the Red Cross, Amnesty International, and Human Rights Watch are prominent watchdogs on the lookout for

potential violations of these human rights. However, even with these organizations at work, obtaining or collecting exact data on the number and treatment of political prisoners is extraordinarily difficult because of the lack of accurate self-reporting by states with problematic human rights records; there is also great risk involved in the preparation of such reports by internal nongovernmental actors.

POLITICAL PRISONERS IN OPPRESSIVE REGIMES

The presence of political prisoners in a country is an important indicator of the level of repression that government exercises over its people. Repressive governments work to reinforce their control over the populace by denying them fundamental political freedoms and curtailing individual civil liberties and rights. Interfering with people and group's ability to freely articulate and act on their dissident political beliefs is a prime tactic that authoritarian and totalitarian regimes use to help strengthen the survival of their regime, and examples of this have been readily observed in the modern era. Poland in the early 1980s prohibited the prodemocracy trade union of Polish Solidarity and anyone involved in it was subject to arrest. Soviet Union dissidents such as Andrei Sakharov and Aleksandr Solzhenitsyn were arrested and exiled by Soviet authorities for their respective public criticisms of the government. Solzhenitsyn's monumental work *The Gulag Archipelago* is an extensive first-hand account of the Soviet Union's prison camp system in which many Soviet political prisoners found themselves. A range of nations have held political prisoners in custody for extended periods of time or dealt with them in more summary ways, including South Africa, Cuba, Tibet, China, Indonesia, Chile, Haiti, and Pakistan.

Other regimes decide to place their political prisoners under house arrest—that is, restricting those people's liberty by confining them to their homes. This was a commonly used tactic of the South African government in its efforts to deal with activists fighting apartheid. One of the most prominent current examples of this politically restricting approach is in Burma, where the ruling military junta of Burma has had Aung San Suu Kyi under house arrest for fourteen years for her pro-democratic political activism.

Political Psychology

The evolution and development of the subfield of political psychology began to take shape during the pre–World War II (1939–1945) period. This is when political science incorporated political psychology more directly; informed largely by psychoanalytic theory, this work focused primarily on leadership studies and the nature of attitudes. Such notions and interests became more peripheral to the broader fields of political science and psychology, as well as the larger world, in the wake of the behavioral revolution of the 1950s and 1960s. While some of these later methods and concepts remained part of U.S. politics, most of the central ideas and concerns of political science began to fall outside the purview of existing psychological models.

PSYCHODYNAMIC THEORY AND THE BEHAVIORAL REVOLUTION

The impact and importance of personality is what distinguishes political psychology from many other areas of political science: its specific and intensive focus on the individual level of analysis, and the central place held by individual decision makers in political processes.

Sigmund Freud's (1856–1939) psychological ideas drew on the model of the newly invented internal combustion engine, positing a primarily sexual and aggressive energy that drives the human psychic machine. Yet his notions were also heavily influenced by his overarching interest in archeology, and he assumed that uncovering core motives held much in common with sorting through the surface debris of an archeological site to find buried treasures. In Freud's view, children are born with hedonistic tendencies, the so-called id, and become socialized by society, primarily in the form of their parents, into civilization through the internalization of the superego, or conscience. The individual's successful attempt to integrate the id and superego into a functional ego represented the life's work, and failures to effectively synthesize these forces led to psychological pain and illness. Freud also speculated that a person's repressed internal drives will unconsciously manifest themselves in behavioral outcomes, in the forms of jokes, slips of the tongue, and other uncontrollable outbursts. Freud's propositions concerning human motivation and action remained definitive for half a century and continue to be influential, at least in some clinical and cultural settings, today.

While the most lasting and significant of Freud's insights remains his characterization of the unconscious, whether conceived in motivational or purely cognitive terms, his larger

belief in the dynamic conflicts between individual desire and larger societal constraints provided a powerful model of personality and action. As a flexible model of human character, psychoanalysis proved adaptable in a number of ways. In addition, Freud's ideas concerning socialization offered a comprehensive theory for understanding the interaction between the individual and the larger society, whether that exchange took place in a smaller family unit or within a larger cultural context such as the Catholic Church or the army. This model readily suggested many applications and implications for political science.

Freud's psychoanalytic ideas were widely adopted in various subfields in political science and quickly became embedded into the literature in various formulations of both group and individual behavior. The two main areas in which these ideas exerted their greatest impact involved leadership studies and work on attitudes and behavior.

Freud himself began the work on leadership studies, albeit outside of the political context, with his psychobiography of Leonardo da Vinci, wherein he attributed much of Leonardo's creative energy to his presumed homosexual desires, as manifested in a famous reported dream. Such analysis sought to locate the origins of individual accomplishment in childhood experiences and the source of personal pathology in repressed sexual and aggressive desires. Indeed, early experiments in the psychology of leadership were conducted on children. In perhaps the most famous of these studies, Kurt Lewin (1890–1947), a German Jewish refugee from Nazi Germany, sought to understand the power that Hitler had exerted over his compatriots. Lewin examined the impact of leadership style over group dynamics by randomly assigning one of three types of leaders to groups of boys. One displayed an autocratic style of leadership, a second a democratic style, and a third a laissez-faire style. In each case, the leader was a confederate of the experimenters. The results proved instructive. Boys in the autocratic group worked hard, but only while under supervision. Predictably, boys in the laissez-faire group simply goofed off, while boys in the democratic group emerged most efficient. More striking, however, was the fact that boys in the autocratic group displayed over thirty times more aggression than boys in either of the other groups. Boys in the autocratic group destroyed their own property and then blamed others for their misdeeds, displacing their anger, frustration, and aggression onto weaker boys. It is notable that Lewin went on to conduct some of the earliest work on persuasion and attitude change, systematically examining various factors, such as strength of argument and vocal intonation, to determine the sources of attitude change.

Knowing that such variables failed to achieve predictable effects, Leon Festinger (1919–1989) went on to develop his powerful model of cognitive dissonance, based on the discrepancy between perceived choice and external justification, showing that arousal encourages people to maintain consistency between their thoughts and behaviors. When perceived choice appears high, and justification remains low, internal attitudes exhibit the most change.

Harold Dwight Lasswell (1902–1978), a real father of the field of political psychology, was the first to translate these psychoanalytic notions into the explicit study of political leadership in several important works. Lasswell explicitly incorporated psychoanalytic theory into his studies of political behavior. Specifically, he argued that individuals project their psychological conflicts onto the external political world. Lasswell's seminal work substantively affected the direction of research in this area for decades by concentrating attention on the ways in which psychological processes in general, and pathological ones in particular, influence subsequent political development and expression. By establishing this unidirectional focus, Lasswell's research precipitated and modeled the development of subsequent work to concentrate almost exclusively on the effect of psychology on politics, paying almost no attention to the potential impact of politics on individual psychology. This directionality in political psychology continues today.

The application of psychodynamic theory to leadership and personality studies came to its most masterful fruition in Alexander George and Juliette George's psychobiography of Woodrow Wilson. In this work, George and George combined Freudian theory with Lasswell's notions to argue that Wilson used power as a compensatory mechanism to bolster his inadequate self-esteem. By documenting Wilson's deeply ambivalent relationship with his brutal father, a powerful Presbyterian minister, they showed that Wilson's later inability to compromise with powerful male authority figures was rooted in his unexpressed defiance of the father he both loved and loathed. In demonstrating the repeated nature of Wilson's battles of will as president of Princeton, governor of New Jersey, and president of the United States, the George and George elucidated the repetition compulsion that tragically forced Wilson to become the assassin in his own demise by refusing to compromise with Senator Henry Cabot Lodge over the League of Nations treaty upon which he had staked his political career.

Other work that used psychodynamic models to investigate the relationship between individual motives and societal outcomes included Lloyd Etheredge's study of actual senior Department of State officials. Using assessments of leaders' personality traits, Etheredge found that he could predict over 75 percent of their policy preference in forty-nine crises between 1898 and 1968. In particular, he noted that individuals who displayed high dominance behavior in their interpersonal interactions were much more likely to advocate the use of military force abroad.

By the late 1950s through the 1970s, the behavioral revolution began to supplant psychoanalysis as the dominant model in academic psychology and the broader intellectual world. No new theory of power and personality emerged in psychology that could explain the interaction of the individual with the group or larger culture in the same comprehensive manner as psychoanalysis; instead, the psychological study of personality progressed into a more *outside-in* model that examined the effects of social processes, such as conformity and obedience,

on individual behavior. This represents a complete reversal from the earlier Freudian notions that explored individual psychology from an *inside-out* perspective. In the absence of the development of an equally comprehensive theory of personality in psychology from within the behavioral paradigm, political scientists proved unable to develop their own alternative appealing theory for the relationship between personality and power, and psychological leadership studies more broadly floundered and tended to fall by the wayside.

A second notable example of the incorporation of psychodynamic notions into research in political attitudes arose in the context of the examination of attitudes and attitude structures. This pursuit found its fullest expression in work on the authoritarian personality. The early research, largely conducted by a group of Jewish refugees from Nazi Germany at the University of California, Berkeley, sought to explain the origins of fascism within individual personalities. These scholars devised an F-scale that ostensibly connected attitudinal traits including anti-Semitism, ethnocentrism, and political and economic conservatism to public policy preferences and outcomes. High authoritarian individuals appeared preoccupied with power and status and demonstrated a low tolerance for ambiguity. The authoritarian personality argument rested on the psychodynamic assumption that interpersonal hostility would inevitably project onto the external world in measurable ways, which could then be correlated with predispositions toward hostile and punitive foreign policy stances.

These early attitudinal studies in political science were inextricably rooted in psychodynamic assumptions of human behavior—and rightfully so. Such models incorporated comprehensive and internally consistent theories of personality, attitude, power, and action. Moreover, they provided a systematic explanation for the interrelationship between the individual and the group that remains such a crucial aspect of any political context and that many other models, even more recent ones, often lack. However, this work faltered because little empirical evidence corroborated the central theoretical association between interpersonal attitudes, as elicited in self-report questionnaires, and policy preferences and behavior. Given the lack of support for this central contention, work on the authoritarian personality came under increasing attack for embodying inherent political motivation and bias. In particular, critics argued against the one-sided focus on right-wing authoritarianism to the exclusion of left-wing dogmatism.

The study of attitudes and attitudinal structure, however, unlike the work on leadership, survived in the face of the behavioral revolution precisely because political science proved able to develop theories of attitude and attitudinal structure that were not rooted in psychological models in general, or psychodynamic theory in particular. Taking advantage of methodological advances in survey research during the behavioral revolution pioneered by sociologists as well as psychologists, important and valuable new work in U.S. politics emerged. Early work in voting studies conducted by Paul Lazarsfeld and colleagues investigating applied social research at Columbia held to a more sociological formulation. Later work epitomized

by the Michigan approach displaced these models with a more psychological and attitudinal approach to voting.

The most notable and influential work in this regard quickly became a classic. Angus Campbell and colleagues' *American Voter* (1960) employed nationwide surveys of large samples to uncover the dynamics underlying public opinion and American voting behavior. This argument located the source of political attitudes and behavior in individual political party identification, which the authors suggested was largely socialized, and learned at the knees of a parent. Such a model posited implicit social processes of group identification but failed to specify the particular psychological mechanisms undergirding this process very carefully.

Later work, such as John Zaller's influential *Nature and Origins of Mass Opinions* (1992), elaborated this survey tradition in attitude research by describing the relationship between the mass media, the assimilation of information by the public, and their opinions in quite sophisticated fashion. This model has proved quite influential in demonstrating the relationship between exposure and assimilation in explaining the effect of the media on public opinion. Zaller's work with Stanley Feldman (1992) similarly provided important insight into the nature of framing and priming effects on response bias in survey questionnaires, where *framing* refers to the order or method of presentation of questions and responses, and *priming* indicates unrelated external cues that may influence responses. In particular, salience and accessibility effects appeared to stimulate response instability across time.

Attitudinal research thus became rooted in the methodological advances of behaviorism, most notably the widespread use of the survey instrument to elicit public opinion attitudes and responses. In this way, the behavioral revolution really brought the psychological underpinnings of political behavior to the forefront, and this type of research became largely incorporated into mainstream political science, while simultaneously shedding itself of any explicit association with psychological models. This work remained mostly restricted to the arena of U.S. politics in general, and the study of voting behavior in particular. However, when psychoanalytic theory collapsed as the dominant theory of human behavior in the wake of the behavioral revolution, the study of attitudes, action, and behavior did not fall away in political science in the same way that leadership studies had, precisely because of the incorporation of behavioral methods into the study of voting research.

THE LIMITS OF POLITICAL PSYCHOLOGY FOR OTHER SUBFIELDS

Because the study of psychology and that of voting behavior both rest on models of individual behavior, their integration proved a match made in heaven. In addition, to the extent that applications of psychology to other subfields in political science took place at the level of the individual, progress and success remained possible. Most notable and influential in this regard was Robert Jervis's seminal and definitive masterpiece, *Perception and Misperception in International Relations* (1976). However, many pressing questions in comparative and

international politics occur at higher levels of analysis, thus requiring larger group-based notions of collective behavior in order to fully explicate underlying causal processes.

Over time within psychology, research in personality psychology declined in stature as its dominant model, psychoanalysis, waned in influence. In many departments, personality psychology no longer exists as a subfield, and in many others its adherents have been folded into clinical subfields. This movement away from deterministic theories of personality and behavior was only strengthened by the backlash against behaviorism that arose in the late 1960s, with the rise of humanist and existential perspectives, such as those advocated by such luminaries as Carl Rogers; this humanist emphasis then lasted through the rise of the cognitive revolution in the mid 1980s, and the later neuroscientific revolution of the last 1990s. As a result, psychology itself has become increasingly fractured. It thus became more difficult both for political science to keep up with quickly changing models of human behavior and to use and justify contentious models of personality in developing and testing their theories of leadership, group membership, or behavior.

The real challenge for political science subfields outside of U.S. politics to adopt psychological models in a widespread fashion results from the paucity of applicable group-based theories within psychology. Indeed, work in sociology may have proved more fruitful in such a pursuit, and, in fact, work in that area helped to spawn the introduction of constructivist models in international relations in the late 1980s. To the extent that any consensually accepted model of group behavior has emerged in psychology with relevance for political science, it is social identity theory, developed by Henri Tajfel. This theory offered two important insights. First, social identity theory posited that people automatically divide themselves and others into categories as a way to organize their social environments. People engage in a process of social comparison to determine the extent to which they are similar to, and different from, others they encounter. Second, Tajfel suggested that human motivation to divide into groups derived from the important self-esteem benefits derived from such membership. There are implicit psychodynamic motivational underpinnings inherent in this model.

Numerous experiments in this vein have demonstrated that individuals form groups easily on the basis of the most minimal reasons, and that once such membership becomes established, predictable differences in the distribution of resources between in-group and out-group members arise. For example, Jonathan Mercer invoked this theory to explain why interstate relations remain inherently competitive. Because of the consistency and robustness of the finding of in-group privilege concomitant with out-group denigration, much of this work concentrated on uncovering the origins of prejudice and discrimination. Social identity theory has been largely supplanted in psychology by self-categorization theory, where researchers stress the ways in which individuals maintain agency through their active choice over the number and intensity of their group memberships and identifications.

Because many political scientists remain interested in large-scale questions and problems related to identity, culture, and other important manifestations of political action, the challenges posed by external validity have limited the applicability of many psychological theories and methods based on experimental research. In U.S. politics, this limitation has been surmounted in large part by the use of survey instruments and other field experiments, including the innovative use of experiments embedded in nationally representative survey samples, which use large numbers of subjects, thus assuring the external validity and generalizability of findings. Most psychologists do not feel a need to solve problems associated with external validity in their studies because they are more interested in underlying processes of human decision making within a laboratory setting, where internal validity is much more crucial in establishing the reliability and validity of findings. Although models of group association or influence might interest some psychologists, methodological differences limit the reverse adoption of ideas and questions from political science into psychology. A few exceptions exist, such as work on the impact of minority positions on majority opinion, but such work remains relatively rare.

THE COGNITIVE REVOLUTION

The behavioral revolution began to lose ascendency in psychology in the late 1960s precisely because of the larger political phenomena occurring in society at large, especially the Vietnam War (1959–1975). Such overarching political pressures on intellectual development in academia have not been unusual. Indeed, the close interrelationship between much behavioral research and the pressing social and political problems of World War II and the cold war provided the impetus for a great deal of work in political psychology, offering both challenging questions, as well as funding to attempt to find answers. In fact, the work of Lasswell and Lewin, among others, came out of government-sponsored projects.

As interest in information processing blossomed in the context of improvements in artificial computing, the domain of investigation shifted from behavior to thought. This new emphasis on the former "black box" of decision making sparked the cognitive revolution in psychology that characterized the main work of the 1980s. As the field of psychology reconstituted itself to address certain specified problems, such as the nature of human information processing, at the expense of others, such as basic human drives and motivations, prospects for political applications remained more amenable in some subfields than in others. In particular, the study of leadership moved into the investigation of individual decision making. This coincided with a movement in U.S. politics away from elite leadership studies in favor of concentrating on mass public opinion and political behavior.

This cognitively oriented research reached its apex with the seminal and definitive contributions of Amos Tversky and Daniel Kahneman in their work on judgmental heuristics and prospect theory. This work documented the importance of the kind of framing effects noted in Zaller and Feldman's work,

along with the systematic way in which people's estimates of probability and frequency become biased by assessments of similarity, availability, and anchoring. In work on prospect theory, which won the Nobel Prize in Economics in 2004, Tversky and Kahneman showed experimentally that perceptions of gain and loss affect risk propensity in predictable ways, such that individuals confronting situations of loss appear much more likely to take risks than those more interested in consolidating gains. Prospect theory has been applied in political science most commonly in the subfield of international relations.

This cognitive work constituted the opposite end of the psychoanalytic pendulum, which located human action in motivated biases that unconsciously drive behavior. The cognitive model, working off the later-day machine analogy of the computer, instead delineated human biases that operated as a kind of bug in the psychological software, similarly unconscious in operation but divergent in their lack of motivation. Once people were told of the errors of their ways, they proved quick to recognize and admonish them, if not so capable of extinguishing them. Thus, "hot" motivated biases, rooted in primitive sexual and aggressive urges, were replaced by interest in "cold" cognitive biases, which predicted systematic errors in human decision making as the inherent side effect of largely effective and efficient cognitive strategies. More recent neuroscientific work has uncovered the artificial nature of this divide.

ADVANCES IN THE COGNITIVE NEUROSCIENCES AND FUTURE DIRECTIONS

In psychology, the pendulum began to swing back toward a renewed emphasis on emotion in the 1990s after Martin Seligman established a prestigious and lucrative prize for research in the area of positive psychology. This newfound concentration on the sources of happiness in particular coincided with the development and more widespread availability of new technologies, particularly functional magnetic resonance imaging (fMRI), which radically improved scientists' ability to uncover and locate the neural mechanisms of human brain functioning. These advances in cognitive neuroscience have sparked the dawn of a new revolution. In combination with similar technological developments in the field of behavior genetics in particular, new avenues for exploring the biological bases of human social and political attitudes, preference, and behavior have emerged. Some of these methods have also been used in concert with other noninvasive techniques such as implicit association tests (IAT) and electroencephalograph (EEG) technology, which both provide measures of reaction time among other outputs.

Many of the empirical advances in the domain of the cognitive neurosciences have taken place in the context of theoretical perspectives drawn from human evolutionary development and behavior. While some of the older evolutionary models in political science impaled on the stake of social Darwinism and associations with racism, sexism, and other prejudices, the modern variants in biology and psychology attempt to develop ecologically valid models of human thought and behavior that

remain rooted in evolutionary goals and strategies, but manifest empirically in demonstrable ways. The bottom-up empiricism of much work in the cognitive neurosciences finds an obvious theoretical exposition in evolutionary approaches. This interaction improves on previous models to provide a coherent theory of human thought and behavior. Also, like the perspective offered by psychoanalysis, evolutionary models provide comprehensive explanations for the interaction of the individual and larger society, rooted in essential reproductive tasks related to finding mates who are not relatives, and establishing coalitions to fight against those who challenge control over scare resources for survival. Although the nature and motives of the model differ, the comprehensive nature of their explanations should offer similar attractions for those who study political structures and behaviors. In combination with increasingly sophisticated work on the nature and manifestation of individual variance from within the field of behavior genetics, evolutionary models offer a theoretical and empirical basis to explore the nature of individual differences within a context of human universals.

Political Risk Assessment

Political risk assessment or analysis is a method of weighing the various political, economic, social, and cultural factors that must be taken into consideration when determining the feasibility of engaging in an endeavor, usually economic, in any country. Political risk assessment is often undertaken by entities, corporations, and organizations that would like to engage in operations in other countries with endeavors such as a multinational corporation planning to make a direct investment in a developing country. Analysis is done on the basis of factors that may be responsible for a sudden change in the stability of a nation that could lead to business losses.

Political risks are defined as any changes in the political environment that may adversely affect the value of a firm's business activities. Risk may imply the nonexistence of established order. It may also mean having some semblance of order but with a high probability of change. Or, it can mean a high level of stability and established order but with some probability of government intervention through expropriation or nationalization. The analysis of risks usually requires acquiring a quantity of data about a country's historical, political, economic, social, and cultural performance; this often requires time necessary to process such data into some meaningful assessment of the direction in which a nation is going. Corporations operating abroad usually try to avoid risk or shift the burden of that risk.

TYPES OF RISKS

In general, there are two broad types of risks: macropolitical risks that affect all firms, entities, or organizations in the country, and micropolitical risks that affect only a specific firm or firms in a specific industry in the country. There are also three categories of political risk of major importance to businesses. The first is ownership risk, occurring when confiscation or expropriation threatens the firm's property. The second type is operating risk, occurring when changes in laws, environmental standards, tax codes, terrorism, insurrection, or other shifts threaten the ongoing operations of the firms or safety of employees. The third type of risk is transfer risk, occurring when government interference with the firms curtails the ability to shift funds into and out of the country; this results from governmental action such as passage of laws that expropriate private property, raise operating costs, devalue the currency, or constrain the repatriation of profits.

Nongovernmental actions such as kidnapping, extortion, and acts of terrorism bring risk to any business endeavor as well. In fact, a broader list of examples of political risks also include nationalization or confiscation, campaigns against foreign goods, mandatory labor benefits legislation, and other forms of violence resulting from civil war, insurrection, or rebellion. In addition, there are also "hidden risks," which include cronyism, organized crime and fraud, unfair competition, counterfeiting and piracy, corruption, poor legal standards, and cultural differences. Beyond the risks themselves, the set of effects that result is most significant, such as the loss of profits or assets, increased costs, loss of sales, and decreased productivity.

MEASURING RISK

There are objective measures for identifying risk factors, but there are subjective measures as well. There are several approaches for evaluating and forecasting the existence of risk. One is the *grand tour*, which relies on the opinion of company executives visiting the country where the investment is being considered. In this method, the analyst engages in selectivity of information required to gauge risk. A second approach is the *old hands approach*, which depends on the advice of an outside consultant, serving as the expert whose input provides the basis for risk assessment. Another approach is the *Delphi technique*, which combines the views of independent experts who use various sets of indices and analysts in determining risk. It can use existing data from the Human Development Index, the Globalization Index, the Corruption Index, and the Freedom Index in determining a nation's level of risk.

Quantitative methods, such as multivariate analysis, can also serve as a means to assess risk. However, most analysts indicate preference for an integrated approach that systematically uses qualitative and quantitative dimensions. For example, the Eurasia Group produces a Global Political Risk Index that can be found in publications such as *The Economist*. Another company that offers political risk analysis is Political Risk Services, which uses a 100-point scale and rates a country on the basis of three factors: 50 points for politics, 33 points for economics, and 17 points for society.

Many different independent dimensions influence a nation's political destiny, including domestic instability, foreign conflict, political climate, and economic climate. Politically, a nation needs to ensure leadership success to avoid crisis. There are several factors that can undermine political success in any country: the erosion of middle-class support for the regime, corruption, work stoppages, ideology or religion, the likelihood of civil disorder and terrorism, military unrest, border disputes, and social revolution. Based on these dimensions and factors, a nation's risk rating can be any of the following: "very high," meaning it will happen; "high," meaning it could occur in the short-term; "very possible," meaning there is a likelihood of it happening; "possible," meaning there is a 50 percent chance of the scenario occurring; "low," meaning there is little chance of occurrence; and "very low," indicating an unlikely occurrence.

According to one method of assessing country risk, Table 1 and 2 show the top ten countries with the least risk and the bottom ten countries that pose the greatest risk.

Political risk analysis thus examines the possibility that political decisions, events, or conditions in a country, including those which may be referred to as social, will affect the economic environment in such a way that investors would lose money or have a reduced profit margin. The results of such an assessment can determine whether a company, entity, or organization will decide to operate in a particular country based on these factors.

Political Science, History of

The idea of politics as a subject of science is as old as Aristotle's *Politics,* but, as British political theorist Bernard Crick stressed, political science, as a distinct academic discipline and branch of social science, originated as a uniquely American invention. Although there were, in many respects, functionally equivalent studies of politics in other countries, the history political science, from the mid-nineteenth century to the mid-twentieth century, was primarily a story of the "American science of politics." Notwithstanding its universal scientific aspirations; its emigration and export to other countries, especially subsequent to World War II (1939–1945); and the waves of foreign influence that have at times significantly contributed to shaping the field, political science has borne a unique relationship to American political life and American democratic ideology. Although the history of the discipline could be written from many perspectives, an important dimension of that history is the democratic narrative. The field has always been committed to creating a truly scientific study of politics, but, despite changing images of science, there has been a consistent search for a discipline that would contribute to realizing and enhancing democratic values and institutions. In this respect, as well as with regard to matters of methodology, the genetic imprint of the American form has remained manifest in the extended speciation that now characterizes so many other countries within which the field has taken root and evolved.

It has often been suggested, however, that the simultaneous commitments to science and democracy have not always been in harmony. Although this tension has, in part, involved the problem of reconciling scientific and political criteria of judgment, it has also been the consequence of a longstanding assumption that only by remaining aloof from politics and establishing its claim to scientific objectivity could the discipline gain the cognitive authority to facilitate practical purchase. Consequently, it is not surprising that some have suggested that the discipline has, at times, become alienated from the realities of political life. However, self-consciousness about its relationship to politics has significantly informed political science's successive crises of intellectual identity. Despite sometimes contradictory claims about the extent to which claims about politics and government produced by political science have influenced political ideas and behavior, the images produced by the discipline have, in various ways—such as through diverse levels of pedagogy and through their influence on a variety of media—been reflected in the practices of citizens and political actors.

There was, from the point of the formation of the U.S Republic, a theoretical paradox that has been a central axis in discussions of popular government. This paradox, which was bequeathed to the field of political science, emerged with respect to validating American democracy—and validating America as a democracy. While it was assumed that a republican or democratic regime was predicated on the existence of an intelligible and autonomous people, it was, at the same time, difficult, after the American Revolution (1776–1783), to

identify any such entity. This search for a "people," and for democracy, was, and has been, through the end of the twentieth century, confronted, and conducted, in two distinct ways. One approach is to argue that, despite great social diversity, there is an American people that has been the author and subject of democratic government. The other approach argues that the existence of such a national community is not necessary to achieve the ends of popular sovereignty. One persistent aspect of the democratic vision in the United States, represented in both of these approaches, is, however, its accomodational character. The tendency adapts the concept of democracy to changes in the perceived realities of American politics.

This paradox of democracy is first exemplified in *The Federalist Papers,* which were devoted to a defense of the proposed 1787 Constitution. While the authors maintained that the Constitution, manifesting the accrued wisdom of Western political thought regarding a science of politics, created a popular government that was republican, or representative, rather than purely democratic, they had difficulty clarifying and defending their continued allegiance to the basic idea of popular sovereignty. The concept of a people that had been at the core of revolutionary ideology, as well as essential to the arguments of certain Anti-Federalist criticisms of the new document, seemed to have an anomalous ring when juxtaposed to the images of American politics advanced by James Madison and Alexander Hamilton. The Federalists and Anti-Federalists shared the worry that there was not an identifiable American people, which transcended the smaller communities of the various states.

From one perspective, the genius of the authors of *The Federalist Papers* was to invent the very idea of a unified people that encompassed more local constituencies and that was to be represented in and by the new national government. To the extent, however, that the oft-mentioned "people" had a concrete meaning for Madison, as voiced in *Federalist* No. 10, it seemed, in the end, to refer either to the sum of self-interested individuals or to diverse and divisive factions that were characterized by their attachment to their own, rather than a public, good. In place of the traditional republican notion of an organic people, Madison conceived of a virtual people that would arise out of an institutional and social balance of conflicting interests. He argued that the disease of republican, and now American, government was factionalism but that it could transform its own cure through an intricate constitutional design combined with fortuitous demographic and geographical circumstances. Political discourse and commentary, however, kept alive the civic republican image of a people capable of, and the subject of, popular government, which lay beneath the surface of American diversity. The origins of political science were closely involved with vouchsafing that image.

THE SCIENCE OF THE DEMOCRATIC STATE

During the nineteenth century, academic publicists produced their own version of the people, which was represented in the concept of the *state.* While today many tend to look back on this concept as an archaic formalistic and legalistic artifact, or as an intellectual reflection of American state-building, it was in fact the nucleus of a theory of American democracy. Apart from a reference to the American states, the word *state* had, by the beginning of the nineteenth century, little currency in the language of American politics.

The introduction of the concept of the state was largely through the work of the German émigré Francis Lieber, beginning about the time that his acquaintance, Alex de Tocqueville, visited America. Tocqueville had noted that the new world of American democracy demanded a "new science of politics," and Lieber can reasonably be designated the founder of American political science. There was already a nascent program of civic education within the traditional American college and university curriculum; Lieber focused on expanding this field of study by integrating German philosophy and images of world history, particularly with his *Manual of Political Ethics* published in 1839. He applied that philosophy to the circumstances and traditions of the United States and to devising a solution to the perennial democratic paradox of a people ruling themselves and yet being ruled by a central government. His adaptation of the German philosophy of the state in his 1853 *Civil Liberty and Self-Government* paralleled the work of individuals such as the German theorist Johann K. Bluntschli, who wrote *The Theory of the State*, and, for nearly a century, it provided the intellectual, institutional, and professional foundation of academic political inquiry in the United States.

In 1857, Lieber was appointed the first professor of political science at Columbia College in New York. Second generation theorists perpetuated and refined his work, including Theodore Woolsey at Yale, Herbert Baxter Adams at Johns Hopkins, and, above all, John W. Burgess, who was Lieber's successor at Columbia. Lieber, and the later American state theorists, who were educated abroad and imbibed the German paradigm of *Staatswissenschaft,* created the image of a democratic people as well as a history of democratic institutions that sprung from ancient Teutonic origins, passed through English government, and culminated in the American polity. Although Americans had at first been wary of the word *democracy*, it had, by the middle of the nineteenth century, been largely divested of its radical overtones and become a general term of approbation in the United States as well as in many places abroad.

Unlike some of his European counterparts and correspondents, such as Edouard Laboulaye in France, as well as the American historian George Bancroft, who all commented extensively on American political society and contributed significantly to the nineteenth-century democratic narrative, Lieber still feared "democratic absolutism" and, like Toqueville, majoritarian rule. He inveighed against ideas such as women's suffrage and tended to eschew the word *democracy* in favor of phrases such as *self-government* and *hamarchy,* by which he basically meant representative institutions. His vision of the state, however, was essentially that of an associationally and institutionally diverse but organic people and its pedigree, which gave theoretical substance to the idea of democracy.

Although the "state talk" of nineteenth-century political inquiry, as well as that of public intellectuals such as Orestes Brownson and Elisha Mulford, paralleled the discourse of democracy in political life, it remained, like many later constructions of political science, far removed from the language of politics in the United States. The most essential feature of the concept of the state during this long and formative period in the evolution of American political science was that it did not refer either to forms of government or to the institutions of government, but rather to a primordial community whose voice expressed a will and interest represented by the agency of government but which preceded, in both time and authority, both the Constitution and the government.

This vision often reflected and abetted the conservative ideology of theorists such as Burgess, who wished to propagate and justify limited government as well as to curtail democratic populism while maintaining the ethic of popular sovereignty. It was also, in some ways, both inspired by, and functioned to legitimate, the cause of the Union before and after the U.S. Civil War (1861–1865). However, social scientists on the political left also embraced this vision, such as the economist Richard Ely, who perceived the state as authorizing government intervention in social life. The theory of the state provided a scientific identity for the discipline and sublimity for its subject matter, but, above all, it offered a distinct answer to the congenital paradox of American democratic theory. It was an answer that extended well into the Progressive Era after the turn of the century.

In *Political Science and Comparative Constitutional Law* (1891), Burgess validated this picture with a singular and ingenious account of American history. He argued that modern states, and particularly the United States, were prime examples of those founded on a national unity and that they represented a self-conscious democracy that was the apex of political history. Nations, as ethical and geographical units tended, at least in the West, to become states; that is, a people with a government—and the highest examples of the latter were those that had achieved the popular or democratic form.

The aim of Burgess's interdisciplinary School of Political Science at Columbia (1880) was both to educate an American administrative and political elite and to influence government policy. The imprint of this curriculum is still evident in contemporary political science programs, and Columbia produced the first professional journal of political science, *The Political Science Quarterly* (1886), which was devoted to the assumption that the "domain of political science" was the study of the state and that among the social sciences concerned with this subject, political science occupied the dominant position. Similar institutional developments took place under Herbert Baxter Adams at Johns Hopkins University, which published *Studies in History and Political Science* and was the site of the first professional political science association. In Europe, institutions such as École Libre des Sciences Politiques in France and the London School of Economics in Britain were established. By this point, political scientists were still not always clearly distinguished from historians and economists, but the theory of the state primarily bound them together.

The third generation of political scientists, which included Bernard Moses at the University of California at Berkeley, Woodrow Wilson at Johns Hopkins and Princeton University, and W. W. Willoughby at Johns Hopkins did much to institutionalize the field of political science in American universities during the last years of the nineteenth century and early years of the twentieth century. By the last decade of the 1800s, however, a significant theoretical transformation began to take place. Theorists such as Wilson (*The State,* 1889), continued in many ways to affirm some aspects of the traditional theory of the state, but they also began to blur the line between state and government. The problem, in a country of great and increasing complexity and multiplicity, was to specify the locus of the invisible community that putatively constituted the American people, and, eventually, no one did more than Willoughby (*An Examination of the Nature of the State,* 1896) to empty the word *state* of its original theoretical meaning and transform it into an analytical or juristic category and synonym for government. This, however, precipitated a crisis in democratic theory.

Although it is often assumed that there was a fundamental break between the state theory of the nineteenth century and the conceptions of both political inquiry and politics embraced by early twentieth-century political scientists, the continuities in many respects exceeded the innovations. One might very well ask how the largely conservative academic culture that dominated nineteenth-century universities, such as Columbia, produced the progressive reform-minded scholars, such as the historian and political scientist Charles Beard and, particularly, Charles Merriam, who might well be considered the father of twentieth-century political science and who contributed so significantly to transforming the discipline. In addition to retaining commitments to the idea of scientific inquiry and its application to practical ends, one thread of continuity was a persistent belief in, and dedication to, the national state as encompassing both government and community. During the early part of the twentieth century, Progressive politics and political and social thought continued to be predicated on the belief, such as in the case of the sociologist Charles Horton Cooley in *Social Organization: A Study of the Larger Mind* (1909), that there was an incipient national political community or, like Herbert Croly in *The Promise of American Life* (1910), that such a community could be created and mobilized, and in whose name government could legitimately and authoritatively act. It was, however, from both traditional state theory and the Progressive vision that a new account of democratic government in America emerged. The decline of the state as a theory of democracy paralleled the beginning and evolution of the theory of democratic pluralism and the account of science and forms of research that the latter entailed.

During the last years of the nineteenth century, professional social science associations began to break away from the umbrella of the American Social Science Association (ASSA) and to affiliate more directly with academic institutions, under the assumption that this would provide scientific authenticity and authority. The American Political Science Association (APSA), under the leadership of individuals such as Willoughby

and its first president Frank Goodnow was formed in 1903, when it broke from the American Historical Association, and the *American Political Science Review* (*APSR*) began publication in 1906. The practical concerns of the previous generation were perpetuated in the creation of this organization, but it represented an emerging progressive ideology and a commitment to endowing the discipline with greater scientific authority. This was achieved by embracing what were viewed as the methods of modern empirical science. For individuals such as Wilson and Goodnow, who were dedicated to more efficient and effective government, these goals were still ultimately practical. There was, however, something of a theoretical hiatus regarding democracy and the nature of politics as the original concept of the state continued to wane, and, at the same time, departments of political science and government continued to emerge at major university systems such as California, Illinois, Wisconsin, Harvard, and Stanford.

PLURALISM AND THE LIBERAL SCIENCE OF POLITICS

The demise of the theory of the state was in part a reaction—in the context of World War I (1914–1918)—to its German origins, but it was also a consequence of the dimming Progressive hope to awaken or create a democratic public that could rise up and take power back from corrupt politicians and a capitalistic economic hegemony. Social scientists, in the wake of immigration and growing cultural and class differences, became overwhelmed with evidence of social and economic diversity and contentiousness. There was an increased sense that there was no homogeneous American public, but rather only complex congeries of interests and groups. In 1907, Harvard historian Albert Bushnell Hart noted that even though the idea of the state as the basis of a theory of popular sovereignty seemed to still hold sway, it really did not fit the present circumstances of American politics. Although he expressed faith that America was a democracy, he could no longer account for it theoretically.

To provide such an account was thus the task of pluralist theory as it evolved during the first third of the twentieth century. Individuals such as Lawrence Lowell (*Public Opinion and Popular Government,* 1913), and, later, Walter Lippmann (*The Phantom Public,* 1925) questioned the existence of an actual public or even the reality of a public opinion that commentators such as James Bryce (*The American Commonwealth,* 1890) had emphasized as constituting the heart of democratic society in America.

Despite the publication of William James's *Pluralistic Universe* in 1904, the term *pluralism* had not entered the discourse of American political science in any substantial manner by the early twentieth century. Although Arthur Bentley's pointed critique of the concept of the state and his analysis of interest groups as the essence of politics, in his 1908 *Process of Government,* would become a central reference for later pluralist theory, it had very little immediate impact, and Bentley never employed the term *pluralism*. It was during Harold Laski's brief sojourn in the United States after World War I that the

term was introduced as part of his attack on the idea of state sovereignty and centralized authority, and his propagation of the notion that the state was merely one association among many in society. Laski's principal concern, as in the case of Tocqueville, was his own country, but he, as well as other English theorists such as Ernest Barker and A. D. Lindsay, helped instigate a debate about pluralism that focused on whether political reality consisted of anything more than an endless process of group interaction, with the government functioning as an arbiter, and whether this could add up, empirically and theoretically, to democracy. It was difficult, however, for American political scientists to give up the idea that the state was nothing more than government and that government was not the agent of a general popular will.

Charles Merriam embraced certain democratic values associated with cultural diversity and political pluralism, but he was equally impressed with the divisiveness inherent in such difference and with the antidemocratic sentiments and practices of certain groups. He retained the assumption that democracy ultimately required unity, even if, in his view and that of his student Harold Lasswell, it was necessary to introduce it from the top down through social control, civic education, and even the judicious use of propaganda. They transferred their hopes for a democratic society to the actions of governmental elites informed by social scientific knowledge, but no articulate image of American democracy and the American political system appeared, for example, in Merriam's principal work of this period, particularly *New Aspects of Politics* in 1925, even though he sponsored much of the research and modes of inquiry that seemed appropriate for a changing image of politics.

The strongest riposte to the normative theory of pluralism associated with Laski and other writers of the period, as well as to empirical political scientists and sociologists whose work increasingly lent support to the notion that politics was irreducibly pluralistic, was the work of William Yandell Elliott in *The Pragmatic Revolt in Politics* (1928). He spoke for many of his generation when he argued that to give up the concept of the state as an organic public was, in effect, to give up democracy as well as the autonomy of political theory and political science. Elliott did not reject the reality of pluralism, but he believed that it tended to undermine the communal basis of democracy. He argued that in an age dominated by empiricism and pragmatism, as well as by the threat of fascism and communism, it was still possible to perceive and believe in what he called a *co-organic* community in American political life, which was the basis of constitutional government. It was difficult, even for someone such as John Dewey (*The Public and its Problems,* 1927)—who along with Laski, Elliott perceived as a purveyor of relativism and its destructive implications for democracy—to sever the idea of popular government from the existence of a national community that transcended the complexity of modern "great society."

By the end of the 1920s, however, the concept of pluralism had become Americanized and formed the basis of an empirical account of American politics and a normative image of democratic practice. This closely connected to work by G. E.

G. Catlin, a transplanted British scholar who championed both pluralism and the work of Merriam, in *The Science and Method of Politics* (1927). For the first time since Madison, a description of social diversity and conflict and of group pressures on government was transformed into a theory of popular government that would provide much of the content of a new and widely embraced image of democratic identity.

The group theory of political reality subsequently became deeply entrenched in political science as it evolved into an argument about how the process of interest group politics constituted a form of democratic interaction and representation. This had been implied by the early research of individuals such as Pendleton Herring (*Group Representation Before Congress,* 1927), but, during the late 1920s and early 1930s, a number of individuals such as Peter Odegard (*The American Public Mind,* 1930) and John Dickinson ("Democratic Realities and Democratic Dogma," *APSR,* 1930) elaborated a pluralist theory of democracy containing all the essential theoretical elements that were rearticulated and reconstructed a generation later in the work of individuals such as David Truman and Robert Dahl.

At the core of this theory was the claim that all societies consisted of groups seeking their own self-interests and that this, at any stage of social evolution, required mechanisms for compromise and adjustment. In the context of modern society, such adjustments were achieved through the medium of government, which functioned as an umpire acting in response to the needs of the situation and with respect to matters of intervention and control. It was through participation in groups that individuals realized their goals and achieved identity, and it was through groups gaining access to influence, more than through formal institutions, that democratic representation was most essentially effected. Stability in society was achieved through a balance of conflicting social pressures constrained by appropriate enabling institutions and a basic consensus on the rules of the game. Majoritarian democracy was viewed as a myth that belied the fact that majorities were little more than aggregations of individual preference that were democratic only in the sense that they had the capacity to effect a circulation of elites through elections.

From the 1920s to the 1940s, political science continued to be institutionalized and expanded as a part of higher education in the United States, and during this period, membership in the APSA tripled. The work of Merriam and Lasswell at the University of Chicago represented the most important developments in the field, but early forms of political science were emerging in England, France, and Germany. During the latter part of the 1930s, there was little in the way of a further explicit statement or elaboration of pluralist theory, but it became, in both politics and the academy, the basis of an account of the United States as a democratic society, and it was advanced as distinguishing the American polity from the growing number of totalitarian regimes, which seemed to be characterized by excessive unity. The name for this new democratic identity was liberalism, and the manner in which pluralism was transfigured as liberalism is a crucial chapter in the story of the evolution of democratic theory in American political science.

Although common in Europe, the term *liberalism* had seldom been systematically invoked in either U.S. politics or political science before the 1930s. Politicians such as Woodrow Wilson and Franklin Roosevelt began to court this label for a variety of policy initiatives, and everyone eventually adopted this synonym for democracy. A variety of individuals, including Herbert Hoover, claimed to be the "true" liberal, but Roosevelt won the title, and his opponents eventually accepted the name he had originally pejoratively bestowed upon them—conservatives. The term *liberalism* gravitated into the language of political science, often via those such as Dewey who were sympathetic to the New Deal, but eventually political theorists such as George Sabine in his paradigmatic *A History of Political Theory* (1937) emptied the concept of its concrete political meaning and began writing the history of Western political thought and institutions as a story of the progress of liberalism. This story found full expression in American society despite the temporary aberrations of totalitarianism. Although there continued to be a certain correspondence between the academic and lay visions of liberalism, two quite distinct traditions of discourse began to evolve as liberalism, in the language of political science, was reified, provided with a philosophy and history, and reimposed as a description of American politics.

To the extent that liberalism had a definite conceptual meaning in the literature of political science and political theory, other than a name for American government and society, it tended to be pluralism and attending values such as individualism, social freedom and difference, bargaining, and compromise. Philosophers such as T. V. Smith (*The Promise of America,* 1936) took the position that what characterized democracy was less any absolute doctrine and regime than a commitment to toleration and the propagation of diversity within a procedural framework for settling conflicts. By the early 1940s, the basic elements of this vision were extracted from the research of mainstream political science, systematized by individuals such as Pendleton Herring, and presented as the *Politics of Democracy* (1940). Herring saw his task as taking all that was often considered bad about politics—from pressure groups to bosses and soft money—and demonstrating that they were all, if understood scientifically, part of a democratic process. One reason for the rearticulation of pluralism qua liberalism was to provide a response and counterideal to the doctrines of totalitarianism. For Lasswell, political science continued to be part of what he titled in a 1942 essay "The Developing Science of Democracy."

THE BEHAVIORAL ERA AND THE RECONSTITUTION OF SCIENCE AND DEMOCRACY

Even as the discipline of political science was expanding in the United States after World War II, it was proliferating abroad. In 1949, the International Political Science Association formed in Paris, which brought together national associations from numerous countries in Europe and elsewhere. The emerging national forms of the discipline were in many respects increasingly responsive to and reflective of the social and cultural

milieu in which they were situated, even though the American commitment to empirical and quantitative studies was widely accepted and promulgated along with more traditional historical and institutional forms of research. In the United States, David Easton's *The Political System: An Inquiry into the State of Political Science* (1953) set the agenda for the next decade by defining political science as the study of the "authoritative allocation of values" and making the case for moving beyond mere factual research and historical and traditional institutional forms by advancing empirical theory and adopting the methods of natural science. The behavioral "revolution," for which Easton was often the principal spokesperson, transformed the practice of political science and increased the substantive and methodological contributions on a variety of subjects, including survey research and voting behavior. It was, however, less a revolution in many respects than a recommitment to the visions of both the scientific study of politics and liberal democracy that had informed the discipline for nearly a half century; it was also, in part, a response to the first significant challenge to those visions.

By the 1950s, the academic image of liberalism had become increasingly dominant as such individuals as Daniel Boorstin (*The Genius of American Politics,* 1953) and Louis Hartz (*The Liberal Tradition in America,* 1955) set out to demonstrate that although there might not be an American public, there was a historically rooted liberal value consensus and tradition that gave credence to the concept of *e pluribus unum*. This notion of a liberal consensus that transcended and reconciled group differences became an essential element of the revived group theory of politics. The continuing attempt to give meaning to the idea of liberalism, and to equate liberalism with democracy, was, however, catalyzed and galvanized by a persistent but often still somewhat submerged attack on liberalism. This began to influence what had been, since the 1920s, a thoroughly American political science. By the 1950s, liberalism became a highly contested concept in American politics because of both doubts about interventionist government and events such as the McCarthy hearings. For quite different reasons, it was also losing its positive valence in academic discourse as a critique of liberal democracy and political science began to infiltrate the discipline and form a counterpoint to the postwar behavioral movement in political science, and its rededication to a scientific study of politics based on emulating what was assumed to be the methods of natural science.

This critique, largely conceived and mounted by émigré scholars, was gaining a place in the literature of political theory, and it was manifest in journals such as the *Review of Politics,* with its theological antiliberal perspective, as well as in the perspective of University of Chicago president Robert Hutchins and those involved in the Committee on Social Thought at the institution, who set themselves directly against the traditional Chicago image of social science. A new mode of political theory emerged that eventually led a number of scholars to choose between political science and political theory. The confrontation between this critique and the reconstituted pluralist account of liberal democracy in political science comprised the dialectic of democracy in the postwar generation. At this point, what separated mainstream political scientists from political theorists was less a commitment to science opposed to a commitment to normative theory than two quite different ethical positions revolving around the issue of democracy.

The predominantly German scholars who emigrated to the United States beginning in the 1930s were in many respects a philosophically and ideologically diverse group that included Hans Morgenthau (*Scientific Man and Power Politics,* 1946), Eric Voegelin (*The New Science of Politics,* 1951) Leo Strauss (*Natural Right and History* 1953), Hannah Arendt (*The Human Condition,* 1958), and members of the neo-Marxist Frankfurt school such as Herbert Marcuse, Theodor Adorno, Otto Kirchheimer, and Max Horkheimer. They shared a suspicion of liberalism, which they believed was philosophically flawed as a political theory and an inherently pathological political form that represented political institutions. These institutions historically were the threshold of totalitarianism, as in the case of Weimar Germany. This form of antimodernism, rooted in the politics and intellectual context of early twentieth-century Germany and in various transcendental philosophies and socialist thought, was a strange and difficult body of ideas for Americans to absorb. These theorists, who rejected scientism and were wedded to images of the decline of Western civilization, represented a profound challenge to a conception of democracy based on commitments to empiricism, relativism, liberalism, and historical progress. These commitments had characterized American political science for half a century. By the end of the 1950s, the work of these foreign scholars largely began to define the subfield of political theory, which heretofore was an integral dimension of mainstream American political science and the principal vehicle of its vision of democracy. This challenge, coupled with the continuing concern about presenting a coherent image of democracy as a counterpoint to totalitarianism, prompted the postwar reconstitution of group theory and the pluralist account of democracy.

David Truman's *The Governmental Process* (1951) and Earl Latham's *The Group Basis of Politics* (1952) revived the relevance of Arthur Bentley's work, and Robert Dahl's *Preface to Democratic Theory* (1955) established the genre of empirical democratic theory, which was devoted to vouchsafing the image of pluralist democracy. The latter work was in one respect less a "preface" than an "epilogue" and codification of ideas that, during the 1930s, had become an essential part of the identity of political science. Dahl returned to Laski's and Barker's term *polyarchy* as a synonym for a form of democracy that Dahl contrasted both with majoritarian, or *populist*, types and with what he claimed was Madison's excessive emphasis on constitutional checks and balances at the expense of adequate attention to the informal and social dimensions of group interaction where, in effect, minorities ruled. In *Who Governs* (1961), Dahl explicitly embraced the term *pluralism*, and his theory of pluralist democracy was offered in part as a counter to the claims about elitism and the structure of community power advanced by individuals such as C. Wright

Mills in *The Power Elite* (1956) and various sociologists such as Floyd Hunter. Yet it was also an attempt to systematize and accentuate an image of Western liberal democracy during the cold war that supported the faith of those who opposed the political ideas and institutions of the East. Dahl, like those after him such as Gabriel Almond and Sidney Verba (*The Civic Culture,* 1963), argued that study should begin by examining the character of those countries known to be democracies and by extracting an empirical basis for a normative theory that, Dahl claimed, was most fully represented in the "American hybrid."

A wide range of political theorists in the 1960s, however, perpetuated the critique of liberalism and pluralism. The "end of ideology," that had been proclaimed by sociologists such as Daniel Bell and Seymour Martin Lipset as the future of the dominance of pluralist liberal democracy, failed to materialize. While the debate precipitated between political theory and behavioral political science during the 1960s is often represented as a conflict between "scientific" and "traditional" theory, the underlying issue was the nature of democracy. The émigré-inspired critique was at this point joined by theorists such as Sheldon Wolin (*Politics and Vision,* 1960) as well as by the persistent progressive statist countertradition that had remained alongside pluralist theory in political science. This was now represented in a new form by individuals such as E. E. Schattschneider (*The Semisovereign People: A Realist View of Democracy in America,* 1960). Schattschneider argued that interest group politics had an upper-class bias as well as a corrosive effect on party democracy. Grant McConnell (*Private Power and American Democracy,* 1966) and Theodore Lowi (*The End of Liberalism,* 1969) mounted sustained attacks on what they claimed were the democratic and institutional pathologies of the theory and practice of *interest-group liberalism*. Despite their similarities, the critiques of behavioralism and liberalism that were inspired by the émigré theorists and those that were rooted in the American tradition were sometimes uneasy allies, such as in the Straussian-inspired *Essays on the Scientific Study of Politics* (1961). Yet, a growing intellectual split between political theory and mainstream political science characterized the 1960s and evolved through the 1980s.

FROM POSTBEHAVIORALISM TO THE TWENTY-FIRST CENTURY

Although Dahl had proclaimed in 1961 that it was possible to write the essay "An Epitaph for a Monument to a Successful Protest" with respect to the behavioral movement, both the commitment to pure science and the pluralist theory of democracy continued to be the target of widespread criticism from political theorists and a number of more mainstream political scientists. This dissatisfaction sprang, in part, from what seemed to many to be political science's lack of relevance for, and attention to, political events such as the Vietnam War, the crisis of American cities and problems of civil rights, and cold war politics. The Caucus for a New Political Science challenged the authority of the APSA, and in 1969 Wolin pitted the "vocation of political theory" against what he claimed was the apolitical "methodism" of behavioral political science.

At the same time, APSA president-elect Easton repudiated the tenets of much of what had represented the behavioral movement when he announced a "new revolution in political science." This was to be a *postbehavioral* revolution, which would recognize the deficiencies of the pluralist theory of democracy and embrace a new "credo of relevance," giving precedence to research on pressing contemporary political issues rather than to the immediate advancement of scientific theories and methods.

By the early 1970s, concerns about practical issues led the mainstream discipline to seek an identity for the postbehavioral era with a return to what Lasswell had championed as policy science. A more ecumenical spirit was apparent as the debate about behavioralism wound down and the issue of maintaining professional inclusiveness became more prominent. Although the controversy about behavioralism had created an intellectual breach between mainstream political science and the subfield of political theory, it also had the effect of relocating, or dislocating, the discussion of American political identity and democratic theory. While political science continued, in various ways and degrees, to validate the traditional liberal vision, it tended to concede to political theory the role of normative theorizing after the 1970s. The conversation about democracy and liberalism increasingly became the property of the interdisciplinary and relatively autonomous enterprise of political theory. It subsequently absorbed into an eclectic conversation, determined more by reigning academic philosophical authorities than by any direct relevance to the particularities of American politics. Debates about liberalism became a large part of the focus of political theory, while political science as a whole and political theory as a subfield became increasingly pluralized.

By the mid-1980s, it was increasingly difficult to speak in general of political science as a discipline and of the history of the field as a whole. Although the debate about behavioralism had fractured the field, it had also constituted the terms of a common conversation that in some respects defined the discipline. The need to recognize the growing distinctions among national practices of political science accentuated the centrifugal forces of specialization, increased concerns about social and gender diversity within the profession, and other internal tendencies toward pluralization in the field. In 1982, the IPSA Study Group on the Comparative Sociology of Political Science was formed, and in 1986 the International Committee for the Study of the Development of Political Science supplemented it. These two groups merged in 1988, forming the IPSA Research Committee for the Study of Political Science as Discipline, which was formally recognized as an IPSA Research Committee 33 (RC 33) in 1989. Since its formal establishment, RC 33 has been active in all of the IPSA congresses, and it has also undertaken a number of intercongress workshops, conferences, research projects, and publications devoted to the study of the history and character of political science in various countries and to features common to the field as a whole. The research sponsored by this endeavor clarifies that political science is no longer simply the American science of politics.

The beginning of the 1990s was a watershed for political science. The public policy orientation inspired by the events of the 1960s had begun to fade, and many believed that the growing popularity of what Anthony Downs had referred to with the title of his 1957 book *An Economic Theory of Democracy* (1957), and what came to be referred to as *rational choice analysis,* promised a new methodological basis for disciplinary identity as well as a reconstruction of democratic theory. This trend, however, was paralleled and challenged by those who had begun to advocate new directions in institutional and historical research, such as Peter B. Evans, Dietrich Rueschemeyer, and Theda Skocpo in *Bringing the State Back In* (1985). There were calls for more diverse approaches to the study of politics as the enthusiasm for rational choice declined, illustrated with Kristen Monroe's compliations in *The Economic Approach to Politics: A Critical Assessment of the Theory of Rational Choice* (1991). The collapse of communism and the bipolar world of the cold war also heightened the sense of plurality as the basic condition of politics and political science, and it catalyzed a renewed concern with the theory of democracy as a variety of national communities sought to define and redefine themselves as democratic societies. In this context, pluralism emerged once again as a dominant theme. Not only had politics become internationally more diverse, but concerns about multiculturalism and philosophies such as postmodernism accentuated the value and reality of diversity.

After its intellectual estrangement from mainstream political science, a unifying and driving force in the increasingly dispersed conversation of political theory continued to be a critique of the liberal and pluralist visions of democracy and an attempt to resurrect some version of participatory democracy. By the early 1990s, however, there was a subtle, but in some ways quite fundamental, shift in perspective. Although the idea that democracy must be rooted in unity was still evident in the work of individuals such as Robert Putnam in *Bowling Alone* (2000), who stressed the importance of "social capital" and a communal basis of democracy, the concept of pluralism once again appeared in the discourse of political theory as the centerpiece of the democratic imagination. The concept was seldom that of the interest-group liberalism of the 1950s, but theorists such as Dahl and Charles Lindblom maintained their faith in social diversity as the ultimate value of democracy. Both Rawls (*Political Liberalism,* 1993) and Jürgen Habermas (*Facts and Norms,* 1992) manifested an increased acceptance of the social realities of liberal democracy, and the many and various versions of deliberative and radical democracy embraced the ethic of pluralism.

The new pluralism, like the emergence of the old pluralism, seems in large measure to be a response to the realities of the sociology of contemporary society. Dahl took it as a virtue that in a polyarchial society one might say that no one governs or that minorities govern, but the problem always was that if this is the case, then it also means that democracy, as the mediation of public decisions through the general citizenry, is difficult to identify. Plurality, one might argue, is surely a necessary condition of any realistic concept of democracy, but it may not be a sufficient condition. In the last analysis, the philosophical reconciliation of pluralism with democracy has been no easier than it was at the time of Madison.

By the beginning of the twenty-first century, it was difficult to discern any clear basis of unity in the discipline, despite a persistent faith that there is an overall identity attaching to the field. This is illustrated by editors Ira Katznelson and Helen V. Ingram, in *Political Science: The State of the Discipline* (2002), and by the end of the first decade, it was still not easy to specify what trends may be most significant. The subfield of political theory continues to be quite intellectually disjoined from the mainstream discipline, and a subfield such as international relations often seems to embrace a relatively independent agenda.

In the United States, concerns about methodological diversity and practical relevance surfaced once again in what came to be known as the *perestroika* debate, but the issues often appeared more professional than intellectual and political. The discipline's origins were closely tied to a definite practical mission of political reform and political education, and the relationship between political science and politics remains unresolved. In addition to noting the continuing tendencies toward specialization within and among subfields, as editors Robert Goodin and Hans-Dieter Klingemann put forth in the 1996 *A New Handbook of Political Science,* it is necessary to recognize that in taking account of the history and current practices of the field, the story of political science, despite some continuing intimations to the contrary, is no longer simply the story of the American science of politics.

Political Science Associations

Political scientists began to organize in professional associations in early twentieth century, and the oldest political science association in the world is the American Political Science Association (APSA), which was founded in 1904. At present, APSA includes more than fifteen thousand members in more than eighty countries. APSA's principal objectives are to expand awareness and understanding of politics, and to support political science education and professional development of political scientists. APSA's membership is individual, departmental, and institutional, and the association publishes a number of professional publications. APSA more recently emphasizes teaching political science, a global professional trend that recognizes the importance of not only political knowledge, but also the most efficient transmission of that knowledge.

The International Political Science Association was founded under the auspices of the United Nations Educational, Scientific and Cultural Organization (UNESCO) in 1949 in Canada, and it has consultative status with the Economic and Social Council of the United Nations (UN) and with UNESCO. Its annual conference brings thousands of participants together to discuss current global themes and issues in politics and political studies.

The European Consortium for Political Research (ECPR) is another major international political science association with a membership of eight thousand political scientists in more than three hundred institutions throughout Europe and beyond. It offers workshops, conferences, research sessions, and summer schools, and it produces numerous professional publications. ECPR includes standing groups, including one on international relations and the recently associated European Political Science Network (*eps*Net) that works to develop political science teaching in Europe. This launched in June 2001 as a successor to the former European Thematic Network in Political Science and is designed to promote political science in Europe, and to cater to the interests of individual political scientists, academic institutions, and other bodies concerned with teaching of the discipline in Europe. The principal professional achievement of the European Political Science Network has been providing a coordinated core political science curriculum within the European Bologna reform of higher education.

The trend of organizing at the continental level has also gained ground in other countries. Africa recently founded the African Political Science Association, which has similar objectives to other international professional associations in political science. Similarly, the Asian Political and International Studies Association promotes research, teaching, and cooperation in political and international studies. There is also a Latin American Political Science Association. Some international political science associations focus on a particular subdiscipline within political science, such as the International Studies Association or the Network for European Social Policy Analysis, and political science students also have their own international association called the International Association for Political Science Students.

There is a national political science association in the majority of countries, but these associations differ in membership, ambitions, and activities. For example, the British Political Studies Association has several thousand members, while smaller countries with fewer universities have national political science associations that include only a few dozen professionals and political science alumni. In the European Union (EU), several national political science associations have recently founded a standing conference upon the initiative of the European Political Science Network to discuss common professional issues and explore synergetic solutions for the Bologna reform, professional accreditation, research funding, the situation of women political scientists, and other issues. The Central European Political Science Association also organizes annual professional conferences where political scientists from the region discuss relevant academic and professional issues. The Nordic Political Science Association represents a similar regional attempt at cooperation of national political science associations in Europe.

Several competitive international political science associations provide welcome alternative options for political scientists worldwide to connect, find forums to present their academic findings, and join international projects and initiatives. International political science associations make it easier to discern trends in the discipline and compare various approaches to political science research and teaching. Via international political science associations, political scientists worldwide are able to compare their professional situations, learn about good practices to adapt to their specific professional environments, and jointly influence political decisions related to scientific research and the educational sphere.

Political Science Journals

Whenever political scientists read newspapers, they are working—that is, doing their job by gathering facts and declarations related to current public affairs and trying to understand the mechanisms and formations of public opinion. But apart from these easily accessible media that reach a wide audience, there are, as in any discipline, academic journals in the field of political science.

Political science journals are distinct from political magazines and newspapers because these academic publications usually try to understand political phenomena or governance in theoretical, comparative, or historical terms. The methodological dimensions of a given research—quantitative, qualitative, or comparative—are also highlighted in every article. All manuscripts submitted to these journals are usually peer-reviewed, that is, read, evaluated, criticized, and finally approved or rejected anonymously by colleagues in the field. This evaluating process, borrowed from the exact sciences, is the guarantee for scientific accuracy and renewed knowledge in the discipline; it is seen as the best way to avoid personal conflicts and local cliques.

In terms of accessibility, hard copies of academic journals in political science typically are not found in newsstands or general bookstores, but usually in university bookstores, specialized libraries, or through subscriptions. The Internet allows potential readers to browse selected pages from a given journal at no cost through a publisher's Web site or through a library that subscribes to a group of selected journals. Of course, readers who are willing to pay can download articles from many academic journals.

Usually, most countries with universities have at least one national political science journal, labelled as such. For example, there are the *British Journal of Political Science* and the *Australian Journal of Political Science,* but there are also many bilingual publications that offer wider perspectives like the *Canadian Journal of Political Science/Revue canadienne de science politique,* which carries articles and book reviews in English or French. The *Swiss Political Science Review* offers articles in four languages: French, German, English, and Italian. Even though English is not an official language in Nordic countries, the journal *Scandinavian Political Studies* is published in English. Of course, a national journal does not automatically exclude foreigners from submitting manuscripts to them; but in some cases, national journals are likely to prefer submissions related to their own country when coming from abroad, while considering almost any related topic from their "insider" authors.

THE RISE OF PRIVATE PUBLISHERS

The last twenty years have witnessed the expansion of many private publishers, such as Routledge, Routledge, and SAGE, which compete with university presses like Cambridge, Oxford, and Duke in creating dozens of new interdisciplinary academic journals in specific domains related to globalization, public opinion, international relations, or political theory. For example, some Routledge journals such as *Global Society: Journal of Interdisciplinary International Relations* and *Journal of Transatlantic Studies* offer more intersections with other dimensions like culture and ethnicity. In recent years, some new electronic journals, such as the *European Journal of American Studies,* are available exclusively through the Internet, which means there is no equivalent version published in hard copy. However, these high-standard e-journals that are sometimes accessible for free often follow the same peer-reviewing process as their predecessors.

While many academic journals fight with limited resources and require efforts from volunteers, others benefit from generous financial support or are published through governmental agencies. This was the case for the journal *Problems of Communism,* a professional publication about communist regimes produced since 1952, with the financial help of the United States Information Agency. Copies were sent free of charge to many libraries and samples of the journal were available in some U.S. consulates. Since 1992, this publication changed its name to *Problems of Post-Communism.*

Some political science journals have an enviable reputation because they are considered more influential, mainly because of their severe criteria for selecting manuscripts, or because they are more often quoted by scholars. Academic journals are like the battlefields of the "publish or perish" motto that hinders many scholars. Many academics in political science are especially obsessed with the place where their articles appear—they value the journals that have an international audience, that are often quoted, that receive high levels of funding, and that emerge from prestigious universities. Some scholars even argue that an article published in a very prestigious journal is more important in terms of achievement, visibility, and promotion than if the same text had appeared in a lesser-known, peer-reviewed publication. There are even statistics relating to a journal's visibility, its circulation, and the reference tools and databases that index its articles. As a consequence, some high-profile journals receive a very large amount of submissions and their ratio of acceptance remains minimal; this phenomenon intensifies the urge of some scholars to have their papers published in the journal that keeps only the top papers.

DISTINGUISHING ATTRIBUTES

Many political science journals also include book reviews, while others only focus on peer-reviewed articles. Because publishing peer-reviewed articles is valued in the academic community, in terms of funding and academic promotion,

some other aspects related to journals are seen as less important, such as being the editor of a journal, doing peer reviews, or writing book reviews.

A scholarly journal offering a handful of trendy articles may have many strong points, but a book review section can be seen as an essential window to the academic world. Because scholars cannot buy or even read everything that is published in their domain of expertise, they can rely on the recommendation of other colleagues. Carrying a generous and diversified section of book reviews can make the difference between the average journals and some upper-grade publications. Academic journals that carry only peer-reviewed articles focusing on tiny aspects of the current research may not be as valuable for the audience; readers, students, and scholars benefit from being informed about what colleagues write and which theoretical trends they are borrowing, criticizing, or adopting. Book reviews are essential not only for the concerned authors and publishers, but also for academic life itself, as they remain the best way for a political scientist to be aware of what is going on inside the discipline and outside usual networks. Given their short format, most book reviews can provide a neutral perspective on a book, which is useful because most bookstore employees and librarians are often too busy to operate this type of preselection of ideas, essays, and thesis.

Apart from book reviews, a journal may offer review essays, comparative articles among books on a related theme or by the same author. The advantage of a review essay is that it offers multiple book reviews, followed by an evaluation of the appropriate audience for each title, providing indications about how each book may complement the others. Other journals may offer a forum section in which several scholars review one book, followed by comments written by the book's author. Although book review sections are complicated to manage in terms of correspondence and deadlines, these examples illustrate how scholarly journals can be more than just a juxtaposition of cutting-edge articles between two covers.

Political Sociology

Political sociology is politics studied sociologically. More specifically, it is politics as the practice of power, as this has typically been defined sociologically, that is, in terms of social relations. Most famously, Max Weber (1968) defined *power* as a probabilistic social relation between hypothetical actors A and B, as the chance of A realizing A's will over the resistance of B, despite B's resistance. In so defining power, Weber defines it as a social relation and, thus, in terms of a defining concept of sociology.

More generally, the social relational study of politics encompasses both aggregate dyadic relations, such as the impact of society on state, and more complex relational patterns involving relations among multiple political actors, such as the differential impacts of actors on each other via the consequences of their differential impacts on the state. It further involves not only interrelations of discrete actors but also consideration of such interrelations in the context of institutions and social structures themselves, conceptualized as patterns of social relations.

SOCIOLOGICAL DEFINITIONS AND THEORIES OF POLITICS

Prominent alternative sociological definitions of politics that have not been explicitly social relational tend to emphasize power as a capability and then highlight organizational or group capacities, or they tend to study actors as incumbents of political institutions. Psychological approaches and other centrally individualistic approaches to the empirical study of politics, such as some economic ones, tend to be social psychological; that is, they typically examine people in terms of their roles within particular social contexts (e.g., as voters in polyarchal electoral systems). Economic theories of politics likewise do not escape specification of action to particular institutional settings. However, these enter as rather broad conditions for choice.

Commonly, sociological theories of politics tend to reflect specific forms of social relations in particular societies, institutions, and organizations. They are often "societal" in the sense that they trace causes of states and the actions of state incumbents to forces in the societal contexts of states, for example, to Marxian classes or Weberian parties, groups or voters, and economic or cultural forces in the state's environment. Sociological theories of politics also are often sociological in the sense that they have state or polity theories centered on states as substantially autonomous social institutions. This is true both for an older, *classical* perspective on institutions like

that of Philip Selznik in 1949 that tended to view institutions as formal organizations (social relationally conceived) at the service of values. More recently, the *new institutionalist* perspective pioneered by Paul DiMaggio and Walter Powell in 1991 conceptualizes institutions in terms of rules and cognitive schema. Often they are sociological in their concentration on the interplay between sociologically conceived attributes of states and societies, for example, state policy and societal inequality.

Sociological theories of politics are often *institutional* in the sense that they focus on the sociocultural and organizational characteristics of state social structures. State-centered institutional approaches have much in common with institutional approaches in political science, but they differ from institutionalists in political science in some respects. In regards to the so-called neoinstitutionalists in political science, sociological institutionalists differ dramatically in that they use little or no neoinstitutional theory from economics and public choice theory. Sociological new institutionalists tend to focus on state and political institutions with both less historical precision and more theoretical self-consciousness than *historical institutionalists* in political science.

Despite certain distinguishing characteristics, differences should still not be drawn too sharply. First, although increasing use of rational choice theoretical models in political science distances political science work on institutions from sociological work on institutions, persistent political science reference to sociological theories of institutions narrows the gap. Second, overlapping academic subfields about welfare states and political economy sustain much cross-fertilization and communality across the sociological and political science disciplines. For all the centrality of societal and state theoretical touchstones in political sociological theory, emphasis on these reference points obscures a distinctive sociological emphasis on cultural—and, to a lesser extent, historical—approaches. To their disadvantage, students of politics in other disciplines (e.g., political science, philosophy) would miss this emphasis.

ORIGINS AND TRENDS

Modern U.S. political sociology traces to three lines of work, and reactions to them, that arose before the Vietnam War (1959–1975). The tradition of voting behavior studies that stressed voter social networks and contexts constitutes one of these lines. This line of work waned during the 1960s due to a marginalization of political sociological interest in voting issues during the Vietnam War era. However, it has been continuously sustained, most recently by the collaborative efforts of Clem Brooks and Jeff Manza.

The class-centered pluralism of the pre-Vietnam works of Seymour Martin Lipset constitutes a second line. This line of work waned because reactions in the 1970s and 1980s against the reformist stress in its treatment of class moderation, as well as because of the manifest conservatism of Lipset's Parsons-inspired work on value traditions. However, a focus on reformist activities of pluralistic class actors has returned in the form of power resource theory.

A pre-Vietnam dialogue between elitist and pluralist interpreters of urban ("community") and national political power, and the neo-Marxist reaction to it, composes a third line of work. The elite side of this debate is virtually Marxian in its skepticism about the representativeness of American democracy and in its considerable stress on *economic elites*. Floyd Hunter and C. Wright Mills's studies of urban and national Atlanta city politics and national elites are seminal works in this line, and responses to these by Robert Dahl and such notable collaborators as Nelson Polsby also proved influential. The debate first evolved as a refutation of claims for the oligarchical power of the few with arguments for the relevance, in democratic contexts, of more dispersed and plural rule. Neopluralists next articulated pluralist-elitist syntheses of elite and pluralist elements, followed by neo-Marxist inspired incorporations of structuralist arguments. Several more distinctive sociological thrusts emerged in the late 1960s, and these innovations are often associated with the intellectual unsettling of sociology following the full onset of U.S. involvement in Vietnam.

First, with the radicalization of sociologists accompanying the social movements of the Vietnam War era, sociological elite and neopluralist work was repudiated and replaced by new systematically Marxian structuralist, or class-analytical, approaches to the analysis of politics. Structuralist variants of the Marxian turn emphasized the power of structural constraints to shape action, while other, class-analytical approaches unequivocally accommodated the causal powers of agency as well as structure. The innovative work of G. William Domhoff in 1967 revitalized elite-theoretical cases for economic oligarchy in new class-analytical terms, while James Petras and Maurice Zeitlin's *Latin America: Reform or Revolution* (1968) and Barrington Moore Jr.'s *The Social Origins of Dictatorship and Democracy* (1966) advanced theories of class conflict as well as hegemony, and revolution as well as domination. These works also helped usher in the eventually ascendant historical-comparative method in political sociology. A two-pronged Marxian development of political sociology emerged in the late 1960s and 1970s, one prong stressing structure and the other action (and conflict). This remains influential today.

A turn to Marxist structuralism helped bring students of politics important conceptions of systemic and structural power. From French structuralists, it imported a conception of power as an effect of structure that may pressure for outcomes favorable to a particular class or group beneficiary, unaided by conscious striving after the outcome by the beneficiary. As Axel Van den Berg and Thomas Janoski detail, the conception is rooted in the Marxist structuralism of Louis Althusser and Nicos Poulantzas, which tends to treat human agency as epiphenomenal.

Fred Block offered extensions of Marxist structuralism, reconciling policy-maker agency, if not ruling-class agency, with structural effect. Block treats policy-maker decision making as a social mechanism linking structural constraint cause to policy effect. For example, no political action (e.g., lobbying) by "capital" is needed for policy-making politicians to lower an interest or tax rate to stimulate economic activity because

the public approval of politicians, as well as the prosperity of capitalists, depends on economic performance. Block's reading appeared at the same time as Charles Edward Lindblom's parallel formulation of the "privileged position of business."

With its assimilation into rational choice formulations, the structural conception of power becomes more strategic and less manifestly sociological. Still, underlying conceptions of class institutions that link economic distributions and processes to political cost and benefits are substantially sociological. While this is true, many social-structural and institutional factors may be treated by nonsociologists as ad hoc additions to, rather than core elements of, their theories. Not only did the structural conceptions of power at issue come to influence political science, but underlying class and institutional conceptions also entered into political science via such avenues as sociologist Wolfgang Streeck's early investigations with Phillip C. Schmitter into neocorporatist institutions and Gøsta Esping-Andersen's 1991 delineation of his three worlds approach to study the welfare state. A turn to class analysis, stressing agency as well as structure, and familiar collective political agencies (e.g., unions, parties) as well as abstract theoretical formulations, shifted emphasis from structures that constrain the action of nondominant classes (e.g. private control of investment) to organizational agencies that empower such classes (e.g., labor parties). Walter Korpi's groundbreaking work on *power resource theory* became widely employed and variously elaborated. Interestingly, on the terrain of twentieth-century European reformist politics, power resource transformation of neo-Marxist thinking on class converges with pluralist thinking on interest politics.

During the Vietnam War era, a second distinctive sociological thrust emerged. Social movement theory gradually emerged from the recent, repudiated precedent of collective behavior theory, with its emphasis on irrational behavior. This new move was oriented not toward the analysis of institutional politics like voting legislation, but instead toward the analysis of relatively uninstitutionalized modes of politics, such as protest and self-help. However, this shift did not preclude attention to such institutional contexts as religious institutions or such institutional consequences as organizational reform and new public policies.

Powerful new tradition of social movement studies emerged in the late 1970s and early 1980s with the work of Charles Tilly, John McCarthy, Meyer Zald, Doug McAdam, and others. This work centered on resources and tactics of politically oriented social movement. In particular, resource mobilization theory began to differentiate a distinct social movement theory from collective behavior theory. This distinction emphasized specific goals opposed to diffuse grievances; rational action rather than irrational behaviors (e.g., panics, outbursts, crazes); organizations instead of unstructured masses; specialized instead of amateur organizational personnel; and reasoned tactics instead of spontaneous disruption. Increasingly, social movement theory attends to the study of outcomes, especially political ones.

Social movement theory remains large despite revitalizations of interest group theory by theorists of interest intermediation, policy networks, and interest groups as crystallized social movements. Theoretical cohesion around the organizational and mobilizational core of resource mobilization theory was followed, first, by theoretical elaborations concerning tactics, strategies, and political opportunities, and subsequently by ones concerning culture (e.g., frames, identities). The sociological commitment to social movements as an area of study has deepened into the substantively focused field of analytical history on topics like the civil rights movement, the labor movement, and the women's movement, and it now ventures into new substantive domains such as terrorism. With works by political scientists and historians, as well as sociologists, the new social movement theory evolved by the 1980s into an interdisciplinary specialty. Indeed, social movement theories' chronicles of its own development and branches, such as that by McAdam, Tarrow and Tilly in 2001, are now often multidisciplinary.

A turn to historical political sociology—historical-comparative sociology for the most part—provided a third new direction. The historical turn in sociology emerged at the same time as the Marxian one. The "historical" thrives in sociology not merely as an arena for studies of the past, but also as a central laboratory for small-n qualitative studies. It is also an approach that stresses the importance of antecedent events and their sequences of occurrence to the explanation of many outcomes, and it is an orientation that claims a historical, time-dependent nature for the social world. Historical comparativists argue for the historical constitution of the social world, the centrality of historical conditions, and the valid identification of theoretical domains. In fact, one of the great historically oriented works of post–World War II (1939–1945) sociology, Michael Mann's multivolume *The Sources of Social Power* series, offers a political sociology of world history that, among much else, sequentially arranges key theoretical domains for sociological theory. Historical comparativists thus stress the importance of national historical processes within nations to the comparison of nations.

In some cases, historical sociology is simply conventional historical interpretation of other times completed with a particular attentiveness to the sociological theory, as when Michael Mann stresses intensive and extensive models of imperial power in his treatment of the fall of the Roman Empire. In other cases, it stresses a combination of historical subject matter with the methodologies of systematic comparison, for example in Torben Iversen and David Soskice's 2009 analysis of distribution and redistribution in modern capitalism. In still others, it has morphed philosophically as well as methodologically into a self-consciously realist, or even interpretive, social science at odds with positivist social science.

In the interpretive—or interpretivist—case, covering law explanations must be rejected by the social scientists because meanings are both integral to human action and too psychologically, culturally, and historically heterogeneous and volatile for explanatory patterns that are stable over time. This complicates the theoretical task for already highly contingent open systems, leaving scholars with more prospect to come up with

potent causal mechanisms that might assemble into compelling post hoc explanations of particular events. These prospects are higher than for those that capture determinist explanatory formulas for general classes of social events. Although this antipathy to generalization may seem antithetical to philosophical and methodological canons of political science, it may resemble the skepticism of many survey researchers—perhaps in the area of voting behavior—to claims for external validity much beyond the spatial and historical perimeters of the data at hand.

The interpretivist variant of the historical turn overlaps with a fourth major political sociological innovation—the cultural turn. This development has numerous sociological precedents: microinteractionist theories ranging from symbolic interactionism and ethnomethodology in the United States (e.g., Herbert Blumer, Howard Garfinkel, Anselm Strauss, Erving Goffman) to hermeneutics, phenomenology, and historicism in Europe (e.g., Edmund Husserl, Alfred Schutz, Paul Ricouer, Hans-Georg Gadamer). The epistemological basis for this new interpretivism lies in the meaning created in small contexts, with their strands dissipating as it moves beyond the original context to other situations.

Although employing cultural variables in a positivist mode, George Steinmetz documents a preponderance of interpretivist approaches to the cultural analysis of politics in the new political sociology of culture. Where history and culture are concerned, sociological precedents of great potential interest to political scientists abound. On the historical side, Michael Mann's work on world history comes most to mind, but the works of Theda Skocpol and Edwin Amenta and collaborators on American political development help illustrate the variety offered by historical–comparative sociologists. As Julia Adams, Lis Clemens, and Ann Orloff extensively catalogue, the cultural facet of comparative and historical sociology ranges across organizational, national, and transnational institutions in a generally constructionist and sometimes interpretivist mode.

NEW CROSS-FERTILIZATION
Questions now arise regarding whether political sociology's turn toward social movements, class-analytical, cultural, and historical–comparative approaches to the study of politics will continue to influence political science. In the area of class analysis, power resource theory is at least one strong continued response from within the class-analytical tradition. For example, Korpi's 2006 take on class politics impacts Iversen and Soskice's 2009 analysis of distribution and redistribution in late twentieth-century advanced capitalism. In the area of social movements, political science is beginning to figure prominently, as the centrality of political scientist Sid Tarrow documents.

Some influences from historical-comparative approaches, especially in the subfields of American political development and comparative politics, are also apparent. In addition, cultural approaches prevail as strong interdisciplinary work along traditional methodological lines. Despite some culturally framed theory and research, such as the studies of

international relations associated with the initiative of Peter Katzenstein in 1996, more interpretive, cultural approaches imported from sociology into political science proceed slowly.

Political Theology

The earliest antecedents to speaking of political theology might be found in the distinction, current among the Stoic philosophers and followed by Varro, then disparaged by St. Augustine in his *City of God*, between mythical, physical, and civil theology.
